provost of Edinburgh. After another short
absence he was kept out of Edinburgh by the
Douglases and a battle was fought on 30
April 1520 in which the Hamiltons were
worsted. But by alloying himself with Angus'
wife, the Queen-mother, he gained another op-
opportunity for power, which he held from 1522-
24, when he was forced to include Angus in
the government. Angus was finally conquered
in 1526 and Arran joined the King at Sterling.
He was succeeded by James Hamilton, who
was Duke of Glencairn and about 1515; d. 22 Jan. 1575. On the death of James V he
was proclaimed protector of the realm and heir
presumptive to the throne. He was a zealous
supporter of the Reformation. At first he supported the English policy in opposition to
Cardinal Beaton, but later joined the French
party and became a Roman Catholic. In 1544
he signed a bond repudiating the English al-
liance. In 1545 he accepted Mary of Lorraine
as a sharer in the government, and in the
meantime was forced to meet the English army
as Queen-mother, whose government he supported
reluctantly agreed to the marriage of the
Dauphin with Mary, whom he had designed for
his son, and accepting a duchy in France, al-
lowed his title to descend to his eldest son.
On 12 April 1554 he abdicated in favor of the
Queen-mother, whose government he supported
until the capture of Edinburgh by the lords of
the congregation, when he declared himself on
their side and took the covenant. After sev-
eral vacillations among the various factions
he was declared a traitor and went into exile
for five years. He went to France; returned
after the murder of Mary's husband and on her
abduction was nominated one of the re-
gents, with support from Scotland, acknowl-
edged James as king, but treacher-
ously supported the cause of Mary, and when
the regency was given to Lennox called a par-
liament which annulled the King's coronation.
In August he was declared a traitor, lost his
estates and finally in 1559, after James' authority and laid down his arms. He
married Margaret, daughter of James Doug-
las, 3d Earl of Morton, and had several
dughters and four sons. James, his eldest
son, succeeded him as 3d Earl of Arran: b.
1537; d. 1609. He was betrothed to the Princess
Elizabeth and was early involved in political
briars. He was seized as a hostage in 1546
by the murderers of Cardinal Beaton. Later
he went to France in command of the Scott
Guards and in 1557 distinguished himself in
the defense of Saint Quentin. He was a strong
adherent of the Reformed doctrine. At the
wish of Mary he was declared a traitor in
1559 and to escape arrest he fled to Geneva
and England. He returned to Scotland in Sep-
ember, supported his father's cause, and
Lorraine, upheld the alliance with Elizabeth and
fought the French at Dysart. He signed the
treaty of Berwick, became one of the lords of
the congregation and with the strong support
of the Protestants and Hamiltons refused the
proposals of marriage with Elizabeth and pre-
sented his suit for Mary without success. He
became a member of her council in 1561, but
took a hostile attitude toward her court be-
cause of the prevalence of the Roman Catho-
lic religion. He showed marked signs of in-
sanity and was confined in Edinburgh Castle,
where he remained until 1566. His estates
were administered by his brother John, 1st
Marquess of Hamilton. Arran and his mother
were besieged on the pretense of delivering
him from unlawful confinement and brought
to Linlithgow while the charge of his estates
was taken over by the government and James
Stewart was appointed his guardian. The for-
feiture was repealed in 1580 and the title de-
volves on Arran's nephew, James, 2d Mar-
quess of Hamilton, son of John Stewart.
Andrew Stewart, 2d Lord Ochiltree: b. about
1556; d. 1596. In his youth he served with
the Dutch forces against the Spanish. Returning to Scotland, he became a favorite of the
King. In 1581 he was the principal accuser of the Earl of Morton and for his share in the latter's destruction was ap-
pointed a member of the Privy Council. By
grant he became Earl of Arran and Hamil-
ton on the ground of the illegitimacy of the
children of his grandfather's father. In the
same year he married Elizabeth, daughter of
John Stewart. By the raid of Ruthven in
August 1582 he was deprived of office and
imprisoned. In 1583 he led a force of 12,000
men against the new government and the
overthrow of the Protestant Lords was made
possible. After service as Governor of Edin-
burgh he was made a Privy Councilor. After
executing Earl Gowrie he was made govern-
orum of Edinburgh Castle, provost of the city and lieutenant-general of the
King's forces. Arran induced the English gov-
ernment to refrain from aiding the banished
ARRAS — ARREST

ARRAS, ār′rās, France, capital of the department of Pas-de-Calais, in the middle of an extensive and fertile plain, on the Scarpe, which here becomes navigable. It is an important station on the French Northern Railway, is 134 miles by rail from Paris and 97 miles from Brussels. It is a well-built town, and has several handsome squares and a citadel, but is no longer fortified. The chief public buildings are the modern cathedral, the extensive buildings of the former abbey of Saint Vaast, now accommodating a museum and the public library of 50,000 volumes; the Hôtel de Ville, one of the handsomest in the north of France, with a fine Gothic façade; the theatre, Hôtel de la Prefecture, barracks, etc. Its industries are varied and important. These include beet sugar, agricultural implements, hose, leather and petroleum products. There is also a large trade in flour, grain, oil, wines, etc. In the Middle Ages it was famous for the manufacture of tapestry, to which the English applied the name of the town itself. The Arras is the most important in the north of France. Arras in ancient times was the capital of the Atraves. It was ceded to Louis XI in 1482, but the inhabitants having revolted, the King stormed it and put the people to the sword or expelled them and named the place France. In 1493 it was ceded to Maximilian of Austria, and was retained by the Hapsburgs until 1640. Arras suffered greatly during the Revolution and again in the European War when it was practically razed to the ground in the conflict of British and German gunboats. During the early stages of the war the French were driven back at Arras on 4 Oct. 1914. About the time fierce battles were raging on the Yser, at La Bassée and Ypres, the Germans made a determined attack on Arras 20 October. They had already bombarded the city during the first week of the month and had attempted to storm it on the 7th. For six days, from the 20th to the 26th, they poured a torrent of shells into Arras. The main attack was made on the 24th; whole quarters of the city were wrecked, but the French line remained firm. Had the Germans succeeded in breaking through they would not only have attained the channel ports and recovered the northern road to Paris, but they would have achieved their main objective, the splitting of the Allied line into two parts, of which the northern must have been annihilated or captured. On the 26th the French under General Maud'huy counter attacked and drove the enemy out of the front trenches, gradually widening the circle till Arras was in the shape of the heavy bowitzer. The earliest advance of the Germans brought them 11 miles west of Arras in 1914; by January 1918 they had been pushed back eight miles east of the city. Arras was the birthplace of Robespierre. Pop. about 26,000.

ARRATE Y ACOSTA, ār-ratā ˌ ē ə kōsˈta, a Cuban historian: b. Havana 1697; d. 1760. He studied law in Mexico and Havana and in 1752 was named alcalde of the last city. His history of Cuba entitled 'Llave del Nuevo Mundo y antemural de las Indias Occidentales' remained in manuscript until 1830. A new edition was issued in 1876.

ARRAWAK, ār′ra-wak. See ARAWAKS.

ARREBO, ār′re-bō, Anders Christensen, a Danish poet: b. Aroskjobing 1857; d. 1937. He was made bishop of Dronthim, Norway, when only 31, but deposed in 1622, owing to his objectionable life; he was afterward rehabilitated as preacher in Vordingborg. As the pioneer of the Renaissance movement he is considered the father of modern poetry in Denmark. His rhymed translation of the 'Psalms of David' (1623), but especially his 'Hexameron' (1641), an imitation of a once famous poem of the French poet Du Bartas on the 'Creation,' are highly esteemed. Consult the 'Life' by Rördam (Copenhagen 1857).

ARREST, the seizure of a suspected criminal or delinquent that security may be taken for his appearance at the proper time. The courts of law or any body of persons having a right to issue such a warrant, or any person or body of persons accused to a court to answer to a charge. Ordinarily a person can be arrested only by a warrant from a justice of the peace; but there are exceptional cases in which he can be apprehended by an officer without a warrant, by a private person also without a warrant, or by what is technically called a 'hue and cry.'

Any peace officer, as a justice of the peace, sheriff, coroner, or watchman may, without a warrant, arrest anyone committing a felony in his presence, 3 Hawkins Pl. Cr. 164; Tiner v. State, 44 Tex. 128; Reg. v. Chapman, 12 Cox C. C. 4, or committing a breach of the peace, during its continuance, 3 Wend. (N. Y.) 384, or even to prevent the commission of a breach of the peace, Rex v. Herms, 7 C. & P. 312, 32 E. L. 522, and such officer may arrest any person whom he reasonably suspects of having committed a felony, whether a felony has actually been committed or not. 40 N. Y. 463; 3 Park. Cr. (N. Y.) 249; 99 Pa. St. 63.

A private person who has reason to believe when a felony is committed, 3 Wend. (N. Y.) 353; 1 Moud. 93; or during the commission of a breach of the peace, 10 Cl. & Fin. Hon. L. 28; 25 Vt. 261, may and should arrest the felon, and may upon reasonable suspicion that the person arrested is the felon, if a felony has been committed. 3 Wend. (N. Y.) 353; 6 Term 315.

An arrest is made by touching the body of the person accused. The object of arrest being to make sure that he answers to a charge about to be brought against him, it does not follow that after being seized he is incarcerated; if bail for his appearance at the proper time be given, and the case be not too aggravated a one for such security to be accepted, he will be released till the day of his appearance, by a man. 'Treaties on the Law of Executions in Civil Cases' (3d ed., San Francisco 1900), and Hawley, 'Law of Arrest on Criminal Charges' (2d ed., Chicago 1891).

ARREST, Military. Before an officer or soldier, or other person subject to military law, can be brought to trial, he must be charged
with some crime or offense against the rules and articles of war, and placed in arrest. The articles of war direct that whenever any officer shall have committed, or caused to be committed, any breach of discipline or of good conduct, he shall be arrested and confined in his barracks, quarters or tent, and deprived of his sword by the commanding officer, and that no commissioned officers and soldiers charged with crimes shall be confined until tried by a court-martial, or released by proper authority. The arrest of an officer is generally executed through a staff officer; by an adjutant, if ordered by the commanding officer of a regiment; or by an officer of the general staff, if ordered by a superior officer; and sometimes by the officer with whom the arrest originates. On being placed in arrest an officer resigns his sword. It is customary, except in capital cases, to allow an officers in arrest the limits of the garrison, or even greater limits, at the discretion of the commanding officer, who regulates his conduct by the dictates of propriety and humanity. A non-commissioned officer or soldier is confined in charge of a guard; but, by the custom of the service, the non-commissioned staff and the sentry may be the same. The articles of war declare that no officer or soldier who shall be put in arrest or imprisonment shall continue in his confinement more than eight days, or until such time as a court-martial can be conveniently assembled.

It is declared by the articles of war that no officer commanding a guard, or provost-marshal, shall refuse to receive or keep any prisoner committed to his charge by any officer belonging to the forces of the United States; provided, the officer committing shall, at the same time, deliver an account in writing, signed by himself, of the crime with which the said prisoner is charged, and it is also declared that no officer commanding a guard or provost-marshal shall presume to release any prisoner committed to his charge without proper authority for so doing, nor shall he suffer any person to escape, on the penalty of being punished for it by the sentence of a court-martial. Every officer or provost-marshal to whom a prisoner shall be committed shall, within 24 hours after such commitment, or as soon as he shall be relieved from his guard, make report in writing to the commanding officer, of their names, their crimes, and the names of the officers who committed them. Thus the liberty of the citizen, under military law, so far as is consistent with the ends of justice, seems to be guarded with precautions little inferior to those which secure personal liberty under the civil laws of the State. The penalty of an officer's breaking his arrest, or leaving his confinement before he is set at liberty by his commanding officer, or by a superior officer, is declared to be cashiering by sentence of a general court-martial. A court-martial has no control over the nature of the arrest of a prisoner except as to his personal freedom in court; the court cannot, even to facilitate his defense, interfere to cause a close arrest to be enlarged. The officer in command is also responsible for the prisoners under his charge. Individuals released in arrest may be released, without being brought before a court-martial, by the authority ordering the arrest or by superior authority. It is not obligatory on the commander to place an officer in arrest on application to that effect from an officer under his command. He will exercise a sound discretion on the subject. But in all applications for redress of such a nature, it will be his duty, in case he shall not deem it proper to order an investigation, to give his reasons, in writing, for declining to act; these reasons, if not satisfactory, the complaining party may inter alia to the next common superior, together with a copy of his application for redress. An officer has no right to demand a court-martial, either on himself or on others; the general-in-chief, or officer competent to order a court, is the judge of its necessity or propriety. Nor has any officer who may have been placed in arrest any right to demand a trial, or to persist in considering himself under arrest, after he shall have been released by proper authority. An officer under arrest will not make a visit of etiquette to the commanding officer or other superior officer, or call on him, unless sent for; and in case of business he will make known his object in writing. It is considered indecorous in an officer in arrest to appear at public places.

ARRETE OF JUDGMENT, in law, is the act or process of preventing or verdict from being carried out till it shall be ascertained whether it is faulty or legally correct. Judgment may be arrested (1) when the declaration made varies from the original visit; (2) where the verdict materially differs from the pleadings and issue thereon; and (3) where the case laid in the declaration is not sufficient in law to admit of an action being founded upon it. A motion for arrest of judgment must be grounded on some objection arising on the face of the record itself. People v. Thompson, 41 N. Y. 1; People v. Kelley, 94 N. Y. 526. If the judgment is arrested all the proceedings are set aside, and judgment of acquittal is given, but this will be no bar to a new indictment. See Judgment and consult works there referred to.

ARRETUM, är-re-šë-üm. See Arezzo.

ARRENATHÉRIUM, genus of three species of tall perennial grasses closely allied to the oat (q.v.). A. elatius (also known as Avena elatius and Holcus avenaceus), which, as these names imply, bears a resemblance to oats, and is sometimes called oat grass and French rye grass, is widely cultivated for fodder in France. True rye grass (Lolium) is, however, not a close relative. It is grown in the United States as a hay grass, but is confined to the States east of the Mississippi.

ARRHENIUS, är-rént-fës, Svante August, Swedish chemist and physicist; b. Wijk, 19 Feb. 1859. He was educated at the University of Upsala and after making many original investigations became professor in the University of Stockholm in 1891. His researches have been of the highest importance, the establishment of the theory of electrolytic dissociation being due to him. This theory supplies a reasonable explanation of many chemical phenomena otherwise insoluble and correlates various hitherto unconnected facts. In 1903 he was awarded the Nobel prize in chemistry. He has published 'Sur la conductibilité galvanique des électrolytes' (1884); 'Larobok i teoretik'
ARRIA — ARROW-MAKER

(Translated into German and English, 1900); 'Lehrbuch der komischen Physik' (1903); 'Immunochemistry' (1907) embodying the course of lectures which he delivered in 1904 at the University of California; 'Das Werden der Welten' (1907), published in English as 'Worlds in the Making,' (1908), a widely discussed work which maintains the theory of the perpetual self-renewing energy of the world against the Clausian theory of final glacial decay, and initiates the theory of universally diversified life, emanating continually as spores from all habitable worlds, which, unless destroyed by contact with flaming stars, propagate life on habitable worlds they may reach.

ARRIA, celebrated Roman matron, wife of Cæcina Petus, consul during the reign of Claudius, about 41 A.D. Petus having raised an unsuccessful revolt against Claudius, in Illyria, was condemned to die, but was offered the option of ending his life by suicide, which the Romans did not deem a crime. Petus hesitated; Arria seized the dagger, plunged it into her bosom, and then presenting it to her husband, said: "It is not painful to Petus." She fell lifeless and Petus at once killed himself with the weapon. Arria was the mother of Arria, who became the wife of P. Claudius Thrasea Petus.

ARRIAGA, är-rē-ä'ga, Manoel de, 1st President of Portugal: b. Horta, Azores, 1842; d. 5 March 1917. Began practising law in Lisbon, and became one of its foremost lawyers. He was always a Republican by conviction, and in 1861 he was sent to the Chamber of Representatives by the Republicans. It was here, where he served his party for many years, that he gained a reputation as a fluent speaker. At one time he was offered the position of tutor to the royal princess, but this honor he refused as inconsistent with his Republican principles. He took a leading part in the revolution which in 1891 deposed the King and proclaimed the republic; on 24 August of that same year he was elected the 1st President of the republic, receiving 121 votes as against 86 cast for Senhor Machado. See PORTUGAL.—History.

ARRIATUS, Flavius, a celebrated Greek philosopher and historian: b. Nicomedia, Bithynia, who flourished in the 2d century under the Emperor Hadrian and the Antonines. He was a disciple of Epictetus, whose lectures he edited. While residing in Greece he gained the friendship of the Emperor Hadrian, who bestowed upon him the citizenship of Rome (124 A.D.), and subsequently appointed him prefect of Cappadocia. He was afterward advanced to the senatorial and even consular dignities. Like Xenophon, whom he imitated in style, he united the literary with the military character. His writings were numerous, but many of them have perished. His 'Anabasis' of Alexander the Great, still extant, narrates the Asiatic expedition of Alexander, and being based on the reports of Lagus and Aristobulus, who both served under that King, is proportionately valuable. To this is added a book on the affairs of India, which pursues the history of Alexander, but is not deemed of equal authority. An epistle from Arrianus to Hadrianus is also extant, entitled 'De sequinis Ponti Euxini' (A Voyage Around the Euxine or Black Sea). There are also ascribed to him 'Treatise on Tactics': and a 'Periplus of the Sea of Azof' and of the Red Sea, of which the authority is doubtful. We possess also his 'Enchiridion,' a moral treatise containing an abstract of the practical philosophy of Epicurus. There have been various editions of the 'Enchiridion' and the 'Anabasis.' His philosophical works have been translated by T. W. Higginson (Boston 1891) and the 'Anabasis' by Chinnock (1893). For biographies consult Bolla, E., 'Arriano di Nicomedia' (Rome 1890); Felham, H., 'Arrian as Legate of Cappadocia' (Eng. Hist. Rev. October 1896).

ARROL, Sir William, British engineer: b. Scotland 1840; d. Ayr, 20 Feb. 1913. Apprenticed to a smith at Paisley in boyhood, he worked in various engineering shops, and set up as a boilermaker in a small way in 1865. In 1872 he started the Dalmarnock Iron Works, and gradually took up construction work in steel. His first important work was the Caledonian railway bridge at Glasgow. He reconstructed the Tay bridge after the disaster of 1879, which occupied five years, and the Forth bridge, 1882-89. He also built the steel work of the Tower bridge, London, and the Nile bridge at Cairo, and widened Blackfriars bridge across the Thames. Arrol devised many ingenious implements for drilling, riveting and other operations. Originally a Liberal, he left the party in the House of Commons and sat as Unionist M.P. for Ayrshire 1895-1906.

ARRONDISSEMENT, är-roh-dë-zhō', name given in France to the 362 subdivisions of the 87 departments, or of the quarters of some of the larger cities, as in Paris. The arrondissement is under the government of a sub-prefect.

ARROO. See ARRU ISLANDS.

ARROW, a missile weapon, straight, slender, pointed and barbed, to be shot with a bow. See ARCHERY.

ARROW LAKE, the name given to an expansion of the Columbia River, in British Columbia, about 95 miles long from north to south. It is often regarded as forming two lakes—the Upper and Lower Arrow.

ARROW-MAKER, The. This play, reflective of American Indian life, especially of the Paiutes, in the Sierras, is by Mrs. Mary Austin. Presented at the New Theatre, New York, under the management of Winthrop Ames, in February 1911, certain concessions had to be made, so the author confessed, "to what was thought to be the demand for a drama of Indian life which should present the Indian more nearly as he is popularly conceived." But, even in the presentation, care was taken that the music be reminiscent of Indian themes, that the chants be played from phonograph records of Indian ceremonial, that the dances be taught by one Chief Red Eagle, and that the costumes and properties have the authenticity of the American Museum of Natural History. When the play was revised and issued definitely in 1915 (Boston), its notes and glossary revealed Mrs. Austin's desire to make of 'The Arrow-Maker' an archaeologically correct representation of the Indian as known to her.
The central character in the drama, The Chisera, is a Medicine Woman of the Paiutes—
who, in commune with the gods, is supposed to be as one removed from human passion. Those
who come to her are cured, but she has an intense and airy, with the power of influencing the Great One.
They all work her to their best advantage.
But The Chisera tires of lonely communion and gives her love to Simwa, the Arrow-Maker. In
the tribal matters that follow this complication, the drama is a tragic revelation of Indian plotting
and deceit. The Chisera is deserted by
Simwa for the chief’s daughter, and though
this Medicine Woman has not been taught the potent processes of the witch do not cease to excite
her power of intercession with the gods. And
this brings misfortune to the tribe and grief to
those involved in the way of both Simwa and of
one Padahoon, both rivals for tribal leadership.
The final curtain falls on the death of The Chisera, cruelly wounded by one of her
own enchanted arrows.

Apart from its archaeological faithfulness,
“The Arrow-Maker” is a dignified attempt to
create an American Indian drama. It is the
latest in the long line of Indian dramas, the first
of which, Maj. Robert Rogers’ “Pontech,” was written in 1767.

MONTROSE J. MOSES.

ARROW-ROOT, a fine-grained starch eaten for making desserts and invalid foods.
It is extracted from the underground parts of various tropical plants, especially of the genus
Maranta of the family Marantaceae. The popular name is said to be derived from the practice of the South American Indians who
used the freshly dug rootstocks as an antidote for poisons and wounds. Probably, however, the derivation is from the Indian word
ara. The principal species is Maranta arundinacea, indigenous to tropical America and cultivated in the West Indies, India and other
warm countries. It is a perennial plant about two feet high, has small white flowers and
fruits about the size and form of currants. The rootstocks, which often exceed a foot in length and three-quarters of an inch in diameter, are
yellow when fresh and covered with long scar-like scales which must be carefully removed before
the extraction of the starch, because they impart their disagreeable flavor if allowed to remain.
The process of extraction, which is
simmie but usually cruelly practised, is as follows: The rootstocks are dug when a year old,
well washed, peeled, beaten to a milky pulp in deep wooden mortars, and well washed to
remove the fibrous parts, which are thrown away.
The crude starch is next passed through a sieve or coarse cloth and allowed to stand until the starch has settled, when the water is
drawn and the white residue again washed. After being settle, the water is drawn off and
the pulp when dried in the sun is reduced to powder. On a large scale arrow-root is manufactured with the aid of specially constructed machinery, but the process is essentially as described.
Bermudian arrow-root is considered the best in the market, and next to it is that of Java.
The East Indian product is believed to be inferior, probably because of adulteration with or substitution of other starches, practices induced by the great demand and the high prices paid for the genuine. Some of these other starches are obtained from closely
related plants, among which may be mentioned certain species of the genera Canna (q.v.), Curcuma (see Turmeric), Manihot (see Cassava),
Taeas (q.v.), and Arum. Potato, corn, rice and wheat are all superior in quality to arrow-root, but may be identified by microscopical examination; the form and markings of the starch grains differ from those of the arrow-root granules. When dry, arrow-root is
odorless and when damp has a slight smell. Like other carbohydrate foods, it is a source of energy, but since it is deficient in nitrogen compounds it should be mixed with eggs, milk or other substances rich in nitrogenous materials, to form a well-balanced diet.

The amount of farina or starch present in the roots of the Maranta varies according to
age, and runs from 8 per cent, in those of the young plants, to 26 per cent when full grown.
The latter stage is reached when the plant is 10 to 12 months old; and the roots then present
the following composition in 100 parts:

| Starch, farina, or arrow-root | 26 |
| Woody fibre | 6 |
| Albumen | 6 |
| Gummy extract, volatile oil, and salts | 1 |
| Water | 65 |

Arrow-root is exported in tin cases, barrels or boxes, carefully closed up. It is a light,
opaque, white powder, which, when rubbed between the fingers, produces a slight crackling
noise like that heard when newly fallen snow is being made into a snowball. Through the
microscope the particles are seen to be convex, more or less elliptical, sometimes obscurely
triangular, and not very elastic. The dry farina is quite inodorous, but when dis
olved in boiling water it has a slight peculiar smell and swells up into a very perfect jelly.
Potato starch, with which it is often adulterated, may be distinguished by the greater size
of its particles, their coarser and more distinct rings, and their more glistening appearance.
Refined sago flour is used for adulteration, many of the particles of which have a truncated extremity, and their surface is irregular or tuberculate. Arrow-root is also sometimes adulterated with rice starch and the common starch of wheat flour.

The starch of the cassava, manihot or manioc is sometimes imported into Europe under the name of Brazilian arrow-root. Pot
tato starch, carefully prepared, is sometimes sold as English arrow-root: and the farina obtained from the roots of Arum maculatum as Portland arrow-root. Otaheite arrow-root is the starch of Taeas pinnatifida. All these, as well as Owego and Chicago corn flour—the starch of maize or Indian corn—are so nearly allied to true arrow-root as not to be certainly distinguishable by chemical test; but the forms of the granules differ, so that they can be distinguished by the microscope.

ARROWHEAD, Sagittaria, a genus of plants of the natural order Alismaceae, distinguished by unisexual flowers, having three her
aceous sepal and three colored petals, numerous stamens and numerous carpels, which are
compressed, one-seeded, and on a glbose receptacle. These natives of very different climates, from the tropics to the cold regions of the world. The common arrow-head (S. sagittifolia) is a beautiful plant, a
native of England, with arrow-shaped leaves
which rise above the surface of the water. It is one of those plants which have enjoyed an undeserved reputation as cures for hydrophobia. The corms (or solid bulbs), dried and powdered, have sometimes been used for food, but have an acrid taste. The Chinese arrowhead (S. simensis) is a native of China, and has long been cultivated in that country and Japan for its edible corms, which, in a fresh state, are somewhat acrid, but abound in starch. It has arrow-shaped acute leaves and a branched pseudo-scalp (leafless stem). It is grown in ditches and ponds and is one of the plants sometimes cultivated in tanks in hot-houses.

ARROYO, är-ro'yō (Sp. *stream*) the name of two towns of Spain, in Estremadura. Arroyo del Puerco, about 10 miles west of Caceres, has a palace of the old duked of Bene- vente, and a parish church adorned with some paintings by Morales. Arroyo Molinos de Montaneches, about 27 miles southeast of Caceres, is noted for the fame of a woman of French, 28 Oct. 1811, by the British under Lord Hill.

ARROYO, Porto Rico, town in the department of Guayama. It is situated on the south coast of the island, at the head of the harbor of the same name, being 6 miles southeast of San Juan. It is the centre of a rich sugar-producing region and exports much rum and molasses. In 1899 it was partially destroyed by a hurricane. Pop. 3,220.

ARRU (a-roo') ISLANDS, a group belonging to the Dutch, situated to the south of western New Guinea, and extending from north to south about 127 miles. They consist of one large island and a number of smaller. They are all low and swampy, but well wooded and tolerably fertile. The natives belong to the Papuan race, and many of them have been converted to Christianity by Dutch missionaries. The chief exports are trepang, tortoise-shell, pearls, mother-of-pearl and edible birds' nests, which they exchange for European goods. Agriculture is in a primitive state, but maize, sugarcane, bananas, etc., are cultivated. Sago is the chief diet, little animal food being eaten. Pop., mainly Papuans, about 23,000.

ARSCACES, är-sä-séz, founder of a dynasty of Parthian kings, who, taking their name from him, are called Arsacidae.

ARCHOT, or ERSCHOT, Philippe de Croy, Duke of, Flemish statesman b. Valenciennes, France, 1520; d. Venice, 11 Dec. 1595. The heir to the wealth of the Croy family, he adopted the profession of arms and received his knighthood from the Spanish King Philip II, who employed him on diplomatic missions. The Roman Catholic Church brought him into great favor with his royal patron and led to his appointment, in 1577, as military governor of Antwerp citadel after the withdrawal of the Spanish troops. Hated by most and mistrusted by all, he was in British Columbia—Canada. Large masses of it are found at Zimeoff, in Siberia, and it occurs also in Saxony, Alsace, Bohemia, Transylvania, in the Harz, in Chile, in Japan, at Kongsberg in Norway, and in the United States in New Hampshire, Maine, Colorado and Washington, and in British Columbia. In ancient times it was one of the most widely distributed of the elements, although the total amount of it in the world does not appear to be large. It occurs in various kinds of pyrites, and is therefore, a common ore of iron (much of which is made from pyrites), and in substances in the manufacture of which this devious career is told by Motley, who describes him as "a splendid seignor, magnificent in cromisy velvet, but a poor creature," and that he was "to serve all, essay to rule all, and to betray all." (The Rise of the Dutch Republic).

ARSENAL, a magazine, or place appointed for the making, repairing, keeping and issuing of ordnance and other appliances required in warfare, whether in the army or navy. Sometimes the name is applied to an establishment where such articles are kept in store only, but the chief arsenals also embrace large factories or workshops. The principal arsenals of the United States are those in Allegheny, Pa.; Augusta, Ga.; Benicia, Cal.; Columbia, Tenn.; Fort Monroe, Va.; Frankford, Pa.; Indiana- polis, Ind.; Augusta Me.; New York, N. Y.; Rock Island, Ill.; San Antonio, Tex.; Watertown, Mass., and Watervliet, N. Y. There are also powder depots at Saint Louis, Mo., and Dover, N. J., a noted armory at Springfield, Mass., an ordnance proving ground at Sandy Hook, N. J. The first arsenals in England, which manufactures warlike implements and stores for the army and navy, was formed about 1720. In France, each territorial military district (19 in all, including Algeria) has its own special arsenal or its own depot of war material. In additional Europe the establish-ments corresponding to our navy yards are included under the general term arsenal, such as are found in France at Cherbourg, Brest, Lorient, Rochefort and Toulon. The chief arsenals of Germany are situated at Spandau, Cologne and Danzig, that at the first-mentioned place being the great centre of the military manufactories. The chief Austrian arsenal is the immense establishment at Vienna, which includes gun-factory, laboratory, small-arms and carriage factories, etc. Austria also purchases quantities of her military stores from private manufacturers. Russia has her prin-cipal arsenals at Petrograd with supplementary arsenals elsewhere. In Italy, Turin is the chief centre of the military factories. One of the most important naval arsenals on the Mediterranean is at Cartagena, Spain.

ARSENIC, steel-gray metal having a high lustre when freshly broken but soon tarnishing. It is very brittle and has a specific gravity of 5.7. Compounds of this metal are known for many centuries, chiefly on account of their poisonous character. The yellow sulphide of arsenic, otherwise called "orpiment," was known to Dioscorides, who called it arsenikon, probably on account of its powerful properties; the Greek word arsen, from which it is derived, signifying "male." Arsenic occurs in the metallic form in nature, usually with ores of iron, silver, lead, cobalt, nickel and antimony. Large masses of it are found at Zimeoff, in Siberia, and it occurs also in Saxony, Alsace, Bohemia, Transylvania, in the Harz, in Chile, in Japan, at Kongsberg in Norway, and in the United States in New Hampshire, Maine, Colorado and Washington, and in British Columbia. In ancient times it is one of the most widely distributed of the elements, although the total amount of it in the world does not appear to be large. It occurs in various kinds of pyrites, and is therefore, a common ore of iron (much of which is made from pyrites), and in substances in the manufacture of which this
ARSENIC

acid is used. The minerals known as kupfernickel (niconite), realgar, orpiment, mispickel (arsenopyrite), and nickelglance (gersdomorite) contain it, as well as many others. The appearance of metallic arsenic is greatly with the source from which it is obtained, and the method adopted for preparing it. That obtained from pyrites is usually compact, crystalline and nearly white, while that obtained from arsenious acid is gray and pulverulent. Metallic arsenic may be gained by reducing the element as it occurs in nature, or by extracting it from arsenopyrite. The process of extraction from arsenopyrite consists in roasting that mineral in earthenware retorts or tubes arranged horizontally in a long furnace, and each having a piece of thin sheet-iron rolled up and inserted into its mouth. On distilling, most of the arsenic condenses on the sheet-iron, from which, after cooling, it may be detached. The product so obtained is further purified by burning with coal and redistilling. The earthenware retorts that are used in the process are made with great care. They are composed of one part of fresh clay and two parts of pulverized bricks or old retorts, and are coated with a mixture of blood, loan, forge scales and alum, which produces a glaze through which the poisonous vapors of the arsenic cannot penetrate. They are then fired. Practically all the arsenic marketed in the United States is a by-product of the smelting of arsenical lead and copper. In 1916 there were made in this way 5,966 short tons valued at $555,186. It would have been as easy to have made 20,000 tons had there been a demand for it. Owing to the fact that the smelters which work on arsenical pyrites (chiefly copper) are located in the Far West, the price of four cents a pound in the New York market is the minimum at which the production of arsenic as a by-product becomes commercially advantageous. It is interesting to note that besides the domestic production there was imported into the United States, in 1916, 1,071 tons of white arsenic, and 1,092 tons of orpiment (arsenic sulphide). The total value of these imports was $232,694.

Arsenic is crystalline, but its hardness, on the mineralogical scale, is about 3.5. It has several allotropic forms, one of which is crystalline, and the other black and amorphous. The specific heat of the crystalline variety is 0.083, and that of the amorphous variety is 0.076. Arsenic conducts electricity better than mercury does; for if the specific resistance of mercury at 32° F. be taken as unity, the specific resistance of arsenic is 0.373 at 32° F., and 0.534 at 212° F. The chemical symbol of arsenic is As, and its atomic weight is about 74.44 (Clarke). Its coefficient of expansion is 0.000031 per degree F. Arsenic oxidizes slowly when exposed to the air, forming a gray powder which is sometimes sold under the name of "fly-powder." It is not affected by pure water. When heated in the air it burns with a blue flame, giving off a characteristic, highly disagreeable, garlic-like odor. When protected from the air, metallic arsenic volatilizes at a red heat without melting; its vapor being a light citron yellow, and phosphorescent. When heated under heavy pressure arsenic melts at about 900° F.

Metallic arsenic forms alloys with many metals, some of which are produced by pulverizing and intimately mixing the constituents, and subjecting them to a pressure of 6,000 or 7,000 atmospheres. If much arsenic be present the alloys are greatly with the element as it occurs in nature, or by extracting it from arsenopyrite. The process of extraction from arsenopyrite consists in roasting that mineral in earthenware retorts or tubes arranged horizontally in a long furnace, and each having a piece of thin sheet-iron rolled up and inserted into its mouth. On distilling, most of the arsenic condenses on the sheet-iron, from which, after cooling, it may be detached. The product so obtained is further purified by burning with coal and redistilling. The earthenware retorts that are used in the process are made with great care. They are composed of one part of fresh clay and two parts of pulverized bricks or old retorts, and are coated with a mixture of blood, loan, forge scales and alum, which produces a glaze through which the poisonous vapors of the arsenic cannot penetrate. They are then fired. Practically all the arsenic marketed in the United States is a by-product of the smelting of arsenical lead and copper. In 1916 there were made in this way 5,966 short tons valued at $555,186. It would have been as easy to have made 20,000 tons had there been a demand for it. Owing to the fact that the smelters which work on arsenical pyrites (chiefly copper) are located in the Far West, the price of four cents a pound in the New York market is the minimum at which the production of arsenic as a by-product becomes commercially advantageous. It is interesting to note that besides the domestic production there was imported into the United States, in 1916, 1,071 tons of white arsenic, and 1,092 tons of orpiment (arsenic sulphide). The total value of these imports was $232,694.

Arsenic is crystalline, but its hardness, on the mineralogical scale, is about 3.5. It has several allotropic forms, one of which is crystalline, and the other black and amorphous. The specific heat of the crystalline variety is 0.083, and that of the amorphous variety is 0.076. When heated in the air it burns with a blue flame, giving off a characteristic, highly disagreeable, garlic-like odor. When protected from the air, metallic arsenic volatilizes at a red heat without melting; its vapor being a light citron yellow, and phosphorescent. When heated under heavy pressure arsenic melts at about 900° F.

Metallic arsenic forms alloys with many
ARSENICAL POISONING—ARSENOLOITE

undoubtedly arsenious oxide, As₂O₃ (often written As₂O₅), or "white arsenic," known to the general public simply as "arsenic." This is used extensively in the arts, in the manufacture of indigo blue and aniline; in glass-making, to remove the color due to the lower oxides of iron; in fly and rat poisons; in taxidermy; in medicines, and in numerous other preparations. Paris green and London purple are used in large quantities as insecticides. Arsenic is used in medicine in the treatment of anemia and asthma. Not all persons, however, can take it. In homoeopathic treatment a minute quantity it is administered for several ailments.

ARSENILICAL POISONING. Arsenic is now used in so many ways that accidental poisoning occurs very often. As a poison employed in committing suicide, and for slow poisoning with homicidal intent, it is less in favor than formerly. The forms of poisoning mostly seen are of the chronic type. These occur from the use of paints containing large quantities of either Schieele's green or Paris green, which are components of various preparations, not widely employed as a means of protection from insect and fungus pests, and from the addition of arsenic to foodstuffs, as a preservative. Acute forms of poisoning are more often the result of attempts to commit suicide. In acute arsenical poisoning the early symptoms are those of an acute inflammation of the stomach and intestines, coming on about half an hour after taking the poison. If taken when the stomach is empty the symptoms may be exhibited within 10 minutes. If the stomach is full, the effects may not appear for 10 to 12 hours. The premonitory symptoms of distress, difficulty in swallowing and a burning pain in the throat, are followed closely by violent cramp-like pains with nausea, vomiting and diarrhoea. The severe symptoms multiply, the diarrhoea becomes watery, "rice water" and blood may appear in the vomit. A cold, damp skin of bluish hue, feebile and irregular heart action, collapse and sighing respiration may precede death attended at times with convulsions. Death may occur within 24 hours, but it is apt to be delayed from two to four days, the patient usually dying of the secondary degenerations in the organs and of exhaustion. Examination of an arsenically poisoned body after death shows arsenic in nearly every part, particularly in the liver and kidneys. It is found also in the brain and even in the spongy parts of the bones. Death by arsenic is very painful. It is, moreover, an extremely uncertain poison, because of its insolvability, and of the vomiting reaction it induces. Many acute cases pass into the chronic stage.

Chronic arsenical poisoning may result from a single large dose, but more often results from the long-continued use of small quantities of the poison. In a recent outbreak of chronic arsenical poisoning in Manchester, hundreds of people were affected. The source of the poisoning was from arsenic in iron pyrites employed in making sulphuric acid; this certain sulphuric acid had been utilized in the manufacture of beer, and many hundreds of the consumers of this beer suffered from various forms of arsenical poisoning. Chronic arsenical poisoning may result from the use of wall papers and hangings colored by arsenical dyes, although such modes of poisoning may be considered extremely rare. The symptoms of this type of poisoning are of gradual onset: the patient is languid, weak and loses his appetite. There is discomfort in the intestines, pains similar to colic and diarrhea other parts of the body. A sub-acute inflammation of the mucous membrane of the nose and gums then develops, with sore gums, puffiness under the eyes with inflammation of the lids and running from the nose. Sneezing, coughing and hoarseness may occur, various skin eruptions are not uncommon and a curious pigmentation of the skin is nearly always observed. The patient progresses until poisoning of the ends of the nerves begins, with disturbances in sensation, anaesthesia, parasthesia and pain. There may then develop paralysis of the extremity, frequently the toe (drop-toe); or the wrist (drop-wrist). Paralysis of sensation may also occur. The course of a chronic poisoning may not be over three or four days, but it usually requires three or four weeks, sometimes longer. Some individuals use arsenic throughout their lives and are never poisoned. The treatment of acute poisoning consists in thorough and prolonged washing out of the stomach and the use of large quantities of magnesia. Supportive treatment is needed in the stage of collapse. Heat, alcohol and coffee are indicated. Brandy and ether are administered hypodermically and morphine is injected to allay the acute suffering. In chronic poisoning electricity and tonic treatment are recommended. See Asernic Acid.

ARSENOUS ACID, the arsenical compound familiarly known and popularly called arsenic. It is obtained principally during the roasting of the arsenic nickel ores in Germany in furnaces communicating with flues. The ordinary arsenious (which is what is popularly known as arsenic) is a white crystalline powder, decidedly gritty, like fine sand, and with no well-marked taste. It is very heavy, so much so as at once to be noticeable when a paper or bottle containing it is lifted by the hand. It is soluble in water, to the extent of one part of acid in about 10 parts of boiling water. When placed in a spoon or other vessel and heated, it volatilizes and condenses in crystals on any cool vessel held above. By this means it can be distinguished from ordinary flour, which, when heated, chars and leaves a coal behind; and from chalk, stucco, baking-soda, tooth-powder and other white substances that, when heated, remain in the vessel as a non-volatile white residue. In some countries, as in the mountainous regions of Austria, Styria and the Tyrol, arsenic is eaten habitually, beginning with small doses and gradually increasing them. It is said to clear the complexion, favor nutrition and to improve the respiration in ascending mountain regions. Some individuals of the "arsenicophages" can take great quantities with impunity. See Mineral Production of the United States.

ARSENOLOITE, a native trioxide of arsenic, having the formula As₂O₃ (often written As₂O₅), and crystallizing in the isometric system—usually in octahedrons. It is commonly white, with a vitreous lustre. Its hardness is
1.5, and its specific gravity about 3.71. It occurs in connection with ores of silver and lead, and with those of other metals when arsenic is associated with them. In the United States it has been found in Nevada and California. Arsenolite and senarmontite (an antimonious mineral of analogous composition and similar crystalline form) are collectively known by mineralogists as the "arsenolite group."  

**ARSENOPYRITE**, ar-sen-o-pī'trit ("arsenical pyrites"), a tin-white, opaque mineral, with a metallic lustre, crystallizing in the orthorhombic system. It contains arsenic, iron and sulphur, and has the formula FeAsS. Its hardness varies from 5.5 to 6.0, and its specific gravity from 5.9 to 6.2. Arsenopyrite is largely used as a source of "white arsenic," or arsenic trioxide. It occurs chiefly in the crystalline rocks with gold and ores of silver, lead and tin. It abounds in Germany, England and the United States.  

**ARSENYEV, Konstantin Ivanovich, är-sän'yef, Russian statistician, historian and geographer:** b. 12 Oct. 1789; d. Petrozavodsk, 29 Nov. 1865. He was the son of a priest of the village of Mirkhanov, government of Kostroma, Chukhlovski district. He was educated in the Seminary of Kostroma and the Pedagogical Institute of Saint Petersburg, from which he graduated in 1810. A year later he was appointed instructor of geography and Latin at the institute. In 1819 the institute was changed to the University of Saint Petersburg and Arsenyev became adjunct professor of geography and statistics. He was dismissed, however, two years later on the charges of freethinking and teaching rules destructive to the morality of the students. He continued, however, teaching in the School of Engineers and Artillers where he also held a position. In 1824 he became instructor in statistics and history to Crown Prince Aleksandr II. He undoubtedly influenced the mind and the character of the future Tsar-Librator. Quitting his duties as educator of the Crown Prince, he entered the civil service, at the same time devoting himself to scientific work. He held the position of head statistician of the Ministry of the Interior (1846-63), being organized. He did a great deal for the organization of Russian statistics and can be called one of its fathers. In 1845, together with Count Th. P. Litke, he founded the Geographical Society of which he was associate-chairman (1850-54). He had attained the rank of privy councillor at the time of his death. His most valuable contributions are his historical works "The Rule of Peter II" (Saint Petersburg 1839); "The Rule of Catherine I" (Saint Petersburg 1856). As the architect of the Peace he had access to the documents of the imperial archives and ministerial bulletins. This enabled him to enrich Russian history with many new data. His "Statistical Sketches of Russia" (Saint Petersburg 1848), for which he used unpublished documents of the department of mines of the Ministry of the Interior and other government bureaus are also of great value. Besides the works mentioned he wrote "The History of the People and the Republics of Ancient Greece" (Saint Petersburg 1825-26); "Short General Geography" (ib. 1818, 20th ed., 1849, the only textbook for 30 years); "Survey of the Physical Conditions of Russia and its Advantages for the Existing Public Industries" (Saint Petersburg 1818). He also contributed a number of articles and studies to current periodicals. Consult "Historical Papers of K. I. Arsenyev," edited posthumously by Pekarski in Saint Petersburg 1872. It presents a collection of documents from archives and has Arsenyev's biography attached to it.  

**ARSNIOE, är-sin'e-ē, the name of several celebrated women of antiquity, the most noted of whom is the daughter of Ptolemy I of Egypt, and Bernice: b. about 316 B.C.; she married Lysimachus, King of Thrace, in 300 B.C. Desirous of securing the crown for her own children, Arsinoe persuaded Lysimachus to put Agathocles, the son of his former wife, to death. This crime proved fatal to the Thracian king; for Lysandra, the wife of the murdered prince, fled with her children to the court of Seleucus Nicator of Syria, who took up arms in her favor. In the course of the war Lysimachus was slain and his kingdom taken possession of by the conqueror. Arsinoe now fled into Macedonia, which was then held by the Syrian army. In less than a year afterward, however, Seleucus was assassinated by Ptolemy Ceraunus, half-brother of Arsinoe. This queen, who held the city of Cassandra in Macedonia, was induced, under promise of marriage, to admit Ptolemy II Philadelphus, her own brother (24 B.C.), thus affording a precedent to these unnatural unions which afterward became common among the Greek rulers of Egypt. She bore no children to her brother, who, however, seems to have had a strong affection for her, as he called one of the districts of Egypt by her name and employed the architect Dinochares to build a temple in her honor. The first wife of Ptolemy II, also named Arsinoe, was a daughter of Lysimachus. A daughter of Ptolemy III, also of the same name, married her brother Ptolemy IV. Cleopatra's younger sister, Arsinoe, was taken prisoner by Julius Caesar and later ordered by Mark Antony to be put to death, 41 B.C.**  

**ARSNOE, city of ancient Egypt, on Lake Meirs, said to have been founded about 2300 B.C., but renamed after Arsinoe, wife and sister of Ptolemy II, of Egypt. The site of Arsinoe is now occupied by the town of Medinet-el-Faiyum. The sacred crocodiles were kept here.**  

**ARSON, the malicious and wilful burning of a dwelling-house or out-house belonging to another person by directly setting fire thereto or even by igniting some edifice of one's own in its immediate vicinity. If a person, by maliciously setting fire to an inhabited house, cause the death of one or more of the inmates, the crime is murder. If the fire does not be inflicted. When no one is fatally injured the crime is not capital, but is still heavily punishable; it is a penal offense also to attempt to set a house on fire, even if the endeavor does not succeed. The New York Penal Code provides that a person who wilfully burns, or sets on fire in the nighttime, either (1) a
dwellings, being those in which there is at the time, a human being; or (2) a car, vessel, or other vehicle, or a structure or building other than a dwellings, being, to the knowledge of the offender, there is, at the time, a human being, in the first degree. Many supposed efforts to change the common law upon this subject. There are three degrees of arson in the State of New York. Arson in the first degree is punishable by imprisonment for any term not exceeding 40 years; in the second degree by imprisonment for a term not exceeding 15 years; and the third degree for a term not exceeding 15 years. Before the crime of arson is complete, the house, or some portion of it, however small, must be burned, or consumed by fire.

ARSUF, Palestine, a town on the coast, 12 miles north of Jaffa, famous as the scene of a victory of the crusaders under Richard I of England over the army of Saladin.

ART, in its broadest sense, is the purposeful exercise of human activities for the accomplishment of some predetermined end. Art is thus set apart from Nature which exists and operates outside of man, and which can enter the domain of Art only when and in so far as man calls her into his service by employing her powers for his own ends. The distinction between Art and Nature, and the relations between them, have been a fruitful subject of philosophical discussion, which cannot here be summarized, as it nowhere contravenes the definition given above. Art is also distinguished from Science, the latter investigates phenomena, it declares facts, and lays down rules, but does not, as Science, execute the operations dictated by these rules. It is Art which, having conceived the end to be realized, learns from Science the laws and rules which must be observed in the exercise of the activities by which the preconceived end is to be attained, and then applies them to that end.

While in the above-defined broad sense the term may be applied to the commonest human activities controlled by the will for a definite end — so that one may speak of an art of eating or walking — in general usage it is confined to such activities as involve imagination and purpose external to the things they produce. One speaks of the art of fishing, of building, of making, of piano-playing. And in nearly all uses of the term there is present the idea of producing or creating, which is warranted by the etymology of the word in nearly all languages. The Latin Art, from which we derive the English Art, is traceable to an ancient root Ar which is believed to signify a creation or begetting. Hence the word is also applied to the generality or totality of the products of the human creative activity in a given field, place, or age, as when one speaks of mediæval art, American art, the art of the Flemish looms, referring not to the activity which created, but to the products of that activity.

In ancient and mediæval times, the whole field of liberal culture was embraced in the term "arts" or "liberal arts"; and this usage survives in the modern degrees of Bachelor of Arts and Master of Arts and the name "Faculty of Arts" or "College of Arts", traditionally applied to certain faculties and institutions engaged in liberal education as distinguished from professional education. Generally, however, modern usage prefers the term "culture" to "arts" to designate the whole body of non-professional or theoretical education and activity, in which are included literature, philosophy, language, history and pure science.

From the foregoing observations it will be seen that in every occupation, trade or pursuit there are involved both an art and a science. The carpenter who makes a box must first conceive mentally — that is imagine — the box he is to produce, and exercise his activities to bring this conception into being: this is Art. Science teaches him the nature of his materials, and the laws which must control the use of his tools and materials to realize his conception. Then Art again appears in his application of his mental powers of skill and judgment and of his bodily powers of muscular activity, in conformity with the rules and laws of Science, and the box which is the product of this application is a work of the carpenter's art.

The mental preconception of a work of art, whether recorded in visible form by a drawing or specification or not, is a design. So in the art of war, the commander's predetermined plan of campaign or system of strategy is a design, as truly as is the architect's drawing of a projected building, or the weaver's pattern of the proposed rug or brocade. Thus in every art there are two distinct elements or stages — design and execution. Design springs from the imagination, and guides and directs the execution. Everything that pertains to the execution is a part of the technic of the art; the rules and laws of the technic are the contribution of Science.

Classifications. — It is customary and convenient as well as reasonable to distinguish between those arts which minister primarily to the physical or material needs of man, and those whose primary and dominant purpose is to minister to man's emotions, apart from practical or material service. The arts of the first sort we call the useful arts; those of the second sort the fine arts. The products of the useful arts are designed for purposes directly related to the use and enjoyment of daily life; in other words they are made to be used. The products of the fine arts, on the other hand, are created for their own sake; they are an end in themselves, or — to be more accurate — they exist for the sake of the emotions they are designed to express and arouse. A chair, however superbly carved, is primarily a work of useful art, because made primarily to be sat on; but a picture is painted for its own sake, not to be used but to be looked at and to excite pleasurable emotions by its beauty of subject, of drawing, of color: it is a work of fine art. So also a poem or a symphony is produced for the sake of the aesthetic emotions it arouses, not for that of any practical or material use to which it is to be put; it is a work of fine art. The fine arts, then, are those whose appeal is to the aesthetic emotions; and just to the extent in which any work of art does so appeal does it enter within the domain of the fine arts. Painting, sculpture, poetry, ballet, obviously in this domain; pottery, weaving,
building, metal-working are as obviously useful as arts.

Since, however, useful objects are often made of such forms and so adorned as to be not only useful but also beautiful to look upon, and therefore to appeal to the aesthetic sense, there is seen to be a wide border-land of art in which both use and beauty are kept in view, and both skill and imagination exercised by the designer and maker of the useful object. The arts which are thus concerned with making useful objects beautiful are sometimes called the industrial arts, sometimes the decorative arts. But these terms cannot be used either as synonyms or as mutually exclusive designations, for by many the name industrial arts is applied to the useful arts, as such; while certain of the decorative arts belong wholly in the category of fine art. (See Fine Arts). Indeed, architecture, which is universally classed as a fine art, is the most important of the decorative arts, to which many of the decorative arts are ancillary and subordinate, such as mosaic, decorative carving, marble inlay and the like. (See Decorative Art). It is therefore evident that any classification of the arts into rigid categories such as the scientific objects of study for the sciences they concern themselves wholly with inquiries into matters of art. The investigation and discussion of the nature of beauty and of the appeal which works of art make to the emotions is a branch of philosophy, and is called Aesthetics (q.v.). The origins, developments, progress and decline of the arts or of an art is a branch of history, especially of history of civilization. The exploration of ancient remains and the study and discussion of works or monuments of antiquity constitute the science of Archaeology (q.v.). The discussion of the qualities, characteristics, merits and defects of an art, a style or a period of art, or of a particular work of art, is a special branch of Criticism (q.v.). The principles and laws at the basis of an art and the rules for its practice form a body known as the Theory of Art, closely related to the science of aesthetics. Every one of these divisions of knowledge concerning art and the arts has given birth to an extensive literature, and the amount of such literature is enormous. Thus, for example, in the Avery Library of Columbia University at New York, there are at this writing 25,000 volumes devoted exclusively to architecture and the allied arts.

For information concerning various divisions of the general subject see the articles Aboriginal Art; Aesthetics; American Art; Archæology; Architecture; Dancing; Decorative Art; Interiors; Decoration; Drama; Fine Arts; Music; Opera; Painting; Painting, American; Painting, Education in; Poetry; Pyrotechny; Sculpture; Sculpture in the United States; Sculpture, Education in; and the various industries or useful arts each under its own title.

ART, Ecclesiastical. See Ecclesiastical Art.

ART DRAWING: Pictorial Representation and Decorative Design. Drawing in general falls into two distinct divisions, namely, Constructive and Art Drawing. Constructive or Mechanical Drawing is a conventional method of representing all the facts of form, size and structure of an object from which the object may be constructed. Art Drawing deals with the representation of the appearance of objects and the evolving of forms for the decoration of surfaces. As taught in art academies and practised in studios, it comprises the subjects of Pictorial Representation and Decorative Design.

PICTORIAL REPRESENTATION. As the title implies, the ultimate aim of pictorial representation, commonly known as free-hand drawing, is the creation of a picture—the graphic expression of the beautiful in plant-life, animal-life and landscape. A true picture shows not merely how an object or group of objects appears, but it tells how these objects impressed the artist. It is the draughtsman's concrete effort to communicate to his fellow beings the aesthetic sensation he experienced in the presence of nature.

To attain his end, the artist must augment a natural aptitude for the subject by a study of linear and aerial perspective in landscape and marine drawing, anatomy in figure and animal drawing, and the principles of selection and arrangement (pictorial composition) in all the types of representation. He must, moreover, be acquainted with the qualities and limitations of the several forms of rendering and mediums used.

Linear or Aerial Perspective. In looking thoughtfully at a landscape, we shall notice that objects diminish in size as they recede farther and farther from the eye; and that forms we know to be rectangular or circular appear modified according to the different positions in which they are placed in relation to the observer. These changes in form and size are due to what is termed linear perspective. We shall also notice that objects in the distance appear paler and grayer in color, due to the action of what is called aerial perspective.

The draughtsman need not necessarily go into a scientific study of linear perspective; but he must embody in his work what is known as free-hand perspective, the general principles of the subject deduced from observation and practice. These principles are hereewith stated:

1. The apparent form of any object, except a sphere, varies with every position in which it is placed, in regard to the observer.
2. The apparent size of an object decreases as its distance from the observer increases.
3. A circle seen obliquely always appears like an ellipse.
4. The more obliquely the circle is seen, the more nearly the ellipse approaches a straight line.
5. A horizontal face, when above or below the eye, appears foreshortened.
6. All parallel horizontal edges receding from the eye appear to converge to a point on the horizon—an imaginary line on a level with the eye.
7. Parallel horizontal edges receding to the left appear to converge to a point on the horizon at the left of the object, called Vanishing Point 1; those receding to the right appear to converge to the right of the object, called Vanishing Point 2.
8. For rectangular objects standing with the side faces turned equally away, the vanishing points are equidistant from the object. (Fig. 1).

9. For rectangular objects standing with side faces turned unequally away, Vanishing Points 1 and 2 are unequally distant from the object according to the angles at which the objects stand. (Fig. 2).

10. Receding parallel lines situated obliquely in relation to the observer appear to converge in a vertical vanishing line. (Fig. 3).

Forms of Rendering.—There are four modes in which objects may be rendered. They may be drawn in outline, in neutral values of light and dark, in light and shade, or painted in color masses. With the last form of rendering we are not concerned in this article. See Painting.

Rendering in Outline.—The practice of drawing in outline as an independent form of pictorial representation is not much in vogue now, as it is more or less abstract and limited in its power to convey to the mind all the truths in the appearance of an object. Nevertheless, an experienced artist can express many characteristics of an object by a skilful modulation of line: now thin, and then thick; here long, graceful and rhythmic, and there short, hard and angular.

Rendering in Flat Values of Light and Dark.—On a gray day when the sky is overcast, the light does not come from a particular spot, but is rather diffused from the sky generally. We shall find that then all the elements in a landscape, as trees, buildings, distant hills, etc., appear in simple flat masses of color. If we interpret in black and white the characteristic forms and relative degree of light and dark, called the values, of these color masses, we shall have a landscape drawing rendered in flat values of light and dark.

This method of rendering is now frequently used by artists in still-life, landscape and figure compositions where decorative effects are required, as in poster work and mural decorations. (Fig. 4).

Rendering in Light and Shade.—A drawing made in light and shade seeks to express the values of the masses as modified by the effect of sunlight and shadow. It is the most realistic of all the methods of pictorial representation in monochromes, as it depicts all the characteristics of the subject with the exception of its actual color. (Fig. 5).

Pictorial Composition.—In order to express his idea perfectly and beautifully, whether it be in still-life, landscape or animal drawing, the artist must use in his work the fundamental principles underlying good arrangement of lines and masses in a picture, known as pictorial composition. These principles are:

1. Dominance, which requires that there be one object or centre in a picture of major interest, having the strongest emphasis or accentuation and all other objects subordinate.

2. Opposition, which requires that the various elements in a composition show contrast and variety of line, shape, and value.

3. Balance, which requires that there be such an adjustment of these contrasts that the whole effect will be harmonious.

In the charcoal drawing, "Sheep Entering a Barn," by the famous Dutch painter Anton Mauve (Fig. 6), we have an example of good composition. The eye first discerns the principal elements, namely, the old man and the sheep, because they occupy a dominant position (near the centre), and their values are accentuated at the expense of the other details, which are purposely kept subdued. Besides, a little scrutiny will reveal that the picture also has ample contrast and variety in line, shape, and tone, and perfect balance of its various attractive forces.

Mediulms Used in Drawing.—Of the various materials used in drawing, the most important are lead-pencil, ink and charcoal, each having its special qualities and limitations.

Lead-pencil Drawing.—The lead-pencil has always been a favorite with artists in mak-
ing preparatory studies for their pictures, and a number in the past, as Lalanne, Ingres, Rousseau and Legros, have used it as an independent means of expression. The technique of lead-pencil drawing is very simple. For ordinary outline work a medium soft pencil is used, held by the thumb and fore-finger three or four inches from the point so that it has the support of the middle finger. The shading is rendered by means of broad intermingled strokes of a soft pencil (4B), held sideways under the fingers. This method is known as pencil-painting. (Fig. 5).

Ink Drawing.—There are three kinds of ink rendering: pure line drawing, made with a pen; tone drawing produced with a brush; and combination drawing of lines supplemented by tones.

In a pure line drawing in ink, the draughtsman seeks to render the light and dark values in his subject by means of pen strokes of graded widths. For this purpose India ink and pens of special make are used. (Fig. 7).

An ink tone drawing is made with washes produced by means of a sable or camel's hair brush and India ink, diluted with quantities of water according to the intensity of the tones desired.

Combining lines and tones in an ink drawing is now very popular with artists, as this method is capable of producing highly interesting effects.

Charcoal Drawing.—One of charcoal's admirable characteristics is that it produces a wide range of subtle grays. Its pale tones are semi-transparent silvery grays, so useful in depicting aerial perspective, and its dark tones are rich and velvety, extremely valuable in landscape and figure drawing generally.

Its chief quality, however, lies in the fact that it is easily removed, enabling the artist to alter the arrangement of the masses as he composes. These changes are done with the chamois skin and kneaded rubber.

When completed, the drawing can be made permanent by spraying with a solution of white shellac and alcohol, called fixative.

DECORATIVE DESIGN.

By design is meant the originating of objects and their decoration according to the laws of use and beauty. It thus naturally falls into two grand divisions, namely, constructive design and decorative design.

Constructive Design, or design in three dimensions, deals with the evolving of objects having length, breadth and thickness. It covers all the fields of human invention, as vessels, utensils, apparel, furniture, architecture and machinery. Each of these forms a distinct department of design. We thus speak of architectural design, machine design, jewelry design, etc.

The chief aim of constructive design is the creation of an article of use and beauty. The object designed must show fitness for its purpose in size, form, material, and in beauty of its proportion. For example, we would be violating the laws of use and beauty if we were to make a chair out of cardboard, the size of a table, and in the form of a pyramid.

But very often objects, although fully satisfactory to themselves as such, are not beautiful, nevertheless present blank surfaces the appearance of which might greatly be improved by the application of ornamentation. This leads us to a consideration of decorative design.

Decorative Design, or design in two dimensions, may be defined as the evolving of forms for the enrichment of surfaces. The result of decorative design, commonly known as ornament, produces its legitimate effect when, without concentration upon itself, it makes the object to which it is applied more pleasing than if unadorned.

To produce satisfactory work, the decorative designer must study the materials of design, the systems and principles of arrangement, and the various methods of application.

Materials of Decorative Design.—Designs may be produced from abstract shapes, from conventionalized natural forms, as plants, animals and landscape, and from lettering.

Abstract Forms in Design are derived from the exhaustless field of geometry. They are arrived at by combining lines of various widths, or by cutting up such geometric surfaces as the square, oblong triangle, circle, etc., into smaller interesting areas. (Fig. 8).

Fig. 8—Design for a Tile (abstract motive).

Nature Forms in Design.—By far the most important elements of design are derived from plant-life, animal-life and landscape. But as a decoration of an object should be subordinate to the object itself, a realistic treatment of a nature subject is not permissible. Before being applied it must be conventionalized.

Conventionalization.—By conventionalization is meant the adaptation of a natural form for design purposes. In a botanic drawing of a flower, for instance, the various organs, as petals, sepal, pistil and stamen are studied with minuteness and all the wonderful structure is revealed. But in drawing it for decorative purposes, the flower is idealized, by keeping only the general characteristics of growth, form and proportion, while simplifying outlines, rejecting unimportant details, and rendering it in flattened values.

Conventionalization may be formal or informal. A nature motive is formally conventionalized, when its elements are decidedly simplified in outline, form and value, and symmetrically arranged. Informal conventionalization refers to the use of the perspective appearance of a nature

subject but slightly modified for decorative purposes.

Systems of Arrangement.—The principal forms of decorative arrangement include:

1. Designs for unlimited areas, or all-over patterns.
2. Designs for partly limited areas or borders.
3. Designs for limited or enclosed areas. (Fig. 9).

In each of these kinds of design, what is termed the unit, or motive, is repeated in a particular mode. The unit of design is a simple decorative figure, either symmetrically arranged, or informally balanced about a vertical line. (Fig. 10).

All-over Patterns, as designs for textiles, cretonnes and wall-papers, are developed by the rhythmic repetition of a unit over a surface in all directions. When the unit is repeated in rhythmic rows which are both horizontal and vertical the design is called a full drop regular repeat; when the unit is repeated in alternating rows, the pattern is known as a full drop alternate repeat. (Fig. 11). In what is termed a half drop repeat, the unit is repeated in alternating rows in which every other row is dropped one-half the height of the unit.

This regular recurrence of a unit over a surface in such a way as to lead the eye consistently through all parts of the pattern is called rhythm, which is responsible for a great deal of the charm that obtains in all kinds of surface design.

Borders.—Borders, or designs used for limiting surfaces, are produced by the rhythmic repetition of a unit in one direction. (Fig. 12).

Lettering in Design.—Lettering forms the major motive in designs for monograms, bookplates, book-covers and posters. The alphabets now generally used are the modern Gothic and Roman.

Monograms.—A monogram is a character consisting of two or more letters, interwoven into one, usually the initials of a name or several names. Besides unity, balance and rhythm, which are essential in all surface design, the special principle governing a good monogram is intricacy. By this means is meant the pleasing effect obtained by a happy interlacing or interweaving of the letters. The more subtle the interweaving, the more attractive the design. (Fig. 13). Unity in a monogram is best obtained by a proper distribution of the letters within any geometric surface as a square circle, kiteform, hexagon, etc. Monograms are generally applied to jewelry, stationery and linen.

Bookplates.—A bookplate or "Ex Libris" is the little label or plate put into a book by its owner. The designer must introduce into the bookplate as much as possible the character, taste, ambition or hobby of the person, for whose library the plate is designed. For
instance, if the person is romantic—knights, castles and brave deeds appeal to him—a decorative treatment of a castle would be appropriate. The lettering, of course, plays the most important part. It should be legible and in such a style as will suit the general idea, and must have a well thought out and important position. (Fig. 14).

Fig. 14—Design for a Bookplate.

Book-covers.—A design for a book-cover generally contains several lines of lettering, that is, the title and the name of the author, and an ornament. The ornament may be a purely decorative figure, or a decorative treatment of a landscape, marine or figure composition, suggesting the contents of the book. All the lettering on the cover should be of the same style, and the title made conspicuous by the use of intense tones.

Posters.—A poster is a placard announcing an event, or advertising an article. It is considered effective, naturally, when it attracts attention, and excites interest in the event announced or the article advertised. To impart this attractive power to his design, the poster designer makes use of either some catch phrase, or some peculiar pictorial decoration, or a combination of both.

ART EDUCATION. See Architecture, Education in; Painting, Education in.

ART ENAMELS. Certain art productions beautified by decoration in enamel are termed by connoisseurs enameled. The enamel body is either translucent or opaque. It is composed of a frit or flux of lead glass. The lead ingredient has for its chief purpose the lowering of the melting point of the medium. This vitreous body, by the addition of metallic oxides, produces a colored translucent enamel. (See Enamel.) It is rendered opaque by a proportion of bone-ash or of oxide of tin. Ground to a degree of extreme fineness this body is washed and moistened to the required consistency and then applied to the article to be decorated. It is then melted in a furnace oven and thereby adheres to the article in its fused condition, to the surface of the metallic background. The origin of the word enamel is its French synonym émail. In most methods of art enameling the reverse side receives a coat of enamel; this so-called contre-émail reduces the risk of the glassy decoration splitting or splintering off in the process of cooling.

Proofs lead to the supposition that the art of enamel decoration originated in the East. Any trace of the date of its discovery is lost, but the art dates very far back. The several different processes can be brought under the two heads: ‘Incrusted’ (i.e., inlaid), such as champlévé and cloisonné; and that superficially applied, the émaux peints, and the so-called Venetian enamels. It had been quite generally supposed that the colored vitreous inlays in extant specimens of ancient Egyptian decoration were enamel work. Filders-Petrie, however, declares they are inlaid pieces of glass and that the early Egyptians were not able to do enamel work on metal. But there are extant examples of Greek cloisonné enamels dating from the finest Greek period (about 400 B.C.). Brooches (fibulae), and horse-harness plates extant of Gallic origin show enamel work. Several vessels and pieces of personal adornment existing with enamel decoration appear to have been made somewhere between the 2d and 3d centuries A.D. In Ireland and England numerous wonderfully artistic and perfectly enamelled ornaments have been dug up from the soil, proving that the Celts and Anglo-Saxons were experts in enamel decoration. Of such we have the Ardagh chalice, Tara brooch, King Æthelwulf’s gold ring, King Alfred’s jewel, brooches, pins, rings, armor, horse-harness plates, etc., in blue, vermilion, green, white enamel. These are in champlévé work.

Cloisonné Enamels.—The process of cloisonné work is, briefly, the following: Wire is bent into curves and angles to form the outline of the design required. This wire network is soldered or otherwise fastened to the
metal surface which is to form the base on which the decoration is to be applied. The different colored enamel powders are next used in filling in the open spaces or cells (cloisons). Then the piece is subjected to the muffle oven to fuse the enamel. When cooled the enamel on gold and silver is ground down further to lower the level of the wire. Additional enamel is charged to fill the cells again, and the fusing process is repeated. This process of filling the cells and fusing is continued till the enamel, after fusion, is about level with the top of the wire. The surface of the piece is then filed off flat (termed stoned). If left with its natural surface after firing it is termed flashed. The surface is next given a friction polish. The early art of enameling in the West appears to have died out, but in the East (about the 7th century) the art was practised in Byzantium (ancient Constantinople). It was cloisonné work. Of this period (in Byzantine enamels) there is extant the Iron Crown of Lombardy at Monza. (See Crowns). Of later dates are the *Paliotto* or San Ambrogio altar (835) by Volvinius in Milan (see *Altar*) made to the order of Archbishop Angilbert; the processional cross of *Harivart* (988–991) in the Cathedral of Aix-la-Chapelle. The votive crown in Saint Mark's, Venice (9th century), has enamel ornament. An enameled *reliquary* in Limburg (containing a piece of the Holy Cross) by its inscription informs us it was made to the order of Emperor Constantine VII (976). Gospel (*Textus*) covers of the 10th century of beautiful cloisonné decoration extant are several in Saint Mark's, Venice, one each in Saint Gall and Sienna. Some gold plates in the National Hungarian Museum, Pest, with their cloisonné pictures of the Emperor Konstantine IX, Monomachos and the Empress Theodora and Zoe are, probably, parts of a crown, and date from 1042 and 1054. The Holy Cross, St. Stephen's crown (see *Crowns*) has enamelled plates in both arches and the cincture. The Pala d'Oro (see *Altar*) in Saint Mark's, Venice, was formerly an antependium and the enamel picture was made for Doge Pietro Orseolo in Constance (1076), and the added enamel plates were done for Doge Ordelao Falieri (1105). Quite a large number of works were produced in Constantinople in Byzantine style for the European churches, such as reliquary caskets (*chasers*), crosses, book-covers, etc.; some show an inscription as proof. Under competition with the new *chaplet*湍, Byzantine enamels disappear about the 12th century.

Champlévė—*Enamels.*—The process of champlévė enamel work consists of carving recesses in the body of the metal base and leaving the outline of the design on the metal untouched. In other words, instead of placing a framework of wire to represent the design's outline (as with cloisonné) the body is carved away leaving only the outline as upper surface. The sunken recesses are filled in with enamel and fired (fused) and finished as with cloisonné work. A defect in the cloisonné process is that it is practicable only on a gold, silver, gilt or a copper base. Champlévė work can be practised on the baser metals, thus greatly reducing the expense of the material. 

**Figure 13**

*Figure 13* Enamels in the 12th century, *opus Lemosicium* quite frequently. But the Rhine provinces (Cologne, etc.) and Lower Saxony were active centres for this work at this time. While the Rhine product came from monasteries, that of Limoges was produced in workshops of civilians; the former, therefore, have tendencies toward ecclesiastical symbolism, and the latter display simple, popular subjects and fewer inscriptions. Some early examples extant follow: Portable altars, one in the Treasury at Berlin; another in the Bamberg Cathedral (chest with flat cover), was, traditionally, a gift of the Emperor Heinrich (1002–24), having angel figures of enamel on the cover. Christ, Holy Virgin, and saints on the sides. Enamel work is on the ambo (pulpit) at Aix-la-Chapelle; two crosses of similar form are in the Wolfenschatz of Hanover, where there are also two reliquary chests (*chasers*), one of which is the same Byzantine church form as that in the South Kensington Museum, from the Soltykoff collection. The other is in the form of a portable altar, rich in combined champlévė and cloisonné, and has the inscription *Eilbert Poloniensis Me Fecit.* Siegburg also has several enamel decorated reliquaries and portable altars of Cologne workmanship. Saint Mary's Church, Cologne, has two very fine reliquaries, one of Saint Maurit, the other of Saint Albin. A noted example is the sarcophagus in Charlemagne's grave in Alto- Chapelle Cathedral. The richest of enamelled reliquaries is that of the *Three Kings* in Cologne Cathedral with its chased work, precious stones, cameos and enamel work in cloisonné and *opus Lemosicium* (20th century). The so-called *Verdun altar* in Klosterneurburg, near Vienna, was an antependium in 1181, and consisted of 45 plates, but six were added in 1329, producing an altarpiece with wings. The plates have scenes from the Old Testament and the Evangel. The enamel triptych from Alton Towers, now in the Victoria and Albert Museum (London), was made at Huy by Godfrey de Claire middle of the 12th century. Of the 73 Limoges champlévė examples in Cluny Museum the two plates representing Saint Stephen de Muret are of the 12th century. In the Paris Louvre, among 80 Limoges champlévė pieces we find a rosette-shaped plate displaying the Vision of Saint Francis of Assisi; it is of the 13th century transition period, when the entire picture becomes covered with enamel and engraved work. In this new style the background is enameled but the figure is bare metal and engraved with lines. It has left much of the art work to the engraver and the enamel took second consideration. This 13th century innovation soon caused decadence in art enameling. In Italy some work was done in champlévė.
mostly on small plates of copper or silver, for the decoration of crucifixes, chalices, etc. They display, of course, Italian design. In Spain champlevé work was done in the 16th century.

Émaux en Basse-Taille.—Called also translucent enamel work. This style is a combination of sculpture and enameling. It originally was the 14th century Italian Renaissance goldsmiths, and the 14th century goldsmiths continued it. The process consisted of sculptured work in low relief on the metallic base and the filling in of the uneven surface with colored translucent enamels. Flesh parts are either colorless or of weak violet enamel. Noted enamlers in this style were Andre Ognobene (antependium in San Giacomo at Pistoja); Andrea Arditi (life-size bust of Saint Zanobi in Florence Cathedral); Francia, as Forzore; Veri (two reliquaries in Orvieto); Leonardo and Piero (parts of the altar of Pistoja); Braccini (chalice in Pistoja); Nicolo and Enrico Bonaventura (reliquary of the head of Saint Sigismondo at Sienna); Pollajoulo (altar cross and pax in Florence); Finiguerra, the arms of the same style as Francia; in the reign of François Premier, but the Limoges enamlers soon suppressed it. We find in this style exist a monstrance in the cathedral treasury at Aix-la-Chapelle, dated 13th century, and two reliquaries in the form of chapels with translucent enamel windows; in Cologne Cathedral treasury is a superb cross in this style.

Émaux Peints.—This style is similar to ordinary painting, the canvas being represented by a surface of enamel and enamel colors substituting oil colors. Its origin is in doubt. We first know of it as done in Limoges in the second half of the 15th century. The oldest known piece exists is a reliquary in the chapel of Saint Sulpice-les-Peulles at Bourganeuf; arched there 1479. One process was to engrave an outline on the copper with an etching needle, cover thinly with translucent enamel, then trace the outlines in dark enamel. These lines formed the border for the other colors. The technique changed in the 16th century, when painting over white was done on a thick coat of black or dark enamel. Thin layers of white formed the half-lights, heavy layers produced the lights; hatching the thick layers with a point sometimes produced the shading. Such manipulation produced the so-called en grisaille (gray on gray) style. Flesh parts were generally given a reddish color. Numerous firings were needed. After the beginning of the 16th century the copper received a background of brown, and the painting was done in translucent colors, the flesh parts being in opaque enamels. Limoges painters generally selected biblical subjects or saints till middle of the 16th century. Italian Renaissance decoration then appeared. Rosso and Primaticcio, Italian artists, called to the court of François Premier; Francois Brevet, the court engraver, later taking to the work themselves. Plates were no longer the sole pieces, but also vessels and services, dishes, plates, bowls, pitchers, saltcellars, candlesticks, etc. They are found everywhere in collections. Of all known artists in this style must be mentioned the three Penciauds, Raymond, Leonard, François and Joseph Limosin, the Nouailher family, Courtois (or Courteys) family, Laudin family, H. Fonce, etc. In England Nic. Hilliard (1542-1619) did fine enamel miniature work of the 16th century, generally of Renaissance forms, and entirely coated in enamel.

Enamels of the 17th and 18th Centuries.—In 1632 Jean Toutin, French goldsmith, discovered a process of painting in vitreous opaque colors on gold coated with white, or weakly colored, enamel, then firing. It was like painting on paper with water-colors, in simplicity, as it avoided hatching for shades and coloring with translucent enamels. The process, however, changed the style and enamel painting gave way to miniature painting in enamel pigments. It soon went out of fashion. Toutin and pastel painter Gribelin worked in this style and had many followers decorating vases, practised in France, flowers, etc. Noted in this style are Jean Petitot, Georg Stratach, the brothers Peter and Amicus Huot, G. F. Dinglinger, Blesender, Menig, Boit, van Meyten, Meier, etc.

Émaux en Résille.—A French style of enameling in the 16th century termed thus was done in enamel work. A piece of gold plate with stamped pattern was fitted into a cavity in the glass; the cavity was filled in with translucent enamel which was then fused. The process, whose origin is unknown, was known as émail en résille, or émail en résille sur verre. Few specimens are extant. One (a crystal bowl with the cipher of Diana of Poitiers) is in the Uffici Palace, Florence; a small oval crystal mirror in this style is in the Louvre.

Asiatic Enamels.—The enamel work in the 17th century came vessels of cloisonné ware built up of rather heavy wire and with insufficent enamel to reach the upper surface of the wire. Designs are in Byzantine style. Chinese enameled gold greatly prized by collector; pieces of the Ming dynasty (1368-1644) show perfection of workmanship, harmony of color and beauty of design. They are all champlevé. The Japanese are past-masters in the art of enamel work. Their artists are often representatives of enamel workers of successive generations of the same family for hundreds of years. They do cloisonné work on iron as well as copper and gold. The East Indian is unrivaled in the delicate class of gorgeous champlevé work in arabesque designs of elaborately ornamented. The workers of Jeypore, Delhi, Lahore; Benares, Lucknow, are in a class by themselves, and their expert knowledge of the art dates back very far, as pieces extant show.

Modern Enamels.—While most of our modern enamel wares are derived from the sources above mentioned, France has its Lamiche and Thesmar; England its Thomas Fisher, whose work is considered fit for exhibition in the Victoria and Albert Museum. George Frampton, R.A., and Mrs. Traquair (Edinburgh) are talented enamellers.

Enamal work is done on glass for windows of churches, also on show pieces of crystal
1 Benvenuto Cellini — Cup of gold and enamel called the Rospigliosi Coupe
2 Limoges Enamel French, 1495–1520 Nardon Penicaud — Triptych. Annunciation, Birth of Christ, Circumcision
ware, such as goblets, etc., and on modern table glass de luxe. See GLASS.

Clement W. Coumbe.

ART GALLERIES, primarily buildings or rooms dedicated to art and used for the exhibition of works of art; hence, secondarily, important public or semi-public collections of art objects. In ancient Athens the notable hall that housed the famous 'Pentad' contained works of celebrate painters and was called the Pinacotheca, gallery of pictures. But in Rome, at the time of Augustus, a wholly different plan was adopted. The design of Augustus and his successors was not to assemblage works of art in a single great building, or a number of such buildings devoted exclusively to that use; rather it was to make Rome itself a true Pinacotheca, and to give the utmost publicity to both paintings and statues by placing them where they would be seen of all men, in porticos, along the promenades, and wherever public meetings were customarily held. Thus even the Roman Forum was brilliant with paintings, and the porticos of Philip, Octavia and Pompey were literally covered with them. Later, when Constantine made Byzantium the imperial capital, it assembled there from all parts meritorious statues and paintings, "the idea did not occur to him," as has been well said, "to shut them up in a single locality; he made them serve for the decoration of various edifices and promenades of the city," which thus became, as Rome had been, an immense museum of art. During the Middle Ages, when art sought ecclesiastical protection, the churches were the only museums of sculpture and painting; but toward the close of the 13th or early 14th century, nobles, as well as powerful ecclesiastics, formed collections which eventually became nuclei of many of the great public European art galleries of the present day. In this sense the collections of the Medici family became the art galleries of Florence, and the herd of the Popes constituted the Vatican galleries; the Farnese collection was the starting-point of the Studi at Naples; and it is well known that the Louvre embraces collections of several other sovereigns beside those of Francis I and Louis XIV.

Now, although it may be truly said that, as long as they remained princely or royal properties, these galleries were as a rule opened freely to artists, we must bear in mind the vicissitudes to which they were exposed, and the privilege of visiting them might be withdrawn by their owners at any time. Moreover a political revolution might occasion their dispersal—the fate that actually overtook the magnificent collection of King Charles I of England. It was only after the French Revolution that art galleries and museums became to such an extent genuinely public institutions that, although still in certain countries dependent upon the power of the Crown, the collections were at least inalienable and not subject to important modifications without the consent of the representatives of the nation; and, as we shall presently note, this change was accompanied by a partial return to the old Roman ideals of publicity, accessibility, utility. Toward the end of the 18th century France set an example to other countries, making the Louvre the first truly national art-institution in Europe. Together with the less important art galleries or art museums of the French capital and provinces, the Louvre became absolutely the nation's property, and as such open to all; and soon the observation was made that not alone artists, but rapidly grew to be of prime importance to the citizens of Paris that they were becoming higher schools of industry, so to speak, and in this way rendered much practical service to the State. The utilitarian influence of the art galleries of Paris was so thoroughly appreciated that many deparmental institutions of a similar character were established, such as those of Dijon, Lyons, Bordeaux, Marseilles, Toulouse, Orleans, Rouen, Avignon, Arras and Grenoble.

Observation of the satisfactory French experience in connection with the democratization of art galleries had four results in other lands: (1) It popularized the theory that art-education must, so far as possible, be provided for all the people; (2) the number of art galleries was greatly increased; (3) systematic efforts were made to utilize the motion of artistry in every form; and (4) galleries and museums of art began to extend their good offices far beyond their walls. They are at present concerned not only with the persons who may come to them seeking instruction but also with the study, registration, and protection of objects—the artistic, the historically valuable and the beautiful things in their
neighboring. Mr. Benjamin Ives Gilman, secretary of the Museum of Fine Arts, Boston, writes: "Let each American museum of art take its neighborhood for its province, acquiring and imparting information about any local works of art, public or private, whose owners may offer them for the purpose. A knowledge of what we have is the necessary and often sufficient condition of its preservation. This excellent program expressly includes the accurate and complete registry, by description, measurement, photography, and otherwise, of such buildings, monuments, paintings, sculptures, etc., in the locality as the officers of the museum may consider of public interest from an artistic point of view; and this may be taken as the last word, up to 1917, in regard to the extension of any art gallery's or art museum's influence beyond its own walls.

But even more noteworthy than such extra-mural activity is the intra-mural; and here the most important subjects are the following: (1) The advanced thought of the day in regard to the installation and exhibition of objects of art, especially paintings; and (2) the development of educational features. As for the first of these subjects, the best usage at present authorizes the propositions that the several collections or groups of a large gallery or museum of art should be arranged in chronological order, to bring out the historical, as well as the aesthetic, relationships; but that, within each of the large groups, the purely aesthetic arrangement should be preferred to the chronological. The effect of this is, that a visitor can observe and study the history of art, from the earliest times to our own day, simply by making intelligent use of his eyes in one gallery after another, taking the rooms or galleries in the prescribed sequence and consulting such catalogues as will give in compact form the last word in competent connoisseurship. That ideal may not indeed be fully realized, but that it shall be approximated is clearly the purpose of the most enlightened and progressive art directors.

In order to appreciate the value of the principle involved, let us note its application to the arrangement and display of paintings only, rather than to the entire museum with all its collections, embracing architecture, sculpture, etc., as well as the pictures. The advanced thought in regard to adequate installation and exhibition of paintings is that we should do our best to make it convenient for visitors to look at them in the way it was intended (by their makers) they should be looked at—not contemplating ourselves with merely having them numbered or labeled and hung in serried rows in a gallery no better suited to the purpose than are some of the European art galleries and museums. A distinguished art expert writes that the public collections of Europe seem to put the impossible or conceivable obstacle in the way of our enjoyment. He believes that each masterpiece should be isolated in a special niche like the image of a jealous god, and he complains that, on the contrary, it is often stuck like a postage stamp on a wall covered with paintings that have little or nothing but archaeological interest to recommend them. Another art critic, looking backward to the times when altar-pieces and easel-pictures (now in our galleries) were visible in the very places for which their painters had designed them—and therefore in their own sympathetic surroundings—manifests an art-lover’s longing for the restoration of surroundings that might at least be suitable, although, naturally, never again quite the same. Progressives who hold that it is not practicable to isolate every masterpiece in a special niche, nevertheless advocate the construction of galleries with wall-space so ample that even those pictures which lack something of the superlative quality we revere in the greatest masterpieces need not be crowded together; since it is very difficult to appreciate fully any single painting when others in the same field of vision compete with it for our attention. Summarizing the conclusions reached by authorities in this field, we may say that, for the better enjoyment of all the oldest paintings, it is desired to reproduce, so far as practicable, such surroundings as they had originally. With only a small collection, this certainly can be done; how far, then, can such a principle of reform apply to large galleries? Admittedly it is possible to achieve, even with very large collections, vastly better results in the future than any to which we have hitherto attained. It is well understood that eventually the reform must be thorough; for example, a systematized collection of paintings in the midst of unorganized collections of architectural and sculptural examples could never produce its proper effect. It must be a part of the harmonious development that shall prevail in every part of the art gallery of the future.

In America every important public collection of art objects is regarded as a part of the educational system; and this view has been both qualified and explained in the following terms: "The main preceptor must always be one’s own eye, and the way to cultivate its powers must always be to use them. This means that, as conditions are in our country today, almost all valid training in the appreciation of art must be gained in the local art gallery. And it follows that in all possible ways the museum, the gallery, should itself facilitate, stimulate, and guide the self-education of the people." And fortunately it is permissible to add that the more progressive galleries or museums of art are working for those of various kinds for the definite instruction of the public. Study-rooms devoted to one branch of art or another, handbooks and special treatises, illustrated lectures delivered in the museum or elsewhere, tours of the galleries under guidance, loan collections sent to various parts of the city—these are some of the methods that they adopt, always with the conviction that true teaching means advising the eye how to educate itself and therefore always with the aid of the museum collection and museums themselves that have started this novel work, which has already been endorsed and facilitated by schools and colleges and by National, State, and municipal authorities, and is winning the support of many others who care for education and who care for art. Consult Wilcox, M., in The International Studio, 1917, p. xxii, and Van Rensselaer, M. G., ibid, p. 2; also Jackson, M. T., ‘The Museum’ (London 1917).
ART, METROPOLITAN MUSEUM OF

Here follows a selected list of art galleries and museums in various parts of the world:

UNITED STATES AND CANADA.

ALBANY, N. Y.—Albany Institute and Historical and Art Society.

BALTIMORE, Md.—Walters Gallery.

BOSTON, Mass.—Museum of Fine Arts.

BUFFALO, N. Y.—Albright Art Gallery.

CHICAGO, Ill.—Art Institute of Chicago.

CINCINNATI.—Contemporary Art Museum Association.

CLEVELAND, Ohio.—The Cleveland Museum of Art.

DETROIT, Mich.—The Detroit Museum of Art.

HARTFORD, Conn.—Wadsworth Atheneum and Morgan Memorial.

MINNEAPOLIS, Minn.—The Minneapolis Institute of Arts.

MONTREAL, Canada.—Montreal Art Gallery.

NEW HAVEN, Conn.—Yale School of Fine Arts (Jawitz Collection, Trumbull Collection, etc.).

NEW ORLEANS.—Museum of Art.

NEW YORK CITY, N. Y.—Brooklyn Institute of Arts and Sciences; Hispanic Society of America; Historical Society; Metropolitan Museum of Art; Public Library (paintings and prints department).

OTTAWA, Canada.—National Gallery of Canada.

PHILADELPHIA.—Pennsylvania Academy of the Fine Arts; Pennsylvania Museum and School of Industrial Art; Wistar Gallery.

PITTSBURGH, Pa.—Carnegie Institute.

 PROVIDENCE, R. I.—Rhode Island School of Design.

QUEBEC, Canada.—Museum of the Université Laval.

ROCHESTER, N. Y.—Memorial Art Gallery.

ST. LOUIS, Mo.—City Art Museum.

SAN FRANCISCO.—The San Francisco Art Association.

SYRACUSE, N. Y.—The Syracuse Museum of Fine Arts.

TORONTO, Canada.—The Toronto Museum of Art.

TORONTO, Canada.—Museum of Art ("The Grange").

WASHINGTON, D. C.—Corcoran Gallery of Art; National Gallery of Art.

WINNIPEG, Canada.—Museum of Fine Arts.

WORCESTER, Mass.—The Worcester Art Museum.

LATIN AMERICA.

BUENOS AIRES, Argentina.—Museo Nacional de Bellas Artes.

CARACAS, Venezuela.—Academia de Bellas Artes.

KINGSTON, Jamaica.—Jamaica History Gallery.

LIMA, Peru.—Gallery of Paintings in the Museo de Historia Natural, Palacio de la Exposición.

MEXICO CITY, Mexico.—Museo de Arte de Academia de Ciencias.

MONTevideo, Uruguay.—Museo Nacional de Bellas Artes.

RIO DE JANEIRO, Brazil.—Escola Nacional de Bellas Artes.

SANTIAGO, Chile.—Museo de Bellas Artes.

EUROPE, AUSTRALIA, AFRICA AND ASIA

AUSTRALIA.—National Gallery at Melbourne.

BELGIUM.—Galleries of old and modern pictures in the Royal Museums of Brussels.

CHINA.—Peking Imperial Museum in Peking.

DENMARK.—Art Museum at Copenhagen.

EGYPT.—Grace-Orozo Museum at Alexandria, and Museum of Egyptian Antiquities and National Museum of Foreign Art at Cairo.

FRANCE.—Louvre, Musée du Luxembourg and Musée de Cluny, at Paris, and Musée National at Versailles. Musées des Departments that have shown positive evidence of growth during the last quarter of a century are those of Amiens, Albi, Bayonne, Boulogne-sur-mer, Clermont-Douai, Lille, Poitiers, Saint-Quentin, Sens and Valenciennes.

GERMANY.—Old and New Museums and National Gallery at Berlin, the Royal Gallery of Paintings at Dresden, and the Glyptothek and the Old and New Pinakothek at Munich.

GREAT BRITAIN.—Museum and Art Gallery at Birmingham, the National Gallery and the Municipal Gallery of Modern Art at Dublin, the National Gallery of Scotland at Edinburgh, the Art Gallery and Museum at Glasgow, the Walker Art Gallery at Liverpool, the Ruskin Museum at Sheffield, and the following in London: National Gallery, British Museum, National Gallery of British Art (formerly the Tate), Victoria and Albert Museum (formerly South Kensington Museum), British Museum Library and Wallace Collection.

GREECE.—National Museum at Athens.

HOLLAND.—Kabinet van Schilderijen and Municipal Museum at The Hague and Museum—Boijmans at Rotterdam.

ITALY.—The Academia di Belli Arti, the Uffizi, the Pitti Palace and the Bargello, at Florence, the Brera at Milan, the Museo Nazionale at Naples, the Vatican, the Capitoline, the Borghese and the Villa Medici at Rome, and the Academia di Belli Arti at Venice.

JAPAN.—The Imperial Museums in Tokio, in Kioto, and in Nara.

KOREA.—The Korean Museum in Kaio.

NORWAY.—The Statens Museum of Art (Nationalgalleriet) at Christiania.

PORTUGAL.—Museu Nacional de Arte Antiga and Museu Nacional de Arte Contemporanea.

SWITZERLAND.—Museo del Prado and Academia de Bellas Artes at Madrid, the Casa Greco at Toledo, and the Palacio de Bellas Artes at Barcelone.

SVERDEN.—National Museum at Stockholm.

SWITZERLAND.—Picture Gallery at Basel.

ART OF POETRY—ART STUDENTS' LEAGUE OF NEW YORK

ministered by a director and regular staff. While the ground and buildings are public property, the additions to the museum and cost of administration (in a recent year over $461,500) with the exception of the city's annual contributions of $20,000, are covered by gifts and an endowment created by rich benefactions. Among the chief benefactors of the museum have been its presidents, John Taylor Johnson, Henry Marquand and J. Pierpont Morgan; Miss Catharine Lorillard Wolfe who besides her collection of paintings donated $200,000; Jacob H. Rogers (1901), $6,000,000; John S. Kennedy (1909), $2,500,000; Francis L. Leland (1912), $1,000,000; Frederick T. Hewitt, $1,600,000 and Mrs. Morris K. Jesup (1915), $500,000 with a collection of paintings. The directors of the museum have been Gen. L. P. di Cesnola (1879–1904); Sir Caspar Purdon Clarke (1905–10) and Edward Robinson (1910–). Mr. Robert W. De Forest was elected president after Mr. J. Pierpont Morgan's death in 1913. The total attendance of visitors to the museum during 1915 was 913,320.

ART OF POETRY. The ('Ars Poetica'). a famous work by Horace. This is not the name given by its author, who called it merely a 'Letter to the Pisos.' Horace treats of the unity that is essential to every composition, and the harmonious combination of the several parts, with which there can be no lasting success. In the second part, the poet confines himself to the form of the drama, the principles he has already established being so general that they apply to every class of composition. See HORACE.

ART OF WAR. The art of war may be conveniently subdivided into the following sections: (a) the organization of armies; (b) tactics; (c) logistics; (d) strategy; (e) engineering; (f) tactics. The organization of armies is the building up necessary for the application of the principles of strategy to them. Logistics is the art of moving and supplying armies. Strategy is the art of using the armies upon the theatre of war. Engineering is the art of disposing troops and making arrangements of obstacles by means of which an inferior force may successfully resist the attacks of a superior force; and also the art of overcoming and removing all obstacles placed in the way by an opposing force. The following are the duties of engineers of an army: the construction and maintenance of field-telegraphs, the construction of fortifications, the conduct of engineering operations at sieges, mining, bridging, surveying, reconnoitering, opening and making roads, choosing positions, sketching ground, etc. Tactics is the art of putting into execution the projects of strategy. An intimate knowledge of all these branches is absolutely necessary in order to be a great and successful general. The formation of a plan, that is, deciding the nature of the war that will be waged; determining the objects to be attained, and the best manner and means of attaining them; or, in other words, outlining the general features of a campaign, belongs to strategy. The execution of the plan depends upon tactics. The capture or battle in which the opposing armies can come into collision is the province of battle. The principles of war cannot be violated with impunity. These principles are fixed and are determined from the narrative of operations conducted by successful generals. A study of military history is then necessary for a proper understanding of the principles of war; and as in all other professions, so in war, he who is most proficient in the lessons as taught by the masters of the art will be most successful.

The duties of each arm of the service overlap and blend into one another, and the higher the grade of an officer attains, the more requisite it is that he should be acquainted with the duties of those arms of the service to which he himself does not belong. By this means alone can we hope to obtain that intelligent cooperation, that harmonious working of all branches of the service together, which makes a perfect machine out of the various elements comprising an army, and at the same time gives the surest guarantee of success. In armies, as elsewhere, there is a tendency for every one to think his own branch, that which he has studied most and knows best, the most important. Such feelings are very natural and in the lower grades often do much good; but as men rise in the service it is desirable that they should know something of the duties of other branches, and the difficulties others have to contend with. Such knowledge tends to produce cordiality and forbearance. Cavalry officers falling into command of mixed forces will not then expect their infantry to gallop; infantry officers will not seek to bind the cavalry to pace of their infantry. A knowledge of capabilities of other arms will enable officers to use those arms to the best advantage as occasion offers. It should, however, be borne in mind that it is impossible to lay down fixed rules of action. Nearly every military regulation should be followed by the words "according to the ground and according to the circumstances." Practice and experience alone can decide many points; practice and experience alone can give the power of applying rules; but theory, by which means experience obtained by others, is not the less important and valuable. Principles are but guides, which must be revised, examined and verified after each war, after each discovery that may be brought to bear on the military art. See ARMY ADMINISTRATION; ARTILLERY; ARTILLERY REGULATIONS; ARMY TRANSPORTATIONS; ARTILLERY; BALLISTICS; CAVALRY; ENGINEERING, MILITARY; GUNNERY; MILITARY EDUCATION; TACTICS.

ART STUDENTS' LEAGUE OF NEW YORK, an important art school, at 215 West 57th street, New York city. It was founded in 1875 by a number of students of the National Academy of Design dissatisfied with the conventions of the older schools. The school is entirely self-supporting, being maintained from the fees of its students, which range from $30 to $70. The membership has grown steadily until now it is over 1,500, while the average number of pupils is about 500. The courses include drawing, antique drawing, composition, still life and miniature painting, modeling, painting from life, illustration, anatomy and study of the theory and history of art. Night classes and a summer term are also among its features. The building is in the Romanesque style, and landscape painting is given at Woodstock, Ulster County, N. Y. There are practically no entrance requirements. The government of
the institution is vested in a board of control, elected by the students, themselves elected from the advanced students. Among the prizes awarded are, the $100 prize, for the best painting, the Saltus Prize, $50, for antique drawing, the Saint-Gaudens Prize, $75, for figure modeling, the Saint-Gaudens Prize, $25, for composition modeling and the Evans Prize, $30, for applied art.

ARTA, är'ta, the name of a gulf, town, and river. The gulf (ancient Ambracius Sinus), an arm of the Ionian Sea, between Greece and Albania, is about 20 miles long by 10 miles broad. Near its entrance the battle of Actium was fought. The town, called also Narda (the ancient Ambracia), about six miles north of the gulf, stands on the river, which is here about 200 yards wide, and begins to be navigable. It carries on a considerable trade in wine, oranges and tobacco. Pop. 8,600.

ARTABANUS IV, the last of the Parthian monarchs, who 217 A.D., escaping with great difficulty from a perfidious massacre begun by the Romans under Caracalla, mustered an army, and engaged his foes in a battle which lasted for two days. Peace was then concluded, but Artabanus afterward incited his subjects to revolt, and in a battle, in 226, was captured and put to death.

ARTABAZUS, the name of several distinguished Persians under the dynasty of the Achemenide. An Artabazus led the Parthians and Chorasmins against Xerxes. Another Artabazus, a general under the Persian King, Artaxerxes II, afterward revolted against Artaxerxes III. He was forgiven through the exertions of his brother-in-law, Mentor, a favorite and staunch supporter of the next king, Darius, whom Artabazus faithfully attended after the battle of Arbela. Alexander rewarded his loyalty by making him satrap of Bactria.

ARTAGNAN d', där'ta-nyâ', the hero of Dumas’ ‘Trois Mousquetaires,’ (‘Vingt ans après,’ and ‘Le Vicomte de Bragelonne.’) He is a Gascon adventurer, very popular among heroes of romance. There was, however, a Count d’ Artagnan (b. about 1612; d. 1672), who was an officer of musketeers, and fell in the siege of Maestricht.

ARTASIERES, the last Arsacid monarch of Armenia. He was placed on the throne by Bahram V of Persia, who afterward deposed him and annexed his dominions to Persia, under the name of Persarmenia, 248 B.C.

ARTAVASDES, är'ta-väs'dè, I, a king of Armenia, who succeeded his father Tigranes. He joined the Roman forces commanded by Crassus, but deserting to the enemy, caused the defeat of the Romans, and the death of Crassus. He similarly betrayed Mark Antony when engaged against the Medes; but afterward falling into Antony’s power, was taken with his wife and children to Alexandria, where they were dragged at the victor’s chariot wheels in golden chains. After the battle of Actium, Cleopatra caused his head to be struck off and sent to the King of Media.

ARTAXATA, the name of the ancient castle or residence of the refugees of Hannibal when forsaken by Antiochus. Its ruins are now known as Ardasbir.

ARTAXERXES, är'taks-érks’es, the name of several Persian kings: (1) Artaxerxes I, surnamed Longimanus, because his right hand was longer than his left, the second son of Xerxes, escaped from Artabanus and the other conspirators who had murdered his father and elder brother Darius, and in 465 B.C. ascended the throne. He conquered the rebellious Egyptians, terminated the war with Athens by granting freedom to the Greek cities of Asia, governed his subjects in peace, and died 425 B.C. (2) Artaxerxes II, surnamed Memon, from his strong memory, succeeded his father, Darius II, in the year 405 B.C. After vanquishing his brother Cyrus he made war on the Spartans, and forced them to abandon the Greek cities and islands of Asia to the Persians. He honored the Athenians, and endeavored to form dissensions among the Greeks. His last days were embittered by the unnatural conduct of his son Ochus, who, to secure the crown to himself, caused the destruction of two of his brothers. On the death of Artaxerxes Memon, 359 B.C. Ochus ascended the throne by the name of (3) Artaxerxes Ochus. After having subdued the Phœnicians and Egyptians, and displayed great cruelty in both Egypt and Phœnicia, he was poisoned in 339 B.C. by his general, Bagas. (4) Artaxerxes Berezan was the first King of Persia of the race of Smerdis. He was a shepherd’s son; but his grandfather, by the mother’s side, being governor of a province, he was sent to the court of King Ardavan. On his grandfather’s death, Artaxerxes, exciting the people to revolt, killed Ardavan and his son, and assumed the title of King of Kings. He made vast conquests, and wisely administered the affairs of his kingdom.

ARTEDI, är-ta’dè, Peter, an eminent Swedish naturalist: b. Anund, 22 Feb. 1705; d. Amsterdam, Holland, 27 Sept. 1735. He went in 1724 to Upsala to study theology, and turning his attention to natural history, soon rose to considerable eminence, particularly in the department of ichthyology, the classification of which he reformed on philosophical principles. This arrangement added greatly to the importance of a station as a naturalist at the time, and afterward he became popular over Europe. Four years later Linnaeus (q.v.) arrived in Upsala, and a life-long friendship grew between the two men. In 1732 both left Upsala—Artem for England, in pursuit of his favorite study; and Linnaeus for Lapland, to examine its natural productions; but before parting they reciprocally bequeathed to each other their manuscripts and books upon the event of death. According to agreement his manuscripts came into the hands of Linnaeus, and his ‘Bibliotheca Ichthyologica’ and ‘Philosophia Ichthyologica,’ together with a life of the author, were published at Leyden in the year 1738. Linnaeus named a genus of umbelliferous plants Artedia, in memory of his friend.

ARTEMIA. See BRINE-SHRIMP.

ARTEMIDORUS, a Greek geographer: b. in Ephesus, who flourished about 100 B.C. His ‘Geographoumena’ in clever books was an exhaustive work on the various features, geographical, physical, historical and political, of the larger part of the then known world, founded on the writer’s own investigations and the work of preceding writers. Only fragments of his work are extant.
ARTEMIS, a Greek goddess, identified with the Roman Diana. She was the daughter of Zeus (Jupiter) and Leto or Latona, and was the sister of Apollo, born in the island of Delos. She is variously represented as a huntress, with bow and arrows; as a goddess of the nympha, in a chariot drawn by four stags; and as the moon goddess, with the crescent above her forehead. She was a maiden divinity, decorated with wreaths, flowers, and graces, and was artfully shone, and is represented as having changed Acteon into a stag, and caused him to be torn in pieces by his own dogs, because he had secretly watched her as she was bathing. The Artemis was a festival celebrated in her honor at Delphi. The famous temple of Artemis at Ephesus was considered one of the wonders of the world, but the goddess worshipped there was very different from the huntress goddess of Greece, being of Eastern origin, and regarded as a symbol of fruitful nature.

ARTEMISIA, a genus of aromatic, herbaceous or shrubby plants of the family Asteraceae, consisting of about 250 species, natives of temperate or subarctic regions. A. dracunculus is tarragon or estragon, the leaves of which are used for seasoning. A. absinthium, wormwood, is the source of absinthe and is also used medicinally. A. abrotanum, southernwood, and A. stellariana, old woman, are cultivated as ornamental plants. A. tridentata is the common sagebrush of the plains of the western United States, being the most common and characteristic plant over many thousands of square miles.

ARTEMISIA I, ār’te-mi-zhi’-a, or mish’-h-ā, a queen of Caria, who lived in the 5th century B.C., and assisted Xerxes in person against the Greeks, and behaved with such valor that the Athenians offered a reward for her capture, and the Spartans erected a statue to her.

ARTEMISIA II, a queen of Caria, who flourished about 350 B.C. She was the sister and wife of Mausolus, whose death she lamented deeply, and to whom she erected, in her capital, Halicarnassus, a monument reckoned among the seven wonders of the world. The principal architects of Greece labored on it. Bryaxis, Scopas, Leochares and Timotheus made the decorations on the four sides of the edifice; Pythies, the chariot drawn by four horses, which adorned the conical top. Vitruvius thought that Praxiteles was also employed on it. After the death of Artemisia the artists finished it without compensation, that they might not be deprived of the honor of their labor. It was an oblong square, 411 feet in compass, and 130 feet high. The principal side was adorned with 36 columns, and 24 steps led to the entrance. From the tomb of Mausolus is derived the word "mausoleum."

ARTEMISIUM, ār-te-mi-shi-um, a promontory in Euboea, an island of the Ægean, near which a great naval battle between the Greeks and Persians was fought, 480 B.C. It was named from a temple to Artemis situated here.

ARTEMUS WARD. See Browne, Charles Farrar.

ARTERIAL PRESSURE. See Blood Pressure.

ARTERIES are the elastic tubes or vessels that carry blood from the heart to the tissues of the body. They owe their name, which was connected by the older anatomists with the Greek aer, air, to the belief that they contained air, since they were found empty after death. The arteries spring from two great trunks, the pulmonary artery which carries blood to the lungs, and the aorta through which the blood is sent throughout the body. Each of these two main trunks divides and subdivides until they become the minute vessels known as the arterioles. The arterial action is a ready adaptation in change of position attendant upon evolutionary development or mechanical obstruction in the individual organism. The main trunks occupy relatively constant positions in the body, but the blood vessels of smaller size and position is less constantly determined. As they approach the periphery of any organ their minute branches connect through the hair-like capillaries with the minute divisions of the veins, which carry the blood back to the heart, thus completing the round of the circulation. The carotid is the branch of the aorta which mainly supplies the blood to the head, the superficial or external carotid supplying the outer structures and the deep or internal carotid supplying the deeper and deeper lying parts. There are numerous anastomoses between the branches of the carotid arteries. The most important of these form a vascular circle, the circle of Willis, which affords freedom of arterial circulation by the anastomoses between arteries not only on the same side but also on opposite sides of the medial plane. For the other main branches of the aorta see AORTA.

The minute structure of the arteries is well adapted to the varying functions that these vessels perform. Their walls consist of several coats. The outer coat, or the tunic adventitia is composed of white, fibrous connective tissue. Next to this is the yellow elastic and within this the muscular coat composed of involuntary muscular tissue. The elastic coat is much thicker in the large arteries than the muscular but in the smaller there is a relatively stronger muscular coat. In the first part of the aorta, pulmonary artery, and arteries of the retina there is no muscular or motor nerves terminate in the muscular coat. Within this layer is a smooth elastic coat perforated by small apertures. The innermost coat is a layer of endothelial cells which forms the free surface over which the blood flows with a minimum of friction. The extreme toughness of the outer layer strengthens and protects while the elasticity with which the walls are provided permits the artery to return to its average diameter after it has been contracted or dilated by the muscular layer. The large arteries are thus more elastic and less contractile while for the smaller ones the reverse is true. The arteries are nourished by their own blood supply through minute vessels, vasa vasorum, distributed through the fibrous, elastic and muscular coats.

SMITH ELY JELIFFE.

ARTERIES, Diseases of. The arteries are subject to a number of diseases which may be classed as (1) due to infectious micro-organisms, (2) degenerations with increase of connective tissue, (3) aneurisms, (4) inflammation due to injury or extension of inflammation from surrounding parts, (5) Fatty Degenera-
ARteriosclerosis — Artesian Wells

Arteriosclerosis is a definite disease, although the great pathologist, Virchow, taught that the arterial diseases — syphilis and syphilis, particularly the latter, are important. Syphilis is one of the most important causes of arterial degeneration. Acute arteritis is a definite disease, but in which syphilis is often a strong factor. Arteriosclerosis is a disease of age, and none of the disease is usually associated with heart and kidney disease. Hence, some writers use instead, the terms Cardio-vascular or Cardio-vascular disease. There is reason to believe that in some cases the disease is due to a disturbance of metabolism, a disturbance of the relation of certain materials which come from food for nourishment and health of the cells of the body. Then the liver, spleen, thyroid gland, supra-venal glands and other metabolizing organs are affected, and the involvement of other organs is a matter of sequence. Hardening of the arteries is a very important diseased condition. Though found in the young, it is usually a disease of advanced life, and prevails especially among the so-called "comfortable classes." It interferes with the proper supply of blood to various organs, principally the heart, kidneys and brain, and may cause actual disease — pylo-myocarditis, nephritis and a weakened condition of the arteries of the brain, which very readily results in cerebral hemorrhage, one of the forms of apoplexy. The various steps in the production of arteriosclerosis are often — an acute illness or a severe nervous strain — in all directions toward a disturbance in metabolism don't act properly, kidneys become sclerotic and do not eliminate waste products, then there is a rise of blood pressure to assist them, so the heart hypertrophies. Then comes an increase in connective tissue of the arteries with hypertrophy of their muscular elements and a thinning or a diffuse or circumscribed thickening of their lining membranes, and if affecting superficial arteries they are recognized as hardened. For there may be so many of these vessels as to make a stratum of the superficial. Arteriosclerosis may show irregular patches of a gelatinous character which at a later period become hard, even calcified and cause arteries to become brittle like pipe stems. Among the causes which favor its development and hardening of the blood from the infection of syphilis and chronic rheumatism, the excessive use of alcohol, the disturbed metabolism caused by diabetes, gout, Bright's disease, etc., and changes in the blood pressure. Arteriosclerosis is maintained and even caused by an over-indulgence of the appetites, and a sluggish mind and body as well as by the wear and tear of modern life, the struggle for wealth and position and by excessive and prolonged muscular exertion and intense emotional activity, especially in middle and later life.

Arteriosclerosis, even if there is a tendency to inheritance, cannot be disease be checked by real temperance and moderation in all things, food and drink, work and play and emotional excitement. While medicines are necessary for special conditions, the removal from the diet of offending food elements is the most appropriate exercise and keeping the intestinal tract clean are the principal remedies. See Old Age and Its Diseases.

Artesian (är-tè'zhan) Wells, bores of considerable depth which tap a subterranean stream or sheet of water. The name is derived from Artois (Latin artisianum), a province in France where the first deep bores in Europe were made. Strictly speaking the term artesian is applicable only to such wells as discharge water at the surface under natural conditions (that is, the surface, the stream or the lake). In America the term is commonly applied to any wells of more than ordinary depth. The United States Geological Survey restricts the term to a well in which the water rises under its own pressure above the point at which it was encountered, even though it does not flow out at the surface, and this is the sense in which the term is here used. The conditions which determine the presence of artesian water in a region relate to the geological structure of the underlying strata. It is essential in the first place that a pervious stratum be overlaid by an impervious layer. The pervious bed, usually sandstone or sand, serves as a reservoir for the accumulation of water, while the impervious bed prevents this water from escaping. The second requisite is that the strata have a gentle pitch toward the site of the well and that they outcrop at some place above the well. The distance of the outcropping edges, which receive the water supply from rains, is sometimes very great. Owing to friction the water column of the well never reaches the level of the outcropping source. The conditions for artesian water are particularly favorable when the strata are arranged in the form of a geological basin dipping in all directions toward the center, then is no opportunity for the water to escape at a lower level. From these considerations it is evident that the discharge from an artesian well depends upon the rainfall of the region and upon the area of the exposed pervious stratum. At first the discharge is usually very abundant owing to the long accumulation, and unless this drain is constantly supplied the flow will gradually decrease until a balance is established. When several wells are bored in the same vicinity, the flow from each well may be diminished, but the total discharge will increase until the limit of supply is reached. This is well illustrated in the wells bored in the London basin which in 1838 gave a total daily supply of 6,000,000 gallons; in 1851 with a larger number of bores the supply was about doubled, while the force has diminished very markedly; also in Denver, Colo., where some years ago there were many flowing wells which yielded water in large volume and with sufficient head to rise to the roofs of the buildings. As wells multiplied the head and volume decreased so that in 1916 all wells in the centre of the city had to be pumped and artesian water was available only in the lower
parts of some of the surrounding country. The large areas, over which water was obtained in southern California has also been greatly decreased by the heavy draft of water to irrigate orange orchards. Artesian water is valuable not only for domestic use, for which it is usually adapted by its purity, but it is also extended to uses in the irrigation of various regions. Some parts of the Sahara Desert have been reclaimed by making use of the subterranean stores of water, and recent investigations have shown that there are many areas which may yet be brought into cultivation. It is, however, in the United States that irrigation by artesian waters has reached its greatest development. Special surveys of the Great Plains region have been undertaken by the United States Geological Survey for the purpose of defining the areas where successful borings may be made, and artesian wells are now largely employed for irrigation in South Dakota, New Mexico, Texas, California and Montana. The supply is drawn mostly from the great aquifers beneath the sandstone and shales at a depth varying from less than 100 to more than 1,500 feet. When the flow of water is sufficiently strong it may be utilized for power purposes as is done in some parts of Europe and in several points in the Dakotas. In the Wurtemberg a supply of warm water is applied to the heating of buildings.

The depth at which artesian water may be found depends entirely upon local conditions. In the Paris basin the water-bearing stratum is usually encountered at a depth exceeding 1,500 feet. The famous well at Grenelle, near Paris, was begun in 1833, and operations were continued until 1841 when at a depth of 1,797 feet the water poured out with great force at the rate of 500,000 gallons per day. Another well was sunk near by at Passy, which yielded 5,600,000 gallons daily, the water rising to a height of 54 feet above the mouth. This well was 1,923 feet deep and had the usual diameter of two in. A well at Kissingen, Bavaria, furnishes a supply of saline water from a depth of 1,878 feet. Another noted foreign well is that at Schladenbach, near Leipzig, with a depth of 5,735 feet. In the United States there are many notable examples of artesian wells. The first deep well was made at Saint Louis in 1849-54; a flow of 75 gallons per minute was obtained from a depth of 2,200 feet, but the water was so heavily charged with sulphured hydrogen and mineral matter as to be unfit for domestic use. Another boring was subsequently made to a depth of 3,843 feet. A well at Louisville, Ky., is 2,086 feet deep and yields 330,000 gallons per day. Among other noteworthy wells are the following: Columbus, O. (2,775 feet); Nashville, Tenn. (3,071 feet); Charleston, S. C. (1,250 feet); Pittsburgh, Pa. (4,625 feet); Chicago (710 feet); and Edge mont, S. D., where two wells (2,965 feet each) yield flows of 1,000,000 gallons a day at temperature of 100° F. A great many wells have been bored in recent years within the Atlantic Coastal Plain, especially in New Jersey, and many cities have thus obtained supplies of pure water. The temperature of the waters from the average artesian well is from 40° to 50° F., but in the case of very deep wells the water often reaches a temperature of from 70° to 80° F. At Charleston, S. C., there is a well the water from which averages 87° F. The cost of sinking artesian wells varies with the depth and the character of the formation at a depth of 150 feet the cost commonly ranges from $1.50 to $3 per foot, but below this limit the cost increases in proportion to the depth. The apparatus used in boring does not differ from that employed in sinking artesian wells. The boreholes were probably made by the Chinese. In the upper basin of the Yang-tse-Kiang there are wells 1,500 to 3,000 feet in depth from which brine for salt manufacture is obtained. This industry has been carried on since a very early period and is an illustration of the comparatively advanced state of progress attained by this people long before the western nations had developed the mechanical arts beyond the crude stage. Deep wells have been found also in Egypt which are thought to have been the work of the ancient Egyptians. A well bored in the year 1126 at Lillers, department of Pas-de-Calais, France, is still flowing. For information regarding artesian areas in the United States consult bulletins and annual reports of the United States Geological Survey, and of the geological surveys of several States, particularly those of Iowa, Mississippi, Missouri and New Jersey.

ARTVELD, ār-tē-vĕl'dē, or ARTVELDE, the name of two men distinguished in the history of the Netherlands. (1) Jacob van, a brewer of Ghent, b. about 1290; d. 17 July 1345. He was selected by his fellow townsmen to lead them in their struggles against Count Louis of Flanders. In 1338 he was appointed captain of the forces of Ghent, and for several years exercised a sort of sovereign power. A proposal to make the Black Prince, son of Edward III of England, governor of Flanders, led to an insurrection, in which Artvelde lost his life. (2) Philip van, son of Jacob: b. 1340; d. 27 Nov. 1382. At the head of the forces of Ghent he gained a great victory over the Count of Flanders, Louis II, and for a time assumed the state of sovereign prince. His reign proved short. He lived. The Count of Flanders returned with a large French force, fully disciplined and skillfully commanded. Artvelde was rash enough to meet them in the open field at Roosebeke, between Courtrai and Ghent, in 1382, and fell with 25,000 Flemings. Condensed by James and Philip van Artvelde' (1883); Hutton, 'James van Artvelde' (1882).

ARTVELDE, Philip van, the title of a tragedy by Sir Henry Taylor, published in 1834. It is one of the best modern English tragedies by an author distinguished for his protest, in the spirit of Wordsworth, against the extreme sentimentalism of Byron. In this play with admirable power he brings back the stress and storm of 14th century life. The father of Philip, the great Jacob van Artevelde, an immensely rich brewery magnate, had played a great part as popular leader at Ghent, 1333-45; and it fell to his son to figure similarly in 1381, but to be slain in a great defeat of the forces of Ghent the next year. Taylor's tragedy recalls the events of these two years.

ARTFUL DODGER, The, the nickname of John Dawkins, a young pickpocket in Dickens' 'Oliver Twist.'
ARTHOIS, ar-"twä', Jacques d', Belgian landscape painter: b. Brussels, 1613; d. 1660. Though he studied his art under Jan Mertens, he later became strongly influenced by the Rubens school. His pictures are mostly of great size and the subjects Biblical, being painted largely for churches and monasteries. He often collaborated with Teniers, Van der Heyden and other neer-arts painters of his time, who painted the figures in his pictures. His color schemes were always rich and virile, but his drawing was sometimes bad. His canvases are found in nearly all the important galleries of Europe.

ARTHRITIS, an acute or chronic inflammation of the joints, usually due to bacterial infection. Such infections may follow a wound, a perforating injury, an operative incision, or the micro-organisms may come to the joint through the blood stream, as in rheumatism, gonorrhea, typhoid, or pyemia. In some cases of arthritis the causes seem to be resident in defective metabolism — gout is an illustration of this type of arthritis. In acute cases there are pain, swelling, heat and occasionally suppuration. In the chronic forms the complaint is more pain and stiffness. The treatment should include rest, counter-irritation, and, in the suppurative cases, prompt surgical attention. In the more chronic cases counter-irritation, dry, hot air, static electricity, and exercise are of service. Sometimes cupping or leeching may be indicated. See ARTHRITIS DEFORMANS; GOUT; JOINTS, DISEASES OF; RHEUMATISM.

ARTHITIS DEFORMANS (rheumatoid arthritis, or osteo-arthritis), a group of chronic progressive diseases of the joints chiefly affecting the articular cartilages, bones and synovial membranes. Such lesions, and producing loss of function and great deformity from ossification of some parts of the joint and atrophy of others. Their origins are various, some of which are known and some still under investigation. The causation appears to be due to a derangement of the blood circulation, showing less variation than the internal causes. Thus there are chronic arthropathies which produce the characteristic deformities and result from chronic gonorrhea of the joints; in others, toxemia, bacteria, dietetic or climatic factors to have their influence. Though sometimes spoken of as rheumatic gout, they are believed to have little in common with rheumatism or gout, but may coexist with either. This type of disorder is very rare in children, occurs occasionally in old age, is more common between 25 and 50, and in females than in males. In certain of its forms, it most often appears after the menopause, though it may occur earlier, as when following parturition. Heredity plays a part in certain arthropathies which come under this group. In the older descriptions one reads of two theories as to the immediate cause of the affection, one following very closely the group of different diseases were treated as one disease.

The first, the nervous or neuropathic theory, is based upon the symmetrical distribution of the joint-lesions, the trophic changes in the skin, nails, etc., the frequent pre-existing mental disturbances, shock, grief, worry and the like, the disproportionate muscular atrophy, and the similarity of the lesions to those arthropathies of locomotor ataxia and other affections of the spinal cord. The second, the infectious theory is derived from the facts that micro-organisms have been found in the fluids and tissues of the joints, that the disease sometimes begins with an acute onset as do many of the infectious diseases, and that enlargement of the spleen and lymph-glands is found in some cases. It is difficult to say which tissue is primarily at fault but sooner or later nearly all are involved. The synovial membrane inflames and papillary outgrowths and cartilaginous nodules form upon it. These last may undergo fatty degeneration or they may ossify. They may slip into the joint-cavity. If serious effusion occurs it is absorbed early in the disease. The cartilages lose their cells, become vascularized soft and are removed by friction and absorption. The ends of the bones (the interarticular cartilages being absorbed) by friction become smooth, rounded and shiny like polished ivory (eburnate). The eburnated surfaces, by attrition, become grooved and minute perforations of the Haversian canals result. Deposits of new bone form around the margins of the joints and may be often felt externally. The muscles atrophy, and are of a brownish color. Fibrous adhesions and bony ankylosis occur. Some of the small joints of the fingers for example may move a little, but the knees, etc., may be interlocked by reason of the rims of bony material deposited. Dislocation or subluxation may result. A combined hypothesis which deals with both sets of factors with interplay between is probably nearer the real facts. In certain cases the nervous instability is accompanied by endocrine — thyroid — deficiency. An acute form of a general or multiple progressive type is rare after 40. Smaller joints become simultaneously painful, tender and swollen but not red as in rheumatism; there is no migration from joint to joint, the affected joints are inflamed, while others are becoming diseased. Patients are anemic, mentally depressed and complain of headache and malaise. Fever seldom goes above 102° F. Temporary improvement occurs, but the disease advances. The chronic form of this type is insidious and more common. One joint (of finger or toe) is involved, the disease affects the corresponding joint and then the symmetric joints of the body, mild or very severe; there are delusive intervals while the disease marches on. After months, or it may be years, all or nearly all of the joints are thickened, rigid and distorted. The hands are bent toward the palms and the fingers strongly flexed and the thumbs of the hands. The thumbs, though drawn may be used. The knees are generally crossed.

The general health through it all may be fair as visceral lesions are uncommon.

In the monarticular, oligoarticular type, changes are usually confined to one or two
the larger joints, occurs mostly in men and after 50. The knee, shoulder, elbow or hip is generally affected, but the vertebrae may be. The entire spinal column becomes rigid. Motion of affected joints often produces a cracking or grating sound. The pathological appearances are similar to those of the general type of systemic disease, but joint injuries are more often an exciting cause. The joint becomes stiff, sore and painful and there is absorption of the ends of the bones, dislocation and deformity.

Hodgen's nodes or nodosities, described by him in 1805, are small exostoses (small hard knobs), seldom larger than peas, which form on either side of the distal joints of fingers. They may be present in either type of disease, at first are tender and swollen, but later on apparently cause little discomfort. Sometimes the bone-enlargement surrounds the joint.

Arthritis deformans in children, although not frequent, is more acute and is more influenced by poor food, cold and damp, etc. There is fever, sometimes a chill. The swelling, stiffness and tenderness seem to be more in the soft parts than in harder tissues. The fingers are flexed and overlapped, the feet are strongly extended and the joints are rigid.

The diagnosis of arthritis deformans must be made from subacute and chronic rheumatism, gonorrheal rheumatism, gout, progressive muscular atrophy, Charcot's disease, etc. Recovery is rare, but the disease is not directly dangerous to life.

Treatment will vary according to the type of cause. Chronic infective foci as from tonsils, teeth, old suppuration foci of the tubes, endometrium, intestines, prostate, etc., should all be cleared up, not by too radical a surgery, such as divest the human being from his teeth, his intestines or other of his essential properties, but stimulating, healthful, with tonic therapy, chiefly psycho-therapeutic with the accessory aids of travel, or by hydrotherapy, or specially indicated pharmacotherapy—iron or arsenic if anaemia be present, mercury for syphilis, etc. Local treatment is usually worthless but certain forms of baking, counter-irritation to the joints and certain types of deep muscle massage and certain vegetative nerve fibers are indicated. See Arthritis; Gout; Rheumatism. Consult Jelliffe and White, "Diseases of the Nervous System." (Chapters on the Vegetative Nervous System and Bony Syndromes).

ARTHROCAPE (Neo.-Lat. from Gr. ἄρθρον, joint + κάτε, evil), a disease of the joints in which the bone is disintegrated and carried away piecemeal. See Caries.

ARTHROIA. See Joint.

ARTHRODYNIA (Neo.-Lat. from Gr. ἄρθρον, joint + δύναμις, pain), pain in a joint; practically synonymous with arthralgia.

ARTHROGASTRA (Neo.-Lat. from Gr. ἄρθρον, joint + γαστήρ, abdomen), a division of the insect class Arachnida (q.v.), having the abdomen annulated, and including spiders and scorpions. See Scorpion.

ARTHROMERE (Gr. ἄρθρον, joint + μέρος, part), one of the series of segments of which arthropoda (q.v.) are composed.

ARTHROPATHY, a disorder of the joints either due to local inflammatory reactions as in the various acute or chronic rheumatic infections or resulting from disorder of the nervous control of the healthy metabolism of the joints as seen in tabetic arthropathy or the arthropathies of chronic lung diseases, kidney diseases, rheumatic fever, etc. The health of the joint is largely dependent upon the functioning of the vegetative nervous system which controls the growth or trophism of the joint. The cells regulating this change are located in the lateral horns of the spinal cord.

ARTHROPHONE (Gr. ἀρθρόν, joint + φωνή, voice), a partition between certain articulations as for example in the crayfish (q.v.).

ARTHROPLEURA (Neo.-Lat. Arthropyleura, from Gr. ἄρθρον, joint + πλεύρα, side), the lateral portions of the arthrodern, or crust of articulated animals. See Articulata.

ARTHROPODA, a phylum comprising those articulated animals which have jointed appendages such as antennae, jaws, maxillae (or accessory jaws), palpi and legs arranged in pairs, the two halves of the body thus being more markedly symmetrical than in the lower animals. It is by far the most numerous in species of any in the animal kingdom, the insects alone probably numbering upward of a million species; other representative or typical forms are the trilobites, king crabs, scorpions, spiders and myriopods. The skin is usually hardened by the deposition of salts (carbonate and phosphate of lime) and of a peculiar organic substance called chitine. The segments (somites or arthromeres) composing the body are usually limited in number, 20 (or 21) in the crustaceans and insects; while each arthromere is primarily divided into an upper (tergum), lower (sternum) and lateral portion (pleurum). These divisions, however, cannot be traced in the head of either the crustaceans or the insects. Moreover, the head is well developed or two pairs of feelers or antennae and from two to four pairs of biting mouth-parts or jaws and two compound eyes; besides the compound eyes there are simple eyes in the insects. The germ is three-layered and there is usually in the more specialized forms a well-marked metamorphosis. The Arthropoda are most nearly related to the worms, certain annelides, with their soft-jointed appendages (tentacles as well as lateral cirri) and more or less definite head, anticipating or foreshadowing the arthropods. On the other hand, certain low parasitic arthropods, as lingualia, have been mistaken for genuine parasitic worms.

Segmentation of the Body.—The segments (somites metameres) are merely thicknings of the skin connected by a thin intersegmental membrane, so that the segments can telescope into each other or extend, thus lending the greatest freedom of motion to the trunk as well as to the appendages; otherwise a rigid chitinous skin would not permit of any movement. As in the annelid worms, this segmentation of the integument is correlated with the serial repetition of the ganglia of the nervous system, of the ostia of the dorsal
vessel, the primitive disposition of the segmental and reproductive organs, of the soft, muscular dissepiments which correspond to the intersegmental membranes, the metameric arrangement of the muscles controlling the movements of the segments on each other; and this internal segmentation or metamersim is indicated very early in embryonic life by the mesoblastic somites.

While we look upon the dorsal tube of worms as a single but flexible lever, the body of the arthropods, as Grüber states, is a linear system of stiff levers. We have here a series of stiff, solid rings or hoops united by the intersegmental membrane into a whole. When the muscles extending from one ring to the next behind contract, and so on through the entire series, the rings approximate each other. The origin of the joints or segments in the limbs of arthropods was probably due to the mechanical strain to which what were at first soft fleshy outgrowths along the sides of the body became subjected. Indeed, certain annelid worms of the family Syllidae have segmented tentacles and parapodia, as in Dugesia; and these habits of these worms to understand how this metamersim may have arisen, but it is possibly due to the act of pushing or repeated efforts to support the body while creeping over the bottom among broken shells, over coarse gravel or among sea-weeds. It is obvious, however, that the jointed structure of the limbs of arthropods, if we are to attempt any explanation at all, was primarily due chiefly to lateral strains and impacts resulting from the primitive endeavors of the ancestral arthropods to raise and to support the body while thus raised and then to push or drag it forward by means of the soft, partially jointed 'lateral limbs which were armed with bristles, hooks or finally claws. By adaptation or as the result of parasitism and consequent lack of active motion the original number of segments may be disuse be diminished. Thus in adult wasps and bees the last three or four abdominal segments may be nearly lost, though this is not the general habit of the body is made over and the number, shape and structure of the segments are greatly modified.

History and Present Classification.—The group or sub-kingdom (Phylum) of Arthropoda was founded in 1848 by Siebold. It has been supposed until recently to be a natural group. In 1893 Kingsley and also Kennel first suggested doubts as to the homogeneity of the group and in the same year Packard published the view that there were four independent lines of development in the Arthropoda, and in 1894 Kingsley divided the group into three subclasses, Laurie and Pocock also considering that the group is polyphyletic. In 1908 Packard stated: “It is becoming evident, however, that there was not a common ancestor of the Arthropoda as a whole, and that the group is a polyphyletic one. Hence, through a convenient group, it is a somewhat artificial one, and may eventually be dismembered into at least three or four phyla branches.”

The five phyla as afterward proposed by Packard are, beginning with the most primitive: (1) Palaeostraca, embracing the classes of Trilobita; (2) Merostomata (Limulus), and Arachnida; (3) Pancarida (Crustacea); (4) Prosogonoeia, including three classes: Pauropoda, Diplopoda and Lymphedia (Scalopendrella); and (5) Entomoptera, comprising the Chilopoda and Insecta; the great majority of the group being winged insects. Each of these phyla represent independent lines of development, judging by their structure and what we know of their development, and have no genetic connection beyond the theory that they have descended from one or more annelid worms.

ARTHROSTRA, crustacea of the sub-class Malacostraca in which the first, sometimes the second thoracic segment is fused with the head and bears maxillipeds; the remaining seven being free and bearing legs. The eyes are usually sessile. The group is divided into the Amphiopoda (q.v.) and Isopoda (q.v.) Common examples are pill-bug, wood-louse, etc.

ARTHUR, king of the Silures in the 6th century, an ancient British hero, whose story has been the theme of much romantic fiction. He is said to have been the son of Uther, chief commander of the Britons, and to have been born about 516. He was reared by his father in the office of general, and performed those heroic deeds against the Saxons, Scots and Picts which have made him so celebrated. He married the celebrated Guinevere belonging to the family of the dukes of Cornwall; established the famous order of the Round Table; and reigned, surrounded by a splendid court, 12 years in peace. After this he is reported to have conquered Denmark, Norway and France, slain the giants of Spain and journeyed to Rome. From thence he is said to have hastened home on account of the faithlessness of his wife, and Modred, his nephew, who carried on an adulterous intercourse, and stirred up his subjects to rebellion; to have subdued the rebels, but to have died in consequence of his wounds, in 542, on the island of Avalon, where it is pretended that his grave was found in the reign of Henry II. The story of Arthur is supposed to have some foundation in fact, and it is generally believed that he was one of the last great Celtic chieftains who left Ireland for the west to resist the settlement of the Saxons in southern Britain. But many authorities regard him as a leader of the Cymry of Cumbria and Strath-Clyde against the Anglo-Saxon invaders of the east coast and the Picts and Scots north of the Forth and the Clyde. In our own day the interest of the old legends has been revived by the works of Lytton and especially Tennyson. For bibliography, see Arthurian Legends.

ARTHUR, Prince. See Connaught, Duke of.

ARTHUR, duke of Brittany, the grandson of King Henry II of England: b. 1187; d. 1203. On the death in 1199 of his cousin, King Louis VII, who had declared the boy his heir, Arthur was proclaimed King of England by the nobles of Anjou, Touraine and Maine, while the English lords decided in John’s favor. King Philip of France supported the claim of Arthur, but a peace being presently concluded between John and Philip, Arthur came later into the hands of his uncle, King John, and soon mysteriously disappeared. According to general belief Arthur was murdered by command of his uncle.
The story of Arthur forms a portion of Shakespeare's 'King John.' See John.

ARTHUR, Chester Alan, the 21st President of the United States: b. Fairfield, Vt., 5 Oct. 1830; d. New York, 18 Nov. 1886. He was graduated from Union College at 18, was principal of an academy at North Pownal, Vt., and in 1853 began the practice of law in New York, where he argued several important legal cases in behalf of the colored people. Through these and other cases he became noted in his profession, and he was also prominent as a Republican politician. In April 1861 Gov. E. D. Morgan made him acting quartermaster-general, and later he was made full quartermaster-general. For the next decade he was a successful and widely known practising lawyer and a leading Republican politician of New York, chairman of the Grant Club in 1868, and of the executive committee of the Republican State committee in 1869. He was appointed by President Grant, 20 Nov. 1871 to the highest office in the State patronage, the chairmanship of the School of New York, which he held till 11 June 1874. The efficiency of the office was not impeached, and he was retained by President Hayes for over a year after his accession; but he was first of all a political manager, in open hostility to civil service reformation. As a matter of actual practice and not theory, however, Mr. Arthur produced figures to show that the annual percentage of removals under him for all causes had been only 2½ per cent, as against an annual average of 26 per cent since 1857. In 1888 he was nominated for the vice-presidency, chiefly to conciliate the Grant section of the Republicans, sore at the defeat of the third-term project, and was elected with Garfield. In place of the customary dignified nullity of his office, he remained an active party leader in the patronage contest of his State between the "Stalwarts" or Grant section led by Roscoe Conkling (q.v.), and of which Mr. Arthur was chief lieutenant, and the "Half-Breeds" or more independent wing which Garfield was trying to build up. Conkling soon resigned his seat in the Senate, declaring that Garfield had broken his promises to him, and the Garfield party for the time was triumphant; but the assassination of Garfield, shortly after, reversed the situation. The open laments of the prospect of the accession of so convinced a spoilsman as himself deeply hurt Mr. Arthur, who felt that he was misjudged, and determined on the most admirable revenge, that of disappointing their prophecies of evil. He did so, not only was his term of office measurably free from the dominance of patronage, but he extended the civil service rules and kept faith with them. In other respects his administration was so excellent that the leading Independents had announced their intention of supporting him for President if nominated in 1884. Its most notable incident was the appointment of a commission to revise the tariff, which, though composed of strong Protectionists, reported that the tariff should be reduced 20 per cent all around, a recommendation strongly opposed by Congress. Several commercial treaties were passed, however. He vetoed a Chinese immigration bill as inconsistent with treaty obligations; favored the stringent laws passed against polygamy, appointed a Utah commission to supervise their enforcement; managed Indian affairs wisely, promoting Indian education and the breaking up of the tribal system; extended postal facilities; took measures to increase the navy, improve its discipline and efficiency and train it for defense; supported the improvement of Mississippi River navigation, etc. The attempts at remonetizing silver, and at forcibly abrogating the Clayton-Bulwer treaty to build a Nicaragua Canal, were in accordance with general party feeling at the time. The loss of the Star from Havana, however, injured the party somewhat, and its policy and methods were gravely disapproved of by the Independents; but this was much more than counterbalanced by distrust of the Democratic party for its alliance with the Greenback element. Mr. Arthur's defeat for the nomination was not caused by any demerits of his own, still less by desire to conciliate the Independents, but by the personal ambitions of Republican leaders, which, justly or unjustly, had aroused and exasperated the Republicans of the State of New York, causing the defeat of C. J. Folger for Governor, and resulting in the nomination of Blaine in 1884. Arthur, although a close adherent of Conkling, supported Blaine and Conwell Smalley, G. W., 'Life of C. A. Arthur' (New York 1880).

ARTHUR, Sir George, British colonial administrator: b. 1784; d. 1854. He was lieutenant-governor of the Honduras 1814-22; of Van Diemen's Land, 1824-37, and the last lieutenant-governor of Upper Canada 1837-41. It fell to his duty to suppress the Upper Canada rebellion of 1837-38, and for his services he was rewarded with a baronetcy. He was governor of Bombay 1842-46, and only the state of his health prevented him from succeeding to the position of Viceroy of India.

ARTHUR, Joseph Charles, American botanist: b. Lowville, N. Y., 11 Jan. 1850. He was graduated from Iowa State College in 1872, and subsequently studied at the universities of Johns Hopkins, Harvard and Bonn, Germany. He was instructor in the universities of Minnesota and Wisconsin; botanist at the Experiment Station, Geneva, N. Y., and for 28 years professor of vegetable physiology and pathology at Purdue University, Lafayette, Ind. Since September 1915, he has been professor emeritus of botany at the last-named institution. He is the author of more than 200 articles in periodicals of a scientific nature, and some 80 of these refer to plant rusts of Uredinales. He has written (with Barnes and Coulter) 'Handbook of Plant Dissection' (1886); (with MacDougall) 'Living Plants and Their Properties' (1898).

ARTHUR, Julia, the stage name of Ida Lewis, an American actress: b. Hamilton, Ont., 3 May 1869. She made her professional début at the age of 14 as the Prince of Wales in 'Richard III,' and then, after three seasons, went to England to study music and drama. Her first New York success was in 'The Black Masque' at the Union Square Theatre. She made her London début February 1895 in Henry Irving's company at the Lyceum, playing roles next to Miss Terry. Next year she accompanied Irving and Terry to America. In 1897
she brought out in New York 'A Lady of Quality' on an elaborate scale; the following session she starred as Crusoe in 'As You Like It' at Wallack's Theatre. In 1899 she produced, at the Broadway Theatre, 'More than Queen,' from the French of Emile Bergerat, taking the part of Josephine Bonaparte, which was her greatest success. She is the wife of B. P. Cheney, Consult Clapp, J. B., and Edgett, E. F., 'Players of the Present' (1899), and Strang, L. C., 'Famous Actresses of the Day in America' (1899).

ARTHUR, Timothy Shay, American author: b. Newburgh, N. Y., 1809; d. Philadelphia, 6 March 1885. In 1852 he founded Arthur's Home Magazine. He was a voluminous writer of moral and domestic tales. His works are over 100 in number, and have had a large sale in England as well as in the United States. His most popular work was the famous 'Ten Nights in a Bar-Room.' Among his other publications were 'Tales for Rich and Poor,' 'Tales of Married Life' and 'Lights and Shadows.'

ARTHUR, William, Irish author and clergyman: b. 1819; d. 1901. During his early career for three years a missionary to the India, after which he became secretary of the Wesleyan Church Missionary Society, then, in 1868, principal of the Wesleyan College in Belfast. Among his works are 'Personal Reminiscences of Thomson' (London 1847); 'The Tongue of Fire, or True Power of Christianity' (1856; 40th ed., 1885); 'The People's Day' (1855; 11th ed., 1856); 'Italy in Transition' (1860); 'The Pope, the Kings and the People' (1863).

ARTHURIAN ROMANCES, The. The figure of Arthur rests, in all probability, upon a historical basis, which has been completely transformed by the accretions of mythology, legend and romance. In the 'Historia Britonum' of Nennius, a compilation of very uncertain date, mention is made of a certain Arthur who was 'dux bellorum' of the Britons against the Saxons invaders. His most brilliant achievement is stated to have been the British victory at Mount Badon (early in the 6th century). This victory is substantiated by the Latin work of Gildas, an ecclesiastic of the 6th century, although Gildas does not mention Arthur by name. The memory of a conquering leader of this sort may well have been cherished by the English Celts in their later adversities, and his deeds magnified into the exaggerated exploits of a popular hero. The more primitive conception of Arthur is revealed in certain portions of the Welsh 'Mabinogion.' In the tale of 'Kilihch and Olwen,' for example, he appears as the leader of a far ruder company than that generally associated with his name. In the course of many features belonging to Celtic mythology became attached to him and his followers, which are occasionally plainly visible in the later romantic narratives. Sir Thomas Malory describes the strength of Gawain as waxing and waning each day, a peculiarity originally belonging to a supernatural being. Episodes in the story of Arthur's life may in probability be traced to a similar one with a surprising care for form and treachery of his nephew may perhaps be the rationalized form of an old myth. It has even been argued that Arthur was originally a Welch deity or culture-hero, but this theory has not met with general acceptance.

The conception of Arthur as the heroic king of medieval romance is due largely to Geoffrey of Monmouth. In his fictitious 'Historia Regum Britanniae,' about 1136, or later he elaborated the slight legends offered by Nennius and presented a complete and well-rounded portrait. A romantic parentage and a wonderful boyhood are given to Arthur, in which supernatural occurrences are not absent. A warrior of surpassing valor, he not only puts to rout the invading Saxons, but subdues Europe to his sway. In the midst of his last foreign campaign he learns of the infidelity of his wife Guanhumara and the treason of his nephew Modred, to whom he has entrusted the government of Britain. Hurriedly returning, he defeats Modred in a bloody combat, but himself receives a mortal wound, and is borne to Avalon to be healed. Too much importance can hardly be attached to this narrative, which forms the beginning of the great body of Arthurian literature which clustered about the name of Arthur, although the later romancers worked along very different lines from those laid down by Geoffrey. Much of the material in the 'Historia' is no doubt due to the author's vivid imagination, but it is certain that he made use of the Arthurian legends in circulation in his native country near the Welsh border. In the 12th century there must have been many of these current among the Welsh people. On the Continent as well, the name and fame of Arthur appear to have been well known in early days. The Celts who crossed the Channel, mainly in the 5th and 6th centuries, and settled in Armorica, carried these legends with them, developed them in their own way, and transmitted them to their French neighbors. The question whence the early trouvères got the matière de Bretagne has been much discussed. It has been contended by some scholars that this was chiefly, if not wholly, derived from the Continent. Others have maintained that the transmission of the Arthurian stories by the Welsh to the Anglo-Normans was the most important factor in their later literary development. Sufficient evidence exists to prove the early circulation of this material both in Wales and Brittany, and the most reasonable view would seem to be that each locality contributed its share, but that a just apportionment of the indebtedness of the later romances is hardly possible.

The most illustrious shaper of Arthurian legend after Geoffrey was a Frenchman, Chrétien de Troyes. A native of Champagne, he wrote in the second half of the 12th century a series of long poems in octosyllabic couplets dealing with prominent knights of Arthur's court, Erec, Lancelot, Yvain and Perceval. A fifth piece, 'Cliges,' is connected with Arthur in a different way, while a romance dealing with Tristan has not yet been traced with certainty. Chrétien introduced into his stories the elaborate love-conventions of the day, which often
produces a certain artificiality. He stood pre-eminent among his contemporaries, and exerted a great influence, not only in France, but in neighboring countries as well, particularly in Germany. The 'Erec' and 'Yvain' were translated by Hartmann von Aue, and the 'Parzival' of Wolfram von Eschenbach gives a good deal to the 'Conte del Graal,' although the extent of this indebtedness is disputed.

Chrétien's sources are no longer extant, but it seems likely that these consisted largely of short narratives in verse. Some idea of the character of these may be gained from the Breton 'lais' of the poetess Marie de France, although Marie's poems are no doubt far more artistic than the reworkings of popular story of which Chrétien made use. Many lays upon Arthurian subjects must have been in existence at this time. The work of Marie herself, although indirectly most significant in considering the literary evolution of the Arthurian legends, is but slightly connected with Arthur, only one of his legends having a setting at his court.

Meanwhile the popularity of Geoffrey of Monmouth's imaginary history was calling forth various paraphrases in England. The demand for a version in French was met by the rhymed prose parable of Geoffrey of Guima'rt, produced shortly before the middle of the 12th century. Only a part of this is extant, but a compensation for its loss appears in the poem by the Norman Wace, which seems to have been considered a more distinguished work than Gaimar's. Wace treated Geoffrey's material with considerable freedom, making additions and omissions as he thought fit. His work falls early in the third quarter of the 12th century.

The chronicle of the British monarchs was put into English about the year 1205 by Layamon, a monk of Unley on the Severn, and called, after the reputed founder of the royal line, the Brut. Of this, about one-third deals with Arthur. It was based largely on the poem of Wace, but the English monk gave a very different coloring to his work than did the elegant Norman. Arthur becomes a more truly English hero, and his deeds are told in the alliterative verse of the Germanic stock, although rhyme and even assonance occasionally appear. The English freedom of the work is apparent in the vocabulary, which contains very few words of Romance origin. Like Geoffrey of Monmouth, Layamon drew from traditions near the Welsh border, adding to the Arthurian story material of great interest. Particularly noteworthy is the account of the Round Table, an institution borrowed from Celtic sources to settle questions of precedence in sitting at meat.

In the further development of the Arthurian romances the tendency to extol the individual knights rather than the great king becomes more marked. Arthur is, indeed, the most majestic figure of all, but he remains in the background, while great exploits are performed by his followers. Gradually a number of cycles arise, centring about prominent figures, Gawan, Lancelot, Perceval, Yvain, Merlin. Tales originally unconnected with Arthur's court are partly localized there, and their heroes made members of the Round Table as, for example, the Quest of the Holy Grail, which consists of the fusion of a Celtic narrative of adventure and an ecclesiastical legend, or the story of Tristram and Ysolt. A vast body of verse-romances thus came into existence, together with long compilations in prose. Chaucer did his part in telling of the bold of days of the king Arthur in the Wife of Bath's tale. In the 15th century the degeneration of the minstrel romance was rapid. With the decay of the chivalric stories which glorified the decay of the romantic stories which glorified it. Prose redactions, often of inferior artistic merit, became more and more common. Meanwhile some Arthurian material reappeared in altered form in the popular ballads. A notable exception to the general level of romance-writing in this period is the 'Morte Darthur' of Sir Thomas Malory, a book which unites episodes drawn from various sources into one harmonious whole, and presents, not merely an account of Arthur's death, but of his whole life, with detailed descriptions of the adventures of the knights of his court. For charm of narrative, and cadence and melody of language, it has no rival among English romances. Written about 1470 and published 13 years later by Caxton, it may be regarded as the classic presentation of the Arthurian story for English readers.

There is little consistency in the legends grouped about the figure of Arthur. Not only were episodes altered at will, but the conceptions of the characters of prominent persons vary in different versions. As the taste of the times changed, one hero displaced another, and one set of romances drove the others out of vogue. In the Grail romances, for example, the earlier heroes Gawan and Perceval were supplanted in times of greater insistence upon purity by the stainless, but less virile Galahad. Lancelot and Merlin were particularly popular in later days. Still further changes have been introduced in modern times. The 'Faerie Queene' of Spenser, which presents Arthur as the ideal type of manhood, bears little resemblance to earlier portraits of the hero. It is well known that Milton projected an epic on the story of Arthur before turning to the composition of 'Paradise Lost.' The most important effort of modern times to reproduce Arthurian legend is perhaps Tennyson's 'Idylls of the King.' These are based mainly on Malory, but the poet allowed himself much freedom in composition and characterization. Swinburne, Matthew Arnold, William Morris and others have rendered several of the old stories into verse. In foreign countries the Arthurian material has enjoyed considerable popularity. Especially noteworthy are Wagner's music-dramas, 'Parsifal' and 'Tristan und Isolde.' See MABINOGION; AVALON; TRISTAN.

ARTUR'S SEAT, a hill overlooking Edinburgh, Scotland, said to have been so called from a tradition that King Arthur surveyed the country from its summit and defeated the Saxons in its neighborhood. It is a steep, and in some places precipitous, rock, exhibited on the south side a range of perpendicular basaltic columns, called Samson's Ribs. The highest point is 822 feet above sea-level. From hence may be seen a wide expanse of sea, the course of the Forth, the distant Grampians, etc., and a large portion of the most populous and best cultivated part of Scotland, including the picturesque city of Edinburgh and its castle. On the north side are the ruins of a chapel and hermitage dedicated to Saint Anthony and a fine spring called Saint Anton's Well. A carriage road called the Queen's Drive goes round its base.

ARTICHOKE, two plants of the family Asteraceae. The true, sometimes called French, artichoke (Cynara scolymus), a native of the Mediterranean region, is a coarse, stout, perennial, thistle-like herb, three to five feet tall, with rather spiny leaves, the lower of which are often three feet or more long, and large terminal heads of blue or white flowers. It is cultivated for the edible thickened outer scales and 'bottoms' of the flower heads which sometimes exceed four inches in diameter without becoming too old for eating raw as salad, pickled or cooked like cauliflower. Sometimes the young stems and leaves are blanched and cooked as a pot-herb. In Europe many varieties are popular; in America the globe variety is planted almost to the exclusion of others, with the result that this variety has almost become united to the name in popular usage. The cultivation of this species in America is confined mostly to the southern States (California). Since the plant is rather tender, winter protection must be given where the ground freezes. If planted in rich soil and set four feet apart the plants will yield two or three crops before a new plantation should be made; if allowed to stand longer the yield gradually diminishes. New plantations are made either with seedling or sucker plants. Most of the artichokes offered in the Northern markets of the United States come from California.

The Jerusalem artichoke (Helianthus tuberosus), a native of eastern North America, is a perennial sunflower-like herb, five to 12 feet tall, with rough leaves four to eight inches long and many yellow terminal flower-heads often two to three inches in diameter. The edible pear-shaped purplish, red, white or yellow tubers for which the plant is often cultivated are numerous, seldom more than three inches in diameter, rather watery but of pleasant flavor, especially when prepared like cauliflower, with a white sauce. Perhaps no vegetable is of easier cultivation. For home use the tubers are generally planted in well-drained soil in some out of the way corner of the garden and allowed to take care of themselves from year to year, the few tubers and pieces of root left after digging sufficing to restock the bed. In field culture the methods are like those practised with the potato except that the tubers may be left in the ground over winter and dug when needed. They are not injured by frost if in the soil, but if frozen after being dug they spoil quickly. If desired they may be dug and stored in pits like turnips, but with a rather lighter covering of straw and earth. The usual yield is from 200 to 500 bushels to the acre. When land becomes infested, as it sometimes does, with the plant, pigs, for which the tubers make valuable food, may be turned loose upon the field. The tubers resemble potatoes in composition and like them are used in Europe for the manufacture of alcohol. The young plants are sometimes used as cattle food and the dry stalks for fuel. Consult 'Bur or Globe Artichoke' (in United States Department of Agriculture Year Book 1890, Circular 31 (1899); Bailey, 'Standard Cyclopedia of Horticulture' (1914); Vilimorin, 'The Vegetable Garden' (translation by Robinson, 1885).

ARTICLE, in grammar, a part of speech used before nouns to limit or define their application. In the English language a or the is the indefinite article (the latter form being used before a vowel sound) and the the definite article. The English indefinite article is really a modified form of the numeral adjective one; so the German ein and the French un stand for the numeral and the article. There are traces in various languages showing that the definite article was originally a pronoun of the form English the is closely akin to both this and that. The Latin language has neither the definite nor the indefinite article; the Greek has the definite; the Hebrew and Arabic definite article was prefixed to its noun, while, on the other hand, in the Syriac and Chaldaic it was affixed to the noun, as it is in the Icelandic. In the Scandinavian language the definite article is appended to the end of the word as hus-et, the house. There is no article in Russian.

Articles, divisions of a printed or written document or agreement. A specification of distinct matters agreed upon or established by authority or requiring judicial action. In chancery practice articles are a formal written statement of objections to the witnesses in a cause in chancery, filed by a party to the proceedings, after the depositions have been taken and published. The object of articles is to enable the party filing them to introduce evidence to discredit the witnesses to whom the objections apply, where it is too late to do so in any other manner (2 Daniel Chan. Pr. 1158), and to notify the party whose witnesses are objected to of the nature of the objections, that he may be prepared to meet them. Upon filing the articles a special order is obtained to
take evidence. The interrogatories must be so shaped as not to call for evidence which applies directly to facts in issue in the case. 3 Johns. Ch. 358. The object of such examination is only to the credit and not to the competency of the witnesses. 3 Johns. Ch. N. Y. 558; 3 Atk. Ch. 643, and the court are to hear all the evidence read and judge of its value. 2 Ves. Ch. 239.

Articles of Association.—In law, written regulations agreed upon by the parties to a joint enterprise.

Articles of Agreement.—A written memorandum of the terms of an agreement. They may relate either to real or personal estate, or both, and if in proper form will create an equitable estate or trust such that a specific performance may be had in equity. The articles of agreement should contain a clear and explicit statement of the names of the parties, with their additions for purposes of distinction, as well as a designation as parties of the first, second, etc., part; the subject-matter of the contract, including the time, place, and more important details of the manner of its performance, and the covenants to be performed by each party; the date, which should be truly stated. It should be signed by the parties or their agents. When signed by an agent the proper form is A. B., by his agent (or attorney), C. D.

Articles of Confederation.—The title of the compact which was made by the 13 original States of the United States of America. It was adopted and carried into force 1 March 1781 and remained as the supreme law until the first Wednesday of March 1789.

Articles of Faith.—Summarized statements of religious views relating to the central doctrines of a theological system. Protestant divines divide these into fundamental and nonfundamental articles. Familiar examples of articles of faith are the Nicene, Apostles' and Athanasian creeds, the Thirty-Nine Articles, the Westminster, Augsburg and Helvetic Confessions. See CREED AND CONFESSIONS.

Articles of Impeachment.—A written articulately allegation of the causes for impeachment. Blackstone calls them a kind of bill of indictment, and they perform the same office which an indictment does in a common criminal case. They do not usually pursue the strict form and accuracy of an indictment, but are sometimes quite general in the form of their allegations. They should, however, contain so much certainty as to enable a party to put himself on the proper defense, and in case of an acquittal to avail himself of it as a bar to another impeachment. Additional articles may perhaps be exhibited at any stage of the proceedings. The answer to articles of impeachment is exempted from observing great strictness of form, and it may contain arguments as well as facts. A full and particular answer to each article of the accusation should be given.

Articles of Partnership.—A written agreement by which the parties enter into a partnership upon the conditions therein mentioned. The instrument should contain the names of the contracting parties severally set out; the agreement that the parties do by the instrument enter into a partnership, expressed in such terms as to distinguish from a covenant to enter into a partnership at a subsequent time; the date and necessary stipulations, some of the more common of which follow. The commencement of the partnership should be expressly provided for. The date of the articles is the time, when the determination of the partnership should be expressly stated. It may be for life, for a limited period of time, or for a limited number of adventures. When a term is fixed it is presumed to endure until that period has elapsed, and when no term is fixed, for the life of the parties, unless sooner dissolved by the acts of one of them, by mutual consent, or operation of law. The duration will not be presumed to be beyond the life of all the partners, but provision may be made in the articles for the succession of the executors or administrators or child or children of a deceased partner to his place and rights. Where provision is made for a succession by appointment and the partner dies without appointing, his executor or administrators may continue the partnership or not at their option. A continuance of the partnership beyond the period fixed for its termination, in the absence of circumstances showing intention of the parties to be performed by each party; the date, which should be truly stated. It should be signed by the parties or their agents. When signed by an agent the proper form is A. B., by his agent (or attorney), C. D.

The name of the firm should be ascertained. The members of the partnership are required to use the name thus agreed upon, and a departure from it will make them individually liable to third persons or to their partners in individual cases. The management of the business, or of some particular branch of it, is frequently entrusted by stipulation to one partner, and such partner will be protected in his rights by equity, or it may be to a majority of the partners, and should be where they are numerous. The manner of furnishing capital and stock should be provided for. When a partner agrees to furnish his proportion of the stock at stated periods, or pay by installments, he will, where there are no stipulations to the contrary, be considered a debtor to the firm. Sometimes a provision is inserted that real estate and fixtures belonging to the firm shall be considered as between the partners, not as part of the partnership, but as individual property. In cases of bankruptcy, this property will be treated as the separate property of the partners. The apportionment of profits and losses should be provided for. The law distributes these equally, in the absence of controlling circumstances, without regard to the capital furnished by each. Periodical accounts of the property of the partners may be stipulated for. These, when settled, are at least prima facie evidence of the facts they contain. The expulsion of a partner for gross misconduct, bankruptcy, or other specified causes may be provided for, and the provision will govern when the case occurs. A settlement of the affairs of the partnership should always be provided for. It is generally accomplished in one of the following ways: First, by turning all of the assets into cash, and after paying all the liabilities of the partnership, dividing such money in proportion to the several interests of the parties; or, sec-
ARTICLES OF WAR

Until the civil war in England in the reign of Charles I, it is probable that no regular permanent code of rules or articles for enforcing military discipline was in existence; the ruling authority had promulgated its orders for the government and regulation of the army as occasion required. Each war, each expedition, had its own edict, which fell into disuse again upon the disbanding of the army, which inevitably followed the cessation of hostilities. The experience of ages and the precedents of former wars, therefore, enabled the authorities to frame a sufficiently comprehensive code in case of need; accordingly, soon after the outbreak of the civil war, the necessities of the case compelled the enactment of ordinances or articles of war. The first complete *Laws and Ordinances of War* were issued by Essex, the commander-in-chief of the Parliamentary Army in 1642. These articles are remarkable and interesting, as undoubtedly forming the groundwork of those now in use. Two years after the publication of Essex's ordinances, on the marching of the Scottish army into England, soon after the ratification of the solemn league and covenant, *articles of war* were issued for its government. These articles, although very dissimilar to those of Essex, considering that both were in force in the same kingdom at the same time, and were applicable to armies fighting on the same side, nevertheless treat mainly of the same offenses. The form of judicature established consisted of two courts of justice, called “councils of war,” the one superior and the other inferior. The superior court, also called the “court of war,” took cognizance of the more serious offenses, and likewise heard appeals from the decisions of the lower court, called the “martial court.” No trace of the constitution of these courts is now to be found except that “the judges were sworn to do justice.” Within a few months of the promulgation of the latter (August 1644), the same Parliament that was the author of the petition of right passed an ordinance establishing a system of martial law, applicable not only to soldiers, but to all persons alike. By this ordinance the Earl of Essex, captain-general of the parliamentary forces, together with 56 others named therein (among them were peers, members of the House of Commons, gentry and gentlemen of the army) were constituted “commissioners,” and any 12 of them authorized to hear and determine all such causes as “belonged to military cognizance,” according to the articles mentioned in the ordinance, and to proceed to the trial, condemnation and execution of such as should offend. The said articles and commissions, or the major part of them then present, should judge to appertain to justice, according to the measure of the offense. Under cover of this ordinance, which, after one refusal by the peers, was renewed by Parliament proceeded to issue a variety of orders for the conduct of the war and the regulation of the army; and many persons were tried by court-martial and executed. After the expiration of this last ordinance, the absolute executive power in all matters of military law, fell into the hands of Cromwell, who claimed it as his right, in virtue of his office of general-in-chief. "The general," says Whitlocke, "sent his order to several garrisons to hold courts-martial for the punishment of soldiers offending against the articles of war; provided that if any be sentenced to lose life or limb, then they transmit to the judge-advocate the examinations and proceedings of the court-martial, that the general's pleasure may be known thereon." On the only allusions to it necessary, for the sake of discipline, to make an immediate example, Cromwell seized several officers with his own hand, called a court-martial on the field, condemned them to death, and shot one forthwith at the head of the regiment. It will thus be seen that the administration of martial law was almost invariably in the hands of the most considerable power in the state—it alternated between King and Parliament, and between Parliament and Dictator, as each became uppermost in the realm. On the restoration of Charles II, the army, with the exception of about 5,000 men, consisting of General Monk's regiment, called "the Coldstream," the first regiment of foot, the royal regiment of Horse-Guards, called "the Oxford Blues," and a few other regiments, was disbanded. The force kept on foot was the first permanent military force, or "Standing Army," known in England; and from it the present army dates its origin. A statute passed in the reign of Charles II, entitled "An Act for ordering the forces in the several counties of this kingdom," recites that "within all his Majesty's realms and dominions, the sole and supreme power, government, command, and disposition of the forces by sea and land, and of all forts and places of strength is, and by the laws of England ever was, the undoubted right of his Majesty, and his royal predecessors, kings and queens of England." With the exception of some slight encroachment on the part of the Crown, and protests on the part of the Parliament, matters remained in very much the same state till the Revolution, at which period military law assumed a permanent and definite form as it now exists. The only allusions to the military power of the Crown, in the Bill of Rights, are "that the raising and keeping of a standing army in time of peace without consent of Parliament, is contrary to law"; and that "subjects, if Protestants, may have arms for their defense, "suitable to their condition, and as allowed by law." In the first year, however, of the reign of William and Mary, British regiments, jealous of the supposed preference shown by William for his Dutch troops, mutinied at Ipswich. The King suppressed the mutiny with a strong hand, at the same time communicative to the event to Parliament. Parliament, anxious to devise means for the con-
venient application of a code of laws for the regulation and management of the army, and at the same time determined to place a check upon the exercise of the military power of the King, passed, on 3 April 1689, for a period of six months only, the first Mutiny Act, the preamble of which is as follows: "Whereas, the raising or keeping a standing army within this kingdom, in time of peace, unless it be with the consent of Parliament, is against law; and whereas it is judged necessary by their majesties and this present Parliament that, during this time of war, severall of the forces now on foot be continued and others raised, for the safety of the kingdom, for the common defence of the Protestant religion, and for the reducing of Ireland, and whereas no man can be prejudged of life or limb, or subjected to any kind of punishment by martial law, or in any other manner than by the judgment of his peers, and according to the known and established laws of this realm, yet, notwithstanding, it being requisite for retaining such forces as are or shall be raised during this existence of affairs in their duty, that an exact discipline be observed; and that soldiers who shall mutiny or stir up sedition, or who shall desert their majesties' service, be brought to more exemplary and speedy punishment than the usual forms of law will allow. The act provides for the assembling and constitution of courts-martial, for the oath of members, for the punishment of desertion, mutiny, sedition, false musters, etc.; for the regulation of billets; and is ordered to be read at the head of every regiment, troops, or company, at every muster, 'that no soldier may pretend ignorance.' No power is, however, reserved to the sovereign to make articles of war. This act was renewed soon after its expiration; and with the exception of about three years only, viz., from 10 April 1698, to 20 Feb. 1701, has been annually re-enacted (with many alterations and amendments).

Under the Constitution of the United States, Congress only can make rules of government and regulation for the land forces, and those rules, commonly called articles of war, were originally borrowed jointly from the English Mutiny Act originally passed by Parliament, and their articles of war established by the King. The existing articles for the government of the army of the United States, enacted 10 April 1806, are substantially the same as those originally borrowed 30 July 1775, and enlarged by the old man from the same sources 20 Sept. 1776. The act consists of but three sections. The first declares: "The following shall be the rules and articles by which the armies of the United States shall be governed;" and gives 101 articles. Each article is confined, in express terms, to the persons composing the army. The second section contains the only exception in the cases as follows: "In time of war, all persons not citizens of, or owing allegiance to the United States of America who shall be found in arms, in or about the fortifications or encampments of the armies of the United States, or any of them, shall suffer death, according to the law and usage of nations, by sentence of a general court-martial." The third section merely repeals the previous act for governing the army. The articles of war, therefore, are, and under the Constitution of the United States can be, nothing more than a code for the government and regulation of the army. Or, in other words, within the United States these articles are a system of rules superadded to the common law for regulating the citizen in his character of a soldier, and applicable to other citizens. Beyond the United States, another code is essential; for although armies take with them the rules and articles of war, and the custom of war in like cases, in a foreign country, the soldier must be tried by some tribunal for offenses which at home would be punishable by the ordinary courts of law. It is impossible to subject him to any foreign dominion, and hence in the absence of rules made by Congress for the government of the army under such circumstances, the will of the commander of the troops, ex necessitate rer, takes the place of law, and the declaration of his will is called martial law. The most casual reader of the articles of war will be struck by the fact that whereas the Mutiny Act of Great Britain is annually subjected to the supervision and altered or modified according to circumstances, yet the rules and articles of war passed in 1806 have remained upon our statute-book from that day to the present without any general revision. Another fact equally important is that while the King of Great Britain not only commands but governs the British army, and therefore modifies the government of the army at his pleasure, the President of the United States is simply the commander of our army, under such rules for raising, supporting and regulating it as Congress may appoint.

The articles of war, as revised in 1916, modernize the proceedings of courts-martial. There are no radical changes, and the most important are those which harmonize the proceedings of the military courts with those of modern civil courts. The reviewing authority of the proceeding of the court-martial includes: (a) The power to approve or disapprove a finding and to approve only so much of a finding of guilty of a particular offense as involves a finding of guilty of a lesser included offense when in the opinion of the authority having power to approve the evidence of record requires a finding of only the lesser degree of guilt; and (b) the power to approve or disapprove the whole or any part of the sentence.

Under the new articles it is no longer mandatory for a court to sentence an offender to dismissal for drunkenness while on duty in time of peace. The court can use its discretion. For the first time military authorities are permitted to adjudicate the affairs of deceased officers and soldiers and to hold inquests. Rights to remove civil suits or criminal prosecution against military persons from State to Federal courts are conferred upon military authorities. These cases include acts done in the line of duty. Depositions are authorized in many cases which were not provided for under the old articles of war.

ARTICLES, THE SIX. In English Church history these were articles of faith imposed by the Act 31 Henry VIII, cap. xiv, passed by Parliament in 1539, and known as the Sixstringed Whip or Bloody Statute, from the merciless persecutions to which it gave rise. They are supposed to have been the composition
of King Henry himself, and they had no formal authority from the Church. They enforced belief in transubstantiation; declared communion in both kinds unnecessary; the marriage of priests was unlawful; that vows of chastity or widowhood were absolutely binding; and that priests and nuns, on commission were expedient and necessary. The severity of the act was soon mitigated, and it was finally repealed in the first year of Edward VI.

**ARTICLES. The Thirty-nine.** of the Church of England, a term applied to a body of divinity, chiefly founded on the formulay of Forty-Two Articles compiled by Archbishop Cranmer in 1551, in obedience to the command of Edward VI and the privy council, who instructed him to frame a book of articles of religion, for the preserving and maintaining peace and unity of doctrine in this Church, that, being finished, they might be set forth by public authority. Several of these articles (the 1st, 2d, 25th and 31st) were drawn directly from the Augsburg Confession, and the 9th and 16th are traceable to the same source. During the reign of Mary the Articles were suppressed, but the accession of Elizabeth offered an opportunity of drawing up a fresh formulay. In 1562–63 a convocation was held, in the course of whose sitting King Edward's Articles were carefully considered and revised. As the result of this revision (mainly the work of Archbishop Parker, assisted by Bishops Grindal, Horn and Fox) four of the original 42 articles were omitted, namely, the 10th, 16th, 19th and 41st, and articles 12th, 29th and 30th were newly introduced; 17 other articles were more or less modified. On a further revision articles 39th, 40th and 42d were struck out, and some slight changes made in several others. These 39 articles were drawn up and ratified in Latin, but when printed both in Latin and English the 29th was omitted and the first clause of the 20th struck out. The 39th was, however, restored on a final revision by Parker in 1571, and then imposed on the clergy for subscription. They were ratified anew in 1604 and 1628. All candidates for ordination must subscribe these articles, but subscription is no longer necessary on matriculating or taking a degree at Oxford or Cambridge. This formulay is now accepted by the episcopal Churches of Scotland, Ireland and America.

The first five articles contain a profession of faith in the Trinity, the incarnation of Jesus Christ, his descent to hell, and his resurrection, and the divinity of the Holy Ghost. The three following relate to the canon of the Scripture. The 8th article declares a belief in the Apostles', Nicene and Athanasian creeds. The 9th and following articles contain the doctrine of original sin, of justification by faith alone, of predestination, etc. The 19th, 20th and 21st declare the Church to be the assembly of the faithful, and that it can decide nothing except by the Scriptures. The 22d rejects the doctrine of purgatory, indulgences, the adoration of images and relics. The 23d decides that only those lawfully called shall preach or administer the sacraments. The 24th requires the liturgy to be in English. The 25th and 26th declare the sacraments effectual signs of grace (though administered by evil men), which God excites and confirms our faith. They are two: Baptism and the Lord's Supper. Baptism, according to the 27th article, is a sign of regeneration, the seal of our adoption, by which faith is confirmed and grace increased. In the Lord's Supper, according to article 28th, the bread is the communion of the body of Christ, the wine the communion of his blood, but only through faith (article 29); and the communion must be received in both kinds (article 30). The 28th article condemns the doctrine of transubstantiation, and the elevation and adoration of the Host; the 31st rejects the sacrifice of the mass as blasphemous; the 32d permits the marriage of the clergy; the 33d maintains the efficacy of excommunication. The remaining articles relate to the supremacy of the king, the condemnation of Anabaptists, etc.

**ARTICULATA.** A name given by Cuvier to a branch of the animal kingdom embracing the worms (Annulata) and Arthropoda (q.v.). The group is not now considered a natural one, and has been subdivided into several branches or phyla.

**ARTICULATION.** See Joint.

**ARTIFICIAL CAMPHOR,** a product manufactured from turpentine. The sap of the pine tree after it is distilled is turpentine of commerce. A couple of thousand pounds of this material is placed in great steam reaction tanks; these are covered with asbestos to retain the heat. A quantity of oxalic acid, which is rich in oxygen, is placed in the reaction tanks, together with the turpentine, and when the chemical action resulting from the union has been completed two new chemicals are formed and are known as pinol oxalate and pinol formate, respectively. These are in liquid form and are conveyed to a set of distilling tanks by means of a force pump; in these tanks a new element is introduced in the form of an alkali, and when mixed with the liquid live steam is turned on. After distillation camphor results, together with some of the siential oils, such as oil of lemon and others, but these are dissolved in the reaction products, which also contain a kind of camphor termed borneol.

**ARTIFICIAL FLOWERS,** flowers made of a large variety of materials in close imitation of natural flowers for purposes of decoration and instruction. The famous collection of Harvard University, made wholly of glass and illustrating the flora of the United States is the best example of the latter. The art was known to the ancients, for the ancient Egyptians made flowers of painted linen and stained horn shavings; gold was also used. Rice paper is used by the Chinese and Japanese and to some extent also in the United States. The South American Indians have fashioned beautiful flowers from varicolored feathers. Crape paper, ribbon and velvet are extensively used. The chief centres for the manufacture of flowers are France and the United States. Wax-flower making is an art which requires that only those lawfully called shall preach or administer the sacraments. The 24th requires the liturgy to be in English. The 25th and 26th declare the sacraments effectual signs of grace (though administered by evil men), which God excites and confirms our faith. They are two: Baptism and the Lord's
ARTIFICIAL LIMBS

are used in this industry. The leaves and petals are generally made of silk or cambric punched out to proper shapes and sizes. These are tinted with a brush and color, and if necessary glazed with gum or sprinkled with fine flock to impart the glossy or velvety surface of natural flowers. The ribs, where present, are indented with a warm iron. The stamens and pistils are formed of wire covered with silk and dipped in gum-water to form the anthers. The stalk is then made of wire coated with green of paint and fixed to the stamens and pistil, around which are attached the petals, and lastly the calyx. Buds are made of cotton or glass balls covered with cambric of a proper color. The coloring matter was resin, often nothing less than the deadly poison arsenic. Hoffman and other chemists have shown that the most terrible effects may spring from the use of these arsenical compounds. Consult Van Kleek, M., 'Artificial Flower Makers' (New York 1913).

ARTIFICIAL LIMBS, substitutes for human arms and legs and parts thereof, toes, feet, hands and fingers, appliances for excisions, fractures and other disabilities of lower and upper extremities, the manufacture of which has received the attention of surgeons and mechanics from a very early date. In the great work on surgery by Ambrose Paré, in 1579, he refers to and gives detailed illustrations of an artificial arm and leg, and although the construction was of a rude character they showed a very good attempt to conceal the mutilation. In 1696 an artificial leg was invented by Verduin, a Dutch surgeon. It was composed of a wooden foot, to which was fastened two strips of steel extending up to the knee. These strips were riveted a copper socket to receive the stump; a leather for lacing around the thigh was connected to the socket by two steel side-joints, thus dividing the points of support between the thigh and stump. The construction of this leg was improved later by Professor Serre of Montpelier. Improvements and new limbs were more recently introduced into England and France by Fred. Martin, M. Charrière, M.M. Mathieu and Boudet, and these were mostly unprotected by patents. Thomas Mann secured patents for artificial limbs 20 Jan. 1790, and 1810. James Potts of England patented a new leg 15 Nov. 1800. This soon became celebrated as the Anglessea leg, because it was recommended by the Marquis of Anglesea. An improvement on this leg was patented by William Selpho, who was the first manufacturer of note in New York, where he established himself in 1839. Other inventors and manufacturers soon took a great interest in the business — so many, in fact, that the American patent office shows a record of about 150 patents on artificial legs, or more than double that of all European patents on limbs. The Civil War, which caused the mutilation of so many soldiers and sailors, and the liberality of the government in supplying their losses with artificial limbs, naturally stimulated the efforts of inventors in producing such substitutes as would be accepted. These soldiers and sailors in subsequent years, and to this demand is added that of those who have lost limbs from disease or accident, making in all about 100,000 in the United States who have to be supplied with new limbs on an average of about once in every five to eight years. The perfection to which limbs have been brought is wonderful and very interesting. A person with two artificial legs can walk so perfectly that he can avoid detection, and a person with a single amputation can almost defy detection. Notable improvements in artificial limbs, and more particularly in legs, were made by C. A. Frees, by J. Condell and by A. A. Marks of New York. One of these improvements, and one of the most, is the introduction of artificial ligaments in the movements of the knee and ankle joints, by which the whole limb is strengthened and made more durable. An important feature of this piece of mechanism consists in the introduction of a universal motion at the ankle-joint, imitating the astragalus movement with an additional joint, and thus producing a most perfect artificial substitute. Another of his improvements, of equal importance, is in the knee-joint of the leg for thigh amputation, which is so arranged that when in a sitting position the cord and spring are entirely relaxed, relieving all strain and pressure; and when rising to an upright position the cord and spring are again brought into proper position without strain or unnatural movements of the other attachments being required. Artificial arms and extension apparatus for short legs are also wonderful examples of American ingenuity.

The great European War gave a great impetus to the manufacture of artificial limbs, and organized effort was made especially by the French authorities to place the entire technique of artificial limb supply upon a standardized scientific basis. A laboratory of military prosthesis was established in Paris where careful determinations were made of the muscular and nervous conditions in and around the damaged limb. In accordance with these observations, individual prescriptions were made and carried out with a degree of skill which could not by any possibility be approached in times of peace, with the negligible number of cases which then arose. A German firm perfected a system attached rigidly to the shoulder, whereby movements based upon the humerus, collar-bone or shoulder-blade are transmitted to the stump of the forearm. The hook terminating this artificial arm can be subjected to heavy loads without in the least straining the enfeebled muscles of the wounded man.

An artificial arm for those whose amputation had preserved the elbow-joint was constructed by an American firm which made possible a large variety of movements. Flexions of the wrist, opening and rotating of the "hand," placing the "fingers" in certain positions and holding them firmly there, are all accomplished with no intervention of the other hand aside from the engaging and disengaging of a catch.

The average price for an arm fitted to an amputation above elbow, with full finger and universal wrist movement is from $100 to $125 and $150; below the elbow from $75 to $100; for a leg above or below the knee the prices are about similar. Consult Condell, J., 'Life-like Artificial Legs and Arms' (New York 1866); Marks, A., "Artificial Limbs" (New York 1914); Palmer, B. F., 'War the American Government Present an Artificial Arm (Not a "Clutch") to the Mutilated American Soldier?' (Philadelphia 1863).
ARTIFICIAL PRECIOUS STONES. 
See Chemistry, Progress of; Gems.

ARTIFICIAL RESPIRATION. See ASPHYXIA; DROWNING (Treatment); RESPIRATION.

ARTIFICIAL RUBBER. See RUBBER.

ARTIFICIAL STONE, a combination of hydraulic cement, broken stone, sand, etc., cemented together. There are many varieties, some of which are exceedingly valuable for building purposes, especially in localities where building-stone is not readily obtained. Cements thus made increase in strength and solidity for an indefinite period. This stone is in constantly increasing demand. For various the kinds and uses see CEMENT.

ARTIGAS, ár-té-gas, Fernando José, a South American soldier, dictator of Uruguay: b. Montevideo, 1755; d. 1851. At an early age he was appointed captain of a corps in Spanish provincial service. In 1811 he joined the revolt of Buenos Aires against Spain, whose troops he repeatedly defeated; but acting for himself was outlawed by the insurrectionary junta, whose troops in turn he routed and compelled to leave Uruguay to him in 1814. He then assumed the dictatorship, but in 1820 was defeated and fled to Paraguay, where the dictator Francia banished him to Candelaria. Thereafter he devoted himself to agriculture and philanthropy.

ARTIGAS, Uruguay, a department of the republic, established by the law of 20 Sept. 1884, which occupies the northern extremity of the country. Its capital, San Eugenio del Careim (also called Cuareim) is situated on the Cuareim River, which separates Uruguay from Brazil. The department is bounded on the north and northeast by Brazil, on the southeast by the department of Rivera, on the south by the department of Salto and on the west by the Uruguay River and Argentina. It is the eighth in size of the 19 Uruguayan departments; is crossed by two railway lines; is divided into the eight judicial sections known as San Eugenio, CuaSo Grande, Catalán Chico, Yacaratú, Yucututí, Estación Isla Sarandi, Santa Rosa and Estación Cabello, and has about 33,000 inhabitants (est. 1916). The name Artígas is also given in honor of Fernando José Artigas (q.v.) to a town of 1,300 inhabitants in the department of Cerro Largo, Uruguay.

ARTILLERY. Projectile arms using gas as a propelling force, and also the troops serving these arms. The history of artillery dates from the discovery of gunpowder in the 13th century. Several small guns were in action at the battle of Crecy in 1346. In the French War of Independence against the English, artillery was in constant use, and in 1428 Joan of Arc is said to have pointed the guns herself. During the 16th century brass guns and cast-iron projectiles were adopted throughout Europe, while Tartaglia in Italy made great improvements in gurney. During the latter part of this century case-shot was invented and shells were fired from mortars. The first half of the 17th century saw great progress in the history of artillery. Maurice and Henry Frederick of Nassau made much advancement in it, but it was under Gustavus Adolphus that it first began to take its true position on the battle-field. He attached two guns to each regiment, and proved its utility in the Thirty Years War. During his life he did much to forward the science of artillery, increasing its mobility and its rapidity of fire. The laboratory at Woolwich was established in 1672, and a reorganization of artillery took place in 1682 under Lord Dartmouth. Louis XIV raised in 1671 a regiment for artillery duty, and in 1686 founded the first artillery schools. The inventions of the elevating-screw, the prolonge and the priming-tube filled with powder, were made during his reign.

Prussian artillery was very backward during the first part of the 18th century, and Frederick the Great did not at first place much value upon it. Although it contributed much to his victory at Rossbach, it was usually no match for the well-handled Austrian guns, which fact impressed him with the importance of increasing his attention to this branch. He therefore raised the proportions of guns, and established horse-artillery in 1759.

After the Seven Years' War the Austrians recognized the importance of artillery in modern warfare, and Prince Liechtenstein was commissioned to reorganize it. Frederick was struck with the improvements effected in Austria, and strove on his return to build up a complete system, as to both personnel and matériel, making a separate provision for field, siege, garrison and coast artillery. At first his reforms met great opposition, but in 1776 he became First Inspector-General of Artillery, and was able to carry through his improvements. French horse-artillery dates from 1791, and the last step in the complete organization of field-artillery was made in 1800, when the establishment of a Drivers' Corps put an end to the old system of horning by contract. Napoleon introduced the tactical combination with brilliant success. To his wars we first look for instances of the important effects produced by this arm in that concentration of fire which in those days was produced only by massing guns. After the war of 1870-71, in which French artillery proved itself far inferior to the German, the French made remarkably successful experiments with a view to the introduction of superior guns. Similar progress has been made by the other great European Powers.

British artillery had greatly deteriorated during the 18th century, and was not up to the standard of other countries, but horse-artillery was formed in 1793, and a Drivers' Corps introduced the following year. At the commencement of the 19th century Prussian artillery was powerful rather than mobile; but after the disasters of 1806-07, this defect was remedied. In 1872 German artillery was reorganized, the field-artillery of each army corps being augmented to 17 batteries and divided into two regiments. Austria and Prussia always had pre-eminence both in the excellence of its matériel and in tactical handling on the field. Russia won special distinction in the Napoleonic wars by the power and good service of its artillery, and has continued to give great attention to this arm. Having adopted the breech-loading system of Prussia, Russia increased its field-artillery from three to four batteries per division, with 38 batteries of mitrailleuses added.
The defense of warships with iron armor caused an increase in the size, weight and calibres of sea-coast and naval cannon, and the whole method of gun-construction was altered. Armstrong was the first in England to see the necessity of a change, and his method was im-

fully a foot of wrought-iron. This monster, ponderous as it is, is surpassed in two important respects by the 16.25-inch breech-loading gun. This celebrated weapon throws a projectile weighing two cwt. less than the 17-inch, but has a more powerful muzzle velocity

proved by Whitworth, Fraser, Palliser, Blakely and others. Francis Krupp of Essen, Prussia, invented a new method which proved so successful that it was introduced in Germany, Russia, Austria, Belgium and Spain. The body of the gun was fabricated from a solid ingot of low steel worked under heavy steel hammers and was strengthened by three or more steel tubes shrunk upon the central tube of the gun, the last ring, or tube, inclosing the breech, being forged in one piece with the trunnions, without a weld. The rings had various lengths and the gun was diminished in thickness toward the muzzle, not by tapering, but by being turned with concentric steps of diminished heights. Krupp made all his projectiles and gun-carriages of steel. In the United States, Rodman, Dahlgren and Parrott devoted themselves to the art of gun-construction. The Rodman gun was of cast-iron; it was cast hollow and cooled from the inside, the exterior being in the meantime kept from rapid cooling by fires built around the gun in the casting pit. The Dahlgren gun was of iron cast solid and cooled from the exterior, very thick at the breech up to the trunnions, then diminishing in thickness to the muzzle. The Parrott gun, like the Rodman, was of cast-iron, cast hollow, cooled from the inside and strengthened about the chamber by an exterior tube of wrought-iron bars spirally coiled and shrunk on.

During the past 25 years the struggle between gun and armor has gone continuously forward. An examination of the products of the Midvale Steel Company, Bethlehem Steel Company and foreign ordnance corporations shows ever-increasing gun power, culminating in the English made, Italian-owned gun, having a bore whose diameter is 17 inches. The actual weight of this gun is 104 tons and its projectile turns the scale at 2,000 pounds. The execution of this gun will be realized when it is remembered that the six-inch gun is capable of crashing a 100-pound projectile through and a penetrating power superior by a couple of inches. With an initial velocity of 23 miles per minute it is not surprising that this gun can send a projectile through three feet of solid wrought-iron like so much cardboard.

One of the teachings of the great European War was the indisputable necessity in the modern army of a numerous and heavy artillery. The question of type is complicated. Without excessive multiplication of calibres it was, nevertheless, necessary to have various types of heavy guns, because they all had definite functions. A review of the different calibres employed by the Germans leads to the conclusion that the modern army should have:

1. Heavy corps artillery, composed of comparatively light pieces, from 2,000 to 3,000 kg. with limber, pulled like ordinary field artillery, by six horses and able to follow the infantry in all of its movements on any ground. The light 105 mm. howitzer, model 1898, and the heavy 150 mm. howitzer, model 1905, represent this type in the German Army. These howitzers fire a projectile weighing, respectively, 15 and 40 kg.

2. Heavy army artillery, including the heaviest guns, drawn by 10 or 12 horses, weighing in general from 4,000 to 6,000 kgs., and firing from take-down platforms. In the German Army this artillery is composed of long 19 cm., 13 cm., and 15 cm. calibres, having a range between 14 and 18 kms., and also of the 21 cm. mortars, throwing a shell of 110 kgs. to a distance of nine kms.

3. Light siege artillery, composed of the 28 cm., 30.5 cm. and 42 cm. mortars of great range and of naval guns, mounted on trucks. This formidable artillery naturally requires motor traction.
ARTILLERY

promptly after their fire is opened; and one which, if successful, might entail a fatal disaster on the assaulted, from the loss of so many pieces at once. In the outset of offensive measures, good positions should be selected for the heaviest pieces, from which they can maintain a strong fire on the enemy until the lighter pieces and the columns of attack are brought into action. These positions should be taken on the flanks of the ground occupied by the assailant, or on the centre if more favorable to the end to be attained. In all cases, wide intervals should be left between the heavy batteries and the other troops, in order that the latter may not suffer from the return-fire which the assaulted will probably open on the batteries. For the same reason, care should be taken not to place other troops behind a point occupied by a battery, where they would be exposed to the return-fire of the assaulted. When this cannot be avoided the troops should be so placed as to be covered by any undulation of the ground, or else be deployed in line to lessen the effects of the shot. The artillery which moves with the columns of attack should be divided into several strong batteries, as the object in the case is to produce a decisive impression upon a few points of the enemy’s line by bringing an overwhelming fire to bear upon these points. These batteries should keep near enough to the other troops to be in safety from any attempts of the assaulted to capture them. Their usual positions will be on the flanks and near the heads of the columns of attack; the intervals between the batteries being sufficient for the free manoeuvres of the other troops in large bodies. The manoeuvres of these batteries should be made with promptitude, so that no time may be lost for the action of their fire. They should get rapidly over unfavorable ground to good positions for firing, and maintain these as long as possible; detaching, in such cases a few pieces to accompany the columns of attack. In all the movements of the batteries great care should be taken not to place them so that they shall in the least impede the operations of the other troops.

French 75 millimeter Field Gun.
The United States is the only country to maintain approximately full strength batteries in time of peace. All other nations skeletonize the firing battery for training purposes, impress teams for ammunition supply and maintain reserves. Howitzers enable a division to act independently. Before the war of 1914 the Germans with 6.4 guns had the highest percentage per 1,000 rifles; the United States with 3.1 the lowest. Nowadays the proportion is enormously greater in all armies. Artillery can easily keep up with the troops it accompanies. In advancing to position it usually moves at the trot, in occupying position at the walk or trot. It seldom moves at the gallop, but when circumstances require it gallops in line for short distances only. The average march for a battery is 15 to 20 miles per day.

The statement that a battery seen is a battery lost still holds true. In the Balkan wars the Bulgarians relied upon long-distance firing. The Serbians usually tried to get within 2,000 yards. At Yenidze-Yardar the Turks held up two Greek divisions by covering a bridge at 6,800 yards. As a rule rather than cross exposed areas, extreme ranges were used or darkness was awaited. In order to be able to deliver an effective fire, the artillery must take its chance and not be afraid to suffer losses. On the march, artillery must be placed with a view to security and availability. Artillery is usually not assigned to the advance guard of a force smaller than a brigade. It is not the size but the mission of the command that should determine the strength in artillery. A pursuit will soon resolve itself into attacks on well-defined positions which the retreating force defends to cover the assembly of its march columns on the roads. A retreating force which adheres to roads will outdistance a pursuing force advancing across country.

Firing practice and exercises in time of peace have the fault of inculcating false ideas concerning the kinds of positions which artillery should occupy. Two essential conditions are that the position be within range of the enemy, and that it be possible to lay upon him. Mountain artillery is especially suited to accompany the infantry line. At present artillery to accompany the infantry line is furnished by the so-called "tanks." In considering a position, protection is secondary to ability to deliver effective fire. Advantages of positions behind the crest are greater mobility, ability to act by surprise, greater field of fire, hostile observation made more difficult, ammunition supply easier.

A battery occupies a front of 100 yards, a battalion 400 yards, a regiment 900 yards. Light guns are rarely placed in tiers. With howitzers or heavy guns in the second line this may be done. Firing over infantry must be considered as the normal procedure and is not dangerous. The artillery can support the infantry up 100 yards from the hostile trenches and on the defense until the hostile attack arrives within charging distance. In offensive action the necessity of getting within suitable and effective range of the hostile positions will usually govern.

Early German successes in the European War were due in great measure to the heavy field artillery and its proper handling. The French relied upon their light 75. The German heavy artillery, using aeroplane reconnaissances, was able to destroy entire batteries of 75's without themselves suffering any damage. The lesson is that heavy calibres and good ammunition supply give better support to the infantry, and this means success. The idea that the six-inch howitzer, with its 120-pound projectile, was the heaviest needed with an army is, of course, discarded, as well as the idea that the only use of the heavier pieces would be in the destruction of permanent fortifications. Howitzers from 11-inch to 16-inch calibres are now transported with armies in the field and the successes obtained by the Germans and Austrians on the Eastern front were due in no small measure to the use of these enormous field pieces.

The field artillery used in the present war may be divided into four great classes: (1) "light artillery," or field artillery proper, which includes all pieces less than about four inches in calibre. These pieces are especially useful in the destruction of wire entanglements, but are too feeble to damage well-constructed dug-outs. (2) "Artillery of medium calibre," up to about six inches in calibre. This is used for the demolition of the less strongly constructed dugouts. (3) "Heavy artillery of great power," including such weapons as howitzers and mortars, which are used to demolish the strongest trench structures. (4) "Heavy artillery of long range," to destroy the
ARTILLERY

enemy's artillery, which is placed far back of the hostile line. The order given is the approximate order of the batteries from front to rear.

Siege Artillery.—An examination of the German formations for sieges indicates that their organization is based on the theories—aggressiveness, quick resolution and celerity of movement. A character of their formations is the great abundance of means provided, and essential equipment, with a view to promptly re-enforcing any field unit charged with a siege with a large number of medium calibre batteries, completely provided with everything necessary for their separate organization, so as to make possible prompt and efficient action on their part.

Thus, many battalions of fortress artillery have a complete equipment of draught animals; the 6-inch howitzers and the 8.2-inch mortars, for example, are organized as heavy field artillery and assigned in considerable numbers to army corps. Each corps has a battalion of four four-gun howitzer batteries—either of 6-inch howitzer batteries, organized as above, or else a battalion of two four-gun 8.2-inch mortars batteries.

To each battalion of fortress artillery there is assigned an ammunition company, which provides not only ammunition but also spare supplies and, to assist in furnishing the same, has a part of its equipment a narrow-gauge railway 4.7 miles long, using animal traction. Each such ammunition company has, in addition, a detachment of mechanics who relieve the batteries of much work, and, besides, it has been found that by keeping the same men constantly busy at the same kind of work, they become more proficient and render better service than do men temporarily employed on several different kinds of work.

The commandant of the field unit is the commandant of the sector, and commands not only his own troops, but all special troops assigned to the sectors. For though there is an artillery commander for the siege artillery to assist the commander-in-chief, yet, after making the necessary distribution of the batteries among the various sectors. The employment of medium-calibre batteries is left entirely to the sector commandants, through their own artillery commanders, and the commander for siege artillery limits himself during the attack to re-enforcing the local sector artillery, as may be required, by drawing on units in reserve, or newly arrived, or by transferring artillery found to be in excess in one sector to another section.

The French regulations differ from the German in that the control of their medium-calibre artillery is directly exercised by the commander of the siege artillery, the sector commandants controlling all troops in their sectors other than the siege artillery.

As all the incidents of the siege from the very commencement of the investment, such as the laying out of lines of communication, unloading the siege material, etc., depend directly on the commander of the point of attack, it is evident that it is of the greatest importance to decide this point as soon as possible. It is quite practicable to do this, when we consider that the studies made and data required in time of peace concerning fortresses which might become objectives for various armies, usually contain information of great importance, and that in addition preliminary reconnaissances can be undertaken by selected officers sent ahead with the advance troops, independent cavalry, advance guard, etc., who can to a certain extent complete this information in such a manner as to enable the siege commander to come to conclusions.

A decision as to the selection of the point to be attacked must be based not only on the defensive powers of the various faces of the fortress and the configuration of the terrain in their fronts, which should be such as to admit of proper deployment of the siege artillery, but should be based also on the influence which the fall of the face attacked will have on the ultimate fate of the fortress. Moreover, consideration must be given to the strategical situation and to the only becomes apparent, which should be such as to facilitate the provision of all necessary supplies and accessories. The state of the defensive works will, of course, not be completely revealed until the attack has actually commenced and often not until it has been pushed well forward.

The general plan of the siege and the points of attack having been determined on, the various available forces and material are assigned and a general scheme of operation is decided on. It is unnecessary to determine every small detail, it being better to leave liberty in such matters to commandants of sectors, so that they may conform to the changing circumstances and incidents of the attack, as they successively develop; for the relations of the attack to the defense are constantly changing, requiring adjustment of plans for the employment of troops and siege matériel.

As to the distance at which artillery ought to be deployed, it being recognized that the nature of the ground and the construction and armament of the hostile works will be quite different in different sectors, a broad initiative is left to sector commandants, in order to permit them from the very commencement of operations the best means of seizing the favorable circumstances in advancing their siege batteries as near as possible to the fortress. The removal of vegetation from the field of fire, the capture by surprise of some advanced post of the defense, inferior conditions of observation or of fire of the defenders' batteries, may permit more progress in one zone than in another. But the possibility of such progress rarely appears at the beginning of operations, when the general plan for the artillery is decided on; apparent as the siege progresses, and then the intervention of the commander-in-chief may embarrass and retard the prompt seizing at opportune moments of advantageous points which the local situation may permit.

There is no doubt that a large part of the losses sustained in siege warfare occur during short range fighting, in which the fire from small arms, machine guns and rapid-fire guns may become annihilating when held under their fire for but a very few moments by some simple obstacles. Wire entanglements, ditches temporarily impassable, a wall which the artillery has previously failed to destroy or at least breach, all may cause enor-
mous losses to the attacker, who unexpectedly finds his progress stopped by such obstacles. However, one of the lessons of the present war has been that no permanent fortification, no matter how strong, can hold against the heavy artillery fire of the besiegers, and that earthworks, with dugouts far beneath the surface of the ground, which can be repaired with relative ease under hostile fire, furnish the only type of fortification which can resist the power of modern arms. The result of this has been that at present we have a use of artillery which renders it neither strictly field artillery nor strictly siege artillery, but a third kind partaking of the nature of both and primarily adapted to the warfare of positions.

Seacoast Artillery.—With few exceptions, the characteristics of the 8-inch, 10-inch and 12-inch rifles are essentially the same. The 12-inch is the gun intended to cope with capital ships, carrying the biggest spurs and armor. The 14-inch gun, advocated by the United States Ordnance Department, was later designed to provide a weapon that would take the place of the 12-inch gun. The length of the gun (34 calibers) was limited so that it could be used on hills and other obstructions already provided for 12-inch guns. The muzzle velocity was established at 2,150 feet per second to secure a penetration at 8,000 yards, approximately equal to that of the 12-inch 2,500 f.s. gun, while securing an accuracy which has proved to be approximately four times as long. While the danger space is somewhat less than that of the 12-inch, 2,500 f.s. gun, the striking energy is materially greater at all ranges, and the bursting charge is approximately 50 per cent greater. Not only for coast fortifications but for the battleships as well, all countries and technical students of the subject have now committed themselves to large calibers, and at present in no situation would it be desired to have the 9.5-inch piece the weapon of maximum size and strength. It has been fully demonstrated that fire against modern armor must be perforating fire with large calibers and explosive charges of from 3.5 to 4.5 per cent of the weight of the projectile, but if, on future time, on account of an alteration in naval construction or for any other cause, the semi-perforating shell with a 10 per cent explosive charge is considered advantageous, then at that time the major calibers will still have a very great superiority. In the first place, they are able to keep the battleships at distances of from 20 to 25 km., as compared with 13 or 14 km. in the case of 240-mm. (9.5-in.) guns; moreover, a battery of two 361-mm. (15-in.) howitzers can fire 12 shots per minute (which is the rate of fire given in tables computed by the Vickers company) will be able to hurl at the enemy 182.4 kg. of explosive in place of 240 kg., which can be thrown by a battery of four 240-mm. (9.5-in.) guns in the same length of time, while the projectiles of the former, piercing the armor before bursting, and exploding a great quantity of powder (76 kg. each time), will have a much greater effect than those of the latter, which will only act as an inoffensive explosion against the exterior of the armor, at the same time that those which do happen to penetrate, since they carry a relatively small charge (20 kg.), will not have a very great explosive effect. Major calibers are also able to utilize a short cap for this type of shell in the attack of decks of battleships thereby causing an enormous amount of damage.

The handling of the larger guns and howitzers is a difficult operation. Two of the Krupp 42-cm. guns need no fewer than 26 traction engines. Each is in four pieces (i.e. loads) and each piece is drawn by three traction engines, the spare engines going on ahead to be used as help, should the 11 that are in the howitzer travels on a special wagon, the cradle is converted into a carriage by putting a pair of wheels on the cradle trunnions, which are central; and the trail and wheels for a third carriage, 4½ girdles, weighing one-half ton each, travel when not in use, on a girdle wagon, weighing four tons gross. The high elevation, namely 65°, of which this howitzer is capable is intended to allow it to be fired with full charge at a short range; and, if the enemy should cause the area over which the attack can operate naturally increases with the length of range at which they can attack, but also because, when restricted to short ranges, ships would also in all probability be confined to certain channels, on account of shoals and banks lying near shore, and these channels—possibly narrow and intricate of navigation—could also be mined. Thus, a fleet armed with modern guns has a greater choice of positions; it could, for instance, take up an enfilading position from which perhaps only one gun of a shore battery could bear, and could more easily bring the concentrated fire of several ships on to one work. This relative advantage of attack over defense would hold good even if the increase in power and range of the defense guns had kept pace with that of naval guns; but it never has and never will.

Again, the increased protection given to modern ships, and the possibilities of observation of fire conferred on them by the introduction of airships, very largely detracts from the advantage hitherto enjoyed by shore defenses of being less vulnerable and of possessing greater facilities for observation of fire than their adversaries.

Also the good effect of increased range in the gun is limited at night by the effective radius of illumination of electric lights, and may be limited by day by atmospheric conditions, and thus permitting the use of long-range guns to the defense in certain forms of attack, as, for instance, in the case of a mine-layer laying mines in a channel of approach beyond efficient electric light limit. Long range guns would be powerless to prevent this. Again, under cover of a fog a ship or squadron might approach to within medium range; the defense would lose all the advantage of long range by being unable to attack during the approach, while at a medium range the greater number of guns probably carried by the attack would enable it to overwhelm and smother the defense. But great as has been the development of guns, the development of torpedoes in speed, range and accuracy has
been as great, if not greater. The advent and development of the submarine has done still more to increase the power of the torpedo as an offensive weapon, and on the whole this development of the torpedo is in favor of the defense.

They would, therefore, seem probable that the future development of coast defense would lie in increasing the number and efficiency of defense flotillas of torpedo boats and submarines, rather than in the size and number of the guns on fixed mountings as they are now. The guns can carry altogether disappear, there must always be a last entrenchment—a keep; and that keep will be the shore batteries.

One of the greatest lessons learned in the European War is the increased importance of heavy mobile artillery, and the necessity for devising plans to use effectively sea-coast armorment and designing mounts for howitzers and mortars to permit them to be easily transported and quickly mounted. Whatever the design, it should be compact. (1) It should be mobile and capable of being transported quickly either by railroad on flat cars or by gasoline tractors over ordinary roads. (2) It should be capable of being mounted quickly in a concrete emplacement of simple design. (3) It should be more powerful than any similar weapon that can be brought against it. (4) In addition to being equipped with the ordinary telescopic sight, it should be practical to lay it in azimuth and range as is done with the present type of sea-coast mortars. In drawing up a project for the defense of a locality on the sea-coast, sites for mobile howitzer batteries should be selected for defense against attack from the land side. The emplacements for these batteries might be constructed in time of peace or upon the outbreak of war. Each coast defense should be equipped permanently with one or more of these batteries to supplement the fixed armament and for the purpose of training coast artillery companies in their use. See AMMUNITION; ARMOR PLATE; COAST DEFENSE; FORTIFICATIONS; GUNNERY; HORSE ARTILLERY; LIGHT ARTILLERY; MOUNTAIN ARTILLERY; ORDNANCE; and TURRETED ARTILLERY.

Y., 1891); Lloyd and Hadcock, 'Artillery; Its Progress and Present Position' (Fortsmouth 1893); May, 'Field Artillery with the Other Arms' (London 1898); Spangard, 'Notes on Field Artillery' (Fort Leavenworth 1908); Roquerol, 'The Tactical Employment of Quick-Firing Field Artillery' (translated by Radcliffe, London 1903); the Field Artillery Journal (Washington, D. C.); the Journal of the United States Artillery (Fort Monroe, Va.); the Royal Artillery Journal (Woolwich, England), and official publications of the Ordnance Department of the United States Army.

EDWARD S. FARROW,
Consulting Civil and Military Engineer.

ARTILLERY COMPANY. The Ancient and Honorable, a military organization of Boston, Mass. It was copied from that of London, was formed in 1637 and was the first regularly organized military company in America. The company hold their drill in Faneuil Hall, Boston.

ARTILLERY COMPANY, The Honorable, the oldest existing body of volunteers in Great Britain. It was instituted in 1537 and comprises six companies. It besides artillery, grenadiers, light infantry and yagers. It furnishes a guard of honor to the sovereign when visiting London. The King is "Captain-General and Colonel" of the force.

ARTILLERY CORPS, the official name of the entire artillery service of the United States army.

ARTILLERY PARK. A collective name given to the whole of the guns, carriages, ammunition and other appurtenances essential to the working of siege or field-artillery. Besides reserve guns and carriages there belong to it the ammunition wagons, as well for the infantry and cavalry as for the artillery, the implements and materials necessary for repairing and completing equipments, harness-stores, field-forges, laboratories and (in some armies) transport and provision wagons. The personnel of a park of artillery consists of artillery officers, non-commissioned officers and artillerymen, besides a large number of smiths, wheelwrights, saddlers, armorers, drivers and other mechanics and laborers. Sometimes the term is applied to the place selected as well as the vast military store collected there.

ARTILLERY SCHOOLS are institutions established for the purpose of giving a special training to the officers and in some cases the men belonging to the artillery service. See MILITARY EDUCATION.

ARTIODACTYLA, the suborder of ungulate mammals in which the central (and in some cases the only) pair of toes in each foot are arranged symmetrically on each side of a vertical line running through the axes of the limbs.

ARTISTS LETTERS FROM JAPAN. An, a work by the noted American artist, John La Farge. The drift of the book is toward a purer art; but it contains much lively matter—accounts of the butterfly dance at the temple of the Green Lotus, and of fishing with trained cormorants. A thread runs through the letters, tracing the character and progress of the usurping Tokugawa family, from the cradle of their fisherman ancestors to the graves of the great shogun and his grandson in the Holy Mountain of Nikko.

ARTOCARPUS, the generic name of the bread-fruit tree (q.v.).

ARTOIS, ar'twi', the name of a former province of France anciently one of the 17 provinces of the Netherlands. It was bounded on the south and west by Picardy, on the east by Hainault and on the north by Flanders. It is now almost completely included in the department of Pas de Calais. Artois is a fertile region, producing grain and hops. Its capital was Arras. The district was the scene of some of the most desperate fighting in the European War.

ARTOTYPE. See PHOTOGRAPHY.

ARTS, the designation of branches of study in the Middle Ages, originally called the
liberal arts to distinguish them from the servile arts or mechanical occupations. These arts were usually classed as grammar, dialectics, rhetoric, music, arithmetic, geometry and astronomy. The terms "art classes," "degrees in arts," "master of arts," still in common use in universities, the faculty of arts being distinguished from those of divinity, law, medicine or science.

ARTSYBASHEV, Mikhail Petrovitch, maternal great-grandson of Kosciusko, Russian writer: b. 1870. Little is known of the Littie Russians, he is of mixed descent, being of Tartar and Polish as well as of Slavic blood. As a boy he studied painting, but later he turned to short-story writing and when his first story was published he was so encouraged as to determine to make a career of literature. At the age of 25 he wrote his first long work, a novel called 'Sanin' (1907), which at once gained him a national reputation. Like Gorky and Andreyev and other Russian writers of the modern school, his writings show the revolutionary luridity of present-day Russia in their frank, almost brutal, treatment of the realities of life.

ARTUSI, aroo-sé, Giovanni Maria, musical writer and composer: b. Bologna 1550; d. 18 Aug. 1613. He was a canon of San Salvatore, in Venice, and extremely conservative in his stand against the progressive tendencies of Gabrieli and Monteverde and other radicals of that school, whom he attacked vigorously. His works are 'L'Artusi, in 1600; L'arte del compose 1589,' Among his compositions are a 'Canzonette' for four voices and a 'Cantate Domino,' to be found in the Vincenti collection.

ARU. See Arru Islands.

ARUBA, or ORUBA, a-roo'ba, a Dutch island o; the Antilles, west of Curaçao, of which it is an administrative part. It is extremely mountainous and abounds in phosphate deposits. Gold, too, is found in sufficient quantities to warrant mining operations. Its area amounts to about 70 square miles with a population of 10,000, most of which is concentrated about Oranjestad, the capital.

ARUM, a small genus of tuberous tropical and subtropical perennial herbs (commonly called callas) of the natural order Araceae, with simple leaves and diversely colored convolute spathes, for which they are cultivated either under glass or, in the case of some hardy species, in the open air, as ornamental plants. The naked topped spadices bear stamine flowers just above the pistillate ones at the bases. The tender species are managed like the fancy-leaved caladium (q.v.): the hardy must be planted in rich soil in cool, moist situations and must be well mulched during the winter. A maculatum, lords-and-ladies, cuckoo-pint, wake-robins, from Europe, is, with its many cultivated varieties, perhaps the best known hardy species grown in America. The leaves and corms are acrid; but the latter when ripe contain starch which may be extracted and used as a food. In places where it abounds it has long been converted into a kind of arrow-root and has been proposed as a substitute for the potato, but the corms are too small for profitable culture. Some closely related native American plants of somewhat similar habit are skunk cabbage (q.v.), water calla (see CALLA), Indian turnip (see JACK-IN-THE-PULPIT). The Arum lily (Richardia atroca) is an aran with a pure white spathe and brilliant yellow spadix; a favorite drawing room flower. Anthurium, a well-known genus of greenhouse plants, is also nearly allied.

ARUNDEL, är-un-del, Thomas, an English prelate, third son of Richard Fitz-Alan, Earl of Arundel. B. Sussex 1553; d. Canterbury, 19 Feb. 1414. He became Archdeacon of Taunton (1373) and Bishop of Ely in August of the same year. In 1388 he was transferred to the archbishopric of York. He was Chancellor of England from 1386-89, and from 1391-1396, and Archbishop of Canterbury in 1396. He concerted with Bolingbroke to deliver the nation from the oppressions of Richard II, for which he was banished from England. On going to Rome he was very favorably received by Boniface IX, who later deprived him of his see and transferred him to Saint Andrews in Scotland. He returned in 1399 and was reinstated at Canterbury. He crowned Henry IV and served as Lord Chancellor for a few days. He persecuted the Lollards and was a chief instrument in procuring the act for the burning of heretics. He also procured a synodal constitution which forbade the translation of the Scriptures into the vulgar tongue.

ARUNDEL, Thomas Howard 2d earl of: b. Essex 1586; d. 1646. An English art collector, the first to make any large assemblage of works of art in England. He received his education at Trinity College, Cambridge, and in 1616 was appointed a Privy Councillor and in 1621 Earl Marshal of England. In 1630 he executed an important diplomatic mission at the Court of Vienna. See ARUNDEL SOCIETY; ARUNDEL MARBLES.

ARUNDEL, England, a small town in Sussex, famous as containing Arundel castle, the family seat of the dukes of Norfolk, it is on the small river Arun and has a showy Roman Catholic cathedral erected by the Duke of Norfolk. Pop. (1911) 2,842.

ARUNDEL HOUSE, on the Strand, London, the residence of Lord Arundel, where the Arundelian Marbles (q.v.) were housed. Another Arundel House, less known, was that in which Lord Bacon died and which stood near Highgate.

ARUNDEL SOCIETY, a society instituted in London in 1848 for promoting the knowledge of art by the publication of facsimiles and photographs. It was named for the collector of the Arundelian Marbles.

ARUNDEL MARBLES, a series of sculptured marbles discovered by William Petty, who explored the ruins of Greece for Thomas Howard, Earl of Arundel, in the reign of the first Stuart kings, James I and Charles I, and devoted a large portion of his fortune to the collection of monuments illustrative of the arts in the history of Greece and Rome. These marbles arrived in England in the year 1627 with many statues, busts, sarcophagi, etc. John Selden published some of the inscriptions which he thought most interesting.
under the title of 'Marmora Arundeliana' (1628). Henry Howard, Duke of Norfolk, presented the collection of inscriptions was published by Humphry Prideaux in 1676; by Michael Maittare in 1732; by Chandos in 1763. These inscriptions are records of a chronicle of public contracts, thanks of the state to patriotic individuals, etc., and many of a private nature. The most curious and interesting is one usually known by the name of the Parian Chronicle, from having been kept in the Island of Paros. It is a chronological account of the principal events in Grecian, and particularly in Athenian history, during a period of 1318 years, from the reign of Cecrops (1450 B.C.) to the archbishop of Dionysus (264 B.C.). The authenticity of this chronicle has been called in question, but has been venerated by many of the most learned men. The best edition is that of Boeckh, with a full Latin commentary in Corpus Inscriptionum Graecarum (Berlin 1828-77); the new fragment is placed as a sign of office among the archaeologists of the Berliner archäologisches Institut, Athens, Abteilung (Vol. XXIV, Berlin 1897). Consult Sandys, 'A History of Classical Scholarship' (Vol. II, pp. 342-343, Cambridge 1908).

ARUSPICES, Roman priests and prophets, who foretold events from inspection of the entrails of animals. They observed, too, all the circumstances which accompanied or happened during the sacrifice; for example, the flame, the mode in which the animal behaved, the smoke. The origin is to be sought for in Etruria. They were introduced into Rome by Romulus, where they flourished till the time of the Emperor Constantine (337 A.D.), who prohibited all soothsaying on pain of death.

ARUSPICES, CON THE SOFTWARE OF THE, an oration by Cicero. After Cicero's recall from exile different proclamations alarmed the people of Rome. The aruspices being consulted, answered that the public ceremonies had been neglected, the holy places profaned and frightful calamities decreed in consequence. Cicero denounced Cicero as the cause of the misfortunes that menaced the city, and on the following day the orator replied in the Senate to the attack. The speech takes rank among the greatest of Cicero's orations, though he had little time for preparation and suffered under the disadvantage of addressing an audience at first openly unfriendly.

ARUWIMI, a'-roo-wé'me, (1) a river of equatorial Africa having its source in the hills to the west of Albert Nyanza and tributary to the Congo. Its length is a little over 800 miles and its breadth at its confluence with the Congo is about a mile. It is navigable up to Yambyua, but beyond that place there are many rapids. In its upper course it is called the Ituri. Stanley discovered its mouth in 1877 and traced a considerable part of its course in his search for Emin Pasha in 1885. (2) One of the 16 districts into which the Kongo Free State is divided.

ARVAL BROTHERS, or ARVALES FRATRES, a Roman college of priests, 12 in number, whose duty it was to offer sacrifices for the fertility of the fields. That they were of extreme antiquity is proved by the legend which refers their institution to Romulus, of whom it is said that when his wife Acca Surrentia lost one of her 12 sons he allowed himself to be adopted by her in his place and called himself and the remaining eleven 'Arvales Fratres.' In 1570 at the place called Affoga t'Asino, a rock beneath the 68th milestone on the Via Portuensis, inscriptions were found sufficient to identify the spot as the grave of the Dea Dia where the chief festival of the Arvalves was held. We have now the protocols of 96 annual meetings dating from 14 a.d. to 241, and a list of officers dating from 2 b.c. to 27 a.d. From the time of Augustus it became usual to appoint princes of the imperial family as extra members. The members were elected for life by the college, usually on the nomination of the emperor. The officers were a magister, who presided; the flamen, who assisted in the sacrifices, and four boys whose parents were living and who were sons of senators, were the attendants. The college had also its staff of servants. The officers wore a fillet, a sign of office; and the flamen was fastened about their head with a white band. The principal duty of the Arvalves was to celebrate a three-days' festival in honor of the Dea Dia, formerly supposed to be Ceres, but now more correctly identified with Ops; the divinity of Ceres, as Marquardt observes, not forming a part of the old Roman worship. The feast was celebrated by offerings to the goddess and the 'touching' or consecrating of the grain, on the first day. On the second, two pigs, a white heifer were sacrificed in the sacred grove, while two of their number collected grains of corn in earthen bowls, probably from the crowd at the temple door; after which the brethren performed the sacred song and dance within the temple and officers were elected for the coming year and there were races in the grove. The third day was celebrated by a sacrifice in the city. The other duties of the Arvalves were to pronounce solemn vows for important events in the imperial family—the birth of a prince, or recovery of the emperor, his setting out or returning from serious undertakings, etc. The Ambavallia, according to the best opinion, were entirely separate from the functions of the Fratres Arvalves. The documents with a valuable commentary were published by Gae- tano Marini (2 vols., Rome 1795). Consult Henzen, 'Acta Pratrum Arvalium' (Berlin 1874); Brown, 'Rome and the Campagna' (p. 440); Freiler, 'Römische Mythologie' (pp. 422-430); and Marquardt (Vol. VI, 426-443).

ARVE, är', a river tributary of the Rhone, which it enters near Geneva and a course of about 50 miles. It flows through the valley of Chamouni and many of the most famous resorts of Switzerland are found in its vicinity.

ARVEYRON, a river in the department of Haute-Savoie, France, having its rise 4,400 feet above sea-level in the Alps and emptying in the Arve.

ARWIDSSON, är'-vid-s ön, Adolff Ivar, Swedish poet: b. Padasjaur, Finland, 7 Aug. 1791; d. Viborg, 21 June 1858. He studied at the University of Åbo and in 1817 was appointed docent of history in the same institution. The strong critical stand he took against the uni-
versity authorities caused his dismissal in 1822, and not long after, because of an essay he had published, he was banished by the government and compelled to seek refuge in Sweden. In Stockholm he found a position in the Royal Library, of which he became director in 1843. His chief work, 'Svenska fornångare' (Stockholm 1834—42), is a collection of old Swedish folk lore and songs. His original poems appear under the title 'Ungdoms rimfrost af sonen i Östergötland' (Stockholm 1830). His other works are 'Svenska konungar och deras tidevarv' (1830—43); 'Stockholm före och nu' (1837—40); and a translation of the Icelandic 'Frithiofs saga' (2d ed. 1841).

ARYA SOMAJ, a religion founded in India by Swami Dayanand Sarasvati (1824—83); 10 April 1875 is the date of the founding of the cult at Bombay. The official creed was in the form of a declamatory. Their doctrine of Nyioga is practically that of free-love. The government is by the local congregation, the Provincial Synod and the General Synod for all India. While it comes from Hinduism it is largely an eclectic religion and borrows from other religions. It is missionary in character and follows the methods of the Christian missionary societies. Its membership is estimated at more than 100,000. It lays great emphasis on education and social reform. The sect has a college at Lahore.

ARYABHATTA, är’-ya-bhât’a, Hindu astronomer and mathematician of the 5th century: b. 476 a.d. His only known work, the 'Aryabhata,' is a mathematical treatise in verse; frequent reference is made to his writings by later Hindu scholars. In the solution of quadratic equations and the application of algebra to geometry and astronomy he anticipated some of the discoveries of modern algebra. He also announced the correct theory of the diurnal rotation of the earth and the correct explanation of solar and lunar eclipses. See ALGEBRA, HISTORY OF.

ARYAN (är’yan, or är’i-an) LANGUAGES, an important language family frequently styled the Indo-European or Indo-Germanic family of tongues. They have reached a higher development than those of the second or the Semitic, and are far in advance of the next one—that comprising the Turanian tongues. Like the Syro-Arabian forms of speech they are inflectional; while those of Turanian origin are only agglutinate. Max Müller separated the Aryan family of languages primarily into a southern and a northern division. The former is subdivided into two classes: (1) The Indic; and (2) the Iranian; and the latter into six: (1) The Celtic; (2) the Italic; (3) the Illyric; (4) the Hellenic; (5) the Windic; and (6) the Teutonic. It is often said that Sanskrit, spoken by the old Brahmins, is the root of all these classes of tongues. It is more correct to consider it as the first branch and assume the existence of a root Germanic, not visible, in common with the Iranian group alone. The Indo-European division includes two branches, the western, which comprises the inhabitants of Europe, with the exception of the Turks, the Magyars of Hungary, the Rus and the Finns of Lapland, and the eastern, which comprehends those of Armenia, Persia, Afghanis-pecially, were grammatical forms made and parts of speech distinguished. The addition of pronominal endings to verbal roots made a verbal tense in three numbers (the dual perhaps of later origin than singular and plural, and mostly lost again in the later language) with three persons in each. The prefixation of an "augment" (doubtless a pronominal adverb, meaning "then") made of this a past tense; but this augment-preterite has left only scantly traces (the 1st and 2d). His other work is "The History of the Greek and Greek. Another past tense, or perfect, was formed by reduplicating the roots, apparently to signify completed action. This is the origin of the Greek and Latin perfects, our ("strong" or (irregular) preterite, etc. Futures were made later, with auxiliary verbs. Into the declensional inflection of nouns, adjectives and pronouns was introduced the distinction of sex; first by the special characterization of a feminine; later, by the additional separation of a neuter. In later history of the Indo-European structure of Aryan language has been variously modified, reduced and added to. It was most fully and distinctly preserved in the Sanskrit, which on that account casts most light upon the common history of all, but there are points in which each branch leads to the illustration of the affinity among the Aryan tongues. The common word daughter may be instanced. It is in Swedish, dotter; Danish, dotter; Dutch, dochter; German, tochter; Old Hebrew German, tochter; Gothic, daughtar; Lithuanian, duktere; Greek, thygater; Armenian, duster; Sanskrit, dukhiri; the last-named word signifying primarily "milkmaid," that being the function in the early Brahman or Aryan household which the daughter discharged. Not only are the roots of very many words akin throughout the several Aryan tongues, but (a more important fact) so also are the inflections. Thus the first person singular of a well-known verb is in Latin, do; Greek, didomi; Lithuanian, dumi; Old Slavonic, domy; Zend, dadhaman; Sanskrit, dadami; and the third person singular present indicative of the substantive verb is in English, is; Gothic, isti; Latin, est; Greek, esti; Sanskrit, asi.

"Tocharisch, die Sprache der Indoskythen" (Berlin 1908).

ARYAN RACE, a name sometimes applied to that particular ethnological division of mankind otherwise called Indo-European or Indo-Germanic. It does not refer to the modern Iranian group alone. The Indo-European division includes two branches, the western, which comprises the inhabitants of Europe, with the exception of the Turks, the Magyars of Hungary, the Rus and the Finns of Lapland, and the eastern, which comprehends those of Armenia, Persia, Afghanistan,
tan and northern Hindustan. From a multitude of details it has been established that the original mother tongue of all these peoples was the same. It is supposed that the Aryan nations were at first located somewhere in central Asia, probably east of the Caspian and north of the Hindu Kush and Paropamisian mountains. From this centre successive migrations took place toward the northwest. The first swarm formed the Celts, who at one time occupied a great part of Europe; at a considerably later epoch came the ancestors of the Italians, the Greeks, and the Teutonic people. The stream that formed the Slavonic nations is thought to have taken the route by the north of the Caspian. At a later period the remnant of the primitive stock would seem to have broken up. Part passed southward and became the dominant race in the valley of the Ganges, while the rest settled in Persia and became the Medes and Persians of history. It is from these eastern members of the race that the 'Hindu' style takes its name. In the most ancient Sanskrit writings (the Veda) the Hindu style themselves Aryas, the word signifying 'excellent,' 'honorable,' originally 'lord of the soil.'

AR'AZACHEL, Jewish astronomer: born in Spain about 1050. He discovered the obliquity of the ecliptic and compiled certain astronomical tables known as the "Toledo Tables," on which two centuries later were based the famous "Alphonsine Tables."

ARZAMAS, är'zá-mas, manufacturing town in the Russian government of Nijni-Novgorod, situated on the right bank of the Tiesha, 250 miles east of Moscow. It contains 34 churches, several convents and schools, 19 tanneries, several soap-works, linen factories, etc., and has a considerable trade. Pop. about 12,400.

AS, a word which the Romans employed in three different ways: to denote (1) any unit whatever considered as divisible; (2) the unit of weight for the pound (libra); (3) a country. The as, whatever unit it represented, was divided into 12 parts, or ounces (uncia). Scholars are not agreed on the weight of a Roman pound, but it was not far from 237.5 grams avoirdupois, or 327.183 grammes, French measure. In the most ancient times of Rome the copper coin which was called as actually weighed an as, or a pound, but in 264 B.C. was reduced to two ounces, in 217 to one ounce, and in 191 to one-half ounce. In 269 B.C., when silver money was first struck by the Romans, the as was superseded as a money of account by the sesteritus coined from the more precious metal.

AS A MAN THINKS. In 1907, Augustus Thomas produced his play, 'The Witching Hour,' different from any work he had previously done. It was more intellectual, more concerned with ideas; it was a departure from the drama of mere situation. Its central theme was telepathy, hypnotism; and Mr. Thomas maintained cleverly, theatrically, this theme from one end of his play to the other. His interest in psychic forces was further the central motive in his next play, 'The Harvest Moon,' produced in 1909. Here the influence of mental suggestion was the theme, and, though the play was less powerful than its predecessor in its theatrical effectiveness, it revealed Mr. Thomas still concerned with the phenomena of mind.

Undoubtedly these two plays influenced the writing of 'As a Man Thinks.' When it was produced in New York, at the 39th Street Theatre on 13 March 1911, it showed some psychological purpose, and impressed the audience with the fact that whatever Mr. Thomas was in the past, or might be in the future, at that moment he was passing through the phase of challenging thinker and teacher. In 'The Witching Hour' and 'The Harvest Moon,' much was held to one theme; but 'As a Man Thinks,' strong in its human quality, skillful in its construction, and brilliant in the French quality of its dialogue, is marred by diffuseness of purpose. For each act of this play is an attempt of new intellectual interests in Mr. Thomas. Is the central theme of 'As a Man Thinks' a discussion of the double moral standard society maintained in 1911 A.D. for men and women? Is it the question of intermarriage between Jew and Gentile and the reasons for race hatred? Is it a rendering of New Testament ethics, and again the mental suggestion of the previous play, 'The Harvest Moon'? Mr. Thomas does not answer us. Or rather, he was not certain in his own mind, while writing this play, which interest was the greatest. The consequence is, 'As a Man Thinks' is marred by overabundance of material; its claim to interest is due to the skillful workmanship which makes of the Jewish doctor a human personality, apart from being a mouthpiece for the dramatist's preachment.

No one story runs through 'As a Man Thinks.' The Jewish doctor preaches Christian ethics to a man who has deceived his wife; and in turn has been challenged by him. Yet the doctor is crushed when his daughter marries a Gentile. The Christian wife morally defies her Christian husband by throwing to the winds the conventional moral discretion which she has discarded many times, but no special plea is convincingly given for the adoption of one moral standard for both. Intellectually, Mr. Thomas merely skims, in each act, over a different motive, in itself important enough for an entire play. It is his technical ability and the interest he creates in his characters which makes 'As a Man Thinks' a worthy drama, if not one with full literary distinction. It was published in 1911.

MONTROSE J. MOSES.
or four great playwrights of modern Italy, began as a romanticist but gradually fell beneath the spell of the social and domestic drama developed in France by Racine and the younger Dumas, and in Norway by Björnson and Ibsen. ‘As the Leaves’, produced in 1900, seems consciously reminiscent of Björnson’s ‘A Bankruptcy’, first played in 1874. Both exhibit a family group, concept through wealth and shaken by its loss. Whereas Björnson is characteristically optimistic in emphasizing the regeneration of the Tjalde family through work, Giacosa depicts rather the inability of the Rosani to cope with poverty. Giovanni Rosani finds that he has never stifled the will of those dependent upon him, and that, in consequence, they are blown hither and thither as the leaves by gusts of misfortune. His second wife lies, steals and succumbs to her fancy for a fellow artist. His son turns to gambling and consents to marry a disreputable woman in order to pay a debt. His more worthy daughter struggles in vain to uplift the others and to earn a livelihood by teaching until, discouraged, she plans to take her life. But her father and the companion of her disdained lover both intercept her. At last she understands the worth of this self-made cousin who alone has endeavored to assist the family in distress. She will marry him, since he at least has learned in the school of adversity to be self-sufficient. The moral purpose of the dramatist is obvious here, although not unduly accentuated. His interest lies in character rather than in plot. ‘As the Leaves’ has been successful upon the stage in Italy and France, and it may be read in English in an anonymous version printed in Drama (1911) and in a translation by Edith and Allan Updegraff (1913) of three of Giacosa’s plays.

FRANK W. CHANDLER.

AS YOU LIKE IT. The joyous and romantic comedy, ‘As You Like It’, was never more happily characterized than by Robert Louis Stevenson in one of his letters: ‘As the view of life is essentially comic; and the romantically comic ‘As You Like It’ is to me the most bird-haunted spot in letters... To me these things are the good: beauty, touched with sex and laughter; beauty with laughter, and more than that, a genuine spot of comedy which keeps the beauty and touches the terrors of our life (laughter and tragedy-in-a-good-humor having kissed), that is the last word of moved representation; embracing the greatest number of elements of fate and character; and telling its story, not with one eye of pity, but with the two of pity and mirth.’ The tone of the play, its atmosphere, the principal characters, and the genial criticism of life which pervades their words, are all suggested in these words and scarcely need further comment.

From internal evidence—the quotation of one of Marlowe’s lines from the latter’s ‘Hero and Leander,’ published in 1598—and from external evidence—an entry in the Stationer’s register in 1600—the date of the play is placed about the 1599–1600. The date fits admirably with the chronological order of Shakespeare’s plays, which would indicate that at the end of the period of his historical plays and his comedies and just before he entered on the period of his great tragedies, he found refreshment in this comedy and in ‘Twelfth Night’ and ‘Much Ado about Nothing.’ It is not fanciful to say that he turned with relief and a long-sought sigh from the oppressive subjects of history, so grave, so real, so massive, and found rest and freedom and pleasure in escape from courts and camps to the Forest of Arden. In this play we are conscious of a sunlight tempered by forest boughs, a serene look of his forehead, a stream humming in his ears.

For the story in its main outlines and even for much of the language, Shakespeare was indebted to Lodge’s ‘Rosalynse’ (1590). A comparison of the prose romance and the play reveals the fact that the dramatist was independent as to his appropriation of material; his main idea being to create a play—the play’s thing. To this end he visualized the characters, arranged them in contrasted groups or types, introduced new characters such as Corin, Touchstone, Audrey and Jaques, and made an organic structure out of what was incoherent and desultory.

The pastoral story or drama had its origin in the tendency—first in Italy and then in England—to escape from the life of the town or court into a sort of Arcadia or ideal world of happiness. The main features of the pastoral drama, the more artificial character of which is paralleled in the Sylvis and Phæbe scenes, are combined in ‘As You Like It’ with the more distinctly English ideas of court and rural life, such as may be found in the Robin Hood ballads and the dramatized forms thereof. The careless, happy life of foresters and freebooters is everywhere manifest. The Forest of Arden, despite the presence of tropical plants and animals, has many of the aspects of the forests in which Shakespeare wandered as a boy; and the figures of an artificial Arcadia are balanced by the sun-burnt maids and men of the soil. In a word, he has returned to the old tale of English outlawry and vengeance which had been modified to suit the demands of the Italian pastoral. One of the chief sources of delight in the play is the three lyrics, ‘Under the Greenwood Tree,’ ‘Blow, Blow, Thou Winter Wind,’ and ‘It was a Lover and his Lass.’ As background to other parts of the comedy which keeps the beauty and touches the terrors of our life (laughter and tragedy-in-a-good-humor having kissed), that is the last word of moved representation; embracing the greatest number of elements of fate and character; and telling its story, not with one eye of pity, but with the two of pity and mirth.

The songs represent that perfect blending of poetry and music—the first fine careless rapture of English song which has never been recaptured. Another feature of the play is the large number of popular quotations such as the Duke’s summing up of the uses of adversity, the seven ages of man as characterized by the somewhat cynical Jaques. Rosalind’s marks of a lover and many other passages and phrases that have become proverbial. But these passages are after all subsidiary to the characters who utter them—all of them drawn to the life. Among all these Rosalind stands out as the epitome of femininity. Her brightness, joyousness, her happy nature, "mount and sing like a bird let loose from a cage." The wild-wood freedom of the forest is in her heart, its beauty in her eyes, its summer in her temper. She is the central figure.
throughout the play and at the end naturally plays the rôle of Providence in setting all things right.

EDWIN MIMS,
Head of English Department, Vanderbilt University.

ASA. 3d king of Judah. During the first 10 years of his reign his kingdom enjoyed peace and prosperity, but in the 11th year he was attacked by the Ethiopian king Zerah at the head of a vast army, which he completely routed and pursued. On his return, he met with the prophet Azariah, who encouraged him to persevere in the extermination of idolatry. In the 36th year of his reign, he met with a man who was presented to him by the prophet Hanani for seeking help elsewhere than from the Lord. The incensed king threw the prophet into prison. He died after a prosperous reign of 41 years.

ASABA, a-sá-bá, a town in west Africa, (Nigeria) on the Niger River, 150 miles from the coast. It is the seat of the Supreme Court and contains the central prison, civil and military hospitals and other public buildings. It was the seat of the Royal Niger Company. Near Asaba large deposits of bitumen were discovered in a mineral survey of southern Nigeria. The town has grown rapidly in the last decade and is now an important commercial centre.

ASAPETIDA is a gum resin obtained from the root of Ferula fatida. Although the United States pharmacopoeia limits the producing plant, it is quite probable that asapetida is obtained from two or even three or four species of Ferula, F. narthex, F. falacissima, F. jaschkeanum. The main sources, however, are F. fatida and F. narthex. These are coarse herbs of the Umbellifera family distributed throughout the eastern Asiatic provinces from Persia, Turkestan, Afghanistan. The root is cleaned from the leaves and while growing is cut off close to the ground. This is then covered close to the ground, leaves in five or six weeks a slice is cut off, and from the cut surfaces the juice exudes. This juice has an overpowering odor, which much resembles that of garlic. This on thickening forms the asapetida of commerce. The chemical composition is complex. It consists of resin, gum, ethereal oil, vanillin and furalic acid. Asapetida is highly prized in the East as a seasoning. In medicine it is stimulant to the sympathetic nervous system and is an excellent carminative stimulant and antispasmodic. It is particularly valuable in expelling flatus from the perineal parts. It is also used in hysteria, but in an empirical fashion.

ASA KAWA, a-sá-ká-wá, Kwan-lich, Japanese-American anthropologist; b. Nihonmatsu, Japan, 20 Dec. 1873. After graduating from Waseda University in Tokyo he came to the United States to continue his studies at Dartmouth College and Yale University. For several years he was lecturer on the history and civilization of east Asia at Dartmouth College. In 1906 he returned to Japan, where he was appointed professor of English at Waseda University. Here he remained only a year, however, when he returned to the United States to accept an appointment as instructor in the history of Japanese civilization at Yale University, becoming assistant professor in 1910. Author of 'The Early Institutional Life of Japan' (1903); 'The Russo-Japanese Conflict: Its Causes and Issues' (1904); 'The United States and Japanese Government in Japan after 1600' (1910); 'Origin of Feudal Land-Tenure in Japan' (1914); concluding chapters in the new edition of 'Japan,' edited by Capt. F. Brinkley (1904); edited 'Japan' in the 'History of the Nations Series' (1907).

ASAM, ā-sám, Hans Georg, father of a famous family of Bavarian artists: b. 1649; d. 1711. He was a teacher of architecture at Prague. Notable among his works are his frescoes in the churches at Benediktbeuren and Tegernsee. His son, COSMAS DAMIAN: b. 1690; d. 1742, was also a painter of high rank. Another son, EGGERT QUIRINUS: d. about 1746, was a sculptor who studied at Rome and settled in Munich in 1715. Their works in common were the cathedral of Freising, which they completely remodeled; the decoration of the monasteries of Maria-Einsiedeln and Münster and the church of Saint Emmeram at Regensburg; the building of the Congregational Hall at Ingolstadt and the church of Saint John. Their own residence was another of their architectural works which is considered one of the best examples of the Baroque school of architecture in Germany.

ASAMA-YAMA, a-sá-má-yá-má, an active volcano of Japan about 50 miles northwest of Tokio, 8,280 feet high. Its latest destructive eruption was in 1783.

ASAPH, the Levite and psalmist whom David appointed as leading chorister in the temple. It is supposed that his office became hereditary in his family, or that he founded a school of poets and musicians called, after him, the sons of Asaph.

AS'ARABAC'C'A, a European herb. See ASARUM.

AS'ARUM, a small genus of herbs of the family Aristolochiaceae, widely distributed in rich, shady woods throughout the northern hemisphere. They have odd chocolate or purplish, bell-shaped, three-lobed perianths containing 12 horned stamens. The flowers which are borne close to or upon the ground are hidden by the kidney-shaped or heart-shaped leaves. A. canadense, wild ginger, or Canada snake-root, is warmly aromatic. It is common in the eastern United States and is often cultivated in wild gardens as are also the following species: A. virginicum, A. arbofolium, both common from Virginia southward; A. caudatum, a Pacific coast species, A. lemmoni and A. hartwegi both of the Sierra Nevada of California at altitudes of 4,000 to 7,000 feet. A. euro- paum is also cultivated. It was formerly used as an emetic, a rôle now played by ipecacuanha. Its leaves are still in demand and are deemed efficacious as counter-irritants.

ASBEN (Sahara). See AIR.

ASBESTIC, a by-product in the mining of asbestos suitable for wall plaster. It is a mixture of a second grade asbestos with serpentine which is crushed and mixed with lime and is susceptible of an excellent finish.
ASBESTOS

ASBESTOS (named from a Greek compound word signifying unextinguishable, incom- bustible), a fibrous fireproof mineral substance, one of the most remarkable found in nature. Serpentine asbestos is the kind most familiar to the public; this is chrysotile asbestos. The most important is chrysotile, the fibrous form of serpentine (\(H_2MgSi_2O_5\)). Actinolite \([Ca(MgFe)_2(SiO_3)]\) yields a variety usually known as hornblende asbestos. Another variety comes from the mineral known as anthophyllite (\(MgFe)SiO_3\)). The fibres formed by the chemical combination above given are perfectly smooth, and in this respect are different from all other known fibres. Paradoxically, it is at once fibrous and crystalline, elastic and brittle, heavy as a rock in its crude state, yet as light as thistledown when treated mechanically. Added to this, its fibres, soft, white and delicate, have, by their inherent quality of indestructibility, withstood the action of the elements since the world began. Asbestos is found widely distributed throughout the world, but the principal supply of crude asbestos suitable for the manufacture of fireproof cloths and curtains comes from near Black Lake and Thetford, Canada, about 75 miles from Quebec, where it has been mined since 1877. The Italian, Corsican and South American (or South American) has a longer, strong fibre, but owing to its stiffness and horniness it cannot be manufactured into a fine fabric, hence the superiority of the Canadian asbestos and its large consumption in the United States.

The asbestos usually occurs in veins, most commonly in serpentine rock which has resulted from the alteration of basic igneous rock, usually peridotites (q.v.). The chrysotile commonly occurs with the fibres across the vein, and is known as “cross fibre.” The hornblende asbestos more often occurs along slip fractures with the fibre parallel to the plane of slipping, and is called “slip fibre.”

The mining of asbestos differs radically from the mining of other minerals, since no shafts are sunk, but excavations are made in the open, somewhat after the manner of a stone quarry. Canadian asbestos, however, is found in narrow veins or seams about an inch and a quarter in thickness, and embedded in rock which is easily severed from it. The rock to which the mineral is attached shows fresh fracture a serpentine mineral of a green shade containing finely divided particles of chromic and magnetic iron. The asbestos on cleavage presents a brilliant, dark-green surface by reflected light, but the fibres after they are detached are perfectly white. The act of separating the mineral from its matrix of rock is termed “hand cobbing,” and after this process the mineral is shipped to various factories in the United States.

The process of manufacture begins by placing the asbestos mineral in a chaser mill, a machine resembling a rolling mill, and revolving at the end of a radical arm in a trough, which crushes the mineral, dividing the fibres without destroying them. The result is a snowy mass of mineral wool ready for winnowing, a method of removing the minute particles of rock still clinging to the fibres very much like the winnowing of grain. A blast of air, which separates and blows away the foreign matter, leaving the fibres in a refined state and in proper condition for the third stage of manufacture. This is termed air fibre raising, and as the name implies, the fibres are raised by a current of air produced by a blower of large dimensions through a vertical pipe inclined at a small angle. The object of this procedure will be obvious, when it is stated that the air blown across the fibres causes those of coarser texture to be deposited in a compartment near the bottom of the pipe. The medium fibres will be projected a little higher, and these will fall into a second compartment. The finer fibres will be blown to a higher point, and there collected, while the dust will be carried to the top and deposited. The fibres are in this way sorted into different lots according to their texture and are ready to be made into articles for which they are best adapted. The fluffy stuff now goes to the carding room, just as though it were genuine wool sheared from a sheep or pure cotton fresh from the plant on which it grows, instead of a mineral substance that in its original state was mined like a lump of anthracite coal. A carding machine, similar to that employed in preparing wool, cotton or flax fibres before spinning, has been adopted by the manufacturers. The problem of mechanically combing these fibres was no small one, and the carding takes place in a machine having a large central rotating cylinder covered with card clothing, that is, strips of leather set with projecting wires termed teeth. Around the main cylinder there are a number of smaller cylinders, also provided with card clothing, which engages the teeth of the central cylinder rotating in the reverse direction. This machine straightens out the fibres and lays them parallel; after passing through the first breaker, they are fed into a second carding engine or breaker, which is set to a finer gauge than the preceding. A third and last carding process takes place in a machine called a finisher or condenser, when all the irregularities are eliminated, and the fibres are stripped from the final cylinder by means of a fly-comb and are converted into unspun threads, when they are delivered on a travelling apron or endless band, and are gathered into rows by reciprocating scrapers; they are then condensed, and the process is continued in the coiling cans. In spinning the yarn, the forgings are delivered to the spindles on a carriage, which then recedes, when the fibres are twisted, and returns when the spun asbestos yarn is wound on the spindles. The spinning frames do not draw the yarn, and no strain is placed on it until after it is twisted. This brings the manufacture of the fireproof material to a point where it is to be woven into cloth, packing, or other forms; for asbestos is used for divers other purposes than those appertaining to theatres.

While adulterated asbestos may be used in some of the mechanical arts, for theatrical hangings and such purposes, its purity should be high, and it forms one of the safest barriers against the calamity of fire. As a matter of fact, much of
that which is termed commercially pure asbestos cloth contains from 5 to 20 per cent of combustible matter, but absolutely pure American-made cloth may be obtained. Not only is protection given in asbestos cloth for protection against fire, but strength as well; and after asbestos is subjected to a high temperature, it has a tendency to powder, when, owing to its weight, it may break through, and its utility be impaired.

One of the leading manufacturers has made an improvement in weaving asbestos cloth for theatre curtains; it consists of two strands of asbestos spun around a strand of high-temperature-melting brass wire, so that the wire is completely embedded and concealed. These asbestos metallic strands form the warp, so that the threads run the long way of the cloth when finished. The weft, or filling-in cross threads, is made of plain, pure asbestos. Such a curtain will stand well under a severe high-temperature test without breaking. Not only theatre curtains, but set scenery of all kinds may be constructed of asbestos. Scenic artists find it more difficult to paint, but the finer textures may be utilized for this purpose; and although asbestos cloth does not take colors as satisfactorily as cheese cloth and burlap, yet its use should be provided for wherever audiences are to be assembled. Flooring and woodwork in general may easily be replaced by compressed asbestos fibre board, and it has been shown that the latter may be stained, polished and finished to as high a degree as wood. All the upholstery should be of pure asbestos cloth, and carpeting is also made to take the place of the combustible vegetable and animal fibres now used so extensively. One of the peculiar properties of asbestos carpeting is that the longer it is in service, the tougher it becomes.

Asbestos is utilized in the arts in many other forms than cloth; it may be worked into a pulp, and a fireproof paper is obtained. This paper is now used on roofs, between walls, flooring, etc. Fireproof rope three-eighths inch in diameter is used in the suspension of curtains and other uses is made, having a tensile strength of 1,650 pounds per foot. High-grade asbestos plaster is fireproof, sound-proof, and hangs together with great tenacity when subjected to water.

In the United States asbestos is produced in five States—Arizona, California, Idaho, Georgia and Virginia. Of these Arizona and Georgia yield the largest output; Arizona of high grade fibre, and Georgia of fibre below the spinning grade. The asbestos of Arizona is chrysotile, and occurs in serpentine associated with lime-stone altered by intrusions of di-basite. The strata are nearly horizontal, and are exposed along the walls of canyons throughout the State. The asbestos is worked out by tunneling into the canyon wall. Two grades are secured; one very fine and silky of first-class spinning quality, and the other harsh, splintery and quite unsuited for textile purposes. Both qualities are found in the same mine. The Arizona asbestos has a much smaller percentage of iron than the Canadian staple, and is, therefore, better adapted for Georgia where the asbestos mine near Sall Mountain has been for years the largest producer of asbestos in the United States. Only the surface portion of the deposit, which has been softened by weathering, is milled for fibre; the deeper lying rock is too hard.

California, Idaho, and Virginia produce no fibre of spinning grade, and their output is small. It is used chiefly for making fibre board and heat insulation, and as a filler for fire-proofing cements, plaster and paints.

An undeveloped source, considered of great possibilities, is the area of asbestos-bearing rocks of Vermont, an extensive aggregate of asbestos deposits of the Quebec region of Canada. Enough work has been done in this section to demonstrate its potential value.

The marketed production of asbestos in the United States in 1916 was 1,479 short tons, valued at $448,214. In addition to this supply, 114,978 tons of raw fibre, valued at $3,069,617, were imported from Canada; 1,072 tons, valued at $223,228, from England; and 112 tons, valued at $10,625, from British South Africa. There was also imported a value of $3,994 in manufactured articles of asbestos, nearly all of which came from England. The asbestos mines of Quebec were extremely active in 1916. Their shipments amounted to 133,339 tons, valued at $1,182,905; of which the United States bought 86 per cent. The market, however, was so scantily supplied that prices rose from the average normal of $350 to $400 per ton for high grade fibre, to $1,250 per ton, and in some cases much higher; and even the low grade short fibre brought 100 per cent more than its usual price. (See Mineral Production of the United States). Consult Cirkel, F., 'Chrysotile Asbestos' (Canada Department of Mines, Ottawa 1910).

ASBJÖRNSEN, as-byrn'sen, Peter Kristensen, a Norwegian folklorist and zoologist. b. Christiania, 15 Jan. 1812; d. there, 6 Jan. 1885. While pursuing botanical and zoological studies, and subsequently during various travels at government expense, he collected folk tales and legends, aided by his friend Jørgen Moe, with whom he published 'Norwegian Fairy Tales' (1842-44); and 'Norwegian Gnome Stories and Folk Legends' (1845-48; 3d ed., 1870), pronounced by Jacob Grimm the best fairy tales in existence. Consult Braekstad, 'Fairy Tales from the Far North' (Norway, 1857); Dasent, G., 'Popular Tales from the North' and 'Tales from the Fjeld' (London).}

ASBOOTH, ösh'bót, Sandor (Alexander), a Hungarian-American soldier: b. in 1811; d. in 1868. He came to America with Kossuth in 1851, and became a United States citizen, serving in the Civil War in the Federal army, attaining the rank of a brevet major-general. He was United States Minister to Argentina when he died from wounds received in 1862 and 1864.

ASBURY, az'ber-i, Francis, the first bishop of the Methodist Episcopal Church in the United States. He was born in Handsworth, Staffordshire, England, 20 Aug. 1745; d. Spottsylvania, Va., 31 March 1816. He joined the local ministry of the Methodists at the age of 16, the itinerant ministry six years later, and was sent by John Wesley as missionary to America at the age of 27. He was appointed by Wesley general superintendent of the connection in America, the duties of which office he exercised through the entire period of the American Revolution. Until the termina-
tion of the war the Methodists of America had called themselves members of the Church of England, and were their laymen. They now considered the political changes of the country as separating them from that Church, and therefore established an organization for themselves. Francis Asbury was constituted the first bishop of the new Church (1784), which office he held till his death. During the 30 years of his episcopal labors he traveled annually from the Androscoggin to the Gulf of Mexico, and from the Atlantic to the Mississippi, ordained not less than 3,000 preachers, and preached about 17,000 sermons. Identified with the religious interests of this country through the two great struggles which have so greatly modified our political and social character, he became eminently American in his sympathies and character, and left the mark of his native enthusiasm and energy upon the ecclesiastical history of the United States. He wrote his journals, published in New York 1852. (3 vols.)

ASBURY PARK, N. J., a city and popular summer resort in Monmouth County on the Atlantic Ocean, six miles south of Long Branch and 40 miles south of New York city. It is on the line of the Pennsylvania and the Central Railroad of New Jersey. It adjoins Ocean Grove on the north, being separated from it by the Atlantic. It was founded in 1869, and given a city charter in 1897. It has a property valuation of $3,000,000. Asbury Park and Ocean Grove were originally laid out by members of the Methodist Episcopal Church for camp meetings and other purposes. At Ocean Grove is one of the largest musical auditoriums in the country. The beach front, waterworks and sewage system are owned by the municipality. Pop. (1910) 10,150; in summer, 25,000 and upward.

ASCALON, or ASHEKELON, a ruined town of Palestine, on the sea-coast, 40 miles west-southwest of Jerusalem. It was noted during the Crusades, Godfrey de Bouillon gaining here a great victory over the Egyptians in 1099, and it was captured by the English, under Richard I, in 1191. During the European War Ascalon was taken by the British 10 Nov. 1917. Its site is now a complete scene of desolation. See War, European; Turkish Campaign.

ASCANIUS, a son of Eneas and Creusa, who accompanied his father to Italy. He supported Eneas in his war with the Latins, and succeeded him in the government of Latium. His descendants ruled over Alba for 420 years. He is known also as Iulus.

ASCARIS. See Round-worm; Thread-worms.

ASCENDANTS, in law, the opposites to descendants in succession. When a father succeeds his son, or an uncle his nephew, etc., the inheritance is said to ascend or to go to ascendants.

ASCENSION, an isolated volcanic island 700 miles northwest of Saint Helena, near the middle of the south Atlantic Ocean, about 7° 55' S.; long. 14° 21' W.; area about 34 square miles. It belongs to Great Britain; is the aerodrome for the British West African squadron. There are about 200 inhabitants, mainly government employees and their families. Ascension is celebrated for its turtle, which weigh in many cases from 500 to 800 pounds. This island was discovered on Ascension Day, 1502, by the Portuguese, who gave it its name; but it was never formally occupied by any nation till Great Britain took possession of it in 1815, after the transportation of Napoleon to Saint Helena. The island is connected by cable with Buenos Aires, England and the Cape.

ASCENSION, Right, a term employed in astronomy in allusion to the position of a star or other heavenly body. Such position is known when we know the right ascension and declination, these terms corresponding respectively to longitude and latitude as applied to the position of places on the globe. Right ascension is measured on the equinoctial or celestial equator, the first point of Aries being taken as the starting point. The ascension of any star is the distance measured eastward along the celestial equator from the first point of Aries to the point where an hour-circle, passing through the star, cuts the equator. The right ascension is easily found by means of the sidereal clock, which, when the first point of Aries passes the meridian, gives the time as 0 hours, 0 minutes, 0 seconds. By noting on the clock the time at which the body is on the meridian, we obtain the right ascension in time, which may be converted into degrees, minutes and seconds at the rate of one hour to 15°.

ASCENSION DAY, a religious festival of many churches in commemoration of the ascension of the Saviour. It is a movable feast, always falling on the Thursday but one before Whitsun tide. It was first observed for the 4th century.

ASCETICISM is the exercise of the faculties in moral and religious practices, the application of Saint Paul's comparison between an athlete's and a Christian's life. (1 Cor. 9: 27.) It is negative, when the object of this exercise is to avoid evil, to curb vicious tendencies, moderate excessive passion, and deny the soul and body any indulgence which might become inordinate or unlawful, and whenever it implies active measures against such disorders as gluttony, sloth, anger, pride and lust, by abstinence, fasting, watching, self-restraint, modesty and habits conducive to continence. It is positive, when its object is the exercise or training in the virtues which perfect life, and the cultivation of the means most efficacious for this end, such as devout reading, especially of the scripture, meditation, prayer, examination of conscience, exertion and sacrifice for the good of others, zealous promotion of good enterprises; in a word, anything that can help one to do what is best, constantly, unhesitatingly and with facility. This is the aim of all asceticism, whether based on the principles of natural or of positive and revealed law. This aim, as well as many others, as enumerated, is found to some extent in Pagan and Jewish, as well as in Christian asceticism. The latter employs additional means of, inculcating and developing the habit of virtue, such
as the religious life, divine worship, and in particular the sacramental system of the Church. Asceticism has some part in every rightly regulated life, even in one based purely on purely ascetic principles. Every sincere Christian is, accordingly, an ascetic; some are profoundly so, men and women, whether in the conventional cloister or domestic circle, who strive to acquire by daily practice habits of virtue, and to advance in holiness. Naturally counsel and direction are needed in a matter so difficult, and it is for want of due attention to these that asceticism is often misunderstood, and is regarded by some as grotesque, a shield for certain excesses and extravagances, associated often with the external observances of communities like the Essenes, with the singularities of some hermits and anchorites, the frenzy of fanatics like the Flagellants, the exclusiveness of the Brahmins, the ablations of the Moham- medan, the dream of men like those composing the Brook Farringdon Community. To appreciate asceticism in its normal exercise, one must study it in the examples of men and women noted for its exercise, or in the books whose guidance they followed, in works of the great ascetical and sermon writers, but chiefly in scripture, and in the life of Christ and of persons distinguished for holiness.

E., "Prolegomena to Study of Greek Religion" (1905); Hastings, "Encyclopedia of Religion and Ethics" (gives a remarkably complete treatment of this topic); Moore, "Greek and Roman Ascetic Tendencies" (Boston 1912); Tylor, E. B., "Primitive Culture" (1908); Zoeeckel, O., "Askeuse und Moenchtum" (1897).

ASCETICS, a name originally given to those Christians who devoted themselves to solitary life, and strove to distinguish themselves from the world by abstinence from sensual enjoyments and by voluntary penances. Hence those writings which teach the spiritual exercises of piety are termed ascetic writings. Even before Christ, and in the time of the early Christian Church, there were similar ascetics among the Jews, such as the Essenes, also among the philosophers of Greece, and in particular among the Platonics. The expression is borrowed from the Greek word ἀσκητός (exert), used to signify some one who conducted a spare diet of the athlete, who, to prepare themselves for their combats, abstained from many indulgences. Consult Frazer, J. G., "The Golden Bough" (London 1900); Moore, G., "Greek and Roman Ascetic Tendencies" (Boston 1912); Müller, F. Max (ed.), "Sacred Books of the East" (London).

ASCH, āsh, manufacturing town in the extreme northwest corner of Bohemia. It contains a large Protestant and a newly erected Roman Catholic Church, a real-school, schools of Queen, reading several hundred boys mainly employed in cotton, wooden and silk manufacture, bleachfields and dye-works. Pop. (1910) 21,583.

ASCHAFFENBURG, a-shá'-fen-burg, a town, of Bavaria, 26 miles east-southeast of Frankfort. The chief edifice is castle of Johannisberg, built in 1605–14. There is also the Pompeianum, an escape built by King Louis of Bavaria, in imitation of the Casa del questore (commonly called the Castor and Pollux House) at Pompeii. The principal industries are the manufactures of colored paper, tobacco and liquors. There are salt works, and an extensive trade is done in wine and timber. Aschaffenburg long belonged to the archbishops of Mainz. Pop. 31,000.

ASCHAM, āsk-kam, Roger, English scholar: b. Kirby Wiske, Yorkshire, 1515; d. London, 30 Dec. 1568. While still a child, he was taken into the family of Sir Anthony Wingfield and educated with the latter's children. He made rapid progress in English and classical studies, and was taught archery by Sir Anthony himself. The same generous patron sent him in 1530 to Saint John's College, Cambridge, where he read nearly all existing books. Having acquired an elegant Latin style that proved most useful to him later, and developed an especial aptitude for Greek, which he taught to students younger than himself. Besides this, he paid some attention to mathematics, became an accomplished musician, and acquired remarkable skill in penmanship. He received his B.A. degree in February 1533–34, and became a fellow of his college. His reputation for Greek learning soon brought him many pupils, several of whom later rose to high places. A number of students from other colleges attended his lectures. In five years, he afterward said, Sophocles and Euripides had become as his college as familiar as Plautus had been previously, and Demosthenes was as much discussed as Cicero. The beauty of his handwriting and the purity of his Latin led to his being employed to write the official letters of the university. He took an active part in the controversy as to the correct mode of pronouncing Greek, opposing Dr John Cheke's system, but later adopting it. In 1543–44 he wrote his famous treatise on archery, 'Toxophilus,' and in person presented a copy of it to Henry VIII, who so approved of the work that he gave the author an annual pension of £10, which was renewed by Edward VI, whose Latin secretary Ascham became. In 1548 he was appointed tutor to Princess Elizabeth. He read with her all 'Cicero,' the greater part of 'Livy,' the 'New Testament' in Greek, 'Isocrates,' 'Sophocles,' and portions of 'Cyprian' and 'Melancthon.' Two years later he was nominated secretary to Sir Richard Moryson, ambassador to the Emperor Charles V. Their headquarters were at Augsburg, but Ascham made trips to Louvain, Halle, Innsbruck, Venice and Brussels, visiting famous teachers and scholars. He lived on excellent terms with Sir Richard, reading Greek with five days in the week. The death of Edward caused the recall of the embassy in 1553, when Ascham became Latin secretary to Queen Mary. With the accession of Elizabeth, he was continued in his offices, and became in addition private tutor to the princess. He continued his studies in the learned languages. She bestowed on him the prebend of Wetwang in York Cathedral 5 Oct. 1559. His last years were filled with.
anxiety and care due to domestic afflictions and pecuniary embarrassment. Between 1563 and his death he found relief in the composition of his best known work, 'The Scholemaster,' of which he completed two books. The first is a general discussion of education with arguments in favor of inducing a child to study by gentle-ness rather than by force. The second is an exposition of his famous method of teaching Latin, by means of "double translation," etc., a method which has been endorsed by all subsequent writers on the theory and methods of education. When Queen Elizabeth heard of Ascham's death, she is said to have exclaimed that she would rather have cast £10,000 into the sea than to have lost her tutor, Ascham. Scholars in England and on the Continent mourned for him, and expressed their grief in stately Latin verses. In English literature Ascham has a secure place on account of the strength and vigor of his English prose, highly Latinized though it was in construction and vocabulary. His style is without the tricks that Lyby introduced, and has an easy flow and straightforwardness.

Bibliography.—By far the best edition of Ascham's writings is 'The Whole Works of Roger Ascham...,' with a Life by Dr. J. A. Giles (3 vols. in 4 parts, London 1864-65). This edition includes 295 Latin and English letters, many printed for the first time. Toxophilus was first published in 1545; other editions appeared in 1571, 1589, 1788, 1821, 1865 (by J. A. Giles), 1868 (by E. Arber). 'The Scholemaster' was first issued 1570; was followed by editions in 1571, 1572, 1573, 1579, 1583, 1589, 1711, 1743. Prof. J. E. B. Mayor published the best modern edition 1863, and E. Arber reproduced the first edition 1870. The best expositions of Ascham's educational system is in R. H. Quick's 'Essays on Educational Reformers' (1868). His English works, edited by Wright, were published in 1905.

ASCHBACH, äš-bähk, Joseph, German historian: b. Höchst, on the Main, 29 April 1801; d. Vienna, 25 April 1882. He studied at Heidelberg, at first taking up philosophy and theology and later history. In 1842 he was appointed professor of history at Bonn University. Several years later he was called to fill the same position in the University of Vienna where he remained until 1872. In his 'Geschichte der Westgoten' (Frankfurt 1827) he cleared up what had been until then a very obscure period in history. Among his other works are 'Geschichte der Omajjad in Spanien' (1829); 'Geschichte Kaiser Sigismundus' (1834-45); 'Geschichte der Wiener Universität' (1865); 'Roswitha und Konrad Celtes' (1867).

ASCHERSLEBEN, äš-ersh-lë'bën, a town of Prussian Saxony, in the district of Magdeburg. It is walled and entered by five gates, and contains several churches, a synagogue, and a real-school of the first class. There are manufactures of woolen goods, paper, sugar, artificial manures, earthenware, etc. Among several interesting ruins in the vicinity is the old castle of Aschern, the cradle of the house of Hanolf. Pop. about 29,000.

ASCHERSON, äš-ør-zön, Paul Friedrich August, German botanist: b. Berlin, 4 June 1834; d. 1913. In 1873 he was appointed professor of botany at the University of Berlin. A few months later he accompanied Rohlfis as botanist on an expedition to the Libyan Desert. The following winter he paid a visit alone to the Little Oasis. In 1884 he was appointed custodian of the Botanical Museum of Berlin. Among his works are 'Flora der Provinz Brandenburg' (Berlin 1864); 'Synopsis der mitteleuropäischen Flora' (2d ed., 1912). He also collaborated with Rohlfis on 'Reise von Tripolis nach Bagdad' (2d ed., 1901).

ASCIDS, äš-ðn, people who live on the equator and consequently, at midday, twice a year, have the sun directly overhead.

ASCIDIAN, a marine animal, so called from Ascidia, a genus of Tunicata. Ascidians were once regarded as mollusks, and afterward as worms, but when their embryology and early stages were studied it was found that they passed through a tadpole-like stage, in which the tail is supported by a notochord, and that in other respects they approached the vertebrates, they were placed with the vertebrates in the group Chordata. The simplex ascidians attain to a large size, A. callosus measures 6 inches in diameter, quite round, and in shape and color much like a potato. The "sea-peach" (Cynthia pyriformis) is of the size and general shape of a peach, with its rich bloom and reddish tints. It is common at a depth of 10 to 50 fathoms on both sides of the north Atlantic. While other forms, as Botlia, are stalked and fixed to the bottom, certain pelagic forms, as Pyrosoma and Salpa (q.v.), are free-swimming. The compound ascidians, such as Ammocetum, grow in white or reddish masses on sea-weeds, rocks, shells, etc., the individual animals being minute. The interesting form Perophora grows in bunches on piles and wharves on the southern coast of New England; it is perfectly transparent, so that the heart and circulation of the blood can readily be observed under the microscope. The heart is a straight tube, open at each end; after beating for a number of times, throwing the blood with its corpuscles in one direction, the beatings or contractions are regularly reversed, and the blood forced in an opposite direction. For a general account of the anatomy, development and metamorphoses of these animals, see Tunicata.

ASCLEPIADAECÉ, a family of more than 200 genera and 2,000 species of dicotyledonous herbs and shrubs, most of them with milky juice and many of them twining. The species are widely distributed in the temperate and tropical zones of both hemispheres and are especially abundant in Africa. They differ greatly in their characteristics and uses; some, like Stephanois floribunda, are delightfully fragrant; others, like Stapelia gigantea, carrion flower, are repellently odoriferous. Some species yield a fibre from their stems or their pods; some are used in medicine; others are planted for ornament. The flowers are usually borne by opposite or whorled, seldom scattered, entire leaves without stipules; umbels of symmetrical flowers, without calyx and with a five-parted corolla with often reflexed lobes; five stamens attached to the corolla and surrounding the stigma; pollen grains more or less coherent; the ovary composed of two carpels; style short; stigma discoid; fruit a follicle or pod; seed flattened, with long silky hairs, which
ASCLEPIADES, aś-kle-пи-дез, the name of several ancient Greek writers—poets, grammarians, etc.—of whom little is known, as well as of several physicians, the most celebrated of whom was Asclepiades, of Bithynia, who acquired considerable repute at Rome about the beginning of the 1st century B.C. Though it is doubtful if he ever learned either medicine or physiology, he obtained some measure of success by prescribing adherence to simple hygienic rules.

ASCLEPIAS, milkweed, silkweed, the type genus, of about 125 species, of the family *Asclepiadaceae* (q.v.), the species of which are mostly erect perennial weeds with thick, deep roots common in pastures and waste places. Some furnish a fibre strong enough for ropes, and the silky dandelion, in which the seeds are often used for stuffing pillows, etc. The young shoots of some species are occasionally cooked like asparagus, which they are said to resemble somewhat. *A. tuberosa*, butterfly-weed, pleurisy root, common in dry banks and fields from New England to Florida, is very showy and seems to deserve a place in the flower-garden. Other well-known American species are *A. rubra*, *A. purpurascens*, *A. syriaca*, etc. The few species cultivated for ornament in America are generally foreign. The genus is named in honor of the Greek god Asclepeine, since some of the species are reputed carminatives, sudorifics and expectorants. Medicinally the milkweeds are of secondary value only. They are irritating, and cause nausea, vomiting and diarrhea. They also cause diuresis and diaphoresis, but their exact action is in need of investigation.

ASCOLI, aś-kō-λē, Graziai Isaia, Jewish-Italian philologist: b. Görz, Austria, 16 July 1829; d. 1907. At the age of 16 he had prepared a paper on south-European dialects which showed remarkable originality. In spite of the fact that he had had no collegiate training, he was, after the publication of his first work, 'Studi orientali linguistici' (1854), appointed professor of philology at the Academy of Milan. He was elected a member of the Institute of France, and of the Academies of Vienna, Budapest, Berlin and St. Petersburg, and in 1888 to the Italian Senate. His most notable work is 'Saggi ladin' (1873).

ASCOLI, or ASCOLI PICENO, aś-kō-लē pēchānō (the ancient Asculum), an Italian town, 90 miles northeast of Rome. The town, one of the most ancient in Italy, is well built, and contains many handsome edifices and noble mansions, and the remains of an ancient theatre, temples, etc. It has manufactories of woolen cloths, leather, hats, cream of tartar, chinaware, sealing-wax, paper and glass. It has an active trade, and is, at the mouth of the river Tronto, is much frequented by coasting vessels. Pop. about 30,000.

ASCOLI SATRIANO (anc. Asculum Apulum), a town of southern Italy, 20 miles south of Foggia. Pop. about 10,000.

ASCOMYCETES, a large and important group of fungi, so called from their spores being contained in asci or sacs. This group includes mildews, rusts, smuts, the truffles, the morel and (according to Schwendener and other authorities) the lichens. Consult Engler and Prantl, 'Die natürlichen Pflanzenfamilien.' See FUNGI.

ASCONIUS (QUINTUS A. PEDIANUS), a Roman historian of the 1st century A.D., who wrote a life of Sallust, a reply to the critics of Virgil, and valuable commentaries to Cicero's orations, some of which are extant.

ASCOT, a celebrated English race-course in Berkshire, near the southwest extremity of the Windsor park and 29 miles southwest of London. The annual races, which take place in the second week in June, are attended by the fashionable and sporting public. From the accounts of the master of horse for the year 1712 it would appear that they were instituted, not in 1727, as is commonly supposed, but by Queen Anne on 6 Aug. 1711. Consult Cawthorne, 'Royal Ascot' (1802).

ASDOOD, or ASDOUD, a seaport of Palestine, on the Mediterranean, 35 miles west of Jerusalem. It was the Ashod of scripture, one of the five confederate cities of the Philistines and one of the seats of the worship of Dagon (1 Sam. vi. 5). It occupied a commanding position on the high road from Palestine to Egypt, and was never subdued by the Israelites. It sustained against Psammethichus a siege of 29 years; was destroyed by the Maccabees, and restored by the Romans. It is now an insignificant village, from which the sea is constantly receding.

ASELLI, aś-sēlē, Gasparro, a famous Italian physician: b. Cremona about 1580; d. 1626. He was professor of anatomy and surgery at Padua, and in 1623 discovered the lachrymal vessels, which he seems, however, never to have understood or described with complete accuracy. He left a treatise, 'De Lactibus' (1627).

ASELLUS, a fresh-water isopod crustacean, allied to the wood-lice (q.v.), common in ponds and standing water, under sticks and stones, and in open caves. These crustaceans differ from the common pill bugs of the land in having a pair of rather narrow two-jointed caudal appendages and antennae of the second pair reaching to the telson. The body is broad and flat, with a broad shield-like telson, formed by the fusion of the last abdominal segments. There are six pairs of legs arising from the middle region of the body between the head and telson. The female carries her eggs under her breast, behind the head. Respiration is carried on by several pairs of broad, gill-like sacs appended to the broad, flat, abdominal legs. Blind individuals occur in caves, which are allied to the true blind *Asellus cecidota*.

ASEN, aś-ən, in northern mythology, the most powerful of the gods. They included 12 gods and the same number of goddesses, among the most renowned of whom were Odin, Thor, Baldur, Freyr, Frigg, Freyja, Idunna, Eira and Saga. Their dwelling was Asgard, a city built of wood. Though this worship was native only to the tribes of Scandinavia, its influence extended throughout ancient Germany, and may still be traced in many German proper names. Thus
the German names of the days of the week, which through the Saxons became incorporated into the English language, are derived from this mythology (see Asgard). Asen was also the name of several medieval czars of Bulgaria.

ASENATH, the daughter of Potipherah, priest of On, and the wife of Joseph (Gen. xli. 45, 50).

ASEPSIS. See Antiseptics.

ASEXUAL GENERATION. See Parthenogenesis.

ASGARD, ás'gár'd, the home of the Æsir, or the gods, and the Olympus of northern mythology. The city of Asgard is fabled to have been built in the middle of Ida's plain, the very centre of the universe. Here the Æsir erected a court for themselves with seats for 12 and one high seat for Odin, the All-father, and also a lofty abode for the goddesses, called Viengolf. They worked diligently, played at games, were rich in gold and all precious things, and happy, till three maidens from Jotunheim, the giants' world, crossed Ida's plain and entered Asaheim, when corruption spread among its inmates. Asgard had many mansions, the largest and noblest of which was Gladheim; while another not so spacious, but the fairest of all and brighter than the sun, was called Gimil. See Scandinavian Mythology.

ASGILL, ás'gíll, John, English writer: b. Hanley Castle 1659; d. 1738. He was bred to the law, and gained considerable reputation, not only by skill in his profession, but from his pamphlet declaring that man might pass into eternal life without dying. In 1701 he took his seat in the Irish Parliament; but was dismissed after four days on account of his so-called blasphemous pamphlet. In 1705 he sat in the English Parliament for Bramer; but in 1707 he was expelled, nominally on account of his ununctuous pamphlet, but really, perhaps because of his debts. The remainder of his life he spent in the Fleet and King's Bench prisons, in one of which he died. He wrote a number of pamphlets against the Pretender in behalf of the Hanoverian succession.

ASH (Fraxinus), a genus of about 50 species of hardy, ornamental trees of the family Oleaceae, natives mainly of North America, Europe and western Asia. The species are prized for street and park planting for which their usually tall pyramidal or broad-topped habit and light green foliage, which turns yellow or purple in autumn but which falls early, make them specially attractive. From the elegance of their forms several species, notably the first mentioned below, have been called the Venus of the forest; the oak being the Hercules. The leaves are rather large, opposite, pinnate and deciduous; the flowers greenish or whitish in panicles, appearing either before, with or after the leaves; the fruits are rather small samaras. Since grass and other plants do not grow well in the immediate vicinity of the ash it is not a good lawn tree. The common ash (Fraxinus excelsior), a native of Europe and western Asia, found in its perfection upon loamy soil, often attains a height of 120 or even 150 feet. It also thrives in exposed and elevated situations better than many other trees. Its naked flowers appear long before the leaves, which drop early in the autumn, but during the summer are very ornamental. Its leaflets are sessile and toothed. Its tough, hard, white wood makes excellent fuel and is highly valued for turning (for carriage wheels, especially) when the tree has grown rapidly, since the toughness is then very great. It is then particularly valuable for carriage shafts, ladders, and handles of agricultural tools, such as rakes, pitchforks and hoes, where plasticity, toughness and lightness are essential. For such uses its only important rival in America is the hickory. When gnarled, as it occasionally is, it is prepared like 'curly' maple for cabinet work and furniture, especially fine-grained specimens being used as veneer. The bark is used to some extent in leather tanning. A large number of cultivated varieties have been produced, among which the most remarkable are: monophylla, with simple instead of compound leaves or with only one or two small leaflets on the base of the main leaf-blade; albo-marginata, the leaflets of which are bordered with white; albo-variegata, with mottled white and green leaflets; aurea, yellow-branched; aurea-pendula, drooping yellow branches; pendula, one of the best weeping trees; crispa, with very dark green leaves. The American or white ash (F. americana), a very variable species common from New Brunswick to Florida and westward to Minnesota and Texas, attains about the same size as the preceding species, but has lighter bark and leaves. The leaflets have short stalks and are entire. In rich, moist, dense woods the trunks often attain a height of 40 feet without a branch, thus furnishing valuable timber, which is used for the finest cabinet work and for molding and other high-class uses. There are many varieties which more or less resemble those of the common ash. The black or water ash (F. nigra), common in swamps and upon stream banks from Nova Scotia to Minnesota and southward to Missouri and Virginia, often attains a height of 80 feet. Its wood is softer than that of the preceding, but, being tough and easily separable longitudinally into layers, is largely used for veneer, baskets, barrel staves and hoops. The red ash (F. pennsylvanica) is common in low-lying places in the United States and in the south-western part of the United States. The common alpine ash (Fraxinus excelsior), a native of Europe and western Asia, found in its perfection upon loamy soil, often attains a height of 120 or even 150 feet. It also thrives in exposed and elevated situations better than many other trees. Its naked flowers appear long before the leaves, which drop early in the autumn, but during the summer are very ornamental. Its leaflets are sessile and toothed. Its tough, hard, white wood makes excellent fuel and is highly valued for turning (for carriage wheels, especially) when the tree has grown rapidly, since the toughness is then very great. It is then particularly valuable for carriage shafts, ladders, and handles of agricultural tools, such as rakes, pitchforks and hoes, where plasticity, toughness and lightness are essential. For such uses its only important rival in America is the hickory. When gnarled, as it occasionally is, it is prepared like 'curly' maple for cabinet work and furniture, especially fine-grained specimens being used as veneer. There are many varieties which more or less resemble those of the common ash. The black or water ash (F. nigra), common in swamps and upon stream banks from Nova Scotia to Minnesota and southward to Missouri and Virginia, often attains a height of 80 feet. Its wood is softer than that of the preceding, but, being tough and easily separable longitudinally into layers, is largely used for veneer, baskets, barrel staves and hoops. The red ash (F. pennsylvanica) is common in low-lying places in the United States and in the south-western part of the United States. The common alpine ash (Fraxinus excelsior), a native of Europe and western Asia, found in its perfection upon loamy soil, often attains a height of 120 or even 150 feet. It also thrives in exposed and elevated situations better than many other trees. Its naked flowers appear long before the leaves, which drop early in the autumn, but during the
(F. caroliniana) seldom exceeds 40 feet in height, but is noted for its very large leaves. It is distributed from Virginia to Florida and westward to Arkansas and Texas, being most plentiful in swamps, along watercourses and in damp, rich woods. Its wood is used like that of the white ash. F. cuspidata, a native of the southwestern United States and northern Mexico, is a shrub or small tree which seldom exceeds 30 feet in height. One of its conspicuous panicles of fragrant flowers is often planted in temperate climates for ornamental purposes. F. velutina, another species of the same region, seldom attains a height of 50 feet, and not being hardy is confined to southern planting. The mansa or flowering ash (F. Ormus), a native of southern Europe and western Asia, is a small tree 25 feet tall which resembles the common ash. It furnishes mansa (q.v.). It is a native of Greece. Many other species are of botanical, economic or ornamental interest, but probably none of as much importance as the species mentioned. The mountain ash (q.v.), a member of the family Malaccae, obtains its name from its ash-like leaves. Coomassie (q.v.). See also Dictionary of Gardening (1888); Bailey, 'Standard Cyclopedia of Horticulture' (1914).

ASH-LEAVED MAPLE. See Box Elder.

ASH-WEDNESDAY, the first day of Lent in the Western Church, so named from the ceremonial use of ashes as a symbol of penitence in the service for the day. The ceremony is of great antiquity, being confined at first to those performing a public penance. Later it was extended to the entire congregation. In 1191 its universal use was first sanctioned by Pope Celestin III. The present custom in the Roman Catholic Church is to take the ashes, made by burning the palms or their substitutes used in the ceremonial of the previous Palm Sunday, and after a prayer the priest, dipping his thumb in the ashes, marks those present, as they kneel, with the sign of the cross on the forehead, or, in the case of clerics, on the place of tonsure, with the words: Memento, homo, quia pulvis es et in pulverem revertiis (Remember, man, that thou art dust and into dust thou shalt return). Of the Reformed churches the Anglican Church and the Protestant Episcopal Church in the United States alone have a special service for this day. In the former a series of denunciations against sinners—the communion—and penitential prayers are appointed to be read; but in the American only the penitential prayers. Consult Duchesne, L., 'Christian Worship,' translated by M. L. McClure (London 1904) and Wetzer and Welte 'Kirchenlexikon.'

ASHANTI or ASHANTEE, a-shan-te, a former native kingdom of western Africa, since 27 Aug. 1896, a British colony of the Gold Coast administered by its governor, under a separate constitution, and definitely annexed, 26 Sept. 1901. Its boundaries defined 22 Oct. 1906, enclose an area of 20,000 square miles. It is in general hilly and is largely covered with forests. It is well watered and extremely fertile, but the climate is unhealthy. Among the trees are the baobab, palms and cotton trees. The crops are chiefly rice, corn, sugar-cane and yams, the last forming the staple vegetable food of the natives. The domestic animals are cattle, horses of small size, goats, and a species of hairy sheep. The larger wild animals are the elephant, rhinoceros, hippopotamus, baboon, hyena, rhinoceros, baboon, hyena, rhinoceros, baboon, hyena, rhinoceros, baboon, hyena, rhinoceros, baboon, hyena, rhinoceros, baboon, hyena, rhinoceros, baboon, hyena, rhinoceros, baboon, hyena, rhinoceros, baboon, hyena. Birds are numerous and crocodiles and other reptiles abound. Gold is obtained in the form of dust or in nuggets; in 1914 the output was 113,286 ounces valued at $2,406,350. Under British rule, agriculture has extended, cocoa and rubber plantations have been established, and the valuable forest trees exploited. Imports into Ashanti in 1914 amounted to $4,427,645; exports, $5,851,350, besides gold, comprising cocoa, $1,750,000; kola, $900,000; rubber, $100,000. The Ashantis long made themselves known as warlike and ferocious, with a love of shedding human blood amounting to a passion. Human teeth and jawbones were worn as personal ornamens, and human sacrifices used to be frequent. On the death of a king or chief enormous numbers of victims were slaughtered with circumstances of revolting cruelty, and there were regularly recurring periods, at intervals of 18 or 24 days, called the great and little ahat, when human sacrifices took place. Notwithstanding this there exist, among them certain of the arts of civilization. They excel in the manufacture of cotton cloths and in the fabrication of articles in gold; they make good earthenware, tin leather, and make sword-blades of superior workmanship. The native government was a monarchy. The chief town is Coomasie or Kumasi; pop. 20,000. The British first came in contact with the Ashantis in 1807, when a treaty was concluded with the governor of Cape Coast with the king of Ashanti, acknowledging the sovereignty of the latter by right of conquest over the coast, including Cape Coast Castle. In 1823 war was proclaimed by the Ashantis against the British, and they succeeded in the following year in defeating a small body of troops led by the governor, who perished with almost all his officers; but in 1826 the Ashantis were completely defeated near Accra. At the close of another war, in 1831, the river Prah was fixed as the boundary between the Ashanti kingdom and the states protected by Great Britain, but the Ashantis soon began to interfere beyond the boundary. Early in 1873 the Ashantis again invaded the territory protected by Great Britain, and General Wolseley (subsequently Viscount Wolseley) was sent against them. The Ashanti general Aamanquanta had concentrated his troops, 20,000 strong, at Amoafu, 20 miles from Coomasie. The British general led to the attack 1,481 English and 728 native troops, whom he formed into a square. The battle began on 31 January, on which day Amoafu was taken. On the 4th Coomasie was entered. The loss of the British in killed and wounded was 300, and a large number ultimately succumbed to the climate. As the King refused to enter Coomasie to sign a treaty, the British set fire to the town and began their return march on the 6th. The treaty signed soon after stipulated that the King of Ashanti should renounce his claims to the country beyond the allies of Great Britain; that free trade and open communication should be established with the coast, and that the King should pay an indemnity of 50,000 ounces of gold. The last condition was not faithfully observed, but the
result of the war was greatly to weaken the power of the Ashantis. The conduct of King Prempeh, a successor of King Koffee, led to the dispatch of another British expedition, which in 1896 entered Coomassie without resistance, and received the submission of the King, who was sent into the interior. A British resident was stationed in the country, which became a British protectorate, subordinate to the governor of the Gold Coast. In June 1898 an agreement was arrived at between Great Britain and France with regard to the boundaries between their respective territories here. In 1900 the Ashantis rose in rebellion and besieged the governor and 700 troops in Coomassie. The governor and part of the garrison fought their way out 23 June, and after four months' siege an expedition reoccupied the British empire followed 26 Sept. 1901. Pop. 300,000.

ASHBOURNE, Edward Gibson, 1st Baron, Irish jurist and politician; b. 4 Dec. 1837; d. 19 Dec. 1923. After graduating from Trinity College he began practising law, becoming a Queen's Counsel in 1872. In 1875 he was sent to Parliament, where he served his constituency until 1885. From 1877 until 1880 he was attorney-general for Ireland and in 1885 he was made Lord Chancellor of Ireland. Here he remained, having a seat in the Cabinet, until 1892. In 1885 he was awarded his title.

ASHBURN, Ga., city and county-seat of Turner County, 83 miles south of Macon, on the Georgia, Southern and Florida, and the Hawkinsville and Florida Southern railways. It has manufactures of yellow pine, a cottonseed-oil mill, a fertilizer factory, feed mills and naval stores. It has also three banks, an assessed property valuation of $1,100,000, county and city buildings, schools for white and colored children and churches of four denominations. The waterworks, lighting plant and sewer system are owned by the municipality, the government of which is vested in a mayor and five councilmen. Pop. 2,500.

ASHBURN, Charles Albert, American geologist; b. Philadelphia, 9 Feb. 1854; d. Pittsburgh, 24 Dec. 1889. He was graduated head of his class at the University of Pennsylvania, and was appointed assistant State geologist in 1875. He originated a method of surveying and representing the geology of the anthracite coal fields which received the approval of mining engineers throughout the world. He was also an accepted authority on the natural-gas fields. In 1886 he entered private practice as an expert and became closely associated with the Westinghouse interests. He prepared over 20 of the Pennsylvania State geological survey reports, and contributed to scientific and technical journals.

ASHBURNHAM, John, English Royalist: b. 1603; d. 15 Jan. 1671. Under Buckingham's patronage, he began his court career very early. In 1627 he was sent to Paris to make overtures for peace, and in 1628 he prepared to join the expedition to Rochelle, interrupted by the Duke's assassination. The same year he was made Groom of the Bedchamber and elected member for Hastings. He also represented this borough in the Long Parliament of 1640. In this capacity he rendered services by reporting proceedings to the King. He made a considerable fortune and recovered the Ashburnham estates alienated by his father. He became one of the King's chief advisers and had his full confidence. In the Civil War he was made treasurer of the Royal army; in 1664 he was a commissioner at Uxbridge and one of the four appointed to lay the King's proposals before Parliament. He accompanied Charles in his flight from Oxford to the Scots and subsequently escaped abroad to Paris and then to Rouen. After which he was sent to The Hague to obtain aid from the Prince of Orange. After the seizure of Charles by the army, Ashburnham joined him at Hampton Court in 1647. When Charles escaped he took Ashburnham's advice and went to the Isle of Wight where he fell into the hands of Hammond. He left Charles, waited on the mainland for his escape, and was later captured and imprisoned at Windsor. During the Civil War, he was exchanged for Sir W. Masham. In November 1660 he was allowed to come to England. After the King's death, he remained in England, an object of suspicion to all parties, until, at the Restoration, he regained his place as Knight of the Bedchamber and was compensated for his losses. He represented the city of London in Parliament from 1661–67 when he was expelled for taking a bribe from the French wine merchants. Consult 'Narrative' published by Lord Ashburnham (3d Earl) in 1830.

ASHBURTON, Alexander Baring, Lord, English statesman and financier; b. London, 27 Oct. 1774; d. 13 May 1848. He was the second son of Sir Francis Baring, and the affairs of the famous mercantile house established by his father kept him employed in Canada and the United States for many years. In 1810 he became the head of the house of Baring Brothers. He sat in Parliament for different constituencies from 1806 to 1835. He was created Baron Ashburnton in 1815. He was appointed special ambassador to the United States in 1842 to settle the northwestern boundary question and other matters in dispute between England and America. A street in Boston, known as Ashburnton Place, was named in his honor.

ASHBURY RIVER, a stream in western Australia flowing 400 miles and emptying into the Indian Ocean, lat. 22° S.; long. 115° W.

ASHBURTON TREATY, a treaty concluded at Washington in August 1842 by Alexander Baring, Lord Ashburnton, and the President of the United States. It defined the boundaries between the United States and Canada.

ASHBY-STERRY, Joseph, English journalist; b. London. Studied painting, then became illustrator for Punch and other papers. Later he took to writing and abandoned illustrating. Among his works are 'Nutshell Novels' (1890); 'Lazy Minstrel' (1892); 'Naughty Girl; a Story of 1893' (1893); 'A Tale of the Thames in Verse' (1896); 'The Bystanders; or, Leaves for the Lazy' (1900); 'Sketches in Song' (1903); 'River Poems' (1909).

ASHBY-DE-LA-ZOUCHE, 'asbi-de-la-zooc', market town in Leicestershire, England, on the borders of Derbyshire, 17 miles north-
west of Leicester. It has wide, well-paved streets, and its parish church of Saint Helen is a handsome building with fine stained-glass windows, carvings and monuments. The Ivanhoe baths attract visitors, the waters being beneficial for some ailments. The ruins of Ashby Castle, well known to readers of 'Ivanhoe,' which received Mary Queen of Scots as a prisoner, are still visible. Pop. (1911) 4,927.

ASHDOD. See Asdoon.

ASHÉ, John, American soldier: b. in North Carolina 1720; d. 24 Oct. 1781. He was a member of the 1st Provincial Congress and served in the American Revolution as a brigadier-general of North Carolina troops. Asheville, N. C., was called in his honor.

ASHER, the name of the eighth son of Jacob. He founded the tribe called after him, which occupied a fertile territory in Palestine along the coast between Carmel and Lebanon.

ASHER, Ben Yehiel, eminent Talmudist: b. western Germany about 1250; d. Toledo, Spain, 1328. He was of a very learned family. To escape persecution, he fled to Spain, where he became rabbi at Toledo. Although he had hard living means in Germany, he lost much of it and was forced to live in poverty in Toledo. In his religious attitude he resembled the teacher, Meir of Rothenburg, representing the school which was opposed to lenient decisions in legal matters, and secular knowledge. He possessed a vast Talmudic learning and was distinguished for his terseness in summing up long Talmudic discussions. His attitude toward secular knowledge made his influence on the Spanish Jews a narrowing one, which turned them from scientific research to the study of the Talmud. He was the first of the German rabbis who displayed a genius for systematization. His works consist of a commentary on 'Zera im,' a 'Compendium of the Talmud,' and various other glosses and commentaries. His son Jacob was the author of the four 'Turim,' a very profound and popular codification of the rabbinical law. It was the standard work on law until Joseph Quaro directed his Code of Jewish Law, the 'Shulan Arukh.' Consult Weiss, 'Dor Dor we Dorshaw' (Vol. V, 61-70); Grätz, 'Geschichte der Juden' (3d ed., VII, 233 et seq.).

ASHVILLE, ash'vil, N. C., city and county-seat of Buncombe County, on the Southern Railroad, near the French Broad River, 275 miles west of Raleigh. It is in a tobacco-growing and market garden region, famous for its fruit, especially apples; and it is widely famed as a winter and summer resort. Its principal manufactures are of cotton goods, shoes, ice, tobacco and flour. The United States census of 1914 recorded 46 manufacturing establishments of factory grade, employing 1,135 persons, of whom 1,006 were wage earners, receiving annually $394,000 in wages. The capital invested amounted to $2,956,000, and the year's production was valued at $3,202,000; of this $1,027,000 was added by manufacture. The city is 2,350 feet above the level of the sea and is surrounded by impressive mountain scenery. It was the Asheville College for Young Women, Bingham Military School, Asheville Farm School for Boys, Normal College and Collegiate Institute for Young Women, Home Industrial School for Girls, Industrial School for Colored Youth, large central auditorium seating 2,000 and free to conventions, sanitarium, weather bureau, national banks, fine parks, beautiful drives, hotels, boarding-houses, etc., and among notable public buildings, post-office, government building, county courthouse, city hall and free public library. It has electric light and gas plants, a modern system of sewers, a water supply by 17 miles of pipe line from the top of the water shed of Mount Mitchell, and an electric street car system with a trolley road to Sunset Mountains. In the suburbs are: the magnificent estate of Biltmore, established by George Vanderbilt of New York city; one of the finest botanical gardens in the world; Pisgah Forest, a hunting preserve of 84,000 acres; Riverside parks; and Mount Beaumont, 2,800 feet high. Asheville was settled in 1792 and was named in honor of Samuel Ashe (1725-1813) jurist, and John Ashe (1720-81) soldier. It received a charter of incorporation in 1835. In 1905 the city boundaries were extended. The commission form of government has been adopted. Pop. (1916) 20,000.

ASHFORD, Bailey Kellogg, American surgeon: b. Washington, D. C., 18 Sept. 1873. Graduating from the Georgetown University Medical School in 1896, and from the Army Medical School two years later, he accompanied the army to Porto Rico in 1898. Here he made a special study of anemia and the hookworm disease and organized the government's campaign against the plague, resulting in a lowering of the death rate from anemia by 90 per cent. From 1904 to 1906 he served as a member of the Porto Rico Anemia Commission, which he himself had organized. He was also chairman of the consulting staff of the Presbyterian Hospital in San Juan. He has written 'Anemia in Porto Rico' (1904); 'Uncinariasis in Porto Rico: a Medical and Economic Problem' (1911).

ASHFORD, England, market town in Kent, pleasantly situated on the river Stour, 56 miles from London. There are corn and cattle markets, and the Southeastern Railway Company have their principal locomotive and carriage establishments here. Pop. (1914) 13,668.

ASHI, Rabbi, Jewish scholar of ancient Babylon: b. 352 a.d.; d. 427 a.d. While still a young man he was the head of the academy at Sura. He is principally known because of his compilation, the 'Gemara,' composed of the discussions of the Jewish rabbis on the Mishnah and which constitutes an important part of the Talmud.

ASHHURST, John, American surgeon: b. 1839; d. 1900. He graduated at the University of Pennsylvania in 1857; served as an army surgeon in the Civil War; became surgeon of several Philadelphia hospitals after his return; and was made president of the College of Physicians in Philadelphia in 1898. He held surgical chairs in the University of Pennsylvania; was a member of the principal medical and surgical associations of the country; and besides many individual publications edited the 'International Encyclopædia of Surgery' (1881-86); and 'Lippincott's New Medical Dictionary.' He was the author of 'Injuries
of the Spine" (1867); and 'Principles and Practice of Surgery' (1871).

ASHIKAGA, あきが, Japan, town on 17 miles by rail from Tokio. From the 9th to the 17th century it was of much importance as a seat of learning. It is now noted for its trade in silk from China. Pop. about 24,000.

ASHIO, あしio, Japan, town, famous because of two copper mines in the vicinity, the largest in the country, whose output in 1910 exceeded 300,000 tons. Silver is also mined in the district. Extensive smelting works make the town quite an industrial centre. Pop. about 22,000.

ASHKELON. See ASCALON.

ASHLAND, Ill., town in Cass County, on the Chicago and Alton, and the Baltimore and Ohio railroads, 20 miles west by north of Springfield. It contains a high school, public primary school, city hall, four churches, and two banks, with combined resources amounting to $800,000. It is located in a thriving agricultural region and has grain elevators and a brick and tile factory. The municipal revenue amounts annually to about $4,000. The government is vested in a president and board of trustees. Pop. 1,200.

ASHLAND, Ky., city of Boyd County, on the Ohio River and on the Chesapeake & Ohio, Norfolk & Western and other railroads, 130 miles northeast of Frankfort. It was settled in 1854 and chartered as a city in 1870. Its manufactures include rake and wire nails, steel billets, sheet steel, leather furniture, etc., and it is a shipping point for iron ore and coal. Among the city's attractive features are Central Park and the corporation-administered Cliffsides Recreation Park. Pop. 6,688.

ASHLAND, Ohio, town and county-seat of Ashland County, on the Erie Railroad, 65 miles southwest of Cleveland. It has important manufactures of rubber goods, pumps, tools, etc., municipal works, public library and carries on a large trade in hay, stock and poultry. Pop. (1910) 6,975.

ASHLAND, Ore., city and county-seat of Jackson County, situated in the extreme southern part of the State, on the Southern Pacific Railroad, 341 miles south from Portland and 431 miles northerly from San Francisco. Ashland is the seat of the Southern Oregon State Normal School, and has three public school buildings and eight church buildings. The city has an excellent municipal organization and police regulation. Ashland owns its own water system. There is an extensive electric-light and power plant, flouring mill, ice plant, salt and door factories, box factory, quartz-mill, foundry and machine shops, and three newspapers. The Southern Oregon Chautauqua Association is located here. There are valuable gold mines in the mountains, and many almost within the city limits. Copper, iron and coal have also been found as well as other valuable minerals, such as cinnabar, kaolin, marble, sandstone, etc. In the vicinity are many mineral springs, whose waters contain medicinal properties. Pop. 4,000.

ASHLAND, Pa., borough in Schuylkill County, in the valley of the Mahanoy, and on the Lehigh Valley and other railroads, 12 miles northwest of Pottsville. It is in the centre of the great anthracite coal field, has extensive mining industries, large machine shops, foundries and factories, municipal waterworks, and contains the State Miners' Hospital, a national bank, fine hall and several churches. Settled in 1850 and named after Henry Clay's home at Lexington, Ky., Ashland was incorporated in 1857. Pop. 6,855.

ASHLAND, Va., town of Hanover County, situated on the Richmond, F. & P. Railroad, 17 miles north of Richmond. It is the seat of Randolph-Macon College, one of the oldest Methodist Episcopal Colleges in the United States, founded in Mecklenburg County in 1832, and removed to Ashland in 1866. Ashland was the scene of several battles during the Civil War. Within short distances of the town are the birthplaces of Henry Clay and Patrick Henry. Pop. 1,324.

ASHLAND, Wis., city and county-seat of Ashland County, on Chequamegon Bay, Lake Superior, and several railroads; 80 miles east of Duluth. It has one of the best ports on the lake, and besides its general lake traffic is the principal shipping port for the hematite ore of the great Gogebic Iron Range. To accommodate its iron interests it has a number of enormous ore docks. Other important interests are lumber and brown stone. It has very large charcoal blast furnaces, used for the manufacture of pig iron, and since 1885, when the real development of the Gogebic iron mines began, the city has grown rapidly. Near by is the scenic and historic group of Apostle Islands. The city has several industries of the manufacturing class, including flouring mills, pulp mills, creameries, etc. The United States census of 1914 reported 37 manufacturing establishments of factory grade, employing 924 persons, of whom 797 were wage earners, receiving $510,000 annually in wages. The capital invested was $3,463,000, and the value of the year's output was $1,827,000; of this, $750,000 was added by manufacture. The institutions include the North Wisconsin Academy, Sisters' Hospital (Roman Catholic) and Rhinehart Hospital. Ashland was settled in 1854, incorporated in 1863, received a city charter in 1897, and since 1913 is administered by a commission form of government. Pop. 14,500.

ASHLEY, Lord. Seeshaftesbury.

ASHLEY, William H., fur trader, soldier and congressman: b. Powhatan County, Va., about 1788; d. near Booneville, Mo., 26 March 1836. After a public school education he removed to Missouri (then upper Louisiana) in 1808. In the territorial militia he rose to the rank of brigadier-general. Embarking in the fur trade, he organized a company of 300 members which in 1822 ranged as far as the Rocky Mountains and entered into trading relations with the Indians of the entire West, and amassed considerable wealth; was appointed lieutenant-governor of Illinois in 1820, and was elected as representative for Missouri to the Congress from 1831-37. Consult Houck, 'History of Missouri,' and Chittenden, 'Fur Traders on the Missouri.'

ASHLEY, William James, Anglo-American economist: b. London, England, 25 Feb. 1860. He was graduated from Balliol College, Oxford, in 1881; was Fellow of Lincoln Col-
lege, Oxford; lecturer in history in Lincoln and Corpus Christi, 1885-88; and professor of political economy and constitutional history at the University of Toronto, Canada, 1888-92. He has been professor of economic history at Harvard University, 1892-1901, and since 1901 professor of commerce and public finance in the University of Birmingham. He has written an Introduction to English Economic History and Theory (1888-93); Surveys, Historic and Economic (1900); "Tariff Problem" (1903); Progress of the German Working Classes (1904); 'The Rise of Prices' (1912); 'Gold and Prices' (1912); 'Economic Organization of England' (1914). He has edited some important works bearing on economics.

ASHLEY, Pâ, town in Luzerne County, near Wilkes-Barre, on the Central of New Jersey and the site of important railroad repair shops. Pop. 5,601.

ASHMEAD-BARTLETT, Sir Ellis, English politician: b. Brooklyn, N. Y., 1840; d. London, England, 18 Jan. 1902. He was educated at Christ Church College, Oxford, and admitted to the bar in 1877. He was examiner of the Education Department, 1874-80; Conservative member of Parliament for the borough of Eton, 1880-85, and from Sheffield, 1885-1902; Civil Lord of the Admiralty, 1885-86; and was knighted in 1892. His popularity with political audiences in the early 80's was second only to that of Lord Randolph Churchill, but he lost much of his influence in later years owing to his association with the Turks and Swazis—a connection which subjected him to considerable ridicule in the House of Commons and the press. His chief literary production was 'The Battlefields of Thessaly' (1897), a record of his experiences in the last war between Greece and Turkey.

ASHMEAD-BARTLETT, Ellis, English war correspondent: b. 1881, son of preceding. He accompanied his father during the Greco-Turkish War and was taken prisoner by the Greeks. He has served as war correspondent in Spain, Morocco, and China. In 1907, accompanied the Spanish army in the expedition against the Riffs in Morocco in 1909; and the Italian army in the Tripolitan campaign; was through the first and second Balkan wars (1912-13), and correspondent in the European War 1914-16. He is the author of Port Arthur, the Siege and Capture; 'The Passing of the Shereefian Empire.'

ASHMOLE, Elias, English antiquary: b. Lichfield 1617; d. 1692. He practised as a chargeable solicitor till the breaking out of the Civil War, when he retired to Oxford and entered himself at Brasenose College, and engaged in the study of natural philosophy, mathematics and astronomy. At the Restoration he received the post of Windsor herald and other appointments, both honorable and lucrative. In 1672 appeared his History of the Order of the Garter. Other works of his are The Antiquities of Berkshire (1719); and his Diary (1717). He presented to the University of Oxford his collection of rarities to which he afterward added his books and manuscripts, thereby commencing the Ashmolean Museum.

ASHMOLEAN MUSEUM, Oxford, the first public museum of antiquities and curiosities in England, was founded by Elias Ashmole (q.v.) in 1679 and presented to Oxford University. The building was erected by Sir Christopher Wren in 1682.

ASHMUN, George, American lawyer: b. Blandford, Mass., 1804; d. 1870. He served for several years in the legislature of the State and was prominent in Congress in 1845-50. He presided over the Chicago Convention which in 1860 nominated Lincoln for the presidency.

ASHMUN, Jehudi, American missionary: b. Champlain, N. Y., April 1794; d. Boston, Mass., 25 Apr. 1828. He was the Congregational ministry and became professor in Bangor Theological Seminary. Later he joined the Protestant Episcopal Church and edited one of its periodicals The Theological Repository. He discovered his true vocation when he became an agent of the American Colonization Society and took charge of a reinforcement for the colony of Liberia in 1822. He found the colony utterly disorganized but in six years his energy and ability had thoroughly reorganized it and he left it in a prosperous and orderly condition. He died soon after his return to the United States. He wrote Memoirs of Samuel Bacon (1822); and his own life was written by R. R. Gurley (1839).

ASHOCHIMI, ash-Ô-chê-mî, or WAPO. A tribe of North American Indians who formerly ranged in California from the geysers to Calistoga hot springs and in Knight's Valley.

ASHOKAN RESERVOIR, a pool formed by the Olive Bridge Dam across Esopus Creek 15 miles west of Kingston, N. Y., and 90 miles north of New York city. It forms part of the Catskill water system and has a capacity of some 132,000,000,000 gallons.

ASHRAF, 4-šcrâf, Persia, a town near the southern coast of the Caspian Sea, 56 miles west of Astrabad. It was a favorite residence of Shah Abbas the Great and was adorned by him with splendid buildings, of which only a few miserable ruins now remain.

ASHTABULA, Ohio, city in Ashtabula County, on Lake Erie, at the mouth of the Ashtabula River, 54 miles east of Cleveland, on the New York, C. & S. I. 7 miles west of the Lake Shore & M. S. railroads. It is the centre of an extensive agricultural and dairying region, largely settled by inhabitants of Finnish extraction, and has large manufactories of leather, woolen goods and farm implements. The United States census of 1914 reported 57 manufacturing establishments of factory grade employing 2,028 persons, of whom 1,184 were wage earners receiving a total of $1,345,000 annually in wages. The capital invested was $4,298,000 and the value of the products was $5,021,000: of this $2,206,000 was the value added by manufacture. It has a Carnegie public library, three national banks, city hospital and numerous large buildings. Its extensive railroad and lake commerce, facilitated by extensive river and harbor improve-
ments, makes it an important transfer shipping point, especially for iron and coal. The city was first settled in 1801, was organized as a township in 1805, incorporated in 1831, and received a city charter in 1892. On 29 Dec. 1876 a railroad accident here at a high bridge over the river resulted in the loss of over 100 lives. The city is governed under the commission-manager plan. Pop. 20,000.

ASHTAROTH, a goddess anciently worshipped by the Jews. Ashtaroth is the Astarté of the Greeks and Romans, and is identified by ancient writers with the goddess Venus (Aphrodite). She is probably the same as the Isis of the Egyptians. In Scripture she is almost always joined with Baal, and is called god, Scripture having no particular word for expressing goddess. She was the goddess of the moon; her temples generally accompanied those of the sun, and while bloody sacrifices or human victims were offered to Baal, bread, liquors and perfumes were presented to Astarté.

ASHTAROTH KARNAIM, supposed to be the modern Tell-Ashtarah, on the Bashan Plateau, 21 miles east of the shores of Lake Galilee. It is mentioned in Gen. xiv, 5. Consult Moore, 'Journal of Biblical Literature' (Vol. XV, 1894) 185. See Astarté.

ASHTAVAKRA, ash-tä-va’krä. In Hindu legend, the hero of a story in the Mahabharata. His father, Kahoda, devoted to study, neglected his wife. Ashvatvaka, though still unborn, rebuked him, and the angry father condemned the son to be crooked (hence the name, from Ash- tan, eight, and sake, crooked). At the court of Janaka, King of Mithila, Kahoda was defeated in argument by a Buddhist sage and was drowned in accordance with the conditions. In his 12th year Ashtavakra set out to avenge his father, and worsted the sage, who declared himself to be a son of Varuna sent to obtain Brahmin to officiate at a sacrifice. Kahoda was restored to life, and commanded his son to bathe in the Samanga River, whence the boy becomes perfectly straight. In the Vishnu Purana some criticism is made of Ashvatavaka, performing penance in the water and worship him. He promises them a boon and they ask the best of husbands. When he offers himself they laugh in derision at his crookedness. He cannot recall his blessing, but condemns them to fall into the hands of thieves.

ASHTON, Albernon Bennet Langton, English composer: b. Durham, 9 Dec. 1856. In 1879 he graduated from the Conservatory at Leipzig, after which he took a special course in composition with Raff. In 1885 he was appointed professor of piano music at the Royal College of Music. He has composed three overtures, four symphonies, two string quartets, two quintets for wind instruments, several compositions for the organ, choruses and songs and many sonatas for piano solo, piano and violin, piano and cello and one sonata for piano and viola.

ASHTON, Lucy, the heroine of Sir Walter Scott's novel, 'The Bride of Lammermoor.' Engaged to a man she loves, she is forced to marry another, and dies a maniac on her wedding day.

ASHTON-IN-MAKERFIELD, England, town of Lancashire, 15 miles from Manchester, and noted for its potteries, collieries and cotton mills. Pop. 21,543.

ASHTON-UNDER-LYNE, England, a market-town of Lancashire, six miles east of Manchester, on the northern side of the river Tame. It was an ancient Saxon town; the most interesting building is the parish church built in the reign of Henry V. Since 1769 it has grown rapidly through the extension of the cotton manufacture, both the spinning of cotton yarn and the weaving of calicoes being carried on in the town to a great extent. Upward of 20,000 work people are employed in factories. There are also collieries and ironworks in the neighborhood which employ a great many persons. Pop. 45,172.

ASHBURST, Henry Fountain, American legislator: b. Winnemucca, Nev., 13 Sept. 1875. After attending the public schools of Flagstaff, Ariz., he began, in 1903, a special course in law and economics at the University of Michigan. In 1896 he became a member of the Arizona Territorial House of Representatives, of which he was chosen speaker two years later. After a term in the territorial Senate he became district attorney of Coconino County. On 27 March 1913, he was elected to the United States Senate by the unanimous vote of the first legislative assembly of the State of Arizona for a term ending in 1917.

ASIA, the largest of the five continental divisions of the earth, lying eastward of the European and African continents, and separated from the American continent by Bering Strait and the Pacific Ocean. It is wholly within the northern hemisphere, but some of the adjacent islands extend south of the equator. It is bounded north, east and south, respectively, by the Arctic, Pacific and Indian oceans, with their various branches and inlets; it is divided from Africa on the southwest by the narrow isthmian Suez Canal; and is connected with Europe on the northwest across the whole breadth of that continent. The natural western boundaries are the Ural Mountains, the Caspian Sea, Caucasus Mountains, Black Sea, Arctic Sea, the Mediterranean and Red Seas. The sinuosities of the Asiatic coast are very extensive; on the south the chief ocean inlets are the Gulf of Aden; the Arabian Sea with its inlets, the Gulf of Oman, the Persian Gulf, and the Gulfs of Cutch, Cambay and Manar, and the Bay of Bengal containing the Gulf of Martaban. On the eastern or Pacific coast proceeding northward the principal indentations are the China Sea with the Gulf of Siam and of Tonkin; the Tung-hai or Eastern Sea; the Hwang-hai or Yellow Sea with the Gulf of Pechili and Korea Bay; the Sea of Japan with the Gulf of Tartary; the Sea of Okhotsk, and Bering Sea with the Gulf of Anadyr. On the north or Arctic coast are the Nordskildau Sea and the Kara Sea with the Gulf of Obi. The coast line is about 35,000 miles, giving a proportion of one mile of coast line to 496 square miles of surface. From the extreme southwestern point of Arabia, at the Strait of Basra, to the extreme northeastern point of Cape Deshnev or East Cape, the length of Asia is about 6,900 miles, its breadth from Cape Chelyuskin or Northeast Cape in Siberia to Cape Romania, the southern extremity of the Malay Peninsula, is about 5,300 miles. The total area is estimated.
at 17,296,000 square miles. The most prominent features of the southern coast are the three great peninsulas of Arabia, India, and the Indo-Chinese coast. The south coast is also flanked by insular and peninsular projections, forming a series of sheltered seas and bays. A series of large islands extends to the southeast of the continent, forming a connection with Australia; while a multitude of smaller islands are scattered over the Pacific and Indian oceans. The principal peninsulas on the east are Kamchatka and Korea. The larger islands, proceeding from the northeast coast, are Sakhalien, the Japanese Islands, the Philippine Islands, Borneo, Sumatra, Java, Celebes, the Moluccas, Papua or New Guinea, which, however, is Australasian rather than Asiatic, and lastly Ceylon at the southeastern extremity of the Indian Peninsula. The Kurile Islands between Kamchatka and Japan, the islands of Loo Choo, Formosa and Hainan on the Chinese coast, and the Andaman and Nicobar Islands in the Indian Ocean, may also be noticed. On the west or Mediterranean coast the principal islands belonging to Asia are Cyprus and Rhodes. The northern coast of Russia, from Kamchatka to the Kamchatka Strait, and on the Arctic Circle, to the Yalmski Peninsula, in the extreme northwest, is almost entirely contained within that circle. The highest point, Cape Chelyuskin, is about 120° E. The largest group of islands on the north coast is the Liakhow Islands (New Siberia); the largest indentation is the Gulf of Obi, which reaches below the Arctic Circle, and receives the river Obi about that latitude.

Mountains.—The mountain systems of Asia are of great extent, and their culminating points are the highest in the world. There are also vast plateaus and elevated valley regions, but large portions of the continent are low and flat. Such are the greater portions of Siberia, from the Ural Mountains across the north of the continent, and the western central region of the continent, where an area of great depression culminates in the Caspian. The greatest mountain system in Asia, and so far at least as altitude is concerned, of the world, is the Himalaya range, which lies between 25° and 40°, and 70°–80° E.; lat. 37°–40° N. The point of junction forms a huge boss or knot, from which the Thian-Shan runs northward for a distance of some 1,200 miles. Between these two systems, which curve round it on the west, lies eastern Turkestan, right in the centre of Asia. The greatest elevations of the Himalayan system are to be found among the Hindu Kush, where is Mount Everest, 29,022 feet high, Kunchinjunga, 28,156, etc. The principal passes here, which rise to the height of 18,000 to 20,000 feet, are the highest in the world. The Kuen-Lun summits reach a height of 22,000 feet. The Himalayas descend by successive slopes to the plain of northern India, which has an elevation of about 1,000 feet above the level of the sea. The Vindhya cross the peninsula, dividing northern from southern India; the latter is further bounded by the eastern and the western Ghats, which run down from the plateau to the shores of the Bay of Bengal, and the interior consists of elevated tablelands rising toward the south, where they attain in the neighborhood of the Nilgiri Hills an elevation of 7,000 feet. The Himalayas are not only connected with the mountains in the interior of India, and with ramifications into China and the Indo-Chinese Peninsula, but on the west with the mountains of Baluchistan and Afghanistan. The Sulimman and Hala ranges bound India on the west, and unite with the mountains of Baluchistan; while the Hindu Kush, passing westward through the north of Afghanistan, has continuations more or less distinct through Persia to the Elburz range south of the Caspian, and so onward to Mount Ararat. From this point again it forms connections with the mountains of Armenia, with the Caucasus, with the Taurus range in Asia Minor, and with the mountains which run to the south of Persia. The mountains belonging to this series form the boundaries of an elevated plateau extending which lies between long. 65° and 110° E. and lat. 28° and 37° N. It thus occupies a position not very far from the centre of the continent, though nearer the southern edge than the northern. It extends, roughly speaking, from northwest to southeast, its total length being about 2,000 miles, while its breadth varies from 100 to 500 or 600. Different names have been given to different portions of the system, such as Hindu Kush (the northwestern extremity), Karakoram and Kuen-Lun, while Himalaya is more especially confined to the portion forming the northern barrier of Hindustan; but all these are really portions of the same connected mountain mass. The Kuen-Lun simply forms the northern flank of the mass, and is not, as it has often been represented, a distinct chain; while the Karakoram Mountains have so little to distinguish them from the rest of the elevated mass to which they belong that they may be crossed without the traveler being aware of it. The breadth of the mountain ranges running generally in an easterly and westerly direction. On the east it is bounded by lofty mountains which separate it from China. Some of the largest rivers of southern and southeastern Asia have
their origin in Tibet, including the Indus, the Brahmaputra, the Yang-tse and the Hoang-Ho. In this region a numerous series of lakes run in a chain parallel to the Himalayas. Another great platea, much larger in Tibet, is the plateau of Iran, occupying a large portion of western Asia, extending from the Indus to the Mediterranean, and from the Persian Gulf to the Caspian Sea. It comprises the countries known as Afghanistan, Baluchistan, Armenia, Azerbaijan and Persia. It rises at altitudes varying from 2,000 to 8,000 feet above the sea. The eastern half of it consists to a large extent of unproductive wastes. Of great political and strategic importance at the junction of Turkestan, Afghanistan and India is the Pamir Plateau, already alluded to, called by the natives "the roof of the world." Its valleys are at an elevation of from 11,000 to 13,000 feet above the sea. Another table-land of smaller extent and elevation is the Dekhan Plateau, India, south of the parallel of lat. 23° N. The principal plain of Asia, as already mentioned, is that of Siberia, which extends along the north of the continent and forms a vast alluvial tract sloping to the Arctic Ocean, and traversed by large rivers, such as the Obi, the Yenisei and the Lena, that convey its drainage to that ocean. Vast swamps of peat-mosses called tundras cover large portions of this region. Southwest of Siberia, and stretching eastward from the Caspian to the Thian-Shan Mountains, is a low-lying tract, consisting to a great extent of steppes and deserts, and including in its area the Sea of Aral, Bokhara, Khiva and other districts. This is a region of internal drainage, the rivers, among which are the Amu Daria and the Syr Daria, either falling into the Sea of Aral or into other smaller sheets of water. In the east of China there is an alluvial plain of some 200,000 square miles in extent, most of it productive and highly cultivated; in Hindustan there are plains extending for 2,000 miles along the southern slope of the Himalayas; and between Arabia and Persia, watered by the Tigris and Euphrates, is the plain of Mesopotamia or Assyria, which could be made one of the richest in the world. Of the rivers of Asia the largest is that of the Indus, which is bounded on the north by the Yablonoi and Thian-Shan Mountains, on the south by Tibet, on the east by the Khiingan Mountains on the borders of China; while in the west it extends into eastern Persia. Large portions of it are covered with nothing but sand or display a surface of bare rock. This desert forms a large part of the country known as Mongolia, the whole of which forms an area of internal drainage, deficient in rainfall. There are also extensive desert tracts in Persia, Arabia and Hindustan. An almost continuous desert region may be traced from the African desert through Arabia, Persia and Baluchistan to the Indus.

Rivers and Lakes.—Asia contains some of the largest rivers in the world. It is remarkable among the continents for the number of its rivers, some of them of large size, that never find their way to the ocean, their waters either being lost in the sand or falling into lakes that have no outlet. The chief rivers in western Asia are the Tigris and Euphrates, that rise in the Armenian plateau and fall into the Persian Gulf; the Indus, from the Tibetan plateau, flows through northwestern Hindustan and falls into the Arabian Sea; the Ganges, which rises in the Himalayas and flows eastward through northern Hindustan, and the Brahmaputra, which rises in Tibet and flows through Assam; and the several rivers of Bengal; the Irrawaddy and the Salwen, rising in the mountains of the Indo-Chinese Peninsula, and both flowing through Burma, likewise enter the Bay of Bengal; the Mekong or Cambodia, the largest river of this peninsula, has its source in the same mountains and flowing north southeasters enters the south China Sea; the Yang-tse and the Hoang-Ho, the two great rivers of China, rise in the Tibetan plateau; and enter the ocean after a winding easterly course; the Amur, the only other great river of eastern Asia, rises in Mongolia, and after a circuitous course enters the Sea of Okhotsk; the great rivers of northern Asia, the Lena, Yenisei and Obi, have already been mentioned. The Yenisei is believed to have a length of 3,400 miles, the Yang-tse, parallel of lat. 25°, the Hoang-Ho of 2,600. The basin of the Obi, including of course those of its tributaries, the Tobol and the Irtilch, is believed to be the largest of any river in the world, except the Amazon. Among the rivers of Persia, the Amu Daria and the Syl Daria. Its area is estimated at 27,000 square miles. Still farther east, to the north of the Thian-Shan Mountains, and bed by the Ili and other streams from this system, is Lake Balkash, a somewhat crescent-shaped sheet of water, with an area of 8,400 square miles. The lake has no outlet; its water is clear but very salt and disagreeable. There are also lakes in the north of the Sea of Okhotsk, such as Issik-Kul, Kara-Kul, Al-a-Kul, Baratala, etc. In the south of Siberia, between long. 104° and 110° E., is Lake Baikal, a mountain lake from which the Yenisei draws a portion of its water, its area is estimated at about 12,500 square miles. In the very centre of the continent is the Lob Lake, or Lob Nor, to which all the drainage of eastern Turkestan converges, being conveyed to it by the Yarkand, Kashgar, and other streams. These unite to form the Tarim, which, from the source of the Yarkand, has a total length of over 1,200 miles. Lob seems to be rather a swampy tract than a lake proper. On the borders of Afghanistan, Persia and Baluchistan, is a similar swampy lake that receives the Helmund and other streams from Afghanistan. Of the numerous lakes in Tibet Dangra-yum Nor and Tengri Nor seem to be the largest; the former is 45 miles long and 25 broad.

Geology.—Though in population and history the most ancient continent, geologically speaking Asia is considered, as regards its present aspect, to be one of the newest. The principal mountain chains are composed largely of
granitic rocks. The Himalayan range of mountains bears a striking resemblance in geological structure to the Alps; they are composed of granite gneiss and mica-schist, with syenite and amphibolites or trap-rocks, particularly primitive greenstone; the Altai Mountains contain granite in layers without distortion of gneiss, argillaceous schist in contact with greenstone, and containing augite, jasper, calcareous rocks, argentiferous lead ore and copper. The ramifications of the Altai into Russian Asia contain also coal, gneiss, schists, quartz and greenstone, rich with lead, silver and auriferous sand. The lower ranges are covered with transported layers of rolled stones of granite, gneiss and porphyry, in which are found agates, carnelians and chalcedonies. In the Kuen-Lun group are found rubies, lapsi-lazuli and turquoises. In the eastern part of the Urals the granite, of which the chain is composed, along with gneiss and other rocks, is extremely rich in iron and copper. The Caucasus contains granite, argillaceous slate, and mica-schist. In Kamchatka there are eight or nine gold, which is also found in Siberia, northern India, Siam, Borneo and Tibet. Diamonds and other precious stones are also found in Borneo as well as in India and Ceylon. The coal fields of China are perhaps the largest in the world. The great plains of northern India, Mesopotamia, central Asia and Siberia are regarded as of very recent geological origin. From various indications many geologists are of opinion that the greater part of western Asia was occupied at no very distant period by an ocean, of which the Caspian and Aral Seas are the remains. It is also conjectured that a continental area extending across the Indian Ocean united Asia during the Permian period to Africa and Australia. Siberia is supposed to have been twice submerged during the Palaeozoic and the later Tertiary period. A line of volcanic action extends on the eastern coast from Kamchatka through the Philippines and the Malay Archipelago to Aracan in the Bay of Bengal. In the south there are eight or more active volcanoes; in the interior of the continent there appear to be none at present active.

Climate, Soil, etc.—The size of Asia, the great altitudes and depressions of the continent, along with the variations of latitude and the distribution of sea and land, etc., make it an inexhaustible source of complexity in the variety and distribution of climate. In Tibet, with a mean elevation of about 15,000 feet, the climate is rigorous, combining great cold with drought; vegetation is, scantly, tends almost absent and the population mostly nomadic; except in the lower valleys, where there is an agricultural population, it is very sparse. The climate of central China generally presents extremes of heat and cold, and a great deficiency of rain. It has accordingly a deficient vegetation and a very nomadic population. The great region of Siberia, which, as already mentioned, is a level or slightly undulating plain, lying wholly within the temperate and frigid zones, has a climate which resembles that of similar latitudes in Europe, with the exception of greater heat and drought in summer and greater cold in winter. The rainfall is very moderate, but the drainage is deficient and the soil often becomes swampy. The vegetation is scanty, consisting mostly of grasses and shrubs in the plains and forest in the mountains. There is very little land under cultivation and the population is very thin. The northern part of China to the east of central Asia has a temperate climate with a warm summer, and in the extreme north a severe winter. It is well watered and wooded, possesses a fertile and well-cultivated soil yielding the usual products of groves, vineyards and greenhouses, and is thickly peopled. The district lying to the south of the central region, comprising the two Indian peninsulas, southern China, and the adjacent islands, presents the characteristic climate of tropical zones, and vegetation and agriculture correspond to the tropical regions. Here, however, the modifying effects of altitude come most largely into play, and every variety of climate and form of vegetation is to be found on the slopes of the Himalayas, and the mountains and plains of southern India and of the Eastern Peninsula. The part of Asia south of the Himalayas, though not all lying within the tropics, is all subject to tropical influences. Among the principal of these may be reckoned the effects of the tropical trade-winds, which, carrying the moisture of the southern seas to the continents to be condensed by the mountain masses against which they strike, by determining the rainfall of the various continental districts, and by the size and course of the rivers, produce so many climatic effects. More local in their effects as well as arbitrary in their occurrence, and consequently fatal in their violence, are the cyclones, or circular storms, common in the Bay of Bengal and the China Sea. The normal directions of the monsoons are northeast and southwest; the northeast monsoon begins in October and the southwest in April; but the direction, duration and intensity of these winds are greatly modified, especially on land, by local circumstances. The soil of the southern regions is usually good, and where moisture is sufficient vegetation is rich and even exuberant. The soil of India is so finely comminuted that it has been said it is possible to go from the Bay of Bengal to the Indus and return again to the sea without finding a single pebble. The rainfall in those regions is extremely irregular. There are belts where hardly any rain falls at all, others of moderate and others of very heavy rainfall. On the Khazir Plateau, at the mouth of the delta of the Ganges and Brahmaputra, the heaviest rainfall in the world takes place, the average fall observed being 550 inches a year. The principal period of rain is during the southwest monsoon. On the mountains which directly face the winds, charged with vapor as they come from the sea, the rain will fall in abundance, while they pass over intermediate plains without parting with their moisture. The rainfall, the course of the rivers and the irrigation and fertility of the plains of India are accordingly determined by the position of the Himalayas, the Ghats and other mountain ranges. The high plateau which extends from Asia Minor to the Indus has a temperate climate, with some extremity of heat in summer and cold in winter. Rain falls chiefly in winter and spring. The eastern part of this plateau is deficient in rain and the soil is poor and unproductive; the western portion, consisting of Asia Minor, is more favored of nature. The desert character of large parts of Arabia, Persia and Baluchistan has already been alluded to. Some parts of the coast of Arabia, as Yemen
and Oman, are fertile, but the greater part, especially on the Red Sea, is barren and desolate. A desert belt surrounds an interior plateau of 1,000 to 3,000 feet in height, and of moderate fertility. Syria is divided between hilly and fertile and low desert tracts. The Japanese Islands, which are traversed by mountains of considerable elevation and extend over about 15° of latitude, experience a great variety of climates. In the north the climate is rigorous, owing to the Siberian winds; in the south it is mild. The eastern coast is milder than the west, being sheltered by the mountain ranges from the cold winds of the continent. The country generally is fertile and populous. The character and productions of the other islands are mostly tropical.

A greater extreme of cold is reached in North America than in northern Asia, the mean temperature of the east coast of Siberia being above the zero of Fahrenheit; and the heat of southern Asia is less than that of Africa, which has more land lying within the tropics. In Siberia, the extremes of temperature are great, exceeding 100° between the mean of the hottest and coldest month on the coast, and being commonly over 60° throughout the country. As the equator is approached the extremes of temperature diminish to 32° and the average length of the continent they approach within 5°. The highest temperature attained in southern Asia is about 112°, the highest mean about 85°. The summers of the northern latitudes, though shorter, attain a maximum of heat not much short of the tropics, the greater length of the day compensating for the less intensity of the midday heat. On the Persian plateau the summer heat is increased by the want of rain, and the severity of the winter by the elevation.

Vegetation.—The plants and animals of northern Asia generally resemble those of similar latitudes in Europe, though the extremes of climate are greater. The plateau extending from Asia Minor to the Himalayas resembles southern Europe in its productions, and the desert belt of Asia has an affinity to the African desert. The characteristic types of Siberia are continued to the high regions of central Asia. The community of type with European forms along the northern parts of the Chinese abyss, besides a relation with the types of North America. The whole of northern Asia differs from Europe more in species than in genera of vegetable productions. Oaks and haws are absent in Siberia. The principal mountain trees are the pine, larch and birch; the willow, alder and poplar are found in lower grounds. The cultivated plants of Asia Minor and Persia resemble those of southern Europe. In the central region European species reach as far as the western Himalayas, but are rare in the eastern. They are here met by Chinese and Japanese forms. The lower slopes of the Himalayas are clothed almost exclusively with tropical forms; higher up, between 4,000 and 10,000 feet, is the region of forests and cultivation, producing all types of trees and plants that belong to the temperate zone, and having extensive forests of conifers; in the east forest trees are met with at a height of 13,000 feet. Rhododendrons extend to 14,000 feet, and phaceraea plants are found at the height of 19,500 feet. The southeastern region, including India, the Eastern Peninsula and China, with the islands, contains a vast variety of indigenous species, varying with the humidity of the climate and the elevation, the forms of higher latitudes being represented on the mountains. In this region we find growing wild a number of plants that have become of the utmost importance to man, such as the sugar-cane, rice, cotton and its allies, camellia, jasmine, assa-foetida, clove, nutmeg and cardamom, banana, cocoanut, areca and sago palms; the mango and many other fruits, with plants producing a vast number of drugs, caoutchouc and gutta-percha. The forests of India contain the oak, teak, sal, deodar and other timber woods, besides bamboos, palms, sandal-wood, laurels, fig-trees, etc. The Malay Peninsula contains dense forests of similar kinds. The cultivated plants of India include wheat, barley, rice, maize, millet, sorghum, tea, indigo, jute, opium, etc. North of the tropic wheat is sown in November and reaped early in April, and a crop of rice or other tropical cereal is sown in June and July, and reaped in September and October. Wheat and barley do not grow in southern India, and the cultivation is being sufficiently severe to prepare the ground for them. Cotton, indigo, sugar, tea, tobacco, coffee, pepper, plantains, mangoes, etc., are cultivated in China. Of the Chinese flora the larger portion resembles the European and the rest is in part typical of Asia. In north China, the country between it and the Amur (Manchuria), and the Japanese Islands, large numbers of deciduous trees occur, such as oaks, maples, limes, walnuts, poplars and willows, the genera being European but the individual species Asiatic. Among cultivated plants are wheat, and in favorable situations rice, cotton, the vine, etc. Japan and the northern parts of this region are rich in species of the pine tribe. According to elevation, the islands of the Asiatic Archipelago display an equal diversity with the mainland, the more tropical types being represented on the lower elevations, the more northern on the higher. Coffee, rice, maize, etc., are extensively grown in some of the islands. A line of demarcation called Wallace's line has been drawn at the Strait of Macassar, at which the flora and fauna of Australia begin to appear, and gradually become more pronounced as the distance from Asia and to north becoming European and American. The variety of plants of the desert region of Arabia, Persia and Baluchistan is comparatively small. The predominance of a few species gives character to the whole region. Vegetation is most abundant in spring, when herbaceous and bulboous plants, which extend through this region from Syria to the Himalayas, are abundant. In Arabia Felix and the warmer valleys of Persia, Afghanistan and Baluchistan, where the hills are high enough to afford a sufficient rainfall, arblic, shrubs are abundant, while much is local. Barley, cotton and indigo are cultivated in Arabia, and the date-palm flourishes in the desert. On the mountain slopes of western Arabia (Arabia Felix) the coffee-plant, which has probably been derived from Africa, is cultivated. Gum-producing acacias are, with the date-palm, the commonest trees in Arabia; the latter also extends through Persia, and even reaches the shore of the Caspian. Fleshy plants are characteristic of the most arid portions. In the higher parts of Persia and Baluchistan numerous forms of Umbellifera of great size, as well as thistles and the borage tribe, are
abundant. African forms are found not only extending from the African desert along the desert region of Asia, but from south Africa to Ceylon. The Caspian lowlands are the tract where the saline vegetation that has spread over the whole region of steppe and deserts has its greatest development. This region is regarded as the native country of the melon.

Zoology.—There is a still closer resemblance than there is from the northern Asia to that of Europe. Asia south to the Himalayas, together with Europe and north Africa, forms a continuous region, which Dr. Sclater has designated as the Palearctic; southeastern Asia, with Sumatra, Java, Borneo and the Philippines, he calls the Indian region; Africa south of the Atlas, with Arabia, Palestine, south Persia, the dry part of Baluchistan and Sind, form the Ethiopian region; Celebes and the other islands beyond Wallace's line, with Australasia, the Australian region. Nearly all the mammals of Europe occur in northern Asia, with numerous additions to the species. Quadrupedal animals are rare among the Carnivora, especially bears, wolves and weasels. Moles, shrews, hedgehogs are common in the Black Sea area, and in the Insectivora. Rodents are represented by marmots, the pika, jerboas, rats, mice, etc. There are numerous species of wild sheep, antelopes and deer. Of the last, the musk and many others are characteristic. In the Indian region there are several peculiar genera of the Quadrupedal or monkey tribe. Among the distinctive forms of this region is the elephant, the Asiatic species being distinct from the African. The lion, tiger, leopard, which are considered as Ethiopian forms, the bear, civets, ichneumons and other carnivorous animals are found. The lion inhabits Arabia, Persia, Asia Minor, Baluchistan, etc., and extends as far east as India, being now, however, confined to Guzerat. The tiger is the most characteristic of the larger Asiatic Carnivora. It extends from Armenia across the entire continent, being absent, however, from the greater portion of Siberia and from the tableland of Tibet; it extends also into Sutchu, Java and Borneo. The hartebeest and the camel have their true home in Asia. In the Indian region we also find the rhinoceros, buffalo, ox, deer, squirrels, porcupines, as well as various species of Edentata. The avifauna of Europe and northern Asia are identified to a still greater extent. A large number of European species extend over northern Asia as far as Japan. In the Malay Archipelago marsupial animals first occur in the Moluccas and Celebes, while various mammals common in the western part of the archipelago are absent. A similar transition toward the Australian type takes place in the species of birds. Of marine mammals the dugong is peculiar to the Indian Ocean; in the Ganges is found a peculiar species of sea buffalo; in the islands of the South Sea the ostrich is represented. Among the most interesting forms are the hornbills, the peacock, the Impy peahen, the tragopans and other gallinaceous birds, the peahen family being very characteristic of the region. The pheasant probably in the wild state is found in northern Asia, the golden peahen and several other species of pheasants to the northeast. The genera and species of passerine birds are very numerous. The desert region, extending from Arabia to Sind, is chiefly distinguished by the absence of many Indian forms and the presence of some African ones, which, however, are not widely spread, most of them being limited to Arabia and Syria. The chief haunts of the reptiles of Asia are the northern portion of Hindustan, the southeastern peninsula, China and the islands of Ceylon, Sumatra and Java. At the head of the reptiles stands the Ganges crocodile, frequenting the Ganges and other large rivers; the double-crested crocodile are numerous in various quarters, both insular and continental. Among the serpents are the cobra de capello and the Ceylonese tic-palanga, both among the most deadly snakes in existence; there are also very large pythons, besides sea and fresh-water snakes. There are also a number of species of frogs and toads and of fresh-water tortoises as well as many terrestrial and aquatic lizards. The seas and rivers of Asia produce a great variety of fish. The Salmonidae are found in rivers flowing into the Arctic and north Pacific oceans, but not in southern Asia. Large numbers are caught. Trout are found in the feeders of the Indus and the Caspian. Sturgeons abound in the Black Sea area, among other remarkable kinds of fishes are the climbing perch and the eel-philus. The well-known gold-fish is a native of China.

Asiatic Races.—The Mongolian race is the most numerous in Asia, and includes about two-thirds of the inhabitants. It occupies the Chinese empire, Tartary and probably Japan, with part of the Indo-Chinese Peninsula. It is partly settled, as in China, Japan and the peninsula; partly nomadic, as in Tartary and Mongolia. The Aryan is the next in numbers, and the most civilized of the Asiatic races. It was until the Mohammedan conquest the dominant, as it is still the most numerous, race in India. It also prevails in Persia and in the middle region from Afghanistan to Asia Minor. The Semitic race is widely spread in Arabia and southwestern Asia, and formerly at least extended to Africa. The black race is represented by the Negroes of the Philippines, the Papuans and some tribes of the Indo-Chinese Peninsula. The Dravidian race in south India, the Malays in the Eastern Peninsula, the Ainos of Japan and other races locally distributed, have no well-defined relation with the larger races. The Dravidians are variously associated with the Mongols and the Australians. The latter theory is connected with the hypothesis of a southern continent, which also connects these races with Africa. See ETHNOLOGY.

Political Divisions. A large portion of Asia is under the dominion of European powers. Russia possesses the whole of northern Asia (Siberia) and a considerable portion of central Asia, together with a great part of ancient Armenia, on the south of the Caucasus; in the south the same power rules over a population of (1913) 27,788,000. Turkey holds Asia Minor, Syria and Palestine, part of Arabia, Mesopotamia, Kurdistan, Armenia, Hejaz and Yemen in Arabia, with a total area of 699,342 square miles and a population of 19,382,000. Great Britain, with Ceylon, a part of the Indo-Chinese Peninsula (Upper and Lower Burma), Aden, Cyprus, Hongkong, etc., in all an area of 1,969,065 square miles, with a population of over 325,000,000; France has acquired a considerable
portion of the Indo-Chinese Peninsula (Cochin-China, Annam, Tonkin, Cambodia) and has besides Pondicherry and four other colonies in India, making a total area of about 256,200 square miles with a population of about 17,000,000, while to Holland belong Java, Sumatra and other islands or parts of islands in the Asiatic or Malay Archipelago, with an approxi-
mate area of about 76,400 square miles and a population of about 38,000,000. The chief independent states are the Chinese Republic and its dependencies, including Mongolia and Tibet, occupying an area of about 3,913,500 square miles with a population estimated at about 200,000, Siberia, Japan, including Korea, Formosa, Sakhalin, Pelewaclores, with an area of 260,738 square miles and a population of about 70,000,000; Siam, area about 195,000 square miles, population about 8,149,000; Afghan-
istan, area about 250,000 square miles, population about 6,000,000; Persia, area about 628,000 square miles, population about 9,500,000, and the Arabian states occupying about 5 cent of the area of Asia. The total population of the continent is estimated at 918,000,000.

Religion.—Asia has been the birthplace of religions; the Jewish, Buddhist, Christian and Mohammedan having their origin in Asia, where they grew up under the influence of still older religions, the Babylonian and that of Zoroaster, both also of Asiatic origin. At present it is estimated that there are 138,000,000 Buddhists in Asia, 210,000,000 Hindus (chiefly in India), 142,000,000 Mohammedans (in western and part of central Asia), 300,000,000 Con-
fucianists and Yavists (chiefly in China), 17,200,000 Orthodox Greeks and Armenian Catholics in Russia, Siberia, Caucasus, and Turkestan), 5,500,000 Roman Catholics and 6,000,000 Protestants. Roman Catholic and Protestant missions are established in almost every part of Asia, particularly in India, China and Japan. About 500,000 Jews are scattered mostly in western and central Asia; and a few fire-worshippers, Guebers or Parsis of India and Persia are the sole remnant of the religion of Zoroaster; while vestiges of Sabaeism are found amidst the Gesides and Sabians in the Tigris.

Civilization.—There are to be found in Asia all varieties of civilization, the primitive tribes of northeastern Siberia, the confedera-
tions of nomadic shepherds and great nations in possession of a common stock of national cus-
toms, beliefs and literature, like China; the tribal state; the compound family, forming the real basis of China's social organization; the rural community, both of the Indian and Musulman type; the loose aggregations of Tchukchtis (northern Siberia), having no rulers and no religion beyond the worship of forces of nature, but professing with regard to one another principles of morality and mutual support often forgotten in higher stages of civilization; and despotic monarchies with a powerful clergy. So also in economic life. While the tribes of the northeast find their means of subsistence exclusively in fishing and hunting, carried on with the simplest imple-
ments, among which stone weapons have not yet quite disappeared, and the tribes of central Asia carry on primitive cattle-breeding and lead a half-nomadic life, others are agriculturists, and have brought irrigation (in Turkestan) to a degree of perfection hardly known in Europe.

Internal Communication.—Caravans of camels are the chief means of transport for goods and travelers in the interior; donkeys, yaks and even goats and sheep are employed in crossing the high passages of the Himalayas; human porters and mules are the usual means of transport in China, Turkestan, Siberia, and in the barren tracts of the north the reindeer, and, still farther north, the dog, are made use of. Fortunately the great rivers of Asia provide water communication over immense distances. The deep and broad streams of China, allowing heavy boats to penetrate far into the interior of the country, connect it with the sea; a brisk traffic is carried on along these arteries. In Siberia the bifurcated rivers supply a waterway, not only north and south along the course of the chief rivers running toward the Arctic Ocean, but also west and east; thus a great line of water communication crosses Siberia, and is, with but few interruptions, con-
tinued in the east by the Amur, navigable for more than 2,000 miles. In the uplands and plains of Siberia become excellent roads for sledges, on which goods are still chiefly transported.

Railways.—In 1912 the lines in existence had a total length of about 63,520 miles, of which 32,667 miles belonged to British India and Ceylon, 10,586 to Asiatic Russia and 5,420 miles to China, about 1,300 miles of which was constructed by British capital. The lines are very remunerative, especially that from Peking to Tien-Tsin. Japan is well provided with rail-
roads, the length being 6,093 miles (including Korea) in 1912. In the same year the French possessions in Cochin-China, Annam and Tonkin had 2,178 miles, the Dutch Indies 1,551 miles, Siam 637 miles. There are as yet no railroads in Persia of any consequence; but in 1914 there were 2,836 miles in Asiatic Turkey, not including the most recently opened sections of the Bagdad Railway, which is being constructed by German capital and is to extend the Anatolian line from Konia to Adana, Sarajeh and Bagdad and Basra, with many branch lines. The great Trans-Siberian Railway connecting Moscow and Petrograd with Vladivostok and Port Arthur was completed in 1904. Telegraph communications are in a much more advanced state than the roads. Petro-
grad is connected by telegraph with the mouth of the Amur and Vladivostok (on the frontier of Korea); while another branch, crossing Turkestan and Mongolia, runs on to Tashkend, Peking and Shanghai; Constantinople is connected with Bombay, Madras, Singapore, Saigon, Hongkong, and Nagasaki in Japan; and Singapore stands in telegraphic communication with Java, and Port Darwin in Australia. Finally, Odessa is connected by wire with Tiflis in Caucasus, Teheran and Bombay.

Trade.—Notwithstanding the difficulties of communication a brisk trade is carried on between the different parts of Asia, but there is no possible way of finding an accurate estimate of its aggregate value. The mari-
time exports to Europe, the United States, and overland to Russia, have an annual value of about $900,000,000, and the imports of about $750,000,000. The bulk of the enormous trade between Great Britain, India, China and Japan
is carried on via the Suez Canal, opened 1869, and there is a steadily growing over-sea trade between China and Japan and the Pacific ports of the United States and Canada. Asia deals chiefly in raw materials and, gold, silver, precious stones, petroleum, tea and a variety of timber-wood, furs, raw cotton, silk, wool, tallow and so on; the products of her tea, coffee and spice plantations; and a yearly increasing amount of wheat and other grain. Steam industry is only now making its appearance in Asia, and, although but a very few years old, threatens to become a rival to European manufacture. Indian cottons of European patterns and jute-stuffs already compete with the looms of her European sister countries. Several of the petty trades carried on in India, China, Japan, Asia Minor and some parts of Persia have been brought to so high a perfection that the silks, printed cottons, carpets, jewelry and cutlery of particular districts far surpass in their artistry and taste many like productions of Europe. The export of these articles is steadily increasing, and Japan supplies Europe with thousands of small articles—applications of Japanese art and taste to objects of European household furniture.

History.—The origin of the name Asia is involved in obscurity, and it is not certainly known whether it arose among the Greeks or was borrowed by them from some Asiatic people. Modern scholars are inclined to believe that the name Asia is connected with the Sanskrit *asiras,* the dawn, as Europe may be connected with the Hebrew *eretz,* the west or the sun-setting.

The oldest historical documents are of Asiatic origin, and next to the immediately contiguous kingdoms of Egypt, Asia possesses the oldest historical monuments in the world.

The oldest historical monuments in Asia are those of Assyria (see Assyria, and with them are associated traditions which carry us back to a remote and indefinite antiquity. A similar vague antiquity belongs to the historical traditions of India and China. Criticism, however, reduces all these claims to moderate dimensions, and assigns to the oldest ascertained facts a date not remote than some 4,000 years from the present.

The earliest facts in the history of Asia, apart from documents and monuments, consist in the migrations of races, the evidence of which is derived from tradition, from language, from customs and from religion. The earliest known seat of the Aryan race was on the banks of the Oxus. Hence probably from the pressure of the Mongolian tribes to the north they spread themselves to the southeast and southwest, pressing upon the Dravidian inhabitants of India and the Semitic races of southwestern Asia. Finally they drove the Dravidians to the south of India and occupied Persia and other parts of western Asia, spreading into Europe. It is a remarkable circumstance that in this invasion the Aryans appear to have acquired the use of letters from the peoples with whom they came in contact, the Dravidian letters being borrowed in India and the Semitic in Persia as the original basis of the Sanskrit and Zendic alphabets. At a later period the Greeks likewise adopted a Semitic alphabet from the Phenicians. The Semites have spread within historical times into northern Africa, and their migrations had probably taken a similar course before they were recorded in history. A large portion of the Mongols are still, as they have always been, a nomadic race, and their migrations, carrying everywhere the terror of their desolation and spread from the settled part of their own race in China along the north of Asia into northern Europe.

The early religion of the Aryan race—a nation of shepherds,—divided itself after their separation into two related but widely different developments, Brahmanism and Zoroastrianism (see India Religions; Zend-Avesta). The former became rich in mythological, theological, and philosophical literature; but historical literature properly so called is wanting, and consequently there is a great absence of certainty with regard to the dates of early events. The war which the Mahabharata (see Sanskrit Language and Literature) professes to narrate is believed to be the earliest event in Indian history that can be regarded as historical, and probably took place about 1200–1400 B.C.

In China authentic history extends back probably to about 1100 B.C., with a long preceding period of which the names of dynasties are preserved without chronological arrangement. The kingdoms of Assyria, Babylonia, Media and Persia alternately predominated in southwestern Asia. The arms of the Pharaohs also extended into Asia, but the war there was short-lived. From Cyrus (B.C. 559), who extended the empire of Persia from the Indus to the Mediterranean, while his son, Cambyses, added Egypt and Libya to it, to the conquest of Alexander (B.C. 330), Persia was the dominant power in Asia. The administration of Persia was not without vigor and policy, yet the Macedonian conquest was an event of great importance to Asia, bringing it, along with northern Africa, into closer relation with the more advanced and progressive continent of Europe.

The division of Alexander's empire led to the protracted struggle between the Greek dynasties of Egypt and Syria, which ended in the absorption of both kingdoms in the Roman empire. After the unfortunate issue of the second Punic War Hannibal took refuge with Antiochus III, Great of Syria, who, in the course of his conquests, had come in contact with the Romans, and was at length incited to try his strength with them. In the course of the war with Antiochus, L. Scipio, together with his brother, the conqueror of Carthage, passed into Asia. The kingdom of Antiochus was spared after his overthrow; but in B.C. 65 Syria became a Roman province. The Roman empire ultimately extended to the Tigris.

The knowledge of Asia possessed by the Greeks and Romans was at its widest extent very limited. The countries with which they were best acquainted were naturally in the west. China they knew as the country of the Seres or Sine, and the northern portions of the continent, inhabited by predatory Mongol tribes, were vaguely designated as Scythia. Of India the northwestern and western parts were known, and Ceylon likewise, under the name of Taprobane. The country traversed by the Hindu Kush and the sources of the Oxus, was known as Bactria; that between the Oxus and the Jaxartes as Sogdians; a large and vaguely defined central district, including Persia, was known as Ariana. Ptolemy had some acquaintance with
the Indian Peninsula, with the table-land of central Asia, with the Himalayas (Imaus) and China. The better known countries of the southwest comprised Asia Minor, Armenia, Achaemenid Persia, Media, Parthia, Mesopotamia, Babylonia, Assyria, Syria. Soon after the most civilized portions of the three continents had been reduced under one empire the great event took place which forms the dividing line of history. Christianity spread rapidly in the Roman empire; but Armenia was the first country which received it as a national religion. In A.D. 220 the Parthian monarchy which had arisen in eastern Persia about B.C. 250, and had disputed the empire of Asia with the Romans, was overthrown by the revived Persian dynasty of the Sassanids. The empire of Asia was now disputed with the Romans by the Persians. In the revived Persian empire the Magian religion was restored, and after the establishment of Christianity in the Roman empire the religious jealousy eminently the feud between the two powers. The possession of Armenia was the subject of a protracted struggle between them; but its religion inclined it to the Roman alliance. The Tigris formed the most important boundary between the two empires, neither being able long to maintain any conquests beyond it. Christianity was persecuted in the Persian empire, and could not extend itself freely beyond the Roman limits. After the division of the Roman empire (A.D. 364) the struggle continued between the eastern and the Persian empires until the rise of a new power destined to absorb them both. While the eastern empire was struggling more and more feebly with the Persians, the Mongols and the barbarians of Europe, a new religion arose in Arabia (A. D. 622), which gathered around it a band of enthusiasts, small at first, but inspired with the most ardent zeal of proselytism. The central tenet of the unity of God gave them the sympathy of the Monotheistic sect, which, persecuted in the empire, was powerful in Egypt, Syria, Mesopotamia and Armenia. Arabia, the country of the Prophet, soon gave its adherence to the new faith. The sword was consecrated as the instrument of its propagation. Persia, was subdued, the first great conquest of the Arabians. Syria and Egypt soon fell before their arms, powerfully aided by the defection of the heretics of the empire, and within 40 years of the celebrated flight of Mohammed from Mecca, which constitutes the era of his followers, the sixth of the Caliphs, or successors of the Prophet, was the most powerful sovereign of Asia. Heraclius, one of the most warlike, and in the early part of his reign one of the most successful of the eastern emperors, had succumbed to this torrent of conquest, and his successors trembled at the names of their rivals. The successors of Mohammed were at first austere and simple in their manners, and narrow and zealous in their religious faith; but from the accession of Moawiya (661), the time when the seat of empire was transferred first to Damascus and subsequently to Bagdad, the throne of the Caliphs was as splendid as it was powerful. The generous blood of Arabia, nourished by more genial climates, showed an aptitude for all that is great, not only in military achievement, but in learning, science, literature and art. The empire was soon divided, but wherever the Arab sway prevailed a liberal patronage of learning and toleration even of speculative inquiry distinguished it. The career of conquest was not soon ended. It spread with astonishing rapidity over Africa and Europe, and was finally checked by the fatal divisions which originated in the disputes between the descendants of the Prophet and the dynasty of the Ommandes, descended from his mortal foe and tardy convert, Abu Sophian. Among the alternate protectors and oppressors of the eastern Roman empire were the various Mongol tribes, whose predatory course led them to the west. In these also the Arab rulers found dangerous converts, who first supplied the place of their own troops, grown effeminate with luxury, and then planted themselves on the throne of which they had superseded the natural defenders. While the Caliphs of Bagdad still held a nominal sway, subject to the dictation of their Turkish guards, Mahmud, the Mongolian Mohammed, asserted his independence (999), conquered India, and established the Mohammedan power in the Punjab. Another revolt from the empire of Mahmud founded the Seljuk dynasty, which was distinguished by the cultivation of learning and Khairism, and which was distinguished for its struggles with the Crusaders. Othman, an emir of the Seljuk Sultan of Iconium, established the Ottoman empire in 1300. About 1220 Genghis Khan, an independent Mongol chieftain, made himself master of central Asia, conquered northern China, overran Turkestan, Afghanistan and Persia; his successors took Bagdad and extinguished the remains of the caliphate. In Asia Minor they overthrew the Seljuk dynasty. His grandson, Kublai Khan, conquered China in 1260. The successors of Genghis Khan also invaded Russia, and the Christian empire established by Vladimir was overthrown by the Golden Horde, led by his grandson Batu (1240). Timur or Tamerlane, who professed to be a descendant of Genghis, carried fire and sword over northern India and western Asia, defeated and took prisoner Bajazet, the descendant of Othman (1402), and received tribute from the Greek Emperor. The Ottoman empire soon recovered from this blow, and the territory which was taken and the eastern empire overthrown by the Sultan Mohammed II in 1453. A descendant of Timur, Baber, again invaded India early in the 16th century, and his grandson, Akbar the Great (1556-1605), founded the Mogul empire at Delhi, for two centuries one of the most brilliant Asia has known. China recovered its independence about 1638 and was again subjected by the Manchu Tartars (1618-45), soon after which it began to extend its empire over central Asia. Siberia was conquered by the Cossacks on behalf of Russia (1580-84) The same country effected a settlement in the Caucasus about 1786, and has since continued to make steady advances into central Asia. The discovery by the Portuguese of the passage to India by the Cape of Good Hope led to their establishment on the coast of the peninsula (1498) and opened a new era in the history of the East, which has been practically isolated from the West since the time of the Crusades. They were speedily followed by the Spanish, Dutch, French and British. The struggle between the last two powers for the supremacy of India was completed by the destruction of
1 Smyrna. Scene along the busy Harbor-front

the French settlements (1760-65), and from that time the conquest of India by the British progressed with uninterrupted success. In 1858 India came directly under the British Crown. The extension of the influence and possessions of European powers, especially Russia, Great Britain and France; the fall of Kiau-Chau in the Chinese province of Shantung in 1897; the rapid development of Japan into a power capable of competing on equal terms with those of Europe, as demonstrated by the victories over China (1894) and Russia (1904-05); the annexation of Korea (22 Aug. 1910), and capture of Kiau-Chau from Germany (7 Nov. 1914); the conquest of the Philippine Islands from Spain by the United States (1899); the Boxer rebellion (1900-01); overthrow of the Manchu dynasty in China and proclamation of the Chinese Republic (12 Feb. 1912); the Japanese demands considered menacing to the independence of China and the agreement of 8 May 1915 between the two nations; the partition of Turkey by the European Powers on the side of the Central Powers are the most important events in modern Asiatic history. For particular phases of this history see CHINA; KOREA; JAPAN; MANCHURIA; RUSSIA and TURKEY. ASIA, Central, a designation loosely applied to that enormous territory lying between the Altai Mountains and the Persian Gulf, and includes part of Siberia, all Turkestan, Afghanistan, Baluchistan and part of Persia. Humboldt's definition of central Asia gave that name to Bokhara and Tartary. In Russian official language, central Asia is an administrative portion of the empire lying to the southwest of Siberia and comprises with part of what used to be called Siberia the divisions of Turkestan. The total area is given at 1,366,000 square miles and the population at 11,135,500. The eastern portion belongs to China; the western or Russian portion is divided into the governments of Astrakhan, Semipalatinsk, Turgai, Uralsk, Semirechinsk, Ferghana, Samarkand, Syr-Daria and the Trans-Caspian territory. For the geography, ethnography, etc., of the region see ASIA; also TURKESTAN, KHIVA, KHORASAN, SIBERIA, RUSSIA, etc. Consult Cordier, R. P. 'Innermost Asia' (London 1900); Knight, E. F. 'Where Three Empires Meet' (London 1893); Kraft, H., 'A travers le Turkestan Russe' (Paris 1901); Meakin, Annette, 'In Russian Turkestan' (London 1915); Philibbs, I. M., 'A Visit to the Russian Turkestan' (London 1889); Skrine, F. H., 'The Expansion of Russia' 1815-1900 (London 1903). Bokhara: Curzon, G. N. (Lord), 'Russians in Central Asia' (London 1889) and 'The Pamirs and the Sources of the Oxus' (London 1897); O'Donovan, E., 'The Merry Oasis' (London 1899); Vambery, A., 'History of
ASIA IN THE BIBLE—ASIA MINOR

As in the Bible. In the Old Testament there is no reference to Asia, but in the Apocrypha it is applied to the territory covering the Tigris and the Euphrates valleys, part of Asia Minor, Syria, Phœnicia and Palestine, probably by the same name to which the Romans applied the name. Consult Acts xix, 10, 26, which refers to Paul laboring in Ephesus, chief city of the Biblical Asia. Paul addressed the circular epistle to the churches of this region, for reference to which see the closing salutation of Corinthians (which was written from Ephesus) xvi, 19. They are also made the recipients of the message of John in the Book of Revelation.

Asia Minor ("Asia the Less"). Modern Anatolia is the extreme western peninsula projection of Asia, forming part of Turkey in Asia. The name is not very ancient; originally the Greeks seem by Asia to have meant only the western part of Asia Minor, but with the development of geographical knowledge the name Asia gradually widened. The late Greek name for Asia Minor is Anatolia—*Anatoli, the East*, whence is formed the Turkish Anatoli. Asia Minor includes the peninsula; it is bounded on the north by the Black Sea and Sea of Marmora, on the west by the *Ægean* Sea, on the south by the Mediterranean and on the east by the Armenian highlands and the Euphrates. In the extreme northwest it is separated from Europe by the Straits of the Bosphorus and the Dardanelles. The western coast is indented with innumerable bays and gulfs, beyond which lie the islands of the Greco-Asiatic Archipelago. The area of the peninsula is about 19,272 square miles. It constitutes the western prolongation of the high table-land of Armenia with its border mountain ranges. The interior consists of a great plateau or rather series of plateaus, rising in gradation from 3,500 to 4,000 feet, with bare steppes, salt deserts and lofty linear mountain chains; the structure is volcanic and there are several conical mountains, one of which, the Ergish-dagh (Argæus), with two craters, attains a height of 13,100 feet, towering above the plain of Kaisarieh which has itself an elevation of between 2,000 and 3,000 feet. The plateau is bordered on the north by the Pontic Coast range, a long train of parallel mountains 4,000 to 6,000 feet high and cut up into groups by cross-valleys. These mountains sink abruptly down on the northern side to a narrow strip of coast; their slopes toward the interior are gentler and bare of wood. Similarly is the character of the border ranges on the south, the ancient Taurus, only that they are more continuous and higher, having an average elevation of about 7,000 feet and rising to over 10,000 feet in Lycia and Cilicia. The western border is intersected by numerous valleys opening upon the archipelago to the north part of which the Suiats, Ida and Olympos belong. Between the highlands and the sea lie the fertile coast lands of the Levant. Of the rivers the largest is the Kizil Irmak (Halys), which, like the Yeshil Irmak (Iris), and the Sakaria (Sangarius), flows into the Black Sea; the Gediz Chai (Hermus) with its affluents the Pactole and Menderes (Meander), flow into the *Ægean*.

Climate. The climate has on the whole a southern European character, except on the central plateau which is much more influenced by very little rain, a hot summer and a long, cold winter; the southern coast has mild winters and scorching summers, while on the coast of the *Ægean* there is the mildest of climates, partly tempered by tidal breezes and a magnificent vegetation. On the northern side, being exposed to the northeast winds from the Black Sea, the climate is not so mild, but there are abundant rains and the vegetation is luxuriant.

Industrial Development. In point of natural history Asia Minor partakes of the character of the East and of the West. The forest trees and cultivated plants of Europe are seen mingled with the former characteristic of Persia and Syria. The central plateau, which is barren, has the character of an Asiatic steppe, more adapted to the raising of flocks and herds than for agriculture, except the cultivation of wheat and other grains; but horses, especially of the nomadic camel-bred and the Angora-goat are bred here. The coasts are rich in all European products, fine fruits, olives, vines and silk have quite the character of the south of Europe, which, on the warmer and drier southern coast, is more reminiscent of the more southerly, and more Mediterranean traits. The chief products besides those mentioned are wheat and other grains, cotton, tobacco, flax, poppy-seed and licorice. Carpets, rugs and silk stuffs are the principal manufactures. Asia Minor is the seat of considerable metal wealth, including lead, copper, petroleum, meerschaum, gold, silver, coal and salt, but it is as yet almost undeveloped. The main exports are figs, raisins and other fruits, olive oil, silk, cocoons, carpets, sponges, mohair, wool, hides, cattle, gum, poultry, wax and tobacco.

The People. The inhabitants, some 10,000,000 in number, consist of the most various races. The dominant race are the Osmanli Turks, numbering about 7,000,000 and are spread over the whole country; they are mainly engaged in agriculture and cattle-raising. Allied to these are the Turkomans and Yuruk, speaking a dialect of the same language. The latter are found chiefly on the tableland, leading a nomadic life; there are also hordes of nomadic Kurds. Among the mountains east of Trebizond are the robber tribes of the Lazes. Before the European War the Greeks and Armenians were the most progressive elements in the population and had most of the trade. While the Greeks monopolized the professions, the ownership of the land was largely passing into the hands of the Greeks, Armenians and Jews.

Administration. The country falls into eight vilayets or governments with their capitals in Brusa, Smyrna, Konia (Iconium), Adana, Sivas, Angora, Trebizond and Kasımpaşa, respectively, and the two "independents" Sanliurfa and Diyarbakir. In ancient times the divisions were Pontus, Paphlagonia, Bithynia in the north; Mysia, Lydia, Caria in the west; Pisidia and Cilicia in the south; Cappadocia in the west; and Galatia with Lycaonia and Phrygia in the centre. The *Ægean* Islands, which have recently passed

out of the hands of Turkey, belonged most of them to Asia Minor.

Railways. The right to construct railways throughout Asia Minor and Armenia has been conceded to Russia. The earliest roads, however, were constructed by English and French companies in 1856 and 1866, respectively, the first running from Smyrna to Aśid and Dineir with several branch lines; the second from Smyrna to Cassaba with extensions to Afion and Karalous. The main or Anatolian line was opened about 1873, the first section running from Haidar Pasha to Ismjd. In 1888 it was taken over by the German Society of Anatolian Railways, financed by the Bank of Berlin, and in 1892 was extended to Angora, and in 1896 to Konia. In 1902 the German Bank received the concession for the Bagdad Railway (q.v.) by which the Anatolian line was to be extended from Konia to Adana, Mosul, Bagdad and Basra, with numerous branch lines. It has been completed continuously as far as Kara Buna in Cilicia (1911-12) and with the various portions already completed was in 1910 operating along a length of 538 miles from Konia. The total length of railways in Asia Minor is about 1,300 miles and the benefits derived from them by the country are incalculable.

History. Here, especially in Ionia, was the early seat of Grecian civilization and here were the cities of Phrygia, Lydia, Paphlagonia, Bithynia, Lydia, Pamphylia, Isauria, Cilicia, Galatia, Cappadocia, etc., with Troy, Ephesus, Smyrna and many other great and famous cities, including the seven churches of the book of Revelation. Here in the dawn of history the non-Aryan race of the Hittites, whose capital is thought to have been at Boghaz Kene, rose to power; here from the obscure era of Semiramis (about 2000 B.C.) to the time of Osman (about 1300 A.D.), the greatest conquerors of the world contended for supremacy; and here took place the wars of the Medes and Persians with the Scythians; of the Greeks with the Persians; of the Romans with the Parthians; of the Arabs, Seljucks, Mongols and Osmanli Turks with the weak Byzantine empire. Here Alexander the Great and the Romans successfully contended for the mastery of the civilized world, and here the Crusaders passed on their way to the Holy Sepulchre. But notwithstanding all these wars the country still continued to enjoy some measure of prosperity till it fell into the hands of the Turks, under whose military despotism its ancient civilization has been sadly brought to ruin. Recently considerable portions of Armenia have been absorbed by Russia. In 1878 Great Britain made a secret engagement to guarantee against Russian aggression the Asiatic dominions of the Porte. Of recent years German influence has been preponderant throughout the Turkish empire and in Asia Minor all the railroads of the plateau are being worked by German companies.

E., "The Holy Land of Asia Minor" (New York 1914); Flitch, "Le Chemin de fer de Bagdad" (Brussels 1914); Gallas, E., "Asie Mineure et Syrie" (Paris 1907); Klausing, K., "Kleineasia und Kaukasus" (Berlin 1897); Leonhart, R., "Paphlagonia" (Berlin 1915); Oberhummer and Zimmerer, "Durch Syrien und Kleinasiien" (Leipzig 1899); Percy, Earl, "The Highlanders of Asiatic Turkey" (London 1901); Philippson, A., "Reisen und Forschungen im Westlichen Kleinasiien" (Gotha 1910-13); Ramsay, W. M., "Historical Geography of Asia Minor" (London 1890); Reclus, E., "Universal Geography, Asiatic Turkey" (London n. d.).

ASIAGO, Italy, town of the province of Vicenza, 17 miles north of the city of that name. It is the capital of the district of Setti Comuni; has manufactories of straw hats and has a large percentage of Teutons among its inhabitants who number about 5,500. In the great German drive of November 1917 Asiago and the surrounding plateau were menaced by the Teuton forces. For a detailed account of the military operations in Venetia see War, European.

ASIARCH, ašiš-ârîk, a Roman officer appointed as director-general of religious ceremonies in the province of Asia. The expression occurs in the Greco-Testament, Tînes de kâ tîn Asîraschôn, "And certain also of the Asiarchs" (Acts xix, 31). Properly speaking there was but one Asiarch residing at Ephesus; the others referred to were his subordinates.

ASIATIC BROTHERS, the designation of a secret society organized in Germany about 1780. SeeROSICRUCIANS.

ASIATIC SOCIETIES, learned associations formed for the purpose of collecting and disseminating valuable information respecting the different countries of Asia. The Royal Asiatic Society of Great Britain and Ireland was established 19 March 1823. With it in 1828 was connected a very active translation committee which published English, French and Latin translations of Orient works, occasionally accompanied with the originals. Similar societies have been formed in Asia itself, such as the Asiatic Society of Bengal at Calcutta, founded in 1784 by Sir William Jones. Since 1846 the Bibliotheca Indica, a series of Oriental works in English and translation,—has been published under the supervision of this society at the expense of the Anglo-Indian government. There are similar societies on the Continent and in America, such as the Société Asiatique at Paris, founded in 1822, the Oriental Society of Germany (Deutsche Morgenländische Gesellschaft), founded in 1845, and the American Oriental Society, organized 7 Sept. 1842, and which in 1915 had a membership of 304.

ASIMINA, ąsimaʼn′a, Papaw, a genus of nine species of small or small trees of the family Annonaceae, eight of which are natives of eastern North America, the West Indies and Mexico, with attractive foliage and large purple or whitish axillary flowers appearing in early spring, and large edible fruits. Two species are cultivated for ornament and deserve more attention at the hands of horticulturists. One of these, A. trilobâ, which has produced some varieties, is the only arborescent species of the genus. It is hardy as far north as Massachusetts and produces very large-seeded fruits, often more than three inches long and too
highly aromatic to suit all palates. The other species *A. grandiflora*, is found in Georgia and Florida and is said to produce delicious fruits.

**Asiphonata** is an order of lamellibranchiate mollusks, destitute of the siphon or tube through which, in the Siphonata, the water that enters the gills is passed outward. It includes the oysters, the scallop shells, the pearl oyster, the mussels, and in general the most useful and valuable mollusks.

**Asir** is a district lying between lat. 17° 30' and 21° N. and long. 40° 30' and 45° E.; bounded north by Nejd, south by Yemen and west by the Red Sea. Its length along the coast is about 230 miles and its breadth about 180. The lowland is hot and barren. Kanfuda is the chief port of the district; Marsa, Hali and El Itwad are smaller ports. The mountainous tract has an average altitude of between 6,000 and 7,000 feet, with a temperate climate and regular rainfall, and is fertile and populous. The valleys are well watered and produce excellent crops. The rocks and stony, juniper forests are said to exist on the higher mountains. The inhabitants are a brave and warlike race of mountaineers and aided by the natural strength of the country have hitherto preserved their independence. The Turks have made repeated attempts to conquer Asir, but beyond occupying Kanfuda and one or two points in the interior, they have effect nothing. No part of Arabia would better repay exploration.

**Ask** is a Scandinavian mythology, the name of the first man created. According to the legend the gods, Odin, Hâner and Loden, found two trees by the seaside, an ash and an elm. From these they created the first man and first woman, Ask and Embia, and gave them the earth as their dwelling place.

**Askabad**, or Ashkabad, is a town in central Asia, capital of the Transcaucasian province, 345 miles by rail southeast of Krasnovodsk and 594 from Samarkand, situated in a small oasis at the northern foot of the Kopet-dagh range. It has a public library and a technical railway school; also cotton, cotton-gin, and brickworks and a mineral-water factory. The trade is valued at $1,300,000 a year. The population, 2,500 in 1881 when the Russians seized it, is now about 20,000, one-thirds of whom are Persians, many of them belonging to the Balhi sect.

**Aske, Robert** was a devout man. He was the first man and first woman, Ask and Embia, and gave them the earth as their dwelling place.

**Aske, Robert**, English rebel: d. 1537. He was of an old Yorkshire family. He became an attorney and fellow at Gray's Inn. Little of his personal history is known, except in connection with the insurrection called the "Pilgrimage of Grace," which began in Lincolnshire in October 1536, as an outbreak against the law passed by Parliament suppressing those monasteries whose revenues fell below £20 a year. Other laws were enacted abrogating a number of old holidays and increasing taxes which impressed the property of the people. Aske led the uprising in Yorkshire. His army took Lord Dacy and the archbishop of York prisoners, who were then forced to take the oath of the rebels. The monks and nuns were reinstated; the royal herald was not permitted to read the King's proclamation; and announcing his intention of marching to London to declare the grievances of the commons to the sovereign himself, Aske soon had the whole country under his control. A military organization with posts from Newport on the Severn to Hull was established and Hull was provided with cannon. No terms could be agreed upon, and it was decided to fight a battle on 27 October. A heavy rain prevented the consummation of this plan. The King, in the meantime, sent a conciliatory message which Aske prevailed upon his followers to accept. Aske was pardoned, but the King's promises were not considered sufficient and another insurrection broke out in the east. For his efforts in suppressing this, Aske was thanked by the King. He was not, in spite of the fact that he had done nothing to forfeit the King's favor, was sent to the Tower of London and sentenced to be hanged. He was paraded back to York and executed there in July. There is a striking inscription on a tower of the church of Aughton in East Riding by a member of his family to commemorate the year 1535. Consult Gasquet, F. A., 'Henry VIII and the English Monasteries' (1906);; a letter and Papers of Roger of Mortimer, *Henry VIII* (Vols XI and XII) *English Historical Review* (Vol. V, pp. 330, 550); 'Chronicle of Henry VIII' (translated by M. A. S. Hume, 1889); Whitaker, 'Richmondshire' (Vol. I, p. 110), containing a pedigree of the Askes; Hall's 'Chronicle', and Wriothesley's 'Chronicle'.

**Askew, ās'kā, or ASCOUGH, Anne**, English religious zealot and martyr: d. Stallingborough 1521; d. Smithfield, 16 July 1546. On the death of her sister she was induced to become the wife of her sister's fiancé, Thomas Kyne, by whom she had two children. She was a staunch Protestant, and upon being denounced by the family priest, her husband, a Catholic, turned her out of his house. She went to London, where she was arrested and charged with heresy, March 1545. Under charge she was acquitted, but persisting in devotion to her faith, she was again arrested, June 1546, and tortured on the rack, in spite of which she refused to recant. In the following month, 16 July 1546, she was burned at the stake in Smithfield Green near to the Charterhouse. The Lattre Examinacyn of Anne Askew (Mârburg 1547), and Webb, 'An Account of Anne Askew' (London 1865).

**Asikhbadab, ās'kha-'bād', the thriving administrative centre of the Russian province of Transcaasia, situated in the Akhaj, Tekke oasis, and occupied by Skobelef in January 1881, after the sack of Gok Tepe. Its distance from Merv is 232 miles, from Herat 388 miles. Pop. about 52,000.

**Askja, āsk'ya**, a volcano in the centre of Iceland, first brought into notice by an eruption in 1875. Its crater is 17 miles in circumference, surrounded by a mountain-ring from 500 to 1,000 feet high, the height of the mountain itself being between 4,000 and 5,000 feet.

**Asluaga's (ā-slow'gæz) KNIGHT**, the title of a romantic tale of medieval chivalry, by Friedrich, Baron de la Motte-Fouqué. It was published in 1814. The story is told with simplicity and grace, and with it may be compared the "Taming of Aslan" in Wm. Morris' 'Earthly Paradise.'
ASMEl—ASPARAGIN

ASMAl, ës'mal, or ASMAI, an Arabic writer, the instructor of Harun-al-Rashid: b. about 740; d. 830. His history of the kings of Arabia and Persia, prior to Islam, is of great value, while his romance of 'Antar' has been called "the lid of the desert."

ASMANITE, a variety of silica, occurring in small grains in certain meteoric irons, and now believed to be identical with tridymite (q.v.).

ASMARA, Africa, capital of the Italian colony of Eritrea in northeast Africa. It is built on the Hasamesh plateau, at an elevation of 7,800 feet, and is 40 miles southwest of the seaport of Massawa. The town is strongly fortified. The European quarter contains several fine public buildings, including the residence of the governor, club house, barracks and hospital. Fort Baldissera is built on a hill to the southwest and is overlooked impregnable. It was occupied by the Italians in 1889, and in 1900 the seat of government was transferred thither from Massawa. It is surrounded by rich agricultural lands, cultivated in part by Italian immigrants and is a busy trading centre. A railway from Massawa to Asmara was completed as far as Ghinda in 1904. There are gold mines about six miles to the north which have been partially worked. The population is about 10,000, including the garrison of 300 Italian and some 1,000 native troops. The European civil population numbers over 300; the rest of the inhabitants are chiefly Abyssinians.

ASMODEUS, or ASMODAI, in Hebrew mythology, an evil spirit which slew seven husbands of Sara, daughter of Raguel, at Rages. By the direction of the angel Raphael the young Tobias exorcised Asmodeus with the smell of a fish's liver burned on the coals, into the uttermost parts of Egypt, whither he was pursued by Raphael, who bound him, so that thereafter Tobias and Sarah might be undisturbed by him. (Tobit VI, 14; VII, 2). According to the Talmudic legends Asmodeus had dves relations with King Solomon, whom on several occasions he aided, especially in planning and constructing the temple. In many of the legends he is given as the cause of the sins and excesses which besmirched the character of Solomon. Several scholars have identified Asmodeus with Æshma deva, the demon of wrath, prominent in Mazdaism, the religion of Persia. Consult Jastrow, 'Hebrew and Babylonian Traditions' (New York 1914); Hastings, 'Dictionary of the Bible' (ib. 1910).

ASMODEUS, The Lame Devil. (Le Diable Boisé) by Alain René Le Sage, first published in 1707, and republished by the author, with many changes and additions, in 1725. It is sometimes known in English as 'Asmodeus,' and sometimes as 'The Devil on Two Sticks,' under which title the first English translation appeared, and was dramatized by Henry Fielding in 1768.

ASMONÉANS, a family of high priests and princes who ruled over the Jews for about 130 years, from 153 B.C. See MACCABEES.

ASMUS, I's'mis, Georg. German-American poet: b. Giessen, 27 Nov. 1830; d. Bonn, 31 May 1892. He came to the United States to conduct some mining operations in the copper region of Lake Superior; then lived in New York until 1884, when he returned to Europe. Among the German population of the United States he had an enormous success with his 'American Sketch-Booklet' (1875), an epistle in verse, written in Upper Hessian dialect and overflowing with delicious humor. It was followed by 'New American Sketch-Booklet' (1876). He also wrote 'Camp Paradise' (1877), a story, and a collection of miscellaneous poems (1891).

ASYNS, as'nch, Adam. Polish patriot and poet: b. Kalish, 11 Sept. 1838; d. Cracow, 2 Aug. 1897. He participated in the insurrection of 1863, for which he had to spend some years in exile in Germany. He was author of 'Poeze' (1872-80), and several successful dramas, 'The Jew'; 'Cola Rienzi'; 'The Friends of Job.'

ASOKA (Juncosis asoca), an Indian tree, of the natural order Leguminosae, sub-order Cesalpinea, with a flower showing orange, scarlet and bright yellow tints. It is sacred to the god Siva, and often mentioned in Indian literature.

ASOKA (q-sä'ka) VARDHANA, an Indian sovereign, who reigned 264-227 B.C. over the whole of northern Hindustan. He embraced Buddhism, and forced his subjects also to become converts. Many temples and topes still remaining are attributed to him.

ASOLANDO: Facts and Fancies, the latest volume of poems written by Robert Browning and published on the day of his death, 12 Dec. 1889.

ASOLO, Italy, town of Venetia, in the province of Treviso, about 19 miles northwest of Treviso, and 10 miles east of Bassano. It is well situated on a hill, 690 feet above sea-level. Remains of Roman baths and of a theatre have been discovered. Asolo was the residence of Catherine Cornaro, Queen of Cyprus, after her abdication. Paulus Manutius was born here. Pop. 5,847.

ASOPUS, the name of several rivers in Greece. The most celebrated of these name are those in Achaea and Boeotia.

ASOTUS, one of the characters in 'Cynthia's Revels,' by Jonson. He is a toady to Amorphus.

ASP, a venomous snake. The name as applied in the Bible probably refers to the hooded, or African cobra (Naja haje), common in Egypt, and often represented in hieroglyphics. The naja haje is from three to five feet long, and the loose skin on its neck can be dilated into a hood like that of the Indian cobra, but its markings differ. (See COBRA). The asp employed for suicide by Cleopatra was probably the small-horned viper (Aspis hassel-quistii). The asp of southern Europe is Vipera aspis, found from France to the Tyrol and in Italy. See VEPER.

ASPARAGIN, or ASPARAGINE, a nitrogenous substance having the formula CH4·N·O3, or CONH2. CH2·(NH2)·COOH, occurring in the juice of most plants, and notably in the growing buds of asparagus. It is readily obtained by filtering the plant juice, and evaporating it to a syrupy consistency. The asparagin then separates in the form of tritrimic pris-
mastic crystals, which are soluble in water and in acids and alkalis, but insoluble in alcohol or ether. Asparagin undoubtedly plays a very important (though yet unknown) part in the chemistry of plants, since it occurs in large amounts in germinating seeds, and wherever growth is actively proceeding.

**Asparagus**, a genus of about 150 species, mostly tuberous-rooted, climbing, drooping, trailing or erect perennial herbs or shrubs widely distributed in tropical and warm temperate countries, especially in southern Europe and southern Africa, but more or less cultivated for food or ornament in all civilized countries. Some species are annual and even excel the most delicate ferns in beauty of habit and foliage, which, botanically considered, consists not of leaves but leaf-like stems. The ornamental species with the exception of *A. verticillatus* (see below), must all be grown in greenhouses, except in southern Florida and southern California, where they may be planted with safety out of doors. They are readily and usually propagated by seeds, but often also by cuttings and by division. Among the best-known ornamental species cultivated in America are the following: *A. asparagoides*, also known as *Myriophyllum asparagoides*, the sililax of the florist, is widely grown for decorative purposes, for which its glossy green leaves especially commend it. (For culture, see *Sililax*.) *A. sprengeri* is a species native in Natal, with long drooping branches, glossy light-green leaves (white in one variety), small white fragrant flowers in small racemes, and little red berries. It is very popular, especially for planting in hanging baskets. *A. plumosus*, a tall climbing species from South Africa with horizontal branches of beautiful form, texture, and color, which qualities are retained for weeks or even months after cutting, is deservedly one of the most popular of decorative plants. It has developed several varieties, some of which, especially the yellow *A. tenuis*, are even more popular than the original species. *A. verticillatus*, a hardy species with tufts of hair-like leaves and small red berries, is a native of Persia and Siberia, and climbs to a height of 12 to 15 feet from a woody root-stock. Several other species are cultivated for ornament in America.

Best and most widely known, however, is *A. officinalis*, esculent asparagus, which is also used to some extent as an ornamental plant. It is a perennial herb, native of Europe and Asia, and commonly found growing on sandy loam or sea shores, river banks and among shrubby undergrowth. In a wild state it rarely exceeds a foot in height and a stem diameter of more than one-third of an inch; but in garden-grown plants are sometimes obtained as thick as a man's wrist, and the plants often grow more than four feet tall. For more than 2,000 years it has been cultivated for its succulent young shoots, produced from the thick root-stocks in spring. An excellent method of growing the plant may be epitomized as follows:

The land chosen for the bed should be a rich, friable and warm loam, preferably exposed to the south or east. Manure should be applied without stint before the plants are set, and the preparation of the soil should be deep and thorough. The plants may be home-grown or purchased. One-year-old plants, if sturdy, are preferable to older ones. For home growing a separate nursery bed should be prepared, and the seed previously soaked 24 hours in order to hasten germination, sown in early spring, about two inches apart and one inch deep, at which rate an ounce should be enough for 200 or more feet of drill. Some radish seed of a small early maturing variety should be sown in the same drill, so that the young radish plants, which quickly appear, may mark the position of the rows when transplanting and less-conspicuous asparagus plants. As soon as the radishes are of edible size, or even before, if necessary, they should be pulled and the asparagus plants, then an inch or two tall, left in possession of the ground. Beyond keeping down weeds, destroying pests and thinning the plants to four inches asunder, no further attention is necessary during the first year. In the spring of the second year, if properly managed during the first, the plants should be large enough to be transplanted to permanent quarters. If too small they should be transplanted at least eight inches asunder and grown a second year in a nursery bed. In the permanent bed the plants should stand at least two feet asunder in rows not less than four feet apart. Five or even six feet for the larger growing varieties is much better. Stamine plants are more productive of shoots than pistillate, but are difficult to recognize until the plants flower. The furrows are plowed six inches deep or deeper, the plants set in the bottom, but at first covered with only about two inches of earth. After growth starts the trench is gradually filled by cultivation which must be thorough, both among the plants and between the rows. Not before the second spring after planting in permanent quarters should any shoots be gathered. At the time of planting a liberal dressing of some slowly decomposing fertilizer, such as ground bone, should be given in the drill, and in the spring of each year complete fertilizers should be applied liberally. (See Fertilizers.) In addition to such applications many growers spread stable manure upon the bed in the autumn after the tops have been removed, a necessary practice to prevent the scattering of the seeds upon the beds as soon as the soil can be worked the land is either plowed shallow or cultivated deeply to bury the manure. Since the plants are gross feeders there need be little fear of fertilizing too heavily. Methods of gathering depend somewhat upon whether the stalks are to be blanched or left green. Blanching is done by ridging the soil 13 inches deep above the crowns. Stalks so produced are gathered as soon as the tips appear above the soil; green stalks are cut when about nine inches long, including the base of two or more inches below the surface of the ground. In each case the stalk may be cut with an asparagus knife or preferably snapped near the crown, or at least at the proper depth, if blanched, by plucking the hand down in the loose ridge and severing it with the fingers. By the latter method there is less danger of injuring other shoots. All cutting should cease when green peas, grown in the same locality, are ready for the table, because the plants must be given opportunity to store up food for the following.
year. The stems are usually sold in bunches of various sizes, the grade depending upon the leanness and quality of the stalks. Every bunch commonly sold is eight and one-half inches long, weighs about two pounds and contains 30 spears. As a rule, the thicker the spear the better. First-class spears are three-quarters of an inch thick or thicker. Every spear must be taken in handling to prevent bruising, since a gummy juice collects in the broken cells, and the injured stalks spoil by heating. After washing, the stalks should be dried and kept cool. If to be shipped long distances, their butts should rest in damp sphagnum moss or similar material. In the home garden, where horse cultivation is not practicable, the plants may be set even as close as 18 inches by two feet, but the manuring, cultivation and other care must be increased in order to obtain choice shoots. Each spring the very liberal dressing of manure applied the previous autumn should be forked, not dug in, and a lavish amount of commercial fertilizer, rich in potash, phosphoric acid and nitrogen, applied. Soap sods may be embedded in the beds to eliminate any potash in them. Asparagus sometimes is forced in hotbeds, under green-house benches, in cellars, etc., by setting mature crowns (plants) close together and supplying heat and moisture. A large amount of light is not essential. It is also forced in the field by covering the beds with cloth and applying heat by means of portable steam pipes, either in or upon the ground. In the former case the roots are ruined by the process; in the latter, they are not, but should be given more or less water to recuperate. (Consult reports and bulletins of Cornell Experiment Station and of Missouri Experiment Station.) Several other species furnish edible shoots; for example, A. acutifolius, A. albus and A. teniusfolius, all European species. The tubers of A. lucidus are eaten in China and Japan, where the species is indigenous. The shoots of A. scaber, which resemble those of A. officinalis, are inedible because bitter.

Enemies.—Asparagus has only two important enemies, and when compared with other general crops, long cultivated, only a few less serious ones. Asparagus rust (Puccinia asparagi) has been known for about 100 years, and does serious damage sometimes. In a badly infested field the plants as a whole seem to be maturing very early, their deep green having been replaced by a tawny brown. The stems, examined closely, show a blistered and ruptured skin, beneath which are brown masses of spores or, in late autumn, almost black winter spores. In the spring the "cluster cup" is the form observed. The most effective control is the resin-Bordeaux mixture, made by adding to each 48 gallons of standard Bordeaux mixture two gallons of resin stock solution, made as follows: Heat five pounds of resin and one pint of fish-oil in a kettle until the resin is dissolved. If very hot, allow to cool somewhat. Then slowly stir in one pound of potash lye and heat again till the mixture becomes the color of wine. An additional gallon of water must be added. If the potash be added while the resin is too hot, the mixture may ignite. This solution increases the adhesiveness of Bordeaux mixture. (See FUNGICIDE.) With the mixture 50 per cent greater yield has been obtained in unfavorable seasons, and 70 per cent in favorable seasons. Growers cutting 800 bunches or more per acre find that the value of the shoots improves each week for four, five or even more weeks pays well. For detailed account of this disease and specific methods of control, consult N. Y. Experiment Station Report (1901). The asparagus beetle (C teaseus) is an European insect introduced about 1856, the only seriously injurious insect pest, is about one-quarter of an inch long with black and yellow or red wing-covers. It belongs to the Chrysomelidae. It appears as the adult in spring, and lays eggs on the shoots. In a few days grayish-green grubs appear and gnaw the green parts of the plants. When full grown they burrow in the ground to pupate for a short time. The broods succeed each other at intervals of about a month, if the weather be favorable. Their natural enemies are lady-bird beetles and soldier beetles. The popular remedies are the corolling of chickens, ducks and turkeys in the plantation; cutting all volunteer plants in waste places; cutting new shoots daily; allowing spindling shoots to remain in the bed to make for the insects to deposit their eggs upon and burning the shoots not less often than once a week; dusting with air-slaked lime or road dust while the dew is on; brushing the grubs to the hot ground from the full grown plants, the middle of the day being chosen for this operation; spraying with arsenites, hellebore or other stomach poisons, etc. A case of light early and fight late! The 12-spotted asparagus beetle (Cricoriis 12-punctatus), about the same size as its relative just described, but orange red with black dots, has a similar life history, and may be controlled in the same way, but is not yet seriously troublesome, except in a few localities. Several plant bugs, moth larve, beetles and aphids also feed upon asparagus, but have not become serious pests. Consult Year-Book United States Department of Agriculture (Washington 1896), and Bulletin No. 10 (1898).

See INSECTICIDE.

For fuller details of asparagus culture consult Hexamer, 'Asparagus Culture' (1901); Bailey, 'Standard Cyclopedia of Horticulture' (1914). In the latter will also be found specific instruction for the cultivation of ornamental asparagus.

ASPARAGUS-STONE, a variety of apatite, found in Murcia, Spain, in the form of small, transparent, yellowish-green crystals.

ASPIASIA, as-pas'ie-a, a celebrated woman of ancient Greece: b. in Miletus in Ionia, but spending a great part of her life in Athens. Her house was the resort of the most virtuous, learned and distinguished men in Greece. She inspired the strongest and most enduring affection in the heart of Pericles, who had separated from his own wife and united himself to Aspasia as closely as was permitted by the Athenian law, which declared marriage with a foreign woman illegal. When the Athenians were dissatisfied with Pericles, instead of attacking him they persecuted the objects of his particular favor, and accused Aspasia of contempt of the gods. Pericles defended her in the Areopagus, but it required all his influence to procure her acquittal. After his death (a.c. 429) Aspasia is said to have attached herself to a wealthy but obscure cattle-dealer, of the
name of Lysicles, whom she soon made, however, an influential citizen in Athens. She had a son by Pericles, who was legitimated by a special decree of the people.

APASIA THE YOUNGER, called Milto by Plutarch, a native of Phocaea. She was at first the wife of Cyrus the Younger, who gave her the name Aspasia (q.v.) after the wife of Pericles of Athens, whose name had become synonymous with wit and brilliancy. When Cyrus died his brother Artaxerxes, as his successor, claimed Aspasia, according to the Persian custom. With him she lived until Darius was proclaimed his successor, whereupon Darius claimed her as his rightful property, upon which Artaxerxes made her a priestess of the temple. So bitter did Darius become over being thus foiled in his desire that he began planning to murder his father, but the result was that he was himself slain.

ASPECT, a term in astronomy and astrology, denoting the situation of the planets and stars with respect to each other. There are five principal aspects: (1) sextile aspect, when the planets or stars are 60° distant and marked ω; (2) the quadrature or quadrate, when they are 90° distant, marked □; (3) trine, when 120° distant, marked Δ; (4) opposition, when 180° distant, marked Ω; and (5) conjunction, when both are in the same degree, marked 0°. Kepler added eight more. It is to be observed that these aspects, being first introduced by astrologers, were distinguished into benign, malignant and indifferent; and Kepler's definition of aspect, in consequence, is "Aspect is the angle formed by the rays of two stars meeting on the earth, whereby their good or bad influence is measured." The aspects now in use are conjunction, opposition and quadrature.

APSEN, trees of the family Salicaceae and genus Populus, native of the cooler parts of Europe and Asia, and succeeding best upon moist, gravelly soils. They grow quickly; usually attain a height of 50 to 60 feet, sometimes even 100 feet; have light, small, thin-toothed leaf-blades upon long, slender, flattened petioles which permit the blade to flutter with the least breeze, hence the specific name of the European aspen, P. tremula, "tremulous." The wood being white, light, soft, and porous, is not a valuable fuel, but is useful for making charcoal for the manufacture of gunpowder, and for turning, often being employed for making bowls, trays, troughs, and pails. The wood may be made harder and thus rendered useful for interior work in houses by peeling off the bark and allowing the stem to dry before felling it. In places where this tree abounds, and other timber is scarce or expensive, this method of hardening is very useful. The bark is rich in glucoside called salicin and used in leather tanning. In the United States the European tree is best known as an ornamental one, its variety, pendula, with graceful, drooping branches, being perhaps the best weeping poplar. The male flowers are spherical, because of the abundance of their catkins, which appear in early spring before the catkins of American species. The American aspen (Populus tremuloides), very generally distributed from Alaska to Labrador and southward to Pennsylvania and California, and in the mountains to Mexico, closely resembles the preceding species. Its light-gray branches render it conspicuous in clearings where it is one of the first to appear. It is said to attain a height of 100 feet when grown in the forest, but is usually much smaller. This tree, like the following, is widely used in the manufacture of wood pulp. The large-toothed aspen (Populus grandidentata) is a large American species found from Nova Scotia to Minnesota and southward to Tennessee. See Poplar.

APSPEN, Col., city and county-seat of Pitkin County, on the Roaring Fork of Grand River, and the Colorado Midland and the Denver & R. G. railways; 30 miles west of Leadville. It is situated at an altitude of 7,900 feet. Aspen was incorporated in 1881; and has since become the centre of a rich mining section. In the city and vicinity are more than 20 mines, from which are extracted silver, gold, lead and ore mills. While the smelting and concentrating of ores is the distinctive industry, the city has several minor factories, and it is also the principal mining trade centre of the Roaring Fork Valley. The government is vested in a mayor, elected every two years, and a council composed of the mayor and four aldermen. Pop. 1,834.

APSERGES, the ceremony of sprinkling the people with holy water at the beginning of mass in the Catholic Church. The term is derived from the first word in the Psalm which is recited in Latin by the officiating priest.

APSPERN, as-bern, and ESSLINGEN, two villages a few miles east of Vienna, on the opposite bank of the Danube, celebrated for the battle fought 21 and 22 May 1809, between the Archduke Charles with 70,000 Austrians and Napoleon with 36,000 French, in which the latter were defeated. After the fall of the capital the Austrian general resolved to suffer a part of the enemy's forces to pass the Danube, and then to surround them with his own army and drive them if possible into the river. As a result of this, the destruction of these two villages: Aspern was at first taken by the Austrians, again lost and retaken, till they at length remained masters of it: from Esslingen they were continually repulsed. The battle was renewed on the 22d; the French army being now increased so as at least to equal the Austrians in number. Thousands of lives were sacrificed in vain attempts to capture the villages. Asperrn continued to be the stronghold of the Austrians and Esslingen of the French. When the news of the Italian victory came up all hopes of gaining the victory by forcing the centre of the Austrians, Esslingen served to secure their retreat to the island of Lobau. The loss of the Austrians in killed, wounded, etc., was estimated less than a third of the whole army; that of the French at 6,000. The latter lost on this occasion Marshal Lannes and General St. Hilaire. The Austrians had 4,000 men killed and 16,000 wounded, the French 8,000 killed and 30,000 wounded. By the French the engagement is known as the battle of Essling or Esslingen, but the Austrians style it the battle of Asperrn.
ASPHALT

The general term asphalt is applied to the several varieties of hydrocarbons of an asphaltic base which exist in all conditions from the liquid to the solid state. It is more specifically employed to include the purer forms of hard and soft bitumen, such as elaterite, albertite, gilsonite, nitrige, wurtzilite, brea, etc. The term bituminous rock includes sandstones and limestones impregnated with bitumen or asphalt. This rock, usually shipped without asphalt, has been used principally for street pavements and is mixed with other ingredients at the place of use.

The importation of asphalt into the United States is chiefly from the island of Trinidad, off the coast of Venezuela, and from Venezuela itself. Bituminous limestones are imported from Neuchâtel and Val de Travers, in Switzerland, from Seyssel in France, and in small quantities from Germany, Italy, Russia, Austria-Hungary, Spain, Turkey in Asia, Great Britain, the United States of Colombia, Canada, the Netherlands, Cuba and Mexico. The total imports from Trinidad and Venezuela in 1916 amounted to 147,383 short tons. The island of Trinidad, one of the British West Indian possessions, is not of much importance in the world. The deposits are operated by an American corporation under a concession from the British government, and also, independently, from land not belonging to the Crown, acquired by purchase. The chief source of supply is a lake of pitch. This lake lies 138 feet above the sea-level and has an area of about 114 acres. The supply is partly renewed by a constant flow of soft pitch into the centre of the lake from subterranean sources. The shipments of this lake pitch average over 140,000 tons per year, and the flow into the lake is at the rate of about 20,000 tons per year. The depth of this lake is about 135 feet at the centre. Distinct from the lake pitch is what is known as “land pitch,” the overflow in past times of pitch from the lake, and deposits of similar nature. During recent years strenuous efforts have been made to discredit all asphalt mined from properties located outside of Pitch Lake. These efforts seem to have failed, however, as there are many deposits of asphalt taken from different parts of Pitch Lake, from deposits outside the lake and from the district of La Brea show that these asphalts are so similar in composition that for practical purposes they may be considered as identical in quality. The samples have a common origin, for the presence of mineral matter in these asphalts cannot be regarded as adventitious, since it is thoroughly incorporated with the bitumen in the same proportion and has the same percentage of composition, as regards the relative proportions of matter soluble in water, in acids and insoluble substances. There is no doubt that the pitch found in the deposits outside the lake has been derived from the lake itself by the subterranean flow of pitch in the viscous condition. It is true there is a difference in the crude materials in these asphalts; one is softer than the other, because of containing more volatile oils. Nature simply began the asphalt outside the lake by being more exposed to the rays of the tropical sun, the process of refining it drove those volatile oils off, a necessary accomplishment to make the material fit for paving purposes. It would appear, therefore, that a part of the labor of refining has been done on the land or overflow asphalt which remains to be done with the lake asphalt.

In 1875 the asphalt paving industry was in its infancy in the United States. In 1903 there were about 42,000,000 square yards of asphalt, sheet and block, which has been laid at a cost of about $110,000,000. These pavements are frequently called bituminous pavements, inasmuch as bitumen is the principal constituent of the asphalt, frequently running as high as 9 per cent. Asphalt is manufactured into a cement by mixing it with other forms of bitumen and this cement is in turn used to bind together particles of sand and limestone in the asphalt pavement. No two asphalts are alike. The life of the pavement depends upon the crude bitumen used, the skill in its manufacture into bituminous cement, the proper proportioning and mixing of the cement with the sand and dust and in the selection of the mineral aggregate.

In 1870, Prof. E. J. Smedt, a Belgian chemist, laid the first sheet asphalt pavement in this country, in Newark, N. J. Prior to this date real tar had been used as a road covering material, but with little satisfaction. In 1876 Congress appointed a commission, consisting of Gen. Horatio G. Wright and Quincy A. Gilmore, of the corps of engineers, and Edward Clark, architect of the capitol, to select the best pavement for Pennsylvania Avenue in Washington. Forty-one proposals for stone, macadam, tar and asphalt pavements were received. The commission selected two and decided to use Neuchâtel rock asphalt and De Smedt's artificial Trinidad mixture, in the proportion of two to three. The artificial Trinidad mixture has been most satisfactory. When it was decided, in 1889, to repave Pennsylvania Avenue in Washington, the entire avenue was relaid with it, and the Neuchâtel was discarded.

Trinidad Pitch Lake has furnished over 85 per cent of the asphalt used in the United States. The liquid asphalt passing through clay saturates it or carries it in suspension and becomes a brown, earthy, non-viscous substance, chemically composed as follows:

| Bitumen | 47 per cent |
| Infusorial earth | 28 per cent |
| Water | 25 per cent |

The water is evaporated in refining and the residue (approximately one-third clay and two-thirds hard asphalt) regains some of its viscosity and requires the admixture of some flux or softening agent to give it the proper consistency for paving operations. Samples taken at 100 and 150 feet deep at the centre of Pitch Lake do not differ in composition from those taken on the surface near the shore, showing the homogeneity of the entire mass. The surface is in constant motion, and gradually lowers as the asphalt is removed. Refined asphalt is shipped from Trinidad to Mexico, South America and other foreign countries; but, owing to the very high duty on refined asphalt coming into the United States, it is cheaper to refine here.

In 1892 the New York and Bermudez Company began the importation of a very pure and hard asphalt from a deposit in the state of Bermudez, Venezuela. The Bermudez Asphalt
Lake, covering an area of about 1,000 acres, lies about 20 miles from the Gulf of Paria, in a straight line. There are many springs of soft asphalt or maltha, the largest being about seven acres in area. Outside of the springs, where new material is constantly exuding, the surface of the lake is covered with vegetation and trees, which must first be cut off to reach the asphalt. The quality of the asphalt varies from maltha or liquid asphalt exuding from the springs, to a hard glance pitch. The crude Bermudez asphalt contains an average about 31 per cent of water, which is present as a mixture and not as an emulsion, and about 66 per cent of bitumen. This asphalt is softer and more brittle than Trinidad, but possesses all essential cementitious qualities. In 1912 extensive deposits of asphalt were discovered in Leyte, Philippine Islands, by a ranger of the Insular Bureau of Forestry. The products of these deposits are now being used in paving the streets of Manila and are also being exported to other points in the Orient by a strongly capitalized corporation.

As early as 1879 asphalt found in southern California was laid at an intersection on Market Street, San Francisco, which is the heaviest traveled street in that city. In 1884 the late Jesse Warren reported on these California asphalts, the only indications of which were slight surface exudations of liquid asphalt and large banks of bituminous sandstone (sand saturated with asphalt). In 1895 the Alcatraz Company successfully laid two streets in New York City and acquired a high standing for the California product which was subsequently controlled by the Asphalt Company of America. It has been laid in many eastern cities under the trade name of "Alcatraz," "Standard," "Ventura," etc., and has been uniformly successful when refined, mixed and laid intelligently by men experienced in handling asphalt in all its stages. Shortly after the organization of the Asphalt Company of America beds of very pure, high grade, liquid asphalt were discovered in southern California. This being a nearly pure, viscous bitumen, it does not require a softening agent or flux, nor the admixture of other bituminous material to make it of the proper consistency for paving. These asphalts have been found in many widely separated areas in the United States, but commercial production is limited to a few localities in six States, whose output for 1916 is shown in the following table:

Within the past few years manufactured or oil asphalt has become an increasingly important part of the industry in the United States and in several countries of Europe. In the United States it is manufactured from certain grades of crude petroleum found in Colorado, Louisiana, Oklahoma, Kansas and Illinois. In 1907 the output of this artificial product for the first time exceeded the combined output of the natural varieties by a margin of over 52,000 short tons. Of late years Mexican oil has proved a strong competitor with our domestic materials, the asphalt product of such oils in

1916 amounting to 572,387 short tons, valued at $6,018,851.

In 1914 there were in the United States 44 plants for the manufacture of artificial asphalt. The following table shows the output and value of the artificial product, made from domestic material, since 1909:

Recent analyses of true Barbados asphalt and of the artificial have given the following results: Specific gravity, natural, 1.0143; artificial, 1.393. Hardness according to Mohs, natural, one to two degrees M.; artificial, two to three degrees M. Hardness according to Breithaupt, natural, one to two degrees B.; artificial, three degrees B. Soluble in petroleum, natural, very easily; artificial, with difficulty, slowly and incompletely. Insoluble in benzine, natural, very easily and completely; artificial, with great difficulty, slowly and incompletely. Soluble in benzoil, natural, very easily and completely; artificial, rather easily. Solubility in wax, natural, not known; artificial, in five to six days, leaving an amber-like remainder. The solution in benzoil of the Barbados natural asphalt gives a beautiful brownish varnish layer, which dries in about 10 minutes; that of the artificial asphalt, however, does not; therefore, the first is to be preferred for fine varnish.

Uses of Asphalt.—The purest varieties of asphalt are used to a great extent in the manufacture of asphalt varnish. A refined asphalt usually mixed with some petroleum residuum is used for saturating felt; machinery is used in the process, and a paint or varnish of similar composition is usually applied after the asphalt felt is in place. Asphalt felting has an advantage over coal-tar felting in that it is not rendered brittle by heat or with age. Insulating paints are made from extracted bitumens of asphalt admixed with various substances, so as to produce a hard product corresponding to ebonite. The most important application of asphalt in the paving industry have been in the use of blacktopping and methods of applying asphalt to the road surface. Upward of 3,000,000 square yards of such pavements were laid in the principal cities of the United States in 1916. The consumption of asphalt and asphalting materials in the United States is rapidly increasing, amounting in 1916 to 1,456,634 short tons—as compared with 1,224,037 short tons in 1915, and 851,699 short tons in 1914. Besides the domestic consumption, the United States manufactured and exported in 1916 asphaltic articles amounting in value to $484,895, in addition to an export of 36,443 tons of crude asphalt; the entire export trade being valued at $1,254,664.

ASPHALT PAINTING—ASPHYXIATING GASES

ASPHALT PAINTING. Asphalt was once largely used in painting, especially in the old Dutch school. It was dissolved in spirits of wine to ensure greater permanence. Because of its unreliability it ceased to be used.

ASPHALTIC COAL, coal-like substances which though they have sometimes been classified as coals, differ from all the true coals in respect to both their geological position and their composition. They do not occur in strata, but occupy cavities and fissures, and are often to have flowed when plastic. They have been found in Devonian, Carboniferous and Tertiary rock. The regions in which they are principally mined are Albert County, New Brunswick (albertite), the Uinta Mountains, Utah (unthite), and Colorado and West Virginia, Texas and Mexico (grahamite). Wurtzilite is found also in Utah. Their chief uses are as a basis for varnishes and as insulators. Consult Blake, 'Untahite, Albertite, etc.; 'Transactions of the American Institute of Mining Engineers' (Vol. XVIII, 1890).

ASPHODEL, the name applied to plants of two genera, Asphodelus and Asphodelone, hardy annual and perennial fleshy-rooted herbs, natives of the Mediterranean region, belonging to the family Liliaceae. Asphodeline lutea, king's spear, or yellow asphodel, the true asphodel of the ancients, attains a height of two to four feet, has numerous long (3 to 12 inches) narrow rough-margined leaves which embrace the stem, and in early summer yellow flowers in long racemes (6 to 18 inches), and large persistent membranous bracts. Asphodelus albus, branching or white asphodel, which has radical leaves, blossoms about the same time as the preceding species, and produces its white funnel-shaped blossoms in branched clusters. Both species are readily propagated by division and are of easy cultivation in any soil. They thrive fairly well in partial shade, but do better when more or less exposed to the sun. Forms of the last species are cultivated in Algeria and some other countries for the starchy roots which are used to make alcohol. The refuse from this manufacture, together with the leaves and stems, is employed in paper and cardboard-making. Several other related plants are often called asphodel, among which are Northisium ossifragum, bog asphodel, common on European moors; N. americanum, American bog asphodel. False asphodel is a name given to several species of Toflania. The asphodel of the poets is Narcissus pseudo-narcissus.

ASPHYXXIA, etymologically, pulselessness, but literally a condition of partial or complete loss of consciousness because of defective oxidation of the blood. The symptoms may be developed rapidly or slowly. In sudden occurrence of the air passants, such as caused by a foreign body in the larynx, or compression of the throat as in hanging or strangling, there is usually a quiet period of from 20 to 30 seconds after which respiratory movements, both of inspiration and of expiration, follow. These gradually increase in frequency and depth until in about a minute powerful expiratory convulsions occur; convulsive movements of inspiration are also produced, but these are usually milder in character. A period of exhaustion sets in, the respiratory movements become slower and more irregular, and gradually cease. During this period the face becomes pallid, and the lips and tongue become dusky and flushed, the lips blue to purple, and the body temperature, at first increased, gradually diminishes. The blood pressure is at first increased and then falls gradually to zero. Unconsciousness develops about a minute after the occlusion, although there is great individual variation, the sphincters relax and the urine and faeces are passed. There is a loss of muscle tone, and the reflexes are abolished. In asphyxia both lack of oxygen and increase of carbonic-acid gas in the blood are the major factors. Asphyxia may result from an excess of carbonic-acid gas with a normal amount of oxygen, and may be produced, if the amount of oxygen is diminished one-half, with no variation of the carbon dioxide. For treatment, see DROWNING.

ASPHYXIATING GASES. The employment of asphyxiants as special munitions of war in the form of shells or other projectiles, which when set free produce a suffocating and poisonous effect, is not new. From the earliest times the Chinese have employed various devices of this sort, and in their *stink-pot* secured such results. The French made experiments with asphyxiating shot at Brest in 1851. The use of asphyxiating gases has always been discouraged by the more enlightened authorities, both military and civil. The Hague Conference of 1899 strongly condemned their employment. Lydite shells were used by the British in the Boer War of 1899-1902, and chimose and similar shells, etc., were used by both sides in the Russo-Japanese War. While not strictly asphyxiating they render untenable a larger area of ground than would be accomplished by an ordinary projectile striking in the same place.

In the European War, at the second battle of Ypres, asphyxiating gases were employed with fearful results. The gases not only caused death but also produced great suffering. The men were seized immediately with an intolerable irritation of the great, nose and eyes, violent choking and severe pains in the chest, accompanied by uncontrollable coughing. Many fell and rose no more. The greater part of those who escaped were sick for several days and many of these after apparent recovery succumbed to pulmonary diseases. After the great outcry in the Allied and neutral press against the action of the Germans in using these gases, the German legation in Berne issued a statement claiming that the French had authorized the use of similar gases two months before their use by the Germans. However, it is claimed the gases authorized by the French cause no permanent injury, but merely sufficient discomfort to force the enemy to leave his trenches. The British have also used asphyxiating gases in their campaign in Picardy and Flanders.
ASPIC, (Fr.) a dish consisting of a clear, savory meat jelly containing fowl, game, fish, etc. In the 18th century the name was applied to a cannon throwing a 12-pound shot. In poetry the word is used in the sense of asp (Shakespeare, Tennyson, Browning). The great lavender or spikenard, French 

spic, Italian 

spigo, is frequently termed aspic.

ASPINWALL, William, American physician: b. Brookline, Mass., 23 May 1743; d. 16 April 1823. He studied medicine in Philadelphia, and practised in his native town. He served as surgeon with the Revolutionary army and later became interested in the subject of vaccination and established that preventive in American practice.

ASPINWALL, William H., American constructor of railroads: b. New York city, 16 Dec. 1807; d. 18 Jan. 1875. He was for many years a partner in a large shipping firm in New York, but retiring from it in 1850, turned his attention to building the Panama Railroad, whose eastern terminus of Aspinwall (now Colon) was named in his honor. He was likewise prominent in forming the Pacific Mail Steamship Company.

ASPINWALL, Pa., borough in Allegheny County, three miles northeast of Pittsburgh, of which it is practically a suburb. It is situated on the banks of the Allegheny River and on the Pennsylvania Railroad. The water works and the lighting system are municipally owned. The government is vested in a council of seven, chosen by popular vote. Pop. 2,592.

ASPIRATOR, a surgical instrument used for drawing off pus from ulcerations otherwise inaccessible, somewhat on the order of a syringe. One form of this instrument consists of a hollow needle, with which internal organs may be reached without extensive operation and through which the pus of a tumor may be pumped out. Other forms are used for drawing off air or other gases with the object of creating a vacuum.

ASPRIN, acetyl-salicylic acid. An unofficial salicylate, thought to be more efficient than and to cause less gastric disturbance because it passes through the stomach unchanged and liberates its salicylic acid in the intestine. It is a white powder, soluble in 100 parts of water. It is employed in rheumatism, gout, tonsillitis, pleurisy, chorea, neuralgia and multiple neuritis.

ASPIROZ, as-pê'roth, Manuel de, Mexican soldier, statesman and diplomat: b. Puebla, 9 June 1836; d. Washington, D. C., 24 March 1905. He was graduated from the University of Mexico in 1855, was licensed to practise law in 1863, but upon the French invasion entered the army. In the Juarez insurrection of 1863 against Maximilian, he served in the insurgent army with great distinction, rising to 2d lieutenant to colonel. After the fall of Queretaro he was appointed judge-advocate of the military court which sentenced the Emperor to death, thereby incurring the lasting hatred of the imperial house of Austria, of which Maximilian was a member. In 1867 Aspiroz became assistant Secretary of State for Foreign Affairs in the new republic; in 1872 he did much to settle amicably the claims between the United States and Mexico, which dated from the Mexican War in 1845; in 1873–75 was consul at San Francisco; and in 1875 was elected senator from his native province to the Mexican National Congress. In 1881 he left the Senate to become a member of the commission appointed to make treaties with the powers of the world; was law professor in the College of Puebla from 1883 to 1890, when appointed by President Diaz assistant Secretary of State, serving in that capacity until appointed, in 1899, first Mexican Ambassador to the United States, a position he held till his death. In 1900 he was the Mexican representative at the Hague tribunal; was a member of several scientific organizations, a knight commander of the military Order of Our Lord Jesus Christ of Portugal, and had been presented by the Shah of Persia with the decoration of the Order of the Lion and Rising Sun, and by the Dowager Empress of China with the insignia of the Order of the Dragon, in both cases in appreciation of his services in negotiating treaties between their respective countries. He published 'Código de extranjeros en los Estados Unidos Mexicanos' (1876); and 'La libertad civil como base del derecho internacional privado' (1896).

ASPLENIUM, a genus of about 200 species of small ferns of world-wide distribution, belonging to the family Polypodiaceae, and characterized by free vein endings, spore cases on the undersides of the fronds, and rhizomes covered by an indusium. Many of the species are very beautiful and are consequently favorites with cultivators whose space is limited. A. viride, A. adiantum-nigrum, A. trichomanes, and other species are commonly called spleenwort from their formerly supposed efficacy in internal medicine. The two last-mentioned species also bear the name of maiden-hair, but are not the true maiden-hair fern (Adiantum). In the eastern United States a dozen or more species are to be found growing wild, among which the more common are A. acrostichoides, A. angustifolium and A. filix-femina which reach a height of from one to four feet. In cultivation, slight shade is almost essential, as they also abundant water at their roots must not be very moist else the leaves will turn brown. The plants thrive in peaty soil. See FERNS.

ASQUITH, Herbert Henry, English statesman: b. Morley, Yorkshire, 12 Sept. 1852. He was educated at City of London School, and Balliol College, Oxford, of which he was a distinguished student. He was called to the bar of Lincoln's Inn in 1876; early took a high place in his profession, was junior to Sir Charles Russell as counsel for the Irish Nationalists in the Parnell Commission; and in 1890 was made King's Counsel. He supported the Home Rule policy of Mr. Gladstone, and was returned to the House of Commons as member for East Fife in 1886, a constituency he has since continued to represent. In 1892 he was chosen by Mr. Gladstone to move the vote of no-confidence in the Salisbury government, and stepped at once into front rank as Secretary for Home Affairs in the subsequent Liberal administrations between 1892 and 1895. On the defeat of the Liberal government in the latter year he resumed his practice at the bar. In 1894 he married as his second wife Margot Tennant, a daughter of Sir Charles
Tennant, Bart. At the time of the South African War he was attached to the Imperial-international section, and was joined to the pro-Boer section led by Sir Henry Campbell-Bannerman, and consequently for a time lost favor with the majority of the party. He took a leading and indeed dominating part in the fiscal controversies raised by Mr. Chamberlain's proposals of the Liberal side in combating the arguments of the tariff reformers. On the accession of the Liberals to power in 1905 he became Chancellor of the Exchequer, and as such introduced the Old Age Pensions Bill which was subsequently passed into law. During the illness of Sir Henry Campbell-Bannerman he led the House of Commons with so much ability and address that on the death of the Prime Minister he was called upon to succeed him, 8 April 1908. Since then he has emerged from some great controversies with his position and authority strengthened in the country. The rejection by the House of Lords of Mr. Lloyd George's budget of 1909 was followed by appeals to the electorate on the part of Mr. Asquith, and as a result the Parliament Act was passed in 1911, which deals drastically with the powers formerly possessed by the upper House of mutilating and rejecting the measures sent up to it by Liberal governments. Mr. Asquith was for a long time regarded as lukewarm on the question of Irish Home Rule; but a vital stage was passed in that old and much controverted issue when in 1914 he finally passed the Home Rule Bill. The Insurance Act (1912) and Welsh Disestablishment Act (1914) stand also to the credit of his government. He is a believer in the Gladsonian principle of never dealing with a question until it is fully ripe; but once a resolution is taken, he acts with promptitude, as witness his assumption of the war secretariat when civil control of the army appeared to be called in question during the crisis of the Ulster dispute. After the outbreak of the European War his cabinet passed through a series of crises, and he was constrained to form a national coalition ministry in May 1915. This coalition cabinet fell in December 1916. Attacks were made on it from all sides but more particularly from the "ginger group" so-called because it wanted the government to inject more ginger into its actions and display more force. Differences also existed between Mr. Asquith and David Lloyd George. These came to a head when Lloyd George demanded a smaller war council which would have power to act independently of the cabinet as a whole. When Asquith refused his assent to this proposal Lloyd George resigned and forced the resignation of Mr. Asquith 5 Dec. 1916, after eight stormy years of domestic and foreign history. Lloyd George succeeded to the premiership 7 Dec. 1916.

ASS (As. asa, Goth. asius, Rus. assyl, Lat. asinus, probably of eastern origin; cf. Heb. ἀδὴν, she-ass) or, when domesticated, Donkey. A member of the family Equidae and usually placed in the genus Equus, with the horse and the ass as more or less distinct types of the separate genus Asinus. There are at least three species, one Asiatic, and the others African. From the north African species the domesticated ass or donkey has probably descended, although many of its characteristics, particularly its spirit and bearing, are greatly altered. In size, in the short hair and terminal tuft of the tail, and in the fact that only the fore-legs present callosities, the ass resembles the zebra rather than the horse; and although not striped like the zebra, it has a varying tendency to stripes on the legs. The Asiatic ass (Equus hemionus) is divided into three local varieties, of which the one found in Persia and Syria must be that which the Old Testament writers used as a type of unhampered wildness. Of the others, the kiang, koulan, or dziggetai of Tibet, is the largest and most strikingly colored. It is seldom times four feet at the shoulders. Like all asses, it is pale underneath, but the color above is a dark red with a narrow black stripe along the mane and backbone from head to tail. The third variety, the onager or ghoorkhla, like the first, is smaller and paler; sometimes it is even silvery, and its dorsal stripe is broader in proportion than that of the Tibetan ass. It inhabits the plains of northern India, Afghanistan and Baluchistan. Unlike the donkey, these wild asses are so extremely enduring and agile that on the plains they cannot be overtaken by a single horseman. In the mountains they are less shy and sometimes voluntarily approach travelers. Wild asses are hunted for sport as well as for the sake of their flesh that, while resembling venison, it has an even finer quality. The asses of the plains migrate to the hills in summer when the plains are dry. See KIANG.

The African ass (Equus africanus) differs widely from the Asiatic, being larger and having a bluish tint rather than a tendency to red. It is sometimes as much as 14 hands high and has the very large ears which characterize the donkey. The dark stripe on the back begins only at the shoulder, but extends from the tail down the withers; the back itself is short and tail is short, and varies little from that of the body in color. It is found in all the open regions of northeastern Africa, and westward through the Sahara and Sudan. Like the Asiatic ass, it is extremely wild and fleet. A second species of African wild ass (Equus asinus) was found in Somaliland some years ago, which is distinguished by its grayer color and faintness of its stripes; it also has smaller ears and a more flowing mane. Living examples have been kept in London.

The donkey, or domestic ass, was probably first tamed in Egypt, where it was known before the horse, and has always been much used; some of the eastern breeds of the donkey are far larger and finer than those commonly seen in Europe, though in Spain and Italy, where they are more used, they are superior to those of other European countries. In England they are little employed, but in America are kept by stock raisers in the Middle and Southern States for the breeding of mules and hinneys. (See MULE.) Their milk is good in cases of consumption and dyspepsia and their skins furnish the leather called shagreen, besides an excellent shoe-leather and the covering of drums.

ASS, Feast of The, a mock ceremony observed in northern France in the Middle Ages. It was originally a good-natured
parody on the church service without intentional irreverence, but degenerated into an indecent performance. It was in substance a brief farce in which Balaam's ass appeared before the door of the church to prophesy the coming of Christ.

ASSAB, às-sáb', an Italian trading station on the coast of the Red Sea (Eritrea), 40 miles from the Strait of Bab-el-Mandeb. The neighboring district with an area of 243 square miles was sold in 1870 by some Danakil chiefs to an Italian steamship company for a coaling station on the road to India. In 1880 it was taken over by the Italian government, which, since 1884, has improved the harbor and erected a lighthouse. The "commissionariat" of Assab has an area of 5,500 square miles and a population of only 3,000.

ASSAI, às-sáî, a food made from the fruit pulp of various species of Brazilian palms closely allied to the cabbage palm (q.v.) and largely used in the lower Amazon region. A beverage is also made from the pulp by pouring warm water on the fruit and by kneading. It is thick and creamy and pulpy in color and has a rather pleasant flavor. The principal species are Euterpe edulis and E. edulis. The first species grows in tide-flooded swamps, where it may attain a height of 90 feet with a diameter of only four or five inches. It produces upon branched spadices an abundance of small pea-like purple fruit with a thin firm pulp and a hard seed. These fruits are kneaded in warm water to produce the thick purplish assai which is generally eaten with starchy foods. The terminal bud of this species is eaten like that of its close relative, E. oleracea, the cabbage palm, and its stems are used as rafters and poles. The other species grow on dry, sandy, upland soils, its smaller quantity of fruit furnishing a sweeter assai.

ASSAL, as-sál', a large salt lake in the district of Adal, in eastern Africa, near the coast of the Bay of Tadjura. It is nearly 600 feet below the level of the sea. Abyssinian caravans rest for the purpose of carrying off the salt, thickly encrusted on its shores.

ASSAM, a chief-commissionership of British India, on the northeastern border of Bengal, bounded on the north by the eastern section of the great Himalayan range; on the northeast by the Mishmi Hills, which sweep round the head of the Brahmaputra Valley; on the east by the mountains inhabited by the Khamtis, Singphos and various Naga tribes, and by the Burmese frontier where it runs with that of the state of Manipur; on the south by the Chin Hills, the Chittagong Hill Tracts, and the state of Hill Tippera; and on the west by the Bengal districts of Tippera, Mymsingh and Rangpur, the state of Couch Behar, and Jalpaiguri District. The area of Assam proper is 33,015 square miles, and with the native state of Manipur (8,456 square miles), a total of 61,471 square miles. The territory may be considered as being strung out like a string of beads with the valleys watered by the Brahmaputra and its tributaries. The valley of the Brahmaputra consists of rich alluvial plains, about 450 miles in length, with an average breadth of about 50 miles, either but little elevated above the flood-level of the river and its feeders, or so low that large extensive of them are flooded for three or four days once or twice in the year. The Surma Valley is a flat plain about 125 miles long by 60 miles wide, shut in on three sides by ranges of hills. It is even more subjected to inundations than the plains of the Brahmaputra Valley itself, and its tributaries have more permanent banks, the shifting is trifling compared with the banks of the Brahmaputra. The range of mountains which separate these two valleys projects at right angles from the Burmese system, and lies almost due east and west. At the western end it attains a height of more than 4,600 feet in the peak of Norek, above the station of Tura. Here the hills are broken up into sharply-serrated ridges and deep valleys, all covered with forest. Further east, in the Shillong peak, they reach a height of 6,450 feet; but this is only the highest point in a table-land of which hardly any part falls much below 6,000 feet. The highest point in Assam is reached in Japi, on the border of the Naga Hills District, still further east, where Mount Manipur consists of a fertile valley, covering an area of about 650 square miles, surrounded by ranges of hills.

In Assam are found the valuable teak and sissoo trees, date and sago palms, the areca palm or betel-nut tree, the Indian fig-tree, oak, pine and bamboo. But the article of most commercial importance grown in Assam is tea, for the production of which there were 779 gardens in 1915, with a total area under crop of 383,821 acres, producing 245,385,920 pounds of manufactured tea. The plant was discovered growing in this region in 1821, but it was not till 1838 that the first shipment reached England. Though not regarded as specifically distinct from the Chinese variety, the plant is much larger and more vigorous. It covers a large extent of the cultivated soil, occupying nearly 2,000,000 acres. The other crops include maize, pulse, oil-seeds, sugar-cane, hemp, jute, potatoes, etc. The State Forest Department controlled (1915) 4,528 square miles of forest, while the public forest land amounted to 18,218 square miles, a total of 22,746 square miles. In the jungles roam herds of elephants; in the dense and swampy parts of the forests the rhinoceros, tiger and wild buffalo abound; leopards, bears and wild hogs are as also are jackals, foxes, goats, deer and the venomous cobra. Coal, petroleum, limestone and iron are found, and gold dust is met with in many of the rivers. The climate is characterized by coolness and extreme humidity, the natural result of the great water surface and the extensive forests over which evaporation and condensation proceed, and the close proximity of the hill ranges, on which an excessive precipitation takes place. Its most distinguishing feature is the copious rainfall between March and May, at a time when precipitation over upper India is at its minimum. The year is thus roughly divided into two seasons, the cold season and the rains, the hot season of the rest of India being complete and of the rains often occur in the early months, generally accompanied by high winds and heavy local rainfall, but seldom take the form of destructive cyclones. From the beginning of November till the end of February the climate is cool and extremely pleasant, and in no part of the year is the heat excessive. Assam is subject to earth-
quakes. In 1607 hills are said to have been rent asunder and swallowed up, writing in 1837, McCosh reported that, occurring 12 June, 1897, when the station of Shillong was razed to the ground and nearly all masonry buildings in Gauhati and Sylhet were completely wrecked, while much damage was done in neighboring towns. Shillong and Guwahati. The greatest seismic disturbance reported that some 20 years before, a village near Goalpara had completely disappeared, leaving a pool of water in its place. Severe shocks were felt at Silchar in 1809 and 1882, and in 1875 some damage was done to banks of river Shillong and Gauhati. The greatest disturbance about which occurred 12 June, 1897, when the station of Shillong was razed to the ground and nearly all masonry buildings in Gauhati and Sylhet were completely wrecked, while much damage was done in neighboring towns. Shillong and Guwahati.

The inhabitants are mainly engaged in agriculture. There is no Assamese nation proper, numerous ethnic groups, being represented. The total population revealed by the last (1911) census of British India is 13,896,384; the people belonged to Assam proper and 346,222 to Assam state (Manipur), showing an increase over 1901 of 871,757 for Assam and 61,757 for Manipur. The birthrate for 1914 was 32.9 per 1,000; deaths, 24.7 per 1,000. The density of population per square mile was (1911) 127 per Assam and only 41 for Manipur.

Religions.—Hindus, Aryans and Brahmins made up a total of 3,637,828; Sikhs, 750; Jews, 2,398; Buddhists, 10,506; Parsees, 5; Mohammadans, 1,886,588; Christians, 66,430; Animistic, 1,109,782; and 1,340,413 were Moslems. Each census has disclosed a deficiency of women, due to the disproportion between the sexes among immigrants. Child-marriage is common among both Hindus and Muslims in the Surma Valley and in Goalpara; but in Assam proper only Brahmins and Gansaks adhere rigidly to this rule, and the lower castes usually defer marriage till the girl is of age. No fewer than 167 different languages are spoken in Assam, the two chief between Assamese. There is a large number of languages belonging mostly to the Tibeto-Burman stock, such as Bodo, or plains Kachari, Khasi, Syntengu, the various forms of Naga dialects, Garo, Manipuri, Lushai, Mikir, Miri and Kuki. The principal foreign languages are Hindustani (Mundari, Santali, Oriya, Eastern and Western Hindi. The people seem to be contented, good-natured and inclined to indolence; they have few wants beyond what can easily be supplied from their fertile fields, for which they pay but a very small rental. There are two systems of land tenure, the Zamindari, where single proprietors or proprietary brotherhoods possess large estates for definite periods, and the Rajiyatwari, where each petty proprietor (ryot) holds his plot directly from the state, usually cultivates his land himself, and has no landlord between himself and the government. The area operated amounted in 1915 to 5,475,901 acres for the Zamidari, and 25,829,673 acres for the Rajiyatwari, producing revenues of $371,405 and $2,229,565, respectively.

Education and Justice.—There were 4,635 public educational institutions in 1915, with an attendance of 226,652 scholars and 187 private institutions with an attendance of 7,231 scholars. The expenditure for the year was $884,745. The proportion of illiteracy is high, only 32.8 per cent of the boys and 5.9 per cent of the girls attend school in British India. In Assam there were 18 vernacular newspapers published in 1915. The administration of justice is vested in the courts of magistrates, divided into three classes; and the courts of session for criminal cases. The highest judicial authority is the high court of Calcutta, i.e., there is no appeal to the Privy Council in England.

Assam, known in ancient history as Kāmārāpa, formed in the 7th century A.D., a powerful independent kingdom under a Brahmān sovereign, but in the 15th century it broke up into 12 separate states, which, in spite of their numerous internal struggles, were generally able to resist the attacks of the powerful Mogul emperors. Late in the 18th century its condition encouraged the Burmese to make the country a dependency of Ava, but the Burmese encroachments, 1757, the territory of the East India Company brought about war with the British. In 1826 Assam became a possession of Great Britain under the administration of the lieutenant-governor of Bengal, and in 1874 was created a chief-commissionership. In 1805 Assam was reunited with eastern Bengal, but by proclamation 22 March 1912 the Assam territories were placed under the immediate authority and management of the government-general (viceroy) of India in Council and formed into a chief-commissionership. The chief-commissioner presides over a legislative council composed of 26 members; 10 being official, 15 unofficial and 1 expert. The revenue 1914-15 amounted to 1,723,391,800 rupees ($5,746,393); the expenditure to 1,446,417,977 rupees ($4,821,659). There are no large towns of importance. Shillong Town (pop. about 9,000), was chosen as the capital in 1874 on account of its salubrity and convenient position between the Brahmaputra and Surma valleys. The district of Sylhet was also separated from eastern Bengal and incorporated with Assam in 1912, thus adding a territory of 5,388 square miles.

Bibliography.—‘The Imperial Gazetteer of India’ (London 1909); Shakespeare, W. L., ‘History of Upper Assam, Upper Burmah and North-Eastern Frontier’ (London 1914); Watson, J. F., and Kaye, J. W., ‘The People of India’ (ib. 1866-70). HENRI F. KLEIN.

ASSAS, āsās, Nicolas, Chevalier d’, a French officer, celebrated for an act of patriotism which cost him his life. He was captain in the regiment of Auvergne when the French army was stationed near Gueldres, in 1760, and on 15 October, while engaged in reconnoitering, was taken prisoner by a division of the enemy advancing to surprise the French camp, and threatened with death if a word escaped him. He shouted, ‘Je meurs, au moins je voudrai les ennemis!’ and was instantly struck down. An annual pension was allowed to his descendants.

ASSASSINATION, a term denoting the murder of any one by surprise or treachery. It is commonly applied to the murder of a public personage, formed by a person who aimed at the death of his victim. In ancient times, assassination
ASSASSINS — ASSAULT

was often even applauded, as in the Scriptural instances of Ehud and Jaël, and in the murder of Hipparchus by Harmodius and Aristogitón; but assassination by fanatics and men devoted to an idea first became prominent in the religious wars of the 16th and 17th centuries. To this class belong the plots against the life of Queen Elizabeth, and in recent years the political assassinations committed by anarchists, while the succession of assassinations of sovereigns is but a series of murders prompted by self-interest or revenge. Omitting these last, the following list includes the most important assassinations, arranged in chronological order. Fuller accounts of the persons mentioned will be found under their particular headings:

Philip of Macedon
Tiberius Gracchus
Julius Caesar
Hypatia
Thomas Becket
Albertus Magnus
James I of Scotland
Alexandre de Medicis
Cardinal Beaton
David Ruccio
Lord Elgin
James, Earl of Murray, Regent of Scotland
William of Orange
Henry IV of France
Henry V of France
Villaume de Dukes of Buckingham
Walestain
Archbishop Sharp
Peter the Cruel
Gustavus III of Sweden, Mar. 16; d.
Mary by Charlotte Corday
General Kleber at Cairo
Paul I, Czar of Russia
Speroni Perceval, premier
Kotzebue, the dramatist
Duc de Berri
Charles III, Duke of Parma, Mar. 26; d.
President Abraham Lincoln, April 14; d.
Michael, Prince of Servia
Marshall Prim, Dec. 28; d.
Georges Darboy, archbishop of Paris
Earl of Mayo, governor-general of India.
Sultan Abdul-Aziz
Alexander II, Czar of Russia
President James A. Garfield, July 2; d.
Lord Frederick Cavendish and T. H. Burke,
In Phoenix Row, Dublin
Carter Harrison, mayor of Chicago
Princess Sadi Carnot, France
Ex-Primier Stefan Stambuloff, Bulgaria, July
Ex-prime minister of Chile, Spain
President Juan Isidro, Uruguay
Emperors of the Lateran, in the Church of St. Peter.
Pres. Jose Maria Reyna Barrios, Guatemala,
Pres. Ulises Heureaux, Santo Domingo
King Humbert of Italy
President McKinley, Sept. 6; d.
Alexander of Servia and wife, Queen Draga
Von Pillave, Russian minister of the Interior.
Grand Duke Sergius of Russia
King Carlos I and son, of Portugal
Prince Iio of Japan
Premier Stolypin of Russia
Premier Minister Canales of Spain
Nazim Pasha, Turkish Minister of War
Pres. Francisco I. Madero, Mexico
King George of Greece
Archduke Francis Ferdinand of Austria-Hungary

Many attempts at assassination have been unsuccessful. Among the most prominent of these may be named: Against Alexander III of Russia, repeatedly; Ali of the Mehemet, Sultan of Spain, 1875 and 1879; Amadues of Spain, 1872; Duc d'Aumale, 1841; Prince Bismarck, 1866 and 1874; Francis Joseph of Austria, 1853; George III of England, 1786 and 1800; George IV (when Regent), 1817; Humbert I of Italy, 1878 and 1897; Isabella II of Spain, 1847, 1852 and 1856; Louis Philippe, six attempts, from 1835 to 1846; Lord Lytton, viceroy of India, 1876; Baron Hardinge, viceroy of India, 1910; Napoleon I, by internal exile to Elba, 1814; Napoleon III, twice in 1855, and Osiris's attempt in 1858; Queen Victoria, 10 June 1840, 30 May 1842, 3 July 1842, 19 May 1849 and 2 March 1882; William I of Germany, 1861, 1875 and twice in 1878; President Diaz of Mexico and President Morales of Brazil, in 1894; the Prince of Wales in 1900; Alfonso of Spain in 1905, 1906 and 1913. Consul Johnson, 'Famous Assassinations' (Chicago 1903).

ASSASSINS, or HASHISHIENS, a term applied to a secret order of religious fanatics who flourished in the 11th and 12th centuries. They derived their name of assassins originally from their immediate use of hashish, which produces an intense cerebral excitement, often amounting to fury. Their founder and lawgiver was Hassán-ben-Sabá, to whom the Orientals gave the name of Sheikh-el-Jebels, but who was better known in Europe as the "Old Man of the Mountains." The principal article of belief was that the Holy Ghost was embodied in their chief and that his orders proceeded from the Deity. They believed assassination to be meritorious when sanctioned by his command, and courted danger and death in the execution of his orders. They were frequently styled Ismaili. A feeble residue of the sect, from whom proceeded the Druses, about a.d. 1020, has survived in Persia and Syria. The Syrian Ismaili dwell around Mesopotamia and on Lebanon. They are under Turkish dominion, with a sheikh of their own, and formerly enjoyed a productive and flourishing agriculture and commerce. Since the war with the Nassarians, 1809-10, they have dragged out a miserable existence, but are commended by modern travelers for their hospitality, frugality, gentleness and piety.

ASSAULT. In law, an assault is a movement virtually implying a threat to strike, as when a person raises his hand or his cane in a menacing manner, or strikes at another but misses him. It is not needful to touch one to constitute an assault, for the threat makes the attempt to strike. The assault which takes effect the crime is not simple assault, but assault and battery. Assault, however, is usually coupled with battery and for the reason that they generally go together; but the assault is rather the initiation or offer to commit the act of which the battery is the consummation. An assault is included in every battery. An aggravated assault is one performed with the intention of committing some additional crime, such as an assault with intent to commit rape, assault with intent to murder, an assault with a deadly weapon, an indecent assault. The defenses usually interposed in cases of assault are self-defense, recapture of property, ejection of trespassers, defense of property, defense of family, accident, etc. A person attacking another may be prosecuted by him for the civil injury and also be punished by the criminal law for the injury done to the public.

In military language an assault is a furious effort to carry a fortified post, camp or fortress where the assailants do not screen them-
selves by any works. It is the appropriate termination of a siege which has not led to the capitulation of the garrison. To give an assault: to attack any point. To repulse an assault: to cause the assailants to retreat; to beat them back. To carry by assault: To gain a post by storm. In fencmg, an assault of (or at) arms is an attack on each other (not in earnest), made by two fencers to exhibit or improve their skill. (Sometimes used in a wider sense for other military exercises).

ASSAY OFFICES. See ASSAYING.

ASSAYE, as-say', village in southern India, where Wellington gained a famous victory in 1803. With only 4,500 troops at his disposal he completely routed the Maharata force of 50,000 men and 100 guns. The victory, however, cost him the loss of more than a third of his men.

ASSAYING, the art of testing ores or alloys for the purpose of determining the amount of some particular metal that is present in the metal. Assays may be made by wet or dry methods, and will vary greatly in detail, according to the metal to be determined. The present article will be chiefly devoted to the usual process of estimating gold and silver in the dry way. The mode of process there is substantially the same, whether the assay is made upon ore or upon bullion, except as to the method of obtaining the sample to be examined. If the material proposed for the assay is bullion, or any metallic alloy, the sample for examination is obtained by drilling into the specimen in different places, and mixing the borings. In the case of an ore, the usual method of obtaining a sample for assaying is by "quartering." If this is done by hand, every tenth shovelful of the ore to be examined is thrown upon the floor, until a conical heap containing perhaps 10 tons has been accumulated. This heap is next flattened somewhat and divided into four quarters, as nearly equal as possible. Two of the diagonally opposite quarters are thrown back, the next two are taken, and the remaining two quarters are thoroughly mixed, spread out into a second pile and "quartered" again in the same manner. The process is continued (the ore being crushed in the meantime as often as appears necessary) until the original sample has been reduced to from one to three pounds, after which it is ground fine and the specimens desired for examination are made up by random selections from the final pulverized product. More commonly, ores are sampled by mechanical or semi-mechanical methods and the sampling is not done by the miner, but by a "sampling mill," which acts as the agent both of the miner and of the smelting works. In such cases the ore is first shipped to the sampling mill, where it is unloaded, weighed, crushed, and further crushed and divided in which one quarter is mechanically selected and passed into a separate bin. The quarter thus mechanically reserved is next thoroughly mixed, after which the "cutting down" is commenced in removing the ore from the floor by means of a specially constructed sampling shovel which catches about half of it, and lets the remainder fall into a barrow. The ore retained by the shovel is thrown into three buckets, in rotation, and the contents of the buckets are then coned up in one pile and divided again in the same manner. The ore is the same, but the process is continued until, finally, three samples, weighing about 10 pounds each, are obtained. Part of each of these is sent separately to the assayer, who assays all three. If the results are not adjudged to be sufficiently accordant, the sampler concludes that the mixing was not well done, and the operations described are repeated. But if the three samples agree fairly well, their average is taken as representing the value of the ore; and on this basis the sampler settles with the miner and afterward with the smelter, thus acting as a middle-man in the sale of the ore.

The specimen of ore received by the assayer is ground fine enough to pass through a 60-mesh or a 100-mesh screen, any "metallics" (or particles of metal that will pass through the screen being carefully collected and reserved for a separate assay). If the ore is new to the assayer, his next step is to examine it microscopically and to apply various preliminary tests so that the general nature of the ore may be known before the quantitative work begins. If assays of the same material have been made before, and the only object is to ascertain the richness of this particular lot of ore, he may proceed directly to the process of "scorification," by which the gold and silver present in the ore are obtained in the form of a metallic button. The scorification process depends for its success upon the fact that when an ore of gold and silver is strongly heated with metallic lead in the presence of air, the baser metals that are present will oxidize and the lead oxide that is also formed will dissolve the silica (or quartz) that is present; while the gold and silver will not oxidize, but will be left in the metallic state, alloyed with that portion of the lead which remains unoxidized. To apply this principle, 50 grains or so of the ore are mixed with some 500 grains of granulated lead and placed in a sort of crucible, called a "scorifier." Another charge of 500 grains of lead is spread evenly about the mass, and a few grains of borax are sprinkled upon the top. The crucible and its contents are next heated for about three-quarters of an hour in a muffle to which a small amount of air is admitted, after which the melted mass in the crucible is poured into a mold to "set," or cool. When the mold is cold it will be found to contain a button of metallic lead (in which the gold and silver originally in the ore are concentrated), and also a considerable amount of slag, consisting of oxide of lead, oxides that are base materials that are present in the ore and silicates of lead, derived from the combination of the melted lead oxide with the quartz of the ore. The slag is readily detached from the metallic button by taps with a hammer.

The next step is to "cupel" the button, so as to obtain the gold and silver in a pure state. Cupellation is based upon the fact that when an alloy of gold, silver, lead, and base metals is heated in a current of air, the lead and the other base metals will oxidize, and the melted lead oxide ("litharge") will retain the other oxides in solution. Moreover, if the crucible in which the operation is carried out is porous, the melted lead oxide will soak into it, carry-
ing the base oxides with it, and leaving a button of pure gold and silver behind.

The "cupel" in which this is performed is made of bone-ash, and after the button left from the scorification process has been heated in the cupel for a short time, the process indicated above is repeated, being indicated, to the practiced eye, by play of iridescent colors on the cupelled button. The button is finally allowed to cool, and after it has been taken from the cupel, any small particles of bone-ash that remain adhering to it are removed by a brush.

If the original ore contained no silver, the assay is now completed, and it only remains to weigh the gold button, and compare its weight with that of the sample of ore used in the assay. But if silver is present, one other process, known as "parting," must be carried out, in order to separate the gold from the silver. Parting depends upon the fact that nitric acid will dissolve the silver out of an alloy of silver and gold, provided the weight of silver present is at least 2.5 times as great as the weight of the gold. In order to ensure the fulfillment of this necessary condition, the button, as it comes from the cupel, is melted with 2.5 or 3 times its own weight of silver that is known to be free from gold, and the alloy so formed is flattened out into a thin plate or ribbons, which is then rolled up into a little spiral, or "cabinet," and boiled in nitric acid. The cabinet is next washed in distilled water, and boiled again in nitric acid, to remove the last traces of silver; after which it is thrown into a crucible and melted into a button, for weighing. The button obtained by this final process consists of pure gold.

Assay Offices in the United States are government establishments in which citizens may deposit gold and silver bullion, receiving in return its value, less charges. The offices are in New York; City, Idaho; Helena, Mont.; Denver, Col.; Seattle, Wash.; San Francisco, Cal.; Charlotte, N. C.; and Saint Louis, Mo.; Carson City, Nev.; Deadwood, S. D.; New Orleans, La.; and Philadelphia, Pa.

The assay office in New York was established in 1854, and was opened in the autumn of 1854. The first assayer of the New York assay office was Dr. John Torrey of Columbia College, who was appointed in 1854 and held his position till 1873. On his death he was succeeded by his son, Herbert Gray Torrey. Andrew Mason, who was appointed superintendent in 1883, having previously been assistant assayer and melter and refiner. While holding the latter office he substituted the use of sulphuric for nitric acid in the refining process, thus saving this one assay office $10,000 per annum.

The United States assay office is in a building located beside the more imposing sub-treasury building, at the intersection of Wall and Broad streets, which marks one of the most historic spots in the country, namely, the site of the old Federal Hall, where Washington took the oath as first President of the United States. Although the building is small, yet it only masks a really large, inner building surrounded on all sides by office buildings and the sub-treasury. The assay offices, and particularly this one, have an important position in the world of finance, for here the precious metals — gold and silver — in all forms and conditions of fineness are assayed and refined. In brief, the work of this office consists in assaying or determining the value of gold and silver, in whatever form presented, as coin, jewelry, or in any other shape. Any one wishing to have gold or silver assayed may at any time or wishing to sell to the government may present his property at the assay office, where he may have the metal reduced and made into bars, or if he prefers, he may sell his bullion to the government. The charge for doing the work is merely nominal, and based on cost. Millions of dollars are stored at all times in the vaults. When the metal is received, the first step consists in weighing the coin, bars, jewelry or tableware. This is done with great exactness and a receipt is given. Each person's holdings are placed in a box and are taken to the melting-room, where they are placed in crucibles with a flux and smelted and cast in ingot molds, the pouring being a highly picturesque operation. A small chip is taken from the bar for assay.

If the depositor wishes to part with his bullion, the government pays for it at the prevailing price and proceeds to separate or part the gold from the silver. The price of gold never varies, costing $20.67 a fine ounce. Silver fluctuates with the market.

ASSEGAI, ās-he-gá, a short spear employed as a weapon among the Kafrers of South Africa. It is made of hard wood tipped with iron, and used for throwing or thrusting.

ASSELIN, as-$lân, Joseph François Ollivar, Canadian nationalist: b. Saint Hilarion, Quebec province, 9 Nov. 1874. He was educated at Rimouski College, was afterward principal of the evening school at Woonsocket, R. I., and private secretary to Sir Lomer Gouin (1901-03). During the Cuban War he served as a private with the United States troops. Since his return to Canada he has taken a prominent part in the advancement of Nationalist sentiment in his own province, has been associated with La Presse and LeDevoir news-
papers, and in 1904 founded and was for a time editor of *Le Nationaliste*. He is the author of a series of political brochures under the title of *'Feuilles de combat,*' and is also author of *A Quebec View of Canadian Nationalism: an Essay by a Dyed-in-the-Wool French Canadian* (1910).

**ASSEMANI, a'se-ma'ne.** (1) *Joseph Simon,* a famous Orientalist: b. of a Maronite family, Tripoli, Syria, 1667; d. Rome, 14 Jan. 1768. He traveled on the Pope's commission through Egypt and Syria, collecting many Oriental manuscripts and coins for the Vatican library, of which he was appointed keeper. Of his numerous learned works, the most important is *Bibliotheca Orientalis,* issued by order of Clement XI and containing (in manuscript form) the Vatican codices in Syriac, Arabic, Persian, Turkish, Hebrew, Samaritan, Armenian, Ethiopic, Greek, Egyptian, Tiberian and Malabarese. (2) *Stephen Enrius* (1707–82), also a learned author of books on Oriental learning. He was titular archbishop of Apocamaca, Syria. Yet another nephew and Orientalist was (3) *Joseph Alyot* (1747–93), professor at Rome. (4) *Simón,* a relative of the preceding, b. Tripoli 1752; d. Padua, 8 April 1821. He filled the chair of Oriental languages at Padua. He wrote an important work on ancient coins, *Museo Cufco Naniano Illustrato* (1787–88).

**ASSEMBLAGES.** *General Theory of.* The doctrine variously entitled *Mengenlehre* and *Mengenoperationlehre* by the Germans, *Théorie des ensembles* by the French, and sometimes referred to in English as the theory or doctrine of manifolds or aggregates or by other analogous designations. Many of its ideas are at least as ancient as historical thought and have figured in important ways in logic, philosophy and mathematics steadily from the earliest times. On the other hand, many of the chief concepts involved in it, its character and their organization into a distinct and self-supporting body of coherent doctrine, may be said to constitute the latest great mathematical creation. Indeed the majority of the founders and builders of the doctrine, including Georg Cantor as easily the first and still among the living, mathematics is the most fundamental of the sciences, the theory of assemblages seems destined to be regarded, if it be not already regarded, as the most fundamental branch of mathematics. Viewed in retrospect, it appears as an inevitable product of the modern critical spirit. Already it is seen to underlie and penetrate both geometry and analysis. Its connection with mathematical logic is most intimate, often approximating identity with the latter; and even philosophy is surely, if at slowly, beginning to recognize in the theory of manifolds her own most inviting and promising field.

**The Notions, Assemblage and Element.**—Roughly speaking, any collection of objects or things of whatever kind or kinds is an assemblage. Whitehead and Russell, however, have shown that certain limitations must be imposed on this great generality to avoid the most baffling paradoxes. Each object in the collection is called an element of the assemblage. An assemblage, to be mathematically available, must be defined, or, as usage has it, well-defined, *mohidefinirt, bien défini.* An assemblage is defined when, by the logical principle of the excluded middle, it can be regarded as intrinsically determined whether an arbitrarily given object is or is not an element of it. Means may or may not be known for deciding the determination actual or extrinsic. Thus if the elements of the assemblage be completely tabulated the determination can be actually effected by comparing the given object with the elements of the table. Again, if an assemblage, such as that of the end integers 1, 2, 3, . . . of integers, be given by a definite law of formation of its elements, the law will generally enable one to determine actually whether any given object, as 5 or 7 or an apple or a sunset, is an element of the assemblage or not. But the possession of means the application of which is in our power is not essential to the notion of defined assemblage. A real number is called *algebraic* or *transcendental* according as it is or is not a root of an equation of the form, $a_1 x^n + a_2 x^{n-1} + a_3 x^{n-2} + \ldots + a_n = 0$, having integral coefficients. Any real number, no matter what its concept or definition, is algebraic or transcendental; it cannot be both and it cannot be neither. Hence the real algebraic numbers constitute a defined assemblage, and so, too, the transcendental. Nevertheless no means is known for ascertaining in every case whether a given number is algebraic or not. It was really a great achievement when the transcendental character of the long familiar classical numbers $\pi$ and $\varepsilon$ was proved, for $\varepsilon$ by Hermite in 1874 and for $\pi$ nine years later by Lindemann. Even the existence of non-algebraic numbers was unknown till it was proved by Liouville in 1851.

**Depiction and Correspondence.**—Assemblages will be denoted by large and elements by small letters. If, in any way, each element $b$ of $B$, $A$ is said to be *depicted* on $B$. The $b$'s so used are the *pictures* of the $a$'s. If all the $b$'s are thus made pictures, $B$ is also depicted on $A$ and the $a$'s are pictures of the $b$'s. If each $a$ is a picture of a $b$ and moreover that there is a one-to-one correspondence between them, the depiction is called *similar*. Obviously an assemblage can be depicted either similarly or dissimilarly on itself, generally in more than one way, often in an endless variety of ways.

**Chains.**—If the elements of $A$ are elements of $B$, $A$ is part of $B$. If in this case not all $b$'s are $a$'s, $A$ is a *proper part* of $B$. Any assemblage is part, but not proper part, of itself. One of the most important ideas connected with that of the depiction of an assemblage on itself is the notion of a *chain*: if $A$ be depicted on itself in any definite way, then any part of $A$ that consists of the pictures thus formed is a chain. The theory of chains, due to Dedekind, has fundamental bearings in logic. See INDUCTION, MATHEMATICAL.

**The Concept of Equivalence or Sameness of Power.**—If $A$ and $B$ are such that each may be similarly depicted on the other, i.e., if a

---

*The exigencies of the present undertaking demand the expository use of data drawn from the Theory of the Real Variable (which see) and other theories, although these are themselves branches of assemblage theory.
one-to-one correspondence can be established between the elements of A and those of B, A and B are said to be equivalent or to have the same power (Mächtigkeit), a relation symbolically expressed by writing \( A \sim B \) or \( B \sim A \). Thus, if A denote the assemblage of positive integers and B denote, say, the even positive integers, \( A \sim B \), for plainly one may pair 1 with 2, 2 with 4, 3 with 6, and so on. Other ways of pairing A and B in this case will readily occur to the reader.

**Division of Finite and Infinite.**—An assemblage is infinite if it has the same power as some proper part of itself. Thus A of the last example is infinite. So, too, is B, for it is easily seen that if \( A \sim B \) and if either A or B is infinite, so is the other. The foregoing definition of infinite is one of the most fruitful of modern concepts. It is due independently to Dedekind and Georg Cantor. A finite assemblage is one which can be exhausted by the removal of its elements one at a time. Sometimes an infinite assemblage is defined to be one that cannot be exhausted by removing from it one element at a time. It has not been proved that the two definitions are logically equivalent. All apparent proofs of this depend on the questionable axiom of Zermelo (see below). For the purposes of investigation, the former is found to be the better instrument. An infinite assemblage is often described as transfinite.

**Denumerability.**—Let A denote the assemblage of positive integers. Any assemblage B such that \( A \sim B \) is said to be denumerable or to have the power of the denumerable assemblage. As \( A \sim A \), A is itself denumerable, and it serves conveniently as the type of denumerable assemblages. The domain of such assemblages is exceedingly rich and is replete with surprises. For example, though the rational fractions, that is, fractions having integral terms, are so numerous that between any two of them, however near to each other in value, there is an infinity of others, nevertheless the assemblage of rational fractions including the integers is denumerable. Of this the reader can quickly convince himself by reflecting that there is but a finite number of such fractions of which each has a specified integer \( n \) for sum of its terms. Thus, if \( n = 2 \), one has 1 or 4; if \( n = 3 \), one has 1 and 1; if \( n = 4, 4, 4, 1 \), and so on. Some are repeated; repetitions may be kept or rejected. Dropping them, the required equivalence is seen in the pairing: \((1, 1), (2, 4), (3, 1); (4, 4), (5, 1), (6, 4), \ldots\). In ordinary speech one is justified in saying that rational numbers are neither more nor less numerous than the integers or than the odd or the even integers. It is plain that the familiar axiom, the whole is greater than any of its parts, is not valid for infinite assemblages. For finite assemblages it is valid absolutely; whether for others is not known. For another example, consider the algebraic numbers before mentioned. These include the rationals and infinitely many beside. Nevertheless the assemblage of all algebraic numbers is denumerable. The proof is too long to insert here. Yet more astonishing is the theorem that an assemblage composed of all the elements of a denumerable infinity of denumerably infinite assemblages is denumerable.

**The Power of the Continuum.**—At this stage the query is natural: is every possible assemblage denumerable? The answer is no. The assemblage of all real numbers, i.e., of all rationals and irrationals, is said to constitute a continuum. The assemblage of points of a straight line is a continuum, in particular a linear continuum. The last two assemblages are in fact of the same power, but neither is denumerable. This is demonstrated by letting \( a_0, a_1, \ldots, a_n, \ldots \) represent any denumerable assemblage of real numbers and then proving that between any two arbitrarily assumed numbers \( a \) and \( b \), there is one number and therefore an infinity of numbers not in the given sequence. From this proposition of Cantor's the existence of transcendental numbers, which had been otherwise previously proved by Liouville, follows as a corollary. Any assemblage equivalent to that of the real numbers or to that of the points of a straight line is said to have the power of the continuum. The assemblage of points of any line-segment however short or, what is the same, the assemblage of numbers between any two numbers nearly equal, has the power of the continuum. Indeed, either of these assemblages is a continuum. But an assemblage may have the power of the continuum without being a continuum. For example, the assemblage of transcendental numbers, though it is not a continuum, has the power of a continuum. In fact, the assemblage left on suppressing from a continuum any denumerable assemblage of elements is equivalent to the original assemblage, and last is a special case of the proposition: If A be infinite, and if the remainder R on suppressing a denumerable part of A be infinite, then \( A \sim R \).

As above seen the power of the continuum is higher than that of the denumerable assemblage, but whether it is the next higher is an outstanding question. There are higher powers than that of any given power (for there is no assemblage of all things), but no assemblage of points has a power higher than that of a continuum. On the contrary, it is one of the most marvelous of known facts that the assemblage of points on a line-segment however short is equivalent to the assemblage of all the points of space, nay, is equivalent to all the points of a space not merely, like our own, three dimensions, but a denumerable infinity of dimensions.

**Limit-points, Dense and Derived Assemblages.**—A neighborhood or vicinity of a point \( p \) is a region small at will taken about \( p \). If \( p \) be in space, a neighborhood may be a sphere having \( p \) as centre; if \( p \) be in a plane or in a line, a neighborhood will naturally be a circle or a line-segment. The following discussion, conducted for assemblages of points of a straight line, is readily extensible to other points assemblages. Denote by \( P \) any given assemblage of points of a line. If there be a point \( p \) in \( P \) or not, such that in any neighborhood of \( p \) there is one point (and hence an infinity of points) of \( P \), then \( p \) is a limit-point of \( P \). If \( p \) be in \( P \) but not a limit-point, \( p \) is an isolated point of \( P \). The assemblage of all the limit-points of \( P \) is the first derived assemblage or derivative \( P^{(1)} \) of \( P \). The first derivative of \( P^{(1)} \) is the second derivative of \( P \), namely, \( P^{(2)} \); and so on. If \( P \) be finite, its \( P^{(1)} \) contains no points, it is empty. If \( P \) be infinite and in a segment, \( P^{(1)} \) contains at least one point—a propo-
tion of exceeding importance in function theory. If the nth derivative \( P^{(n)} \) is empty and the preceding derivative contains one or more points, \( P \) is said to be of the first genus and nth species. Every point of a given derivative of \( P \) is a point of each preceding derivative, but \( P \) may contain points not in any of its derivatives. If some or all of the points of \( P \) are in an interval \((a \ldots b)\) and every sub-interval of the given interval contains a point or points of \( P \), \( P \) is said to be dense throughout the given interval. For example, the assemblage of points whose distances from a fixed point of the line are rational numbers is dense throughout every interval. If \( P \) be dense throughout a given interval, so is every derivative; in fact, each derivative in such case contains all points of the interval, and conversely. Hence one might lay down the definition: \( P \) is dense throughout an interval when and only when \( P^{(1)} \) contains every point of the interval. Obviously, if \( P \) is dense throughout an interval, \( P \) is of second genus, and so, too, are its derivatives. It follows that if \( P \) or one of its derivatives be of first genus, \( P \) is not dense in any interval. But it is not true that every \( P \) of second genus is dense throughout some interval.

**Greatest Common Divisor, Least Common Multiple.**—The equation \( P \equiv Q \) will signify that the point assemblages \( P \) and \( Q \) are identical. Two assemblages having no element in common are said to be without connection. If \( P \) contains all and only the points of the assemblages \( P_a, P_b, \ldots \), every two of the latter being without connection, the fact is expressed by writing \( P \equiv (P_a, P_b, \ldots) \). A part of \( P \) is called a divisor of \( P \), and \( P \) is a multiple of each of its divisors. The symbol, \( D(P_a, P_b, \ldots) \), is read greatest common divisor of \( P_a, P_b, \ldots \) and is the assemblage of their common points. \( M(P_a, P_b, \ldots) \) is read least common multiple of \( P_a, P_b, \ldots \), and is the assemblage of all the different points of the \( P \)'s, it being understood that the latter have no common point. To express that \( P \) is empty, one may write \( P \equiv 0 \). If and only if \( P \) and \( Q \) are without connection, \( D(P, Q) \) is empty and derivative. If \( P \) is a divisor of any preceding derivative. If \( P \) is of second genus, then \( P \equiv (Q, R) \), where \( Q \) is the assemblage of those points of \( P \) that are not common to \( P, Q, \ldots \), and \( R \) is the assemblage of those that are common.

**Determinants.**—A \( R \) is therefore defined by the equation \( R \equiv D(P^{(3)}, P^{(1)}) \) or by \( R \equiv D(P^{(3)}, P^{(1)}, \ldots) \), or by \( R \equiv D(P, Q, \ldots) \), where \( m, m_1, \ldots \) are a denumerably infinite assemblage of increasing positive integers. \( R \) is called a derivative of \( P \), but the order of the derivative is not expressible by a number of the sequence \( 1, 2, 3, \ldots \); these numbers are finite. The order of the derivative is denoted by the transfinite number \( \omega \), and one may write \( R \equiv K(P^{(n)}) \). The first derivative of \( P^{(0)} \) is denoted by \( P^{(0)} \), and the nth by \( P^{(n)} \).

If \( P^{(0)} \) have a derivative of transfinite order \( \omega \), it is denoted by \( P^{(\omega)} \). Continuation of the process yields \( P^{(\omega)}, P^{(\omega+1)} \equiv D(P^{(\omega)}, P^{(\omega)}), P^{(\omega+1)}, \ldots \), and so on endlessly. For any assemblage \( P \) of first genus, \( P^{(0)} \equiv 0 \), an equation serving to characterize assemblage of first genus. Assemblages of the second genus are definable for which the derivative of any given transfinite order shall consist of a single specified point.

If \( D(P, P^{(1)}) \equiv 0 \), \( P \) is an assemblage of isolated points. From any assemblage \( P \), an assemblage \( Q \) of isolated points is obtainable by suppressing from \( P \) the assemblage \( D(P, P^{(n)}) \), and one may write \( \equiv P \) or \( D(P, P^{(n)}) \). It is known that if \( P \) be an assemblage of isolated points, it is denumerable, though, as already noted, the converse is not true. Also, if \( P^{(0)} \) is denumerable, so is \( P \); but not conversely, for, for example, the assemblage of rational fractions is denumerable, while its first derivative is a continuum, namely, the assemblage of real numbers. Again, if \( P \) be of second genus, and if \( P^{(\omega)} \), \( \omega \) being finite or transfinite, be denumerable, so, too, is \( P \) denumerable. A very remarkable theorem is the following: if \( P \) be in any given interval and if \( P \) be denumerable, the points of \( P \) can be enclosed in a finite number of sub-intervals having a sum less than any prescribed length.

**Perfect Assemblages.**—If \( P \) and \( P^{(1)} \) coincide \( P \) is called a perfect assemblage; in the contrary case, imperfect. For example, if \( P \) is the assemblage of points from \( p_i \) to \( p_s \) including \( p \), and \( p_s \), \( P \) is perfect; but if \( P \) includes only the points between \( p_i \) and \( p_s \), \( P \) is imperfect, for clearly \( P^{(1)} \) includes \( p_i \) and \( p_s \). The definition just given is Cantor's. Another current definition is that by Jordan: \( P \) is perfect if it includes \( P^{(1)} \). It has been proposed to distinguish the two by describing an assemblage, if perfect in Cantor's sense, as perfect, and if perfect in Jordan's but not in Cantor's sense, as closed. It has been proved that if \( P \) be closed, the assemblage \( R \), which results on suppressing \( P^{(1)} \) from \( P \) is denumerable. But it is not true that every absolutely perfect assemblage is decomposable into a closed assemblage and a denumerable assemblage. The theory of perfect assemblages, though exceedingly subtle, is far simpler than that of imperfect assemblages. Every derivative of \( P \) is relatively perfect. There are absolutely perfect assemblages not dense in any interval.

**Measure and Measurable Assemblages.**—This subject can best be considered by limiting our discussion to sets of numbers in the interval between 0 and 1. Let \( P \) be such a set, and let \( Q \) be the complementary set—the set of all numbers between 0 and 1 that are not in \( P \). Suppose that a denumerable number of intervals—i.e., sets of all the numbers between \( k \) and \( k+1 \) of these values—have been found, including all the points of \( P \). These intervals have lengths, and these lengths, added in the descending order of magnitude, form a series. If this series is convergent, it has a sum, which we shall call \( S \); if it diverges, we shall say that \( S \) is infinite. \( S \) depends in general on the particular choice of intervals containing \( P \). However, \( S \) will have either a minimum value or a lower limiting value. This is called \( m \) (\( P \)), or the upper measure of \( P \), and depends on \( P \) alone. If \( m (Q) \) is the lower measure of \( P \) is equal to \( m (P) \), their common value is called \( m (P) \), the measure of \( P \). A set \( P \) is said to be measurable. The theory of measurable sets is of the utmost importance in the
modern discussion of integration (see Real Variable, Theory of Functions). Whether there are sets that are not measurable is unknown; an apparent exemplification of such sets by Van Vleck rests on the precarious axiom of Zermelo. Every limited closed assemblage is measurable.

Improper Infinite and Proper Infinite, or Transfinite.—The ordinary notion of mathematical infinity is that of a finite variable, such as $\tan \alpha$, which can take a finite value greater than any previously specified finite value; and such an equation as $\tan 90^\circ = \infty$ is understood by mathematicians to be a kind of short-hand for saying that, by taking $\alpha$ near enough to $90^\circ$, $\tan \alpha$ can be made to exceed any preassigned finite number, and it does not mean that $\infty$ is a value that $\tan \alpha$ may assume. Similar illustrations abound. Such a variable as thus remains always finite but may be made large at will is sometimes described as an infinite (variable) in analogy with the reciprocal notion of Infinitesimal, a variable that remains always finite but may be made small at will. Such infinites are described by Cantor as improper infinites. On the other hand both geometry and analysis have long recognized another sort of infinite, viz., one that is not variable but is constant. Such an infinite, for example, is the distance from any finite point of a line (see Projective Geometry) to the point common to the line and any parallel line. Another example is the distance from any finite point of the complex plane to an *infinite point* of the plane (see Complex Variable). Such infinites are proper infinites. Proper infinites of a now different sort arise in the theory of assemblages. We shall now give an account of their genesis and nature.

Transfinite Cardinal Numbers and their Laws.—Denote by $A$ any assemblage of elements $a$; symbolically, $A = \{a\}$. On disregarding both the character of the $a$'s and any and every order of their arrangement, a new assemblage, an assemblage of characters less elements ($\min$), arises, called the power or cardinal number of $A$ and denoted by the symbol $|A|$. Herewith the term power (Mächtigkeit) is itself defined; sameness of power was defined above. Plainly every class has a definite power, or cardinal number. The equation $|A| = |B|$ means that $A$ and $B$ have the same or equal powers or cardinal numbers. It is easily seen that, when and only when $A \sim B$, $|A| = |B|$. If $A, B, C, \ldots$ have no common element, the assemblage of all the elements involved will be denoted by $(A, B, C, \ldots)$. If also $A', B', C', \ldots$ have no common element, and if $A \sim A'$, $B \sim B', C \sim C', \ldots$, then $(A, B, C, \ldots) \sim (A', B', C', \ldots)$, and the cardinal numbers of these composite assemblages are equal, or the same.

Notion of Greater and Less Powers or Cardinals.—If $A$ and $B$ are such that $A$ has no element equivalent to $B$ and that $B$ has a part equivalent to $A$, the cardinal number of $A$ is said to be less than that of $B$, that of $B$ greater than that of $A$; symbolically, $A < B$, or $B > A$.

If $a, \beta, \gamma$ are cardinal numbers, and if $a < \beta$, and $\beta < \gamma$, then $a < \gamma$. Any one of the relations $a = \beta$, $a < \beta$, $a > \beta$, excludes the other two. But it does not follow that every pair of cardinals $a$ and $\beta$ must satisfy one of the relations, and it is not known whether they satisfy one of them. This last proposition belongs to the theory of well-ordered assemblages, a term explained at a later stage of this writing.

Addition of Powers or Cardinals.—If $a$ and $\beta$ be the cardinal numbers of $A$ and $B$, $A$ and $B$ having no common element, and if $a > \beta$, then $a + \beta = a$. This is the definition of addition. As a power in an orderless assemblage, $a + \beta = a + \beta$, and, in case of any three powers, $a + (\beta + \gamma) = (a + \beta) + \gamma$; that is, addition of powers is commutative and associative.

Multiplication.—Let $A = \{a\}$ and $B = \{b\}$. Associate each $a$ with each $b$. Consider each pair $(a, b)$ as an element. The assemblage of these is denoted by $(A, B)$. Hence $(A, B) = \{(a, b)\}$. The power $\gamma$ of this last obviously depends only on the powers $a$ and $b$ of $A$ and $B$. Hence the definition of product: $a \cdot \beta = \gamma$. As the power, or cardinal number, of an assemblage is orderless, it is read from left to right and that, for any three powers, $a \cdot (\beta \cdot \gamma) = (a \cdot \beta) \cdot \gamma$, $a \cdot (\beta + \gamma) = a \cdot \beta + a \cdot \gamma$; that is, multiplication of powers is commutative, associative and distributive.

Involvation.—If with each of $A$ a $b$ of $B$ is associated, any $a$ and the associate $b$ will be a pair. The same $b$ may enter two or more pairs. The assemblage of all the pairs resulting from any such definite association is called a covering of $A$ with $B$, and is denoted by $(A \times B)$. A different covering results if with any $a$ there is associated a $b$ not associated with it before. The assemblage of all possible coverings of $A$ with $B$ is denoted by $(B \mid A)$; then $(B \mid A) = \{(A)\}$. The power $\gamma$ of $(B \mid A)$ depends only on the powers $a$ and $\beta$ of $A$ and $B$; hence the definition: $a \cdot \beta = \gamma$. It may be proved that, if $a, \beta, \gamma$ denote any three powers, $a \cdot \beta = \beta \cdot a$, $a \cdot (\beta \cdot \gamma) = (a \cdot \beta) \cdot \gamma$, and $(a \cdot \beta) \gamma = a \cdot (\beta \cdot \gamma)$. It is an interesting fact that by means of the foregoing definitions of power, and addition, multiplication and involvation of powers, the definition and the fundamental properties of the ordinary (finite) cardinals 1, 2, 3, \ldots, can be rigorously deduced.

**The Smallest Transfinite Cardinal.**—The cardinal number of the assemblage $\{v\}$ of finite cardinals is denoted by $\aleph_0$, alef-null. Symbolically, $\aleph_0 = \{v\}$. The transfinite number $\aleph_0$ has the properties: $\aleph_0 + 1 = \aleph_0$; $\aleph_0 > \mu$, where $\mu$ is any finite cardinal; $\aleph_0 < a$, where $a$ is any transfinite cardinal different from $\aleph_0$; $\aleph_0 + \aleph_0 = \aleph_0$; $\aleph_0 \cdot \aleph_0 = \aleph_0$; $\aleph_0 \cdot \aleph_0 = \aleph_0$; \ldots; etc. It is one of the interesting facts met with in the doctrine of transfinite assemblages that the cardinal number of the points of space or other continuum is precisely $2^{\aleph_0}$.

Simply Ordered Assemblages, Order-types.—$A$ is simply ordered when and only when its elements $a$ are so disposed that of every pair $a_1, a_2$ of them, one, as $a_1$ precedes, i.e., has lower rank and the other, as $a_2$, comes after, i.e., has higher rank, and of every
ASSEMBLAGES 419

triplet $a_0, a_1, a_2$ is lower than $a_0$, if $a_1$ is lower than $a_0$ and $a_2$ is lower than $a_0$. To say symbolically that $a_1$ is lower in rank than $a_2$ and that $a_2$ is higher than $a_0$, we write either $a_1 \prec a_2$ or $a_1 \prec a_2$. A simply ordered assemblage that is further so arranged that it has an element of lowest rank, a first element, and that every part of it has a first element, is said to be well-ordered. For example, the assemblage of rational fractions greater than zero and less than one, if arranged in natural order, so that the larger the fraction the higher its rank, is simply ordered but not well-ordered. The same assemblage can, however, be well-ordered, thus: \( \frac{1}{2}, \frac{1}{3}, \frac{1}{4}, \frac{1}{5}, \ldots \), where the scheme is that \( \frac{1}{2} \) shall have lower rank \( \frac{1}{3} \) than \( \frac{1}{2} \), when \( p_1 + q_1 < p_2 + q_2 \) and \( q_1 < q_2 \), and if \( p_1 + q_1 = p_2 + q_2 \) then the fraction having the smaller number for its numerator shall have the lower rank.

If \( A \) is a simply ordered assemblage, the new assemblage obtained by abstracting from the character of the elements of \( A \) is called the order-type of \( A \) and is denoted by \( \mathcal{O}A \). Obviously, \( \mathcal{O}A \) is simply ordered. If \( A \) and \( B \) are simply ordered, and if their elements can be paired in one-to-one fashion so that the rank relation of every two elements of \( A \) and \( B \) is the same as the rank relation of their correspondents, then \( A \) and \( B \) are said to be similar, and to be depreciable on one another. These definitions of similar and depreciable, it is noteworthy, are more restricted than that above given. The similarity of two similar simply ordered assemblages \( A \) and \( B \) is expressed by writing \( A \sim B \). If \( A \) is simply ordered, \( A \preceq A \), and if \( B \) and \( C \) are simply ordered, and if \( A \preceq C \) and \( B \preceq C \), then \( A \preceq B \) is implied. It is plain, too, that either of the relations, \( A = B \), \( A \sim B \), implies the other. The definition of similarity given here is analogous to that of sameness of power in an earlier paragraph and can be rendered precise in the same manner.

To every order-type, or ordinal number, corresponds a power, or cardinal number. Thus to \( \mathcal{O}A \) corresponds \( A \). The distinction of ordinal and cardinal is of no importance for finite assemblages, but is absolutely indispensable in the doctrine of transfinite. All order-types corresponding to a finite cardinal \( a \) are similar, but those corresponding to a transfinite cardinal present a countless variety and are said to constitute a type-class \( \{a\} \). To every transfinite cardinal corresponds such a type-class. Any type-class is itself an assemblage, namely, of order-types, and as such has its own cardinal number, which may be shown to be greater than that of each of the order-types involved.

Addition and Multiplication of Order-types. - If \( A \) and \( B \) are simply ordered, it will be understood that in their union \( (A, B) \) the elements of \( A \) have the same rank relation as in \( A \), that the like is true of \( B \), and that every \( a \) is of lower rank than every \( b \). Hence \( (A, B) \) is simply ordered. If \( A' \) and \( B' \) are simply ordered and if \( A \preceq A' \) and \( B \preceq B' \), then \( (A, B) \preceq (A', B') \). Hence the order-type of \( (A, B) \) depends only on \( a = A \) and \( \beta = B \). Hence the definition of addition: \( a + \beta \equiv (A, B) \). Here \( a \) is the augend and \( \beta \) the addend. If \( a, \beta, \gamma \) be three type-classes, then \( a + (\beta + \gamma) = (a + \beta) + \gamma \), \( a \cdot (\beta + \gamma) = a \cdot \beta + a \cdot \gamma \), \( (a + \beta) \cdot (\gamma + \delta) = (a \cdot \gamma) + (a \cdot \delta) + (\beta \cdot \gamma) + (\beta \cdot \delta) \). Addition of ordinals is associative; but, unlike cardinals, ordinals do not in general obey the commutative law. For example, if \( \omega = E \) where \( E \) denotes \( \varepsilon_1, \varepsilon_2, \ldots \), \( \varepsilon_1 \leq \varepsilon_{1+1} \), and if \( \mu \) be any new element, then \( \omega + 1 \neq \omega + \mu \), for \( (E, \mu) \) are not similar the first having a last element, while the former has not.

Next from the simply ordered assemblages \( A \) and \( B \), form the assemblage \( S \) by replacing each \( b \) by an assemblage \( Ab \preceq A \). It is easily seen that the order-type \( S \) depends only on \( a = A \) and \( \beta = B \). Hence the definition of multiplication: \( a \cdot \beta \equiv S \). Here \( a \) is multiplicant and \( \beta \) is multiplier. It is readily proved in respect to three types \( a, \beta, \gamma \), that \( (a \cdot \beta) \cdot \gamma = a \cdot (\beta \cdot \gamma) \) and that \( a \cdot (\beta + \gamma) = a \cdot \beta + a \cdot \gamma \). That is multiplication of ordinals like that of cardinals is associative and distributive. But in general ordinals do not obey, while cardinals always obey, the commutative law. The reader can easily convince himself that, for example, \( \omega \cdot 2 \equiv 2 \omega \), \( \omega^\omega \equiv \omega + \omega + \cdots \), and such order-types as \( \omega^\omega, \omega^\omega, \omega^\omega \), etc., are defined by analogous chains of additions.

Order-type of Rationals. - Denote by \( R \) the rational numbers less than 1 and greater than zero, taken in natural order. Let \( = R \).

Obviously every \( \eta \) belongs to the type-class \( \aleph_0 \), for we have seen that \( R \) is denumerable. Moreover, \( R \) is dense (contains an element between every two elements) and has no element of lowest rank and none of highest. By these three properties, \( R \) is completely characterized; that means that if \( A \) is simply ordered, dense, denumerable, and has neither lowest nor highest order-type \( A \) and \( R \) are similar, and \( = R \). It follows that \( \eta + \eta = \eta, \eta \cdot \eta = \eta, (1 + \eta) = \eta, (1 + \eta + 1) = \eta, \) but \( \eta + 1 \neq 1 + \eta \), and, though \( \eta + 1 = \eta \), \( \eta + \eta \neq \eta + \eta \), if \( \eta > 1 \).

Order-type of Linear continuum. - Denote by \( \theta \) the order-type of the linear continuum \( X = x \), where \( 0 < x < 1 \), and where \( X \) is disposed in natural order, i.e., so that if \( x \) and \( x' \) are any two elements of \( X \), then only when \( x < x' \). Now \( X \) is dense and perfect. It also contains \( R \) in such way that in respect to rank there are elements of \( R \) between every pair of \( x \). So is suggested the following fundamental theorem, which serves to characterize the type of the linear continuum completely: If a simply ordered assemblage \( A \) is perfect and if it contains a denumerable assemblage \( P \) such that in respect to rank \( P \) has elements between every two elements of \( A \), then \( = A \).

Zermelo's Axiom. - In 1904, Zermelo pointed out that a certain principle, which amounts to the statement that given an assemblage \( A \) of assemblages \( B \), there exists an assemblage \( C \) containing just one member from every \( B \), was being tacitly employed throughout the theory of assemblages. Zermelo considered this axiomatic, but as soon as it was
rendered explicit, most of the mathematicians who had formerly unconsciously employed it disowned it, and set themselves the task of freeing the theory of assemblages from all taint of it. In general, this work has been very successful, but there are a group of outstanding propositions which have not been proved except on the basis of Zermelo's axiom, some of which actually imply it. Among these are:

1. that of two assemblages from finite cardinal numbers, one is always the greater;
2. that every assemblage can be well-ordered;
3. that every number is either finite or infinite (in the senses already defined).

The conscientious mathematician, when he employs this principle, will always make clear the fact of this employment explicit. See also Algebra, Definitions and Fundamental Concepts.

Adrain Professor of Mathematics, Columbia University.

ASSEMBLY, Constituent. See Assembly, National.

ASSEMBLY, General. The name applied to the highest ecclesiastical court of the Established Church of Scotland. It consists of delegates from every presbytery, university and royal burgh in Scotland, holds meetings annually, in the month of May, and usually continues to sit for 12 days. In its judicial capacity and as the court of last resort, the General Assembly has a right to determine finally every question brought from the inferior courts, by reference, complaint or appeal. The laws enacted by the assembly, after receiving the sanction of a majority of presbyteries, are the established and permanent statutes of the Church, by which everything belonging to the ecclesiastical state, or to the Church courts, is authoritatively regulated. The United Free Church of Scotland has a General Assembly similar in its constitution to this Established Church, and the same is true of the Presbyterian churches (q.v.) of Ireland and America. See General Assembly of the Presbyterian Church.
ASSEMBLY DISTRICT—ASSESSMENT

Theoretically the constitutional provisions are adequate to protect the right of assembly, but in practice they have not always been found sufficient to prevent occasional infringement. The unauthorized and often indiscriminate use of the powers conferred upon or possessed by administrative or judicial officials constitutes the chief danger to the due exercise of the right.

ASSEMBLY DISTRICT. See District.

ASSEMBLY OF DIVINES, a celebrated assembly appointed by the Long Parliament, and held at Westminster to determine upon the doctrine and liturgy of the English Church. By an ordinance passed 12 June 1643, 121 clergymen, with 10 Lords and 20 Commons as lay assessors, were nominated as constituents of the assembly. The assembly began its sittings in July 1643, in Westminster Abbey, but in the meantime a royal proclamation had been issued forbidding the assembly to meet, which had the effect of inducing the greater part of the Episcopal members to absent themselves. The majority of those who remained were Presbyterians, but there was a strong minority of Independents. A deputation was now sent along with commissioners from the English Parliament to the General Assembly of the Scottish Church and the Scottish Convention of Estates, soliciting their co-operation in the proceedings of the Westminster Assembly, and in September four Scotch clergymen, with two laymen, were admitted to seats and votes. The assembly continued to hold its sittings till February 1649. Among the results of its deliberations were the Directory of Public Worship, the Confession of Faith, and the Larger and Shorter Catechisms, which remain practically the standards of the Presbyterians to the present day.

At the Restoration the whole proceedings of the Westminster Assembly were annulled as invalid. Consult Hetherington, 'History of the Westminster Assembly' (1843); Masson, 'Life of Milton' (1858-79).

ASSEN, a'sen, Holland, the capital of the province of Drenthe. Near it are the Giants' Caves, to which Tacitus makes allusion. Pop. 11,191.

ASSENT, in law, an undertaking to do something in compliance with a request. Approval of something done. Express assent is that which is openly declared. Implied assent is that which is presumed by law. Assent must be to the same thing in the same sense. It must embrace the whole of the proposition, must be exactly equal to its extent and proportions, and must not qualify them by any new matter. Unless express dissent is shown, acceptance of what it is for a person's benefit to take, is presumed, as in the case of a conveyance of land. The Royal Assent is the approbation given by the sovereign in Parliament to a bill which has passed both houses, after which it becomes a law. It may be given in person, when the sovereign comes to the House of Peers and the assent (in Norman French) is declared by the clerk of Parliament, and again declared by letters patent under the great seal, signed by the sovereign.

ASSER, a'sär, Tobias Michael Carle, Dutch educator and an authority on interna-
ASSASSEUR — ASSIGNMENT

ASSASSEUR, (1) one who advises or assists. Both in Great Britain and the United States nautical assessors are called in to advise and assist the courts in the administration of admiralty cases on difficult questions of navigation. Assessors are also called into various other courts, as the court of appeals or county courts, in Great Britain to act in an advisory capacity. By Federal statute in the United States, our foreign courts may call in assessors to act in certain criminal cases. (2) One who assesses, as taxes. The term is used in this sense both in Great Britain and the United States. His duties are mainly to adjudge the value of real and personal property and compute the taxes thereon.

ASSETTEAGUE (äs'se-tëg') ISLAND, a small island off the coast of Virginia in Hampton County. Upon it is a lighthouse 150 feet in height.

ASSETS, in law, strictly the property of a debtor in the hands of his representative sufficient for the satisfaction of his creditors or legatees. Thus the property of a bankrupt is termed his assets and is the fund out of which his liabilities must be paid. All property of the debtor is assets, and it is not necessary that it should have been reduced into possession by him.

ASSIENTO, aš-yântô (Spanish, asiento, seat, contract, treaty), a term especially applied to an agreement between the Spanish government and a foreign nation to import negro slaves from Africa into the Spanish colonies in America, for a limited time, on payment of certain duties. The English were the sole possessors of this assiento till 1701. In 1713 the celebrated assiento treaty with Britain for 30 years was concluded at Utrecht. By this contract the English, among other privileges, obtained the right of sending a permission or assiento ship, so called, of 500 tons every year, with all sorts of merchandise, to the Spanish colonies. By the treaty of Madrid, 5 Oct. 1750, the contract was annulled.

ASSIER, aš-yâ, Adolphe d', French philosopher, born at Labastide de Salvan 1828. He spent much of his life traveling, on which his earlier writings are based, but his later books are on the science of philology. He is the author of 'Le Brésil contemporain, races, moeurs, institutions, paysages' (1867); 'Souvenirs des Pyrénées' (3d ed., 1885); 'Essai de grammaire générale, d'après la comparaison des principales langues indo-européennes' (1857); 'Histoire naturelle du langage; Physiologie du langage phonétique' (1868); 'Le langage graphique' (1868).

ASSIGNATION. See Assignment.

ASSIGNAIS, a-se-nya, as-je-nâts, a term applied to the paper money issued during the French Revolution. The French National Assembly after appropriating to national purposes the land belonging to the Church instead of selling it at a time when its value was greatly depreciated, because of the unsettled state of affairs, provided for the security of it, which were called assignats, as representing land assigned to the holder. This paper currency consisted chiefly of notes for 100 francs each, though many of them were for lower sums. The first issue in 1790 amounted to 400,000 francs. The government was relieved by this plan, for the time being the assignats saved the Revolution. This arrangement for relieving the necessities of the government seemed so easy that recourse was repeatedly had to it, as the property of wealthy emigrés, until the amount arose to the vast sum of 46,000,000,000 francs, besides many forged notes. The consequence was that the value of assignats sank almost nothing. In March 1796, a louis d'or (24 francs) bought 7,200 francs in assignats. They were withdrawn from the currency after this, and redeemed at a thirtieth of their nominal value, by territorial mandates, a new kind of paper currency, which empowered the holder at once to take possession of public lands at the estimated value, while assignats could only be offered at a sale. These territorial mandates afterward became almost worthless and were returned to the government in payment of taxes or of land. Early in 1797 the system came suddenly to an end.

ASSIGNMENT, a term denoting a transfer by deed of any property, or right, title or interest in property, real or personal. Assignments are usually given for leases, mortgages, and funded property. In the United States, assignment is of broader significance and applies also to the transfer of real property by certain conveyance. In general, every right of property, real or personal, and every demand connected with a right of property, real or personal; and all choses in action, as bonds, notes, judgments, mortgages, debts, contracts, agreements, relating both to real and personal property, are assignable, and the assignment thereof will pass to the assignee a right of action in the name of such assignee against all parties liable to an action. It is now most frequently used to describe the transfer of non-negotiable choses in action; and is more particularly applied to a written transfer, as distinguished from a transfer by mere delivery. Assignment carries with it all collateral securities held by the assignor for the creditor of a debt or the fulfilment of a contract, and is subject to all the equities and charges which attached in the hands of the assignor. A personal trust, as the right of a master in his indented apprentice, or of a testator's executor or trustee, etc., is not assignable. The validity of an assignment must be determined by the law of the State in which it was made, provided the thing assigned is subject of municipal or State law; but copyrights, patents, and government claims are governed by acts of Congress. In general, assignments should be recorded in the office prescribed by law, or are void as against those claiming under subsequent assignments. In a few States recording is necessary to the assignment of certain classes of choses in action, such as future earnings. In many States statutes give preference to laborers for their claims to payment of debts due them for labor furnished, and it has been generally held that the security of it, which were called assignats, as representing land assigned to the holder. This paper currency consisted chiefly of notes for 100 francs each, though many of them were for lower sums. The first issue in 1790 amounted to 400,000 francs. The government was relieved by this plan, for the time being the assignats saved the Revolution. This arrangement for relieving the necessities of the government seemed so easy that recourse was repeatedly had to it, as the property of wealthy emigrés, until the amount arose to the vast sum of 46,000,000,000 francs, besides many forged notes. The consequence was that the value of assignats sank almost nothing. In March 1796, a louis d'or (24 francs) bought 7,200 francs in assignats. They were withdrawn from the currency after this, and redeemed at a thirtieth of their nominal value, by territorial mandates, a new kind of paper currency, which empowered the holder at once to take possession of public lands at the estimated value, while assignats could only be offered at a sale. These territorial mandates afterward became almost worthless and were returned to the government in payment of taxes or of land. Early in 1797 the system came suddenly to an end.
ASSIMILATION — ASSIZE OF CLARENDON

ASSIMILATION, a term denoting the transformation of foods into living substance. The animal body is constantly changing. New compounds are being made from others; old products are cast off. There is a constant interplay of materials, some building up, others breaking down. The chief factors in the assimilative process are the foods and the oxygen in the air. Another sense of the word implies the act of making similar; also to acquire, as assimilation of knowledge. For a discussion of the latter see RESPIRATION. See also METABOLISM.

ASSIMILATION, in geology, that process by which fragments of the wall rock of an intrusive mass are broken away and melted so that they finally become a part of the molten intrusive itself.

ASSING, a’sing, Ludmilla, German writer, niece of Varnhagen von Ense, who adopted her: b. Hamburg, 22 Feb. 1827; d. 25 March 1880. On the death of her mother, Regina Maria Assing and her two sisters, she was adopted by and went to live with her uncle, who gave her an excellent education. Through him she became intimately acquainted with Alexander von Humboldt. Her first notable work was a biography of the Countess Elise Aschfeldt (Berlin 1857). On the death of her uncle she published a correspondence that had been carried on between him and von Humboldt, under the title 'Briefe Alexander von Humboldt an Varnhagen von Ense' (Leipzig 1860), which was followed by her uncle’s memoirs and diary (14 vols. 1861-71). Certain references to political matters in the latter aroused the wrath of the government, with the result that she was tried and sentenced to eight months’ imprisonment. In the meantime, however, she had fled to Florence, where she immediately published further instalments of the diary, whereupon she was again tried and sentenced to imprisonment. In 1866, however, a general amnesty enabled her to return to Germany. Among her other works are 'Piero Cironi, ein Beitrag zur Geschichte der Revolution in Italien' (Leipzig 1867); ‘Fürst Hermann Fückler-Muskau’ (Hamburg 1868).

ASSINI, a-sie-ne’, small seaport in the French Sudan, about 120 miles west of Cape Coast Castle. It taps much of the trade in that section of the Ivory Coast. Considerable coffee is being grown in the region about, but hardwood timber is the chief export. The population, mostly native, is about 3,000.

ASSINIBOIA, a-sin’-t’-boi’-a, formerly a district in northwestern Canada, west of Manitoba, having the district of Saskatchewan on the north and Alberta on the west. On 1 Sept. 1905, Assiniboia was united with the province of Saskatchewan and the eastern portion of Athabasca to form the new province of Saskatchewan (q.v.).

ASSINIBOIN, a-sin’-t’-boin, signifying stone boilers, a name applied by the Algonquins to Indians to a Siouan tribe which formerly inhabited the territory between the Missouri and the Saskatchewan and who did their cooking by dropping heated stones in water. They are distantly related to the Dakotas, with whom they are able to make themselves understood in conversation. The few survivors now live on reservations in Montana and on the other side of the Canadian border, altogether numbering about 2,000. Consult L. H. ‘The Assiniboine’ (in ‘Anthropological Papers,’ American Museum of Natural History, Vol. IV, 1910).

ASSINIBOINE, a river of Canada, which flows through Manitoba and joins the Red River at Winnipeg, about 40 miles above the entrance of the latter into Lake Winnipeg. It has a somewhat circuitous course of about 500 miles and steamers ply on it for over 300 miles.

ASSISI, a-sis’-si, Italy, a hill town in the province of Umbria, 20 miles from Spoleto. It is the see of a bishop and is famous as the birthplace of Saint Francis, founder of the Franciscan Order, and of Saint Clara, foundress of a religious community for women. The splendid church built over the chapel where Saint Francis received his first impulse to devotion is one of the finest remains of the Gothic architecture of the 13th century. Pop. (1911) 18,587. Consult ‘Assisi’ in ‘Medieval Towns Series’ (1901).

ASSISTANCE, Writ of, legal term, applied to an order issued by a court of equity to a sheriff or any other officer of similar authority authorizing him to enforce a decree for the possession of land. The English term is ‘writ of possession.’ In colonial days the term was also applied to orders issued to customs and revenue officers, authorizing them to seize goods on which duty had not been paid. Consult Quincy’s ‘Reports, Superior Court of Judicature, Province of Massachusetts Bay, 1761-72, with an Appendix upon Writs of Assistance’ (Boston 1865).

ASSIUT, Egypt, the capital of the province of the same name, and the largest and best built town in the Nile Valley south of Cairo, from which it is distant 248 miles by rail. There are several bazaars, baths and handsome mosques. It is famous for its red and black pottery and for ornamental wood and ivory work, which find a ready market all over Egypt. It is one of the chief centres of the Copts. Here also is the northern terminus of the caravan route across the desert to Darfur. There are many archaeological remains in the neighborhood. Pop. 42,000.

ASSIZE OF ARMS. A law enacted in the reign of Henry II which enjoined every able-bodied man in the realm to maintain arms suitable to his rank and condition of life, at his own expense. Of this law our militia is the modern offspring.

ASSIZE OF CLARENDON, regulations established by Henry II of England in 1166. They provided for juries, one in each county, each jury composed of 12 men from each hundred of freeholders and 20 holders of sokemen, and the hundred of sokemen. The function of this body was to present before the justices all who were charged with murder or robbery, or of harboring such criminals. Certain sections also provided for the prosecution of heretics. Consult Adams and Stephens, 'Select Documents of English Constitutional History' (New York 1901).
ASSIZE OF JERUSALEM, a code of laws in force in the Christian kingdom of Jerusalem and Cyprus. It consisted of two parts, the assize of the high court with jurisdiction over the court of burgesses, or code of the common people. It was supposed for some time that the laws were framed by Godfrey de Bouillon; but this is now known to be incorrect. The assize of the high court was first framed as a code named in the name of the court of burgesses, in the latter part of the 12th century, but the exact date is uncertain.

ASSIZES, an English legal term signifying the sessions of the courts held at intervals in every county by the judges. The whole country is divided into circuits, and three times in the year two judges, who are members of the highest courts in England, hold assizes in all the counties of their respective circuit. In London and Middlesex, instead of circuits, what are known as courts of nisi prius are held. At the assizes all the justices of the peace of the county are bound to attend, or else are liable to a fine; and also all the persons who have been summoned as grand jurymen or petit jurymen by the sheriff. At these assizes the judges sit under five separate commissions, some of which relate to civil and some to criminal causes or business. In this manner, and by these means, the jails are in general cleared, and offenders tried and convicted at least every half year.

In America there are no courts or sessions of courts technically called assizes. The judges, however, perform the same duties in the counties, within their respective circuits and jurisdictions, as the English judges, and generally in the same manner, that is to say, according to the course of the common law. Since 1808 there have been assize courts in the judicial system in France. With the English institutions, however, they have scarcely anything in common.

ASSMANSHAUSEN, Prussia, a village in the province of Wiesbaden, on the Rhine, on the railroad from Frankfort-on-the-Main to Niederlahnstein. It is celebrated for producing the best red wine in the Rhine provinces. It has several baths and a warm spring, which have made of it a popular health resort.

ASSOCIATED PRESS, a co-operative organization formed to gather news for the daily papers. Even before the Civil War the New York newspapers realized that each was paying large sums of money for news that was accessible to all. Accordingly provision was made for a joint agency which acted as a sort of clearing house through which each paper gave to all other papers (members of the agency) any news that it might receive. This formed the nucleus for the later organization known as the New York Associated Press. In 1885 the western papers incorporated their agency as the Western Associated Press; and there were several minor associations which formed a general alliance centred in the New York association. In 1892 a general association in the nature of a stock corporation was formed, and its stockholders, being newspaper proprietors, were not allowed to hold more than eight shares of stock apiece, though being a mutual corporation it was not necessary that proprietors be stockholders in order to become members of the association or to secure its news service. In 1900 the association was changed from a stock corporation into a mutual association for such newspaper publishers as were interested in cooperative press reports. This was done 22 May 1900, when the present association was organized under New York laws. Proprietors of papers or executive officers of corporations owning papers entitled in one name are members of the association, though only as representing their papers. The income of the association is derived from members (of which there are about 860) by weekly assessment prorated according to the cost and value of the service. The association has its own system of leased wires for its more important service (about 22,000 miles of day wires and 28,000 miles of night wires), stretching across the continent from Saint John, N. B., to Seattle, Wash., and from Duluth, Minn., to New Orleans, La., Galveston, Tex., and Mexico City. The number of words received and transmitted daily at each of the more important offices is 50,000, equivalent to about 35 columns of the average newspaper. See Press Associations.

ASSOCIATION AREAS. In the brain of many lower animals as well as in that of man there are definite areas associated with other areas by sets of fibres, known as association fibres. These different areas act together in performing many of the complicated acts of human life. Thus, the general sensory area in the brain, that feels the skin sensations and determines their character, is in close association with the motor area determining the movements of the body in correspondence with the knowledge it receives by the sensory areas. Under the heading APHASIA several of these association areas are discussed. The studies of psychology and of mental diseases are largely concerned with the relations and connections of the association areas in the brain.

ASSOCIATION FIBRES, a term applied to those fibres that connect different parts of the brain, particularly those that unite different areas in the same hemisphere, distinguishing them from the commissural fibres that connect areas in different hemispheres, or projection fibres that bind the cerebrum with the lower cerebellar or spinal systems. These association fibres form late in childhood and on their development depends much of the increased intellectual growth of the individual.

ASSOCIATIONS OF CATHOLIC COLLEGES OF THE UNITED STATES, an organization founded in Chicago in 1899 under the guidance of Rt. Rev. Mgr. Thomas Conaty, rector of the Catholic University. Its purpose is to study the questions connected with college education, to enlarge the development of college work and to advance the unification of system of education. Members of the Association include representatives from 53 colleges joined in the first organization of the Association, which now includes about 90 colleges, conducted chiefly by religious teaching orders of men. The studies
association of ideas

range from classical to commercial subjects. No uniformity of entrance requirements exist.

Association of Ideas, a phrase current in philosophy and psychology since the days of John Locke. The term "association" has had, in this connection, many different meanings. In popular psychology, it indicates the way the mind passes from idea to idea; or the way one idea suggests or "reproduces" another. Thus, in passing from the thought of gold to the recollection of a recent visit to a mining camp and then to the plot of a novel laid in a mountainous region, one may be said to "associate" the story with the idea of the mining camp, and this, in turn, with the idea of gold (see Memory). It is but a step from this popular conception of association—association as "reproduction"—to the notion that association is an explanation of reproduction. Association then becomes (to change the figure) not the actual passage from idea to idea, but the intangible bond which holds ideas together and which enables one idea (that is, the "gold" idea) to drag after it another (the "camp" idea). This second interpretation of the term is in disrepute among psychologists because no evidence whatever is adduced that the interpretation implies to be found in consciousness. It may be urged, however, that even if association in this causal sense be unobservable by introspection it may, nevertheless, be regarded as a general principle of mental activity:—as the means by which the mind creates knowledge. When, however, association is thus interpreted to mean a principle underlying and conditioning the process of knowing it passes from psychology to epistemology (see Psychology). The doctrine of Associativism, which is connected with the names of David Hume, James Mill, Alexander Bain and other "associationists," rests upon this epistemological meaning of the term.

Returning to the psychological use of the word "association," we may note that the popular conception stands in need of modification and precision. (1) To say that mind "associates" idea with idea implies that ideas are by nature separate and distinct and require some "general form" in which to unite themselves. This is not true. Ideas are interwoven; they are organically connected; they are not held together as in a bundle. (2) In the second place, the popular use of the term is too narrow; a chain of actions, or of emotions, or of feelings, may be associated as well as a chain of ideas. In habitual performances, for example,—such as dressing—one act calls forth the next, this in turn the next, and so on; or emotion may be linked with emotion, as anger following fear; or, finally, associations may set out from a perception, as the thought of home from the sight of a letter. (3) Again, association does not necessarily imply a sequence of associated elements. It may be simultaneous, as well as successive; for example, I see the table before me and, at the same time, I apprehend it as a hard resisting substance, or I hear the rumble of a carriage behind me and I see, in my "mind's eye," its form and color (see Perception). (4) Finally, associations in the particular and direct sense that idea follows idea; it tells us nothing of the nature of the associated consciousness; of how, that is, an association differs from a perception. Now association, in its strict technical sense, means the associated elements of consciousness; to illustrate, it means the mass of constantly shifting processes which make up mind while one is thinking gold—mining—camp—novel. Just as there exist typical groups of mental processes which underlie the perception of a landscape, a swinging pendulum or a musical composition, there exist other typical groups—such as those already mentioned—which are known to exist. Psychological work upon association has been directed, for the most part, upon the conditions under which associative groups arise. These conditions have, since the days of Aristotle, been set down under the headings of "principles" or "laws" of association. Thus a is said to call up or reproduce b when a and b have, at some previous time, stood together in consciousness (law of contiguity), or when a has been the cause of b (law of causality), or when b resembles a (law of similarity), etc. At the present time, these "laws" of association are usually reduced to two: the law of contiguity and the law of similarity. But even these are by no means final or adequate statements of the conditions under which associations arise; for—to point to only two or three of their imperfections—"similarity" is an extremely ambiguous term; it may mean simple likeness, or partial identity, or likeness of relationship; and "contiguity" is inadequate—it does not determine how near processes must lie in consciousness in order for one to reproduce the other. Moreover, it should be said that there are thousands of contiguity and similarity connections that are never realized in association; this follows from the fact that almost everything is, to some extent, similar to everything else, and that the elementary processes of mind have appeared "contiguously" in almost every conceivable form of combination. Both terms are, then, too broad to have much significance. If we set them down as "laws" we have still to determine under what particular conditions a given association is formed. Many of these particular and more important conditions have been determined. They involve frequency, frequency, frequency (the more recently or frequently a process or group of processes has stood in consciousness the greater the liability of its appearing in an associative connection), the general interests of the individual (for example, botanical ideas crop up in the botanist's mind, geological ideas in the mind of the geologist) the presence or absence of inhibitory associations (if a has already stood associated with b and c, its chances for associating with d will be lessened), mood (unpleasant subjects crowd into mind when one is depressed), etc. The actual liability of a given association being formed is thus seen to rest upon a great number of possible conditions. So far as there is any truth in a general all-inclusive "law" of association it is best expressed as a law of neutral habit. This law is formulated by W. James as follows: "When two elementary brain-processes have been active together or in immediate succession, one of them, on reoccurring, tends to propagate its excitement into the other;" the formulation of this law to the law of contiguity is obvious.

ASSOLANT—ASSOUAN

MADISON BENLEY,
Professor of Psychology, University of Illinois.

ASSOLANT, as'so-lan', Alfred, a French novelist and political writer: b. Aubusson, 20 March 1827; d. Paris, March 1880. Having traveled extensively over the United States, he published, on his return, 'Scenes from Life in the United States' (1858), a series of tales which attracted a good deal of attention. Among his numerous novels are 'Two Friends in 1792' (1859), a story of the Reign of Terror; 'Brancas' (1859), a picture of the corruption under Louis Philippe; 'Gabrielle de Chenevert' (1865), portraying the provincial nobility before the Revolution; 'Pendragon' (1881); and 'Plantagenet' (1885).

ASSOMAIR, l', la'so'mwar', a novel by Émile Berhacé, e in the English translation, published in 1877. It forms one of the series dealing with the fortunes of the Rougon-Macquart family, and is a series of repulsive pictures unrelied by one gleam of a noble humanity, but only 'realistic' as scraps; the life as a possible whole is as purely imaginative as if it were lovely instead of loathsorne.

ASSONANCE, in poetry, a term used when the lines end with the same vowel-sound, but make no proper rhyme. Such verses having what we should consider false rhymes are regularly employed in Spanish poetry; as in ligero, cubierta, tierra, mesa.

ASSOS, as'os, an ancient Hellenic port on the Gulf of Edremid, from whose still imposing remains the successful excavations, in 1861-83, of the American Institute of Archæology have brought to light the age of the sentry house and colonnade, a bath, theatre, gymnasium, statues of heroes, and seven Christian churches.

ASSOUAN, a-swahn', or ASSUAN, also called Aswan (Arabic al su'wan, 'the opening,' that is, of the Nile; the ancient Syene, whence the red granite of the vicinity—from whose famous quarries were cut under the earliest dynasties so many of the huge obelisks and colossal statues that adorned the temples and palaces of Egypt—is called syenite), capital of the province of the same name, the southemmost city of Egypt proper, near Nubia, on the right or eastern bank of the Nile, and beside the first or lowest cataract, 590 miles by rail south of Cairo. Near it are the islands of Philæ and Elephantine, the ruined monuiments of the former of which are of such fascination to tourists; on the left bank are many rock tombs of the ancient dynasties. Up to the crushing of the Mahdist rebellion Assouan was an important garrison town and the central depot for the Sudan caravan trade. This trade, as its title implies, since declined but the opening of a railway to Alexandria has increased its commercial prosperity. The chief export is senna. Assouan is also a famous health and tourist resort.

Pop. (1907), including suburbs, 16,125. Of still greater importance is the new dam which was added 1,408,000 acres to the arable soil of Egypt, besides forming the foundations of the large irrigations on the Nile lands, and which is described in extenso below.

The monumental dam at Assouan, one of the greatest achievements of the kind in ancient or modern times, forms a reservoir in the Nile Valley capable of storing 2,423,000,000 cubic metres of water. It has not only produced a revolution in the primitive and laborious methods of irrigation in Egypt, but has reclaimed vast areas of land that have hitherto been accounted as arid and worthless. The old system of irrigation was little more than a high Nile flooding of different areas of land or basins surrounded by embankments. Less than a hundred years ago, the introduction of perennial irrigation was first attempted under Inchenet Ali by cutting deep canals to convey the water to the lands when the Nile was at its low summer level. When the Nile rose, these canals had to be blocked by temporary earthen dams, or the current would have wrought destruction. As a result, they silted up, and had to be cleared of many millions of tons of silt each year by enforced labor, much misery and extortion resulting therefrom. About half a century ago the first serious attempt to improve matters was made by the construction of the celebrated Barrage at the apex of the delta. This work consists, in effect, of two brick-arched viaducts crossing the Rosetta and Damietta, branches of the Nile, having together 132 arches of 16 feet 4 inches span, which were entirely closed by iron sluices during the summer months, thus heading up the water some 15 feet and throwing it at a high level into the six main irrigation canals below Cairo. In the summer months the whole flow of the Nile is arrested and thrown into the aforesaid canals. The old Barrage was constructed under great difficulties by French engineers, subject to the passing whims of their Oriental chiefs. About 15 years elapsed between the commencement of the work and the closing of all the sluices, and another 20 years before the structure was sufficiently strengthened by British engineers to fulfil the duties for which it was originally designed. Forced labor was largely employed in its construction and at one time 12,000 soldiers, 3,000 marines, 2,000 laborers and 1,100 masons were at work at the old Barrage.

In connection with the Nile reservoir subdary weirs were constructed below the old Barrage to reduce the stress on that structure. The system adopted was a novel one, devised by Major Brown, inspector-general of irrigation in lower Egypt. His aim was to dispense almost entirely with plant and skilled labor; and so, without attempting to dry the bed of the river, he made solid masonry blocks under water by coating rubble dropped by natives into a movable timber caisson. Both branches of the Nile were thus dammed in three seasons at a cost, including navigation locks, of about $2,500,000. Many other subsidiary works have been and will be constructed, including regulators, irrigation works on the upper Nile, and the Aswan Canal. The most important of the works are the Barrage across the Nile at Assiut, about 250 miles above Cairo, which was commenced by Sir John Aird & Co. in the winter of 1898.
ASSOUAN DAM

Bird's-eye View of the Structure and Surrounding Region
and completed in 1902, the Barrage at Zifta, designed and built by Sir Hanbury Brown, 1900-02; and the Barrage at Esna, designed by Sir Arthur Webb, built by M. McDonald, 1900. The Barrage at Assiut, 590 miles above Cairo, is not a solid wall, but is pierced with sluice openings of sufficient area for the flood discharge of the river, which may amount to 15,000 tons of water per second. The sections are four in number, one 140 feet long by 23 feet high by 6½ feet wide, the upper 40 are 11 by 6½ feet; and where subject to heavy pressure when being moved they are of the well-known Stoney roller pattern. The total length of the dam is about 1½ miles; the original height from foundation, about 130 feet; the difference of level water above and below, 65 feet; and the weight of masonry 149.5 pounds per cubic foot. The total excavation has been estimated at 824,000 cubic yards. The new depth of water is about 38 feet. Navigation is provided for by a "ladder" of four locks, each 260 feet long by 32 feet wide. As was the case at Assiut, the difficulties in dam construction are not in design but in the obstruction to the passage of trains: the "ront"* in the bed was discovered, Sir Benjamin Baker reported to Lord Cromer frankly that he could not say what the extra cost or time involved by this and other unforeseen conditions would be, and that he said was that, however bad the conditions, the job could be done. Lord Cromer replied that the dam had to be completed whatever the time and cost involved. The contract was let to Sir John Aird & Co., of London, with Messrs. Ransomes and Rapier, of London, as subcontractors for the iron work, in February 1898. The engineer who designed it was Sir William Willcocks. Two months after signing the contract the permanent works were commenced, and before the end of the year thousands of native laborers and hundreds of Italian granite masons were at work. On 12 Feb. 1899, the foundation stone of the dam was laid by the Duke of Connaught. Many plans were considered by the engineers and architects, and the foundation of the dam across the roaring cataract channels, and it was finally decided to form temporary rubble dams across three of the channels below the site of the great dam, so as to break the force of the torrent and get a pond of comparatively still water up stream to work in. Stones of from one ton to 12 tons in weight were tipped into the cataract, till finally a rubble mound appeared above the surface. The first channel was successfully closed on 17 Jan. 1899, at a depth of 30 feet and the velocity of current nearly 15 miles an hour. In the case of another channel the closing had to be helped by tipping in railway cars themselves, loaded with heavy stones and bound together with wire ropes, making a mass of about 50 tons, the great mass being necessary to resist displacement by the torrent. These rubble dams were well tested when the high Nile ran over them; and on work being resumed in November, after the fall of the height of the "sudds,"* were made around the site of the dam foundation in the still waters above the rubble dams, and pumps were fixed to lay dry the bed of the river. This was the most exciting time in this stage of the operations, for no one could predict whether it would be possible to dry the bed, or whether the water would not pour through the fissured rock in an overwhelming flood. After four 12-inch centrifugal pumps were provided to deal, if necessary, with one small channel; but happily the sandbags and gravel and sand embankments stanchied the fissures in the rock and the interstices between the lower 140 feet, preventing the bottom of this channel, and a couple of 12-inch pumps sufficed. The masonry of the dam is of local granite, set in British Portland cement mortar. The interior is of rubble set by hand, with about 40 per cent of the bulk in cement mortar, four of sand to one of cement. All the face work is of coursed rock-faced ashlar, except the sluice linings, which are finely dressed. This was steam crane and Italian masons' work. There was a great pressing of labor, the work being completed before the inevitable rise of the Nile, and as much as 3,600 tons of masonry was executed per day, chiefly at one point in the dam. A triple line of railway and numerous flat-bottomed sledge boats convey the materials from quarries and stores to every part of the work. The maximum number of men employed was 11,000, of whom 1,000 were European masons and other skilled men. Messrs. Wilt, Stoker, and co., civil engineer and managing director of Messrs. Ransomes and Rapier, was responsible for the detailed designing and manufacture of the sluices and lock gates; 140 of the sluices are 23 feet high by 6 feet 6 inches wide, and 40 of them half that height; 130 of the sluices are on the "Stoney" principle with rollers, and the remainder move on sliding surfaces. The larger of the Stoney sluices weigh 14 tons, and are capable of being moved by hand under a head of water producing a pressure, after the heightening of the dam, of 325 tons against the gate. There are five lock gates, 32 feet wide and varying in height up to 62 feet. They are of an entirely different type from ordinary folding lock gates, being drawn from the top of the bore and not like a sliding coach-house door. This arrangement was adopted for safety, as over 1,000,000,000 tons of water are stored up above the lock gates, and each of the two upper gates is made strong enough to hold up the water, assuming that the four other gates were destroyed. After the heightening of the dam a fifth lock and gate were added. When the river is rising the sluices are open and the red water passes freely through, without deposing the pressing silt to the bottom when the water has become clear and the discharge of the Nile has fallen to about 2,000 tons per second, the gates without rollers are closed, and then some of those with rollers; so that between December and March the reservoir is gradually filled. The reopening of the sluices takes place between May and July, according to the state of the Nile and the requirements of the crops. On 10 Dec. 1902 the dam was formally declared complete, the total cost being £1,900,000. In 1907-12, in accordance with a plan prepared by Sir Benjamin Baker, it was raised about 16½ feet and its thickness increased about an equal amount. The capacity
ASSUMPTIS — ASSYRIA

of the original dam was thus increased from about 1,000,000,000 cubic metres to 2,423,000,000 cubic metres, its depth from about 65 feet to 88 feet, and the extent of river affected from 140 miles to 185 miles. The total cost of raising the dam was about $7,500,000. It has been estimated that each milliard of cubic metres of water suffices for the irrigation of 225,000 acres of summer crop and has a value to the treasury of about $2,500,000 per year. In 1905-06 a talus was constructed down stream at a cost of $1,413,500. Since the raising of the dam the Island of Philae is flooded between December and May, when the reservoir is full, and is only entirely above water between August and December. Elaborate operations have taken place to preserve the ruins as far as possible from the injury which is bound to ensue from their annual submergence. It is impossible to estimate the far-reaching beneficial influence these irrigation works will bestow upon Egypt; but the reclamation of so many thousands of acres of desert for agricultural development cannot fail to improve the agricultural possibilities of the land and assist Egypt to regain the prosperity it enjoyed in the era of the Pharaohs, with a greater cultivable area than it had ever before. See (1) Harrow; (2) Harington; (3) W. Willcock, "The Nile Reservoir Dam at Assuan" (London 1903); (4) Willcocks and Craig, "Egyptian Irrigation" (London 1913) and Fowler, "Heightening of the Assuan Dam" (in 'Fortune in Egypt', New, 30 Sept. 1909).

ASSUMPTIS, in law, an action to recover a compensation in damages for non-performance of a simple contract; that is, a promise, whether verbal or written, not contained in a deed under seal. The word assumptis (Latin) means, he has undertaken, and was taken as the name of this action from its occurrence in declarations, that is, formal statements of the plaintiff's cause of action, when these were in Latin. Assumptis were of two kinds, express and implied; the former being where the contracts were actually made in word or writing; the latter being such as the law implies from the justice of the case; as, for instance, if one is employed to perform service or labor, the obvious justice of paying him a reasonable sum therefor when completed raises an implication, in law, of a promise to make such payment.

ASSUMPTION, a church festival celebrating the translation into heaven of the Virgin Mary, kept on 15 August. The legend first appeared in the 3d or 4th century, and the festival was instituted some three centuries later. The story has been made the subject of a number of paintings by the most celebrated artists in history. The following are the best known: (1) Titian: in the Accademia in Venice; represents the Virgin being carried on bright clouds to heaven, surrounded by rejoicing angels, while the apostles look up from earth in amazement; (2) Titian: another painting in the Cathedral of Verona; (3) Correggio: frescoes in the cathedral in Parma, Italy; (4) Rubens: painting in the cathedral at Antwerp, Belgium; representing the Virgin being carried to heaven, surrounded by angels, while several apostles and women are gathered at the empty tomb below; (5) Poussin: in the Accademia, in Florence; showing, in addition to the Virgin, four saints in the foreground; the representation of the Virgin is considered one of Perugino's most beautiful figures; (6) Guido Reni: a large canvas in Bridgewater House, in London; (7) Gaudenzio Ferrari: fresco in the Church of San Cristoforo, in Vercelli, Italy; showing figures of the Father, the Virgin, the angels and the apostles; (8) Murillo: painting in the Hermitage Museum, Petrograd; representing the Virgin floating.

ASSUMPTION, city in Paraguay. See ASUNCION.

ASSUR, aš-soor, chief god of the ancient Assyrians, who first created himself and then created all things. (See ASSYRIA). Also the name of the first capital of ancient Assyria, built on the western bank of the Tigris, 37 miles below its juncture with the upper Zab and near the modern Kalat Sherkat. It is referred to in the Bible (Gen. 11, 14). In 1903 extensive excavation was begun by the Deutsche Orient-Gesellschaft which has continued up to the present. Whole buildings, streets and quays along the ancient bed of the river have been laid bare and many objects of artistic and historical interest have been found. The city was destroyed in 605 B.C. by the Chaldeans. See (1) Martin, "Mitteilungen der deutschen Orient-Gesellschaft" (1903-14), Andre, "Die Festungswerke von Assur" (1913).

ASSURANCE. See INSURANCE.

ASSURANCE, Sisters of the, a teaching Order of Sisters in the Catholic Church, founded by Monsignor Aflre in Paris in 1839.

ASSURANIPAL, aš-soor-ibus-pa’il. See ASSYRIA; NINEVEH; SARRANAPALUS.

ASSUS. See ASSOS.

ASYNT, aš-ınt, a wild and rugged district of Scotland. There are inexhaustible quarries of marble, both white and variegated. Fresh-water lakes are numerous; the largest, Loch Assynt, is about seven miles in length and one mile in breadth.

ASYRIA (the Assur of the Hebrews, Ašur of the ancient Persians), the ancient name of a portion of Mesopotamia, lying mainly between the Euphrates and Tigris, and the seat of the earliest recorded monarchy. In the earliest times it was probably limited to the low-lying tract between the Jebel Makhlob and the little Zab (Zab-Asfal), on the left bank of the Tigris; but at its greatest extent Assyria must have been nearly 500 miles long, with an area of about 100,000 square miles. Toward the north Assyria bordered on the mountainous country of Armenia, which was at times under Assyrian dominion, but which at no time was considered as an actual part of the country. On the east dwelt numerous independent and warlike tribes, sheltered by the fastnesses of the Zagros Mountains. On the southeast Susiana or Elam was the frontier state east of the Tigris, while Babylonia occupied the same position between the rivers. Southwest of Assyria lay Arabia, and higher up Syria and the land of the Hittites. The chief cities of Assyria in the days of its greatest prosperity were Nineveh, whose site is marked by the mounds opposite Mosul (Nebi Yunus and Kuyunjik), Calah (or Kalakh, the modern Nimrud), Assur (or Kalah), Assur (or Assur, Kalat Sherkat), Sargina (Khora-
bad), Arbel (Arbil), etc. The surface of the country within its widest limits was of a diversified character. On the north and east the lofty mountain-ranges of Armenia and Kurdistan are succeeded by upland country. On the west and south is Mesopotamia, occasionally enclosing fertile plains and valleys. Immediately south of this is a well-watered, productive and undulating belt of country, into which run limestone rocks of a golden color and wooded with dwarf-oak. This sinks suddenly down upon the great Eastern desert: (the modern El Jezirah), about 250 miles in length, interrupted only by a single limestone range branching off from the Zagros Mountains across the plain. The numerous remains of ancient habitations show how thickly this vast flat must have once been peopled; now, for the most part, it is a mere wilderness.

History.—Scripture tells us that the early inhabitants of Assyria went from Babylon, and the traditions of later times, as well as inscription on the disintegrated Assyrian monuments, and the character of those remains go to show that the power and civilization of Babylon were earlier than those of Assyria. In Genesis x, 11 it is mentioned that Nineveh was founded by Nimrod, the great national deity, and to Anu and Adad, besides a temple to the goddess of Nineveh in the city of that name. The Assyrian rulers gradually began to treat with their southern neighbors on equal terms, the boundaries of the two countries were for a time clearly marked out, and intermarriages among the reigning families occasionally took place. About the latter end of the 14th century Shalmaneser I acquired the whole of Naharina (the country round the sources of the Euphrates and Tigris) by conquest, and planted Assyrian colonies there, and also founded the city of Calah or Kalakh and restored the great temple at Nineveh. About 1300 B.C. he was succeeded by his son Tukulti-Ninib I, who conquered the whole of the valley of Babylonia and restored the palace at the city of Assur. The five following reigns were occupied with wars, more or less successful, with the Babylonians. About the year 1107 B.C. Tiglath-pileser I, one of the most eminent of the sovereigns of the first Assyrian monarchy, ascended the throne, beginning his reign by the conquest of the Syrians and Hittites in the west. He then carried his arms far and wide, subjugating the Moschians, Commageneans, Urmurians and other tribes in the north; on the south he shattered the Babylonian power and took their capital. But this empire, acquired and ruled by the energy and genius of one man, began to fall to pieces at his death. The period of decline lasted over 200 years, during which time little is known of Assyrian history. Under Assurbanipal, who reigned from 884 to 858 B.C., Assyria once more advanced to the position of the leading power in the world. The extent of his kingdom was greater than that of Tiglath-pileser, and the magnificent palaces, temples and other buildings, which he erected, are still visible. The rich treasures, sculpture and paintings, proved that wealth, art and luxury must have reached a high stage of development. When he ascended the throne Nineveh was the capital of the kingdom, but he restored and beautified Calah, which had suffered during the troubled and declining years of the country, made it his favorite residence, and raised it to the dignity of the chief city of the state. Among the first acts of his reign was the suppression of a revolt by the Assyrian colonists of Naharina (883). This was followed by the victorious campaigns in Zambu on the east (882-881), against several rebellious provinces in the northwest (880), and against the Shukhi or Shuhites, who then occupied a tract of country between Babylonia and Assyria (679). In another expedition he crossed the Euphrates and advanced to the Mediterranean, near the mouth of the Orontes. In 858 Assur-imiral was succeeded by his son Shalmaneser II, whose career of conquest was equally successful. The closing years of his reign were troubled by the rebellion of his eldest son Assur-danapali, who had gained over to his side the cities of Nineveh, Assur, Arbel and other important towns. After much fighting the rebellion was put down by Shalmaneser's second son Shamshi-Adad V, who succeeded to the chief, and Shalmaneser's dynasty came to an end in the person of Assur-nirari V, who was driven from the throne by a usurper, Tiglath-pileser, in 745, after a struggle of some years. (See Assyriology). Tiglath-pileser IV was driven from his throne by another claimant named Shalmaneser V, (727). (See Assyriology). His successor was Sargon II (722-705). (See Assyriology). The attitude of Babylonia now began to look extremely dangerous. Merodach-baladan, a Chaldæan leader, taking advantage of the troubles which closed the reign of Tiglath-pileser, had possessed himself of Babylonia and held it for 12 years, strengthening himself by alliances with Egypt and the various rulers of Palestine. In 710 Merodach-baladan was driven out of Babylonia; in a single campaign the allies were crushed, Judah was overrun, and Ashdod leveled to the ground. Sargon spent the latter years of his reign in internal reforms, and in founding or beautifying several cities of his kingdom. A new capital, Assur, was founded to the north-northeast of Nineveh, now Khorsabad, the library of Calah was restored and enlarged, and special attention was devoted to law reform. In the midst of these labors Sargon was murdered, and was succeeded by Sennacherib, one of his younger sons, in 705.

No sooner was Sennacherib seated on the throne than he was compelled to take up arms against Merodach-baladan, who had again obtained possession of Babylon. In 701 fresh outbreaks in Syria led him in that direction. He first swept down on Sidon, the King fled to Cyprus, and Sennacherib seated Tubal on his empty throne. Next he deposed Zidqa of Askelon, and advanced against Ekron and Judah. The people of Ekron and dethroned Padi, their King, and gave him into the hands of Hezekiah, King of Judah. The Egyptian and Ethiopian forces advanced to the assistance of their Judean allies, but Sennacherib totally routed the confederates at Elteku, and he rapidly overran Judah, taking 46 of its fortified cities. Hezekiah now submitted and paid the conqueror a sum of 30 talents of gold and 800 talents of
silver. Padi was given up and restored to Ekron, and Sennacherib chastised the rebels. His expedition into Syria is one of the most memorable in the history of Assyria, and is briefly narrated in 2 Kings xxvii. 35. But his career of conquest was stopped by an appalling catastrophe: his army lay before Libna, when in one night the angel of Jehovah went out and smote in the camp of the Assyrians 185,000 men (2 Kings xxvii. 35). Sennacherib himself returned to Assyria, and occupied much of the last years of his reign in repressing the outbreaks of the Babylonians and Elamites, in constructing canals and aqueducts, and in entirely rebuilding Nineveh. In 681 he was murdered by his two sons, Adrammelech and Sharezer, but they soon found themselves confronted by a veteran army under Esarhaddon, their father's younger and favorite son, who defeated them in a battle at Khanigalbat, and assumed the crown (680).

See Assyriology.

Esarhaddon ruled vigorously for 12 years (680-668). (See Assyriology.) The King died the next year. At the climax of Assurbanipal's reign constant wars were beginning to exhaust the men and treasure of the empire; and luxury, which had flowed in suddenly like a flood, was conservatively curbed. The King now no longer appeared at the head of his army, but entrusted it to generals, and abandoned himself to indolence and sensuality. Assurbanipal was a zealous patron of the arts; learned men from all countries were welcomed to his court; and works were collected (Sources of all sources; the library of Nineveh was greatly augmented; the study of the dead language of Akkad was encouraged and dictionaries and grammars were compiled. The buildings were unrivalled for magnificence, his palace glittered with gold and silver and was adorned with the rarest sculptures. Unfortunately the King's character was marked by cruelty and sensuality, and his example descended through the court to the people. He died in 626 and was succeeded by his son Assur-etil-ilani under whom Babylon definitely threw off the Assyrian yoke. The country continued rapidly to decline, fighting hard for mere existence until, under its last king, Sin-shar-ishkun, Nineveh was captured and destroyed by the Medes in 605 B.C.

Ethnology, Language, Religion, etc.—The original inhabitants of Assyria and Babylonia are thought by some scholars to have belonged to that race variously called Turanian, Ural-Altaic, Scythian, or Tatar, and which appears at one time to have occupied the entire region from the Caucasus to the Indian Ocean, and from the Mediterranean to the delta of the Ganges. The ancient inhabitants of Babylonia, therefore, were possibly of the same stock as that from which the Finns, Turks and Magyars have descended; and their language, which has been preserved to us in inscriptions, and is known by the name of Sumerian, is allied to the Ugro-Bulgarian division of the Finnic group of languages. The Sumerian race descended from the mountainous region of Elam on the east, and the origin of Chaldean civilization and writing was due to them. In course of time, however, a Semitic race of people spread themselves over the country, mingled with or supplanted the original inhabitants, while their language took the place of the Sumerian, the latter becoming a dead language. Belonging to the Semitic family, these later Assyrians were thus members of the same great division of the human race as the Hebrews, Syrians, Phenicians, etc. But his career of conquest differed little from the Babylonian, which was characterized by a preference for the softer sounds and a fuller use of the vowels. Both languages retained traces of the influence of the earlier Sumerian. Assyrian is closely allied to Hebrew, which in its peculiarities of phonology, vocabulary and grammar, and some obscure points in Hebrew etymology have been cleared up by its aid. The language changed little throughout the 1,500 years during which we can trace its career in the recently deciphered inscriptions. It continued to be written with the cuneiform character down to the 3d century B.C. Assyria could boast of but little native literature; it was a land of warriors, and the peaceful arts had their home in Babylonia. It was not until the time of Assurbanipal that the arts were made to rival Babylon in learning. Their original works were for the first time composed, and treatises were composed even, in the dead Sumerian language. The greater part of the literature was composed in baked bricks, but papyrus was also used, although no books in this form have come down to us. The subjects of the Assyrian literature comprise hymns to the gods, mythological and epic poems and works on history, chronology, astrology, law, etc. (See Babylonian Literature). The Assyrian religion, like the language and arts, was in most essential points derived from Babylonia. There were the same gods, the same ceremonial and prayers, and even the temples had the same names. There is, however, in one point a notable difference. In addition to the worship of the Babylonian deities the Assyrians adored their national deity Assur, placing him at the head of the Pantheon. He was called king of all the chief gods, the god who created himself, and being supposed that he was self-existent and the creator of all things. After Assur come the 12 chief deities, Anu, god of heaven, ruler of angels and spirits; Bel, the father of the gods; Ea, king of the sea; Sin, or the Moon, lord of crowns; Shamash, or the Sun, judge of heaven and earth; Ninib, god of hunting; Nergal, god of war; Nusku, bestower of sceptres; Belitis, mother of the gods; Ishtar, leader of heaven and earth, and Bel, or Mero- dash, lord of Babylon. Most of those divinities had consorts, who were not, however, admitted to the first rank of the gods. Below this first rank was a number of spirits, good and evil, who presided over the minor operations of nature. There were set forms regulating the worship of all the gods and spirits, and prayers to each were inscribed on clay tablets with blanks for the names of the persons using them.

Art and Science, etc.—Although in art, as in other things, Assyria was the pupil of Babylon, there was yet a notable difference between its development in the two countries, due partly to two causes. The alabaster quarries scattered over the country supplied the Assyrians with a material inaccessible to their southern neighbors, on which they could represent, far better than the Babylonians on their enameled bricks,
ASSYRIOLOGY

the scenes which interested them. Sculpture was naturally developed by the one, just as painting was by the other, and the ornamentation which could be lavished on the exterior of buildings in Assyria had to be confined to the interior in Babylonia. The Assyrian artists, faithful and indefatigable, acquired a considerable power in representing the forms of men and animals, and produced vivid and striking scenes of the chief occupations of human life. If they did not strive greatly after the ideal, and never in this direction led to amalgamation, and in the primitive empires there was not even any attempt at that governmental centralization which we find at a later period in the satrapal system of Persia. The Assyrian monarchs reigned over a number of petty kings, the native rulers of the several countries, over the whole extent of their dominions. These native princes were feudatories of the Great Monarch, holding their crowns from him by the double tenure of homage and tribute. This system naturally led to the frequent outbreak of troubles as shared in the system of Cuneiform Writing; Nineveh; Nippur.

Bibliography.—Botta and Fladlin, 'Monuments de Ninive' (1847-50); Layard, 'Nineveh and its Remains' (1849); Oppert, 'Histoire des Empires de Chaldee et d'Assyrie' (1852); George Smith, 'Assyrian Discoveries'; 'Assyria'; and 'The Assyrian Eponym, (1875); Sayce, 'Ancient Empires of the East' (1884); his 'Assyria'; its Princes, Priests and People' (1885), and his 'Fresh Light from the Ancient Monuments' (1886); Jastrow, 'Religion of Babylon and Assyria' (1898); Maspero, 'The Dawn of Civilization' (1894), etc. See Assyriology for detailed bibliography.

IRA MAURICE PRICE, Professor of Semitic Languages and Literatures, University of Chicago.

ASSYRIOLOGY. Assyriology may be defined as that department of study and investigation which embraces within its realm the country, people, languages, literature and history of ancient Mesopotamia, Babylonia and so much of adjourning countries as shared in the life of the Semitic valley-peoples prior to 538 B.C. The term is often popularly employed to cover a study of those languages written in the cuneiform script, or their immediate antecedents, the linear and picture scripts, of the cuneiform language, the cuneiform writing, current in primeval times in this great river valley. Such a delimitation of our theme would include a study of early Babylon, Assyria, somewhat of Elam and somewhat of later Persia, and slightly of the Greek period. Assyriology, therefore, deals with an antiquity which was centred in the great Babylonian Valley, and embodied in the cuneiform languages.

Age.—This is a comparatively new department of research. It has been built up upon the basis of the discovery of antiquities which have been made during the last three-quarters of a century in the countries tributary to the Persian Gulf. The tentacles of this department reach out into every phase of ancient Oriental life and knowledge, and require of the modern investigator a comparatively comprehensive understanding of the complexities of that primitive life. This department includes in its sphere some of the most important of all branches of ancient lore. Among these we note especially Semitic philology, general archaeology, architecture, sculpture, history, legend, so-called

comet, the polar star, the conjunction of the sun and moon and motions of Venus and Mars. The study of mathematics was fairly advanced, and the people who were acquainted with the sundial, the clepsydra, the pulley and the lever must have had considerable knowledge of mechanics. See Assyriology.

Government.—Like all the ancient monarchies which attained to any considerable extent, Assyria was composed of a number of separate kingdoms. In the East conquest was very seldom led by the king, yet even here their emblematic figures of the gods have a dignity and grandeur which implies the possession of some elevated feelings. But their grand merit is in the representation of the real. Their scenes of war and of the chase, and even sometimes of the more peaceful incidents of life, have a fidelity, boldness and lifelike appearance which place them high among the realistic schools. Unlike that of the Egyptians, which remained comparatively stationary from the earliest to the latest age and art of the Assyrians, this was progressive, becoming gradually more natural and less uncouth, more lifelike and less stiff, more varied and less conventional. It may be said to have reached its highest stage of development in the reign of Assurbanipal, when it was characterized by great chasteness and softness, delicacy and finish. The beginning of Greek art coincides with the decadence of the Assyrian, and there can be no doubt that the Hellenic artists owe much to their Assyrian predecessors. The advanced condition of the Assyrians in various other respects is sufficiently evidenced by the representations on the sculptures and by the remains discovered among their ruined buildings. We now know that they understood and applied the arch; that they constructed tunnels, aqueducts and drains; that they used the lever and the roller; that they engraved gems in a highly artistic way; that they understood the arts of inlaying, enamelling and overlaying with metals; that they manufactured porcelain and transparent and colored glass; and were acquainted with the lens; that they possessed vases, jars and other dishes, bronze and ivory ornaments, bells, gold earrings and bracelets of excellent design and workmanship. Their homes were so well adapted to the practical and their skill, taste, minuteness and accuracy. The cities of Nineveh, Assur and Arbela had each its royal observatory, superintended by an astronomer-royal, who had to send in his report to the king twice a month. At an early date the stars were numbered and named; a calendar was formed, in which the year was divided into 12 months (of 30 days each) called after the zodiacal signs, but as this division was found to be inaccurate an intercalary month was added every six years. The week was divided into seven days, the seventh being a day of rest; the day was divided into 12 casbu of two hours each, each casbu being subdivided into 60 minutes, and these again into 60 seconds. Eclipses were recorded from a very remote epoch, and their determination was the principal astronomical work, called the 'Illumination of Bel,' was compiled for the library of Sargon of Agade; it was inscribed on 70 tablets, and went through numerous editions, one of the latest being in the British Museum. It treats, among other things, on observations of
assyriology

science, and religion. Assyriology has already taken its place as one of the great departments of human knowledge and research. The results of its investigations must now be reckoned with in any estimate of early Semitic legends, traditions or history. Its importance to the student of the Old Testament is assuming greater proportions with each old site overturned by the spade of the excavator. The great museums of Europe and America count among their chief treasures the magnificent colossal, bas-reliefs, slabs, statues and tablets that belong to the department of Assyriology.

Names.—The oldest of the governments represented in Assyriology is that centred in the Babylonian Valley. Its earliest known mention at the beginning of the last century was that found in Genesis x, 10, where the beginning of the kingdom of Nimrod is said to have been Babel (Hebrew, בֵּבֵל), probably the city of Babylon, in the land of Shinar (Hebrew, שִׁינָר), a name for lower Babylonia. In post-exilic times the country was designated Chaldea, or "land of the Chaldeans" (Hebrew, שִׂנְאַר, צַדְיָה), Ezek. i, 3. Classical writers named this country after Babylon, that metropolitan city of their day, Babylonia, and this name has been transferred to it down to the present time.

The next great country covered by Assyriology is Assyria. The Hebrews called it (Gen. x, 11) Asshur (אֲשֻׂר), either the name of a personage, of a city or of a country, probably the last. The transmitters of the Septuagint called it αὐσθορ and οὐσθορία, while Josephus, a couple of centuries later, refers to it as Αὔσθορία. The Arameans named it Atur, or Aturriya, the Persians Arshārād.

Boundaries.—The territory covered by ancient Babylonia was delimited on the west by the Arabian Desert, on the south by the Persian Gulf and Arabian Desert, on the east by Elamite territory backed up by the Zagros Mountains, and on the north by the uplands of Assyria. Assyria proper, in its primitive period, was delimited on the east by the mountains of Kurdistan, on the north by those of Armenia, on the south by Babylonia, with an ever-shifting boundary line, and on the west by the western limits of the Tigris Valley and plain. In a word, Assyria was a constantly seated in the upper Tigris Valley, in possession of several great city-centres.

These two important countries were thus largely guarded by nature from foes on the south and southwest, but we were always open to the intrigues of invaders from the east, north or northwest. The historical records of these lands confirm this statement.

Description.—The great valley of Babylonia derives its marvelous fertility from its two main rivers, the Tigris and Euphrates. Both have their rise in the mountains of Armenia, and both have their debouchement in the Persian Gulf. The Tigris, from its source, flows in a southeasterly and southerly direction, cutting through the uplands of Assyria, and along the valley of the Euphrates begins gradually mingling with the waters of the Euphrates, it falls into the Persian Gulf. The Euphrates, from its source, flows toward the southwest and bends southward within 100 miles of the Mediterranean Sea, and thence in general toward the southeast and south until, in union with the Tigris, it pours into the same gulf. These two arterial streams are the life of this great lower valley. By irrigation they were made to fertilize all their adjacent lands, and thus placed these among the richest countries on earth. In addition to water these streams bring annually from the mountains of Armenia great quantities of alluvium and deposit it in the lower valley. Geologists estimate that the shores of the Persian Gulf have been pushed southward, by deposits of this alluvium, fully 125 miles since the earliest periods of Babylonian history. In other words, the Tigris and Euphrates rivers that now enter the Gulf as one stream forming a vast morass, formerly had separate mouths, about 125 miles north-northwest of their present outlet. If this estimate be correct, the ancient Ur of the Chaldees (modern Mekheir) was practically a seaport city. The Tigris, being the shorter river, has a very swift current, and is less valuable for navigation than the Euphrates. Upon this latter stream vessels of profitable draft may ride to a distance of 800 miles above its mouth. Of the territory watered by the Balikh and Khabur, two rivers that flow southward, emptying into the Euphrates above the site of ancient Babylon. The region of Babylonia proper, though a waste to-day, shows evidences of having supported a dense population in antiquity.

References to Ancient Peoples.—Present-day students and scholars inferred from frequent references in the Old Testament and in the compiled works of Berosus, Manetho, Josephus and others that this valley had been the headquarters of mighty nations. Classical writers carry echoes of an ancient glory won by great armies and powerful monarchs from the East, whose records were otherwise unknown, and whose mighty deeds seemed as unreal as fiction. The rise, conquest and reign of these giant figures aroused the enthusiasm of every student of ancient history. The far-reaching influence and power over neighboring kings of these monarchs, dimly outlined in the vague second-hand records, set scholars to work. It drove them to search far and wide for other traces of peoples who had completely perished from the face of the earth, and who had, so far as they could see, left no story of their achievements. The reports of travelers, often passed through and spent some time in those countries attracted their attention.

Ancient Remains.—The entire territory drained by the two great rivers, Tigris and Euphrates, was found to be dotted by extensive mounds, ruins of ancient walls, piles of disintegrating towers, beds of ancient irrigating canals and other marks of a once elaborate civilization. Travelers had often picked up near these mounds little bits of antiquities, bricks, tablets and cylinder seals, that carried on their surfaces many curious wedge-shaped characters, which they regarded either as writing or ornamentation. These miscellaneous curios were thought to represent the civilizations of an unknown past, of peoples who occupied this territory in ancient times, or perhaps the ruins of cities and fruitful fields filled by this great valley.

Earliest Excavations.—The first persons to take an active interest in the ruins of Babylonia and Assyria were Englishmen resident as government officials in some one of the chief modern cities of that country. C. J. Rich, a resident of Bagdad (1806-21), carefully ex-
amined and described several mounds, and some inscriptions, in small works published during his residence. These attracted considerable attention. But the first systematic excavations within this valley were undertaken by P. E. Bolt, a French consul at the time in Mosul, a modern city of some commercial and political importance on the upper Tigris River, in 1842-45. He began work on the colossal mounds opposite Mosul, on the east bank of the Tigris River; but had little success until he transferred his force to the mound Khorsabad, about 14 miles north-northeast of the first site. Khorsabad proved to be an immense treasure-house of antiquities. Here he uncovered the stupendous royal palace which later proved to be that of Sargon II (722-705 B.C.), with a mass of inscriptions and antiquities of various kinds. This splendid find was greeted with enthusiasm by the scholarly world, and set minds to thinking and wills to acting to uncover other antiquities of such a magnificent past. In 1845-47, A. H. Layard, an Englishman, began to dig at Nimroud, the ancient Calah, a mound about 20 miles south of Mosul, on the east bank of the Tigris. Persevering through almost insurmountable difficulties, Layard, with the aid of E. de Sarzec, managed in bringing to light the palaces of Assurnasirpal (884-858 B.C.), Shalmaneser III (858-823 B.C.) and Esarhaddon (680-668 B.C.). In 1849-51 this same intrepid excavator burrowed into the mound Kuyunjik on the mound of ancient Nineveh, and laid bare two more great palaces, that of Sennacherib (705-680 B.C.), and that of Assurbanipal (668-626 B.C.). Botta's finds, so far as transportable, were taken to Paris and deposited in the Museum of the Louvre; those of Layard to the British Museum in London, but the largest objects were again buried for their better preservation.

In this same period, Hormuzd Rassam, trained under Layard, made some valuable discoveries (1851-54) at Kuyunjik for the English and Victor Place at Khorsabad and Fuggle Frensel and Jules Oppert at Hillah for the French. In most of the work undertaken by the English, Henry C. Rawlinson was a close adviser and an enthusiastic promoter.

The period 1850-73 (1854-73) were a period of cessation of excavations of any note. An occasional traveler or explorer found a few specimens of antiquities and did a little desultory work. This 20 years, however, saw the publication of many notable works by Batta, Layard, Place, Oppert and Rawlinson on the results of the active work of excavating and of the decipherment of inscriptions previously gathered out of the mounds. The second period of excavations began in 1873, when George Smith of the British Museum, who had found some fragments of tablets describing a deluge, was sent by the London Daily Telegraph to the site of ancient Nineveh to find other fragments of the same kind. Smith's phenomenal success in finding Assurbanipal's 30,000-tablet library gave new life to archaeological research, and was the immediate cause of his being sent on three expeditions, on the last of which he succumbed to a fever at Aleppo 19 Aug. 1875. Smith's genius had prepared the way for others. A steady flow of the important discoveries made by himself and others that the contagion spread, and other centres of scholarship turned their eyes toward the mounds of Babylonia and Assyria. Rassam was again called into requisition, and in 1877-78 gathered rich spoils on the site of old Nineveh, at Nimrud, and at Balawat, where he found the remains of the bronze doors of Shalmaneser III (858-823 B.C.). In 1878-80 and 1880-81 he also found valuable relics on Babylonian ground.

From 1877 to the present day the French government has conducted excavations intermittingly at Tellich, in lower Babylonia; for more than 23 years he transferred his forces to the mound of E. de Sarzec, and since that date under Commandant G. Cros. This mound has yielded a rich store of antiquities, consisting of many thousands of tablets, of several beautiful diorite statues, of friezes, of palace plans, and of cylinders, many of which are deposited and mounted in the superb collection in the Louvre in Paris. These represent the remains of the old Sumerian civilization of the 3d and 4th millennium B.C. The accompanying illustration presents two views of part of the mound Tellich, where such notable discoveries have been made. The same government inaugurated and carried on excavations at Susa under M. and Mme. Dieulafoy (1884-86); and latterly under M. J. de Morgan. M. laboratories have opened up new volumes on the history of ancient Elam and its relations to adjoining countries.

A few broad-minded gentlemen, under the leadership of W. E. Clark, of Philadelphia, provided the means for the organization and prosecution of an expedition to Babylonia under the auspices of the University of Pennsylvania. This expedition was duly organized and equipped and prosecuted under the direction of John P. Peters, during 1888-90 at the mound Niffer, about 30 miles southeast of Babylon. Since that time the same institution has carried on work intermittently on this site, under supervision of H. V. Hilprecht, and, for the most part, under the directorship of John Henry Haynes, and has brought to light thousands of inscriptions and other antiquities. These have made the University of Pennsylvania the richest Babylonian-Assyrian museum in America in antiquities of both the Sumerian and Semitic population of early Babylonia.

Beginning with the year 1897, many archaeologists under the leadership of Robert Koldewey have carried on extensive excavations on the site of old Babylon and the old city of Ashur. The full results of their activity are being published in beautifully illustrated volumes and series of texts. In 1903 the Oriental Exploration Fund of the University of Chicago was organized, and an expedition sent out under the direction of Robert Francis Harper, and under the field directorship of Edgar James Banks, to excavate on the old site Bismya, in lower Babylonia. The first season's work justified the hope that this might prove to be a fruitful mound, belonging to a high antiquity. The old city proved to be the ancient Adab, and the many antiquities uncovered, including a famous statue, now in the Imperial Ottoman Museum at Constantinople, to belong to the 3d millennium B.C.

Outside of Babylonia proper, some notable discoveries of cuneiform inscriptions have been made by explorers. A stele found in the Island of Cyprus in 1845. There were found at Tel-el-Amarna, in Egypt, in 1887, more than 300 cuneiform tablets, which proved
to be correspondence between the kings of Egypt and their Asiatic underlords and rulers in the 15th century B.C. Even Palestine has produced some in its excavated cities. Luschan found at Zjinjirli, Asia Minor, among a host of Hittite antiquities, a statuette and inscription of Esarhaddon (680-668 B.C.). And the Germans under the leadership of Hugo Winckler brought to light at Bogaz-Keui a splendid collection of cuneiform tablets, in Sumerian, Babylonian and the Hittite languages (first reported in 1906).

Decipherment of Inscriptions.—The neat little wedge-shaped characters, put together in so many combinations to form individual signs, very early attracted the genius of the linguist. As early as 1801, Grotefend, a German, discovered the significance of some of the old Persian cuneiform characters; and other scholars, following in his wake, likewise made some advance in identification of those old characters. But the long and sure step ahead was not made until Henry C. Rawlinson, the Englishman, took up the problem. As an officer in the Persian army about 1835, he had unusual facilities for examining ancient ruins in that country. He observed at Behistun, in the Zagros Mountains, a rock stretching up almost 1,700 feet above the plain, and at about 350 feet above its base a large space carefully smoothed off. Upon this space was inscribed a mass of writing, distributed in several columns of varying lengths. After years of toil at intervals, he succeeded in copying the entire set. In a study of them he found that they contained three languages. The first, the Old Persian, through his knowledge of modern Persian and other related tongues, after years of study, he was able to decipher, and sent his translation to London, where, in 1847, it was published in the Journal of the Royal Asiatic Society. Rawlinson's success was epochal, for it broke the seal into the hidden treasures of the cuneiform languages of Babylonia. His decipherment of one of the trilingual inscriptions opened the door into the next, the Susian or Elamite. These two being deciphered, scholars were soon able to penetrate the mysteries of the third language, the Babylonian-Assyrian.

These triumphs extended, roughly, over the years 1845-55. In 1857 the British Museum made the test of giving to the Assyrian tongue. Four men, H. C. Rawlinson, Edward Hincks, Jules Oppert and H. F. Talbot, were given a fine copy of a long historical inscription of Tiglath-pileser I (ca. 1107 B.C.), and were requested each to make an independent translation of the text and report on their results. At a given time these scholars reported; and to the amazement, one should say, of all concerned, their translations were in substantial agreement from first to last. This was the crowning triumph of all in the eyes of other departments of learning. It showed that the riddle had been solved, that the Babylonian Valley would henceforth speak for itself through its multitudes of ancient records.

Furthermore, this triumph of philology succeeded in bringing to light many ancient nations some of the most powerful of peoples. Babylonia, Assyria and Elam henceforth became the early home of vigorous nations, well-organized governments, conquering armies and world-wide rulers. The ruin-covered wastes were suddenly transformed into fertile fields and prosperous cities, occupied by peoples whose influence touched the horizon of civilization in every direction. In short, this triumph of philology opened a door to a new world in southwestern Asia, prior to, and contemporaneous with, the times of the Hebrew kingdom.

Language.—The language in which this new-old material is preserved is the so-called Babylonian-Assyrian written tongue. Even though the Old Persian is alphabetic, the Babylonian-Assyrian is a sign and syllabic tongue. Each separate wedge (\(\text{\textbullet}\)), or each combination of wedges (\(\text{\textbullet}\)), constitutes a sign. This language was written by pressing the wedges with an instrument into clay or cutting them into stone or metal, for they never appear in relief. The primitive signs were probably rude pictures, which gradually grew through use into the form of curved and straight lines; these lines soon took on the artistic form of wedges. This evolution is seen in the fact that a large number of the signs possess merely an ideographic value; for example, we find a sign for the idea "land" (\(\text{\textbullet}\)), "sun" (\(\text{\textbullet}\)), "male" (\(\text{\textbullet}\)), "female" (\(\text{\textbullet}\)), "fish" (\(\text{\textbullet}\)), "king," etc. Some of these signs also possess a syllabic value, as da, ra, la, mat, lak, rid, sun, pad, etc. Quite a number possess several syllabic values, the context being the reader's only guide as to which should be used in any given case. The reader's troubles are still more aggravated by the fact that the same sign sometimes has both ideographic and syllabic values. In this, as in the preceding case, the reader's skill must find in the context the reason for the reading which he should adopt.

There are about 600 independent and entirely distinct signs formed by combinations of anywhere from two to 30 wedges set together at different angles, or paralleled, or inserted within other combinations. But the great difficulties arise when we find that there were almost numberless combinations of anywhere from two to six different ideographic signs to express other and often very different ideas. There are full 20,000 such combinations known to-day to Assyriologists.

The number of inscriptions, small and large, discovered in Babylonia up to the present, is about 30,000. The French alone found in one library 30,000; and at Nippur the University of Pennsylvania secured 20,000, all large aids in our quest.

This Babylonian-Assyrian language is Semitic in character, though its soil is thought, by most English, German and French scholars, to be a non-Semitic tongue, the so-called Semitic, in which most of the valuable finds made by the French at Telloh are written, and some of the inscriptions found at Nippur. The Babylonian-Assyrian was borrowed to the Hebrew of the Old Testament, and has already proved its real value in the interpretation of that book. See SYRIA.

The People.—The peoples best known to Assyriology are Semites. The primitive inhabitants of Babylonia, the predecessors of the Semitic population of Babylonia and Assyria, were probably a mixture of various nationalities, with the Semarians in the lead. Whence the Semarians or Semites came has not been positively ascertained. The Semites were in the

ASSYRILOGY

land by 4,000 B.C. Side by side they lived and amalgamated in succeeding years. These Sumerians were the predecessors and probably for a long time the contemporaries of the Semites, the lineal forebears of the independent Semitic language of those countries. We know, at least, from inscriptions found at Nippur, that the Semitic language was in use in Babylonia as early as the 4th millennium B.C. The population of Babylonia and Assyria in later historic times was Semitic. Their location made them warriors, for they had to be perpetually on the defense. The Babylonians cultivated the peaceful arts and were wide awake to the best things of life in their time and day. The Assyrians, on the other hand, built up an engine of warfare, a tremendous military machine, that, under powerful leaders, beat down and overthrew nations on every hand. Someone has compared Babylonia and Assyria to Greece and Rome respectively, as fostering and furthering different elements of national life and character.

The Civilization.—One of the marvels of these ancient peoples was their advancement in all that counts for civilization. Their governments were centralized and powerful. They maintained standing armies for their immediate protection. Their civil courts were provided with ample laws for the regulation of society and of trade. Their cities were advantageously built, and surrounded with walls of a magnitude sufficient to withstand any ordinary attack. Their schools were carefully fostered and occupied a first place in their peaceful life. They cultivated the arts with assiduity and attained a notable degree of perfection in some lines. Their architecture and sculpture, their language and literature, are marks of a people high in the scale of Oriental civilization. Of religious ritual and all its accompaniments and organization, we have a detailed description, which exhibits this as a favorite side of that early Sumerian and Semitic life. Their industry and trade activities were such as to place them in the front rank of commercial peoples. Their amusements and sports were of that adventurous and daring kind that became noted in these cities, and character found only among a hardy and vigorous people. Their political and commercial relations with their neighbors were such as mark an advanced stage in cordial international affairs. Their methods of warfare, and their treatment of their subjects, while often cruel and inhuman, were distinguished by a high grade of intelligence, and more than ordinary genius (cf. ASSYRIA)

Natural Resources.—The vastness and barrenness of modern Babylonia give little intimation of its early resources. Its flora was quite varied and useful. Its plains were plentifully supplied with fruit trees of various kinds, such as fig-, olive-, date-, palm-, vine- and various nut-trees. On the mountain sides were found the oak, plane and pine trees of different varieties. By cultivation the land produced wheat, barley, sesame, millet, hemp and other cereals and articles of commerce. The date-palm was their universal utility article, for from it they seem to have obtained almost everything, from vinegar, wine and raw material for wickerwork. The reed that grew with such luxuriance on the banks of the rivers and canals was utilized for a number of purposes. It served for build-ing huts, weaving mats and for boat-building, and for layering mortar in the construction of walls.

The absence of stone and minerals in the basin of the valley was partially compensated for by their proximity to the mountains on the north and east, though clay bricks, sun-dried and burnt, were always their chief building material. When marble, alabaster, diorite or any of the precious metals were used they were brought either from the mountains near by or from distant lands. Stone was used for colossi, statues, wall decorations, bas-reliefs and some inscriptions. The precious metals were employed for making jewelry, ornaments, serviceable utensils, decorations on buildings and gates and for tablets upon which inscriptions were engraved.

The list of the fauna of the country is made quite complete by the pictures found on the walls of the old palaces a. German, and the catalogues of names preserved in their literature. These reveal to us a great variety of valuable animals. Among them we find the lion, the favorite game hunted by kings, the panther, the wild ox, the fox, the wild boar, wild asses and camels—expected, with standing armies for their immediate protection. There were also several kinds of gazelles and antelopes that played about on the border hills and mountains. Of domestic animals, there were the horse in later times, the ass, the camel, the cow, sheep, goat and dog. Of wild birds, the inscriptions mention most frequently the eagle and the owl; also the swallow, dove, raven, geese and other waterfowls.

Cities.—There is no more notable index of a great people than the number and magnitude of its great cities. Babylonia-Assyria, through the decipherment of the monuments, is seen to have been well dotted over with prosperous cities. Beginning in the south and proceeding northward, we find in that ancient day, Adab, Eredu, Ur, Erech, Larsa, Lagash, Nisir, Nippur, Borsippa, Babylon, Cutha, Sippar and Agade (!)—all famous cities in the Babylonian kingdoms and empires of four millenniums ago. The earliest civilization of that valley was centered in the vicinity of which these cities had been originally capitals of districts. There are other mounds in considerable quantity that have not been identified, but which doubtless cover still other cities that played an important role in the life of early Babylonia.

As we advance into the territory occupied by Assyria great cities present themselves in a formidable array. The ancient mother city of Assyria was Assur, located on the right bank of the Tigris, near the modern Kaldi Shekali, recently excavated by the British. As we pass up the Tigris River of that day the next city of importance that one meets is Calah, or Nimrud, on the left bank of the river, just above the junction with the Tigris of the Upper Zab River. This was a palatial city, first unearthed by Layard, and then by Rassam, containing at least three royal palaces already mentioned. Off to the east of Calah, on the east bank of the Upper Zab, was Arbela, a city of minor importance. Nineveh, whose mounds stand on the eastern brim of the Tigris, was the modern Mosul, was a very ancient city. The small stream or river Khosr, passing between the two great mounds Kuyunjik and Nebi Yunus, that represent the remains of
Nineveh, empires into the Tigris. Sargon II (722-705 B.C.) built for himself at Khorsabad, north of Nineveh, a veritable royal city, the most magnificent building reproduced by excavation, and even by the imagination, was the palace, uncovered by Botta and Place. It was, Dur-Sargina, "the wall or fortress of Sargon," designates sufficiently its significance for his reign. To the southeast of Nineveh we find another city of especial significance in the region of Shalmaneser III (858-823 B.C.), Imgur-Bel, on the site of the modern Balawat. Adjacent to this valley were such mighty cities and fortresses as Susa in Elam and Harran in upper Mesopotamia, and Carchemish, which the British have partially excavated within the past five years, with other cities on its western frontier—all evidence of the thrift and permanency of the civilization of 3,000 and 4,000 years ago.

Architecture.—The buildings of Babylonia-Assyria were modified architecturally, no doubt, by the character of the material accessible for their construction. Throughout this entire valley the absence of stone led to the use of clay bricks in sun- and kiln-dried, for building maquereuns. This, of course, necessitated a plain-ness of form that admitted of little exterior decoration. The walls were often built very thickly, of sun-dried, with a veneer of kiln-dried, bricks. This veneer was a protection against the ravages of the weather and the depredations of robbers, who could readily dig through a wall merely of sun-dried bricks. The strength of a sun-dried brick wall was sometimes increased by inserting between the courses of bricks, layers of reeds. The entire structure was built on an artificially raised mound, primarily to lift the building above the danger of the overflows of the rivers, but later apparently because of the age-long custom of placing it on an eminence. The entrances to the palaces and temples were usually guarded by great monolithic colossi, human-headed bulls or lions, standing on either side and facing outward. Within were courts of different sizes that served the royal personages or their attendants. In immediate connection with each palace or group of royal buildings, particularly in Babylonia, was the tower or temple. It was a structure that towered above everything else, and rose from its base to its summit in a series of stages, sometimes seven, or steps, by which one ascended. On the top of this massive pile one would find the image of the god held in particular reverence, or to whom the tower was dedicated. There are several remains of these sacred structures found in Babylonia today. Their ability to withstand the ravages of time is due to the hard burnt bricks with which they were constructed. The remains of the tower at Mugheir, the ancient "Ur of the Chaldees," was built, according to its present indication, upon a platform 20 feet above the plain; its base was a parallelogram about 200 feet by 135 feet.

One of the niceties of these constructions was their adaptation to the necessities and comforts of the people. There was an admirable system of drainage, a general one that embodied some of the best principles of modern sanitation. The arch contributed no little to the construction of some of the primitive royal buildings of the 20th century B.C. (cf. ASSYRIA).

Sculpture, Engraving, etc.—The most precious contents of the temples and palaces were the statues of the gods and kings, respectively. They are among the most imposing and beautiful monuments of the Babylonian-Assyrian peoples. These works of art were often chiseled out of diorite, as those found by the French at Telshô; of alabaster, as many of the giant colossi, or out of a basaltic rock, or black marble. The sculptors, even as far back as 3000 B.C., executed some wonderful work. Even more striking and complicated were their bas-reliefs, found so numerous on the walls of the palaces of the Assyrian kings. In this species of art there is often superb genius displayed in the introduction of many figures, of warriors, war-chariots, cavalry charges, battle scenes, sieges and captures of cities, and divinities of various grades. But in all these representations the modern student must not be disconcerted because of the lack of perspective. This is one of the characteristics of all early relief work and painting, and must be reckoned with in our study of those times. Besides the large and imposing works of art, there were numerous small objects that occupied large attention and revealed some real artistic skill. There were the silver vases of the time of Entemena (about 2900 B.C.), ivory objects showing exquisite workmanship, gold ornaments, cylinder seals reaching back to 4000 B.C., of many precious stones whose intaglio work would be a credit to this day. The method of executing such fine work on the hardest of precious stones is still a puzzle to modern engravers. The decorations of Assyrian and Persian palaces include also painting, though of a kind that reveals more crudeness than the specimens of the engraver's art.

Literature.—The discoveries of the last three-quarters of a century have opened for us the doors to a new library of ancient Oriental literature. These clay and alabaster volumes cover a large range of subjects, and treat them in a manner entirely unique. The first that attracted attention was, of course, the immense amount of historical matter, found mainly in the ruins of Assyria. Another large element in these tablets, particularly in Babylonia, is the poetry, pure Semitic poetry, or interleaved with so-called Accadian or Sumerian poetry, whose character is determined by the presence of parallel members. This poetry contains hymns to the gods, penitential psalms, incantations, magical formulae, and even epics of surprising strength. Examples of this poetry in Assyria were copied from Babylonian originals, as Assyria was notably weak in its literary ability. Then there are legends, mythology and popular treatments of technical subjects. We find also treatises that are geographical, biological, geological; tablets that are commercial in character, recording loans, deeds, rents and trades; long lists of matter that is purely linguistic, for it deals with signs and their values; a codified system of laws that touched almost every complication in the complexities of Babylonian life; letters, domestic and international, relating to many customs of the nation and their foreign relationships and authority.

Myth and Legend.—The poems that are sometimes called epic, in the literature of Babylonia, are based upon events that are usually
 Assyriology 437
termed mythical. The epic and mythical ele-
ments are so thoroughly commingled that the
total narrative may be termed mythological.
The scenes depicted are those between gods and
gods, or gods and men, and between
gods and the animals and plants, and between
gods and the weather. The most famous stories
classified as mythology are the so-called creation epic,
the epic of Gilgamesh, of the eleventh tablet or
poem in the Babylonian story of the deluge.
There are several legends and poems and stories
which have received careful study in recent years,
whose matter is arranged on the
customary Babylonian poetical plan. Some of
these are, the ascent of Ishtar into the world
of departed spirits, the Nattar legend, the
Adapa and Etana legends, and legends of va-
rious gods. Some of these entertaining literary
stories take their place for real merit and in-
terest beside the best legendary lore of ancient
Greek. Their archaeological value is often consi-
niderable, and the information about the religious life
of Babylonia-Assyria is irreplaceable.
Religion.—The primitive religion of Baby-
lonia was doubtless the worship of the different
powers of nature. These became personified and
everything that took place in the world was
attributed to the action of the particu-
lar god, who stood above man in the scale of
being, and executed all movements in the es-
special sphere where he was supreme. The re-
presentatives of these deities on the monuments
are seen sometimes to be men, and at other
times to be part man and part beast and bird.
Those in the form of men possessed attributes
like, but far superior to, man. Since they rep-
resented different powers in nature, none of
them was all-powerful. Their functions lay in
special lines, and for these they were wor-
shipped. In Assyria the gods as a whole were
practically borrowed from Babylonia. But
Assur, the great divinity of Assyria, stood
alone, unique in all the Mesopotamian pantheon
and supreme in Assyria. The chief gods of
Babylonia, those that were supreme in its
pantheon, were three, Anu, the god of heaven;
Bel, the god of the earth, and Ea, the god of
the abyss and of secret knowledge. These great
gods were represented as the source of reg-
ulated light and the weather, namely, Shamash,
the sun-god, Sin, the moon-god, and Ramman
or Adad, the weather-god. These six divinities
were localized, in that each was the patron deity
of some city. For example, Anu was the patron
deity of Erech, Bel of Nippur, Ea of Eridu,
Shamash of Larsa and Sippur, and Sin of Ur
(of the Chaldees). There is a long list of other
gods and goddesses who were doubtless
related to the chief triads, but up to the pres-
tent time these relations cannot be
determined. Slightly aside from the lists al-
ready named we find the great goddess Ishtar,
one of whose feats is described in the legend
'Descent of Ishtar.'
Worship.—The cities of Babylonia-Assyria
were well supplied with temples in which the
gods were devotedly and assiduously wor-
shipped. Indeed, this worship was an essential
element in the life of the Babylonians, to a
great extent. For example, the temples
were the most elaborate buildings of Babylonia,
and were under the immediate direc-
tion of the priesthood, the most powerful class of
men, next to the king, in the nation. Baby-
lonian inscriptions, particularly, enumerate
many temples in the chief cities that were dedi-
cated to the patron deity of each several city.
Each temple had an organization of official
priests, whose duties included the preservation
and propagation of the worship of the god of
that temple, and the ritual and traditions thereof.
The king was the great overlord or guardian
of the temple, and spared no means to keep it
in a thoroughly good state of preservation and
to increase its popular and political influence.
The support of the priesthood was provided for
by revenues produced by the lands attached to
the temple, or belonging thereto, supple-
mented by regular offerings. These priests, as
those in Egypt, were the most influential men
in the kingdom, for they controlled the religious
life of the community and had no small part
in the affairs of political and civil life. They
were probably the best educated men in the
nation, and by their learning filled the offices
that required a somewhat broad training, such
as scribes, historians and librarians.
The regular duties of the priests in connec-
tion with the temple service were (1) to offici-
cate at all the regularly appointed services of
the temple, including the regular set-feasts, and (2)
to carry out the worshipful desires of any individual worshipper.
The minutiae of conditions regnant in temple service are voluminous and touch almost every condi-
tion of life. Some of the incantations and
prayers, already referred to, preserve the peti-
tions that must be recited by the supplicant.
Other tablets enumerate the great variety of
offerings that must be presented to the gods
to secure their good-will and blessings. The
multiplicity of such requirements easily kept
an army of priests busy in the great temples of
the principal cities of Babylonia-Assyria.
Sources of Babylonian-Assyrian History.
—Before the excavations of the last 75 years in
the ruins of Babylonia-Assyria, the two main
sources of the history of the peoples and coun-
try in our theme were (1) the books of the Old
Testament, and (2) the second-hand narratives
of Berosus, Manetho and Josephus, with a few
scattered statements and some questionable
narrative in Greek and the Chaldean. Some of
the discoveries in the ruins of Mesopotamia have
now given us first-hand information of the
best kind, narratives just as they were written
down by the original scribes, and not copies
made from age to age, as are the works above
referred to. These clay, stone and metal rec-
ords stretch not continuously as yet, but with
breaks here and there, from at least 4000 B.C.
down through the fall of Babylon before the
army of Cyrus 539 B.C. Of course, they cannot
be regarded as infallible, but are still for our
purpose reasonably reliable. They give us, at
least, a new panorama, of the most vivid kind,
of the great nations that moved down the ave-
 nue of time in Babylonia for nearly 4,000 years.
Chronology.—The chronology of Baby-
lonia must be described in part separately
from that of Assyria. The early Babylonians reck-
oned events from some great calamity or oc-
currence, such as the destruction of a city, the
dedication of a temple, or the opening of a new
irrigating canal. Later dates in the history
they counted time by the years of a reigning
king. There were several early dynasties in
Babylonia whose succession of rulers is pretty
well established. Such are those of Sumer,
ASSYRIOLOGY

Akkad, Nisn, Larsa and Babylon, whose beginnings fall approximately within 3000 to 2200 B.C., according to King. 'A History of Babylon,' appendix 2, and 'A History of Babylon,' appendices). The 'List of Kings,' a list of the kings (not complete) of Babylon from about 2400 B.C. to 625 B.C., by dynasties, with the length of reign of each king and of each dynasty, and the so-called 'Babylonian Chronicle,' consisting of a record of events in Babylonia and Assyria from about 745 B.C. early in the reign of Nabonassar, to 669 B.C., the beginning year of the reign of Shamash-shum-ukin, are valuable documents. The Ptolemaic Canon, which has some reliable features, also begins with Nabonassar's reign. Besides these guides there are references here and there that both serve as checks and give us fixed points from which and toward which we may figure. One of the most striking is that mentioned by Nabonidus (555-538 B.C.) on one of his cylinder inscriptions. He there states that an inscription of Sargon which he found in the cornerstone of a temple had been deposited in its hiding place 200 years before his time, that is, in 3750 B.C. The more we find of ancient Babylonia facts the less probable the correctness of this date seems to be. It should be reduced about 1,100 years. Then there are chronological notes and hints, such as the statement that Burna-buriash lived 700 years after Hammurabi, that Marduk-nadin-akhe defeated Tiglath-pileser I 418 years before Sennacherib conquered Babylon. Each such hint furnishes a valuable check on the whole chronological scheme, and aids the scholar in his construction of a valid and reliable list of rulers and events, even though for the present there are some wide and embarrassing gaps in the period covered by the early history of Babylonia...

The History of Babylonia.—The history of Babylonia may be roughly divided into three periods: (1) that stretch of time reaching from the remotest recorded events of the land to the time of the consolidation of the city-kings of Babylonia under Hammurabi at Babylon about 2130 B.C.; (2) the time included between Hammurabi's supremacy and 626 B.C., the death of Assurbanipal, last great king of Assyria, and the rise of Nabopolassar, first king of the new Babylonian kingdom; (3) beginning of Nabopolassar's reign (625 B.C.) to the fall of Babylon before Cyrus (539 B.C.).

First Period.—First Period: Babylonia and Assyria, 1900 B.C.—With the beginning of this period are enfolded in fog scattered fragments of antiquities and archaic inscriptions tell a broken tale of a very remote antiquity. Telloh, Nippur, Babylon and Susa have yielded to the excavator many evidences of an extreme antiquity and have put into our hands material for beginning to estimate some of the elements of such early civilizations. Some of the earliest kings were those who ruled over Sumer, Akkad, Nisn, Larsa, Erech, Lagash and Babylon, which occupied territory on either side of the Tigris and Euphrates rivers. Other kingdoms in this early period, about 3400 B.C., were Kish and Ur. The formal name of a governor in this earliest age was pates, Lugal-zag-zi-si, however, King of Erech, apparently a Semitic name, designates himself 'King of Erech, King of the world,' but calls his father Ukkush, 'pates of Gishpah.' Other kings of this very early period were Ur-Ninah, the founders of whose palace at Telloh and Erech date to 3200 B.C., and Lagash seized and maintained authority, among others, over Gishpah, Kish, Erech, Ur and Larsa. These events must have occurred about 3400 B.C.

About 2650 B.C., according to the corrected reckoning of Nabonidus, already mentioned, we find Sargon I in power, swaying his sceptre to the westward as far as the shores of the Mediterranean Sea. His son, Naram-Sin, carried on the extensions of his father's kingdom until he included in his realm northern Syria, northern Arabia, Mesopotamia and Elam. He designates himself, therefore, 'King of the four quarters of the world.' There is a break in the records at this point. The next ruler, rather pates, of Lagash apparently inaugurates a new reign, that enfolds within its borders the sway of all southeastern Babylonia, including also Elam. This pates was Gudea, one of the most famous rulers of this valley, at about 2500 B.C. The accompanying cuneiform inscription of his inscribed statues of black diorite found at Telloh, around which we find 366 lines of writing very artistically cut into this hard stone. On the top of the statue there is a plan of a building, designed in exact proportions, revealing the standard form of buildings of Gudea's day. His numerous inscriptions tell us of his world-wide commercial activity, though his political power may not have included more than Elam outside of Babylonian territory. The power of the pates of Lagash stretched over some time, and was a distinct force in the civilization of lower Babylonia. We have also the names of several kings of Ur, of Nisn, of Erech, of Larsa and of some smaller cities, whose exact location in the chain of history is not yet fixed.

Second Period—Babylonia: 1st to 3d Dynasties. Beginning of Assyria, 2232-1181 B.C.—The isolated city-kings of Babylonia had already existed for centuries, with here and there a ruler who had been able to gain the supremacy over one or more of his neighbors for a time. But the ma. above all others who unified these scattered realms under his own sceptre, with Babylon as a centre, was Hammurabi, whose long reign of 43 years began about 2130 B.C. He greatly improved the
internal condition of his own country, both materially and politically, and carried his conquests to Elam, as has been shown, to his predecessor by 500 years. Hammurabi's influence and power for the welfare of his subjects have been brought out anew by the discovery at Susa, in December 1901–January 1902, by M. J. de Morgan at the head of the French expedition, of a code of laws which had been compiled under his direction and orders. This remarkable document shows that Hammurabi's government was thoroughly regulated, for it provides laws now intact to the number of 243, to govern the complexities of commercial, social and official life. Successive kings of this 1st dynasty, founded about 2232 B.C. by Sumu-abu, are known as yet but slightly, though many contract tablets belonging to this period have been found.

The 2d dynasty in the 'List of Kings' began in 1927 B.C. and consists of 11 rulers, about whom we know nothing. It is thought that during their reign the Kassites made their way into Babylonia from Media and Elam and secured a hold on the throne.

The 3d dynasty in the 'List of Kings,' beginning at 1757 B.C., is made up of 36 kings, but only the names at the beginning and at the close are preserved. The 'Synchronic History,' however, supplements this lacuna in some respects and gives us an idea of the relations of this dynasty to Assyria. In fact, early in this dynasty the former little colony of Assyria, which had migrated from Babylon some time about 2500-2300 B.C., rebelled against its mother-country, Babylon, and secured its independence. Its first king of whom we know the name was Bêl-Kapkapu (about 1900 B.C.), mentioned by Adad-nirari IV (810-781 B.C.) as an early king on the Assyrian throne. Ashur-bêl-nishishu is the first king about whom we know anything of value. He ruled about 1480 B.C. and was on friendly terms with Karkadashi, a king of the 3d Babylonian dynasty. Several successive Assyrian kings seem to have perpetuated this friendship, but jealousy and hostility sprung up and there were, repeatedly, clashes of arms, in which, on the whole, the younger and more continuous Assyrians was victorious. One of the notable Assyrian kings of this period was Shalmaneser I, who ruled about 1300 B.C. His great campaigns against the territory northwest of Assyria are celebrated in the records of Assurnasirpal (884-858 B.C.).

Second Period — Babylonia: 4th to 7th Dynasties. Assyria, 1180-997 B.C. — We do not know the name of the founder of the 4th Babylonian dynasty. It came into being about 1180 B.C. The 'List of Kings' is, unfortunately mutilated so that we have only portions of the names of the last three kings. The 'Synchronic History' fills part of the gap by giving some of the relations between Babylonia and Assyria during the life of this dynasty. These relations were hostile in some of its earlier years, when Nebuchadrezzar I (1140 B.C.) was on the throne, and the battle went against the Babylonians. Then Marduk-nadin-akhe, a Babylonian king, wrested victory from the Assyrians. Tiglath-pileser I (1107 B.C.) as king of Assyria, on the other hand, completely routed the same Babylonian king, captured a number of cities in north Babylonia, and even the city of Babylon itself. Succeeding kings of this Babylonian dynasty and of Assyria made treaties of peace and friendship, and in time being ceased their wasteful warfare. Of all the Assyrian kings who reigned in the time of this Babylonian dynasty, Tiglath-pileser I was the most vigorous, aggressive and successful. His example furnished an inspiration for all succeeding Assyrian rulers, and his conquests, related in full in his cylinder inscription, give us a fine specimen of early Assyrian historical writing.

The 5th Babylonian dynasty (about 1046-1024 B.C.) consisted of three kings whose full time of reining was 21 years and five months. It has been called the 'Sea-land' dynasty, because it is thought probable that the Chaldeans about the head of the Persian Gulf were the occupants of the throne. At least, it is probable that the country was in political confusion during the life of this dynasty.

The 6th dynasty (about 1024-1003 B.C.) like its predecessor, had just three kings, covering 20 years and three months, of whose acts very little is known.

A gap of about 100 years is found at this place in our sources, a part of which is attributed to an Elamite dynasty of one king who ruled six years.

Assyrian history likewise has a gap of more than 100 years (1070-950 B.C.). The 'Synchronic History' leaves us in the dark in this period.

Second Period — Babylonia: 8th Dynasty. Assyria, 996-815 B.C. Assyria about 930-783 B.C. — The 8th dynasty of Babylonia is supposed to have been native Babylonian, and occupied the throne from about 996 to ca. 815 B.C. The kings who ruled in Babylonia during these 200 years fought a losing battle with the Assyrians, for in almost every clash the Assyrian was victorious. Though many of the names of the early kings of this dynasty are lost, we know those of the kings who waged war with Assyria during the larger portion of the life of the dynasty. With this dynasty the 'Synchronic History' closes.

The Assyrian records, the 'Eponym Canon,' begin in this period, at 893 B.C., and give us an almost continuous annal from that date to 666 B.C. One of the most notable Assyrian kings of this period who have left us their records was Assur-nasirpal (884-858 B.C.). This king was one of the most energetic and aggressive monarchs of Assyria. He established Assyria's authority in every direction, even to the coasts of the far-off Mediterranean Sea. His reign was vigorous, cruel and even barbaric. Locally, he built a great palace at Calah, and one at Nineveh, and restored the temple of Ishtar at the latter place. His son, Shalmaneser III (858-823 B.C.), still further extended the limits of his paternal realm by including lakes Van and Urmiyeh, in Armenia, and becoming protector of Babylon. To students of the Old Testament his reign assumes more than ordinary importance, for he was the first Assyrian king to come into contact with the Hebrew nation of Palestine. He mentions 'Ahab of Israel' and 'Jehu, son of Omri,' both of whom became his subjects in the Westland. The accompanying illustration presents the first relief on one of the four sides of the famous Black Obelisk of Shalmaneser III. These four represent
the tribute paid by four foreign countries to the Assyrian king. The first reads: "Tribute of Sia of the land of Guzan, silver, gold;" over the second: "Tribute of Jehu, son of Omri, silver;" over the third: "Tribute of the land of Mutsh, double-humped dromedaries;" over the fourth: "Tribute of Merodach-baladan, the land of the Sukhites." These four reliefs and inscriptions are only the first of four, the other three being found on the other three sides of the obelisk. Shalmaneser's son, Shamshi-Adad V (823–810 b.c.), succeeded him on the throne, and rescued the kingdom from a rebellion which had been stirred up by a brother. His only notable conquest was over Babylon under command of King Marduk-balatun-ikbi.

The next king of Assyria was Adad-nirari IV (810–781 b.c.), son and successor of his father. His was a prosperous reign, reaching to Tyre, Sidon, Palestine and Philistia. Even Mari, king of Damascus, yielded submission to his sway, so strong was the Babylonian, so the next rulers in Assyria, three in number, amounted to little.

Assyrian Supremacy: Tiglathpileser IV, Babylonian Subjection.—Assyria's three lethargic rulers between 783 and 745 left no record of Assyria that deserve mention. But their great successor, Tiglathpileser IV (745–727 b.c.), redefined the ancient reputation of Assyria. This new king, although a usurper, revolutionized the policy and methods of the Assyrian empire. He pushed out the boundaries of Assyria farther than any predecessor on the throne. He completely subdued Syria, Palestine and Philistia. According to his own records he, more than any other Assyrian monarch, came into close contact with the Hebrews. The Hebrew monarchies were subservient to his sway. He mentions Menahem, Pekah and Hoshea, kings of the northern kingdom, and Uzziah and Ahaz, kings of the southern kingdom. To him also is to be attributed the policy of deportation of captives from a given district, and importation into that same district of peoples from distant districts, in order thereby to prevent the possibility of uprisings and rebellion. He also inaugurated a kind of local self-government, or provincial districts, as parts of Assyria; and, by this policy, thus making a decided advance over the reigns of his predecessors.

The next Babylonian king of whom we know anything of consequence is Nabonassar (747–734 b.c.), mentioned in the Canon of Ptolemy, as well as in the 'List of Kings' and the 'Babylonian Chronicle.' But from this time down to the rise of the new Babylonian empire, Babylon was everywhere practically in the hands of Assyria, though there were some sanguinary struggles for the supremacy.

Sargon II, 722–705 B.C.—Tiglathpileser's successor was Shalmaneser V (727–722 b.c.), about whom we know little, as none of his inscriptions have been found. He blockaded Tyre for five years, and on the treacherous revolt of Hoshea, King of Samaria, laid siege to that city (722 b.c.) but did not take it. His successor was Sargon II, whose first act was the capture of Samaria in 722 and the deportation of the Jewish captives to various parts of his empire. He conquered the combined forces of Elam and Babylon. In 717 he besieged and captured the city of Carchemish belonging to the Hittites. This Sargon was a master ruler, who not only subdued and held down the peoples on the east coast of the Mediterranean Sea, but also with indefatigable skill put down Merodach-baladan of BABYLON and his attempted conspiracy (cf. Isa. xxxix). Sargon's great home settlement was the construction of that colossal palace at KHORSABAD, north-northeast of Nineveh, that was first discovered by Botta in 1842, as already described.

Sennacherib, 705–681 B.C.—Sargon II was assassinated in his new palace at KHORSABAD in 705 B.C. and was succeeded by Senna cherib, his son. This vigorous ruler conducted at least three successful campaigns: (1) against the Westland: Syria, Pheenicia, and Palestine (701 b.c.), when he overran Judah, carried off 200,150 captives, threatened Jerusalem, making Hezekiah his subject, and met and, according to his own records, defeated an Egyptian army at Elteku; (2) in an expedition against Elam (693 B.C.) he was only partially successful, not quite capturing the capital, Susa; (3) in 689 B.C. he sacked, burned and practically destroyed the city of Babylon in revenge for the rebellious acts of its former ruler and inhabitants. Sennacherib removed the capital from Calah to Nineveh, and erected for himself a magnificent palace in that newly-made capital of the unified Assyrian-Babylonian empire. Other public works of an extensive nature, such as walls, gates, moats, arsenals and water supply, were the objects of his energy. Sennacherib was murdered by one of his sons, according to the 'Babylonian Chronicle,' and was succeeded by Esarhaddon, his son, who was not implicated in the conspiracy.

Esarhaddon, 681–668 B.C.—Sennacherib's son, Esarhaddon, made one of his residences at Babylon, carried on a successful warfare against the mountaineers to the north and northeast, and was the first Assyrian ruler to carry his conquests into Egypt. In 670 B.C. he crossed the frontier of that age-old land, took Memphis, and carried his arms as far as Thebes, driving the Ethiopian monarch of Egypt, Tirhakah, back into his home land. He was the first king of Assyria who could add the title 'Egypt, Paturius (biblical, *Pathros*) and Kapar (biblical, *Cush,* *Ethiopia*), He associated with him on the throne his son Assurbanipal (669). In his list of 122 tribute-paying kings of the Westland we find 'Manasseh of Judah.' His successor was his son, Assurbanipal (the *Saranatus* of the Greeks, and *Osnappa* of Ezra iv, 10). Egypt had revolted about the time of the death of Esarhaddon, and thus necessitated the early attention of Assurbanipal to hold it. He was completely successful, driving back the rebel Tirhakah and re-establishing his authority over the whole land. A second expedition was required again in 663 B.C., when the land was completely reconquered and Assyrian authority re-established. Very soon, however, Psammeticus of Egypt, with the help of foreign troops, threw off the yoke of Assyria. Assurbanipal's great work was the conquest of Babylon and his rebellious brother Shamash-shum-ukin in 647 B.C.; and, after several terrific battles, the crushing of the power of the Elamite in 640 B.C., and the destruction of their great capital, Susa. These
colossal military achievements marked the culmination of Assyria's career, for henceforth there was a rapid decline (see Assyria). Assurbanipal's notable contribution to the history of literature was his causing to be collected and copied for his royal library at Nineveh many of the most famous pieces of literature found in the libraries of Babylon. The last years of his reign are wrapped in obscurity.

The Third Period of Babylon: the Rise of the Neo-Babylonian Empire (625 B.C.-Fall of Assyria, 606 B.C.)—Almost simultaneously with the death of Assurbanipal (626 B.C.) we find one of his former generals, Nabopolassar, a Chaldean by descent, securing the throne of Babylon for himself (625-605 B.C.). While he was developing and extending his influence and grasp over the territory that was naturally tributary to Babylon, momentous events were occurring in the north country, in and about Assyria, and the whole scene was changing. After a very long reign, Ashurnasirpal's son, Adad-nirari III, died in 810 B.C., with no successor. A gap of about 200 years before his day, making the date of said Sargon, on his calculation, about 3750 B.C., or, as corrected, 2650 B.C. Nabonidus' enthusiasm carried him too far, for he attempted to centralize in Babylon the religion of the kingdom. In doing this he alienated the priesthood, and even aroused their active opposition. For throughout the history of Babylonia each city had its own patron deity, to whom its temple was dedicated and its people devoted. The images and shrines of these various divinities were collected in Babylon. This act, with others of similar offense to the priests, paved the way for his downfall before a mightier power.

 Cyrus, 538-529 B.C.—Cyrus, an Elamite by descent, began an active career as a conqueror in 558 B.C. He conquered successively the Medes under Astyages (550 B.C.), Cresus and Asia Minor (547 B.C.), and then moved against Nabonidus, who had allied himself against this new conqueror. The Babylonian army was probably under the command of Nabonidus' son, Belshazzar. Suffering a defeat at Opis, the army of Babylon later scarcely offered resistance. Cyrus marched, almost without further opposition, to the gates of the capital city. The outraged priesthood and citizens, in open defiance of their own king, flung open the gates and welcomed the new and liberal conqueror to authority over them. Cyrus restored the gods to their cities and shrines, and permitted enforced exiles to return to their native places and lands. Besides, he became one of the ardent worshippers of the gods of the land and established himself as a liberty-loving, people-serving potentate.

The fall of Babylon before the advance of Cyrus meant the fall of Semitic sway in Babylonia, and the rise of Aryan power. The cuneiform tongue served the purpose of a language in Babylonia for long years after this revolution. In fact, throughout the Persian and Greek periods, cuneiform remained the official language of Babylonia, particularly in writing contract tablets. There are some inscriptions dating from the Parthian era, due doubtless to the enthusiastic support of the priesthood of those times. Thus for nearly or quite 4,000 years the cuneiform language was the vehicle of expression for the peoples of Babylonia.

Bibliography.—The literature on Babylonia-Assyria has already become voluminous. Consequently, in a limited bibliography, only selections will be given. After a long and prosperous reign he was succeeded on the throne by his son, Evil-Merodach. This king was assassinated after a reign of two years (561-559 B.C.), by Nergilissar, his brother-in-law. This usurper ruled four years (559-555 B.C.), and spent most of his time, according to his inscriptions, in building operations. At his death his son, Labashi-Marduk, not yet of age, succeeded him, but fell under the assassin's dagger within nine months.

Nabidus, 555-538 B.C.—By some machinations of the priesthood, apparently, the new king, Nabonidus, was a native Babylonian and not a Chaldean as was the dynasty of Nabopolassar. He was an enthusiastic politician and antiquarian. He built and rebuilt many temples in the principal cities of his kingdom. He was the discoverer, in the foundations of a temple, as already stated, of an inscription of Sargon I, which had been lost for more than 1,200 years before his day, making the date of said Sargon, on his calculation, about 3750 B.C., or, as corrected, 2650 B.C. Nabonidus' enthusiasm carried him too far, for he attempted to centralize in Babylon the religion of the kingdom. In doing this he alienated the priesthood, and even aroused their active opposition. and translation of the Behistun Inscription (in the Journal of the Royal Asiatic Society, Vol. X, 1847). Botta, Layard and Oppert also published inscriptions as a result of their explorations in the Persian provinces (1801-84) for the trustees of the British Museum five standard volumes of texts under the title 'Cuneiform Inscriptions of Western Asia.' Many minor series have appeared since that date, such as 'Assyriologische Bibliothek' (1882-1913), by G. R. Driver; the 'Babylonian Expedition of the University of Pennsylvania' (edited by H. V. Hilprecht, many volumes, 1893-); 'Cuneiform Texts in the British Museum' (34 parts have appeared to 1917), by officials of that museum; 'Découvertes en Chaldée' (1884-1913), by E. de Sarzec; 14 volumes of 'Assyrian-Babylonian Letters' (1892-1914), by R. F. Harper, and 'Mémoires de M. J. de Morgan' at Susa, in which V. Scheil has edited notable Elamite-Anzantine texts, including the Code of Hammurabi, and M. Price, 'The Great Cylinders' and B of Gudea' (1899). A series of valuable texts (13 parts in 1914) entitled 'Vorderasiatische Schriftenkäufer der Königlichen Museen zu Berlin' edited by Frdr. Delitzsch, 1907-1912; Hobart Library Collection of Cuneiform Tablets' (Parts I, II, III, 1905-14); Mary J. Hussey, 'Sumerian Tablets in the Harvard Semitic Museum' (Part I, 1912; Part II, 1915); A. T. Clay, 'Miscellaneous Inscriptions in the Yale Babylonian Collection: Babylonian Texts' (Vol. I, 1915). In addition to these there are scores of texts of lesser value to the student.

(3) Equipment for Study of the Language.—The former dearth in this field has been largely supplied by Frdr. Delitzsch. His 'Assyrische Lesestücke' (5th ed., 1910); his 'Assyrische Grammatik' (2d ed., 1906); B. Meissner, 'Kurzgefasste assyrische Grammatik' (1907); Delitzsch, Assyriologisches Wörterbuch (1887-); and 'Assyriologie und) (1896), constitute a fairly good outfit. Other works helpful in the same line are Brünnow's 'Classified List of Cuneiform Ideographs' (1889); Muss-Arnolt's 'Concise Dictionary of the Assyrian Language' (1894-1905); H. C. Rawlinson ed. (1891); a Sumerian Grammar and Chrestomathy' (1911); Frdr. Delitzsch, 'Sumerische Grammatik' (1914); 'Kleine sumerische Sprachlehre' (1914), and 'Sumerisches Glossar' (1914).

(4) Translations, Commentaries, etc.—There is a long list of material, but some of the most useful for modern students are 'Keilinschriften-Bibliothek' (1890, edited by E. Schrader); 'Assyrian and Babylonian Literature' (1901, edited by R. F. Harper); 'Zeitschrift für Assyriologie' (1885-1895), edited by C. Bezold); several volumes in Delitzsch and Hatt's 'Assyriologische Bibliothek', and 'Assyriologie' (1880-85); A. T. Clay, 'Personal Names of the Cassite Period' (Yale Oriental Series, Vol. I, 1912); 'Vorderasiatische Bibliothek' (1906), edited by A. Jeremias, H. Winckler, and Otto Weber); and many valuable volumes by L. W. King and R. C. Thompson, published by the British Museum; and other volumes issued by C. H. W. Rawlinson editions later); A. Jeremias, 'Babylonische-assyrische Vorstellungen vom Leben nach dem Tode' (1897); C. P. Tiele, 'Geschichte d. assyrischen u. d. babyl.-assyr. Religion' (1895); M. Jastrow, Jr., 'Religion of Babylonia and Assyria' (1898, newly revised and greatly enlarged ed., 1905-12, in German); H. Zimmern, 'Beiträge zur Kenntnis der babylonischen Religion' (1901); Perrot and Chipiez, 'Histoire de l'art dans l'antiquité' (Vol. II) Chaldée et Assyrie' (1894); 'Collection de Clercq' (1883-); Viroletaud, 'L'Astrologie Chaldéenne' (1905-); older works, such as those of Botta, Layard and Place, are of value chiefly for their illustrations.

(5) History and Archaeology.—Some of the most prominent works superseding the large work of George Rawlinson are Fr. Hommel, 'Geschichte Babyloniens u. Assyriens' (1885-89); C. P. Tiele, 'Babyl.-Assyr. Geschichte' (1886-88); H. Winckler, 'Geschichte Babylon. u. Assyriens' (1892); J. F. McCurdy, 'History, Prophecy and the Monuments' (1894-1901); H. R. Hall, 'Ancient History of the Near East' (1913); R. W. Rogers, 'History of Babylonia and Assyria' (6th ed., 1915); L. W. King, 'A History of Sumer and Akkad' (1910), and 'A History of Babylonia' (1915); Schrader-Winckler-Zimmern, 'Die Keilschrifttexte und das Alte Testament' (3d Auflage, 1901-03); A. Jeremias, 'Das Alte Testament im Lichte des alten Orients' (2d ed., 1906); 'Handbuch der aorientalischen Geisteskultur' (1913); M. Jastrow, Jr., 'Civilization of Babylonia and Assyria' (1915).

Further bibliographical material may be found in the periodicals devoted to Assyriology, 'Zeitschrift für Assyriologie, the American Journal of Semitic Languages and literatures, Orientalische Bibliographie, Orientalische Literaturzeitung' (1886-); Revue d'Assyriologie et d'Archéologie Orientale (1884-); also in the comprehensive articles on Assyria and Babylonia by Hommel and King in Hastings' 'Dictionary of the Bible' and Cheyne's 'Encyclopedia Biblica' respectively.

IRA MAURICE PRICE,
Professor of Semitic Languages and Literatures, University of Chicago.

AST, äst, Georg Anton Friedrich, German scholar and philosophical writer; b. Gottha, 29 Dec. 1775; d. Munich, 31 Oct. 1841. In 1805 he was appointed to the chair of classical literature at Landshut and in 1826 accepted an appointment to the same chair in the University of Munich. Among his best known publications are: 'Handbuch der Aesthetik' (1803); 'Grundriss der Geschichtsphilosophie' (1807); 'Wissenschaftliche Darstellungen der Grammatik, Hermeneutik und Kritik' (1808); 'Platos Leben und Schriften' (1816). He also published an edition of the works of Plato in
ASTACIDÆ, the family of decapod Crustacea containing the crayfishes (q.v.). It is divided by some into two families—Astacidae of the northern hemisphere, and Parastacidae of the southern. "There can be no doubt," says W. T. Calman ("Life of Crustacea," 1911), "that the two families have been derived from a common stock of marine, lobster-like animals, and it is reasonable to suppose that two branches of this stock became independently adapted to a fresh-water habitat in the North and in the South."

ASTACUS, a genus of decapod Crustaceans of the family Astacidae, including the A. marinus, or lobster, and the A. fluviatilis, or crayfish. The species A. fluviatilis contain the crayfishes of Europe, and also those of the Pacific States of the United States, while the others found along the Atlantic coast belong to the species Cambarus.

ASTARA, a port of Russian Transcaucasia, government of Baku on the Caspian in lat. 38° 27' N., and long. 48° 53' E. on a river of the same name, which forms the frontier between Persia and Russia. Russian merchandise is landed there and forwarded to Azerbajian and Tabriz via Ardebil.

ASTARABAD, Persia, province bounded on the north by the Caspian Sea and Russian Transcaucasia, south by the Elburz Mountains, west by Mazandaran, and east by Kharasen. The country is mountainous, possesses extensive forests, fertile valleys, producing rice, wheat and other grains in abundance, and rich pasturages. The soil is exceedingly productive owing to the abundance of water which irrigates and fertilizes it. It is, however, a prey to the ravages of disease, principally malarial fevers due to the extensive swamps formed by waters stagnating in the forests, and to the frequent incursions of the Turkomans. The inhabitants, nevertheless, are a strong and athletic race. The population is about 100,000. Astarabad, the capital, is situated on the Astar, has post and telegraph offices, and a population of about 10,000.

ASTARTE, a genus of bivalve mollusks belonging to the family Cypridae. They have 2-2 hinge teeth and are suborbicular, compressed, thick, smooth or concentrically furrowed shells. Tate estimated the recent species known at 20 and the fossil at 285. The former belong to the temperate and Arctic zones, and the latter to the rocks from the carboniferous formation upward.

ASTARTE, as-tar'te, a character in Byron's play, "Manfred." The hero guiltily falls in love with her, and in the second act her shadow appears to him in a denunciatory attitude.

ASTARTE, as-tar-te, or ASHTORETH, a Syrian goddess, probably identical with the Semela of the Greeks, and the Ashtoreth of the Hebrews, and worshipped also by the Phoenicians and Carthaginians, being regarded by some as the original of the Greek goddess Aphrodite (Aphroditus). She was the moon-goddess, or goddess of the heavens, and appears also to have been worshipped as the goddess of fruitfulness. In the Old Testament, Astarte is frequently mentioned as the goddess of the Sidonians (see 1 Kings xi, 5-33; 2 Kings xxiii, 13), but the form of her name seems to have been perverted, to her original name of Ashtar being infixed the vowels of Bosheath, or Ishshame, and we find her there called Ash-terath. In 1 Samuel xxxii, 10, Astarte is again mentioned, as is also the fact that a temple was built to her at Ashekclon. There were also temples at Citium in Cyprus, at Eryx in Sicily and in Carthage. The Syrians also built a famous temple to her at Antioch, and at Sidon. She is probably identical with the Assyrian goddess Ishtar, or Istar, the "Lady," the "Queen of the Gods" or the virgin goddess of death and war, who enforces strict chastity upon her priestesses and priestesses. Astarte is represented in various forms, but more usually with four wings, the two uppermost representing the horns of the moon and having on her head a pointed cap and a white dove in her hand. Others represent her as a naked female figure, short and stout and the hands holding the breasts. She is also represented in Phoenicia as a cow.

ASTATIC (as-ta'tik) NEEDLE (Greek, 'unstable'), in physics, a magnetic needle whose tendency to set itself in the magnetic meridian has been nearly or quite neutralized in some way, so that while the needle retains its full magnetic power it will remain indifferently in any position, even when quite free to turn. A magnetic needle may be made astatic in various ways; for example, by disposing magnets in the vicinity of the needle in such a way that their field of force opposes and neutralizes the earth's field. A commoner method is to make use of a pair of needles of equal size and equal magnetic strength, securing them together, one above the other, by a light rigid connection, so that their lengths shall be parallel and their poles turned in opposite directions. If the conditions here assumed are fulfilled rigorously the system will have no directive tendency whatever. In practice it is quite possible to secure an arrangement so good that the directive tendency is masked by the torsional force of the suspending fibre. Astatic needles are used in the construction of delicate galvanometers, the coil conveying the current passing around only one of the needles of the system or around both of them in opposite directions. The full magnetic moment of the current is thus obtained, while the directive action of the earth's field remains practically zero and the motion of the needle is opposed only by the torsion of the suspension. See GALVANOMETER.

ASTEN, ast'en, Friedrich Emil von, German astronomer: b. Cologne 1842; d. 1878. From 1870 he was employed at the Imperial Russian Observatory at Pulkowa. He will be best remembered for his work upon拴ne's comet, the results of which were published in 1877, and included an elaborate discussion of all the appearances of this interesting body from 1819 to 1875.

ASTER, a genus of plants belonging to the family Asteraceae, and comprehending several hundred species, mostly natives of North America, although some are also found over most regions of the globe. The name is derived from the Greek aster, a star,
and is due to the fact that the heads of the flowers bear some resemblance to stars. The species are mostly herbaceous plants. Large as the genus is, it contains no species of any great utility in the arts, but many are cultivated as ornamental plants. The most beautiful species among those which are natives of Europe are *A. alpinus*, *A. amellus* and *A. pyreneus*, and among those of America, *A. puniceus*, *A. multiflora* and *A. nova-angliae*. The China aster (*Callistephus chinensis*), introduced from China upward of a hundred years ago, is a well-known annual, growing to a height of from 12 to 18 inches and bearing an abundance of large and beautiful flowers, exhibiting in the numerous varieties every hue except yellow and a great diversity of marking. This plant lends itself readily to culture and florists are constantly adding new varieties to a stock that already numbers nearly 300. The French call this species Reine Marguerite. The chrysanthemum and peony flowered varieties are particularly worthy of cultivation for the size, color and abundance of their flowers. From the lateness of the season in which they bloom some species of aster have obtained the name in England of Christmas daisies.

**ASTER**, ăs’tër, Ernst Ludwig von, German military engineer; b. Dresden 5 Oct. 1778; d. Berlin, 10 Feb. 1855. His first service was in the Saxon army. It was in 1810, as an officer in that army, that he submitted his plans, subsequently accepted, for the fortification of Torgau for Napoleon. Subsequently he entered the Russian service and soon after 1815 the Prussian. While in the last service he undertook the fortification of Coblenz and Ehrenbreitstein, and in 1842 was appointed general and inspector of all the Prussian fortresses.

**ASTERISK** ("a little star"), a sign or symbol (*) used in writing and printing, as a reference to a note at the bottom of the page. The obelisk or dagger (†) and many other marks are similarly employed; but when there are several references on the same page, it is now common to use the numerals 1, 2, 3, etc. The asterisk often marks the omission of words or sentences, or it distinguishes words as conjunctival or oblique, or it may be used merely as a typographical mark for any specified purpose.

**ASTERISM**, a property possessed by a few minerals of exhibiting star-like rays. It is due either to reflection of light from twinning lamellae or minute enclosed tubes, as in the case of star-sapphire (q.v.), star-ruby and star-quartz (q.v.), or to the regular arrangement of minute enclosed crystals as seen by transmitted light in the case of some phlogopite or star-mica.

**ASTEROIDA**DEA, an order of echinoderms. See STARFISH.

**ASTEROIDS**, a group of small planetary bodies known also as minor planets which revolve round the sun between the orbits of Mars and Jupiter. The most remarkable feature of these bodies is that they occupy a vacant place in the solar system in which a planet would naturally belong. Between the orbit of Mars, the fourth planet in order, and that of Jupiter, the fifth, there is a space more than double the radius of the orbit of Mars. This gap was noticed from the time that the distances of the planets were laid down by Kepler. It was long suspected that a planet would be found occupying such space and an organized effort was made to discover it. The discovery of a planet which was supposed to be the long-sought body was made by Piazzi at Palermo on the first day of the 19th century. To the great surprise of astronomers three other planets were found in the course of the next six years to be revolving in the same region. The smallness of the four bodies gave rise to the celebrated hypothesis of Olbers that these bodies were the fragments of a single planet which had been disrupted by some cataclysm. Some 40 years elapsed when in 1846 a fifth asteroid was discovered. Others soon followed. More powerful telescopes were applied to the search, a thorough system was introduced and in this way the number known went on increasing until it mounted into the hundreds, and now a dozen or more are added to the list in a single year.

When photography was applied to form a permanent picture of the stars in the sky, it was found that this method was the easiest way by which discoveries of new objects could be made. Whatever method may be used, the difficulty of discovering an asteroid arises from the fact that it is impossible to distinguish such a body from a fixed star by its mere aspect. It can be detected only by its motion among the stars and therefore requires that the same body should be observed at different times. But a photograph enables the motion to be detected in a very simple way, as follows:

If a telescope, mounted so as to serve as a camera, is pointed at a given region of the sky for half an hour or more the images of the stars which fall on the plate remain immovable, and these bodies are photographed as simple points of light. But if an asteroid is in the field, its motion during the exposure is quite appreciable; and its picture appears as a short line, equal in length to the amount of motion during the exposure of the plate, which can be detected at sight. A decided improvement to this photographic method has been recently devised which consists in subjecting the plate to a slight, uniform, side-way motion equal to that of the average asteroid in the part of the sky under examination. The stars are thus photographed upon the plate as trails while the asteroid appears as a very much shorter trail or as a point of light; its image is thus rendered far more intense than if it were allowed to trail, and numerous asteroids have been thus discovered which would have been far too fast to be detected by the older method. During the last 10 years the number discovered has carried the total list up to more than 800, a number so great that it is almost impossible to compute the orbits or motions or even to find separate and appropriate names for the bodies.

The asteroids are distinguished from the major planets by several distinct and interesting features. One of these concerns their orbits. While the major planets, with the exception of Mars, move in nearly circular orbits, the orbits of the asteroids are, in the general average, markedly eccentric.
In some cases the asteroid is twice as far from the sun at aphelion as at perihelion. One result of this is that they appear several times nearer the sun when seen from the earth at perihelion than at aphelion. The inclination of the orbits is also frequently very large. That of Pallas, one of the original four, is inclined no less than 34° to the ecliptic. The result of this is that some of these bodies wander far outside of the limits of the Zodiac; indeed, in many cases they are seen north of the zenith in our latitudes when nearest the earth.

The size and mass of the asteroids do not admit of very accurate definition, for the reason that, with rare exceptions, they are seen in the telescopes only as points of light. Barnard has, however, succeeded in measuring the apparent diameter of the first four, three of which are probably the largest of the group, with the great Lick telescope. The results are:

Only the largest shows a diameter exceeding one-twentieth of that of the earth, and all the others are much smaller than this. Judging from the amount of light they reflect very few of them are 100 miles in diameter and most of those known may not exceed 10 or 12 miles in extent. Indeed, we have reason to believe that as we take smaller diameters the number increases without any limit. The same remark might apply in a still greater extent to the masses. The latter are so small that the attraction of the whole mass of all the asteroids does not produce any effect that has yet been observed upon any planet or comet.

Of the total number of these bodies it is hardly possible to form any estimate, because the more powerful the means of research the more are found. We can hardly be astray in supposing that thousands exist, and if we include those that must forever remain invisible to us, the number must be countless. Yet they are all so minute that the total mass cannot be as great as that of the planet Mercury.

The hypothesis already mentioned, that these bodies are fragments of a great planet, has been effectually disproved by modern research. Apart from the impossibility of an explosion which would rend a planet, we have the fact that in the event of a disruption all the orbits would pass through a single point. It is true that this coincidence would not continue indefinitely, because the orbits would change their positions by the attraction of the other planets; but their sizes are found to be such that they could not originally have passed through any single point. It is more probable that the asteroids are merely scattered meteoric material which formed a small part of the original nebula from which the solar system was developed but which was prevented from becoming aggregated into a single planet, probably by the great disturbances produced by the attraction of the nearby planet, Jupiter. There is a curious grouping of the orbits which seems to have some connection with the origin of the whole collection.

Many years ago it was noticed by Kirkwood that, if the orbits were arranged according to their mean distance from the sun, there would be gaps in the series at those points where the time of revolution was commensurable with the period of Jupiter. For example, there are no known asteroids having a period one-third that of Jupiter, or one-half or two-fifths, although there are plenty of orbits within and outside these peculiar limiting values. The subsequent discovery of hundreds of asteroids has led to a slight modification of this law. The orbits not only seem to avoid these peculiar values, but to accumulate midway between them. To get an idea of the results suppose that every orbit stretched into a circle of a radius equal to its mean distance. Then treating these orbits as hoops, suppose that we arrange them all round on one centre. We should then find that the rings are divisible into four, five or six nearly distinct groups with vacant spaces between them. The explanation seems to be that the material which might have been originally in these vacant zones could not long remain there, for the accumulating, periodic, planetary perturbations would speedily force it nearer or farther away from the centre.

Perhaps the most remarkable of the asteroids was one discovered in 1898. Some of its peculiarities have excited great attention on the part of the astronomer. The orbits of all the other known asteroids are contained between the orbits of Mars and Jupiter; no known orbits approaching very near either of these planets. But, in the summer of 1898, Witt, of Berlin, found an asteroid which at perihelion came far inside the orbit of Mars, indeed within 13,500,000 miles of the orbit of the earth. Its orbit was found to be extremely eccentric and, which was more curious, it was interlinked with that of Mars, so that if the orbits were rings, they would have passed through each other and hung together like two links. What gives this planet especial interest is that on these rare occasions when it comes nearest to the earth its parallax can be measured with greater precision than that of any of the other planets. It therefore affords us the best possible method of directly measuring the solar system; but, most unfortunately, it is only at intervals of 37 years that the nearest approaches occur. What is most tantalizing, is that only six years before it was discovered, it is known to have passed at nearly the least distance from the earth, but it was then unseen by human eye. It was found to have been photographed a great number of times at the Harvard Observatory; but among the hundreds of stars whose images were found on the plate, its image was completely lost after the discovery in 1898. It was recognized through the determination of its orbit which made possible the computation of its position in the heavens at former positions.

In the winter of 1900-01 there was as close an approach to the earth as would occur during the next 30 years, although the distance was then but little less than 30,000,000 miles. A cooperative effort was made to measure the parallax on this occasion. Many observatories took part, some making photographic and others micrometric measures of the planet, while many others co-operated by making meridian observations of reference stars. When the great mass of observational material was finally reduced, there resulted for the solar
ASTEROPEIS - ASTHMA

parallax the value, 8.306 with a probable error of but 0.004. This is the most accurate value thus far determined by any method. The next closest approach of Eros to the earth will occur in 1931 when the distance apart of the planets will be less than half as great as it was at the time of their closest approach in 1900. So far as is now known, there are more of the fundamental unit of astronomy will become known with a far greater accuracy.

A curious property of this most remarkable body is a periodical variation in its light which was noticed during the opposition of 1900-01. It was found to go through a series of changes in the course of five hours quite similar to those of a variable star. The period was found to be two and one-half hours, but possibly the same brightness was not reproduced except in a period of five hours. It was yet more curious that these variations seemed to have nearly or quite ceased at the next opposition.

SIMON NEWCOMB

Revised by Eric Doolittle, Professor of Astronomy and Director Flower Astronomical Observatory.

ASTEROPEIS, a genus of ganoid fishes named on account of the starry color of its scales. A bone of a species belonging to this genus, found at Stromness, the capital of Orkney, suggested to Hugh Miller the writing of his beautiful volume entitled 'Footprints of the Creator; or, the Asteropeis of Stromness.' It was an elaborate argument against the development hypothesis. According to that hypothesis, the first species of any class appearing on the scene should be low in organization, and probably small in size. Mr. Miller showed that the asteropeis was large in size and high in organization, and yet it was at that time believed to be the oldest fossil vertebrate found in Scotland. This argument was subsequently weakened by the discovery that the Stromness rocks were less ancient than the Forfarshire beds, containing cephalaspid and other fish genera subsequently discovered, mostly of small size, though of a still very low organization.

ASTEROPHYLLITES, fossil plant remains, which with Annularia and Sphenophyllum form the leaves of the group Calamites of the Devonian, Carboniferous and Permian periods.

ASTHENIA, a disease of poultry, known in the United States as "goose light." The treatment is purgation and tonics. Also a symptom of many disorders of the body characterized by muscular weakness. Such muscular weakness is normal in fatigue, but such fatigue may be greatly exaggerated when toxic factors reduce the muscular power. Such reduction is frequent in disease of the adrenal system. See ADRENALS.

ASTHENOPIA, or WEAK SIGHT, common affection of the eye, due immediately to muscular fatigue. Its chief symptoms are pain in and around the eyes or headache, which is increased by use of the eyes on near objects and in artificial light. It occurs most frequently in persons of weakened constitution and especially neurasthenics. A prolonged strain may have serious results, often causing temporary damage of vision, and otherwise may cause general sight disorders. See EYE, DISEASES OF.
of respiration and which they assume at the onset of the attack and keep until it begins to subside. The face becomes pale and anxious, the voice is gasping, and the expression of the eyes is difficult, the eyes bulge and the face becomes cyanotic as the paroxysm continues; cold clammy perspiration covers the face, breathing becomes more difficult and laborious as the chest is depressed, and the duration of the attack is very much prolonged. This breathing is accompanied by wheezing sounds upon the chest. The attack may last from one hour to several days; it subsides gradually, the patient begins to cough and rid his lungs of some frothy mucus in which is mixed grayish-white masses; he then feels greatly relieved, the color returns to his face, and he goes off into a sound sleep from which he awakens feeling greatly refreshed. A patient rarely, if ever, dies during a paroxysm as it is of spasmodic character, and once over it, he quickly regains his normal condition.

Children bear attacks better than adults, and in their case the disease is usually periodic in its recurrence, but as the years advance it tends to become more erratic both in its manifestations and time of appearance, and is apt to disappear at puberty. Persons past middle age are not apt to rid themselves of it, although they may live to a good old age and die of some other disease. Much can be done to prevent future attacks if the cause of the paroxysm can be determined and properly treated. Constipation, over-eating, and eating at bedtime should be avoided. An operation upon the nose may be necessary to remove a growth that is causing undue pressure upon the nasal septum. It is often advisable to move to another climate or locality. Endeavor should be made to strengthen the nervous system, if that be at fault; breathing exercises are often helpful. Another method, which has come into prominence of late, is to restore the stability of the respiratory centre by cauterizing the septal mucous membrane, and combining this with hygienic measures. This is performed by painting one side of the nasal septum with a few drops of cocaine and resorcin, and then drawing a line with a galvano-cautery point from a spot opposite the middle turbinate body, forward and slightly downward for a line or an inch. After an interval of six or seven days the operation is repeated on the other side. The heart, kidneys, gout and rheumatism should be treated separately and without reference to an asthmatic attack. During the attack a hypodermic injection of ½ grain of morphia generally gives relief; amyl-nitrite inhaled or nitroglycerine 1/100 grain injected lessens the severity of an attack. Adrenalin by hypodermic injection is claimed by some to be very useful. Cigarettes of various kinds usually composed of a combination of the leaves of belladonna, stramonium and hyoscyamus are used and help some patients very much. Inhalation of fumes from burning blotting paper soaked in potassium nitrate (1/15) is also used. In the interval remedies recommended for internal use to prevent and lessen the severity of future attacks are potassium iodide, belladona, lobelia, hyoscyamus and grindelia robust.

ASTI, Italy, known in ancient times as Asia Pompeia, a city in the province of Alessandria. It is on the left bank of the Tanaro and on the railroad running from Alessandro to Turin, being about 35 miles southeast from the latter city. It is of the same appearance that it did during the Middle Ages, with its narrow, twisting streets and ancient buildings. Among the latter is the cathedral, which was built in 1348. Early in its history it was noted for its beautiful pottery. In the Middle Ages it was one of the formidable city republics into which Italy was then divided. It is the centre of a fertile agricultural region; but the chief product of the neighboring districts is the sparkling wine named after the city and which alone causes it to be remembered in modern times. Pop. 41,252.

ASTIE, aa’tya’, Jean Frédéric, French theologian: b. Nérac, 21 Sept. 1822; d. 20 May 1894. He studied at Geneva, Halle and Berlin, then, in 1848, came to the United States, where he remained as a clergyman for five years. In 1856 he was appointed professor of philosophy and theology at Lausanne, Switzerland. In 1868 he became the editor of the Revue de Théologie et de Philosophie. He wrote 'Histoire de la république' in the U. States-Unis (2 vols., 1865); 'Mélanges de théologie et de philosophie' (Lausanne 1878); 'Réalité, franchise et courage' (Paris 1888).

ASTIGMATISM, a defect of vision in which the rays of light do not converge to a single point on the retina. It is usually due to irregularities in the curvature of either the cornea or the crystalline lens, or both, so that rays refracted in one meridian are brought to a focus at a point in advance of or behind those refracted in the meridian at right angles to the first, or it may be due to functional defective control of the crystalline lens. A slight degree of astigmatism is present in all eyes, because neither the cornea nor the anterior or posterior lens surface is part of a perfect sphere; but normally the defect is so slight as not to be noticeable. The conventional star-shaped appearance, assumed by very distant points of light, as, for example, the stars themselves, is due to this universal defect. If, however, the radii of curvature are markedly unequal in the different meridians, a more or less serious blurring of the images formed on the retina by all objects results. Two main varieties of astigmatism are recognized. The commoner is regular astigmatism, in which there is a difference of curvature in two meridians, usually at right angles to each other, but the refraction is the same throughout any given meridian. In irregular astigmatism, however, there are variations of curvature along the length of the different meridians themselves; that is, each one does not, as in regular astigmatism, represent a segment of a circle. This form is usually the result of injury or disease of the cornea or lens, and is difficult to correct by glasses. Regular astigmatism is nearly always congenital and is frequently present in several members of the same family. The symptoms produced by it are purely local and comprise blurred vision and fatigue after protracted near work, but even slight amounts may in some cases cause serious disturbances of the general health by the constant headache and reflex symptoms, such as
ASTLEY — ASTOR

nausea and vomiting, dizziness, etc., that result. Many of these symptoms may be purely psycho-
genic and indicate an unwillingness on the part of the patient to face the problems. The difficulties complained of are usually, at least partly, relieved by resting the eyes. Numerous methods of examination are employed by optometrists to detect astigmatism, one of the simplest being the use of test diagrams representing radial planes or sectors of dots, etc., which, to the astigmatic eye, appear more or less blurred in certain meridians. The treatment consists in the use of glasses which are ground so as to compensate for the variations in refracting power of the optic media in the different meridians. This correction is accomplished by using cylindrical lenses, which are segments of cylinders and refract only at right angles to their axis, combined, if necessary, with the appropriate spherical lenses. Psychogenic symptoms may be relieved by a proper psychotherapy. See EYE; VISION, DEFECTS OF.

ASTLEY, Hugh John Dukinfield, English theologian and anthropologist: b. 29 Sept. 1855. In 1881 he was ordained a clergyman of the Church of England; in 1894 he was incumbent at the Parish of St. John the Evangelist, Brixton, after which he became vicar of East and West Rushden, Norfolk. In 1906 he was appointed Donnellan lecturer at the University of Dublin. He was also librarian of the Royal Geographical Society. Among his works are 'The Resurrection and Modern Thought' (1889); 'The Date of the Samaritan Pentateuch' (1892); 'The Housing Problems in the Country' (1901); 'The Higher Critic and Holy Writ' (1905); 'Portuguese Parallels to the Clyde Isles Discoveries' (1904); 'The Saxon Church at Bradford-on-Avon' (1905); 'Memorials of Old Norfolk' (1908); 'Prehistoric Archeology and the Old Testament' (1908).

ASTON, William George, Irish philologist: b. near Londonderry in 1841; d. Devonshire, 22 Nov. 1911. He became interpreter and translator to the British Legation at Tokio in 1870; assistant Japanese secretary at Tokio in 1873-80; consul-general for Korea in 1884-86; vice-secretary at Tokio in 1886; and was retired in 1889. He published 'A Grammar of the Japanese Spoken Language'; 'A Grammar of the Japanese Written Language'; 'A Translation of the Nihongi'; or, Annals of Ancient Japan'; 'History of Japanese Literature'; 'Shinto', etc.

ASTON HALL, an old manor house in Birmingham, England, purchased by the city and turned into a museum. It is supposed to be the original 'Bracebridge Hall' described by Washington Irving.

ASTOR, John Jacob, American merchant: b. Walder, Baden, near Heidelberg, 17 July 1763; d. 29 March 1848. He came to America in 1783, where his elder brother had settled and invested his savings in the fur trade. In 1784 he went with a cargo of furs to London; sold them and formed connection with fur houses there, and as his capital he made annual trips to Montreal, buying furs there and shipping them direct to London, as Canada was allowed to trade only with the mother country. In 1794 Jay's treaty removed this embargo, and Astor, then in London, at once made a contract with the Northwest Company of Montreal and Quebec (then the magnate of the Canadian Northwest fur trade), imported furs from Montreal to New York, and shipped them to all parts of Europe and China. The surrender of the lake posts under the treaty also greatly extended the trading limits, and Astor in a few years became one of the leading merchants and capitalists of the country, having a quarter of a million in assets in 1798, and doubling that a few years later. In 1807 he embarked in direct trade with the Indians by way of the Mohawk, and with the English fur companies; but found the American trade chiefly monopolized by the Mackinaw Company, and knowing our government's desire to keep its home trade in home hands, proposed with its protection to accomplish this himself. In 1809 he secured a New York charter for the American Fur Company, but the War of 1812 suspended operations, and after it a government prohibition of British fur trade in the United States broke up the company. Meantime a grander scheme had been initiated. Sir Alexander Mackenzie, after crossing the continent far up the Mackenzie, had suggested establishing a line of trading posts from ocean to ocean, with terminal, coast and island stations, to draw all except the Russian fur trade into one channel. Lewis and Clarke's transcontinental expedition in 1804 proved its practicability on American soil, and Astor evolved the plan of distributing such posts along the Missouri and Columbia rivers, with a central station at the mouth of the latter, where all the peltries from the interior and those gathered by coasting vessels were to be collected and taken by a yearly ship to Canton, loading in return with Chinese goods. A later development was to operate a line of ships from the Pacific coast to the Chinese and East Indian ports, with a Hawaiian island for an intermediate port. The Russian Fur Company had already complained to the United States of the casual American trading vessels selling liquor and firearms to their Indians; the American government had consulted Astor for a remedy and his idea was to abolish this irresponsible trading by making his yearly supply ship take its place. To prevent ruinous competition he offered the Northwest Company a one-third interest in the enterprise; but they declined it and sent a company to seize the mouth of the Columbia before his party could arrive. He succeeded in spite of them, however, in planting a settlement, which was named Astoria; but on the breaking out of the War of 1812 the English seized it. It reverted to the United States by the Treaty of Ghent, and Astor wished to revive the project, but the government was cool, and he dropped it, still however, buying his furs direct and trading with many countries, more particularly China, at that time the best fur mart in the world. He also made large amounts by buying depreciated government securities, which afterward commanded a considerable premium. But his chief investment was the one which has founded the family greatness on a rock. Foreseeing the growth of the New York city, he bought large tracts on Manhattan Island far beyond the then city limits, taught his son to invest his accumulations in the same way, and established the system of handling them described under Astor FAMILY. In 1827 he and...
his son William, who had been his partner since 1815, withdrew from the China trade and formed the American Fur Company, chiefly managed by the gift expert; but a few years later he retired from business altogether, henceforth devoting himself to his investments, and devising, in consultation with others, plans for a public library suggested by Washington Irving.—afterward the Astor Libr ary, for which he left $400,000 in his will. He made gifts and bequests to other objects; among them $50,000 for a school for poor children and a home for the indigent aged in his birthplace, Waldorf, called the Astor House. He was much more than a great trader: he had a breath of conception, a combined energy and patience of execution, a mastery of detail, a retentiveness of memory and a sagacity of judgment, which in the opinion of his intimates would have raised him to greatness in any other sphere of life. He left two sons, William B. and John Jacob, and three daughters.

ASTOR, John Jacob, American capitalist and soldier, son of William B.; b. New York, 10 June 1822; d. 22 Feb. 1890. He was educated at Columbia University and at Göttingen; he then took the full course at the Harvard Law School, and practised law for a year, solely to qualify himself for assisting in the management of the immense estate, one-half of which later descended to him. In the Civil War he served on McClellan's staff, with the rank of colonel; and was a devoted and hard-working military student. He always regarded this period as the best of his life, and attended the reunions of the Loyal Legion with zeal. Not only was he always a liberal giver to public institutions and charities, but he gave much of his personal time and devotion to them, especially to the Astor Library and Trinity Church; but he shrank from public notice. On his father's death in 1875 he received half of the estate, estimated at considerably over $100,000,000; all which, with accumulations believed to have swollen it to some $200,000,000, he left to his only son, William Waldorf Astor. His wife, Charlotte Augusta Gibbs, was an active assistant in his charitable work, taking part in personal service as "Sister Augusta," incognito.

ASTOR, John Jacob, American capitalist and inventor, fourth of the name of nephew of John Jacob the third, and son of William: b. Rhinebeck, N. Y., 13 July 1864; d. at sea (Titanic wreck) 15 April 1912. He was graduated from Harvard in 1888. He was the manager of the Astor properties in America; a director in many banking, insurance and railroad companies, and member of various clubs and social organizations. He built in 1897 a very costly hotel, the Astoria (named after the famous fur settlement of 1811), on Fifth avenue, New York, adjoining the Waldorf built by his cousin, William Waldorf, the two being now joined as the Waldorf-Astoria. Besides his business activities, he had strong individual faculties. He was an expert in marine mechanics, inventor of a bicycle brake, and a pneumatic road improver; and was a member of many intellectual societies. He wrote "A Journey in Other Worlds: A Romance of the Future" (1894). He was on Governor Morton's staff 1894-96, and in the Spanish-American War of 1898 was commissioned lieu-
tenant-colonel of United States Volunteers, and served in the Santiago campaign.

ASTOR, William Backhouse, American merchant and capitalist, eldest son of John Jacob Astor: b. New York, 19 Sept. 1792; d. 24 Nov. 1875. He was trained in his father's business in the intervals of public school education; and the father is said to have remarked that "William would never make money, but would keep what he had." At 16 he was sent to Heidelberg University, and at 18 went to Göttingen, where he was courted by Blumenau, afterward the great cavalier. Returning to New York in 1815, he was made a partner in his father's foreign shipping trade, especially cultivating the Chinese field. The firm was John Jacob Astor & Son till 1827, when it dissolved and both partners gave up the China trade to form the American Fur Company, of which William was president, but John Jacob the head manager till he withdrew from active business life a few years later. He was shortly followed into retirement by his son. By 1848 he had amassed a fortune of his own; besides receiving a legacy of half a million from his uncle Henry, and a gift of the Astor House from his father; the latter on his death in that year leaving him sole legatee save for the mortgage being estimated at $20,000,000 to $30,000,000. His life thenceforth was spent in conserving and developing this. He built nearly a thousand houses on his uptown lots, and was currently termed "the landlord of New York." He was also a heavy investor in other lines, notably coal and railroad stocks. He founded the Astor Library under his father's bequest, adding by gifts and bequests over $600,000 to his father's gift, giving much time to its administration from the completion of the building in 1853 on his plans. His wife was the daughter of Madison's second Secretary of War; his sons were John Jacob and William, and the estate was shared between them.

ASTOR, William Waldorf, capitalist: b. New York, 31 March 1842. He was called to the United States Bar in 1875; was a member of the legislature of the State of New York 1878-81; and was United States Minister to Italy 1882-85. In 1890 he transferred his residence to England and in 1899 became a naturalized British subject. In 1892 he purchased the Pall Mall Gazette; in 1893 he established the Pall Mall Magazine, and in 1911 acquired The Observer. In 1912 he sold the first named journal, and in 1914 made a present of the Pall Mall Gazette and The Observer, with the building in Newton street and its contents, to his son, Maj. Waldorf Astor, M.P. He is the author of 'Valentino,' a story of Rome (1886); 'Sforza,' an historical romance of the 16th century in Italy (1889); 'Pharaoh's Daughter, and Other Stories' (1889), besides numerous stories and articles which have appeared in the pages of the Pall Mall Magazine. His benevolence is well known and his gifts to charities have amounted to very considerable sums. Among those charities benefited by his gifts are The Hospital for Sick Children at 4 Great Ormond street (to which he gave $250,000 in 1903); University College, London; The Cancer Research Fund; Oxford University; Cambridge University; The National Society for the Prevention of Cruelty to Children; The British
Red Cross Society; Gordon Memorial College, Khartum; The Soldier and Sailors’ Families Association, and the Women’s Memorial to Queen Victoria. His gifts to the war charities include $125,000 to the Prince of Wales’s National Relief Fund; $250,000 to Prince Louis’s Officers’ Families Fund; $200,000 to the British Red Cross Society; $25,000 to Queen Mary’s Employment Committee, and a similar sum to the Lord Mayor’s National Bands Fund. He has given $5,000 to King Edward’s Hospital Fund annually since 1897 when the fund was started. On 1 Jan. 1916, he was offered and accepted a peerage of the United Kingdom under the title of Baron Astor of Hever Castle in the County of Kent. Hever Castle is well known as having been the residence of Anne Boleyn and the place at which her courtship by Henry VIII was carried on. It was purchased with the surrounding estate by Mr. Astor in 1903. On 3 June 1917 Baron Astor was elevated to the rank of Viscount.

ASTOR FAMILY. A famous American family representing one of the three or four greatest private properties in the world. A family in the Old World sense,—a territorial aristocracy, impossible to destroy, and fortified with legal immunities and privileges,—can hardly be found in America; but the Astors have approached it as nearly as our institutions will admit. They form a group of immense hereditary real-estate owners, with holdings so solidly based and well distributed in the metropolis of America that no apparent catastrophe could deface their business, removed by some three-quarters of a century from its actual conduct. For many years they were known as the landlords of New York, the best of landlords, prompt, just and courteous; they still probably form the largest set of individual real-estate holders. The family is also connected with notable municipal charities and public foundations. See Astor, John Jacob (1763-1836); Astor, John Jacob (1822-90); Astor, John Jacob (1864-1912); Astor, William Backhouse (1792-1875); Astor, William Waldorf (1848-).

ASTOR LIBRARY. See NEW YORK PUBLIC LIBRARY.

ASTOR PLACE RIOT, in American history: a riot on the evening of 10 May 1849, in Astor Place, New York. It was an attempt to drive the English actor, William Charles Macready (q.v.) from the stage, and grew out of a London tour of Edwin Forrest (q.v.), in which he played Virginius and Richelieu with great success till Macready bought the acting rights for himself, though he had personally treated Forrest with kindness. Forrest then essayed Macbeth, but it was unsuited to his style and person, and he was hissed. He attributed this to Macready’s machinations, and when Macready four years later announced ‘Macbeth’ in the Astor Place Opera House, a crowd of Forrest’s partisans gathered early in the evening before the theatre, and waiting till the performance had begun, attempted to force a way inside and put a stop to it. The police with the Seventh Regiment (New York militia) came up, and was assailed by the mob with showers of brickbats and stones. Before the fray was ended, 34 rioters were killed, a great number wounded and 141 of the regiment injured by the missiles. The mob was successful in its purpose, however. Macready had to cancel his engagement and was not heard in New York for a couple of days, and then travel secretly to Boston, whence he sailed for England. Consult Barrett, ‘Edwin Forrest’ (1882).

ASTORGIA, Emanuele d’, an Italian composer: b. Palermo, 11 Dec. 1681; d. 21 Aug. 1736. He was educated in a monastery in Astorga in Spain, from which he afterward took his name. A ‘Stabat Mater,’ which he is said to have written in London, is considered the best of his works, and is still highly regarded.

ASTORGIA, as-tör’gä, a city in northwest Spain, province of Leon, the Asturica Augusta of the Romans. It figured prominently during the Persecution War, after an obstinate defense, 1810; and regained by the Spaniards, 1812. It is the see of a bishop. Pop. 7,600.

ASTORIA, Ore., city, port of entry and seat of Clatsop County, on the Columbia River, nine miles from its mouth, in the Astoria & C. R. Railroad from Portland. Several foreign steamship lines touch here, the largest vessels coming up to its five miles of water frontage through the deep, broad channel dredged in the bar at the river mouth. Its salmon fishing and canning industries are among the greatest in the world: several hundred boats go out to the fishing grounds on the bar every afternoon during the season of about 100 days, some 1,500 in all being employed; and the canneries utilize some $2,000,000 capital, and turn out about 15,000,000 cans of salmon a year. It has also subsidiary can factories and iron works, great lumber works from the vast forests of the Pacific slope, flouring mills, breweries, etc. The United States census of 1914 recorded 57 manufacturing establishments of factory grade, employing 1,375 persons, of whom 1,172 were wage earners, receiving $866,000 annually in wages. The capital invested aggregated $5,293,000, and the year’s production was valued at $4,351,936, and 836,000 was the value added by manufacture. The city has a very large export trade in the special products of Oregon and Washington — lumber, wheat, oats, live stock, wool, potatoes, apples, etc. Among its buildings, the most notable are the United States custom-house, the post office, Saint Mary’s Hospital (R. C.), and Fort Clatsop dating from its foundation by the Lewis and Clarke expedition in 1805. For the founding of Astoria in 1811, see Astor, John Jacob, and consult Irving, W., ‘Astoria, or Anecdotes of an Enterprise beyond the Rocky Mountains’ (Philadelphia 1836). On its seizure by the English in the War of 1812, they renamed it Fort Saint George; in 1818 it was restored to the United States, though occupied till 1845 by the fur station first of the Astor Company, then of the Hudson Bay Company with which the former consolidated. It received a city charter in 1876. Pop. (1910) 9,599; (1914) 10,100.

ASTORIA, or ANECDOTES OF AN ENTERPRISE BEYOND THE ROCKY MOUNTAINS, a thrilling work by Washington Irving (1836). It comprises stories of expeditions by land and
ASTRAD—ASTRINGENTS

sea, and as a chapter of Far West history, does not lose its value by the lapse of time.

ASTRAD, ä's'tra-bad', Persia, a town about 30 miles east of the Caspian Sea. It carries on a trade in horses, sheep, cotton, silk, woolen fabrics, etc., and is connected by caravan with Afghanistan and is the seat of a Russian consulate. Pop. estimated at about 15,000 to 20,000.

ASTRÉE, The Divine, a name applied to the English novelist and dramatist, Mrs. Aphra Behn, a Jewess, who was noted for the coarseness of her plays. "The stage how loosely Astrea tread." She was the first English female novelist.

ASTREA, in mythology, the daughter of Zeus and Themis, and goddess of justice. In the age of gold she was a regular inhabitant of this world; in the age of silver an occasional visitor; and in the age of brass, when men began to forge weapons of war, fled to the skies, where she is seen in the Zodiac, forming the constellation Virgo. She is usually represented with scales in her hand and a crown of stars on her head.

ASTRAL, in architecture, a small semi-circular molding, with a fillet beneath it, encircling a column and separating the shaft from the capital.

ASTRALOMANCY (Greek astra- galos, in the plural—as dice, and manies—divination), a pretended divination performed by casting down dice with marks corresponding to letters of the alphabet, and observing words thus formed. It was practised in the temple of Hercules, in Achaia.

ASTRAGALUS. See Foot.

ASTRAGALUS, Milk Vetch, a genus of more than 1,000 species of hardy leguminous herbs and under-shrubs which, except in Australia where they have not been found, are of world-wide distribution on dry soils. A. gummifer and other species yield tragacanth (q.v.) gum. Certain species native to the western United States called crazy weeds (q.v.) are considered responsible for crazy disease of stock. The leaves are usually pinnate; the flowers arranged in racemes, white or purplish. A few native and foreign species are grown from seed for ornamental purposes. They succeed best on dry, porous soil in sunny situations.

ASTRAKHAN, a name given to sheep-skins with a curled woolly surface obtained from a variety of sheep found in Bokhara, Persia and Syria, and also to a rough fabric with a pile in imitation of this.

ASTRAKHAN, ä's'tra khân', a government in the southeast of European Russia, on the Caspian; with an area of about 91,042 square miles. It consists almost entirely of two vast steppes separated from each other by the Volga, and forming for the most part arid sterile deserts. The livestock consist chiefly of sheep of the broad-tailed species. The chief employment are pasturage and fishing—the former occupying the rural and nomadic tribes, and the latter the tribes on the Caspian coast and the banks of the Volga. The extraction of salt from the lakes is also a source of employment. The population is extremely diverse—consisting of Kirghiz, Kalmucks, Tatars, Cossacks, Armenians and Jews—and numbered in 1914 1,315,900.

ASTRAKHAN, the capital of the Russian government of the same name. It is situated on an island in the Volga, about 60 miles from the Caspian Sea, is surrounded by a wall and consists of crooked, dirty, but broad streets, with irregular lines of houses. The communication with the opposite banks of the river is maintained by numerous bridges. It is the see of Greek Catholic and Armenian archbishops, and there are numerous sacred edifices, including mosques and an Indian temple. The most important edifice is the cathedral, of a rectangular form, with four small gilt and painted cupolas on the roof, and a large one in the centre. The city gives its name to a kind of fur, the skin of new-born Persian lamb, and its imitation in rough woollen coats. The manufactures, consisting of silks, cottons, wools, shagreen skins, morocco leather and soap, are increasing in extent. The fisheries, shipbuilding and tanning are the staple industries. Immense quantities of fish, caviar, and isinglass are exported to foreign countries. Salt, fishery goods, flour and tobacco, are exported from 20,000 to 30,000 persons connected with the fisheries frequent the city. It is the naval station of the Caspian fleet; is the most important port of the Caspian, and has regular steam communication with the principal towns on the shores of that sea. The development of the petroleum fields at Baku and the opening of the Trans-Caspian Railway have increased its importance as a centre of trade between western Europe and central Asia. The city fell into the hands of Russia in 1594. Pop. (1913) 162,482.

ASTRAL BODY, a term used by Theosophists. According to their belief the soul has two bodies, one of attenuated matter which is sometimes able to carry the spirit away from the material body during sleep, and which may survive the death of the material body for some time. See THEOSOPHY.

ASTRAL SPIRITS, spirits believed by the Greeks and Orientals to inhabit the heavenly bodies or the aerial regions. In the Middle Ages they were variously conceived as fallen angels, souls of departed men or spirits originating in fire, and belonging neither to heaven, earth nor hell. Paracelsus regarded them as demoniacal in character.

ASTRAPOTHERIIDÆ, a family of hoofed mammals, fossil in the Santa Cruz beds of Miocene Age in Patagonia, which had a rude resemblance to the primitive rhinocerose. Their most remarkable feature was a long trunk-like proboscis.

ASTRINGENTS. Substances that have the property of precipitating albumin and other proteids as astringents. When used on mucous membranes they contract the tissues, diminish the blood supply, decrease the mucus and modify the sense perceptions in the part. In the mouth they cause the sensation of puckering. Their action is purely local. Vegetable astringents all contain tannic acid, to which substance their action is due. Nearly all of the mineral salts are astringent when used well diluted with water. In concentrated solution their coagulant action is so
pronounced as to cause death of the tissue (caustic). The astringents are particularly serviceable in tanning animal mucous membranes, causing them to secrete less mucus. They are thus useful in chronic diarrheas, in leucorrhoea and in mucous discharges from other parts of the body. The most serviceable of the vegetable astringents is tannic acid, or its component of tannin and related bodies. Others used are rhathane, catechu, kino, logwood and white-oak bark. Of the mineral salts, solutions of copper sulphate, zinc sulphate, lead acetate, nitrate of silver, sulphate and chloride of iron, alum, sulphuric, hydrochloric, nitric acid, and the aluminum salts are the most useful.

ASTROCARYUM, a genus of about 30 species of tropical American pinnate-leaved palms noted for their profuse sharp spines sometimes a foot long. *A. murumuru*, the murumuru palm, a common species in the lower Amazon region, seldom attains a height of more than 20 feet. It bears an edible, melon-flavored, musky-scented ovoid fruit about an inch long, the pulp of which is highly prized as food for man and cattle. Hogs consider them, which are almost as hard as vegetable ivory, and fatten well upon them. *A. tucuma*, the tucuma palm, reaches a height of 30 to 40 feet, and has very regularly arranged spines, bears an edible, globular fruit, and is native of the same region as the preceding species. *A. vulgare* is a taller-palm than the above. The unexpanded leaves furnish a strong fibre, for which the tree is often cultivated where it is not native. To obtain this fibre the terminal bud is cut and the epidermis of the delicate leaves carefully peeled in ribbon-like strips; when dry are twisted into fine, strong, durable threads used for making twine, bowstrings, harnocks, fishing nets, etc. The fibre of older leaves is coarser, tougher and stronger and is used for cordage; the petioles of the young leaves are used for making into baskets and hats. This species, commonly known as the tecum palm, is distinct from the tucuma palm noted above, but was confounded with it by Martius, who pictured the same as the preceding species. Coming, Wallace, ‘Palm Trees of the Amazon’ (1853). Several species are cultivated in greenhouses for ornamental purposes and specimens as large as 10 feet tall often bear fruit. For culture, consult Bailey, ‘Standard Cyclopedia of Horticulture’ (1914).

ASTROLABE (from Greek *astron*, a star, and *lambano*, I take), the name given by the Greeks to any circular instrument having one or more graduated circles. In modern astronomy this instrument is no longer used, because wholly superseded by the sextant. The first application of the astrolabe to navigation was made by the physicians, Roderic and Joseph and Martin Behaim of Nürnberg, when John II, King of Portugal, desired them to invent a method of preserving a certain course at sea. Angles of altitude were found by suspending the astrolabe perpendicularly.

ASTROLOGY, the science which claims to foretell future events, especially the fate of men, from the position of the stars. Originally, that is, among the Greeks and Romans, the word had the meaning of ‘astronomy,’ and, as in the case of alchemy and chemistry, the pseudo-science and the real science had the same name. In early times, when the earth was regarded as the centre of the universe and as that to which all else was somehow tributary, it was a not unnatural hypothesis that the changing configurations of the heavenly bodies might be indicative of the inner workings of human character. Hence, the Chinese, the Egyptians, the Chaldeans, the Romans and most other ancient nations, with the exception of the Greeks, became implicit believers in astrology. It was partly the cause and partly the effect of the prevalent worship of the heavenly bodies. The *star-gazers*, sarcastically referred to in Isa. xlvii, 13, were perhaps astrologers; so also may have been what are called in the margin “viewers of the heavens”; but the Hebrew word rendered “astrologers” in Dan. i, 20; ii, 2, 27; iv, 7; v, 7, is a much vaguer one, meaning those who practise incantations, without indicating what the character of these incantations may be. The later Jews, the Arabs, with other Mohammedan races, and the Christians in medieval Europe, were the greatest advocates of astrology. Some of the greatest astronomers, among whom was John Kepler, who knew very much better, were accustomed to cast horoscopes, and to receive large fees for so doing. The ordinary method of procedure in the Middle Ages was to divide a globe or a planisphere into 12 portions by circles running from pole to pole, like those which now mark meridians of longitude. Each of the 12 spaces or intervals between these circles was called a “house” of heaven. The sun, the moon and the stars all pass once in the 12 houses. Each house has one of the heavenly bodies ruling over it as its lord. The houses symbolize different advantages or disadvantages. The first is the house of life; the second, of riches; the third, of brethren; the fourth, of parents; the fifth, of children; the sixth, of health; the seventh, of marriage; the eighth, of death; the ninth, of religion; the tenth, of dignities; the eleventh, of friends; and the twelfth, of enemies. The houses vary in strength, the first, one, that containing the part of the heavens about to rise, being the most powerful of all; it is called the ascendant, while the point of the ecliptic just rising is termed the horizon. The important matter was to ascertain what house and star was in the ascendant at the moment of a person’s birth, from which it was deemed possible to augur his fortune. It followed that all people born in the same part of the world at the same time ought to have had the same future, an allegation which experience decisively contradicted. Even apart from this, astrological predictions of all kinds had a fatal tendency to pass away without being fulfilled; and when, finally, it was discovered that the earth was not the centre of the universe, but only a planet round another body, and itself much exceeded in size by several of its companions, every scientific mind in Europe felt itself unable any longer to believe in astrology, which has been in an increasingly languishing state since the middle of the 17th century. It still flourishes, however, in Asia and Africa, and is a means of livelihood to...
ASTRONOMICAL CLOCKS. See Astronomy, Practical.

ASTRONOMY. Astronomy is that branch of science which treats of the heavenly bodies—including practically all the bodies of the universe. The great advance which our times have witnessed in the methods of research has made it one of the most progressive of the sciences, while at the same time it is one of the oldest of all. The vast extent of its field, including the entire universe within its bounds, leads to its having a number of different branches. There is, first, a branch which embraces our general knowledge of the heavenly bodies, their motions, aspects and physical constitution. This branch is commonly termed descriptive or general astronomy. It is now recognized as having two divisions, one relating principally to the motion, mutual relations and motions of the heavenly bodies, their motions, aspects and physical constitution. The former division is sometimes termed astrometry, because it is principally concerned with measurements of position, motion, and other physical constants, considered individually. The former division is sometimes termed astrometry, because it is principally concerned with measurements of position, motion, mass, etc. The other branch is termed theoretical astronomy, which has received its greatest development in recent times. There is also a branch which teaches the methods of observing the heavenly bodies, including the instruments used in observation and measurement, and the principles governing their use, as well as the practical computations incident thereto. This branch is termed practical astronomy. Another branch is the mathematical one, which determines the orbits and motions of the heavenly bodies by deductive methods taking as a basis the facts of observation and the laws of motion, especially that of gravitation. This branch treats of the orbits of the heavenly bodies and of the methods of computing the effects of their mutual attraction. It is commonly termed theoretical astronomy, because the more purely mathematical theory is known as celestial mechanics.

The subject of astronomy is treated in the present work on the following plan: We begin with a brief, but comprehensive, survey of the universe, referring to special articles—Stars, Universe, Nebula, Solar System, etc., for details. This survey will be followed by reviews of Practical Astronomy, Theoretical Astronomy and of the historical development of the science.

Descriptive Astronomy.—Considered as to their nature, the heavenly bodies may be divided into two great classes; the one, incandescent bodies which shine by their own light; the other, opaque bodies which are visible only by reflecting the light of some incandescent body in their neighborhood. Examples of the first class are the stars which stud the heavens at night; examples of the second are the planets, of which our earth is one. From the very nature of the case, it is evident that the possible number of opaque bodies which may exist in the universe. There may be some rather uncertain ground for inferring that they are less massive and less numerous than the incandescent bodies; but it is sometimes supposed that they may far surpass the latter without our being aware of the fact. The stars are scattered through the wilderness of space at distances which baffle all our powers of conception. Light moves with such speed that it would make the circuit of the earth seven times in a single second. But the cases are rather exceptional when a star is so near one of its neighbors that light would not take years to travel over the distance which separates them. Indeed, the only known exceptions belong to the class of double or multiple stars—two or more such bodies forming a system by themselves. There is time, however, that its light would reach us in four years, and the same is probably true of most other stars. That the universe of stars extends to distances which light would require several thousand years to travel is certain; but no well-defined limit has yet been set to its extent. Our sun is one of the stars, and is the one of which we know most because of our proximity to it. It is the centre around which eight great planets and a number of other bodies perform their revolutions. On these planets, in the third in the order of distance, we dwell. Our knowledge of the heavens is largely conditioned by our residence on this planet. We see the other planets by the light of the sun, which they reflect to our eyes, and see the appearance of stars; and it is only when scrutinized with the telescope that they are found to have a measurable apparent size. Vast indeed is their distance from the sun when measured by our standards. Yet, the dimensions of our solar system are very small when compared with the distance which separates the stars. Light passes from the sun to the outer planet, Neptune, in about four hours, while, as we have said, it requires years to reach any star. The nearest star is therefore thousands of times farther than the most distant planet. A most interesting question is whether other stars have systems of planets revolving round them, as our sun has. This is a question which it is impossible to answer conclusively. Such planets would be absolutely invisible through the most powerful telescope that man can ever hope to construct. Yet certain theoretical considerations seem to render it probable that many, and perhaps the majority, of the stars have planetary systems. It is generally held by astronomers that all stars were originally nebula; investigation shows that if the nebula was of a more or less heterogeneous structure it will develop, at least usually, into a central sun attended by a system of planets (see Cosmology). As by far the greater part of the nebula of the sky are of a spiral structure, and hence far from having a uniform density, it is indicated that this is the usual condition of these objects; it is thus rendered probable that at least many of the stars are the centres of systems which bear a less closely resemble our own. In special cases evidence on the subject is afforded by the spectroscope, which shows that great numbers of stars really have one or more dark bodies revolving around them. From these bodies, which are observable with the spectroscope, these bodies must be vastly larger than the planets which revolve round our sun. The existence of a planet like that on which we dwell could not be determined even with the best spectroscope. The bodies of the solar system are bound together by the law of gravitation. Were it
not for the attraction of the sun each planet would fly off in a straight line through space. Through the attraction of the sun all the planets are kept in their several orbits. Every consideration leads us to believe that gravitation extends from one star to all the others, but diminishing as the inverse square of the distance. Revolving double stars show that systems of two stars in proximity to each other are subject to the law of mutual attraction and hence that gravitation is not peculiar to our solar system, but operates throughout the entire visible universe.

All of the stars are in motion, some of them with exceedingly high velocities, but though there are several instances of streams of stars, the members of which are moving along parallel paths with the same velocities, in nearly all cases the stars are found to be moving differently in any direction and with different velocities. Though we do not doubt that their motion is truly and uniformly applied to all of them, it is apparent that gravitation is not the determining force. The combined attraction of all the bodies which compose our universe, the nature of the resulting motion in any particular case is necessarily very complicated. Attempts have been made from time to time to estimate the total mass of our universe so to form an estimate of the mass of the dark suns and other opaque matter which is invisible to us. But the result is naturally subject to very great uncertainty. It will require the observations of many centuries, and perhaps of many millenniums, before the total mass of matter in our universe and its distribution can be determined in this way.

The three fundamental facts which determine the great phenomena of astronomy, as we observe them in the course of our lives, are (1) the globular form of the earth on which we dwell; (2) its diurnal rotation on its axis; (3) its annual revolution around the sun. The first of these facts is so familiar to all that we need not discuss it. Out of it grow the general phenomena of the sky. The heavenly bodies surround us in every direction. They are really as numerous by day as by night, only in the former case they are blotted out by the brightness of the sky. To the eye, as they really are we must fancy stars as always visible in every part of the sky. Then, by day, we should see the sun among the stars, and perhaps the moon also. Mere observation of a heavenly body gives us no idea of its distance. By looking at a star we cannot tell whether its distance is to be measured by hundreds of miles, by millions or by thousands of millions, which it actually is. Hence, all the heavenly bodies appear to us to be at the same distance, as if they were all upon the interior surface of a stupendous sphere in the centre of which we seem to be placed. This imaginary form is called the celestial sphere; it is one of the most ancient conceptions of astronomy, and it is used in the science to the present day to represent the appearance of the heavens. It is divided into two hemispheres, a visible and an invisible one. The visible hemisphere is the half which is above the horizon, which we call the sky and can always see, excepting the blackness of night and the inequalities of the ground may prevent. The other half is below the horizon, and is hidden from our view because the earth is opaque.

Were the latter transparent, we should see the heavenly bodies in every possible direction. The rotation of the earth on its axis produces the phenomena of day and night, and the apparent rising and setting of the heavenly bodies. This is known as the diurnal motion. The latter may be considered in two aspects, either as the real rotation of the earth on its axis, or as an apparent rotation of the heavens in the opposite direction, due to our being unconscious of the motion of the earth. In consequence of the diurnal motion the celestial sphere, seeming to our eyes to carry the heavenly bodies on its interior surface, appears to us to make a daily rotation on its axis. The two opposite points of the celestial sphere situated on the prolongation of the earth's axis are called the celestial poles. On these poles as pivots the celestial sphere seems to turn. They are called north or south according to the earth. As their apparent position in the sky depends on the longitude of the place where the observer is situated. A heavenly body situated at either pole does not seem to have any diurnal motion. This is nearly the case with the pole star, which, except in the northern hemisphere, can always see at an altitude above the northern horizon equal to their latitude. A voyager into the southern hemisphere sees the pole star set when he crosses the equator. Then, the south polar star would be visible if there were one. But it happens there is no bright star very near the southern prolongation of the axis. In the United States, say from 30° to 45° of latitude, the pole star is at a corresponding altitude above the horizon, and all the stars in its neighborhood appear to make a diurnal rotation round it, without changing their form or position, and without ever setting. Any one who chooses can verify this fact by noting the appearance of the northern sky about the end of twilight, and then looking at it again two or three hours later. He will then see that stars below the pole have moved toward the east; those on the east side of it have risen higher, and those on the west side are lower, while those above it, as we imagine the heavens to be, have remained in their places. For us, therefore, the sphere of the heavens may be divided into three parts; a circle round the north celestial pole within which stars never set; a corresponding circle round the south pole, the stars in which never rise above our horizon, and a broad middle region where they rise and set.

To represent the positions of the stars, astronomers imagine circles on the celestial sphere corresponding to the circles of longitude and latitude on the earth. The circle of the sun line and south meridians drawn on the earth from one pole to another, to measure terrestrial longitudes, so we imagine in the heavens circles drawn on the sphere from the north celestial pole to the south one. As the longitude of a place on the earth is expressed by the angle which its meridian makes with the meridian of Greenwich, so the corresponding quantity for a star is the angle which the circle through it makes with a certain prime meridian on the celestial sphere. The corresponding quantity for the stars is not called longitude, but right ascension, and the celestial meridians which determine it are called hour circles.
ASTRONOMY AND GEOGRAPHY

Minerva, goddess of wisdom, encircles with her arm a young child, while through the telescope she directs his gaze to the "clear night of stars" spread above him; at sight of which the child clasps his hands with a gesture of wonder. Near at hand a seated youth, holding the symbolic lamp of research, is bent over a large globe following the path of man over the traveled earth. Above and behind the terrace on which these figures are seated rises the façade of the library of Columbia University, New York.
In the same way as we have on the earth a great circle spanning it, everywhere equally distant from the two poles, and called the equator, so we imagine a circle spanning the heavens, everywhere equally distant from the zenith by a solstice circle equal to one half the distance from the celestial equator, or the equinoctial. At any one place this circle will be apparently fixed in its position, always intersecting the horizon at its east and west points, and, in our latitudes, intersecting the meridian south of the zenith by a solstice circle equal to our distance from the equator. For example, to a dweller in latitude 40°, the highest point of the celestial equator will be 40° from the zenith, and 50° above the horizon. From this point it spreads toward the east and west until it intersects the horizon as just stated. As a traveler journeys south, the position of the celestial equator becomes more and more nearly vertical; at the equator it rises vertically and passes through the zenith; south of the equator it passes north of the horizon.

As the latitude of a place is measured by its angular distance from the equator north or south, so the corresponding number for a star is measured by its mean angular distance from the celestial equator, whether north or south. This is called the star's declination. Thus the right ascension and declination of a star determine its position on the celestial sphere just as longitude and latitude determine the position of a city on the earth. All star charts are constructed with this system of circles as a basis; in all modern star catalogues it is the right ascension and declination that are tabulated.

We now have to consider the effect of the annual motion of the earth round the sun. If we watch the heavens at a certain hour every evening, say eight o'clock p.m., we shall find that the stars are every night a little farther advanced in their diurnal motion then they were the night before. If they are in a certain position at eight o'clock on one evening, they will pass through the same position four minutes before and after the next, and so on. In the course of a year these continually accumulating changes make up the whole 24 hours, so that the stars will have moved in the space of three years. In the morning six months hence, and at eight in the evening it will be at its greatest distance below the horizon. If we could see the sun among the stars, what we should notice would be that our luminary always forges a little farther east each day after day, and in the course of a year seems to make a complete revolution among the stars. The result is that while the sun rises and sets 365 times, the stars rise and set 366 times. Since the latter are always in the same absolute direction, and seem to rise and set in consequence of the earth's rotation on its axis, we infer that the direction of the sun from the earth goes through a complete revolution in the course of a year. In other words we set about 30° of the circle of the ecliptic, which is the path of the sun round the heavens, on to the sphere in circles which do not deviate greatly from the ecliptic. A belt of the heavens extending 8° on each side of the ecliptic will include all the planets visible to the naked eye. This belt is called the zodiac. Beginning at the vernal equinox it is divided into 12 portions, or 30° each, called the signs of the zodiac. In former times great stress was laid upon the entrance of the sun into these several signs, which entrances occurred about a month apart. They now occur about the 20th of every month. In our times, when the superstitions connected with this subject have van-
ished, the entrance of the sun into the signs is no longer of importance (see ZODIAC). There are also 12 constellations, beginning with Aries, and ending with Pisces, which have the same names as the signs of the zodiac, and are scattered along its course. Two thousand years ago these constellations coincided pretty closely with the signs. But now, in consequence of the precession of the equinoxes, the two no longer correspond. The sign Aries is now located in the constellation Pisces; the sign Taurus in the constellation Aries, etc.

The ecliptic, together with circles drawn parallel to it on the celestial sphere, is frequently used as a reference circle to indicate the positions of stars and planets, the circles drawn through the poles of the ecliptic then taking the place of the hour circles already described. The co-ordinates of the object in this system are known as Longitude and Latitude, respectively, but it is to be noticed that these are not analogous to latitude and longitude on the earth since the equator is no longer the fundamental reference circle. This system is employed almost exclusively in orbit work and in celestial mechanics, but it is inconvenient for the purposes of practical astrology.

The Time of Day—It is in its relation to times and seasons that the results of astronomical science come into every household. Our daily round of activity and rest is determined by the earth's rotation on its axis, alternately bringing us under the sun, and then carrying us around until it is hidden from our sight. A century ago people used to set their clocks at 12 when the sun crossed the meridian. This moment, being the middle of the day, is noon properly so-called. But if a good clock is exactly regulated, and kept going all the time, it will not show noon at the true time. The reason is that the intervals of time between one noon and the next are not exactly the same. See TIME.

Bibliography.—The most extended general treatise on astronomy for the use of the general reader is Chambers' 'Astronomy' (3 vols., 8vo., London); briefer is Newcomb's 'Astronomy for Everybody'; Ball, 'Story of the Heavens'; Flammarion, 'Popular Astronomy'; etc.

SIMON NEWCOMB.
Revised by ERIC DOOLITTLE, Professor of Astronomy and Director Flower Astronomical Observatory.

ASTRONOMY, History of. We may recognize four great periods in the history of astronomical knowledge. The first and most ancient is that in which no accurate observations were made, but in which men had a general knowledge of the apparent annual revolution of the sun, of the constellations and of the relation of the sun's annual course to the changes of the seasons. The next period was that of the celebrated Alexandrian school, so-called because Alexandria was the principal seat of its activity. This period was distinguished as that at which the first attempts were made at precise observation and measurement. It began three or four centuries before Christ. It is very remarkable that, at so early a period as this, men to whom all our modern science was completely unknown, had so far advanced in astronomical observation as to measure the obliquity of the ecliptic, determine the times of the equinoxes and detect their precession. The latter was done by a comparison of two methods for determining the length of the year, as measured by the sun's apparent revolution around the celestial sphere. Timocharis, who flourished about 300 B.C., determined the moment at which the sun crossed the equinox by means of an east and west line on the level sandy plains of Egypt, showing exactly where the sun rose or set. The day on which the point of setting in the west was exactly opposite that of its rising in the east marked the equinox, which could thus be determined within a few hours. The annual course of the sun can also be determined by the time which it takes to return to the same position among the stars after an annual apparent revolution. As the stars and sun cannot be seen at the same time, the adopted plan was to measure the distance of the sun from the moon before sunset, and after dark to measure the distance from the moon to some bright star. Allowing for the motion of the moon during the interval, the distance of the sun from the star would be known. In this way the curious discovery was made, that the apparent revolution of the equinoxes was several minutes shorter than that determined from the stars. This discovery was made by Hipparchus through a comparison of his observations with those of Timocharis about 150 years before.

Eratosthenes, who flourished just before Timocharis, was able to estimate the size of the earth. This he did by noting that at the ancient town of Syene, in central Egypt, the sun was exactly in the zenith at the time of the summer solstice, so that the gnomons of the sun-dials cast no shadows, while at Alexandria the sun was 1/50 of a circumference south of the zenith. He therefore concluded that the circumference of the earth was 50 times the distance between Alexandria and Syene. The latter being 5,000 stadia, it followed that the circumference of the earth was 250,000 stadia. Although many different stadia were in use, the records of Pliny show that the stadium of Eratosthenes must have been a length of very approximately 516.73 feet; the resulting diameter of the earth is 7,788 miles,—a very fair approximation.

Hipparchus was considered as the greatest astronomer of antiquity. He made more accurate observations than any of his predecessors upon the courses of the sun, moon and planets, determining their times of revolution with extraordinary exactness. Unfortunately none of his works survive, and our knowledge of them is derived mainly from Ptolemy's 'Almagest.'

The celebrated Ptolemy (q.v.), besides being a practical astronomer, was accomplished as a musician, a geographer and a mathematician. His most important discovery in astronomy was the ejection of the moon. He also was the first to point out the effect of refraction. He was the founder of the false system, known by his name, and which was universally accepted as the true theory of the universe until the researches of Copernicus exploded it. The Ptolemaic system placed the earth, immovable, in the centre of the universe, making the entire heavens revolve round it in
THE SEASONS.

The Earth advances thirty degrees every month in each of these Signs, which causes the Sun apparently to do the same in the opposite Sign; thus, when the Earth is in Scorpio, the Sun appears to be in Taurus, which is the opposite Sign, and so on through the others.

THE EQUINOX: Represents that point in the heavens which the Sun seems to describe by the Earth's revolution around it. It is divided into twelve equal parts or Signs, each of which contains thirty degrees.

All the Planets move round the Sun from West to East. The paths in which the Planets move round the Sun are called their Orbits. These Orbits are not exactly circular, but elliptical, so that the Planets are nearer the Sun when in one part of their Orbits than in another. When the Earth is in any other Planet is in that part of its Orbit nearest the Sun, it is said to be in its Perihelion; and when most remote, in its Aphelion.

The Earth travels at the rate of about 19 miles per second, and revolves in its orbit in 365 days, 5 hours, 48 minutes, 53.8 seconds.

Diameter of the Earth: 7,900 miles; Circumference: 25,100 miles; mean distance from the Sun, 93 millions of miles.

ROTUNDITY OF THE EARTH AND REFRACTION OF THE ATMOSPHERE.

the course of 24 hours. The work by which he is best known, however, is the collection and systematic arrangement of the ancient observations in his great work, the *Megalae Syntaxis,* which gives a complete résumé of the astronomical knowledge of the day. This work was translated into Arabic in the first part of the 9th century and was called by the Arabs the *Almagest,* and by this name it is known today in its various translations into Greek and Latin. The importance of its is lying in the seventh and eighth books, which contain the catalogue of stars which bears Ptolemy’s name, though it is only a compilation of the catalogue of Hipparchus with the positions brought up to the time of Ptolemy. This work was all accomplished during the years 127–151 A.D. The dates of Ptolemy’s birth and death are unknown. The advance of astronomy almost ceased, after the death of Ptolemy, and his *Almagest,* together with the false system of the universe which it taught, continued to be the recognized authority in Europe for the next 14 centuries.

With the death of Ptolemy, everything in the way of actual progress in astronomical theories ceased. But, a few centuries later, in the first half of the 15th century, lived Ulugh Beg (q.v.), a Tartar prince, who made important additions to astronomical knowledge.

The third period commenced when Copernicus, in 1543, first demonstrated the true theory of the universe to his fellow men in his great work *De Revolutionibus Orbium Coelestium.* His two fundamental principles were that, instead of the diurnal motion of the heavens being real, it was only apparent, being due to the revolution of the earth on its own axis; and that the apparent revolution of the sun around the sky was, in the same way, due to the actual revolution of the earth around the sun, which latter remained at rest. Centuries of observation have shown that these two principles explain so exactly every detail of celestial phenomena that they are subject to no more doubt than our conclusions as to the arrangement of streets and houses in a city which we see from our lives. Half a century after the death of Copernicus flourished Galileo and Kepler, of whom the first invented the telescope, while the second demonstrated the correctness of the Copernican theory, and also showed that the planet Mars revolved around the sun in an ellipse with the sun in its focus.

The invention of the telescope added another proof to the Copernican theory, and also enlarged our views of things by showing that Jupiter and his satellites formed a miniature solar system on the Copernican plan; that the planet Venus had phases like the moon; that the moon itself had a variegated surface apparently similar to that of our globe, and that the wonderful Milky Way was composed of innumerable stars too faint to be seen separately by the naked eye. The spots on the sun were also discovered, and the rotation of our central luminary on its axis made known. Such enormous advances were too great for the human mind at once to grasp, and the generation in which Galileo lived had to pass away before the Copernican theory was universally accepted by the learned world. To this same period belong the observations of Tycho Brahe on the motions of the sun, moon, and planets, which were, most unfortunately, made just before the invention of the telescope, and so failed of the precision which would have been gained by the use of that instrument. But, as was shown on which Kepler founded his celebrated laws of planetary motion.

The fourth and last period began when Newton showed that all the complicated phenomena of the celestial motions—the revolution of the planets in elliptic orbits, and the revolution of the satellites around their primaries, were all due to the mutual gravitation of these bodies, and took place according to the same laws which govern the motion of matter around us on the earth. As in the case of the Copernican theory, it took the learned world a whole generation to grasp the idea of Newton as to the theory of gravitation. The progress made in our knowledge of the celestial motions during the two centuries since Newton’s time have all rested on the principle which he discovered.

Toward the end of the 18th century, Sir William Herschel, then in the zenith of his fame, was interested in the telescopic observations of his contemporaries on the Continent, that the work of everyone else at the time seems unimportant in comparison. Yet not only were great successors of Herschel coming on the stage, but important additions to our knowledge of the heavens were being made outside of England. William Herschel’s son, John, was a lad of eight years. In France, Arago, a boy of 14, was fitting himself for the École Polytechnique. At Paris, Lalande, the leading astronomer of France, was actively preparing a catalogue of the faint stars, which would now be consigned to the junkshop. But it was the first attempt that had ever been made to determine accurately the positions of the many thousand telescopic stars invisible to.
the naked eye, and in consequence the 'Histoire Céleste' is still one of the classics of the astronomical investigator. In Germany, Olbers combined the professions of physician and astronomer, and Bessel, a youth of 16, was clerk in a mercantile house.

The first day of the century was marked by a discovery of capital interest and importance. The wide gap between the planets Mars and Jupiter had been a source of wonder, and the conviction that there must be a planet in it had become so strong that an association of astronomers was formed to search for it. But, on 1 Jan. 1801, before they got to work, Piazzi, the Italian astronomer of Palermo, found Ceres. The year following Olbers discovered Pallas, and propounded his celebrated theory that the newly-formed bodies were fragments of a shattered planet, more of which might be found. This anticipation was amply justified by the result, though the theory of a shattered planet has long been rejected. By 1808 the number reached 30, and in 1839 Schwabe and another quite independently published the orbit of a comet which appeared in 1866. A third astronomer, Schiaparelli, noticed that the two orbits were practically the same. The conclusion was obvious. The minute bodies which caused the shower moved in the orbit of the comet and were portions of its substance which had from time to time separated from it. The disappointing failure of the shower in 1899 and 1900 can have but one cause—a small change in the orbit of the meteoric swarm caused by the attraction of the planets. Nor has the comet associated with them shown itself; it was perhaps dissipated like that of Biela's. Apart from this, the question of the constitution of comets is still not completely solved. Their spectrum is that of a body which shines by its own light, but we are not certain whether this light principally emanates from matter in a radiant condition or whether it is due (at least in large part), to electrical discharges through the enveloping gases between the particles of the comet. But it is very probable that all comets are vast cloudlike swarms, made up of meteoric particles, cosmic dust and matter in a radiant condition, the whole immersed in a cloud of gas. In the case of the spectra it is that we obtain in our instruments. The brighter comets may have a more or less massive nucleus. Yet it is not certain that the nucleus is entirely opaque. In 1852, the astronomers at the Cape of Good Hope enjoyed the opportunity of seeing a comet enter on the disc of the sun. Unfortunately, the sun disappeared from view a very few minutes afterward. But not a trace of the comet could be seen on the sun as a spot. It was seemingly quite transparent to the solar rays. That the fainter comets have no nucleus and are merely composed of a collection of foggy particles seems certain. See Comet.

The Greenwich Observatory was taken in charge by Airy in 1834. He immediately instituted a great improvement in its organization and work, but it was not till 1850 that he acquired for it new instruments of great importance. He was the founder of what has sometimes been called the Greenwich system: the astronomers residing in the various stations using a part like those of soldiers in an army, making all their observations on a plan prescribed by the author-
ity and rarely using their own discretion in any way. The mathematical theory of the motions of the planets, which had received its greatest improvement for the hands of Hansen, born about 1795. He may fairly rank as the greatest of celestial mechanics since the time of Laplace. Toward the middle of the century, he prepared the first tables of the moon which could satisfy the requirements of modern astronomical theory. These were published by the British government in 1857, and have now formed the basis of astronomical ephemerides for nearly half a century. The most striking event of the mid-century period, and one which in the popular mind must long hold its place as among the greatest of intellectual achievements, was the computation by Leverrier of the position of an unknown planet from its attraction on Uranus. The speedy discovery of the planet on the very night it was first looked for was, for the public, a proof of the absolute correctness of gravitational theories that surpassed all others. It was as a first and bold attempt on an unknown, as in the case of Columbus and the Atlantic, its repetition would not now be generally considered a difficult matter. With the discovery of Neptune and with the advance in the art of astronomical observation, improvements in the theories of the movements of the planets were necessary. The greatest step forward in this direction was taken by Leverrier. Among the results of his work was the discovery that the perihelion of Mercury moves more rapidly than it should under the influence of gravitation. This excess of movement has been abundantly proved by observation since his time, but its cause has only very recently been plausibly explained. (See Astronomy, Theoretical.) As a general rule, it may be said that during the last half century the Germans have been the leaders in astronomical research. Their work on the subject has been more voluminous than that of any other nation. The leading astronomical journal of the world is still that of Germany. But when we consider not quantity of work, but the special importance of particular works, precedence has, from one point of view, passed to America. While, perhaps, we still have fewer students of astronomy in the United States than they have in Germany, the number among us who have acquired the highest distinction and most skillfully made applications of this science is greater than in any other country. The rapidity of progress from small beginnings is very remarkable.

In 1832, Professor Airy delivered, before the British Association for the Advancement of Science, an address on the progress of astronomy, which soon acquired celebrity. The state of astronomy in different countries was reviewed. America was dismissed with the remark that he was not aware of any observatory existing in that country. In the revival of astronomy among us and its advance to its present position in popular favor, one agency has not been eschewed. Professor D. C. Strobel of the Yerkes Observatory of the University of Chicago (situated at Williams Bay, Wis.) and the Carnegie Solar Observatory at Mount Wilson, Cal. At each of these there are Corliss, who brought considerable with the visit of Dr. Lardner were the lectures of Prof. Ormsby M. Mitchel. With unsurpassed eloquence he explained the wonders of astronomy to audiences intensely interested in the novelties of the subject. From a scientific point of view the lectures were probably not of a high order, nor could it be said that Mitchel himself, active and enthusiastic though he was, was a great astronomer. Yet it may well be said that to him is due the ability of our astronomers since that time to secure the public support necessary to the erection of the fabric of their science. A few years after he addressed small college observatories were founded at Williams College and at the Western Reserve College, Ohio. These were doubtless a stimulus to students, but can hardly have added to astronomical science. When the Wilkes Exploring Expedition was being organized it was found necessary to have a continuous series of observations made at home during the absence of the expedition which compared with those made on the ships would enable the navigators to determine the longitudes of the lands they discovered. A little wooden structure, erected by Captain Gilliss for this purpose, on Capitol Hill, Washington city, was in some sort the beginning of our National Observatory. The actual foundation of the latter was not contemporaneous with that of the Harvard Observatory, which being commenced about the year 1843. The Harvard Observatory was placed under the direction of William C. Bond, who had, for many years, made observations, first at his own house in Dorchester, and then on top of a house at Cambridge. At Washington the Naval Observatory was placed under the charge of Lieut. Fauch. After getting its instruments in operation, he devoted himself almost entirely to those researches on ocean currents, which, so long as the commerce of the world was carried on mostly in sailing vessels, were of the first importance. But the institution soon acquired astronomical celebrity in other ways. Here Searls Cook Walker made the first thorough investigation of the orbit of Leverrier's newly-discovered planet, and showed that it had been twice observed by Lalande as far back as 1795, but without its character being suspected. Here also the device of recording the transit of stars by means of the chronograph and determining the longitude of places by telegraph found their first application. New observatories, some founded in connection with colleges, others by private individuals, now sprang up rapidly. America. Twenty-four were enumerated by Loomis in 1856. What figure the number has now reached it is impossible to say; in a catalogue of the observatories of the world compiled in 1907 by Strobant, of the Royal Observatory of Belgium, there are included no less than 107 from the United States.

Beside the very important Naval Observatory, above referred to, the four largest observatories of our country are (in the order of their establishment), the Harvard Observatory, at Cambridge, Mass., the Lick Observatory at Mount Hamilton, Cal., the Yerkes Observatory of the University of Chicago (situated at Williams Bay, Wis.) and the Carnegie Solar Observatory at Mount Wilson, Cal. At each of these there are Corliss, who brought considerable with the visit of Dr. Lardner were the lectures of Prof. Ormsby M. Mitchel. With unsurpassed eloquence he explained the wonders of astronomy to audiences intensely interested in the novelties of the subject. From a scientific point of view the lectures were probably not of a high order, nor could it be said that Mitchel himself, active and enthusiastic though he was, was a great astronomer. Yet it may well be said that to him is due the ability of our astronomers since that time to secure the public support necessary to the erection of the fabric of their science. A few years after he addressed small college observatories were founded at Williams College and at the Western Reserve College, Ohio. These were doubtless a stimulus to students, but can hardly have added to astronomical science. When the Wilkes Exploring Expedition was being organized it was found necessary to have a continuous series of observations made at home during the absence of the expedition which compared with those made on the ships would enable the navigators to determine the longitudes of the lands they discovered. A little wooden structure, erected by Captain Gilliss for this purpose, on Capitol Hill, Washington city, was in some sort the beginning of our National Observatory. The actual foundation of the latter was not contemporaneous with that of the Harvard Observatory, which being commenced about the year 1843. The Harvard Observatory was placed under the direction of William C. Bond, who had, for many years, made observations, first at his own house in Dorchester, and then on top of a house at Cambridge. At Washington the Naval Observatory was placed under the charge of Lieuten.
are wisely concentrated along but one or two lines of specialized work. At institutions where the observer and his assistants are still small, but one kind of research is usually undertaken. A great part of the advancement of the science throughout the world is due to such, somewhat smaller, observatories when their resources are devoted to fundamental work, although the total amount accomplished by any one of them is less than that of the larger institutions because their field of research is necessarily less diversified.

The Harvard Observatory, while a respectable institution from its foundation and made famous by the work of the Bonds, had never commanded the means necessary to prosecute astronomical research on a large scale. When Pickering assumed the directorship in 1873, he devoted his energies to those branches of research which are now known under the general term of astro-physics, being concerned with the physical constitutions of the heavenly bodies rather than with their motions. The extension of work made possible by very large additions to the endowment of the observatory.

It thus became one of the best-supported institutions of the kind in the world. Photometry and spectroscopy have been its main subjects. With the aid of a branch established in Arequipa, Peru, the magnitudes of all the stars in the heavens visible to the naked eye, as well as many fainter ones, have been determined. A system of constantly photographing the heavens is also here carried on; the tens of thousands of plates thus far secured have many times proved of great value for reference, constituting, as they do, a permanent record of the appearance of the face of the sky.

The success of the Lick Observatory in a different, yet not wholly dissimilar, direction must be regarded as one of the most extraordinary developments of our time. Commencing work about the beginning of 1888, under the direction of Holdén, and supplied with the greatest telescope that human art had then produced, the observations of Burnham and Barnard excited universal interest, both among astronomers and the public. The discovery of a fifth satellite of Jupiter was made there by Barnard in 1892, and very recently two additional satellites of this planet were discovered at the same observatory. Later, the optical discovery of the companion of Procyon, an object known to exist from its attraction on that star, was made by Schaerbebe. But its most epoch-making work is due in still more recent years to Campbell, by measurements of the motion of stars in the line of sight with the spectroscopic, who, armed with the best spectrograph that human art could make, the gift of D. O. Mills, has, by the introduction of every refinement of his method, brought into these measures a degree of precision never before reached. The cases of variable motion, as found by him, are so numerous as to indicate that isolated stars may be the exception rather than the rule among the brighter stars. As to the host of faint stars in the sky, the irregularities in the motion of these is as yet far beyond the power of any spectroscope.

The construction of the great Yerkes Observatory was begun in 1892 and completed in 1897. Here there is mounted an equatorial telescope of 40 inches aperture, the largest refracting telescope in existence. This, together with the numerous smaller instruments, is devoted in part to spectroscopic work and in part to the accurate measures in astronomy of position. Under the former head, most important and fundamental researches have been continuously prosecuted in the spectra of the stars, while under the latter are most accurate determinations of the parallaxes of numerous stars, both by the photographic and the visual methods, and micrometric measures and discoveries on double stars and other heavenly bodies. The first director was George E. Hale, who was succeeded in 1905 by E. B. Frost, with whom are associated Burnham, Barnard and many other astronomers.

The Mount Wilson Solar Observatory of the Carnegie Institution of Washington was begun in 1904, with George E. Hale as director; it is situated on the summit of Mount Wilson, 12 miles from Pasadena, Cal. Though primarily designed for the spectroscopic study of the sun, many other lines of work are also prosecuted, the photographic studies of the stars and the unexcelled photographs of nebulae here secured are especially noteworthy. (See Astronomical Photography.) The peculiar and unusual forms of some of the telescopes designed for the special work of this observatory aroused much interest among astronomers. There is a reflecting telescope of 60 feet focal length which lies horizontally, and two refracting telescopes of which the lenses are placed on the summits of vertical towers, 60 and 150 feet in height, respectively, while the spectroscopes and photographic apparatus are placed in wells below the towers. The second tower telescope, because of its great focal length, forms an image of the sun 17 inches in diameter. There is also a 60-inch reflecting telescope, and a 100-inch mirror, which last, after many failures arising from the difficulty of casting so large a disc of glass, has now been figured, and mounted for use.

no magnifying power at all would still enable him to determine the directions of the heavenly bodies at any moment with greater accuracy than would otherwise be attainable. The principle on which the telescope is used in celestial measurement will first be explained. Let Fig. 1 represent the section of a telescope; A B being the object glass, and C the eye-end, where the rays from a star are brought to a focus. The lines converging to the plane E F represent the rays of light from a star reaching the focus. Here they form an image of the star, which the observer sees by looking into the eye-piece at C. The plane, of which the dotted line E F is a section, passing through the focus at right angles to the telescope, is called the focal plane. By changing slightly the direction in which the telescope is pointed, the rays may come to a focus on any point in this plane not too far from the axis or central line of the telescope. In the focal plane is placed a system of very fine threads which the observer sees when he looks into the eye-piece; these threads are generally made of fibres of spider-web, a substance so well adapted to this purpose that nothing better has yet come into use. To fix the ideas we shall suppose several cross threads; then the observer by looking into the telescope may see the stars and the cross-threads as represented in Fig. 2. Here we have the images of two stars quite near the crossing point of the threads. The observer moves the telescope until one of the stars is seen exactly at the point of intersection of the two threads. The fundamental principle in the use of the telescope is that when this occurs the star is apparently situated exactly on a straight line passing through the cross-threads, and the centre of the object glass. This line is called the line of sight of the telescope.

Now, let the observer move the telescope until he finds another star, whose image he brings upon the cross-threads. The angle through which he has moved the telescope from one star to the other, supposing the two stars to be at rest, will then be precisely the angle between the rays of light coming from the two stars. If, then, any system is adopted of determining through how many degrees, minutes, etc., the telescope has moved, the angular distance between the stars is known. The studious reader will remark that, owing to the rotation of the earth, the image of a star seen in a fixed telescope is continually moving across the field of view. To explain the principle we must, however, leave this motion out of account, or suppose it allowed for.

We have next to show how a large angle through which the telescope may be moved is measured. This is done by means of the graduated circle, a representation of which is shown in Fig. 3. It will be seen that the rim of the circle is divided up into degrees by fine lines as represented in the figure, where, however, only every fifth degree is marked. In the instruments actually used in astronomy, not only is every degree marked, but in the circles for the finest observations the degrees are still further subdivided into spaces of 5', 3', or even 2'. Since there are 360° in a circumference, it follows that in a division to 2' there will be 10,800 of the graduations, or fine marks, on the circle. These marks must all be as nearly equidistant as human art can make them, and the problem of doing this, together with that of making them so fine and sharp that they can be used in the most precise measurement,
the dotted outline of the latter. The circle is attached to it so that both move on an axis concentric with the circle and perpendicular to its plane. Then, when the telescope is turned on this axis, the circle turns with it as a grindstone does on its axis. The distance through which the telescope and circle are turned is then measured by means of the graduations. To show how this is done, other appliances must be described.

Instead of two stars being far apart, so that the telescope has to be moved, they may be alongside of each other, as in Fig. 2; then, the observer, by moving the cross-threads from one star to the other, and measuring the amount of the motion, can determine the angular distance between the stars, and their relation to each other. This is done by a micrometer, one kind of which will now be described.

The Filar Micrometer.—This adjunct is so called because an essential part of it consists in fine threads of spider lines stretched across the field of view, as already described. The aim of its construction is to admit of these threads being moved in a direction at right angles to their length, by a very fine screw, so that the space over which they pass may be measured by the turns of the screw. The principal appliances for effecting this are a fixed frame, A B C D, Fig. 4, in which slides another frame, E F G, moved by a fine screw at S. Across this inner frame is stretched the spider line J, and across the fixed one the spider line H. To the head of the screw is attached a cylindrical rim, which has 100 or some other number of divisions cut upon it. An index mark serves to show how far the screw is turned. An apparatus for measuring the number of turns of the screw is attached, but need not be described here. Then when the observer turns the screw, the movable frame of the spider lines is slowly carried along with it. The position of the spider lines as they move is then shown by every moment by the number of turns of the screw and the fractions of a turn. To show the accuracy with which this can be done, we remark that the screws used by astronomers may have 100 or even 125 turns to the inch. Then each revolution of the screw, as read off on the head, measures to a motion through this space. There being 100 graduations on the head, each graduation may measure the motion of 1-10,000 of an inch. But the observer may estimate the tenths between the divisions, thus carrying his measurements down to the 1-100,000 of an inch. Beside the movable spider line across the frame, fixed spider lines may also be stretched across the fixed frame. Then we shall have two systems of spider lines, one movable and the other fixed. The relation of each to the other is measured by the turns of the screw.

To determine the exact position of the graduated circle, a filar micrometer O is attached to a microscope of the form shown in Fig. 5, and the latter is finally fastened to a fixed frame in such a position that, when the observer looks into the microscope, he sees the graduations on the circle magnified as many times as necessary, and also the threads of the micrometer. The microscope being fixed remains at rest while the circle turns. If the instrument were geometrically perfect in every respect, one reading microscope would answer the purpose; but, as the circle cannot be centred with mathematical exactness, pairs of microscopes are used which are at opposite ends of diameters of the circle. For example, when the graduation 15° 20' is brought under one microscope, the graduation 195° 15' would be under the opposite one. It is customary, for greater precision, to have two such pairs at right angles to each other, or four microscopes in all.

To determine the position of the circle, and hence the direction in which the telescope attached to it points, the observer looks into one of the microscopes, and fixes upon some graduation of the circle, turns the micrometer screw till a spider line, or the middle of a pair of lines, is central on the graduation, and then reads the indication of the head of the screw. This will be 1. An index mark on the scale that mark 21° is central under the microscope. By pointing his telescope on one star after another and reading the microscope in this way, noting
on each occasion what graduation is read, the
distance through which the telescope is moved,
and therefore the angles between the stars, are
measured with the highest precision.

The Clock.—The astronomical clock does not
differ greatly in its construction from the
ordinary clock. Its arrangement and the num-
bers on its face are, however, adapted to the
measurement of time in the part of the solar
time, which is the time we make use of in
the affairs of daily life, is also used by the
astronomer with a slightly different arrange-
ment. Instead of the hours being designated
as A.M. and P.M., the astronomer counts through
the whole 24 hours. Moreover, the count does
not begin at midnight, but at noon, which is
therefore the commencement of the astronomi-
cal day. For purely scientific purposes this is
the natural time to begin the day, because it is
determined by the passage of the sun across
the meridian. Therefore, any day of the month,
as used by the astronomer, continues until noon
of the following day, when a new day begins.
For the reason that the hour hand of his clock
only makes one revolution in the 24 hours, the
hours being numbered from 0 to 23. The astro-
nomers makes use of a second system of
time, entirely different from that used in daily
life, being based on the apparent diurnal move-
ment of the stars. We have explained, in the
preceding article (ASTRONOMY) that the time
between two passages of the same star over
the meridian of a place is not quite 24 hours,
but nearly four minutes less. This is the true
time of rotation of the earth on its axis, be-
cause, in consequence of the advance of the
earth in its orbit, it must go through a little
more than its true revolution in order that the
meridian of any place on its surface—that of
Washington for example—may again pass
directly under the sun. The astronomer there-
fore uses a sidereal day, which is shorter
than the day determined by the sun in the propor-
tion 365.24 : 360.24. This day is divided
into 24 sidereal hours, and each hour into
sidereal minutes and seconds, according to the
usual system. A sidereal clock is regulated
so as to gain about 3 m. 56 s. every day on our
ordinary clocks and, in this key, keep time
with the apparent diurnal movement of the
fixed stars. It is so set that it shall read
0 h., 0 m., 0 s. at the moment when the vernal
equinocix crosses the meridian. As any of us,
by looking at the clock, can tell, by the time of
day, whether the sun is in the east, south or
west, so the astronomer, by his sidereal clock,
can tell in what part of its apparent diurnal
course any star may be situated. For ex-
ample, at 5 h. he knows that the constellation
Auriga is on the meridian, and at 18 h. 34 m.
that the beautiful Lyra is crossing the meridian.

The Chronograph.—There are two prin-
cipal methods by which the astronomer notes
the time of occurrence of an instantaneous
phenomenon to a fraction of a second. On
the older system, which is not without its ad-
vantages, the observer, looking at his clock,
counts its beats until the occurrence of the
phenomenon he is to observe. We may take,
as an example, the occultation of a star by the
moon. He sees that it begins when the moon ap-
proaches a star until it is clear that in a
few seconds, it is going to pass over it and
hide it from view. Then looking at the clock,
he listens to the seconds, mentally counting the

number of each beat. At length, there is a
 certain beat of the clock when the star is not
entirely hidden, while before the next beat the
star has disappeared from view. He estimates how
many tenths of the interval between the beats
of the clock had elapsed when the star dis-
appeared, and records the hours, minutes,
seconds and tenths in his note-book. The
skilled observer will select a record that is al-
most to a few tenths of a second in error in this estimate.
It requires long practice, and much natural
aptitude, to be able to make an accurate obser-
vation in this way. The method has also the
inconvenience that there is no permanent record
except that which is written down at the
moment, so that, if the observer has made an
error of any kind, he has no direct way of
detecting it except by subsequently discov-
ering that something must be wrong. This diffi-
culty is avoided by means of a chronograph.
In the form commonly used, the chronograph
consists essentially of a cylinder, generally
about eight inches in diameter and one or two
feet in length, revolving on its axis by clock
work at the rate of one turn a minute. Around
the cylinder is stretched a sheet of paper,
which is carried with it in its motion. The
sheet is pressed by a pen, pencil or other point,
so as to leave a mark on the paper as the cy-
linder revolves. The pen is carried by a little
luggage moving slowly forward from
one end of the cylinder to the other at a rate
of about one-tenth of an inch, or a little more,
in a minute. Consequently, the point describes a spiral line on the paper as the chronograph
goes through its successive revolutions, until
the pen arrives at the farther end of the cy-
linder. This may take a period of two, three
or four hours, according to the adjustments.
The pen is connected with an electro-magnet,
the current around which passes through the
works of the clock. The arrangement is such
that at every beat of the clock, or sometimes
at every alternate beat, the electric current is
either closed or broken. With each closing
or breaking of the current a slight motion is
given to the pen so that the seconds are
marked on the paper on the revolving cylinder.
The same or another current also passes
through a key held in the hand of the observer.
When the latter sees the movement of the
phenomenon he is to note approaching, he holds
the key in his hand, and presses it at the exact
moment to be recorded. A motion is thus
given to the pen, and the position of the signal on the paper among the signals given
by the clock shows the moment to a fraction of
a second at which the signal was given.

Different systems are used based on this
general principle. There are various ways in
which the pen marks the clock beats on the
paper. In that mostly used in this country, the
pen is not raised from the paper, but is given
a sudden lateral jerk, producing a notch in the
line, as shown in Fig. 6, which is a copy of a
small portion of a chronograph record. On
another system the pen simply makes dots on the paper at each beat of the clock. Sometimes the electric current passes around the electric magnet all the time except at the instant a signal is made. Then one and the same electric circuit is used for both the clock and the observer. Sometimes the clock only makes the circuit at the moment of its beat; then the circuit at the command of the observer is a second one, which he makes by pressing the key. The main point in all systems is that the beginnings of the minutes all come under each other so that, by taking the sheet off of the cylinder, and spreading it out, writing in the minutes and the lines of seconds, the observer can determine the exact moments at which every one of any number of signals were made while the chronograph was running. For example, in Fig. 6 it will be seen that the observer pressed the key at 12 m. 3.4 s. and again at 13 m. 2.4 s.

The Spirit Level.—Another appliance much used in astronomy is the spirit level. It serves to set the axis of an instrument exactly horizontal. It consists of a glass tube, generally six or eight inches long, of which the rounded surface is not a perfect cylinder, but is formed by the revolution of the arc of a very large circle around its chord. The tube is therefore of the shape shown in Fig. 7, slightly larger in the middle part than at the two ends. The amount of bulging is, however, so slight that the eye cannot perceive it. In the most delicate levels, a section of the curved surface is an arc of a circle perhaps half a mile, more or less, in diameter. The tube is nearly filled with chloroform or ether. Water, or even alcohol, is not liquid enough for the purpose. A small vacant bubble is left at the top of the cylinder, as shown at A B in Fig. 7. When this bubble is in the middle of the tube, the axis of the level is perfectly horizontal. The remainder of the level is sketched in Fig. 8, which shows the level completely mounted, so that it can be set on the horizontal pivots of the instrument of observation. The true horizontality of the pivots is tested by reversing the level end for end, reading the position of the bubble at each setting. Details need not be entered into at present, as we only wish to make the principle of the instrument clear. Nearly all instruments for astronomical measurement are made by putting together some combination of the device we have described. The two combinations most used in astronomical observations are the Meridian Circle or Transit Circle, which are the same in principle, and the Equatorial Telescope.

The Meridian Circle.—This instrument is used for two distinct purposes. One is the determination of the right ascensions of the heavenly bodies; the other the determination of their declinations. It will condude to clear-
greatest possible exactness. The result is that the observer, looking into the instrument, sees these spider lines, and he may also see a star moving toward the meridian by virtue of its apparent diurnal motion as shown in the figure, where it is about to cross the meridian line. Watching it with a key connected with the electric circuit of the chronograph in his hand, he taps the key at the moment the image of the star crosses each of the lines. The middle line marks the passage across the meridian. The other lines are used in order to secure greater exactness by taking the mean of all the transits across the separate lines. Thus, by pointing his instrument into any part of the meridian, the observer may determine the times by his sidereal clock at which any number of stars crossed the meridian of his place.

In order that the line of sight of the instrument may describe the true meridian, it is necessary that, when the instrument is turned in the proper direction, the line shall pass through the celestial pole. This is effected by the following arrangement: In the course of its apparent diurnal motion, a star near the pole will cross the meridian of any place twice in the course of a sidereal day, first above the pole and then below it. Let the dotted circle in Fig. 11 be its apparent diurnal circuit around the pole P. Let the vertical line M R be the true meridian passing through the pole, and the other line A B that marked out by the line of sight of the transit instrument, supposed not to be exactly in the meridian. Then the star will take a less time in passing around from A to B on the left than in the other part of its course from B to A. Therefore by observing the transit both above and below the pole, across the middle thread of the instrument, the observer determines whether the line of sight of the instrument passes east or west of the pole and may adjust it accordingly. It may be said that, in astronomical practice, no instrument is ever assumed to be perfectly adjusted.

Astronomical time is based on the rotation of the earth. The clock, assumed to be correct, then reads exactly 0 h., 0 m., 0 s. Since the clock is based on the rotation of the earth, it is important to determine the right ascensions of the stars accurately. This is done by noting the time at which the star crosses the meridian. The accuracy of the clock is based on the rotation of the earth, and thus the time reading of the clock is used to determine the right ascension of the star. This system of using the clock instead of a divided circle for determining right ascensions constitutes one of the greatest advances ever made in astronomical measurement. It depends upon the perfect uniformity of the earth's rotation and the excellence with which a clock can be made.

In this manner we may obtain the right ascension of any star. If we suppose that the error of the clock is known and that the middle wire is exactly in the meridian, the corrected (sidereal) clock time when the star is bisected by the middle wire will be precisely the same as the right ascension of the star. The clock error is determined by observing the transits of a selected number of fundamental stars whose right ascensions are assumed to be known; the deviations of the middle wire from the meridian are also determined from these transits, and finally, the combined effect of these errors and the error of level is readily computed and applied to the recorded time of transit of the star whose right ascension is desired.

A far more troublesome source of error, however, and one which it is exceedingly difficult to completely eliminate is known to astronomers as the Personal Equation. By this is meant the difference between the time when the star is actually bisected and the time at which the observer presses the chronographic key. The latter is usually later by about 0.2 second, an amount which approximates to the Reaction time of the psychologists, but this is by no means always the case. Moreover, as the apparent motion of equatorial stars across the field is very rapid compared with that of stars near the pole, there occurs a marked variation in the observer’s personal equation, depending on the declination of the star observed. It is found that a telluric variation also occurs which depends upon the brightness of the star, and finally, the personal equation varies with the physical condition, fatigue, etc., of the observer, though with an observer of long experience who takes care to work as far as is possible only under normal conditions, the last source of error should be slight.

As meridian work is the most important and fundamental of all observation for the purposes of exact astronomy, every effort is made to either determine or eliminate the effects of personal equation. In the United States Naval Observatory, it is directly determined for each observer by means of an artificial star which is made to cross the field at all varying rates of speed and automatically record upon the chronograph the instants when it was bisected by each wire; the observer's records appear upon the same sheet, whence the personal equation follows by a direct measurement. Here also, a screen placed before the objective of the telescope by which all stars observed are made to appear equally bright during the transit. There are
two devices already coming into considerable use which almost completely eliminate this troublesome source of error. In the first, called the Transit Micrometer, a moving wire is kept accurately bisecting the star as the latter crosses the field. The frame which carries the movable wire automatically makes an electric contact and records on the chronographic sheet when this movable wire reaches the successions of transverse wires indicated in Fig. 10, which latter are therefore omitted. The second device is the Photo-chronograph. Here the eye is replaced by a small photographic plate on which the star photographs itself as a straight line. An electro-magnet is so arranged that at every second or fourth beat of the clock the plate is displaced slightly upward or downward; the trail thus appears on the developed plate as a series of short dashes arranged alternately in two parallel lines. The image of the wires is afterward obtained by holding a light for a few seconds in front of the object glass. By a later measurement of the developed plate under a microscope a result is obtained which is practically free from the effects of personal equation.

The Meridian Circle is the transit instrument, just described, with one or two graduated circles on its axis of rotation. The method of using it and determining the arc through which the circle has moved at any time has already been explained. The inquiring reader may wish to know how, by such readings, the astronomer can determine the declination of stars. If the celestial pole were a visible point in the heavens this would be very simple; the observer would turn his instrument until it pointed exactly at the pole and then read his microscopes. Then as one star after another crossed the meridian he would make a similar pointing, reading his microscope for the transit of each star. The difference between the readings on the pole and that on the different stars would show their distances from the pole. Subtracting each of these from 90° would give the declination of the stars as seen in the instrument.

A little further down it is, of course, the pole is not a visible point. The observer has therefore to refer his position to the direction of gravity, which is done by a very ingenious use of a basin of quicksilver. The basin is set on a firm support on the ground under the telescope, and the latter is pointed directly downward. By mounting up to the eye-piece and looking down, the observer looks perpendicularly into the basin of mercury. A combination of reflectors is then arranged in the eye-piece of the telescope so that he can, at the same time, see the threads in his eye-piece and the images of these threads as reflected from the basin of mercury. When a telescope is so adjusted that the image and the thread coincide, he knows that the line of sight of his telescope is truly vertical. He then reads the microscope of his circle and he determines what this reading of his circle is for the vertical position. He knows that if the telescope is pointed at the zenith, the reading will be different by exactly 180°. He thus determines the exact distance at which the heavenly bodies crossed the meridian north or south of his zenith. From this, the determination of the declination is, in principle, a simple matter.

The Equatorial.—One of the most important arrangements in nature with which the astronomer has to deal is the diurnal motion. This takes place so slowly that, in looking at the stars, we do not notice it unless we watch for some time. But, if we point a telescope at a heavenly body, it magnifies the diurnal motion on an page. In this case the result is that such a body, seen in a fixed telescope, is continually traveling across the field of view, and the instrument has to be moved continually to keep up with it.

In order to avoid this inconvenience, it is necessary that, if measures are to be made upon the body, or if it is to be continuously studied, the telescope must move to correspond. This is brought about by mounting it upon an axis parallel to that of the earth, and therefore oblique to the horizon, called the polar axis. The inclination to the horizon must be equal to the latitude of the place. All great telescopes are thus mounted. The way in which this is done will be seen by the accompanying picture of the equatorial telescope mounted at Pulkova, Russia. In order to keep the telescope pointed at the object it must be turned upon the polar axis by clockwork, moving it steadily at a rate equal to the diurnal motion of the object observed.

In reality the telescope is then pointed in a fixed direction, the motion of the earth being simply neutralized by the clock-work of the telescope carrying the latter in the opposite direction. The equatorial telescope must also have a second axis, called the declination axis, in order that it may be pointed at stars in different declinations. The direction is determined by circles attached to the telescope, which show, at any time, to what declination on the celestial sphere the instrument is pointed. By a combination of contrivances the astronomer can point his telescope by day at any star bright enough to be visible in it; or, by night, at any object visible to the naked eye, of which he knows the right ascension and declination. He first turns his telescope until one divided circle corresponds to the declination of the star, and then clamps it in that position. Then, looking at his sidereal clock and taking the difference between the sidereal time and the right ascension of the star, he turns his telescope on the polar axis until the other circle shows the correct pointing. Then he starts the clock-work which sets the telescope in motion, and looking into the eye-piece, sees the required object. Every large telescope is also supplied with a finder. This consists of a smaller telescope fastened to the larger one in such a way that the centre of the field of view is the same in both. But the finder has a lower magnifying power, and therefore a much larger field. Looking into it and recognizing the object he wishes to observe, the observer moves the telescope until the object is seen on the cross-threads of the finder. This is in the field of view of the large telescope.

Application of Photography to Astronomy.—From the time that photographic methods were introduced, the idea of taking pictures of the heavenly bodies by such methods must have occurred to astronomers.
ASTRONOMY

About the year 1840, Prof. J. W. Draper of New York put this method into practice by taking a daguerreotype of the moon. Shortly after our present system of photography was devised, several American astronomers carried the experiment yet farther. Notable among these were G. P. Bond, first assistant and afterward director of the Harvard Observatory; and L. M. Rutherford of New York, who was the possessor of an excellent telescope, and brought the method to a high state of perfection.

The principle on which a photograph of a heavenly body is taken is extremely simple. A telescope is pointed at the body so that the image of the latter is formed in its focus. A sensitized plate is placed in the focus and exposed for the necessary time. This may be only a fraction of a second, or it may be several hours. Unless the exposure is very brief, it is necessary that the telescope shall be kept in position, so as to follow the object in its apparent diurnal course. When the exposure is completed, the image is developed in the usual way. In photographing, the ordinary telescope, as used for eye observations, is not well suited to the purpose, for the reason that the chromatic aberration is not the same for the visual and for the photographic rays. It is necessary to have a somewhat stronger crown lens or a weaker flint lens if a telescope is to be used in photographing than if it is to be used by the eye. But the necessity of having telescopes of the two kinds is now, to a certain extent, done away with by the use of sensitized plates which are especially sensitive to the visual rays. By putting in an absorbing screen through which the rays must pass before they reach the focus and which allows only the visual rays to pass, very accurate photographs can be taken by the plates. This defect is felt only in the refracting telescope. A reflecting telescope brings all the rays, of whatever color, to one and the same focus, and therefore may be used either for photographing or for seeing. Improvements made in recent times in the sensitiveness of photographic plates have given an enormous extension to this method in astronomy. It is now found that celestial objects completely invisible to ordinary vision can be photographed. While only a few thousand nebulae have been catalogued as visible to the naked eye, it is found that there are hundreds of thousands which admit of being determined by photography.

Photography is now employed for two distinct purposes. The first is simply that of forming a picture of the sky, or rather of the stars in the sky. For this purpose the best telescope is one as large as can conveniently be obtained, but of short focal length. A great enterprise in this direction was started in 1887 by an association of astronomers who met at the Paris Observatory, and put into operation a plan of photographing the entire heavens on from 10,000 to 20,000 plates, each two degrees square. The labor of measuring these plates and of afterward reducing the measures from them is so great that at least 30 years will probably elapse before this catalogue is completed and published. A similar object is reached on a different system at the Harvard Observatory. There photographs are being constantly taken with telescopes much shorter than those used for the international chart. In this way new stars are from time to time discovered and variations in the light of different stars are brought out. The other purpose is that of exact measurement. When the astronomer had to determine the respective distances of stars in the same field of view he had hitherto generally depended on the filar or other micrometer. The use of this instrument is laborious. When the photographic method is used he simply takes a picture of the stars he wishes to measure, and at any convenient time, places it under a measuring engine supplied with sliding microscopes, and measures off the distance on his negative. The result of these two applications is that photography is now slowly supplanting eye observations in an important fraction of the astronomical work of the world.

SIMON NEWCOMB.

Revised by Eric Doolittle, Professor of Astronomy and Director of the Harvard Observatory.

ASTRONOMY, Theoretical. This branch of the science grows out of the great discovery of Newton, that the motions of the heavenly bodies, especially those of the solar system, are determined by their mutual gravitation. The results of this theory are now worked out by purely mathematical methods with a degree of precision scarcely attainable in any other branch of science. The adopted method consists first in expressing the attraction or pull experienced by each body from all the others in the form of differential equations. These equations express, in the most general way, the acceleration which the planets experience at every moment from the attraction of the other bodies. We do not write them because they would be understood only by a reader expert in the calculus, who, if he desires to be acquainted with them, will consult special treatises. It will suffice to say that there are three differential equations for each planet, which express the attraction, and its effect on the motion of the planet at any instant, in the directions of the coordinates. The problem then becomes the purely algebraic one of integrating these equations. The result of this process is that the effect of the
attraction or pull upon the body, through a period of days, years or even centuries, is summed up with great exactness, so that the motion of the body through the whole period can be expressed by algebraic equations. The simplest case occurs when there are only two bodies. The integration shows that, in this case, the bodies revolve round their common centre of gravity in orbits each of which is an ellipse. Commonly it is necessary to consider only the motion of the smaller of the two bodies, the motion being defined as if the larger were at rest. This is the case of a planet revolving around the sun, or of a satellite round its primary. It is then found that the orbit described by the revolving body round the great central body is an ellipse having the latter in one of its foci. The discovery of this fact, which marked an epoch in the development of astronomy, was due to Kepler; it is known as Kepler’s First Law. Kepler also discovered that the motion is subject to two other laws. One of these is that the radius vector, that is to say, the line drawn from the central body to the other, sweeps over equal areas in equal times. The result of this is that if A B be the orbit having the sun, S, in the focus; and if we mark on the orbit the points a, b, c, etc., which the planet passes through at any equal intervals of time, and then draw lines from each of these points to the sun, the areas included between these lines will all be equal to each other. A glance is sufficient to show that the nearer the body is to the sun the more rapidly it must move.

The position of the orbit and the place of the body in it are determined by six quantities called elements. Two of these elements express the position of the plane in which the ellipse lies, and therefore in which the planet moves. One is the inclination of the plane of the orbit to some other plane taken as that of reference. For the latter is commonly adopted the plane of the ecliptic, in which the earth revolves round the sun. When the inclination of the orbit of any other planet is spoken of, the astronomer means the angle which the plane of its orbit makes with the plane of the ecliptic. The other of the two elements expresses the line passing through the sun along which the two planes intersect. This is called the Line of Nodes. The position of the node is defined by the angle, as seen from the sun, between the vernal equinox and that node where the planet crosses the line which points north towards the north side of the ecliptic. Three other elements determine the size and form of the elliptic orbit, and its position in its plane. The semi-major axis, A B, of the ellipse is called the mean distance of the planet from the sun, it being half the sum of the greatest and least distances. The other of these elements is the eccentricity of the orbit, which is equal to the quotient obtained by dividing the distance of the sun, O S, from the centre of the orbit by O A, the semi-major axis. These two elements completely determine the ellipse. The exact position of the ellipse in the plane may then be defined by the angle which the semi-major axis, O B, makes with the line of the nodes. It will be seen that the point B is that at which the planet is nearest to the sun. This is called the perihelion of the orbit if the central body is the sun; if the earth is the centre, the perigee. The opposite point, A, where the planet is most distant, is called the aphelion, or apogee. Finally, the sixth element defines the position of the planet at some given moment, P E.

The time of revolution of the planet is given by Kepler’s Third Law, which is that the squares of these times are proportional to the cubes of the major axes of their orbits. For example, let one planet be four times as far as another from the sun. The cube of 4 is 64. The square root of this is 8. It follows that the planet which is four times as far will be eight times as long in completing its circuit. If the outer planet went as rapidly as the other, it would be only four times as long. Its orbital motion is therefore, on the average, only about half as rapid.

The three laws just described were discovered by Kepler from a prolonged study of the observations of planetary positions made by Tycho Brahe; they could then have been regarded as interesting coincidences merely or at most as facts of which the explanation was unknown. Upon Newton’s discovery of the law of universal gravitation, however, they were at once seen to be immediate and very simple consequences of this law, but it then appeared that the third law in the form stated by Kepler was slightly inexact. For it could be easily demonstrated that it was not the squares of the times of revolution which are proportional to the cubes of the major axes of the orbits, but that the products of the squares of these times multiplied by the sum of the masses of the central and of the revolving body are proportional to these quantities. This is sometimes called Kepler’s Modified Third Law. It furnishes us with a very simple means of finding with a high accuracy the masses of such planets as have satellites revolving around them. The introduction of the masses into Kepler’s third law alters the results by quantities far too small to have been detected in the observations studied by him; thus, it can be shown that were the earth suddenly to diminish to a mere particle devoid of weight, the length of the year would be increased by only 47.8 seconds.

In theoretical astronomy a unit of distance is necessary. Our ordinary units do not well serve the purpose of the astronomer for two
reasons. They are too short for the great distances he has to measure, and the magnitude of the heavens in terms of miles is not known with sufficient exactness to make that method accurate. What Newton did, therefore, is to take the mean distance of the earth from the sun as his yardstick, and to express the distance of all the bodies of the solar system, both from the earth and from each other, the moon sometimes excepted, in terms of this distance.

From the laws of motion based on gravitation may be derived several interesting theorems. For example, suppose that at some point in the solar system,—we may take, to fix the ideas, a point at the mean distance of the earth from the sun,—a number of bodies are projected in different directions, but all with the same velocity. Then, the equations of motion show that the major axes of the orbits which these bodies will describe will all be equal. This is the fourth of Kepler’s third law. It follows that the times of revolution will also be equal. Consequently, at the end of a certain period the bodies will all return at the same moment to the point from which they started. This period will be that during which the bodies are projected. There is a certain velocity, called the circular velocity, which is such that if the bodies are projected in a direction at right angles to that of the sun, they will describe circular orbits. If all the bodies are projected at different directions with the same velocity, they will all be exactly one year in getting around and returning to the starting point. Now suppose that, instead of the bodies being projected with this circular velocity, which is very nearly that of the earth in its orbit, they are projected with a somewhat smaller velocity. Then, the less the velocity the less the major axis of the orbit, and the greater the velocity the greater the major axis. A body projected with a speed one-third greater than that of the earth would fly out beyond the orbit of Jupiter. A slightly greater speed would carry it beyond the orbit of Neptune, the reason being that, as the body recedes, the attraction of the sun diminishes at so rapid a rate that the velocity is not sufficient to overcome the slight surplus velocity. Finally, if the speed is equal to that of the earth multiplied by the square root of two, that is to say, about 26 miles per second, the body will never return. The ellipse into which it would move is stretched out into a parabola, still having the sun in its focus. If the velocity is greater than this, the parabola will be still farther changed into a hyperbola. Then the body would fly out into the stellar spaces, perhaps in the course of millions of years reaching some other sun, but would certainly never return to our system. Another theorem is that the velocity, no matter what the form of the orbit, diminishes as we go out from the sun in proportion to the square root of the distance. This we have already seen by Kepler’s third law, when we found from that law that a planet four times as far from the sun would move only half as fast. Thus the parabolic velocity is less the farther a body is from the sun. At the planet Uranus it is less than six miles per second: at that of Neptune, about five miles per second. Still another theorem is that if a planet moving in a circular orbit were stopped at any point of its motion, and then were allowed to drop toward the sun, the time of reaching the sun would be equal to that of revolution divided by the square root of 32. It follows that if the earth should be stopped in its motion, it would drop to the sun in a number of days found by dividing 365.24 by the square root of 32. This would be approximately 64 days.

The orbits of most of the large planets are nearly circular. For particulars relating to them see SOLAR SYSTEM. The orbits of the comets, however, mostly parabolas, or ellipses which cannot be distinguished from parabolas when the comet is near enough the sun to be visible. It is possible that some of those orbits which are ellipses have become so through the comet at some time in its history passing very near a planet. (See Comet). One of the problems of theoretical astronomy which the astronomer often meets with is that of determining the orbit of a newly-discovered body of the solar system. That is, if a body is seen, what is its orbit? The determination requires from five to ten hours’ work by an expert calculator having at his command the necessary tables. The first orbit thus computed may be considerably in error, because the effect of errors of observation is multiplied many fold, unless the planet has moved through a considerable arc of its orbit between the times of observation. But while the greater planet is observed, the more exactly the elements of its orbit can be determined. It is found that when two stars are so near each other as to be kept together by their mutual attraction, they revolve around each other in an elliptic orbit. It follows that the law of gravitation extends to these systems. Thus the calculations of the theoretical astronomer are not confined to the solar system, but may be extended to the fixed stars.

In all that precedes we have considered only the motion of two bodies, the smaller of which moves around the larger in an elliptic orbit. But, as a matter of fact, the whole solar system is acted upon not only by the great central body, but by every one of the other planets. The result is that the actual orbit, although very nearly an ellipse, deviates slightly from it, and the motion is not exactly in accordance with Kepler’s laws. The problem of taking account of these additional forces is an extremely complicated one, in which success has been reached only by successive generations of the ablest mathematicians devoting long years of study and calculation to the subject. While the solution, even to-day, is far from complete, it has been so far advanced that it is possible to prepare tables of the motions of the planets which shall hold good for generations, and even for centuries. The method in which the problem can best be solved was devised by Lagrange, who flourished in France toward the latter part of the 18th century. The fundamental idea of his method was that the motion of the planet at every instant should be represented by an ellipse, but this ellipse continually changes its form and dimensions so as to fit in with the actual motion of the planet under the influence of the attraction of all the
other planets. Some idea of the case may be
imagined by supposing a cord of some light
material made into an ellipse very nearly a
circle, and left to float on the waves of the
ocean. Of course, if we bent the end of the
other arm of the eclipse, while the whole
remaining almost in its original shape, con-
tinually bending and twisting as it was moved
by the waves. So does the variable eclipse in
which the planet moves. It is exactly defined
by supposing that, at a given instant, the attrac-
tion of all the other bodies, the sun excepted,
causes. Then the planet would move in a fixed
and unchangeable ellipse. This ellipse is taken
as that which corresponds with the motion of
the planet at the instant. At a second instant the
planet would actually have deviated slightly in
consequence of the attraction of the other
planets, but there would still be a corresponding
eclipse, but somewhat different. So the ellipse
goes on changing continually.

When these changes are subjected to the
rigor of mathematical formula, it is found that
they nearly, but not quite, compensate each
other in the long run. Let us take, for example,
the eccentricity of any one orbit. This will vary
in the course of every revolution of the planet,
and return back to its original amount after a
number of times. But, if we watch it revolu-
tion after revolution, we shall find that, in the
long run, it continually increases or diminishes.
It is thus found that the eccentricity of the
earth's orbit has been diminishing through all
historic times. Moreover, the general rule is
that the perihelion of the planet is gradually
moving forward, and the line of nodes back-
ward. These variations, which go on century
after century, are called secular variations,
while those which are compensated from time
to time are called periodic. Now, the most
interesting and important question of celestial
mechanics is whether the secular variations
will continue forever in the same direction.
The profound analysis of Laplace and La-
grange shows that such will not be the case so
far as the eccentricities are concerned. At the
end of immense periods the direction will be
reversed. It is now known that the eccentricity
of the earth's orbit after diminishing to about
the value of 0.0006 will increase by a certain
period. It is thus with all the orbits; the
motions go through a series of oscillations hav-
ing periods of hundreds of thousands of years
—like "great clocks of eternity which beat
ages as our last seconds."
The precision with
which the astronomer is now able to predict the
motions of the heavenly bodies is reached by a
combination of mathematical computations of
the most difficult and complicated character,
with the most refined observations upon the
positions of the moon and planets, year after
year.

The most complex of all the problems is
that of the moon's motion around the earth, of
which we shall mention some features. In this
case the central body, the earth, is vastly
smaller than the sun; and the moon's orbit is
only about a quarter the distance from the sun and the consequent small
difference in the force of its attraction upon the
earth and moon, it happens that the moon re-
volves around the earth in an orbit which ap-
proximates to an ellipse. But the changes and
motions in this ellipse are much larger and
more rapid than in the case of the planets. For
example, the perigee of the moon's orbit makes
a revolution round the earth in 8.85 years,
while the node on the ecliptic makes a revolu-
tion in 18.6 years. The moon also makes two
swings back and forth during the space between
two full moons, while the earth's orbital eccentricity and perigee both make an annual swing, all owing
to the action of the sun. See Moon.

The principles of theoretical astronomy and
the operations of practical astronomy are com-
bined in one of the greatest achievements of the
human intellect—that of measuring the heav-
ens and weighing the planets, and, in a few
cases, even the fixed stars.

The distance of the moon is determined in
two ways, the results of which agree within
the necessary range of uncertainty of the meth-
ods. One is the measurement of the moon's
parallax, taking as the base line two distant
observatories, Greenwich and the Cape of Good
Hope. (See Parallax). The other method
consists in determining exactly what ought to
be the size of the moon's orbit in order that she
may make her revolution around the earth in
the time that she actually does. The probable
error of the distance of the moon at any time,
as determined in this way, is not more than 40
or 50 miles.

The proportions between the orbits of the
several planets are known with the greatest ex-
actness from their observed times of revolution,
and from Kepler's third law. It follows that if
we can get the exact distance of any one planet
at any one time, all the other distances in the
solar system may be derived by the known pro-
portion. The fundamental quantity which is
used as a unit of measure is the distance of the
sun. This distance has been determined by
four complete separate and independent
methods, the agreement between which illus-
trates the great exactness of astronomical
theory.

The first method is by measures of parallax.
The application of this method is fully de-
scribed in the article Parallax. It requires
that the apparent direction of a planet among
the stars be observed with great exactness from
two far distant points of the earth's surface, or
at two times of day during the interval between
which these for a certain period.

The next celebrated way of determin-
ing parallax has been by observing transits of
Venus (q.v.). But these occur at such rare
intervals, the last having been in 1882, and there
being no other to occur during the 20th century,
that the measures have to be made on other
planets which approach nearest to the earth.
For this purpose Mars has sometimes been used,
because it occasionally approaches us
within less than half the distance of the sun.
But the most exact observations can be made
on minor planets at the time of their nearest
approach to the earth. This method furnishes
a more accurate value than can be obtained in
any other way.

The second method is by the velocity of
light. This method is, in principle, the most
simple, but the changes and motions in this ellipse
are so small that it is possible, by two kinds of observation,
to determine how long it takes light to pass
from the sun to the earth, or to cross the
earth's orbit. If then we can determine by measures of the earth's surface how fast light travels, it follows that by multiplying this velocity by the time it takes to travel from the earth to the sun we shall have the distance of the sun. The velocity of light has actually been determined with great precision by means of the revolving mirror. (See Light, Velocity of.) The result is a speed of 186,330 miles per second. The time required for the earth's orbit is much more difficult to determine. The only way in which a direct determination can be made is through observations of the eclipses of Jupiter's first satellite. By comparing the times of these eclipses through a long series of years when Jupiter is at various distances from the earth, it is found that the eclipses are seen later, the farther Jupiter is from the earth at the time. This is because light requires time to travel over the different distances. But the determinations made in this way are not very exact because such eclipses take place so gradually that it is impossible to fix upon a precise phase without a possible error of several seconds. All we can say as a result of this method is that it takes about 8 m. 20 s. for light to pass from the sun to the earth.

A more exact result is reached by measuring the displacement of the fixed stars produced by aberration. As the earth makes its annual course around the sun, the position of every star in the heavens is, at every moment, slightly displaced toward the direction in which the earth is, at the moment, moving. This is due to the proportion between the velocity of light and the speed of the earth in its orbit. Unfortunately, the speed is so great that the displacement in question is only about 20.5"; an arc too small to be determined with the precision that is desirable. Still, the observations available are so numerous that the result, 20.5", found by Chandler, is probably within one, or at most, two hundredths of a second of truth. Accepting Chandler's number, light requires 499.67 seconds to pass over the distance which separates the sun from the earth. Multiplying this by the speed of light, we have, 196,330 x 499.67 = 95,103,511 miles as the distance of the sun.

The third method is a very recondite one, because it rests on the mathematical principles of celestial mechanics, applied to the case of the earth's motion around the sun. It requires, in advance, an exact determination of the ratio of the mass of the sun to that of the earth. This is best found by observations of Venus, which now extend through more than a century and a half, by which the motion of the node of Venus on the ecliptic is determined. This motion is due principally to the attraction of the earth; and from it the proportion between the mass of the earth, and that of the sun is determined. The next step requires a comparison between the distance which a body falls at the surface of the earth from its own gravitation, and the fall of the earth toward the sun as shown by the curvature of its orbit. By combining these various ratios, the distance of the sun is calculated. The fourth method also rests on the theory of gravitation. One consequence of the sun's action on the moon is that the latter falls behind about two minutes in its monthly course near the time of the first quarter, and is ahead by the same amount near the last quarter. Knowing the exact amount of this swing, the distance at which the sun must be placed in order to produce it is determined. Each of these four methods has its strong and its weak points; and there is no one of them so much better than all the others that we can rely upon it exclusively. Still, their agreement affords a remarkable proof of the accuracy of astronomical theory, and of the precision with which astronomical measures are made under such difficulties as the observer and computer have to encounter. The astronomer does not use the distance of the sun in his computations, because, as already remarked, this is simply his unit of length. What he actually uses is the sun's parallax; this is equal to the angle which the equatorial radius of the earth subtends when seen at a distance equal to that of the sun. The latest results for this parallax from the four methods are the following:

First method, from Eratosthenes, 8.806".
Second method, light, 8.796".
Third method, mass earth, 8.762".
Fourth method, moon, 8.773".

The general conclusion which we reach is that the distance of the sun is very nearly 93,000,000 miles, probably a little less, rather than a little more.

What may seem a yet more wonderful result of celestial measurement is the weighing of the planets and other heavenly bodies. This requires very complex mathematics. But, after all, the principles on which the method rests can readily be made clear. In the case of the planets, there are two methods, one of which can be applied only when a planet has a satellite moving around it. We have already seen that the motion of every planet which, were there no other planet, would take place in an ellipse having the sun in a focus, is changed by the attraction of other planets. The observation of the deviations, when carefully measured through many revolutions of a planet, enable the mathematical astronomer to compute the ratio of the mass of each attracting planet to that of the sun. This ratio is all that the astronomer requires for his ordinary work.

When the planet has a satellite, its mass can be determined with much more ease and simplicity by a direct application of the modification of Kepler's third law. The measurements of the distance of the satellite from the planet, carried through a great number of revolutions of the former, enable the astronomer to determine this distance with high accuracy; combining this with the time of revolution of the satellite and substituting the values in the equation which expresses the law, it will be noticed that two unknown quantities appear in the equation. The first of these is the desired sum of the masses of the planet and its satellite, and the second is the constant expressing the ratio of the law. The figure expressing the latter can be found by applying the equation to any system all of whose elements are known, such, for example, as the earth-sun system; when this is done, the sum of the masses of the planet and its satellite remains as the only unknown quantity; the solution of the equation will thus furnish this sum in terms of the sum of the masses of the earth and sun as a unit.

It is in exactly the same way that the com-
bined mass of two suns forming a double-star system is determined. The distance of the system from the earth must be known and the motion must have been sufficiently rapid to enable the period and the major axis of the relative orbit to have been determined. The law then gives us directly the total mass compared with that of the earth and sun. In this case stars are of nearly equal mass and the motion of each takes place about the common centre of gravity of the system. If we determine the actual motion of each star by measuring its positions with reference to one or more fixed stars which happen to be found in the field of view, the position of the centre of gravity, and hence the comparative masses of the two stars of the system, can readily be found. From this the actual weight of each star separately at once follows. The masses determined by astronomical methods are all expressed by taking the mass of the sun as the unit. To translate the result into our ordinary measures of weight, we must know the mass of some one body, say the earth, in pounds, or kilogrammes. How this is found is set forth in the article Gravitation.

SIMON NEWCOMB.
Revised by ERIC DOOLITTLE, Professor of Astronomy and Director Flower Astronomical Observatory.

ASTROPALIA, an island of the Sporades, the modern name for the ancient Greek Astypalae. It is high and rugged and almost the shape of a dumbbell, its centre being a narrow isthmus connecting the larger ends. It has an area of about 80 square miles and several good harbors for small craft. Pop. about 2,000.

ASTROPHEL, the nom-de-plume of Sir Philip Sidney in writing the famous sonnets to "Stella" (1591). They are considered his masterpiece. Spenser so entitled an elegy which he wrote to Sidney.

ASTROPHOTOGRAPHY. The use of photographic methods in astronomical observations has very greatly increased the effectiveness of astronomical telescopes and also the accuracy of astronomical measurements.

By exposing a photographic plate to the light of a heavenly body, at the focus of a suitable telescope or camera, and giving the requisite motion to the telescope to compensate for the apparent motion of the heavenly body, we are able to secure an autographic record of the form and details of that body, and also of its apparent position with reference to the surrounding stars. In the case of celestial objects such as the nebulae and the more distant stars, whose light is in most cases so faint that they cannot be properly studied or measured by visual observations even with the greatest telescopes, long exposures of the photographic plate enable us to secure strong and distinct photographic records which can be studied and measured at leisure. Further, the more recent photographs show countless stars and countless details of nebula which are so faint that no trace of them can be detected visually with any telescope. These methods are described in separate articles.

The present paper describes briefly the methods and instruments used in photographing the Milky Way or galaxy, star-fields, star clusters, nebulae, planets, comets and the moon. These methods will be described under the heads (1) astrophotography with refracting telescopes, (2) astrophotography with reflecting telescopes.

The telescope is used as a great camera. The large lens, or in the case of a reflecting telescope the spéculum, of the telescope serves as the lens of the camera; the tube of the telescope serves as the camera body or box; the photographic plate is placed at the focus of the lens or spéculum. The telescope is moved slowly by a powerful machine called the driving-clock, so that it continually points accurately at the apparently moving celestial object. In addition, a guiding or pointing telescope is usually attached rigidly to the tube of the photographic telescope, to enable the astronomer to watch throughout the exposure of the photographic plate, and to introduce minute corrections of position or motion when he sees that such corrections are necessary.

Astrophotography with Refracting Telescopes.—Among the earliest celestial photographs of great value secured with refracting telescopes were those made by Barnard, Russell, Wolf and others, using the type of refractor known as the portrait-lens or photographic doublet. This type of instrument possesses the advantage that it includes a large area of the sky in one photograph, with considerable sharpness of detail all over; the best instruments of this class give a usable field of 10 or 12 degrees of arc in diameter, whereas the usual type of photographic refractor gives a usable field only one or two degrees in diameter. The astronomical photographic doublet is usually made of relatively small focal length, the ratio of focal length to aperture being 4½ or 5 to 1; this course results in a relatively low magnifying power. In fact the great usefulness of this type of instrument is due primarily to the large area of sky which it includes; and sharpness of detail is to some extent sacrificed in order to cover a very large field.

Using this type of instrument Barnard, Wolf, the astronomers of Harvard University Observatory, Franklin-Adams and others have been eminently successful. Barnard, using first the six-inch Willard doublet of the Lick Observatory, and later the 10-inch Bruce doublet of the Yerkes Observatory, has photographed the great star-clouds and the remarkable dark rifts of the Milky Way, the great areas of extended faint nebulousity and comets. Wolf at Heidelberg, using a pair of 16-inch photographic doublets, has made a study of all of the known large nebula and nebulous regions of the northern heavens. The Harvard University astronomers have covered the entire northern heavens again and again with similar instruments of moderate power at Cambridge, and have also established an extremely powerful 24-inch telescope of this type at Arequipa, Peru, with which they have photographed the Milky Way, the Magellanic Clouds, the star-clusters and the nebula of the southern celestial hemisphere. Franklin-Adams, using a 10-inch
1 The double-slide plate-carrier of the 60-inch reflector, Mt. Wilson Observatory
2 Globular star-cluster Messier 13 in constellation of Hercules
instrument, and working in England and in southern Africa, has included the entire northern and southern celestial hemispheres in his studies.

In the hands of Barnard and others the portrait-lens type of refractor has been of great service in the photography of comets, with their extended tails. This type of instrument has been successfully used also in obtaining pictures of faint comets and asteroids, by means of the slight movement of the comet or asteroid among the surrounding stars, in an exposure of several hours' duration.

An entirely different type of photographic refractor is that which was first used by Rutherford of New York, a great pioneer in this work. About 1870 Rutherford took a fine achromatic visual objective of 12 inches aperture and 15 feet focal length, and deliberately modified the surfaces of the glasses composing this objective, in such a way as to convert the visual objective into a photographic one. With this telescope Rutherford made a series of fine photographs of the moon and the cratered star clusters. At a later date he repeated this successfully with a very sharp photographic telescope of a type which proved so successful that it was adopted by the Paris observatory. It was used to photograph the International photographic map of the heavens. Observatories of many nations have co-operated in this great work, the telescopes used being of uniform size and power. Each telescope has both a photographic and a visual lens or objective, the two objectives being set back from each other by side in a double tube. The visual lens enables the astronomer to watch and to introduce the necessary minute corrections in the motion of the telescope while the photograph is being taken with the other lens. The photographic lens or objective does not give a sharp visual image or focus, but does unite in sharp focus all of the rays of light of the blue region of the spectrum, which rays are the ones which are chiefly effective in photography. Similarly the visual lens or objective would not give a sharp photograph, unless special precautions were taken, as described later in this article, but it does unite in one sharp focus all of the rays of light in the yellow region of the spectrum, which rays affect the human eye.

The type of photographic refractor now being described gives sharply defined photographs covering an area of the sky about two degrees in diameter; and by its use the work of charting the stars of the entire heavens down to stars of the 13th magnitude has progressed with much success.

The marked success of the type of photographic refractor just described has led to the construction of several telescopes of much greater size but of similar type; i.e., with both photographic and visual objectives. Two of these great instruments, one at Meudon, France, and one at Potsdam, Prussia, are probably the largest and finest refractors in Europe. They have been used for spectroscopic work, and also for direct photography of star-clusters, planetary nebulae, etc.

In the United States, methods very different from the above have been used for adapting photographic purposes the very large visual refractors of the Lick, Yerkes and other observatories. The 36-inch Lick refractor is provided with an additional single lens, 33 inches in diameter, called the photographic corrector, which can be attached to the camera in front of the two lenses comprising the visual objective. The resulting combination of three lenses gives a sharp blue or photographic image or focus. This combination was utilized by Burnham, Catliff and others in making a very fine series of photographs of the moon. A lunar atlas comprising these photographs was published by the Lick Observatory.

At the Yerkes observatory a much simpler and more economical method is used for adapting the 40-inch visual refractor to photographic purposes. A yellow color-screen or ray-filter is used at the focal plane in contact with a very sensitive "isochromatic" or yellow-sensitive photographic plate. The ray-filter excludes the out-of-focus blue image (which otherwise would destroy the sharpness of the photograph) and allows the sharp and intense yellow image given by the visual objective to pass through and act upon the yellow-sensitive plate. By this means Ritchey and Proctor have secured a series of very sharp photographs of lunar details, and with the aid of a double-slide plate-carrier for guiding during long exposures, the same observer secured a series of large-scale photographs of the dense globular star-clusters. With the same telescope and with similar methods Barnard secured very fine photographs of the brighter planetary nebulae and of the planets. The use in this way of the yellow ray-filter and yellow-sensitive plates has made all visual refractors available for photographic purposes. In fact several of the largest visual refractors in the world are now being used, by this means, in securing photographs for measurements of the very greatest refinement and accuracy, including measurements for stellar parallax.

Astrophotography with Reflecting Telescopes.—For photographic purposes the reflecting telescope possesses several most important advantages over the refractor. First of these is its perfect achromatism; that is, in the reflector all colors or wave-lengths of light are brought to a focus in one and the same focal plane. A second advantage is that, in the case of the very large telescopes necessary in modern astrophotography for securing a quality suitable for reflectors can be secured much more easily and cheaply than those required for refractors; in practice this means that reflecting telescopes can be made of very much greater size and power than is possible in the case of refractors. A third advantage of the reflector is that a single instrument can be so designed and constructed that it can be quickly adapted to various focal lengths, and it is therefore readily available for the photography of celestial objects requiring either long, intermediate or high magnifying powers. A fourth great practical advantage is that the reflector is relatively a short and compact form of telescope; this ensures comparative freedom from flexures which would affect the sharpness of the resulting photographs; and it greatly reduces the size and cost of the protecting dome and building.

About 1863, De La Rue in England and Draper in America first used reflecting telescopes for celestial photography, chiefly of the
ASTROPHOTOGRAPHY

moon; De La Rue using a 13-inch telescope with speculum-metal mirror and Draper a 16-inch with silvered glass mirror. About 1886 Common in England, using a 37-inch reflecting telescope with mirror by Calver, made the first photographs of the larger and brighter nebule made up to that time. Common's success was so encouraging that he later constructed a 60-inch reflector, with which he secured many exquisite photographs of nebule. A marked contribution made to astrophotography at this time was the invention by Common of the double-slide plate-carrier in its simple form, for guiding during long exposures. In 1888 Roberts in England, using a 20-inch reflector with mirror by Grubb, began a long series of photographs of nebule and star-clusters. Common's and Roberts' work with reflectors aroused profound interest among astronomers, as did also the Henry brothers' work with refractors, for this instrumental effort in astrophotography with large instruments and with long exposures. Common's 37-inch reflector was bought by Crossley, and was presented by him to Lick Observatory in California, where it was used by Keeler, with more refined methods than had hitherto been applied, in making a long series of exquisite photographs of faint nebule and star-clusters.

As a result of these photographs Keeler was able to announce two discoveries of capital importance: First, that the spiral nebule is the prevailing or most numerous type of nebule; second, that hundreds of thousands of spiral nebule are within the reach, photographically, of such an instrument as the Crossley reflector.

In 1901 Ritchey completed the 24-inch reflector of the Yerkes Observatory, and in 1901 and 1902 secured with it a series of photographs of the remarkable changing nebulosity around the star Nova Persei, a work which was simultaneously carried on by Perrine at Lick Observatory. This nebulosity was so faint that it was invisible in all usual telescopes, and could not be photographed successfully only with the great short-focus reflectors. Later Parkhurst and others used the 24-inch reflector with great success in stellar photometry.

In 1908, under Ritchey's superintendence, the 60-inch reflector of the Mount Wilson Observatory was completed and installed at the summit of Mount Wilson, California, nearly 6,000 feet above sea-level. This great instrument, designed especially for celestial photography in many ways, is useful in many respects, two of which may be mentioned: first, nearly the entire weight of the moving parts is floated in mercury, thus securing a very high degree of smoothness of motion in following the apparent motion of the heavenly bodies; second, a series of interchangeable ends of the telescope tube allows any one of a number of small mirrors, plane and convex, to be used in combination with the great mirror; by this means the telescope can be very quickly changed from any one of the several forms needed for the various kinds of work in celestial photography; the forms used are the Newtonian, the Cassegrainian and the Conde.

With this instrument used in a superb climatute, and combining great size with great refinement of construction and the high photographic efficiency of the reflector, remarkable results have been secured in many lines of astrophotography. Ritchey has conducted epoch-making researches in stellar spectroscopy; Sears and Shapley have secured a long series of observations of the highest accuracy in stellar photometry; Van Maanen has measured stellar parallaxes. Ritchey has made a series of photographs of spiral and other nebule and of star-clusters for the purpose of studying internal rotation and proper motion of these bodies. Faith and Pease have also made many fine direct photographs of nebule, and have made very long-exposure photographs of the spectra of nebule and star-clusters.

As an illustration of the degree of refinement attained in astrophotography with such an instrument as the 60-inch reflector, the attachment used in direct photography, and illustrated in Fig. 1, may be briefly described. It is the improved double-slide plate-carrier, developed by Ritchey from the simple form devised by Crossley. As the course moves by clock-work to follow the apparent motion of the heavenly bodies due to the earth's daily rotation. This motion of the telescope is marvelously smooth and accurate, but is nevertheless far from being accurate enough to suffice, alone. To secure the sharpest attainable photographs the observer must watch, throughout the entire time of exposure of the sensitive plate, a suitable guide-star as close as possible to the object being photographed; this is done by means of a high-power eye-piece or microscope with illuminated cross-lines of spider-web at its focus. Minute corrections of position are constantly introduced by the observer by means of two screws, the large milled heads of which are held in the observer's fingers; these screws move the two slides, at right angles to each other, which carry the plate-holder. A second guiding eye-piece, on the opposite side of the plate-holder, is also used to permit the detection and correction of any slight error in the telescope, and corrections are made certain to occur in an instrument as powerful and sensitive as the 60-inch, and long-exposure photographs would be ruined by it unless such corrections were introduced. Furthermore, as the length of the steel tube of the telescope changes slightly with temperature throughout the night, the focal plane of the mirror changes slightly with reference to the plane of the photographic plate. Hence an accurate method of refocussing is used, by which this relative change is corrected at frequent intervals. With these refinements very long exposures on excessively faint objects can be continued hour after hour and night after night with the certainty that no errors can occur which would injure the sharpness of the photographs. Two concrete examples will illustrate the results secured by these methods. A photograph of the spiral nebula Messier 33 Trianguli, taken with an exposure of 8½ hours, shows over 26,000 nebulous stars underlying the nebula itself, besides about 3,500 other stars not nebulous, which lie between us and the nebula; all of these are within an area of the sky 30 minutes of arc square. A photograph of the globular star-cluster Messier 13 Hercules,
ASTROPHYSICS

with 11 hours' exposure, shows by actual count over 30,000 stars in the cluster, outside of the dense central region in which the star-images to some extent superpose, and where counting is therefore impossible; photometric measures show, however, that at least an equal number of stars are present in this dense central region.

In the latter photograph the faintest stars shown are of 21½ magnitude; this is five magnitudes, or approximately 100 times, fainter than the faintest stars which can be seen (visually) in the largest visual refractors.

In the best of these photographs the fainter star-images are less than one second of arc in diameter.

Another illustration of the extraordinary results in astrophotography made possible by the great modern reflecting telescopes is the recent discovery of numbers of very faint novae or temporary stars in the spiral nebulae. These stars apparently correspond in all respects the principal wave of spectrum analysis, stellar system or galaxy; they form another link in the chain of evidence tending to show that some of the spiral nebulae, at least, are other stellar systems similar to our own. A comparison of the stars and the novae which have occurred in our own galaxy (about 5½ magnitude) with the average brightness of all of those which have recently been discovered in the photographs of spiral nebulae (about 14 magnitude), affords what is at present the most reliable method of estimating the average distance from us of the spiral nebulae, as compared with that of the novae in our galaxy; this relative distance is thus shown to be of the order of 50 to 1.

George W. Ritchey, Astronomer, Mt. Wilson Solar Observatory, Pasadena, Cal.

ASTROPHYSICS, or the new astronomy, the science dealing with the physical nature of the heavenly bodies, has revealed in a remarkable manner, through its discoveries during the last half-century, the wonderful ability and resourcefulness of the human mind. By means of the spectroscopy we have been able to investigate the physical constitution of the stars, and in ruling gratings of wave-lengths. The formula for resolving power which is defined by \( \gamma = \frac{\lambda}{\lambda_{\Delta}} \), where \( \lambda_{\Delta} \) is the difference of wave-length of two lines of mean wave-length \( \lambda \) which can just be divided, can easily be expressed for a grating and is the product of the total number of lines of the grating and the order of the spectrum. Ordinary six-inch Rowland gratings have a resolving power of about 400,000. Rowland's dividing engine was not capable of ruling gratings greater than six inches in diameter. Quite recently Michelson of the University of Chicago and Anderson of the Carnegie Solar Observatory have succeeded in ruling 10-inch gratings of 1,000,000, which is quite comparable with that attained by Rowland. A grating of different form is the echelon invented by Michelson, by putting together glass plates of uniform thickness. By this means, Michelson has obtained a resolving power as great as 900,000. The precision of wave-lengths has been still further increased by the use of interferometers. Four different kinds have been invented by Michelson, Perot and Fabry, Hany, and Lummer and Gehreke. Michelson has been able to compare directly the wave-lengths of the prominent cadmium lines with the International Metre (Michelson, 'Light Waves and Their Uses,' 1903), and has separated lines less than 0.01 tenth-metre apart which appear single in the most powerful gratings, while Perot and Fabry have observed interference with the green mercury line at a difference in path of 750,000 wave-lengths.

Wave-lengths.—The unit generally used in the measurement of wave-lengths is the Angstrom, or tenth-metre, or metre divided by 10^8. A great change has recently come over our ideas of the wave-length. Formerly

Instruments.—A spectrum is produced either by a prism or a grating. With prisms, increased dispersion is obtained by additional prisms. In work on the sun, before the use of gratings, it was quite common to employ 20 or more prisms. Gratings were used as early as 1815 by Fraunhofer and were made by winding fine wire over two exactly similar screws. Rutherford of New York ruled some very satisfactory gratings on spectum metal. A diamond is used as the ruling point and the plate to be ruled is moved by means of a screw. The character of the grating depends on the excellence of the screw. Rowland of Johns Hopkins University made a dividing engine of such accuracy that he was able to rule six-inch gratings with 20,000 lines per inch. The splendid definition of Rowland gratings has never been surpassed. Rowland made the brilliant discovery that if the grating were ruled on a concave surface the spectrum could be focussed without the use of collimator or camera lenses. By the employment of these lenses not only was the sharpness of definition increased but the region of short wave-lengths could be investigated. This vast increase in accuracy, coupled with other properties of the grating, namely overlapping spectra and astigmatism, whereby comparisons are rendered easy by coincidences, have wonderfully augmented the power of the astrophysicist to determine accurate wave-lengths. The formula for resolving power which is defined by \( \gamma = \frac{\lambda}{\lambda_{\Delta}} \), where \( \lambda_{\Delta} \) is the difference of wave-length of two lines of mean wave-length \( \lambda \) which can just be divided, can easily be expressed for a grating and is the product of the total number of lines of the grating and the order of the spectrum. Ordinary six-inch Rowland gratings have a resolving power of about 400,000. Rowland's dividing engine was not capable of ruling gratings greater than six inches in diameter. Quite recently Michelson of the University of Chicago and Anderson of the Carnegie Solar Observatory have succeeded in ruling 10-inch gratings of 1,000,000, which is quite comparable with that attained by Rowland. A grating of different form is the echelon invented by Michelson, by putting together glass plates of uniform thickness. By this means, Michelson has obtained a resolving power as great as 900,000. The precision of wave-lengths has been still further increased by the use of interferometers. Four different kinds have been invented by Michelson, Perot andFabry, Hany, and Lummer and Gehreke. Michelson has been able to compare directly the wave-lengths of the prominent cadmium lines with the International Metre (Michelson, 'Light Waves and Their Uses,' 1903), and has separated lines less than 0.01 tenth-metre apart which appear single in the most powerful gratings, while Perot and Fabry have observed interference with the green mercury line at a difference in path of 750,000 wave-lengths.
the wave-length was looked upon as an invariable property of a line in the spectrum, unalterably fixed by nature, and consequently it was thought that a wave-length determination would give a standard measure of distance more reliable even than that obtained by the use of the Internonial Metre (Michelson, 'Astronomy and Astrophysics,' XIII, 92, 1894). But we now know that the position of the lines in the spectrum may vary with the pressure of the gas in which they are produced, and moreover, single lines, by the action of a magnetic field, have been separated into as many as 19 different components. The shift in the lines of the spectrum due to motion in the line of sight, which has been shown experimentally in the laboratory, has given rise to many interesting developments in astrophysics, the discovery of an entirely new class of stars called spectroscopic binaries, the measurement of the axial rotation of the sun and Jupiter, and has confirmed in a magnificent manner the meteoric constitution of Saturn's rings.

Spectra of the Elements.—The invention of the concave grating and the manufacture of nearly perfect gratings, plane and concave, by Rowland, greatly increased the accuracy of the wave-lengths in the spectra of the elements. The chief investigations in this field have been carried on by Rowland and his assistants, by Kayser, Runge, Paschen, Hasselberg, Liveng and Dewar, Eder and Valenta, Exner and Haschek, Hartley and Edney, Trowbridge, Ames, Lockyer, Deslandres, Lohse and others. The most complete tables of wave-lengths are those of Exner and Haschek, in which the wave-lengths are given to 0.01 Angström. Other tables are Watt's 'Index of Spectra.' The standards on which all wave-length tables are based are Rowland's 'Table of Solar Spectrum Wave-Lengths,' which were based on Bell's determination of absolute wave-length. American Journal of Science, XXXIII, March 1887. For a discussion of methods of determining wave-lengths consult Perot and Fabry, Ann. Chim. et Phys., ser. 7, XV, 1892, and also Bell (Philosophical Magazine, XV, 157, 1902). The infra-red spectrum of the elements has been investigated by prism and concave grating with the help of bolometer and radiomicrometer by Snow, Lewis, Rubens, Paschen, Julius, Nichols and others. Short wave-lengths are absorbed by even a few centimetres of air, but Schumann ('Sitz. Akad. d. Wissens. in Wien,' CII, Abh. 2a, 1893), has greatly increased our information of this region of the spectrum. By means of a spectroscopic apparatus in a vacuum with lenses and prisms of fluorite and photographic plates prepared by himself, a wave-length of 1,000 was supposed to be reached. More accurate wave-lengths have been determined by Lyman of Harvard, using a concave grating in a vacuum and photographic plates poor in gelatine, as shown by Schumann. Lyman has reached as short wave-lengths as + 600 (Astrophysical Journal, XLIII, 89, 1916), and the limit of short wave-lengths can probably be pushed still further by this method.

Line Series.—That there is some orderly arrangement in the lines of a spectrum was shown by Balmer's law for the hydrogen series in 1885, and by the presence of numerous triplets in the spectra of magnesium, calcium and zinc. Researches by Kayser and Runge, Rydberg and Schuster, with the development by them of empirical and mathematical formulae, have led to a great deal of interesting information regarding these series of lines. Our knowledge of the spectrum of hydrogen is derived mainly from the observations of the heavenly bodies. In the laboratory, comparatively few lines are found in the series obeying Balmer's law, but these lines are well shown in the spectra of hydrogen-type stars. A stars, and as many as 32 lines of this series have been measured by Mitchell in the eclipse spectra of the sun. The further interdependence of astronomy and physics was clearly demonstrated when Pickering in 1896 discovered a new series of lines in the spectrum of the star ζ Puppis. It was not till 1892 that Fowler of London succeeded in finding in the laboratory some lines of the ζ Puppis series, and also δ 4686, and other lines of the Principal series of hydrogen. At the same time Fowler discovered a second Principal series, and comes to the conclusion that 'there are no special kinds of matter in celestial bodies and that most, if not all, of the celestial spectra are well within the range of laboratory experiments.' ('Monthly Notices,' R. A. S., LXIII, 82, 1912). However, in a great majority of the elements the series already discovered comprise only a small percentage of the total number of lines. The exact meaning of these series is as yet unknown, although several very promising attempts have been made to explain them from theoretical considerations. The chief among them may be mentioned those of Julius, Ames, Kövesligethy and Stoney. Stoney ('Trans. Roy. Soc.,' Dublin 1891) has sought to explain multiple lines from dynamical considerations, comparing the motions of the molecule with those of the bodies of the solar system whose motions in ellipses are perturbed by the presence of other bodies. Stoney, moreover, shows that the conclusions drawn by these dynamical methods may also be considered valid under the electro-magnetic theory of light, a statement which receives support from Poyntton's observations of the Zeeman effect ('Philosophical Magazine,' XLVI, 176, 1899). For detailed information on spectral series see Kayser's 'Handbuch der Spectroskopie,' Vol. II.

Change in Physical Conditions.—The early idea that the position of a line of a spectrum was the result of chance is still further modified by the change of the wave-length of a line resulting from a change in the physical conditions. Jewell noticed while measuring solar spectrum photographs that the arc lines of the comparison spectrum did not in many cases exactly correspond with the lines in the sun. This led to the investigations of Jewell, Humphreys and Mohler ('Monthly Notices,' VI, 169, 1897), on the spectra of an arc under pressure of from one to 15 atmospheres. From measurements of the spectra of 53 elements, it was shown that the lines are shifted by pressure toward the red end of the spectrum, the shifts being directly proportional to the increase of pressure, but being independent of the temperature. For a given element, the shifts of similar lines are proportional to their wave-length, but lines of
different series, principal, first and second sub-
ordinate, are shifted in the ratios of 1:2:4.

The appearances of lines in a spectrum are
greatly altered by other physical conditions.
Eder and Valenta have found that argon gives
three distinct spectra under different electrical
conditions, Schenck that the spark line of Mg
at $\lambda$ 4481, which has so often been considered
as a sure sign of a high temperature, vanishes
if the electrodes become so hot that they glow
and begin to melt. Lockyer has made a
great number of investigations on "enhanced"
lines, or those which are brighter in the spark than
in the arc. He explains their meaning on the
assumption that the spark is hotter than the
arc, an assumption which is hard to reconcile
with other observed phenomena. In this con-
nection, Kayser, in his excellent 'Handbuch der
Spectroskopie,' Vol. II, p. 181, says: "We
cannot assume any connection between the spec-
trum and the temperature of the body produc-
ing it, and all conclusions which are based on
the temperature at which a line or band will
appear are quite unsound." Enhanced lines are
found in the atmospheres of stars like that of Cygni,
and also in the flash spectrum taken at
the time of a total solar eclipse of the sun.
Evershed of India, and the observers at Mount
Wilson, Adams, Gale and St. John, recog-
nize the importance of enhanced lines in the
interpretation of solar phenomena. Observa-
tions of solar spectra, with and without an
eclipse, point to the conclusion ('Astrophysical
Journal,' XXXVIII, 407, 1913), that "the vapors
forming the enhanced lines ascend to relatively
high altitudes from which there results a de-
crease in pressure and a mixing with hydrogen,
and that on account of height, reduced pres-
sure and the presence of hydrogen, the en-
hanced lines become relatively strong.

Solar Spectrum.—The infra-red solar
spectrum has been investigated by Becquerel
and Lommel to $\lambda$ 9500 by using phosphorescent
screens, by Abney to $\lambda$ 27,000, who photo-
graphed with a special emulsion of silver
bromide and collodion, and by Langley by the
use of the bolometer to $\lambda$ 53,856. Rowland's
'Photographic Map of the Normal Solar Spec-
trum' (Baltimore 1888), made with a powerful
concave grating extending from $\lambda$ 3000 to
$\lambda$ 6950, and his 'Table of Solar Spectrum
Wave-Lengths' (Chicago 1888), which contain
accurate measures of some 20,000 lines, give
the most accurate information we possess of
the solar spectrum, and have been accepted by
all astrophysicists as the common standard of
reference. Rowland's determinations of relative
wave-lengths leave little to be desired in ac-
curacy. Measurements were made by the method
of coincidences which is rendered possible by
the use of concave gratings which permit two over-
lapping spectra to be photographed on the same
plate without change of focus. However, the
screen in Rowland's spectroscope has not had
their wave-lengths determined with equal ac-
curacy, and they have not been quite properly
spaced throughout the spectrum, with the re-
sult that at the Saint Louis conference, 1905, a
resolution of the line $\lambda$ 5025 of He I was dis-
regarded as one of the present greatest needs in
astrophysics. Considerable work has already
been done toward obtaining the wave-lengths of
200 standard lines to be reduced to the so-
called "international system." This work has
made evident the difficulty of obtaining satis-
factory wave-lengths for the standard lines on
account of a slight change in wave-length due
to the systematic deviations of Rowland's wave-
lengths from the international system amounts
to 0.02 Angstroms or more, the accidental
errors are much less than 0.01 Angstroms. As
present-day investigations of solar problems
need the third decimal place in the wave-
lengths, St. John concludes ('Proceedings'
of the National Academy of Sciences, April
1916), that it will be more satisfactory to re-
duce all wave-lengths to the Rowland standard
until some years hence, when complete tables
of solar wave-lengths based on the new stand-
ards will be available.

The importance of a detailed study of our
nearest fixed star, the sun, has been empha-
sized by the erection by the Carnegie Institu-
tion at Washington of the Solar Observatory
at Mount Wilson. The discoveries at this ob-
servatory have been epoch-making. The work
at Mount Wilson has demanded (1) a large
beam of the sun's rays, that spectrographs be
kept under as nearly constant conditions of
temperature as possible. Hence there has been
the erection by Hale of the "tower telescope."9
There was first erected a 60-foot tower, and
this proving successful, there was later put up
a tower 150 feet high. A beam of sunlight re-
lected from a plane mirror at the top of the
tower passes through an objective and is
brought to a focus on the slit plate of the spec-
trograph. From the slit, the beam passes verti-
cally down a 75-foot wall, at the bottom of
which is placed a concave grating. The splen-
did definition obtained in California, and the
great dispersion of the large spectrograph, have
permitted a detailed study of spots on the sun.
The work of Hale has shown (1) that sun-
spots are cooler than the rest of the sun; (2)
that the spots are vortices; (3) that they are
centres of magnetic disturbance. These facts
have been verified only after a great variety
of experiments carried out at Mount Wilson
and at the Solar Observatory Office in Paso-
dena.

Eclipses have furnished interesting develop-
ments in the history of spectrum analysis. The
spectroscope was first used at the eclipse of
1868 by Janssen in India, when it was shown
that the prominences give a bright line spectrum,
thus showing that they are masses of gas. The
lines appeared so bright in the spectroscope
that Janssen looked for them the next day
without an eclipse and found them readily
enough. In 1869 helium was discovered on
the sun, though it was not found in the laboratory
by Sir William Ramsay till 1895; in 1870 Young
discovered the "flash spectrum."9

Observations similar to Janssen's of 1868
were independently carried out by Lockyer in
England, who found the prominences without
the aid of an eclipse. Both communicated their
results to the French Academy, and by a strange
coincidence both papers were read at the same
meeting of the Academy. Prominences thus
released to be purely observational, reliable
observations were made by Young, who used visual methods. In 1890 Hale invented the spectrophotograph, by means of which it was possible to photograph the prominences.

Quite independently, Deslandres of Paris in-
vented a similar instrument. The essential feature of the spectrophotograph is the second slit, which is placed directly in front of the photographic plate and is illuminated by light of only one wave-length to reach the plate. Hale's spectrophotograph reached its highest development on the 40-inch Yerkes telescope. By setting the second slit on a certain line of the spectrum it was possible to photograph that prominence in the light of that line only. Photographs could thus be obtained in the light of glowing calcium vapor by utilizing the H or the K line of calcium or from glowing hydrogen using the C or H line. The exquisite defining power of the 40-inch lens has permitted remarkable detail to be shown in the prominence photographs. At times prominences reach the great elevations of 300,000 miles above the sun, and are shot up with velocities as great as 100 miles per second. The chief workers along these lines have been Hale, Deslandres, Evershed, Fox, Slocum and Ellerman. They all have shown that prominences are intimately associated with sun spots.

Next, by photographing the surface of the sun by means of the spectrophotograph, Hale discovered bright patches of gas which he called "flocculi." In his investigations of flocculi, Hale found that the photographs showed different appearances when the slit was shifted to a slight amount from the centre of the line of the spectrum which was being utilized. A photograph may be taken with the slit of the spectrophotograph at the centre of the K line at λ 3933, another with the slit moved a trifle to λ 3932, and still others with the slit at λ 3929 and λ 3924. These photographs show bright "flocculi," but the fourth of them not only differ from photographs taken with the calcium H or with hydrogen C or F lines, but differ materially among themselves. These photographs are explained as being due to a difference in level of the gases, and from these and other results it seems probable that the calcium flocculi are in general made up of a series of columns, which expand as they reach higher levels, and that the cases overlap laterally. Both prominences and flocculi may be photographed by a spectrophotograph attached to a horizontal telescope in which the light is fed to the objective by means of a plane mirror, as Hale has shown at Mount Wilson and in India. These horizontal telescopes, however, do not equal the definition obtained by the 40-inch telescope.

The dark Fraunhofer lines of the solar spectrum are caused by the absorption of light as it passes from the hot photosphere through the relatively cooler layers of atmosphere surrounding the photosphere, the so-called "reversing layer." The gases forming the reversing layer are cool only in contrast to the very hot matter making up the photosphere, but these gases, nevertheless, are at such a high temperature, that if we could obtain their spectrum separated from the photosphere, the spectrum would consist of a series of bright lines on a dark background. At the time of a total eclipse the observer is permitted to obtain the spectrum of the reversing layer. So long as even a small portion of the sun's disc remains visible, the light from the photosphere is so overpowering compared with that of the reversing layer, that the ordinary, dark-line Fraunhofer spectrum is obtained. Just before totality a few bright lines of the upper chromosphere become visible, first the H and K lines of calcium and the used hydrogen and helium lines. At the instant that the sun's disc is entirely covered by the moon, there flashes out the bright line spectrum of the reversing layer. The change from dark-line to bright-line spectrum is so rapid that Young in 1870, who was the first to see it, called it the "flash spectrum." The flash remains visible in its entirety only for a few seconds, while the moon is passing over the relatively shallow reversing layer. The flash spectrum was first photographed in the year 1890 by Shackleton, who used a prismatic camera. The most complete results so far published are those of Mitchell, who obtained exquisite definition on his photographs at the 1905 eclipse. The apparatus used was extremely simple and consisted of a plane mirror to turn the sun's light horizontally. From the mirror, the beam of light fell on a concave grating by means of which the spectrum was brought to a focus on the photographic plate.

Photographs were obtained extending from λ 3300 in the violet to λ 5900, with a dispersion of one mm equal 10.8 Angstroms. The wavelengths of 2841 lines in this region (Astrophysical Journal, XXXVII, 407, 1913), show an accuracy of 0.02 Angstroms. In addition to the wave-lengths, there were also given the heights to which the vapors forming each line of the spectrum extend in kilometres above the sun's photosphere. The general conclusions from this eclipse are: (1) That the reversing layer is merely the densest part of the chromosphere, and has no existence separate from the chromosphere; (2) that the reversing layer extends about 600 kilometres above the photosphere; (3) that there is no difference in wave-lengths between the spectrum of the reversing layer and Rowland's values for the Fraunhofer lines, showing that in reality the flash spectrum is truly a reversal spectrum; but (4) there are great differences in intensities between the lines of the flash spectrum and the Fraunhofer spectrum. These intensity differences find a ready explanation in the differences in height to which the vapors extend. On account of the great heights, the H and K lines of calcium, the hydrogen D lines of calcium and the hydrogen lines are all strong in the flash spectrum. Very great differences in intensity are shown by the enhanced lines.

Prominences are merely portions of the chromosphere shot up to great heights above the sun. Since we are able to photograph the prominences without waiting for an eclipse, would it not be possible to obtain a photograph of the chromosphere, even of the portion that lies closest to the photosphere, the reversing layer, which produces the flash spectrum? Young many years ago observed the brighter chromosphere lines without an eclipse. Evidently it would be quite possible to photograph the flash spectrum provided that during the exposure the slit could be held pointed at the reversing layer, and the photosphere not be allowed to encroach. An idea can be obtained of the accuracy demanded in pointing the slit to the proper region on the sun when it is realized that the sun is 866,000 miles in diameter, while the reversing layer is less than 400
ASTROPHYSICS

miles in thickness. To photograph the flash spectrum without an eclipse, there is hence needed a large image of the sun, and some convenient guiding device. Hale and Adams, using a 40-in. equatorial instrument and a 40-in. tower telescope, have obtained the only photographs of the flash spectrum without an eclipse. Using a dispersion of 1 mm equal 0.9 Angstroms, excellent photographs have been obtained which show about as many lines as secured by Mitchell with an accuracy of wave-length about the same as that obtained by him. Success, however, has not followed the attempts to photograph the corona in full sunlight without an eclipse. This was tried as early as 1885 by Sir William Huggins. In 1893 and 1894, Riccò at Mount Etna, and Hale at Pike's Peak, attempted to photograph the corona, both by direct photography and also by the spectroheliograph, which has been so successful in obtaining photographs of the prominences. Failure to reach results, turned Hale's attention to the bolometer joined up with a sensitive galvanometer, and many experiments were made at Yerkes Observatory between the years 1895 and 1900 (Astrophysical Journal, 1, 372, 1900). The simultaneous bolometer measures at the eclipse of 1908 by Abbot with the aid of the bolometer. The work of Abbot ('Sun,' p. 132, 1911) shows that the daylight sky as seen from sea-level even 20° from the sun is fully 10 times as bright as the corona in its brightest parts close to the sun's limb. Close to the sun's edge the daylight sky is so intensely brilliant compared with the corona, that no method yet attempted, even when tried at a mountain top to diminish the atmospheric glare, has had the slightest amount of success.

Remarkable work has been done by Evershed in measuring the radial motion of matter forming sun-spots. With the better equipment at Mount Wilson, St. John has carried out Evershed's work more in detail. His researches (Astrophysical Journal, XXXVIII, 341, 1913) have been supplemented by the determination of brightnesses by Mitchell from observations at the time of an eclipse. These results show that the different displacements of the Fraunhofer lines at t-spots seem to find their simplest explanation in movements of the solar vapors tangential to the surface, with velocities varying with the elevation: large outflowing displacements are taken by vapors that exist as low as 9,000 while large inflowing motions are taken by vapors like calcium and hydrogen which exist at great heights. This excellent work of St. John's gives a very clear insight into the physical constitution of sun-spots. The lighter materials of the chromosphere which cause the darkest lines in the sun's spectrum, hydrogen, helium, calcium and substances forming the stronger enhanced lines, flow in to the spots, the higher the elevation above the photosphere the greater the speed of the in-flow. This in-flow of matter is partly balanced by the out-flow of matter from the spot, matter at the least heights above the photosphere flowing with the greatest velocities. The spot vortex, therefore, resembles in appearance that of an inverted water-spout seen in a terrestrial stream. Additional information regarding sun-spots, St. John's work coupled with eclipse observations has given the means of measuring the depths of the layers of gases forming the inner chromosphere, while Hale's wonderful researches on flocculi can be interpreted only by assuming differences of elevations in the outer chromosphere. We therefore seem to have in Hale's observation of the motions of the earth's atmosphere in spite of the great improvements in methods of observing meteorological phenomena.

Motion in the Line of Sight.—One of the greatest triumphs of astrophysics has been the measurement of radial velocity, or motion in the line of sight, in linear units of miles or kilometres per second. The Doppler-Fizeau principle is easy to understand. Light is a wave phenomenon. When the source of light and the observer are approaching each other, either by a motion of the object, or the observer, or both combined, then the number of waves which reach the eye per second is increased, whereas if the observer and object are moving from each other, fewer light waves reach the eye per second. If more waves are met, the wave-length must be shortened. The position of a line in the spectrum is known by its wave-length, and, if in consequence of motion, the wave-length is shortened, the position of the line is shifted toward the region of short wave-lengths, the violet. The measurement of the amount of the shift gives the means of determining the velocity in the line of sight. Consequently, a shift toward the violet means a motion of the object toward the observer (the motion taking place either in the object, or in the observer, or both), while a shift toward the red means a motion increasing the distance between observer and object. This is the Doppler-Fizeau principle. All are familiar with this same principle in sound, in the sudden drop in the pitch of the whistle of a locomotive as a train going in the opposite direction is met and passed. The motion in the line of sight corresponding to a shift $\Delta \lambda$ of a spectral line of wave-length $\lambda$ is given by the formula

$$\sqrt{\frac{\Delta \lambda}{\lambda}} = \sqrt{\frac{\lambda}{\lambda}} \cdot \sqrt{\frac{\Delta \lambda}{\lambda}}$$

Where $\sqrt{\lambda}$ is the velocity of the star relative to the observer, and $\sqrt{\lambda}$ is the velocity of light. If the velocity of light is measured in miles per second (186,300), the velocity $\sqrt{\lambda}$ is known in miles per second. In scientific work velocities are usually determined in kilometres per second, when the velocity of light (in round numbers) is 300,000. One can easily see, therefore, the accuracy necessary in the measurement of spectrograms in order to attain knowledge of radial motions of stars to a given degree of refinement. If, for instance, we wish to know the velocity in the line of sight accurately within one kilometre per second, it will be necessary to determine wave-lengths with a precision of one part in 300,000. For a line of wave-lengths $\lambda$ 4500, it is necessary to measure the shift in wave-lengths within 0.015 Angstroms. This accuracy is reached in the best work done with our best spectrographs, when the spectrum of the star being investi-
gated consists of fine, clean-cut lines. With a slit spectrograph a comparison spectrum is placed alongside the stellar spectrum. From the known wave-lengths of the comparison lines the wave-lengths of the stellar lines may be found, and these, compared with the normal wave-lengths, give the shift due to the motion of the star in the line of sight. The grandest application is seen in Keeler's proof (Astrophysical Journal, I, 416, 1895) of the meteoric constitution of Saturn's rings. If meteoric, the linear motion of the rings will be greatest nearest the planet and decrease outward; if solid the rings will rotate as a whole, all particles having the same angular motion, the linear speed increasing from centre to circumference. With solid rings and a slit placed across the planet's equator, the lines on the side moving toward us would be shifted toward the region of short wave-lengths, the shift being proportional to the linear motion, while for the side moving away from us the lines would be shifted in the opposite direction. Thus, on account of the gradual increase in linear motion from centre to circumference, the lines would be gradually shifted, in the complete spectrum having the effect of lines slightly inclined. Such, however, is not the appearance of the lines photographed by Keeler, and these can be explained only under the assumption that the rings are a collection of small satellites, giving, therefore, a direct confirmation of the mathematical theory of Maxwell.

One of the most interesting applications of the Doppler-Fizeau principle is the determination of the rotation periods of the sun and the planets. As the sun rotates the eastern edge moves toward us while the western moves away from us. Measurements of the rotation of the sun have been carried out mainly by Halm of Edinburgh, Plaskett at Ottawa, and Adams at Mount Wilson. The rotation time at the sun's equator is found to be 24.8 days; at latitude 30°, 26.3 days; at latitude 45°, 28.1 days; at latitude 60°, 30.2 days; and at latitude 75°, 31.9 days. Adams used more than 20 lines of iron, titanium, manganese, etc., and he found that the different elements do not all show the same rotation period. The differences, according to Hale, can be explained as being due to differences of level of the layers producing the different lines. Most interesting are the results from the H α line which shows a rotation period at the equator of 24.0 days instead of 24.8, and at latitude 75°, a rotation in 26.3 days instead of 31.9 days, as shown by the metallic lines at the same latitude. Hale has investigated the rotation time by means of the flocculi. The calcium flocculi show a decrease in rotation speed in higher latitudes, just as is shown by the spots, but to a lesser degree, while on the other hand the hydrogen flocculi H α show an increase from a rotation speed of 25.2 days at the equator to 24.7 days in middle latitudes. There is still a vast amount of work left to be done before a thorough knowledge is obtained of the manner of rotation of the sun.

In investigating the rotation of the planets, most satisfactory results are obtained from Jupiter. On account of its great size and rapid rotation, a point on Jupiter's equator moves with a speed of 12.9°/hour; consequently a slit of the spectrograph is placed across the planet, parallel to the equator, the lines of the spectrum will be inclined on account of the great rotational velocity. Although the planet Uranus shows no conspicuous markings, and its rotation time, therefore, cannot be determined from visual observations, Lowell and Slipher have been able to show from spectroscopic observations that it rotates once in 104 hours, and in the retrograde direction, or in the same direction that the satellites move around Uranus. Applied to Venus, the spectroscopic method has not had the same degree of success due to the fact that the moon, rays from rotation is small, and, consequently, difficult to measure. While Slipher finds the rotation period to be 225 days, thus corroborating the results obtained visually by Schiaparelli and Lowell, Belopolsky in Pulkowa finds a period of about 24 hours.

**Water Vapor on Mars.**—According to Percival Lowell there are a great number of canals on Mars which are for the purpose of irrigating the arid planet. As there is very little water visible on the Mars, Lowell concludes that the atmosphere is rich in water vapor. This is a matter that can be investigated spectroscopically. Since the moon has no atmosphere, it shows the same spectrum as the sun. Light coming from the earth's atmosphere, so that its spectrum might show atmospheric lines due to the earth's water vapor. When light reaches us from Mars the rays from the sun have twice passed through the atmosphere of Mars. If the spectrum of Mars is compared with that of the moon, care being taken that the two spectra are observed under as nearly as possible identical conditions regarding altitude, the presence of water vapor in the earth's atmosphere, etc., then if the atmosphere of Mars is rich in water vapor, these lines should show by increased absorption at the red end of the spectrum. Slipher believes that he has proved this to be the case. Campbell, under vastly superior conditions, observing from the top of Mount Whitney (15,000 feet), finds that the spectra of Mars and moon are identical. Campbell has also tested this matter in a different manner, but with negative results. The water vapor lines resulting from the earth's atmosphere should show a different radial velocity from those formed by the Martian atmosphere, since Mars is moving. Although the terrestrial atmospheric lines were found and measured by Campbell, there were none found due to Mars.

**The Solar Constant.**—Astrophysical work along entirely different lines has been carried out at the Astrophysical Observatory of the Smithsonian Institution for the purpose of determining the value of the solar constant, or the amount of heat from the sun that reaches the outside of the earth's atmosphere. The amount of heat received at the surface of the earth is measured by means of the pyrheliometer or actinometer. It is very difficult to eliminate the absorbing effect of the earth's atmosphere. Abbot has shown that this can be accomplished by the use of the bolometer, invented by Langley and used in connection with a sensitive galvanometer. The bolometer and galvanometer, both perfected in the hands of Abbot, are used to measure the energy at different regions of the spectrum of the sun. The determination made by Langley from the
ASTROPHYSICS

Photography is almost exclusively used in modern work. One, two or three prisms may be used to obtain dispersion. Needless to say, increase in the dispersion adds to the time of exposure necessary to obtain a photograph.

Modern stellar spectroscopes are best represented by the Mills spectroscope of the Lick Observatory (Campbell, *Astrophysical Journal*, VIII, 123, 1898), by the Bruce spectroscope of the Yerkes Observatory (Frost, *Astrophysical Journal*, XV, 1, 1902), and that of the Astrophysical Observatory of Potsdam (Hartmann, *Zeitsch. für Instrum.*, December 1901). The spectrographs are similar in having the slit placed at the focus of the great telescope, and a dispersion of three prisms giving a total deviation of 180°. By means of a guiding eyepiece, it is possible to keep the star's light centrally on the slit during the exposure. Since this exposure may last for four or five hours, it is necessary, in order to have perfect definition, to keep the temperature constant. This is accomplished by means of an automatic temperature control which will keep the prisms of the spectrograph within 0.1° C. during an exposure, when outside in the dome the temperature may change by several degrees. A stellar spectrum is photographed, alongside a comparison spectrum in order to determine wavelengths more accurately, and to give measures of the motion in the line of sight, the most important work of stellar spectroscopy. The spectrograms are most readily reduced by the Hartmann-Cornu formula:

$$\lambda = \lambda_0 + \varepsilon \frac{\varepsilon_s}{1 + \varepsilon_s},$$

where $\lambda_0$, $\varepsilon$ and $\varepsilon_s$ are constants and $\varepsilon_s$ is the scale reading on the line whose wave-length is desired.

It needed little investigation of the stars to show that difference in color of the stars corresponded to differences in the character of their spectra. One of the best known classifications is that of Secchi, who divided the stars into the following types:

Type I.—White or blue stars, the spectrum characterized by the breadth and intensity of the hydrogen lines with metallic lines very faint. This type includes more than half the stars.

Type II.—Yellow stars like our sun, with spectra resembling that of the sun very closely, consisting of a great number of fine dark lines.

Type III.—Red and orange stars, including most of the variables. The spectrum is crossed by numerous dark bands or flutings, which are sharply defined on the blue side and shade off toward the red. α Orionis, Antares and ζ Ceti are good examples.

Type IV.—Deep reddish stars, all faint. The spectrum resembles that of Type III, but the flutings are reversed in direction, being sharply defined on the red side. 152 Schjellerup is the best example.

Pickering has added a fifth type to include many stars having bright lines in their spectra, and the planetary nebulae.

Other satisfactory classifications are those of Vogel and Lockyer. The classification most used at the present time is the one devised at the Harvard College Observatory. In this, not only are there the main classes, but also subdivisions of each class as, B0, B1, B2, B3, ..., B9. The main classes are:

Class B.—Helium stars, represented by δ and ε Orionis.

Class A.—Hydrogen stars, represented by Syrius and Vega, and characterized by the great intensity of the hydrogen line.

Class F.—Calcium stars, in which H and K lines have the greatest intensity; represented by δ Aquilæ and a Cariniæ.

Class G.—Solar type, represented by the sun and Capella.

Class K.—Represented by Arcturus. There is a decrease in intensity at the violet end of the spectrum.

Class M.—Represented by B Andromedæ, a Orionis, a Herculis and Mira Ceti. Absorption bands are found in the blue-green.

Class N.—Similar to Secchi's type IV.

Miss Cannon of Harvard College Observatory has completed the classification of 250,000 stars according to the above system. This classification seems to represent successive steps in the evolution of the stars.

By common consent the nebula is regarded as being the primordial matter. The first stage of development is represented, according to Huggins ('Atlas of Representative Stellar Spectra,' London 1899), a masterpiece with superb illustrations, by the hydrogen line of a of Orionis, one of the stars of the great nebula. Orion and helium stars are followed in development by the white stars of Secchi's first type. Evolution can be traced step by step, through stages like those represented by the stars a Lyrae, Castor (fainter star), a Aquilæ, Procyon, ζ Cygni, till we come to the fully developed second type star like Capella and the sun. Increased absorption at the violet end of the spectrum gives the red stars of Secchi's third and fourth types which, according to Huggins, develop in parallel lines. The period of increasing age is evident from the carbon absorption bands, and it is easy to imagine this absorption increasing in amount till the whole light of the star is cut off. But even at this stage, with no light, the spectroscopic power is not powerless to follow, for if the dark star accompanies a bright one, its presence is revealed through a change in the motion of the line of sight. There has been quite considerable discussion as to which star, Sirius or the sun, is in the hotter stage of development. The color of Sirius, and the maximum in its spectrum being more toward the violet end than in the case of the sun, would seem to indicate a higher temperature. Huggins and a great many astronomers think that the sun is the hottest state, but that the great absorption in its atmosphere, compared with that of Sirius, makes the color of the sun yellow.

All classifications of stellar spectra begin with white stars and end with red. If we interpret this as the result of a change in temperature corresponding to a progress in evolution, as shown by Wien's law, and if the intensities of the different regions of the spectrum are measured by a spectral photometer and Planck's energy equation is applied, as in the case of the sun, then we find the following approximate effective temperatures of the stars of the different classes: Class O6, 12,000° C; classes B and A, 10,000° C; class F, 7,500° C; class G, 5,500° C; class K, 4,000° C; and class M, 3,000° C. Other methods of evolution among the stars have been shown possible by Lockyer, Russell and others.

Motions of the Stars.—Proper motion is determined from meridian circle observations. The motions are measured in angular units of seconds of arc per year. The most complete work is the 'Preliminary General Catalogue' of Boss containing the proper motions of 6,188 stars. Radial velocities are measured by the spectograph in linear units of miles, or kilometres per second. The most prominent workers in this field have been Vogel, Duftner, Campbell, Frost, Bélopolsky, Hartmann, Schlesinger, Plaskett and Adams, who together have pretty thoroughly surveyed the northern hemisphere. Work in the southern hemisphere has been done by the Lick Observatory station at Santiago, Chile, and by the Cape Observatory in South Africa. In stellar spectroscope work the advantage is shown of the great light-gathering power of the large modern reflecting telescopes. The advantage of the reflector over the refractor in this field of work lies in the absence of chromatic aberration, so that the light of all wavelengths is brought to a focus on the slit. The small field of good definition, which the reflector shows in comparison with the refractor, is no drawback in spectroscopic work. With the five-foot reflector of Mount Wilson, it has been possible to photograph the spectra of stars as faint as the 12th magnitude, while with the 100-inch reflector, it will be possible to photograph the spectra of stars of the 15th magnitude, or even fainter. In addition to measuring the motions of the stars toward, or away from, the observer in the line of sight, the spectograph has permitted the discovery of an entirely new class of stars known as spectroscopic binaries. The first discovered was Mizar by Pickering, who noticed the periodic doubling of the lines of the spectrum. It is comparatively rare that both stars are of so nearly equal brightness that both show the stellar absorption lines. But when the motion of the star in the line of sight varies in amount (after eliminating the motion of the earth about the sun), this change in velocity is certain proof that there is a second body. Repeated observations of such stars permit the determination of their orbits. It is found that the periods have a wide range, from 0.19 days in the case of B Cephei, to 60 years as in α Orionis, this latter period being longer than that of the shortest period of a visual binary δ Equulei, which has a period of 5.7 years. Among the brighter stars, about one star in every four is found to be a spectroscopic binary.

The most complete work on radial velocities so far published is ' Stellar Motions,' by Campbell, Yale University Press, 1913. Campbell has made the remarkable discovery that the stars increase in age their velocities increase according to the following table:

<table>
<thead>
<tr>
<th>Spectral Classes</th>
<th>Number of Stars</th>
<th>Average radial velocity</th>

</table>

There is no satisfactory explanation of this curious increase of speed with age unless we...
accept that of Adams (Astrophysical Journal, XLII, 172, 1915). The early type stars have smaller proper motions and are at much greater distances from us than the later type stars. Due to the fact that Campbell's work has been limited to stars brighter than 5.0 magnitude, he has, in consequence, measured stars of higher average velocities in the later types than in the earlier. Kapteyn has shown that there is an intimate connection between proper motion, radial velocity, magnitude and spectral type of the stars, and has derived empirical formulae showing the connection. The most complete work in this field has been done by van Rhijn (Astrophysical Journal, XLIII, 36, 1916). This work shows very clearly that the early type stars belonging to the O, B and A classes on the average are much more distant than the stars belonging to the later types. Adams at Mount Wilson has gone a step farther, and has made the wonderful discovery ('Proceedings' of the National Academy, April 1916), that the relative intensities of certain lines in stellar spectrums do not depend on the absolute luminosity of the stars, and by means of measures of these intensities, Adams has been able to determine the parallaxes of the stars. The spectrum of the sun is almost identical with that of Capella, which shows that the sun is a star, rendered brighter and bigger on account of its nearness. The stellar magnitude of the sun is — 26.4 on the same scale that Sirius is a star of magnitude — 1.4. Thus, according to Newcomb ('Stars', p. 27), the sun gives us: 10,000,000,000,000,000,000,000 times the light of Sirius.

9,100,000,000,000 times the light of a star of magnitude 6.

The square roots of these numbers show the number of times we should increase the actual distance of the sun in order that it might shine as a star of the corresponding magnitude. Under these conditions the distance and parallax of the sun would be:

- Sirius: Distance 100,000; Parallax, 0.06
- Mag. 1: Distance, 302,000; Parallax, 0.68
- Mag. 6: Distance, 3,020,000; Parallax, 0.07

From the large size of the parallaxes, it is evident that the sun must be a very small star in the heavens. But its nearness renders it a very important star in which we can study the second stage of stellar development in all its details. Researches by means of radial velocity, proper motion and parallax determinations show the presence of groups of stars in the sky like the Taurus group, the Ursa Major group, etc., in which the stars are moving with motions that are equal and parallel. To the Ursa Major group belong all the stars of the "Dipper" except the two extreme ones, and also such widely separated stars as Sirius, Auriga, and Corona. Such results show the necessity of co-operation among the different observatories in order that observational work may be done with the highest degree of accuracy. So far the value of the measurements has been the parallax determinations. Recent work by means of photography with telescopes of great focal length has shown the possibility of greatly increasing the accuracy of parallax measures over the results obtained visually. Several American observatories possessing large telescopes, together with the Greenwich Observatory, are co-operating in parallax determinations. The American observatories are: Allegheny, Dearborn, McCormick, Mount Wilson, Swarthmore, Van Vleck and Yerkes.

The position of the apex of the solar motion is fixed by Weersma from the proper motions of 3,600 stars at right ascension 268° and declination, 31°, north, and by Boss from 5,400 proper motions deduced from his 'Preliminary General Catalogue,' at right ascension 271° and declination 34°, north. Campbell, from the investigations of the spectra of 1,464 stars, places the position at right ascension 272° and declination 27°, north. The motion of the solar system through space was found by Campbell to be 17.85 kilometres, or about 12 miles per second. This speed carries the solar system 255,000,000 miles per year, or 375 times the earth's mean distance from the sun.

Twentieth century astronomy will have as its special study more detailed information concerning the motions of the stars and their distances in order that more complete knowledge may be gained regarding stellar evolution, and regarding the shape and size of the universe, and the distribution and motions of the heavenly bodies forming it.

Bibliography—The best books on the subject are Kayser's 'Handbuch der Spectroskopie' (6 vols.); Scheiner's 'Astronomical Spectroscopy' (Frost's translation); Campbell's 'Stellar Motions' and Newcomb-Engelmann's 'Populäre Astronomie.'

SAMUEL A. MITCHELL,
Director Leander McCormick Observatory,
University of Virginia.

ASTRUC, as'truk', Jean, French physician; b. 19 March 1684; d. Paris, 5 March 1766. He acquired high reputation as an anatomist, and was the author of 'Venerial Diseases' (1736), and other medical works. The work, however, which has immortalized him is purely theological and is entitled 'Conjectures as to the Original Materials of Which Moses Seems to Have Availed Himself in Composing the Book of Genesis' (1753). In this he divided the book of Genesis into two parts, on the ground of the use of Elohim (God) or Yahveh (Jehovah). He holds that these two names for the Deity point to the fact that Genesis was compiled from two parallel, independent documents. His memoir forms the origin of modern criticism on the Pentateuch.

ASTRUP, Elvind, Norwegian explorer: b. Christiania 1870; d. 1896. He was a member of the first and second Peary expeditions, 1891 and 1893, and made the first survey of the northern coast of Melville Bay. He perished while on a snowshoe expedition from Dovre, Norway.

ASTURA, as-too'ra, Italy, a maritime village 40 miles from Rome. In its little harbor a high tower is said to stand on the site of the villa of Cicero, where Cicero was slain by order of Antony 43 B.C.

ASTURIAS, as-too'ri-as, The, a former principality of Spain. To this mountainous country of the north of Spain the Goths retreated in the 8th century before the sword of the Saracens. The inhabitants of Asturias are said to be less industrious than the Galicians, and less sociable than the Biscayans. The
ASTYAGES—ASYLUM

hereditary Prince of Spain has borne since 1388 the title of Prince of Asturias, or of the Asturians, according to the obsolete division into Asturias de Oviedo and Asturias de Santillana, Oviedo and Santillana being the two chief cities of the principality. Since 1838 the principality has been officially known as the province of Oviedo. See Oviedo.

ASTYAGES, the last King of Media, reigned 594-550 B.C. In the latter year he was dethroned by Cyrus, who, according to Herodotus, was his grandson. Cyrus revolted in 559, and defeated Astyages, whom he took prisoner, but afterward appointed governor of Hycrania.

ASTYANAX, sometimes known as Scamandrius. A Greek legendary character, the son of Hector and Andromache.

ASUNCIÓN, a-soon-the-on, or NUESTRA SEÑORA DE LA ASUNCIÓN (in English, Assumption), the capital of Paraguay, on the river Paraguay. The principal edifices are the cathedral, several other churches and convents, the President's Palace, house of Congress, arsenal, National Library, custom-house, a college, hospital, railway station, etc. In the Museum of Fine Arts there are a few old paintings, but without interest. The trade of the town is in Paraguay tea, tobacco, fruits, hides, timber, provisions, manufactured goods, very beautiful lace (made by the civilized Indians), excellent hammocks, preserves and sweetmeats.

The location of Asunción on a hill above the river favors natural drainage, and to this circumstance is due, in part at least, its established reputation as a healthful place. The dictator Lopez endeavor to give his little capital the appearance of grandeur, and that design was expressed in the larger buildings completed (with a single exception) before the war with Argentina, Brazil and Uruguay (see PARAGUAY—HISTORY). There are through services, by river steamers and rail, with Buenos Aires. Pop. 80,000 in 1916.

ASURNAZIRPAL, a-soor-nâ'zer-pal, a King of Assyria from 881 B.C. to 860. He was one of the most powerful of the Assyrian kings, and in numerous campaigns enlarged his empire, especially toward the westward, extending it from Lebanon to the Tigris. He also rebuilt Calah, his capital, and left a record of his achievements in the so-called "Standard Inscription." See ASSYRIA; ASSYRIOLOGY.

AVSALAYANA, also ACVALYANA, ancient Hindu author. He is supposed to have written the Srauta-Sutra and theGrhya-Sutra of the Vedas.

ASVIN, or ACVIN, two Vedic deities, Dasra and Nasatya. They were the husbands of Surya, daughter of the sun god, and they brought the light of the sun to the world each morning. They could cure all ills of the flesh and the sickly and the diseased prayed to them for health. Consult Bergaigne, "La religion védique" (Vol. II, Paris 1879-83); Myrianthes, "Die Aevins oder arischen Dioskuren" (Munich 1876).

ASWAL, a-swâl, a Hindu name of the sloth-bear. See BEARS.

ASYLUM, a place where persons flee for protection. Under the Moslem dispensation cities of refuge were set apart to which the slayer might flee so that innocent blood should not be shed, in case the person was not worthy of death— that is, in case the act was accidental and not malicious. But among the Jews outside of the Jews, it seems that temples, statues to the gods, and altars particularly consecrated for such purposes, constituted places of refuge for persons generally, and it was deemed an act of impiety to remove anybody who had fled to such an asylum for protection. However, Tiberius abolished all asylum except the temples of Juno and AEsculapius. These asylum finally passed over to the Christian world, and under Constantine the Great all Christian churches were made asylum for all those who were pursued by officers of justice or the violence of their enemies, and the younger Theodosius, in the year 431, extended these privileges to all courts, gardens, walks and houses belonging to the Church. In the year 631 the Synod of Toledo extended the limits of asylums 30 paces from every church, and this privilege afterward prevailed in Catholic countries, and it is said to have been a strong armor of defense against the wild spirit of the Middle Ages, and not without good consequences at the time when force often prevailed against justice. But in later times as other and better systems of procedure in the administration of justice became adopted, asylum were abolished in most countries. This seems to have been the origin, nature and object of asylums, and such the common acceptance of the term, but more recently in some countries, the name has been given to institutions for the insane, and care of the poor, blind, deaf and dumb and lunatics who are incapable of taking care of themselves.

ASYLUM, Right of. In modern international law the phrase means the privilege extended to foreign legations, whether by the law of nations or by custom, to afford shelter to persons who are subject to the jurisdiction of the states in which the legations are located. Actually no person may claim the right of asylum but the legation may extend its protection, and thus the modern right differs greatly from the ancient Assyrian right.

Asylum in Legations.—Prior to the middle of the 17th century, diplomatic agents based their claims to the right to grant asylum to fugitives from local authorities on the doctrine of "extraterritoriality"—i.e., the exclusion of the domestic jurisdiction of one state from the precincts of the legation of another state. When a person took refuge within a legation he was considered to be under the protection of the country to which that legation belonged and during his stay to be absolutely exempt from the operation of the domestic laws. The legation officials might surrender him, either at pleasure or through extradition (q.v.) proceedings; but any attempt to capture him or compel his release by force was deemed an invasion of the territory of the state to which the legation belonged. Since the middle of the 17th century the theory of extraterritoriality in this respect has been abandoned and the claim to the right of asylum has been modified greatly. Attempts have been made to justify the right of asylum on the ground of the inviolability of diplomatic agents, but while the legation is still deemed to be exempt from local jurisdiction and an asylum for the diplomatic agent and his
bona fide official and personal household, and while others for a time may gain immunity from arrests by entering legations, that immunity should now prevail that the right of asylum in legations does not apply to visitors or strangers temporarily residing with the agent and still less to fugitives (save perhaps in states where the government is insecure or where frequent revolutions occur) and that fugitives should be surrendered to local officials on demand of the proper authorities. The United States has repeatedly endeavored to secure an international agreement respecting this right but has failed, owing to practices prevailing in states outside of Europe and the United States. The representatives of the Powers often exercised the right in Greece during the revolution of 1862 and in Spain during various periods of anarchy; and as late as 1895 the British Ambassador at Constantinople extended the privilege to the deposed Grand Vizier. In Asia and the South and Central American states there have been numerous instances of granting asylum, but even in these states asylum for other than political offenders is rarely granted, and then in some instances it has been limited to residents of the state granting the asylum on humane rather than on legal grounds. The United States has discouraged the practice even in this restricted form and has instructed its diplomatic agents to the effect that "The privilege of immunity from local jurisdiction does not embrace the right of asylum for persons outside of a representative's diplomatic or personal household. In some instances the grant of asylum is regulated by treaty, as that of 1856 between the United States and Peru, Article VII of which provides that "The diplomatic agent or consuls of the United States shall not protect secretly or publicly the subjects of the Persian government, and they shall never suffer a departure from the principles here laid down and agreed to by mutual consent." In no case is a minister permitted to offer his dwelling as a resort for refugees and if a fugitive, uninvited, should apply for protection, this should be granted only if his life be in imminent danger from mob violence and only during the continuance of such danger.

Asylum in Consulates.—Under the treaty of 1856 mentioned above no consulate is to be used as a place of asylum for fugitives from local authorities, but other treaties, as that with Italy in 1871, state that such offices "shall never serve as places of asylum." There have been some extreme cases, as in Oriental and South American states, where the consulates have been used as asylum, and in 1903-04, during the Dominican revolution, when political prisoners were threatened with execution, a large number of refugees found asylum in the United States and British consulates. Since consuls are not diplomatic agents they are not by right exempt from local jurisdiction and hence cannot claim the right to extend asylum, but they are sometimes granted immunities, though more as an act of courtesy than as a conceded right.

Asylum on Ships.—In some respects public ships, such as ships of war, are similar to legations, so far as the right of asylum is concerned, since they are generally conceded to be exempt from the local jurisdiction of the ports which they enter; in certain cases the commanders of such ships may extend asylum to refugees, but they are supposed not to abuse the local hospitality by making their vessels places of refuge for political offenders against the laws. The navy regulations state: "The right of asylum for political or other refugees has no foundation in international law. In countries, however, where frequent insurrections occur, and constant instability exists, usage sanctions the granting of asylum. In cases of such countries, officers should refuse all applications for asylum, except when required in the interests of humanity, in extreme or exceptional cases, such as the pursuit of a refugee by a mob. Officers must not directly or indirectly invite others to accept asylum. Under modern usage asylum on private ships is not permissible and even though a vessel be in transit criminals aboard such vessels are amenable to local jurisdiction for crimes committed prior to embarkation. Merchant vessels are not exempt from local jurisdiction and cannot claim the right to grant asylum. The right of neutrals to grant asylum to belligerent forces is covered by the Hague Convention of 29 July 1899, articles 57 to 59 of the regulations which relate to the Laws and Customs of War on Land. See Aliens; Extradition; Extraterritoriality; Intervention; Neutrality; Refuge, Cities of; Sanctuary.

ASYMMETRIC (as-i-met'rik) SYSTEM, in crystallography, the crystal form now more commonly called "triclinic". It was called asymmetric because it has no plane of symmetry. See CRYSTAL.

ASYMPTOTE, as'im-töt (from three Greek words, meaning "not to fall with" or coincide), a term used in geometry to designate a line which continually approaches a curved line, but becomes tangent to it only at an infinite distance. Though the existence of such a line seems paradoxical, it can be demonstrated on the straightest mathematical principles, as in the case of the hyperbola and its directrix. The term first occurs in the conic sections of Apollonius. Asymptotes are of two classes: rectilinear and curvilinear. The latter class includes the spiral, which is also known as a circular asymptote. The equation of the rectilinear asymptote referred to any rectangular axis is

\[ y - y^* = \frac{dy}{dx} (x - x^*) \]

in which \( x^* \) and \( y^* \) denote the co-ordinates of the point of contact, and \( \frac{dy}{dx} \) the differential coefficient of the ordinate of any point when \( x^* \) and \( y^* \) are substituted for \( x \) and \( y \). The asymptote idea is applied also to surfaces.
AT ODDS, the title of a novel by the Baroness Tautpheus (1863), dealing with the vicissitudes of a Bavarian family during the struggle of the Hohenlinden to Wagrain. It is told with a happy ease and directness; and if it has not the brilliancy of 'The Initials,' is not less clever as a study of character.

ATA, the people of the Davao district in the island of Mindanao, Philippine Islands. They present the physical characteristics of both the negroid Papuans and the later Malays, from which it is inferred that they are a mixture of both races. This theory is still further borne out by the fact that they do not show any of the homogeneity of a tribe, but are broken up into various isolated groups, some of these groups speaking a dialect only distantly similar to the speech of the rest.

ATACAMA, ā-tā-kā'-ma, the name, formerly, of two South American provinces: (1) A northern province of Chile, with an area of more than 29,000 square miles. This was, before the war on the Pacific (see Chile), the Chilean part of the great Atacama desert region. (2) A department, which formerly extended as far north as Peru, and east to Argentina. All that part of the district west of the Andes was ceded, in 1884, to the Chileans, and formed into the department of Antofagasta. The former capital, Coquimbo, was long the only port in the district; but the rival port of Antofagasta, founded in 1870, rapidly outstripped it (see Antofagasta). At present the Chilean Atacama is bounded on the north by the province of Antofagasta, by the Argentine Republic on the east, by the province of Coquimbo on the south, and the Pacific Ocean on the west. The area is given as 30,728 square miles. Salt-petre, copper and silver are the most important products of the mines. Capital, Copiapó; best seaport, Caldera. Pop. 65,000 to 66,000.

ATACAMA, a desert region on the west coast of South America, formerly belonging partly to Bolivia, partly to Chile, but now belonging wholly to the latter. It lies between the Andes and the sea and much of it at the height of 3,000 to 5,000 feet above the sea. The country is covered with many mountains. The Salina of Atacama, a salt morass, mostly dried up, has a surface of 1,084 square miles, and lies at the height of over 7,000 feet. The best and most recently published description of "the lofty Puna de Atacama," situated between 23° and 26° S. latitude, is in the 'Bulletin of the American Geographical Society' (Vol. XLVI, No. 3).

ATACAMITE, -tak'-, a mineral, originally found as sand in the Atacama province, in northern Chile. It is essentially a hydroxy-chloride of copper, having the formula Cu₂O(CuOH)₂. It crystallizes in the orthorhombic system, and has a hardness of from 3 to 3.5, and a specific gravity of 3.76. Atacamite is green in color, and commonly occurs either massive or in the form of sand. A coating having the same chemical composition is formed on metallic copper, as the result of prolonged exposure to sea-water or air. Atacamite exists in considerable quantity in various parts of South America, and in Australia; and has been used to some extent as a source of copper.

In the United States it is found at Jerome, Ariz.

ATAHUALPA (d. 1533), son of the famous Inca Emperor Huayna Capac, of interest chiefly because of his unfortunate career as ruler of Peru. On the death of Atahualpa's father (1525), his half-brother (Huascar) usurped the throne. In the civil war that immediately followed between the followers of the two claimants—a long struggle whose details are not clearly recorded—Atahualpa's rebellion gained complete victory. The usurper, Huascar, was taken prisoner and confined in the strong fortress of Xauxa. The massacre usual under such circumstances followed, affecting all the royals who had sided with Huascar. But Atahualpa's reign was proved to be neither long nor happy. Soon after he had been recognized as the rightful ruler of Peru, a Spanish Catholic leader, Pizarro, came to urge upon Atahualpa to embrace the Christian faith and become a vassal of Charles V. This proved to be a mere pretext, however, for wresting the kingdom from the young ruler's hands. Even while these overtures were being made, Pizarro's army had already mustered at Cassamarcia, where the Inca gave battle, bravely, without the slightest warning. Pizarro gave the signal for attack. The Peruvians, of course, were absolutely unprepared to withstand this prearranged attack. After hundreds of them had been slain and their king made prisoner, the one-sided onslaught ceased. Atahualpa's release, however, was repeatedly put off, despite his readiness to pay the demanded ransom money. It would seem that Atahualpa, while still in captivity, fostered a counter-attack upon the invaders and also conspired for the assassination of his treacherous half-brother, then in league with the Spaniards. Accounts of his intrigue are neither clear nor very convincing. At any rate, it was on these charges, colored with the accusation of heresy, that Atahualpa, after a mock trial, was condemned to death. He was burned at the stake on 29 Aug. 1533. Consult Prescott's 'History of Peru' and Garcilasso de la Vega's 'Royal Commentaries of the Incas.'

ATALA, the heroine in a romance by Chateaubriand, bearing her name at the title. She is the daughter of an American Indian chief. The braves of her tribe bring into camp a prisoner, the chief of another tribe. She falls in love with him, releases him and flees with him. But having made a vow to her Christian mother that she would never marry, she has no alternative between breaking her vow and leaving her lover. Finally she commits suicide.

The romance was first published in the newspaper Mercure de France (1801).

ATALANTA, the name of two heroines in Greek mythology. One was a native of Arcadia, celebrated for her skill in archery and slew with her arrows the Centaurs Rhæcus and Hylæus, and was present at the chase of the Caledonian boar, which she first wounded; hence Meleager awarded to her the prize. She was renowned for her beauty and the brilliancy of her actions. The other stipulated that every candidate for her hand should run a race with her, and if he conquered her she was his own, but if he was conquered he was doomed to death at her hand. Many
had fallen victims in the attempt, when Mešlanion, by the aid of Aphroditē, overcame her. The goddess gave him three golden apples, which he threw behind him, one after another, as he ran. Atlantā stopped to pick them up and Mešlanion reached the goal before her. She accordingly became his wife. The other Atlantā, who cannot very well be distinguished from the preceding, the same stories being told about both, is connected with Beotia and Beotian localities. She is said to have been married to Hippomenes. Consult Morris, 'Atlantā's Race.'

**ATALANTA IN CALYDON** Swinburne's 'Atlantā in Calydon,' perhaps the greatest, certainly the best known, of his works, is a lyrical drama after the Greek model. Though lacking the severe nobility and restraint of Milton's 'Samson Agonistes,' it is more purely Greek in other respects, and re-creates much of its kind in all modern poetry. Published in 1865, when the poet was 28 years old, it created a literary sensation comparable only to that of 'Childe Harold' and brought to Swinburne a fame almost as sudden and short-lived as that of his English poet has surpassed Swinburne in familiarity with both the spirit and form of Greek literature; and 'Atlantā' reads not like an imitation of some remote and inimitable original, but like the spontaneous utterance of a poet who feels like a Greek, has a Greek story to tell, and inevitably expresses himself in a Greek form. The plot, founded on the story of the hunting of the wild boar of Calydon as told by Homer and later by Ovid, is tragic, simple and replete with all the elements of passion, and is handled with superb skill, from the first entrance of the mother Althea, with her forbidding of woe, to the final dirge over her dying son Meleager. The blank verse of the recitative abounds with subtle and varied harmonies unsurpassed in modern English poetry. The choral passages, while perhaps more intimately related to the action than those of Euripides, are less so than those of Aeschylus and Sophocles. Eulogy has exhausted itself over the lyrical songs in 'Atlantā,' which surpass even Shelley in vehemence and richness and which added new resources to English verse. The irresistible melody of such lyrics as 'When the hounds of spring are on winter's traces,' *Before the beginning of years,* 'We have seen thee, O Love, thou art fair,' show what music our language may become in the hands of a master. It is doubtful if any single work ancient or modern offers a greater variety of metrical effects. What may be termed the theatricalities of 'Atlantā,' with its bitter arraignment of fate and its hatred of the gods, is scarcely classic, though here and there such a note is sounded by Euripides. Swinburne has here injected into the drama something of his own pessimism and his rebellion against established beliefs. Again, while the story, the form, the general sentiment and many of the details of 'Atlantā' are purely Greek, the style, incomparably splendid as it is, lacks on the whole the conciseness and restraint of Greek tragedy. However much faults if faults they be, are negligible in a work which stands as one of the most remarkable achievements of modern poetry. Consult Gosse, 'Life of Swinburne,' (ch. 4); Wratishlaw, Theodore,

**MARION TUCKER.**

**ATAMAN,** the title of the chief of the Cossack tribes. See HETMAN.

**ATARGATIS,** a Syrian deity referred to in the Apocrypha. She is generally described as the fish goddess. The name is derived by compounding two divine names: the first part being a form of the Himyaritic *Aṭ fün*, the equivalent of the Old Testament 'Ashōrēth,* and the Phoenician *Aṭartē,* with the feminine ending omitted; and the second is a Palmyrene name *Aṭē* (i.e., *tempus opportūnum*) which occurs as part of many compounds. This similarity of the first syllable has led to the confusion of the goddess with Astarte. The origin of both deities is probably the same. A plausible hypothesis is that after the political extinction of the Semites and the consequent deterioration of the English poet has surpassed Swinburne in familiarity with both the spirit and form of Greek literature; and 'Atlantā' reads not like an imitation of some remote and inimitable original, but like the spontaneous utterance of a poet who feels like a Greek, has a Greek story to tell, and inevitably expresses himself in a Greek form. The plot, founded on the story of the hunting of the wild boar of Calydon as told by Homer and later by Ovid, is tragic, simple and replete with all the elements of passion, and is handled with superb skill, from the first entrance of the mother Althea, with her forbidding of woe, to the final dirge over her dying son Meleager. The blank verse of the recitative abounds with subtle and varied harmonies unsurpassed in modern English poetry. However much faults if faults they be, are negligible in a work which stands as one of the most remarkable achievements of modern poetry. Consult Gosse, 'Life of Swinburne,' (ch. 4); Wratishlaw, Theodore,
phallic emblems) and the inventor of useful appliances. Not unnaturally she is identified with the Greek Aphrodite. By a conjunction of these many functions, she becomes ultimately a great Nature goddess, analogous to Cybele and Rhea; in one aspect she typifies the function of waters in producing life; in another, the universal mother-earth (Macfieus, Siuare 123); in a third, the power of destiny. Consult articles in Herzog-Hauck, 'Relayencylopédie' (1897); Robertson-Smith, 'Religion of the Semites' (2d ed., pp. 172-73, London 1914) and in the Encyclopaedia Britannica, 11, 281; Wetschmann, 'Geschichte der Phénizier' (1889).

ATAULFUS, ATAULF, or ADOLE, King of the Visigoths. The date of his birth is unknown. He was the brother-in-law of Alaric, whom he assisted in the sieges of Rome. After Alaric's death he went to Gaul and married Gala Placidia, sister of the emperor Honorius; he was assassinated at Barcelona in 415.

ATAVISM (Latin atavus, originally "ancestor," later specialized as "great-great-great-grandfather"); in biology, the reappearance in an organism of specific ancestral peculiarities, which have not appeared in intermediate generations, or of peculiarities of ancestral side branches not represented in the direct line. It is often loosely used as synonymous with reversion, but in scientific usage the latter is not the reappearance of single characteristics, and certainly not of abnormal ones, but the return in general type to the primitive type from which the special race was evolved. In this sense, it may be said that reversion is the extreme backward limit of atavism. For example, the birth of a six-fingered child with a six-fingered grandfather or uncle but normal parents would be atavism; but the approach of human beings left on a desert island to the progenitors and hairy type of the simians, were it conceivable, would be atavism. Sometimes the two are hardly to be discriminated; thus, the appearance of a tail-bone or pointed ears would be an atavism recalling the primitive type, as are horses with toes, yet not quite a reversion. A true reversion is the banded pigeon which is a fancy breed; and the still commoner mongrel "yellow dog," a reversion to the jackal type. Atavisms are part of the perpetual family wonders, the reproduction of minute special features, habits, tricks of behavior, even tunes and fashions of speech, characteristic of distant relatives or far-back ancestors, but perhaps obliterated for long periods. In sociology, especially criminology, the word is used precisely in the sense of reversion to primitive instincts and passions, supposed to be overlaid or suppressed by civilization. The criminal on this theory is a being who has lost his evolved characteristics, and gone backward to the primitive savage. This, however, has too many flaws to be scientifically acceptable.

ATAVIA, an irregularity of function, but the term is usually applied to incoordination of movement. Ataxia is a condition of the body, and not confined to the one disease, locomotor ataxia. Thus, ataxia is a common symptom of alcoholic intoxication. Two forms of ataxia may be distinguished, static and motor. In static ataxia there is an irregularity in the maintenance of attitudes and positions. This form of ataxia is common in chronic cocaine poisoning and is present in some severe cases of chorea, or Saint Vitus' dance. The patients' limbs seem to give way beneath them and there is a restless irregularity in attitude and pose. Static ataxia is also a symptom in certain types of insanity, notably the disease (123); in a third, the power of destiny. Consult articles in Herzog-Hauck, 'Relayencylopédie' (1897); Robertson-Smith, 'Religion of the Semites' (2d ed., pp. 172-73, London 1914) and in the Encyclopaedia Britannica, 11, 281; Wetschmann, 'Geschichte der Phénizier' (1889).

The criminal on this theory is a being who has lost his evolved characteristics, and gone backward to the primitive savage. This, however, has too many flaws to be scientifically acceptable.
sale trade of the city in groceries, drugs, hardware, etc., is also very extensive, representing annually more than $30,000,000. The manufacturing interests of Atchison are important, there being over 50 large industrial establishments, including grain elevators, flouring-mills, foundries, railroad shops, yards, furniture, broom and harness factories, etc. The United States census of 1914 recorded 60 manufacturing establishments of factory grade, employing 859 persons, of whom 64 are wage earners, receiving $403,000 annually in wages. The capital of the Pueblo aggregates $2,073,000, and the value of the year's output was $3,899,000. The city contains many attractive buildings, notably the county courthouse and government building and the union depot erected at a cost of $140,000. The Missouri River is bridged by a noteworthy structure some 1,200 feet long. There are three parks in the city — Forest, City and Central; three banks with a combined capital of $390,000 and an annual business of $960,000; 8 churches; 8 newspapers; 16 public schools; and 24 public charities. Atchison is the seat of the State Soldiers' Orphans' Home; Wells' Insane Asylum; Allamah's Hospital; Midland College (Lutheran); Saint Benedict's College (Roman Catholic); and Saint Scholastica's Academy (Roman Catholic); has a fine public library and an excellent system of public education (8 public and 3 parish schools). The school board is chosen by popular vote. The city is governed by a mayor elected for two years, and a municipal council of 10 members. The mayor appoints the administrative officials who are subject to confirmation by the city council. The city was first settled in 1854 and was named in honor of Senator D. R. Atchison. It was incorporated as a city in 1859. Pop. (1910) 16,429; (1914) 17,000.

**ATCHISON, TOPEKA & SANTA FÉ RAILWAY.** The one of the most important railroads in the United States, and including a long list of auxiliary companies. The charter was granted in March 1863, the route prescribed being from Atchison on the Missouri River to the western boundary of the State of Kansas, in the direction of Santa Fé, N. Mex., a distance estimated at 500 miles. The time for completion was limited to 10 years, which expired 3 March 1873. Five years and six months were allowed to pass without commencing operations. In September 1868 the charter was transferred to new parties. In 1869, 28 miles were built; in 1870, 54 miles; in 1871, 75 miles. The western boundary of Kansas not having been established, it was estimated that the remainder to be built, with only one year for the completion of the road and telegraph line which was to accompany it, was 345 miles. By great effort the means were provided, and the work commenced. By March 1873, the cars were run over the entire line from the Missouri River to Colorado, about 470 miles, on 28 Dec. 1872, thereby saving the land grant, which would have been forfeited had the road not been completed before 3 March 1873. The road was not built, much better than the majority of western railroads at that time, and in general construction bore comparison with the best roads either east or west. It ran for the greater part in the valley of the Arkansas River, with easy grades and curves, and almost immediately developed an amount of business that surprised the ownership and the public. The part which this railroad has had in the building up of Kansas, Colorado and other sections through which it runs cannot be overestimated. It opened vast tracts of productive land to settlement, and drew a large emigration from the East to that region, where thriving towns and fertile farms took the place of what had been a desert. The road acquired a large share of through business in 1876 by leasing the Atchison, Pueblo & Arkansas Valley and the Kansas City, Topeka & Western. Steel rails were adopted in place of iron, and neither effort nor expense were spared to bring the road up to the highest standard. The growth of the Atchison, Topeka & Santa Fé in 40 years is shown by recent statistics. In 1875 the gross earnings of the system were $1,500,000, operating expenses $700,000; and net earnings $800,000; in 1917 the gross earnings were $156,791,219; operating expenses were $96,333,268; and net earnings, $51,457,951. Among the important localities are Kansas City, Topeka, Pueblo, and the Kansas City, Topeka & Western. Steel rails were adopted in place of iron, and neither effort nor expense were spared to bring the road up to the highest standard. The growth of the Atchison, Topeka & Santa Fé in 40 years is shown by recent statistics. for the purposes above referred to, and it is believed that the expenditure of this capital will result in a substantial increase of the surplus net income of the company.

In the fiscal year 1916-17 the company's operating expenses consisted of $19,119,336 for maintenance of way, $25,273,168 for equipment, $2,780,823 for traffic, $45,910,504 for transportation, and $3,494,122 for general expenses.

ATE, āte, among the Greeks the goddess of hate, injustice, crime and retribution. According to Homer she was the daughter of Zeus, but according to Hesiod, the daughter of Eris (Strife). She was a vengeful goddess and was banished from Olympus by Zeus, whom she had induced to take an oath of which he subsequently repented. Her influence was always pernicious, and in her journeys over the earth she afflicted mankind, but she was followed by other goddesses, the benvolent daughters of Zeus, who restored those who had come under Ate's evil influence.

ATELES, a genus of South American monkeys of the division with long prehensile tails to which the orang-utan belongs. Three species are known. The head is round, and the facial angle about 60 degrees; the limbs are remarkably long and slender, upon which account the English name of spider monkey is sometimes used as a generic designation; the forelimbs are either destitute of a thumb or have a rudimentary one.

ATELESTITE, a native basic arsenate of bismuth, having the formula 3Bi₂O₆As₂O₃. 2H₂O. It is yellow in color, and translucent with an adamantine lustre. It occurs in small monoclinic crystals, at Schneeberg, Saxony.

ATELIERS NATIONAUX, a-tē-lē' nāzyō' nō, national workshops established by the provisional government of France in 1848. Previous to the outbreak of the revolution of February 1848, there had been two years of scarcity, inundations and commercial crisis. Ateliers nationaux, or national workshops, were opened at once. The workmen were organized under lieutenants and brigadiers of their election. The number of apprentices included arrivals from the provinces at length exceeded 100,000 and the total expense reached nearly 16,000,000 francs. The men were employed on roads, railways, earthworks, etc., but it was impossible to find work for the whole, and a great part of the labor was unprofitable. There were besides 30,000 to 40,000 women employed in preparing articles of outfit for the army, whose work left only a trifling loss. In June the Constituent Assembly resolved upon the immediate closing of the ateliers. This rash step provoked the insurrection of the Red Republicans (23-26 June), suppressed by General Cavaignac with fearful slaughter. In Lyons the ateliers were closed without disturbance, but in some other towns trouble was occasioned.

ATELLANÆ FABULÆ (called also Oscan plays), a kind of light interlude between tragedy and comedy, performed by freeborn young Romans. This kind of a play is said to have originated in Atella, a city of the Oscans, between Capua and Naples, and a few disconnected fragments are all that remain of a national Italian comedy, consisting of farce seasoned by satire.

ATESHGA (the place of fire), a place much revered by Persian fire-worshippers. It is on the peninsula of Apsahron, on the west coast of the Caspian, and is visited by large numbers of pilgrims, who bow before the sacred flames issuing from the bituminous soil.

ATH, åt, town of Belgium, 14 miles from Mons. It has a hospital and college and important manufactures of linen, lace, cutlery, soap and large hammers. It was formerly a fortress. Pop. at outbreak of European War about 12,000.

ATHA, a false prophet in the reign of the Caliph Meheydd, or his predecessor, Almansur. He taught the doctrine of metempsychosis, and claimed to be an incarnation of divinity. He had lost one of his eyes, on account of which he always wore a veil, whence he received the epithet of Mokanna. He is the hero of Moore's 'Veiled Prophet of Khorassan' in 'Lalla Rookh.'

ATHABASCA, āth'ā-bās'ka, formerly a district in northwestern Canada formed in 1882 and enlarged in 1895. On 1 Sept. 1905 the province was divided, the westerly portion being united to Alberta (q.v.), and the easterly portion combined with Saskatchewan and Assiniboia to form the province of Saskatchewan (q.v.).

ATHABASCA, (1) the name of a river in northwestern Canada which has its source in the western slopes of the Rocky Mountains, near Mount Brown, pursues a tortuous course to the north till it falls into Lake Athabasca. (2) The name of a Canadian lake, in the northwest territories, also called Lake of the Hills, 230 miles in length and averaging 14 miles in width. Near its southwestern extremity it receives the Athabasca River and discharges its waters northward by the Great Slave Lake. The north shore is high and rocky and thickly wooded with firs and poplars, etc., the south shore is level.

ATHABASCA PASS, a narrow passage in the Canadian Rocky Mountains, between Mount Brown and Mount Hooker. It crosses the boundary between the district of Alberta and British Columbia.

ATHALARIC, a king of the Ostrogoths: b. 516; d. 534. He was the grandson of Theodoric the Great and succeeded him on the throne, but died at the early age of 18 from dissipation.

ATHALIAH, the daughter of Ahab, King of Israel, and wife of Joram, King of Judah. She was a woman of abandoned character, and fond of power, who, after the death of her son Ahaziah, opened her way to the throne by the murder of 42 princes of the royal blood. She reigned six years; in the seventh the high priest Jehoiada placed Joash, the young son of Ahaziah, on the throne of his father. Athaliah, attracted by the noise of the people who were crowding to the coronation of Joash, entered with them into the temple, where the ceremony was going on. At the sight of the new king, surrounded by priests, Levites, great officers of the kingdom, and the joyful people, she was beside herself; she tore her hair, and cried out, "Treason!" Jehoiada ordered her to be immediately led from the temple by the officers, and commanded that all who should offer to defend
her should be slain; but she was put to death at the gate of the palace without opposition. The altars of Baal, which she had erected, were thrown down, and the worship of God restored (about 877 B.C.) (2 Kings viii, ix). This story is the theme of Racine's 'Athalie,' written at the request of Madame de Maintenon.

ATHALIE. This drama by Racine was called by Voltaire "the masterpiece of the human intellect" and by Boileau Racine's "most beautiful work." Most modern critics would accord it at least the second place among his dramas. But it was slow in winning general recognition. After his 'Esther' had been produced with much éclat in 1689 by the aristocratic young ladies of Madame de Maintenon's foundation at Saint Cyr, Louis XIV ordered the poet to compose for the same amateur stage a new tragedy drawn also from the Scriptures. Two years later 'Athalie' was ready, but Madame de Maintenon had conceived scruples as to the disturbing effect of dramatic representations on her educational wards. It was a notably successful chamber performance without costumes in 1691, and passed almost unnoticed. Had the express will of king and author been followed, the French stage would have been permanently deprived of a great masterpiece. It was first presented to the theatre-going public 3 March 1718. The subject of the play is the revolt of the loyalist priesthood under Jehoiada against the usurping Queen Athaliah, the anointing of the Child-King Joash, the destruction of the temple of Baal, the slaying of his priest Mathan and finally of Athaliah as told in 2 Kings xi, supplemented by the account in 2 Chronicles, xxii and xxiii. In the poet's hands this rather crude account of dynastic rivalries and sacerdotal ambition has become a splendid picture of religious enthusiasm, a superb plea for the divinity that was supposed to hedge true royal blood as well at the court of Versailles as in Jerusalem. Racine's 'Athalie' is a grandly tragic portrayal of a commanding woman who knows no law but the feverish pursuit of the objects of her inconsequent passion. Prone to superstition, she struggles wildly with the portents of her fears, dashing herself against righteous fate to ruin. Joab, the high priest, is the type of a pious, fanatical, any one but unscrupulous by conviction. Abner is the simple soldier, Mathan the ambitious priest who seeks to make a stepping stone of religion, Nabat the selfish zealot, Joas one of the very few genially conceived children of the stage. To a chorus of Levite girls the poet has given several canticles, yielding little to those of 'Esther' in devout beauty. There are translations of the play by R. B. Boswell and others.

BENJAMIN W. WELLS

ATHAMAS, the son of Eolus, and husband of Nephelé, the cloud goddess. Their children were Hélè and Phryxsus. Being afterward separated from Nephelé, he had by Ino, his second wife, Learchus, Melicertes and Eurycleia. Athamas, having lost his reason through the anger of Hera, and taking Ino and her children, for a lioness and her whelp-seized Learchus and dashed him against a stone; while Ino, with Melicertes in her arms, plunged into the sea, and became the sea goddess Leucotha, Melicertes being transformed into Palaenon, a divinity worshipped by sailors. Athamas now abandoned Beotia and fled to Phthiotis, where he built Alos, and united himself with Themisto.

ATHANAGILD, the 14th king of the Spanish Visigoths, who succeeded Agila in 554, and died in 566. Being threatened by Agila, he applied for aid to Justinian, Emperor of the East, who sent troops, and Athanagild defeated his adversary, who was obliged to retire to Merida. Athanagild was re-established at Toledo, which he made his capital.

ATHANARIC, a king of the Visigoths in Thrace about the middle of the 4th century: d. Constantinople, 25 Jan. 381. The Emperor Valens made war upon him and compelled him to sue for peace, but Athanaric would not come upon the Roman territory to sign the treaty, while Valens thought it beneath his dignity to visit the barbarian at home. Accordingly a bridge of boats was constructed across the Danube, and the two potentates met in the middle. In 380 he was compelled to flee to Constantinople, where Theodosius received him hospitably, and gave him a small pension until his death. Consult Hodgkin, 'Italy and Her Invaders' (Vol. I, 1880).

ATHANASIAN (āth’a-nəz’ān) CREED. See CREED.

ATHANASIUS, āth’a-nə-zē’sēs, Saint, bishop of Alexandria, a celebrated Greek theologian: b. Alexandria about 296; d. 373. He had a Christian education, and came into the family of Alexander, afterward archbishop of Alexandria. Alexander took him to the council at Nice, where he gained the highest esteem of the fathers by the talents he displayed in the Arian controversy. About 326 he became bishop of Alexandria. The complaints and accusations of his enemies at length induced the Emperor Constantine to summon him in 334 before the councils of Tyre and Jerusalem, but his judges could do nothing, however, further than suspend him from his office. He still continued in the discharge of his duties until the Emperor, deceived by new falsehoods, banished him to Treves. The death of Constantine put an end to this banishment at the end of some months. Constantius, Emperor of the East, recalled the holy patriarch. His return to Alexandria resembled a triumph. The Arians made new complaints against him, and he was condemned by 90 Arian bishops assembled at Antioch, while 100 orthodox bishops, assembled at Alexandria, declared him innocent. Pope Julius confirmed this sentence, in conjunction with more than 300 bishops assembled at Sardis from the east and west, and in consequence of this he returned a second time to his diocese. But when Constans, Emperor of the West, died, and Constantius became master of the whole empire, the Arians ventured to rise up against Athanasius. Athanasius, displaced for a third time, died. His enemies pursued him even here, and set a price on his head. To relieve the hermits who dwelt in these solitary places, and who would not betray his retreat, from suffering on his account, he went into those parts of the desert which were entirely uninhabited. He was followed by a faithful servant, who, at the risk of his life supplied him with the means of subsistence. In this undisturbed spot Athanasius composed many writings, full of
eloquence, to strengthen the faith of the believers, or expose the falsehood of his enemies. When Julian the Apostate ascended the throne in 361, the bishops of the churches, Athanasius therefore returned after an absence of six years. The mildness which he exercised toward his enemies was imitated in Gaul, Spain, Italy and Greece, and restored peace to the Church. But this political tact was interrupted by the complaints on the heathen, whose temples the zeal of Athanasius kept always empty. They excited the Emperor against him, and he was obliged to flee to Thebaïs to save his life. The death of the Emperor and the accession of Julian again brought him back; but Valens becoming Emperor eight months after, and the Arians recovering the superiority, he was once more compelled to flee. He concealed himself several months, until Valens, moved by the pressing appeals and threats of the Alexandrians, allowed him to return. From this period he remained undisturbed in his office until he died, 373. Of the 46 years of his official life he spent 20 in banishment, and the greater part of the remainder in the Great Church. Athanasius is one of the greatest men of whom the Church can boast. His deep mind, his noble heart, his invincible courage, his living faith, his unbounded benevolence, sincere humility, lofty eloquence, and strictly virtuous life, gained him the honor and love of all. His voluminous writings, which are chiefly controversial and dogmatical, treat of the mysterious doctrines of the Trinity, the incarnation of Christ and the divinity of the Holy Spirit. His "Apology Against the Arians," addressed to the Emperor Constantine, is a masterpiece. The creed which goes under his name was not written by him, but belongs to a later time (see CREED). The most complete edition of his works is that published at Padua in 1777 (4 vols. fol.).

ATHAPASCAN STOCK (also Tinneh), of numerous American Indians, and one of their most numerous and widely distributed linguistic and ethnographic groups. The type-name is taken from a northwest Canadian group, the western Montagnais; but the tribes are scattered from Alaska to Mexico. The original stock were semi-arctic, along the Yukon and Mackenzie, fierce and energetic, but of a low type of cultural and religious development, by conquest on both sides of the Rocky Mountains. They are divided into three chief groups, the northern, the Pacific and the southern. The first are those in the original home,—northwest Canada and interior Alaska,—Montagnais, Montagnais, Naskapi, etc., number about 8,500. The second are those of Washington, Oregon and California, except the Thlenkeet coast tribes which extend along the Alaskan coast also. These are few and scattered tribes, about 900 souls in all. The southern, more or less broken up, comprises some 23,500, mostly of the great Apache and Navajo confederacies, also the Jícara and Mesqueros, and the Lipan, of Mexico.

ATHARVANA, atharvāna, the fourth of the Indian Vedas. Its language is more modern than that of the other three. The theological treatises, regarded as 52 in number, called Upnishads, are appended to the Atharvāna Veda.

ATHEISM, the denial of the existence of a God. Among the Greeks atheism consisted in a denial or non-recognition of the gods of the state. Socrates was put to death for asserting the superiority of the divine wisdom to the other gods as the ruler and disposer of the universe. In the Latin religion the doctrine of the immortality of the human soul was a point of dogma, which assigned that office to Zoroaster. In Latin times atheism still continued to be a negation, with no pretension to rank as a system. It was closely akin to that cultured unbelief which extensively prevailed among the Humanists during the early part of the Renaissance. The atheism of the 18th century was a protest against current religious hypocrify; and, like its predecessors, put forward little or nothing to replace the system it attempted to destroy. The atheism of the 19th century may be taken to include every philosophic system which rejects the notion of a personal Creator; in this sense it ranks as a genus, of which Atomism, Pantheism, Positivism, etc., are species. Strictly it is the doctrine that sees in matter the sole principle of the universe. Popularly, atheism consists in the denial of a God; this view is probably founded on the mistranslation of Psalms xiv, 1, and lili, 1, which should be the fool hath said 'There is no God.' (London 1840); Beecher, L., 'Lectures on Scepticism' (Cincinnati 1835); Belot, G., 'L'idée de Dieu et l'athéisme' (Paris 1913); Bentley, R., 'The Folly of Atheism' (London 1836-38); Braden, C., 'The Problem of Problems and the Two Solutions, or Atheism, Darwinism, and Theism' (Cincinnati 1877); Browne, W. R., 'The Present Aspect of the Conflict with Atheism' (London 1883); Carret, J., 'Demonstration de l'inexistence de Dieu' (Paris 1912); Ceillers, A., 'Germes et fruits de l'athéisme social' (Paris 1870); Crusus, T. T., 'The Origins of Atheism' (London 1864); Du Bois, H. A., 'The Scientific Atheism of the Darwinian School of Evolutionists' (New York 1880); Dwight, T., 'The Nature and Danger of Infidel Philosophy' (New Haven 1879); Génishi, K., 'Atheism refuté par la science' (Paris 1869); Gibbon, J. **ATHOEL** or **ÆTHEL**, an Old English word signifying noble, eminent, not only in blood or by descent, but in mind. It is frequently a part of Anglo-Saxon proper names.

**ATHERLING**, a title of honor among the Anglo-Saxons, meaning one who is of noble blood. The title was gradually confined to princes of the blood royal, and in the 9th and 10th centuries applied exclusively to the sons or brothers of the reigning king. It was first conferred on Edgar by Edward the Confessor, his granduncle, who bestowed it when he designed to make him successor to himself.

**ÄTHELNEY**, 4th-e1-ni, a marshy island in Somersetshire, England, about seven miles southeast of Bridgewater. It is formed by the junction of the rivers Parret and Tone. Alfred the Great established a fortified post here during a Danish invasion, and afterward founded an abbey which has entirely vanished.

**ÄTHELSTAN**, a Saxon monarch, the first to assume the title of King of England. He succeeded his father, Edward the Elder, in 925, and died in Gloucester, 27 Oct. 940. He was victorious in his wars with the Danes of Northumberland, and the Scots, by whom they were assisted. After the overthrow of his enemies at Brunanburh (937), which he became famous in Saxon song, he governed in peace and with great ability.

**ÄTHENAEUM** or *ÄTEHENAEM*, the general name of temples to Athena, but more especially applied to the temple at Athens, frequented by poets, learned men and orators. Instruction was also given there to the youth, and in later times the name was applied to all places of education for the young. The same name was given at Rome to the celebrated school which Hadrian established on the Capitoline Mount about 135 A.D. Many learned men received ample salaries for giving instruction in this institution, and that they might be enabled to study at leisure. Here also learned men assembled to exchange ideas.

**ÄTHENÆUS**, Greek rhetorician and grammarian: b. Naucratis, lived first in Egypt, then at Alexandria, and afterward at Rome, at the end of the 2d and beginning of the 3d century after Christ. He has left an encyclopedic work in the form of conversation, called the 'Feast of the Learned' (Deipnosophista), a rich but ill-arranged treasury of historical, antiquarian, philosophical, grammatical and other knowledge. The principal editions are those of Schweighäuser (1801–07); Dindorf (1827); Meinecke (1859–67) and was translated by Yonge in 'Bohn's Classical Library' (1854).

**ÄTHENAGORAS**, Christian philosopher of Athens, who wrote in Greek an 'Apology for the Christian Religion.' He wrote also two books on the excavation of Marcus Aurelius, in 177. This work defends the Christians from the accusations brought against them by the heathens (of atheism, of incest, of eating murdered children and the like), with a philosophical spirit and in a lively and forcible style.

**ÄTHERNAIS**, or **EUDOCIA**, Empress of the East, daughter of the Athenian philosopher Leonius: b. Athens about 393–94 a.d.; d. Jerusalem about 465. Thenais gaining the favor of Pulchera, sister of the Emperor Theodosius, a youth of 20 years of age, presently became the wife of Theodosius and was persuaded to receive baptism by the name of Eudocia. By Theodosius she had a daughter, Eudokia, who was married to Valentinian III, Emperor of the West. She was indisposed to submit to the authority of Pulchera, who virtually ruled the empire of the East, and a quarrel ensued, in which Eudocia had for a time the ascendency; but the jealousy of her husband being aroused, the authority of Pulchera was restored, and Eudocia was permitted to retire to Jerusalem. When her daughter and granddaughters were taken prisoners by Genseric she became reconciled to the orthodox Church.

**ÄTHENE**, a-the'ne. See Minerva.

**ÄTHENE**, Temple of. See ÄGINA.

**ÄTHENE PARTHENOS** (Athena the Virgin), a copy of the statue of Athena by Phidias, but much inferior to it, now in possession of the National Museum at Athens.

**ÄTHENODORUS**, the name of several noted men of ancient Greece. (1) Athenodorus of Tarsus, surnamed Cananites, son of Sandon: b. Tarsus 74 b.c.; d. 8 a.d. He was a philosopher of the school of the Stoics and the teacher of the Roman Emperor Augustus when the latter was a boy. On becoming emperor Augustus sent for him and made him the teacher of young Tiberius. Strabo refers to him as a man of profound learning. He was also on friendly terms with Cicero. His influence with the Emperor was strong, but he did not exercise it to any great extent, beyond allowing himself a wide latitude in the matter of free speech. It is said that he advised the Emperor to repeat the alphabet to himself whenever he felt offended. A few years before his death he returned to his native Tarsus. (2) A sculptor of the Rhodian school who, in collaboration with Agesander and Polydoros, executed that remarkable group, the Laocoon, and who lived during the 1st c. (3) A Stoic philosopher: b. Tarsus 110 b.c.; d. 40 b.c. He was chief of the library at Pergamum, where he attempted to revise the whole literature of the Stoics by cutting out of the writings of all of its writers passages with which he did not agree. Later in life he removed to Rome.

**ÄTHENS**, Ala., county-seat of Limestone County, situated on the Louisville & N. Railroad, 95 miles north of Birmingham. Athens has a cotton factory, knitting mill, sash, door and blind factory, two large and State Agricultural School. It is the seat of Athens Female College, opened in 1843, under ownership and direction of North Alabama Conference, Methodist Episcopal Church south, and also of Greens University and Trinity College (colored). It has five churches for whites and several churches for colored population, and two newspapers. Surrounded by a splendid agricultural country and has many advantages. City owns and operates water and light plant and the town has an excellent sewer system. City also owns and operates a dispensary.
During the Civil War Colonel Campbell with 600 Federal troops surrendered here on 23 Sept. 1864 to the Confederate forces under General Forrest. Pop. 2,000.

ATHENS, Ga., a city and county-seat of Clarke County, on the Oconee River, and the Central of Georgia, the Southern, the Gainesville M. and the Seaboard A. L. railroads, 67 miles east of Atlanta, the State capital. It is in a cotton-growing region; has a large trade in that staple; and contains cotton and woolen, cotton-seed oil, bobbin and hosiery mills, iron works, furniture factories, and other industrial plants. The United States census of 1914 recorded 48 manufacturing plants of factory grade, employing 1,480 persons, of whom 1,398 were wage earners, receiving $450,000 annually in wages. The capital invested amounted to $3,230,000, and the year's output was valued at $3,023,000: of this, $1,080,000 was the value added by manufacture. It is the seat of the University of Georgia, the State College of Agriculture and Mechanic Arts, Lucy Cobb Institute, Knox Institute, Jeruel Academy, and a State Normal School. There are electric light and street railway plants, a public library, two national banks, salesmen's clubs, weekly and monthly and annual periodicals. The waterworks are owned and operated by the city. The government is vested in a mayor elected for two years, and a council. The assessed property valuation exceeds $6,000,000. Athens was first settled in 1801. Pop. (1910) 14,913; (1917) 17,000.

ATHENS (ancient Greek, Ἀθῆναι), Greece, the capital of the kingdom anciently the capital of the state of Attica and the centre of Greek culture. Its origin and early history are shrouded in darkness. It is situated in the central plain of Attica, which is bounded on the north and northwest by Mounts Parnes and Ægaleos, east and northeast by Pentellikon and Hymettos and on the south by the Saronic Gulf or Gulf of Athens, an arm of the Ægean Sea, running in between the mainland of Greece and the Peloponnesus from which Athens is about nine miles distant. The site is irregular, the city having been built on and around several hills rising from the plain, Mount Lykabettus, on the northeast, overlooking the whole. The principal eminence within the city boundary was the Acropolis, the site first built on; west from the Acropolis was a lower hill, called the Areopagus; southwest from the Areopagus was the Pnyx and south from the Pnyx the Museum Hill; toward the sea on the south the view was unimpeded. On the east of the city was the stream known as the Iliissus, and on the west the Cephissus. On the Acropolis, the Pnyx and the line of hills that run north and south to the west of it traces of numerous dwellings cut in the rocks have recently been found. At its most flourishing period, in the 5th century B.C., Athens was connected with its port-town Piræus and the harbors of Cantharus, Zeea and Munychia by two massive walls called the "Long Walls" 550 feet apart. It is thought that a third wall ran to the less important harbor of Phalerum but this was not rebuilt after its destruction in 279 B.C. with its port-town Piræus and the harbors of Cantharus, Zeea and Munychia by two massive walls called the "Long Walls." The first harbor was considered the most convenient, and was one of the emporiums of Grecian commerce. Piræus was considered part of Athens, the joint city being often termed the Polis while Athens proper was called Asty. The surrounding coast was crowned with magnificent buildings rivaled with those of the city. The walls of rough stone which connected the harbors with the city were about 10 feet thick and 60 feet high. The Acropolis contained the most splendid works of art of which Athens could boast. Its chief ornament was the Parthenon or Temple of Athena Parthenos (the Virgin). This magnificent building was 228 feet long, 101 broad and 60 high. It was built under the administration of Pericles, on the site of a temple started probably by Themistocles, and was finished in 438 B.C. It was of the Doric order of architecture, and was built of Pentelic marble, resting upon a basement of limestone. The architects were Callicrates and Tetrion. It had columns on all sides, eight at either front and 17 at the sides, counting the corner columns twice. These columns were fully six feet in diameter at the base, and 34 feet high. The structure was adorned both within and without, with statues, reliefs and other sculptures. The frieze and pediments of which are now in the British Museum—are ascribed to Phidias. Inside the temple stood the statue of Athena by Phidias, a masterpiece of art, 42½ feet high, the unclad portions formed of ivory, the drapery of plates of gold, the value of which was estimated at 44 talents (about $750,000). The Propylæa, a magnificent building, built of white Pentelic marble, begun in 437 B.C. and probably never completed according to the original plan, formed the entrance to the Acropolis, of which it covered the whole western end. A splendid marble stair, 70 feet broad, led up to the Propylæa. The chief building on the Acropolis, in addition to the Parthenon and the Propylæa, was the Erechtheum, a kind of double temple, especially sacred to Athena Polias (or Athena, guardian of the city), and Erechtheus and possibly also Poseidon. On the Acropolis also were other temples, altars, statues, etc., including a colossal bronze statue of Athena Promachos by Phidias, about 30 feet high. On the south slope of the Acropolis were the theatre of Dionysus, the sanctuary of Asclepius, the Odeum of Pericles, and the later Odeum of Herodes, the latter two buildings being intended for musical competitions. In the longevity of the greatest pieces of architecture were the so-called temple of Theseus (more probably temple of Hephaestus), and the temple of Olympian Zeus, one of which stood on the northwest, the other on the southeast side of the Acropolis. The first was of Doric architecture, and resembled the Parthenon, the latter two buildings being intended for musical competitions. In the longevity of the most famous of Greek architecture the famous deeds of Hercules and Theseus were excellently represented. The temple of Zeus Olympia was of Corinthian architecture, and was the largest temple in Attica and claimed to hold the supreme deity of the Greeks. It was begun by Pisistratus about 530 B.C., and continued from time to time until at length, after 700 years, it was finished by Hadrian. The outside of this temple was adorned by 104 fluted columns, 35 feet high and 14 feet in diameter. It was 354 feet long and 135 broad. Other structures deserving of notice were the Horologium of Andronicus Cynrheus or the
PARTHENON AND ACROPOLIS

2 Parthenon (west front) restored
Athens

The Tower of the Winds, the choragic monument of Lysicrates, and the Stoa Poikile or Painted Porch, in the Hellenic Agora or Market. Besides these wonderful works of art Athens contained many other places which must always be interesting to the recollections connected with them. Such a spot was the renowned Academy where Plato taught, lying about six stadia (¾ of a mile) north of the city, and consisting of a gymnasion surrounded by walks, gardens and fountains. Such a place was also the Lyceum, where Aristotle taught, and which, through him, became the seat of the Peripatetic School. It lay on the bank of the Ilissus, opposite the city, and was also used for gymnastic exercises. Not far from thence was the less renowned Gymnarges, where Antithenes, the founder of the Cynic School, taught. The sects of Zeno and Epicurus held their meetings in the city. Zeno chose the well-known Poikile, and Epicurus established himself in a garden which he called Amano and was given to him by the rich man Lycon. The northern wing of the Propyela is still tolerably perfect, and in the inner wall, with its five gateways leading into the Acropolis, still stands. The Parthenon remained almost entire till 1687, when it was much injured by an explosion of gunpowder during the siege of Athens by the Venetians. It is now a magnificent ruin. Its two pediments represented, respectively, the contest of Poseidon and Athena for Athens and the birth of the goddess, while the metopes represented the battles of the gods and the giants, of the Athenians and the Amazons, of the Centaurs and Lapithae, and lastly the siege of Troy and victory over the Persians. The celebrated frieze depicted the great Panathenaic procession in which the sacred amphora was carried, and these sculptures are now in the British Museum. In the whole of this mutilated building we find an indescribable expression of grandeur and sublimity. The Propylaea is the small but elegant Ionic temple of Athena Nike or Niké Apteros (Winged Victory), which having been destroyed in 1687, was re-erected in 1835 from its remains. There are well-preserved remains to be seen of the Erechtheum, especially the beautiful female figures called Caryatides, supporting the roof of the southern portico. The Tower of the Winds is still tolerably perfect. Its form is an octagon; on each side it is covered with reliefs, which represent one of the principal winds. The choragic monument of Lysicrates also remains. It consists of a pediment surrounded by a colonnade, and is surmounted by a dome of Corinthian architecture. In southeast Athens are the lofty ruins of the temple of the Olympian Zeus. Of 104 pillars 16 remain, but none of the statues are in existence. The olympian Zeus was worshipped here and there, and partly buried in the earth. The main body of the temple of Hephaestus has remained almost entire, and is the best preserved edifice of the ancient Greek world; it now contains a Byzantine collection. On the hill where the famous court of Areopagus held its sittings are to be seen steps hewn in the rock, a roughly leveled platform and cuttings in the rock. The Pnyx, the place of assembly for the people, not far from the Areopagus, is very nearly in its primitive state. One may see the place from which the orators spoke hewn in the rock, the seats of the scribes, and at both sides the places of the orators where it was to preserve silence, and to make known the events of public deliberations. The niches for votive offerings are still to be seen. The spot occupied by the Lyceum has not been exactly identified. The ground occupied by the gardens of the Academy is still well cultivated and fertile. The long walls are totally destroyed, though the foundations are yet to be found on the plain. The Piraeus has scarcely anything of its ancient splendor, except a few ruined pillars scattered here and there, though it promises to become a handsome modern town and has again a harbor filled with shipping, engaged in carrying on a considerable trade. The ancient Stadium, 670 feet long by 109 wide, where the ancient Olympic games were held, first constructed by Lycurgus, c. 330 B.C., and rebuilt in white marble by Herodes Atticus, 140 A.D., has recently been magnificently restored through the generosity of another Greek merchant, M. Averoff, in accordance with the ancient remains. The Olympic games were held here in 1896 and 1906. Ancient Athens is believed to have had a population of not more than 200,000.

Athens was at no time so splendid as under the Antonines, when the magnificent works of from 8 to 10 centuries stood in view, and the edifices of Pericles were in equal preservation with the new buildings. Plutarch himself wonders how the ancient structures could retain such a perpetual freshness. Pausanias, who traveled in Greece at this time, that is, in the 2d century A.D., has left a valuable account of the state of Athens as he saw it. Many of the edifices of later times were due to foreign potentates, rulers of Pergamus, of Egypt, of Rome. Roman artists of every age made sale robberies of collectors, the removal of great quantities of the works of art, first to Rome and then to Constantinople, Christian zeal, and the attacks of barbarians, made sad inroads among the monuments. When Justinian closed the schools of the philosophers in 529, Athens soon ceased to be a centre of intellectual activity. The Parthenon was turned into a church of the Virgin Mary, and Saint George stepped into the place of Hephaestus. In 1456 Athens fell into the hands of the Turks, under whom the Parthenon became a mosque. In 1687 it was partially destroyed by the Venetians. When it was selected as the capital of the modern kingdom in 1834, it had only a scanty population inhabiting a scene of ruins.

Modern Athens lies mostly northward and eastward from the Acropolis, and consists of well-built streets, the most important being Piraeus, Athens, Stadion and University, which radiates from the Place du Congres. Among the principal buildings are the royal palaces, the university, the academy of science and art, the polytechnic, the national museum, the observatory, the chamber of deputies, exhibition build-
ings, new theatre and new library. The palace (1834–38) is a conspicuous but unattractive building of limestone with marble portico. The beautiful gardens were laid out by Queen Amelia. The National University, founded in 1837, is a handsome structure, with a large number of teachers and an attendance of over 2,500 students. The academy is a beautiful building faced with Pentelic marble; the new National Library, also the University Library, is a fine building, containing 250,000 volumes and 2,300 manuscripts, and so is the Polytechnic School, part of which is occupied as a museum. The National Archeological Museum, built 1866, contains the Schliemann and other priceless collections of antiquities. There is another interesting museum on the Acropolis. The Metropolitan Church is a tasteless modern structure. More noteworthy is the Small Metropolis dating from the 9th century, the oldest of the Byzantine churches. Athens is well equipped with educational institutions, possessing besides the National University and Polytechnic School, a number of high schools, a gymnasium, a school for the higher education of girls, female teachers, orphanage for boys and girls, and a national and four foreign archeological schools or institutes, the French, German, American (opened 1882) and British. The city is governed by a mayor elected every four years, with a council of 18 members. There is a municipal fire department and the city controls the gas, electric light and water works, but the water supply is so inefficient that the inhabitants are obliged to have recourse to water carriers who cross the city in all directions and it is an important railroad centre. The bathing resort of Phaleron, adjoining the port of Piraeus, is connected with Athens by a suburban railroad. The city has very little manufacturing, although the financial centre of the kingdom, and its trade is concerned chiefly with its own requirements. Its industrial and commercial activities are centred in the Piraeus, now the chief port of the Aegean, with a population of 73,579. Pop. 167,479.

For his tours in Greece consult Miller, ‘Latins in the Levant’ (London 1908); Ferguson, ‘Hellenistic Athens’ (London 1911). For modern Athens consult Horton, ‘Modern Athens’ (London 1901), and Whiting, ‘Athens the Violet-Crowned’ (Boston 1913).

ATHENS, N. Y., village of Greene County, on the west bank of the Hudson River; on the Watervliet and Hudson River Branch of the New York Central by ferry; State road trunk line connects with Berkshires. The chief industries are fruit raising and the manufacture of textiles, knit-goods and ice tools. It contains a school and a free circulating public library, a high school, six grade schools and a bank with a capital of $25,000; taxable property valued at $1,450,374. Pop. 2,900.

ATHENS, Ohio, city and county-seat of Athens County, 75 miles southwest of Columbus, situated on the Hocking River, 35 miles south of Baltimore & O. S. W., the Toledo & O. C., the Hocking V., the Kanawha & M. railroads, and Hocking Sunday Creek Traction line. Athens is in the heart of a rich coal mining region and fruit belt, and has important industries, brick and woodworking plants. It has banks, with a combined capital of $2,000,000; a government building worth $100,000; courthouse, city building, State armory (costing $20,000), children’s home, infirmary, six large churches and a Carnegie library. It is the seat of the Ohio State University (q.v.), the State Normal School and the State Hospital for Insane. There is an annual summer school with a large attendance. Taxable property is valued at about $8,000,000. There are 15 miles of paved streets. Natural gas and a central power plant make fuel and power exceptionally cheap. Athens was settled in 1799, and in 1811 was incorporated. The government is by a mayor elected every two years, and a city council. The town owns and operates the waterworks (reservoir system). The government receipts and expenses are about $35,000 a year. Pop. (1910) 5,463; (1916) 6,500.

ATHENS, Pa., borough of Bradford County, near the New York State line, on the Lehigh Valley Railroad, and on the Chemung and Susquehanna rivers. It has manufactories of cigars, overalls, tools and furniture, and contains in addition planing mills, silk mills, foundries, boatworks and milling and produce companies. Pop. 3,796.

ATHENS, Tenn., town and county-seat of McMinn County, on the Southern Railway, half way between Knoxville and Chattanooga, 56 miles to either city. The town was laid out in 1823 and incorporated in 1868. It has woolen mills, spinning mills, lumber factories and two newspapers. It is the seat of the Methodist-Episcopal Grant Memorial University. Pop. 3,000.

ATHENS, Texas, city and county-seat of Henderson County, at the junction of the Saint Louis & S. W. and the Texas & N. O. railroad, 75 miles southwest of Dallas. It is situated in a cotton, fruit and vegetable-growing region, which also contains coal and hard and soft timber. Athens is an important manufacturing town and has pressed brick, fire brick and tile works, cotton-oil mills, potteries and other industries. There are excellent public schools, a fine courthouse, four churches and two national banks. Athens was first settled in 1850 and was incorporated as a city in 1901. The waterworks are owned by the municipality. Pop. 3,000.

ATHENS, American School at, an institution for classical study, founded in Athens, Greece, in 1882. It is affiliated with the Archaeological Institute of America and is managed by a committee representing the colleges in the United States which contribute to its support. The building was erected by means of private subscriptions on grounds donated by the Greek government, and the institution has an endowment of $50,000.
ATHENS OF AMERICA—ATHLETICS

ATHENS OF AMERICA, a name frequently applied to Boston, Mass., on account of her intellectual and literary pre-eminence.

ATHENS OF THE NORTH, a name given to Edinburgh, Scotland, on account of the picturesqueness of the site and beauty of architecture, as well as intellectual distinction. Copenhagen also is often so called.

ATHENS OF THE WEST, a name given to Cordova, Spain, the centre of Arab learning and culture in the Middle Ages.

ATHERINE, a small fish, from five to six inches long, called also the sandsmelt.

ATHEROMA, properly a wen (sebaceous cyst), so named from the porridge-like character of the contents. The term is applied also to the later stages of atheroma, when the fatty and calcareous degeneration of the aorta and other arteries manifests itself in yellow patches of induration or of softening. See ARTERIES, DISEASES OF.

ATHERTON, Charles Gordon, American politician: b. Amherst, N. H., 1804; d. Manchester, N. H., 15 Nov. 1853. He was graduated at Bowdoin in 1822, was a member of the New Hampshire legislature for five years and speaker of the lower house for four, and in 1837-43 was a Democratic representative from New Hampshire in Congress. In 1843 and 1845-53 he was a member of the House. On 11 Dec. 1838 he introduced in the House the so-called "Atherton gag" resolution, which provided that all bills or petitions on the subject of slavery should be "laid on the table without being debated, printed or referred." The resolution was passed by a vote of 126 to 73, and remained in effect until 1844. It was resolutely opposed by J. Q. Adams, who advocated the "right of petition." Adams was ultimately victorious and on 3 Dec. 1844 the 21st rule of the House, providing that no paper praying the abolition of slavery or the slave trade should be in any wise entertained, was abolished by a vote of 108 to 80. See GAG RULES.

ATHERTON, George William, American educator: b. Boston, Mass., 20 June 1837; d. Bedminster, Pa., 24 July 1906. He worked his way through Phillips Exeter Academy and Yale College; was professor of political economy and constitutional law in Rutgers College, N. J., in 1869-82; was admitted to the bar of New Jersey in 1878; and from 1882-1906 was president of the Pennsylvania State College.

ATHERTON, Gertrude Franklin (Horn), American novelist: b. San Francisco. Since the death of her husband she has chiefly pursued a literary career. She has written "The Doomswoman" (1892); "Before the Gringo Came" (1894); "A Whirl Asunder" (1895); "Patient Sparhawk and Her Times" (1897); "American Wives and English Husband" (1899); "The Californians" (1898); "A Daughter of the Gringo" (1898); "The Valiant Runaways" (1899); "Senator North" (1900); "The Aristocrats" (1901); "The Conqueror" (1902); "The Splendid Idle Forties" (1902, a revision of "Before the Gringo Came"); "Ruber his Journal" (1904); "Bete Fog" (1905); "The Travelling Thirds" (1905); "Rezanov" (1906); "Ancestors" (1907); "The Gorgeous Isle" (1908); "Tower of Ivory" (1910); "Julia France and Her Times" (1912); "Percy of the Devil" (1914); "California: An Intimate History" (1914); "The Conqueror" (23d ed., 1915); "Mrs. Balfour" (New York 1916).

ATHERTON, a manufacturing town of England, Lancashire, 13 miles northwest of Manchester, containing cotton-factories, collieries, iron-works. Pop. 19,582.

ATHERTON RESOLUTIONS. See GAG RULES.

ATHETOSIS, a peculiar movement, usually of the hands and fingers, occurring after some destructive process in the brain. It is seen in the young who have suffered severe injuries at birth and sometimes following an apoplectic stroke.

ATHIEST'S TRAGEDY, The, or, the Honest Man's Revenge. The title of a play by Cyril Tourneur and generally considered one of his best. It is supposed to have been written in 1600, though it was not published until 11 years later. The plot is obviously suggested by some of the crude tales of the "Decameron" of Boccaccio.

ATHLETE, The, a statue found in Pompeii and now in the Museo Nazionale at Naples. It is a copy of the spear bearer of Polycleitus. So beautifully shaped and proportioned is it that it is regarded as the ideal of physical manhood.

ATHLETES (Greek, athletai), combatants who took part in the public games of Greece; also young men who went through the gymnastic exercises to harden themselves and to become fit to bear arms. In a narrower sense athletes were those who made the athletic or gymnastic exercises their principal business, particularly wrestlers and boxers. Their business was to contend at the Olympic games and they regulated their habits of life for this end. Not only the applause of the people, but also crowns and statues, were conferred upon the victor. He was led in triumph; his name was written in the public records; and poets sang his praise. He also received peculiar privileges, had a yearly pension and the foremost seat at the sacred games.

ATHLETICS, or ATHLETISM, is the exhibition of man's physical prowess in games of skill and endurance, and though in passing centuries it has undergone many phases, it is practically the same to-day as when the Olympic games, which were resumed at the Pan-American Exhibition at Buffalo in 1901, were originally given 2,500 years ago, and Greece was in her prime. Then not only Greek met Greek, but the influence of Pythagorean, Pyean, Nemean and Isthmian games was felt to the farthest extreme of Asia. After the fall of Rome, the mantle of physical prowess which that nation had inherited from the Greeks fell upon the shoulders of sturdy Scandinavians, whose chief glory was in his individual capacity to bear unflinchingly the stress and strain of
ATHLETICS

contests and the elements. They bred into the bone the hardihood and love of personal achievement which in turn carried the current through the Dark Ages, even into those of the exaggerated chivalry, which Cervantes killed with ridicule in 'Don Quixote.' The spirit of the Greek, Roman and Norseman planted its seeds in the hardy Anglo-Saxons, who in turn transplanted them into Virginian and New England soils on the northern continent of America, where its influence has been felt, even to the entire disappearance of the softer Latin races' supremacy. It is not surprising, therefore, that, with the disappearance of the earlier modes of life of the first settlers, calling for all the physical strain that the human frame was capable of, and of the return of the comparative leisure which in early youth now surrounds the American universities and colleges, there has reappeared a yearning after opportunities to supply, artificially, if so it must be, the stress and contest, physical effort and the proof of supremacy of the earlier ages, when such contest was compulsory. It was in the blood and it came out, much to the nation's benefit. First in the form of isolated college and club contests, and subsequently in such a volume as to need a separation of contests into classes and the creation of an especial federation of the separate units, to regulate and control it. In the beginning, athletics developed in this or that college, or university or club, acting separately and indiscriminately in its scope. Ultimately the lines of natural cleavage forced athletics into its two great branches: one outdoors, commonly known as track-events; the other, those carried on in a gymnasium. The outdoor events are those which are now usually meant when the term athletics is used. The development of these came tentatively. First one college, or university, or club, then another, organized outdoor contests, until at length the net was spread over all the rising generation, and the Amateur Athletic Union was formed, whose fundamental rule is that "no person shall be eligible to compete in any athletic meeting, game or entertainment given or sanctioned by this Union who has (1) received or competed for compensation or reward, in any form, for the display, exercise or example of his skill in any athletic exercise, or for rendering personal service of any kind to any athletic organization, or for becoming or continuing a member of any athletic organization; or (2) has entered any competition under a name other than his own, or from a club of which he was not at that time a member in good standing; or (3) has knowingly entered any competition open to any professional or professionals, or has knowingly competed with any professional for any prize or token; or (4) has been or allowed to be issued in his behalf any challenge to compete against any professional, or for money; or (5) has been barred or sold any prize won in athletic competition; or (6) is not a registered athlete. Nor shall any person residing within the territory of any active member of this Union be eligible to compete for or to enter any competition as a member of any club in the territory of any other active member of this Union, unless he shall have been elected to membership in such club prior to 1 April last; provided, however, that this restriction as to residence shall not apply to undergraduates connected with any allied college athletic organization.

No one shall be eligible to compete in any athletic meeting, games or entertainment given or sanctioned by this Union, unless he shall be a duly registered athlete, a member of the organization from which he enters, and shall not have competed from any club in this Union during a period of three months next preceding such entry; nor shall any member of any club in this Union, or any club in any district in this Union be allowed to compete in case he has within one year competed as a member of any other club then in this Union, except with the consent of such other club. Each club shall be filed with the registration committee of his district prior to such competition unless such other club shall have disbanded or practically ceased to exist; provided that the requirements of this section shall not apply to any athletic meeting, games, or entertainment, the entries for which are confined to the club or organization giving such meeting or entertainment.

No athlete who has been released from a club which is a member of this Union, and who competes for another club, directly or indirectly, shall be allowed to compete again for the club he was released from for one year from the date of his release, except that the club has disbanded or ceased to exist.

No person shall be eligible to compete for or enter any competition as a member of any club in the territory of any active member of this Union, until he shall have resided within the territory of said active member at least four months previous to entering for competition; nor shall any person be eligible to enter or compete in any district championship meeting unless he shall have been a bona-fide resident of such district for at least six months prior to the holding of such championship meeting; and no person shall be eligible to compete in a championship meeting of more than one district in one year. The restrictions contained in this section shall not affect the eligibility of an undergraduate connected with any allied college athletic organization who shall have been elected to membership in any club of this Union prior to 20 Nov., 1899, and who continues to remain a member of such club so long as he remains an undergraduate; nor shall these restrictions apply to an undergraduate competing for any college belonging to an allied body.

The Amateur Athletic Union (A. A. U.) of the United States has jurisdiction over the following games or sports: Basketball, billiards, boxing, fencing, gymnastics, handball, hurdle, racing, jumping, lacrosse, pole vaulting, putting the shot and throwing the discus, hammer and weights, running, swimming, tug of war, walking and wrestling. The Union consists of the Metropolitan Association comprising the States of New York, New Jersey, north of Trenton; the New England Association, comprising Maine, New Hampshire, New Hampshire, Rhode Island and Connecticut; the Atlantic Association, comprising New Jersey, south of and including Trenton, Delaware, Maryland, Pennsylvania, West Virginia, District of Columbia, Virginia, North Carolina and South Carolina; the Central Association, comprising Ohio, Illinois, Indiana, Michigan, Wisconsin,
Iowa and Minnesota; the Pacific Association, comprising California, Arizona, Nevada and Utah; the Southern Association, comprising Alabama, Louisiana, Florida, Mississippi, Texas, Georgia and Tennessee; the Western Association, comprising Missouri, Wyoming, Arkansas, Oklahoma, South Dakota, North Dakota, Indian Territory, Kansas, Kentucky, New Mexico and Colorado; and the Pacific Northwest Association, comprising Idaho, Montana, Oregon, hands from a seven-foot circle, the hammer being swung around the head. Putting the shot consists of throwing a 16-pound iron ball straight from the shoulder with one hand. Throwing the discus is somewhat similar; the discus, a flat, circular stone or piece of metal, weighing four pounds and seven ounces, is hurled from a nine-foot square.

* Also world record.

Washington and Alaska. All its meetings are under the direction of "a games committee," one referee, two or more inspectors, three judges at finish, three or more timekeepers, a starter, a clerk of the course, a scorer and a marshal; besides which all the conditions and restrictions for various events: the number of throws allowed, the size and area of preliminary effort, as in shot-putting, etc., are subject to definitions from time to time promulgated, and imposed, by virtue of the authority of the A. A. U. in meeting assembled.

The Intercollegiate Association of Amateur Athletes of America is the governing body of intercollegiate athletics. Its championship must be won at the annual meeting. The events at outdoor field meetings, track and field athletics, as they are more closely defined, include the following:

Flat racing, subdivided into sprint, middle-distance and long-distance races. "Sprinting" signifies top speed running, up to 300 yards. "Middle-distance" events are the half-mile, mile and two-mile race, longer stretches being "long-distance."

Hurdle racing, covering two events, the 120-yard and 220-yard hurdle race. The first is run over 10 flights of hurdles, 10 yards apart, the first being 15 yards from the start, each hurdle being three feet and a half feet in height. The 220-yard race is over 10 hurdles two and a half feet high, the conditions being otherwise the same.

Jumping, including the broad jump, the high jump and the pole vault. The first is a running jump, over a bar or a plank sunk into the track, with a distance as the main object. The high jump is over a bar, with height as the main object. Vaulting is the same as high jumping, except that the athlete has the assistance of a spring pole.

Weight events, including throwing the hammer, putting the shot and throwing the discus. In the first a 16-pound hammer with a four-foot flexible wire handle is thrown with both

ATHLONE, [Ath-lon], Ireland, town on the Shannon, about 67 miles west by north of Dublin. It is divided by the river into two nearly equal parts, which communicate by a handsome stone bridge of five arches. It is one of the chief depots for troops and military stores; and the barracks, occupying a height above the river, can accommodate 15,000 men, and have attached an ordinance yard, magazines and armory provided with a large stand of arms. By means of a canal the Shannon has been rendered navigable for 71 miles above the town, which, being also terminus of four important railways, carries on a brisk trade. The chief industrial establishment is an extensive woolen factory, and there are also large saw-mills. Pop. 9,631.

ATHOL, Mass., town in Worcester County, on Miller's River and the Boston & A. and Fitchburg railroads, 26 miles northwest of Worcester. It contains several villages, has electric railways connecting with the suburbs, municipal water works, and is principally engaged in the manufacture of cotton cloths, shoes, sewing-silk, fine mechanical tools, matches, organ-cases, pocketbooks, billiard-tables and furniture. The town has two national banks, public library, high school, several weekly and monthly periodicals, and a property valuation exceeding $4,000,000. From its settlement in 1735 until its incorporation in 1762, Athol was known as Pequot. Pop. (1910) 8,536.
ATHOL, or ATHOLE, a mountainous and romantic district, situated in the north of Perthshire, Scotland. It gives the title of duke to the Marquess of Murray, and the Duke owns the greater part of the district.

ATHOR, a-thor, HATHOR or HETH-ER, an Egyptian goddess, identified with Aphrodite (Venus). Her symbol was the cow bearing between its horns the solar disc and hawk feather plumes. Her chief temple was at Dendera. From her the third month of the Egyptian year derived its name.

ATHOS, now HAGION OROS or MONTE SANTO (Holy Mountain), a high mountain in Macedonia, 50 miles east of Salonica, the extremity of a long chain of mountains which runs through a peninsula jutting into the Archipelago. The peninsula is about 30 miles long and five miles broad. It is covered with forests of various kinds of trees, and with vineyards and plantations of olive and other fruit-trees. The surface is very irregular, and the coast displays coves and inlets of the sea. In ancient history the peninsula is mentioned chiefly on account of the shipwreck which here befell the Persian fleet under Mardonius in 493 B.C., and on account of the canal which, in order to avoid a similar calamity, Xerxes caused to be cut through the isthmus that joins the peninsula to the mainland. The whole peninsula, as well as the mountain, which is about 6,700 feet above the level of the sea, receives the name of Athos. It contains some 20 monasteries and a multitude of hermitages, inhabited by about 6,000 monks and hermits of the Order of Saint Basil. They are extremely industrious: they diligently cultivate the soil, grow vines and olives, vegetables, etc., and actively engage in fishing, and they also carve statues of the saints, Agni Dri, crucifixes, rosaries, etc., which they send to the small town of Karyes, on the mountain, where weekly markets are held, and to the rest of Europe, especially to Russia. They also collected alms to pay their heavy yearly tax to the Porte. There is an academy in which the younger monks receive instruction in various subjects. The libraries of the monasteries are rich in literary treasures, particularly in manuscripts, partly procured from Constantinople before its conquest by the Turks, partly presented to them from the same place, and partly written by the laborious monks. Many books have been brought thence to the great collections at Paris, Vienna, etc., and the rest are but little used among the monks themselves. Their monasteries and churches were the only ones in the Ottoman empire which had bells. Every nation belonging to the Greek Church has here one or more monasteries of its own, annually visited by pilgrims from Russia, Serbia, Bulgaria, etc., as well as from Greece, Asia Minor and Constantinople. The churches of the various establishments enjoy they owe to Murad II, who, on account of their voluntary submission, even before the capture of Constantinople, granted them his protection. Hermits were established on Athos in the middle of the 9th century, and the first monastery, that of Saint Lavra, was founded by the monk Athanasius in 968. In 1912 Athos was occupied by the Greeks during the Balkan War, and is now under Greek sovereignty.

ATHOS, a-tös', a character who figures in Dumas' 'Musketeer' novels. He is one of the three guardsmen associated with d'Artagnan.

ATHY, a-thi', a market-town in Ireland, 37 miles southwest of Dublin, with Protestant and Roman Catholic churches, extensive cloth and linen trade, jail, police barracks, etc. It has a large trade in corn, by canal and river, and is an important railway station.

ATTITLAN, a-te-tlan', a lake, mountain and town of Central America, in Guatemala. The lake is about 24 miles long and 10 broad; the mountain an active volcano, 12,160 feet high. The town, known also as Santiago de Atitlan, is located on the side of the mountain, and is chiefly known for its medicinal springs. Pop. about 11,500.

ATJEH. See ACHEHN.

ATKINSON, Edward, American economist: b. Brookline, Mass., 10 Feb. 1827; d. Boston, 11 Dec. 1905. He was educated in private schools. He invented a cooking-stove called the 'Aladdin Oven,' and was president of the Boston Manufacturers' Mutual Fire Insurance Company after 1878. His wide reputation was due chiefly to the fact that for 40 years he was a prolific writer of pamphlets on economic, commercial and political subjects, including banking, competition, railroads, fire-prevention, economic legislation, industrial education, the money and tariff questions, and colonial expansion. He vigorously opposed the war in the Philippines, and during 1899-1900 published the 'Anti-Imperialist' in support of his views. The following is a selected list of his more important publications: 'Cheap Cotton by Free Labor' (1861); 'Collection of Revenue' (1866); 'Reform of the Legal Tender Act' (1874); 'The Fire-Engine, the Architect and the Underwriter' (1880); 'Distribution of Products' (1885); 'The Margin of Profit' (1887); 'Taxation and Work'; 'Science of Nutrition'; 'Prevention of Loss by Fire'; 'Fifty Years' Record of Factory Mutual Insurance' (1900); 'Facts and Figures as the Basis of Economic Science' (1904). Consult the biographical notice by T. W. Higginson in 'Proceedings of the American Academy of Arts and Sciences' (Boston 1907).

ATKINSON, Eleanor (Stackhouse), American writer: b. Rensselaer, Ind. For several years she was a public school teacher in Indianapolis and Chicago, but in 1889 she took up newspaper work, becoming a special writer on the staff of the Chicago Tribune. Her work was always written in familiar and popular style, and became very popular. In 1891 she married Francis Blake Atkinson. In 1900 she became editor of 'The Little Chronicle,' in which position she continued for seven years. Among her books are 'Mamzell Fifi' (1903); 'Boyhood of Lincoln' (1908); 'Lincoln's Love Story' (1909); 'The Story of Chicago' (1910); 'The Students' Reference Work' (1911); 'Greyfriars Bobby' (1912); 'Loyal Love' (1912); 'How and Why Library' (1913); 'Johnny Appleseed' (1915).

ATKINSON, George Francis, American botanist: b. Raisinville, Mich., 26 Jan. 1854. He was educated at Olivet College, Michigan, and Cornell University, and was graduated in 1885. He taught general zoology, biology and ento-
ATKINSON—ATLANTA

mology in the universities of North Carolina, South Carolina and the Alabama Agricultural and Mechanical College, from which he has described in his delightful 'Forty Years in a Moorland Parish' (1891). He wrote much on natural history, and his 'Walks, Talks, Travels and Exploits of Two School-Boys' (1889); 'Play Hours and Half Holidays' (1880); 'British Birds' Eggs and Nests' (1861), and 'The Last of the Giant Killers' (1891), have been widely read.

ATKINSON, Thomas, American bishop: b. Mansfield, Va., 6 Aug. 1807; d. Wilmington, N. C., 4 Jan. 1881. He was graduated from Hampden-Sidney College, Virginia, in 1825, and practised law for nine years. Ordained priest in the Episcopal Church in 1837, he served as rector in Norfolk and Lynchburg, Va., and Baltimore, Md. He became the third bishop of North Carolina 26 May 1853. He was an able administrator and prominent in the councils of his Church. He published various sermons and Episcopal charges.

ATKINSON, Thomas Witiarn, English traveler, writer and artist: b. Yorkshire, 6 March 1793; d. Kent, 13 Aug. 1861. He began his career as an architect in Manchester, where he built a large church. It was in this connection that he acquired a facility for drawing which he later developed into the ability to draw and paint. Becoming interested in central Asia through the works of Humboldt, he went to Saint Petersburg in 1844 and thence began one of the most remarkable series of journeys and explorations ever undertaken. He wandered across the Russian steppes, over the plains of Siberia, into central Mongolia and even ventured into Chinese Tibet, many stretches of this extended journey being undertaken on foot. On returning to England in 1853 he estimated that he had traveled some 15,000 miles, much of it before 1830, then practically unknown to Europeans. His experiences are related in 'Explorations in Oriental and Western Siberia' (1858) and 'Travels in the Regions of the Upper and Lower Amur' (1860).

ATKYNs, Sir Robert, English jurist and statesman: b. Gloucester 1621; d. Sapperton Hill, Gloucestershire, 1709. He was the son of a distinguished family, of which no less than four generations had been represented in high judicial offices. In 1659 he entered Parliament and being a strong partisan of the king, he was made Knight of the Bath at the coronation in 1661. In the same year he became recorder of the city of Bristol. In 1672 he was judge of the Court of Common Pleas. But on account of friction with Chief Justice Scroggs he resigned his appointment and retired to his family estate in Gloucestershire. During this period, however, he showed himself bitterly opposed to the Stuarts and after the flight of James II he openly proclaimed himself for the lords, dissenting as their legal writer, 'The Living Way' (1856); 'Memorials of Methodism in New Jersey' (2d ed., 1860); 'The Garden of Sorrows' (1868); 'Centennial History of American Methodism' (1884); 'The Beginnings of the Wesleyan Movement in America, and the Establishment Therein of Methodism' (1896).

ATKINSON, John Christopher, English clergyman and antiquary: b. Edsdangor, England, 1814; d. 1900. He was for half a century vicar of the parish of Danby in the North Riding of Yorkshire, which he has described in his delightful 'Forty Years in a Moorland Parish' (1891). He wrote much on natural history, and his 'Walks, Talks, Travels and Exploits of Two School-Boys' (1889); 'Play Hours and Half Holidays' (1880); 'British Birds' Eggs and Nests' (1861), and 'The Last of the Giant Killers' (1891), have been widely read.

ATKINSON, Thomas, American bishop: b. Mansfield, Va., 6 Aug. 1807; d. Wilmington, N. C., 4 Jan. 1881. He was graduated from Hampden-Sidney College, Virginia, in 1825, and practised law for nine years. Ordained
boundary is nearly a circle of 3½ miles diameter, extended in two suburbs. Situated at the foot of the Appalachian chain of mountains on the ridge dividing the watershed of the Atlantic Ocean from that of the Gulf of Mexico, the altitude of 1,050 feet at the lowest point and 1,100 feet at the highest makes the climate cooler than the latitude, 33° 44′ 58.8″, would indicate, and the air has a bracing and invigorating effect conducive to mental and physical vigor which makes Atlanta a desirable place of residence. The mean temperature is 44° in winter and 77° in summer; winter, 44°. This commanding site was developed by the building of railroads in the first half of the 19th century. The village of Marthasville was first a terminus of the line from Savannah and Macon. As one road after another centred there the place grew rapidly and became known as “Terminus”; its destiny as a business centre was foreseen, and the name changed to Atlanta. Here eastern and western traffic meet. After the vicissitudes of the Civil War, the legislature removed from Milledgeville and Atlanta became the capital of the State during the reconstruction era. It was made the permanent capital by vote of the people in 1869, and the capitol building was erected in 1880. Atlanta became the business centre of the Southern States and shared the general growth, developing rapidly after the Cotton Exposition of 1881, projected by citizens of Atlanta, became a rallying point for Southern industry. A second exposition held in 1895 greatly stimulated the growth of business; in 1914 the national government selected Atlanta as a site for the regional bank to serve the Southern States of Alabama, Florida, Georgia, Mississippi, North and South Carolina and Tennessee; and in 1915 the annual fair became a permanent fixture. Bank clearings increased from $5,000,000 in 1894 to $739,294,232 in 1915. In the same period bank deposits grew from less than $4,000,000 to $36,216,566. Business increased four times as fast as population, although that has grown at the rate of 4 per cent a year. The wholesale and retail trade of one year is now estimated at $200,000,000. The mule market is now the second most important in the country. Sales for the recent year were estimated at 65,000 head, valued at more than $11,000,000. Total trade and manufactures, $300,000,000. As a manufacturing centre, Atlanta’s output is varied. A recent census reported 598 establishments with $562,614,530 of capital, 21,482 wage earners, $14,284,923 total wages, and $55,011,690 of products. The most important products are cotton goods, fertilizers, gins, engines, car-wheels, machinery, lumber, sheet-metal work, terra-cotta, brick, wagons, carriages and buggies, furniture, confectionery, cigars, coffins, chemicals, printing, lithographing, electrotyping, engraving, paper bags, flour and meal, paints, varnish, cottonseed oil and cake, ice, harness, belting, hosery, suspenders, underwear, neckwear, woolen goods, shoes, and clothing. The factories of the city use 45,000 horsepower furnished by steam and electricity. A massive masonry dam has been constructed at Bull Sluice Shoals on the Chattahoochee, and a plant costing $2,000,000, completed near the middle of 1904, delivers 11,000 horse-power of electric current in the city. This gave a new impetus to manufacturing, much of the additional power having been taken in advance of completion. Atlanta’s central position has made it southern headquarters for large business concerns. It is the fourth insurance centre of the United States, with premium income estimated at $11,000,000 per annum, and is headquarters for the railways, telegraphs, telephones and the large industrial corporations doing business in the Southern or Southeastern States. The concentration of these interests has created such a demand for quarters in Atlanta that fireproof office buildings than any other Southern city. A fireproof hotel with over 300 rooms was recently completed. With other excellent hotels, Atlanta has been famous for many years as a Convention City* and has an auditorium seating 8,000 people. Atlanta is the most important centre of publication for newspapers and periodicals in the Southern States. The postal receipts for the second-class matter reach $100,000 in a single fiscal year, thus exceeding those of Brooklyn, Baltimore, Buffalo, Washington city, Omaha, New Orleans, Louisville or Indianapolis, while the increase of general postal receipts since the exposition has been remarkable and now exceed $1,600,000. The city Appropriated $300,000 for an entire block of ground upon which a very handsome post-office and custom house has been erected at a cost of $1,600,000. This and the State capitol, already mentioned, with its exterior of oolitic limestone and the interior ornamented with Georgia marble, are the chief among the fine buildings of the city. Street improvements have cost more than $10,000,000, including 230 miles of sewers, 250 of paved streets, 457 of sidewalks. Fifteen miles of streets are paved with asphalt, the remainder with granite blocks, macadam and vitrified brick. The city water works takes its supply from the Chattahoochee River above Peachtree Creek, in a sparsely populated district. By settling and filtration water is purified. Two engines of 15,000,000 gallons daily capacity each pump it into the city. The consumption is nearly 20,000,000 gallons a day. For domestic use water is supplied at 10 cents per thousand gallons. At this rate, with some reduction, the recent year’s revenue was $235,000 profit. Fire, police, sanitary and other city departments are well equipped and efficient. The city government is administered by a mayor and general council. Appropriation bills are voted separately by two legislative branches, and the mayor has a veto. Bonded debt is limited by State Constitution to 7 per cent of the taxable wealth. The charter requires a sinking fund to retire all bonds in 30 years from date of issue. Atlanta is one of 10 cities designated by the Secretary of the Treasury whose bonds might be used as security for Federal deposits. The tax rate is 1½ per cent and the assessment averages 60 per cent of actual value. The city assessment for 1915 showed $185,825,693 of taxable wealth. The streets of the residential sections are bordered by grass, the streets, lawns and shade trees. Grant Park, Piedmont Park, Lakewood, East Lake, Ponce De Leon Spring and the Chattahoochee River are outing resorts. A bill has been introduced in Congress to make a national military park on the battle ground north of the city. Public spirit is strong in Atlanta. The Chamber of
Commerce, Clearing House Association, Credit Men's Association, Manufacturers' Association and Freight Bureau are organs for concerted action among business men. The Greater Georgia Association, projected by the Atlanta Chamber of Commerce, unites the efforts of Georgia towns and counties to develop the resources of the State. Fraternal and social organizations are numerous and active. Religious denominations are well organized. The public school system comprises grammar schools and high schools, with over 26,000 pupils; three business colleges have 1,500 students, medical and dental colleges have 1,500. Two male colleges, a female seminary and several select schools for boys have an attendance of 2,500. The Georgia Institute of Technology with 900 students is the most important institution for higher education. It has textile, mechanical engineering and electrical engineering schools and machine-shop practice in addition to literary and scientific courses. The total number of students in the city in higher institutions for white youths and girls is about 7,000. Twenty-four public schools have 9,000 students. The total attendance for 1917 was 4,500. The total investment of which is estimated at $1,000,000. Emory (Methodist) University is also being established with funds already acquired, amounting to $31,000,000.

There are six institutions for the higher education of colored youth, with a total attendance of 3,000. They include literary and scientific schools, theology, industrial training and a training school for nurses. Charities are numerous and well equipped. There are free kindergartens, night schools and three orphan asylums. Grady Hospital is supported by the city; Saint Joseph's Infirmary by the Roman Catholics, and the Presbyterian Hospital by the Presbyterians. Private hospitals or sanatoriums are well equipped. There are two theatres with 2,500 and 2,000 seating capacity, and two lyceum or lecture associations. Carnegie Library is a white marble building in classic style, and contains over 400,000 volumes. The book circulation is over 150,000. There are four daily newspapers, there are 264 churches, including missions, and the attendance is made up of a fair proportion of all of the population. The total membership exceeds a third of the population. Atlanta was an important strategic point in the Civil War. In 1861 it became a depot of Confederate military supplies, and this made it an objective point in General Sherman's march to the sea. After a siege of several weeks he occupied the city (see JONESBORO, BATTLE OF, AND FALL OF ATLANTA), and by his order it was burned on Nov. 1864. In later years General Sherman described the strategic position of Atlanta by comparing it to the wrist of a hand whose fingers reached the five principal ports of the gulf and south Atlantic coast. Twice the test of war has appeared in this city, the first invasion by Sherman and the second by Grant. The destruction of the city by Sherman and the occupation of Atlanta by Grant was an important step in the war. Atlanta was settled in 1854 on the site of a fishing settlement dating from 1780. It is governed, subject to referendum and recall, by five commissioners, elected every four years. Pop. 44,000; in summer, about 350,000.

ATLANTIC COAST LINE RAILROAD COMPANY, The. A railway system extending from Richmond, Va., to Port Tampa, Fla.,
a trunk line distance of 900 miles, with many auxiliaries and branches. On 30 June 1916 the system was operating 4,730.6 miles of road, of which 52.17 miles were operated under lease, and 53.79 miles under trackage rights. The Company also owned several small branches (totaling 16.83 miles) which it did not operate.

The Atlantic Coast Line Railroad Company had its beginning in the Richmond & Petersburg Railroad Company chartered by the State of Virginia in 1836. In 1900 the name was changed to The Atlantic Coast Line Railroad Company of Virginia. Later in that year the Norfolk & Carolina Railroad, the Wilmington & Weldon Railroad, the South Eastern Railroad and the Atlantic Coast Line Railroad of South Carolina were consolidated with it, and the name was again changed to its present title.

The Company's operating revenues for the fiscal year ended 30 June 1916 were $34,445,110; earned by the transportation of 7,850,394 passengers and 12,291,713 tons of freight. The passenger travel averaged 48.07 miles per person and the freight charge of 2.152 cents per ton-mile—aggregating in the year 377,368,440 passenger miles, and $8,271,629. The freight traffic averaged 167.08 miles per ton, at a charge of 1.835 cents per ton-mile—aggregating in the year 10,296,523.90-ton miles, and $23,292,860. The operating expenses for the year were $22,797,908. After deducting taxes and bills uncollectible, the total operating income was $9,838,805. A dividend income of $2,386,447 and other non-operating income increased the gross income to $13,975,955. The interest paid on the funded debt amounted to $5,846,656, and this, with other miscellaneous deductions, reduced the net income to $7,755,356. Of this, $140,551 was appropriated for physical betterments and $7,598,893 was transferred to profit-and-loss account. The operating revenue per mile of road was $7.324 and the operating expenses $4.847; making the net operating revenue per mile of road $2.476.

The equipment of the road on 30 June 1916 consisted of 820 locomotives, with an aggregate tractive capacity of 18,411,700 pounds; 353 passenger coaches; and 28,313 freight cars—of which 635 were coal cars with an aggregate capacity of 25,400 tons. The largest item of freight car equipment amounted to 2,658,210 tons. Following this in tonnage are mining products, including 683,470 tons of bituminous coal, amounting to 1,104,921 tons; forest products not included under lumber, 1,748,292 tons; and cotton, fruit and vegetables, with other agricultural products, 1,697,912 tons.

The entire investment in the road and its equipment on 30 June 1916 was $178,568,333. Investments of the Company in affiliated companies amounted to $60,432,922; and other investments totaled $3,193,230. The stock outstanding on the date named was $73,574,272 (out of $100,000,000 authorized), and the total long-term debt was $138,777,635. The credit balance of the profit-and-loss account was $33,583,626. The Company owns the capital stock of the Louisville & Nashville Railroad Company, and with the latter jointly leases the Georgia Railroad and its dependencies, covering 91 miles. The Atlantic Coast Line Railroad Company is affiliated with the Atlantic Coast Line Company, a security-holding corpo-

ration which owns $18,413,600 of the stock of the railroad company.

**ATLANTIC HIGHLANDS—N. J.**

Borough and summer resort of Monmouth County, 20 miles south of Jersey City, on Sandy Hook Bay, and on the Central Railroad of New Jersey. There are the usual resort amusements, yacht and tennis clubs, a casino, and very many residences, hotels and boarding-houses. The waterworks and electric-lighting plants are the property of the borough. Pop. 1,645.

**ATLANTIC OCEAN**

The body of water lying between the eastern coasts of the Americas and the western coasts of Europe and Africa, and extending from the Arctic Basin to the Great Southern Ocean. Its greatest breadth, attained in lat. 25° N., is 4,500 miles; but between Cape S. Roque in Brazil and Cape Palmas its breadth is only 1,600 miles. Its superficial extent, not including the inland seas, is approximately 23,215,000 square miles, or 10,588,000 square miles in the north Atlantic and 12,627,000 square miles in the south Atlantic. The mean depth of the north Atlantic is 2,047 fathoms; of the south Atlantic 2,067 fathoms.

**Chief Distinguishing Characteristics.—** A preliminary and strictly condensed statement may serve, in some slight degree, to characterize this ocean and to differentiate it from the others. In the following respects, then, if we limit the number of particulars to a dozen, the Atlantic seems to be most clearly differentiated: (1) It has a much larger drainage area than either the Indian Ocean or the Pacific Ocean. (2) That portion of the Atlantic Ocean lying north of the equator and known as the north Atlantic has been more carefully studied than the other main divisions of the hydrosphere; and the interest manifested in this way is partly due to the number and exceptional importance of the enclosed seas connected with it. (3) The Atlantic Basin has, as the dominant feature of its relief, a submarine ridge that extends approximately, from lat. 50° N. to lat. 40° S. and divides the basin into the eastern and western submarine valleys or troughs. (4) The number of islands in the Atlantic is relatively small—particularly small in the south Atlantic. (5) The basin of the Atlantic Ocean was formed in comparatively recent geologic time. It dates probably from the Mesozoic era, whereas the Pacific Ocean’s basin is of truly great antiquity. (6) The salinity of the Atlantic far exceeds that of the other great oceans; it is especially marked in its great inland sea, the Mediterranean, and increases as we proceed toward the eastern part of that sea. (7) As compared with the wind circulation over the other great oceans, that over the Atlantic has a very definite character. (We shall refer to this subject again in connection with the formation of drifts and currents.) (8) The Atlantic contains the Gulf stream, which probably extends in volume and in rapidity of its current to the rest of the world. (9) Between lat. 20° N. and 35° N. and long. 40° W. and 75° W. there is a distinctly Atlantic area in which there is practically no surface circulation and which—owing to the circumstance that it is covered by enormous banks of gulf-weed (Sargassum
bucciferum — has received the name Sargasso Sea. (10) Between South America and Africa, a secondary tidal-wave moves northward; and this is produced by, or perhaps deflected from, the east-to-west tidal-wave of the Southern Ocean. (11) Ice formations of the north Atlantic are noticeably different in character from those of the north Pacific. (12) The entire Atlantic, vast though it is, may be called simply the greatest of inland seas, rather than a true ocean. (The reasons for this will be mentioned in the paragraph Fauna).

Islands and Enclosed Seas.— The principal oceanic islands are the Canaries, Azores, Cape Verde Islands, Madeira, Ascension, Saint Helena, Bouvet Island and Tristan da Cunha; while those classed as continental groups are the British Isles, West Indies, Iceland, Newfoundland and the Falklands. Connected with the Atlantic are, on the eastern side, the Mediterranean and the Black Sea, the North Sea, and the Baltic; and on the Pacific, Mexico and the Caribbean Sea (together forming the American Mediterranean), Hudson Bay and the Gulf of Saint Lawrence.

Winds and Currents.— Of the winds of the Atlantic, the most remarkable are (1) the perennial or trade winds which blow constantly in one direction, or nearly so — from east to west, southeast to northwest, or northeast to southwest, and (2) the so-called "roaring forties." The region of the trade winds north of the equator is known as the zone of the northeast trades; that south of the equator as the region of the southeast trades. The northeast trade wind blows with less steadiness than the southeast; in the West Indies, however, the former seldom forsakes its regular course. Both are found to be most constant when the observations are taken far out at sea; less steady on the land or near it. Commander W. W. Campbell Hepworth has written (in the Geographical Journal, November 1914, Vol. XLIV, No. 3): "The northeast trade current flows from the Southern into the Atlantic Ocean, its general direction being east-northeast. Rennel current, a drift from the Gulf Stream, enters the Bay of Biscay from the west. The Arctic current runs along the east coast of Greenland and continues along the coast of the United States, from which it separates the Gulf Stream by a band of cold water. An Antarctic current of cold water — not at the surface, like the foregoing, but at a great depth — flows from Antarctic regions toward the equator.

Fauna.— The suggestion has been made by several geologists that the Atlantic is not a true ocean like the Pacific, but rather a basin of secondary formation and comparatively recent origin. Moreover it has been shown that, meteorologically, the Atlantic should be considered as an inland sea — not a true ocean. Mr. Austin H. Clark has recently discussed the same matter from the biological standpoint. We premise the Equatorial Current. For convenience, the northern portion of this great ocean river, which owes its origin mainly from the southeast trade wind-drift-current, is called the North Equatorial Current, while the southern portion, which is derived mainly from the southeast trade wind-drift-current, is called the South Equatorial Current; but there is in fact no definite dividing line, except that during the six months of the year, June to November, the heaped-up waters of the two currents overlap between the third and 13th parallels of north latitude, east of about the 50th meridian, and turn to the eastward, thus becoming a counter current, which subsequently joins a southeastward setting branch of the northeast trade wind-drift-current and a northeastward setting branch of the southeast trade wind-drift-current, when the combined current flows eastward, immediately south of and parallel to the Guinea Coast. The Gulf Stream is a continuation, partly of the main and partly of the north equatorial currents, which pass across the Atlantic to the South American coast. That portion of the ocean river deflected northward then runs along the coast until it enters the American Mediterranean; receiving later the name of Gulf Stream when (and because) it issues, between Florida and Cuba, from the Gulf of Mexico. It afterward flows nearly parallel to the coast of the United States, separated from it by a belt of cold water. Off Cape Hatteras it attains a width of 167 miles and comprises three warm sections with two cold belts interposed. On passing Sandy Hook it turns eastward and continues to be recognizable, partly by its characteristic blue color, until it reaches long. 30° W., where, with diminished temperature, it is found flowing nearly due east. The warm drift from it that reaches the coasts of the British Isles represents, not the Gulf Stream proper, but a side branch, which derives its impetus from the southwest winds of those latitudes. There is, none the less, a real connection between the two. The Brazil Current is formed by the equatorial ocean river which is turned southward from Cape S. Roque in South America. The South African current originates near the Cape of Good Hope and flows in a northwesterly direction, eventually uniting with the equatorial currents. The Cape Horn current flows from the Southern into the Atlantic Ocean, its general direction being east-northeast. Rennel current, a drift from the Gulf Stream, enters the Bay of Biscay from the west. The Arctic current runs along the east coast of Greenland and continues along the coast of the United States, from which it separates the Gulf Stream by a band of cold water. An Antarctic current of cold water — not at the surface, like the foregoing, but at a great depth — flows from Antarctic regions toward the equator.
for the fauna of the Caribbean region, composed of ancient and generalized types, appears to have become established before the intrusion of the species from the Mediterranean region, which are more modern and more specialized, became possible.9

 Depths.—The most profound depression yet discovered in the Atlantic is the 3 deep,3 north of Porto Rico, measured by scientists of the coast survey steamer Blake (4,561 fathoms or 7,078 fathoms less than that given by soundings near Guam in the Pacific). Recurring now to the two great undersea valleys or troughs we have mentioned, we note that the mean depth of the east valley is about 3,150,000 feet, while the maximum depth of the west valley or trough is 16,800 feet. The submarine ridge separating these troughs is submerged to a depth of 1,600 fathoms from the Azores to the latitude of the Hebrides. It then rises gradually, emerging along the west coast of Ireland. The southern Atlantic has a slightly greater average depth than the north Atlantic.

 MARRION WILCOX.

 ATLANTIC SEABoard DIFFERENTIALS. See DIFFERENTIALS in RAILROAD TRAFFIC.

 ATLANTIC TELEGRAPH. See TELEGRAPH.

 ATLANTICO, Colombia, the smallest of the departments of the republic, bounded on the north and northwest by the Caribbean Sea, on the east by Magdalena and on the south and southwest by Bolivar. Area 1,082 square miles; capital Barranquilla. Its provinces are Barranquilla and Sabanalarga. Its plains, sloping to the Magdalena River or to the Caribbean Sea, are of value as pastures for cattle and also for the cultivation of tropical fruits, etc. There are 67 primary schools in the department, with 4,273 pupils (3.71 per cent of total population), and the school budget is about 15.34 per cent of the entire departmental budget. Pop. 116,000.

 ATLANTIDA, a department of Honduras, Central America, established in 1902. It is bounded on the north by the Caribbean Sea and Gulf of Honduras, on the east by the department of Colón, on the south by Yoro, and on the west by Cortés. It embraces the municipalities of 27,360 square miles 708 fathoms less than 6,000 inhabitants), Tela, El Porvenir, San Cristóbal and San Francisco. Chief elevation, the Cerro de Bonito (5,900 feet); capes, Can- grejal, Hisopo, Papaloteca, Salado and Olan; rivers, the Uluá, the Colorado, the Cuero, Bonito and Bonifio; products, cocoa, coffee, sugar, aguacates, oranges, lemons, pineapples, and all sorts of vegetables. Pop. 20,000.

 ATLANTIDES, a name given to the Pleiades, the seven daughters of Atlas or of his brother Hesperus.

 ATLANTIS, or ATLANTICA, a large island traditionally asserted to have once existed in the ocean immediately beyond the Strait of Gades; that is, in what is now called the Atlantic Ocean, a short distance west of the Strait of Gibraltar. Homer, Horace and some others made two Atlanticas, distinguished as the Hesperides and the Elysian Fields, and believed to be the abodes of the blessed. Plato states that an easy passage existed from the one Atlantis into other islands, which lay near a continent extending in size all Europe and Asia. Some have thought this America. Atlantis is represented as having ultimately sunk beneath the waves, leaving only isolated rocks and shoals in its place. Geologists have discovered that the coast line of western Europe did once run farther in the direction of America than now; but its submergence seems to have taken place long before historic times. Plato's accounts in his 'Timeus' and 'Critias' are considered a pure invention by some, but very many regard them as real tradition. 'The New Atlantis' is the title which Lord Bacon gives to a literary fragment, in which he sketched out an ideal commonwealth. Consult Steiner, 'Submerged Continents of Atlantis and Lemuria' (Chicago 1911) and Volgardsen, 'Ueber die Mythen bei Plato' (Schleswig 1871).

 ATLAS, an anatomical term applied to the first vertebra of the neck, which supports the head. It is connected with the occipital bone in such a way as to permit of the nodding movement of the head, and rests on the second vertebra or axis, their union allowing the head to turn from side to side.

 ATLAS, in Greek mythology, the Titan whom Zeus condemned to bear the vault of heaven. The same name is given to a collection of maps and charts, and was first used by Gerard Mercator in the 16th century, the figure of Atlas bearing the globe being represented on the titlepages of such works.

 ATLAS, an extensive mountain system in north Africa, starting near Cape Nun, on the Atlantic Ocean, traversing Morocco, Algiers and Tunis, and terminating on the coast of the Mediterranean. It is divided into the Moroccan, or western, and the Algerian, or eastern, Atlas. The western group is divided into the great Atlas, the little Atlas on the Mediterranean coast, and the anti-Atlas, southwest of the great Atlas and near the Atlantic coast. The great Atlas contains the highest peaks of the whole system, Jebel Ayashim (14,600 feet) and Tamjurt (14,500 feet). On the coast, the range skirts the Mediterranean, from Cape Spartel, and the Straits of Gibraltar, to Cape Bon, on the northeast of Tunis. The Atlantic shore is sometimes formed by cliffs, which do not attain any great height, except at Cape Ghir. The Mediter-
region, between Capes Spartel and Bon, is generally rugged, and in places attains a considerable height. Between Cape Bon and the Gulf of Gabes it is rocky, but without reaching any great elevation. The southern slope of the Atlas reaches the great desert, from which it is separated by a region of sand-burns, shiftingly but often fired by a destructive wind, and gradually making encroachments on the fertile lands at the foot of the mountains. On the west of the Gulf of Gabes, Mount Nofusa, the last eastern spur of the Atlas, joins Mount Garjan, which extends into Tripoli. The French geographers include within the limits of the Atlas their own province of Algeria, together with Morocco, and a part of Tunis. The rocks of the system are igneous and sedimentary, of the Archean and Paleozoic systems. There are also many Jurassic and Tertiary formations. Copper, iron, marble and salt are found. While snow remains on the higher peaks during the greater part of the year no peak has a perpetual cover of snow. The whole area is 1,000,000 square miles, including a great variety of surface, mountains, valleys and extensive plains. The valleys are very fertile, are nearly all under cultivation and compare most favorably with other Mediterranean regions. Consult Fischer, "Uber meine Reise im Marokkanischen Atlas," in Zeitschrift der Gesellschaft für Erdkunde (Vol. XXVI, Berlin 1889); Gentil, Louis, "Mission de Sagonza" (Paris 1906); Schnell, P., "L'Atlas marocain" (Paris 1898); Thomson, Joseph, "Travels in the Atlas and Southern Morocco" (London 1889).

ATLASS POWDER, highly explosive dynamite used in mining, quarrying, tunneling, shaft and well sinking, submarine blasting, road building, in farming to remove tree stumps or bulldozers from land, and subsiding. It is composed of nitroglycerin, sodium nitrate, wood pulp, and a small quantity of some anti-acid, as chalk, etc. For special requirements as to strength and destructive potentiality the proportions of the ingredients are varied. When not confined it will burn slowly, but when subjected to a detonating cap it explodes with enormous force. It is put up in cartridges about 8 inches long and from seven-eighths to two inches in diameter, containing from 25 to 75 per cent of nitroglycerin, according to the use to which it is to be put. See Explosives.

ATLIEE, Washington Lemu, American surgeon: b. Lancaster, Pa., 22 Feb. 1808; d. 6 Sept. 1878. He became noted as a pioneer in ovariotomy and the removal of uterine fibroid tumors, and published "Ovarian Tumors" (1873), "Struggles and Triumphs of Ovariotomy" (1875), and a prize essay on "Fibroid Tumors of the Uterus" (1876).

ATMIDOMETER, an instrument for measuring the evaporation from water, ice, snow, etc. It consists of two glass or metal bulbs, one of them placed above the other, with which it communicates by a narrow neck. The instrument having been immersed in a vessel of water through a circular hole in which the steam rises, distilled water is gradually poured into the pan above, causing it to sink to the point at which the zero of the stem is on a level with the meniscus in the pan. Evaporation in the pan gradually evaporates the steam slowly ascends, the amount of evaporation being indicated in grains on the graduated scale.

ATMOLYSIS, the separation of the components of a gaseous mixture by means of diffusion. See DIFFUSION.

ATMOGRAPH, an instrument recording water evaporation. See ATMOMETER.

ATMOMETER, an instrument for measuring the quantity of moisture exhaled in the open air in a given time from an exposed surface or from the surface of a liquid. The first instrument of this kind was invented by Sir John Leslie. It consisted of a very thin ball of porous earthenware, from one to three inches in diameter, having a small neck firmly cemented to a long and rather wide glass tube, to which is fitted a brass cap with a leather collar. It is filled with distilled or pure water and its cap is screwed on tightly. It is then suspended out of doors where it is exposed to the action of the wind but is sheltered from rain. As water evaporates from the surface of the ball the waste is indicated by a corresponding descent of the water level in the glass tube, accurately measured by a finely-graduated scale. Another form of this instrument consists of a round dish into which is placed an inclined scale, which gives a magnified record of the rate of evaporation from the surface of the liquid in the dish. Sometimes the loss of moisture through evaporation is recorded by means of weighing. The Marvin atomometer consists of a surface of water fed from a supply well where the rate of evaporation can be measured. The Pich instrument is a glass tube, closed on top and open below. The open bottom is then rested on a disc of paper and fastened to it. The water is absorbed by the paper, whence it evaporates, the rate of evaporation being indicated by the descending level in the glass tube as in the Leslie instrument. This instrument, however, is more accurate because of the fact that the paper surface gives off more evaporation than does the exposed surface of the water in an open dish. There is also the balance instrument invented by Wild, in which a pan of water forms the water on a balance scale, the action of the scale indicating the loss by evaporation. For a detailed description of atomometers consult Russell's "Meteorology" (New York 1899).

ATMORE, Charles, English Wesleyan clergyman: b. Heacham, 17 Aug. 1759; d. Shrewsbury, 1 July 1826. He was received into the Wesleyan Church in 1779 by the noted Joseph Pifo Moor, one of Mr. Wesley's missionaries to America. In 1781 he met John Wesley and then decided to enter the Wesleyan ministry, and served in various places for nearly 45 years. He was pastor in Glasgow for ten years and served in several of the leading English cities. He was author of "The Methodist Memorial" (1801); "A Concise History of the Introduction of Methodism in America" (1802); "The Whole Duty of Man" (1811); "Familiar Discourses on the Lord's Prayer" (1821), and was the editor of several volumes.

ATMOSHERE (Greek, "vaporous sphere"), in ordinary usage, the gaseous envelope that surrounds the earth. The atmosphere consists chiefly of the gases, oxygen and nitrogen, not chemically combined, but mechanically mixed in the proportion of about 21 vol-
column so drawn up would precisely balance that of the atmosphere. The limit of 34 feet corresponds (as is easily shown by a simple calculation) to a pressure of about 15 pounds to the square inch; and hence Torricelli inferred that the atmosphere exerts a pressure of that amount upon all objects. Meditating upon this hypothesis, it occurred to him that if his explanation were indeed correct, the atmosphere would be able to raise mercury (which is about 14 times as heavy as water) to only about one-fourteenth of the height to which it can raise water. He accordingly took a glass tube some 35 inches long, and closed at one end. Placing it with the open end upward, he filled it with mercury. He then covered the open end to prevent the escape of the mercury and inverted the tube so that its mouth dipped into a basin also filled with mercury. Upon uncovering the open end of the tube, he was gratified to see that the mercury in the tube at once sank until its upper surface stood at about 30 inches above that in the basin. This experiment proved that the pressure of the atmosphere must be regarded as merely the excess of that element that remained unused, after all the possible oxidations had been effected. According to this view, the earth (at least in its more superficial parts) is a gigantic, burned-out cinder; and this accords with the estimates that chemists and geologists make, that nearly one-half of the weight of the earth's crust consists of oxygen. It is likely that in past ages, and particularly in the carboniferous period when the vegetation that gave rise to our modern coal fields was flourishing, the quantity of carbon dioxide present in the atmosphere was considerably greater than at the present time. Part of this gas was absorbed by plants, its carbon being stored in the coal beds and its oxygen returned to the air; but it is likely that by far the greater portion combined with lime and other similar earths to produce the present vast deposits of limestone and other carbonated minerals and rocks. At the present day, carbon dioxide is being absorbed from the atmosphere by plants, and returned to it again by animals, and by factories in which coal is burned. We have no means of knowing whether the balance is being preserved, so far as this constituent of the earth's atmosphere is concerned, because the mass of the entire atmosphere is too vast for the composition to be sensibly changed by these causes, since the time when exact analyses became possible.

Galle observed that water cannot be drawn up by a suction pump, or any equivalent device, to a greater distance than about 34 feet. He did not succeed in explaining the existence of this limiting height, but his friend and amanuensis, Torricelli, who succeeded him as professor at Florence, afterward made the shrewd guess that water rises in such a pump for the reason that the atmosphere exerts a certain pressure upon all terrestrial objects, and that when a portion of this pressure is removed from within the tube of the pump, it is the pressure of the atmosphere upon the water external to the pump that causes the water in the pump-tube to rise; and he saw that if that were the case, it would follow that a pump could only draw water up to the particular height at which the pressure due to the water-
phere. The calculation, when performed, shows that the mass of the atmosphere is about 1/1,000,000,000 of that of the whole earth. The atmosphere is, therefore, of uniform density, and it would be easy to calculate the height to which it extends. We should only have to divide the pressure upon one square inch of the earth's surface by the weight of a cubic inch of the air, and the quotient would be the height of the atmosphere, in inches. Thus, a cubic inch of air, at a pressure of 30 inches of mercury and at the temperature of freezing water, weighs about 0.000749 of an ounce; and as a column of mercury 30 inches high exerts a static pressure of about 25.8 ounces, it follows that if the atmosphere were homogeneous (that is, of uniform density throughout), its height would be about 253.8 + 0.000749 = 314,000 inches, or 4.97 miles, when the air has a temperature of 32° F., and the barometric pressure is 30 inches. The height so calculated is convenient for use in certain physical computations, and is called the height of the homogeneous atmosphere. If we turn from this problem to the more difficult one of determining the actual height of the atmosphere, we find that satisfactory results can not be given. As we go up, the strata become rarer and rarer, for the reason that the lower layers are weighed down and compressed by those above, and at increasing heights there is less and less air above, to exert this compression. At great heights the atmosphere becomes more and more attenuated, and thins out by insensible gradations into a perfect vacuum. There is no definite boundary, immediately below which there is an atmosphere, and immediately above which there is not. A stratosphere is the term given to the region of rarefied air or gases that extends from the surface of the earth to a height of about 50 to 60 miles. Above this is the mesosphere, which extends from 60 to 120 miles, and the thermosphere, which extends from 120 to 600 miles. The ionosphere is the region of the atmosphere that is heated by solar radiation and is composed of ions and excited atoms. This layer extends from about 60 to 500 miles above the earth's surface. The thickness of the atmosphere varies with the season of the year and the latitude. In general, the atmosphere is thickest at the equator and thinnest at the poles. The atmosphere is composed of about 78% nitrogen, 21% oxygen, and 1% argon, with small amounts of other gases. The atmosphere is a dynamic system, with winds, currents, and storms that affect the weather and climate.
very attenuated state. Such a theory was taught by Lucretius and other ancient philosophers, but the views of these early writers were never very popular or widely received, and the atomic theory, as held by chemists of to-day, is generally attributed to the English scientist, John Dalton. In the early part of the 19th century Dalton called attention to the fact that when substances combine chemically they do so in certain definite proportions. His reasoning was something like this: In 100 pounds of carbon monoxide there are 42.9 pounds of carbon, and 57.1 pounds of oxygen. In the same weight of carbon dioxide there are 27.3 pounds of carbon, and 72.7 pounds of oxygen. These are merely experimental facts, obtainable by direct analysis, and they involve no hypothesis whatever. No particular relations are discernable among the numbers stated above; but Dalton discovered that if the same facts are stated in a different way, a very remarkable relation appears. Thus, suppose we calculate what weight of oxygen is combined with each pound of carbon in the two gases. In carbon monoxide we find 
\[
\frac{71}{42.9} \approx 1.66
\]
and in carbon dioxide we find that there are 
\[
\frac{72.7}{27.3} \approx 2.66
\]
One of these numbers being exactly twice the other, we conclude that carbon can unite with oxygen in two proportions, the quantity of oxygen per unit weight of carbon being twice as great in one case as in the other. Dalton observed similar relations among other compounds; in fact, his theory first occurred to him while he was studying the simpler compounds of carbon and hydrogen; and after turning the matter over in his mind he came to the conclusion that the facts can best be explained by assuming that matter consists of exceedingly minute, indivisible particles or atoms, each of which has a definite weight. When two bodies combine chemically, he conceived their atoms to come together in pairs, or in threes, or fours, according to the compound formed; and he devised symbols to represent the various elementary bodies and their compounds. Thus oxygen was represented by a circle with a white centre, hydrogen by a circle with a dot in the centre, nitrogen by a circle crossed by a vertical straight line, and carbon by a solid black circle. His notation has no advantages over the one now in common use, and hence, in what follows, we shall adopt the modern symbols. As water was the only compound of oxygen and hydrogen that Dalton knew, he naturally represented it by the symbol OH, considering that in it the particles of oxygen and hydrogen are united in pairs. Taking the weight of the hydrogen atom as unity, it follows that the weight of the oxygen atom must be 8, if Dalton's view of the composition of water is correct; for experiment shows that in a given mass of water there are eight times as much oxygen, by weight, as there is hydrogen. Carbon monoxide was represented by the symbol OC, and since for each unit of its oxygen (by weight) this gas contains three units of carbon, it follows that the atomic weight of carbon is three-fourths of that of oxygen. Hence the weight of the carbon atom is 6, the weight of the hydrogen atom being arbitrarily taken, as before, as 1. Carbon dioxide was represented by the symbol CO. Ammonia gas, being the only compound of hydrogen and nitrogen known to Dalton, was represented by the simple symbol NH; and since experiment shows that ammonia gas contains (by weight) 4% times as much nitrogen as hydrogen, the atomic weight of nitrogen must be 4%, or 4.67. In presenting the foregoing sketch of Dalton's views, use has been made of better experimental data than were available in his time, in order that the relation of his system of atomic weights to the modern system may be more clearly seen. A few of his actual determinations of atomic weights, from the imperfect data that he had, are given in the accompanying table. These were published in

1805, and his general theory of chemical compounds was given in the first volume of his "New System of Chemical Philosophy," published in 1808. All subsequent researches have tended to confirm Dalton's fundamental conception, that matter is discontinuous in its ultimate nature, and consists of discrete atoms which come together in definite groups when chemical combination occurs. And we agree with him, to-day, in the belief that the so-called "atomic weights" of substances are really the true relative weights of their atoms; the weight of the hydrogen atom being taken as unity. Soon after Dalton's theory had been announced, it was observed that there are simple volumetric relations among gases when they combine. Thus it was noticed that two volumes of hydrogen combine with one volume of oxygen to form water; that one volume of hydrogen combines with one volume of chlorine to form two volumes of hydrochloric acid gas; and so on. This being the fact it was suggested by Avogadro in 1811, and independently by Ampère in 1813, that all gases, when under the same conditions of temperature and pressure, contain the same number of constituent particles per unit of volume. This principle, known as "Avogadro's Law," has been of the greatest service to chemistry. Its truth was long questioned, but as it has led to results of great value, and has been found to be in conformity with all other known facts of chemistry, it is now accepted without reserve as a fundamental principle of nature. Moreover, the kinetic theory of gases has shown that it is a mathematical necessity, if gases are admitted to consist of elastic particles, flying about through space, and colliding with one another, and with the walls of their containing vessels. (See Gases, Kinetic Theory of.) But if Avogadro's law be admitted to be a fact of nature, it becomes necessary, at once, to make an important modification in Dalton's theory. For it is plain that if one cubic inch of hydrogen, containing (say) n atoms, combines with one cubic inch of chlorine, also containing n atoms, to produce two cubic inches of hydrochloric acid gas, containing n constituent particles altogether, then the number of such particles
The atoms of hydrogen and chlorine, thus set free, then combine to form hydrochloric acid.

It is then written as follows:

\[ 
H + H + Cl + Cl \rightleftharpoons HCl + HCl; 
\]

or we may write the whole operation in the following simple manner:

\[ 
H_2 + Cl_2 \rightleftharpoons 2HCl. 
\]

Dalton, assuming that the formula of ammonia is NH, and knowing by experiment that the weight of the nitrogen present is 4.67 times as great as the weight of the hydrogen, would conclude that the atomic weight of nitrogen is 4.67; but since experiment shows that when ammonia gas is separated into its constituent elements, two volumes of the ammonia yield one volume of nitrogen and three volumes of hydrogen, Avogadro's law requires us to conclude that the true formula for ammonia is NH\(_2\); and hence we must take 3 \times 4.67 = 14 as the atomic weight of nitrogen. This example will suffice to show how Avogadro's law obliged chemists to modify the atomic weights that would be obtained by the methods known to Dalton. Direct analysis of compounds of an element whose atomic weight is desired will give either that atomic weight itself, or some simple multiple or submultiple of it; but to decide between these several multiples (as for example between 4.67 and 14, in the case cited above), it is necessary to have recourse to Avogadro's law, or to some other equally general principle. Unfortunately Avogadro's law cannot always be applied to the determination of atomic weights, because it frequently happens that no compound of the element under examination can be obtained in the gaseous condition, or that the gaseous compounds that can be obtained are unsatisfactory, for one reason or another, and not adapted to the determination of the particular multiple that should be selected as the atomic weight of the element. In such cases recourse may be had to the law of Dulong and Petit, or to the "periodic law" of Meyer and Mendeleeff. In 1819 two distinguished French chemists, MM. Dulong and Petit, announced that the specific heats of 13 elements upon which they had made careful experiments are inversely proportional to the respective atomic weights of those elements. In other words, that the atomic weight of a particular element is inversely proportional to its specific heat (which product is called the "atomic heat") is the same for all of them. This remarkable generalization did not meet with universal and immediate acceptance, because it failed in numerous cases, and the atomic weights of the corresponding elements were changed somewhat from the values that had been previously assigned to them from purely chemical considerations. Thus in the cases of bismuth, platinum, silver and cobalt, Dulong and Petit substituted multiples or submultiples of the atomic weights then in use; and other changes were also made. Moreover, the law could not possibly be exact, because the specific heats of bodies are not constant, but vary with the temperature, and sometimes to a considerable extent. Subsequent experimenters have paid great attention to Dulong and Petit's law, however, and now that the atomic weights of the more familiar elements have been pretty well determined in one way and another, the law is found to come nearer to the truth, and most of the changes for
which they contended, in connection with previously accepted atomic weights, have since been made. A list of 10 elements whose specific heats have been well determined are presented in the table, to illustrate the degree of accuracy

with which a proposed element may be expected to conform to it. The atomic weights in the table range from 7 to 238, and yet when we multiply each one by the corresponding specific heat, we find that the product (or "atomic heat") remains constant, or nearly so. In some cases (e.g., for copper and gold), we find a large deviation from the law is observed; but these exceptions cannot be considered in the present place. As an example of the use of Dulong and Petit's law, the case of silver may be cited. Previous to the publication of this law, the atomic weight of silver had been taken at 215. Dulong and Petit pointed out that if this value were retained, the product of the atomic weight and the specific heat greatly exceeded the value 6, to which many of the other elements approximated. They therefore proposed to halve the then accepted atomic weight of this element, and to make (of course) a corresponding change in the formulas of all compounds of silver. Regnault confirmed their experiments, and repeated their demand that the atomic weight be halved. But Berzelius, then the greatest living authority on such matters, refused to consent to the change, on the ground that silver and sodium compounds are isomorphous (see Isomorphism), and that the analogy between the formulas of their compounds would be destroyed, if the atomic weight of silver were halved, while that of sodium was left unchanged. Regnault then determined the specific heat of metallic sodium, and showed that the atomic weight of that element should also be halved, in order for it to conform to Dulong and Petit's law. Berzelius' objection thus lost its force, and the atomic weights of both silver and sodium were ultimately halved, by universal consent. The "periodic law," already referred to, cannot be adequately treated in this place (see Periodic Law); but it may be said that when the known elements are arranged in the order of their atomic weights, it is found that certain attributes recur in a remarkable "periodic" manner, as we pass from one end of the array to the other. This fact is of great assistance in the determination of atomic weight because any great error in the assignment of the atomic weight of an element would throw that element among others with which it would have relations entirely out of harmony with analogous relations prevailing in other parts of the array. This "periodic" classification is so powerful and far-reaching that the existence of new and previously unsuspected elements has been predicted by it, and afterward verified (in some cases) by the actual discovery of the elements themselves. The gas "argon" (q.v.) affords an interesting case of the determination of an atomic weight by indirect means. Argon has resisted all attempts to make it combine with other substances, and hence has been impossible, thus far, to analyze any of its compounds. Its density was found, by direct experiment, to be about 20 times as great as that of hydrogen. Now if, as Avogadro's law states, a cubic inch of argon contains just as many molecules as a cubic inch of hydrogen (under the same conditions of temperature and pressure), then it follows that a molecule of argon weighs 20 times as much as a molecule of hydrogen, or 40 times as much as an atom of hydrogen. To find the weight of an atom of argon we therefore merely have to divide 40 by the number of atoms that there are in its molecule. For an explanation of the method by which the number of atoms in the molecule of such a gas is obtained, we must refer to the section on Atomic Theory. Therefore it will suffice, in the present place, to state that it was found that argon is monatomic, its molecule containing but a single atom. Therefore the conclusion was, that the atomic weight of argon is about 40. The "periodic law" was not of any great service in this case, because the properties of the new gas proved to be so unlike those of any previously known substance that its proper place in the general scheme could not be even guessed until its atomic weight had been determined. The subsequent discovery of helium and the other inert gases of the same group showed, however, that the atomic weight already assigned to argon is in reasonably good accordance with the periodic law.

Chemists educated in recent years can hardly conceive the confusion that prevailed 60 years or so ago, while the principles that have been outlined above were struggling for recognition and universal adoption. There was no agreement as to what rules should govern what formulas should be used. Mendeleeff says: "Some took O = 8 and others O = 16. Water in the first case would be HO and hydrogen peroxide HO2, and in the second case (as is now generally accepted) water would be H2O and hydrogen peroxide H2O2 or HO2. Discussion and confusion were reigning. In 1860 the chemists of the whole world met at Karlsruhe for the purpose of arriving at some agreement on the subject. There was great difference of opinion, and a conditional agreement (or compromise) was proposed and defended with the greatest acumen by the ranks of science. A conditional agreement was not arrived at, and sought not to have been; but instead of it, truth, in the form of the law of Avogadro-Gerhardt, received by means of the congress a wider development, and so afterward conquered all minds. Then the so-called Gerhardt atomic weights established themselves, and in the seventies they had already become generally used. As soon as a few of the atomic weights had been determined with some little degree of precision, it became evident that they
came nearer to exact integers than one would naturally expect them to, judging from the theory of probability. As early as 1815, Prout made the assumption (since known as "Prout's hypothesis") that the true values of these atomic weights are really integral numbers; and he drew the inference that all elements are composed of hydrogen. Thus nitrogen, whose atomic weight is almost exactly 14, he believed to contain 14 times as many atoms to the molecule as hydrogen contains, and he believed the fundamental atom to be the same in each case. There is nothing about this assumption which conflicts with what has been said above about nitrogen being a diatomic gas; for all that, nitrogen's law positively shows is that when a molecule of that gas divides, it splits into halve, and therefore contains an even number of atoms. In the absence of any evidence to the contrary we assume it to be simply diatomic, although we must always remember that future research may require us to admit it to be tetrametric, hexatomic, or even more complex. Prout's hypothesis has provoked a great deal of discussion, and since it was first proposed it has been attacked and defended by many distinguished chemists; and although it in neither of the forms it presents, we cannot hardly say that it has been finally laid to rest. One can scarcely glance at a table of atomic weights (such as that here presented) without noting the tendency shown by these atomic weights to approach integral values. Of course, there are numerous exceptions — chlorine, for example — but the fact that many of the atomic weights are nearly integral demands some sort of an explanation. What that explanation may ultimately prove to be no one knows; but it is possible that it will be found in the development of the remarkable "corpuscular hypothesis" of Prof. J. J. Thomson. (See ELECTRON.) The atomic weight of oxygen was long thought to be precisely 16; very careful experiments then indicated that 15.96 is a closer approximation to the real fact; and it has recently been ascertained that 15.88 is a still better approximation. It is a matter of choice what element is taken as having the atomic weight unity, hydrogen having been chosen for this purpose merely because it is the lightest element known. For many purposes it would be convenient if the atomic weight of oxygen were precisely 16; but this value is now known to be incompatible with the assumption that the atomic weight of hydrogen is 1. Chemists have therefore been in the habit, in recent years, of multiplying all the atomic weights, as deduced on the hypothesis that H = 1, by a constant number, so determined as to make the atomic weight of oxygen come precisely 16. It happens that the multiplier required for this purpose is 1.008, which is the atomic weight that must be assigned to hydrogen, if we are to adopt a scale on which the atomic weight of oxygen is to be precisely 16. A majority of the chemists of the world now use this modified scale, on which the atomic weight of hydrogen is taken as 1.008; and the scale so established is known as the "International" scale of atomic weights. The values of the atomic weights on this scale, according to the latest official revision (that of 1917) are given in the accompanying table.

The many questions that suggest themselves, as to the size and physical nature of atoms belonging properly to the domain of physics, and are discussed under BROWNIAN MOVEMENT, ELECTRON, and MOLECULAR THEORY. The day will doubtless come when the physicist and the chemist will find some common ground for the discussion of the nature of atoms and molecules; but at present these two sciences deal with such widely different classes of phenomena that no such common ground can be clearly discerned. The atom and the molecule of the physicist appear to be hardly capable of possessing the appearance that the chemist demands; but this difficulty may one day be overcome. See CHEMISTRY; ELECTRON; MOLECULAR THEORY; GASES, KINETIC THEORY OF; VALENCE; SPECTROSCOPE; PERIODIC LAW.

### ATONEMENT

The Atonement is the caption under which Christian theology introduces the discussion of the application of the merits of the life and death of Christ to the reconciliation of fallen man to his relationship, as well as of the acceptance thereof by the Divinity. It expresses the crowning effect of the incarnation. It is, in this sense, an attempt at an explanation of the coming of the Redeemer. In a general way it means compensation, res-
oration, expiation, satisfaction, ransom. It is a word made up etymologically of at and one, and suggests that two who were divided have become one again. His Saviour accomplished all that was necessary to nullify the effects of sin. The atonement is considered to have repaired the consequences of the primal transgression, all the moral consequences, say some, say most of the authorities. As to the physical outcome of the fall, it is held that no change save that, through it, man has been enabled to bear patiently and meritoriously all the ills of existence and to wrest from what is evil a good that worketh unto satisfaction. The atonement idea is consistent with what it is ordered to avoid conflict with those who think otherwise, may be called Biblical humanity; that is, the race whose chronicle is found in the pages of Scripture. It has no meaning for those who reject the inspiration of Holy Writ or the doctrines of Christianity. With these, if there be any atonement at all, it lies in an evolution, by virtue of which man develops from worse to better and in the "process of the suns" reaches, unaided, to a deliverance and a perfection subject to even the dynamics of Christianity. The subject is a vast one. It has many and far-reaching ramifications which are constantly in contact with every issue of soteriological study. To confine it within the limits of an encyclopedic article necessarily cramps it and scarcely makes for completeness. All that can be done is to present its general features, the basis on which it rests, and some of the opinions which deserve attention in the different stages of development incidental to its growth. The fact upon which the doctrine rests is that narrated in Genesis iii, wherein the prevarication of the first couple is said to draw on them and posterity the curse of the Almighty, which He tempers with the promise of a Redeemer to come. This violation of God's command, while it rendered Adam and Eve criminal and placed them under a ban, was at the same time an insult outraging, as much as anything finite could, the infinite perfections. The sinner was turned from God and consigned man to punishment and left an antagonist against the Creator to be, in some way or other, atoned for. In this plight the whole race was involved and became estranged from God. All humanity was confronted by a God whose infinite justice called for an indemnity of some kind as a reparation for the indignity offered to His perfections, by a penal sentence to be endured, by the loss of innocence, by the unbridling of concupiscence and by a slavery which reached to the death of the prince of the powers of darkness. Immediately is perceived the gaping breach which the atonement had to bridge over. Could the restoration be achieved by man himself and alone, or by entire humanity? The general answer is a negative. It is clear from the attitude into which man was forced by his sin what the questions are which in this discussion call for a reply. The views entertained by theologians are not marked by very harmonious notes. There is a very discordant participation. Like other doctrines, that of the atonement did not come into existence full grown. It was not formulated in the beginning. Hints of its nature are found in the New Testament. By Christians up to the time of the Reformation it was received from individual teachers, by whom, as by the laity, it was instinctively grasped, though its recognition had been short. It traversed the duration of nearly 15 centuries. Whenever, during all that period, it was treated by the fathers and doctors and other writers, there was unanimity on this one point: that the atonement was effected by the incarnate Son of God, and that the Son of Man was complete and answered all the exactions of a just Deity, while it simply deluged man with a sea of spiritual blessings. Their contention, summed up, was that it was in the absolute power of God to perfect the atonement, without sending His Christ. In His wisdom, however, consulting not only the great wrong perpetrated against Him, but the welfare of His creatures, He decreed the incarnation of His divine Son, the second person of the Blessed Trinity, the antithesis of Christianity. He was both God and man, possessing two natures in one person. This person was divine. As all acts are attributable to the personality of the individual, it followed that the acts of the God-man were divine, and so, whether proceeding from the nature of the Father, were infinite in value. It was necessary for an atonement act to have infinity, because sin, though committed by a finite agent, was in a measure infinite, since its malice was directed toward a being infinite in nature. Theologians made the distinction that sin was finite subjectively, but objectively infinite. The divinity of the person made the atonement secure on the side of the Father. Man was doubly-privileged. The Redemption of Christ obtained for him, through grace which had its efficacy in the blood of the Saviour, the remission of sin, and strengthened him against his own weakness, his own passion and the wiles of the enemy from whose thraldom he had been rescued. In a word, the insult to the Father was wiped out; man was restored to the old friendship, was endowed with the means of justification and sanctification and his feet put on a path to the vision of God, in the enjoyment of which sin becomes impossible and happiness is supreme. With very few exceptions, or less completely, was the form the atonement took in the thoughts of the large majority of teachers of the Church for a decade and half of centuries. They labored to hold up the dignity and liberality of the atonement. The Ator was Christ, and He atoned through His sacrifice on the cross in a manner ample beyond all human reckoning. But the atonement was not a thing of Christianity only; its effects reached all of the prince of the powers of darkness. Immediately is perceived the gaping breach which the atonement had to bridge over. Could the restoration be achieved by man himself and alone, or by entire humanity? The general answer is a negative. It is clear from the attitude into which man was forced by his sin what the questions are which in this discussion call for a reply. The views entertained by theologians are not marked by very harmonious notes. There is a very discordant participation. Like other doctrines, that of the atonement did not come into existence full grown. It was not formulated in the beginning. Hints of its nature are found in the New Testament. By Christians
to the merits of Christ, who was to come in the fullness of time and pay the ransom. The concession of the Creator in granting a Redeemer who was to make plenary atonement for every man until the passing away of the race was, before the incarnation, a promissory note—by the God, by grace in the present and by glory in the future. Others, ministerially or otherwise, may co-operate in uniting God and man, but Christ is the chief and first and literally the only mediator (Billiot).

The doctrine of the incarnation in its entirety illumines this subject, but of it and of other cognate subjects, such as justification and original sin, notice cannot be taken here. The atonement, as such, has not been treated specifically by early writers, and it would be difficult to put one's finger on any dogmatic decree in which it is definitely formulated. Just as from definitions here and there spread over the volume of authoritative teaching the nature of the atonement is elicted, so from the utterances of ecclesiastical writers one is able to reach a conclusion offered by the confirmation of tradition. The view still claiming attention bases itself on Scripture. Texts therefrom are not necessary for the present writing; they embrace the prophetic language of the Old and the literal language of the New Testament. The Apostolic Fathers, from Clement to Polycarp, are satisfied with stating the fundamental idea that *Christ died for us* and for our sakes. Irenaeus and Origen insist that a price had to be paid to Satan because Satan had gained a rightful might of possession of men, for which the only equivalent was the blood of Jesus. This view was never universal, but now and again it is brought forward, even up to the time of Peter Lombard. The Fathers and writers from Origen to Anselm wrote more systematically on nearly every topic, but were unanimous in maintaining that the death of Christ was the sacrifice unique and par excellence and amply satisfactory. Some do, others do not, endeavor to explain whether and why this sacrifice was imperative by the necessity of atonement. The work of mediation was summed up but not exhausted in the dying. He was a priest and a sacrifice from the beginning, and is and always will be. The imitability of Christ's career was not confined to the death on the cross, but as well to the whole existence* (Newman).

Occasionally a peculiar view would startle the world, but without changing the generally accepted opinion. Anselm (1033) in his 'Cur Deus homo' vigorously opposes the view of Origen and others concerning the so-called bare or gratuitous ransom, by which the heavenly Father purchased back the souls of men from the grasp of Satan. Then came the age of the Schoolmen. It has been the custom to look upon these men as triflers and hair splitters, but what Huxley says of Saint Thomas is, with much truth applicable to many of these very imperfectly known and much abused investigators: *His marvelous grasp and subtlety of intellect seem to me to be almost without a parallel* (Science and Morals). They all united
in declaring that Christ by His sacrifice was the Atoner. They differ in their explanation of some points connected with the incarnation which are irrelevant here. They are broad and mature, with eternal Christ not only free from us, says Aquinas, but won for us grace and glory, and it was fitting that by death He should overcome the power of death, but His death need not have been a violent one. Over the question whether the incarnation was an absolute necessity or only something congruous, they run through every note of the gamut of argument. Duns Scotus is one of the principal figures in the discussion. Among other views he maintains that a mere man conceived without sin, or a good angel, could have made satisfaction for the entire race had it pleased God to accept it. Express treatises on the atonement cannot be found. It is always treated as an adjunct of the incarnation. There have been many pious and devotional essays on this topic. Since the days of the scholastics all Catholic analysis of the atonement can be traced back to them or to the Fathers and doctors. The Reform opens with the 15th century of modern times, and those later, who have had an indelible imprint upon their followers will receive attention. Arians, and those who reject the divinity of Christ directly or by implication, fall outside this inquiry.

An insistent tenet of the Reformers is, that Christ reconciled God to us, whereas the Tridentine Council teaches that He reconciled us to God. The Divinity by the very force of the divine perfections, Catholics hold, remained in itself unchanged. The fall affected man, that is, man by his transgression placed himself voluntarily under the ban of infinite justice and willingly subjected himself to all the consequences of his disobedience. Man alone changed. God's attitude was always the same. In one of his bulls Leo X (1520) condemned 4 propositions of Luther, some of which in one way or another refer to the doctrine of the atonement. In the sixth session of the Council of Trent the decrees on justification, on the advent of Christ, etc., (Dec. Concil. Trid.) set forth a basis for views on the Atonement which are in opposition to those of Luther, and others. Luther denies the supernatural character of man's original sanctity. God, according to Luther, planted in the very essence of human nature the capabilities and the acts of virtue. Hence no freedom of will. Sin is of the essence of man. Man is wholly evil. Calvin asserts that everything coming from man's corrupt nature is damnable and so can in no way co-operate in the atonement. It must all occur outside of himself. He contributes nothing. He is justified; he is reconciled to God by God's reconciling himself to him through faith in the merits of Christ, whose obedience becomes man's obedience and whose righteousness becomes man's justification. In this way the Creator remits sin, reputes man just and rewards him with eternal life. Christ made satisfaction for sinners in two ways: by fulfilling the law in their place and by enduring the curse and penalty of the law. Everything in the atonement becomes vicarious. Another person is substituted for the debtor and the criminal. These doctrines are gathered from the Epistles of St. Paul. Only the bare statement has been here presented of the doctrine of the Reformers. A review of the reasons advanced to sustain this teaching would repay the student. Those who came after Luther and Calvin and Methodian modified the former or greater degree the teaching and modified the idea of the atonement as atonement and demanded at least some co-operation, on the part of the sinner. Imputation soon became the great battleground of controversy. Investigation will reveal that in the Protestant churches there has been a recoil from the positive utterances of the Reformers. The disparity existing between the above and what can be gleaned from the early and modern history of the Catholic Church is undoubtedly marked. So much that Pusey in his introductory essay to 'Essays on the Reunion of Christendom' observes: «The Lutheran and the Catholic belief are as like two different religions as any can be, wherein the belief as to the adorable Trinity and the incarnation is the same. The whole doctrine of the application of the merits of Christ to fallen man and the condition of man in consequence of the fall is radically different.» In fact, the difference is so radical that there is no possibility of understanding one with the other. All Protestant theology from the rise of that religion is a literature which is within the reach of any one to consult, and further quotations or references are unnecessary. «Just as the justice of man binds the judge to punish the criminal, so is some penalty inflicted on man by virtue of the same attribute, which, of course, is more perfect in the divinity. It is not the spirit of vengeance which animates God. In spite of the transgression God's love remains as it was in the beginning, without diminution or alteration of any kind. The Son of man died for all men sufficiently, for the elect efficiently. Satisfaction is required of man. But that satisfaction is amply made by man by believing, who thus becomes one with the Redeemer and shares with Him in the redemption He wrought as the Head of the Redeemed. This is enough to excite love and repentance and the striving after holiness.»

Everything quoted above, though taken from different writers, expresses the view of the Atonement, as held by Protestant exponents.

In later years, both in Germany and elsewhere, the theology of the Catholic Church, while apparently concordant with the opinion of necessity, man's co-operation, harks back, consciously or unconsciously, to the belief of Luther and his immediate disciples that Christ atoned fully, and so fully that the sinner need only by some interior act appropriate to himself the work already done by the Saviour. Where the Church of God is such that man must of himself do something positive, in so much is that insistence at variance with the thought that in the beginning of the Reformation was spread broadcast among the adherents of the New Religion. Might there not be a distinction between atonement and salvation? The atonement would mean that Christ had done all that was necessary to reconcile man with God, but there could be no salvation unless man turned to God through the path of the atonement, and by individual repentance and satisfaction so comported himself as to bring by voluntary acts his life into entire harmony.
with the will of his Creator. No solution of the evidently complicated nature of the atonement will compel conviction which does not answer adequately the following questions: What is the relation of the atonement to God? What was His acceptance of the sacrifice? How far did that sacrifice in itself go toward bringing God and man together? Was it alone enough to liberate man so absolutely that after the death of the victim no more was expected of him? How was the outraged excellence of the Godhead—His justice, His mercy, His love—compensated for the injury done them by sin? Did that injury really affect the divine nature? It may be advanced here that in every theory which pos sesses any serious claim to assent the Supreme Being remained unimpaired in the beauty of His perfection, and it was due to the infinite justice of God to demand a conguous if not a condign reparation. What part does Satan play in the plan of redemption? Has some responsibility been incurred? Is it and will it always be an impenetrable mystery? It is a matter so significant for Christians that they have the right to expect from some form of Christianity a clear exposition based on Scripture and authoritative teaching. For Christians it means reasoning which certainty is security and doubt a calamity.

Thus much for Christianity, which emphasizes the necessity of an atonement. All Christians admit Christ as the fountain head of all reconciliation of man with God. But the world is far from being entirely or even largely Christian. In the world to-day there are about 1,500,000,000 human souls, of which number only a little over 400,000,000 have received the religion of Christ. Half of these, it is computed, are Protestants or Catholics of some kind or other, but divided from the See of Rome. The rest of the race is either Jewish or Mohammedan or belongs to some Oriental form of worship or is out and out heathen. Will Christianity assume the responsibility of stating that beyond its pale the atonement does not reach and that therefore for the pagan there is hope neither here nor hereafter? Some mention has already been made of the Jews and their manner of atonement. Their views have crystallized into the shape which their orthodox members adopt to-day and which they base upon certain books of the Old Testament, upon their Talmud and their Targum. It differs in no way materially from the teachings of Moses and the Law and the Prophets. They lived in the past as they are living now in the house of a great Deliverer to whom every act of worship bore and bears reference. In some way or other these typical ceremonies, it is said, influenced Jehovah to make them the promise: "I will be merciful to their iniquities, and their sins I will remember no more" (Exodus viii, 12). The space of this article is inadequate to include even the most summary account of the atonement idea as it was understood by the nations outside of the chosen people. Research has made it admissible that everywhere there have been religious beliefs, practices pointing to the acknowledgment of a Supreme Being and judgment to come and a reward or punishment in a life beyond this. With this are apparently connected sacrifices which no matter how accompanied by fanaticism and superstition are an attestation of a homage paid to a deity, a homage of praise, or petition, or thanksgiving or sacrifice, offered in supplication, and which was inspired by an underlying sentiment of the need of appeasing some offended divinity. Yet it is not easy to trace this need in those religions which are so widespread in the Levant and farthest East and proclaim as fundamental Patahism, Monotheism, Polytheism, and Pantheism. The investigation of the subject of atonement as advanced by the followers of Christ, by those followers who profess that Jesus was the Son of God, that is to say, Divine, among other questions inevitably the question of the possibility of salvation for all individuals of the race whose creed negatives Christianity altogether. Some reply, adequate or otherwise, may be found in the dogma that "Christ died for all men," whence the inference is deductible that even those who never heard of the Redeemer, or the atonement, cannot but be affected by that death. How? is a large thesis. That the problem has been approached by honest and able thinkers is plain to the readers of history. In the Christian Church, a small number who deny the primal fall and hence see nothing urgent in the discussion of the atonement. The Messiah has not yet reached this earth say the Jews, Christ was not God, say the Arians, there is no God, say the Atheists, if there be He is unknowable, say the Agnostics. For all these the atonement has very slight, if any, significance. Teachers of advanced the theory, basing it on Scripture, that the first tradition of a redeemer to come and who was to atone was carried by the earlier peoples as they grew and scattered and populated the earth. The Jewish idea brought by the Israelites in their wanderings and captivities, and assimilated by the tribes and nations among whom they dwelt, was in the lapse of time weakened or metamorphosed, or adapted to pagan beliefs and so corrupted. "The only theory which accounts for all these facts," says Rawinson, "is that of a primeval revelation variously corrupted through the manifold and multiformal deterioration of human nature, in different races and places."

Patrick A. Halpin, Professor of Metaphysics and Ethics, New Rochelle College.
ATOSSA, the daughter of Cyrus, 530 B.C. She was successively married to Cambyses, Smerdis, one of the Magi, and Darius, son of Hydaspes, the last of whom she incited to invade Greece. It is given in one account that she was killed by her son, Xerxes. The word served as a poetical name given by Pope, in his 'Moral Essays,' to Sarah, Duchess of Marlborough.

ATRATÔ, a-trâ-tô, river of Colombia, of note, because it has repeatedly been made to bear a part in schemes for a ship-channel across the Isthmus of Panama. Rising on the western Cordillera at an altitude of 10,560 feet above sea-level, it runs 305 miles north-west through low, swampy country and falls by several mouths, interrupted by bars, into the Gulf of Darien. It is navigable by steamers for fully 250 miles, being 750 to 1,000 feet wide, and 8 to 70 feet deep. A route, surveyed by the United States government in 1871, proposed to connect the Atrato and the San Juan, flowing into the Pacific, by a canal 48 miles long. At the Paris International Congress (1900) that route was, with various others, discussed and rejected in favor of De Lesseps' line from Limon to Panama. Gold-dust is found in and about the Atrato.

ATRAULI, town of India, in the north-west provinces. It is clean, well built and has a good trade.

ATREBATES, a-trēbā-tēz, or a-tre'bā-tēz, the ancient inhabitants of that part of Gallia Belgica afterward called Atriós. A colony of them settled in Britain, in a part of Berkshire and Wiltshire.

ATREK, a-trēk', river of Asia, forming the boundary between Persia and the Russian Transcaspian territory, and flowing into the Caspian. It takes its rise in the northeastern part of the country, in the neighborhood of Khi, and terminating in the Sea of Caspian, which attains an elevation of 9,700 feet. The general course of the stream is westward. Its length is over 300 miles.

ATREUS, a-troos, in Greek legend, the son of Pelops and Hippodamia. He and his brother, Thyestes, murdered their half-brother, Chrysippus, from jealousy of the affection shown to him by their father. Thereupon they fled to Euystheus, with whose daughter, Aérope, Atreus united himself, and after the death of his father-in-law became King of Mycènae. Thyestes had two sons by the wife of his brother, and was banished by Atreus. Thrusting for revenge, Thyestes conveyed away secretly a son of his brother, and instigated him to murder his own father. This design was discovered, and the youth, whom Atreus thought to be the son of his brother, was put to death. Too late did the unhappy father perceive his mistake. A terrible revenge was necessary to give him consolation. He pretended to be reconciled to Thyestes, and invited him with his two sons to a feast, and after he had caused the latter to be secretly slain he placed a dish made of the flesh of his guests. When the father had finished eating Atreus brought the bones of his sons and showed him the dreadful revenge which he had taken. Atreus (or his son Pleisthenes) was the father of Agamemnon and Menelaus, who are hence called the Atridiæ, Atridës (the singular) being often distinctively applied to Agamemnon.

ATREUS, Treasury of, a subterranean building at Mycenæ, so styled by Pausanias and frequently referred to as "the tomb of Agamemnon." It is a vaulted tomb resembling a bee-hive in construction, its arch being composed of projecting horizontal courses of stone narrowing as the top is approached. It contains a circular chamber 50 feet wide with a smaller square one adjoining.

ATRI, a-trî, Italy, the ancient Adria; a town of the province of Teramo, 14 miles southeast of the city of Teramo, on the Brindisi Railroad. There are some ruins of ancient walls and buildings. The cathedral is interesting for its frescoes, and a 15th-century painting of the Madonna worshipping the child. It manufactures silk, soap and licorice. Pop. 14,043.

ATRIPLEX, a genus of herbs or shrubs of the family Chenopodiaceæ, consisting of about 250 species, widely distributed in temperate and tropical regions, usually along sea-coasts or in alkaline soil. Not less than 100 species occur in the United States. The northernmost shrubs are in the western part, where some of them, especially the shrubby species (generally known as salt-bush, shad-sacle, or incorrectly as sage-brush), are often very abundant, forming the most conspicuous feature of the vegetation. They are important as being valuable for forage for stock, particularly sheep. Attempts have been made to grow some of these species, especially Australian ones, for forage in the southwestern United States, but without much success. A. hortensis, orach, is sometimes cultivated for its leaves which are used like spinach.

ATRIO, the entrance hall and most important apartment in ancient Roman houses. It was usually ornamented with statues and various family relics and in the roof there was an opening called the compluvium, toward which the roof sloped so as to throw the rain-water into a cistern in the floor known as the impluvium. In this room the nuptial couch was placed, and here the matron with the women of the household sat and spun. It was also used as a reception room for visitors and clients. As the Roman house became more sumptuous several small rooms were added around the atrium. Its form also changed. First came the atrium testudinatum with solid roof, followed by the Tuscan type which long remained popular. Its roof sloped inward as stated above. Later columns were added to support the roof and in the Augustan period a real colonnade was added. During the empire the atria were profusely decorated with frescoes and sculptures. Several well-preserved types are to be seen at Pompeii. In mediæval times, till the 12th century, the name was given to a covered court, somewhat on the model of the ancient atrium, constructed in front of the principal doors of an edifice. Later the cloister at the side of the church, for the use of the monks, took the place of the atrium.

ATROPA, a genus of plants of the natural order Solanaceæ. Its best known species is probably A. belladonna. See Belladonna.

ATROPATENNE, Persia, a province of the ancient kingdom of Armenia, of which it formed a part from 140 B.C. to 429 A.D. It is
ATTACHÉ, a 'ta'shā', a military, naval or subordinate member of the diplomatic service attached to an embassy or legation. Modern usage in effect restricts the term to subordinate officers of an embassy or legation. Military and naval attachés are officers of those services accompanying their country's minister, detailed especially to observe movements of force on the part of the military or naval administration of their own country.

ATTACHMENT, in law, a taking of a person, goods or estate by virtue of a writ or precept. It is distinguished from an arrest by proceeding out of a higher court by precept or writ, whereas the latter proceeds out of an inferior court by precept only. An arrest lies only against the body of a person, whereas an attachment lies against the goods only, and sometimes against the body and goods. It differs from a distress in that an attachment does not extend to lands, while a distress cannot touch the body. In the United States attachment may be defined as the taking into the custody of the law the person or property of the defendant, or with whom it is falsely represented that the defendant resides, or who is supposed to be in his custody or power, or against whom it is sought to bring before the court; also a writ for this purpose. To some extent it is of the nature of a criminal process. In some States a plaintiff can at the beginning of an action to recover money on the property of the defendant as a security for the payment of the judgment expected to be recovered; and in case of recovery the property is applied in satisfaction of the judgment. But the more usual rule is that there can be no sequestration of property, and until the rights of the parties have been settled by judgment of the court. The exceptions are chiefly in cases where the defendant is a non-resident or a fraudulent debtor, or is attempting to conceal or remove his property. In some States, attachments are distinguished as foreign and domestic—the former issued against a non-resident having property within the jurisdiction of the State, the latter against a resident in the State; jurisdiction over the person or property of necessity for an attachment. An attachment issued under a State law not adopted by Congress, or by a rule of court, cannot be sustained in a United States court. Consult Drake, 'Treatise on the Law of Suits by Attachment in the United States' (Boston 1891). Consult also works referred to under EXECUTION.

ATTACK, a term denoting the opening act of hostility by a force seeking to dislodge an enemy from its position. It is considered more advantageous to offer than to await an attack, even in a defensive war. The various forms of attack are: (1) The parallel; (2) The form in which both the wings attack and the centre is kept back; (3) The form in which the centre is pushed forward and the wings kept back; (4) The famous oblique mode, dating at least from Ermantius, and employed by Frederick the Great, where one wing advances to engage, while the other is kept back, and occupies the attention of the enemy by pretending an attack. Napoleon preferred to mass heavy columns against an enemy's centre. The form of attack was varied to suit the situation. Upon meeting the enemy's line it became a question of changed with the weapons used. In the days of the pike, heavy masses were the rule, but the use of the musket led to an extended battle

now a province of Persia, known as Azerbaijan, or Adarabian, the provincial city being Tabriz. The name was derived from one of the governors of Alexander the Great, who governed the district in 326 B.C. The second largest city in the province, Urumiah, on the shores of a lake of the same name, figured largely in recent history.

ATROPHY, a term denoting a diminution in the size of the organs, or tissues that make up the body. It is part of the physiological process in its simpler forms, as many parts of the body atrophy and become of secondary service in adult life; the thymus gland and umbilical vessels being examples. It may also be a symptom of disease, particularly in affections of the nervous system in which the trophic fibres of an organ are involved. It may also indicate a perverted state of nutrition. See NUTRITION.

ATROPINE, a crystalline alkaloid obtained from the deadly nightshade. Its chemical formula is C_{22}H_{31}NO_{5}. The plant contains atropine, which is extracted by shaking the alkaline liquid with chloroform. The layer of chloroform is evaporated, leaving a residue which is extracted by means of dilute sulphuric acid and precipitating with potassium carbonate. The alkaloid is recrystallized from alcohol. Atropine itself is insoluble in water, but its sulphate is readily soluble. It is extremely poisonous. Large doses cause delirium, convulsions, and finally stupor and death. It is employed for several purposes in medicine, to relieve pain or spasm, and to arrest excessive sweats. The physiologic action of atropine is chiefly exerted on the nervous system. It is a strong stimulant, particularly of the motor and respiratory centres, and paralyses the end filaments of many nerves, particularly those that supply the secretory glands, the involuntary muscles and the heart. Its chief poisonous symptoms are dryness of the mouth and pharynx, with anesthesia, a hot dry skin, dilatation of the pupil with blurred vision, due to paralysis, extreme restlessness, due to the motor excitation, a noisy, busy and incoherent brain action, perhaps a delirium, quickened pulse, quickened respiration. This stage may pass into one of depression in which the patient becomes comatose, the pulse and respiration become slowed and death results from asphyxia. Treatment of the poisoning should include prompt washing of the stomach, emetics being of no service because of the anesthesis, artificial respiration, infusions of hot coffee, and general supportive measures. See BELLADONNA; SOLANACEÆ.

ATROPOS, at'rō-pōs, the eldest of the Fates, who cuts the thread of human life with her shears. In art she is often represented with a cutting instrument, a sundial or a pair of scales.

ATSUTA, a'tsō-tō, Japan, a town in the southern part of Honshū, practically a suburb of Nagoya, with a population of 10,000, and a railroad. It contains a number of Shintose temples, in one of which the sword forming part of the Japanese imperial regalia, is kept. Pop. 24,491.
ATTAINDER — ATTAR

front to give effect to the fire. The advent of machine guns, trench-throwing and rapid-fire guns, breech-loading field and horse artillery guns, smokeless powder, etc., has reduced the methods of attack to a practical science. See TACTICS.

ATTAINDER, the legal consequence of a sentence of death or outlawry pronounced against a person for treason or felony, the person being said to be attainted. It resulted in forfeiture of estate and corruption of blood, rendering the party incapable of inheriting property or transmitting it to heirs; but the results now no longer follow. Formerly persons were often subjected to attainted by a special bill or act passed in Parliament. In the United States, the Federal Constitution declares that "No bill of attainder shall be passed, and no attainer of treason, in consequence of a judicial sentence, shall, in consequence of a judicial sentence, work corruption of blood or forfeiture except during the life of the person attainted." Similar provisions have been inserted in the Constitutions of several States, while in others all forms of property have been abolished. Consult Blackstone, 'Commentaries'; and Stephen, 'New Commentaries on the Laws of England' (London 1903).

ATTAIN, a writ at common law against a jury for a false verdict. It was a proceeding of the nature of an appeal from a judgment entered upon the verdict of a jury. When such a writ was issued a special jury of 24 persons was summoned to pass upon the verdict of the first jury. It was abolished in England in 1826 except as to jurors guilty of embezzlement. See ATTAINDEE.

ATTALEA, a genus of about 20 species of mostly tall, smooth-stemmed tropical American palms with large pinnate leaves sometimes used for thatch, mats, hats, etc., and with nut fruits enclosed in a fibrous husk. *A. funifera*, the palo santo palm of the coast provinces of southern Brazil, yields a cordage of great strength and durability in sea water. Its fruits (coquilla nuts) are as large as ostrich eggs and are used like vegetable ivory (see VEG- ETABLE). The picture palm of northern Brazil is a different species. It furnishes a fibre which is exported. *A. excelsa* and *A. speciosa* furnish nuts which are burned in rubber-making to dry and color the rubber obtained from *Siphonia elastica*. *A. compta*, the pindóva or indájá palm, a handsome species with a wide-spreading crown, yields edible fruits as large as goose eggs. *A. cohune*, indigenous to Honduras, supplies a fruit from which the oil is extracted for soap-making at home and abroad. Several species are cultivated in greenhouses, but are generally considered too slow of growth from seed to be satisfactory.

ATTALIA, the ancient name of the modern Adail, a city on the south coast of Asia Minor, above the head of the Gulf of Adalia. Attalus II of Pergamum founded it in the 2d century B.C. During the height of Roman colonial expansion it was an important seaport, being on the main highway between the northwestern provinces of Asia Minor and the south coast. Reference is made to it in the Bible; it was from this port that Paul sailed to Antioch in Syria after his first missionary journey (Acts xiv, 25).

ATTALUS, the uncle of Cleopatra, wife of Philip II of Macedon. He served as general in Philip's armies. He opposed Alexander after Philip's death and was put to death by order of the former.

ATTALUS, Flavius Priscus, prefect of Rome under Honorius and Emperor of the East for one year, 409-10. He was proclaimed by Alaric and his Goths who set up Attalus at Ravenna. The latter ordered Honorius to leave the throne, retire, and cut off his feet. Alaric soon failed to support Attalus and he was deposed. He was again put forward as Emperor by Ataulphus in 414, but was taken prisoner by Honorius. Honorius cut off his thumb and forefinger and banished him to the island of Lipari.

ATTAR, â†-târ, Ferid Eddin, celebrated Persian poet; b. near Nishapur 1119; d. about 1229 (?). The son of a spacer, he followed his father's trade (whence his surname of At- târ), but afterward became a dervish and one of the greatest mystics of Persia. He is said to have been killed by a Mongol soldier during the invasion by Jenghiz Khan. Of his extant political works the most famous are *The Book of Council,* a series of didactic poems on ethics; 'The Parliament of Birds' (1184-87). His principal work in prose is *Biographies of the Saints.*

ATTAR, or OTTO, OF ROSES, a perfume extracted from rose petals. It is a volatile oil, of soft consistency, nearly colorless, and deposits a crystallizable substance partially soluble in alcohol. The best article is prepared at Ghaziipoor in Hindustan; but is apt to be much adulterated with sandalwood and other oils. The whole country, for many miles around Ghaziipoor, is a garden of roses, and in the spring of the year presents a most beautiful picture of red and green. The roses are used both for rose water and the oil of roses. The latter is obtained from the rose water by setting it out during the night in large open vessels, and early in the morning skimming off the essential oil, which floats at the top. The rose water after the removal of the oil is not so highly valued as before. Attar is also imported from Bulgaria, Persia, Syria and Turkey. In these countries the attar is obtained by distilling the rose petals with about twice their weight of water, the distillate being then exposed in open vessels to the cool night air and skimmed off with a feather in the morning. By weight, one part oil is obtained from 3,300 parts of rose petals. About 20,000 acres are devoted to rose culture in Bulgaria, the annual harvest yielding about 45,000,000 pounds of roses or 8,000,000,000 roses. A one-acre garden under favorable conditions produces 2,000 to 2,500 pounds of roses, from which 10 to 15 ounces of attar of roses may be distilled. Generally 180 to 200 pounds of roses will produce 1 ounce of attar, there being about 200 roses to the pound. The average price, prior to the war, was $12 per ounce. Attar of roses is commonly adulterated with spermaceti and a volatile oil, which appears to be derived from one or more species of *Andropogon,* and which
ATTAVANTE—ATTERBURY

is called oil of ginger-grass, or oil of geranium. Pure attar of rose, carefully distilled, is at first colorless, but speedily becomes yellowish. It congeals below 80° C. At 94° C. 1,000 alcohol melts in 7½ oz. of oil, and at 98° C. 33 oz. Specific gravity 0.872. Formula, C₉H₈O₅. Many attempts have been made to discover some chemical reaction which would reveal the falsification of attar with geranium oil, but hitherto mostly in vain. It is much used for manufacturing hair oil, lavender water and other perfumes. Solid oil of roses (rose camphor, stearoptene of oil of roses) has no odor, is insoluble in alcohol, but soluble in ether. Carbon and hydrogen are its constituents. The liquid oil of roses (rhodine, cleoptene of oil of roses) is very fragrant and is composed of carbon, hydrogen and oxygen. See Perfumery.

ATTAVANTE, âttâ-vân'ta, Marco, an Italian painter: b. Florence 1452; d. about 1508 or later. He was especially famous for his illuminations, in which class of art he is considered to have been the best of his period. He was also a miniaturist of the highest rank. Among his patrons were most of the great nobles and potentates of the time, including Matthias Corvinus, King of Hungary, the Medici, the Duke Federigo di Urbino and the Dom of Florence. Much of his work, especially his illuminations, is still preserved in the collections of Europe. The best of which is in the manuscripts of Marcianus Capella (Marcus collection in Venice), in a Bible in the Vatican Library and in a Bible of seven volumes in the Belem Monastery in Portugal. Consult article Attavante in Bradley's Dictionary of Miniaturists (London 1887) and Meyer and Thiemes, 'Allegemeine Lexicon der bildenten Künstler' (Vol. II, Leipzig 1908).

ATTEMPT, in criminal law an endeavor to accomplish a crime carried beyond mere preparation of the means or preparation of the execution of the ultimate design in any part of it. 5 Cush. Mass. 367. To constitute an attempt, there must be an intent to commit some act which would be indictable, if done, either from its nature, or from that of its natural and probable consequences. In some States an attempt to commit a crime is defined by statute. The statute in New York is substantially similar to that of other States. The Penal Code of New York, § 34, provides that 'An act, done with intent to commit a crime, and tending but failing to effect its commission, is an attempt to commit that crime.' See Criminal Law, and consult works there referred to.

ATTENTION, a familiar mental state, variously defined as The act of holding a present idea in mind, the power of concentration in the mind, the unity of consciousness, as respects intensity, content and clearness (Ladd). Titchener emphasizes the part played in attention by the clearness of the presented object. This clearness is dependent on the duration, intensity, extension, quality, temporal relations, movement, nobility, and familiarity of the stimulus, on the accommodation of the organs of sense for its reception, and in certain cases on the sudden removal of a stimulus to which we have grown accustomed. Titchener interprets clearness as an independent attribute of sensation. While it is universally recognized that attention admits of degrees, and that at the same time as we focus our attention on certain things other things are in what may be termed our peripheral consciousness, there is a conserved faculty of opinion as to the precise nature of the relation between the centre of consciousness and its periphery. For a detailed discussion of the laws of attention, consult Titchener, 'Lectures on the Elementary Psychology of Feeling and Attention' (New York 1908). See Consciousness.

ATTERBOM, âttér-bôm, Peter Daniel Amadeus, Swedish poet: b. Asbo, East Gothland, 19 Jan. 1790; d. Upsala, 21 July 1855. Having visited Germany and Italy in 1817-19 he formed ties of friendship with Schellin and Thorwaldsen; became instructor to Crown Prince Oscar, in 1820, and professor at the university in Upsala in 1828. He was unquestionably the foremost among the lyric poets of the romantic school in Sweden. His most celebrated work is 'The Isle of Bulles' (1823), a romantic drama in the manner of Tieck; but he also wrote 'The Flowers,' a cycle of lyrics; 'The Blue Bird,' a play; and 'Swedish Seers and Poets,' a volume of criticism. His 'Collectors of Poems' appeared in 1854-63 and his 'Works' in 1870. Atterbom early came under German influence and founded the Aurora League which helped to liberate Swedish literature from French academic tradition.

ATTERBURY, Francis, English prelate: b. Middleton Keynes, England, 6 March 1662; d. Paris, 15 Feb. 1732. He distinguished himself at the university as a classical scholar, and gave proofs of an elegant taste for poetry. In 1687 he took his degree of M.A.; is thought to have assisted his pupil, Pope, in his famous controversy with Bentley on the Epistles of Phalaris. Taking orders in 1691 he settled in London, where he became chaplain to William and Mary, preacher of Bridewell, and lecturer of Saint Bride's, and soon became distinguished by the spirit and elegance of his compositions, but not without incurring opposition, on the score of their tendency and doctrine, from Hoadly and others. Soon after the accession of Queen Anne he was made dean of Carlisle, and besides his dispute with Hoadly on the subject of passive obedience, he aided in the defense of the famous Sacheverell, and wrote 'A Representation of the Present State of Religion,' deemed too violent to be presented to the Queen, although privately circulated. In 1712 he was made dean of Christ Church, and in 1713 bishop of Rochester and dean of Westminster. The death of the Queen, in 1714, put an end to his hopes of further advancement; for the new king treated him with great coldness. Atterbury's position was the loyal declaration of the bishops in the rebellion of 1715, but suspended a clergyman for lending his church for the performance of divine service to the Dutch troops brought over to act against the rebels. Not content with a constitutional opposition, he entered into a correspondence with the Pretender's party, was
apprehended in August 1722, and committed to the Tower; and in the March following a bill was brought in at the instance of Commons for the infliction of pains and penalties. This measure met with considerable opposition in the House of Lords, and was resisted by the bishop, who maintained his innocence with his usual acuteness and dexterity. His guilt, however, has been tolerably well proved by documents since published. He was deprived of his dignities, and outlawed, and went to Paris, where he chiefly occupied himself in study, and in correspondence with men of letters. But even here, in 1725, he was actively engaged in fomenting discontent in the Highlands of Scotland. As a composer of sermons he still retains a great portion of his original reputation. His letters, also, are extremely easy and elegant; but, as a critic and a controversialist, he is deemed rather dexterous and popular than accurate and profound. Consult the ‘Life’ by Beeching (London 1909) and ‘Memoirs and Correspondence,’ edited by F. Williams (ib. 1809).

ATTERBURY, William Wallace, American railroad official: b. New Albany, Ind., 31 Jan. 1839. He began his railroad career as an apprentice in the shops of the Pennsylvania Railroad, after graduating from Yale University, in 1860. By 1890 he had risen to be general superintendent of motor power on the Pennsylvania lines east of Pittsburgh and Erie. In 1903 he became vice-president of the Pennsylvania Railroad corporation and transportation manager. Since 1911 he has been 4th vice-president.

ATTERIDGE, Andrew Hilliard, English journalist and author: b. Liverpool, England. He was educated at London University, Stonhurh College and Louvain University. He became assistant editor of the Month, London, qualified as a specialist in military and naval subjects. He did special work in introducing cyclist infantry in the army and was a member of the staff of General Maurice in the first great cyclist manoeuvres held in England. He was correspondent of the London Daily Chronicle at the manoeuvres of the French, German and British armies; was war correspondent in the Dongola campaign of 1896, receiving a medal and clasp for the battle of Firket. He was military editor during the South African War and thereafter, was for three years associated with an engineering firm, designing and building the experimental submarine Volta and carrying out experimental trials on the east coast of England. He has published ‘Towards Khartoum’ (1897); ‘A Popular History of the Boer War’ (1901); ‘Napoleon’s Brothers’ (1909); ‘Modern Battles from Alma to Mukden’ (1910); ‘The First Phase of the Great War’ (1914); ‘The British Army of Today’ (1915); ‘The German Army in War’ (1915); ‘The Second Phase of the Great War’ (1915); ‘The World-Wide War’ (1915). He is a contributor to various periodicals and to the Catholic Encyclopedia.

ATTERSEE, or KAMMERSSEE, Austria’s largest lake in upper Austria. It is about 11 miles in length and its greatest width being 1.525 feet. The shores are rough and mountainous and extremely picturesque. Near the south end of the lake are the summer resorts of Urfahr and the market town of Sankt Jakob an der Krems, above which rises an ancient ruined castle on the north shore.

ATTEN, the verification of an instrument, as a will, by the signature of a person or persons to a memorandum stating that it was executed in his or their presence. The purpose of the attestation is to furnish a record of the names of disinterested persons who were present at the execution of the document in order that they may later, if necessary, appear as competent witnesses to testify as to the attesting circumstances. In many States two attesting witnesses are required to will devising land, but in some States three are necessary. At common law deeds do not require attestation, but this has been modified largely by statute. See WILL.

ATTFIELD, John, English chemist: b. Hertfordshire 1835; d. 1911. From 1862 to 1896 he was professor of practical chemistry to the Pharmaceutical Society. He was one of the originators of the British Pharmaceutical Conferences. He is the author of Chemistry—General, Medical and Pharmaceutical’ (19th ed. 1906); ‘Water and Water Supplies’ (three editions).

ATTIC, pertaining to Attica or to Athens. Elegant; classical; poignant; characterized by keen intellect, delicate wit, sound judgment and expressive brevity; as, the Attic Muse. Attic dialect was the most refined and polished of all the dialects of ancient Greece; and in it wrote Solon, the lawgiver; Thucydides and Xenophon, the historians; Aristophanes, the comic poet; Plato and Aristotle, the philosophers, and Demosthenes, the orator. When, after the Macedonian conquest, Greek became the language of literature and diplomacy in most parts of the civilized world, the Attic came to be that dialect of the Greek tongue which was generally adopted.

ATTIC MUSE, The, a title which has sometimes been applied to Xenophon because of the flowery style which is sometimes characteristic of his writing.

ATTIC ORDER, in architecture, a low order, commonly used over a principal order, never with columns, but usually with antae or small pilasters. It is employed to decorate the facade of a story of little height, terminating the upper part of a building; and it doubtless derives its name from its resemblance in proportioned height and concealed roof to some of the buildings of Greece. In all the best examples, and especially in the remains of antiquity at Rome, the attic is decorated with a molded base and cornice; often with pilasters and figures, as in the Arch of Constantine. In modern architecture, the proportions of the Attic order have never been subject to fixed rules, and their good effect is entirely dependent on the taste and feeling of the architect. Attic base: The base of a column, consisting of an upper and lower torus, a scotia and fillets between them. Attic story: A term frequently used to mean the area of a house, when the ceiling is square with the sides, to distinguish it from a garret.
ATTIC SALT, a term which is sometimes applied to the style of a piece of writing, to define a certain vigor, or keenness, which was supposed to be characteristic of Athenian, as a contrast to the AetumItalicum, or heavier style of the Romans.

ATTICA, a state of ancient Greece, whose capital, Athens, was once the first city in the world. It is a peninsula, united, toward the north, with Beozia, toward the west, in some degree, with Boeotia, and extends far into the Egean Sea at Cape Sounium (now Cape Colonna). The unfruitfulness of its soil protected it against foreign invaders, and the Athenians boasted of their ancient and unmixed race. The earliest inhabitants of Attica lived in a savage manner until the time of Cecrops, who came 1550 B.C. with a colony from Sais, at the mouth of the Nile, to Attica, and is acknowledged as their first real king. One of Cecrops' descendants founded 11 other cities, which in after-times made war upon each other. Thesecs compelled these cities to unite, and to give to Cecropia, now called Athens, as the capital city of the whole country, the supreme power over the confederacy. He founded the great panathenaia, watched over the administration of the laws, commanded the army, divided the whole people into three classes—noblemen, husbandmen and mechanics. He embellished and enlarged Athens, and invited foreigners to people the country. After the death of Cecrops, 1068 B.C., the monarchical form of government, which had continued 487 years from the time of Cecrops, was abolished. An archon, chosen for life, possessed the regal power. After 316 years the term of office of the archons was limited to 10 years, and 70 years later to one year, and their number was increased to nine. A regular code of laws was now needed. The archon Draco was commissioned to draw one up; but his severity disgusted the minds of the people, and 594 B.C. Solon introduced a milder code and a better constitution. He provided that the form of government should continue democratic, and that a senate of 400 members, chosen from the people, should administer the government. For this purpose he compelled, put himself at the head of the poorer classes, and made himself master of the supreme power in Athens. His government was splendid and beneficent, but his two sons could not maintain it. Clitotheus, a friend of the people, exerted himself to prevent future abuses by some changes in the laws of Solon. He divided the people into 10 classes, and made the senate consist of 500 persons. Attica was already highly cultivated; the vintages and harvest, like all the labors of this gay people, were celebrated with dance and song, with feasts and sacrifices. Then came the splendid era of the Persian War, which elevated Athens to the summit of fame. Miltiades at Marathon, and Themistocles at Salamis, conquered the Persians by land and by sea. The freedom of Greece escaped the dangers which had threatened it; the rights of the people were enlarged; the archons and other magistrates were chosen from the lowest classes. Without, however, the peril from the Persian War to the time of Alexander (500 B.C. to 336) was most remarkable for the development of the Athenian constitution. According to Böckh's 'The Public Economy of Athens,' Attica contained, together with the islands of Salamis and Helena, a territory of 847 square miles, with 500,000 inhabitants, 65,000 of whom were citizens. Under Pericles (444 B.C.) introduced the highest elegance into Athens, but the latter laid the foundation for the future corruption of manners, and for the gradual overthrow of the state. Under him began the Peloponnnesian War, which ended with the conquest of Athens by the Lacedaemians. A more dangerous enemy rose in the north—Philip of Macedon. Athens, together with the other states of Greece, became dependent on the Macedonians. When they suffered themselves to be misled to support Mithridates against the Romans, they drew upon themselves the vengeance of Rome. Sulla captured the city, and left it only an appearance of liberty, which it retained until the time of Vespasian. This Emperor formally changed it into a Roman province. After the division of the Roman empire, Attica belonged to the empire of the East. In 396 A.D., it was conquered by Alaric the Goth, and the country devastated. Attica, along with the Boeotian territory, now forms a nome or province (Attike and Viotia) of the kingdom. See ATHENS. Consult Frazer, J. G., 'Pausania's Description of Greece' (new ed., London 1910); Gardner, E. A., 'Ancient Athens' (New York 1902); Kauff- bert and Curtius, 'Karten von Attika' (Berlin 1897); Leake, 'The Topography of Athens and the Deme of Attica' (London 1841); Wordsworth, Chr., 'Athens and Attica' (id. 1869).

ATTICA, Ind., city in Fountain County, on the Wabash River and Wabash and the Chicago & Eastern railroads, 10 miles southwest of Lafayette. It has numerous manufactories of proprietary medicines, bricks, etc., and contains churches, schools, banks and a public library. Attica was settled in 1827 and was incorporated in 1867. It was chartered in 1905 as a city, is governed by a mayor, chosen for four years, and a council. The city owns and operates the electric lighting plant. Pop. (1910) 3,335.

ATTICUS, Titus Pomponius, a noble Roman, the intimate friend of Cicero, b. 109 B.C.; d. 32 B.C. The Pontifex Maximus, from which he originated, was one of the most distinguished of the equites, and derived its origin from Numa Pomphilus. When he attained maturity, the republic was disturbed by the factions of Cinna and Sulla. His brother, Sul- picius, the tribune of the people, being killed, he thought himself not safe in Rome, for which reason he removed, with his fortune, to Athens, where he devoted himself to science. His benefits to the city were so great, that he gained the affections of the people in the highest degree, and acquired so thorough a knowledge of Greek, that he could not be distinguished from a native Athenian. When quiet was restored in Rome he returned and inherited from his uncle 10,000,000 sesterces ($3,000,000). He married the brother of Cicero. Caesar treated him with the greatest regard, though he was known as a friend of Pompey. After the death of Caesar, he lived in friendship with Brutus, without, however, offering to Aventino. In 32 B.C. he being seized with an illness deemed incurable he starved himself to death. He wrote several works, including a history of Cicero's consulship, but none of his writings have been pre-
served. There is a life by Nepos and Cicero's 'Epistles to Atticus' give many facts concerning him.

**ATTIXUS HERODES, Tiberius Clau-
dius, a wealthy Athenian: b. about 104 A.D.; d. about 180. He received a careful education under the most distinguished masters of the time, and special training in oratory, to excel in which seems to have been the ruling motive of his life, ultimately attaining to great celebrity as a speaker and as a teacher of rhetoric. Among his pupils were Marcus Aurelius and Lucius Verus. He was highly esteemed by the Antonines, parti-
cularly by Aurelius, and received many marks of favor, among others the archonship at Athens and the consulate at Rome. Atticus is prin-
cipally celebrated, however, for the vast sums he expended on public the human race. He built a great race-course at Athens and a great musical theatre, called the Odeum, and which still ex-
ists. He also built a theatre at Corinth, a stadium at Delphi and baths at Thermopylae. He withdrew from Athens, and resided at his villa, Marathon, where he died about 180 A.D. None of his writings are extant.

**ATTILA, a'til-laa (in German, Etzel), the son of Mundzuk, a Hun of royal descent, who followed his uncle, Roas, in 434, and shared the supreme authority with his brother, Bleda. These two leaders of the barbarians, who had settled in Scythia and Hungary, threatened the Eastern empire, and twice compelled Theo-
dosius II to purchase an inglorious peace. The Huns themselves esteemed Attila their bravest warrior and most skilful general. Their regard for his person soon amounted to super-
stitious reverence, and being now sole master of a warlike people, his unbounded ambition made him the terror of all nations; and he became, as he called himself, the scourge which God had chosen to chastise the human race. In a short time he extended his dominion over all the people of Germany and Scythia, and the eastern and western emperors paid him tribute. The Vandals, the Ostrogoths, the Gepids and a part of the Franks united under his banners. Hearing a rumor of the riches and power of Persia, he directed his march thither, but was defeated on the plains of Armenia, and drew back to satisfy his desire of plunder in the do-
minoion of the Emperor of the East. He easily found a pretext for war, for all states which promised him a rich booty were his natural enemies, and all princes whom he hoped to conquer had broken alliances. The Emperor Theodosius collected an army to oppose his progress; but in three bloody battles fortune declared herself for the barbarians. Constanti-
nople was indebted to the strength of its walls, and to the ignorance of the enemy in the art of besieging, for its preservation. Thrace, Mac-
donia and Greece, all submitted to the savage robber, who destroyed 70 flourishing cities. Theodosius was at the mercy of the victor, and was obliged to purchase a peace. Attila now directed his eyes to Gaul. With an immense army he crossed the Rhine, the Moselle and the Seine, came to the Loire, and sat down under the walls of Orleans. The inhabitants of this city, encouraged by their bishop, Agnan (Anianus), recouled the first attack of the bar-
barians, and the united forces of the Romans, under their general, Asterius, and of the Visi-

**goths, under their King, Theodoric, compelled

Attila to raise the siege. He retreated to Champagne, and waited for the enemy in the plains of Chalons. The two armies soon app-
ached each other. Attila, anxious for the event of the battle, consulted the soothsayers, who assured him of a defeat. He concealed his alarm, rode to the spot where it was to be

reminded them of their deeds, spoke of his joy at the prospect of a battle, and at the thought that their valor was to be rewarded. Inflamed by his speech, and by the presence of their leader, the Huns were impatient to sate.

At length the ranks of the Romans and Goths were broken through, and Attila was already sure of the victory, when the Gothic prince, Thorismond, the son of Theodoric, poured down from the neighboring height upon the Huns. Attila, pressed on all sides, escaped with difficulty to his camp. This was perhaps the bloodiest battle which had been fought in Eu-

rope until the great conflict of 1914; for ac-

cording to contemporary historians, 100,000 dead bodies rested at his villa, Marathon, where he died about 180 A.D. None of his writings are extant.

ATTIREST, ât-râ, Jean Denis, French painter: b. Dôle, Franche-Comté, 1702; d. Peking, China, 1768. He first studied painting in Rome, then, at the age of 30, joined the Jesuits, by whom he was sent as a missionary to China. Here he attracted the attention of the Chinese Emperor, Lien Lung, who made him his court painter. Together with three other Jesuit missionaries, Damascenus, Sicelbarth and Castiglione, he executed 16 great historical paintings, illustrating the military campaigns of the Emperor against the Tartars. These were reproduced in France under the direction of Cochlin in the form of engravings, but the plates were sent to the Emperor of China, only two sets of prints being retained; one for the royal family and another for the National Library. So potent was his influence as a painter in China that he founded a European school of painting among the Chinese. In 1754 he was honored by the Emperor with the offer of the title of mandarin, but this he refused.

ATTIS. See Arts.

ATTLEBORO, Mass., town in Bristol County, 30 miles southwest of Boston, and 12 miles from Providence. It has good railroad connections, contains national banks, newspapers and offices, several churches, a system of graded schools. The town is the seat of several important industries, the chief of which is the manufacture of jewelry and electro-plate. There are also manufactories of cotton, woolen and knit goods, and of boots and shoes. The United States census of 1914 reported 151 manufacturing establishments of factory grade, employing 6,950 persons, of whom 6,058 were wage earners, receiving $3,518,000 annually in wages. The capital invested aggregated $15,-656,000, and the value of the output was $13,947,000; of this, $6,568,000 was added by manufacture. The government is administered by annual town meeting; and the waterworks are owned and operated by the municipality. The town was settled in 1662 and was originally called both. It derived its name from Attleborough, England, and was incorporated as a town in 1694. Consult J. Doggett, 'A Sketch of the History of Attleborough' 1 (Boston 1894). Pop. (1910) 16,215; (1914) 18,000.

ATTOCK, ât-ôk', India, a town and fort of the Punjab, on the east bank of the Indus. Attoc stands below the fort, established by the Emperor Akbar in 1581, to defend the passage of the river. The great railway bridge across the Indus here was opened in 1883. It has five arches 130 feet high, and renders continuous the railway connection between Calcutta and Peshawur (1,600 miles). The situation of Attoc is important, whether in a commercial or in a military view. It is at the head of the steamboat navigation of the Indus, being 940 miles from its mouth. Taxila, where the Macedonians crossed the Indus, has been identified with Attoc. Pop. about 40,000.

ATTORNEY (Latin, a Latin), a person appointed to do something for and in the stead and name of another. A public attorney or attorney at law is a person quali-

fied to appear for another before a court of law to prosecute or defend any action on behalf of his client. The term was formerly applied especially to those practising before the supreme courts of common law at Westminster, and corresponded to the term solicitor used in regard to the courts of chancery. As an attorney was almost invariably a solicitor, the two terms came to be generally regarded as synonymous. By the Judicature Act of 1873 all persons practising before the supreme courts in Westminster are now called solicitors. Attorneys or solicitors do not plead or argue in court on behalf of their clients, this being the part of the barristers or counsel: their special functions may be defined to be, to institute actions on behalf of their clients and take necessary steps for defending them, to furnish counsel with necessary materials to enable them to get up their pleadings, to practise conveyancing, to prepare legal deeds and instruments of all kinds, and generally to advise with and act for their clients in all matters connected with law. An attorney, whether private or public, may have general powers to act for another; or his power may be special and limited to a particular act or acts. In Scotland there is no class of practitioners of the law who take the title of attorneys. A special attorney is appointed by a deed called a power or letter of attorney, and the deed of which he is appointed specifies the acts he is authorized to perform. It is a commission, to the extent of which only he can bind his principal. As far as the acts of the attorney, in the name of the principal, are authorized by his power, his acts are those of his principal. But if he goes beyond his authority, his acts will bind himself only; and he must indemnify any one to whom, without authority, he represents himself as an attorney of another, and who contracts with him, or otherwise puts confidence in him, as being such attorney. Consult Weeks, 'Treatises on Attorneys and Counselors at Law' (San Francisco 1892). See AGENT.

ATTORNEY, Power of, which may be limited or general. A general power of attorney is an instrument by which one person confers on another person full and unlimited authority to act as his representative or agent. A limited power of attorney specifies the special business on which the agent is authorized to act. Under the law a power of attorney cannot be extended to a third person, without such action being provided for in the instrument itself. The death of the principal, the person who grants the power of attorney, renders it at once void. See ATTORNEY.

ATTORNEY AT LAW, an officer of a court of justice employed by a party in a cause to manage it for him. Appearance by attorney has been allowed in England from the time of the earliest records of the courts of that country. Such appearances were first allowed in France by letters patent of Philip le Bel 1290 A.D. No one can, by consent, be the attorney of both the litigating parties in the same action or suit. The agreement of an attorney at law, within the scope of his employment, in general, binds his client (1 Salk. 86) as to amend the record, to refer a cause, notwithstanding error, to strike out a non pros, to waive a judgment by default, etc. The principal duties of
ATTORNEY-GENERAL

an attorney are to be true to the court and to his client, to attend to the business of his client with prudence, skill and honesty (4 Burr. 2061, 72 Ga. 83); to keep his client informed as to the state of his business, and to keep his secrets confided to him as such, and an attorney is privileged from disclosing such secrets when called as a witness (16 N. Y. 180, 29 Vt. 701). An attorney is allowed considerable freedom of speech, and, ordinarily, is not liable for the use of false, defamatory or malicious language, provided it was material to the issues raised by the pleadings (Hastings v. Lusk, 22 Wend. N. Y. 410). He is liable, however, if his language is defamatory, if it can be shown that it was not relevant to the issues, and was used for the purpose of injuring the character of his adversary (1 Barn. & C. 258).

ATTORNEY-GENERAL, the official legal adviser of a nation or state and the head of its legal department.

Attorney-General of the United States. — In the United States the office of Attorney-General was created by the Judiciary Act of 1789; from the beginning this officer was a member of the cabinet, appointed by the President, and under the provisions of the Act of Congress of 19 Jan. 1866, he is fourth in succession, after the Vice-President, to the office of President should a vacancy occur in that office. He is required by statute to give his advice and opinion upon questions of law when required by the President, and, upon request, to give his opinion to the head of any executive department on any question of law arising in his department and to interpret for the department the statutes under which they act; but while he may furnish information to Congress, he does not render opinions to that body or any of its committees. He passes on the validity of the title to public lands purchased for the erection of public buildings by the United States; he exercises general superintendence and direction over attorneys and marshals of all the districts of the United States and Territories as to the manner of discharging their respective duties and over the government penal and reformatory institutions, also advising the President regarding pardon matters. Before signing certain clauses of bills the President usually consults the Attorney-General and also confers with him regarding the appointment of judges and officers of the courts. To him are referred questions involving the interpretation of the Constitution and any opinions rendered by his subordinates regarding matters of minor importance are subject to his approval. He does not determine questions of fact nor pass upon questions in controversy before the courts; he does not answer hypothetical questions of his own decision subject to review. The published opinions of the Attorney-General have come to be regarded almost as authoritative as court decisions and constitute a body of precedents that have assumed a quasi-judicial character.

As the government's chief advocate the Attorney-General renders counsel in cases in which the United States is concerned, whenever he deems that the interests of the country require his personal attention; he appears at times in the Supreme Court, but rarely in the inferior courts. If the United States should have an interest in a suit between States, he may appear in order to introduce evidence or argument but not in a manner to make the national government a party to such suit. While suits may not as a matter of right be instituted against the United States, certain classes of claims may be prosecuted in special courts created by laws regarding minor claims, and the Attorney-General exercises general jurisdiction over such courts.

The State Attorney-General. — In a few States the attorney-general is appointed by the governor or by joint ballot of both branches of the legislature, but in most of the States he is elected by popular vote. The term varies from one to four years, the tendency being toward the longer period, but in some cases the term of attorney-general does not coincide with that of the governor. He may be removed by impeachment or in a few cases by special process, as in New York, where on the recommendation of the governor he may be removed by a two-thirds vote of the senate; but nowhere can he be removed save for cause and on the preferring of charges, against which he shall be given an opportunity to defend himself.

As a rule all the powers and duties of the attorney-generals are not enumerated and defined by the statutes of the various States and, therefore, so far as applicable to our altered situation, jurisdiction and system of government, they are clothed with the common-law powers of the attorney-generals of England. The attorney-general is required, upon request, to render to the governor, legislature, department heads and other State officers, opinions upon questions relating to their work. He prosecutes offenders against State laws and defends State officers if they be sued in their official capacity; he also appears in Federal and State courts on behalf of the State in any case in which it may be interested or to which it is a party. He may also serve on various State boards. Owing to the confusion arising from the employment of special counsel by State boards and commissioners, many States have prohibited this and require that the attorney-general shall conduct all the legal work of the State, or at least have general supervision over it. In New York, however, irrespective of the attorney-general, the governor may appoint a person to investigate any State department or institution.

The Local Prosecuting Attorney. — In each county or local district into which a State may be divided for this purpose is an officer called the district attorney, prosecuting attorney or State's attorney, who has charge of the State's legal business in that locality. He is elected by the people of the county or district usually for a term of two or four years, and may be removed from office only after the completion of certain judicial or quasi-judicial proceedings. In New York and Minnesota he may be removed by the governor alone after having had the opportunity of defending himself against the charges. The district attorney's power is executive and not reviewable by the courts. In some States quo warranto proceedings may be instituted in the State Supreme Court by the attorney-general. The district attorney is required to advise county officials
ATTORNEYS — ATTU

597

upon legal questions concerning their official duties, and to advise the grand jury; he examines witnesses, draws up indictments and proceeds at all actions, civil and criminal, in the County Courts in which either the State or county may be interested or a party. While the State attorney-general may advise the prosecuting attorneys as to their duties, he seldom possesses actual direction over them and is often embarrassed by a difference of opinion as to the enforcement of State laws in local districts. In some States there is no remedy, but in New York prosecuting attorneys may be removed from office, and in Pennsylvania the chief duty is to be supervised by officers of central appointment and control. See also COURT; JUDICIARY; LAW, ADMINISTRATIVE; LAW, CRIMINAL.

The British Attorney-General.—In England the Attorney-General is appointed by letters patent and holds office during the King’s pleasure. He is the chief law officer of the Crown, and ex officio the leader of the bar having precedence in all courts and in the House of Lords even of the lord advocate. The Attorney-General is also one of the members of the House of Commons, and also of the ministry, usually being chosen from the party in power, save, perhaps, in the case of a coalition ministry. In Scotland (where he is called lord advocate), Ireland and almost all the colonies, there are attorney-generals in self-governing colonies; they are appointed by the colonial administrations and in the Crown colonies by royal warrant. The Duchies of Cornwall and Lancaster have attorney-generals who manage legal affairs in those localities. The most important duty is the British Attorney-General are to exhibit informations and prosecute for the Crown in matters criminal, and to file bills in the exchequer in any manner concerning the King’s revenue. The Attorney-General of England has the power (1) to prosecute all actions necessary for the protection and defense of the property and revenues of the Crown; (2) by information to bring certain classes of persons accused of crimes and misdemeanors to trial; (3) by petitiojus to remove valid grants made by the Crown improperly, or when forfeited by the grantee thereof; (4) by information, to recover money or other chattels or damages for wrongs committed on the land, or other possessions of the Crown; (5) by writ of quo warranto, to determine the right of him who claims or usurps any office, franchise or liberty, and to vacate the charter, or annul the existence of a corporation for violations of its charter, or for omitting to exercise its corporate powers; (6) by writ of mandamus to compel the admission of an officer duly chosen to his office, and to compel his restoration when illegally ousted; (7) by information to chancery, to enforce trusts, and to prevent public nuisances, and the abuse of trust powers; (8) by proceedings in rem, to recover the possession of the Crown which is entitled, by forfeiture for treason, and property for which there is no other legal owner, such as wrecks, treasure trove, etc.; (9) and in certain cases, by information in chancery, for the protection of the right of owners or others who are under the protection of the Crown.

IRVING E. RINES.

ATTORNEYS, a formal recognition by a tenant, of the grantee of the freehold or landlord. Formerly this assent was manifested by words, by agreement in writing, by the payment of rent or of a nominal sum. Without such attornment the grantee was not entitled to the rents of the tenant, and could not enforce against the tenant any covenant or condition of the tenancy. In the course of time the law was so modified as to dispense with attornment in ordinary cases of conveyance, such conveyance being regarded effectual from its date, the tenant becoming the grantee according to the terms of the existing lease. The tenant, however, is not liable on the obligations of his lease to the new owner until notified of the conveyance. Consult Kent, Commentaries on American Law (Boston 1896); Taylor, ‘Treatise on the American Law of Landlord and Tenant’ (9th ed. Boston 1904); Tiffany, ‘The Law of Landlord and Tenant’ (Saint Paul 1910).

ATTRACT, in physics, any force acting between two bodies, which tends to bring them nearer together, or to oppose their further separation. All attractions can be divided into two classes: (1) Those which act at sensible distances, such as gravity and magnetism, and (2) those which exert measurable effects only when the bodies are exceedingly close together. Cohesion and molecular forces are examples of the second class. See COHESION; ELECTRICITY; ELECTROHYDRODYNAMICS; GRAVITATION; MAGNETISM; MOLECULAR THEORETICAL; SURFACE TENSION.

ATTRIBUTION, in philosophy, a quality or property of a substance, such as whiteness or hardness. A substance is known to us only as a congeries of attributes. In the fine arts an attribute is a symbol regularly accompanying and characterizing some personage. Thus the caduceus, purse, winged hat and sandals are attributes of Mercury, the trampled dragon an attribute of Saint George, the keys of Saint Peter, etc.

ATRITION, a disposition of the soul which consists in sorrow for sin springing from a salutary fear of its consequences. Theologians of the Catholic Church teach that such sorrow joined to the absolution of the priest in the Sacrament of Penance is sufficient for the remission of sin, although the penitent is counselled to strive for the more perfect sorrow (contrition), which has for its motive the love of God. See CONTRITION.

ATTU, or ATTJ, one of the islands of the Aleutian group, being the outermost of the chain, therefore the most westerly point of United States home territory. It is extremely rugged and rocky, its highest elevation being over 3,000 feet above sea-level. The population is about 400, all of which are natives. Some excavations have been carried on in the island which have resulted in throwing some light on the movements of the early races that are supposed to have migrated from Asia to America.
ATTUCKS, Crespin, the first man to fall in the Boston Massacre, 5 March 1770. He was born in Framingham, Mass., either of an Indian or Negro mother, in about 1720. A statue to his memory has been erected on Boston Common. The accounts vary as to his participation in the disturbance, some stating that he was a mere spectator, others that he was one of the chief ringleaders. "American Historical Record" (1872) and Kidder, "History of the Boston Massacre" (Albany 1870).

ATWATER, Wilbur Olin, American chemist: b. Johnsburg, N. Y., 3 May 1844; d. Middletown, Conn., 22 Sept. 1907. He was graduated at Wesleyan University in 1868, made a special study of chemistry in the Sheffield Scientific School of Yale and the universities of Leipzig and Berlin. He was successively professor of chemistry in East Tennessee University, Maine State College and Wesleyan University. He was director of the Connecticut Agricultural Experiment Station, 1875-77, and was appointed director of the Storrs (Conn.) Experiment Station in 1887. He was connected for several years with the United States Department of Agriculture; published a large number of papers on chemical and allied subjects; and after 1894 gave much attention to nutrition investigations. He wrote extensively on agricultural and physiological chemistry, including 'An Experimental Enquiry Regarding the Nutritive Value of Animal and several bulitins of the office of experiment stations of the United States Department of Agriculture.

ATWILL, Edward Robert, American bishop: b. Red Hook, N. Y., 18 Jan. 1849; d. 1911. He was graduated from Columbia University in 1862, and at the General Theological Seminary, 1864. He was rector of Saint Paul's Church, Burlington, Vt., 1867-80; of Trinity Parish, Toledo, Ohio, 1881-90; and was consecrated first Protestant Episcopal bishop of western Kentucky, 14 Oct. 1890. He was a leader in the movement for the reunion of the Union and Confederate churches.

ATWOOD, Charles B., American architect: b. Millbury, Mass., 18 May 1849; d. Chicago, 19 Dec. 1895. He studied at the Harvard Scientific School, and opened an office in 1872. Within three years he received prizes for design of the Springfield city hall, the Connecticut State capitol, the courthouse in Springfield, Mass., and a commission to build the Holyoke, Mass., city hall. Removing to New York in 1875, he designed residences for W. H. Vanderbilt, E. F. Shepard and W. D. Sloane, and interior decorations for the houses of Mrs. Mark Hopkins in San Francisco and Great Barrington, Mass. In 1884 he gained the first prize for a design for the Boston Public Library, and later a prize of $5,000 for plans for a new city hall in New York city. From 1891-93 he was associated with D. H. Burnham in planning the World's Fair buildings in Chicago. The art building (now the Columbian Museum), peristyle, service building and many minor buildings were from his designs. He was a close student of art, and a marvelous draughtsman, using his left hand with sureness and rapidity. D. H. Burnham said of him, "He was of an honorable, charitable disposition, but like most great artists, a mere child in the practical business of life."

ATWOOD, George, an eminent English mathematician: b. London 1746; d. 11 July 1807. He was graduated at Trinity College, Cambridge, in 1769, where he was also fellow and tutor. He was elected to the Royal Society in 1776. Through the agency of William Pitt he secured a position in the customs service, where he made several important calculations in connection with the revenue. In 1774 he published "Treatise on the Rectilinear Motion and Rotation of a Chief of Consulate in Original Experiments relative to that Subject"—a work remarkable for its perspicuity and the extensive information which it affords. About the same time he made public an "Analysis of a Course of Lectures on the Principles of Natural Philosophy," read at the University of Cambridge, which is not less valuable than the preceding. He published a "Dissertation on the Construction and Properties of Arches" (1801), and several other valuable treatises relating to mathematics and mechanical science. He invented a machine still used in physical lecture rooms, which affords great facilities for verifying the laws of falling bodies. See Arwood's Machine.

ATWOOD, Isaac Morgan, American Universalist clergyman, editor and educator: b. Pembroke, N. Y., 24 March 1838; d. Washington, D. C., 26 Oct. 1917. Educated in common schools and academies he was ordained to the Universalist ministry in 1860. He held pastorates in Churchville, Clifton Springs and Watertown, N. Y.; in Portland, Me.; and in Brockton, Chelsea and Cambridge, Mass. He became editor of the Boston Universalist in 1867; of the Christian Leader in New York in 1872; was associate editor of the Universalist Leader, Boston, 1874-1909; and one of the contributors to the Independent for several years. Elected president of the Canton Theological School, 1879; he was appointed general superintendent of the Universalist Church in 1899; general secretary in 1905; became minister of the Canton Universalist Church; and professor of systematic theology in the theological department of Saint Lawrence University in 1911. Author of 'Have We Outgrown Christianity?' (1870); 'Glance at Religious Progress in a Hundred Years'; 'Latest Views of Agnosticism' (1879); 'Walks About Zion' (1880); 'Episcopacy' (1885); 'Manual of Revelation' (1893); 'System of Christian Doctrines' (1900); and also a great many encyclopedic articles. He received the following degrees: A.M., Saint Lawrence University, 1869; D.D., Tufts College, 1879; LL.D., Buchtel College, 1905.

ATWOOD, Julius Walter, American clergyman: b. Salisbury, Vt., 27 June 1857. He was graduated from the Episcopalian Theological School at Cambridge and in 1883 was ordained priest of the Protestant Episcopal Church, after which, until 1907, he was rector at Ipswich, Mass., Providence, R. I., and Phenix, Ariz. At the end of that period he became archdeacon of the diocese of Arizona, being consecrated deacon in 1911. He is the author of 'The Spiritual Influence of John Greenleaf Whittier' (1893).

ATWOOD, Melville, Anglo-American geologist: b. Prescott Hall, England, 31 July 1812; d. Berkeley, Cal., 25 April 1890. He studied lithology, microscopy, and geology in life, and engaged in gold and diamond mining in Brazil. In 1843 he made a discovery that
greatly enhanced the value of zinc ore. After coming to the United States, in 1832, he invented the blanket system of amalgamation. He also established the value of the famous Comstock silver lode, by an assay of minerals in that region.

ATWOOD'S MACHINE, an instrument devised by George Atwood, an English physicist, for illustrating the principles governing the motion of falling bodies, and described by him in a book published in 1784. It consists essentially of a light wheel or pulley, over which a long flexible cord passes. A mass of matter is attached to each end of the cord, and the experiment consists in observing the velocity acquired by the system at the end of a given time. The mass to be moved is evidently the sum of the two masses attached to the ends of the cord (assuming that the wheel is light enough to be disregarded); and the force tending to set the system in motion is the difference of the weights of the two masses. By making these masses nearly equal, the motion can be made slow enough to be conveniently studied. The intensity of gravity can be determined by the aid of this machine, with sufficient accuracy for class-room purposes, and it is an admirable device for illustrating the laws of uniformly accelerated motion.

ATWINS, Kts, or ATTLES, Lts (1). The favorers of Cynel, who, having broken the vow of chastity which he made to the goddess, castrated himself, as a punishment for his crime. Consult Frazer, J. G., 'Adonis, Atthis, Osiris' (London 1906), and Showmer, 'GreatMother oftheHeavens' (Madras, 1931). A son of Cresus, King of Lydia—affecting example of filial love. He was dumb, but, seeing a soldier in a battle who had raised a sword against his father, he exerted himself so much that the bands of his tongue gave way, and he cried out, 'Soldier, kill not Cresus!'

AUBANEL, o-ba-ne, Theodor, French poet, sometimes called 'The Petrarch of France': b. 1829; d. 1886. He was the son of a printer of Avignon, and for years followed his father's profession. He devoted his life to the embellishment of the troubadour literature. He was a collaborator of Mistral, Roumanille, and other fêtards. His drama, 'Lou Pan don Pecat,' was successfully staged in 1878 at Montpellier.

AUBE, Jean Paul, French sculptor: b. Longwy, Meurthe-et-Moselle, 1837. He studied art at the Beaux-Arts, under Duret and the elder Dauban. His works are found in many of the public places of the city of Paris. Among the more important ones are 'Bailly,' a bronze statue in the Luxembourg Gardens; Gamber, in Madeleine, Carrousel, Paris; Général Joubert à Rivoli, at Bourges and 'France and Russia,' a decoration, in the Luxembourg.

AUBE, ob, a French department, formed out of the south of Champagne and a small portion of Burgundy; area, 2,351 square miles. The west districts are wooded, bare of trees, and almost destitute of vegetation; the southern districts are remarkably fertile. Grain, hemp, vegetables and wine are produced in large quantities. The forests, which are extensive, furnish much fuel for the supply of Paris. The chief manufactures are worsted and hosiery. Troyes is the capital. Pop. (1911) 240,755.

AUBENAS, oh-nya, France, town in the department of Ardèche, 19 miles southwest of Privas. It is beautifully situated on the right bank of the Ardèche, but its streets generally are crooked and narrow. It has a castle of the 16th century, now occupied by the departmental public institutions of the town. These include a tribunal and chamber of commerce, and a conditioning-house for silk. Iron and coal mines are worked in the vicinity. As the centre of the silk trade of southern France Aubenas is a place of considerable traffic. It has also a large silk spinning and weaving industry, and carries on tanning and various minor industries together with trade in silk. The district is rich in plantations of mulberries and olives. Pop. about 4,000.

AUBER, o-bahr, Daniel François Esprit, French composer: b. Caen 1782; d. Paris 1871. His father was a violinist of some note, and also dealt in prints. He sent his son to England to learn the trade; but the latter's love for music triumphed and he returned to Paris in 1804, and attracted considerable attention in several musical compositions. He came under the notice of Cherubini, who gave him instruction in composition. His 'Le séjour militaire' appeared in 1813 but met an unfavorable reception. 'Le testament des billet-doux' (1819) was equally unsuccessful, but 'La bergère châtelaine' (1820), a comic opera, was well received, established his fame, which he sustained in the 40 other works which appeared in rapid succession of his death. Among these the most noteworthy were: 'Le maître' (1825); 'La muette de Portici' (1828), his most serious opera and perhaps his greatest; 'Fra Diavolo' (1830); 'Le philètre' (1831); 'Le cheval de bronze' (1835); 'Le domino noir' (1837); 'Le lac des fées' (1839); 'Les diamants de la couronne' (1841). In 1829 he succeeded Gossec at the Academy, was appointed director of the Conservatory in 1842, and court chapel master to Napoleon III in 1857. He is regarded as the founder of the French grand opera. For polish, melody, brilliant orchestration and formal structure his work stands among the greatest. Consult Kohut, A., 'Auber' (Leipzig 1895); and Malherbe, C., 'Auber, biographie critique' (Paris 1911).

AUBER, Harriet, English poetess and hymn-writer: b. London, 4 Oct. 1774; d. Hoddesdon, 20 Jan. 1862. She led a very quiet life. She published 'The Spirit of the Psalms' (1829). Some 25 of her hymns from this book have been more or less in use. When Charles H. Spurgeon, on compiling 'Our Own Hymnbook' (1866) he included 20 hymns written by Miss Auber. Three are included in the edition of the 'Methodist Hymnal' in present use. The best known of her hymns is the one beginning 'Hasten Lord, the glorious time, When beneath Messiah's sway.' Another widely used hymn by Miss Auber begins 'Our bless Redeemer ere he breathed.'

AUBEURGE ROUGE, L', le bárzh-roozh ('The Red Inn'), a romance published by Balzac in 1831, appearing first in the 'Revue de Paris.' The narrator of the story is in love with the daughter of a man whom he knows to have committed a murder for robbery and from
AUBERLEN, ou-bär-lén, Karl August, German theologian: b. Fellbach, near Stuttgart, 1824; d. Basel, Switzerland, 1864. He studied at Tübingen, where he was strongly influenced by the teachings of Ferdinand Christian von Baur, whose pupil he was. Later in life he held views of a more conservative nature than those of Baur's Tübingen school. In 1851 he was appointed professor of theology at Basel. His chief work is 'Die Theosophie Otingers nach ihren Grundzügen' (2d ed., Basel 1856). His important works are 'Der Prophet Daniel und die Offenbarung Johannes' (1853), and 'Die göttliche Offenbarung' (1864).

AUBERT, o-bär, Jean de la Rédemption, French writer: b. Paris 1731; d. there, 10 Nov. 1814. He first attracted attention by his 'Fables,' which were published in the Mercure de France and brought forth high praise from Voltaire. From 1773 to 1784 he was professor of French literature in the Royal College, during which period he was also managing editor of the Gazette de France. At one time he was the official censor of the government. A collection of his works appeared under the title 'Fables et œuvres diverses' (1775).

AUBERT, Louis François Marie, French composer: b. Parame, 15 Feb. 1877. Already at an early age he showed indications of musical talent and at the age of nine he was studying at the Paris Conservatory under Diemer and Fauré. He has composed various collections of songs, a fantastic for piano and orchestra (1901) and the opera 'La Forêt Bleue' (1906), which was produced by the Boston Opera Company in America in 1913.

AUBERVILLIERS, o-bär-ve'yá, France, city in the department of Seine, on the canals Saint Denis, two miles from the right bank of the Seine, and one mile north of the fortifications of Paris. Its manufactures include cardboard, glue, oils, colors, fertilizers, chemical products, perfumery, etc. During the Middle Ages and till modern times Aubervilliers was the resort of pilgrims, who came to pay honor to Notre Dame des Vertus. In 1814 the loyalists were in a stubborn contest between the French and the Allies. Pop. about 33,000.

AUBIGNAC, o-bi-nyák, François Hédelin, Abbe n', French dramatist: b. Paris, 4 Aug. 1604; d. 25 July 1676. He was the tutor of Richelieu's nephew and was later made abbé of Aubignac, under which name he became more generally recognized. His chief works are the tragedy in prose, 'Zenobie,' and 'Pratique du théâtre' (1657), in which he, for the first time, codified the laws of dramatic method and construction. He is chiefly remembered as the first to raise the question as to the authorship of the poems of Homer.

AUBIGNÉ, d', J. H. M. See D'Aubigné, J. H. M.

AUBIGNE, o-be-nyák, Theodore Agrippa d', French soldier and author: b. Saint Maury (Saintonge), 8 Feb. 1552; d. Geneva, 29 April 1630. Early in life he embraced the Huguenot cause, was condemned to death but escaped and was sent by his guardian to Geneva for safety. In 1567 he enlisted under Condé. He fought under King Henry IV. King of France, who made him a gentleman of his bedchamber; but when the King, thinking it necessary, favored the Roman Catholics more than the Protestants, Aubigné expressed his displeasure with little reserve, and lost the favor of Henry. He now retired to Geneva, where he devoted himself to literary pursuits. He produced works in prose and verse to write to literature and to the history of his time. He wrote a valuable 'Histoire Universelle, from 1550 to 1601' (3 vols. folio), the first volume of which was ordered to be burned by the Parliament of Paris. A volume of sonnets and other poems, under the title 'Le Prin temps,' also bears his name. The group of satirical poems 'Les tragiques' (1616) is his greatest work. It contains some descriptions of the religious wars.

AUBLET, o-blé', Albert, French painter: b. Paris 1851. He studied historical painting under Gerome; won a first-class medal at the Paris Exposition of 1889, and the decoration of the Legion of Honor in 1890. His first great painting was 'The Wash-room of the Reserves in the Cherbourg Barracks,' exhibited in the Salon of 1879, and probably his most celebrated one is the 'Meeting of Henri III and the Duc de Guise,' shown in the Salon of 1880. He is a chevalier of the Legion of Honor.

AUBREY, a-bre, John, English antiquary: b. Easton Piers 1606; d. 1697. He published little, but left large collections of manuscripts, which have been used by other writers. He collected materials for the 'Monasticon Anglicanum,' and afforded important assistance to Wood, the Oxford antiquary. His 'Miscellaneia' (1696) contains a great deal of curious and interesting information, but also displays much credulity and superstition. Another work of his was published in 1719 under the title of the 'Natural History and Antiquities of the County of Surrey.' In 1898 appeared a work by him entitled 'Brief Lives Chiefly of Contemporaries,' edited by Andrew Clark. Consult biography by J. Britton (London 1845) and essay by Masson in British Quarterly Review (Vol. XXIV, London 1857).

AUBRIOT, o-bre-ò, Hugues, a mayor of Paris, who figures frequently in French history. He was born in Dijon and died about 1382. He is first heard of as treasurer under Charles V. In 1364 he became mayor and governor of Paris. Under his administration some of the greatest public works were initiated. He laid
the cornerstone of the Bastille and he was responsible for the building of the Pont Saint-Michel, Le Petit Châtelet and the completion of some of the most important fortifications of the city. Later he is heard of as being accused of heresy and was confined in his own bastile. His sculptural likeness may be found to-day on the façade of the Hôtel de Ville of Paris. Consult Eugène Dépréz, "Hugo Aubriot, Primus Romanus et Urbanus Prætor, 1367-81" (Paris 1902).

AUBRY, bār', Charles Marie Barbe Antoine, French jurist: b. Zabern, Alsace, 20 June 1803; d. Paris, 13 March 1883. In 1870 he was assistant judge of the tribunal at Strassburg. In 1872 he became councillor of the Court of Cassation in Paris, a position he held until 1878. In that same year he was made a commander of the Legion of Honor. Aside from his writings on jurisprudence, which rank very high, he made a translation of Goethe’s "Faust." His chief work is "Cours de droit civil français d’après la méthode de Zacharias" (8 vols., Paris 1890-97).

AUBRY DE MONTDIDIER, mō-dé’ dzhā’, French knight under Charles V, supposed to have been murdered by Richard de Macaire in 1371. The story is that the assassin was suspected on account of the fierce animosity the dog of the murdered man showed toward him and that the King ordered him to engage in a combat with the animal. The result was that the dog killed the man, becoming famous as "Aubry's Dog," under which title the story became a popular play. Other versions were dramatized, though always with the same general features, one of these plays, a popular melodrama, being presented as late as 1816. This last play was translated into German and presented in Vienna and Berlin and appeared at the Weimar Theatre in 1817, of which Goethe was manager, the leading rôle being played by a large poodle.

AUBURN, Ala., town in Lee County, 60 miles northeast of Montgomery, on the Western of Alabama Railroad. The Alabama Polytechnic Institute, founded 1872, is located here. Total pop. (1940) 1,408.

AUBURN, Cal., city and county-seat of Placer County, situated on the Southern Pacific Railroad, 36 miles east of Sacramento. It was first settled in 1849 and was incorporated as a city in 1888. It is the seat of the Sierra Normal College. Gold and quartz is found in the vicinity and there are many quartz mills. The leading industries are mining, fruit-growing and farming. Pop. (1910) 2,376.

AUBURN, Ind., city and county-seat of De Kalb County, situated on branches of the Lake Shore & M. S. and the Baltimore & Ohio railroads, 22 miles north of Fort Wayne. It has its chief manufactures are furniture, carriages, automobiles, gas engines, windmills and stoves. Auburn was first settled in 1833, became a borough in 1856 and a city in 1900. The mayor and other officials are elected biennially. The buildings of note are the city hall, the Y. M. C. A. Building, the Eckhart public library and the county buildings. The waterworks and electric plant are owned and operated by the municipality. Pop. (1910) 3,919.

AUBURN, Me., a city and county-seat of Androscoggin County, on the west bank of the Androscoggin River, on the line of the Maine C. & Grand Trunk railroads, 34 miles north of Portland. The city is one of the most beautiful in the State. It rises westerly from the river in almost amphitheatre form, culminating in beautiful heights known as the Western Promenade. These heights are terraced by broad, handsome avenues, upon which the beautiful city, are elegant residences with spacious and well-kept grounds. The view from the summit of these heights is one of the most striking in Maine. The beautiful Androscoggin River, with its waterfall grand and picturesque, flows through the valley below, the two thriving cities of Auburn and Lewiston on either bank, while broad and fertile fields dotted with comfortable farm homes stretch to the north and east. Taylor Pond and Lake Auburn lie to the west and are justly considered among the most beautiful lakes of Maine. The territory of the city covers an area of 65.4 square miles.

History.—Auburn is an old town and has an interesting history. Its territory is a part of a large tract of land, originally known as Bakerstown, granted by the general court of Massachusetts in 1765. It was settled as early as 1786 and Auburn was incorporated as a town in 1842, and as a city in 1869.

Industries.—Its largest single industry is the manufacture of boots and shoes, and in this branch of manufacture it is one of the foremost cities in the country. Its industries include cotton mill, last, box and carriage factories, machine shops, shoe findings, dairy products, beef and packing houses, marble and foundry products, lumber, shuttles and spoons. The United States census of manufactures for 1914 recorded 84 establishments of factory grade, employing 5,247 persons, of whom 4,811 were wage earners, receiving $2,885,000 annually in wages. The capital invested aggregated $6,020,000, and the year’s output was valued at $13,840,000; of this $5,154,000 was added by manufacture.

Banks.—There are two national banks and two savings banks located here. The capital stock of the two national banks is $350,000; surplus, $138,378. The deposits in the savings banks, about $2,500,000.

Government.—The commission form of government has been put in operation and has proved much more satisfactory than the old form of municipal government with a mayor, a board of aldermen and a board of common councilmen. The city owns its waterworks. The assessed valuation of the real and personal property according to latest obtainable reports is $11,025,007; rate of taxation 20 mills; bonded debt $462,700; floating debt $46,500.

Churches and Schools.—The city has nine churches, one of them organized as early as 1807, supported by the following denominations: Baptist, Free Baptist, Universalist, Episcopal, Methodist, Congregational and Catholic.

The city has a school population of about 5,000. School accommodations are furnished absolutely free from the kindergarten to the completion of the high school course. Excellent buildings, commodious, well appointed and equipped with modern improvements are distributed over the city sufficient for the full accommodation of
all the pupils in the primary, intermediate, grammar and high school grades. At the head of the public schools, and stands the Edward D. Little High School, a noted institution having its origin in the old Lewiston Falls Academy, incorporated in 1834. In addition to the public schools there is a Catholic parochial school of 56 scholars, supported solely by the contributions of the parents. There is also a
excellent free public library. The city, generally speaking, is thriving and prosperous. Its population is composed largely of skilled workmen who own their own homes and are permanent residents. The streets are wide and well paved, regularly laid out, and in the residential sections adorned with beautiful shade trees. There is an excellent and extensive electric street railway, two large and centrally located hotels, a beautiful public park, a handsome and commodious set of county buildings in which are located the Supreme Court rooms and all the county offices, and the railroad facilities and connections with all parts of the country are of the best. The city is connected with the city of Lewiston (n.y.), located immediately across the river, by four large iron bridges, and the two cities are so closely related socially and in a business way that they form practically one community and are known as the Twin Cities of Maine. Pop. (1842, at the time of its incorporation as a town) about 2,000; (1869, at the time of its incorporation as a city) 6,160; (1910) 15,064; (1914) 16,000.

AUBURN, N. Y., city and county-seat of Cayuga County, on Oswaco River, the outlet of Oswaco Lake, and on the New York Central, Lehigh Valley, and Central New York Southern steam railroad, 25 miles southwest of Syracuse. Interurban trolley lines connect with Rochester and Syracuse, and local trolley lines with the beautiful Oswaco Lake and picturesque neighborhood. Auburn was first settled in 1793 by Col. John Hardenbergh, and was called Hardenbergh's Corners; in 1805 the name was changed to Auburn, and it was selected as the county-seat; in 1815 it was incorporated as a village and in 1848 became a city. Auburn was the home of the late William H. Seward, and the Museum of Science and Industry is one of the city's attractions. The city is situated in the heart of the Empire State lake country. One can leave Auburn every morning during a vacation period and visit a different lake each day, and return to the city before nightfall. Oswaco Lake, the nearest and most accessible of the lakes, is a picturesque expanse of water, two miles from the city, 12 miles long. In the vicinity are excellent State roads with ample and up-to-date garage and hotel accommodations. It is a beautiful summering place, where fishing, boating, yachting, bathing, canoeing and sports at the lake are the favorite amusements. There is the Burris Auditorium seating about 3,000 people for indoor entertainment, and a number of other theatres. There are two country clubs, one city club and numerous fraternal organizations that own their own buildings. Auburn is a shopping centre with modern stores and is an industrial centre with 174 factories, employing 8,110 people. The largest industry is a manufacturing system of agricultural implements which exports its goods to every part of the world; other industries of almost equal importance are carpet, rug and shoe factories, woolen mills, cordage, twine and rope works; the Diesel oil and steel works. The area of the city is 17,725 acres, made here. The United States census of manufactures for 1914 recorded 123 establishments of factory grade, employing 6,627 persons of whom 5,769 were wage earners, receiving $3,578,000 by the city. The capital invested was $23,129,000, and the value of the year's output was $16,686,000; of this $6,896,000 was the value added by manufacture. The city has a progressive Chamber of Commerce, two savings banks, two private banks, two national banks and one trust company. The city contains a number of unusually fine private homes with attractive grounds, including Italian and English gardens; fine public and private buildings; churches of practically all denominations; a municipal and general hospital; courthouse; United States government building; State armory, which is the headquarters of Company M of the National Guard; State prison; two libraries, and a fine Woman's Educational and Industrial Union building. One of the largest and best equipped in the United States; there are 12 up-to-date public schools and one high school; there are four Roman Catholic parish schools. Auburn is also the seat of the Auburn Theological Seminary (Presbyterian), which, with its fine chapel, library, and religious hall, is the largest of its kind in America. The library contains 20,000 volumes, and the chapel seats 1,500 persons. A historical society, public and private libraries, and the beautiful and artistic buildings are other striking features of the city. The seminary maintains a summer school for laymen as well as the regular student's theological course during the remainder of the year. The city maintains a first-class paid fire department, and the municipality owns and operates its own waterworks. Pop. (1910) 34,668; (1914) 36,500.

AUBURN, Neb., city and county-seat of Nemaha County, situated on the Nemaha River and on the Missouri P. and the Chicago, B. & Q. railroads, 65 miles south of Omaha. It was first settled in 1861, became a borough in 1884 and a city in 1890. It is in a rich agricultural region and has large fruit packing and canning plants and a flour mill. The water and lighting system are owned by the city. Pop. (1910) 2,729.

AUBURN THEOLOGICAL SEMINARY, a Presbyterian institution in Auburn, N. Y.; founded in 1818 by the Synod of Geneva, incorporated in 1820. The course, designed primarily for college graduates, is for three years. At the close of 1915 it had 12 professors and instructors, 64 students, 36,315 volumes in the library, grounds and buildings valued at $300,000; endowment, $790,000; productive funds, $703,770; income, $43,279. Its graduates then numbered 1,778.

AUBUSSON, Pierre d, French crusader and grand master of the Order of Saint John of Jerusalem; b. 1423; d. 1503. As a mere boy he fought against the Turks in Hungary, under Duke Albert of Austria. After campaigning against the Swiss in 1444 he went to Rhodes and became a member of the Order of Saint John, where he distinguished himself in fighting the Saracens. In 1476 he was elected grand master and four years later he defended Rhodes successfully against an attack delivered by the Turks under the personal command of Mohammed II. In 1489 the Pope rewarded him by
making him a cardinal, not only on account of his military feats, but because of his endeavors to organize a powerful league of all the Christian nations against the Turks, for which he was often called 'the Shield of the Church.'

Consult Bounhous, 'Histoire de Pierre d'Aubusson' (The Hague 1793), and Streck, 'Pierre d'Aubusson' (Chernniitz 1872).

AUBUSSON, d'bus'son, France, capital of the arrondissement of the same name in the department of Creuse. It is situated on the Creuse River, east of the Orleans Railroad, and is especially noted for the carpets manufactured in its factories. Pop. (1911) 7,211.

AUBUSSON TAPESTRY. See Tapestry.

AUCASSIN and NICOLETTE, one of the earliest and by far the best of the efforts of French creative fancy to imitate the Oriental and Latin tales that had won public favor in translations, belongs probably to the 12th century and illustrates a type of story-telling that grew in favor up to the 15th century, with progressive elimination of the lively verses that are here interspersed in the prose. The story recounts the fresh, though not altogether innocent, love of Aucassin, son of the Count of Beaucarie, for Nicolette, captive daughter of a king of Carthage. The author who is unknown seems to have had democratic sympathies that distinguish him from his fellow raconteurs and associate him politically with such writers of the 13th century as Rutebeuf and Jean de Meung. The pitiful lot of serfs under landlord oppression stirs him to a palpitation of sympathy. On the other hand there is a daintiness in the description of Nicolette as greatly daring in her girlish love, she makes her way by an improvised cord from her chamber window, through darkness and brambles, to the tower where Aucassin lay prisoner.

She felt that the old woman who was with her slept. She put on a dress of silk cloth that she had very good. She took sheets and towels and knotted them together and made a cord as long as she could and she tied it to the pillar of the window and on it slid down toward the garden. She held her robe with one hand before and the other at the back. And she tied herself on the brambles that were great over the grass and she went along the garden. Her blond hair was in little curls and her eyes were bright and smiling, her face regular, her nose slender and well placed, her lips redder than cherry or rose in summer and teeth small and white. And she had a slender waist that you could clasp in your two hands, and the daisy flowers that she bent with the toes of her feet so that they lay low under the daintiness of her feet were just blue, and her feet just blue, and her legs, so pure when there was that girl. There is no other French prose to rival this for more than two centuries. There is a beautiful translation by A. Lang.

Benjamin W. Wells.

AUCH, ozh, France, capital of the department of Gers, 55 miles west of Toulouse. It contains a town united in several places by flights of steps. The streets generally are steep and narrow. It is the seat of an archbishop, a prefect, and has a Court of Assizes, and has tribunals of first instance and of commerce, a lycée, training-colleges and a lunatic asylum. The manufactures include agricultural implements, leather, vinegar, plaited sandals, and there is a trade in brandy, wine, cattle, poultry and wool; there are quarries of building-stone in the neighborhood. Pop. about 9,000.

AUCHMUTY, ok-mú-ti or à-mú-ti, Sir Samuel, British soldier, son of the Rev. Dr. Samuel Auchmuty: b. New York 1756; d. Ireland, 11 Aug. 1822. He graduated from Kings, now Columbia, College, in 1775, after which he entered the British army and fought against the Continentals, notably at White Plains and in the battle of Brooklyn. After the termination of British operations in America, he went to India, in 1783, where he served until 1796. In February, 1807, he was in command of the British forces which stormed the South American city, Montevideo. He was now promoted to the rank of major-general and for the next three years was commander-in-chief of the British forces in Madras, during which period he commanded operations against the Java Settlements. Just before his death he was commander-in-chief of the British army in Ireland.

AUCHTERARDER, ouk'ter-är'der, Perthshire, Scotland, the Seat of A. F. William, which originated the popular agitation that lead to the disruption in the Church of Scotland and to the establishment of the Free Church. It was the centre of a thriving textile industry, to which has since been added the manufacture of agricultural implements. Pop. (1911) 3,175.

Consult 'The Auchterarder Case' (Edinburgh 1842).

AUCKLAND, George Eden, Earl of, governor-general of India, son of William Eden, Lord Auckland: b. 25 Aug. 1784; d. 1 Jan. 1849. He was called to the bar in 1809; in 1814 he succeeded his father as Lord Auckland. In 1833 he was appointed president of the Board of Trade and master of the mint, under Earl Grey's administration. These offices he held, with the exception of a few months, during which he was First Lord of the Admiralty, until 1835, when he was appointed governor-general of India, on which occasion he was made a Knight of the Grand Cross of the Bath, being created earl in 1839. In 1841 he returned to England. In 1846 he again became First Lord of the Admiralty, which office he held until his death.

Auckland, William Eden, Lord, English statesman: b. 1744; d. 28 May 1814. He was educated at Eton and Oxford and called to the bar in 1768. Four years later he was appointed Under-Secretary of State and one of the directors of Greenwich Hospital. In 1778 he was nominated, with the Earl of Carlisle and Governor Johnstone, a commissioner to treat with the insurgent American colonists, but this mission was not successful. In 1785 he was sent as minister plenipotentiary to the court of France, where he concluded a commercial treaty with that country in the following year. In 1788 he was sent as ambassador to Spain and on his return in October, 1789, he was created an Irish peer as Baron Auckland, being created a British baron four years later. In 1790 he became ambassador to Holland. From 1798 to 1801 he was joint Postmaster-General. Among his writings are
‘The Principles of Penal Law’ (1772); ‘Remarks on the Apparent Circumstances of the War’ (1795); ‘Speech in Support of the Union with Ireland’ (1800).

AUCKLAND, New Zealand, a province forming the northern part of North Island, and with an area of 25,746 square miles. Auckland, a city and capital of the province, and formerly capital of New Zealand, is situated on the northeast coast of North Island at the mouth of an arm of Hauraki Gulf, 1,350 miles from Sydney, Australia. It stands upon a cluster of extinct volcanoes. In the city and its suburbs there are evidences of as many as 63 points of eruption, making the narrow isthmus a fruitful field for the study of volcanic formations. It has two excellent harbors, one at Waiheke and one six miles distant at Manukau on the opposite side of the isthmus. The former is one of the finest in New Zealand. There are numerous wharves and two graving docks, one of which, the Calliope dock, opened in 1887, is one of the largest in the south seas, admitting 10,000-ton steamers. Connected by steamer with Australia, South Africa, Great Britain, South Pacific, and the Pacific Islands and by rail with the chief towns of the island, the city has a large and increasing trade, valued at about $40,000,000 annually; 361 vessels of 856,317 tons burden entered and 241 of 554,815 tons cleared out in 1913. The site is fine, and there are numerous handsome public buildings, including churches, fine schools, an excellent public library containing the Grey collection of manuscripts, a museum and the Auckland University College. Chief manufacturing interests are ship-building yards, sugar refineries, rope factories, boiler works, etc. Its lumber industry, taking advantage of the wide rivers down which logs can be floated, is a very prosperous one, as is also its trade in Kauri gum. The government is municipal. For the year 1917, the municipal electric plant showed a good increase, selling 1,872,938 units valued at $75,168, as compared with 1,601,292 units, value $63,795, for 1916. There is a United States consular post. Pop. (1911) with suburbs, 102,676; (1913) 113,334.

AUCKLAND ISLANDS, a group of islands in the Pacific Ocean, 200 miles to the south of New Zealand, lat. 50° 31' S., long. 160° 19' E. The largest island is about 30 miles long by 15 broad, and is covered with dense vegetation. They were discovered in 1806, and settled in 1849 by the British. At present they are almost entirely uninhabited, and serve as a station for whaling ships. The New Zealand government maintains a station on the largest island as a haven for shipwrecked sailors.

AUCTION and AUCTIONER. An auction and an auctioneer. An auction is a public sale of property to the highest bidder. It is not material how the sale is conducted, whether by public outcry or other manner. The essential part is the selection of a purchaser from a number of bidders. Catalogues containing the property are usually published, the terms of the sale are also usually stated in the catalogue. Auctions are generally conducted by persons licensed for that purpose. Bidders may be employed by the owner of the property, if it he done bona-fide and to prevent a sacrifice of the property under a given price, but where the bidding is fictitious and by combination with the owner to mislead the judgment or inflame the zeal of others, it would be a fraudulent and void sale. If on the part of the purchaser will void the sale. Misdescription of property sold will void the sale if it is material. An auctioneer cannot bid for himself; he cannot deny his principal’s title; he cannot sell at private sale; he has ordinarily the power to collect the purchase price of goods sold from the buyer. The auctioneer must use ordinary care and skill in the discharge of his duties, and like other agents he must obey the instructions he receives from the owner of property sent him for sale. An auctioneer, according to the weight of authority, who sells stolen property is liable to the owner, notwithstanding that the goods were sold by him, and the proceeds paid over to the thief without notice of the felony. An auctioneer is also liable for want of care of the goods which is in his possession. The auctioneer has a lien upon the goods for the charges of the sale, and for his commission. He is the agent of the seller, and, for the same purposes, of the buyer. Consult Bateman, ‘Treatise on the Law of Auctions’ (7th ed., London 1895.)

AUCTION BRIDGE. See Bridge.

AUCUBA, ákù-bà, a genus containing three species, of which A. japonica is the best known. They belong to the Cornaceae family. The species mentioned is a dioecious evergreen laurel-like shrub of many varieties, native of China and Japan, largely planted on lawns and in shrubberies. It withstands the frosts and gales of cities remarkably well, but is not hardy in the Northern States. The plants bear purple flowers in summer and are particularly beautiful when bearing their scarlet berries which ripen in early spring. They are easily propagated by seed, or by green wood cuttings, and succeed in half shade where the soil is good, friable, moist, but well-drained.

AUDÈUS (Syrian Udo), the founder of a religious sect called Audians, which held anthropomorphic views, and was established under the following circumstances: Audius (b. at the end of 3d century; d. 370) was a Mesopotamian, of singular purity and severity of character. He became disgusted with the Syrian clergy, and on expressing his opinion with more firmness than discretion, was excommunicated; when a considerable number of sympathizers gathered around him and constituted themselves into a church. But this sect could not long withstand the persecutions to which it was exposed, and died almost at the same time as its founder, who passed the latter part of his life in exile in Scythia, where he converted many pagans to Christianity by the force of his teachings, and the moral beauty of his ascetic life.

AUGE, öd, a maritime department in the south of France; area, 2,433 square miles. It is mainly covered by hills belonging to the Pyrenees or the Cevennes, and is traversed by a valley drained by the Aude. The loftier districts are bleak and unproductive; the others tolerably fertile, yielding good crops of grain. Its capital is Carcassonne. Pop. about 31,000.

AUDE, a river of France, which rises in the east Pyrenees, in the department of Pyrenees Orientales, and after a course of
nearly 130 miles, falls into the Mediterranean. It receives several affluents, of which the principal is the Oribou.

AUDEBERT, ō-dĕr-baⁿ', Jean Baptiste, French naturalist and engraver: b. Rochefort 1759; d. 1800. The first work was 'Histoire Naturelle des Singes, des Makis, et des Galépithèques' (1800), in which he shows himself an able draughtsman, engraver and writer. Nature history was greatly benefited by his work, the splendor of which was astonishing. His 'Histoire des Colibris, des Oiseaux-Mouches, des Jacamars, et des Promerops' (1802), is esteemed the most complete work that has appeared in this department. Fifteen copies were struck off with golden letters. He changed the color of his impressions in different ways to increase the splendor of the patterns.

AUGHUMLA, ou-d'hoom'-lă, a cow in Scandinavian mythology: she licked away the frosts in the spring, she breathed warmth into the earth and brought forth Buri, father of Borr, who was the father of Odin. Upon her milk subsisted the giant Ymir.

AUDIFFRET-PASQUIER, o'dĕ-fra'pas-kyă', Edmé Armand Gaston, Duc d', French statesman: b. Paris 1823; d. 1905. He was president of the Senate 1879. He was elected to the French Academy in 1878.

AUIDIOMETER, for the measurement of hearing, an instrument devised by Professor Hughes, the English inventor of the microphone. Among its constituent parts are an induction coil, a microphone key and a telephone. The audiometer has been materially modified, and is now principally used for obtaining a balance of induction from two electric coils acting upon a third. A scale is provided to show the extent of the movement. A varying or interrupted current being passed through the two outer coils, the preponderating current will produce the most induction if the central coil is equidistant. It can always be moved to such a point that there will be no inductive effect, one counteracting the other. Thus its position measures the relative induction. A telephone is in circuit with the intermediate coil and is used to determine when its position is such that no current is induced in it.

AUDIPHONE, an invention to assist the hearing of partially deaf persons in whom the auditory nerve is not entirely destroyed. The instrument, made of a thin sheet of ebonite rubber or hard vulcanite, is about the size of a palm leaf fan, with a handle and strings attached to bend it into a curving form, and a small clamp for fixing the string at the handles. The audiophone is pressed by the person using it against his upper front teeth, with the convex side outward; when so placed it communicates the vibrations caused by musical sounds or articulate speech to the teeth and bones of the skull, thence to the organs of hearing. For different sounds it requires to be focused to different points. A piece of fine glazed mill-board has been recommended by some experimenters as cheaper and equally serviceable; and birch wood veneer has been used with success for the same purpose. The ear trumpet and modern electric devices have to a great extent supplanted the audiophone.

AUDIT, a term denoting an examination into accounts or dealings with money or property, along with vouchers or other documents connected therewith, especially by proper officers, or persons appointed for the purpose. Also the occasion of receiving the rents from tenants on an estate.

AUDITING. See ACCOUNTING.

AUDITION. See EAR; HEARING.

AUDITOR. Term now commonly applied to expert accountants who examine and state the accounts of government departments, corporations, etc. An auditor is an officer of the government, whose duty it is to examine the accounts of officers who have received and disbursed public moneys by lawful authority. In practice an auditor is an officer of law or court, assigned to state the items of debit and credit between the parties in a suit where accounts are in question, and exhibit the balance. They may be appointed either by courts of law or equity. They are appointed at common law in actions of account, and in many of the states in other actions, under statutory regulations. The auditor's report must state a special account, 4 Yeates, Penn. 514, giving items allowed and disallowed, 5 Vt. 70, but it is sufficient if it refer to the account, and it is their duty to report exceptions to their decisions of questions taken before them to the court, and exceptions must be taken before them, 4 Cranch, U. S. 308; 22 Bart. N. Y. 39, unless apparent on the face of the report. The report of the auditor as to facts is final in some of the States, unless impeached for fraud, misconduct or very evident error. When the report is set aside in whole or in part, it may be referred back or may be rectified by the court, or accepted if the party in favor of whom the wrong decision is made remits the item.

Treasury Auditors.—In the United States Treasury Department there are six auditors, one for this department itself while the others audit the accounts of the Army, Interior, Post-office, War and State and other departments. These auditors decide whether accounts against the government are submitted in the proper form, but if differences of opinion arise appeal may be made to the Comptroller of the Treasury.

State Auditors.—Most of the State Constitutions provide for auditors who shall audit the public accounts and perform whatever other duties are prescribed by the statutes. These officers are usually elected, New Jersey, Tennessee and Virginia the election being by joint ballot of the legislature. In Colorado, Oklahoma and Pennsylvania two successive terms are prohibited. Often the auditor is a member of the State executive boards, such as the board of taxes, etc.

Local Auditors.—In Indiana, Iowa, Minnesota, Ohio and South Dakota the county auditors are elective and in about one-third of the States the county auditors are regular county officers. County auditors also are found regularly in California, Mississippi, Nevada, New Jersey, South Carolina and Washington, and such officials may be found also in the larger counties of Kansas, Michigan, New York, Pennsylvania and Utah. It is the duty
of these auditors to keep accounts of receipts and expenditures, to issue warrants for the expenditures of the county, to prepare tax lists, and sometimes to assess property for purposes of taxation. In some States the county auditors act as assessors and auditors and in several States the county commissioners or board of supervisors audit the accounts. In New England the boards of selectmen usually examine town and township accounts, while in the Middle Atlantic and North Central States this work is performed by the town boards. In Kansas, Minnesota, Nebraska, North Dakota, Ohio, South Dakota, Wyoming, and partially in Massachusetts and New York, a centralized system of auditing county and town accounts has been put into operation. Consult Beard, C. A., 'American Government and Politics' (New York 1911), and 'American City Government' (New York 1912); Fairlie, J. A., 'Local Government in Counties, Towns and Villages' (New York 1909); F. W. Field, 'The Actual Government' (New York 1908); Renick, E. L., 'Control of National Expenditures,' in Political Science Quarterly, Vol. VI, pp. 248-81 (1891); Thorpe, F. N., 'Federal and State Constitutions' (Washington 1899). For the law as to auditors in England see Pixley, 'Auditors: their Duties and Responsibilities' (London 1896).

AUDITORY CANAL. See EAR.

AUDITORY, or EIGHTH, NERVE, the nerve of hearing, and of the sense of position. It has its origin in two distinct portions of the ear, in reality being two distinct nerves, the cochlear and the vestibular, both of which are sensory in their function. The cochlear nerve originates in the cells of the organ of Corti in the cochlea of the ear, and is the one that carries sound impressions into the brain. The vestibular nerve has its origin in the semicircular canals and is the nerve that conveys the sense of localization of position. Both of these nerves soon join and run together in the internal meatus, where they lie in the same sheath for some distance with the seventh or facial nerve. They enter the medulla, the cochlear nerves forming the acoustic stria on the floor of the fourth ventricle, and end above the superior olivary body and the nucleus of the trapezium. From here the fibres enter the fillet and end about the auditory centre in the brain in the second temporal convolution. Disease here causes auditory aphasia. The fibres of the vestibular branch end in the nuclei of Deiters and Budge in the medulla, and then further fibres pass for the most part into the cerebellum. Disease here causes cerebellar ataxia. See ATAXIA; APHASIA; EAR; EQUILIBRUM; HEARING.

AUDLEY, Sir James, one of the original knights of the Order of the Garter: b. 1316; d. 1369. He was in the suite of Edward III and the Black Prince in France, and in 1350 distinguished himself in the naval engagement with the Spaniards at Sluys. He was so conspicuous here that after the Prince retained him as his own knight and conferred on him an annual revenue of 500 marks, which he immediately gave over to his squires. This generosity so pleased the Prince that he immediately conferred a further annuity of 600 marks on Audley. He also ac-

compained the Black Prince to Spain and in 1369 the office of seneschal of Poitou was conferred on him. He took part in the capture of La Roche sur Yon, in Poitou, in the same year, dying some months later. When Edward III founded the Order of the Garter, in 1344, Audley was one of the first honored.

AUDLEY, a manufacturing town in Staffordshire, England. It has a church dating from the time of Edward II. Pop. 14,776.

AUDLEY OF WALDEN, Thomas, Baron, English Lord Chancellor in the reign of Henry VIII: b. 1468; d. 1544. In 1529 he was speaker of the famous Long Parliament. In 1532 he was knighted and made Keeper of the Great Seal, becoming Lord Chancellor in the following year. In this office he succeeded Sir Thomas More, at whose trial he was presiding judge. He was also presiding judge at the trials of the supposed accomplices of Anne Boleyn, when the King wished to bring himself of that Queen, and of the paramour of Catherine Howard. He figures throughout English history of that period as the accomplish of Henry VIII in all his foulest deeds.

AUDOUARD, d' Olympe, French writer: b. 1630; d. 1690. She was married to a notary in Marseilles, but soon after divorced. She traveled in Egypt, Turkey and Russia, and having conducted various journals in Paris since 1660, made a successful lecture tour through the United States in 1865-69. After her return she became interested in spiritualism. She was an ardent advocate of women's rights. Among her novels and books of travel may be mentioned 'How Men Love' (1861); 'The Mysteries of the Seraglio and of the Turkish Harem' (1863); 'The Mysteries of Egypt Unveiled' (1865); 'War to Man' (1865); 'Across America' (1869-71); 'Parisian Silhouettes' (1883).

AUDOUIN, Jean Victor, French naturalist: b. Paris 1797; d. 1841. He was professor of entomology in the Paris Natural History Museum and was one of the first and first president of the Entomological Society. He wrote much respecting the injuries done by insects to vine and silk culture. He contributed the part on insects in Cuvier's 'Regol Animal.'

AUDRAN, Edmond, French composer: b. Lyons 1842; d. 1891. He studied music in Paris and in 1861 became choral director at Saint Joseph's Church, Marseilles. In 1881 he returned to Paris and collaborated with Chivol and Duru in comic operas. He composed several comic operas which were exceedingly popular, among them 'La Mascotte' (1881); 'Olivette: Le Grand Mogol' (1884); 'Miss Helyett' (1890); 'La Poupée.'

AUDRAN, Gerard, French engraver: b. Lyons 1640; d. Paris 1703. He studied under his father and uncle and after three years at Rome under Maratti, where he acquired a high reputation by his engraving of Pope Clement IX, was recalled to France by Colbert, and became his pupil. Here he engraved the works of Lebrun, illustrating the battles of Alexander, and many paintings by Raphael, Titian, Domenichino, Poussin and others. He reproduced Mignard's decorations of the ceiling of the royal apartment at Versailles, and the cupola of the

AUBREY, Saint. See ETHELREDA, SAINT.

AUBREY, a’dri (1) a shepherdess in Shakespeare’s comedy ‘As You Like It.’ (2) A character in Jonson’s comedy ‘A Tale of a Tub.’

AUDLEY, George Ashdown, Scottish-American architect: b. Elgin, Scotland, 6 Sept. 1838. He established himself in the United States in 1892, and subsequently became prominent both as an architect and author. In collaboration with his brother, WILLIAM J. A. AUDLEY, he was author of several works—on illuminating, decorating, Christian symbolism, etc., and, individually, published ‘Keramic Art of Japan,’ ‘Ornamental Art of Japan,’ ‘The Art of Chromolithography,’ etc.

AUDUBON, a’dou-bon, John James Fougèrè, American naturalist: b. Les Cayes, Saint-Domingue (now Haiti), 26 Jan. 1785; d. New York, 27 Jan. 1851. His father was an adventurer and his mother a Creole. At an early age he showed an absorbing interest in all living things, especially birds, a fondness which remained with him throughout his life. He was a keen and sympathetic observer, rather than a trained specialist either in science or art. He was educated in France and studied drawing for some time under the great artist, David, but in 1788 he returned to America and took possession of a farm owned by his father on the Perquimans River, near Philadelphia. Here, in 1808, he married Lucy Bakewell, the daughter of an English neighbor; with her he moved to Kentucky and subsequently to Louisiana, living in both places with financial misadventures due to his inadaptability to attend properly to trade, which left him so poor that he was obliged to paint portraits and teach dancing and fencing. From his boyhood, however, he had been much interested in sketching birds and studying their habits, and in 1826 he found means to take these sketches to England, where he elaborated them into the great series which made him famous and relieved his pecuniary troubles. From 1827–38 he published a series of 1,055 colored figures of American birds in a work, ‘The Birds of America,’ which still holds its place as one of the most attractive and beautiful ornithologies of the world. No reading matter accompanied these plates, but later in 1831–39 five volumes were issued under the title ‘Ornithological Biography,’ the technical part of which was by William McGillivray. Many editions and reprints were issued later, of which the most important was the octavo edition of 1844. In 1830 he returned to America to travel for new material and, in 1831, began the publication of his ‘Ornithological Biography,’ in five volumes. In 1842, after 12 years spent chiefly in explorations, he bought a home on the Hudson River at a spot considerably north of New York city at that time, but now within the city limits and known as Audubon Park; here his two sons, Victor Gifford and John Woodhouse Audubon, also lived with their families. In 1843 the naturalist took up residence, going to the Missouri River region. After 1844 he devoted himself with Dr. John Bachman (q.v.) and his sons, to a new publication, ‘The Quadrupeds of America.’ After 1847 his health began to fail and he gradually lost the use of his mind. He was buried in Trinity Cemetery, New York. The full details of his life may be found in ‘His Journals,’ by his granddaughter, Maria R. Audubon, with zoological and other notes by Eliott Coues (1897), and in another biography by Lucy Audubon, as well as in ‘The Life and Adventures of J. J. Audubon, the Naturalist,’ by Robert Buchanan (1867); the biographer is Francis Hobart Herrick, who has compiled a very excellent work, ‘Audubon the Naturalist,’ from a mass of documents in the possession of an old notary in Couéron, France (2 vols., New York 1917).

AUDUBON SOCIETIES are organizations of bird-lovers who work to educate public opinion to a proper appreciation and protection of bird life. The term ‘Audubon Society’ was coined by George Bird Grinnell (q.v.) in 1886, and an organization for the protection of birds was at that time started by Dr. Grinnell in New York, in association with William H. Nyheim, a member of his congregation, and Grinnell was elected president and Nyheim vice-president. The national committee of Audubon societies was organized at a meeting held in Washington in 1902; and 1905 saw the organization of the National Association of Audubon Societies for the Protection of Wild Birds and Animals; with William Dutcher as president and T. Gilbert Pearson as secretary and financial agent. The generosity of Mr. Albert Willcox provided financial support of the undertaking at this period (more than $531,072 in 1906 and 1907), and at the end of 1906 the Association had an interest-bearing endowment fund of more than $336,000 and an income from other sources of approximately $9,000. In May 1910, the Audubon bill to prohibit the sale of the feathers of native birds in the State of New York was enacted. A similar law has since that time been enacted in about 12 other States. Many laws for the establishment of game commissions and game warden forces, or prohibiting the sale of game, owe their existence to Audubon’s society activities; and from the beginning the educational side of Audubon work has been prominent. Up to 1 July 1915 the Association had enrolled as Junior Audubon members 373,153 school children, and had given systematic instruction in bird lore to them and to 18,906 teachers. Hundreds of articles bearing on the economic value of birds to mankind have been published in school journals, in various literary magazines and in newspapers throughout the country. A force of six or seven leaders is maintained, who give illustrated addresses before audiences of school children and to women’s clubs, granges and other organizations. A system of courses in bird study is given by the association’s special corps of lecturers at many different State summer schools for teachers.

In 1914 the Association began its department of applied ornithology. This is a special work to encourage the people generally to attract birds to their gardens by planting native trees and to induce those favorably situated to engage in the propagation of wild ducks and other game
birds. Bulletins and lectures bearing on this point are destined to produce a decided influence on popular sentiment.

The National Association of Audubon Societies is to-day a strong, far-reaching institution. The organization, in preserving wild life, it recognizes fully the claims of the sportsman, and has no fight with the man who legally kills game birds and game animals. In summer it guards, by means of paid wardens, thirty thousand in full of a colony of sea-birds on the Atlantic and Gulf coasts of the United States, as well as on many lakes of the interior. It owns or leases many islands where ducks and sea-birds breed. It originated the system of Federal bird reservations, and co-operates financially with the government in protecting them. It publishes and distributes annually over 6,000,000 pages of bird-protective literature, and the home office has become a general clearing house for all kinds of information in reference to the study and conservation of wild birds and animals. The Association makes expenditures every year for the protection of big game, for feeding game birds and song birds in winter, and in prosecuting violators of the laws. The Association collected over $90,000 in the bird-protective cause in 1914, and the friends of the organization speak with pride of the fact that only 7 per cent of the income is being expended for administrative salaries.

AUE, Hartmann von, German poet: b. 1170; d. about 1215. He was of humble birth, being the vassal of the Lord of Aue, who took him with him in one of the crusades, either in 1189 or 1197. Very little is known of his life. Of his works 'Erec' is undoubtedly the best (2d ed. in High German, Halle 1855). In this epic poem, of some 10,000 lines, the Arthurian legend is re-woven into German. Next in importance is his 'Gregorius von Stein,' the material of which is drawn from French romance (Berlin 1838). His most popular work was 'Der arme Heinrich,' his one work which is based on German folk lore (published by the Grimm Brothers, Berlin 1815). Many editions of his works have been published in German. Consult Cassel, 'Die Symbolik des Blutes und der arme Heinrich des Hartmann von Aue' (Berlin 1882).

AUE, Saxony, Germany, city in Zwickau, on the Zwackau-Schwarzenberg Railroad, near the juncture of the Mulde and the Schwarzwasser rivers. It is a busy industrial centre, manufacturing paints, metal ware goods, textiles, furniture, paper, tobacco pipes, etc. It is the seat of the District Court, has five public buildings and its population is about 20,000.

AUBER, Alois, Ritter von Welsbach, Austrian printer: b. Wels 1813; d. 1869. He was trained as a compositor and in his leisure moments acquired several languages, becoming a professor of Italian in the Gymnasium of Linz. In 1844 he printed in Switzerland, France and England, collecting material for his art. From 1841 to 1868 he was at the head of the imperial printing office at Vienna. He made many typographical discoveries; among them 'Das Vaterunser in 608 Sprachen' (1844); and 'Das Vaterunser in 206 Sprachen' (1847); 'Die Buchschriften des Mittelalters' (1852); 'Geschichte der K.-K. Hof-und Stadtsdruckerei in Wien' (1851).

AUEP, Leopold, Hungarian violinist: b. Veszprém, Hungary, 26 May 1845. His first musical training was gained in Pest; in 1858 he studied in the Vienna Conservatory and later was a pupil of Joachim in Hanover. In 1863 he was concert master in Düsseldorf. In 1868 he was appointed soloist of the imperial orchestra in St. Petersburg, where he was professor in the conservatory. By this time he was becoming known as one of the world's greatest violin soloists. In 1895 he was raised to the rank of a hereditary noble. He is also famous as a teacher, among his pupils being Elman and Zimbalist.

AUBERBACH, ow'-er-bach, Berthold, German novelist: b. Nordstetten, Würtemberg, 28 Feb. 1812; d. Cannes, France, 8 Feb. 1882. He began to write while a student in Heidelberg and under the pseudonym Theobald Chauber produced a 'Biography of Frederick the Great' (1834-36). He was the founder of the modern German 'tendency novel,' in which fiction is used to influence public opinion on social, political and religious questions. Auberbach was an admirer of Spinoza, and the latter's philosophy is evident in his novels. A series of novels from the history of Judaism, under the collective title 'The Ghetto,' of which 'Spinoza' (1837) and 'Poet and Merchant' (1839) were printed in separate editions, was followed by a translation of Spinoza, with a critical biogra phy (1841). 'Black Forest Village Stories' (1843), was received with universal favor, translated into nearly all European languages and established his fame. To this class of tales belong also 'The Professor's Lady' (1847); 'Little Barefoot' (1856); 'Joseph in the Snow' (1860); 'Edelweiss' (1861); and 'After Thirty Years' (1876). His first effort in the field of the novel, 'New Life' (1851), met with little favor; but 'On the Heights' (1865) constituted the crowning success of his literary career. It was followed by 'The Villa on the Rhine' (1868); 'Waldfried, a Family History' (1874); and 'The Head Forester' (1879). His last years were embittered by the growth of anti-Semitism in Germany. His 'On the Heights' is still popular. His works appeared in 18 volumes in 1892-95. See Auf der Höhe, Consult Bettehalm, A., 'B. Auberbach, der Mann, sein Werk' (1907); Lasker, E., 'Berthold Auberbach, ein Gedenkblatt' (1882), and Zabel, 'Berthold Auberbach' (Berlin 1882).

AUBERBACH, Henry: b. 1482, at a place of the same name, in Bavaria, was the founder of the Auberbach court and cellars, named in Goethe's 'Faust.' The building was
AUERLITE—AUFRICHT 

erected in 1530, and tradition reports that five years after Dr. Faust was seen riding out of it on a barrel of wine. This tale Goethe has made use of in his famous poem.

AUERLITE, a rare North Carolina mineral, remarkably rich in thorium, named after Dr. Carl Auer von Welsbach, the inventor of the Welsbach gas mantel. It was originally described as a hydrous silico-phosphate of thorium, \( \text{ThO}_3(\text{SiO}_4 \cdot \text{P}_2\text{O}_7) + 2\text{H}_2\text{O} \). It occurs in yellowish, zircon-like crystals of resinous lustre and having a hardness of 2.5 to 3 and a specific gravity of 4.1 to 4.7.

AUERSBERG, Adolf Wilhelm Daniel, Pastor, Karl von, Austrian statesman: b. 21 July 1821; d. 5 Jan. 1885. From 1841 until 1860 he served in the army, attaining the rank of major of dragoons, in the regiment of Prince Eugene. In 1867 he began his political career as a member of the Bohemian Diet, where he represented the landed proprietors in the Liberal party. In the following year he became a life member of the upper chamber of the Austrian Reichsrath. In 1870 he became governor of Salzburg, and was made a member of the Austrian ministry in the year following. With the authority that this office gave him he was very active in effecting electoral reforms, especially in the matter of securing direct representation in the lower chamber of the Reichsrath. He was also instrumental in bringing about closer relations with Hungary.

AUERSBERG, ow-er-spöhr, Anton Alexander, Count of, Austrian poet and statesman, wrote under the name Anastasius Grün: b. Lainbach, Carinthia, 11 April 1806; d. Graz, 12 Sept. 1876. Studied engineering in Graz, but later took up philosophy and law in the University of Vienna. In 1848 he was elected to the German preliminary Parliament, and later became a member of the National Assembly in Frankfurt. In 1861, under the ministry of Schmerling, he was created a life member of the Austrian upper house, where he became prominent as a Liberal. Already as a youth his poetry had been attracting attention, his first works being of a political nature. His best known, non-political poem was 'Der letzte Ritter' (1830), written in the metre of the 'Nibelungenlied' and eulogizing Maximilian I. Among his other noteworthy works are 'Die Niederung im Fräulein' (1843); 'Der Pfaff vom Kählenberg' (1850); 'Volkslieder aus Kain' (1850); 'Rohin Hood' (1864). His collected works were edited by L. A. Frankl (5 vols., Berlin 1877).

AUERSTADT, ow-er-stät, Saxony, a village famous for the great battle which took place there on 14 Oct. 1806, between the French under Davoust and the Prussian army under Duke Charles of Brunswick, which ended in a great victory for the former. The Prussians, who numbered 48,000, left nearly half of their men dead or wounded on the ground, while the French (30,000) escaped with a loss of only 7,000. Napoleon made Davoust Duke of Auerstadt. The village lies 25 miles northeast of Weimar. Consult Lettow-Vorbeck, 'Der Krieg von 1806 und 1807' (Vol. I, Jena and Auerstädt, Berlin 1891).

AUF DER HÖHÉ, 'On the Heights' (1865) reflects a period of constitutional political conflict in Germany, and is the most widely known of Auerbach's novels. The central figure is a king whose self-confident individuality comes in conflict with his love of popular freedom. Anticipating the 'superman' of later writers, he feels that his nature is cast in too large a mold to be accommodated by constitutional restraints or ethical conventions. In conflict with a majority of the elected representatives of the people over some ecclesiastical question, he dissolves the assembly in his impatience of any outer control. The same characteristics are manifesting themselves meantime in his domestic life. His queen is a gentle lady of domestic instincts. He loves her, yet finds in the forceful, energetic Countess Irma, one of her ladies in waiting, a spirit so answering to his own that they join to transgress, he the bond of marriage, she of loyalty to her queen. Atonement comes first to Irma, who withdraws from the court into solitude, recognizing that one who would live a life of nature may not claim the protection of the social order. Thus the king is brought to realize that life for its full unfolding depends not only on following the law of nature or the law of custom, but in the co-ordination of them, when man of his own free will yields obedience to law. He dismisses his automatic councillors and bows to the will of his people. The stress of this psychic drama is relieved by scenes between the queen and Wallpurga, the little prince's peasant nurse, who passes, as does her husband, through a conflict parallel to that of Irma and the king, though both are saved from straying by their unsophisticated respect for the folk-ways. The contrast between court and peasant life is a primary interest in 'On the Heights.' There are translations by S. A. Stern and others.

BENJAMIN W. WELLS.

AUFFENBERG, owf-in-born, Joseph, Baron von, German dramatist: b. Freiburg, 25 Aug. 1798; d. there, 25 Dec. 1857. After studying law in the Freiburg University, he entered the army, where he attained the rank of lieutenant of the horse guards. Several years afterward he became a member of the same committee of the Court Theatre at Karlsruhe. Among his more important productions are 'Pizzaro' (1823); 'Ludwig XI in Peronne'; 'Die Flibustier'; 'Konig Erich'; 'Das Geister des Themistokles'; 'Fergus MacIvor'; 'Das Nordlicht von Kasan.' His collected works were published at Wiesbaden in 1855 in 22 volumes. Consult Stahl, 'Joseph von Auffenberg' (Hamburg and Leipzig 1910).

AUFRICHT, owf-reht, Theodor, German Oriental scholar: b. Lenzitz, 7 Jan. 1822; d. 1907. Graduating from the University of Berlin, he immediately became interested in Oriental research. When only 25 years of age he published a treatise on Sanskrit (Bonn 1847). With Kirchhoff he collaborated in the publication of 'Die urmischen Denkmaler' (1849-51). In 1862 he was appointed professor of Sanskrit at the University of Bonn, but in 1875 returned to Bonn. Among his works are the edition of 'Rigaveda,' rendered into Roman letters (Bonn 1877); 'Altreya Brahmana' (1879); 'Catalogus Catalogorum,' an alphabetical register of Sanskrit works and authors (Leipzig 1899-1903).
AUGLEAN (ä’jé-an) CODEX (Codex Augien sii), a noted Greek and Latin manuscript of a work of St. Paul, supposed to have been written in the 9th century, and so called from Augia Major, the name of a monastery at Rheinau. After passing through several hands it came, in 1718, to Dr. Bentley, who purchased it for 250 Dutch florins. It is now in the library of Trinity College, Cambridge. This manuscript is written in uncial letters, and without accents; not continua serie, as is common with the more ancient copies, but with intervals between the words, and a dot at the end of each. The Greek text is written in capitals, the Latin in Anglo-Saxon characters; hence it is tolerably clear that it must have been written in the west of Europe, where that formation of the Latin letters, usually called Anglo-Saxon, was in general use between the 7th and 12th centuries.

AUGEAS, in Greek legend, a king of Elis, famed for his stable, which contained 3,000 oxen and had not been cleaned for 30 years. Hercules was desired to clear the filth away in one day, and Augeas promised if he performed it to give him a tenth part of the cattle. This task was thought to have been executed by turning the river Alpheus, or as some say, the Peneus, through the stable, which immediately carried away the dung and filth. Augeas refused to perform his engagement. Upon this a war ensued and Hercules conquered Elis and put Augeas to death.

AUGER-SHELL, a common designation of the spiral gastropod mollusks of the Tereboidea family. The shells are slender and tapering, sometimes ending in a sharp point and are usually decorated with brown, orange and red spots or patches. More than 200 species are known, all inhabitants of tropical waters, where they occur from the shallow waters of the shore to very great depths.

AUGEREAU, özh-ro’, Pierre François Charles, Duke of Castiglione, a marshal of France: b. Paris, 1757; d. 12 June 1816. He came of humble parents and at an early age was sent to school. He served for some time in the French carabiniers and later joined the Neapolitan army. He remained in the latter service until 1787, when he became a fencing master at Naples. In 1792 he, with all other French residents, was banished from Naples and at once joined the French Revolutionary army. He distinguished himself in 1794 as general of brigade in the army of the Pyrenees, and in 1796 as general of division in the army of Italy. He made himself master, 16 April, of the entrenched camp of the Piedmontese at Ceva, afterward of that at Casale; threw himself on the bridge of Lodì, and carried it with the enemy’s intrenchments. 1 August he came to the assistance of Massena; maintained during a whole day a most obstinate struggle against a superior number of troops and took the village of Castiglione, from which he derived his ducal title. In the battle of Arcole, when the French columns wavered, Augereau seized a standard, rushed upon the enemy and gained the victory. The Directory bestowed this standard on him 29 Jan. 1797. In 1799 he was chosen a member of the Council of Five Hundred, and therefore resigned his command. He then obtained from the consul Bonaparte the command of the army in Holland. Being superseded in October 1801, he remained without employment till 1803, when he was appointed to lead the army stationed at Bayonne against Portugal. When this enterprise failed he went back to Paris, and 19 May 1804 was named marshal of the empire, and grand officer of the Legion of Honor. In July of this year the King of Spain sent him the command of the forces in Italy for his successes which gave birth to the peace of Pressburg, and in March 1806, had possession of Wetzlar and the country around, until, in the autumn of this year, a new war called him to Prussia. Early in 1807 Napoleon gave him the command of a corps in the army of Spain. After the entrance of the allies into France, he made submission to Louis XVIII, who made him a peer, Napoleon, on his landing in 1813, declared him a traitor. Augereau expressed himself in his favor, but took no active part in the new order. After the King’s return he took his place again in the chamber of peers.

AUGIER, ö-zhýär’, Guillaume Victor Emile, French dramatist: b. Valence, 17 Sept. 1820; d. Croissy, 25 Oct. 1889. He was well educated and prepared for the law, which he was not intended to follow, but his grandfather of Figault Lebrun, and from him inherited a bent for literature. In 1844 he wrote a two-act play in verse, ‘La Cigüé,’ which enjoyed considerable success at the Odéon. Thereafter his career was decided and regular intervals for many years, alone, or in collaboration with others — Sandaye, Labiche, Foussier — plays were produced which raised the drama to a realistic life and to a true morality than it had known since Molière. ‘L'Aventurière’ (1886) was the first of his important works and in it there is apparent a deviation from the romantic models of the earlier years of the century. ‘Gabrielle’ (1849) champions the average conventional. ‘Diane’ (1852) and ‘La pierre de touche’ (1853) show a tendency to get away from the sensationalism of the romanticists. ‘Le fils de Giboyeur’ (1862) was regarded as an attack on the Clerical party and was only brought out by the direct intervention of the Emperor. With Sandaye he produced ‘Le gendre de M. Poirier’ (1854), thought by many the greatest French drama of the 19th century. ‘Ceinture dorée’ (1855) was a satire on the conventional marriage and was the forerunner of a series of social satires of which ‘Les effrontés’ (1861) was perhaps the most noteworthy. ‘Le mariage d’Olympe’ (1855) shows the courtesan as she is and without the glamour with which she was surrounded by the romanticists. In ‘Les liones pauvres’ (1838) appears Augier’s greatest female character, Séraphine. ‘Maitre Guérin’ (1864) presents a fine study of the tricky country lawyer. In 1873 appeared ‘Jean de Thommery.’ While patriotic it is a trifle prosaic and its success was mediocre. ‘Madame Caverlet’ (1876) deals with divorce and ‘Les Fourchambault’ (1879) is also a problem play. Augier was not a mere preacher, but a moralist, with a sane outlook on life. His dramas are not dependent merely on plot for their interest, as the delineation and evolution of the characters introduced. See Le Gendre de M. Poirier; Le Fils de Giboyeur; Consult Dournic, ‘Portraits d’écrivains’ (Paris 1894); Gaillard, ‘Émile Augier et la comédie sociale’ (Paris 1910); La-

AUGSBURG, owgs'burg, Bavaria, city and capital of the government districts of Suabia and Neuberg, 35 miles northwest of Munich. It is situated on a point of land formed by the junction of the Lech and the Wertach. The town has a medieval appearance, and there are many buildings extant of the period from the 15th to the 17th centuries. It contains several churches, rich in architectural beauty and in artistic associations. These churches are rich in metalwork, stained glass windows, etc., the liberal containing several altar pieces by Holbein the Elder. The Rathaus is notable for its Golden Hall. Other noteworthy buildings are the former palace of the prince-bishops, the royal picture gallery, the city library, etc. Augsburg has large hallowed woolen mills, machine shops, and manufactures acetylene gas, chemicals, paper, jewelry and leather. The city was founded by Augustus in 12 B.C. The Huns devastated it in the 5th century, Charlemagne in the 8th and Welf in the 11th. In 1273 its freedom and at the time of the Reformation was one of the most flourishing cities of Europe. Its trade at this time was very great and a great number of merchant princes were numbered among its citizens. It also became distinguished as an art centre, and was represented in this field by the Holbeins, Altdorfer and Burgkmair. Several Diets were held here and it was prominent in the Reformation. Much of its prosperity was destroyed during the Thirty Years' War. It lost its freedom with the fall of the German empire in 1806, and was joined to Bavaria. Pop. (1910) 102,487. Consult ‘Die Chroniken der schwäbischen Städte, Augsburg’ (Leipzig 1896); Lewis, ‘Roman Antiquities of Augsburg and Ratisbonn’, Vol. LVI (London 1891); Werner, ‘Geschichte der Stadt Augsburg’ (Augsburg 1900).

AUGSBURG, League of, a league concluded at Augsburg, 9 July 1686, for the maintenance of the treaties of Münster and Nimègue, and the truce of Ratisbon, and to resist the encroachments of France. The contracting parties were the Emperor Leopold I, the Kings of Spain and Sweden, the Electors of Saxony and Bavaria, and the circles of Suabia, Franconia, upper Saxony and Bavaria.

AUGSBURG CONFERENCE, a document adopted by the Protestants in 1530 as a declaration of faith. Charles V, on his accession to the throne of Germany (1520), found his new dominion the theatre of religious dissections. The insurrection in Castile, and the war with France and Italy, called Charles into Spain. The Diet of Augsburg (1529) had issued a decree for the purpose of conciliating the Lutherans to the proposed Roman Catholic reform, and uniting them against the Sacramentarians and Anabaptists. At this juncture, Charles tacked on the princes and estates were summoned to convene in Diet at Augsburg in June. The summons was conciliatory, and called for aid against the Turks, making no reference to the religious difficulties of the kingdom, further than to promise at no distinct time a speedy adjustment of them. On the 25th of the month a conference was prepared by Melanchthon, and approved by Luther, was presented and read by Dr. Christian Bayer in the Diet. This conference is said to have been prepared on the basis of the Swabach and Torgau articles, although these had been drawn up (1528-29) in the attempt to unite with the Zwinglians, and the object of the present conference was to become reconciled to the Roman Catholic reform party. A copy of the confession, in German and Latin, was delivered to Charles. Two days after the reading of the confession, it was delivered to the Roman Catholic theologians for a reply. The reply was read in the Diet on 3 August following, and called forth from Melanchthon a defense (Apologetia Confessionis), which was afterward enlarged and published in Latin, and then in German. The object of the Augsburg Confession was not attained, and the edict of the Emperor (22 September) gave the Lutherans until the following April to bring themselves into conformity with the Roman Catholic Church, and required their co-operation with the throne against the Zwinglians and Anabaptists. The Augsburg confession and Melanchthon's defense were generally circulated in western Europe, and became a sort of rallying point among the reformers. Consult Jacobs, 'The Book of Concord' (Philadelphia 1882) and Schaaf, 'Creeds of Christendom' (New York 1884).

AUGSBURG SEMINARY, an educational institution in Minneapolis, Minn., under the auspices of the Lutheran Church, was organized in 1869 and reported in 1915: Professors, 9; students, 154; grounds and buildings valued at $120,000; income, $19,000; graduates, 393 from theological department; 247 from college.

AUGUR, Christopher Colon, American military officer: b. New York, 10 July 1821; d. Washington, 16 Jan. 1898. He was graduated at the United States Military Academy in 1843; became major of the 13th United States Infantry in 1861; colonel of the 12th Infantry in 1866; brigadier-general, United States army, 4 March 1869; major-general in the volunteer service in 1862; mustered out of that service in 1866; and was retired in the regular army, 16 July 1885. He commanded a division in the battle of Cedar Mountain, being severely wounded. Consult Augur, E. P., 'The Augur Family' (Middletontown 1904).

AUGUR, Hezekiah, American sculptor: b. New Haven, Conn., 21 Feb. 1791; d. 18 Jan. 1858. He was the son of a carpenter and early developed a talent for wood carving. He became successively a cobbler, grocery clerk and merchant. 'Jepthah and His Daughter,' in the Trumbull gallery at Yale, is the most important of his works. In addition to his skill as a sculptor, he possessed much mechanical genius, inventing among other machines one for carving wood.

AUGURIES AND AUSPICES, the replies of the augurs, a celebrated college of diviners in ancient Rome. Their function was to determine, reveal and interpret the will of the gods towards men in regard to some
definite matter or course of action already determined or in progress. This they determined from the occurrence of certain signs, connected with thunder and lightning; the flight and cries of birds; the feeding of the sacred chickens; the action of certain quadrupeds or serpents; accidents, such as spilling the salt, stumbling of a horse, etc. The answers of the augurs and the signs were called auspices; bird-predictions were called auspices. Nothing was undertaken without the advice of the augurs, and by the words "aliae diei" (*meet on another day*), they could dissolve the assembly of the people and annul decrees passed at the meeting. Taking the auspices in regard to state action gradually degenerated into a mere religious fiction, used by the ruling powers to promote or thwart action, according to their desires. Consult Bouché-Leclerc, "Histoire de la divination dans l'antiquité" (Paris 1881-82); and articles "Augures" and "Auspicium" in Pauly-Waissow, "Realencylopädie der klassischen Altertumswissenschaft" (Stuttgart 1896).

AUGURS. See AUGURIES AND AUSPICES.

AUGUST, ou'göst, the name of many princes of the German principalities: (1) AUGUST WILHELM, Prince of Prussia, brother of Frederick the Great and general in the Prussian army: b. Berlin, 9 Aug. 1722; d. 12 June 1758. He took an active part in the Silesian campaign, and distinguished himself at the battle of Hohenfriedberg (in June 1745), but owing to the fatal retreat of Zittau, in 1756, he incurred the displeasure of his brother, and withdrew from the army. This conflict between the two brothers led to a correspondence, which was published in 1769. (2) AUGUST EMIL LEOPOLD, Duke of Saxe-Gotha and Altenburg, successor to the throne, 20 April 1804. He was twice married, and the first marriage left him issue, one daughter, who became the reigning Duchess of Saxe-Coburg, and died in 1822. By the second marriage he had no children, and on his death he was succeeded on the throne by his brother, Frederick IV, with whose decease, 11 Feb. 1825, the line of Saxe-Gotha became extinct. Duke August Emil Leopold was a favorite of Napoleon, and his duchy enjoyed perfect immunity from the burdens of French invasions and French wars. He was a man of taste and considerable literary talent. (3) AUGUST FRIEDRICH WILHELM HEINRICH, Prince of Prussia: b. 19 Sept. 1790; d. 19 July 1843, in Bromberg; the son of Prince August Ferdinand, the brother of Frederick the Great, who died in 1813. He was considered one of the richest men in Prussia, and left various children by morganatic marriages. He took an active part in the campaign against Napoleon in 1806, by whom he was taken prisoner, and detained in Paris until after the Peace of Tilsit. On his return to Prussia in 1813, he resumed his duties in the Prussian army, fought at Dresden, Ulm and Leipzig, distinguished himself during the campaign of 1814, on various occasions, and bore throughout his life the character of a gallant soldier and an upright man. (4) AUGUST VICTORIA, Grand Duke of Oldenburg: b. 1783; d. 27 Feb. 1853; mounted the throne 21 May 1829, under the title of grand duke, which had been conferred upon his family by the Congress of Vienna; but of which his father had never availed himself. When Oldenburg was invaded by the French, in 1813, he accompanied his father to Russia, where his younger brother (b. 1784, d. 1812) was married to the Grand Duchess Catharine. He distinguished himself in the Russian War, and in 1813 was appointed governor of Revel. His reign, after his brother-in-law, lasted until the political and material progress. In 1830 he concluded a treaty with Prussia for the annexation of Birkenfeld to the Prussian-Hessian Zollverein, and a reciprocal treaty of navigation. In 1836 he prevailed upon Hanover and Brunswick to make satisfactory arrangements for the regulation of excise duties. In 1831 he laid the foundation for a constitution of Oldenburg, which was ratified in 1848, and which, although modified in 1852, still secures much civil and religious freedom to the people. In 1817 he married the Princess Adelaida of Anhalt-Bernburg, who died in 1820, leaving him two daughters, Frederica and Amalie; the latter, in 1830, married King Otho of Greece. In 1825 he married the sister of his first wife, Ida, who died in 1828, having borne him a son. He was married, for the third time, Cecilia, youngest daughter of the former King of Sweden, Gustavus Adolphus IV, who died in 1844, leaving a son. He was succeeded by his first son, Nicholas Frederick Peter, Grand Duke of Oldenburg.

AUGUST, the eighth month of our year, named by the Roman Emperor Augustus after himself, being associated with several of his victories and other fortunate events. Before this it was called Sextilis or the sixth month (counting from March). July had been named for Julius Caesar, and the Senate, to gratify Augustus, decreed that August should have equal length, taking a day from February.

AUGUSTA, ou'göst-ē, a title first given to his wife Livia, after the death of Augustus, according to the will of the Emperor. It was afterward conferred by Claudius on Agrippina (51 A.D.), and by Nero on his wife, Poppea, as well as her daughter (64 A.D.). Eventually it became a common title of the mother, wife, sister or daughter of an emperor.

AUGUSTA, Marie Luise Katharina, a Queen of Prussia, and Empress of Germany: b. 1811; d. 1890. She was the daughter of Charles Frederick, Grand Duke of Saxe-Weimar, and was educated at the Weimar court where she made the acquaintance of Goethe. In 1829 she married William, then Crown Prince of Prussia, afterward Emperor of Germany.

AUGUSTA, Ga., the third city of the State in population and wealth. It is the capital of Richmond County, and at the head of naviga-
tion on the Savannah River, 231 miles by water above its mouth. It is 132 miles by rail from Savannah, 171 miles east of Atlanta and 137 miles northwest of Charleston. There is an electric line to Aiken, which eventually is to be extended to Columbia. Two foot bridges and two railroad bridges span the river, which is about 300 yards wide. It lies about 150 feet above sea-level, has an even temperature and dry, invigorating atmosphere very different from most riverside cities, being indeed a real sea of land suitable to growing vegetables, particularly its suburban Summerville, on the Sand Hills 400 feet above it. It is laid out in broad rectangular streets, many of them beautifully shaded, and with a good electric car service; and has several parks, of which the chief are May Park of about 11 acres and Allen Park of 19 acres. The courthouse is in a park containing a granite monument to the Georgia signers of the Declaration of Independence; while on Broad street, the principal thoroughfare of the city, there is the most imposing monument to the Confederate dead with marble statues of Generals Lee, Jackson, Walker and Cobb, and crowned with one of a private soldier, heroic size. The cemetery and fair grounds are also suburbs of the city.

Manufactures.—The power is chiefly derived from a dam across the river seven miles above the city (enlarged from a smaller one in 1875, at a cost of about $1,000,000), 150 feet wide, 106 feet high, and 11 feet deep, turning a part of the river into a canal affording 14,000 horse-power, sold to industries at $5.50 per horse-power per annum, with a working day of 16 hours. Also 31,000 additional horse-power is derived from an electric power plant recently completed costing $2,250,000. To protect the city from overflows from the river a levee was built in 1915, upon which about $3,000,000 was expended. A large line has been established for the carriage of freight by the river, thus giving an all-water route to and from Eastern markets, together with the lowest freight rate. Augusta is one of the chief seats of cotton manufacture in the South. Eli Whitney’s cotton gin was invented on a farm on the outskirts, and the first working gin was set up in the city. There are 13 cotton mills with offices in the city, having a capital of nearly $6,000,000, operating 320,740 spindles, and 19,360 looms and employing some 8,000 hands. Of over $10,000,000 capital invested in Georgia cotton manufacture, fully a third is in Augusta. There are also six large cotton-seed oil mills and a bleacher. Of other manufactures, the chief are of lumber and wood products, bricks and tile drain pipe from the fine clays in the vicinity, flour, and iron goods. There are 371 manufacturing establishments, with $11,066,000 capital and 5,073 employees, paying $2,153,000 for wages and $6,602,000 for materials, and having a total output valued at $10,456,000. The increase within the past few years, however, has been very marked; it being prepared to utilize the river still more for electric power, the present manufactories practically exhausting the direct water power. The river at Augusta is from five to seven feet deep the year round, and fair-sized passages at low water. It is navigable 40 miles by weekly trips to Savannah. Augusta is the largest inland cotton market in the South; and it has also a large shipping trade in lumber, fruit and vegetables. Its annual trade exceeds $80,000,000, its cotton receipts amounting to 550,000 bales. The water supply is derived from the Savannah River and is unlimited. The city abounds in educational and charitable institutions. Most notable among the former is the Georgia Medical College, a branch of the State University at Athens; there are also Richmond Academy, which has recently been placed under the care of the State University; Saint Mary’s and Sacred Heart (Roman Catholic) academies. Pain’e Institute for Colored Students, and high schools for white and colored youth. There are two public libraries, an orphan asylum, two public hospitals (white and colored), a juvenile reformatory, and the Louise King Home. A United States arsenal, a Masonic temple, an Odd Fellows’ hall, a Chamber of Commerce and a cotton exchange are also prominent buildings. The city has three daily and several weekly newspapers. The assessable property valuation exceeds $26,000,000, and the bonded debt is about $2,000,000. There are two national and several State banks of which the total capital surplus and undivided profits aggregate about $5,000,000; total deposits about $8,000,000. Augusta is on the line of many railroads, among them the Central of Georgia, the Charleston & West Carolina, the South Carolina & Georgia, the Southern, etc. Its original charter was obtained in 1798, and revised 1882; the mayor is elected for three years, and a city council, consisting of 18 members, is also elected for three years, one-third being elected each year. The board of education is elected by the people. All other offices are appointive by the council, save that the mayor appoints the superintendent of canal and waterworks, and of streets and drains.

Population (1910) 37,826. It suffers in the census from having suburbs, North Augusta, across the river in South Carolina; Summerville, and others not counted in; and claims about 60,000 at present.

History.—Augusta was founded in 1736 by Gen. James Edward Ogilthorpe (q.v.), the founder of Georgia, and named after the Princess Augusta of Saxony, who married Frederick, Prince of Wales, in that year, and became the mother of George III. All through its early period it was the chief trading station in Georgia, and a very important military post; especially notable as the seat of conference, and treaties with the Southern Indians, who under the treaties of 1763 and 1773 ceded large tracts of land to the whites; the latter, however, had to occupy much of it at the same risk of Indian warfare, which in 1777 made the State capital, and remained such till 1798. The building of the Georgia Railroad in the middle of the 19th century was a heavy blow to its prosperity for a time, carrying trade over new routes; but its natural advantages enabled it to recover itself.

The Southern Confederacy’s powder works were located at Augusta, and their tall chimneys still stand to mark the site.

AUGUSTA, Maine, city, county-seat of Kennebec County and capital of the State, on the Kennebec River, 40 miles by water from the sea, at the head of tidal navigation, and on the Maine Central Railroad, 63 miles northeast of
AUGUSTA—AUGUSTINE

Portland. It is situated on both sides of the Kennebec, mainly on the right or west bank, and some portion of it, including much of the residential section, occupies an elevation considerably above the river, along which the principal business part of the city extends. The Augusta, Winthrop & Gardiner Electric Railway connects the city with neighboring places, and its water communications afford excellent facilities for travel and trade. The State Capitol is a handsome granite building, for which the stone was quarried from the surrounding hills. It stands on high ground overlooking a wide extent of pleasant country. Among other noteworthy buildings are those of the Maine Insane Hospital, the City Hospital, the public library, the county buildings and the United States arsenal. The churches include those of the Congregationalists, Episcopalians, Free Baptists, Colonist Baptists, Christians, Universalists, Unitarians, Methodists, Roman Catholics and the People's Church. The public schools include all grades from the primary to the high school. In the capitol are the State library, a notable collection of portraits of American statesmen, and in the rotunda, an impressive array of the Connecticut, Maine and New Hampshire soldiers. In the principal park is a soldiers and sailors' monument. Augusta, by reason of its railroad and river facilities, is the trade centre of a large region, and the water-power furnished by the Kennebec, across which, just above the city, extends a dam nearly 1,000 feet in length, affords abundant means for manufacturing. The cotton factories here employ about 10,000 persons; shoe manufacture, 300; pulp mill, 250; lumber mill, 100; sash and blind factory, 75; and besides various smaller establishments the city has publishing houses in which some 400 persons are employed. The United States census of manufactures for 1914 reported 39 establishments of factory grade, employing 2,379 persons, of whom 2,231 were wage earners, and 1,071 annually in wages. The aggregate capital invested was $5,069,000, and the year’s output was valued at $4,918,000: of this, $1,938,000 was the value added by manufacture. There are two national banks in the city, with a combined capital of $350,000, a trust company having a capital of $100,000, and two savings banks. The deposits of these institutions aggregate $11,000,000. The city is governed by a mayor and a city council, a body consisting of boards of aldermen and common council, elected by the people. Augusta was first permanently settled in 1754 by colonists from Massachusetts; was incorporated under the name of Hallowell in 1771; and upon the setting off of Hallowell in 1797 became a separate town. In 1831 it became the capital of the State, and has been the scene of many important political events. It received a city charter in 1849. Its population in 1900 was 11,683; in 1910 it was 13,211; in 1914, 14,000. The employees of the cotton factories are mostly French Canadians, the other inhabitants chiefly natives of Consult North. ‘History of Augusta’ (1870).

AUGUSTA, the name of many ancient European towns, as Augusta T Trevor, now Treves; Augusta Taurinorum, now Turin; Augusta Vindelicorum, now Augsburg, etc.

AUGUSTA, a city of Sicily. See AGOSTA.

AUGUSTA HISTORIA, a series of Roman biographies of the emperors from the accession of Hadrian to the death of Carinus, the predecessor of Diocletian, a period covering 167 years. The writers included in this collection are six in number, namely, Aelius Spartanius, Julia Capitolinus, Aelius Lampridius, Vulciatus Gallicanus, Trebellius Pollio, and Flavius Vopiscus.

AUGUSTALIA (Augustales ludii), games that were celebrated, not only in Rome, but wherever Roman authority was maintained, in honor of Emperor Augustus. They took place on 23 September, the birthday of Augustus, and on 1 August and during a period from 3 to 12 October.

AUGUSTAN AGE, the Latin literary epoch of the reign of the Emperor Augustus Caesar. During this period Horace, Ovid, Virgil, Tibullus, and other writers flourished; also great patrons of literature like Maccenas. The poets of the Augustan Age are noted for their pure Latinity. The name is applied in England to the reign of Queen Anne (1702-14). By far its foremost name is Isaac Newton, while of contemporary literature John Churchill (Duke of Marlborough). The poets were Congreve, Garth, Gay, Parnell, Philips, Pope, Prior, Rowe and Swift. The other authors were Addison, Barnes, George Bull, Anthony Collins, Jeremy Collier, Roger Cotes, Defoe, Dodwell, George Hickes, Dr. John Jeffery, John Norris, Ray, South, Steele, etc. Wren, Archibald Pitcairne and Sir Cloudesley Shovel also lived in this reign.

AUGUSTANA COLLEGE AND THEOLOGICAL SEMINARY, institution in Rock Island, Ill., organized at Chicago in 1860 under the auspices of the Lutheran Church; removed to Paxton, Ill., in 1863, and to its present site in 1875. It is coeducational except in the theological department. In 1917 it had over 40 professors; 630 students; volumes in the library, 20,000.

AUGUSTINE, Saint (Aurelius Augustinus), one of the most renowned fathers of the Church of the West: b. Tagaste, in Numidia, 13 Nov. 354; d. Hippo, modern Algeria, 28 Aug. 430. His father, Patricius, was a pagan, his mother, Monica, a Christian. He has related his own early life in the work to which he gave the title of 'Confessions.' His mother instructed him in Christianity, but for many years this faith had little influence on his life. In youth and early manhood he was addicted to excessive sensuality, which he bitterly regretted in after life; when quite young he became father of an illegitimate child. He was intended for the profession of rhetorician, and was sent to Carthage to study with this object in view. Cicero's work, 'Hortensius,' which has not come down to our times first led him to speculative studies, and he now became a member of the Manichaeans. He was one of their disciples for nine years but after having obtained a full knowledge of their doctrine, he found it unsatisfactory and left them. In 383 he left Africa for Rome, and after a short stay there proceeded to Milan, where he was invited as a teacher of rhetoric. Saint Ambrose
was bishop of this city, and his eloquent discourses, combined with the study of the Scriptures, converted Augustine to the orthodox faith, and wrought a change in his life and character. His conversion appears to have taken place in 386. He now retired into solitude, and prepared himself for baptism, which he received in the 33d year of his life, together with his son Adeodatus, from the hands of Ambrose, his mother being then with him. Returning to Africa, he sold his estate, and gave the proceeds to the poor, retaining only enough to support him in a moderate manner. For three years he lived a retired life, devoting himself to religious duties, and to the composition of several treatises. Chancing on one occasion to be present in the church at Hippo, the bishop, who was a very old man, signified a desire to consecrate a priest to assist and succeed him. At the desire of the people Augustine entered upon the holy office, preached with extraordinary success, and in a few years became bishop of Hippo. The remainder of his life was occupied with his ecclesiastical labors, and with various controversies. He was strongly engaged, such as those with the Donatists, the Manicheans, and more especially the Pelagians, concerning the doctrines of free-will, grace and predestination. Augustine maintained the necessity of divine grace in determining man's moral acts to salvation, and he supported the doctrine of predestination, including election and reprobation, but always allowing for free-will and for the merit of the individual. His authority has always been very influential in the Roman Catholic Church, and his view upon any doctrinal matter has at all times carried great weight and is constantly cited in controverted questions. He died at Hippo, while the town was besieged by the Vandals. There have been more learned fathers of the Church, but none has ever more powerfully touched the human heart, and warmed it toward religion. Painters have, therefore, given him for a symbol a flaming heart. His writings (which are in Latin) are very numerous. The most celebrated and to the present year 397, his 'De Civitate Dei' (On the City of God), a work on the Christian Church, his treatise on the Trinity, 'Christian Doctrine'; 'Nature and Grace'; 'Grace and Free-Will'; 'Immutability of the Soul,' and his 'Letters,' his works have been published at Paris in 22 volumes, and an English translation in 15 volumes has appeared at Edinburgh, edited by Dr. Marcus Dod. The standard edition is that issued by the Vienna Academy in its 'Corpus Scriptorum Ecclesiasticorum Latinarum.' Most of Augustine's important works may be found in Schaff, P., 'Nicene and Post-Nicene Fathers' (New York 1888). Consult Smith and Wace, 'Dictionary of Christian Biography' (London 1887); Neeser, 'Church History'; Milman, 'Latin Christianity'; Farrar, 'Lives of the Fathers'; Harnack, 'History of Dogma,' Eng. trans. (Vol. V, Boston 1898); Cunningham, 'Saint Austin and his Place in the History of Christian Thought' (London 1885); Allen, A. V. G., 'Constitution of Christian Thought' (Boston 1894), an comprehensive view of Augustine, etc. Two monastic bodies, the Augustinian Canons, or Black Canons, and the Augustinian Hermits (q.v.), claim to derive their origin from Saint Augustine. There are several translations of 'The Confessions,' e.g., by W. G. T. Shedd (Andover 1860) and C. Brey (London 1900). See also Hitchcock, F. R. M., 'Saint Augustine's Treatise on the City of God' (London 1900).

AUGUSTINE, or AUSTIN, Saint, the first archbishop of Canterbury: d. 26 May 604. While prior of the Benedictine monastery of Saint Andrew at Rome he was selected by Gregory I, together with other monks, to convert the Anglo-Saxons to Christianity, and establish the authority of the Roman See in Britain. Arriving at Aix-en-Provence, they heard various reports about the savage nature of the Britons, and hesitated before proceeding further. Augustine went to Rome to seek permission to turn back, but Pope Gregory prevailed on him to continue, and asked the Frankish clergy to assist the enterprise. Therein in the spring of 597 the missionaries landed on the Island of Thanet and were kindly received by Ethelbert, King of Kent, whose wife Bertha was already a Christian. The conversion of the King speedily followed, contributing greatly to the success of Augustine's work; large numbers were converted and baptized, and it was soon manifest that a new influence for good had come into the lives of the Anglo-Saxons. In acknowledgment of his success, the Pope directed Augustine in 597 to go to Arles, where he was consecrated archbishop of Canterbury and metropolitan of England. On his return he at once informed the Pope of his success, sending a presbyter and a monk to Rome for that purpose and also to obtain instructions concerning other questions with regard to the propagating of the faith. The answers of Gregory to the archbishop's inquiries are fine examples of tact, good sense and judgment in dealing with the problems confronting the early missionaries, and instead of destroying the heathen temples they were converted into Christian churches. Saint Augustine was a zealous missionary of the Church and labored with untiring energy to extend the authority of the Church to the provinces of the Anglo-Saxons, whom the English had driven into the mountains of Wales. In this, however, he was only partially successful, some of the British bishops refusing to acknowledge his authority and to unite with the English Church. Augustine died in Canterbury perhaps in 604, though the year is uncertain and is placed by some as late as 613, and his body was removed to the Cathedral of Canterbury in 1091. The 1300th anniversary of Augustine's landing was celebrated in 1897, when several biographical volumes appeared—by E. W. Benson, Father Brou, S. J., G. F. Browne and W. E. Collins. Consult also Bede, 'Historia Ecclesiastica Gentis Anglorum'; Cooke, J. A., 'Early Churches in Great Britain Prior to the Conquest of Augustin's' (London 1897); Mason, 'The Mission of Saint Augustine to England' (Cambridge 1897); and Stanley, 'Historical Memorials of Canterbury' (New York 1892).

AUGUSTINIANISM, the system of philosophy and theology taught by Saint Augustine. In order to reach the teachings of Augustine, we must remember that we are not dealing with a philosopher simply, or with a theologian simply, but with
one whose nature combined in a marked de-
gree the philosophical and theological strains
together. He was both philosopher and theo-
logian. These elements are so mixed in him at
times as to be irreconcilably at variance with
one another, but again so disparate as to cause irreconcil-
able inconsistencies and bold contradictions.
There is a most excellent analysis of this ex-
ceedingly complex nature by Teuffel in his 'His-
try of Roman Literature,' a remarkably
like for its comprehensiveness and brevity.
Augustine combined in his character qualities
seemingly opposite: an abundant imagination,
and penetrating intellectual vigor, a passion-
ate want of regard and affectionate tender-
ness, a tender heart and zealotism, a blind be-
lief in superior authority and originality of
thought, zeal for unity of the Church and in-
dividual piety, romanticism and scholasticism,
mythicism and sophistry, poetical talent and
philosophy, a passion for unabashed and
grammatical pedantry—himself a psychologi-
cal mystery. With this portrait of his per-
sonality before us, let us examine his teachings.
For him, the source of all truth is to be found in
the inner experience, and the inner experience
His philosophy is primarily anthropocentric.
In consciousness lies the assurance of the
reality of one's own being. This is the earnest and
the warrant of all reality. Without this
central and elemental knowledge all other
knowledge would be vague and illusory. This
assurance is given even in the very act of
questioning it; for, as Augustine insists, the
simple fact that I am conscious of doubting,
even the doubting of my own reality, is in it-
self an indication that I the doubter am.
Man cannot escape himself. Such an analysis
of the implications of self-consciousness forms a
striking anticipation of Descartes' famous
Cogito ergo sum.

With the reality of human personality firmly
established upon a basis which even the most
searching scepticism is unable to shake, but on
the contrary the rather confirms, Augustine
proceeds through a profound analysis of the
human reason to disclose abundant intimations of
a divinity present, and the fore of a divinity
being. For his whole examination of the
processes of reason, he points out that these
processes are ever working toward one and
the same end,—the constructing of a body of
knowledge consisting of truths universally
valid, that it truth which hold, not merely
for the individual but which necessarily hold
for all individuals, under all circumstances and
at all times. They become, moreover, the norm
or standard for all our thinking and their
sway embraces the complete range of all hu-
man activity. These truths are so universal, so
complete, so commanding as to indicate a one-
ess of origin which can be nothing less than
that of an eternal mind. Moreover, the eterno-
nal mind must be an eternal personality. The
universal truths, therefore, which lie at the
basis of all thought, of all being, of all desire,
and all activity are according to Augustine
ideas in God. In regarding the Absolute as
not merely the sum total and unification of all
truth, but a living personality, the divine Logos, we recog-
nize the marks of the religious teacher, and
in this respect Augustinianism is to be re-
garded as a significant advance beyond the
doctrines of Neo-Platonism. From this ex-
position, it should not be inferred, however, that
in the Augustinian psychology, the primary,
or for the sole, basis of our conscious-
edge. On the contrary it is quite evident
throughout the works of Augustine that he exalts
the will above knowledge. He finds in
consciousness three elements, memoria, intel-
lectus, voluntas. Of these memoria is equiva-
ient to a reproducible idea (Vorstellung), an
idea which, moreover, carries with it the war-
rant of the reality which underlies it as its
ground; intellectus is the judgment; and
voluntas of course, the will. The three form
a psychological trinity corresponding to the
trinity which is manifested in the unity of the
divine nature. Both in God and man, the
will is supreme. Omnes nihil aliud quam
voluntates sunt.

Certain difficulties emerge at this point in
the exposition. Man is not free according to
according to the shifting of the point of view. The
philosopher gives way to the theologian. Au-
gustine's philosophy is essentially anthropo-
centric; his theology, theocentric. And in dis-
puting the relations which obtain between
God and man Augustine essentially identi-
ifies the human to the divine, so much so
indeed that the Augustinian system is severely
criticised because, as it is alleged, it leads
logically to a pantheism which wipes out the
individuality and responsibility of man. For
Augustine insists that to appreciate divine
truth and the will of God for man there is
need of an inner spiritual illumination, and
that such an illumination comes only to the
soul in which faith resides, and that faith is
the gift of divine grace. Faith, therefore,
must precede knowledge, that is, knowledge of
things divine and knowledge of things as they
are. Insight may be regarded as the fruitage
but faith is the root of knowledge. There is a
grave difficulty at this point in reconciling such
a doctrine with Augustine's fundamental posi-
tion which puts supreme emphasis upon the
dignity and worth of man's inner nature, and
the trustworthiness of that inner guiding light.
It can only be a way of explanation that in
the one the theologian, and in the other, the
philosopher, speaks.

Moreover, in this view of the human con-
sciousness the primacy of the will is in a large
measure denied by the insistence that man is
wholly dependent upon divine grace in order to
exercise his will aright. He alone is free, says
Augustine, whose will has been touched by the
divine will, and whose desires and activities are
found wholly in accord with the will of God.
The natural desires of the race, addicted to
the race, abused his natural freedom of will and
in his fall has left as an inheritance to the
race the tendency to sin. And the most sig-
nificant consequence of sin is the bondage of
the will, which divine grace alone can over-
come. Augustine, therefore, seems to solve
the problem of free will and predestination by
denying to man a real freedom. He indulges
in many sin, but also a loving personality, the
divine Logos, we recognize the marks of the religious teacher, and
in this respect Augustinianism is to be re-
garded as a significant advance beyond the
doctrines of Neo-Platonism. From this ex-
position, it should not be inferred, however, that
in the Augustinian psychology, the primary,
or for the sole, basis of our conscious-
edge. On the contrary it is quite evident
throughout the works of Augustine that he exalts
the will above knowledge. He finds in
consciousness three elements, memoria, intel-
lectus, voluntas. Of these memoria is equiva-
ient to a reproducible idea (Vorstellung), an
idea which, moreover, carries with it the war-
rant of the reality which underlies it as its
ground; intellectus is the judgment; and
voluntas of course, the will. The three form
a psychological trinity corresponding to the
trinity which is manifested in the unity of the
divine nature. Both in God and man, the
will is supreme. Omnes nihil aliud quam
voluntates sunt.

Certain difficulties emerge at this point in

garded as a significant advance beyond the
AUGUSTINIANS

No distinction, however, is drawn which relieves the system from the criticism already mentioned of minimizing the autonomy of the human will.

This position of Augustine naturally raises the question as to how the evil in the world can be reconciled with the idea of divine power and divine goodness. For if God alone is free, he alone is responsible; and man should not be held accountable for that which he unaided is unable to prevent. Such a criticism Augustine meets by the statement that the evil in the world is after all not a real evil; it is not a causa efficiens, but merely a causa deficiens, in fact only an incausa. Such an explanation, however, is not satisfactory and does not squarely meet the difficulty of the problem which the common experience of humanity all too unhappily emphasizes.

Augustine’s type of mind is essentially that of a great systematizer of doctrine. He could rest content with no form of knowledge unless it could be reduced to a schema in which part fitted to part in an exact and inflexible manner. Augustine’s system has been criticized for this very reason that its lines are hard and fast, yielding no point of rest, its ineradicable doctrines. But while in a certain sense such criticism is justified, there was, in addition to this pronounced synoptical tendency of thought, an equally profound strain of sentiment and feeling. Augustine was essentially human, and went to be moved by the passions and aspirations common to man. Within the very body of this system of doctrine, and its closely concatenated dogmas, it is possible to discover a deep underlying current of mysticism, which may be traced no doubt to its source in Neo-Platonism,—a mysticism manifesting itself in that compulsion of the soul, to long for communion with God, and to behold him face to face. It is this intensely human strain, this mystical element, which relieves the Augustinian system as a system from its more severe and sombre features. The great system builder after all subordinates the system to that which is the ground of the system. No part of the process of reason, but in a direct and immediate consciousness of God, does he find the ultimate certitude. Nothing can more beautifully or more adequately express this mystical strain in Augustine’s nature than those words which embody both a philosophy and a creed: “Thou hast made me for thyself and my heart is restless until it finds rest in thee.”

AUGUSTINIANS. The name of about 60 different monastic bodies in the Roman Catholic Church, all of which deduce their community rules from the sermons or writings of Saint Augustine, bishop of Hippo. The chief of these were the “Hermits of Saint Augustine,” or Begging Hermits; the “Friars Preachers,” or Dominicans; the “Knight Tem-
outside were such masters as Egidius Colonna of Rome, known as the "Fundamental Doctor"; the theologians, Scholasticism; John Capgrave in history; Onuphrius Panvinio in antiquities; Luis de Leon in theology and poetry; John Laurence Berti in history; John Baptist Cotta in poetry; John Michael Cavalieri in liturgy, and lately Augustus Cocker on Oriental languages. Eminent for their supernatural gifts, many of the most singular characters, were Nicholas of Tolentine, "wonder-worker of the Church," so styled by Pope Eugene IV; Clare of Montefalco, the stigmatized, in whose heart were discovered the insignia of Christ's passion; Rita of Cascia, ecstatic, known as "the saint of the impossible"; Thomas of Villanova, almsgiver of Spain, and Joan de Schaghen, reformer of the clergy of that country. The Augustinians are of prominence from the 16th century especially in various mission fields in Mahometan and heathen countries; in Asia, in China, India, Persia, Japan and the Philippines; in Africa, in Zanzibar, Mozambique and the Guinea; throughout America, both North and South, and Australia. In later times during the closing years of the 18th century, was established the first English-speaking branch of the Augustinians in the United States, where, in 1796, a house of that brotherhood was opened in Philadelphia by two members of Irish blood—Dr. Matthew Carr and John Rosseter—the latter said to have been formerly an officer under Rochambeau. Such was the genesis of the calcia communities. In the United States their aim has been missionary work among the faithful in pulpit and school. Offshoots from Philadelphia, now thriving in the United States as well as in Cuba and the Philippines, are some 23 convents and houses of the order, as mission-centres, with more than 100 members in residence or in study-houses in Europe. Furthermore attached to every central establishment the Augustinians have charge of various guilds, or societies, devoted to such aims as religion, social improvement, beneficence in the promotion of good works in the several fields of charity, patriotism, letters and science. The Canons Regular or Austin Canons trace their descent as an order from the 11th century. Their rules were scarcely more rigid than that of the monks, but it is far less severe than that of monks. They were all in sacred orders (ordained clergy) and thus differed from the monks who included in their number many lay brothers. The canons lived together and had a common refectory. From their long black hoods they were popularly called Black Canons. They established themselves in England about the beginning of the 12th century and had over 160 monasteries there at the time of the dissolution of the latter by Henry VIII. Ireland had over 200 establishments of this order and several nunneries, while Scotland had about 25 monasteries of which the earliest was at Scone. The abuses which crept into the various orders in the 14th and 15th centuries led to several new or reformed Augustinian bodies, among which was the Saxon congregation to which Luther belonged. Shortly after the revolution of 1789 the order was entirely suppressed in France, Spain and Portugal, and in parts of Italy and Germany. It is at present strongest in the two Americas. For the other divisions—Dominicans, Knight Templars and Premonstratensians see special articles under those heads. For a complete list of Augustinian priories see "The Augustinian Revolution in Theology" (London 1911); Clark, "Customs of the Augustinian Canons" (Cambridge 1897); "Observations at the Augustinian Priories of Saint Giles and Saint Andrews at Barnwell, Cambridge" (London 1897). AUGUSTUS, nephew of Augustus, ougus-tos, Russian Poland, city in the government of Smolensk, situated on a large lake on the Netta River, a tributary of the Bug. It is situated at one terminus of the Augustowo Canal, which connects the Netta with the Niemen River. Its principal industries are its river and lake fisheries and textile manufactories. It is also the centre of quite an extensive cattle and lumber trade. Pop. about 15,000.

AUGUSTULUS, Romulus, the son of Orestes, a general of the Roman Emperor Julius Nepos. Orestes deposed the Emperor and placed his son upon the throne in 475. In the following year Odoacer, a commander of the German forces in the Roman service, revolted, put Orestes to death, obliged Augustulus to resign and thus put an end to the Roman empire in the west. Augustulus, being of too little importance to be put to death, was conducted to a villa near Naples, with a yearly pension of 6,000 gold solidi. The rest of his life was passed in obscurity. The Emperor's name was originally Romulus Augustus, but the Romans changed the latter into the diminutive form Augustus, out of contempt for his character.

AUGUSTUS, Gaius Julius Caesar Octavianus, originally called GAIUS OCTAVIUS, the celebrated Roman Emperor: b. 23 Sept. 63 B.C.; d. Nola, 19 Aug. 14 A.D. He was the son of Gaius Octavius and Atia, a daughter of Julia, the sister of Julius Caesar. The Octavian family originated at Velitrae, in the country of the Volscians. The father of Octavius had risen to the rank of senator, and had gone to Macedonia, after being chosen praetor, where he was a civil and military officer. Octavius lost his father when young, but was taken up by his mother and L. Marcus Philippus, the second husband of Atia. His talents gained him the regard of his great-uncle, Julius Caesar, who declared himself willing to adopt him as his son in case he himself should remain without children. Octavius was studying under the renowned orator Apollodorus when he received the news of the tragic death of his uncle and of his having adopted him as his son. Notwithstanding the anxiety of his friends, he went to Italy, and on landing at Brundusium, deputies from the veterans collected there came to him. Conducted in triumph to the city and saluted as the heir and avenger of Caesar, he made his adoption publicly known and took the name of his uncle, adding to it that of Octavianus. He then advanced to Rome, where there were now two parties, that of the republicans, who had killed Caesar, and that of Antony and Lepidus, who, under the pretense of avenging him, strove to win over the old victorious. Octavius addressed himself first to Cicero at Cumae, being desirous to gain over this great orator, and from thence he went to Rome, where the greater part of the magistrates, soldiers and citizens came to meet him, Antony alone paying no attention to his return. After
Octavius had caused his adoption to be confirmed in the most solemn manner, he went to Antony and demanded of him the inheritance left him in order to pay the legacies mentioned in his uncle's will. Antony at first haughtily refused to acknowledge his claim, but changed his attitude when he found the influence of Octavius continually increasing, and his own proportionately diminishing. There could be no real union, however, between two equally ambitious rivals. In their hearts they cherished reciprocal hatred and jealousy; and their enmity was so little a secret that Octavius was accused of having wished to get Antony murdered. He afterward, when Antony, together with Lepidus, entered Italy at the head of a powerful army, united with him, and a triumvirate was formed by the three generals, who defeated the republican army under Brutus and Cassius, at Philippi in Macedonia (42 B.C.). After his return to Rome he satisfied the demands of his soldiers by dividing among them confiscated lands. This division caused great disturbances. In the midst of the stormy scenes which convulsed Italy, he was obliged to contend with Fulvia, whose daughter, Clodia, he had married, the wife of his son-in-law of Antony. After several battles, Lucius threw himself into the city of Perusia, where he was soon after obliged to surrender. The city was given up to be plundered, and 300 senators were condemned to death. After the return of Antony an end was put to the proscriptions. Octavius allowed such of the proscribed persons as had escaped death by flight, and whom he no longer feared, to return. There were still some disturbances in Gaul, and the naval war with Sextus Pompeius continued for several years. By a skilful course of conduct he brought about the defeat of Pompeius and reduced Lepidus to a nullity, thus leaving Antony alone as his rival. The empire was now divided between him and Antony; but while the former, in the east, gave himself up to a life of luxury, the young Octavius pursued his plan of making himself sole master of the world. He especially strove to obtain the love of his country by displaying magnanimity, without the appearance of striving after the highest power, and declared himself ready to lay down his power when Antony should return from the war against the Parthians. He appeared rather to permit than to wish himself to be appointed perpetual tribune—an office which gave him supreme power. The more he advanced in the affections of the people the more openly did he declare himself against Antony. By making public a will, wherein his rival appointed his sons by Cleopatra his heirs, he stirred up the ill-will of the Romans against him. Availing himself of this feeling, Octavius declared war against the Queen of Egypt and led a considerable force, both by sea and land, to the Ambracian Gulf. Here his admiral Vipsanius Agrippa gained the naval victory of Actium (q.v.), which made Octavius master of the world, 31 B.C. He pursued his rival to Egypt, and ended the war, after rejecting the proposals for a reconciliation by a personal combat. Cleopatra and Antony having killed themselves, Octavius caused them to be buried with imposing ceremonies. A son of Antony and Fulvia was sacrificed to ensure his safety, and Cæsarion, a son of Cæsar and Cleopatra, shared the same fate. All the other relations of Antony remained uninjured, and Octavius, on the whole, used his power with moderation. He spent two years in the East, in order to arrange the affairs of Egypt, Greece, Syria, Asia Minor and the islands. On his return to Rome he celebrated a triumph for three days in succession, and (29 B.C.) closed the temple of Jutus—for the third time since the foundation of Rome. Freed from rivals and enemies, and master of the world, he is said to have been undecided as to how he should exercise his power, or whether he should even retain it. He first set about correcting the abuses which had prevailed during the civil war, established a general peace, ejected unworthy members from the Senate, restored ruined temples and built new ones.

At the end of his seventh consulship, he entered the Senate house, and declared his resolution to lay down his power. The Senate, astonished at his moderation, besought him to retain it. He yielded to their pressing entreaties, and continued to govern through them. He now obtained the surname of Augustus, which marked the dignity of a prince, and united, by degrees, in himself, the offices of imperator, or commander-in-chief by sea and land, with power to make war and peace; of proconsul over all the provinces; of perpetual tribune of the people, which rendered his person inviolable, and gave him the power of interrupting public proceedings; and, in fine, of censor, and pontifex maximus, or controller of all religious matters. The laws themselves were subject to him, and the observance of them depended upon his will. It was the spirit of his policy to retain old names and forms, but he steadfastly refused to assume the title of dictator, which latterly had become especially odious. He conducted many wars in Africa, Asia, and particularly in Gaul and Spain, where he triumphed over the Cantabrians after a severe struggle. His arms subjected Aquitania, Pannonia, Dalmatia and Illyria, and held the Dacians, Numidians and Ethiopians in check. He concluded a treaty of peace with the Parthians, by which they gave up Armenia, and restored the eagles taken from Crassus and Antony. At the foot of the Alps he erected monuments of his triumphs over the mountaineers, the proud remains of which are yet to be seen at Susa and Aosta. After he had established peace throughout the empire, he again closed the temple of Janus. But this peace was interrupted, 9 A.D., by the defeat of Varus, who lost three legions in an engagement with the Germans, under Arminius, and killed himself in despair. The information of this misfortune greatly agitated Augustus. He let his beard and hair grow, and often cried out in the deepest grief. "O Varus, restore me my legions!" Meanwhile the Germans were held in check by Tiberius. During the peace, Augustus had issued many useful decrees, and abolished abuses in the government. He gave a new form to the Senate, employed himself in improving the manners of the people, particularly by promoting marriage, enacted laws for repressing luxury, introduced discipline into the armies, and order into the games of the circus. He adorned Rome in such a manner that it was truly said, "He found it of brick, and left it
of marble. He made journeys, as Vellius says, everywhere, to increase the blessings of peace; he went to Britain, Minor, Syria, Gaul, etc.; in several places he founded cities and colonies. The people erected altars to him, and, by a decree of the Senate, the month Sextilis was called August. The de- barment of his daughter Julia gave him great pain, and he showed himself more severe against those who destroyed the honor of his family, than against those who threatened his life. History says that, in his old age, he was ruled by his wife, Livia, the only person, per- haps, whom he truly loved. He had no sons, and lost by death his sister's son, Marcellus, and his daughter's sons, Gaius and Lucius, whom he had appointed his successors. Also Drusus, his son-in-law, whom he loved, died early; and Tiberius, the brother of the latter, whom he hated, on account of his bad qualities, alone survived.

These numerous calamities, together with his continually increasing infirmities, gave him a strong desire of repose. He undertook a journey to Campania, from whose purer air he hoped for relief; but disease fixed upon him, and he died, in the 79th year of his age, and 45th of his reign. When he felt his death approach, he is said to have called for a mirror, arranged his hair, and demanded of the bystanders, "Have I played my part well?" and, an answer being returned in the affirmative, "Then," added he, using the form of the players, "farewell, and applause" (valse, et applaudis). If this last passage in the life of Augustus is true, it is certainly indicative of his character, his policy, and even of his fortune. He conquered Brutus by means of Antony, and Antony by means of Agrippa. He several times changed his party, but never his purposes, and knew how to cause power to be offered, and pressed upon him, while it was, in fact, the object of all his exertions. It cannot be denied that he used his power with wisdom, and became the benefactor of his country, which he had previously plunged into the horrors of civil war. His taste and active mind led him to favor and protect the learned; and he even exercised the art of the poet himself; so that he was not unworthy of giving his name to his age distinguished for intellectual creations. His death plunged the empire into the greatest grief. He was numbered among the gods, and temples and altars were erected to him. Consult Beulé, "Auguste, sa famille et ses amis" (Paris 1867); Boissier, "La religion romaine" (1883); Gardthausen, "Augustus und seine Zeit" (Leipzig 1891); Firth, J. B., "Augustus Caesar" (New York 1903); Schuckburg, "Augustus" (1903).

AUGUSTUS I, Elector of Saxony: b. Freiburg 1526; d. 1586. He spent some time at court, and became a close friend of Maximilian, afterward the Emperor Maximilian II. He married the daughter of Christian III of Denmark who was very popular. In 1553 Augustus succeeded his brother Maurice as Elector. At first he favored Calvinism but later adopted Lutheranism. His internal administration was remarkable for many beneficent reforms in jurisprudence and finance. He also aided education, manufactures and commerce. He ordered that every newly-wedded couple should plant two fruit trees within the year following their marriage. He greatly beautified Dresden, his capital and founded and Greece, Asia Minor, Syria, Gaul, etc.; in several places he founded cities and colonies. The people erected altars to him, and, by a decree of the Senate, the month Sextilis was called August. The debarment of his daughter Julia gave him great pain, and he showed himself more severe against those who destroyed the honor of his family, than against those who threatened his life. History says that, in his old age, he was ruled by his wife, Livia, the only person, perhaps, whom he truly loved. He had no sons, and lost by death his sister's son, Marcellus, and his daughter's sons, Gaius and Lucius, whom he had appointed his successors. Also Drusus, his son-in-law, whom he loved, died early; and Tiberius, the brother of the latter, whom he hated, on account of his bad qualities, alone survived.

These numerous calamities, together with his continually increasing infirmities, gave him a strong desire of repose. He undertook a journey to Campania, from whose purer air he hoped for relief; but disease fixed upon him, and he died, in the 79th year of his age, and 45th of his reign. When he felt his death approach, he is said to have called for a mirror, arranged his hair, and demanded of the bystanders, "Have I played my part well?" and, an answer being returned in the affirmative, "Then," added he, using the form of the players, "farewell, and applause" (vaule, et applaudis). If this last passage in the life of Augustus is true, it is certainly indicative of his character, his policy, and even of his fortune. He conquered Brutus by means of Antony, and Antony by means of Agrippa. He several times changed his party, but never his purposes, and knew how to cause power to be offered, and pressed upon him, while it was, in fact, the object of all his exertions. It cannot be denied that he used his power with wisdom, and became the benefactor of his country, which he had previously plunged into the horrors of civil war. His taste and active mind led him to favor and protect the learned; and he even exercised the art of the poet himself; so that he was not unworthy of giving his name to his age distinguished for intellectual creations. His death plunged the empire into the greatest grief. He was numbered among the gods, and temples and altars were erected to him. Consult Beulé, "Auguste, sa famille et ses amis" (Paris 1867); Boissier, "La religion romaine" (1883); Gardthausen, "Augustus und seine Zeit" (Leipzig 1891); Firth, J. B., "Augustus Caesar" (New York 1903); Schuckburg, "Augustus" (1903).

AUGUSTUS II, Elector of Saxony: b. Dresden 1670; d. there, 5 Oct. 1733. He was married for the second time a few weeks before his death. Consult Falke, "Geschichte des Kurfürsten August von Sachsen" (Leipzig 1868).

AUGUSTUS II, Frederick ("The Strong"), Elector of Saxony and King of Poland, second son of John George III, Elector of Saxony: b. Dresden 1670; d. Feb. 1733. He was noted for his activity. In 1697 he became Elector and in 1696 was candidate for the vacant Polish throne. The French Ambassador and the nobles supported the Prince of Conti, but Augustus by acceptance of the Roman Catholic faith, by bribery and intimidation secured the election, 27 June 1697. Early in his reign, a treaty was made between Denmark, Poland and Russia against Charles XII of Sweden, for the conquest of Livonia. But Charles, after having defeated the Danes and the Russians, advanced toward Poland. Thus began the celebrated Northern War, which lasted 20 years. Charles gained a complete victory, 20 July 1702, and on 1 May 1703, the Saxon army was defeated again at Pultusk. The Diet assembled in covering Augustus, 14 Feb. 1704, incapable of wearing the crown of Poland, and Stanislaus Lesczinsky, Waywode of Posen, was chosen king, 12 July 1704. Charles victorious on every side, advanced into Saxony, and Augustus found himself obliged to negotiate a secret peace, at Altranstadt, 24 Sept. 1706.

He now devoted himself to the domestic aff airs of Saxony. His love of splendor involved him in many expenses, by which the finances of his kingdom were disordered. In 1709, after the defeat of Charles at Pultowa, the Poles recalled Augustus, who united himself anew with Peter the Great. A confederation was now formed in Poland against the Saxon troops, by the party of Stanislaus, in the belief that Augustus was aiming at absolute power. The Saxons were attacked and obliged to surrender. At length, through the mediation of Peter, an arrangement was concluded at Warsaw, 1717, between Augustus and the Polish leaders. The Saxon troops were removed from the kingdom, and Augustus agreed not to maintain more than 17,000 soldiers in Poland, who were to be under the Polish authorities. The last years of his reign were characterized by boundless luxury and corruption of manners. He was not disliked by his subjects, and filled with dignity his station among the European powers. In his character, generous ideas were united with despotic feelings, a taste for pleasure with the cares of ambition, and the restlessness of a war-like spirit with the effeminacy of a luxurious life. By his mistresses he had many children. The Countess of Königsmark bore him the celebrated Maurice of Saxony. He left an only son who succeeded him. Consult Desroches de Parthény, "Histoire de Pologne sous le roi Auguste" (The Hague 1734).

AUGUSTUS III, Frederick, Elector of Saxony and King of Poland, son of Augustus II: b. Dresden 1696; d. there, 5 Oct. 1763. He succeeded his father as Elector in 1733. A part of the Polish nobility chose Augustus king; and in 1736 he was first generally recognized as
such by the Congress assembled at Warsaw to conclude a peace. Although without the great and amiable qualities of his father, in other respects he closely followed his example, distin-
guished himself by the splendor of his feasts and the extravagance of his court. His system of politics consisted in entire dependence upon
Russia. He preferred Dresden to Warsaw, and through his long absence from Poland the gov-
ernment sank into entire inactivity. When Frederick attacked Saxony itself in 1745, Au-
gustus deserted his capital, and preserved his pictures and porcelain, but lost the archives of the state, which fell into the hands of the victors.
By the peace of Dresden, 25 Dec. 1745, he was reinstated in the possession of Saxony, in the next year. In 1750 he saw himself in-
volved anew in a war against Prussia, and fled to Königstein, and afterward to Poland. His
authority in this country had always been incon-
sequent, which were due to the extravagance of his feasts, because they were still more insignificant. The accession of Cath-
arine to the Russian throne was a source of dis-
quietude, for she sought to deprive the Saxon princes, who were allies of France, of the
Polish thrones. The peace of Hubertberg was hastily signed, when Augustus returned from Warsaw to Dresden, where he died. His son,
Frederick Christian, succeeded him as Elector of Saxony, and Stanislaus Poniatowski as King of Poland. Consult Ruthière, Histoire de
l'anarchie de Pologne (Paris 1819).

AUGUSTUS. Apotheosis of, a celebrated cameo, cut out of sardonyx, nearly a foot in
diameter. It is the largest work of its kind. It contains 26 figures, formerly supposed to
represent Joseph leading a procession through Egypt. It is now one of the gems of the
Cabinet des Médailles et Antiquités at the Louvre.

AUGUSTUS, Arch of, a triumphal arch erected in the Roman Forum in honor of
Augustus, about 20 B.C. Destroyed in 1540, its foundations were discovered in 1888. Consult

AUGUSTUS, Forum of, the Imperial forum built by Augustus at Rome. Portions of
its walls still remain, with ruins of the temple of Mars Ultor, which was built in the centre in commemoration of the battle of Philippi and
the retribution brought by Augustus on the murderers of Caesar. Consult Plutarch, The Topography and Monuments of Ancient Rome
(New York 1911).

AUGUSTUS, Mausoleum of, a circular structure of huge diameter (280 feet), built of
white marble and covered by a mound of earth, on which grew evergreen trees. At the summit of the mound, among the shrubbery,
was placed a colossal bronze statue of Au-
gustus, who had caused the mausoleum to be
built, 28 B.C. On each side of the portal stood
an obelisk, still preserved in the Piazza del
Esquilino and the Piazza del Quirinale. Within
were interred the great Romans honored by the
Emperor, the first being young Marcellus and the
last Nerva, 98 A.D. Later the structure was
allowed to fall into ruins, was for a time used as
a bull ring and a circus and now only the brick shell is visible.

AUK, âk, a diving sea-fowl of the family
Alcidae found in the northern regions, the term
covering guillemots, murrets, lornvias, puffins
and others. They are thick-set birds, seldom
more than a foot long, which move about with
difficulty on land, from the fact that their legs
are set very far back, giving them an erect,
penguin-like attitudes fearsome, the plumage
brown, black, or lead-color above, and white be-
neath, except in the breeding season, when
bright colors and ornamental plumes tempo-
arily appear on the males of some species. The
wing-feathers are so short as to be of little
use for flight, and the wings are more used as
aids in swimming under water, where they
pursue fishes with great speed. The bill is
much compressed, but in the breeding season,
among the puffins, which show the most
marked compression of bill at other times,
the bills increase in size and develop orna-
mental appendages which disappear as the
moulting season comes on. The most
important north Atlantic auks are the now-extinct great auk (Platopus impennis)
which was as large as a goose and within
historic times abounded as far south as the
Hebrides (see GAREFOWL); the little auk (Alle
alle), not larger than a robin and very abun-
dant, sometimes in winter coming as far south as New York and the Great Lakes (see Dow-
kie); and the razor-billed auk (Alca torda),
which has a bill of remarkable length and
sharpness, and in which breeds as far south
as the Maine coast (see MURRELET; PUFFIN;
RAZOR-BILL). The auk lays only a single large
egg, which, as no nest is prepared, the parents
are no trees are held for by holding upon the top of their
webbed feet and between their thighs. These
eggs are a staple food for the natives of the
Arctic regions, as are the birds, also. They
are taken in summer and preserved for winter
use, as in the autumn the auks migrate from the
frozen coasts and spend the winter in the open
spaces of the sea. Consult American
and British ornithologists; and Grieve, The
Great Auk (London 1885); Stejneger, Bulletin of the United States National Museum
No. 29 (1885); Harriman Alaska Expedition (Vol. II, New York 1902); Selous, Bird
Watching (London 1901).

AULARD, Édouard François Victor Alphonse, French historian. b. Montbron,
Charente, 1849. He is considered one of the best authorities on the French Revolution,
of which subject he was professor at the Sorbonne. Among his many works are Les orateurs de
l'assemblée constituante (1882); Le culte de
la raison et le culte de l'être suprême (1892). He
also edited La société des Jacobins (6 vols.
1889-97).

AULD LANG SYNE, âld lang sin, a song attributed to Burns, who added a couple
of stanzas to a poem known to have existed in
1600 and set to an old Lowland air by George
Thompson. Consult Grove, Dictionary of
Music and Musicians (New York 1910).

AULD LICHT IDYLLS, âld licht i'dills, a work by James M. Barrie. It is a series of
12 sketches of life in Glen Quharity and
Thurms. In all of them the same characters
appear.

AULDRobin Gray, a famous Scottish
ballet by Lady Anne Barnard, published
anonymously in 1772, but unacknowledged till
1825. She afterward wrote a sequel to the ballet.
AULIC COUNCIL, one of the two highest courts of the Holy Roman empire (Reichshofrath), the other being the court of the Imperial Chamber (Reichskammergericht). It was at first a paid Council of the Emperor, and was reorganized 1497 by Maximilian I, who set it up as a rival to the Imperial Chamber, which the Diet had forced upon him. At first its main functions appear to have been in regard to the business administration of the crownlands and the empire in general, and so to facilitate and expedite the decisions of the Imperial Chamber. In the course of time, other functions devolved upon it and it received a fixed constitution in 1559. Its powers were greatly limited by the Peace of Westphalia in 1648, but six years later it was formally constituted as one of the two supreme courts of the empire, the equal of the Imperial Chamber, and the highest Court of Appeals in the empire. In this form it consisted of a president, vice-president, a vice-chancellor and 18 councilors, all of Aulic were selected and paid by the Emperor, except the vice-chancellor, who was appointed by the Elector of Mainz. Its seat was at the Imperial residence, Vienna. It had jurisdiction in all matters concerning the reserved right of the Emperor, all questions of appeal on the part of the states from decisions in minor courts, and whatever concerned the Imperial jurisdiction in Italy. It was dissolved on the death of the Emperor, and had to be re-instituted by his successor. Six of the councilors were Protestants, who could thus exercise an effective veto and preserve religious parity. The council ceased to exist on the fall of the Holy Roman empire in 1806. The title is now applied in Germany in a general sense to the chief council of any department, political, administrative judicial or military. Consult Herschenhahn, ‘Geschichte des kaiserlichen Reichshofraths’ (Mannheim 1793).

AULICH, ou’lîch, Ludwig, Hungarian general: b. Presburg 1792; d. Arad, 6 Oct. 1849. When the Hungarian Revolution of 1848 broke out, Ulrich continued to serve in an Austrian regiment, which afterwards took up the Hungarian cause. He was later made general of the 2nd Hungarian army corps, in which capacity he was an important factor in the victory at Windischgrätz. After the evacuation of Pesth by the imperial troops in 1849, Aulich made his triumphant entry into that capital, and was received with enthusiasm by the people. In his famous proclamation of Gödöllő, Kosuth paid also an appropriate homage to Aulich’s gallantry. Subsequently, when Görgey was forced to renounce either the army or the Minister of War, he took the latter alternative, and Aulich was appointed his successor. But although he might have used his authority as Minister of War to frustrate Görgey’s negotiations with the Russians, he actually assisted Görgey to bring these negotiations to a successful close. He was then delivered over to Austria by the Russians, and, in company with 12 others, perished on the gal lows.

AULIS, in ancient Greece, a seaport in Boetia, on the strait called Euripus, between Boetia and Euboea, noted chiefly for its temple of Artemis, and as the scene of the sacrifice of Iphigenia, and as the gathering place of the Greek fleet before the Trojan War.

AULLAGAS, ou-lâ’gâs, a salt lake in Bolivia, which receives the surplus waters of Lake Titicaca through the Rio Desaguadero, and has only one perceptible, insignificant outlet. The disposition of its superfluous water is, therefore, still a matter of uncertainty.

AULNEAU DE LA TOUCHE, o’lnô’ de-la-tû’sh, Jeanne Pierre, Jesuit martyr: b. France 1705. In 1735 he was sent as missionary to the Indians at the Lake of the Woods. In the following year he set out with a party of Frenchmen for Mackinac, but the whole party was surprised and massacred by Sioux on the 8th of June at Massacre Island, Lake of the Woods.

AULULARIA (from Aulula, a pot), a comedy by Plautus. Euclon, an old miser, is the principal character.

AUMALE, o’mâl’, Henri Eugène Philippe Louis d’Orleans, Duke of, 4th son of King Louis Philippe of France: b. Paris, 16 Jan. 1822; d. Zucco, Sicily, 7 May 1850. In 1841 he entered the military service at the age of 17, and distinguished himself by his bravery. At the age of 20, he was promoted to the rank of brigadier-general, and was sent to Algeria, in October 1842. Entrusted with the command of the district of Medea, where the Djebel of Abd el Kader with such impetuosity that in less than two hours the emir’s troops were entirely routed. As a reward, Aumale was made lieutenant-general and commander of the province of Constantine. In 1847, the young prince, but 25 years old, was entrusted with the general governorship of Algeria, which was taken from the hands of Marshal Bugeaud. This appointment was not approved either by the army or the French nation, and it was the occasion for loud complaints against the ambition of the King, who was concentrating the direction of the whole military service in the hands of his sons. After the revolution of 1848, he went to England, where he devoted his attention to literary pursuits. In 1870 he was refused permission to enter the French army, but in the following year he was elected to the Assembly from Oise and took his seat. In 1871 the Prince was general of division and Chief of the staff. At the trial of Bazaine, in 1886 he was debarred from the army under the Expulsion Act and withdrew to England. He bequeathed the Château of Chantilly to the Institut de France. In 1889 the decree of banishment against him was revoked. His latest years were passed in Sicily. He wrote ‘Les institutions militaires de la France’ (1867); ‘Histoire des Princes de Condé’ (1867) and ‘Lettre sur l’histoire de France’ (1881), which attracted wide notice because of its attacks upon Napoleon III and the Prince Imperial.

AUMAUL, o’môl’, France, a town 35 miles northeast of Rouen, which has given titles to several notables in French history: Jean d’Ar- court, 8th Count d’Aumale, fought at Agincourt, and defeated the English at Gravelle (10th Aug. 1423): Claude II, Duc d’Aumale, chief instigators of the Massacre of Saint Bartholomew, was killed 1573. Charles de Lorraine, Duc d’Aumale, was an ardent partisan of the League in the politico-religious French wars of the 16th century. Glass and steel are manufactured in the modern town.
AUMONT — AURELIAN

Pop. (1911) 2,412. Consult Semichon, "Histoire de la ville d'Aumale" (Paris 1862).

AUMONT, 5-môn, the name of one of the great historical families of France. The first Aumont mentioned in history is JEAN III, SIRE DE AUMONT, who, in 1268, took part in the battle of Cassel, and served under Philip de Valois, on many other important occasions. A more distinguished member of the family was JEAN D'AUMONT: b. 1522; d. 1595. He was on the battlefield almost from his cradle to his grave, and served under six kings: Francis I, Henry II, Francis II, Charles III, Henry IX, and Henry IV. ANTOINE D'AUMONT: b. 1601; d. 1669; served with distinction under Louis XIV, and in 1662 was appointed governor of Paris. LOUIS MARIE VICTOR D'AUMONT and DE ROCHEBON: b. 1632; d. 1704; took an active part in the war in Flanders under Louis XIV, was governor of Boulogne and the Boulognais, and member of the Academy of Inscriptions and Belles-lettres. JACQUES, Duc d'Aumonta: b. 1732; d. 1799; was the commandant of the national guard, on 5 Oct. 1789, when Louis XVI was forcibly taken away from Versailles. LOUIS MARIE CELESTE DE VIENNE, Duc d'Aumonta: b. 1762; d. 1831; served in Germany, Spain and Sweden, until the restoration, when he was appointed lieutenant-general. He made himself very useful to the cause of royalty in suppressing the troubles in Normandy, and in 1815 was created peer of France, and raised to the office of first chamberlain. He was one of the most prominent men at the courts of Louis XVIII and Charles X, but he exchanged politics for theatres, and became the chief director of the comic opera.

AUNGERVILLE, än'ger-vil, Richard, known as Richard de Bury (from his birthplace, Bury in Saint Edmunds), an English statesman, bibliographer and correspondent of Petrarch: b. 1261; d. 1345. He was educated at Oxford. He entered the order of Benedictine monks, and became tutor to the Prince of Wales. He was rewarded by being made a prebendary at Ely and at Durham, and several offices of dignity; he ultimately became bishop of Durham (1333) and Lord Chancellor of England. He made the acquaintance of many of the eminent men of the day, and was a diligent collector of books. He was the author of "Philobiblon," "Epistolarum Familiarum," including letters to Petrarch, etc. (See Philobiblon). Consult Boardman, "Richard de Bury" (Bangor 1902); Dutt, "Bury St. Edmunds" (London 1907); Kitchin, "Seven Sages of Durham" (ib. 1911).

AURA. See Eclipse.

AURAMINE. See Coal Tar Colors.

AURANGABAD, ou-rän'ga-bad', India, town 175 miles from Bombay, and on the Konam River, a small tributary of the Godavari. It is surrounded by walls with semi-circular towers at the different angles, and contains a ruined palace of Aurungzebe and a mausoleum erected to the memory of his favorite wife. A mile to the west of the town are cemeteries for cavalry, infantry and artillery. Aurangabad was founded early in the 17th century, and rose to be a considerable trading centre, but its commercial importance decreased when Hyderabad became the capital of the Nizam. In late years the trade has revived considerably, and embraces wheat, cotton and manufactured goods. Pop. about 25,000.

AURANTIA. See Coal Tar Colors.

AURATES. See Auric Acid.

AURAY, ə-rā', France, town in the department of Morbihan, near the mouth of the Auray River, in Brittany, 12 miles west of Vannes. Its port is frequented by coasting and fishing vessels. Auray is one of the chief centres in France for oyster-fisheries, and carries on boat-building and sardine-fishing. The principal buildings are the church of Saint Esprit, the Renaissance church of Saint Gildas, and, at a short distance from the town, the Carthusian monastery, now a deaf and dumb institute. Adjoining it is a small chapel in which are preserved the bones of the Royalists captured by the Republicans in a battle here in 1795. In the neighborhood is the church of Sainte Anne d'Auray, one of the principal places of pilgrimage in Brittany. Pop. about 5,000.

AURBACHER, owr-bäk'er, Ludwig, German author: b. 1784; d. 1847; well remembered by his "Volksbuchlein" (1827-29); a collection of popular tales, ranking among the best productions of this kind in German literature.

AURELIA. See Jellyfish.

AURELIAN, Lucius Domitius Aurelianus, one of the later emperors of Rome: b. about 212; d. 275. He was the son of a peasant of Illyricum, and rose to the highest rank in the army, and even to the consulate; which good fortune was increased by a wealthy marriage. Claudius II, on his death-bed, in 270, recommended Aurelian to the choice of the troops of Illyricum, who readily acceded to his wishes. He delivered Italy from the barbarians, reduced Tetricus, who had been unwillingly made to assume the purple in Gaul, and conquered the famous Zenobia, Queen of Palmyra. Aurelian followed up his victories by the reformation of abuses, and the restoration throughout the empire of order and regularity, but tarnished his good intentions by the general severity of his measures, and the sacrifice of the senatorial order to his slightest suspicions. He had planned a great expedition against Persia, and was waiting in Thrace for an opportunity to cross the straits, when he lost his life by assassination, the result of a conspiracy excited by a secretary whom he intended to call to account for peculation. Aurelian was a wise, able and active prince, and well deserved the title given him by the Senate of "Restorer of the Roman Empire." Consult "Cambridge Medieval History" (Vol. I, New York 1911) and Homs, L., "Le règne de l'empereur Aurelien" (1904).

AURELIAN, a historical novel by William Ware, an American author born in 1797. It was first published in 1838 under the title "Probus," and was a sequel to "Letters of Lucius M. Piso," published the year before; and like that novel, written in the form of letters. The full title is "Aurelian; or, Rome in the Third Century." In Letters of Lucius M. Piso, from Rome, to Fausta, the daughter of Gracchus at Palmyra, the novel presents a singularly faithful picture of the Rome of the second half of the 3d century.
AURELIAN WALL—AURIFABER

AURELIAN WALL, a wall around Rome, built mostly by the Emperor Aurelian, but completed in the reign of Probus. It was almost 26 miles long and 54 feet high, enclosing an area of 5,000 square miles, and marking the boundaries of Rome in the time of Aurelian. The wall was built in great haste as a defense against the barbarians, and includes the remains of house- and garden-walls, some with statues in niches. The base of the wall was provided with loopholes toward the outer side and arcade on the inner. Towers, 380 in number, connected this way with the battlements above. A large part of the wall is still well preserved. Much has been learned from the stamped bricks used in its construction, and from the statues and frescoes on the walls of houses filled in instead of being demolished in the hurry of building. Consult Lanciani, 'Ancient Rome' (New York 1900) and Plaster, 'Topography and Monuments of Ancient Rome' (Boston 1911).

AURELIUS ANTONINUS, Marcus. See MARCUS AURELIUS ANTONINUS.

AURELIUS VICTOR, Sextus, Roman historian of the 4th century whose 'History of the Caesars' is a collection of biographical sketches of the emperors from Augustus to Constantine. In this work he states that Julian appointed him governor of a division of the province of Pannonia and also that he was made city prefect by Theodosius. He is identified as the Aurelius Victor who was a quaestor in 373 A.D.

AURELLE DE PALADINES, o-rel-de-pa-lä-dan, Louis Jean Baptiste d', French soldier: b. Malégiez, Lozère, 9 Jan. 1804; d. Versailles, 17 Dec. 1877. Entering the army in 1824, he served throughout the Algerian and Crimean campaigns, becoming a general of division in 1855. He did not participate in the Franco-Prussian War until after the battle of Sedan, when he received a command and drove the Prussian General Von der Tann-Rathsamhausen from Orleans, thus winning the first French victory of the war. His later operations were not so successful, however, as he was beaten by the army of the Grand Duke of Mecklenburg at Artzenay, whereupon he was relieved of his command. During the days of the Commune he was in command of the National Guard in the department of the Seine. After the war, in 1875, he was elected to the French Senate for life. He is the author of 'Campagne de 1870-71; la première armée de la Loire' (1872).

AURENGZEBE, a-réng-zéb'. See AURENGZEBE.

AUREOLA, or AUREOLE, in paintings, an illumination surrounding a holy person, as Christ, a saint or a martyr, intended to represent a luminous cloud or haze emanating from him. It is generally of an oval shape, but may be nearly or quite circular, and differs from the aureole of the ancient Romans by excluding the heads of sacred personages in being an emanation of light from the whole body. The aureole did not come into favor until after the 8th century and was abandoned by most painters of the Renaissance in the 15th century. It was used around figures of Christ, the Trinity and the Virgin Mary.

AUREUS, är-rús, or AUREUS NUMMUS, the earliest gold coin of Rome, coined 207 B.C., in the second Punic War. It weighed 3 denarii and 1 quinarius, and was worth 25 denarii, or 100 sesterces. In modern terms, its average weight was 121 grains and its value was about $500. In later times it was called solidus, but had diminished in value. Consult Hill, G. F., 'Handbook of Greek and Roman Coins' (La Canada 1911).

AURIC ACID. Trioxide of gold, AuO3, does not combine with acids to form salts, but a hydrated form of the oxide, AuO2.H2O, is known, which unites with bases to form salts. From this acid-like property, the hydrated oxide has been called 'aureic acid.' Compounds of auric acid with bases are called 'aurates.' Aurate of potassium, AuO2.K.O.3H2O, is a crystalline substance, readily dissolving in water with the formation of an alkaline solution. When digested with ammonium sulphate, it yields an aurate of ammonia of undetermined composition, called 'fulminating gold.' This substance, yellowish-brown in color when in the solid form, decomposes explosively upon percussion, or when heated to 212°F.

AURICH, ou-rich, Germany, town in the province of Hanover, 18 miles northwest of Emden. It has a palace, two churches, a gymnasium and four libraries. There are breweries and small manufactories of paper and tobacco. It is built in Dutch style, and lies in a sandy but fertile plain, surrounded by pleasant promenades which have taken the place of the old fortifications. Pop. about 6,000.

AURICHALCITE (ä-rík'h-lit'), a native basic carbonate of copper and zinc, usually occurring in beautiful bright blue or green, pearly inclusions, composed of ill-defined crystals or scales. Its hardness is 2, and its specific gravity about 3.6. It has been found in Greece, Italy, England and various other European countries, and in fine specimens at Morenci in Arizona, Magdalena in New Mexico, in Colorado, Montana, Utah and elsewhere.

AURICLE. See EAR.

AURICLES OF THE HEART. See HEART; CIRCULATION.

AURICULA, a hardy perennial herb, Primula auricula, of the family Primulaceae, found in the mountainous parts of central Europe. The wild plant has an umbel of small yellow flowers on a short stalk, which rises from a rosette of basal leaves. By selection a very large number of varieties have been produced. These have long stalks and very diverse-colored, fragrant, large flowers, for which the plant is widely cultivated in Europe. In the United States the plant is mostly confined to greenhouses. It is propagated by means of seeds and offsets, and succeeds best on rich, light, loamy soil.

AURICULAR CONFESIONS. See CONFESSION; PENANCE; SACRAMENTS.

AURIFABER, the Latinized name of Johann Golschmidt, one of Luther's friends: b. 1519; d. Erfurt 1579. He became pastor at Erfurt in 1566. He collected the unpublished manuscripts of Luther, and edited the 'Epistle' and the 'Table-Talk.'

AUREOSIN. See COAL TAR COLORS.
AURIGA, in astronomy, the Wagoner, a constellation of the northern hemisphere, containing as its chief luminary Capella, a star of the first magnitude. This star was discovered in the foot of Auriga. At its brightest it showed as a star of the fourth magnitude and remained visible to the naked eye for about a month, afterward becoming rapidly invisible. After several months it again reached the tenth magnitude, but it is uncertain whether or not it has ever again reached a great change, having become assimilated to the nebular type. It has since resumed its stellar character and is of the thirteenth magnitude.

AURILLAC, ë-re-yak', France, a town 272 miles south of Paris, capital of the department of Cantal (Auvergne), on the Jumonne. It is noted for its ancient buildings, among which are the church of Notre Dame, constructed in the 13th century, and the castle of Saint Stephen. It has manufactures of jewelry, copper, kettles, paper, woolen stuffs and carpets. It is said to owe its origin to a Benedictine monastery founded in the 9th century by Saint Géraud. The town was besieged several times by the English in the 14th and 15th centuries and it suffered in the religious wars of the following century, being both the birthplace of Pope Sylvester II and also of the infamous Carrier of the French Revolution. Pop. (1911) 18,036.

AURIN, or AURINE, C₄H₆O₃. A coloring substance used in the manufacture of lacquers. It is obtained by the action of sulphuric and oxalic acids on carbolic acid at 130°-150° C. It is also used as a dye because of the difficulty of fixing it. Its solution in alkali has a beautiful red color.

AURINGER, Obadiah Cyrus, American author and clergyman: b. 4 June 1849, at Glens Falls, N. Y. Educated in public schools and by private tutors, he contributed literature to the papers and magazines of the United States from the age of 18. Entered the United States Marine Corps June 1871; and served in the tropics on the flagship Worcester till August 1875. Engaged in agriculture for some years, studied theology and was ordained to the Presbyterian ministry in 1890. He served churches at Northwood, N. Y. (1890-93); Troy, N. Y. (1893-99); Forestport, N. Y., till 1912. He is the author of several volumes of verse, including 'Scythe and Sword' (1887), 'The Heart of the Golden Poem' (1890), 'Book of the Hills' (1896), 'Friendship's Crown of Verse,' 'The Lover's Tragedy' (1898), 'William McKinley Memorial' (1906), 'Eagle's Bride' (1911). In prose he has contributed a sketch of Edward Eggleston to 'Authors at Home' series; and numerous papers on American archaeology to State publications. His latest work is an historical play 'Thistledown.'

AURISPA, ou-rë-sà, Giovanni, Italian scholar: b. Noto, Sicily, 1369; d. Ferrara 1460. He lived for some years in Florence, with his brothers, men of medicine for the purpose of studying Greek. On his return some years later he brought with him many valuable manuscripts, among them some of the writings of Pindar, Sophocles, Plato and Cassius. In 1431 he was called to Bologna. After this period he taught Greek literature at Ferrara. In 1438 he was invited by the Emperor of Byzantium, John Palæologus to attend the council called by the Pope Eugene IV at Basel. The result was that he became the Pope's secretary, in 1441, and remained in this office for six years. In July 1446 a summons to find a reconciliation to be found in manuscript, in the libraries of Europe, but only the following have been published: Hierocles' 'Liber in Pythagoras Aurea Carmina, Latinitate Donatus' (Padua 1474); 'Philisci Consolotoria' (Paris 1510). Consult Voigt's 'Die Werke der gelehrten klassischen Alterthums' (Vol. I, Berlin 1893).

AUROCHS, ä-rôks, the European bison (Bos primigenius, or Bison europaeus) called by Germans "wisent" and in the Slavonic languages "subor" or "sobor." This great bison stands six feet or more in height at the shoulder, and closely resembles the American bison or "buffalo" (q.v.); it is believed, indeed, that the American animal descended from the ancestral race of aurochs. When the Romans spread northward into Europe, they found these and other oxen in the forests wherever they went, and even down in the days of Charlemagne they were spread over Germany and were beasts of chase. They have steadily diminished, however, until now they exist only as a single herd in the Bavarian Forest, and in the lakes of Bieloveze, in Lithuania, which in 1899 numbered 700 while a few hundred roam in the Caucasian Mountains. The name "aurochs" is also applied sometimes to the urus, the ancient wild ox of Europe (Bos primigenius), the supposed ancestor of our domestic cattle. See Bison.

AURORA, Ill., city, Kane County, on Fox River, and on the C., B. & Q., the C. & N. W., the E. J. & E., and the C. M. & G. railroads. Is the hub of electric interurban lines extending in all directions to Chicago, to Elgin and Dundee, to DeKalb, Yorkville, and Morris and Joliet. It was founded in 1834 by Joseph and Samuel McCarty; at first there were two incorporated villages, one on each side of the river, until 1864, when they made one municipality and organized as a city. Aurora is an important manufacturing city, having a variety of extensive establishments; these include the shops of the Chicago, Burlington & Quincy Railroad; a wheelbarrow factory; railroad dump cars, racing sulky, paint, door hangers, chemical supplies, wrappers, shirts, corsets, steel cabinets and shelving, flour, mattresses, roofing, silverware, lithography, cooperage, print shops, toilet articles, binder board, automatic tools, stoves and ranges, brick, brushes, typewriter supplies, conveying machinery, gravel plants, condensed milk, acetylene gas, woodworking machinery, pumps, motorcycles, grindstones, paper boxes, gas mantles, millwork, well machinery. There are several foundries and machine shops, and a large number of small manufactories. The United States census of manufactures for 1914 recorded 140 industrial establishments or factories, employing 5,497 persons, of whom 4,779 were wage earners, receiving $3,033,000 annually in wages. The aggregate capital employed was $14,806,000, and the year's output was valued at $10,789,000; of this, $5,550,000 was added by manufacture. The city has five national banks and one State bank. The city has 43 churches, a good system of public schools, including two high schools, the East
High School and the West High School, and a public library, a building for which was presented by Andrew Carnegie. It is also the seat of the Advent Christian College, and of the Jennings Seminary for young women. There are six buildings owned by the Y. M. C. A. and the Y. W. C. A., a city hospital and Saint Joseph and Saint Charles hospitals, and a new State armory. The government is vested in a mayor and city council of 14, seven of which are selected each year, for a term of two years. The water and electric lighting plants are owned and operated by the city. Aurora was the first city in the world to light its streets by electricity. Pop. (1900) 24,147; (1910) 29,807, an increase of 23.4 per cent; (1916) 36,000.

AURORA, Ind., a city in Dearborn County, on the Ohio River, C., C. & St. L. and the B. & O. S. W. railroads, 29 miles southwest of Cincinnati, Ohio, with which it has regular steamboat connection. There are extensive car and machine shops here, and manufactories of furniture, wheels, tools, barrels, buggies, coffins, brick and flour. It has also a large grain and hay trade. There is a public library and recreation park. Aurora was settled in 1819 and chartered as a city in 1848. Pop. (1910) 4,410.

AURORA, Mo., city in Lawrence County, situated on the St. L. & S. F. and St. L. I. M. & S. railroads, 30 miles southwest of Springfield, 18 miles northeast of Pierce City. The chief industries are fruit growing, lead and zinc mining and farming. There are also flour mills, foundries and machine shops, marble works and a canning factory. Aurora has two banks with $75,000 capital. The city has adopted the commission form of government, and is supplied with water from dams in the White River. Pop. 4,148.

AURORA, Neb., city, county-seat of Hamilton County, on the Burlington and Missouri River Railroad, 105 miles southwest of Omaha. Though extensive brick yards and flour mills are operated in the town, it is mainly a stock raising and farming centre. The community owns its own waterworks. Pop. 2,630.

AURORA, N. Y., village in Cayuga County, situated on Cayuga Lake, 25 miles northwest of Ithaca, on the Lehigh Valley Railroad. It is the centre of an agricultural region, and is a residential town and favorite summer resort. It is the seat of Wells College for Women, the Wallcourt School for Girls and the Somes School for Boys. Aurora is two miles south of the site of the Jesuit mission to the Cayuga Indians, started in 1656, and was settled in 1789. The government is by town-meeting, held every two years to elect officers. Pop. (1910) 693.

AURORA (Greek, Ἀορα), in mythology, daughter of Hyperion and Theia, and sister of Helios and Selene. She is goddess of the dawn; rises from the ocean, drawn by the celestial horses, Lampus and Phethon, and with rosy fingers raises the veil of night, and opens to the world. She was the wife of the Titan Astraeus. Bores, Notus, Hesperus and Zephyrus, and the other stars were her children. In art she appears as present at the death and burial of Memnon, as carrying away her favorites, as a goddess of light rising from the sea in a chariot with winged horses. She preceeds the sun god and strews flowers in his path. The fresco is remarkable for its coloring and is the painter's greatest work.

AURORA BOREALIS (French, aurore boreale; German, Nordlicht), the northern light. An illumination in the sky, seen oftenest north of middle latitudes in the northern hemisphere, and south of them in the southern hemisphere. In our hemisphere it is generally visible in the north, and has, therefore, been called the Aurora Borealis. In the southern hemisphere it is called the Aurora Australis.

The frequency with which it is seen varies with the latitude of the place. It is comparatively rare within 45° of the equator, but becomes more frequent toward the north up to the latitudes of about 60°, where it sometimes becomes almost a nightly phenomenon. Near the pole it again becomes less frequent. We shall first describe it as it is commonly seen in our own latitudes. The first noticeable phenomenon commonly occurs after the end of twilight, when the northern sky near the horizon will be seen illuminated with a light somewhat like that of the dawn. Careful examination will show, however, that the illumination is in the form of a broad arch, highest near the magnetic north, and reaching the horizon in the northeast and northwest directions. Presently beams of light are seen crossing this arch with a quivering or flickering motion and shooting toward the zenith. Each beam constantly varies in brightness and seemingly fades away to give place to another.

In more northern latitudes, say north of 45° or 50°, these beams form the most brilliant feature of the aurora. Sometimes they are arranged in curved, wavy lines like the slats of a window shade flying in the wind, giving the appearance of a scroll in the process of being unrolled. In the case of a very brilliant aurora the beams may cover almost or quite the entire sky. In this case they will be seen to converge toward a point commonly not far from the zenith. The appearance of these beams grows out of the direction in which they are seen and from the laws of perspective. Long-repeated observations show that the rays are really parallel to the direction of the dipping needle, or to the line of a earth's magnetic force. In the latitudes which we have mentioned, the dip is commonly more than 60°, increasing to 90° at the magnetic pole; hence when a great number of beams, all parallel to each other, are viewed from a point on the earth's surface under the region in which they are found, they all seem to converge according to the laws of perspective toward that part of the sky to which the upper (south) pole of a dipping needle is directed. If the parallelism to the magnetic lines is exact, the direction of this point will be the same as that of the compass needle itself. It is still an open question where the parallelism is exact. Many observations seem to show a deviation of 10° or more, but the determina-
tion of the exact centre of convergence is diffi-
cult unless the rays are so numerous as to
cover a large part of the sky, and it is not
certain that the position so determined may not be due to
terrors of estimation.

The Nature of the Auroral Light.—As a
general, perhaps universal, rule, the rays or
beams which we have described have a slightly
yellowish tinge. When their light is ana-
lyzed with the spectroscope, many lines, in one case
nearly 150, have been found in the spectrum.
Of these the brightest and most constant is in
the yellowish green part of the spectrum, hav-
ing a wave length of 557. This line is char-
acteristic of the aurora, and is almost certainly
due to krypton. Several of the others have
been identified with the lines of oxygen and of
nitrogen, a result which might have been ex-
pected since it is practically certain that the
aurora is due to an electrical discharge in or
through our atmosphere.

The light of an aurora does not proceed
wholly from the beams. Very irregular sheets
of light, having the appearance of thin lumin-
ous clouds, are often seen, and of various
forms, colors, and sometimes, especially frequent.
The appearance is then that of a red cloud
illuminated by the rays of the sun sometime
after the latter has set. The light can, how-
ever, be easily distinguished from that of a
cloud by its diffused character and the ab-
sence of any definite outline. The height
of the region in which the auroras are
formed has never been definitely determined.
The most important question is, whether the
height is, in any case, above the upper limits
of the atmosphere. This question is all the
more difficult in that this limit is in itself an
uncertain quantity. Observations of shooting
stars show that these objects become visible at
a height of about 100 miles above the earth’s
surface. The limit of the atmosphere must
therefore be as high as this, and may be much
higher. The difficulty of making observations
upon the same auroral beams, at one moment,
at different points of the region from which
they are visible, is such that an exact deter-
mination of the height of a beam has ever
been made. There is some reason to believe
that the height may sometimes range from 100
to 150 miles, but there is no reason to believe
that the beam is ever seen above the possible
limit of the atmosphere. It might be supposed
that by laying off a suitable base line on the
earth, from the extremities of which the alti-
itudes of selected portions of the light are
measured, the heights might be determined in
a very simple manner, and indeed in the older
meteorologies results of observations made in
this way are frequently stated. But it is now
regarded as certain that such figures can claim
but little accuracy. If the base is a long one,
as is necessary in measuring the greater heights,
it is very uncertain whether the two observers
are measuring to the same region of illumina-
tion, beside which the very rapid motions of
such regions in auroral display introduce a
further element of uncertainty.

Periodicity of the Aurora.—Records of
auroras extending back two centuries or more
show that they have been much more numerous
at some periods than at others. Sometimes it
has been supposed that the aurora is nume-
rous at intervals of 33 or some fixed
number of years, but this has not yet been
proved, nor has any law been determined by
which we can definitely say at what times they
appear in the greatest number. But several

observers have in some cases seen the beams
between their own positions and a nearby
mountain, or below the clouds, while careful
measurements of the brightness indicate that
auroras have been secured. It is also very fre-
cently observed in countries where auroras
are numerous that the phenomenon is accom-
panied by a crackling sound, somewhat resem-
bling the rustling of silk or straw, or the
electrical sputterings accompanying wireless
messages. Such sounds have been described
in the Arctic regions as regularly increasing
and decreasing in intensity as the brightness
of the aurora waxed and waned. In such
cases the aurora must have been very near
the ground; it is not to be expected that any
sound can be detected in lower latitudes, where
the aurora occurs at a far greater altitude.

Cause of the Aurora.—Science has not
been able to determine as yet with certainty
and precision the cause of this very common
phenomenon. When the luminous effect pro-
duced by the passage of electricity through the
highly rarefied air of a vacuum tube was first
observed, its resemblance to the aurora was
the view that the latter was produced by electric
currents in the upper regions of the atmosphere.
Although it is not impossible that such currents
can be associated with the aurora, they do not
adequately explain its light, and are apparently
inadequate to explain its rays. Yet there is no
doubt that the aurora is associated in some way
with the magnetism of the earth. The coinci-
dence of the rays of the aurora with the direc-
tion of the magnetic needle is one proof of this
relationship; another proof is found in the re-
solution of the aurora to magnetic storms.
The general rule is, that a very brilliant aurora is
associated with such a storm, disturbing the
magnetic needle not only at the point where the
aurora is visible, but perhaps over the whole
earth. Earth currents so strong that from time
to time a line of telegraph may be run by them
are also occasional accompaniments of a bril-
liant aurora, but although the intimate connec-
tion of the two phenomena is so well estab-
lished, the exact relationship is yet to be worked
out. In recent years Archenius has propounded
a theory, based on the very probable fact that
the sun emits a flood of corpuscles of a nature
similar to that of the mysterious rays known as
X-rays, cathode rays, electrons, etc., the investi-
gation of which has occupied so large a place
in recent physics. His theory is, that these cor-
puscles on approaching the earth are acted on
in the direction of the lines of its magnetic
force round which they describe helixes. While
nothing as yet has been found to disprove this
theory, it is one which still needs much prov-
ing. What can be said with reasonable prob-
ability is that the aurora is caused by irregular
emanations of corpuscles from the sun, which
are stopped in the upper regions of our atmos-
phere.
periods are observed which show that the appearance of the aurora is in some way connected with the sun. The first instance of this is the fact that they are more numerous when the spots of the sun are more numerous. As there is an 11-year period in the spots on the sun, so there is a corresponding period in the aurora. There is also a semi-annual period in the frequency of the aurora, the greatest number being observed in March and September and the smallest in June and December. Archenius has connected this with the fact that in March and September the earth is over the region of the sun's surface in which spots are more numerous. Statistics also show that there are more auroras in the northern hemisphere when the moon is south of the equator than when she is north. This, however, is not proved to be a general law. There is also an observed period of 25.93 days in the frequency of the aurora. This is so near the time of the sun's rotation that it may be connected with the latter. Consult Angot, 'The Aurora' (International Scientific Series).

Simon Newcomb,

Revised by Eric Doollittle, Director Flower Astronomical Observatory.

AURORA LEIGH. 'Aurora Leigh,' a narrative poem or "novel," as Mrs. Browning herself termed it, was begun in Italy, and completed in London in 1856. This romantic autobiography in blank verse tells, in nine books, the story of its half-English, half-Italian heroine; of her struggles to live by and for her art; and of the final triumph of her love for her cousin, the reformer Romney Leigh.

As a novel, 'Aurora Leigh' was immediately and enormously popular. But the poem holds other appeals to modern readers. Those who find its action undramatic, its characters unconvincing, its scenes unreal, its style too often that of rhetoric, not of poetry, will still turn to it as an inexhaustible mirror of its age. For in it lives mid-Victorian England: its complacent wealth, and appalling poverty; its fine fashion and its prostitutes; its Fourierists and its Christian Socialists. It is in depicting the failure of Romney's reforms that Mrs. Browning voices the conviction that gives the poem its theme:

"Tis impossible
To get at men excepting through their souls.
And poets get director at the soul
Than any of your economists."

And some readers will prize 'Aurora Leigh,' as the record of the heart and mind of Elizabeth Barrett Browning; her keen satire on the English social order; her fearless sympathy with its victims; her recognition of the poet as the true interpreter of modern life; her exaltation of the creative power of love. Such readers will find in 'Aurora Leigh,' the poem into which Mrs. Browning's 'highest convictions upon Life and Art have entered,' the record of a poem rather than her poet. For full bibliography, see 'The Cambridge History of English Literature' (Vol. XIII, Ch. 3). Consult also Montgut, Emile, 'Ecrivains modernes de l'Angleterre' (Deuxièmè série, Paris 1889); Texte, Joseph, 'Études de littérature européenne' (Paris 1898).

Frances Wentworth Cutler.

AU R U N G Z E B E, a'rng-żeb', the last important emperor of Hindustan, of the Mogul dynasty: b. 1st Oct. 1818; d. Ahmmedpur, 21 Feb. 1707. He was the son of Shah Jahan and properly named Mohammed, but received from his grandfather that of Aurungzebe (Ornament of the Throne), by which he is known to history. Aurungzebe, in 1658, was crowned sole monarch of India, the great Mogul being represented by his great uncle, Shah Jahan. Sught Stanly Lane-Poole, 'Aurungzib' (London 1893); Sarkhan, T. N., 'Anecdotes of Aurangzib' (ib. 1812); id., 'History of Aurangzib' (ib. 1913).

AUS DEM LEBEN EINES TAUENICHTS (1858) ("Out of the Life of a Good-for-Nothing"), by Josef Freiherr von Eichendorff is one of the most pleasing products of German romanticism, a story of perennial charm. The hero, whose name, oddly enough, is never disclosed, listens dreamily to the melody of his father's mill-wheel, but he hears rather the call of the open road, and with naive recklessness he simply wanders forth from the humdrum and the every-day for the unknown, his only luggage being his violin. The story is the record of his diverting and highly romantic adventures. His adventures as a traveler may well be described in the words of another wanderer with whom he journeys for a time: "When we start out in the morning, the finest thing about it is that we have no idea what chimney is smoking for us that day, or what good fortune may be ours before night-fall." But, unlike various other stories of romantic wandering, Tieck's 'Franz Sternbalds Wanderungen,' for example, Eichendorff's tale has a genuine plot upon which a substantial part of the interest depends. As a late product of the romantic era, the story lacks the earlier vagueness, mysticism or morbidity of the school; it is an unsurpassed example of romantic 'Wanderlust;' and it illustrates as well the characteristic turning of northern eyes toward the colorful lands of the south, for the hero seeks the road to Italy and finds it. Eichendorff's talent was essentially lyric, and his little story is flooded with lyric feeling; in it, indeed, several of his most charming lyrics are embedded; for example, till rechte Gunst erweisen, den schick er in die weite Welt ("When God a special favor graneth, He sends one roaming through the world," or, using the Fremde will wandern ("Who in distant lands would wander"), Consulting C. G. Leland, 'Memoirs of a Good-for-Nothing' (New York 1866), and by Mrs. A. L. Wister, 'Leaves from the Life of a Good-for-Nothing' (Philadelphia 1889).

Harvey W. Thayer.

AUSABLE (ä-snäb') CHASM, a picturesque and popular American summer resort, in New York State, 12 miles from Lake Champlain and one mile from Keeseville. It is an isolated formation, wholly independent of, and disconnected from, any other similar panorama. At the beginning of the chasm, the river is hemmed into a channel not more than 10 feet wide by walls of rock from 100 to 200 feet high. Lower down the walls gradually spread apart till in some places there is a distance between them of 50 feet, and then extend with sharp turns and occasional enlargements for nearly two miles. Lateral fissures, narrow and deep, pro-
AUSCULTATION—AUSTEN

ject from the main ravine at nearly right angles, and through one of these a staircase of over 200 feet reaches to the abyss. The walls are formed of limestone of sandstone, laid in precise, regular order, and their crevices are filled with a thick growth of hardy pines and cedars. The trip through the chasm may be made in a small boat or on foot. For the accommodation of tourists, stone walks with substantial iron railings and firm bridges have been constructed.

AUSCULTATION, a method of examining the body by means of the sounds given to the ear. The naked ear may be used, or instruments, such as the stethoscope (q.v.), or the phonendoscope, be employed. The natural sounds may be alone investigated, as in listening to the breathing sounds, or the heart sounds, or the organ, or that portion contiguous or remote from the organs, may be tapped, or percussed, to determine variations in the response. All of the parts of the body may be investigated by these means. Auscultation is probably, next to inspection, the oldest mode of investigation. Hippocrates II used it extensively, but it was not until Lænæ, in 1816, gave his demonstrations about the peculiar sound that came to be recognized as one of the most important in the diagnosis of diseased conditions. Early views had it that the sounds produced were capable of directly revealing the nature of disease and Skoda first demonstrated this, and has done so with great success. The normal conditions of peculiar physical states of the body. Consult Butler, 'Diagnosics of Internal Medicine' (1901); Cabot, 'Physical Diagnosis' (New York 1912); Le Fevre, 'Physical Diagnosis' (ib. 1905); Sahli, 'Untersuchumphethoden.' See Percussion.

AUSGELICH (ous'-glish) OF 1867. The, a compact by which was created the present close union between Austria and Hungary; the Austro-Hungarian monarchy. According to the provisions of this document, the two monarchies henceforth were to act as a whole, the emperor of Austria being also the Apostolic King of Hungary. He is crowned both at Vienna and Buda-Pesth. Aside from that, the agreement extends to a common administration for certain matters of state; a customs union, a joint commercial policy, a uniform system of coinage and weights and measures, as well as a joint control of industrial monopolies and the railways. In foreign affairs the two nations have only one policy, as well as one financial policy. In military organization they are practically one state. Each nation has an independent Parliament, but the two ministries are controlled by a third body, a joint Parliament, known as the Delegations. This body is made up of representatives of both governments, each delegation numbering 60 members, elected by their respective Parliaments. They meet alternately each year in Vienna and Buda-Pesth, though much of their business is carried on by correspondence. The various treaties of the Ausgleich are renewable every 10 years. In 1897 the agreement regarding the customs union failed of renewal, and was later replaced by a reciprocity treaty. The last general renewal was in 1907.

AUSONIA, a poetical synonym for Italy; so used by Virgil and other Roman poets.

AUSONIUS DECIMUS MAGNUS, the most distinguished Roman poet of the 4th century A.D.: b. Burdigala (Bordeaux) about 310; d. about 392. He studied under several distinguished masters, and became professor of rhetoric in his native city, whence his fame extended through the whole empire. Valentinian entrusted to him the education of his son, Gratian, and appointed him afterward questor and pretorian prefect. After Gratian had ascended the throne he showed himself less grateful to his preceptor. About the year 379 he appointed him consul in Gaul. After the death of Gratian, Ausonius lived upon an estate at Bordeaux, devoted to literary pursuits. As Valentinian was of the Christian religion, it is probable that Ausonius was so, too; and many of his writings confirm this conjecture. Critics are not unanimous on the subject of his poetical merits. He is undeniably learned and ingenious, but his style and versification have the blemishes of the age, and his Latin is impure. His epigrams, idyls, eclogues, letters in verse, etc., are extant. The best edition is that of 'Peiper' (Leipzig 1866). Consult Delachaux, A., 'La latinité d'Ausone' (Lausanne 1909); Dhillon, 'Roman Sociology'; Mackail, 'Latin Literature' (New York 1896).

AUSPERG, Karlo, Prince. Austrian statesman: b. 1 May 1814; d. 1890. After a long service in the army he became a member of the upper chamber of the Austrian Reichsrath. Later he became president of the Austrian House of Peers, where he used all his influence against the Clericals. In 1868 he presided over the ministry and strongly supported the Liberal Cabinet, at the head of which was his younger brother Adolf.

AUSPICES. See AUGURIES AND AUSPICIES.

AUSTEN, Jane, English novelist: b. Steventon, Hampshire, 16 Dec. 1775; d. Wincheste, 18 July 1817. Miss Austen was the daughter of the Rev. George Austen, rector of Steventon and Deane, and Cassandra Leigh Austen, daughter of the Rev. Thomas Leigh and niece of Theophilus Leigh, for many years master of Balliol College, Oxford. Jane is the youngest of seven children, of whom others besides herself, particularly Admiral Francis William Austen, became distinguished. Until 1801 she lived at Steventon. Her life here was quiet, domestic and moderately studious. Much of her spare time she spent in writing, chiefly for her own amusement. In 1801 the family removed to Bath, whence Miss Austen made visits to Lyme, Southampton and other places in the south of England. Her father died in 1805, and in 1809 she settled at Chawton, in Hampshire, where she remained until within two months of her death. In May 1817, after some months of ailing health, she went to Winchester for treatment, and there died in the following July.

Miss Austen began writing stories at an early age, and before 16 is said to have composed good-humored nonsense. The first of her extant novels, 'Pride and Prejudice,' was written between October 1796 and August 1797. Before that she had written 'Eleanor and Marianne,' which, in 1797-98, she altered into the present 'Sense and Sensibility.' Her third novel, 'Northanger Abbey,' belongs to 1798. The first of these novels to be published was
Sense and Sensibility' in 1811. Two years later 'Pride and Prejudice,' which had been refused by a publisher in her father's lifetime, made its appearance. 'Northanger Abbey' had an even longer period of darkness; in 1803 it had been sold to a publisher for £10, but the publisher, after keeping it 10 years or more, sold it back to the family, by whom it was issued in 1818, the year after the author's death. In 1804, Miss Austen began 'The Watsons,' but never finished it, and until 1811 apparently did comparatively little writing. Between that year and 1816, however, she wrote 'Mansfield Park,' 'Emma' and 'Persuasion,' published respectively in 1814, 1816 and 1818. There is also an unfinished story, 'Lady Susan.' The novels were not especially popular in the author's lifetime, though Scott and Macaulay (a little later) paid sincere and high tribute to their excellence. To-day they are regarded as among the best novels in the language and are probably as widely read as those of any first-rate woman novelist in English. The place which now seems to appear to belong to Miss Austen's skill as a story-teller and a drawer of character. The people she deals with are chiefly from the higher middle classes in the English country, and she rarely goes above or below them. At a time, that of the Napoleonic wars, when there was every temptation to write battle stories and heroics, Miss Austen kept her eye on the life that she knew, and had nothing to do with spectacular means of arousing interest. The aspect of the few warriors and seamen who come into her pages is domestic rather than martial. Nor is there any very serious adventure of any sort; the worst that happens is an elopement, or when a heroine slips down stairs and is stunned. Her people are quite unintellectual and in no wise grand or heroic. On the whole, her material is less startling than that of any English novelist, but the picture which she gives is unsurpassed in the perfection of truth, humor and vivacity. As a story-teller, she has, in point of technique, construction, no superior. Her plots are not elaborate and there is no conspicuous wealth of invention; in all her six novels the plot turns on an elopement or a hidden engagement; but, granting this, the construction of 'Pride and Prejudice,' 'Emma' and 'Mansfield Park' is not to be bettered. They are models of their class of story telling. As an artist in character drawing, Miss Austen has contributed to the gallery of familiar persons such figures as Miss Bates, Mr. Woodhouse, Mrs. Bennet, Mrs. Norris and a number of others, all of whom are brilliant, though occasionally exaggerated, creations. All her important characters are strongly individual, and are so firmly drawn that there is no tendency to confuse them as types or as persons. 'Pride and Prejudice' is usually regarded as the best of the novels in point of liveliness of style, neatness of structure and vigor of substance. This position would be disputed by admirers of the more intricate 'Emma' and the more intricate and gloomy 'Mansfield Park,' both of which probably surpass 'Pride and Prejudice' in maturity and variety of characterization. 'Northanger Abbey' is less ambitious than either of the preceding; it is a very vivacious burlesque, with a charming moral. The other two novels, 'Sense and Sensibility' and 'Persuasion,' are usually thought to be inferior. See PRIDE AND PREJUDICE; ARROW MAKER, THE; EMMA; MANSFIELD PARK.

Bibliography.—Excellent editions of the novels of Jane Austen are easily to be had. The principal is in the Rev. J. E. Austen Leigh's 'Memoir of Jane Austen' (London 1870). There is also a life by Goldwin Smith in the 'Great Writers' series (New York 1890). The place of Jane Austen in literature is treated in such literary histories as Mrs. Oliphant's 'Literary History of the 19th Century' and W. L. Cross's 'The Development of the English Novel.' W. D. Howells, in 'The Heroines of English Novels' (1901) and 'Criticism and Fiction' (1891) pays very high tribute to Miss Austen as an artist and as a creator of character. Recent works are Constance Hill's 'Jane Austen: Her Home and Her Friends' (New York 1902); Mitton, G. E., 'Jane Austen and Her Times' (London 1905); Austen-Leigh, Jane; 'Austen: Her Life and Letters: A Family Record' (London 1913); and 'English Men of Letter Series' (New York 1913).

William T. Brewster, Professor of English, Columbia University. AUSTEN, Peter Townsend, American chemist: b. Clifton, S. I., N. Y., 10 Sept. 1852; d. 1907. He was educated at Columbia University, School of Mines, and in Germany and Switzerland. In 1876, he was appointed instructor of chemistry at Dartmouth; in 1877, professor of chemistry at Rutgers. From 1887 to 1893 he was engaged in industrial work and 1893-98 was professor of chemistry at Brooklyn Polytechnic Institute. He invented several useful manufacturing processes; wrote a number of valuable papers, and translated Pinner's 'Repetition der organischem Chemie' under the title 'An Introduction to the Study of Organic Chemistry,' and published the volume 'Kurze Einleitung zu den Nitro-Verbindungen' (Leipzig 1876).

AUSTERTLITZ, oüster-lets, Moravia, a town on the Littawa, 13 miles southeast of Brinn. In the vicinity, on 2 Dec. 1805, was fought the famous battle between the French army of 80,000 men, commanded by Napoleon, and the combined Russian and Austrian armies, numbering 84,000, under their respective emperors; in which the former achieved a signal victory. According to Alison, the allies lost 30,000 in killed, wounded and prisoners, and the French, 12,000. The battle was followed by an armistice, the terms of which were dictated by Napoleon; and immediately after, on 26 December, by the Treaty of Presburg, which disastrously affected Austria. The battle of Austertitz is sometimes called 'The Battle of the Three Emperors.' The present town has a population of about 4,000.

AUSTERTLITZ, The Sun of, a term given to any favorable omen, in allusion to the brilliant appearance of the sun just before the battle of Austertitz, and which Napoleon accepted as a token of coming victory.

AUSTIN, Saint. See AUGUSTINE, SAINT.

JANE AUSTEN

From the Hollyer photograph after Linton
was the son of a wool merchant, educated at Stoneyhurst, Oscott and London University; called to the bar in 1857. After his father's death he abandoned the law and devoted himself to study and travel, and in 1864 he published his first volume, "The Season; a Satire," after Byron. He had, however, written volumes of verse earlier. He ran for Parliament in 1865, but was defeated. In 1867 he joined the staff of the Standard, at that time one of the most influential London dailies, which ceased publication 16 March, 1916. For this paper he wrote many leader reviews and biographies, and so stamped his personality and opinions upon that journal that it was humorously called "The Daily Alfred Austin." Sent abroad, he did good work as special correspondent at the Vatican Council, the Prussian headquarters in the Franco-German War (1870), and the Berlin Congress (1878). He was editor of the National Review, 1883-93. His appointment as poet laureate in succession to Lord Tennyson, backed nearly a decade after the latter's death, was the cause of much surprise and comment. It was known that Swinburne, Browning and William Morris — his greatest contemporaries — were out of the running owing to their pronounced tendencies, and his chief competitors were Lewis Morris and Sir Edwin Arnold. Austin could by no stretch of imagination be called a great poet; yet he performed his official work satisfactorily, though both his poetry and his criticism were decidedly conservative and conventional. Perhaps his most attractive work was done in his pleasant books of garden life, of which "In Veronica's Garden" was the most conspicuous. Some of his other works are: The Human Tragedy (1892); The Golden Age: a Satire (1871); The Tower of Babel, a drama (1874); Savonarola, a tragedy (1881); The Garden that I Love; In Lamia's Winter Quarters; Haunts of Ancient Peace (1902); and A Lesson in Harmony (1904). In December 1899, he published To Arms! and in May 1900, one on the relief of Maeki. In 1885 Austin married Miss Hester Mulock, who survived him, but left no children. His successor in the poet laureateship is Mr. Robert Bridges (q.v.).

AUSTIN, George Lowell, American physician and writer: b. Massachusetts 1849; d. 1893. Among his numerous works are: Perils of American Women; Water-Analysis (1882); Under the Tide; Life of Franz Schubert; Popular History of Massachusetts; Life of Wendell Phillips (1888).

AUSTIN, Henry, American lawyer and legal writer: b. Boston, Mass., 21 Dec. 1858. He has been a commissioner of insolvency for six years and is an associate justice of the municipal court of Boston (West Roxbury district). He is the author of American Farm and Game Laws; American Fish and Game Laws; Liquor Law in New England.

AUSTIN, Jane (Goodwin), American novelist: b. Worcester, Mass., 25 Feb. 1831; d. Boston, 30 March 1894. Her works include Captain Todd, 1864; An Alternative, 1866; Mrs. Beauchamp Brown (1880); A Nameless Nobleman (1881); The Desmond Hundred (1882); Nantucket Scraps (1882); Standish of Standish (1889); Betty Alden (1891); and David Alden's Daughter and Other Stories (1892).

AUSTIN, John, the most distinguished of English writers on jurisprudence: b. Creeling Mill, Suffork, 3 March 1790; d. Weybridge, Surrey, 1 Dec. 1859. He entered the army in 1806 and served as a subaltern in Sicily and elsewhere until 1811, when he resigned his commission, returned to London, and took up the study of law. In 1818 he was called to the bar, and in 1820 married Miss Sarah Taylor of Norwich, a talented woman, to whose devotion and purpose Austin's success is in great part due. He removed to Westminster, where he became the intimate of some of the greatest minds of England, among others, of Jeremy Bentham and John Stuart Mill. His weak constitution coupled with a lack of courage hindered his success at the bar despite his great natural gifts and adequate legal knowledge. He retired from practice in 1825 and in the following year was appointed to the chair of jurisprudence in the newly-founded University of London. Jurisprudence had not yet received its due share of scientific scrutiny and was neglected; hence Austin's efforts in this direction received scant recognition and his work may be classed a failure. The better to qualify himself for his task he spent some time at Bonn in reading and study under Niebuhr, Brandis, Arndt, Welcker and others who at that time made Bonn the chief seat of juristic learning in Europe. Austin returned to his classroom early in 1828 but his earnestness coupled with his precise and accurate definitions and classifications evoked scant enthusiasm among his students, whose number gradually dwindled until in 1832 he was obliged to resign his post. In this same year he published The Province of Jurisprudence Determined, a work that placed his author in the foremost rank of writers on this subject. It was little appreciated by the public, however, and Austin was not encouraged to undertake other works of the kind. In the course of the following years he served on several royal commissions, one of which in 1836 took him to Malta. But here his health broke down, and on returning to England he was ordered abroad by his physicians. He remained on the continent until the troubles of 1848 in Europe drove him back to England, where he settled at Weybridge, residing there until his death. His widow issued a second edition of The Province of Jurisprudence in 1861, and in her introductions gives a pathetic account of Austin's life struggle. In 1863 she collected and arranged for publication his lectures on the principles of jurisprudence, which were issued under the title Lectures on Jurisprudence, Being the Sequel to The Province of Jurisprudence Determined. Austin's fame rests on these lectures, which are remarkable for the clearness and penetration of their analysis of legal conceptions. Austin is the first systematic writer on law in the English language. His work revolutionized the science of jurisprudence and exerted a wide influence on the legal thought of the last half of the 19th century. In the 20th century this influence appears to be on the wane owing to the larger conception of human society now possible and the historical spirit which has so moulded the thought of our day. For a defense

AUSTIN, Jonathan Loring, secretary and treasurer of Massachusetts: b. Boston, 2 Jan. 1748; d. 10 May 1826. He was graduated at Harvard in 1766, engaged in trade at Portsmouth, N. H., and in 1775 entered the army. For a time he was secretary of the Massachusetts Board of War and in 1777 was sent to Paris to announce to Franklin Burgoyne’s surrender at Saratoga. He remained two years in Paris as Dr. Franklin’s secretary. He also spent some time in England as agent of Dr. Franklin. On his return in May 1779, he was liberally rewarded by Congress. In 1780, in his passage to Spain as agent of the State, he was taken prisoner. Dr. Loring held the offices of State secretary and treasurer in Massachusetts, and died universally respected. His son, James Trecotic: b. Boston, 7 Jan. 1784, studied law, rose in the profession, and was attorney-general of the State from 1832 to 1843.

AUSTIN, Mary Hunter, American author and playwright: b. Carlinville, Ill., 9 Sept. 1868. She was graduated from Blackburn University, after which she spent 17 years in acquainting herself with the life of the Indians in the Mohave Desert. This experience has furnished the material for most of her works, which are: ‘The Land of Little Rain’ (1903); ‘The Basket Woman’ (1904); ‘Isidro’ (1905); ‘The Flock’ (1906); ‘Santa Lucia’ (1908); ‘Lost Borders’ (1909); ‘Christ in Italy’ (1912); ‘At Great Llano’ (1913). In 1911 she produced a play, ‘The Arrowmaker,’ at the New Theatre, in New York city; ‘Fire,’ a drama; ‘Love and the Soul-Maker’ (1914); ‘The Man Jesus’ (1915).

AUSTIN, Moses, an American who obtained the first grant from the Mexican government for the formation of an American colony in Texas: b. Durham, Conn.; d. January 1821. He forwarded to the commandant-general at Monterey an application for permission to colonize 300 families in some part of Texas. The application was successful, and the enterprise prosecuted by his son, Stephen F. Austin (q.v.).

AUSTIN, Oscar Phelps, American statistician: b. Illinois. At the age of 12 he removed with his parents to Nebraska, where he remained until manhood. Engaged in journalism in Chicago and Cincinnati and Washington, serving as correspondent for newspapers in New York, Chicago and other cities. Appointed Chief of Bureau of Statistics, United States Treasury Department in 1898; resigned 1914 and became statistician of foreign trade department of the National Bank of New York. He is the author of ‘Uncle Sam’s Secrets’; ‘Uncle Sam’s Soldier’; and other publications for the instruction of youth in national and international affairs; ‘Economics of World Trade’; ‘Territorial Expansion of the United States’; also of official monographs ‘Commercial China’; ‘Commercial Japan’; ‘Commercial Africa’; ‘Russia and the Trans-Siberian Railway’; ‘American Commerce’; ‘Commercial Alaska’; ‘Submarine and Land Telegraphs of the World’; ‘Colonies of the World and Their Government’; ‘Colonial Administration’; etc. He is secretary of the National Geographic Society; was lecturer on international trade and commercial geography in the George Washington University, 1904 to 1914, and before trade bodies in many cities; honorary degree M.A. from George Washington University; visited 20 principal countries in commercial studies.

AUSTIN, Sarah Taylor, English writer, wife of John Austin: b. Norwich 1793; d. London, August 1867. She was a member of a family distinguished for its literary and scientific attainments. She spent a long period of travel abroad, mainly in Germany, where she attained a wide knowledge of the German language and literature. Most of her works are translations from the German, the first of which was ‘Kleist’s German Prince in England’ (London 1832). Then followed ‘Characteristics of Goethe’ by Falk (1833); ‘The Story Without an End,’ by Carové (1834); and ‘History of the Popes,’ by Ranke (1840). Among other works are ‘Considerations on National Education’ (1839); ‘Letters on Girls’ Schools’ (1857). Her daughter Lucie married Sir Alexander Duff-Gordon.

AUSTIN, Stephen Fuller, American pioneer: b. Wythe Co., Va., 1792; d. 27 Dec. 1836. He was a son of Moses Austin. He followed up the grant for a colony in Texas previously issued to his father. By it he was clothed with almost absolute power over the colonists, and only obliged to report to the captain-general. He founded what is now the city of Austin, the capital of Texas. The colony prospered, and, being accompanied by a considerable number of similar associations, promoted an influx of Americans to such an extent that they met 1 March 1833, without the concurrence of the Mexican population, in a convention to form a constitution for the as yet Mexican state of Texas. Austin was one of the delegates chosen to carry the result of their deliberations to the central government at Mexico, and obtain its ratification. The delays and frequent revolutions at Mexico leading him to despair of ever bringing his commission to a close, he addressed a letter, 2 Oct. 1833, to the municipality of Bexar, and through them to the people, recommending a union of all the municipalities to provide against the consequences of a probable refusal of their applications by organizing a state under the Act constitutiva of 7 May 1824. This letter was considered treasonable, and Austin was arrested and held as a hostage for the good behavior of Texas. There he was detained until September 1835. He was appointed a commissioner to the United States in November 1835. This was before the Texan declaration of independence; and it was not till after his arrival at New Orleans, and the information of the union of Santa Anna with the federal party for the invasion of Texas, that he was brought to the point of recom-
mending such a measure. He acted with prudence and patience, and was successful in preparing for the independence and annexation of the new republic. He was a candidate for the presidency of Mexico, in 1829, but was defeated by Houston, who appointed Austin his Secretary of State. The latter, however, died suddenly on 27 December of the same year. He is looked upon as one of the most eminent and honorable of the founders of Texan nationality. Consult Wooten, 'History of Texas' (2 vols., Dallas 1899); and Yoakum, 'History of Texas' (New York 1856).

AUSTIN, William, American author: b. Massachusetts 1778; d. 1841; remembered for his striking and original tale, 'Peter Rugge, the Missing Man,' in effect a New England variant of the Wandering Jew legend. Other works were 'Letters from London' (1804); 'An Essay on the Human Character of Jesus Christ' (1807). Consult 'Literary Papers of William Austin,' with biographical sketch (Boston 1870).

AUSTIN, Minn., city and county-seat of Mower County, situated on Red Cedar River, and on the Chicago G. W. and the Chicago, M. & St. P. railroads, 100 miles south of St Paul. It is the centre of a fertile agricultural region, producing live stock, corn, barley, flax and grass seeds, and has a large export trade, as well as a variety of manufacturing establishments including a meat-packing factory, flour mills, cement works, railroad shops, brick and tile works, creamery, foundry, machine and steel works, roller mills, broom and brush factories, etc. It is the seat of the Southern Minnesota Normal College, and has several fine public buildings, among them a Carnegie library, county courthouse, State armory, post office, central high school, and Saint Augustine's Roman Catholic Church and Methodist Episcopal Church. Austin was first settled in 1854, incorporated as a village in 1868 and chartered as a city in 1873. The present government, vested in a mayor, elected biennially, and a city council, is under a charter adopted in 1903. The waterworks and electric-light plant are owned by the municipality. Pop. (1910) 6,960.

AUSTIN, Texas, city, the capital, and county-seat of Travis County, situated on the Colorado River. It was settled in 1836, it was first called Waterloo, but in 1837, after the Texas Revolution, incorporated and renamed after Stephen F. Austin, the Father of Texas, and the county was named after William B. Travis who was killed at the Alamo. It was made the capital of the State in 1839 and has remained such since the admission of Texas to the United States. The first free school in the State was established here in 1871. Area is 16 square miles. Altitude ranges from 650 to 650 feet. It is 14 miles north-northeast of San Antonio by the International & G. N. Railroad, 166 miles west by north of Houston, and 205 miles northwest of Galveston by the same, and the Houston & Texas Central Railroad; and on the Austin and N. W. Railroad; and on the Austin and Missouri, K. & T. Railroad. The city is beautifully located, 60 feet above the river, which here flows through very attractive scenery, is navigable for small river steamers in the winter and is spanned by two indestructible bridges. An immense dam, 1,275 feet long, 67 feet above bed rock, the twelfth longest in the world, was completed in 1916, for water supply and power. This dam creates a lake 29 miles long, known as Lake Austin, which is a favorite resort for fishing, hunting and health-seeking parties. This lake was made famous by two international regattas. Stansbury of Australia won the championship of the world on this lake. There are innumerable mountain streams flowing into the lake from the surrounding hills and mountains. The power house generates 6,000 horsepower. Much work is being done to construct beautiful drives on both sides of the lake. There is an inexhaustible supply of the best mineral water to be found; analysis is identical to the water of Carlsbad. There are 115 factories in this city, both large and small. These produce lumber, iron goods, flour and leather goods. There are oil refineries, presses, candy factory, gins and other similar factories. There is a large export trade in agricultural products and live stock, hides, wool, cotton and grain. Austin is also the wholesale supply centre for a great district in provisions, dry goods, drug and agricultural implements, ranching supplies, etc. The shipment of canned goods is increasing very rapidly. One of the largest canneries in the South is located in Austin. From one to three carloads of products are shipped from this plant every day. Austin is the largest producing and shipping point for spinach in the nation. The largest silk farm in America is located here. The city is well built with wide and well-shaded streets. There are about 18 miles of paved streets. Every section of the city is supplied with artificial gas, electric lights and pure water. The sewerage system is complete in every section of the city. There are 21 miles of street railway. The most prominent building is the capitol, which is the largest State building in the country. It is built of granite and cost $3,500,000. Austin is the educational centre of the State with the State University and its many buildings, accommodating the literary, law, educational, extension and many other departments. There is also the Blind Institute, Deaf and Dumb Institute and the Insane Asylum. There are a number of other homes and schools such as the State Confederate Home, Saint Edward's College, Tillotson College for the Colored Pupils, Saint Mary's Academy, Texas Wesleyan College, Presbyterian Theological Seminary, one business college and a number of other schools. There are two high schools and 10 ward schools. The State land office and the county courthouse are prominent buildings. The post-office receipts in 1916 were $183,054.02. There are four banks and one trust company. The bank clearings for 1916 were $134,447,420.01. There are three hospitals and eight hotels. Value of building permits in 1916 was $1,845,000. Austin is the second city in the United States to have the commission form of government. The city owns its own waterworks and electric plant. Pop. (1916) 45,763.

AUSTIN FRIARS, an old monastery, built by the Earl of Hereford and Essex in 1253 and which still stands in Broad street, London.
AUSTRALASIA — AUSTRALIA — AREAS AND DIVISIONS (1)

After the abolition of the monasteries by Henry VIII, Austin Friars became a place of worship for the Dutch refugees from London, which it has remained until this day.

AUSTRALASIA, ˌɑsˈtrɔləsə, a geographical term of loose application, but usually regarded by British geographers as comprehending the continental island of Australia and an unascertained number of other islands, some of them very little known, lying between long. 110° and 180° E. and stretching from Papua or New Guinea, the farthest northern island of the division, to lat. 50° S. Besides the great island of Australia, it thus includes Tasmania, New Zealand, the Loyalty Islands (New Caledonia, etc.), Norfolk Island, New Hebrides, Solomon Islands, New Ireland (New-Mecklenburg), New Britain (New-Pommer), Admiralty Islands and New Guinea, besides numerous other islands and island groups. The island of Timor and those lying west of it, though coming within the general boundary above indicated, belong to the Eastern or Indian Archipelago, called also Malaysia. Australasia is estimated to have an area of 3,700,000 English square miles, and a population of 6,400,000. It forms one of three portions into which some geographers have divided Oceania, the other two being Malaysia and Polynesia. In America the term is generally limited to Australia, Tasmania and New Zealand.

Consult A. R. Wallace, 'Australia,' 3rd ed., 1910; J. A. Thomson, 'Australia.'

AUSTRALIA, formerly known as New Holland, the world's largest island and only sea-girt continent, lies between the Indian and Pacific oceans, to the southeast of Asia. It is separated from New Guinea on the north by Torres Strait, and from Tasmania, on the southeast, by Bass Strait. The Tropic of Capricorn divides it into two unequal parts. In the present article Australia, its geography, historical and political development, commerce and industry, social life, etc., are dealt with under the following heads:

1. Area and Divisions
2. The Aborigines
3. Discovery and Early History
4. Political History
5. The Commonwealth, its Constitution and Government
6. The States, their Constitutions and Governmental Departments
7. Municipal and Local Government
8. Education
9. Law and Literature
10. Religion
11. Industries and Commerce
12. Finance
13. Railways and Transport
14. The Labor Party
15. Social Conditions
16. Military and Naval Defence

1. AREAS AND DIVISIONS. Australia, the largest island in the world, is of continental dimensions, with an area of approximately 2,946,691 square miles. The smaller island, Tasmania, which is now included in the general term 'Australia,' as well as in the federal Commonwealth, and has an expanse of 26,215 square miles, is 150 miles south of Australia. The total area of the federated states is thus 2,962,906 square miles. This does not include British New Guinea, a territory of about 90,540 square miles, which is practically under the direction of the Commonwealth. The area of the respective states is — Western Australia, 975,876 square miles; South Australia, 380,070 square miles; Queensland, 668,497 square miles; New South Wales, 309,175 square miles; Victoria, 87,884 square miles; Tasmania, 26,215 square miles. The Northern Territory, which now is under the Commonwealth government, is 523,620 square miles. With the exception of a small space in the northwest part of the continent the whole of the land has been more or less explored and mapped and a fairly accurate idea may be formed of its physical features, though new facts are naturally frequently disclosed with the gradual advance of settlement over a sparsely populated country. Population of the island, exclusive of aborigines, estimated for 1915 was 5,000,000. The coast-line of Australia is somewhat less than 8,000 miles. Its widest part from east to west is 2,400 miles, and its deepest from north to south, nearly 2,000 miles. The configuration of the island in places is so irregular that political terminology of some of the states is misleading. Victoria, for example, is more southerly than South Australia.

Geology. — The east coast of Australia is mostly rugged and rocky, and fringed with many islets. Part of the south coast is low and sandy, but on other portions are bold cliffs rising several hundred feet sheer from the sea. The north and west coasts are comparatively flat, and the country is characterized by massed hill ranges and by scattered, rounded, and largely wind-blown sandhills. The interior, so far as explored, is largely composed of rocky tracts and sandy plains with little or no surface water, though thousands of artesian wells have revealed the presence of underground currents, which fertilize the soil, and transform deserts into highly productive areas. The whole continent is an irregular plain with high ridges in the east, and a marked depression in the centre, which is more distinctly marked in the western regions. The base of the table-land is granite, which appears on the surface on the southern and western sides. Silurian rocks are prominent in South Australia, where unmistakable marks of glacial action have recently been discovered. In the southeast and east the rocks are volcanic. Silurian, carbonaceous and carboniferous; the coal deposits, in the eastern and western parts of the western coasts are extensive, and brown coal has been found in South Australia, but at too great depths to be profitably worked, at a long distance from the seaboard.

Minerals, etc. — West of the Dividing Range are extensive plains largely used for pastoral and for agricultural purposes. The comparatively dry and scrub, or saltbush-covered lands in the interior, are in many cases richly mineralized, and succeeding years show that they deserve less and less their old designation of desert. On one of such deserts is situated the famous Broken Hill silver mine in New South Wales, and on others the celebrated Coolgardie and Kalgoorlie gold mines in Western Australia. In various parts of Australia and Tasmania are found, often in payable quantities (besides the royal metals and coal), tin, as well as nearly all the minor minerals and precious stones; while on the northeastern and eastern coasts there are probably the most extensive and productive pearl-shelling waters known. It has been shown, too, that the monotonous and extensive mallee country everywhere yields profitable returns when farmed under mixed cultivation and grazing systems; while some varieties of the mallee itself contain water-yielding roots
long used by the aborigines and capable of sustaining the life of lost travelers.

Mountains.—There is no active volcano in the Commonwealth, but there is a record of only recent eruption and of intermittent previous eruptions. A mountain range varying from 100 to 200 miles in width outlines the eastern and southern border of the continent; and, broadly speaking, all the rivers of Southern Australia flow in a westerly direction. The rise in this Great Dividing Range. The Australian Alps, in the southeast part of the Dividing Range, contain the highest mountains in Australia—Kosciusko (N.S.W.), 7,308 feet; Mount Bogong (Vic.), 6,506. These are the highest elevated points on the continent. In Queensland, peaks in the Belford Ker Range rise to 5,400 feet, and in other parts of the state are several eminences of about 4,000 feet. In South Australia the loftiest range is the Flinders—Mounts Remarkable and Brown, 3,100 feet each; and the principal elevation in the Gawler Range in the northwestern interior is about 2,000 feet. In Western Australia Mount William (3,000 feet) in the Darling Range, and Ellen's Peak (3,420 feet), are the loftiest. Tasmania is very mountainous—highest peaks, Cradle Mountain 5,099 feet, and Ben Lomond 5,104 feet.

Rivers and Lakes.—The Australian *Father of Waters* is the river Murray, which with its chief tributary, the Darling, flows 2,400 miles before reaching the Southern Ocean on the South Australian coast; and with its Queensland extensions has in favorable seasons a length of about 3,000 miles navigable by small steamers. It is under agreement between the riparian states (South Australia, Victoria and New South Wales), now being looked to for improved navigation and also to provide water for irrigation. In the Northern Territory, as well as elsewhere, some of the rivers are of large volume, and are navigable for comparatively short distances. On the east coast are the Hunter, Clarence, Brisbane, Fitzroy and Barwon; on the west the Swan, Murchison, Gascoyne, Ashburton and De Grey; on the north the Fitzroy, Victoria, Flinders and Mitchell. A considerable river on the interior is Cooper's Creek, or the Barcoo, which falls into Lake Eyre, one of a group of lakes on the south side of the continent having no outlet, and, accordingly, salt. The principal of these are lakes Eyre, Torrens and Gairdner, all of which vary in size and saltiness according to the season. Another large salt lake of little depth, Lake Amadeus, lies a little west of the centre of Australia. Various others of less magnitude are scattered over the interior.

Rainfall.—Speaking generally, wherever the land is elevated the rainfall is good. It varies from about 70 inches annually in the tropical zone to three or four inches or even less in the arid interior regions, and in the southern part to about 40 inches. The fall diminishes in close relation to the decline in the elevation of the land, allowing for coastal influence in the south, and tropical or sub-tropical conditions in the north.

The climate of Australia is generally temperate, and in summer hot and dry, especially in the southern and central parts, but very healthy. In the tropical portions heavy rains fall and in most of the coast districts there is a sufficiency of moisture but in portions of the interior the heat and drought are sometimes extreme. The air is, however, so exhilarating that even 120°F. is far from being unbearable, while the dry heat of Australia is less oppressive than 90°F. in London, Paris or New York, and cases of sunstroke are rare. This dry-hot atmosphere is especially recommended by medical men as an essential for sanitation for sufferers from lung disease, and among the artesian waters in some of the arid country are highly mineralized and have valuable medicinal properties. The dangers of drought, too, are being largely reduced by the rapid extension of the artesian boring area. At Melbourne (Vic.) the mean temperature is about 57°F.; Sydney (N.S.W.), about 63; Adelaide (S.A.), 61; Perth (W.A.), 64; Brisbane (Q.), 68; and Port Darwin (N.T.), 82 (tropical); Hobart (Tas.), 55. In the mountainous and more temperate parts of Australia snow falls in winter (June, July and August), and long remains unmelted on portions of the Great Dividing Range, as well as in Tasmania. Practically, however, at no time of the year is it possible to skate on ice in any division of the Commonwealth. Australia is essentially a warm country throughout, but the winters are keen and bracing.

Fauna (extinct).—The distinguishing features of the extinct fauna (of which most interesting discoveries have been made) are specially worthy of note. In the mammalian class the great majority are marsupials, though the dingo and the whale (non-marsupial) are also found in a fossil state. Fossil remains of birds, reptiles (such as crocodile, monitor), turtles, and fishes, have also been unearthed, and in the banks of the rivers in the interior. This indicates that the ancient vertebrate fauna of Australia was very similar to what it is now. The preponderant type of mammal was marsupial. In most respects, however, the species and even the genera were different, and many (such as diprotodon, nototherium, and the giant kangaroo) were much larger animals and of a more specialized type than now exist in Australia. One living type (a wombat) is precisely of the same species as is found in a fossil condition. Regarding the probable cause of the destruction of the extinct animals, it is impossible to give a general statement applicable to such a wide-stretching country as Australia, any more than such a statement could be applied to other countries where there has been a wholesale disappearance of numerous groups. Changes of climate or physical conditions rendering the country or district unsuitable for their maintenance; over-specialization in structure caus-
and the character of the matrix in which they are imbedded — negative any theory that they have been carried thither by floods. The likelihood, rather, is that they met their death by being entombed in the effort to reach food and water. . . . The accumulation of so many bodies in one locality points to the fact of their assemblage around one of the last remaining oases in the region of desiccation which succeeded an unprecedented condition of plenty of rains and abundant waters. An identical explanation has been suggested by Daintree in his ‘Notes on the Geology of the Colony of Queensland.’ Among the extinct fauna the most remarkable of the mammals is the Diprotodon australis; size 10 to 11 feet in length, five and one-half to six feet in height. Of the birds, the most noteworthy is Genyornis newtoni, a large bird with bones as big and massive as the elephant-footed moa of New Zealand, and the Aepyornis of Madagascar. It stood about 18 feet high, but is remarkable mostly for its massiveness. The deposit of this treasure trove of natural history at Callabonna is large and valuable, but (so far as the ground has been explored) it does not equal the Callabonna deposits in certain places of fossil mammals and reptiles in the United States of America. Still, only one area of limited extent in Lake Callabonna has been exploited. Owing to the superior resources of the United States, and the greater generosity displayed there in this direction, much more systematic search has been undertaken both in that country and in South America than in Australia; but the possibilities are cherished of further revelations of the highest importance in this branch of research in the Commonwealth.

Fauna (existing).—To the northwest of Australia between the Dutch-Javanese islands of Lombok and Bali runs the Lombok Strait, which curiously marks a dividing line between the fauna and the flora of Asia and those of Australia. The channel is narrow, if very deep, and the Asiatic birds might easily fly across it in one direction and the Australian in another. So might a natural growth of plants be encouraged by the agency of wind and water, the carriers of seed; but none of these things has happened to any extent; the individuality of the relative fauna and flora has been strongly preserved. A number of the birds in Australia, however, migrate from one part of the Commonwealth to others with the changes of the seasons, and some pass to and from the continent of Asia — e.g., the sandpiper or sharp-tailed stilt, that each season comes from Siberia, a distance of 10,000 miles. As already indicated, the existing fauna does not differ widely (except in proportions) from the extinct; and the forms observed in some instances are exceedingly interesting, if not bizarre. The "Bunyip" of the aborigines’ legends (a monster that lurked in certain rivers and creeks and swamps) has neither been proved to be or than fabulous. Much speculation and some mystery, however, surround the occasionally recurring visitations of plagues of rats in the far-northerly country, and of mice in the more southerly or agricultural areas. At periods of several years the rodents suddenly appear in vast numbers, and as suddenly disappear after doing, in some cases, much damage. The locust or grasshopper plague, which at one time was much feared, is now almost unknown. In a generalization, Australia may claim to be free from all animals that attack man, except in exported cases; as well as from the dangerous dingo; the magpie and the magpie may be brought to bay, and in frenzy of fear strive to defend itself almost invariably vainly. Introduced animals, such as the rabbit and the fox, the sparrow, the starling and other "old-world" birds, as well as the small, multiply literally by millions, and become sheep raisers, farmers and gardeners. The imported dog running wild has sometimes been confused with the aboriginal dingo (Canis dingo) (q.v.) or "warriaga" (native name), a predatory animal, the wolf of Australia, that has caused heavy losses among sheep and lambs, which he destroys in mere wantonness. The dingo never barks, but howls dismally in the bush at night. Kangaroos once abounded virtually all over Australia, and varied in size from the "goat" man, 5 feet high, to the 6 feet high, 9 feet high, and in the minute specimens, including the wallabies and the kangaroo rats. The most interesting example is the tree kangaroo, discovered in Queensland about 100 years after and not far from the spot where the first "pithecus" (Macropus major) was found by Captain Cook, the great navigator, in 1770. In particular the southern and western parts of Australia is seen a small "native bear," that inhabits trees, and, in Tasmania, the "Tasmanian devil," (Sarcophilus harrisii), (like the dingo) untamable, and the "Tasmanian tiger" (Thylacinus cynocephalus) are the principal examples of fauna. The numbers of these latter, like those of the kangaroos and the opposum, have been largely reduced through indiscriminate slaughter with the advance of settlement; but recent legislation for the protection of the kangaroo (the skin of which is valuable for export) has stayed the race toward destruction. The wombat (Phascolomys) is a curious, burrowing and omnivorous animal, species of which has been proved to be omnivorous; the platypus or platypus (Ornithorhynchus anatinus), an amphibious animal that forms a connecting link between the classes of mammals and birds, and the emu (Dromaius nova hollandiae) is from five to six feet high, and ranks next to the African ostrich, which it resembles in its habits; its numbers, as with the kangaroo, have been greatly reduced as settlement has progressed. The cassowary (Casuarius australis) is small, and nearly so widely diffused as the emu; and the native companion or Australian crane (Grus australasianus) is still slightly smaller than the cassowary, and an exceedingly graceful bird of somewhat eccentric habits. The black swan (Cygnus atratus) is scarcely so large as the white swan of the northern hemisphere, but is a beautiful bird. Strange in its habits is the satin bower-bird (Ptilonorhynchus holosericeus) that forms for itself a playground or bower in which it sports with a miscellaneous collection of bright objects. Altogether about 750 species of birds have been found, mostly in northeast Australia (which has been chiefly explored), but some of them are gradually becoming extinct. The old idea that Australian birds are songless is only relatively true. The flute-like note of the magpie or shrike is one of the most mellifluously melodious sounds in nature, and
has been declared to surpass that of the nightingale. The reptiles are numerous. The largest of the snakes is the carpet snake (Morelia variegata), non-venomous, with an average length of about seven or eight feet, but with authenticated specimens up to 15 feet and even more; its habits are generally similar to the python's. Of the five principal poisonous reptiles the most deadly is the death adder (about three feet). Not more than 12 or 15 fatal cases of snakebite occur annually throughout Australia; the comparatively small number is due partly to the prompt application of effective remedies. The white ant is common in the northern part of the Commonwealth, and is very destructive to wooden buildings in the early stages of settlement; its nests of mud and clay, generally with angles pointing north and south, range from 20 feet in height downward. The seas abound in numerous varieties of fish. In the period of pioneer settlement the Australian whaling grounds were very productive, and stations in this industry were the principal means of support. Sharks are exceedingly numerous. The largest, the white pointer or white shark (Carcharodon rondeletii), to the length of 16 feet and over has been caught, and attended by the pilot-fish (Naucrates ductor) it preys upon man as well as upon denizens of the deep. Death through sharks are rarer even than those from snake-bite, but this is to a large extent due to the precautions taken in bathing in the seas. The crocodiles or alligators, as they are popularly called (Crocodylus Porosus and Phylloca johnsoni — a small variety Mydist), are plentiful in the tropical and sub-tropical zone on the north-east, northwest and north coasts; they vary from about 20 feet (an unusual length) to five or six feet. In common with the shark the larger alligator sometimes attacks human beings, but the aborigines evidently stand in little fear of it. In the warmer waters is found the dugong (Halichoera australis), from whose habits and structure doubtless originated the fabula concerning the mermaid. Seals are still seen on the western shores of the continent and on the islands. The most noteworthy is the sea bear (Otaria cinerea) of about seven feet in length, that is more prized for its oil than for its skin. In the northern waters turtles, the edible green turtle (Chelonia imbricate) and the shell-yielding hawkbill (Chelonia imbricata) varieties are very numerous, and attain to a large size. The trepang or bêche-de-mer is found, with the mother-of-pearl oyster — large (Melanagrina margarifera) and small (Melanagrina radiata). The former frequently yield fine pearls, some single specimens of which have been sold for thousands, and many for hundreds, of pounds. The edible rock oyster is widely represented, and the mangrove tree-climbing fish (persophi luminus) abounds particularly in the northern waters.

Flora.—In a concise description the Australian flora may be said to possess peculiarities which distinguish it unmistakably. Many of its most striking features bear a natural relation to the general constitution of the country, owing to the vast area of the Commonwealth. The trees and bushes have mostly a scanty foliage, with little surface for evaporation, or thick leathery leaves well fitted to retain moisture. Nearly all are evergreen, but the effect upon the landscape is rather monotonous. The most extensively spread types of vegetation are the various kinds of gumtree (Eucalyptus), the shea-oak (Casuarina), the acacia or wattle, the grass tree (Xanthorrhoea), many varieties of the Proteaceae, a few baobab trees, and very many ferns and tree-ferns. Of the gumtree there are more than 150 species, nearly all valuable for timber, and for their essential oils, which possess important medicinal properties. The wattle or acacia includes about 1000 species, some of which also yield good timber or bark for tanning. The most beautiful, the most fragrant and the most useful in these latter respects is the golden wattle (Acacia dealbata). Palms (of which there are at least 24 species, all, except the cocoa-palm, peculiar to Australia) are mostly confined to the northern and eastern coasts. The mallee scrub is formed by a dwarf eucalyptus, and the mulga scrub by a thorny acacia. A plant which covers large areas in the arid regions is the annual Simplicia grass (coarse and spiny), which renders travelling difficult, and is uneatable by any animal. Other expansive tracts are occupied by useful herbs and fodder bushes. Foremost among those stands the salt-bush (Atriplex mummularia, order Chenopodiales), an exceedingly hardy plant, upon which the sheep and other animals thrive, and which has strong drought-resisting powers. Beautiful flowering plants, especially in Western Australia, are almost innumerable. Australia also possesses many turf-forming grasses, particularly the kangaroo grass (Anthisoria australis), which survives in even a protracted rainless period. The native fruits, including the native cherry (Exocarpos cupres-siformis), the nut of which grows partially outside of the fruit proper, are few and of little practical worth, and the plants yielding roots used as food are not of much economic value; but exotic fruits and vegetables grow everywhere in unstinted abundance, and some of the cherished garden blooms of the older countries flourish so riotously as to become a necessity in Australia. The vine and the olive thrive better than in the country of their origin, and enormous quantities of wine and oil are produced and exported. The cereals of Europe and maize are extensively cultivated, and large tracts of the country, particularly in Queensland, are under the sugar cane, the pineapple, the cocomut and other tropical exotics.

The Aborigines.—Although the racial antipathies and collisions due to the seizure by superior races of the lands of inferior peoples have been at least as marked in Australia as elsewhere, and although the treatment of the aborigines by many of the pioneer settlers did not err on the side of scrupulous humaneness, the governments, as such, have done a good deal to mitigate the sufferings of the unfortunate people, the dealing with whom was more difficult than it would have been if the vast majority of them had not in hereditary indolence always manifested an un conquerable repugnance to systematic labor or anything like sustained industry. The policy shown toward them might well have reflected — and in some cases it has done so — the fact that the conquest of the natives in Australia has been exceedingly easy owing to their utterly disorganized condition and their almost complete helplessness. These defects were in contrast to the valor, the country-loyal and country-wellness of the colored inhabitants whom the early white settlers found in New Zealand. As a rule the Australian aborigine — while in good districts physically stalwart and strong — was not of a ferocious or blood-thirstily aggressive nature; and in most cases when numbers of them have attacked a few isolated European settlers or travelers, the cause has been either a lack of firmness or judicial care on the part of the persons molested, or else revenge for wrongs inflicted upon the natives by other white men, mostly in the shape of injuries with the black women, or by way of reprisals for the killing of cattle, the intrusion of which upon their former hunting grounds the blacks naturally connected with the gradual disappearance of the indigenous game.

All the state governments have enacted, and so far as possible enforced, laws for the protection of the blacks — laws in some instances providing for them special reserves within which the Europeans must not kill game or depasture stock; prohibiting the supply of intoxicating liquor or opium to the aborigines, and defending them against anything like enslavement or other ill-usage. During many years past at least a yearly — and in bad seasons a more frequent — distribution of flour, tobacco, blankets and other useful articles has been made by the governments among the natives; and the state-aided efforts have been liberally supplemented by the benefactions of private persons and philanthropic institutions, especially in relation to education, spiritual and otherwise, by missionaries who have established aboriginal stations. In the latest year for which statistics are available the purely governmental expenditure amounted annually (with allowances for endowed lands) to £20,000 in New South Wales, £16,000 in Queensland, including the Northern
Australia—The Aborigines (2)

Territory £14,000 in South Australia, £4,000 in Victoria and £24,000 in Western Australia. The origin of the aboriginal tribes of Australia has been a theme of much controversy; and space available here is not adequate for even an enumeration of the many theories—including one comprehending an invasion by representatives of the Lost Tribes of Israel—advanced by various differing authorities. This seems to be a problem insoluble. In such circumstances sufficient must be the statement that there is a fair consensus of opinion to the effect that the native black races, as they were found by the European pioneers, had apparently been substantially affected (especially in the northern areas, which were for many centuries visited periodically by Malay proas in search of pearl shell, trepang and other products) by strains of blood introduced from beyond the island continent. A judicious balance of the evidence adduced by the most trustworthy ethnographers tends to the conclusion that the two points whence Australia benefited or otherwise was influenced by the teeming flocks of fowls as ethnologically, were the group culminating in New Guinea on the one hand, and on the other in the chain of islands and peninsulas touching Australia on the northwest. Certain plants and animals came from Asia to Australia, and it is held to be extremely probable that the ancestors of the Australian native tribes (who differ somewhat from those of Tasmania) crossed over to Australia from those two points. The native population is declared to be an admixture of at least two distinct races, somewhat as ethnologically, were the black of the one a true yellow, and that of the other was a velvety black. The hair varies from straight to woolly, and the face and skull also have material dissimilarities. The nose assumes various grades, from the flat negro to the arched Jewish, and these contrasted types are believed to be due to the immigration of Malays and Papuans as indicated.

One reason why the black had no means of sea navigation was that "the negroid blood in his veins fitted the Australian firmament of the soil"; and another was that unkindly nature made the pressure of food requirements so heavy that the black was forced to be a wanderer, and had little time for anything else than the barest living. This judgment reflects disparagingly upon the natural resources of the land, it is important to add that on their advent Australia's Pilgrim Fathers surprised the black inhabitants in a state of the most primitive savagery. There was not anywhere the remotest sign of any cultivation of the soil, or of the slightest attempt at tillage, or the thrift or providence which stores food for emergencies. Neither had the natives made—though they possessed roughly hewn bark or log canoes—any effort to clothe themselves or apart from miserable hovels constructed of rank grass or reeds, or boughs or bark of trees—to provide shelter from the cold of winter or the heat of summer. They had no written language, unless one may include in them the Australo-Melanesian arts of the artificers who inscribed on rocks or in caverns. Some of these, like the message sticks sent from one part of the country to another, are ideographic—or picture-writing—but none was at any rate unmistakably idealistic. Though most of the tribes paid deference to their medicine men, sages—or mostly the older members of the tribal camps, who were always well treated by the younger blacks—they possessed practically no conception of abstractions. In this respect they were, while less provident than the ants, essentially as untutored children of nature—almost as much so as the dogs and the lower animals. They were endowed with instinct rather than with intuition. No bloodhound ever displayed keener sight or scent than the Australian black trackers, whose power in following a trail seems almost miraculous.

On the other hand, a close study of the aborigines reveals curious anomalies. Speaking generally the natives rise and fall in mental and physical superiority in exact harmony with the fertility or otherwise of the territory over which they roamed. Some of them had scarcely reached the low stage of intelligence associated with the Stone Age, others rapidly acquired education under European teachers, and in the wilds had constructed the boomerang, with its marvelous powers. In his use of the throwing stick, has long puzzled even the most profound scientific experimenters. Among the highest-class natives, too, the character of their spears and other weapons indicated the possession of no little constructive skill, a sense of measured patience and perseverance on the part of the makers. Where an aboriginal population is divided into hundreds, and probably thousands, of tribes, all mutually independent and mutually hostile, and distinguished usually by arbitrarily marked rings of exclusiveness, and each tribe speaking a dialect of its own, it is impossible to write with exactitude concerning their customs. One must not, therefore, attempt to explain why the tribal boundaries should in some cases be defined by geometrical devices; why in tribal territories here and there circumcision should be practised, and on adjoining areas not observed; why some natives should exchange salutes similar to Masonic signs, and others be unaware of the meaning of this interchange. It may be a sign of what intricate code of smoke signals; why some should be cannibals and others should not be; why the superstitious ceremonies should vary so widely; and yet why the main idea of the native's corroboree or dance should be apparently almost everywhere the same or closely similar.

What seems to be certain is that the wild aborigines have no religion properly so called—no impelling attraction toward or trust in a God of Love, but a wholesome fear of Moon-darbic® or the devil, whom all tribes sedulously seek to propitiate—some even by periodic human sacrifices, and the dread of whom as a spirit walking in the darkness keeps them shrinking in their camps until the break of day. Very extensively diffused along the length of the belief that nobody can die a natural death, but must be the victim of a maleficent influence or the evil eye. Equally widespread is the aspiration among the aborigines that after death they may jump up, be reborn, and have all the advantages of the world. It is, however, as said, perhaps fancifully, to have originated in the general custom of smoking the corpses of the dead, with the result that the peeling outer cuticle revealed the white dermis or true skin. Some tribes are prudishly modest in their rela-
tions with their women, others are as flagrantly immoral. The language of some seems to be little better than mere gibberish, while concerning that of others one of the Jesuit missionaries has written that in its construction it is most ingenious, and curious in its form, indicating high intelligence and suggestive of the Hebrew. Many of the natives are musical, but their musical instruments are of the crudest character, made chiefly of hollowed wood or grasses, or bambooos. At the age of puberty young men of both sexes are initiated in peculiar, jealously preserved, and often indescribable ceremonies, into the respective secrets of manhood and womanhood, but even the old men and women of the tribes who perform these rites—which include the knocking out of some of the young men’s teeth and certain genital mutilations—seem to have no clear and coherent idea of their import.

3. DISCOVERY AND EARLY HISTORY. The discovery and the early history of Australia have been the themes of much discussion, and one conclusion, admitted by all disputants is that the really pioneer navigation which resulted in the finding of the great island continent of the Southern Seas was not conducted by the British who now occupy the territory that was originally called Terra Incognita, and then New Holland. British enterprise, however, built a structure of colonization upon the site disclosed by the investigations of the people of other nations; and nearly all the definite surveying of the Australasian seas has been done by the sailors of Britain.

The later days of the time in which Australia was still unknown were the days when the Portuguese, the Spaniards and the Dutch roamed the oceans as intrepid searchers for new sensations rather than in the hope of territorial aggrandisement. Though anything like the exact year in which Australia was first sighted is doubtful, records show that between 1531 and 1542 the Portuguese declared the existence of a land which they styled "Great Java," and which corresponded with the northern parts of what is now the Australian Commonwealth. The most authentic available data indicate that the first European who saw the land was a Portuguese named Manoel Godinho de Eredia, who sighted it in 1601. By common consent, however, it has been conceded, as a starting point for Australian history, that Luis Vaez de Torres, who had been second in command of the De Quiros expedition, saw and sailed close to the Australian coastline in 1606; and that he was navigating in the neighborhood of New Guinea to the east of Cape York Peninsula at about the same time when a Dutch mariner was similarly engaged to the west of that peninsula. Yet centuries elapsed before any attempt was made to settle the newly-found continent, though meanwhile it was more than once passed and even circumnavigated. After 1619, when the Dutch expedition under de Houtmann anchored off the Abrolhos Reef on northwest Australia, that part of the continent was repeatedly visited during the earlier half of the 17th century, and well-verified history shows that in 1658 a Dutch ship was wrecked in the vicinity of the Abrolhos Group. The languages, customs, etc. are now washed up occasionally by the sea or found in the guano deposits. Toward the end of 1642 Abel Jansen Tasman, a Dutch navigator, discovered and landed on Tasmania, and named it Van Diemen's Land. It continued to bear until 1854. In 1668 William Dampier, a freebooter, was the first English man to set foot on Australia—at King Sound on the northwest coast. This same Dampier on a subsequent voyage took Alexander Selkirk (Defoe's "Robinson Crusoe") off the island of Juan Fernandez, on which the man had disembarked some time before. Still, curiously enough, Australia was not annexed on behalf of any nation until the last third of the 18th century. In 1768 Lieut. James Cook set out from England in a crazy ship, the Endeavour, in charge of an expedition appointed to observe at Tahiti the transit of Venus. Steering thence westward, he made an examination of New Zealand, came on 19 April 1770, upon the east coast of Australia and anchored in Botany Bay. Later he proceeded northerly along the coast; and, after the Endeavour had in June struck upon a coral reef and well-nigh foundered near to the present Queensland port of Cairns, he continued his journey until 21 Aug. 1770, he hoisted thr colors of England on the north Australian peninsula of Cape York, and thus formally took possession of the whole eastern part of Australia.

But Britisdid not follow closely upon the heels of the navigators, and 18 years had passed before, on 18 Jan. 1788, a British convict expedition with 1,030 persons, of whom 750 were under penal servitude and banishment, reached Botany Bay. On 25 January (now celebrated as Australian Foundation Day) the expedition landed, displayed its national colors with due pomp and circumstances, and so inaugurated European settlement in the "Great Land of the Southern Cross," which was, however, even thus late imperfectly known even in outline, and was comprehended under the general title of New South Wales, now applied to one of the territorially smallest states of Australia. With the occupation of the country further exploration by land and by sea proceeded apace. In 1798 Dr. Bass and Captain Flinders (who afterward achieved immortal renown as a great navigator in association with Sir John

Franklin, the Arctic hero) demonstrated by sailing around Tasmania that that country was part of the Australian continent, as had been supposed. In 1802, having been provided by the British Admiralty with a scarcely seaworthy vessel, the Investigator, Captain Flinders surveyed the larger part of the southern coast of Australia, from west to east, and at last in a crooked expedition which had been sent out under Captain Baudin in the ship Le Geographe, for purposes similar to those Flinders had in view.

The course of further marine exploration need not be further pursued; for the initial work had been accomplished. In 1803 the first colonization settlement was begun in Van Diemen's Land (Tasmania). In 1804 an unsuccessful attempt was made by Col. David Collins, first governor of Tasmania, to found another convict colony in the now prosperous state of Victoria, which, however, from that time remained for 30 years with only one white man in it—a deserted convict named William Buckley, who dwelt among the aborigines until the year 1834, when he started, 10 years subsequent to the founding of Queensland, five years after that of Western Australia, and two years before that of South Australia.

During all the intervening time the exploration of the interior of the continent, mainly from Sydney, had been steadily progressing. First the disclosing of a means of passing beyond the Blue Mountains in 1813 showed (by Blaxland) a way out of what had been regarded as an impasse preventing access from the coastal fringe to the expansive interior territories which represented the Mystery Land of the early colonists. In 1824 Hume discovered the upper Murray, the head of the great Australian Mississippi. Following the course of that river in 1828, Capt. Charles Sturt added to the geographies of the period the name of its tributary, the Darling; and in 1830 he made, with almost sensational intrepidity, a journey down the Murray to its junction with the sea, not far from Adelaide (the present capital of South Australia). In many directions other explorers were contemporaneously (and subsequently) causing the wilderness of the Terra Incognita of the Portuguese to yield up its secrets to the two of the countless explorers who have laid mankind under obligation to them for all generations need be particularly mentioned here. One of these was Ludwig Leichhardt, who started out from the east in 1846, and (with all the members of his party) apparently disappeared mysteriously and absolutely from the face of the earth; for no sign or trace of the expedition has ever since been seen or heard of. The other was John McDouall Stuart, who, after having been repeatedly baffled, succeeded at last in crossing the continent from south to north, and on 24 July 1862, laced his hands in the waters of the Indian Ocean, and hoisted the British flag on the northern shores of Australia. And now in this year, 1877, all the blank spaces in the Commonwealth may have been filled in by the cartographer, and Australia has no further laurels of fame to offer as worthy gunners to brave and daring explorers by land or by sea.

4. POLITICAL HISTORY. Beginnings of Colonial Self-Government.—It was a maxim of the common law that, if an uninhabited country were discovered and peopled by British subjects, they were supposed to possess themselves of it for the benefit of their sovereign, and that such of the laws of England as were applicable and necessary to their situation and the conditions of an infant colony were immediately in force; that wherever an Englishman went he carried with him as much of English law and liberty as the nature of his circumstances required. It was recognized that Englishmen carried their political birthright with them over the broad surface of the earth; that the charters of freedom for which their ancestors fought were not left behind, but accompanied them to their new homes beyond the seas.

The colonial legislatures of Newfoundland and Jamaica were established not by British statutes, but by royal commissions under the great seal accompanied by royal instructions. Local self-government in Australia did not, however, originate in the exercise of the prerogatives of the Crown, as it did in some of the early North American and West Indian colonies. From the very first it was founded upon, as it was subsequently developed and built up by, statutory authority.

NEW SOUTH WALES THE FIRST ORIGINAL COLONY.

Foundation.—In 1784 the British Parliament passed the statute of 24 Geo. III, c. 56, entitled 'An Act for the effectual transporta- tion of felons and other offenders, and to au- thorize the removal of prisoners in certain cases, and for other purposes therein mentioned.' This law empowered the King, with the advice of the Privy Council, to appoint places to which felons might be transferred. By an order in council bearing date 6 Dec. 1786, His Majesty's territory of New South Wales, situated on the east part of New Holland, was appointed a place for the reception of persons within the meaning of the act.

By letters patent and commission dated 2 April 1787, Capt. Arthur Phillip was appointed governor of the territory. The limits of his authority extended from Cape York on the north to the southern extremity of the coast of the continent and inland westward as
far as the 135th meridian, which was afterward extended to the 129th meridian east longitude. The government was empowered to make orders for the good government of the settlement.

By the Act of 27 Geo. III, c. 2, the King was authorized to establish a Court of Criminal Jurisdiction on the eastern coast of New South Wales. Such was the legal authority under which, on 26 Jan. 1788, a penal settlement was established at Sydney Cove. In was not at first intended to be a colony, or plantation, for the purposes of trade and cultivation, with the remaining officers of those terms.

The First Constitutional Charter.—The temporary Act 4 Geo. IV, c. 96 (1823), which became law during the governorship of Sir Thomas Brisbane, was the first legislation passed by the Imperial Parliament conferring anything like the rudiments of local self-government on the New South Wales community. A council of five persons was appointed having limited legislative powers. On 17 May 1824, a Charter of Justice, creating a Supreme Court, was promulgated.

The Second Constitutional Charter.—The Act of 9 Geo. IV, c. 83 (25 July 1828), passed during the governorship of Lieutenant-General Sir Ralph Darling, was the second Constitutional Charter of Australia. The Courts of Criminal and Civil Jurisdiction, coupled with trial by jury, were organized. The laws and statutes in force within the realm of England, so far as applicable, were applied to the administration of justice in New South Wales and Van Diemen's Land. The Crown's power was to constirute in New South Wales and Van Diemen's Land, respectively, an Advisory Council to consist of such persons residing in the said colonies respectively, not exceeding 15, and not less than 10, as the King might be pleased to nominate.

The Third Constitutional Charter.—The third charter regulating the government of New South Wales was the Act 5 and 6 Vic., c. 76 (31 July 1842), passed during the governorship of Sir George Gipps. This act established for the first time in Australia a legislature, partly, but not wholly, representative in its character. It enacted that there should be within the colony of New South Wales a Legislative Council and Assembly. The Legislative Council was to consist of 30 members, 12 of whom were to be appointed by the Crown, and 24 were to be elected by the inhabitants of the colony having certain property qualifications. The governor, with the advice of the Council, was authorized to make laws for the peace, welfare and good government of the colony, provided that such laws were not repugnant to the laws of England; nor were they to interfere with the sale or occupation of the waste lands of the Crown. Bills imposing duties of customs had to be reserved for the Queen's assent. This act did not grant to New South Wales the system known as "Responsible Government." The governor presided over and managed all the public departments. It contained, however, the feehie geims whence has since sprung the splendid fabric of parliamentary institutions in Australia. It was the first concession made by enlightened British statesmen to the growing wealth and importance of the Australian colonies.

The new Council was opened by Sir George Gipps on 1 Aug. 1843.

The Fourth Constitutional Charter.—The next important charter related to Australia was 13 and 14 Vic., c. 59 (5 Aug. 1850, entitled "An Act for the better government of Her Majesty's Australian Colonies," and commonly known as the Australian Colonies Government Act. The bill, of which this act was the outcome, was introduced into the House of Commons in June 1849. The two main objects of the act were the separation of the Port Phillip District from New South Wales, and the establishment in all the colonies of an improved system of provincial government. The Legislative Council, erected in New South Wales by the Act of 1842 was not materially disturbed. Its powers were in some respects increased, and the franchise on which its representative members were elected was liberalized.

The New Constitution.—A new election of members of the Legislative Council of New South Wales on the liberalized franchise then took place. The new council complained that the Act 13 and 14 Vic., c. 59, did not place the control of revenue taxation, and the lands of the Crown in the colonial legislature, and a full measure of local self-government in a Constitution similar in outline to that of Canada was applied for.

In 1851, gold was discovered in New South Wales and Victoria, which caused a great influx of immigrants into these colonies. In a despatch addressed to Governor Fitzroy, dated 15 Dec. 1852, Sir John Packington, Secretary of State for the Colonies, stated that Her Majesty's Government had been greatly influenced by considerations arising from the extraordinary discoveries of gold in the Australian colonies, which had imparted new and unforeseen features to their political and social positions. It was the wish, therefore, of Her Majesty's government that there should be established in each colony a new legislature consisting of a Legislative Council nominated by the Crown, and an elective House chosen by qualified inhabitants. To such legislatures it was proposed to give general powers including that of dealing with the waste lands of the Crown.

Upon the receipt of this despatch the Legislative Council of New South Wales, under the authority conferred by 13 and 14 Vic., c. 59, s. 132, appointed a select committee to consider a constitution establishing a bicameral legislature, having increased powers and functions. A constitution was accordingly drawn up. It provided that, in place of the Legislative Council then existing, there should be a Legislative Council and a Legislative Assembly, and that Her Majesty should have power by and with the advice and consent of the said Council and Assembly, to make laws for the peace, welfare and good government of the said colony in all cases whatsoever. The members of the Council were to be nominated by the governor with the advice of the Executive Council. The first nominees were to hold their seats for five years only. The members of the Assembly were to be chosen by male electors having certain residential and property qualifications. A new legislature was endowed with full power to deal with the waste lands of the Crown and to impose duties or customs.

On 21 Dec. 1853, the New Constitution was
adopted and transmitted to the Secretary of State for the Colonies. In an amended shape it was then introduced into the Imperial Parliament, entitled "A Bill to enable Her Majesty to assent to a bill as amended by the legislature of New South Wales to confer a Constitution on New South Wales." The bill was passed by Parliament and received the royal assent on 16 July. Its number is 18 and 19 Vic., c. 54. The act conferring a constitution on Victoria was assented to on the same day. The constitutions were then transmitted to the respective colonies, accompanied by explanatory despatches from the Secretary of State, Lord John Russell, in which the governors were instructed as to the introduction of responsible government.

Responsible Government.—That great change in the colonial system of administration known as "the Introduction of Responsible Government"—that is of ministers appointed by and responsible to the governor, but constitutionally and practically responsible to Parliament—is said by some authorities to have been effected solely by despatches from the Secretary of State to colonial governors. These despatches described the circumstances in which the Crown, through the governor for the time being, would exercise its right of displacing one set of public servants and of appointing others in their places—that no change would be made so long as those public servants, being ministers in charge of departments, possessed the confidence of the local legislature. In the body of the Constitution Act of New South Wales (and this remark applies equally to that of Victoria) the words "responsible ministers" do not occur. Were it not for a marginal note to one of the sections, not even a hint would have been given on its face of the important change it was intended to effect.

Other constitutional jurists, however, affirm that section 37 of the Constitution Act of New South Wales, and the corresponding section of that of Victoria, contains provisions which amount if they do not originate some plan of ministerial and responsible government. Both those sections declared that appointments of all public offices shall be vested in the governor with the advice of the Executive Council, "except the appointment of officers liable to retire from the public service on political grounds which appointments shall be vested in the governor alone." The Constitution Acts of South Australia, Queensland and Western Australia contain substantially similar sections. But section 18 of the Constitution Act of Victoria and section 32 of the act of South Australia went much further in the direction of expressly recognizing and introducing responsible government. Those sections enacted that a certain number of officers of the governments in those colonies for the time being should be members of the legislature created by the new constitutions. On 22 May 1856, the first Parliament of New South Wales under the new Constitution was opened by Sir William T. Denison. The first responsible ministers were Messrs. Donaldson and St. George as Colonial Secretary and Premier.

Administration and Legislation.—With the establishment of responsible government in New South Wales the initial pulsations of political life in Australia may fairly be said to date their beginnings. The governor of the colony was the representative of the Crown, but he was no longer his own Prime Minister. In 1859 a new Parliament was elected under the provisions of an Act to Amend the Constitution, introduced and passed by the advice of the Cowper administration, providing for increased electoral representation, vote by ballot and manhood suffrage which in later years was developed into "one man, one vote," and finally into "one adult one vote."

In 1860 the Robertson Ministry introduced two land bills, one providing for the alienation and the other for the pastoral occupation of Crown lands. The main principles of these bills were free selection—before survey, which constituted the battle-cry of the land reformers. In 1861 the bills were again introduced into the Assembly, Mr. Robertson resigned his seat in the Assembly and was appointed a member of the Council in order to pilot the bills through that chamber. Both bills were again reintroduced by the Assembly and sent to the Council. In order to counteract and overcome the opposition in the Council it was decided to swamp that chamber by the appointment of 21 members. A parliamentary crisis was thus created. A majority of the old members withdrew from the chamber, thus leaving it without a quorum and the fresh nominees could not be sworn in. The term of office of the first members of the Council was limited to five years, which was then about to expire. The Council was reconstructed by the appointment of 17 life members on 24 June 1861; Wentworth being appointed the first president. In 1862 the Crown land alienation bill and the Crown land occupation bill were passed by both Houses. A Chinese immigration restriction bill, embodying the main provisions of Victorian legislation, was also passed.

In 1863 Messrs. Dalley and Parkes returned to the colony from England, where they had been sent on a mission to promote emigration to New South Wales. From this time on Mr. Parkes became a prominent figure in the political world of New South Wales. He was closely identified with the cause of free trade. In 1868 Mr. Parkes resigned and temporarily withdrew from public life. The most public events of this period were the withdrawal of the British troops from New South Wales and Victoria, and the successful transmission of the first through cable message from Australia to England.

In 1872 the Martin-Robertson Ministry was defeated. Mr. Parkes having returned to the House was entrusted with the task of forming a ministry. He retained the premiership until 1875, when his government was defeated on the motion by Mr. Robertson. The Robertson Ministry remained in office until 15 Dec. 1877, when Mr. Parkes formed another ministry which had but a short reign. A political duel went on between Mr. Parkes and Mr. Robertson for a considerable time, but was at last terminated by a coalition of the two leaders who, in December 1880, formed the Government which lasted until January 1883. In 1881 a Chinese immigration restriction act was passed imposing severe penalties on Chinese entering the colony without payment of a poll tax of £10. An act was passed legalizing trade unions. The Federal Council of Australia was created.
on 28 Nov. 1883. A rich silver field was discovered at Broken Hill (1883).

The Land Bill of 1882 was the rock on which the Parkes-Robertson Ministry was wrecked. A general election resulted in Mr. (afterward Sir) Alexander Stuart coming to power which he held until October 1885. In 1888 another Chinese Restriction Act was passed. The poll tax was raised to £100 per head. Chinese were not permitted to engage in mining and they were not qualified to be naturalized. A tonnage limitation was imposed on vessels bringing Chinese to New South Wales; they were not allowed to bring more than one Chinese passenger to every 300 tons.

In February 1890, a Federal Conference, presided over by Sir Henry Parkes, was held in Melbourne, at which it was resolved that a National Australian Convention should be held to draft a constitution for the federation of the Australian colonies. In March 1891, the Convention was held in Sydney and a draft constitution was adopted. In October 1891, the last Parkes Ministry was defeated, being succeeded by the Ministry of Sir George Dibbs. In 1893 an Electoral Bill was passed embodying the principle of "one man one vote."

In August 1894, the Dibbs' Ministry, which had introduced protection in a modified form, gave way to a free trade ministry formed by George Reid. A new tariff on free trade lines, a land tax, an income tax, and homestead bills were passed under his leadership. Early in 1895 Mr. Reid attended a conference of premiers at Hobart at which the draft of an Enabling Bill to be introduced into the legislature was provided for the election directly by the people of each colony of 10 representatives to attend a Federal Convention to frame a constitution for the federation of the colonies, to be afterward submitted to a referendum of the people of each colony, was adopted. Subsequently the Parliament of New South Wales, as well as the Parliaments of the other colonies, passed identical bills for the aforesaid purpose. It was under the authority of this legislation that the Commonwealth Constitution was afterward framed and adopted.

In 1897 an Immigration Restriction Act, based on the Natal Act, imposing an education test in order to exclude colored aliens, was passed. Legislation on similar lines was adopted in several other colonies.

On 13 Sept. 1899, the Reid Ministry was defeated and Sir William Lyne formed a government which succeeded in passing the Early Closing Act, the Navigation Act, the Old Age Pension Act, and the Women's Franchise Act. In March 1901, Sir William Lyne retired in order to take office as a Commonwealth Minister. The ministry formed by Mr. (afterward Sir) John See succeeded it. One of the most important measures passed through its instrumentality was the Industrial Arbitration Act (1901); under which the principle of compulsory arbitration in settlement of industrial disputes was established. A short-lived Waddell Ministry was followed by one formed by Mr. Joseph Hector Carruthers, who resigned on account of ill health and was succeeded by Mr. Wade who held office until October 1910 when he was defeated and Mr. McKean became Premier until 30 June 1913 when he resigned and was succeeded by Mr. W. A. Holman who is still in office November 1916.

VICTORIA AN OFF-SHOOT OF NEW SOUTH WALES.

Separation.—By Act 13 and 14 Vic. c. 59 (5 Aug. 1850), the district of Port Phillip, bounded on the north and northeast by a straight line drawn from Cape Howe to the nearest source of the river Murray, and thence by the course of that river to the eastern boundary of the colony of South Australia, was separated from the colony of New South Wales, ceased to return members to the Legislative Council of such colony, and was erected into and thenceforth formed a separate colony, to be known and designated as the colony of Victoria. A Legislative Council was created in and for the new colony having powers and functions similar to those of the newly-organized Council of New South Wales. On 1 July 1851, writs for the election of 20 elective members for the Legislative Council of Victoria were issued; 10 were nominated by the Crown. Mr. Latrobe was appointed lieutenant-governor. In this manner the colony of Victoria was called into existence and received the first impulse of an autonomous political life. The new Council was convened for the despatch of business in November 1851, at about the time when gold was being discovered in fabulous quantities in the famous goldfields of Ballarat and Bendigo. The official members were: Mr. W. Lonsdale, Colonial Secretary; Mr. (afterward Sir) W. F. Stawell, Attorney-General; Mr. (afterward Sir) Redmond Barry, Solicitor-General; C. H. Ebdon, Auditor-General; and R. W. Pohlman, Chairman of the Court of Requests. J. F. Palmer was elected speaker.

The New Constitution.—A new constitution drawn on the same lines, and passed in the same manner as that of New South Wales, was assented to by Her Majesty on 16 July 1855. The only substantial difference between the two bicameral legislatures was that while the Legislative Council of New South Wales was composed of members nominated by the Crown the members of the Legislative Council of Victoria were elected by residential inhabitants having high property qualifications.

Responsible Government. The premier of the first responsible government was W. C. Haines. The first election for the Legislative Assembly took place in the spring of 1856. The first ministry resigned on the passing of an unfavorable resolution upon the subject of the estimates, in March 1859. Sir John O'Shanassy, the mover of the resolution, then became Premier.

Administration and Legislation.—Among the problems which soon engaged the attention of the newly-created Parliament of Victoria were those of constitutional reform, manhood suffrage, land and mining legislation, agriculture, protection, and free trade, inter-colonial relations, public works, railways, telegraphs, water supply, immigration, Chinese immigration restriction, naval and military defense and education.

Among the first administrations which held office in Victoria were those of which William Clark Haines was Premier in 1855–57; 1857–58; Mr. (afterward Sir) J. T. Bentleigh, 1855; 1857; 1858–59; 1861–63; Wm. Nicholson,
Premier, 1859-60; Richard Heales, Premier, 1860-61.

In the early days of the goldfields great dis- content existed because of the heavy license fee of 30 shillings per month which every digger was required to pay. In November 1854, the tyrannical policy of the government culminated in an open insurrection which broke out at Ballarat. A flag of revolt, having the emblem of the Southern Cross, was hoisted over a barricade known as "Skodake." By command of Governor Sir Charles Hotham a force of British troops was sent to Ballarat to storm the stockade. Many lives were lost. After this tragic period,—the first and only bloodshed in Australia in the name and for the cause of political freedom,—the grievances of the diggers were redressed.

In 1855 the Legislative Council of the newly-created colony of Victoria led the way in the passage of a number of laws intended to restrict Chinese immigration, which commenced in 1854, when the fame of the gold diggings of Victoria began to attract thousands of Chinamen to that colony. The Victorian Council passed a bill, which was assented to by the governor, "to make provision for certain immigrants." The substance of the law was that no ship should bring to a Victorian port more passengers, being Chinese immigrants, than in the proportion of one person to every 10 tons of the tonnage of such ship, under a penalty of £10 for each passenger in excess of such proportion. On the arrival of a ship in any port of Victoria with Chinese immigrants on board, the master was required to pay to the collector of customs a tax of £10 for every such immigrant. The money so collected was to be invested by the government to form a fund for the relief, support and maintenance of such immigrants. Provision was made for the registration of such immigrants, on their arrival in any district or place to which they proceeded. This and other Immigration Acts were consolidated in 1863.

Another notable measure passed by the first Legislative Council of Victoria was a bill adopting a "vote by ballot." This was the first measure in the history of parliamentary government in which this method was made legal.

The first important bill was introduced by James Service as Commissioner of Crown Lands and Surveys in the Nicholson government, on 30 Nov. 1859. The chief feature in this bill was that of free selection for settlement and agriculture over all the waste land of the colony, subject to certain conditions with respect to lands not yet surveyed. The bill was passed by the Assembly but was rejected by the Council. The period from 1863 to 1866 was memorable in the history of Victoria. It began in a conflict between the parties representing Protection and Free Trade. It then developed into a struggle between the two Houses for financial supremacy, and in its third and last stage it became a contest between the Legislative Assembly and the Crown. The first McCulloch Ministry took office in June 1863; it remained in power until 6 May 1868. One of its first proposals was a bill imposing numerous customs duties on a protective character. It was passed by the Lower House and rejected by the Council. It was then reintroduced tackd on to the Appropriation Bill. The Council again rejected it, and a deadlock ensued. The government in the meantime collected duties on the authority of the Assembly alone. Funds not having been voted for payment of the public service the government borrowed money from the amount of £40,000 from the London Chartered bank which then sued the government for money lent. The government confessed judgment. The Supreme Court pronounced the collection of customs duties on the resolution of the Assembly to be illegal. It also held that confessed judgments against the Crown were illegal. A tariff, separated from the Appropriation Bill, was again passed by the Assembly and again thrown out by the Council. The ministry resigned. Mr. Fellows formed a government which, however, could not carry on. Mr. McCulloch returned to office and the Tariff Bill was again passed by the Assembly, and again sent up to the Council. The preamble of the bill assuring the exclusive right of the Assembly to grant money and taxes was eventually withdrawn, and the bill was passed.

The second McCulloch Ministry was defeated on 20 Sept. 1869. It was followed by an administration formed by John Alexander McPherson which remained in power for nine months. It was displaced on 9 April 1870, by Sir James McCulloch, who, on 19 June 1871, was defeated on his property tax proposals. Charles Gavan Duffy then formed a ministry which successfully proposed and carried a protectionist tariff. The Duffy Ministry was defeated on 10 June 1872. The minister refused a dissolution and James Goodall Francis became Premier. The first Mining on Private Property Bill was carried in the Assembly by 43 votes to 3, but was rejected by the Upper House. A bill to regulate mines, in order to prevent mining accidents, and to protect miners, was passed.

In 1875 the Kerferd government introduced a bill imposing certain duties on wines and spirits. The tariff proposals were carried by a majority of one. This the government accepted as an adverse vote and applied for a dissolution, which the government refused. On 11 Aug. 1875, fancy parliament fell. The ministry, but he was defeated on 20 Oct. 1875. Sir James McCulloch's fourth and last government then came into power. Its accession marked the beginning of a stormy and momentous political period. The Berry party raised a "stone wall" of obstruction, and the McCulloch party retaliated by passing standing orders to restrict and limit debate, which were known as the "Ironhand" and the "Gag." The McCulloch Ministry became very unpopular throughout the country. At a general election on 11 May 1877, an immense majority was returned against the government. Mr. Berry then formed his second ministry. The principal planks in its program were, a land tax to "burst up the large estates," and payment of members. A Land Tax Bill was introduced and passed. Provision for the payment of members to the amount of £500 per year, was made in the Appropriation Bill. In that form it was sent to the Council where it was rejected on the ground that it was a "tax." Then ensued the historic deadlock of 1877-78. No money having been voted to pay the public servants the government on 8 Jan. 1878, ordered the dismissal of
all heads of departments, County Court judges, police magistrates and other public officers. This proceeding caused a great sensation, and by the opponents of the ministry it was denounced as "revolutionary." Shortly afterward a compromise was arrived at: payment of members was passed in a separate bill and the Appropriation Bill without the obnoxious "tack" was carried. The Berry party then devoted their attention to the question of constitutional reform. A bill was passed through the Assembly providing for the adoption of a means of settling constitutional difficulties between the two Houses. It was rejected by the Council. A deputation, or embassy, consisting of the Premier and Professor Pearson, was sent to England to interview the Secretary of State for the Colonies, who was asked to settle the constitutional difficulty in Victoria. Sir Michael Hicks-Beach gave a very guarded reply stating that the Imperial Parliament would never alter the Constitution of the colony at the request of only one House.

In 1879 the Parliament of Victoria again resorted to legislation in order to arrest the influx of Chinese. Vessels were not allowed to introduce into any Victorian port more than one Chinaman per 100 tons of tonnage, and a poll tax of £10 was imposed on each immigrant on his landing. In April 1888, a Chinaman, Chun Toy, arrived in the port of Melbourne on board the British ship *Afghan*. The collector of customs considered that the *Afghan* had brought a larger number of Chinese than was allowed by law; he refused to allow any of them to land, or to accept the poll tax of £10 each. Chun Toy brought an action against the collector in the Supreme Court of Victoria, which decided that the action of the government in preventing the landing of the Chinese prepared to pay the prescribed poll tax was illegal. The Victorian government appealed from this decision to the Privy Council which reversed the judgment of the Victorian court, and held (1) that the collector of customs was under no legal obligation to accept payment of the poll tax tendered by the master on behalf of any such immigrant, or tendered by or for any individual immigrant; (2) that, apart from the act, an alien has not a legal right, enforceable by action, to enter British territory.

After an appeal to the constituencies in March 1889, Berry resigned, and James Service then formed a ministry. He introduced a measure to amend the Constitution, which upon a division was lost by two votes. Parliament was dissolved and a general election was held in June 1889, which resulted in the Berry party being returned to office with a substantial majority. The principal work done by the third Berry Ministry was the carrying of a bill to amend the constitution of the Legislative Council by reducing the qualification of electors and of members. A bill was also passed making permanent provision for payment of members. In July 1881, the third Berry Ministry was succeeded by one formed by Sir Bryan O'Loughlin. The ministry lost office in March 1883, when a coalition ministry under Service and Berry was formed. Under this government, acts were passed for the abolition of political control of the government railways by placing them under the management of three independent commissioners, and for the abolition of patronage in the public service. During his premiership, Service took great interest in the question of Australian Federation, and through his instrumentality a convention was held in Sydney at which a scheme for the establishment of a Federal Council was adopted. The Service-Deakin Ministry was followed in February 1886, by the Gillies-Deakin combination. In 1888 another Chinese Immigration Restriction Act was passed providing that no vessel should enter any Victorian port having on board more than one Chinaman for every 500 tons of tonnage. Special vessels for Chinese who should enter Victoria by land, without first obtaining a permit in writing, from some person to be appointed by the governor in Council, was declared guilty of an offense against the act, and made liable on conviction to a penalty of not less than £5 nor more than £20 and also, upon the warrant of the commissioner of trade and customs, to be removed or deported to the colony from whence he came.

On 5 Nov. 1890, the Gillies-Deakin Ministry was succeeded by a ministry formed by James Munro, who in his turn gave place in February 1892, to one formed by William Shiels. The careers of the Shiels Ministry, the Patterson Ministry and the one formed by Sir George Turner, which came into office on 27 Sept. 1894, were comparatively uneventful. In February 1895, Sir George Turner was associated with Reid and other premiers in a conference held at Hobart at which a Federal Enabling Bill was drafted. The first Turner Ministry was defeated in December 1899. Allen McLean's Ministry held office for a little over 11 months; during which time several contingents were sent from Victoria to assist the British army in South Africa. On 15 Nov. 1900 Sir George Turner again became Premier in time to make arrangements for the establishment of the Commonwealth. An Old Age Pension Act was passed, also bills protecting the rights and interests of Victorian public servants. In the beginning of 1901 Sir George Turner resigned the premiership and accepted office as Treasurer in the first Federal Cabinet. Sir Alexander Peacock became head of the new government. On 3 June 1903 the Ministry was displaced on a no-confidence motion by Mr. (now Sir) W. H. Irvine. During the career of the Irvine Ministry a railway strike occurred in Victoria which resulted in an act being passed for the separate representation in Parliament of railway and other public servants. On the retirement of Irvine he was succeeded by Thomas Bent who resigned and was succeeded by John Murray, who held office until May 1912, when he was succeeded by Mr. W. A. Watt, who resigned 9 Dec. 1913. When Mr. G. A. Elmslie formed a labor ministry which was defeated by Mr. Watt who again resumed office 22 Dec. 1913. Mr. Watt resigned to enter the Federal Parliament in June 1914 and was succeeded by Sir A. J. Peacock, who still holds office (November 1916).

**TASMANIA AN OFF-SHOOT OF NEW SOUTH WALES.**

**Separation.—**By the Act 4 Geo. IV, c. 96 (19 July 1823), the Crown was empowered to separate Van Diemen's Land from New South Wales, and erect it into a separate colony which then received a lieutenant-governor, an Executive Council and a small Legislative Council,
consisting of seven members. By Act 13 and 14 Vic., c. 59, s. 7, it was provided that the legislature already existing in Van Diemen's Land should be continued into the colony a Legislative Council to consist of not more than 24 members, of whom one-third should be nominated by Her Majesty and the remainder elected by qualified inhabitants of the colony. Under the authority of this law the new Legislative Council was elected into existence, having powers and functions similar to the Legislative Council of New South Wales.

The New Constitution.—During the governorship of Sir William Denison the new Legislative Council of Van Diemen's Land, under the powers conferred by 13 and 14 Vic., c. 59, s. 32, drafted a constitution for the establishment of a bicameral legislature in Van Diemen's Land composed of a Legislative Council of 15 members elected by the qualified inhabitants and a House of Assembly of 30 members elected on a more popular franchise than that of the Council. The bill so drawn was passed by the Legislative Council and reserved by the lieutenant-governor for the Royal assent. The Royal Assent was given on the 12th of May 1856; the Parliament being opened on 2 Dec. 1856. Sir Henry E. F. Young was appointed the first governor-in-chief of the colony under the new system of responsible government. The first premier was William T. N. Champ. In the year 1853, upon the cessation of transportation, the name of the island was changed from that of Van Diemen's Land to Tasmania.

Administration and Legislation.—Upon the cessation of transportation and the grant of responsible government to Tasmania a new life and destiny was imparted to the struggling community. Between 1855 and 1872 there was substantial improvement and progress in the position and prospects of the island, marked by the development of the interior, the construction of roads and tramways, the initiation of railway and telegraphic communication, the expansion of the agricultural and pastoral industries, the division of the colony into municipalities, the laying of a submarine cable between Tasmania and the mainland, the discovery of tin at Mount Bischoff and other places, gold in the quartz reefs at Brandy Creek and subsequently of silver and lead at Zechan, and gold and copper at Mount Lyell. The west coast became famous by the opening up of some of the richest silver lead mines in the world; coal seams were opened at Hastings, Langloch and Ivanhoe.

In February 1894, while the Dobson Ministry was in office, the necessity of financial reform became a question. Financial proposals were submitted by the government. A bill to authorize a graduated land tax was submitted to the Assembly and rejected; consequently Dobson and his colleagues resigned in April 1894, and Sir Edward Braddon formed a ministry. An income tax was passed, together with a land tax imposing one penny per pound on the capital value of all land in the colony. This general tax was adopted as a sort of a compromise instead of the proposed tax on the unimproved capital value of the land which was introduced by Mr. Bragg and which offended the country.

In February 1895, a conference of premiers was held at Hobart at which the draft of a Federal Enabling Bill was adopted. At a general election held in 1897, a system of voting based upon Hare's preferential method was used for the first time. During the year a Federal referendum was held to determine if the three colonies of New South Wales, Victoria and South Australia should remain separate or federate. The result was in favor of federation, and on 1 January 1901, the Commonwealth of Australia was created.

Queensland was embodied in an Order in Council bearing the same date as the letters patent.

The New Constitution.—The Order in Council provided that there should be within the colony of Queensland a Legislative Council and a Legislative Assembly, with the advice and consent of which the Queen must always and in all cases whatsoever. In its main outlines the Constitution of Queensland was almost a replica of that of New South Wales. The first Parliament under the new Constitution was convened for the despatch of business on 29 May 1859.

From the date of separation Queensland began to advance with rapid strides, and it soon occupied a prominent position in the Australian group. Between 1861 and 1871, under a policy of assisted immigration, the population largely increased and the interior of the country was developed in the direction of pastoral and agricultural pursuits, gold and silver mining, sugar and cotton growing. Cotton growing was stim-
ulated by bounties. The pastoral industry was promoted; railway construction was commenced; state aid to religion was withdrawn and a system of primary and secondary education was initiated. Queensland was found to be particularly suitable for sugar growing and a demand for cheap labor quickly sprang up. In course of time shiploads of South Sea Islanders were introduced by the sugar planters and it was soon found necessary for the legislature to interfere.

A financial crisis occurred in 1865, which in turn resulted in a change of ministry. The first MacAlister Ministry had a short term of office. Herbert was again called to the helm of affairs but in a few months he was again displaced. The second MacAlister Ministry lasted for 12 months and eight days. It secured the passing of an important measure dealing with the cultivation and occupation of Crown lands. It was followed by the MacKenzie Ministry and the Lilley Ministry. The MacKenzie Ministry of 1867 introduced and passed a Crown Lands Act which gave facilities for settlement. The Lilley Ministry of 1868 passed acts relating to the civil service, court procedure, and electoral laws. The Lilley Ministry was followed by the Palmer Ministry which lasted from 3 Jan. 1870 to 8 June 1874. In 1875 during the reign of the third MacAlister administration a State Education Act was passed which embodied the principles of free, secular and compulsory education. A complete measure of local government was passed in 1878, under the rule of the Douglas administration.

In the same year the first act to restrict Chinese immigration into Queensland became law.

In 1879, Mr. (afterward Sir) Thomas McIlwraith formed his first government. On 4 April 1883, he made a dramatic and sensational attempt to annex New Guinea, directing H. M. Chester, at Thursday Island, to cross Torres Straits and on behalf of Her Majesty's government in Queensland to hoist the British flag and proclaim the annexation to that colony of the Territory of New Guinea not claimed by the Dutch. This act was repudiated by Lord Derby, who, however, on 10 Oct. 1884 declared a British protectorate over the southern part of the island; Germany seized the remainder.

In 1886 McIlwraith was defeated and Mr. (afterward Sir) Samuel Griffith succeeded him. During his term of office a convention of Australian representatives was held in Sydney, at which a scheme for the establishment of a Federal Council of Australasia, drafted by Griffith, was adopted and it afterward became law by Imperial legislation. A Crown Lands Act was passed by the Griffith administration in 1884. It encouraged Crown tenants to improve their holdings, facilitated bona-fide settlement and discouraged the speculation in acquisition of land. The first Griffith Ministry was succeeded (13 June 1888) by the second McIlwraith government, which had only a brief tenure of office, being on 20 Nov. 1888, supplanted by the Morehead Ministry which lasted until 19 Dec. 1890. The second Griffith Ministry was then formed. In April 1891, Griffith took an active part in a Federal convention held in Sydney at which a draft constitution for the union of the Australian colonies was adopted.

The Kanaka labor question became important about this time and the Griffith Ministry advocated the reintroduction of Polynesian laborers. On 14 April 1892, the Pacific Laborers’ Extension Bill was passed, notwithstanding strong objections urged against the introduction of colored races into Queensland. On 11 Jan. 1893, Griffith was succeeded by Mr. (afterward Sir) Hugh Muir Nelson occupied the post of acting Chief Secretary pending the arrival from England of Sir Thomas McIlwraith who, on 27 March, became Premier of his third and last administration. In October following he resigned the premiership in which he was succeeded by Sir Hugh Muir Nelson. In 1894 the great strike of shearsers occurred in Queensland, leading to a reign of lawlessness which resulted in the passage of the Peace Preservation Act. In 1896 a Meat and Dairy Produce Act was passed which gave a stimulus to the primary industries. Increased facilities for land settlement were offered.

On 13 April 1898, Sir Hugh Nelson resigned the premiership and was appointed president of the Legislative Council. On 10 Aug. 1898 a new government was entrusted to T. J. Byrnes who gave promise of a brilliant political career which was cut short by his death at the early age of 36, after five months of office. Mr. (afterward Sir) James R. Dickson then became Premier. He was an ardent Federalist and exercised the power of his influence in favor of Queensland joining the Commonwealth which was then on the eve of being established. He represented Queensland at a conference of premiers in Melbourne, but the constitution, as adopted by the Convention, was slightly modified. In September 1899 the Constitution was submitted to the people of Queensland by a referendum and was approved by a large majority. In December 1899, a Labor Ministry was formed by Anderson Dawson; it lasted six days and R. Philip, a former colleague of Dickson, then formed a ministry. Philip held office until 17 Sept. 1903. The Labor party, having in the meantime increased in members and influence, was sufficiently strong to take a share in the executive government of the country, and accordingly Arthur Morgan vacated the speaker’s chair and formed a Liberal Labor government in which the Liberals and Laborites were equally represented. In January 1906, Morgan resigned the premiership and became vice-president of the Executive Council, William Kidston, leader of the Labor party, becoming Premier, a position he held until February 1911, when he was succeeded by Mr. D. F. Denham, who held office until 1 Jan. 1915, when he was defeated by Mr. T. J. Ryan who formed a Labor government.

WESTERN AUSTRALIA THE SECOND ORIGINAL COLONY.

Foundation.—The first Imperial Act applicable to Western Australia was 10 Geo. IV. c. 22 (1829). It was entitled “An Act to provide Until the 31st December 1834 For the Three Years of His Majesty’s Settlements in Western Australia on the Western Coast of New Holland.” It will be noticed that the name “Australia” first suggested for the continent in 1814 by Matthew Flinders is here used and for the first time mentioned by
an Imperial Act. By that act the king, with the advice of the Privy Council, was empowered to authorize any three or more persons resident within the settlements to make, ordain and constitute laws, institutions and ordinances for and good government of His Majesty's subjects and others within the settlement.

A Representative Legislature.—Under the Act 13 and 14 Vic., c. 59 (5 Aug. 1850), Western Australia was a Legislative Council, consisting of 25 members, nine of whom were nominated by the Crown and 17 were elected by qualified inhabitants. Three years afterward an agitation was commenced in favor of responsible government as it existed in the eastern colonies. In 1874, a draft of a Constitutional Bill was sent to the Secretary of State, who, however, decided that the colony was not yet ripe for the change.

The New Constitution.—The movement was not successful until July 1890, when a new Constitution was passed by the Imperial Parliament, being embodied in the Act 53 and 54 Vic., c. 26. It created a bicameral legislature consisting of a nominee Council and an elective Assembly to make laws in and for Western Australia, and along with it responsible government was introduced. The first Premier was Sir John Forrest.

Administration and Legislation.—The discovery of goldfields and a rapid influx of population were factors which largely contributed toward the success of the constitutional movement. The new Parliament was called upon to pass legislation relating to gold mining, land settlement, railway construction and water supply. Under the old régime a railway 243 miles long had been constructed on the land grant system between Beverley and Albany. Under the terms of the contract, payment was made at the rate of 12,000 acres for every mile of completed road. The lands selected in payment were situated within a belt of 40 miles on each side of the line; half the frontage to the railway was reserved to the government. In 1896 the government acquired this private land-grant railway, the purchase price being £1,100,000. The Perth waterworks constructed by the Perth Water Supply Company were taken over by the government at a cost of £220,000. Among the lines of railways which greatly assisted in the development of the interior were the lines to Kalgoorlie, Menzies and Kanowna, penetrating into the heart of the eastern goldfields. A gigantic scheme of water supply for the conveyance of water through pipes by pumping from stations, from the Mundaring Reservoir to Coolgardie and Kalgoorlie, a distance of 330 miles at a cost of £2,500,000, was inaugurated, and afterward successfully completed.

In 1897-98 the question of federation came into prominence. The attitude of the Forrest government toward the new constitution was not favorable whilst on the gold-fields there was a strong movement in favor of the bill backed up by threats of separation. This led to a change of attitude on the part of the government, and at the general election of 1898 a majority of electors voted in favor of Federal union.

In 1899 an Electoral Bill was passed which conferred the political franchise on adult women; it was exercised for the first time on the occasion of the Federal referendum. Sir John Forrest retired from state politics in February 1901, and G. Throssell succeeded him as Premier. The Premier was defeated at a general election held the same year. George Leake then formed a ministry which was short-lived, as also was another formed by Alfred Edwards Morgans. On 23 Dec. 1901 Leake formed his second ministry and held office until his death on 24 June 1902. He was succeeded in the premiership by Walter H. James on 1 July 1902. The only notable matters of legislation passed in this period of short-lived ministries were the Arbitration and Conciliation Act and the Workmen's Compensation Act. On 10 Aug. 1904 James was defeated and a Labor ministry was formed by Henry Daglish. It remained in office until 25 Aug. 1905 when it was displaced—partly by dissension within the ranks of the Labor party, and ostensibly on the ground of mismanagement, disorder and the resuming possession of the Midland Railway. On 25 Aug. 1905 Cornthwaite Hector Rason became Premier of a Liberal administration, pledged to oppose the extreme policy of the Labor party. He secured a majority, went to the country from which he returned with a strong working majority. He resigned in May 1906, to accept the position of agent-general in London and Mr. (now Sir) Newton James Moore became Premier and he held office until September 1910 when he was succeeded by Mr. Frank Wilson who was defeated by the Labor party in October 1911 and Mr. John Scadden became Premier, until July 1916 when he was defeated by Mr. Frank Wilson.

SOUTH AUSTRALIA THE THIRD ORIGINAL COLONY.

Foundation.—This province was originally carved out of that part of the colony of New South Wales lying between the meridians 132° and 141° E. longitude, bounded on the north by the 26° parallel of S. latitude and on the south by the Southern Ocean. This region was never occupied, or settled, by the New South Wales government. On 15 Aug. 1834, the Act 4 and 5 Wm. IV, c. 95, entitled "An Act to empower His Majesty to erect Australia into a British Possession or Province, and to provide for the Colonization Thereof" was passed. It did not purport to separate the territory from New South Wales; it seemed to contemplate the whole of the whole continent as not being subject to any prior statutory authority. It empowered the King to appoint a governor and colonization commissioners, who were to have the control of the Crown lands, with power to survey and sell the same, and to employ a portion of the money so derived in conducting the immigration of laborers from Great Britain. In the exercise of these powers the province was erected; a governor, a judge, seven commissioners and other officials were appointed. The governor, with the concurrence of the chief justice, the colonial secretary and advocate-general, or two of them, was authorized to make laws and impose taxes. Captain (afterward Sir) John K. Hindmarsh was appointed the first governor. On 28 Dec. 1836, G. F. Hindmarsh arrived at Glenelg and proclaimed the establishment of the government. He was succeeded on 12 Oct. 1838, by Governor Gawler, during
whose term of office the settlement became involved in debt to the extent of £281,842. Gawler was recalled (May 1841), and a radical change was made in the government of the colony; the office of Colonization Commission in London was abolished; South Australia was made a Crown colony, the government was vested in the Secretary of States for the Colonies. Captain (afterward Sir) George Grey was appointed governor, and almost absolute power was entrusted to him.

In 1842 the Act 5 and 6 Vic., 61, entitled "An Act to provide for the better government of South Australia" was passed. Under it a nominated Legislative Council, consisting of the governor and seven other persons resident in the colony, was created, having power to make laws for its government. On 25 Oct., 1843, Captain Grey was transferred to New Zealand, and Lieutenant-Colonel Robe acted as governor for a short time. His successor was Sir Henry Fox Young, to whom the colony was indebted for an extensive railway road system, and the institution of local government in the shape of district councils.

A Representative Council.—Under the Act 13 and 14 Vic., c. 59 (5 Aug. 1850), the Legislative Council then established in South Australia was authorized to establish a Legislative Council consisting of not more than 24 members, one-third of whom were to be appointed by the Crown and the remainder were to be elected by the qualified inhabitants. This new Council was authorized to make laws for the peace, order and good government of the province and to impose rates and taxes. On 21 July 1851, this Council consisting of 24 members was duly constituted.

The New Constitution.—In 1853 the Legislative Council of South Australia, in pursuance of powers conferred by section 32 of the Act 13 and 14 Vic., c. 59, passed a bill to establish a bicameral legislature for South Australia, consisting of a Legislative Council and a House of Assembly. This bill was reserved for the Queen’s assent but it was disallowed. Subsequently a second bill to create a bicameral legislature was introduced in the Council and passed. It provided for the creation of two elective House of Representatives. This bill was received by the Imperial Parliament, passed by the House of Commons on 8 March 1857, and received by the Imperial government on 7 March 1857. It subsequently received Royal assent, and is sometimes called the "Constitution Act" of South Australia. It contained provisions and machinery somewhat similar to the Constitution Act of Victoria. The preamble of the Act was manhood coupled with registration and residence. Both Houses were chosen by ballot which was adopted on the motion of Francis S. Dutton, afterward Premier.

Responsibility of Government.—The election of members of the two new Houses took place on 8 March 1857. The first session of the new Parliament commenced on 22 April 1857, during the governorship of Sir Richard Graves McDonnell. The first Premier was B. T. Finniss.

Administration and Legislation.—Among the public men of South Australia, who, in the early history of the colony under responsible government, took an active and prominent part in the great business of administration and legislation were the following who held office as Premiers from 1857 to 1887: Robert Robert Richard Torrens, Richard Davies Hanson, Thomas Reynolds, George Marsden Waterhouse, Francis Stokes Dutton, Henry Ayers, John Hart, Arthur Blyth and Henry Bull Templar, R. R. Torrens took office in 1857. His name has become famous by association with an act simplifying the transfer, conveyance and registration of land. Torrens was the originator of the plan; it was based on practical knowledge obtained by him as collector of customs, and was fortified by the legal knowledge of Dr. Hubbe. The Torrens’ Land Act system was afterward adopted by all the other Australian colonies. In 1861 a strip of territory lying between latitude 129° and 132° E. longitude and south of the 26° S. latitude known as "No Man’s Land" was added to South Australia.

Sir Dominic Daly succeeded Sir Richard G. MacDonnell on 4 March 1862. In March 1863 an intercolonial conference was held in Melbourne at which the majority of the Australian colonies were represented. This conference was organized in a suggestion made by Sir Dominic Daly. It was resolved that it was desirable to settle the basis for a uniform tariff for the Australian colonies. No practical results were followed by this conference, but it foretold the necessity of some form of Federal Union. In the same year the Northern Territory was added to South Australia by letters patent.

In 1866-69, a ministry, of which Henry B. Templar, Strangways was Premier, held office. Its career was distinguished by the passing of a Land Act which was intended to promote settlement and prevent the monopolization of the large tracts of land by land sharks and dummies. Sale of land by auction was limited. Land was sold to bona-fide selectors on credit, the payments being allowed to extend over a period of four years, and no selector was allowed to take up more than 640 acres.

The great overland telegraph line from Port Augusta to Port Darwin, the construction of which was prosecuted during the premierships of Strangways, John Hart and Sir Arthur Blyth, was completed on 2 Aug. 1872. In 1875-76 a strong administration formed by Mr. (afterward Sir) James Penn Boucaut, was in power; it introduced a third of internal development, public works and railways. It was proposed that a loan of £3,000,000 should be raised, coupled with increased taxation, stamp tax and probate duties. This scheme was passed by the Assembly and rejected by the Council. Mr. (afterward Sir) John Colton formed a ministry which adopted Boucaut’s policy and carried his scheme of public works and railways without the increased taxation. In 1877 Boucaut’s second ministry was formed and during that year the overland telegraph line between Adelaide and Perth was completed.

The second Boucaut Ministry was succeeded by administrations of which the following were Premiers from 1878 to 1916: William Morgan, John Cox Bray, John Colton, John W. Downer, Thomas Playford, John Alexander Cockburn, Frederick William Holder, C. C. Kingston, Vaubeu Louis Solomon, J. G. Jenkins, Richard Butler, Thomas Price, A. H. Peake, John Verran and Crawford Varcoe. In 1886 the jubilee of South Australia was
celebrated. C. C. Kingston came into power in 1893. A Crown Lands Consolidation Act was passed by his ministry which restricted the sale of Crown lands by auction, introducing a system of leasing country lands, coupled with the right of purchase and provided perpetual leases for agricultural purposes. Small blocks not exceeding the unimproved value of £100 were thrown open for lease on the application of bidders. If no bid was made in the block was necessary, either by the lessee or by his wife or children. The rent of each lease was notified in the Gazette. These lots were not subject to a revaluation, but were liable to land tax. In 1894 a bill was passed confering the franchise on women. In order to give encouragement and to grant assistance to the farmers an Advance to Farmers' Act was passed in 1896, under which a state bank has been established in South Australia with power to grant loans to farmers at a low rate of interest with extended time for repayment of the principal.

On 25 April 1896, a general election was held in South Australia at which women exercised the right of voting for a curtailment of the women whose names were enrolled recorded their vote. On 22 Jan. 1897, Sir Samuel J. Way, chief justice of South Australia, was appointed a member of the Judicial Committee of the Prvvy Council. On 22 March the Federal Convention held its first session at Adelaide, at which the first preliminary draft was prepared. Mr. Kingston being defeated 1 Dec. 1899, resigned, and V. L. Solomon formed a ministry which was defeated on 7 December. F. W. Holder then became Premier. An Early Closing Act and a Workmen's Compensation Act were passed. In May 1901, Holder resigned in order to accept office in the Federal Parliament. He was succeeded in the premiership by J. G. Jenkins, who held office in the Playford, Kingston and Holder cabinets. He undertook the difficult task of carrying constitutional amendments rendered necessary by the adoption of the Federal Constitution transferring certain powers, functions and departments to the federal government. He succeeded in carrying a measure reducing the number of responsible ministers, reducing the number of members of the Assembly from 54 to 42, and reducing the number of the Council from 24 to 18. He resigned on 1 March 1905, and accepted the appointment of agent-general for South Australia in London. A ministry of which Richard Butler was Premier then took office. A general election took place in May at which Butler's party was defeated and on 20 July he resigned, and was succeeded as Premier by Thomas Price who died in 1909 and was succeeded by A. H. Peake whose party was defeated at the elections in April 1910 by the Labor party, and its leader, J. Verran, became Premier in June 1910, and held office until 17 Feb. 1912, when he was defeated by Mr. A. H. Peake who held office until 3 April 1915, when he was defeated by the Labor party and Mr. Crawford Vaughan became Premier.

Commonwealth of Australia Constitution Act, the people of New South Wales, Victoria, South Australia, Queensland, Tasmania, and Western Australia were united in a Federal Commonwealth under the name of The Commonwealth of Australia; and the old colonies, under the name of states, were declared to be parts of the Commonwealth. The Constitution Act marked the completion and consummation of a movement in favor of Australian federation, which extended over a period of nearly 60 years.

In 1847, Earl Grey, Secretary of State for the Colonies, proposed to create a separate legislature in and for Australia in which all the colonies then in existence should be represented, and which should have power to make laws in matters of common concern. In 1849, the Privy Council proposed that there should be a General Assembly having power to deal with custom duties, postal matters and to create a Supreme Court of Appeal. In 1853 a committee of the Legislative Council of New South Wales recommended the establishment of a General Assembly. All these proposals, however, were regarded as mere gestures. The following is a summary of other unsuccessful efforts in the same direction; (1857) a select committee of the Victorian Legislative Assembly agreed that "the time for union had come"; in the same year a select committee of the New South Wales Parliament passed a similar resolution; (1860) a select committee of the Victorian Assembly recommended negotiation; (1862) the Colonial Secretary of South Australia commenced correspondence with other colonies urging that a uniform tariff was indispensable; (1863) tariff conference in Melbourne; (1865) inter-colonial conference at Sydney resulting in agreement by which the Murray border was made free of fiscal restriction; (1867) inter-colonial conference in Melbourne in reference to ocean postal service to Australia at which Sir Henry Parkes said: "the time has arrived when the colonies should be united"; (1880) inter-colonial conference in Melbourne at which a resolution was passed that "a Federal Council should consider the question of inter-colonial interest"; (1883) inter-colonial conference at Sydney at which the necessity of a Federal Council was affirmed, and at which a draft bill was adopted which afterward became law (this council, however, was not a success as only three of the colonies joined it); (1890) Federal conference in Melbourne convened by Sir Henry Parkes at which resolutions were passed affirming the necessity for an early convention of the representatives of all the colonies to prepare a scheme for a Federal constitution. Convention of 1891— On 22 March 1891, the first Federal convention was held in Sydney at which all the Australasian colonies, including New Zealand, were represented by seven delegates chosen by the Parliament of each colony. A constitution was drafted and adopted by the convention, but no practical action was taken to give it effect. In January 1895, a conference of premiers was held at Hobart, at which all the Australasian colonies were represented. It was resolved that a convention consisting of 10 representatives from each colony, directly chosen by the electors, be
charged with the duty to frame a constitution; that the constitution so framed be submitted to the electors for acceptance or rejection by direct vote. Five of the six colonies, viz., New South Wales, Victoria, South Australia, Tasmania and Western Australia elected 10 representatives. Queensland did not take part in the convention which met in Adelaide in March 1897. C. C. Kingston, then Premier of South Australia, was elected president of the convention, which afterward sat in Sydney and Melbourne. The constitution was drafted, subsequently submitted to the people of the various colonies, and ratified, Queensland coming in at the last moment. The constitution so drafted and ratified by the people of Australia was afterward embodied in an Imperial Act, came into force and the Commonwealth was proclaimed.

The Federal Constitution.—The Federal Constitution came into force and the Australian colonies were united on 1 Jan. 1901. By this Constitution a new Parliament was called into existence, as well as a new executive and a new judiciary. The union of people and states, so organized and constituted, in many respects resembles that of the United States of America. The new form of government has been created for special and limited purposes to deal with matters of common Australian interests. The power and authority of the Federal Parliament, and Federal government, are limited and restricted to such powers and authorities as have been expressly taken from the state, or such new powers as are specified and particularized in the instrument. The governments and Parliaments of the states have the same legislative and executive scope as before — save as to matters delegated to the Federal authority. In this respect the Australian Constitution differs from that of Canada, which limits and defines the power of the province and confers upon the Dominion Parliament all the residue of sovereign power.

Legislative Department of the Commonwealth.—The legislative power of the Commonwealth is vested in a Federal Parliament consisting of the King, or Queen, of the United Kingdom, the Senate and the House of Representatives. The Senate consists of representatives from each state and territory, the number of each state fixed by the people of each state voting as one electorate; each state is entitled to six senators. Senators are chosen for six years, one-half retiring every three years. The House of Representatives is composed of members directly chosen by the electors of the Commonwealth; the total number of such members must be as nearly as practicable twice the number of the senators. The Senate is called the State House, the House of Representatives is called the National Chamber, in which the people of each state are represented according to population, save and except that no state is to have less than five members. In the first Parliament, New South Wales sent 26 members to the House of Representatives, Victoria sent 23, Queensland sent 9, South Australia sent 7, Western Australia and Tasmania sent 5 each. The House of Representatives continues to exist for a period of three years from the day of the last meeting, unless sooner dissolved by the governor-general. In case of a deadlock between the two Houses extending over a certain time the governor-general may under certain conditions and circumstances dissolve both Houses and send them to the people; after such a double dissolution a joint sitting of both Houses of the newly-elected members must be held at which they deliberate and vote upon the proposed law in dispute.

The Federal Parliament can make laws respecting trade and commerce taxation, bounties, borrowing, postal and telegraphic matters, naval and military defense, light houses, fisheries, census, currency, interstate insurance, weights and measures, negotiable instruments, bankruptcy, copyrights, patents, naturalization, foreign co-operations, marriage and divorce, old age pensions, service and execution of process, immigration, influx of criminals, external affairs, relations of the Commonwealth with the islands of the Pacific, acquisition of property for Federal purposes, control of railways for naval and military transport, acquisition of state railways with the consent of such state, construction of railways through a state with the consent of such state, conciliation and arbitration for the settlement of interstate industrial disputes, seat of government of the Commonwealth and departments of the public service.

On 1 Jan. 1911 "The Northern Territory" of Australia which had previously belonged to the state of South Australia was transferred to the Commonwealth government. This is an area of 523,620 square miles with a white population of only about 2,000.

Judicial Department of the Commonwealth.—The judicial power of the Commonwealth is vested in a High Court consisting of a chief justice and not less than two other justices. The High Court has appellate and original jurisdiction. It has jurisdiction to hear appeals from all other Federal courts, courts exercising Federal jurisdiction, and from
the Supreme Courts of states in the exercise of jurisdiction conferred by state laws. The High Court must be regarded as a Federal Court of Appeal, and a National Court of Appeal, and as such it holds a wider jurisdictional area than its great exemplar, the Supreme Court of the United States of America, which cannot entertain appeals from state courts in cases not involving Federal issues. The act confers a new right of appeal from the Supreme Courts of states in state law cases, but it does not abolish the existing right of appeal in those cases to the Privy Council. The latter right still remains. The High Court, though a general Court of Appeal for Australia, is not the sole or exclusive, but a concurrent Court of Appeal in state law cases. Parties to cases decided by the Supreme Courts of state on matters of state law have, therefore, an alternative right of appeal, either to the Privy Council direct or to the High Court.

The judgments of the High Court are declared by the Constitution to be final and conclusive, which negates the right of litigants in the High Court to appeal to the Privy Council as a matter of right. The appeal as a matter of right has been taken away, but the Constitution has left unimpaired any right the King may be pleased to exercise by virtue of his prerogative to grant special leave of appeal from the High Court to His Majesty in Council. To this reservation of the prerogative to grant leave there is, however, a most important exception. No appeal can be permitted to be made to the King in Council from a decision of the High Courts upon any question as to the limits inter se of the constitutional powers of the Commonwealth and those of any state, or states, or as to the limits inter se of the constitutional powers of any two or more states unless the High Court shall certify that question is one which ought to be determined by His Majesty in Council. The High Court has original jurisdiction to decide all matters arising under any treaty, all matters affecting Consuls, all matters in which the Commonwealth is a party, all matters between states or between residents of different states in any matters arising under the Constitution or involving its interpretation.

For several courts of the states have been vested in Federal jurisdiction. The Constitution provision is made for the appointment of an interstate commission. In December 1912 the Fisher government passed the Interstate Commission Act and in August 1913 the Cook government appointed three commissioners to carry out the provisions of the act. The first duty entrusted to them was that they should investigate and report on the extent of matters arising under the Constitution, or involving its interpretation, and in matters of any laws made by the Federal jurisdiction. In section 101 of the Commonwealth Constitution provision is made for the appointment of an interstate commission. In December 1912 the Fisher government passed the Interstate Commission Act and in August 1913 the Cook government appointed three commissioners to carry out the provisions of the act. The first duty entrusted to them was that they should investigate and report upon the extent of matters arising under the Constitution, or involving its interpretation, and in matters of any laws made by the Federal jurisdiction. In section 101 of the Commonwealth Constitution provision is made for the appointment of an interstate commission. In December 1912 the Fisher government passed the Interstate Commission Act and in August 1913 the Cook government appointed three commissioners to carry out the provisions of the act. The first duty entrusted to them was that they should investigate and report upon the extent of matters arising under the Constitution, or involving its interpretation, and in matters of any laws made by the Federal jurisdiction.

Finance and Trade.—During the first 10 years after the establishment of the Commonwealth, the Federal government had only a limited use of the revenue derived from customs and excise duties. It could only use for Federal purposes one-fourth of the total of the net sum so collected. The remaining three-fourths had to be paid to the several states according to the following method of distribution, viz., each state was credited with the whole of the revenue collected in it and each state was debited: (a) with departmental expenditure actually incurred in such state; and (b) with a proportion in those cases to the privy expenditure of the Commonwealth. The Commonwealth paid to each state monthly the balance in favor of each state. Upon the imposition of uniform customs duties in October 1901, trade, commerce and intercourse, between the states, whether by land or by sea became absolutely free.

Relations of States to the Commonwealth and the Crown.—The relations of the Australian states to the Commonwealth and to the Crown were authorised by the Constitution by the Secretary of State, Mr. Chamberlain. In the despatch dated 15 April 1903, directed to the lieutenant-governor of South Australia in reference to the case of the Dutch ship Vondel. The owners of this ship complained to the British Government that the state government of South Australia had declined to arrest the crew of the ship while she was in South Australian waters. The Secretary of States brought the complaint under the notice of the governor-general of Australia. The Federal government forwarded the papers to the state government desiring them to furnish a report on the case. The state government refused to report to the Federal Government on the ground that the latter had no jurisdiction in the matter. The constitutional issues raised by the action of the South Australian government were dealt with at length in Mr. Chamberlain's despatch. So far as other communities in the empire or foreign nations are concerned, the people of Australia form one political community for all purposes of the Commonwealth alone can speak, and for everything affecting external states or communities which takes place within its boundaries, that government is responsible. The distribution of powers between the Commonwealth and the states is a matter of purely internal concern of which no external country or community can take cognizance. It is to the Commonwealth and to the Commonwealth alone that, through the Imperial government, they must look for remedy or relief for any action affecting them done within the bounds of the Commonwealth, whether it is the act of a private individual, of a state official, or of a state government. The Commonwealth is, through His Majesty's government, just as responsible for any action of South Australia affecting an external community as the United States of America are for the action of Louisiana or any other State of the Union. The Crown undoubtedly remains part of the Constitution of the state of South Australia, and in its executive capacity, the proper channel of communication is between the Secretary of State and the state governor. But in matters affecting the Crown in its capacity as the central authority of the empire, the Secretary of State can, since the people of Australia have become one political
community, look only to the governor-general as the representative of the Crown in that community. The view of your ministers would, if adopted, reduce the Commonwealth to the position of a Federal league, not a federation, and appears to me to be entirely opposed not only to the spirit but to the letter of the act.²

Administration and Legislation.—The first Federal government was formed by Mr. ( afterward Sir) Edmund Barton. The principal measures passed by the 1st Parliament were as follows: A uniform Tariff Act, an act to restrict immigration by the imposition of an educational test for the purpose of excluding colored races and to exclude laborers coming to Australia under contract of service; an act to abolish Kanaka labor in connection with sugar growing, and to encourage the use of white labor by granting a bonus of £2 per ton on sugar so produced; an act establishing a uniform system of weights and measures for both the Senate and the House of Representatives; a naval agreement with the Admiralty under which the Commonwealth undertook to pay £200,000 per year for 10 years toward the maintenance of a naval force on the Australian station; an act to control and regulate the High Court, of which Sir Samuel Griffith was appointed chief justice, Sir Edmond Barton and R. E. O'Connor, justices.

An administration formed by Alfred Deakin came into office on 24 Sept. 1903. The 1st Parliament was dissolved on 23 November, and the 2d Parliament was convened for business on 2 March 1904. The Deakin Ministry was defeated on 26 April by an amendment to the Conciliation and Arbitration Bill proposed by the Labor party extending it to state railway servants. J. C. Watson then formed a Labor ministry. On 17 August an adverse amendment to the Constitution and Arbitration Bill, limiting the principle of preference to unionists, was carried against the Labor ministry and they resigned. G. H. Reid, leader of the Free Trade party, next formed a government in combination with a number of Protectionists. Parliament reassembled on 26 July 1905 when the Reid Ministry was defeated. Deakin formed his second ministry in the name of La Trobe party. Among the measures passed were a Commerce Act, Sugar Bonus Extension Act and a Trade Marks Act—the latter legalizing the "Union Label." Acts were also passed modifying educational tests and the contract labor clauses of the Immigration Act. In November 1908 Deakin was defeated and Fisher, a member of the Labor party, formed a ministry which was defeated by Deakin in June 1909. Deakin was again defeated in April 1910, Fisher becoming Premier. Fisher was defeated 20 June 1913 and the Hon. Joseph Cook became Premier. He was defeated 17 Sept. 1914 and the Rt. Hon. Andrew Fisher again became Premier, a position he held until 27 Oct. 1915, when he resigned to accept the office of High Commissioner for Australia in London. The Hon. W. M. Hughes then became Premier and is still in office (November 1917).

6. The States, Their Constitutions and Governmental Departments.

Colonies Transformed Into States.—Under the Constitution of the Commonwealth Act, the colonies of New South Wales, Victoria, Tasmania, Queensland, Western Australia and South Australia have been converted into states of the Federal Union, and certain legislative, executive and judicial powers formerly vested in colonial authorities have been transferred to the Commonwealth.

Executive Departments.—In each state there is a governor representing the King, and he is the head of the executive as well as a branch of the legislature. In the administration of public affairs the governor is assisted and advised by responsible ministers who preside over the public departments and generally have seats in the legislature.

In New South Wales the governor receives a salary of £5,000. There are seven responsible ministers, among whom the public departments are distributed as follows, viz.: (1) premier and treasurer; (2) chief secretary; (3) attorney-general and minister of justice; (4) lands; (5) public instruction; (6) lands and agriculture; (7) the minister for labor and industry and mines. The sum of £10,400 is appropriated for payment of ministers in such proportions as may be arranged among themselves.

The governor of Victoria receives a salary of £5,000; the various public departments are presided over and distributed among ministers as follows, viz.: (1) premier, chief secretary and minister of railways; (2) chief secretary and minister of labor; (3) attorney-general and minister of justice; (4) lands; (5) public instruction; (6) works; (7) mines and forests; (8) water supply and irrigation. Two ministers must sit in the Council. The aggregate amount of salary payable among ministers is £8,400 per year. A minister being a member of one house may attend the other house by its permission, and speak upon and explain bills relating to his department.

In Queensland the governor's salary is £3,000. There are seven salaried ministers among whom the offices are distributed as follows, viz.: (1) premier, chief secretary and secretary for railways; (2) treasurer; (3) home secretary; (4) secretary for agriculture and public works; (5) attorney-general, secretary of mines; (6) secretary of lands; (7) public instruction. The aggregate amount of salary payable among ministers is £8,300 per year.

The governor of Tasmania receives a salary of £2,750. Ministerial offices are distributed as follows, viz.: (1) premier and chief secretary; (2) attorney-general and minister of (3) mines and works. The aggregate amount of salary payable among ministers is £3,200 per year.
In South Australia the governor's salary is £4,000. There were formerly six responsible ministers, but by the Constitutional Amendment Act of South Australia (1901), the number was reduced to four, the aggregate salary being divisible among them at £4,000 per year. By an act passed in 1913 the number of ministers was raised to six and salaries to £5,000. The offices at present are distributed among them as follows: viz.: (1) premier and treasurer; (2) attorney-general and education; (3) colonial secretary; (4) works and industry; (5) mines and water supply; (6) lands and agriculture.

The governor of Western Australia receives a salary of £4,000. There are six ministers holding offices as follows, viz.: (1) premier and treasurer; (2) attorney-general and education; (3) colonial secretary; (4) works and industry; (5) mines and water supply; (6) lands and agriculture. The aggregate amount of salary payable among ministers is £6,200 per year.

The Parliament of New South Wales, like those of every Australian state, consists of a Legislative Council and a Legislative Assembly. The council is still a nominated body as it was at the beginning of responsible government, being composed of 56 life members. There were before Federation 125 members of the Assembly; in 1901 that number was reduced to 90 as one of the results of the transfer of certain powers and functions to the Commonwealth government. Plural voting was abolished in 1893. Manhood suffrage, established in 1858, was in 1903 superseded by adult suffrage, that is to say, "one adult person one vote." Since 1899, each member of the Assembly receives the sum of £300 per year in reimbursement of his expenses together with a free railway pass. Members of the Council receive a railway grant of £20 per annum. The Assembly is a triennial chamber, but it may be at any time dissolved by the governor. Elections are conducted by ballot; this being the method of election of members in all the Australian states.

By the Constitutional Amendment Act (1903), the Legislative Council of Victoria consists of 34 members, one of whom is directly elected by, and represents, the public and railway servants; the others are elected by qualified voters of whom there are three classes, viz.: (1) owners of freehold land of the annual value of £10; (2) rate-paying occupiers of land of the annual value of £15; (3) university and professional men. The property qualifications of the municipalities were formerly ownership of freehold land of the annual value of £10; that has been reduced to £50. The tenure of a seat in the Council is six years, one-half the members retiring every three years. In the event of a deadlock between the two Houses on matters of ordinary legislation (constitutional alterations being excepted), the governor may, subject to certain conditions, dissolve both Houses. The council has power by message to the Assembly to suggest amendments in the Appropriation Bill. Manhood suffrage coupled with "no personal voting" is the franchise for the Assembly in addition to which, however, every owner of freehold land of the capital value of £100, and of the annual value of £5 is entitled to be registered, and to record his vote in every electoral district in which such land is situated; the act also allows the aggregate Australian plant, promoting his her however, from voting more than once on the same day. There are 65 members of the Assembly. Public and railway officers are unable to vote in and for ordinary electorates; instead of which they are allowed to choose three special members to represent them in the Assembly. Members of this House receive £300 per year, and a free railway pass. Legislative councillors receive free railway passes but no payment. The Assembly is a triennial chamber, but it may be dissolved by the governor at any time. Every elector is qualified to be chosen as a member.

In Tasmania the Legislative Council consists of 18 members elected by resident inhabitants possessed either of freehold land of the annual value of £15 or of property to the annual value of £40, or having university or professional qualification (Constitutional Amendment Act, 1901). The Assembly consists of 30 members elected by adult suffrage coupled with residential qualification. Members of the Assembly chambers receive an honorarium of £100 each, subject to their attending a certain number of days per session. An act to confer the franchise on women was passed in 1904.

In Queensland the Legislative Council, like that of New South Wales, is a nominated body consisting of 40 members; they are appointed by the governor in council, and subject to certain attendance each session they hold their seats for life; they receive no payment, but are entitled to free railway passes. The Assembly consists of 72 members elected practically by manhood suffrage; but owners of freehold land of the value of £100, and household occupiers of the annual value of £10, are entitled to vote in every electoral district in which they have that property but no payment. Members exist for three years unless previously dissolved, and its members receive a remuneration of £300 per year, and free railway passes, and allowances for traveling expenses. Every elector is qualified to be chosen a member.

In Western Australia the Legislative Council consists of 30 members elected by adult persons having as a qualification, either, freehold lands of the capital value of £100, or leasehold of the annual value of £25, or being Crown lessees or licensees of land of the annual value of £10. The tenure of seats is six years; one-third retiring every two years (Constitution Act, 1890). The Assembly consists of 50 members elected by adult persons being residents of an electorate, but persons having freehold land of the capital value of £50, or leasehold land of the annual value of £10, are entitled to vote in any district in which they hold the property qualification. The Assembly, like other popular chambers of Australia, is a triennial House. A bill confers the franchise on women was passed in the year 1899.

Under the provisions of the Constitutional Amendment Act (1901), the number of members of the Legislative Council of South Australia was reduced from 24 to 18. Under earlier acts the members are elected by different classes of both sexes, having as a property qualification either a freehold estate of the capital value of £50, or
A Leasehold of the annual value of £20 with three years to run, or being the occupiers of dwelling-houses of the annual value of £35. Members of the Council hold their seats for six years, one-half retiring every three years; unless the chamber is sooner dissolved by the mayor; which can be done in cases of disputes, or deadlocks between the two chambers extending over a certain time. By the Constitutional Amendment Act of 1901 the number of members of the Assembly was reduced from 54 to 42. By an act passed in 1913 the number in the upper House was increased to 20 and in the lower House to 46. The Assembly is a triennial chamber, unless previously dissolved. In the event of a deadlock between the two Houses in reference to a proposed law it is in the power of the governor to dissolve them both, subject to the following limitations, districts. In Wards the Courts and Courts of Assembly were passed by the Assembly and rejected by the council in one session; (2) it must have been, after a general election, passed a second time by an absolute majority of the whole number of members of the council and accepted by the mayor. Members of both Houses are entitled to receive £200 per annum each and free passes over government railways.

Judicial Departments of States.—The Supreme Court of New South Wales is constituted under Act 4 Geo. IV, c. 99, and 9 Geo. IV, c. 83. It consists of a chief justice and six other justices. It has unlimited civil and criminal jurisdiction. Circuit districts and Circuit Courts are established to try civil actions and determine the decisions of all inferior courts. The Supreme Court has appellate jurisdiction to hear appeals from all inferior courts. There are seven District Courts having jurisdiction in personal actions not exceeding £200 and a limited criminal jurisdiction. Courts of Petty Sessions having summary jurisdiction to deal with minor offenses and a limited civil jurisdiction presided over by a stipendiary magistrate, or by two or more justices, exist in all cities, towns and centres of population.

There is a Supreme Court in and for Victoria, constituted under the authority of the Constitution. It consists of a chief justice and four justices. It is unlimited in civil jurisdiction as well as jurisdiction to try crimes and misdemeanors; as a full court it has appellate jurisdiction from all inferior tribunals. Courts of General Sessions of the Peace having jurisdiction to inquire into a limited class of indictable offenses and to hear appeals from Courts of Petty Sessions exist in certain proclaimed districts. Mines exist for hearing mining disputes; County Courts having authority to decide all personal actions up to the amount of £500; Courts of Petty Sessions having summary jurisdiction in minor criminal matters and civil jurisdiction up to the amount of £50.

The Supreme Court of Tasmania consists of a chief justice and two puisne judges; it has both original and appellate jurisdiction in common law, equity, ecclesiastical and criminal matters. The office of a city with civil matters, some up to £100, and others up to £50. Justices in Petty Sessions can make convictions and orders in minor or criminal matters.

The Supreme Court of Queensland may be composed of not less than four, and not more than five, judges. It has the same jurisdiction as the Superior Courts of common law in Great Britain; the High Court of Chancery, England; it also possesses ecclesiastical and criminal jurisdiction. An appeal lies to the full court from all inferior courts. District Courts are vested with a limited civil and criminal jurisdiction. Courts of Petty Sessions and Small Debt Courts exercise a limited authority in specified civil and criminal matters. Wardens Courts are constituted to deal with mining disputes.

The Supreme Court of Western Australia was established by Royal Charter in 1861, and the main provisions relating to its constitution and jurisdiction are contained in the Supreme Court Act (1880). It has jurisdiction in common law, equity, ecclesiastical and criminal matters. Local courts similar to those in some of the other Australian states can decide small debt cases. Justices in Courts of Petty Session can summarily convict, imprison or fine persons guilty of minor offenses. Wardens Courts have authority to deal with mining cases.

The Supreme Court of South Australia is composed of a chief justice and two other puisne judges. Its jurisdiction extends to all matters of law and equity. It has also jurisdiction in crimes and misdemeanors. It is the court of appeal from the decisions of all inferior courts. South Australian local courts are to some extent analogous to the District Courts and County Courts of other states. Some of these courts have jurisdiction in civil matters up to the amount of £450; other local courts are limited to the amount of £20 claimed in no more than £20.

Bibliography.—See article Australia—Political History.

Sir John Quick, Postmaster-General in Deakin's Commonwealth Government, 2 June 1909 to 29 April 1910, Joint Author of ‘Constitution of Australian Commonwealth’.

7. MUNICIPAL AND LOCAL GOVERNMENT. Introductory and General.—The organization of municipal government in Australia is modeled largely on the English system and is composed of mayors, aldermen and councillors in the chief cities and large towns, with district or shire councils, local or divisional boards (the nomenclature varies in the different states) presided over by elected chairmen or presidents in the small towns or villages, and outlying districts where settlement is sparse. All of these are creations of statute deriving their authority, power and duties from the Parliament of the various states. No salaries are paid to the mayors who in the capital and most of the larger towns are voted an annual allowance by the councils for entertaining and keeping up the traditional dignities of the office. In Melbourne the vote is £1,500, in Sydney and Adelaide £1,000. The mayor has no direct power of veto over the council's actions. He represents the city as a whole and presides over the council and undertakes only those duties which devolve naturally on the leading official of a city with civil matters, some up to £100, and others up to £50. Justices in Petty Sessions can make convictions and orders in minor or criminal matters.

The Supreme Court of Queensland may be
changeable as applying to (a) the cities and the larger towns of the Commonwealth, of which the capitals are types, and (b) to the smaller towns and villages. They are microcosms like unto the larger bodies but with functions of a more prosaic and limited character conditioned mostly by population. In fact it may be taken as axiomatic that when the government of a city is understood everything of importance to the student is known about municipal and local government in the Commonwealth of the newest of the nations.

Nominations for municipal offices usually require the signatures of proposer, seconder and candidate. In Melbourne 10 ratepayers' signatures are required together with a deposit of £10. Secret voting, or voting by ballot as it is styled, is the universal system, which had its origin many years ago in Australia and has since become world-wide and accepted.

Generally speaking adult owners and occupiers of real estate assessed for taxation who have paid their rates, whether residents or non-residents, are entitled to vote in the cities of Australia. Aliens are barred in some cities and wards, yet not universally welcomed to the council chambers although they may vote.

The councils of the capital cities are single chambers, aldermen and councillors sitting together, presided over by the mayor. Except in the Federal government, and in the state Parliament, of which it is universal, the bicameral system of government as it exists in some American cities is unknown in Australia.

The Origin of Local Government.—The beginning of municipal government in Australia dates back to 1839 when the first municipal law (based on the English statute of 1835) was passed in the state of South Australia and put into operation in 1840 in the city of Adelaide whose virgin soil was surveyed in 1836. The parent city of Sydney, the capital of New South Wales, established in 1788, was incorporated in 1842. Melbourne, the chief city of the state of Victoria, originated as a small settlement in 1835 and was incorporated in 1842 by the legislature of New South Wales of which state it then formed an integral portion. The other capital cities are: Brisbane (Queensland), founded 1826, incorporated 1859; Perth (West Australia), founded 1829, incorporated 1871; Hobart (Tasmania), founded 1804, incorporated 1857.

Local Government in New South Wales.—The city council of Sydney is composed of 24 aldermen, one of whom is elected by the council annually to be lord mayor. Two aldermen for each of the 12 wards are elected by ballot by the ratepayers every two years. Plural voting obtains, based on assessment values up to four votes. Owners, leaseholders, occupiers and lodgers are entitled to vote. Accounts are audited by state government inspectors. Assessments are based on rental values of improved property.

The condition of local government in this state is admittedly unsatisfactory. In the metropolitan area the agitation for a "Greater Sydney" is still proceeding by which its advocates hope that the city council will absorb the small surrounding suburban local governing bodies, of whom there are no less than 41, each with its own separate mayor, council, officered staff and administration.

The number of municipalities in New South Wales is only 366, occupying an area of 1,810,912 acres with an annual value for assessment purposes of £10,309,655 and a very large area still remains under the control of the state government which is now considering proposals to extend the system of local government by the creation of shire councils and new municipalities, allowing such bodies to levy their rates on the unimproved capital value of the land instead of on the annual value of improved property.

Besides the municipalities there are boards and trusts composed of members appointed by the state government and members appointed by various municipal bodies, which are established for the benefit of districts covering areas of two or more ordinary municipalities and are empowered to construct and supervise waterworks, drainage works and similar undertakings with power to raise money by the sale of debenture stock and levy rates on the assessed value of benefited properties. In New South Wales there are the metropolitan board of water supply and sewerage, various harbor trusts, country water trusts and the metropolitan fire brigades board, on which latter representatives of the fire insurance companies sit who contribute to the upkeep of the brigades.

Local Government in Victoria.—The city council of Melbourne consists of 28 members (seven aldermen and 21 councillors) presided over by the lord mayor who is elected annually by the councillors. Three councillors are elected for each of the seven wards of the city, one being chosen annually by plural voting for a period of three years. The aldermen are appointed by the council and hold office for four years. Residence within seven miles of the city and minimum rating of £10 qualifies for a vote which slides upward to three votes on a £150 assessment.

This state has had a comprehensive system of local government in force for many years which divides it into cities, towns, boroughs and shires; the councillors are elected by the ratepayers, and the mayors of cities, towns and boroughs, and presidents of shires by the councillors. The total area under local control is 87,302 square miles, only 592 square miles remaining outside of local government.

Melbourne and 22 suburban municipalities constitute the metropolitan area, and thoughtful students of local government look forward to the time when all or most of these will be amalgamated with the city. A royal commission has taken most exhaustive evidence pro and con during the past three years but so far has not submitted its report.

Other governing bodies outside, yet dovetailing in with the municipal councils and the state government in Victoria, are the metropolitan fire brigades board, the Melbourne harbor trust, the tramway trust consisting of representatives of the Melbourne city council and 11 other suburban municipalities, the metropolitan board of works controlling water supplies, sewerage and drainage and various other waterworks, irrigation and water supply trusts under quasi-local and quasi-state government control.

Local Government in South Australia.—The council of the city of Adelaide consists of
1 King William Street, Adelaide

2 General Postoffice, Adelaide
1 Customs House, Brisbane

2 School of Mines, Adelaide
the mayor, six aldermen and 12 councillors. All of them including the mayor are elected by the ratepayers. The mayor and aldermen hold office for one and three years respectively; the councillors (two for each of the six wards) hold office for two years. At each annual election the mayor, two aldermen and six councillors are ballot for. Plural voting obtains for mayor and aldermen, the system allowing a citizen one vote in each ward where he has property assessed. The state is divided for local government purposes into municipal and district councils. Aldermen may be elected to suburban councils in addition to councillors after a poll of the ratepayers has been taken approving such a proposition, followed by a proclamation by the state governor, and it is worthy of note that the chairmen of the district councils are elected not by the ratepayers but by the members of the councils. The annual assessed value of property in municipalities is £2,000. The fire brigades board (other than the fire brigades board) of any importance, but very extensive powers are vested in corporate bodies who may raise loans for the construction and working of tramways, ferries, jetties, waterworks, gas works, electric-light works, baths and washhouses, abattoirs, markets; and make and provide pleasure grounds, libraries, museums, hospitals and asylums.

Local Government in Queensland.—The city council of Brisbane comprises 14 members who are styled aldermen, one of whom is elected annually to be mayor. The capital value of land is assessed here and not the rental value. The owner or occupier has from one to three votes according to valuation. If, however, the property is valued at less than £120, only the occupier has a vote.

A general system of local government was started in 1878 and revised in 1902. Local areas are divided into cities, towns and shires. Members of councils are styled aldermen in cities and towns and councillors in the shires. Aldermen and councillors are elected by ratepayers in each area, but all mayors of cities and towns and chairman of shires are chosen by the councils. The total area controlled by local bodies is 668,252 square miles, leaving only 245 square miles unincorporated.

In Queensland the water supply construction work is undertaken by the state government and when complete is handed over to the local authorities with attendant liabilities, which become a debt due from the local authority to the state government which must be repaid in instalments. There are a few bridge boards and harbour boards in various districts.

Local Government in Western Australia and Tasmania.—The city of Perth — the capital of Western Australia — is governed by a mayor and 15 councillors, all of whom are elected by the ratepayers. For ward elections there are two classes of voters and for general municipal elections four. The local governing bodies in Western Australia are termed municipalities, water boards, road boards and health boards; the latter may be established within or without municipal boundaries. Members of boards are elected by ratepayers and the chairman by the members.

In Hobart — the capital city of the island state of Tasmania — the council consists of nine aldermen, one of whom is elected by the members to be mayor. The aldermen are elected by plural voting with a minimum qualification of 28 annual value, the scale being from one to seven votes, according to assessed value of property.

Tasmania has its outlying districts governed by town boards and road trusts. The ratepayers in these districts elect their representatives who are termed "councillors" and these councillors elect their chairman who is styled "warden."

Powers and Duties of the City Councils.—The functions of the city councils are legislative as well as administrative. They are empowered under statutes granted by the state and Parliaments to make by-laws for the suppression of nuisances for all matters of minutiae relating to good rule and government, and affecting the comfort, convenience and welfare of their inhabitants. They may fix the rates to cover the cost of general administration and raise loans (under certain restrictions) when necessary for public works. Properties exempted from payment of rates are Federal and state government buildings (including state schools), charitable and benevolent institutions, churches, chapels and buildings used exclusively for public worship, and buildings privately owned which are used exclusively as schools. They are charged with the control of traffic, the testing of weights and measures, the construction and maintenance of roads, bridges and footways, the care and management of parks and recreation grounds, public baths, street lighting, sheep and cattle markets, meat, produce and fish markets, abattoirs, the collection and disposal of garbage, trade refuse, and they may and do hold large properties in real estate. They supervise the erection and construction of buildings and in some cities have jurisdiction over theatres, music halls and places of public entertainment, proof of fireproof materials and means of exit. They regulate sky signs and scaffolding and in most cities license cars, cabs and conveyances plying for hire.

Public Health and Sanitary Functions.—The city councils are constituted as boards of health and are responsible in their areas for the proper administration of the various public health acts to the state boards of health or government commissioners as the case may be. They inspect and license private hospitals and maternity homes and employ medical officers of health and staffs of inspectors (male and female) whose duties are to look after the adulteration of food and to have the oversight of food supplies (particularly meat, milk and bread), inspection of common lodging-houses, dairies, milkshops and dairy cattle; noxious trades and businesses, abatement of common nuisances and smoke nuisances; to prevent spitting in the streets and in public vehicles; to inspect restaurants, fish shops, butcher's shops and all premises where food is prepared or consumed; to prevent overcrowding of premises; and to attend to matters of isolation, disinfection and hospital accommodation for infectious diseases and fever.

Notification of disease is generally compulsory under penalty. Medical practitioners, heads of families and relatives are all liable for
neglect. In compulsory notification of pulmonary tuberculosis (consumption) the state of South Australia has led the way, and the difficulties and dangers feared by some medical men have been found to be mythical and non-existent.

Budget Items and Flotation of Loans.—The chief sources of municipal revenue are income from rates, rents from real estate, market dues, fines, penalties and license fees.

The rates levied in the city of Adelaide may be taken as typical of Australia and are as follows: General purposes, rate, one shilling in the pound; street lighting, rate, three pence; parks and gardens, rate, one halfpenny; rate for sinking funds (loans), one halfpenny; rate for police purposes, two pence; and a sanitary rate of three pence. To which must be added a total water and sewerage rate of one shilling and sixpence in the pound (levied by the state government), making a total of three shillings and three pence to be paid by the citizens, which in comparison with the rates charged in London and other large cities of Great Britain is an exceedingly light impost.

The expenditure budgets of the cities contain as principal items: Road and footway maintenance, upkeep of parks and gardens, baths, markets and kindred establishments, salaries and wages. Day labor invariably obtains except on new construction work. The wage of the ordinary unskilled municipal laborer is on an average of 8/6 per day—in some cities slightly higher.

Loans are mostly raised by the sale of debenture stock, redeemable at due dates, although in some instances the state government advances money and becomes the creditor of the local authority. In Sydney and Melbourne, bills are passed by the state Parliaments authorizing those cities to float loans for street construction work, establishment of electric light, erection of markets, etc. In Victoria, outside the capital, the limit of indebtedness for municipalities is fixed at 10 times the amount of annual income; the establishment of a sinking fund is obligatory with an annual appropriation of not less than 2 per cent of the amount of the debt. A law similar in many respects exists in New South Wales. A referendum of any proposed loan may be demanded in Victoria and the consent of the state governor is required in Western Australia.

In New South Wales municipalities may borrow on debentures, with the sanction of the state government, any sum not exceeding the total estimated amount of revenue for an ensuing five years.

In South Australia the consent of the rate-payers is required preparatory to floating any loan, the maximum indebtedness of a municipality is fixed, sinking funds are compulsory, and where the loan is to be applied to works of a non-revenue producing character, a rate must be struck to provide sinking fund and interest.

Statistics of the Metropolitan Cities. In any survey of the progress of modern civilization the concentration of population in cities is the most startling fact. It is a world-wide movement and is nowhere more strikingly exemplified than in the cities of Australia. The progress of the chief cities has been remarkable and by parallel among the cities of the old world. Even in the United States the rise of the great cities has been accompanied by a corresponding increase in the rural population, but in Australia (perhaps for the first time in history) is presented the spectacle of magnificent cities growing with marvellous rapidity and embracing within their limits one-thousand or more of the population of the states of which they are the seat of government.

The population and annual assessment value for rating purposes of the metropolitan areas are illustrated in the following table.

City Functions Controlled by the States.—The police, although supervising traffic and administering city bylaws and regulations, are controlled and paid by the state governments with the exceptions of South Australia where the city and all other municipal corporations are compelled to contribute a moiety of the cost in each district. Education is invariably state controlled although private schools exist. The care of the poor is attended to by the states side by side with religious and philanthropic institutions. Prisons, asylums and hospitals are under the charge of the central governments, although the local authorities are compelled to pay for the accommodation in some states of indigent cases of infectious disease. The cities generally take no share in the management of public libraries, museums, technical schools and art galleries which exist in every capital. Telegraphs and telephones are entirely controlled by the Federal government. Tramways (street railways) are in the hands of the state government in New South Wales and in the other capitals are owned and operated by private companies, under charters granted by the state Parliament. Provision is, however, made in some states, notably in Melbourne and Perth, for the metropolitan municipalities to control or take them over. Gas works and supplies are mostly owned and operated by private companies. Electric lighting is owned and operated municipally in Melbourne and Sydney. In Adelaide the private company's existing rights expired in 1908. Fire brigades are municipal, with municipal representation upon them. Water and sewerage are managed either by state government departments or quasi-government boards.

The Municipal Outlook for the Future.—The municipal limits of the capital cities of Australia by no means correspond to their social, industrial and economic boundaries; as municipal centres they are the "pulses" which contain only a fraction of the population of the metropolitan areas and are only just now waking up to the necessity of bringing into being comprehensive Greater Sydney, Greater Brisbane, Greater Melbournes and Greater Adelaides. The same sociological forces are at work in Australia as in America, Great Britain and the continent of Eupone, where enlargement of areas and greater cities have been dominant planks in municipal programs for years.

We may therefore expect similar results to fol-
low in Australia as have been achieved elsewhere in the course of the next decade.

Some small effort in this direction has already been accomplished, notably in Brisbane and Melbourne with the recent absorption of one or two adjacent suburbs, but the movement generally can hardly be said to have yet passed much beyond the embryonic stage.

In the metropolitan areas of Sydney, Melbourne and Adelaide there are respectively 41, 22 and 15 municipal governments and with bewildering codes of by-laws and methods of administration, and it has been well said that on the score of economy alone the arrangement is an absurdity which tolerates within a 10-mile radius of the centres such an enormous number of local governing bodies — each separate, distinct and independent of the other — to manage the affairs of from 160,000 to half a million of people with, of course, as many staffs of municipal officers, all working in isolation, and often unable to agree about matters of vital concern to all. Experience has shown that occasional conferences are at best but an inadequate substitute for a permanent body with a fair representation of all interests and smoothly working with the local councils. While some form of federal shape or unification, whether it comes with a rush or gradually, as the dwellers outside the city bounds awaken to the advantages of co-operative effort — come it must, in order to permit the carrying out of work at present impracticable, such as the control and working of tramways, gas and electric light concerns and kindred undertakings. With the example of the London County Council before us it is obvious that it pays to concentrate as much as possible the municipal work of cities in one central body. Lord Roseberry has said that the larger the sense of municipal responsibility which prevails the more it reacts on the community itself. And men outside the municipality, or who have hitherto held aloof from municipal government when they see the high aims of which the municipality is capable, when they see the wider work that lies before it, when they see the incomparable practical purposes to which the municipality may lend its great power, are not inclined any longer to hold aloof. The policy of the London county council is proof of this where the finest intellects in England take their share of the work in common with those who are attracted to the Council of the Nation at Westminster.

Notwithstanding its shortcomings the development of municipal government in Australia exhibits an upward and progressive tendency. The cities have always been free from that gross corruption which has been such a marked feature and has wrought such pernicious results in some other countries. Municipal government in Australia stands for probity and purity and as a recent Australian writer in 'The Annals' of the American Academy has put it: "We are undoubtedly further advanced to-day than we were 20 years ago, and we may reasonably hope that the silent evolution working at the date of its formation will work its way into the social, as truly as in the physical world, will equip us for the achievement of higher things in the future." Consult Ellery, 'Health Ministration of the Health Act' (1907), and Murdoch, 'The Australian Citizen' (1912). See also General Bibliography under Australia — Political History.

T. G. ELLERY,
Town Clerk of Melbourne, Victoria.

8. EDUCATION. Formed, like the United States, by the union of previously autonomous communities, the Commonwealth of Australia has followed the example of the United States in the distribution of powers between the Federal and state authority. That is to say none but enumerated powers have been conferred upon the Commonwealth, and all unenumerated powers remain in the hands of the originating states. Thus education, not being among the enumerated powers, is retained, as in the case of America, by the individual states. Every man, and in recent years, every woman, possesses, after registration, a parliamentary franchise, and it is customary to subject knotty public questions to a direct referendum to the people of a state. Such a degree of democracy could exist only in a highly enlightened community. Elementary education, therefore, being essential for the exercise of the duties of citizenship which are imposed upon all, is compulsory, and the corollary follows, in almost every case free; otherwise the school fees would amount to a poll tax on children, which in a country crying out for population is the most undesirable of impost. Being for the benefit of all and not of any sect, state education is secular; and this not from any disregard for religion, but because experience has proved that when the state concerns itself with dogma, strife rather than religious amity is produced. Education was in the early days of each colony left to private enterprise. Before long, however, it was recognized consciously by some and instinctively in the majority, that a function so essential to the general welfare must be regarded as a duty of the state. So it came to pass that education was one of the first matters of public concern to be included in the ever-widening of the sphere of state activity which is the most characteristic movement of the present age. Primary education accordingly throughout Australia undertaken by the several governments.

There is a general resemblance in the conditions which those who settle in new countries are called upon to face. The problems of education in Australia are very similar to those in America. The circulars of information issued by the bureau in Washington have been of the greatest assistance to the educational departments in Australia, and several useful reforms have derived their inspiration from this source. The laws relating to education in the Australian states, as might naturally be expected in adjacent communities springing from the same general type, show strong family likeness; but as considerable intervals intervened between the dates of colonization, and as the science of education was steadily progressive, the system adopted by each state was colored with the views which obtained at the date of its formation. The original colonies had, therefore, a more difficult task in bringing the laws into conformity with improved methods than those which at a later period were established on ground unencumbered. All have, however, now come into
a fairly uniform line. The sequence of evolution has been the same, although the successive steps taken were independent and not simultaneous. In the beginning of each colony the first schools were established by the churches, aided by government grants. Soon, however, state non-sectarian schools were established and the subsidies to private schools ceased. The state schools were in the first instance placed under the control of a Board of Public Instruction appointed by the government; but the basic British idea of responsibility to Parliament asserted itself, and a cabinet minister was vested with the powers previously exercised by the board. The Minister of Instruction, as he is sometimes termed, appoints and dismisses teachers and officers, arranges the curriculum and controls the whole department. Regulations framed by him and approved by the governor in Council acquire the force of law after they have been laid before Parliament. This centralized administration is mitigated, and to some extent, assimilated to local conditions, through the agency of district inspectors, appointed by the central office to assist the local boards of education. The funds necessary for education are derived from the general revenue. From time to time attempts have been made to place a portion, at least, of the burden upon the local rates, but it is felt that the cost of a system designed for the benefit of the public at large should be met from a source to which, either directly or through the customs, all contribute. In New South Wales and Tasmania fees are still levied but in the former state a smaller amount is only a fraction of the whole expenditure, and are about to be abolished; and in the latter there are free schools in the large towns. The net yearly cost to the states of primary instruction per scholar in average attendance, excluding the cost of school premises, varies from £4.6.5 to £7.8.1, the average of all six states being £6.8.9.

The statutory school age is in New South Wales and Western Australia from 6 to 14 years; in Victoria from 6 to 13; in Queensland from 6 to 12; in South Australia and Tasmania from 7 to 13. Pupils under the maximum age are exempted from further attendance if on examination they pass a prescribed standard. Attendance is required in New South Wales on 70 days, and in Queensland on 60 days in each half year; in South Australia on 35 days in each quarter, and in central districts on 8 out of 10 school sessions in each week; in Victoria on 75 per cent of the days in each quarter; in Western Australia and in Tasmania on every day on which the school is open. As a rule, children under the age of nine, living within a radius of two miles by road from a state school, and those between nine and the maximum age living within a radius of three miles, come under the laws relating to compulsory attendance. Truant officers and in some cases the police are employed to enforce the law. Prosecution and imprisonment of the parents of truants and of defaulting children is when necessary resorted to without hesitation.

State schools in Australia come under the category of public, provisional, half-time and special. In most of the states a public school may be established if an average attendance of 20 can be maintained. The buildings are provided by the department. In Queensland an average attendance of 30 is required, and the locality has to contribute one-fifth of the cost of the extension and maintenance. Where the average attendance is under 20, but over 12, the school is termed provisional. In sparsely populated districts half-time and special schools or itinerant teachers are provided. If a Board of Education appointed by the government; but the basic British idea of responsibility to Parliament asserted itself, and a cabinet minister was vested with the powers previously exercised by the board. The Minister of Education or of Public Instruction, as he is sometimes termed, appoints and dismisses teachers and officers, arranges the curriculum and controls the whole department. Regulations framed by him and approved by the governor in Council acquire the force of law after they have been laid before Parliament. This centralized administration is mitigated, and to some extent, assimilated to local conditions, through the agency of district inspectors, appointed by the central office to assist the local boards of education. The funds necessary for education are derived from the general revenue. From time to time attempts have been made to place a portion, at least, of the burden upon the local rates, but it is felt that the cost of a system designed for the benefit of the public at large should be met from a source to which, either directly or through the customs, all contribute. In New South Wales and Tasmania fees are still levied but in the former state a smaller amount is only a fraction of the whole expenditure, and are about to be abolished; and in the latter there are free schools in the large towns. The net yearly cost to the states of primary instruction per scholar in average attendance, excluding the cost of school premises, varies from £4.6.5 to £7.8.1, the average of all six states being £6.8.9.

The statutory school age is in New South Wales and Western Australia from 6 to 14 years; in Victoria from 6 to 13; in Queensland from 6 to 12; in South Australia and Tasmania from 7 to 13. Pupils under the maximum age are exempted from further attendance if on examination they pass a prescribed standard. Attendance is required in New South Wales on 70 days, and in Queensland on 60 days in each half year; in South Australia on 35 days in each quarter, and in central districts on 8 out of 10 school sessions in each week; in Victoria on 75 per cent of the days in each quarter; in Western Australia and in Tasmania on every day on which the school is open. As a rule, children under the age of nine, living within a radius of two miles by road from a state school, and those between nine and the maximum age living within a radius of three miles, come under the laws relating to compulsory attendance. Truant officers and in some cases the police are employed to enforce the law. Prosecution and imprisonment of the parents of truants and of defaulting children is when necessary resorted to without hesitation.

State schools in Australia come under the category of public, provisional, half-time and special. In most of the states a public school may be established if an average attendance
The greatest latitude is given as to the form of the instruction; for that subject is taught best in which the teacher feels the deepest interest. Chip-carving, joinery, brush-making, book-binding and wire work are among the subjects taken up in the various schools. Domestic economy and cookery are taught to girls in most of the states. Calisthenic class exercises to a musical accompaniment are commonly adopted as an attractive form of physical training. The pupils are taught by dry drill to move in masses and the school is occasionally given for fire parade. The Cadet Corps are under military supervision. Rifles are supplied to the boys, but they have to provide themselves with an inexpensive uniform. Swimming is taught in some of the schools. The teaching of singing by the tonic solfa method is a prominent feature. The principles of morality are sedulously instilled and good manners cultivated. Special attention is given to temperance lessons in almost all the states.

The average minimum time devoted to secular instruction is four and one-half hours each day. This stipulated condition being fulfilled certain facilities are provided for imparting religious instruction. In New South Wales and Western Australia the word *secular* is held to include religious teaching of a general as distinguished from that of a dogmatic character; and the teachers, in the performance of the ordinary day's duty, give Scripture lessons based on those issued by the Commissioners for National Education in Ireland. In South Australia, if the parents at any school so desire, teachers may be required to read without note or comment a portion of Scripture for a quarter of an hour before ordinary work begins. In Victoria and Queensland no teacher is allowed to give other than secular instruction in a school building. In Victoria, Queensland and South Australia the buildings may be used for any approved purpose out of school hours. The regulation in Victoria states that half an hour may be set apart in one or two school days in each week for religious instruction by persons other than state school teachers. Such classes must, however, be held between 9.15 to 9.45 A.M., or from 3.30 to 4 P.M. No substituted secular instruction is to be given to the children who do not attend these classes. In New South Wales and Tasmania one hour a day may be set apart for the use of visiting clergymen or teachers of religion. The time, if not used for this purpose, is devoted to ordinary instruction. In Western Australia half an hour at any time on each day is available for special teachers of religion, subject to as little interference as possible with the ordinary work of the school. In none of the states is a child required to attend any religious lessons without the parents' consent. In South Australia the desire to arrive at a settlement of the vexed question of religious teaching in state schools led to the following resolution being carried in the House of Assembly 16 Dec. 1893: "That in the opinion of this House a poll of electors should not be called on for the following questions: Do you favor: (1) The continuance of the present system of education in state schools? (2) The introduction of
Scriptural instruction in state schools during school hours? (3) The payment of a capitation grant to denominational schools for secular results? The results were taken at the general election in April 1896, and resulted in the following answers: Question No. 1: Yes, 51,681; no, 17,819. Question No. 2: Yes, 10,280; no, 34,834. Question No. 3: Yes, 13,349; no, 42,007. Informal, 12,830. The referendum theme initiative has since been adapted to the solution of various questions in Australia.

Secular education does not satisfy the requirements of the Roman Catholic Church, which, therefore, in populous centres, maintains separate schools. In some of the states private schools are officially inspected. There are but few evening schools; little public requirement in this direction has so far been manifest. But continuation schools have been fairly successful in Western Australia.

Although, as has been seen above, primary education is chiefly a state function, this is not the case with secondary education. With few exceptions the secondary and high schools for both sexes are private or denominational institutions. The higher classes, however, in the state schools include subjects usually regarded as secondary. Provision is made by means of exhibitions, scholarships, etc., to enable bright and successful pupils from the state schools to continue their ascent, free of charge, up the educational ladder, through the high schools and at the universities. In New South Wales children who reach the highest class in the public schools may receive advanced instruction including Latin and French for 3d. a week, and the department maintains four high schools, two for girls and two for boys. The Sydney grammar school receives an annual grant from the state, as does also the high school in Perth. Queensland liberally subsidizes secondary schools. In South Australia there is an advanced school for girls which, although a state institution, is largely supported by fees. There is also in Adelaide a secondary school for boys which is preparatory for the School of Mines and Industries and the Agricultural College. The distinctive feature of this school is that only half of each day is spent in the class rooms, during the other half the pupils receive practical instruction in the garden, the laboratory and the workshop. In Victoria extra and advanced subjects are taught in many of the public schools for a small fee. The Chambers of Commerce, the Bankers' Institute and the Incorpo rating Institute conduct periodic examinations in commercial and allied subjects which have a stimulating effect on this branch of education. There are private schools in each of the capitals which provide a commercial curriculum. Technical education, being a special need in a new country whose resources are only partially developed, is largely undertaken by the state. In the cities and in many of the towns, schools of design, schools of mines and industries, and workingmen's colleges abound. There are also numerous agricultural colleges. In several of the states technical schools have been built and equipped by private munificence.

In the capitals are art galleries containing many works by famous modern artists and sculptors. In connection with these are fine art schools, where instruction in painting, sculpture, art, needlework, and allied subjects reaches a high standard. These are as a rule controlled by boards, in some cases partly appointed by the government and partly elected. The University of Sydney was established in 1852 and that of Melbourne in 1855. South Australia followed in 1874, since the example thus set and Tasmania founded a university in 1890, and recently Western Australia has established a university. These universities are supported by grants from the public chest, by public and private endowments and by fees. The Australian universities do not confer degrees in divinity; otherwise they resemble and are in no way inferior to those of the Old World. The universities in Adelaide and Melbourne grant degrees in music and each has a fully equipped conservatorium of music. In all the universities women are admitted to degrees and to the full privileges of graduates. The universities of Sydney and Adelaide grant degrees in medicine to both sexes. Consult Anderson, 'System of Education' (1901); Barff, 'The University of Sydney' (1914), and Peacock, 'System of Education' (1910).

JOHN ALEXANDER COCKBURN, Formerly Minister of Education in South Australia.

9. LITERATURE. Australian literature may be said to be the thing of the last half century. Previous to that writers were busy in Australia, but most of them were either of foreign birth or produced work that can scarcely, by any stretch of courtesy, be called literature. Even when writers of Australian birth, education and sympathies began to write, they practically always kept their faces turned toward London; for few native publishers cared to encourage native writers who had not first secured the approbation of some English publisher. This condition of literary affairs was quite natural given the conditions existing in Australia practically up to the close of the 19th century. The island continent was divided into seven distinct parts, which, far from being united in national sentiment, were cut asunder from one another as completely as though they had been separate political entities, as, to all intents and purposes, they were. This provincial spirit killed all national sentiment, without which a national literature is impossible. The educational system of the country was practically in the hands of foreign-born, and all the educational and literary influences at work in the various states of the island were European. So the writers of Australia but feebly echoed the voices of the master singers from the home land. Naturally such writers, foreign-born and educated, failed to feel, think and express themselves as Australians; nor could they have well been expected to when the natives failed to do so themselves.

But the growth and progress of the increase of interstate communication, the drawing closer together of the separate state entities following the establishment of the Commonwealth, and the gradual increase in the powers
of the Federal legislature, coupled with the rapidly expanding interests of the country as a whole, all tended to create a sense of nationality which is sensibly reflected in the younger Australian writers. Provincialism exists still; but the rejection of its business in all forms of the bitter partisanship of past local rivalries has disappeared. The localism has come already, in a few short years, to accentuate only the local color that marks each individualistic writer and to give a variety to Australian literature and journalism that the whole world of the English-speaking world to the best of it for the past 20 years. Australian critics have strongly condemned this spirit of localism without apparently realizing that it is distinctly a different localism from that of the past, and that its leading note is more national than local. It is the same localism that animates Scott and Dickens and the brilliant younger literary lights of Scotland whose strongly reflected localism is their chief charm.

Another story of Australia was not favorable to literary development. The island was long used as a penal colony by Great Britain. Many of the convicts escaping, overran the southern part. This population was increased by sheep farmers and a few settlers on the coast who grouped themselves in small towns and villages around the ports. These settlements being all separated from one another they had no community of interests. The discovery of gold in 1851 attracted to the island a horde of adventurers who, while they added practically nothing to the national feeling, were the means of attracting attention to the country itself; and the following 10 years saw a very large increase in population throughout the southern and southeastern coast country. Many of the adventurers brought to Australia by the gold rush were educated men; and to some of these we owe the first serious attempts at literature in Australia, if we except a few local writers whose work is generally of a very poor character. The best of these was Barron Field who published at Sydney, in 1819, 'First Fruits of Australian Poetry,' and Lionel Michael, whose 'Songs without Music' was issued in 1857. Among other writers of this earlier literary period who sing in uncertain tones are J. D. Lacy, Henry Parks and W. C. Wentworth, the best of whom is Wentworth whose ' Australia' is well known in Australia.

The real active, interesting, hopeful period of Australian literature began with Adam Lindsay Gordon (1833-72), who, though born in the Azores, came to South Australia, a young Oxford graduate in 1853. His father, a naval officer, was of a literary turn of mind, and the boy, who was early well versed in the classics, was widely read in English literature before he left the university. He was an ardent admirer of Byron, whom he had already success- fully imitated. In Australia Gordon was two years on the mounted police; and the seven following years he was a horse dealer and breaker and became champion steepelchase rider of the island. He was by temperament a man of action, and the more popular of his poems abound in movement, in the action of the life he led, which he liked for its activity and hated on account of its lack of social advantages and intellectual surroundings and opportunities. A legacy of £7,000 suddenly changed Gordon's life and surroundings and he became a member of the state legislature, where success came to him as a poet and cross-country rider. But the legacy was lost in speculation and with it went Gordon's business in all its ramifications of life and he had to struggle on for a livelihood. In ill health and out of work he took his own life when apparently on the verge of material success. Gordon is the greatest of the Australian poets. His verse is spontaneous, musical, refined and natural. He has such a sensitive ear he rarest gift of the composer and he has the genuine gift of melodic form. His temperament is always superior to his surroundings and his literary touch is certain and self-possessed yet accompanied with emotional strength and restrained passion. But he is strongly touched with classical fatalism and sombre clouds ever hang over him constantly. His work naturally divides itself into three classes: Poems of action; strange, music-haunted poems of fatalism and brooding fancy; and poems blending action and fancy with brooding melancholy, in which he attains his highest note. Three volumes of poems, 'Sea-Spray and Smoke-Drift' and 'Ashtaroth' (1867), and 'Bush Ballads' (1870) constitute his published works. Henry Clarence Kendall (1842-82), the man of only three volumes of poems in which he died in an asylum for the insane, is, after Gordon, the best of the native poets. He sings in a pure, spontaneous manner, in clear, lyrical tones, the glories of Australian forests, hills and plains. He loves her rivers and lakes and his verse is near to nature's heart. His published works include 'Songs and Poems,' 'Songs from the Mountains' and 'Leaves from an Australian Forest.' Like that of Gordon his verse is strikingly spontaneous and natural.

Alfred Dommett (1811-87) a Fenian, who was in New Zealand, who, in 'Ranolf and Amohia' (1872) goes to the Maori for his subject and the inspiration for a forceful narrative poem, was highly praised by Longfellow, Tennyson and Browning. Charles Harpur (1812-68) has published several volumes of poems in which he sings, in a melancholy minor note touched with weird fancy upon which the bushland has placed its hand, the life of the back country in which his early manhood was passed. He is known as the bush poet. James Brunton Stephens (1835—) who published 'Convict Once' in London in 1871, was better known, until recently, than Gordon or Kendall, though he is inferior to them. He was quite a prolific writer. George Gordon McCrae (1833—) who wrote original, though rather unfinished, poems, on native Australian legends and stories; Alexander-Sutherland (1852-—), D. W. Sladen (1856—), W. P. Reeves (1857—) Victor Daley (1858-1905), A. B. Patterson (1864—), Bernard O'Dowd (1866—) Will Ogilvie (1869—), Roderick Quinn (1869—), Edwin J. Brady (1869—) are among the best known of Australian poets after those already mentioned. Daley was a somewhat reticent journalist who wrote much in both prose and verse for Melbourne, Sydney and other papers. He is idealistic, dreamily sensuous, suggesting often more than he says. He has been successful in picturesque, romantic poetry, love verse and humorous fancies. His work is cosmopolitan in tone and subject and occupies a high place
among writers of imaginative literature in Australia; for he is imaginative rather than realistic, and his pictures of the early history and literature generation of the Commonwealth. The great charge laid at his door is that his pretended realism is the creation of his own vivid imagination and that he gives an untrue picture of Australian life and characters. Be this as it may, he has widened literature and pulled it out of the rut in which it had gone since the days of Gordon, and he has turned the attention of native literary men to the great wealth of literary material at home, more full of interest, life and originality than any field heretofore entered in Australia during the present century. Prose, like verse, in Australia, has gone through a long apprenticeship of imitation and worshipping at foreign literary shrines. From 1840 to 1860 Australia went through a literary phase somewhat like the American dime novel, Indian and Wild West literature. Its literary aspirants for prose honors were, for the most part, but little superior to the writers of this American dime novel output. In Australia, however, they differentiated the period with the name of school. This school was helped to quicken the imagination and to create an interest in Australia, if not in things Australian. It dealt, in its first phase, with escaped convicts, immigrants with a shabby past, bushrangers, gold diggers, highwaymen and the other picturesque and lawless characters who then made up a fair part of the life of the island. Henry Kingsley, an Englishman and brother of Charles Kingsley, after several years' residence in Australia, published, in 1859, 'The Recollections of Geoffrey Hamilton,' which is credited with having had a strong salutary influence upon Australian fiction. L. B. Farjeon ('Griit,' 1889), Marcus Clarke (1846-81, 'For the Term of His Natural Life,' 1874) are among the few names of this early literary movement worthy of remembrance. Farjeon depicted vividly and truthfully the night life of Melbourne, while Clarke handled the convict system in a manner that compelled attention, not only at home in Australia but in the countries of Europe. Martin, in 'Letters and Journal of an Australian Writer,' of which his novel has been translated, Charles Alexander Brown is the best of the Australian novelists. Under his pen name of 'Rolf Boldrewood,' he has written a series of novels which show the life of Australia of the last half of the 19th century is a vivid and interesting manner. 'Robbery under Arms' (1888) won for him a reputation as a novelist throughout the English-speaking world. He has more than a dozen works of a like nature to his credit. A. B. Good work has also ventured into this field, the crudeness of the life of which he delights in depicting. Louis Becke, too, finds the unpleasant and immoral phases of Australian life to his taste. Guy Boothby ('The Beautiful White Devil' and 'Dr. Nikola,' 1886), W. S. Jeffreys ('By Reef and Palm,' 1896, 'Pacific Tales,' 'Child Life in the Southern Seas,' 1897, and 'The Mutineer,' 1899) are the legitimate forerunners of the modern Australian school of fiction headed by Davis, who has put on the appearance, at least, of being true and truthful. He has turned the creative life in the interior of Queensland. He has done Australian literature the great service of rid-
AUSTRALIA—RELIGION (10)

In the convention which framed the Federal instrument after long and earnest debate the words "humbly relying on the blessing of Almighty God" were inserted in the Preamble to the Act in recognition of the deeply religious sentiment of the people. At the census of 1911 the numbers of adherents of the various denominations in the Australian Commonwealth were given as follows:

- Church of England: 1,710,443
- Roman Catholic: 921,425
- Presbyterian: 547,806
- Methodist: 97,074
- Congregational: 74,046
- Lutheran: 72,395
- Salvation Army: 266,224

Total: 4,274,414

Non-Christian religion: 56,785
Indefinite: 14,673
No religion: 10,000
Declined to state: 83,000

Australia was originally included for ecclesiastical purposes in the province of Canterbury and up to the year 1836 was attached as an archdeaconry to the diocese of Calcutta. For 15 years after the foundation of New South Wales the only denomination recognized by the government or possessing a minister was the Church of England. There is now a general Synod of this Church which meets every five years under the presidency of the archbishop of Sydney, who has the title of primate of Australia, although each state preserves its autonomy in church affairs. Melbourne and Brisbane also have archbishops. There are six dioceses in New South Wales; five in Victoria; four in Queensland, together with that of New Guinea; and two in Western Australia. There is also the diocese of Adelaide in South Australia and of Tasmania. The Roman Catholic Church occupies, so far as numbers are concerned, the second place in each of the states, with the exception of South Australia, where the Methodists are numerically stronger, and its organization in Australia as elsewhere is superb. At the head of the Church stands the archbishop of Sidney. There are archbishops in Melbourne, Brisbane, Adelaide and Hobart, and 14 bishops in the six states. Until 1872, Queensland, and 14 bishops in the six states. Until 1872, Queensland, and so far as the Roman Catholic Church is concerned, was under the bishop of Mauritius. Sydney was in that year constituted a see; eight years later the prelate was invested with the title of "Archbishop of Sydney and Vicar Apostolic of New Holland." In 1883 the archbishop of Sydney was created a cardinal and placed at the head of the Roman Catholic Church throughout Australasia. In 1876 Melbourne was made an archdiocese as were also Adelaide and Brisbane in 1887, and Hobart a year later. The cathedrals of Saint Mary in Sydney and Saint Patrick in Melbourne are especially magnificent structures. The Roman Catholic Church takes a prominent part in furthering social and industrial legislation and charities. Temperance work is carried on by all religions. The Roman Catholic Church was established in New South Wales in 1812, at a class meeting attended by 12 persons. Up to 1855 this Church was regarded as a mission, but in that year it was constituted an affiliated conference. In 1873 the Australian Wesleyan Church was raised to the rank of an independent conference. On 1 Jan. 1902,
the Wesleyan Methodist, the Primitive Methodist and the United Methodist Free Churches of Australia and New Zealand were united under the name of the Methodist Church of Australasia. In South Australia this Church includes 25 per cent of the whole population and throughout Australia its members form a compact, enlightened and progressive body, which has exercised a preponderating influence in promoting temperance legislation and measures tending toward a higher plane of morality. The Presbyterians erected in 1810 one of the first places of worship in New South Wales. The Presbyterian Churches in all the states are united under the title of the Presbyterian Church of Australia in a General Assembly which meets every year in the capital cities in rotation. The Church in each state, however, acts independently in local administration and is autonomous so far as property is concerned. There is a Union of the Congregational Churches in each state federized in the Congregational Union of Australasia. Thus pervading the Churches and leading to interstate Unions is witnessed the same synthetic spirit which was materialized in Australian Federation. By this means strength is acquired without the sacrifice of local liberty. The Federal union combines firmness with flexibility.

The youngest and one of the most active religious bodies in Australia is the Salvation Army. It started in South Australia in 1880 and two years later officers were sent from Adelaide to organize forces in Victoria, New South Wales and Tasmania, and in 1886 to Queensland; operations in Western Australia were commenced in 1891. At first the officers of the Army met with much ill-treatment but the earnest and effective manner in which they grappled with the problems of social reform soon reconciled the public to their methods. Persecution gave way to popularity, and the work of the Army is now applauded by all classes. The Prison Gate Brigade reclaims many criminals, and does such good service in diminishing crime that several of the state governments give a grant in aid of its operations. The headquarters of the Army are in Melbourne and the officer commanding in Australia has the rank of a commissioner. There are colonels and brigadiers in each state.

The several churches in Australia are animated by those friendly and tolerant sentiments which are the natural offspring of freedom. An interchange of pulpits is not infrequent. On Empire day in 1906 a special service was arranged at Saint Paul's Cathedral, Melbourne, in which the president of the Methodist Conference and the minister of the principal Presbyterian Church took part. 

John Alexander Cockburn, 
Formerly Minister of Education in South Australia.

11. INDUSTRIES AND COMMERCE

Manufactures.—For many years Australia relied chiefly on its raw products for its wealth, but recently steady progress has been made with its manufacturing industries, and at the present time over 230,000 men and more than 82,000 women find employment in what are ordinarily termed factories, as well as a large number of others in smaller establishments.

The most rapid increase in the manufacturing industry has taken place during the past few years—in fact between 1894 and 1917 the hands employed increased from 133,631 to 320,922, an increase of nearly 10,000 per annum, as compared with an increase of only 2,800 per year during the 10 years previous to 1894, the growth of the factory employees being proportionately far greater than that of the population.

As regards the manufacturing industry generally, the population of the continent is at present hardly sufficient to maintain a large manufacturing population, while its distance from other market places is at some disadvantage as regards the export of manufactured products. The total horse-power of machinery used in the factories amounts to over 440,000, the increased use of electricity in recent years being accountable for a rapid addition in such power.

The following table shows the number of establishments and the hands employed in each state of the Commonwealth in factories and works employing four hands and over:

In Queensland the two principal manufacturing industries are sugar refining and meat preserving, and of the total number of people employed, about 12 per cent find employment in these two industries.

The total output of all factories in Australia, exclusive of those engaged in the production of butter, cheese and bacon, figures of which are included in the pastoral industry, amounts to £166,405,923, of which £99,776,684 represents the value of material and fuel used, and about £66,627,039 the value added in the process of treatment.

The following table gives the class of industries which give employment to people in the Commonwealth:

AUSTRALIA—INDUSTRIES AND COMMERCE (11)

Tanning, fell-mongering and wool scouring afford the largest amount of employment among the industries in class 1, and this can be readily understood, seeing that the pastoral industry is still the greatest in the Commonwealth.

In class 2 the manufacture of soap and candles is increasing rapidly.

In class 3 the manufacture of bricks and tiles is the most important, about 65 per cent of those engaged in this class being employed in that industry.

In class 4 it can be readily understood that with the immense forests of valuable timber, the saw mill is the most important of woodworking establishments, and about 70 per cent of those employed in that section are in saw mills.

Class 5 included a great number of persons employed in the engineering works of the respective state government railway and tramway workshops. Also workers in smelting establishments for the extraction of ore, though these employed in quartz batteries are not classified as working in the metal industries. There are several important establishments for the manufacture of agricultural implements, and at Gawler, in South Australia, and in Melbourne, the capital of Victoria, important agricultural implement works have been founded. To an Australian firm is due the credit of inventing that great labor-saving appliance, the "Complete Harvester."

In industries connected with food and drink, butter, cheese, meat preserving, sugar mills and breweries employ a great number of hands, while flour mills, aërated water factories, biscuits and other articles required for local consumption also employ a great number of persons.

Factories connected with clothing and textile fabrics offer more employment than any other section, and here the females employed largely outnumber the males. Victoria shows the greatest development in this industry, and during the last few years the manufacture of wool has made considerable progress in the various states.

Speaking of wages generally, Australia pays its employees high wages compared to other countries, while the genial climate and general healthy conditions of life make living cheap compared to other countries of the world.

During the last few years a system of industrial legislation has come into force in most of the states, which brings about better conditions of work, cleanliness, air space, sanitation, etc. Australian factories, as a rule, are well built and roomy. The day's work is generally limited to eight hours with extra payment for overtime in cases of need. Wages boards have also been appointed for many of the principal industries, and to prevent strikes and lock-outs courts of conciliation and arbitration have been established.

Taking the Commonwealth as a whole, the last records show that in industries controlled by wages boards the average earnings of male workers, 21 years old and upward, is £2 15s. 7d. per week, and of females, £1 7s. 6d. per week. The industrial conditions are not so regulated being about 2/ per week less.

Pastoral Industry.—The pastoral industry plays the most important part in the resources and wealth of Australia. At the close of 1915 Australia had 69,693,375 sheep, 9,993,743 cattle, 5,302,566 horses and 758,962 pigs.

Nothing is more marvelous than the progress of the pastoral industry. In the year 1800 there were only 6,124 sheep, 1,044 head of cattle, 293 horses and 4,017 pigs in New South Wales, but it is since 1850 that the greatest progress has been made, and from that date the number of sheep alone which has been exported has amounted to £580,000,000 sterling.

The first sheep imported were brought from the Cape of Good Hope, and in 1823 and 1825 further lots of Spanish sheep were introduced. In some respects the climate of Australia changed and improved the character of the Spanish fleece. The wool became softer and more elastic and increased considerably in length. The average weight of a fleece has increased remarkably, and while in 1861 the average weight of a sheep was 3.28 pounds, the present average weight is 7.3 pounds.

In recent years there has been a tendency to divide the sheep into smaller flocks. In New South Wales for instance there are 17,361 sheep owners as compared with 14,033 10 years previous, while the average size of a flock is now 1,650 as against 4,050 at a former period. Of the total number of sheep raised in Australia about 95 per cent are merinos. On the coastal districts, however, where merino sheep do not do so well, the rearing of cross-bred and long wool sheep is increasing and these are specially valuable for the meat they produce. It is interesting to note that at the present time Australia carries one-fifth of the total sheep in the world.

The export of wool brings an immense amount of money to the Commonwealth and in 1913 returns for the Commonwealth were £29,277,000.

The production of wool for the fiscal year ending 30 June 1916 was large and the prices set new records for Australasia. The number of bales exported from the different states of the Commonwealth was as follows: New South Wales, 840,515; Victoria, 314,476; Queensland, 258,122; South Australia, 92,654; Western Australia, 73,564; and Tasmania, 11,928. Shipments from New Zealand amounted to 510,656 bales, making a total for Australasia of 2,129,915 bales, against 2,137,702 bales for 1914-15. There was a decrease of more than 12,000,000 sheep in the Australian flocks during the year. The gross proceeds from the sale of wool in Australia and New Zealand were $145,525,537, an average of $80.50 per bale, in 1915-16, compared with $95,077,100, an average of $62.19 per bale, in 1914-15. The average is the highest yet realized in the colonial market. When the British government took over the remaining Australian wool clip in November 1916, there was doubt whether the high prices would be maintained, but the reports of the appraisers allayed this. The value of wool purchased by Great Britain will exceed $100,000,000. Although the removal of the embargo permitted shipments of burry wools to America, it is likely that the demands from Great Britain will require practically the entire clip.

Cattle.—Owing to the more profitable character of sheep farming, cattle farming in the Australian states is, with the exception of Queensland, second to that of sheep. The fol-
lowing table shows the number of cattle in the various states at the end of 1916:

<table>
<thead>
<tr>

Horses.—Considerable attention has been paid to the breeding of horses and at an early period the stock of colonial-bred horses was improved by the importation of Arabian and other breeds. The following table shows the number of horses in the different states in 1916:

<table>
<thead>
<tr>

Total: 2,378,368

There is a considerable demand in India for Australian horses and as a rule between 6,000 and 7,000 are exported annually to India, valued at from £80,000 to £85,000.

Angora Goats.—Considerable attention has been given during the last few years, especially in Queensland and New South Wales, to the production of mohair and considerable numbers of pure-bred angoras have been imported from the United States. The goat thrives admirably in the warm dry climate of Australia and it seems likely that in the near future the export of mohair will show considerable increase. At the present time there are about 282,000 goats depastured in Australia.

Camels.—In some of the states camels are employed for the carriage of wool and other produce. In the Commonwealth as a whole the number of camels is more than 10,000.

Pastoral Returns.—The annual return from the pastoral pursuits in 1915 was £60,265,-000, of which total sheep contributed about 58 per cent. The greater part of the sheep industry is, of course, the return from wool and skins. The value of wool consumed locally is not more than £250,000.

Frozen Meats.—A rapid increase in live stock in Australia in favorable seasons makes the question of disposing of the surplus material of serious consequence. In 1882 the first shipment of frozen mutton from Australia to Great Britain was tried. In 1916 4,116,663 worth of frozen meat, including £1,270,707 worth of frozen mutton and £724,624 worth of hares and rabbits were exported from Australia over seas.

Queensland exports large quantities of chilled and frozen beef, the total amounting to about £1,000,000 worth annually. Much of this is sent to the other states and is not included in the overseas exports. New South Wales exports chiefly frozen mutton, which varies in value from about £200,000 to £500,000 annually. Victoria also exports large quantities of frozen mutton and beef, while South Australian lambs are highly prized in the British markets. The export of canned meat was valued at £500,955.

Dairy Farming.—The introduction of the factories system at convenient centres in Australia has caused rapid extension in this industry. Immense quantities of butter are now exported to Great Britain, in 1916 the export amounting to £117,629 sterling. The total amount of the dairy products of Australia for 1916 was valued at £21,562,000.

Forestry.—Australia is chiefly famous for its hardwood timbers, the export of which is now a considerable industry. In 1916 the total exports from Australia amounted to £396,337, of which West Australia exported the greater part. The present annual value of the timber industry of the Commonwealth, that is of the rough timber as it leaves the forest saw mills, is about £3,000,000 sterling. In West Australia alone the forests of marketable timbers are estimated to cover about 21,000,000 acres. The governments of all the states have a number of reserves where the young timber is conserved so that the source of supply can be maintained.

Jarrah is the chief timber exported, its principal use being for wood-blocks, piles, railway sleepers, etc. The wattle tree grows well in most parts of Australia, from the bark of which large quantities of tanning materials are produced. There are various species of eucalyptus from which is distilled the famous eucalyptus oil which has a considerable value for medicinal purposes. Some of the fine-grained woods are also very beautiful and much used for decorative purposes. The karri is probably the finest tree of the Australian forests, and sometimes run to over 30 feet in circumference at three feet from the ground and up to 150 feet from the ground to the first branch. Other prime timbers are ironbark, tallow wood, spotted gum, grey box, mahogany, blackbutt, etc. Besides hard woods there are beautiful cabinet woods, viz., cedar, rosewood, redbean, silky oak, blackwood, etc.

Agriculture.—Judging by the experience of the past 30 years, Australia appears to be on the threshold of vast agricultural developments. Up to 1871 only 2,345,922 acres were under crop in the Commonwealth, but in 1916 this had increased to 13,651,974 acres. Of the cultivated land 90 per cent lies within the states of New South Wales, Victoria and South Australia. The following table shows the area cultivated in the various states:

<table>

As in most new countries where the pioneer farmer needs a quick return from his land, wheat is the principal crop and nearly 67 per cent of the cultivated land is sown to wheat. The area under wheat for grain in the various states in 1916 was as follows:

<table>
<thead>
<tr>

</tbody>
</table>

Total: 10,817,116
In 1915 the yield of wheat for the Commonwealth amounted to 125,000,000 bushels. The other crops of most importance are hay, oats and maize.

The Commonwealth requires about 30,000,000 bushels of wheat annually for home consumption and seed and a production of 125,000,000 leaves about 95,000,000 bushels annually for export.

The average yield of wheat in Australia may be taken at about 10 bushels per acre. This appears low judging by the standard of many other countries, but a bare statement of average is misleading, as in Australia the cost of production is relatively very low. In ordinary districts the expenses of ploughing, seed and sowing and harvesting the wheat amount to from 15/ to 20/ per acre, so that a yield of 10 bushels at 3/ a bushel means a return of from 10/ to 15/ an acre out of which to pay the other expenses.

In South Australia the conditions of cultivation are even more favorable than the above indicates, and with a smaller yield, wheat growing is bound to be very profitable. The present comparatively low yields are largely due to the fact that immense areas are put under crops by individual farmers. In consequence, the cultivation and harvesting methods are not carried out so thoroughly as in older countries of the world. With smaller areas and better farming, far higher averages will, it is believed, be obtained in the future. The following tables show the average area and yield of some of the other principal crops:

<table>

Large areas are also under orchards in the various states of the Commonwealth, the total being 216,000 acres. Victoria heads the list with 67,000; New South Wales 51,000, and South Australia 24,000. The export of apples, oranges and dried fruits to Great Britain has been commenced and promises to develop into an important industry.

All the governments give considerable attention to agricultural education and have established agricultural colleges and experimental farms where practical and scientific agriculture is taught.

In most of the states also arrangements are made by the government to advance money to assist farmers at low rates of interest.

Irrigation.—The necessity for providing water for stock and irrigation in the dry parts of Australia induced the respective governments to spend a good deal of money on water conservation and artesian boring. Cretaceous beds extend over large areas of New South Wales, found in all the states either alone or in the form of sulphides, chloride, bromide, iodide, chloro-bromide of silver and antimonial and arsenical ores and argentiferous lead ores. In the latter the largest deposits of metal are found.

Prior to 1882 the output of silver in Australia was small, but with the opening up of the Barrier mines at Broken Hill, close to the boundary of New South Wales and South Australia, rapid advances took place. The following table shows the output of silver and silver lead in Australia up to the close of 1915 and for the year 1915:

<table>

Copper.—The production of copper in Australia in 1915 amounted to £3,035,890.

Tin is also found in payable quantities in many parts of Australia, the production in 1915
AUSTRALIA—FINANCE (12)

amounting to £806,691. Iron is distributed throughout the Commonwealth and at Lithgow, in New South Wales, where iron and coal deposits lie alongside each other, a commencement has been made to smelt the ore. Tasmania has enormous deposits situated near the Bligh River. Other minerals widely diffused throughout Australia are antimony, bismuth, manganese, platinum, tellurium, lead, wolfram and a number of earth colors. The annual production of such other minerals amounts to about £1,000,000.

Coal was first discovered in New South Wales in 1797. Since that time it has been proved that nature has bountifully supplied Australia with mineral fuel. Black coal forms one of the principal mineral resources of New South Wales. The total output of coal in 1915 reached £4,277,592.

Brown coal or lignite occurs principally in Victoria but it is much inferior to the black coal. Good coal has been found in West Australia, while in Queensland the extent of the coal bearing region is only just beginning to be explored. Queensland has become a great coal producer. (1906) Birt, "History of the Founding of the Wool Industry" (1907); Bottomly, "Cotton Growing in Australia" (1905); Boyd, "Cotton Culture" (1904); Brown, "White Range Gold Mines" (1902); Cameron, "Wolfram Mining in Queensland" (1904); Ed., "Reports of Mining Developments" (1903); Clarke, "Australian Mining and Metallurgy" (1904); Curle, "Gold Mines of the World" (1906); Coventry, "Anthracite Coal" (1900); Dashwood, "Pearl Industry" (1902); Evans, "The Sugar Industry" (1906); Ferguson, "The Coconut Palm" (1904); Gisborne, "Apple Industry of Tasmania" (1905); id., "Commerce and Industry" (1911); Holzte, "The Northern Territory and Tropical Agriculture" (1902); Jenkins, "Report on Cotton Growing in Northern Territory" (1906); Lance, "Australia as a Food Producing Country" (1904); McLaren, "Mining and Milling Progress" (1901); Morgan, "Trade and Industry of Australia" (1900); Neville, "Cultivation of Tobacco" (1906); Simpson, "Minerals of Economic Value" (1905).

SIR TIMOTHY AUGUSTINE COGLAN,
Agent-General for New South Wales.

12. FINANCE. In matters of finance, as well as in many other things, Australia presents a most interesting field for study. Springing from a splendid body of pioneers, who had been brave and enterprising enough to quit the old home-land, with all its tender associations, the colonists have wrought wonders. Untrammeled by any undue preference for the old ways and with ample scope for bold, not to say audacious, experimenting, the spirit of enterprise, inherent from their fathers strong in them, the second generations of the settlers, who are the Australians of to-day, have driven to put into practical form, by no means without success, some theories which have elsewhere remained merely theories. In their systems of land settlements, their state ownership of such undertakings as railways, tramways, water works, etc., and in schemes of taxation, to say nothing of other matters of finance, they have sometimes discarded precedent and have no reason to be ashamed of the results which they have to show for their enterprise and fearlessness. Compliated as are the subjects respecting the taxation, through the existence, at one and the

The external trade of the Commonwealth amounts to £32.19 per head of population, which is nearly four times that of the United States and considerably greater than that of the United Kingdom.

Of the total trade 52 per cent in 1913 was with Great Britain, 12 per cent with other parts of the British empire and 36 per cent with foreign countries. The trade of Australia shows a considerable diversion in recent years from Britain to the foreign countries. In fact nearly one-third of imported goods are now of non-British origin as compared to one-fourth a few years ago, and of the exports over two-fifths are sent to non-British countries compared with one-tenth in 1885. The chief cause of this is the establishment of a railway communication between Germany, France, Belgium, Japan and the United States with Australia.

In the exports the same tendency is noticeable, in 20 years the percentage to Great Britain having fallen from 74.91 per cent to 44.30 while exports to foreign countries have increased to 43.57 per cent.

Shipping.—In 1913 the total number of vessels in the overseas trade entering and clearing Commonwealth ports was 3,985, of 10,601,948 tons.

Since 1904 Australian shipping has increased considerably, both in the total tonnage entered and cleared and number of vessels engaged in overseas commerce. This progress has not been so great, however, as to materially alter the balance of trade. Australia being chiefly an agricultural country, no great or sudden rise in its exports is to be expected. Yet, were it not for this fact, the general rise in shipping would be specially the increase in the number of vessels clearing and entering in recent years would be but normal and in keeping with the country's general advance.
same time, of a dual citizenship, every person owing allegiance to his own individual state and to the Commonwealth government, a very little care will enable one to take a complete view to be taken of Australian finance, including both those figures relating to the Commonwealth, or national, and to the state or provincial governments. The 5,000,000 people of the Commonwealth occupying the great island continent of Australia and the adjacent small one of Tasmania, with an area in all, or as nearly as possible, 3,000,000 square miles, having, for national purposes, united under the Commonwealth Constitution Act, are still, in respect of all but certain specified matters, citizens of one or other of the six states of New South Wales, Victoria, Queensland, South Australia, Western Australia and Tasmania. So far as their finances are concerned it is necessary to remember that to the Commonwealth are assigned very large powers of taxation, which, however, up to 1914 were only exercised in respect of customs and excise, the whole revenue from which is collected by the Commonwealth. The balance, after meeting its own necessary outlay, was handed over to the states, in proportion to the amount of the duties derived in each state. In 1910 arrangements were made with the states in lieu of the above provision that 25¢ per head of the population should be returned to the states. The Commonwealth controls all posts, telegraph and telephone services, as well as all military and naval defenses, and also several other important departments of state, but the finances and statistics are unaffected by these matters, as in the case of all of them where there is a Commonwealth control, state control ceases. In taxation, however, if we attempted to show the total for Australia by adding to the total for the Commonwealth those for the states, the result would be wrong: just as would be any attempt to get the total revenue and expenditure for Australia by adding Commonwealth totals to those of all the states, because of the portion of the customs and excise revenue which is collected first by the Commonwealth, is afterward paid over to the states and so would appear twice in the totals.

In this statement care will be taken to show all the figures once, without any duplication which is the principle which, if otherwise stated, be from the latest volume published by the Commonwealth government statistician, Mr. G. H. Knibbs, C.M.G.

The customs and excise revenue for the year ending 30 June 1914 was collected under the following remits:

Total excise | £2,325,333 |

Total customs and excise | £14,978,070 |

The Commonwealth up to 1910 had no revenue from any other form of taxation besides customs and excise. A land tax was then imposed which in 1914 brought into the revenue £1,609,836. The total revenue, including postal, teachers, trade marks, coinage, etc., amounted in 1914 to £21,741,775. A progressive income tax was passed in 1915 for the war expenditure. This is as high as 5% in the pound on incomes of £6,500 or over; an excess tax on profits has also been imposed.

The Commonwealth was to a large extent a tax-gatherer for the states up to 1910, the Constitution requiring it for the first 10 years at least to return to the states or to pay on their behalf, as interest or principal on state loans, not less than three-fourths of the total income from customs and excise. This provision was adopted in order to avoid selection of the state finances through the transfer of this revenue from the states to the Commonwealth, and also to restrain the Commonwealth Parliament from mopping up all the revenue from customs and excise by launching out on new and costly enterprises which might leave the states in an awkward financial position. The Commonwealth Parliament as it has set its face sternly against borrowing, even for public works, pays for all that is necessary out of surplus revenue. It is proposed in influential circles to federalize the state loans to such an extent as would finally absorb the revenue now returned year by year to the states, so as to remove the present interdependence of Commonwealth and state finance. The expenditure of the Commonwealth is narrowed down to a very few items; they have to deal with the departments transferred from the states to the Commonwealth and now controlled by it, such as the customs and excise, posts, telegraphs and telephones, military and naval defenses, etc. To these are added the cost of the Commonwealth machinery of government, including the departments of the governor-general, the ministers of state, and the legislature, together with the judiciary. The outlay on public works and buildings for the year 1914 was £2,576,000 and the total expenditure was £15,458,776.

The revenue and expenditure of all the states forming the Commonwealth for the year ending 30 June 1914 was as follows: Revenue, £4,269,093; expenditure, £6,551,907. Nearly one-half of the total revenue of the states is derived from "public works." This represents the earnings of the railways, tramways, harbor works and water works, together with other less important undertakings, the construction of which has been the main factor in building up what at first sight appears to be the huge debt of Australia. It may, however, be noted that the public works not only aid very greatly in the development of the vast areas of the unoccupied Crown lands in Australia, but they also produce a large annual revenue, which may
well be set off against the annual interest charge, as the value of these permanent assets are set off against the debts themselves. The works include nearly 18,000 miles of railways, which cost £177,000,000 up to the end of 1914, the latest year for which the details are available, and for that year they earned, over and above working expenses and upkeep, the sum of £6,887,000 toward interest on the loans raised to pay for them. As the country through which they pass develops its earnings must increase. The item land sales and rents is substantial, and for several years as the present policy of all the states is to encourage settlement by leasing land on very long leases, with or without right of purchase, so as to assist people with little capital, rather than to sell land for cash. In many cases the purchase money is spread over as many as 20 years, all payments going off the purchase money, so as to aid would-be cultivators who are short of funds to make a start. The provision of such conveniences as roads, bridges and schoolhouses, is in fact, the political and financial basis of the land for several years after it is first leased, so that the states are by no means living on their capital. The lands which once returned no revenue at all are, by these means, being gradually developed and made to produce loading for the railways and business for the harbors as well as assets and income taxable by the treasurers. The taxation differs in the several states, though most of them now levy on the estates of deceased persons in proportion to the size of the bequests left and to the degree of relationship between the testator and the legatee, the larger bequest and the more distant relation paying the higher rate. There are also, in most states, taxes on income and on "unimproved land values" that is to say on the capital value of land less the value of improvements thereon. The principle of progression in taxation is recognized in the Commonwealth and the different states, not only in succession duties, but in income and also in land values taxation; and as usual there is a graduated taxation, and therefore dependent upon the life and health of the earner, and that derived from investments or property, which is independent of personal effort. The rate of tax is higher on the income from property than upon the produce of personal exertion. There is, too, the further graduation according to the amount of the income. The land values taxation levied in the Commonwealth and in the states is on the value of the land after deducting the value of improvements thereon. It is, therefore, much heavier on city and suburban than on country land, area for area. There is also an extra tax of 20 per cent on the first tax if the owner of the land be not resident in the state. The miscellaneous receipts call for no special remark. The total revenue looks very large, but it needs to be remembered that altogether apart from the postal and telegraphic receipts, which appear not in the state, but in the federal budget, and naval expenditure of the Commonwealth, is spent for the people by means of public works, and altogether outside the functions (ordinary) of government, as commonly understood. On this account it cannot be said that Australians are burdened by the contributions they make to revenue, even though they pay in all, to Commonwealth and states, 919 to £12 per head per annum. The further taxation levied by local governing bodies for purely local expenditure, such as road maintenance and sanitation, etc., is not included. The figures for Western Australia are abnormal on account of the rapid development of the gold fields and the resulting preponderance of highly paid adult males in the population, consuming highly dutiable goods. The expenditure of the states would be, in past years, as the fact that it includes, to the extent of 56 per cent of the whole, provision for the working of the railway and the payment of interest and the repayment of debts. These charges are not in any true sense "costs of government." They must be considered in relation to special income appearing on the other side of the account. That 7 per cent of the expenditure is for education is indicative of the general trend of affairs in Australia and of the f of the proceeds trend. It needs to be remembered that at the present stage settlement is sparsely spread over a huge territory, and that the costs of administration would be slightly increased, if at all, if there were three or four times the number of people on the land that there are to-day, while the revenue would be largely multiplied. It is area rather than population which, under certain circumstances, determines expenditure, and these circumstances exist in many parts of Australia to-day. The Australian of the present is fully determined not to allow extravagance in public expenditure, and no blunder in public life is more speedily punished by the electors. The expenditure of the states of course includes all the cost of legislative machinery, with the salary of the state governors, and the members of the state Parliaments, and also all the charges connected with the administration of all the departments, such as police, public health and educational distinction is of an elaborate system of local government, and each state in its turn deals with a wide area of purely local concerns. Australia indeed possesses all the concomitants of a highly organized political and social organism, and believes that it gets a full return for its public expenditure. The exceedingly close approximation of expenditure to revenue results from a disposition, whenever any considerable surplus appears in the accounts for any year, to devise further public convenience which may be provided for the future, and so the surplus is absorbed. There is no general desire to show large surpluses nor is there much effort to reduce taxation, which is not felt to be burdensome, but rather to add to the facilities afforded for trade, and for the occupation and development of the country and of its industries. These ends are being achieved, and the cost of them is not grudged by those who have to find the money, and who reap the gain.

The defense, as do all other figures relating to military and naval defense nearly one-half of the total is for services rendered to the people by means of public works, and altogether outside the functions (ordinary) of government, as commonly understood. On this account it cannot be said that
mined to construct all such public works as post-offices, fortifications, etc., out of revenue. It has taken over from the states all the crown homesteads, post-offices, naval and military defenses, forest and grazing properties of the states, prior to the establishment of the Commonwealth, and will ultimately have to recoup the states for them, either by taking over states' debts to an account equivalent to their value, or in some other way, which must almost of necessity involve the Commonwealth in a debt. There are further schemes in contemplation for the transfer of state obligations on certain terms to the Commonwealth, besides which there are proposals under consideration for the construction of trunk lines of railway across the continent of Australia; the line from South Australia to Western Australia has been approved and is in course of construction. All the states have some provision of the nature of a sinking fund for the ultimate extinction of the debts and in several cases stock is from time to time purchased and canceled out of funds set apart for purposes of redemption. None of these funds have, however, as yet assumed proportions sufficient to modify materially the facts as to the total debts. The debt of Australia up to 1915 in no case represented the cost of the war. The whole of it had been incurred with a view to the development of the vast resources of the continent and for practically the whole of it there are very valuable permanent assets. Of the total debt of the Australian states for 1914 £317,598,788 — £177,000,000 was spent on railways and tramways, on water supplies and sewerage, on harbors, rivers and navigation; and for public works and buildings about £75,000,000 has been spent, besides other sums for telegraphs, telephones, defense and other items. The net revenue produced by these works aggregated, in the year under review, over and above working expenses and maintenance, nearly 3 per cent on their cost. It should also be remarked that the year 1914 for which the figures are given was not a normal year, the effects of the previous year's drought having by no means disappeared. The various sources of income could be increased to an amount sufficient to meet in full the interest charge, if it were desired to do so, but the charges for railage and harbor dues and water supplies, etc., are all kept down with a view to the encouragement of settlement and of production, it being recognized that the direct return received from the enterprises is by no means the sum of their earnings, as they produce through the resulting prosperity of the people, a very large indirect return through the customs house, and in many other ways. It is the general prosperity rather than the direct revenue which is the primary objective for the time being. Meantime the works are permanent assets of constantly increasing value and revenue earning power, as pointed out, Australia could, by sale of her railways, harbor works and water services, immensely reduce her public indebtedness, for the undertakings would sell readily for what they cost, but she would be poorer, not richer, by the transaction at once, to say nothing of the folly of such a policy from the point of view of the future. There is, further, one great asset of Australia which cannot be overlooked in any consideration of her financial position, and that is her unalienated land. In four out of the six states the area is very large and the value varies greatly according to climate and other conditions.

It is necessary to bear in mind that the public indebtedness of the Australian states was not contracted against their specific security, but against the public credit of each generally, so that there is behind it, not only the public estate in the shape of the land and works of every kind, but also the whole taxing power of the respective governments. In view of this it must be manifest that the securities are absolutely "gilt edged."

The extent of the financial operations conducted within the Commonwealth will appear from the sworn returns of the banks other than the Commonwealth Bank, doing business there for the year 1914. The totals are shown as follow:

- Notes in circulation not bearing interest, £306,809;
- bills in circulation not bearing interest, £1,089,548;
- deposits not bearing interest £70,195,462;
- deposits bearing interest, £93,659,093;
- balances due to book banks, £2,750,788;
- total liabilities, £168,001,700.

The assets are as shown as follow: Coin, £35,585,924; bullion, £1,024,100; land property, £4,592,951; debts due to banks, £183,593,500 and other banks, £16,186,000; total assets, £175,449,306. Besides the joint-stock banks whose returns have just been quoted, there are numerous investment companies carrying on business in the Commonwealth, such as savings banks, land, building and investment, trading and commercial companies, complete returns of whose business are not available. For the savings banks, which are under government supervision, the following figures will be suggestive: Number of depositors, 2,108,000, or over 40 per cent of the whole population. Amount of deposit at close of 1914, over £400,000,000, or £80 per head of the whole population, and £200 per depositor. The volume of business done in the Commonwealth by the Commonwealth Bank is very large as the figures quoted below will show, and there are also a number of friendly benefit societies, whose roll of membership is indicative of the widespread practice of habits of thrift and self-help. Industrial life assurance is also widely availed of by persons who are not able to afford large premiums for life assurance of other types. The receipts and expenditure of the 17 life assurance institutions for the year were, receipts £6,000,000, expenditure £3,950,000. The average amount of life assurance per head of the population was £25. There are 477,000 members of the friendly societies, and their funds amount to £6,237,000.

Commonwealth Bank of Australia.—The Commonwealth Bank of Australia is the only state-owned bank in the group. It has had a most rapid growth and remarkable progress. The Commonwealth Bank Act was passed in 1911. On 15 July 1912 the act was brought into force by proclamation and savings bank business was included from that date. Every post-office throughout the whole of the Commonwealth of the rank of a money-order-office is an agency of the Savings Bank
Department of the Commonwealth of Australia, and at present there are 2,700 such agencies in communication with the six central offices, one in each of the state capitals.

General banking business was commenced in January 1913, and the expansion of business in the general as well as the Savings Bank Department has been phenomenal.

The outbreak of the European War in August 1914 found the Commonwealth Bank in a strong position, prepared to meet generally any emergencies which might arise, either in Australia or concerning Australian affairs in London, and an important part has been taken by the bank in the finance of Australia. Amongst the many matters of war finance which the bank has handled, the one which has brought it most before the public has been the Commonwealth war loans, the flotation of which was placed in the hands of the bank by the Federal Treasurer. Until the first Commonwealth war loan was issued in July 1915, no financial operations on a large scale had been carried out in Australia, and the issue for such a huge sum as £5,000,000 was, to a considerable extent, an experiment. Complete arrangements were made by the Commonwealth Bank with all the private banks, states savings banks and money-order offices throughout Australia to receive applications, and the loan was floated before the public in such an energetic manner that over £13,000,000 was subscribed in Australia. Since then two further loans have been issued. Each flotation has been carried out in the same energetic manner and the results of the three issues may be summarised as follows: First issue subscribers, 18,748; amount applied for, £13,389,440. Second issue subscribers, 28,945; amount applied for, £21,655,680. Third issue subscribers, 81,727; amount applied for, £22,276,200. The Commonwealth Bank acts as bankers in London to the governments of the Commonwealth of Australia, of South Australia, Tasmania, and mostly to the Western Australian government. In October 1915 the bank floated successfully in London £2,000,000, for the South Australian Government, and toward the end of June 1916 the first issue of £4,000,000 was made by the Bank of London, on behalf of the government of the Commonwealth of Australia. In view of the fact that exchequer bonds, treasury bills, war certificates and French loans, all bearing interest at 5 per cent or over, were being offered by the Imperial and French governments at the same time, the launching of this loan was an event of considerable interest in the world, and its success showed the confidence felt in the future of the Australian Commonwealth.

The Bank's Progress.—The progress of the bank may be demonstrated by the following figures. The deposits in the General Banking Department as well as the Savings Bank Department as under: June 1913, £5,055,381; June 1916, £41,732,116.

The figures of the profit and loss account are significant, it being borne in mind that the first six months of the year the bank had a debit balance of £46,636, owing to expenses of establishing and equipping branches throughout the Commonwealth. Since then the following profits have been made: December 1913, £1,547; June 1914, £8,093; December 1914, £13,428; June 1915, £25,788; December 1915, £50,949; June 1916, £93,856.

Savings Bank Department.—The comparative figures in this department indicate the steady increase in the support given in this institution—June 1913, depositors, 85,888; deposits, £2,694,774; June 1914, depositors, 143,786; deposits, £4,645,258; June 1915, depositors, 210,361; deposits, £7,420,647; June 1916, depositors, 278,536; deposits, £9,477,895.

It will thus appear that as regards the public wealth, the private wealth and the annual product of labor and capital in Australia there are abundant evidences of soundness and of progress, and that Australia may fearlessly challenge comparison with any other part of the world. At the same time the magnitude of her undeveloped resources points unerringly to a future which shall outshine both the past and the present. Consult Carroll, 'The Agricultural Bank' (1914); McCarthy, 'Banking in Australia' (1912).

Sir F. W. HOLDER,
Speaker House of Representatives, Commonwealth Parliament 1901-09.

Hon. J. G. JENKINS,

13. RAILWAYS AND TRANSPORTATION.
The great problem which Australia has had to face in the development of her vast territory has been one of means of communication. Living on an island so large that it has been rated as an additional continent unlike any other, the people of Australia are in the midst of plains bounded and crossed at frequent intervals by stretches of hill country, devoted, for the most part, of extensive river systems, and beset by hostile native tribes, the people of Australia have been called upon to face conditions such as never confronted the builders of any other continent. In both the Americas vast river systems have stretched forth the hands of the temptress to those adventurous and daring spirits for whom 'gold and peril' was an attraction. Australia has had her explorers, but their pathway has been constantly beset by many and great difficulties. They have had to battle with heat, wind, apparently interminable stretches of sand and prevailing tropical diseases, all forming a foreground to the constant hostility of the natives and working in conjunction with a still more terrible enemy, thirst. These same enemies have continued to oppose every step taken in the direction of the establishment of communication by the government of the various states of Australia, upon whom has fallen, for the most part, a task which, in most other countries of recent development, has been undertaken and carried through by private enterprise. Naturally, therefore, Australia's communication has been largely by way of the sea and this, in turn, has developed her coast lands at the expense of her vast interior regions, most of which still remain partially or altogether unsettled and unshamed by railways and other highways, byways or trails. Most of the 22,000 miles of railways of government and private ownership of Australia are situated in the south, southeast and southwest, in the states.
of New South Wales, Victoria, Western Australia and Queensland. A line planned to cross the centre of the island from north to south is partially constructed, most of the finished part being in South Australia. The Federal government has lately completed 200 miles of track from Port Darwin to Catherine in Northern Territory. The present plan is to continue this latter road through Queensland to make connection with the line running out of Brisbane westward, and to extend another branch southward to Oodnadatta, the northern end of the state railway system of South Australia. But all this railway construction, encouraging though it may be, is but a comparatively small part of the railway facilities demanded by Australia's vast territorial expanse. When the comparatively level nature of her territory is taken into consideration, Australia has made less progress in railway construction than many of the southern states of the United States. The commercial and needs for ways of communication. This is due to the fact that railway construction on the island continent has been almost altogether in the hands of the various states of the union, who are jealous of one another's interests which reached a point where the welfare of the country as a whole was forgotten in the antagonism of state against state. In the early days of Australia's development, the various states were so effectually separated from one another that they formed, for all practical purposes, separate political entities; and even when the Federal government began to exert itself for greater Federal unity and the subjection of state interests to those of the island as a whole, the states continued to develop a policy of commercial rivalry which strongly approached antagonism and formed a barrier to the political unity of the Commonwealth. This policy of localism runs throughout the history of the railroad promotion and construction of Australia. Owing to this political isolation of the states of the Union, and the consequent weakness of the Federal government and its comparative poverty, practically all the railway construction undertaken in Australia has been controlled and supervised by the various states. As the states voted the money for the building and maintenance of all new railways, this part of the nation's development became strongly subject to local politics. Each member of the local legislature, in conjunction with the local politicians, found it to his interest to secure railway concessions for his own particular district; and the local districts objected strongly to voting money for the extension of railways into other districts where the population was nil or too sparse to force the attention of the state legislature. The result was that scores of comparatively short lines were built at the state's charge as feeding lines to the more populous centres. Most of these ended, a noted Australian writer has said, "nowhere." This policy, or want of policy, was bad enough, but the commercial rivalry and jealousy of the various states forming the Commonwealth intensified the situation by ceaseless and tireless efforts to divert trade from other states and by the cost of the work of establishing state interests, rights and necessities. Thus even after railway lines had been extended practically across state, they were not allowed to be continued to the border of the neighboring state lest the government of that state should make railway connection therewith and thus be in a position to divert trade to its own capital, seaport or other important commercial centre. The Federal government has established cut rates lower and more demoralizing than were probably ever put into effect in any other country. By this means the trade of interior towns and districts was diverted from its natural market often less than a score of miles away, and carried across state by rail to the state capital or seaport. In support of this restrictive policy, Australia, with scores of the finest natural ports in the world, remained with her waterfront comparatively undeveloped, because each state seemed to think that trade could be better controlled for local interests by having it go through one great port. So strong was this feeling of localism that even the state ports were, to a certain extent, jealous of one another's success; so strong was the feeling when one port succeeded in getting the lead of all the others in the state, it was able to maintain this lead through its political and commercial importance. Though the Federal government is empowered to construct railways for the Commonwealth, it can do so only after receiving the consent of each state through which the railway line has to pass, and the localism and jealousy of the states have in many cases prevented the construction of Federal railway lines. South Australia held up, for a considerable time, in order to secure special state concessions, the projected Federal railway laid out across the centre of the island from east to west; and other Federal railway projects have met similar difficulties. The plan to unify the railway system of Australia met for years with strong opposition from local state interests. The result of this short-sighted policy is that not only have state interests suffered, but the development of vast fertile regions of the interior has been retarded and their settlement discouraged to such an extent that the more populous centres of the island went so far as to persistently misrepresent the conditions for agricultural settlement in their own districts. Through these misrepresentations the outside world was long led to look upon Australia as a land of great deserts bordered by a fertile belt running round the coast of the island. This misrepresentation gave the death blow temporarily to the building of a great railway system which would undoubtedly have opened up and developed the rich interior districts of the island and solved the question of attracting immigrants. Owing to the early developed and intense localism, Australia has become an ardent advocate of state-owned railways; but as the railways were, for the most part, under the control of the states, whose local antagonism was well known, it became very difficult for these local entities to secure foreign capital for the building of roads which, in many cases "began nowhere and ended nowhere." The states were generally disinclined to take risks by extending existing railways or building new ones into sparsely settled or unpopulated districts; and they were equally unwilling to encourage or even allow exploiting companies to take risks in railway extension where they declined to do so themselves; and even to
the few companies to whom concessions were granted, for special local or industrial reasons, to construct private railways, they refused to grant concessions for railway lines. Thus one of the greatest incentives of modern times to the development of unpopulated districts has been legislated out of existence in Australia.

The control of harbors, rivers, telegraphs and telephones came naturally under the government of the individual states. The convenience of this condition of affairs was early seen and the six distinct state postal and telegraph departments were taken over by the Federal executive in 1901 and amalgamated, and the administration placed in the hands of a Postmaster-General; a cabinet minister and a secretary for each state acting under the Postmaster-General. But notwithstanding the fact that the Federal legislature was thus put in control of the postal and telegraph business of the Commonwealth the localism of the states made it necessary to retain, for a time, existing postal rates, which the states were unwilling to give up. The Postal and Telegraph Rates Act of 1 Nov. 1902 provided for uniform postal rates for all states for the conveyance by post of newspapers and the transmission of telegrams, but it was not until 1910 that uniform postage rates became part of the law of the Commonwealth under the Postal Rates Act which became effective 1 May 1911. The passage of this act and the good results to local and Federal business interests which resulted therefrom did probably more than any other factor to uniform the sentiment throughout Australia in favor of a united railway policy. This unity of sentiment was heightened by Australia's very active participation in the European War which gave the Federal executive an influence over the states of the Commonwealth which it had never before possessed, and tended very strongly to increase the feeling of nationality throughout the land and the subjection of local interests to the welfare of the island as a whole. Burning questions which have long stirred up state rivalries, such as riparian rights, seem in a fair way to be settled amicably in the interest of the common weal. This latter question, at one time, seriously threatened to affect transportation of river, railway and port. South Australia greatly feared that the deflection of the waters of the rivers Darling and Murray by riparian landowners for irrigation and other purposes would so lower the water in these rivers as to kill the river trade to the railways and the coast from the towns along the banks within state territory. This bitterness of feeling over state water rights exerted a very strong influence upon the railway policies of the four interested states, South Australia, on the one hand, and New South Wales, Victoria and, incidentally, Queensland, on the other, by accentuating their desire to each thwart the commercial schemes of its rival states by preventing their making use of the railways within its own boundaries under conditions favorable to their commercial ambitions. According to Federal law preferential rates in the various states had to be approved by an interstate commission; but the states easily found a way to avoid the provisions of this law, which was somewhat weak-kneed in its provisions and still more so in its enforcement. Lately, however, sentiment has turned strongly in favor of the enforcement of this and other laws for the development of the interests of the Commonwealth and the upbuilding of a truly national spirit in commercial as well as in other respects.

The first short railway was opened in Australia in 1855, but building did not become active until 1875, and then only in sections of the southeast of New South Wales. Australia possessed 23 lines of railway; in 1861, 243; in 1871, 1,042; in 1881, 4,192; in 1891, 10,123; in 1901, 13,551; in 1910, 17,421; in 1912, 18,677. The mileage of railways increased more slowly in Australia during war years than in normal times preceding the outbreak of the European struggle. During the fiscal year ending 30 June 1916, the government lines open for traffic were increased by 676 miles, while private lines actually decreased 33 miles. During the previous year the increase in the mileage of the government lines was 1,735 miles and that of the private lines 146 miles. At the close of the fiscal year ending 30 June 1915, the railway mileage of the several states was as follows: New South Wales, 4,134; Victoria, 3,348; Queensland, 4,839; South Australia, 2,090; North Territory, 145; Western Australia, 3,332; and Tasmania, 533 miles. The cost of construction of these various state lines was in round numbers; New South Wales, $267,500,000; Victoria, $229,000,000; Queensland, $138,500,000; South Australia, $500,000; Western Australia, $66,000,000; Tasmania, $21,000,000. At the close of the fiscal year ending 30 June 1917, Australia possessed about 22,000 miles of government and privately owned railways.

The highest earnings of the government roads were during the fiscal year 1913-14, when they reached $33,640,920. The highest earnings of the several states were as follows: New South Wales (1915-16), $11,296,700; South Australia (1912-13), $3,960,000; Tasmania (1912-13), $534,600; Queensland (1914-15), $6,936,800.

Australia has at last awakened to the necessity of interstate railway and other means of communication, and Sydney, Melbourne and Adelaide are now connected by a main interstate line 1,790 miles in length and, in Western Australia, a system of trunk lines is in a fair way to connect the state ports with most of the important agricultural, pastoral and mining districts by means of an extensive system of branch lines. The latest movement to unify the transportation facilities of the southern half of the Australian continent from east to west coasts has resulted in the connecting of the various state lines and the construction of a Federal government trunk line known as the Transcontinental or Kalgoorlie Railway, linking the eastern and southern roads with the western, by means of a line 1,052 miles in length skirting the Great Australian Bight. By means of this line the state roads of Western Australia, Victoria, New South Wales and Queensland have been linked together so as to enable an increased movement of traffic across Australia from the Indian to the Pacific oceans. This line, or union of lines, is a curious combination which well illustrates the difficulties to be overcome in the upbuilding.
of a truly national system of railways in Australia. Over 2,000 miles constituting the part from Brisbane to Port Augusta, by way of Sydney, Melbourne and Adelaide, is composed of various state lines. The next link in the chain, from Port Augusta to Kalgoorlie, over 1,000 miles, is a Federal line, while the remaining part, from Kalgoorlie to Perth, 370 miles, is under state control. The Federal part of this transcontinental line was begun at Port Augusta in September 1912 and finished finally in 1917, the construction cost of the Commonwealth was originally $20,228,230; but before the road was completed there had been expended upon it about $34,000,000. This increased cost was due largely to the increase in the value of materials of all kinds, the advance in wages and the alteration in the original plans for the betterment of the road in general.

In Tasmania the principal towns are connected by a system of lines with branches reaching out to the mining districts, more especially in the south. Of the 1,755 miles of privately owned railway lines in the Commonwealth on 30 June 1913, only 944 were available for general traffic, to a greater or less extent, while 811 miles were used for tramways.

Australia is subject to a great yearly rush of business when wool, live sheep and mutton are hurried to port. The one-door policy of each state invited congestion of traffic. This congestion was increased by the want of system in the construction of the railways of the country which prevented the use of the rolling stock to anything like its full capacity; for the east was cut off from the west and, as we have seen, one state from another. Another great difficulty, which still exists, was the many railway gauges in use throughout the Commonwealth. In New South Wales practically all the railway is standard gauge; in Victoria most of the track is 5 feet 3 inches; in Queensland and South Australia and Western Australia it is 3 feet 6 inches. These various gauges have formed one of the greatest stumbling blocks in the way of the unification of the railway system of the Commonwealth and a strong barrier to cheap interstate traffic. In 1912 there were cars of different gauges; 4,013 of 4 feet 8½ inches; 10,099 of 3 feet 6 inches; 122 of 2 feet 6 inches; 221 of 2 feet; and 18 of 1 foot 8 inches. The natural result of these railway conditions is that everywhere in Australia, except where preferential rates are made to promote local aims, freight rates are high, often running from 6 to 10 times what they are for similar distances in the United States. A considerable part of these high rates is to be charged up to frequent handling and transshipment of goods en route between different states, and even between different points within the same state when roads of different gauges have to be used for the same shipment. Freight rates have improved lately owing to the opening of inter-state communication in the south and east; but there is urgent call for a still greater improvement.

In the various states of the Commonwealth the railways are grouped for convenience of administration and management into the following divisions or systems: New South Wales, Northern, North Coast, Western, Southern, South Coast and Suburban lines; Victoria, Southeastern, Eastern, Northeastern, Western and Southeastern, and Suburban; Queensland, Southern, Central and Northern divisions; South Australia, Midland, Northern, Southern, Southeastern, Port Broughton and Western systems; Western Australia, Eastern, East Goldfields, Southwestern, Great Southern, Northern, Hopetoun-Rovensthorpe railways. Tasmania's railway system is arranged in 12 divisions following the names of the railways, each of which is under a State management. In all the states the administration of its railways each state has its own laws, customs and regulations. The Federal government has also railway lines in South Australia and in the Northern Territory. In New South Wales the management of the state railways is in the hands of a chief commissioner, who has an official commissioner for railways and another for tramways; Victoria has three railway commissioners; Queensland, South Australia, Western Australia and Tasmania one commissioner. Railway rates are under the control of the respective state governments. The private roads which, naturally, are administered by their owners, are engaged for the most part, in the carriage of coal, ores, stone, sand, gravel, firewood timber, sugar, farm produce and occasionally passengers.

Shipping and Navigation.—Regular steamship communication between Australia and Europe was established in 1852 by the Peninsular and Oriental Company by way of Singapore to Sydney via Adelaide and Melbourne. Owing to the Crimean War this service was suspended in 1854, to be resumed two years later by the same company in conjunction with the Royal Mail Company. In 1869 the Union Pacific Steamship Company and the Pacific Steamship Company opened a line of communication between Sydney and San Francisco via Auckland. For this service a subvention of $7,000 per annum was paid by the state governments of New South Wales and New Zealand. About this time subsidized French and German mail service was established and later lines were put into commission via Vancouver and via the Suez. In 1873 the Great Britain and Great Britain entered into an agreement for an inter-British line and great increase in speed and efficiency was the result of this agreement, not only via Canada but, as a natural result, via San Francisco. This again acted on the home ports which were forced to increase their facilities for communication with one another. Numerous other steamship lines, local and inter-continental, have since been established, so that Australia is now well connected by water with all the great maritime countries of the globe.

Submarine Cables.—The question of the connection of Australia by cable with Europe was brought up in Great Britain and Australia in 1853, but it was not until 1871 that the dream was realized and London was connected by wire with Port Darwin, and the following year, via this latter port, with Adelaide at a cost of $500,000. Tasmania had already been connected with the mainland in 1869. In 1909 two cables were laid to connect Tasmania with Victoria (590 miles). In 1901 a direct cable was laid to Great Britain via the Cape of Good
Hope and another across the Pacific, the following year, from Adelaide to Canada, thus linking up the chief British possessions and touching only British territory. As early as 1856 New Zealand had already been joined with Australia by cable covering 1,191 miles. Numerous other cables have been constructed to connect the island with outside points or the various seaport cities of Australia with one another. These cables are connected with a very extensive telegraph system traversing the island from north to south and from east to west and reaching out to practically all the cities, towns and villages of the island. Wireless telegraph stations are in operation in all the state capitals and larger cities of the Commonwealth.

Postal Rates.—According to the Postal Rates Act of 1910 the rate on letters, letter cards and post cards anywhere within the Commonwealth is 2 cents per ½ ounce; printed papers 1 cent per 2 ounces; domestic books and magazines 1 cent per 8 ounces; foreign books and magazines 1 cent per 4 ounces; commercial papers, patterns, samples and merchandise 2 cents per 2 ounces; newspapers issued from the office of the publisher or vender or retailer thereof or from the agent or dealer 2 cents per 20 ounces; all other newspapers 1 cent each for weight of 10 ounces or under. Ordinary letters of a private or semi-private nature are 5 cents per half ounce for countries outside the British empire and 2 cents per half ounce for countries within the empire.

Professor of English, Universidad Nacional, Mexico.

14. THE LABOR PARTY. The Australian Labor party has its genesis in the great maritime strike of 1890. It is true that spasmodic attempts had been made during earlier years to procure direct parliamentary representation for working-class interests, and in two or three isolated instances men had been returned to one or other of the colonial Parliaments. Nothing, however, in the nature of an extended or sustained effort had been attempted prior to the great strike. For some years before 1890 the trades unions generally had been gaining in strength and influence and had won many concessions from the employers in regard to wages and working conditions; but the seafaring classes had not participated in these advantages in anything like equal degree. A crisis was reached when the marine officers, who had been for years overlookered and underpaid, decided to form a union and affiliate with the other labor organizations. The shipowners demanded, as a preliminary to the discussion of grievances, that the officers should dissociate themselves from the labor unions; but fearing this would leave them at the mercy of the employers, the officers refused to acquiesce, and a strike was precipitated. In sympathy with the officers, the seamen and longshoremen around the coast ceased work and as the employers continued obdurate the struggle extended until the strike included many unions wholly unconnected with seamen. "Freedom of Contract"—an equivalent of the American "open shop"—became the war-cry of the employers, and practically the whole community took sides with one party or the other. After a struggle lasting some three months, during which trade was paralyzed, much bad blood created and both sides financially injured, the men acknowledged defeat. Apart from the cost to the combatants themselves the public had suffered severely, and when the smoke of battle had cleared away there was a general desire expressed to find some way of avoiding similar conflicts in the future. A commission was appointed by the government of New South Wales, and served some good purpose in ascertaining clearly the grievances of the men; but it achieved little of a practical nature beyond suggesting the creation of an arbitration court to which disputes could be voluntarily referred. The press, while mostly taking the employers' view upon the points at issue, concurred in advising the unions to rely upon legislation to remedy their legitimate grievances, and this advice was taken seriously by the men when they emerged from the conflict—defeated, but grimly determined to retrieve their lost influence.

While the effects of the strike had been felt all through Australia, the battle had raged most fiercely along the eastern seaboard, where population is greatest, and therefore the colonies mostly affected were those of New South Wales, Victoria, Queensland and South Australia. It was in these colonies, then, where the cry arose for a more equitable distribution of political power and a greater consideration of labor interests. This demand was accentuated by the political conditions existing at the time. From the granting of self-government the Parliaments of the various colonies had included many men who fought strenuously for the people's interests, and who deserve the whole-hearted gratitude of the reformers of to-day; but in spite of their efforts matters political were so backward in 1890 that there was an urgent need of a fresh impulse. While manhood suffrage had been nominally secured, plural voting obtained in all the colonies except South Australia, there was either non-existent or so inefficient as to be practically useless; except in Victoria, nothing had been done to protect those working in dangerous occupations, such as mining; the question of employers' liability was in a very unsatisfactory state; hours of employment were unregulated, and sweating was rampant; and many other social questions were carefully avoided. In addition, and perhaps most important, there was no method by which public opinion could find expression in an authoritative manner with regard to the merits of labor disputes. Briefly, the complaint of the unionists and their sympathizers was that working-class interests had been neglected, as should perhaps have been expected from Parliaments made up for the most part of the wealthier classes or their representatives.

With a view to altering this state of affairs for the better, the unions decided upon political organization; but, recognizing that no purely class effort could be permanently successful, they called upon radicals generally to assist them in the work of reform. On this wider basis leagues connected with, but independent of, the unions were formed, and programs embracing the legislation immediately desired were speedily adopted. Necessarily these dif-
On these lines the Labor party entered the political arena in the four eastern colonies. The first skirmish occurred in South Australia, when the new party succeeded in returning three workmen to the Legislative Council (the Second Chamber) in spite of a restricted franchise. This happened early in 1891, and in the middle of that year the first real trial of strength for control of the popular chamber took place. This was in New South Wales where, notwithstanding the existence of plural voting, the Laborites captured some 36 seats out of 141. In 1892, Victoria followed the example of the older colony by returning a small contingent of Labor members, and in 1893, both Queensland and South Australia elected parties of greater proportionate strength on the Labor ticket.

With the first Labor successes the wildest views were expressed by critics on both sides—the Conservatives prophesying utter ruin for the community, and many Labor supporters expecting that the millennium would arrive in short order. Needless to say, the future did not correspond. In the first place it was soon found that a proportion of those returned as Laborites were so only in name, and had no conception of the sentiment responsible for the movement. These quickly dropped out or were pushed aside. Then as might have been expected in a party hurriedly organized, there arose internal dissensions of such a character as to seriously threaten, in one or two of the colonies, the future of the movement. As matters settled down, however, the need for cohesion was emphasized and with the recognition of that fact better work resulted. Looked at broadly, the first Labor contingents did excellent work, which served to encourage the party's supporters to renewed efforts, and as a result the parties in the various colonies have been increasingly strengthened at each successive election. This steady growth has not been confined to those colonies where political organization was first attempted upon, but has extended also to Western Australia and Tasmania. At the present time (1916) Labor Premiers are at the head of governments in New South Wales, Queensland and South Australia, while in Victoria and West Australia the Labor parties constitute the direct opposition, with the Liberal Party in office. Until an election in 1916 the Labor party had been in power for some time in Tasmania and in Western Australia.

The Labor party has, during its 25 years of existence, succeeded in gaining a majority in the Australian Parliaments with the exception of Victoria. Its influence is not to be gauged solely by its numerical strength. In most of the colonies its appearance galvanized the older parties into some appreciation of the need for social legislation. Old-time politicians suddenly manifested a tender regard for the interests of the working classes, and vied with each other in propounding schemes for the amelioration of their condition. The democratization of those outside its ranks by imposing the franchise enabled gains of the Labor party, and has resulted in many useful reforms being brought about.

In New South Wales there has thus been secured during the party's existence and since their assumed office of a liberal Electoral Act, abolishing plural voting; an act to protect mining on private property; land and income
taxes, adjusting taxation more equitably; a Coal Mines Regulation Act; a Workshops and Factories Act; an Amending Land Act to permit of perpetual leasing in lieu of outright sale; an Act to restrict the admission of immigrants; an important Navigation Act; an Early Closing Act, applying to shops; an Old Age Pensions Act; an act to nationalize the private wharves of Sydney; the Miners' Accident Related Act; and the relief and maintenance of injured miners and their dependents; the much-discussed Industrial Arbitration Act, prohibiting strikes and insisting upon the reference of disputes to the decision of a judicial body, the Women's Franchise Act and several other acts in connection with industrial matters.

In South Australia education has been made free; the state has established a successful Produce Export Department; the nucleus of a state bank has been formed, providing cheap loans to settlers; workers have been assisted to take up land; adult suffrage has been passed; factory legislation and early closing of shops secured; wages have been protected against liens; private estates have been resumed and cut up for settlement, and other practical measures made.

In Victoria the party's influence has secured, among other things, improved factory legislation, providing for boards to fix minimum wages; compulsory early closing of shops; abolition of plural voting; resumption of land for closer settlement, and cheap money for farmers on the credit foncier system; minimum wage on government contracts; state supervision of dairies; prohibition of secret trade commissions; pure food laws; exemption of tools of trade and furniture to the value of £20 from distraint for rent.

In Queensland legislation has been passed providing for the early closing of shops; adult suffrage and equal voting power; workers' compensation; state supervision of exports; cheap advances to settlers, and the readjustment of taxation in favor of the poorer classes.

In West Australia the record includes adult suffrage, with electorates, approaching equality; factory legislation and early closing of shops; compulsory arbitration in industrial disputes; prohibition of secret commissions in trade, and minimum wages on government contracts.

With the inauguration of Federation in 1901 a new phase was entered upon as a number of the most important governmental functions were transferred from state to Federal control; and the Labor political organization throughout Australia agreed to a common platform upon which to contest the first Commonwealth elections. It ran as follows:

1. Electoral Law, providing for one adult one vote.
2. Total exclusion of colored and other undesirable races.
3. Old Age Pensions.
4. The Constitution to be amended to provide for: (a) The initiative and Referendum for the alteration of the Constitution; (b) the substitution of the National Referendum for the double dissolution in the case of clashes between the two Houses.

At the first Federal elections, held in 1901, the Labor party returned eight members out of 36 in the Senate and 16 out of 75 in the House of Representatives. Three years later, at the elections of 1903, the numbers were increased to 18 in the Senate and 22 in the House of Representatives. Since then the number in both Houses has so increased that a large majority of the members are Labor representatives. In the 1st Parliament it found a fairly progressive government in office, with a program including several planks of the Labor platform, and some of these found expression in legislation. Not until the time was occupied in passing necessary machinery measures, and the tariff discussion alone took up nearly 18 months.

But time was found to pass adult suffrage and a liberal electoral law. The restriction, amounting practically to exclusion of colored immigration was secured, and provision made for the cessation of the traffic in Kanaka labor. In the Public Service Act a clause was inserted providing for a minimum wage of £110 yearly for adults of three years' service. When the tariff was being considered, the Labor party, though assuming no party attitude on protection or free trade, led the way in abolishing or reducing revenue taxes through the customs, and later it headed a successful resistance to the proposal for a borrowing policy.

At the second general election the Labor party increased its strength at the expense of both the Protectionists and Free Traders, with the result that when the Parliament met it contained three parties nearly equal in numbers. The Protectionist government, suffering defeat on an important phase of the Industrial Arbitration Bill, and a Labor government took office. After a few months it was also defeated on one of the principles of the same measure, and was succeeded by a coalition ministry representing Free Traders and Protectionists. This government passed the Arbitration Bill through its remaining stages, but on again meeting Parliament was in turn defeated by a combination of Protectionists with the Labor party. Since then measures have been passed to prohibit false trade descriptions; to render illegal the acceptance of secret trade commissions; to allow of the protection of union trade-marks in common with those of the trading community; and dealing with other matters of importance.

In touching thus sketchily upon the work of the various Parliaments of Australia since the Labor party has arisen, the writer attempts to do no more than indicate the trend of legislation as affecting the working classes and social problems generally. In both the state and Federal Parliaments, during the time covered, many other important laws have been passed, and in regard to these the Laborites have borne their share of the work involved.

It is, however, to the Labor party that credit is mainly due for the quickening of the public conscience which has resulted in so many ameliorative measures being passed in a comparatively short period.

The Labor party has been accused of concerning itself only with the interests of the working classes; but gradually it is being recognized that the term "Labor" includes brain as well as hand workers, and all sympathizers are welcomed as members of the political organization. The Labor party in Parliament include a fair sprinkling of professional and business men, who in any narrow interpretation would be excluded. There is no doubt that much of the success so far achieved is due to the recognition of the fact that the interests of all producers are identical, and that justice must be extended to all equally.

Much has been said about the socialism of
the Australian Labor party, and it is alluded to by some as a recent development. That is not so. There has been no change, except perhaps in form, in the aims and program as first put forward. Leaving aside the fact that nearly every plank of the original platform was broadly socialistic in its interference with individualism, distinct aspirations are placed in the first declarations of the party. In Queensland this took the most pronounced form, where as early as 1890 the council of the Australian Labor Federation, having decided upon political action, put forward as its aim "The nationalization of all sources of wealth and all means of producing and exchanging wealth." This was a declaration for complete socialism, but the organizations in the other colonies refused to go that distance. The New South Wales League in 1890 adopted a proposal for "the extension of the principle of the government acting as an employer, through the medium of local self-governing bodies," and thus committed itself to socialistic ideals. In some of the other colonies there was a distinct change or unification, and the platforms contained no direct mention of socialism, though many of the detailed proposals were of a socialistic character. Later on, the Queensland organization dropped for a time any direct reference to socialism, but continued its propaganda on collective lines. In 1897 New South Wales adopted as a plank of its platform "the nationalization of the means of production, distribution and exchange," and that remained on the program until 1905, when it was struck out. At the same conference a statement of the local party's objective was agreed to, which has since been adopted by an Australian conference as the objective of the Federal party, and may be here quoted: "(1) The cultivation of an Australian sentiment, based upon the maintenance of racial purity and the development in Australia of an enlightened and self-reliant community. (2) The securing of the full results of their industry to all people by the collective ownership of monopolies and the extension of the industrial and economic functions of the state and municipality."

The dropping of the "whole hog" plank in favor of clearer, more defined aims was looked upon as a retrograde step by the more ardent socialists in the movement; but it appears to have been dictated by common sense. The platform is theoretically a program for realization when the party gets a majority, and it is clearly impracticable to attempt to carry out any complete scheme of socialism to-day. Recognizing this, the party declares its belief in socialistic principles, and adjusts its program so that "every step taken" will be in consonance with that ideal. This is shown in the platform for the Federal elections at the end of 1906, which was as follows:

1. Maintenance of a white Australia.
2. Nationalization of monopolies.
3. Old-age pensions.
4. Tariff referendum.
5. Progressive tax on unimproved land values.
6. Restriction of public borrowing.
7. Nationalization (provision for manning, etc.)
8. Citizen defense forces.
10. Commonwealth bank of deposit and issue and life and fire insurance department.
11. Uniform industrial legislation; amendment of constitutions to provide for same.

Since this platform was put forward, "White Australia" has been maintained, "Old Age Pensions" have been adopted, a "Progressive Land Tax" has been passed, "Navigation Laws" and laws to provide for "Citizen Defense Forces" have also been passed. Amendments to the "Arbitration Acts," "Uniform Industrial Legislation" and a "Commonwealth Bank of Deposit and Issue" (see FINANCE) have also been enacted.

This platform insists that monopolies shall be nationalized, as constituting a public danger, and the Labor party expresses its disbelief in the efficacy of measures designed to merely regulate modern trusts. Under its objective the party will embrace every opportunity of extending the functions of collective authority where it is shown to be practicable and of value to the community. From this statement of the position it will be seen that the Labor party is undoubtedly socialistic, but it does not propose to plunge Australia suddenly into any experiment of a wholesale character. The people have control in respect of each successive step, and may be relied upon to call a halt if at any stage failure is experienced.

Two proposed laws for the alteration of the constitutional powers of the Commonwealth in regard to industries and business were submitted to the people by referendum for acceptance or rejection in April 1911. The first proposal was to amend the Constitution Act so as to give the Commonwealth government increased powers to deal with trade and commerce, corporations, industrial matters and trusts and monopolies. The second proposal was to empower the Commonwealth government to make laws with respect to monopolies; both of these proposals were rejected by popular vote. They were again submitted to the vote at the general elections in May 1913, and again rejected.

On the whole, the Labor party throughout Australia has given a much needed impetus to social legislation; and, in reply to those who urge that its objects and methods are opposed to the welfare of the community, it points to the fact that since its appearance in Australian politics welfare has found a wider distribution; hours have been shortened and wages raised in many occupations; sweat shops are being eliminated; and that, though much remains to be done, the people enjoy greater prosperity than before the advent of the new political force.

C. WATSON,
Premier of Australia, 1904.

15. SOCIAL CONDITIONS. The social conditions of a country may be considered from different points of view. They might be considered from the general welfare of the people, or from what is known as social distinction in society. This last aspect of the question is the chief consideration so far as Australia is concerned. The people mostly belong to the great class of honest industry in one form or another. The large majority are, if necessity requires, willing to undertake al-
most any kind of work, while those who are wealthy, with but few exceptions, prefer useful and remunerative employment to a life of idle dissipation.

The common weal of the people is indicated by the fact that in no country is there less real poverty than in Australia, or better and more systematic organization for dealing with those few persons who are in need of temporary assistance. No one is ever knowingly allowed to suffer for want of food. The state does not consider it to be its duty to find employment for those who may be out of work, but in the interest of humanity it always provides food for those in want of it.

It has been said that the happiest people are those who can live upon the products of their own country. Australia offers greater possibilities for such happiness than almost any other land. Cattle and sheep, pigs and poultry, all kinds of grain, vegetables of every variety, and nearly all known fruits are easily produced by properly applied industry.

Primary Productions.—Lord Sydenham, G.C.M.G., who was governor of Victoria for some years after his return from Australia said "It may be taken as certain that where the averages from primary production stand high the country is a good one." This dictum has such a direct bearing upon the condition of the people that the comparisons become important. According to population the primary production in Australia is greater than in Canada, 50 per cent greater than in the United States, twice as great as in France, three times as great as in England and over four times as great as in Russia.

The productive nature of the soil and climate has a great deal to do with the fact that a greater number of people in Australia, in proportion to its population, enjoy more of the comforts and pleasures of life than is the case in many other parts of the world. The people as a whole are better housed, fed and clothed than the residents of most other countries. Cheap houses and discomforts are to be found in Australia as elsewhere, but even in the cities there is a lack of the poor shanties and tenements which are so noticeable in many large cities in Europe, Asia and America.

Educational Advantages.—No one question has a more important or direct bearing upon the social conditions of the people than that of education. No country has better facilities, and but few as good, and with the exception of some parts of America, Australia affords as good an opportunity for secondary and advanced education at a moderate cost as any other country.

Generally speaking, the system of public education is free, compulsory and secular, the whole expense being met out of the general revenue. The greatest care is taken to provide schools in every part of the country in combination with the population. In some of the thinly settled districts, schools of from 10 to 15 children are established. Fortunately, Australia's educational advancement has not been delayed by sectarian interference. There it is negatively considered that a country's advancement rests on the education of its people, and that as national education is a national gain, the nation's treasury should meet the bill. Efforts have been made from time to time by zealous propounders of sectarian beliefs to incorporate religious instruction with the Education Acts of the different states, but the majority of the people are strongly opposed to any form of state aid to religion. They feel that in the bitter strife for sectarian supremacy the efficiency of the schools would become impaired and the practical education of the children neglected. A large majority of parents take advantage of the public schools for their children, but for those who object, either from class prejudice or religious scruples, good private schools are available.

The technical schools, colleges and universities afford ample facilities for higher education. The Australian universities stand high in the educational world. By bequests, endowments and grants of land they have been enabled to provide splendid buildings and appliances, and to procure able and learned professors. The degrees conferred are recognized and respected in other lands. No one need leave Australia to become well versed in music, medicine, literature, law or science. The technical schools have been especially prominent mining point of view, and many of those who have received their instruction there are now holding important positions on mining fields in Australia and other countries. Nearly 1,300 public libraries with 2,000,000 volumes of valuable literature are a great help to those who have passed on beyond school life. In all the principal cities there are public museums and art galleries, which are largely patronized, and have an elevating and refining influence. See Education.

Religious Instruction.—The secular and non-sectarian nature of the public schools does not imply that the religious instruction of the people is neglected. Churches of every known denomination are well supported. Sunday schools, Christian endeavor societies and young men's and young women's Christian Associations are well attended, and all doing good work, while the Salvation Army has its branches stretching over every part of the land, and is to be commended for its tireless endeavors to reclaim the drunkard, lift up the oppressed and to bring back to the paths of virtue and truth those who have strayed or fallen by the wayside. Temperance organizations of various kinds have many members, and are a powerful factor in preserving the better, simpler and purer life of the community. See Australia—Religion.

Government Institutions.—The governments of the different states look after the poor, the sick and the afflicted. They have destitute homes where the aged are properly housed, fed and cared for. They have hospitals for the sick, where those who cannot afford to pay are nursed and attended equally with those who can. Asylums for the insane, sanatoriums for the consumptive, and homes for incurables and schools for the blind are supported or subsidized by the governments. Genuine workingmen, if unable to obtain employment, are allowed to do certain work to pay for the food which is provided for them and their families. Such relief is of temporary character until more permanent employment is secured.

Benefit societies and insurance companies have been established in every state, and num-

AUSTRALIA.—SOCIAL CONDITIONS (15)
Old-age pensions were formerly provided by some of the states, but a system of old-age pensions is now the law for the whole Commonwealth.

Outdoor Life.—For those who are fond of an outdoor life Australia is an ideal country. The climate is such that one can practically spend the whole year in the open air. The advantages of fresh air have been wisely considered by those who had to do with laying out cities and towns, as well as those connected with the government of the country. Wide streets, squares and parks are to be found in and adjacent to all the cities, while large tracts of land have been reserved as national parks within a few miles of the centres of population.

This affords every opportunity for outdoor sport of all kinds. Rowing, football, cricket, lacrosse, golf, baseball and almost all other outside games are popular. In fact, games and sport are carried on so extensively that tourists have criticized Australians for indulging in such sport. Numerous holidays, reasonable hours for work, and long, fine days offer every inducement. Austrians are decidedly a sport-loving people. The Melbourne Cup is one of the world's greatest racing events and the Flemington grounds with their commodious stands and extensive lawns are unsurpassed for any purpose. In fact, the roads are so well made that motoring and cycling are greatly indulged in. Many residents own motors, and during the last few years money has become so plentiful that vehicles for pleasure have been purchased in large numbers.

Wealth of the People.—It is not generally known that the Australians are the richest people in the world, except the residents of England, and a good many of these draw their incomes from Australian investments. During the year (1914) Australia exported produce of a greater value than ever before. The distribution of wealth is more general than in most other parts of the world. Over 30 per cent of the adult population are possessors of property, while in England only about 12 per cent of the adult population enjoy that privilege. There are 2,108,000 depositors in the savings bank, being over 40 per cent of the entire population, and they have to their credit over $400,000,000, an average of about $200 for each depositor.

Laws and Socialism.—Taking an active and responsible part in the management of national affairs has a moderating effect upon most politicians, and to a large degree they have recognized the responsibility of office and endeavored to safeguard the country's interest.

The voice of the people can be made fully known through the ballot-box. The judgment of the people is likely to be considered the wisest for the country's advancement by all, but when the error is discovered the same power that caused it can apply the remedy. The Australian Commonwealth franchise is the broadest and most liberal possible. Everyone over the age of 21 (except criminals and lunatics) has the right to vote. In some of the state elections as well, women have the privilege. There were many strongly opposed to woman's franchise. All the arguments about taking her from her home, destroying her womenly instincts, causing her to neglect her proper duties, etc., were indulged in. After the law was passed however, those who previously opposed it quickly realized (especially if they were parliamentary candidates) that woman was highly intelligent and that it was her duty in the interest of the country to vote.

Australia's socialism has grown with her people. It has not meant the destruction of private property. The state railways, harbors, waterworks, telegraphy, telephones, wharves, exporting departments, public schools, and other undertakings, have naturally followed one after the other, and have not been a hardship to the capitalists, but have rather been the means of allowing them to invest their money in other undertakings and thereby assist in opening up the pastoral, agricultural and mining industries.

Many of Australia's laws have been passed on the belief that the government could undertake certain things for the benefit of the public at less expense than this assistance could be carried out privately. National credit, as a rule, is much better than individual credit. Money can be borrowed by the state and lent to producers on better terms than it can be borrowed by private people for that purpose. Under certain laws the well-to-do pastoralists, as well as the poorer producer, can be assisted.

It is necessary to understand Australian life to realize the need for pastoralists. The governments own most of the lands; hundreds of miles of which are let on lease to pastoralists. Wire netting has been found to be the most effective means of protecting the sheep from wild dogs, and of keeping the rabbits down. For the lessee on his own account to undertake to fence his leasehold would mean an expense which would be a heavy burden upon him, and prevent the use of his capital for other improvements; so by combining with adjoining lessees they form a vermin trust, and apply to the government for miles of wire netting; this is supplied upon the joint security of the lessees and they repay the government, with interest, in instalments extending over a number of years. Large sums have been lent in this way, but little if any loss has occurred and it has been the means of stocking much land that would otherwise have remained idle. The governments also assist the farmers by loans from state banks at low interest, a long term of years being allowed for repayments. Blockers, who only have a few acres, are also assisted, and under certain conditions they borrow from the government to help build their houses and carry out other improvements. All these loans are only granted on business principles, after the officers of the land departments have made full inquiries as to necessary security. The governments also largely assist in exporting produce and finding outside markets. This business is conducted on commercial lines, certain fields of production being reserved for the storage, freezing and work done. If the producer is in need of ready money before his goods are disposed of an advance is made by the government. All this may be considered socialistic; however upon a moment's reflection
it will be seen that it is only an assistance to further stimulate individual enterprise and effort. It has carried many a struggling producer over early years of hardship, and probably saved his property for his family when under other circumstances it might have gone into the hands of the mortgagee.

**Charges, Rates, Taxes.—** Railway charges are, in agriculture, less than on the roads owned and worked by private companies in other countries. The conveniences for traveling are good. The government control of waterworks and sewage systems for the large cities has proved economical and satisfactory. The land tax is not heavy enough to be burdensome. Municipal and local rates are low in comparison with England. The total rates in the Australian cities, including water rates, on property worth $500 per annum, would be from $50 to $100, while in and around London it would be from $150 to $300.

**Employer and Employee.—** The relations between the employer and the employee are generally harmonious; occasionally disputes may arise, but they are nearly always settled without those long strikes which result in heavy loss to both resisting forces and engender such bitterness of feeling. The employers as a rule pay good wages, the hours worked are short, and the employees are provided with favorable sanitary and safety conditions. Being thus satisfied that their treatment is just, they in turn do their best to give full value in their work for the wages they receive.

**Literature, Art and Song.—** According to Mr. Coghlan, who is a statistical authority, Australia has as large a number of first-class newspapers, considering its population, as any other country in the world, while in the matter of letter-writing the only two countries that surpass it are the United States and England.

That Australians have a taste for literature cannot be denied; what they read may not always be of the highest standard, and what they write may sometimes lack artistic finish, but one must recall that theirs is comparatively a new country. Its real growth has taken place during the last 50 years. Other countries have not risen rapidly to literary fame. The first settlements of America were made two centuries before the world had the benefit of Irving, Longfellow, Emerson or Lowell. England's men of letters were not numerous or renowned until many generations had passed away.

While in literature Australia may not up to the present have produced writers of marked distinction, yet there are those of more or less note whose productions are of no small merit, and who have thrown the bright sunshine and free life into their work. The same may be said of art. While no one person stands out as a producer of highly valuable pictures there are several who have the true artist's spirit and have made creditable displays at the Royal Academy in London and the Salons of Paris. But when one considers musical artists, Australia has no need to feel ashamed. With the climatic conditions it naturally follows that there is not industrially so much need of muscular energy; and to-day, in proportion to her population, Australia is stated to have more prominent musical talent of world-wide reputation than any other English-speaking country.

Taking the residents of Australia as a whole they are a happy, prosperous and contented people. They have of course the political and theological differences which are common to all nations. The lead of public thought endeavor to convince by reason not by force. Occasional dissatisfaction is expressed. It is questionable, all things considered, whether any country in the world is more congenial as a place of residence for the following reasons: The death-rate is lower, the primary production is greater, the wages are higher, the standard of living is better, the houses are more substantial, and surrounded with more land, the hours of labor are shorter, telegraphic communication is cheaper, the weather is brighter, the laws more liberal, the wealth more evenly distributed and class distinctions fewer than in almost any other country.

Besides all this, Australia, in the matter of language, is more English than England or America. One can hear more foreign languages spoken in New York or London in a day than could be heard in Australia in a year. Consult Taylor, 'Australia of To-Day' (1906) and Moore, 'Australian Literature and Art' (1919).

**16. MILITARY AND NAVAL DEFENSE.** Up to 1870 Australian defense consisted of a small garrison of British troops. These were placed in the principal cities as a kind of guard. The withdrawal of the last Imperial regiment in 1870, and the effect of the Franco-Prussian War and other European and Asiatic disturbances, led to the establishment of a colonial system of defense. The system was voluntary; men willingly came forward, gave their time and service, the governments providing them with arms and accoutrements and in many cases uniforms.

In 1880 experts from the Imperial army advised that a "Militia" or partly paid system should be substituted for the voluntary system. This was adopted about 1884. The expenditure to the colonies was increased by this system, but the general efficiency was very much greater. In most of the large schools cadet corps were established where the boys were given a regular course of drilling. The strength of the military forces in the different states prior to Federation was based upon population and amounted in all exclusive of rifle clubs to about 28,000.

Under the Constitution of the Commonwealth Act of 1900 the complete control of the defenses was transferred from the states to the Commonwealth. Under the Minister of Defense a general officer was appointed who organized and took charge of the land forces until 1915 when a Council of Defense was appointed to deal generally with questions of policy, and a military board to which the administration of the forces was entrusted. The Commonwealth was divided into six military districts generally corresponding to the boundaries of the six states. The main portion of the land forces is made up of the Citizen soldiers or militia. Over 600 professional soldiers were engaged as expert instructors spread over all the principal places in the Commonwealth. For defending the leading ports
and manning the fort permanent troops of Royal Australian garrison artillery are stationed.

The defense of Australia at present is prescribed by the Defense Acts and amendments from 1903 to 1914. In the Act of 1909 provision is made for compulsory military and naval training with the necessary regulations as regards exemption, registration and enrolment. Since then further acts have been passed extending the provisions, removing difficulties and providing necessary changes. The moral position of Australia instilled in the minds of the people the necessity for greater security than they felt they could depend upon in a purely voluntary system. Leading statesmen of all parties recognized the danger and the system of compulsory training above referred to was the result.

By the acts passed in 1903 and 1904 all male inhabitants in Australia between the ages of 18 and 60 were made liable for home service in time of war, with some exceptions for home defense who never had been trained would not be effective, so the Compulsory Act to provide for universal liability to train in time of peace was passed, and it is worth noting the compulsory act was passed by any English-speaking country which compels all youths to undergo a system of military training. On 1 Jan. 1911 the Compulsory Act was put in force. All male inhabitants who are British subjects and have lived in Australia for six months are liable to service. The training is as follows: (a) From 12 to 14 years of age in the Junior Cadets; (b) From 14 to 18 years of age in the Senior Cadets; (c) From 18 to 26 years of age in the Citizen Forces.

Before the Act of 1909 came into operation, at the request of the Commonwealth government, Lord Kitchener visited Australia and inspected the military forces, the forts and various defense works, and those in course of erection. He made a comprehensive report upon the whole scheme of local defense as for home defense who never had been trained would not be effective, so the Compulsory Act to provide for universal liability to train in time of peace was passed, and it is worth noting the compulsory act was passed by any English-speaking country which compels all youths to undergo a system of military training. On 1 Jan. 1911 the Compulsory Act was put in force. All male inhabitants who are British subjects and have lived in Australia for six months are liable to service. The training is as follows: (a) From 12 to 14 years of age in the Junior Cadets; (b) From 14 to 18 years of age in the Senior Cadets; (c) From 18 to 26 years of age in the Citizen Forces.

Junior Cadets.—The training for Junior Cadets, which lasts for two years, consists of 90 hours each year and begins on 1 July in the year in which the cadet reaches the age of 12. This training is especially aimed at the development of the physique of the cadet. It consists principally of physical training for at least 15 minutes on each school day, and elementary marching drill. The following subjects are taught: Long and short range rifle shooting, swimming, running exercises in organized games and first aid. The Junior Cadets do not wear uniforms. A special staff of instructors is maintained by the government and many classes of this kind are held throughout the country. The teachers then instruct the boys and the inspectors of the schools supervise the training and inspect the boys on behalf of the military authorities.

Senior Cadets.—The training of Senior Cadets, which lasts for four years, commences on 1 July in the year in which the cadet reaches the age of 14. It consists of at least 40 drills each year, of which four are classed as whole days, 12 as half days, the remainder being night drills of not less than one hour. The four years’ training comprises marching, handling of arms, musketry, physical drill, first aid, guards and sentries, technical training as a company in elementary field work and elementary battalion drill.

Adult Forces.—Training in the Citizen Forces, which covers a period of eight years, begins on 1 July of the grandly era and he reaches the age of 18 years. The work consists of training continuously in camp for 17 days in the case of the naval forces, artillery and engineer arms, and eight days for other arms and eight days’ home training for all arms. The total service is 25 days per annum. Persons, if by their religion they are not allowed to carry arms, as far as possible are allotted to duties of non-combatant character such as stretcher bearers, or as members of the Army Medical Corps, necessary proof being given that for home defense who never had been trained would not be effective, so the Compulsory Act to provide for universal liability to train in time of peace was passed, and it is worth noting the compulsory act was passed by any English-speaking country which compels all youths to undergo a system of military training. On 1 Jan. 1911 the Compulsory Act was put in force. All male inhabitants who are British subjects and have lived in Australia for six months are liable to service. The training is as follows: (a) From 12 to 14 years of age in the Junior Cadets; (b) From 14 to 18 years of age in the Senior Cadets; (c) From 18 to 26 years of age in the Citizen Forces.

The four years’ training comprises marching, handling of arms, musketry, physical drill, first aid, guards and sentries, technical training as a company in elementary field work and elementary battalion drill.

Pay.—All members of the militia are provided with certain pay. Citizen soldiers who enlisted voluntarily under the old system have the same rate of pay as formerly, the basis being 5/- per day for gunners, sappers or privates. Under the compulsory system they receive 3/- per day during the first year and 4/- per day during the following years of their training. Non-commissioned officers and officers are paid as follows: Corporals, 9/- per day; Sergeants, 10/- and 11/- per day; Lieutenants, 15/- per day; Captains, 22/6 per day; Majors, 30/- per day; Lieutenant-Colonels, 37/6 per day; Colonels, 45/- per day; mounted officers also receive horse allowance.

Uniforms are provided free for use on drills and parades, but are not permitted to be worn when the cadets or soldiers are not on duty. The Citizen soldiers have rifles issued to them, but the arms for the Senior Cadets are kept at local depots and issued as required for musketry practice and drill. A new organization is provided to encourage rifle shooting. The Commonwealth government has established factories for the manufacture of all military equipment.

In addition to those who are undergoing regular training there are nearly 1,200 rifle clubs in Australia with a membership of about 50,000. An annual course of musketry is fired by these members but they do not undergo any systematic course of training. It is estimated that 60 per cent of the members of these rifle clubs are fit for active service.

A Royal Military College was established in 1911. The ordinary college course lasts for four years and when completed those who have passed through go for a period on duty to England, India, or Australia. They are appointed to positions on the staff or with the permanent troops in Australia or New Zealand. The Royal Military College was established in 1911. The ordinary college course lasts for four years and when completed those who have passed through go for a period on duty to England, India, or Australia. They are appointed to positions on the staff or with the permanent troops in Australia or New Zealand. During the European War, which commenced in August 1914, the course at the Military College has been temporarily modified. No fees are charged for instruction and maintenance, each staff cadet being credited to meet necessary expenses.
of uniforms, books, instruments, etc., with an allowance of 5/6 per day. Both educational and military work are comprised in the course of instruction. Cadets are prepared for engineering, artillery, light horse and infantry work.

The working of the compulsory training system is proving most successful. The number in training in 1914 was Citizen soldiers, 95,000; Officers, 10,000; Junior Cadets, 50,000; nearly 200,000 in all in actual training. G. H. Knibbs, Esq., C.M.G., the Commonwealth statistician (to whose works the writer of this article is greatly indebted), deals with the success of the Australian system. The scheme both before its inception and since its successful inauguration has had the support of leading statesmen of all political views as well as the vast majority of the citizens of the Commonwealth. In general the trainees are alert and well disciplined while on parade, and their instruction and training is shown by the large number of candidates seeking promotion at competitive examinations after courses of lectures, demonstrations and special parades. A great deal of voluntary service is rendered in all services of the Citizen Units, and the rifle clubs of the Citizen Units are well patronized. Many of the regiments have athletic, gymnastic and swimming clubs and sports meetings are frequently held. Moreover, a marked improvement has become apparent in the general conduct and bearing of the youths of Australia, and it is claimed that this is the effect of the system of universal training. As a result of enquiries made in 1914, the police authorities in all the states concurred in the opinion that the behavior of the youths who are subject to the training is vastly improved. It is stated that both mentally and morally as well as physically the benefits are very definite and that "the principal effects of a beneficial nature are increased self-respect, diminution of juvenile cigarette smoking, and generally a tendency toward a sense of responsibility and a desire to become good citizens."

Naval Defense.—Prior to the Federation of the Australian states the naval defense was chiefly maintained under the agreement with the British government. After the Commonwealth was established it was considered that Australia should take a greater part in naval defense so it was decided in 1909 to create an Australian naval force to replace the squadron previously maintained under the agreement with the British government. The Australian government invited Admiral Sir Reginald Henderson to visit Australia and advise on naval matters generally. His scheme has been principally adopted. It provides for 52 vessels and 15,000 men. Expenditure on construction works extending over 20 years £40,000,000 with an ultimate annual national vote of nearly £5,000,000. The 52 vessels would consist of 8 armored cruisers, 10 protected cruisers, 18 destroyers, 12 submarines, 3 depot ships, 1 fleet repair ship. Six naval bases and 11 sub-bases were recommended. The Australian navy in April 1915 consisted all told of about 20 vessels varying in size from a gunboat of 360 tons to the battle cruiser of 19,200 tons, aggregating about 60,000 tons or an average of 3,000 tons per vessel.

In the great war the Australian navy by its prompt and effective action rendered valuable service in clearing the islands of the Pacific of German ships. The most spectacular feat was the destruction of the commerce raider Emden by the light cruiser Sydney, after the former had destroyed, principally in the Indian Ocean, 21 British vessels valued between two and one-half and three million pounds.

The Australian forces rendered valuable aid also in the campaigns in Egypt, Mesopotamia, Gallipoli, Macedonia, and the western front. An army of about 300,000 was raised, the majority of whom saw actual service with the British and French forces, and much of the credit for the prompt way in which they adapted themselves to modern warfare is undoubtedly due to the national system of compulsory training in Australia. That the quality of the troops was of the best was evidenced by the frequency with which they were mentioned in dispatches. See War, European.

AUSTRALIA, South, one of the original states in the Commonwealth of Australia. It occupies the middle of Australia, and at first, as the colony of South Australia, extended between long. 132° and 141° E., and from Southern Ocean to lat. 26° N., having then an area of about 300,000 square miles. In 1861 a district lying to the west of the colony was added to it, so that its western boundary was shifted to the meridian of 129°. In 1863 it received in addition the country between its northern boundary and the line of 26° S. (being now known as the Northern Territory), so that South Australia now possesses a territory extending across Australia, and occupying an area estimated at 903,690 square miles. It is bounded on the east by Victoria, New South Wales and Queensland; on the west by the Australian coast. Its greatest length from north to south is 1,850 miles, and its width 650 miles. The south coast, for the first 120 miles east of where it begins at Port Eucla, is backed by steep limestone ranges from 400 to 600' in height, but as a whole the coast is low and desolate-looking. In a straight line from Port Eucla on the west to Cape Northumberland, near the boundary of Victoria, the distance is 850 miles, but the coast-line between these points extends to nearly twice that distance, owing to the indentations of Spencer Gulf and the Gulf of Saint Vincent. Opposite the latter is Kangaroo Island, the largest island on the Australian coast, excepting Tasmania. The coast of the Northern Territory is thickly strewn with islands, three of which are of large size. There are also some excellent ports, one of these, Port Darwin, where the overland telegraph and the cable from Batavia and the East
meet, being among the finest harbors in Australia. On the eastern side of the Gulf of Saint Vincent lie the most populous portions of the state, and here is situated Adelaide, the state capital, with a population in 1911 of 189,466.

The interior of South Australia widens from that of the most eastern states. The mountains here run from the sea to the interior, ending somewhat abruptly among the lakes. The principal channel, the Mount Lofty Range, begins at Cape Jervis, and follows the shore of the Gulf of Saint Vincent past Adelaide, meeting at the head of the gulf, the ridges forming the backbone of Yorke Peninsula. The range still running north is called Flinders Range, and ends in a wide mass of mountain 3,000 feet high, separating the lakes Torrens, Eyre, Frome and Blanche. All these so-called lakes are huge expanses of salt water swamp and mud. On the west of Spencer Gulf is Eyre Peninsula, through the heart of which runs a railroad to Flinders Ranges, with an elevation of 2,000 feet, and on the shores of another series of lakes of the same character as Lake Torrens. The principal summits of the Mount Lofty Range are Razor-back, in latitude 33° 20', and Immediately north of it Mount Bryan, close to which is the celebrated Burra Burra copper mine. The highest peaks of the Flinders Range are Mount Remarkable 3,179 feet, Brown 3,174 feet, and Arden 3,000 feet.

None of the peaks in the Gawler Range attain more than a moderate elevation. On the left bank of the Murray, and near its mouth, a range of moderately elevated heights proceed south-southeast, skirting the coast to its extremity near Cape Northumberland. Throughout these ranges the existence of volcanic agency at a former period is everywhere apparent. The Warburton Range and the Stuart ranges lie beyond and to the north and west of the lakes; further north on the Tropic of Capricorn are the MacDonnell ranges, rising to a height of 4,000 feet, from which the extreme western affluents of the Lake Eyre River system take their rise. The other portions of the territory to the north and west are almost level, and consist of either waterless plains or plains of mudstone boulders, with desert grass and spinifex.

Among the mountains east of Gulf of Saint Vincent, primitive limestone, often in the form of a beautiful white marble, is very abundant. There are indications of a large variety of minerals throughout the state, but copper is the only one that has been met with in large quantities. The total mineral production to the end of 1907 was valued at £91,863, of which £74,525 represented copper and £36,002 represented gold. In 1913 the total mineral production was £84,458. In the Northern Territory gold has also been found over a considerable tract of country, and good progress has been made in mining while other minerals are known to exist. Almost the only stream within the state proper is found here, and that is the Murray, which enters the colony on the east in latitude 34°, and flows first circuitously west and then south, into the extensive lagoon called Lake Alexandria, communicating with the sea by a narrow opening. During the rainy season it is navigated by steamers that go up as far as the port of Renmark. The course of the Murray through the state is 500 miles in New South Wales. In the Northern Territory the Roper River is a fine large stream, navigable for sea-going vessels for 100 miles from its mouth in the Gulf of Carpentaria; the Victoria is also navigable. The climate of South Australia proper greatly resembles that of Sicily and with the hot months of the year it is agreeable, the disagreeable portion of the year being the three summer months of December, January and February, when the natural heat of the season is greatly increased by the heat of the Gulf of Carpentaria. What is called winter would be considered in England merely a wet autumn. There are no epidemic diseases. Scrofulous and tubercular diseases are rare, but diseases of the eyes are common in summer, being either occasioned by the impalpable dust floating in the atmosphere, or by exposure to the night air after the glare of the sun.

South Australia produces nearly all the fruits and vegetables that are cultivated in Europe as well as old watermelons. The wheat regions is chiefly distinguished as a wheat and grape-growing country. Besides supplying its own wants, it sends large quantities of wheat to the neighboring states and to Europe, where "Adelaide" wheat is held in high regard. The area under wheat is about 2,190,782 acres. The quantity produced varies greatly with the season, but the average production is six bushels per acre. The area under vineyards is gradually extending, and now approaches 25,000 acres. In 1912 the total area under cultivation was about 3,000,000 acres, of which 107,881 acres were in oats; 40,643 acres in barley; 23,214 acres in fruits; 321,182 acres in hay and 7,412 acres in potatoes. Brandy is produced as well as wine. Hop-growing is attracting some attention, and the olive is also cultivated. The chief exports are wool, wheat, flour, copper and copper ore, skins, etc. The trade of a large part of New South Wales passes through South Australia. The remainder in 1912 was £4,450,739, the expenditures being the same. The length of railways in 1912 was 2,168 miles. There is a complete system of telegraphs, besides the great line from Adelaide across the continent to Port Darwin, a distance of 2,000 miles, which is all public. The public debt of the state is £31,118,574 and has been mostly incurred for reproductive public works. In 1912 there were 768 schools, 1,473 teachers and 58,273 pupils. The total population in 1914 was 438,173, not including aborigines. See AUSTRALIA—POLITICAL HISTORY; AUSTRALIAN FEDERATION.

AUSTRALIA, West, one of the original states in the Commonwealth of Australia. It includes that portion of Australia west of long. 129° E., and is bounded, east by South Australia, and northwest and south by the Indian Ocean. It lies between the parallels of 13° 30' and 35° 8' S.; greatest length, 1,450 miles north to south; greatest breadth, 850 miles; area, 975,920 square miles. The coast-line measures about 3,000 miles, and that part is indented by numerous bays, creeks and estuaries. The coast is fringed by many islands, but none of any importance. The principal inlets are Cambridge Gulf, Admiralty Gulf, York Sound, Collier Bay, King Sound, Roebuck Bay, Exmouth Gulf, Shark Bay, Melville Gulf, Bay and King George Sound, the last the most
important as having Albany on its shore, the port of call for the European mail steamers. The chief rivers are the Ord and Fitzroy on the northwest, the Grey, Avon, Gwaggo, Murchison, Greenough, Swan and Blackwood on the west. The Swan River is important as Perth, the capital, is situated on its banks. Some of the rivers within the tropics are large and navigable, but few of the others are large enough to carry cargo and few are navigable even for boats to any great distance. The interior was till recent years not well known, but at present there is little territory which has not been explored. The country is chiefly an alternation of ridges and hollows, sandy, without grass, and clothed with bushes and scruffy timber, without the trace of a water-course. The really settled and occupied portion of the state forms only a mere fraction of its whole area. The population is mostly concentrated in the southwest corner, where the first settlements were made, and around the recently discovered gold reefs. Scattered settlements stud the coast at various points. On the west coast are extensive banks covered with the kauri, a species of Araucaria, and a fleet of boats. The Kimberley district in the north is a region of great promise; it comprises 20,000,000 acres of well-watered land intersected by the Fitzroy River and other large streams, and is said to be admirably adapted for pastoral purposes, besides having a large area suitable for the cultivation of sugar, coffee and rice. The greater part of the seaboard, except along the Australian bight, is separated from the interior by a low range of hills running parallel to it, and covered with forests. The fertile land exists in patches, and some of it is of a very rich character. The principal crops are wheat, barley, hay and potatoes; the vine is also successfully cultivated, and excellent wine is made in the colony. The area under cultivation comprises about 1,072,000 acres, of which wheat occupies 612,104 acres, hay 344,032 acres, oats 77,488 acres and fruit 18,194 acres. An available area of 1,000 square miles is covered with jarrah forests. This is a species of eucalyptus (E. marginata); its timber is in great request for railway sleepers, for building purposes, and especially for marine constructions, having the valuable property of resisting the attacks of the white ant on land and the ship worm at sea. Considerable areas in the southwest are covered with karri (E. diversicolor). There are also numerous forests of sandalwood trees, the timber of which is exported in large quantities, chiefly to China for incense purposes. Flowers and fruits from all quarters of the globe grow luxuriantly. Among the fruits successfully cultivated are apples, pears, oranges, peaches, plums, apricots, figs, almonds, bananas, olives, etc. English vegetables may be profitably cultivated at almost all seasons. Bees thrive and produce abundant stores of honey.

The mineral resources of the state are not yet fully known. Gold has been discovered in large quantities, and West Australia is now the chief gold-producing state of Australia, the Coolgardie gold field being among the most productive. Its gold production to 1908 amounted to 20,011,698 fine ounces, valued at £85,004,290. In 1908 it was 1,047,912 fine ounces and valued at £6,999,885. But in 1913 its total product of minerals was only £5,760,207, from which it is obvious that the production of gold has declined. Lead and copper exist abundantly, and there is a deposit of iron ore, and the gold ore might be raised in almost inexhaustible quantities, and tin also exists. The gold discoveries have formed an epoch in the history of the state, and trade and population have recently increased very rapidly. Besides gold the exports include hides and tallow, jute and hemp, tar and turpen tin ore, sands and gravel, pearls, pearl shells, tin ore, skins, etc. The revenue has grown enormously. In 1881 it was £206,205; in 1891, £497,670; and in 1912 it was £3,960,767, the expenditures being £4,101,962 in 1912. The state received £23,364,790. There were, in 1914, about 2,967 miles of railway open. The principal towns are Perth, the capital, with a population in 1911 of 106,792. Fremantle is the port of entry. The population of the whole state in 1914 was 323,952. In 1912 there were 1,453 clergymen, 1,189 teachers and 38,184 pupils. The first part of the state settled was the southwest corner, long known as the Swan River Settlement, established in 1829. From 1850 to 1886 it was a place for the transportation of convicts. In 1886 the state received a system of responsible government similar to that prevailing in the other colonies of Australia. See AUSTRALIA — POLITICAL HISTORY.

AUSTRALIAN ALPS, a range of mountains in the southeast of Australia, extending over a length of about 400 miles. The highest peaks are in New South Wales, and the highest, according to Lendenfeld, is Mount Townshend (7,353 feet), belonging to a group which he calls the Kosciusko group. The peaks next in height belong to the Bogong group in Victoria, and the west of the Mitta Mitta, the highest of which is Mount Bogong (6,508 feet). They do not reach the snow line, though snow lies in the higher valleys all the summer. Geologically, the Australian Alps are composed mainly of very ancient metamorphic rocks, which have been worn down in the course of ages to table-lands, and which slope down rather steeply on all sides. Volcanic rocks cover the table-land to the south of Mount Bogong.

AUSTRALIAN BALLOT. See BALLOT. AUSTRALIAN FEDERATION, the political union of the five Australian colonies, together with the two smaller Australian islands, New Zealand, and Fiji. Another conference took place in 1891, at Sydney, New South Wales, attended by delegates from each of the colonies. A plan of Federal government was proposed, resembling in many of its features that of the United States. A draft bill to constitute the Commonwealth of Australia was adopted by the convention, and it was agreed to submit it to the approval of the individual legislatures of the several colonies. This bill met with success in the lower branch of but one colonial legislature—that of Victoria. In January 1895 there was a conference of premiers of five colonies at Hobart, and the Legislative Assembly of New South Wales passed a Federal Enabling Act in November of that year, and notice of motion was given in other legislatures to bring in a similar bill. The first practical step was taken
AUSTRIA—AUSTRIA-HUNGARY

in 1898. A convention of representatives of New South Wales, Victoria, Tasmania, South Australia and Western Australia succeeded in drafting a Constitution which was submitted to the popular vote of each of those colonies in June. The Constitution provided for a governor-general, appointed by the Crown; a Federal Parliament, composed of the Crown, represented by the governor-general, a Senate and a House of Representatives. The powers of the Parliament were set forth in 39 articles, and covered trade with other countries, taxation, coinage, weights and measures, foreign corporations, pensions, arbitration, etc. Free trade between the states was recognized. By the terms of the plebiscite, an affirmative vote of substantially one-third of the electors of New South Wales, and of one-fifth of the electors of each of the other colonies, was required to adopt this Constitution. But the election returns in June were fatal to the scheme. While the majorities in the four lesser colonies were overwhelmingly in favor of the Constitution, the requisite affirmative vote in New South Wales was not secured.

On 2 Feb. 1899, a unanimous agreement was reached by the colonial premiers in conference at Melbourne, regarding the unsettled questions referred to them by the colonial legislatures, thus inaugurating the success of the Federation project. In 1900, a bill making Federation effective was introduced into Parliament, at London, and passed, the only amendment offered having reference to the royal prerogative. On 1 Jan. 1901 the Australian Commonwealth was proclaimed. So similar in character is the Constitution of the Australian Commonwealth to that of the United States that there can be no doubt that the former is modeled very largely after the latter. This is especially obvious in the matter of states' rights. Evidently there is in Australia that same tendency toward local autonomy that is here represented by the principles of Thomas Jefferson.

The Australian Constitution provides for a Parliament very similar to the United States Congress, comprising a Senate and a House of Representatives. In place of the President there is the governor-general, appointed from London, who has the power to summons, to prorogue or to dissolve Parliament, though it must meet every year. There are six senators from each of the six states, elected by the people for a term of six years each. The representatives are elected for terms of three years, also by direct ballot, and it is so arranged that they shall always number twice as many as the senators. By a majority vote Parliament may increase or decrease either chamber, though it may not interfere with the proportion of any state's representation in the House without that state's consent.

Although the principle of states' rights is fundamental, the Australian Parliament has a wider scope of legislative activity than has the Congress of the United States. It has the power to legislate on marriage, divorce, bankruptcy and incorporation of commercial enterprises; obtains certain legislation passed by the House, and thus cause a deadlock, Parliament automatically dissolves and a new election takes place.

The judicial power of the Federation is represented by the High Court of Appeals, corresponding to the Supreme Court of the United States. This court hears appeals from the state Supreme Courts or the minor Federal courts. An appeal from the High Court may, however, be carried to London in matters not involving the Constitution. It was at first intended to limit this right of interference on the part of the home government to matters affecting other parts of the British empire, but certain compromises were made on both sides. On the whole, however, the Australian Federal government is practically independent, and the power of the home government and the governor-general is limited almost entirely to the veto.

On 9 May 1901 the 1st Parliament opened in Melbourne, which was made the temporary capital. The Earl of Hopetoun was appointed the first governor-general. The following year he resigned and was replaced by Baron Tennyson, who was replaced by Baron Northcote in 1904. In 1908 the latter gave place to the Earl of Dudley. Ronald Munro-Ferguson was appointed governor-general in May 1914. He is assisted by a cabinet of seven members, appointed by himself.

On 5 Dec. 1910 New South Wales agreed to cede to the new Federal government 912 square miles of territory in the Yass-Canberra district, which is to be a Federal district, corresponding to the District of Columbia in the United States. In 1913 work was begun on the building of the Australian capital; this city is to be known as Canberra (q.v.). At present the population of the whole Federal district is only 2,868. In 1915 the customs revenue of the Australian Federal government was £11,000,000. Consult O'Callaghan, 'The Annotated Constitution of the Australian Commonwealth' (Sydney 1901); Turner, 'First Decade of the Australian Commonwealth' (New York 1911).

AUSTRIAN, äs-trä'ši-ən (the East Kingdom), the name given, under the Merovingians, to the eastern possessions of the Franks, embracing Lorraine, Belgium and the right bank of the Rhine. These districts, thickly inhabited by Franks, were of great importance at the time of the rise of the Frankish power.

AUSTRIA-HUNGARY (Österreich-Ungarn), officially designated THE AUSTRO-HUNGARIAN MONARCHY, an empire of central Europe, consisting of two semi-independent countries, each according to the Act of Compromise of 1867 having its own Constitution, a limited monarchy and separate Parliament, but each united in the conduct of foreign affairs and in the establishment of a common army and navy under one ruler: "His Apostolic
Majesty the Emperor of Austria and the King of Hungary.

Area and Divisions.—The Austrian empire extends from about lat. 42° to 51° N., and from long. 8° 30' to 26° 30' E.; the total area in round numbers is 240,000 square miles. Its greatest length from east to west is about 800 miles; its greatest breadth about 400 miles. It is bounded south by Montenegro, Serbia, Rumania, the Adriatic Sea and the kingdom of Italy; west by Switzerland, Bavaria and Saxony; north by Prussia and Russian Poland; and east by Russia and Rumania. On the shores of the Adriatic, along the coasts of Dalmatia, Croatia, Istria, etc., lies its only sea frontage, which, compared to the size of the monarchy, is of insignificant extent. Besides being divided into the two great divisions above mentioned, the Austro-Hungarian monarchy is further divided into a number of governments or provinces. The following table exhibits the name and area of these governments, with their population in 1900 and 1910:

Natural Features.—Although presenting every variety of surface the prevailing character of the Austrian dominions is mountainous, there being few districts where mountains are not found; whilst the plains do not occupy more than a fifth part of the whole superficies. The highest ranges, and the most extensively rangeless, are found in Tyrol, Styria, Illyria and the southern parts of Austria proper. In some of these regions the scenery is bold and romantic, and has been considered equal to that of Switzerland. The most extensive tracts of low or flat land occur in Slavonia and the southeast and central parts of Hungary; much of this level land is remarkably fertile, but it is met at various points by vast morasses and arid steppes. The principal valleys are found in Tyrol, Salzburg, Styria and Illyria. Extensive plains stretch along the courses of the rivers, particularly, the Danube, the Theiss and the March. The principal rivers of Austria are the Danube, the Elbe, the Save, the Drave, the Waag, the March, the Inn, the Theiss or Theiss and the Maros. The Danube for upward of 800 miles is navigable for quite large vessels throughout the whole Austrian territory; while all the others, most of them tributaries of the Danube, are navigable for vessels of smaller size. All the rivers abound in fish. The lakes are numerous and often picturesque, although those in the lowlands, particularly in the plains of Hungary, are rather marshes than lakes. Austria lies between the isotherms of 60° and 50°, and has a climate nearly as various as its surface. The northern regions, between the 49th and 51st degrees of north latitude, have an average temperature resembling that of the north of France. Between lat. 46° and 49° the heat is considerable; and between 42° and 46° which comprises the whole of south Austria, it is still greater; the winter lasting two or three months only, and being, in general, extremely mild. The principal products of the north are wheat, barley, oats and rye which are so plentiful that the greater part of them is exported abroad; in the central province wine and maize are added; and in the south, olives. The productive capabilities of the soil have undergone considerable development in recent decades. The wines of Austria are inferior on the whole, with exception of the famous Tokay, including the well-known Tokay. A great portion of the worst wine is made into brandy. The produce of wine annually has reached over 240,000,000 gallons, of which Hungary yields by far the largest proportion. The forests cover 69,000 square miles, the result of the productive soil of the empire, and yield timber of excellent quality, adapted for all purposes. Wild deer, wild swine, chamois, foxes, lynxes and a species of small black bear, are found in many districts, the fox and lynx being particularly abundant. Herds of a native breed of horses, of small size, roam wild over the plains of Hungary. All the domestic animals of England are known throughout the empire. A large portion of the countries now composing the Austrian empire was at one time a marshy land near the sea, particularly Hungary, where the general appearance of its vast plains, the nature of their soil, and, above all, the occurrence of fossil sea shells, leave no room to doubt the former dominion of the ocean. Throughout all Austria the Tertiary formation prevails, with a margin of the Secondary formation, stretching to a greater or lesser extent into the surrounding countries, and diversified by patches of igneous rocks of the Tertiary and Alluvial epochs. In mineral productions Austria is very rich, possessing, with the exception of platinum, all the metals, particularly gold, silver, copper, lead, zinc, quicksilver, coal and salt. The total annual value of the mineral products of the Austrian empire is estimated at upward of $74,268,500; of which $34,926,583 represents silver; $29,389,302, lead. Manufactures and Commerce.—Manufactures are in the most flourishing condition in Bohemia, Moravia, Silesia and Lower Austria: less so in the eastern provinces, and insignificant in Dalmatia, Bukowina and the military frontiers. The total money value of manufactured products amounts to at least $500,000,000, of the value of agricultural products to more than
$1,000,000,000. As regards the individual branches of manufacture, there are machines produced extensively to the value of $25,000,000, and the supply about equals the demand. In the manufacture of musical and scientific instruments Austria holds a high position; those of Vienna are especially celebrated. The manufacture of stoneware and chinaware is very extensive to the value of about $1,334,000 yearly, and giving rise to a brisk export trade. The glass manufacture is one of the oldest and most highly developed branches of industry in Austria. The manufactories, about 200 in number, are spread over the entire monarchy, but are most numerous in Bohemia, where glass and glasswares of every kind are produced. The yearly value of this class of manufactures is estimated at about $12,500,000, of which a very considerable quantity is exported. The manufacture of metal goods is carried on to a great extent, being valued at about $50,000,000; and some of the iron and steel goods, such as scythes and reaping hooks, have a world-wide reputation. The manufacture of tobacco is also very important, and the articles of Vienna workmanship compete successfully with the French. The production of chemicals reaches the amount of $25,000,000, and about covers the home demand. As regards articles of food, the sugar from beet has an annual value of about $60,000,000; of beer the production is $20,000,000 in value, the number of breweries is over 2,000; spirits are distilled to the value of $20,000,000. The manufacture of tobacco is a state monopoly, and is carried on in 38, mostly large, establishments. Of textile industries, the silk manufacture, since the loss of the Lombardo-Venetian provinces, has become greatly limited. The manufactures of woolen, hemp and flax are among the oldest and most important of the state. The first gives employment to about 400,000 persons, and turns out about $70,000,000 worth of goods yearly, of which a considerable proportion is annually exported. In the whole monarchy there are about 650,000 looms and 65,000 looms employed in woolen weaving. The linen manufacture (including also hemp and jute) gives employment to a greater number of persons than any other branch of industry (many of them in their homes), and produces goods to the value of $70,000,000. Of the various branches of the manufacture are Bohemia, Moravia and Silesia. The annual produce of the cotton manufacture is next in value to that of woolens. Although about 2,400,000 spindles are in activity, cotton yarn has to be imported. On the other hand, however, cotton goods are exported. Tannings is carried on to the greatest extent in Moravia, Lower Austria and Bohemia. The manufacture of leather goods, however, is very large, and in the production of gloves (in Vienna and Prague) Austria stands next to France. Altogether the manufacture of leather and leather goods employs about 200,000 persons and produces goods to about $50,000,000 yearly.

In addition to the general import and export trade, Austria carries on,—partly from its central position in the continent of Europe, and partly from its numerous navigable streams, excellent roads and railway system,—a very considerable amount of business in the transit of goods through her territory to other countries. In recent years the total annual value of the imports into Austria-Hungary was, in round numbers, $730,500,000, while the total value of the exports reached $591,000,000. The principal imports are raw cotton, wool, cotton and woolen yarn, silk and silk goods, coffee, tobacco leaf, furs and hides, leather, machinery, locomotives, etc., hardware and clocks, books, newspapers, maps, grain and cattle at about $1,500,000. In value. An article of export, next came sugar, cattle, grain, leather and leather wares (including gloves), hardware, eggs, coal and coke, woolen manufactures, glass and glassware, paper and paper-wares, wool, malt, wooden goods, hides, etc. Nearly one-half of the commerce of Austria is carried on with Germany, the next places being occupied by Great Britain, Italy, Russia and the United States. Including fishing vessels and small craft, Austria-Hungary, in 1913, had 17,297 vessels of all sizes, with a tonnage of 610,541, and employing 48,689 men. The principal ports of the empire are Trieste, Pola and Fiume. In 1913 there were 27,845 miles of railway open for traffic in the empire, of which 14,512 were in Austria and 13,333 in Hungary.

Money, Weights and Measures.—On 1 Jan. 1900 a new monetary system went into effect, the coinage being changed from a silver to a gold basis, and the standard coin and money of account being the crown (equal to 20.3 cents in United States gold). Practically the chief medium of exchange is banknotes, of various denominations. The Austrian centner, the weight by which all large quantities are rated, is 123½ pounds avoirdupois. The mette (pl., metzen), the largest dry measure, is equal to a bushel, or somewhat less than the fourth part of an English imperial quarter, nine metzen making two quarters nearly. The eimer, the most generally used liquid measure, is equal to 14.94 English wine gallons. The Vienna foot is equal to 12.45 inches English. The joch of land is 1.43 English acre.

Population.—None of the European states, with the exception of Russia, exhibits such a diversity of race and language among their population as does the Austrian empire. The Slavs, who amount to about 19,000,000, or 45 per cent of the total population, are the chief of the component nationalities of the monarchy in point of numbers, forming the great mass of the population of Bohemia, Moravia, Carniola, Galicia, Dalmatia, the kingdom of Croatia and Slavonia, and southern Hungary, and half the population of Silesia and Bukovina. This preponderance, however, is only apparent, as none of the other races are split up into so many branches differing so greatly from each other in language, religion, civilization, manners and customs. These branches are the North Slavic Czechs, Moravians and Slovaks, the Ruthenians and Poles and the South Slavic Slovenians, Croats, Serbs and Bulgarians. The Germans, about 10,570,000 in number, are scattered over the whole monarchy and form almost the sole population of the archduchy of Austria, Salzburg, the greatest portion of Styria and Carinthia, almost the whole of Tyrol and Vorarlberg, considerable portions of Bohemia and Moravia, the whole of the west of Silesia, etc.; and they are also numerous in Hungary and Transylvania. The Magyars or Hungarians (7,440,000 in number, or about 16 per cent of the total population) form the great bulk of the inhabitants.
of the kingdom of Hungary and of the eastern portion of Transylvania. To the Italic or western Romanic stock belong the inhabitants of south Tyrol and parts of the coast lands and Dalmatia, numbering about 700,000 in all. A considerable area of the empire is occupied by members of the Rumanian (or eastern Romanic) stock, who number altogether about 2,800,000, and from more than half the population of Transylvania, besides being spread over the southeastern parts of Hungary, Bukowina and Hungaria, with a part of Croatia and Slavonia. The number of Jews is also very considerable (above 2,258,000), especially in Galicia, Hungary, Bohemia and Moravia. There are also several other races whose numbers are small, such as the Gypsies (95,000), who are most numerous in Hungary and Transylvania, and the Albanians in Dalmatia and neighboring regions. The population is thickest in lower Austria, Bohemia, Silesia and Moravia; thinnest in Salzburg. Generally speaking, it decreases gradually from west to east.

Religion.—The state religion of Austria is the Roman Catholic, and next in numbers is the Greek Church. Calvinism and Lutheranism are also professed by a large body of the people; the latter mostly in Hungary and Transylvania, the latter in the German provinces and in Galicia. The civil power exercises supreme control in all ecclesiastical matters, the Emperor being, in everything but name, head of the Church; and as no sentence of excommunication, or other ecclesiastical edict, can be issued without the sanction of the Crown, the Pope's direct authority in Austria is somewhat limited. In 1910 there were in the Austrian portion of the monarchy 22,530,109 Roman Catholics, 3,417,223 Greek Catholics united to the Roman Church, 666,458 non-united, 430,900 Protestants and 1,313,687 Jews. In Hungary and Transylvania there were 9,010,305 Roman Catholics, 2,007,916 Greek united and 2,333,979 non-united, 1,306,384 Protestants and 911,227 Jews.

Education.—The Debrettian culture of the people is at very different stages of development among the different races. It is highest in the German provinces and lowest in the east. In Upper and Lower Austria, Salzburg, Tyrol, Moravia, Silesia and Bukowina the children of suitable age are in attendance on the public schools; while in Bukowina only about 34, and in Galicia about 59, per cent of them are at the schools. The educational system has been entirely remodeled. The elementary schools, or those in which the common branches are taught, are designated national schools or schools for the people (Volksschulen), and there children have to attend from the end of their 6th to the end of their 14th (in some provinces only their 12th) year. A higher class of elementary schools are known as town schools (Bürgerschulen), in which a superior education may be obtained. For the training of instructors for the people's schools, there are 43 normal schools for male teachers and 26 for female. As an additional class of elementary schools or institutions of a more advanced grade, there are the gymnasia and the *real-schools,* as they are called. The gymnasia resemble the best sort of our grammar schools, being intended chiefly to prepare pupils for the universities, with great attention being paid in them to the classical languages and history, universal and literary. In the real-schools a more practical end is kept in view, and modern languages and physical science form the groundwork of the educational course. A complete course in a gymnasia extends over four years, in a real-school over five, and in a technical school over six. In Vienna, Prague (two—a German and a Bohemian), Pesth, Gratz, Cracow, Lemberg, Innsbruck, Klausenburg, Agram and Czernowitz. Most of these have four faculties—Catholic theology, law and politics, medicine and philosophy. There are also several technical high schools in which mathematics, physics and natural science are the chief objects of study. Besides these there are theological institutions; schools for jurisprudence and philosophy; schools of commerce, agriculture, forestry, art, music and mining; military schools, naval schools, art schools, conservatories of music, etc. The principal libraries are the royal library at Vienna, and the university libraries of Vienna and Prague.

Constitution, Revenue.—As already mentioned, the Austrian dominions consist of a German or Slavo-Germanic or Cisleithan empire, and a Transleithan or Hungarian kingdom, each with its own Parliament, ministers and government as established by the Pragmatic Sanction of 6 Dec. 1724. The same hereditary sovereign rules over both, and they have a common army and navy, and a common Parliament known as the Delegations. The Delegations consist of 120 members, one-half of whom are chosen by and represent the legislature of German-Austria, and the other half that of Hungary; the upper house of each legislature returning 20 and the lower house 40 deputies. In all matters affecting the common affairs of the monarchical Delegations have a decisive vote, and their resolutions do not require the confirmation of the representative assemblies in which they have their source. The Delegations meet alternately in Vienna and Budapest. Their orders are divided into two chambers, the 60 members, one-half in each, and vote in two chambers, the 60 deputies of Cisleithan Austria forming the one, and the 60 of Hungary the other. But if no agreement can be arrived at in this manner, the two bodie must meet together and without further debate give their final vote, which is binding for the whole empire. The jurisdiction of the Delegations extends specially to all matters affecting foreign affairs, war and finance. The Constitution of German-Austria was finally established in December 1867. The provinces have each a diet or legislature of their own for provincial affairs, these diets being 16 in number, one each for Bohemia, Dalmatia, Galicia, Upper Austria, Lower Austria, Salzburg, Styria, Carinthia, Carniola, Bukowina, Moravia, Teschen, Gorycz, Lemberg, Moravia, Gradisca and Istria, the municipal council of Trieste having similar functions. The provincial diets are composed of the archbishops and bishops, the rectors of the universities, the representatives of the great estates, of towns, of boards of commerce, of rural communities, etc. The laws passed in these diets have reference
to provincial taxation, agricultural, educational and other matters. The national Parliament or legislature of German-Austria, called the Reichsrath (or council of the realm), consists of a lower house or House of Lords (Herrenhaus), and a lower house or House of Deputies (Abgeordnetenhaus). The former is composed of princes of the Imperial family, of nobles whose families have a hereditary right to this dignity, of the archbishops, the bishops of principal ranks, and of House of Lords (Herrenhaus), and a lower house or House of Deputies (Abgeordnetenhaus). The latter consists of members nominated by the Emperor. The lower houses consist of 353 members, elected by all citizens above 24 possessing a small property qualification. The rights belonging to the Reichsrath are: consent to all laws relating to military service; co-operation in the legislation on commercial matters, customs, railways, etc.; and examination of the estimates of the income and expenditure of the state, and other financial matters. The Constitution of Hungary, including the laws of Croatia, Slavonia and Transylvania, dates from the foundation of the kingdom, or about 895 A.D. It rests upon a number of statutes published at long intervals, the principal of these being the Bulka Avara or Golden Book. If the Empire of the Hapsburgs should perish, the government was defined as an aristocratic monarchy. The legislative power is vested in the King and the Parliament (Reichstag) conjointly. The latter consists of an upper house or House of Magnates, and of a lower house or House of Representatives. The House of Magnates consists of the archdukes of the Imperial family who have attained their majority, 54 ecclesiastical dignitaries, 151 counts and 36 barons as hereditary members, 84 life members nominated by the sovereign, or elected by the chamber, etc. The lower house (of 453 members) is composed of elected representatives. The Hungarian Reichstag corresponds to the Reichsrath of the Cisleithan provinces, and accordingly only deals with such matters as are common to the provinces belonging to the Hungarian Crown. Transylvania is, so far as legislation and administration are concerned, entirely incorporated with Hungary. Croatia and Slavonia, however, have a Landtag or diet of their own. The republics of Dalmatia, Croatia and Slavonia, the Austrian crown, and the Slavonian portion of the empire, consists of only one chamber, and which is competent to deal with all matters belonging to the interior administration of the provinces, with religion and education, and with the administration of justice. Fiume, which was formerly associated with Croatia and Slavonia, and subject to the Landtag of these provinces, in August 1870, was put directly under the central Hungarian government.

There being three distinct parliaments in the empire, there are also three budgets, namely, that for the whole empire, that for Cisleithan and that for Transleithan Austria. In the budget for 1910 the revenue of Austria was $450,068,400; of Hungary $414,900,800; the expenditure of Austria was $380,272,800; of Hungary $380,333,200. A small portion of the imperial revenue of Austria is derived from customs and other sources, and the remainder is made up by the two divisions of the empire, Hungary paying the greater proportion by Austria and 30 per cent by Hungary.

Recent Politics.—Austria to-day is, what Metternich with less truth called Italy, little more than a geographical expression. Three bonds unite its discordant nationalities. There is nothing really Austrian in Austria — no Austrian interests, no Austrian language, or literature, or patriotism, no Austrian nationality, no Austrian standard of civilization; nothing except the Emperor, and the army, and the forum of the Reichsrath that the races share in common. The Germans form a compact entity by themselves in Upper and Lower Austria and in the duchy of Salzburg and in Bohemia, they constitute a considerable colony along the borders of Saxony and Bavaria, over 2,000,000 strong, but even so they are outnumbered by the Czechs in the ratio of 3 to 5. All together the German-speaking subjects are about a third of the total population of Austria—some 10,750,000 out of 28,572,000. The Czechs in Bohemia, Moravia and Silesia number roughly 5,000,000. In Galicia some 4,000,000 Poles hold down a trifle over 4,000,000 Ruthenians. The Serbs, Croats and the Slovenians, in the undivided kingdom of Jugoslau (i.e., South Slavs), number roughly 6,000,000 and constitute the bulk of the population of the provinces of Bosnia, Herzegovina, Dalmatia and the Dalmatian archipelago, Croatia and Slavonia which was achieved by the government was defined as an aristocratic monarchy. The legislative power is vested in the King and the Parliament (Reichstag) conjointly. The latter consists of an upper house or House of Magnates, and of a lower house or House of Representatives. by the irresistible and peaceful process of de-
nationalization in the schoolroom, has gone on
at such a pace that the Magyars increase nearly
three times as quickly as any of the neighboring
races. The struggle of the nationalities in Hun-
gary ended in more or less resigned
acquiescence in Magyar rule.

In Austria, as in Spain, the factory is placed
some distance behind the barracks as an ele-
ment of national welfare, and a contemptuous
bureaucracy shackles trade with a hundred ent-
tangling regulations. The Magyars, on the
other hand, have been as attentive to commerce
as to their racial position. Perhaps there is no
country in which the state, as such, has done
more for industrial development. The really
vital domestic problems of Hungary are, in-
deed, no longer racial, and as freedom of
worship is the law, they have never been acutely
religious. But in the rise of what is called
Agrarian Socialism there is something that may
be called Magyar agnosticism, in opposition to the
while the Magyars are the backbone of the dual
monarchy. Against the rising tides of Pan-
Slavism they present a compact and unbending
front. Together with the German empire they
would be able to resist any Slav aggression; and even in the
domestic affairs of the monarchy their unbreakable
unity as a political force has made their influ-
ence well-nigh decisive. The Ausgleich of 1867,
the partnership agreement between the two
halves of the realm,—prescribed that matters
of common concern, such as foreign affairs,
diplomatic representation and naval and mili-
tary matters, should be arranged by 60 dele-
gates from each country, meeting twice a year.
The Austrian delegation, on the other
hand, is composed of 35 Magyars and five
Croats, working with the directness and
harmony of a single man. The consequence is
that in the long run the Hungarian view is
fairly sure to carry the day. So far each
renewal of the Ausgleich has brought substanc-
tial modifications in favor of Hungary, and the
trend is in a steady gravity as the Powers move
from Vienna to Budapest. The Emperor, when driven
to it, might go against the German-speaking
Austrians, but never against the Magyars; and
the Magyars, fully realizing their power, have
exerted concession after concession from their
unhappy partner; have applied the screw so
persistently that it is becoming a question
whether they are not as unpopular among Aus-
trian statesmen as the very Czechs themselves.
The troubles of the dual monarchy are due to
the failure of the Germans to repeat in Austria
the successes of the Magyars in Hungary.
*You look after your hordes,* said Count Beust
to a Hungarian statesman when the Austrian
empire became the dual monarchy, *and we'll
look after ours.* The Czechs of Bohemia have
turned to ridicule the count's too valiant decla-
ration. The Germans of Vienna, one must
remember, are very different from the
Germans of Berlin. Of all the sections of the
Teutonic race they appear to have
the least robustness of intellect, the
least character and the latest grip on practical
affairs. Indolent, hypercritical and self-satisfied,
they are emasculated editions of their northern
kinsmen. From whatever cause, some para-
lizing blight of lassitude and ineffectiveness
seems to have eaten its way into their energies.
Against their cultured fakeliness the Czechs
oppose the elemental force of racial ambition,
the driving power of a Jotunthey have the
consciousness of a great destiny before it and
feels itself on the top of the rising wave.
The Germans protest that they have educated
themselves beyond the point where race is
everything. But if at the time of playing, they
are expected to return to first principles. It is of
course tenable that the variety of parties into
which the Germans are split up argues an
advanced and broad political intelligence. At
the same time it makes a poor barrier against
the impact of a race that subordinates every-
thing to a single practical end; and unless the
Germans are prepared to see a great part of
their old ascendency pass away, they must be
ready to drop *theorizing,* take up the issue
that has been fogy on both sides, back against
Slav aggression; and even in the
domestic affairs of the monarchy their unbreakable
unity as a political force has made their influ-
ence well-nigh decisive. The Ausgleich of 1867,
the partnership agreement between the two
halves of the realm,—prescribed that matters
of common concern, such as foreign affairs,
diplomatic representation and naval and mili-
tary matters, should be arranged by 60 dele-
gates from each country, meeting twice a year.
The Austrian delegation, on the other

the successes of the Magyars in Hungary.
*You look after your hordes,* said Count Beust
to a Hungarian statesman when the Austrian
empire became the dual monarchy, *and we'll
look after ours.* The Czechs of Bohemia have
turned to ridicule the count's too valiant decla-
ration. The Germans of Vienna, one must
remember, are very different from the
Germans of Berlin. Of all the sections of the
Teutonic race they appear to have
the least robustness of intellect, the
least character and the latest grip on practical
affairs. Indolent, hypercritical and self-satisfied,
they are emasculated editions of their northern
shortest step toward Home Rule, the Germans at once adopt their opponents' tactics, throw themselves into the arms of their Prussian brethren, and vow that sooner than stay and be swamped by a hated and inferior race, they would willingly exchange the Hapsburgs for the Hapsburgs against racial politics among the Kaiser Wilhelm's subjects. The suspicion cannot be avoided that these dramatics are at bottom intended for home consumption and that the tune would be quickly changed if the Tsar or Kaiser were to be replaced. The blind and unreasoned patriotism of both nations seems to be the real interest of both, and of that interest, the two countries. And not only is the monarchy secure in the affections of the people, but the dynasty is equally popular. So long as there is a throne it is not conceivable that any one but a Hapsburg should occupy it. This two-fold devotion to monarchy and dynasty was greatly strengthened, partly by the breakdown of parliamentary government and weariness which made the people look to the throne as an escape from the turmoil and wranglings of small groups, and partly through the patience and wisdom, the sterling fairness and competency of the late Emperor Francis Joseph, as well as the ghastly tragedies of his private life. What the Czechs and the other races want is, the same independence as the Magyars possess: new unity, and of these problems, the most prominent is the relationship with the Magyars. The interplay of these racial ambitions has been complicated, sometimes delayed and sometimes acutely emphasized by a hundred differences of religious, social, economic, and political kind, all of which have representatives in the Reichsrath. They act upon one another under the shadow of the racial issues in a way that no foreigner can disentangle. The confusion of the country is worthily reproduced in the 15 distinct parties and the seven or eight languages that crop up in the Vienna Parliament. Austria-Hungary is a polyglot chaos in which even Austrians do not profess to see more than a half light. The spectres of disruption may therefore appear at least plausible. But it is one of the many paradoxes of the dual monarchy that it seems unable to break up. In part it is protected by the very diversity and number of the antagonisms it is obliged to house. A more visible bond of union is the army, in which all must serve, which is of all races and creeds, and therefore of none, and the atmosphere of which is broadly and impressively imperial. What its actual effectiveness will prove to be is another matter. It is one of the most interesting modern experiments in the army, with which it can be compared in the excellence of its units and the variety of its nationalities and tongues is the allied army which rescued the Pekin legations, and the parallel is not altogether hopeful. A polyglot army must of necessity be to some extent a disorganized army, and while the forces of the dual monarchy use German as the language of military command, the rank and file and the bulk of the officers retain their own speech for general purposes. The heterogeneous character of its composition has had a steady influence on the internal struggles of the dual monarchy, however much it may hamper its efficiency on the battlefield. The army has kept itself largely aloof from politics, and though the Czechs did once attempt to overthrow the Imperial Government by answering the roll-call in their own tongue, a sharp rebuke from the Emperor was enough to bring them to reason.

A second and equally powerful bond of union has been the monarch. Not only is it by now accepted everywhere, but the idea of upsetting it in favor of any other form of government has never yet been broached. Even the irreconcilable, who would like to see the Ausgleich abolished and Hungary direct her own fiscal policy,—a quite possible development,—and manage her own foreign affairs, still do not propose to sever the personal tie that binds the two countries. And not only is the monarchy secure in the affections of the people, but the dynasty is equally popular. So long as there is a throne it is not conceivable that any one but a Hapsburg should occupy it. This two-fold devotion to monarchy and dynasty was greatly strengthened, partly by the breakdown of parliamentary government and weariness which made the people look to the throne as an escape from the turmoil and wranglings of small groups, and partly through the patience and wisdom, the sterling fairness and competency of the late Emperor Francis Joseph, as well as the ghastly tragedies of his private life. The army has kept itself largely aloof from politics, and though the Czechs did once attempt to overthrow the Imperial Government by answering the roll-call in their own tongue, a sharp rebuke from the Emperor was enough to bring them to reason.
longed to the kingdom of the Marcomanni and Quadi; a part of Low Austria and Styria, with Vienna (Vindobona), a municipal city of the Roman empire, belonged to upper Pannonia; the rest of the country, with Carinthia and a part of Carniola, formed a portion of Noricum. Görz belonged to the Roman province of Ilyricum and Tyrol to Rhaetia. These limits became confused by the irritations of the West-Goths, who spread over the upper Pannonia and Noricum but recognized the Roman supremacy as early as 380 A.D. The Boi, Vandals, Heruli, Rugii, Goths, Huns, Lombards and Avars, in the course of the 5th and 6th centuries, successively occupied the country. But after the year 568, when the Lombards had established their power in upper Italy, the river Enns formed the boundary line between the German tribe of Bavarii, the proprietors of the territory above the Enns, and the Avars, who had removed from the east to the banks of that stream. In 611 the Wendi, a Slavonic tribe, appeared on the Murr, Drave and Save. They were opposed by the Franks in the Bavarian territory. In 791 Charlemagne forced them to retire to the Rhine, and united the territory extending from the Rhine to the junction of the Rhine with the Danube (the territory below the Enns) with Bavaria under the name of Avaria, or the Eastern Mark (Marchia Orientalis), or Austria; and in the 10th century (in a document of Otto III 996) it was called Österrich, equivalent to the modern Österreich. Many colonies were planted in the new province, and a margrave was appointed to administer the government. The archbishop of Salzburg was at the head of ecclesiastical affairs. After its separation from Verona in 843, Avaria formed the eastern boundary of the German empire. On the invasion of Germany by the Hungarianians, in 900, Avaria fell into their hands, and was held by them till 955, when the Emperor Otto I, in consequence of the victory of Austerlitz, restored it to Bavaria. In 976 the margrave Albert I (the Victorious), its limits were extended to the Leitha.

Austria under the House of Bamberg till 1282—Otto II transferred in 976 the Austrian margravate to his faithful adherent Leopold I, who was, according to tradition, a descendant of the house of Count Adelbert of Badenburg, who became famous by his victories over the Magyars, and perished in 994. From that year to 1156 the margravate of Austria was hereditary in the family of the counts of Badenburg (Bamberg); the succession, however, was not regulated by primogeniture but by the will of the Emperor. In ancient documents mention is made of the estates of Austria in the year 1096. After Henry the Proud (Duke of Bavaria and Saxony) was put under the ban of the empire, Leopold VI, margrave of Austria, received the dukedom of Styria in 1138 from the Emperor Conrad. But when the Margrave Henry, son of Leopold, under the title of Jo-so-mir-Gott (Yes-so-me-God), had again ceded it, in 1156, to Henry the Lion, the boundaries of Austria were extended so as to include the territory above the Enns, and the margrave was created a duke with the privileges of a prince. Under this duke the court resided at Vienna. Duke Leopold VI, the son of Henry, received the dukedom of Styria in 1192 as a fief from the Emperor Henry VI, it having been added to the empire by Otto I, in 976, by the treaty of the Hungarians. It was this prince who imprisoned Richard Coeur de Lion, King of England. Duke Leopold VII, the youngest son of the former, erected a palace within the city of Vienna, which was long occupied by the Austrian monarchs, under the name of the old castle. Leopold VII, called the Glorious, established the hospital of the Holy Cross, made Vienna, which had adopted a municipal constitution in 1198, a staple town, and granted 30,000 marks of silver for the promotion of trade and commerce. In 1229 he purchased a part of Carniola from the ecclesiastical principality of Freisingen for 1,650 marks, and left the country in a flourishing condition to the youngest of his three sons, Frederick II, surnamed the Warrior. In 1236 this prince was invited to invade the kingdom on account of his joining the alliance of the cities of Lombardy against the Emperor Frederick II; and Otho, Duke of Bavaria, seized upon his territory above the Enns as far as Linz. The rest of the country was granted, as a fief by the Emperor to a margrave, and Vienna became an imperial city.

During the Emperor’s campaign in Italy Duke Frederick recovered the principal part of his lands, and his rights were confirmed by the Emperor at Verona, 1243. The rights of Vienna as an imperial city were abolished, and Frederick was to be called king, as sovereign of Austria and Styria; but all his expectations of empire were disappointed by his death in the battle of the Leitha against Bela IV, King of Hungary, 15 July 1246, in the 35th year of his age. Thus the male line of the house of Bamberg became extinct. The period from 1246 to 1282 is styled the Austrian interregnum. The Emperor Frederick II declared Austria and Styria a free imperial fief, the hereditary property of the German emperors, and sent a governor to Vienna, the privileges of which, as an imperial city, were once more renewed. But the female relations of the deceased Duke Frederick, his sister Margaret (widow of the Emperor Henry VI), and his niece Gertrude, the wife of Pope Innocent IV, in 1248, laid claim to the inheritance of their brother. The Margrave Hermann, with the aid of the Pope and a strong party, made himself master of Vienna, and of several Austrian cities. In Styria he was opposed by the governor Meinhard, Count of Görz. But Hermann died in 1250, and his son Frederick, who was afterward beheaded in 1268, at Naples, with Conradin of Swabia, was then only a year old. The whole country was distracted by warring emperors. The election of Emperor Conrad IV was prevented, by disputes with his neighbors, from turning his attention to Austria. In 1251 the states of Austria and Styria determined to appoint one of the sons of the second wife of Frederick of Swabia, Eleanor (widow of the Margrave Henry the Illustrious), to the office of duke. The deputies were on the way to Misnia when they were persuaded by King Wenceslaus, on their entrance into Prague, to declare his son Ottocar
Duke of Austria and Styria, who made every effort to support his appointment by arms, money, and especially by his marriage with the Empress widow Margaret. Ottocar wrested Styria from Bela, King of Hungary, by his victory of July 1260, in the Marchfield; and in 1262 forced the Emperor Richard to invest him with both duchies. Soon after, by the will of his uncle Ulrich, the last Duke of Carinthia and Friuli (who died 1296), Ottocar became master of Carinthia, a part of Carniola connected with it, the kingdom of Istria and a part of Friuli, for which he had made his father’s fall. In 1272 he refused to acknowledge Count Rudolph of Hapsburg emperor, and was obliged to defend himself against Rudolph. After an unsuccessful war he was forced to cede all of his Austrian possessions in November 1276. In 1277 he attempted to recover these territories, but, in the battle of the Marchfield, 26 Aug. 1278, he was slain, and his son Wenceslaus was obliged to renounce all claim to them, in order to save his younger brothers. The Emperor, Rudolph, remained three years in Vienna, and then appointed his eldest son Albert governor. But having succeeded in gaining the consent of the Electors of Saxony and Brandenburg, of the three ecclesiastical electors and of the Count-Palatine of the Palatinate, he granted the duchies of Austria and Styria, with the province of Carinthia, to his two sons, Albert and Rudolph, 27 Dec. 1280.

**Austria under the House of Hapsburg**—I. From 1282 to 1326. Albert and Rudolph transferred Carinthia to Meinhard Count of Tyrol, father-in-law to Albert. In 1283 they concluded a treaty, by which Albert was made sole possessor of Austria, Styria and Carniola. Vienna having again renounced its privileges as an Imperial city, was made the residence of the court, and the successors of Rudolph, from this time, assumed Austria as the family title. The introduction of the Hapsburg dynasty was the foundation of the future greatness of Austria. Albert, the despotic Albert was assailed by Hungary and Styria. In 1298 he not only again united in an engagement with Adolphus of Nassau. After this he undertook the conquest of Switzerland; but was assassinated 1 May 1308, at Rheinfelden, by his nephew, John of Suhl, and his brother Albert, who, as the heir to his hereditary estates. The inheritance of John now fell to the five sons of the murdered Albert—Frederick, surnamed the Fair, Leopold, Henry, Albert and Otho. They were forced to purchase of the Emperor Henry VII the investiture of their paternal estates (consisting, in 1308, of 26,572 square miles) for 20,000 marks of silver. Under their father, in 1301, the margraviate of Suabia was added to the territories of Austria, and the contest with Bavaria ended in Austria obtaining Neuburg. On the contrary, the attempt of Duke Leopold, in 1315, to recover the forest towns of Switzerland, which had been lost under Albert, was frustrated by the valor of the troops of the Swiss confederacy in the battle of Morgarten. In 1316 his brother, Emperor Henry (of Bavaria), in 1322, at Mühldorf, and was his prisoner for two years and a half in the castle of Traunstein. The dispute with the house of Luxemburg, in Bohemia, and with Pope John XXII induced the Emperor, in 1325, to liberate his captive. Upon this the latter renounced all share in the government, and pledged himself to surrender all the Imperial domains which were still in the possession of Austria. But Leopold considered the agreement derogatory to his dignity and continued the war against Louis, Frederick, therefore, again surrendered himself a prisoner in Munich. Moved by his faithful adherence to his word, Louis concluded a friendly compact with Frederick, and made preparations for their common government, 7 Sept. 1326. These preparations, however, were never carried into execution; for the agreement had been concluded without the consent of the electors. Leopold died in 1326, and Henry of Austria in 1327; Frederick also died without children, 13 Jan. 1330, after which his brothers, Albert II and Otho, came to a reconciliation with the Emperor Louis. After the death of their uncle, Henry, Margrave of Tyrol and Duke of Carinthia (the father of Margaret Maultasch), they persuaded the Emperor to grant them the investiture of Tyrol and Carinthia, in May 1335; they ceded Tyrol, however, to John, King of Bohemia, by the treaty of 9 Oct. 1356, in behalf of his son John Henry, or rather of his wife, Margaret Maultasch. In 1344, after the death of Otho and his sons, Albert II, called the Wise, united all his Austrian territories, which, by his marriage with the daughter of the last Count of Pfirt, had been augmented by the estates of her father in 1324, and by the Kyburg estates in Burgundy in 1326. Of the four sons of Albert II (Rodolph, Albert, Leopold and Frederick), Rudolph II (IV) completed the church of Saint Stephen's and laid the foundation of the University of Vienna. He died in Milan in 1365, without children, a short time after his youngest brother, Frederick. In 1379 the two surviving brothers divided the kingdom, so that Albert III (with the Queue) became master of Austria, and gave the other territories to his brother, Leopold III, the Pious. Leopold had made repeated attempts to gain the Hapsburg possessions in Switzerland and extended the territory of his realm to a considerable degree, having purchased, among other minor provinces, the county of Feldkirche, Bludenz, Hohenberg, upper and lower Suabia and, 1382, without his heir, to his hereditary estates. The inheritance of John now fell to the five sons of the murdered Albert—Frederick, surnamed the Fair, Leopold, Henry, Albert and Otho. They were forced to purchase of the Emperor Henry VII the investiture of their paternal estates (consisting, in 1308, of 26,572 square miles) for 20,000 marks of silver. Under their father, in 1301, the margraviate of Suabia was added to the territories of Austria, and the contest with Bavaria ended in Austria obtaining Neuburg. On the contrary, the attempt of Duke Leopold, in 1315, to recover the forest towns of Switzerland, which had been lost under Albert, was frustrated by the valor of the troops of the Swiss confederacy in the battle of Morgarten. In 1316 his brother, Emperor Henry (of Bavaria), in 1322, at Mühldorf, and was his prisoner for two years and a half in the castle of Traunstein. The dispute with the house of Luxemburg, in Bohemia, and with Pope John XXII induced the Emperor, in 1325, to liberate his captive. Upon this the latter renounced all share in the government, and pledged himself to surrender all the Imperial domains which were still in the possession of Austria. But Leopold considered the agreement derogatory to his dignity and continued the war against Louis, Frederick, therefore, again surrendered himself a prisoner in Munich. Moved by his faithful adherence to his word, Louis concluded a friendly compact with Frederick, and made preparations for their common government, 7 Sept. 1326. These preparations, however, were never carried into execution; for the agreement had been concluded without the consent of the electors. Leopold died in 1326, and Henry of Austria in 1327; Frederick also died without children, 13 Jan. 1330, after which his brothers, Albert II and Otho, came to a reconciliation with the Emperor Louis. After the death of their uncle, Henry, Margrave of Tyrol and Duke of Carinthia (the father of Margaret Maultasch), they persuaded the Emperor to grant them the investiture of Tyrol and Carinthia, in May 1335; they ceded Tyrol, however, to John, King of Bohemia, by the treaty of 9 Oct. 1356, in behalf of his son John Henry, or rather of his wife, Margaret Maultasch. In 1344, after the death of Otho and his sons, Albert II, called the Wise, united all his Austrian territories, which, by his marriage with the daughter of the last Count of Pfirt, had been augmented by the estates of her father in 1324, and by the Kyburg estates in Burgundy in 1326. Of the four sons of Albert II (Rodolph, Albert, Leopold and Frederick), Rudolph II (IV) completed the church of Saint Stephen's and laid the foundation of the University of Vienna. He died in Milan in 1365, without children, a short time after his youngest brother, Frederick. In 1379 the two surviving brothers divided the kingdom, so that Albert III (with the Queue) became master of Austria, and gave the other territories to his brother, Leopold III, the Pious. Leopold had made repeated attempts to gain the Hapsburg possessions in Switzerland and extended the territory of his realm to a considerable degree, having purchased, among other minor provinces, the county of Feldkirche, Bludenz, Hohenberg, upper and lower Suabia and, 1382, without his heir, to his hereditary estates.
Trieste was acquired in 1380 by aiding in the war between Hungary and Venice. Moreover, the crown governments of Upper and Lower Silesia were pledged for 40,000 florins by the King of Rome, Wenceslaus, to Duke Leopold. The Austrian and Styrian lines, founded by Albert III and Leopold III, his brother, continued for 78 years. In 1395, when Albert III died, his only son, Albert IV, was in Palestine. On his return he determined to take vengeance on Procopius, Margrave of Moravia, for his hostile conduct; but he was poisoned in 1404 at Znaym. His young son and successor, Albert V, was declared king in 1410; and being the son-in-law of the Emperor Sigismund, he united the crowns of Hungary and Bohemia in 1437, and connected them with that of Germany in 1438. But in the following year the young prince died. His posthumous son, Ladislaus, was the last of the Austrian line of Albert, and its possessions devolved on the Styrian line, 1457. From this time the house of Austria has furnished an unbroken succession of German emperors. Hungary and Bohemia were lost for a time by the death of Albert V, and, after the disastrous contests with the Switzers, under Frederick III, the remains of the Hapsburg estates in Switzerland. But several territories were gained; and, to increase the rising splendor of the family, the Emperor conferred upon the country the rank of an archduchy. The dispute which broke out between Frederick and his brothers Albert and Sigismund, relating to the division of their paternal inheritance, ended with the death of Albert in December 1460. In the course of the troubles which resulted from this quarrel the Emperor was besieged in the citadel of Vienna by the citizens, who favored the cause of the murdered prince. Sigismund now succeeded to his portion of the estate of Ladislaus and Frederick became sole ruler of all Austria. His son Maximilian, by his marriage with Mary, the surviving daughter of Charles the Bold, united the Netherlands to the Austrian dominions. But it cost Maximilian much anxiety and toil to maintain his power in this new province, which he administered with the guidance of his brother Philip. After the death of his father, 19 Aug. 1493, he was made Emperor of Germany, and transferred to his son Philip the government of the Netherlands. Maximilian added to his paternal inheritance all Tyrol, and several other territories, particularly some belonging to Bavaria. He also acquired for his family new claims to Hungary and Bohemia. During his reign Vienna became the great metropolis of the arts and sciences in the German empire. The marriage of his son Philip to Joanna of Castile raised the house of Hapsburg to the throne of Spain and the Indies. But Philip died in 1506, 13 years before his father, and the death of Maximilian, which happened 12 Jan. 1519, was followed by the union of Spain and Austria; his son Charles I (the Holy Roman Emperor Charles V), was elected Emperor of Germany. In the Treaty of Worms, 28 April 1521, and of Ghent, 7 May 1540, he ceded to his brother Ferdinand all his hereditary estates in Germany, and retained for himself the kingdom of the Netherlands. The house of Austria was now the proprietor of a tract of country in Europe comprising 300,230 square miles. The Emperor Charles V immediately increased the number of provinces in the Netherlands to 17, and confirmed their union with the German states, which had been concluded by his grandfather, under the title of the circle of Burgundy. In 1526 Austria was recognized as a European monarchy.

II. From 1526 to 1740. Ferdinand I, by his marriage with Anna, the sister of Louis II, King of Hungary, who was killed in 1526 in the battle of Mohacs, acquired the kingdoms of Hungary and Bohemia, with Moravia, Silesia and Lusatia, the appendages of Bohemia. Bohemia rejoiced to hail Ferdinand its king. Notwithstanding the divided opinions of the nobles, and the rising fortune of his adversary, John von Zapolya, he was raised to the throne of Hungary 26 Nov. 1526, by the Hungarian Diet, and was crowned 5 Nov. 1527. But Zapolya resorted for assistance to the Sultan, Soliman II, who appeared in 1529 at the gates of Vienna. The capital was rescued from ruin solely by the Count of Salem, general of the Austrian army, and the Imperial forces compelled Soliman to retreat. In 1535 a treaty was made by which John Zapolya was permitted to retain the royal title and half of Hungary, and his posterity were to be entitled to nothing but Transylvania. But after the death of John new disputes arose, in which Soliman was again involved, and Ferdinand maintained the possession of lower Hungary only by paying the warlike Sultan the sum of 30,000 ducats annually. This took place in 1562. Ferdinand was equally unsuccessful in the duchy of Württemberg. This province was taken from the restless Duke Ulrich by the Swabian confederacy, and sold to the Emperor Charles V; and when his estates were divided it fell to Ferdinand. Philip, Landgrave of Hesse, the friend of Duke Ulrich, took advantage of the opportunity offered him by the embarrassment of Ferdinand in the Hungarian War. With the aid of France he conquered Württemberg; but France ceded it again to Ulrich in the Treaty of Baden, in Bohemia, concluded 20 June 1534 on condition that the province should still be a fief of Austria; and after the death of the last Duke of Saxe-Lauenburg succeeded to the line of the Duke that it should revert to that country. Ferdinand received also the Imperial crown in 1556, when his brother Charles laid by the sceptre for a cowl. He died 25 July 1564, with the fame of an able prince, leaving three sons and 10 daughters. According to the directions given in his will, the three brothers divided the patrimony, so that Maximilian II, the eldest son, who succeeded his father as Emperor, obtained Austria, Hungary and Bohemia; Ferdinand, the second son, received Tyrol and Hither Austria; and Charles, the third, became master of Styria, Carinthia, Carniola and Görz. But in 1595, after the death of the Archduke Ferdinand, the husband of Philippine Welser, the fair maid of Augsburg, his sons Andrew (cardinal of the Church of Brixen, and governor of the Netherlands for Spain) and Charles (Margrave of Burgau) were declared incompetent to succeed their father, and his possessions reverted to his relations in Germany, and retained for himself the kingdom of the Netherlands. The house of Austria was now the proprietor of a tract of country in Europe comprising 300,230 square miles. The Emperor in 1566 was followed by a peace, and in 1572 Maximilian crowned his eldest son, Rodolph, King of Hun-

gary; he was afterward crowned King of Bohemia, and was elected King of Rome. In his attempts to recover his Austrian dominions he was equally unsuccessful with his fourth son, Maximilian, who engaged in an identical enterprise after the death of Stephen Bathori in 1587. Maximilian died 12 Oct. 1576, and Rudolph, the eldest of his five sons, succeeded to the imperial throne. King Rudolph's most remarkable events by which his reign is distinguished are the war against Turkey and Transylvania, the persecutions of the Protestants, who were all driven from his dominions, and the circumstances which obliged him to cede Hungary in 1608, and Bohemia and his hereditary estates in Austria in 1611, to his brother Matthias. From this time we may date the successful excursions of the Austrian sovereigns to put down the restless spirit of the nation, and to keep the people in a state of abject submission. Matthias, who succeeded Maximilian on the imperial throne, concluded a peace for 20 years with the Turks; but he was disturbed by the Bohemians, who took up arms in his allies at Rastatt; Matthias died 20 March 1619, before the negotiations for a compromise were completed. The Bohemians refused to acknowledge his successor, Ferdinand II, and chose Frederick V, the head of the Protestant League, and elector of the palatinate, for their king. After the battle of Prague, 1620, Bohemia submitted to the authority of Ferdinand. He immediately applied himself to eradicate Protestantism out of Bohemia proper and Moravia. At the same time he deprived the right of possessing a king and of her other privileges. He erected a Catholic court of reform, and thus led to the emigration of thousands of the inhabitants. This large exodus of inhabitants did much to retard the growth of Bohemia. In fact the religious wars waged upon Bohemian soil for so long a time, dating back to the first outbreaks of the Hussites, with the subsequent agitations and conflicts consequent upon the Reformation, long and seriously hampered that state's general development up to modern times. Tests also against the general the Protestant religion, were compelled by Fer-
dinand to swear allegiance to him, and Lutheranism was strictly forbidden in all the Austrian dominions. The province of Hungary, which revolted under Bethlem Gabor, Prince of Transylvania, was, after a long struggle, subdued. This religious war dispeopled, impoverished, and paralyzed the energies of the most fertile provinces of the, house of Austria. Dur-
ing the reign of Ferdinand III, the successor of Ferdinand II (1629–57), Austria was constant the theatre of war. In the midst of these troubles Ferdinand ceded Lusatia to Saxony at the peace of Prague, concluded in 1635; and when the war was ended he ceded Alsace to France, at the peace of Westphalia, in 1648. Leopold I, son and successor of Ferdinand III, was victorious through the talents of his min-
ister Eugene, in two wars with Turkey; and Vienna was delivered by John Sobieski and the emperor under Karl Luitpold from the attacks of Kara Mustapha in 1683. In 1687 he changed Hungary into a hereditary kingdom, and joined to it the territory of Transylvania, which had been governed by dis-
ect princes. Thanks to the victories of Prince Eugene of Savoy, Leopold succeeded in concluding a permanent peace of Czernina in 1699. Moreover, he restored to Hungary the country lying between the Danube and the Theiss. It was now the chief aim of Leopold to secure to Charles, his second son, the inheri-
tance of the Spanish monarchy; then in the bands of Charles II. Leopold, Spain, who had no children; but his own indecision, and the policy of France, induced Charles II to appoint Philippe d'Anjou, the grandson of Louis XIV, his successor. Thus began the war of the Spanish Succession (see Succession Wars) in 1701. Leopold died 5 May 1705, before it was terminated. Emperor Joseph I, his successor and eldest son, continued the war, but died without children, 17 April 1711. His brother Charles, the destined King of Spain, immedi-
ately hastened from Barcelona to his hereditary states, to take upon him the administration of the government. He was elected emperor 24 December of the same year; but was obliged to accede to the peace of Utrecht, concluded by his allies at Rastatt; in which, by this treaty Austria received the Netherlands, Milan, Mantua, Naples and Sardinia. In 1720 Sicily was given to Austria in exchange for Sardinia. The duchy of Mantua, occupied by Joseph in 1708, was now made an Austrian fief, because it had formed an alliance with France prejudicial to the interests of Germany. This monarchy now embraced 191,621 square miles. Its annual income was between 13,000,000 and 14,000,000 florins, and its army consisted of 40,000 men, but losing 30,000 men by new wars with Spain and France. In the peace concluded at Vienna 1735 and 1738, Charles VI was forced to cede Naples and Sicily to Don Carlos, the Infante of Spain, and to the King of Sardinia a part of Milan, for which he re-
ceived only a part of Parma and Piacenza. In the next year, by the peace of Belgrade, he lost nearly all of the fruits of Eugene's victories, even the province of Temeswar; for he was obliged to transfer to the Porte, Belgrade, Servia and all the possessions of Austria in Wallachia and Bosnia. To all this Charles VI willingly acceded in order to secure the suc-
cession of his daughter, Maria Theresa, by the Pragmatic Sanction. This law of inheritance was passed 1713–19, and acknowledged one after another by all the European powers. Austria under the House of Hapsburg-Lorraine.—By the death of Charles VI, 20 Oct. 1740, the male line of the Austrian house of Hapsburg became extinct; and Maria Theresa having married Stephen, Duke of Lor-
orraine, ascended the Austrian throne. On the side her claims were disputed, and rival claims set up. A violent war began in which she had no protector but England. Frederick II of Prussia subdued Silesia; the Elector of Bavaria was crowned in Linz and Prague, and in 1742 was chosen emperor under the name of Charles VII. Hungary alone supported the Queen. But in the peace of Brilsaul, concluded 4 June 1742, she was obliged to cede to Prussia, Silesia and Glaitz, with the exception of Teschen, Jager-
sburg, Rastorf and Troppau. Francis I, reigning at the party of Charles VII, soon renewed the war. But Charles died 20 Jan. 1745, and the husband of Theresa was crowned Emperor of Germany under the title of Francis I. A second treaty
of peace, concluded 25 Dec. 1745, confirmed to Frederick the possession of Silesia. By the peace of Aix-la-Chapelle, 10 Oct. 1748, Austria was obliged to cede the duchies of Parma, Piacenza and Guastalla to Philip, Infante of Spain, and several districts of Milan to Sardinia. The Austrian monarchy was now firmly established; and it was the first wish of Maria Theresa to recover Silesia. With this object in view she formed an alliance with France, Russia, Saxony and Sweden. This was the origin of the Seven Years' War; but, by the peace of Hubertswalde, 1763, Prussia retained Silesia, and Austria had sacrificed her blood and treasures in vain. The first paper money was now issued in Austria, called state obligations, and the Emperor Francis erected a bank to exchange them. After his death, 18 Aug. 1765, Joseph II, his eldest son, was appointed colleague with his mother in the government of his hereditary states, and elected Emperor of Germany. To prevent the extinction of the male line of her family Maria Theresa now established two collateral lines: the house of Tuscany, in her second son, Peter Leopold, and the house of Bavaria, in the person of the Archduke Ferdinand. For these separations Maria Theresa indemnified the country by the confiscation of several cities, formerly pledged to Poland by Hungary, without paying the sum for which they stood pledged; by obtaining Galicia and Lodomeria in the first profligate division of the kingdom of Poland in 1772; and by the capture of Bukowina, which was ceded by the Porte in 1777. In the peace of Teschen, 13 May 1779, Austria received Inviertel, and the province of Hohenems, Suabia, the county of Falkenstein, and the Suabian territories of Tettin and Argen; and thus at the death of the Empress, 28 Nov. 1780, Austria contained 234,684 square miles; it had lost 16,336 square miles, and gained 34,301. The population was estimated at 24,000,000; but the public debt also had increased to 160,000,000 florins. The administration of the Empress was distinguished by substantial improvements in connection with government, agriculture, trade and commerce, the education of the people, the progress of the arts and sciences and of religion. The foreign relations of the kingdom also, even those with the Roman court, were happily conducted by the talents of her minister, Kaunitz.

Her successor, Joseph II, was active and restless; impartial, but too often rash and violent. While a colleague with his mother in the government he diminished the expenses of the state, and introduced a new system in the payment of pensions and of officers. But after the death of his mother all his activity and talent as a sovereign was fully developed. As severe to the military as to the civil officers, he adhered, however, to liberal principles. The censorship of the press was reformed; the Protestant received full toleration, and the rights of the Jews were treated with kindness; 900 convents and religious establishments were abolished, and even the visit of Pius VI made no alteration in Joseph's system of reformation. The system of education he subjected to revision and improvement; and the rise of manufactures by duties on foreign goods. But his zeal excited the opposition of the enemies of improvement. The low countries revolted, and his vexation probably led him to attempt the exchange of the Netherlands, under the title of the kingdom of Austria, for the palatinate; but Austria under an elector. But the project was frustrated by the constancy and firmness of the next magnate, the Duke of Deux-Ponts, and by the German league concluded by Frederick II. Joseph was equally unsuccessful in the war of 1788 against the Porte. Fie exertions in the field destroyed his health; and grief at the rebellious disposition of his hereditary states accelerated his death, which happened 20 Feb. 1790. Joseph II was succeeded by his eldest brother, Leopold II. By his moderation and firmness he quelled the turbulent spirit of the Netherlands, and restored tranquillity to Hungary. The Treaty of Reichenbach with Prussia, 27 July 1790, and the Treaty of Sistova, 4 Aug. 1791, led to a peace with the Porte. The unhappy fate of his sister and her husband, Louis XVI of France, induced him to form an alliance with Prussia, but he died 1 March 1792, before the revolutionary war broke out. Soon after the accession of his son, Francis II, to the throne, and before the new Emperor of France declared war against him as King of Hungary and Bohemia. In the first articles of peace, dated at Campo Formio, 17 Oct. 1797, Austria lost Lombardy and the Netherlands, and received as a compensation the largest part of the Venetian territory; two years previous, in 1795, in the third division of Poland, the Austrian dominions had been enlarged by the addition of west Galicia. In the beginning of the year 1799, the Emperor Francis, in alliance with Russia, renewed the war with France. But Napoleon extorted the peace of Lunéville, 9 Feb. 1801, and Francis acceded to it, without the consent of England. By the conditions of the treaty he was to cede the county of Falkenstein and the Frickthal. Ferdinand, Grand Duke of Tuscany, at the same time renounced his claim to this province and received in return for it Salzburg and Berchtesgaden, with a part of the territory of Passau, and was afterward made master of the largest part of the empire of the pope. With the title of Protector Austria obtained the Tyrolese archbishops, Trent and Brixen, and, notwithstanding its cessions of territory to France, had gained, including its acquisitions in Poland, 580 square miles; this made the whole extent 253,770 square miles. The public debt had also increased to 1,220,000,000 florins.

The first consul of France now caused himself to be proclaimed emperor; and 11 Aug. 1804, Francis declared himself hereditary Emperor of Austria, and united the Austrian states under the name of the Empire of Austria. Immediately after this important act he took arms once more with his allies, Russia and Great Britain, against the government of France. The war of 1805 was terminated by the peace of Presburg (26 Dec. 1805). By the conditions if the treaty Francis was obliged to cede to France the remaining provinces of Italy; to the King of Bavaria, Burgau, Eichstätt, a part of Passau, all Tyrol, Vorarlberg, Hohenems, Rothenfels, Tettin, Argen and Lindau; to the King of Württemberg the five towns on the Danube, the county of Hohenberg, the landgrave of Nellenburg, Altshofen and a part of Brisgau; and to the Grand Duke of Baden the remainder of Brisgau, Ortenau, Constance
and the commandery of Meinau. He received, in return, Salzburg and Berchtesgaden; the Elector of Salzburg was compensated by the province of Würzburg; and the dignity of grand master of the Teutonic order was made hereditary in the house of Austria. Thus ended a war which cost the Austrian monarchy, besides the territories just enumerated, 90,000,000 florins, which were carried away by the French from Vienna, and 800,000,000 for the other expenses of the war; of which Francis paid a large part of revenue from his public estates. After the formation of the Confederation of the Rhine (12 July 1806) Francis was forced to resign his dignity as Emperor of Germany (6 Aug. 1806), which had been in his family more than 500 years. The old German, or Holy Roman Empire thus came to an end, and Francis had now only the title of Francis I, Emperor of Austria. In 1809 he resolved on a new war with France, aided by Great Britain, which did nothing more than furnish some pecuniary assistance a second time. He engaged in a series of battles with Napoleon. Austria fought courageously, but in vain. The peace of Vienna (14 Oct. 1809) cost the monarchy 42,380 square miles of territory, 5,500,000 subjects and more than 11,000,000 florins of revenue. The public debt increased to 1,200,000,000 florins, and all the paper money in circulation was estimated at 950,000,000.

Napoleon, after tearing from the Austrian monarchy its fairest provinces—the duchy of Salzburg, with Berchtesgaden, Innviertel, western Hausruhrviertel, Carniola and Görz, Trieste, the circle of Villach, a large part of Croatia, Istria, a part of the Grisons, the Bohemian territories in Saxony, all west Galicia, the circle of Zamoski in east Galicia, Cracow, with half the salt works of Wielczka, the circle of Tarnopol and many other territories which were given to Russia—formed a personal connection with the ancient family of Hapsburg, by his marriage with Maria Louisa, daughter and heiress of the Emperor of Austria, and (14 March 1812) concluded an alliance with the Emperor Francis against Russia. But the Emperor of France was repulsed on his invasion of this country; Prussia rose up against him; and after the Congress of Vienna (9 Sept. 1814), concluded the exchanges of territory, and signed a convention of friendship and navigation. Austria placed itself under the protection of England and France, and concluded a treaty of amity with the United States. The Austrian troops were withdrawn from Prussia and other countries. The Emperor Francis, 12 Aug. 1813, declared war against France, and formed an alliance, 9 Sept. 1813, at Teplitz, with Great Britain, Russia, Prussia and Sweden, against his son-in-law. In the battle of Leipzig, the Austrian troops took an honorable part. The firmness with which the Emperor signed the act of proscription against his son-in-law, and fixed the fate of his daughter and her infant, excited general respect. He signed the same act against Napoleon a second time, when he returned from Elba. He also opposed Murat in Italy. Yet the Austrian Cabinet endeavored to provide for young Napoleon in the settlement of the affairs of France. By the Congress of Vienna, 1814–15, Austria gained the portion of Italy which is usually known as Lombardy and Venetia, and recovered, together with Dalmatia, the hereditary territories which it had been obliged to cede. The former Grand Duke of Würzburg, on the contrary, ceded his territory to Bavaria, and again took possession of Tuscany. The final act resulting from the congress was signed in 1820. In 1821 liberal movements in Italy were put down. The July revolution of 1830, in France, caused warlike preparations to be made; but after Great Britain had acknowledged the new government Austria acknowledged it also. Insurrections which took place in Modena, Parma and the Papal states, 1831–32, were suppressed without much difficulty. In the London conference relative to the affairs of Belgium Austria took an active share; but in proportion as Great Britain and France became more closely united, Austria entered into more intimate relations with Russia. After the Polish insurrection Austria ultimately gave indications of a strong leaning in favor of Russia. The death of the Emperor Francis I, 2 March 1835, and the accession of Ferdinand I made little change in the Austrian system of government. Metternich still continued at the head of affairs and to foster the reactionary policy. In 1846 the failure of the Polish insurrection had led to the incorporation of Cracow with Austria, but discontent with the government very soon spread. In Italy, the declarations of Pio Nino in favor of reform, and the concessions into which most of the other governments of the Italian Peninsula had been hurried, increased the difficulties of Austria. In Hungary the position became stronger and stronger, and latterly, under the guidance of Kossuth and other popular agitators, assumed the form of a great constitutional movement. In 1848 the expulsion of Louis Philippe shook all Europe to its foundations. Metternich found it impossible any longer to guide the ship of state, and the government found itself compelled to grant a free press, and allow the citizens freely to arm themselves. The popular movement made great progress in Hungary; and in Italy a formidable insurrection broke out, threatening the very existence of the Austrian power in the peninsula. In the very centre of the empire, in Vienna itself, the insurrection made equal progress, and the royal family, no longer for safety, removed to Innsbruck. The Austrian monarchy appeared now to be hanging by a thread. The Hungarian Diet declared itself permanent, under the presidency of Kossuth. Various ministerial changes took place. At last the Emperor abdicated in favor of his nephew, Francis Joseph. More vigorous measures were now adopted, and Austria, strongly aided by the forces of Russia, who feared a revolution within her own borders, succeeded in suppressing the Hungarian insurrection. Haynau, on the occasion, rendered himself notorious by his severity, and Hungary underwent the fate of a conquered country. The year 1855 is memorable in Austrian history for the conclusion of a concordat with the Pope which put the educational and ecclesiastical affairs of the empire entirely into the hands of the Papal see. It established an ecclesiastical censorship of the press, and placed all schools, even private schools, under surveillance of the bishops; it proclaimed the complete independence of the bishops in relation to the civil government, so that all decrees proceeding from Rome might be published without obtaining the royal placet, and it authorized the bishops to convolve the provincial councils and diocesan synods, without the consent of the civil authority. In 1859 the hostile intentions of France and Sardinia against the possessions of Austria in Italy be-
came so evident that she declared war by sending an army across the Ticino, but after dis- astrous results in Milan she was compelled to cede Milan and the northwest portion of Lombardy to the Sardinian King. In 1864 she joined with Prussia and the other German states in the spoliation of Denmark, but a dispute about the conquered provinces of Schleswig and Holstein led to a renewal of the old conflict between her allies (1866), while at the same time Italy renewed her attempts for the recovery of Venice. Austria had accordingly to show front both in the north and in the south. The southern army under Archduke Albert fought successfully, defeating the Italians under Victor Emanuel at Custozza, 24 June, and driving them back across the Mincio, but the fortune of the northern army under General Benedek was very different. On 3 July Benedek was completely defeated by the Prussian forces at Königgrätz (Sadowa) in Bohemia, and the road to Vienna lay open to the victors. Francis Joseph now ceded Venetia to Napoleon III., and claimed his intervention to assist in procuring a compromise with Italy. His demand was finally witheld, and a separate arrangement and continued the war. On 20 July Admiral Teghthoff defeated the Italian fleet near the Dalmatian island Lissa: but, on the other hand, the Prussians continued to advance into Austria and threatened Vienna. Francis Joseph accordingly saw himself obliged to conclude a peace with Prussia 23 August, and a little later peace was concluded with Italy also, 3 October. The result of the war was the cession of Venetia through France to Italy, and the withdrawal of Austria from all interference in the affairs of Germany. See SEVEN WEEKS' WAR.

After 1866 Austria was occupied chiefly with the internal affairs of the empire. The first aim of the government was to restore the Constitu- tion of the state, which had been established in February 1861, but which had been suspended since 1865 owing to the demand of Hungary for self-government. As Austrian statesmen were anxious for a settlement of the dispute, the Hungarian demands were finally agreed to, and the empire of Austria divided into two parts, the one made up of the Cisleithan or Slavonic-German provinces, the other of the Transleithan provinces, the latter forming together the kingdom of Hungary. These two divisions of the empire were to be entirely independent, except in matters of diplomacy and military and naval matters—to some extent also in matters of finance. This settlement was consummated by the coronation of the Emperor Francis Joseph I as King of Hungary, which took place at Pesth-Ofen, on 8 June 1867. During the session of the Reichsrath, that is, the Diet of the Cisleithan provinces, held in the same year, the important question of the concordat of 1855 came up for discussion. The Liberal majority in the Diet, desirous of seeing it entirely repealed, but as they fully recognized the insuperable obstacles in the way of this step, they were content to proceed by separate enactments intended to weaken the power that had been gained to the Papal see by the concordat. With this end in view three measures were brought forward, one for the re-establishment of ecclesiastical autono- my, another for the emancipation of the schools from the domination of the Church and one for the placing of the different creeds on a footing of equality. Before 25 May 1868, all these measures had passed through both houses of the Diet, and on that day the representatives of the imperial sanction. These laws were declared by the Pope to be "abominable," as well as null and void. Further enactments having in view the weakening of the power of the papal see in the state were passed in 1874 and were condemned by the Pope in the severest terms. The fact of the Austro-Hungarian dominions comprising so many different nationalities with different languages has always given the government much trouble, both in the management of the internal affairs and in regard to external matters. In the Eastern question, for instance, the course of Austria was hampered by the sympathy shown by the Magyars for the Turks, while her Slav subjects were naturally more favorable to Russia. Make a separate agreement, and the outbreak of hostilities between Russia and Turkey she joined with the other powers in remonstrance with Turkey, but as to the actual struggle remained neutral. At the close of the war in the middle of 1878 Austria took part in the Congress of Berlin, where the settlement of the Eastern question was arranged, and by this congress it was decided that the provinces of Bosnia and Herzegovina should in future be administered by Austria-Hungary instead of Turkey.

The occupation of Bosnia and Herzegovina, however, was not accomplished without a fierce struggle, and simply added new factors to the incessant internal friction which continued between the different nationalities and political factions of the empire. This was not diminished by the final act of annexation, 13 Oct. 1908. In 1907, following two years of persistent agitation throughout the empire, the law of general manhood suffrage was passed, and resulted, in ensuing elections, in the accession of a great number of socialistic members to both Parliaments and the common Delegations. While internal turmoil did not abate, Austrian external policy was also disturbed by the results of the Balkan Wars of 1912 and 1913, the defeat of Turkey and Bulgaria, and the increased influence of Russia as the "big brother" of the Slav nationalities. The trend of events culminated in a crisis when on a visit to Bosnia, the Crown-Prince Ferdinand and his consort were assassinated at Sarajevo by two Austrian subjects of Serbian extraction 28 June 1914. See AUSTRIA-HUNGARY AND THE WAR; and, WAR, EUROPEAN.

She attracted very little attention in the United States before the meetings of the Vienna Congress. The American government declined an invitation to participate in the meetings of the Holy Alliance, but in 1823 Monroe appointed a confidential agent to observe and report its activities. Commercial intercourse, insignificance of first, increased by the defeat of Napoleon in 1815 and in 1828 resulted in the negotiation of a treaty of commerce and navigation.

Regular diplomatic relations began with the American appointment of Nathaniel Niles as agent (in 1837) to procure a modification of duties and restrictions on the importation of American tobacco, and the Austrian appointment of Baron de Mareschal as Envoy Extraordinary and Minister Plenipotentiary in 1838. A treaty relating to property and consular jurisdiction was negotiated in 1848, followed by a treaty of extradition in 1856. Under the stimulus of democratic expansion and manifest destiny at the middle of the century, the United States exhibited a deep sympathy for Hungary (in her struggles against Austria and Russia) which induced the American government in 1849 to send an agent, A. Dudley Mann, with a view to the recognition of the Hungarian republic, and led Congress at that time to offer an asylum to Kossuth and his fellow exiles and to give a public reception to Kossuth on his visit to Washington. The Mann mission, when it became known, was the subject of a strong protest of Austria through her chargé d'affaires, M. Huelsmann, to whom Webster made a vigorous and spirited reply and who temporarily withdrew from Washington soon after the Kossuth craze.

In 1853 new friction arose in the case of Martin Koszta, a Hungarian refugee to the United States, who, having returned to Europe after declaring his intention to become an American citizen, had been arrested and deported by an Austrian cruiser. His forcible release from the vessel by Captain Ingraham of the United States war vessel brought from Huelsmann a demand for reparation and disavowal which Secretary Marcy refused to give. At the close of a diplomatic warfare, Austria surrendered her claim to jurisdiction over Koszta who returned to the United States with the understanding that Austria could proceed against him in case he should ever return to Turkey. Appomattox and was received by the United States at the opening of the secession struggle, Austria never accorded belligerent rights to the Confederates. In the summer of 1863 Motley reported that she was recruiting troops to accompany Maximilian to Mexico and submitted to the Austrian government some unauthorized views in regard to the Mexican question for which Seward censured him. At the close of the war, however (in 1867), Motley was instructed to warn Austria not to send volunteers to replace the French troops in Mexico, and when he hesitated to act Seward disapproved his delay and effectively directed him to file a protest at once and to withdraw from Vienna in case the departure of the troops was permitted.

Since the Civil War, questions relating to naturalization and expatriation have been the most prominent and most persistent. Although the naturalization convention of 1870 with Austria-Hungary recognizes the right of citizens or subjects of one country to become citizens or subjects of the other after an uninterrupted residence of five years, its interpretation has frequently been a subject of diplomatic discussion in connection with the arrest of persons who, having been born in Hungary, had emigrated to the United States before the performance of their military service, and often to escape it, and after meeting the requirements for American citizenship had returned to their native land to reside permanently, enjoying all the privileges of the government without sharing its burdens and responsibilities, and perhaps creating discord and loudly boasting of their immunity from military service. The Austro-Hungarian government, claiming that the citizenship of many such pseudo-Americans had been obtained in fraudem legis, or that it had never been completed, summoned them to military duty; in case of their refusal to serve, it arrested them; and, in some instances of ostentations evasion, while feeling beginning hostility to the United States, resorted to expulsion from the country under a law of 1871, asserting that the presence of the persons expelled exerted a pernicious influence in the community of their origin and that the treaty of 1849 gave them no right to permanent residence in the country.

The earlier friction arising from such cases
greatly decreased by 1900, however, as a result of the steady progress made toward their satisfaction through conciliation. Arrests became more infrequent. On the representations of the American legation, the Austrian government observed treaty provisions in the larger number of arrests of American naturalized citizens for alleged evasion of military service and released them from military obligations. Representations against expulsion were made only when its adoption appeared unduly onerous. In November 1899, on the ground that so many Austro-Hungarians had taken advantage of treaty stipulations to become nominally citizens of the United States with the sole object of living in their native country in defiance of its military law, the Austrian legation at Washington renewed a proposal (which had been offered as early as 1883 as a result of the military law of 1882) for a modification of the naturalization treaty of 1870 by which the American government would no longer feel obliged to extend protection to alien citizens, and the Austrian government would no longer feel compelled to expel them. The American Department of State which in reply to similar prior proposals had admitted that this abuse of treaty stipulations should be discontinued, and still admitted that there were "doubtless grave abuses of the privileges of naturalization," declined to accept the proposal for amendments which would have annulled beneficial treaty provisions preventing the subjection of bona-fide naturalized citizens to military service. In June 1896, the Austro-Hungarian legation at Washington suggested the necessity of using a form of naturalization oath which should "mention the fact of the existence of separate Austrian and Hungarian citizenship." Among other questions affecting diplomatic relations since 1870, Austrian tariffs and trade restrictions (especially on meats and fruits) stand first. Trade relations were improved by the reciprocity arrangement of 1892, but obstructions to Austrian imports still threatened to provoke retaliatory inspection of Austrian imports into the United States.

Still other questions arose. In 1885 Austria objected to the appointment of A. M. Keeley as American Minister at Vienna on the double ground of his Jewish race and nationality. His "most Government in America, the University of Virginia, 1877-78. He was the first American Jew to hold an official position in the United States. In 1891 there was considerable correspondence relating to the question of preventing the emigration of defective, dependent, and delinquent classes. Although Austria sympathized with Spain in the Spanish-American War, her authorities at Trieste gave a friendly reception to Admiral Dewey in 1899. In 1909 she agreed to an arbitration treaty with the United States.

The American government, when it declared war against Germany in the spring of 1917, hoped to avoid the necessity of a declaration against Austria-Hungary, Germany's ally; but, by the conditions of the war, it finally, in the decree of December 20, 1918, declared war against Austria-Hungary also.

JAMES M. CALLAHAN, Professor of History and Political Science, West Virginia University.

AUSTRIA-HUNGARY AND THE WAR. The position of the Dual Monarchy in regard to the European War will long remain a controversial topic for historians to debate. More precise than conjecture, however, is the fact that Austria-Hungary was a party to the ultimatum to Serbia on 23 July 1914 as the direct or immediate cause of the great conflagration. It is equally established that the grounds for the ultimatum were furnished by the assassination of the Archduke Francis Ferdinand and his wife at Sarajevo, the capital of the Austrian province of Bosnia, on 28 June 1914. The Austrian government charged that the crime had been instigated in Serbia and by Serbian officials. A storm of anti-Serbian feeling swept over Austria and Hungary; the members of the Serb party in the Provincial Council of Croatia were assaulted by their colleagues with cries of "Serbian assassins," while excited mobs in Vienna threatened the Serbian legation. The Austrian press demanded the punishment of Serbia. On 23 July the Austro-Hungarian government presented the ultimatum to Serbia. Thus it may be said that the war took its origin in the murder of an archduke and the indignation of Austria against Serbia, where the plot was alleged to have been hatched. These antecedent conditions do not, however, explain how a purely local quarrel came to embroil the whole world. So far as the two original belligerents—Austria-Hungary and Serbia—are concerned, the following review of their past relations will serve to show that the Sarajevo tragedy was but the culminating point—the last straw—that brought a long-standing quarrel to a head.

The Austrian defeat by Prussia at Sadowa in 1866 compelled the house of Hapsburg to seek a new centre of gravity in the southeast. The German victories over France in 1870 and 1871 placed the Austrian dream of revenge beyond hope of fulfilment. But meantime, between Sadowa and Sedan, Austria had admitted Hungary to full partnership in the monarchy with a view to a fresh struggle against the German empire. With the outbreak of the Franco-German War, the Emperor Francis Joseph realized the necessity of admitting also his Slav subjects to partnership in the monarchy, he found in the existence of the Dual System an ideal basis for the geographical hemmed in by Slav populaciones, Hungary had always pursued a strongly anti-Slav policy, working on the principle that the Slavs, and particularly the Serbo-Croatians, both in the monarchy and in the kingdom of Serbia, must be kept in a state of subjection. Under the Hungar-Croatian settlement of 1868, which resulted from the Dual System, the inhabitants of Croatia-Slavonia, constitutionally subjects of the Hungarian crown, were oppressed and their development impeded, while continual discord was fomented and encouraged between the Croatian, or Roman Catholic branch of the Southern Slav race, and the Serbo, or Orthodox branch. The oscillation of Bosnia-Herzegovina (q.v.) in 1878 formed part of the policy of ruling the Southern Slav race and of keeping the various branches divided in order to rule them the more effectively. At the same time Austro-Hungarian diplomacy sought to gain control over the kingdom of Serbia, which for
AUSTRIA-HUNGARY AND THE WAR

many years stood practically under Austrian tutelage. After the defeat of Serbia by Bulgaria in 1885, Austria intervened as a protector to check the Bulgarian advance. Not until after the expulsion of King Milan (q.v.) in 1899 did Serbia begin to emancipate herself from Austrian control. The young King Alexander showed a disposition to turn toward Russia, but his unfortunate marriage made him unpopular and led to his murder on 11 June 1903. The accession of Peter Kara-georgevitch promised more friendly relations between Serbia and Austria, but trouble arose in 1905 when Serbia concluded a customs union with Bulgaria. This prospect of economic union between two Balkan Slav states was so distasteful to Austria-Hungary that the government immediately declared a tariff war against Serbia and excluded all her cattle and agricultural produce. Serbia resisted the attack to the best of her ability and succeeded in finding new markets in France, England and Egypt. From this tariff war, which lasted a year, emerged the desire of the Serbian spirit of economic and political independence and the accentuation of Serbian resentment against Austria-Hungary.

Under Russian guidance a conciliatory spirit was meanwhile spreading among the Southern Slavs of the Dual Monarchy. At a conference held in Fiume October 1905 a resolution was adopted that ended the old feud between Roman Catholic Croatians and Orthodox Serbs. Regarding this reconciliation as a conspiracy rather than spontaneous movement, the Hungaro-Croatian authorities in 1907 arrested 53 Southern Slavs, who were accused of high treason on the strength of denunciations by an agent provocateur. The trial of these individuals at Agram developed into a judicial scandal; it lasted two years and ended in acquittal of the defendants. In 1908 Baron Achenenthal (q.v.) utilized an alleged Pan-Serb conspiracy as a pretext for annexing Bosnia and Herzegovina (q.v.). The annexation aroused indignation in Serbia, where hopes of adding the two provinces to the kingdom had long been entertained. These aspirations were based upon the fact that the population of the provinces is entirely Serb. In 1885, save Serbia Roman Catholic, Orthodox and Mohammedans. The Bosnia-Hercegovina coup brought Austria no practical advantage; the provinces were her own to all intents and purposes, and few seriously believed that they would ever be handed back to Turkey or be permitted to fall to Serbia. What the event did, however, was to draw upon Austria the hostility of Russia and Serbia and to teach the smaller Balkan states that they could achieve their national aims only by united action and in disregard of the Great Powers. Accordingly, they formed a new and formidable power bordering on Austria-Hungary and looking forward to the acquisition of provinces in that empire inhabited by people of their race. Austria-Hungary thus became exposed to a double menace: besides that of the "Italia Irredenta" of the Trentino and Trieste, the prospect of a "Slavonia Irredenta" in Croatia, Dalmatia, Bosnia, Herzegovina, Istria, Carniola and Carinthia and a "Romania Irredenta" in Transylvania and Bukovina. Even her naval power in the Adriatic was imperilled by her abandonment (at the time of the annexation) of the Sanjaks of Novi Bazar, which barred the access of Serbia to that sea, and Serbia's claim to an Adriatic port, now that the way was open to her, brought Austria-Hungary to the verge of a war with her and her protector, Russia, already in 1909.

The members of the Serbo-Croatian coalition in the Diet of Agram, the capital of Croatia, prosecuted an Austrian semi-official writer, the historian Dr. Friedjung, in December 1909 for libel. Himmler had made charges of treasonable commerce with Serbia against the members, who proved, at the trial, that the historian had based his accusations on forged documents which had been supplied to him by the Austrian Foreign Office. These documents, tending to prove a Pan-Serbian conspiracy against Austria-Hungary, had been forged by an individual who was in the employ of the Austrian legation at Belgrade. The Serbian government prosecuted the forger, who received 1 year's imprisonment. In course of time a strong sympathy with Serbia became general among the Southern Slavs of the Monarchy. When the Balkan League (q.v.) was formed in 1912 against Turkey, it was understood to be directed in almost equal measure against Austria-Hungary, which country was suspected of harboring a design to humiliate Serbia and reduce her to her former position of dependence. The murdered Archduke Francis Ferdinand was regarded as the head of the anti-Serbian military and clerical party in Austria. He had fully estimated the vital importance of the Southern Slav question for Austria; he wished to upset the Dual System, which he regarded as the main obstacle to proper treatment of the Austro-Hungarian Southern Slavs, and at the same time to find a Roman Catholic "Croatian," as opposed to a Serb Orthodox, solution for the problem. On the outbreak of the Balkan War (q.v.) in October 1912, the military party in Austrian affairs argued that intervention against Serbia. Their wish was overruled, mainly because it was expected that the Turks would defeat the Serbians and that Austria would then be able to intervene again, as in 1885, save Serbia Roman Catholic, Orthodox and Mohammedans. The Bosnia-Herzegovina coup brought Austria no practical advantage; the provinces were her own to all intents and purposes, and few seriously believed that they would ever be handed back to Turkey or be permitted to fall to Serbia. What the event did, however, was to draw upon Austria the hostility of Russia and Serbia and to teach the smaller Balkan states that they could achieve their national aims only by united action and in disregard of the Great Powers. Accordingly, they formed a new and formidable power bordering on Austria-Hungary and looking forward to the acquisition of provinces in that empire inhabited by people of their race. Austria-Hungary thus became exposed to a double menace: besides that of the "Italia Irredenta" of the Trentino and Trieste, the prospect of a "Slavonia Irredenta" in Croatia, Dalmatia, Bosnia, Herzegovina, Istria, Carniola and Carinthia and a "Romania Irredenta" in Transylvania and Bukovina. Even her naval power in the Adriatic was imperilled by her abandonment (at the time of the annexation) of the Sanjaks of Novi Bazar, which barred the access of Serbia to that sea, and Serbia's claim to an Adriatic port, now that the way was open to her, brought Austria-Hungary to the verge of a war with her and her protector, Russia, already in 1909.

The members of the Serbo-Croatian coalition in the Diet of Agram, the capital of Croatia, prosecuted an Austrian semi-official writer, the historian Dr. Friedjung, in December 1909 for libel. What the event did, however, was to draw upon Austria the hostility of Russia and Serbia and to teach the smaller Balkan states that they could achieve their national aims only by united action and in disregard of the Great Powers. Accordingly, they formed a new and formidable power bordering on Austria-Hungary and looking forward to the acquisition of provinces in that empire inhabited by people of their race. Austria-Hungary thus became exposed to a double menace: besides that of the "Italia Irredenta" of the Trentino and Trieste, the prospect of a "Slavonia Irredenta" in Croatia, Dalmatia, Bosnia, Herzegovina, Istria, Carniola and Carinthia and a "Romania Irredenta" in Transylvania and Bukovina. Even her
Serbia to a commercial port. He offered binding guarantees that this port would be purely commercial and urged that friendship would be sealed between the two countries by such a proof of Austro-Hungarian good will. These overtures were accepted. Austria-Hungary was the only great power that had any vital interest in the Balkan question, and it was no doubt her grave concern that her neighbor Serbia should not become too strong. Influential persons in the empire came to the conclusion that the only practical way of securing this object was to compel Serbia to submit to Austrian dictation by force of arms. This process was seriously under consideration in 1913, but Count Berchtold, supported by the Emperor, held that this would be too risky a policy, as it might not only involve a war with Serbia and her allies, but also with Russia. He therefore hit upon the idea of creating a buffer state of Albania, whose harbors on the coast would be open to Serbia for purposes of trade and commerce. Russia consented that some compensation should be made to Serbia for the Albanian territories she had conquered in the Balkan War and would now have to surrender again. At the time Russia had a large force on the Galician frontier, which compelled Austria to retain her troops there. Negotiations between the Emperor and the Tsar led to an agreement whereby Serbia received the principal Albanian towns on her frontier, Ipek, Priazrend, Dibra and Dikovica. Thus was the spectre of a European war removed in 1913. But not for long. The Serajevo assassinations in 1914 fanned the smouldering embers of animosity once more into flame. It was immediately realized by those acquainted with the past history that Austria-Hungary might take advantage of the murder as a reasonable excuse for invading Serbia, and that, if the struggle could be localized, it might well end in the annihilation of Serbia. But success in this direction would not have brought the Dual Monarchy a solution of the Southern Slav problem, for though conquest might indeed bring Serbia under Austro-Hungarian domination, it would have tended to unite within the Monarchy all the branches of the Southern Slav race and raised in an acute form the question of the stability of the Dual System, that legacy of Sadowa which was the primary cause of the ill-treatment and disaffection of the Southern Slavs within the Austrian empire and of the perpetual agitation and plotting of the other Slavs outside.

The ultimatum presented at Belgrade on 23 July demanded a reply before 6 P.M. on the 25th. It stated that "the history of recent years has shown the existence in Serbia of a subversive movement with the object of detaching a part of Austria-Hungary from the Monarchy—a movement which had its birth under the eyes of the Serbian government, and was carried out by a series of acts of terrorism, outrages and murders." The Serbian government had "done nothing to repress the movement"; it had permitted "the criminal machinations of various societies and associations," had "tolerated apologies for the perpetration of outrages and the participation of Serbian officers and statesmen in the movement," and had "permitted all the manifestations which have incited the Serbian people to hatred of the Monarchy and contempt of its institutions." The assassinations had been traced to Belgrade, and it was therefore impossible for the Austro-Hungarian government to pursue any longer the attitude of expectation. Serbia maintained for years in face of the machinations started in Belgrade and thence propagated to the territories of the Monarchy. The Serbian government was demanded to publish a declaration on the front page of the Official Journal for 28 June to the effect that it condemns the movement whose final aim is to detach from the Austro-Hungarian Monarchy territories belonging to it, and that it regrets that Serbian officers and civil functionaries have profited by the new régime to detach from the Monarchy territories belonging to it and to hand them over to the neighboring relations to which Serbia was solemnly pledged by its declaration of 31 March 1909. The following categorical demands were also made: 1. The suppression of all publications inciting to hatred and contempt of the Monarchy, whose tendency is directed against its territorial integrity. 2. Immediate dissolution of the society Narodna Obra and confiscation of all its means of propaganda in other societies with the same objects. 3. Elimination from public instruction in Serbia of everything serving to foment the propaganda against Austria-Hungary. 4. Removal from the service of all officers and civil functionaries guilty of such propaganda whose names and acts shall be communicated by the Austro-Hungarian government to that of Serbia. 5. Representatives of the Austro-Hungarian government to be accepted by Serbia for the purpose of collaborating in the suppression of the above propaganda. 6. Judicial proceedings to be taken against accessories to the plot of 28 June who are on Serbian territory, and delegates of the Austro-Hungarian government to take part in the investigation relating thereto. 7. The immediate arrest of Major Jankasitch and the Serbian state functionary, Ciganovitch, who were found to be implicated in the plot at the official inquiry at Serajevo. 8. The prevention by effective measures of the co-operation of the Serbian authorities in the illicit traffic in arms and explosives across the frontier, and the dismissal and severe punishment of the officials of the frontier service who had facilitated the passage of the frontier for the perpetrators of the outrage. 9. Explanation of the utterances of high Serbian officials, both in Serbia and abroad, who notwithstanding their official position did not hesitate after the crime of 28 June to express themselves in terms of hostility to the Austro-Hungarian government. 10. Notification to the Austro-Hungarian government without delay of the execution of the measures comprised under the preceding heads.

The feverish activity occasioned by the Austrian Note among the chancelleries of Europe, the exchange of telegrams and resultant consultations and negotiations between the Powers, will be found under WAR, EUROPEAN: DIPLOMATIC HISTORY. The Serbian reply, delivered within the stipulated time, accepted "in principle," but with certain reservations, nearly all the Austrian demands. Serbia protested, however, against the claim that Austro-Hungarian officials should take part in the judicial inquiry on Serbian territory and in the suppression of propaganda, and suggested that the matter should be settled by arbitration. The reply was deemed unsatisfactory; Austria declared war on Serbia. The two countries declared war on one another and opened hostilities on the 29th by bombarding Belgrade. The Austrian case for commencing the war was published in a manifesto by the late Emperor Francis Joseph, dated Ischl, 28 July: "To my peoples! It was my fervent wish to consecrate the years which, by the grace of God, still remain to me, to the works of peace and to protect my peoples from the heavy
AUSTRIAN SUCCESSION—AUTHORS

sacrifices and burdens of war.... The intrigues of a malevolent opponent compel me, in the first beginnings of its existence, to support the Monarchy for the protection of its dignity and its position as a Power, for the security of its possessions, to grasp the sword after long years of peace. With a quickly forgetful ingratitude, the kingdom of Serbia, which, from the first beginnings of its existence, has been supported and assisted by my ancestors, has for years trodden the path of open hostility to Austria-Hungary. When, after three decades of fruitful work for peace in Bosnia and Herzegovina, I extended my sovereign rights to those lands, my decree called forth the kingdom of Serbia, whose rights were in no wise injured, outbreaks of unrestrained passion and the bitterest hate. My government at that time employed the handsome privileges of the stronger, and with extreme consideration and leniency only requested Serbia to reduce her army to a peace footing and to promise that, for the future, she would tread the path of peace and friendship. Guided by the same spirit of moderation, my government, when Serbia, two years ago, was embroiled in a struggle with the Turkish empire, restricted its action to the defense of the most serious and vital interests of the Monarchy. It was to this attitude that Serbia primarily owed the attainment of the objects of that war. The hope that the Serbian kingdom would appreciate the patience and love of peace of my government and would keep its word has not been fulfilled. The flame of its hatred for myself and my house has blazed ever higher; the design to tear from us by force inseparable portions of Austria-Hungary has been made manifest with less and less disguise. A criminal propaganda has extended over the frontier with the object of destroying the foundations of state order in the southeastern part of the Monarchy; of making the people to whom I, in my paternal affection, extended my full confidence, waver in their loyalty to the ruling house and to the Fatherland; of leading astray its growing youth and inciting it to mischievous deeds of madness and high treason. A series of murderous attacks, an organized, carefully-prepared, and well-carried-out conspiracy, whose fruitful success wounded me and my loyal peoples to the heart, forms a visible bloody track of those secret machinations which were operated and directed in Serbia. A halt must be called to these intolerable proceedings and an end must be put to the incessant provocations of Serbia. The honor and dignity of my Monarchy must be preserved unimpaired.... In vain did my government make a last attempt to accomplish this object by peaceful means and to induce Serbia, by means of a grave warning, to desist. Serbia has rejected the just and moderate demands of my government and refused to conform to those obligations, the fulfilment of which formed the necessary foundation of peace in the life of peoples and states. I must therefore proceed by force of arms to secure those indispensable pledges which alone can insure tranquility to my states within and durable peace abroad. Finally, the Emperor declared that "in this solemn hour I am fully conscious of the whole significance of my resolve and my responsibility before the Almighty"; that he had "examined everything," and with a serene conscience would "set out on the path to which duty points."

It is important to record that Count Berchtold strove up to the last for a pacific issue. He repeatedly asked the Foreign Office to carry out a policy distasteful to him out of loyalty to his Imperial master. On 31 July, three days after he had launched the fateful declaration of war, Count Berchtold announced in London that he would consent to submit to mediation the points in the Note to Serbia which seemed incompatible with the maintenance of Serbian independence, but the matter had by that time passed into the hands of Germany and the Austro-Hungarian leaders and could not be pursued diplomatically any further. Russia would not permit Serbia to be crushed and supported the proposal of Sir Edward Grey (q.v.) for a conference. Germany rejected that proposal, favored direct mobilization and upheld the stand taken by Austria-Hungary. Germany had further issued a general warning on 26 July that she would not tolerate interference with the Austrian resolve to punish Serbia, and demanded of Russia the immediate cessation of a reported mobilization. This was followed by a German declaration of war against Russia on 1 Aug. 1914; against France, 3 August; and against Belgium, 4 August. On the last-named date came the British ultimatum regarding the neutrality of Belgium, and by 11 o'clock in the evening Great Britain was also a belligerent. Holland, Belgium and Switzerland had meanwhile mobilized to defend their neutrality. Austria declared war on Russia 6 August; Montenegro on Austria 7 August; France declared war on Austria 10 August, and Great Britain on 13 August. Then followed the Austrian declaration of war on Japan, 27 August; on Belgium, 28 August; Italy turned against her former ally on 23 May 1915; Rumania declared war on Austria 27 Aug. 1916, and the United States on 7 Dec. 1917. During the progress of the war the venerable Emperor Francis Joseph I died in his 86th year and the 68th year of his reign, on 21 Nov. 1916. He was succeeded by his grandnephew under the title of Charles I (q.v.). Consult Steed, W., "What is Austria?" (Edinburgh Review, October 1917).

AUSTRIAN SUCCESSION. See Succession Wars.

AUTHORS, American, Society of, an organization founded in New York in 1892, and incorporated in 1895, having for its objects the promotion of a professional spirit among authors and a better understanding between authors and their publishers, and, in general, the
protection of literary property and the advancement of the interests of American authors and literature. All persons engaged in literary pursuits are eligible to membership. The Society has a pension fund for members who may become needy.

AUTHORS, British, Society of, an association of authors formed in London in 1883, for social and business purposes. It has a governing committee of 30 members; maintains an attractive clubroom and publishes a periodical called The Author.

AUTHORS, French, Society of, an organization founded in Paris in 1837, for the protection of authors in their rights, and open to any man of letters. It is governed by an elective committee of 24 members and has a pension fund which provides for aid in work, for sickness and in old age. Besides publishing a journal, the Chronique, the Society has recovered a large sum of money from pirating publishers.

AUTHORS' CLUB, an American organization founded in New York in 1882, and incorporated in 1887. It is governed by an executive committee without a president. Any person who is the author of a published book proper to literature, or of creditable literary work equitably comparable in such a book, is eligible to membership. The Club holds meetings semi-monthly, and gives Saturday receptions for ladies in the winter season. It has a library consisting of the publications of its members and another devoted to literary biography.

AUTHORS' LEAGUE OF AMERICA. The, Inc., was organized as a protective association for all persons producing copyrightable material, or in the words of the League constitution "all persons actually engaged in literary, dramatic, musical or artistic composition." It is the object of the League to supply its members with full information as to the business side of their work and to assist them in safeguarding and maintaining their rights. In somewhat over three years the membership had grown to 1,300 and is at present steadily increasing. The income of the League is derived entirely from membership dues. The membership is divided into three classes: Life membership, regular membership, associate membership. The latter class is restricted to publishers, editors, agents and others who are not directly engaged in writing or other artistic production.

AUTO-DA-FÉ, ou'to dâ fâ (Portuguese, act of faith), the solemn public act that from 1481 to 1810 was performed in Spain and Portugal at the execution of those condemned to death by the Inquisition. It took the form of a procession through the chief streets of the city or town to the church where a sermon was preached on the true faith, after which, the condemned were turned over to the secular power. The procession was usually witnessed by multitudes, many believing that it was an act of merit to assist at such a function, others in fear of the terrible Inquisition lent their presence as a matter of expediency. The procession was led by the Dominicans, who were long among the chief inquisitors; they were followed by those who were condemned only to perform public penance. A great cross separated these from those condemned to death. The latter were clad in a garment called the san benito, a kind of shirt inscribed with the crimes of the victim and painted with infernal symbols. They wore also a pointed cap on the head. Next came effigies of the fugitives and the bones of dead culprits. The rear was brought up by numerous priests and monks. The most elaborate Auto-da-fé was that of Madrid in 1680 under Charles II. The system persisted down to the end of the first decade of the 19th century, and five years longer in America, the last recorded event of this kind taking place in Mexico as late as 1815. For the crimes, mode of execution, number of victims, etc., see general article INQUISITION.

AUTO-INTOXICATION. This term signifies poisoning from substances which are formed within the body. These substances may be the normal products of metabolism which are normally changed to inert or harmless bodies in the chemistry of the organs, or are eliminated by the proper eliminative organs, or they may be the product of bacteria or of bacterial action upon decomposable or fermentable material which is found by the bacteria of the alimentary canal, stomach, or intestines. These substances are absorbed from the gastro-intestinal canal and passing into the blood are conveyed to various parts of the body and produce their characteristic symptoms. This can readily be understood when we realize that a very considerable portion of the food material which is taken into the body is not acted upon by the digestive secretions and decomposes or ferments, especially when acted upon in the intestines by putrefactive anaerobes.

Of the substances which are normally formed and which if retained would produce auto-intoxication, carbonic acid is one of the most familiar examples. It is a product of metabolism, it is absorbed into the blood, carried to the lungs and oxidized, or, if it is retained in the blood and the blood remains unoxidized, auto-intoxication from its influence is the result. Urea is another product of metabolism which it is the function of the kidneys to excrete with the urine. If this kidney function is inefficient and enough of the urea is retained within the blood, convulsions, coma and death will be the result of the auto-intoxication.

Bacterial fermentations, including the familiar yeast fermentation, have as their products alcohol and such acids as lactic, formic, butric, acetic and succinic. These are carbohydrate fermentations which usually take place in the stomach and small intestine and with them may come both absorption and the formation of gases in the stomach and intestines, also well-known and very common gastric and general disorders.

The proteid fermentations usually take place from the undigested material which has accumulated in the large intestine, yielding mercaptans, amido-acids and aromatic bodies like indol, phenyl and skatol. These may be absorbed and perhaps changed and eliminated, or, if they are carried into the blood in excess, may produce auto-intoxication.

The body may be protected from the bad effect of these poisonous products by chemical changes which they undergo while passing
through the liver or by the action of antibodies which are present in the blood to destroy them and which may even be increased in numbers and consequently in anti-toxic action by the presence of these poisonous substances. Sometimes great harm comes to the liver while it is attempting to dispose of these substances and this result may not only follow from proteid decomposition but from the injudicious use of anesthetics, causing an inhibition of metabolism and incomplete combustion of fats.

Auto-intoxication is very apt to occur with such diseases as chronic nephritis, cholangitis, gall-stones, hepatic cancer, with some forms of appendicitis and in connection with intestinal parasites. It is also present in diabetes, pernicious anemia, myxedema, acromegaly, Addison's disease and gout. It is the very common condition with those who consume more proteid food than their metabolic capacity will demand. Among European nations the characteristics symptoms are persistent frontal headache, muddy or sallow complexion, dizziness, nausea, a constant feeling of inertness, constipation alternating with diarrhea, flatulence, indigestion, induration of the abdomen and many other things that are distressing. In treating this condition it is especially necessary to insist on simple diet with little proteid, plenty of milk and a minimum of sugar and fat.

AUTO SUGGESTION. See HYPNOTISM.

AUTOCHTHONES, a Greek word equivalent to the more familiar Latin savage, meaning the aboriginal inhabitants of a country. It was especially applied to the ancient Athenians by themselves, to distinguish themselves from later immigrants or their descendants, with much the same pride that an American attaches to his descent from pure revolutionary stock. The word is frequently used in English as a synonym of "aborigine." AUTOCHTHONOUS, a term in botany, zoology and palaeontology used to indicate such plants, animals or fossils as are indigenous to the places where they are found. The term is opposed to "exotic," etc., etc. The plants, etc., are not indigenous to the places where they are found but have been transferred thither by some agency.

AUTOCRACY, a form of government in which power is invested in a single person; a government in which the sovereign unites in himself the legislative and the executive powers of the state, and thus rules uncontrollably. The word is therefore synonymous with supremacy, or uncontrolled authority. Nearly all eastern governments are of this form, and European rulers the late Tsars of Russia alone bore the title of Autocrat, thus signifying their constitutional absoluteness. The Imperial German government is in many respects autocratic; although the Emperor is not strictly an autocrat, yet the power vested in him is not "derived from the consent of the governed," which is essential in the case of democracy or popular government. Many of the dictators in the republics of Latin America were real autocrats, having arrogated to themselves the control of all branches of government despite the democratic constitutions which they were supposed to uphold. Kant uses the word autocracy in philosophy, to denote the mastery of the reason over the rebellious propensities—the self-government of the soul. See GOVERNMENT.

AUTOCRAT OF THE BREAKFAST TABLE. The, a noted work by Oliver Wendell Holmes, consisting of imaginary conversations around a boarding-house table. The characters are introduced to the reader as the Schoolmistress, the Old Gentleman Opposite, the Young Man Called John, the Landlady, the Landlady's Daughter, the Poor Relation and the Divinity Student. It is the most popular of Dr. Holmes' books; and in none of them are his ease of style, his wit, his humor, his kindly sympathy and love of humanity more clearly shown. It was first published serially in the Atlantic Monthly in 1857-58 and appeared in book form in 1858.

AUTOGENOUS PLUMBING APPARATUS. The purpose of this apparatus is to provide, by means of the reaction between oil of vitriol, water and zinc, a supply of hydrogen gas, and, after mixing it with air, to burn the mixture at the end of a blowpipe nozzle and, by means of flexible rubber tubing, apply the Joule flame ready to the work. The zinc, lead sheet, pipes, etc., may be joined together by melting the points of junction, without the use of solder or flux. It can also be used for soldering, brazing and annealing; in fact, for any purpose requiring an intense heat locally applied. It consists of a rectangular box divided into two closed compartments. The upper one is an acid chamber, opening at the top, and a pipe connects it with the bottom of the lower compartment. The lower compartment is divided into two parts, the zinc and gas chamber, having a pipe near its top to convey the gas generated into a purifier arranged in the space between the upper and lower compartments. This space also contains the opening into the lower compartment, through which the zinc is inserted. The dilute acid runs down the pipe from the upper chamber into and up through the zinc in the lower chamber, in the upper part of which the gas collects, and passes out by a bent pipe into the bottom of the first part. Thus there is a box intended to collect any drips which may pass over with the gas. From its upper part a pipe conveys the gas to the bottom of a second purifier, filled with water, through which the gas rises and passes to the blowpipe. The water removes any sulphurous acid gas or other impurities that may pass over with the hydrogen gas.

The rear end of the blowpipe is divided into two branches. To one of these the tube conveying the hydrogen is attached, and to the other a tube conveying air driven in by a bel lows. The hydrogen and air combine and mix in the blowpipe, and flow out of its nozzle, when the mixture is ignited for application of the flame to the work. Lead sheets may be joined edge to edge or by a lap. In the former case lead straps are melted along the joint to perfect and strengthen it. The apparatus is used when lining pickling vats, covering floors with lead, etc.; also for annealing the serrated wires for friction primers.

In and near the larger cities, where compressed gasses may be bought in portable cylinders, the hydrogen-making apparatus may be dispensed with, and the oxy-hydrogen blowpipe
substituted. In the latter case coal gas or blau-gas may effectively take the place of the pure hydrogen. The gasses from the portable cylinders are very easily conducted to even the most contracted localities by the simple lengthening of the rubber conducting tubes. Consult Clarke, J. W., 'Modern Plumbing Practice' (London 1914).

**AUTOGRAPH,** an inscription made by hand, but commonly meaning the signature of a person in his own handwriting. Apparently there is nothing in which one's personality is so inherent as in his handwriting, for the law recognizes the fact that one person cannot successfully counterfeit another's autograph. This is probably the reason why the accumulation of autographs of famous men has been one of the favorite pursuits of collectors from the most ancient times. It is recorded that one of the Egyptian Pharaohs paid high prices to the Greeks for the autographs of Sophocles, Euripides and others of their noted countrymen. The Greeks and Romans were also voracious collectors of such souvenirs, one of the Roman emperors having even the autographs of Chinesefellers. In the British Museum there is one collection which was begun as far back as the 14th century. It is an established fact that in the early Middle Ages there were manufactured in Germany books of blank pages which were sold to travelers that they might obtain the signatures of prominent people in other countries. In the British Museum is such an album dated 1554. It is only within comparatively recent times, however, that the collection of autographs has been commercialized. The buying and selling of signatures has become an international industry, or business, in which experts may command very high salaries. The value of an autograph depends, not only on the fame of the writer, but upon the rarity of his autographs and its condition. Naturally, if it is accompanied by a letter also in his handwriting, the value is many times increased. The most valuable collection of American autographs is in the New York Public Library; it includes the best set of the signers of the Constitution, among which is the autograph of Thomas Lynch, which once brought $5,000 at a sale. Among the most high-priced autographs are those of Raphael, the younger Bach, Charlotte Corday, Sir Francis Drake, Thomas More and Milton. Of the signers of the Constitution the rarest autographs are those of Lynch, Gwinnett, Hart, Morton, Heywood and Middleton. It is estimated that a set of autograph letters of the signers of the Constitution in good condition would be worth about $25,000.

**AUTOLYCUS,** a Greek mathematician and astronomer of Pitane in Aetolia, who lived about 330 B.C., the author of two extant works on astronomy; one on the revolution of the spheres and the other on the rising and setting of the fixed stars. These works have been translated into Latin by Hultsch (Leipzig 1885).

**AUTOLYCUS,** character in Shakespeare's 'Winter's Tale' (q.v.), a roguish thief who produces some cleverPercentage error in the play. He is obviously suggested by the Autolycus of Greek mythology, the son of Mercury and Philonis, who dwelt on Parnassus and was celebrated as a stealer of cattle.

**AUTOMATIC BLOCK SIGNALS.** See **Block Signal System.**

**AUTOMATIC SPRINKLERS.** See Fire Protection.

**AUTOMATISM,** in animals the power of movement or of action without any stimulus independent of that arising in the protoplasm of cells and tissues. Thus Descartes regarded animals (other than man) as 'automata,' and declared that they act independently of any volition or instinctive or intellectual power or faculty; in other words, that their so-called mental acts are involuntary and mechanical—that they may be compared to machines. In physiology, while automatism is apparently the result of the internal conditions of the living body, yet strictly speaking, says Loeb, no animal movements are exclusively determined by internal conditions. The co-ordinated character of automatic movements has been explained by a 'centre of co-ordination,' which is supposed to keep a kind of police watch on the different elements and see that they move in the right order. But, he adds, 'observations on the lower animals show that the co-ordination of automatic movements is caused by the fact that the element which beats most quickly forces the others to beat in its own rhythm.' The swarm-spores of algae, which possess no nervous system, are not equal to that of animals having ganglion cells, and he concludes that automatism is due to a chemical cause; that is, the pressure or absence of certain ions, or, in other words, to the chemical constitution of the protoplasm. Consult Carpenter, W. B., 'Mental Physiology' (Boston 1891); Loeb, 'Physiology of the Brain' (1901).

**AUTOMATON,** a mechanical contrivance whose actions are arranged to correspond to those of a human being. Friar Bacon had the reputation of having constructed a machine which, spoke, and Regiomontanus an iron fly, which, after making the tour of the room, returned to its master. Albertus Magnus is said to have spent 30 years in constructing a human figure which advanced to the door when anyone knocked, opened it and saluted the visitor. In the water-clock presented to Charlemagne by Harun al-Rashid, 12 doors in the dial opened respectively at the hour which they represented; they continued open till noon, when 12 knights issued out on horseback, paraded round the dial, and then returning, shut themselves in again. Camus constructed an ingenious toy for Louis XIV, consisting of a carriage drawn by two horses, containing a little figure of a lady with a coachman and attendants. The coachman cracked his whip, the horses moved their legs naturally, and when the carriage arrived opposite the King's seat it stopped; the page stepped down and opened the door; the lady alighted and presented a petition to Louis. The flute-players, the tambour- player and the wonderful duck of Vaucanson are celebrated for the astonishing ingenuity displayed in their construction. Among the most remarkable automata are the whist-playing and other figures of Maxey. Consult Brewster, 'Letters on Natural Magic' (London 1834); Houdin, 'Secrets of Conjura-
AUTOMEDON — AUTOMOBILE

ing"; and "Memoirs of Houdin" (ib. 1891); Ozanam, "Mathematical Recreations" (ib. 1854).

AUTOMEDON, son of Dioreus, who went to the Trojan War with 10 ships. Later he became the charioteer and chariot of Achilles, after whose death he served his son Pyrrhus in the same capacity, as described in Homer's "Iliad."

AUTOMEDON, two epigrammatists of ancient Greece. One was a native of Cyzicus, the other was an Eolian. Except that one is supposed to have lived in the time of Nerva, nothing is known of their lives.

AUTOMOBILE. A vehicle adapted for performing transportation work over ordinary roads by means of an engine forming a structural part of it, or by means of a source of power, such as an electric storage battery, installed within it. Synonymous terms are motor vehicle, self-propelled vehicle, horseless carriage or vehicle, motor car. Terms denoting special varieties are steam vehicle, gasoline vehicle, electric vehicle, motor truck, electric truck and other compound terms of similar general character. The word is now used more commonly as an adjective than as a noun; as a verb it is used in the participle form "automobile," meaning traveling by means of an automobile, but in this sense "motorizing" is preferred.

The history of the origin of the automobile records a large number of attempts at producing vehicles of this class, but not until 1895 did the manufacture of automobiles begin to assume the character of a regular industry. Since then the number of automobiles in use has increased at a rapidly progressive rate. In 1899 the United States had about 3,700, mostly steam carriages and "runabouts," but including perhaps 300 gasoline motor cars and 500 electric carriages, cabs and trucks. In 1903 the number had risen to about 11,000, mostly gasoline motor cars, and in 1916 to 1,200,000, including about 32,000 electric carriages and 13,000 electric trucks.

In France and England there were in 1899 about 3,000 automobiles, nearly all gasoline motor cars, and in 1903 the number in all of Europe was estimated at 28,000. In 1914 the total had reached over 600,000 gasoline motor vehicles, of which nearly one-half were in Great Britain, to which should be added a few thousands of steam carriages, steam trucks and electric vehicles, the latter mostly in Germany. These figures include all vehicles registered, new and old. The yearly production shows a still higher rate of progressivity, but the figures cannot be traced readily or accurately.

France, England and Germany divide the European production in the order named, Austria and Italy following with considerably smaller shares. Other statistics and some historical data are given under AUTOMOBILE INDUSTRY.

By far the larger number of all automobiles in use are employed for the transportation of passengers, the percentage used mainly for the transportation of goods is steadily increasing. Classifying by the nature of the power source, a decided majority of all automobiles derive power from an automobile engine, often designated as an "automobilized motor," which is an engine of the internal-combustion type (see INTERNAL COMBUSTION ENGINES) and is usually operated with gasoline as the fuel, although less volatile hydrocarbon fluids, such as benzol, alcohol, kerosene and molasses, may also be used conditionally, especially benzol, which is employed regularly in Europe for motor trucks and omnibuses. From these facts it follows that the automobile intended for the transportation of persons and driven by means of gasoline burned alone in an automobile engine is the dominant type. It is to this type that the word automobile is applied without the use of additional qualifying terms. Motor car, car, motor, gasoline car, as well as other terms implying nothing to the contrary, are also usually meant to designate the type only. Gasoline motor trucks and delivery wagons are variations of it, differing mainly in the dimensions of machine parts and in the arrangements of the vehicle bodies for the carrying of loads. Motorcycles ("cyph") would come under the same classification as the dominant type if they had not by common consent, due to their origin and peculiarities as bicycles with a motor equipment, been placed in a separate class. After those mentioned, other varieties of automobiles follow, in order: Electric trucks and delivery wagons, electric carriages and cabs, steam trucks (mainly in Great Britain), steam carriages.

As at least 95 per cent of all automobiles are operated by means of an internal-combustion engine, burning a fluid hydrocarbon fuel and probably 90 per cent of these are used for the transportation of persons and constitute the dominant type of automobile, there is good reason for the popular usage in accordance with which the word "automobile," when used as a noun, refers to this dominant type only. Going a step further in order to avoid all confusion of terms, the word "automobile" is used in the following only as an adjective, and the dominant type is designated by it, while trucks and wagons of the same general type (using the same type of engine, especially) are mentioned as motor trucks and motor wagons, and all other motor vehicles by their more specific names. The division of the very large subject comes then, so far as mechanical construction is concerned, under the following heads: (1) Motor cars, (2) Motor wagons, (3) Motor trucks, (4) Electric trucks and wagons, (5) Electric carriages, (6) Steam trucks and (7) Steam carriages. But not even this division can be strictly adhered to on account of intermediate construction types and the increasing number of special classes of vehicles in which the purpose and the special equipment adopted for serving it are of greater interest than the automobile mechanism which they share, in the essentials, with many other motor vehicles. Special constructions, among which motor omnibuses (see MOTOR OMNIBUS), fire department vehicles (see FIRE ENGINE), and army vehicles (see ARMY TRANSPORTATION; AUTOMOBILE IN WAR) are the most important, are treated mainly under special captions. Tractors and motor ploughs, while in part an outgrowth of the automobile movement and industry, are treated quite separately under TRACTORS and MOTOR PLough.

Every motor vehicle manufactured for the
market has so far been made in three structural divisions, (1) the chassis, comprising a frame carrying the whole power equipment, the actuating and control mechanism, the vehicle springs and axles and the wheels; (2) the vehicle body or carriage work, comprising all parts of the structural unit which is mounted upon the chassis frame for the purpose of carrying the load of persons or goods in a suitable manner, and (3) the accessories, comprising a number of detached or readily detachable devices serving secondary purposes. Rubber tires, lamps, speed- recorders, tops, carburetors, lubricators, fenders, motor-starters, air-pumps, lifting-jacks — are commonly mentioned as accessories. But tires, electric lamps, lubricators, carburetors and motor-starters operate in organic connection with the engine or vehicle mechanism as a whole, and the classification is only one of convenience to indicate that these units are often manufactured separately.

![Image](image_url)

**Fig. 1.** Chassis (1917) for light-weight 6-cylinder Motor Car. Frame reaches straight and converging. Springs directly under them. No torsion rods or driving-struts. Running-boards and fenders omitted.

**Motor Cars.** — The motor car chassis (Figs. 1 and 2) comprises a frame, a power equipment, means for power transmission from engine to road wheels, axles, vehicle springs, means for transmitting a driving-thrust from the road wheels to the vehicle frame, a steering gear, a system of brakes, road wheels and tires. In nearly all motor cars the means for transmitting power from the engine to road wheels are purely mechanical, but in a minority these means are electrical. In a still smaller minority of cases they are hydraulic, which, however, is only a special form of mechanical transmission. Nearly all engines are kept from reaching inadmissible temperatures by the circulation of water which in turn is cooled by air, but in some instances the engine is cooled directly by air. In nearly all motor cars the engine power is transmitted to the rear road wheels only, and the front road wheels are rotated by the push from the rear wheels against the vehicle frame and are utilized for steering, but in a few instances the front wheels are driven from the engine and steered as well, or all four wheels are driven and steered. These variations in construction are indicated when a motor car is referred to as a "gas-electric" car, a "hydraulic-transmission" car or truck, an "air-cooled" car, a "front-drive" car, cabriolet, a "four-wheel-drive" vehicle.

**The Frame.** — The motor car frame has been developed from a rectangular section made by riveting industrial angle iron side members to transverse angle iron girders or from a wooden frame of the same simple conformation. The arrangements and proportions of the vehicle body, springs, fenders and even of the power equipment and transmission elements were made to suit this form. The modern frame began its evolution when, about the year 1900, large strips of sheet steel were first shaped for this purpose in hydraulic presses. By degrees it has become practicable to bend the sheet steel in all three directions. Nearly all the side reaches of frames are of I section. Most of the frames are contracted at the front to allow a large turning angle for the front wheels and many are also bent upward at the rear to make room for spring and axle movements. Recently, by using straight but converging side members, as in Fig. 1, cost is saved and such frames readily meet varying design require-
is less active when the car goes uphill than when it moves on the level or downhill. To combine the advantages of both methods, a system is now frequently used by which a small auxiliary tank is placed near the engine and higher than the carburetor, supplying the latter by a gravity flow with practically unvarying head of pressure while the auxiliary tank is supplied from the main tank at the rear by suction from the intake manifold of the engine.

Fig. 3 shows the latter arrangement. Formerly pressure above the fluid in the main tank at the rear was often maintained by piping a portion of the exhaust gas from the engine into the tank. The fuel piping should have few joints, no sharp downward or upward bends where impurities may settle or air bubbles may lodge. The automobile engine may be considered as a development of the gas engine, which was the first internal-combustion engine, so called, when it made its first appearance, to distinguish its nature from that of steam engines. The fuel is burned inside of the cylinders which are utilized for transforming the expansion of gases into mechanical movement, instead of outside of them. Gas engines, stationary and marine hydrocarbon (gasoline or oil) engines, Diesel engines and automobile engines are the four large varieties of the internal-combustion type and each of them has characteristics which overshadow their similarity on the point mentioned. In France and Germany the automobile engine is rarely mentioned as an internal-combustion engine, this distinction from steam engines being apparently considered superfluous.

The German term Verbrennungsmaschine is a simplification. The term "explosion engine" (French: Moteur à explosion), an equivalent for internal-combustion engine, is now seldom used. (See INTERNAL-COMBUSTION ENGINE; GAS ENGINE; DIESEL ENGINE; AUTOMOBILE ENGINE.) The typical automobile engine is operated with gasoline as fuel, the equivalent of which is called petrol (petrol) in Great Britain, Benzin in Germany and essence de pétrole (or more commonly essence only) in France.

It has four cylinders usually bored in a single iron casting and is bolted to an aluminum crank casing and mounted to stand lengthwise and upright in the front portion of the automobile frame. Four pistons connect by connecting-rods, without crossheads, with a crankshaft machined from a single drop-forging. It draws a spray of fuel, fuel-vapor and air through a carburetor (q.v.) by means of the suction caused by downward strokes of the pistons, admits the mixture to the cylinders by poppet valves which are opened mechanically and closed by valve springs, ignites the mixture with a spark generated by means of a magneto (q.v.) or other electrical machine at the in-
terior terminals of a spark plug (or "sparking plug") screwed into the head of each cylinder, expels burnt gases by poppet valves which are operated mechanically and closed by springs. It has one camshaft geared to open, and hold open, both intake and exhaust valves at the proper periods. It detonates and burns an explosive gas mixture at every fourth piston stroke in each cylinder. The rear end of the crankshaft carries a small flywheel which is arranged to be used as one member of the coupling between the engine and the power transmission mechanism, and to which is also frequently applied the effort by which the engine is started, unless this is done by hand power by applying a crank to the front end of the crankshaft. The upper portion of each cylinder is cast with hollow walls forming a water jacket, and the water jackets are placed in a water circulation circuit by piping to the upper and lower portions of a "radiator" which is mounted upright and transversely at the front end of the automobile frame. Between the radiator and the camshaft gearing, in front of the foremost cylinder, a rotary fan is operated by an auxiliary shaft running on the camshaft to increase the flow of water and air in the interstices of the radiator structure. A centrifugal pump gear-driven in the lower branch of the water circuit often assists in effecting the circulation. External piping gathers the exhaust from the cylinders and is continued rearward underneath the frame, supported at an intermediate point in a muffler or silencer where the flow of hot exhaust gases, already cooled somewhat on the way, is further baffled and cooled before it is allowed to reach the atmosphere. Of the descriptive statements here made not a single one holds true for all automobile engines. Those which come nearest to representing universal practice refer to the use of a carburetor operated by suction from the engine and to the ignition of the fuel mixture by an electrically generated spark. The world-wide demand for an automobile engine in which liquid fuels less volatile and costly than gasoline may be used with equal facility already foreshadows the eventual disappearance of the carburetor operated by engine suction and the substitution of a predetermined preliminary action upon the less volatile fuels being required to make them readily inflammable in the cylinders when the engine is cold and under other adverse conditions of operation, as are bound to obtain in practice occasionally.

Fig. 4 shows a typical automobile engine equipment. With regard to the very numerous variations in design and details of construction see AUTOMOBILE ENGINE; AEROPLANE; MOTOR BOAT.

The equipment for the starting and control of automobile engines has undergone a continuous development; the control mostly through the improvement of carburetors, the starting mainly since 1910 and in conjunction with the gradual adoption of electric lighting for automobiles, the practicality of electric lighting for vehicles being in turn determined by the perfection of Tungsten filaments for electric incandescent lamps, as the older filament lamps were unable to withstand shocks and vibration long enough. The improvement of carburetors has had three main objects: To obtain the best and most economical mixture at all degrees of throttling, to permit the use of benzol of higher specific gravity which in the course of the years has become the only kind available in large quantities in the market, and to make it possible to accelerate an engine rapidly. The method adopted has been singularly restricted to modifications in the detonation from the engine reaches a carburetor and the atmosphere, separate mechanical means for varying the fuel feed rate being rarely tried. Details of this development, by which remarkable results have been accomplished by a very difficult route, are given under AUTOMOBILE ENGINE.

For many years, starting of the automobile engine was accomplished universally by turning a crank applied to the free end of the crankshaft—nearly always at the front of the motor car, and this is still the method employed in cars of limited pretensions to luxurious equipment as well as in most motor wagons and trucks. This crank grips only in one direction of rotation and has an automatic spring release. In some cases, extra springs are added to the crank arm to increase the pressure of the reversion of the engine cylinders. They are similar to those used for hoists and other machinery subject to reverse movements, but not losing importance for automobiles with the general introduction of engine-starter devices.

As the operation of a starting crank involves a physical effort which can become onerous in cold weather or when carburetion and ignition are not in perfect order, and is on the whole inelegant and inconvenient, many methods for starting the engine have been tried (see AUTOMOBILE ENGINE). The simplest of these is employed in practice in conjunction with a starting crank equipment and consists in turning the timing-lever of the ignition equipment, thereby producing sparks which may ignite explosive charges remaining in one or two of the cylinder after the last previous operation of the engine. But this method is not dependable. The more radical and reliable methods consist in (1) a mechanical connection enabling the driver to turn the engine shaft without leaving his seat, (2) arrangements for storing compressed air and by its release turning the crankshaft, and (3) arrangements for turning the crankshaft (often from the rim of the flywheel) by means of a small electric motor receiving current from an electric storage battery which has previously been charged from the engine by means of a generator or from an independent source of current. The compressed-air engine-starter arrangement is used mostly in France but is giving way to the electric method. Fig. 5 shows a diagram of one of the many electrical arrangements, which additionally supply current for electric lamps.

Power Transmission. The typical mechanical power transmission mechanism of a motor car comprises the clutch, the gearset, the drive shaft with universal joints, a bevel gear and a differential gear mounted at the middle of the rear axle with a central clutch which is again keyed at their outer ends to the hubs of the road wheels. A transmission set less used
1 Modern Type American Limousine  
2 Light car with Sedan Body  
3 Touring Car
for motor cars but more for motor wagons and trucks comprises the clutch, the gearset, the bevel gear and differential on a transverse countershaft near the middle of the vehicle, a

sprocket pinion at each end of the countershaft, a chain from each pinion to a sprocket wheel on each road wheel. In motor trucks a worm gearset often takes the place of the bevel gearset, being better adapted for effecting a large reduction of the rotary speed of the wheelshafts, while less suitable for motor cars, causing more resistance against coasting and other movements of the vehicle for which engine power is not applied. Other variations, known as internal gear drive and compound rear axle gear reduction, are referred to under Motor Trucks. All other methods for transmitting the power are exceptional.

The clutch may be of the friction cone type, the brake type or the plate type, the latter having few or many plates which may be lubricated or dry. Types rarely employed are the hydraulic and the pneumatic.

Fig. 6 shows a cone clutch arranged to centre itself automatically in the flywheel.

The brake type, which is rare, is similar to rear wheel brakes, comprising either two semicircular segments arranged to be expanded against the flywheel rim or a steel band contractible on a drum secured to the face of the flywheel. It is mostly used in Europe, especially in German cars.

Fig. 7 shows a single-plate clutch with one plate. Fig. 8 one with many, half of which are secured to rotate with the flywheel of the engine and the alternate ones with the clutch shaft. The plates in clutches operating without lubricant are generally made of other materials than steel or bronze, or alternate plates are of metal and the intervening plates of composition material. Frequently the clutch as well as the gearset is so encased as to form a rigid unit with the
engine (Fig. 9), and the enlarged "unit power plant" so formed is then often mounted in the automobile frame with support at only three points (or four points of which two are very close together), with the object of preventing any twisting or other deformation of the frame.

Fig. 9.—A six-cylinder unit power plant.

which may be caused by the roughness of roads, from reaching and affecting the alignment of engine, clutch and gear shafts. If this means

Fig. 10.—Transmission showing operation of clutch, reverse and brake pedals.

(also serving to exclude dust) is not adopted, a universal joint is interposed between the clutch and the gearbox.

Fig. 11.—Transmission showing gears in mesh.

Fig. 12.—Thermosyphon cooling system.

bevel gear on the rear axle, where it is reduced in the proportion of one to four, approximately. With this important exception the typical gearset follows more or less closely the design shown in Fig. 13, representing a gearbox (and clutch) with three forward gearspeeds and a reverse. For many large motor cars and heavy motor trucks four forward gearspeeds are used.

Fig. 13.—Typical 3-speed gearset (with one-plate clutch in front and transmission brake at the rear). Operating levers, at top, shown in part only.

The methods by which gears are shifted have undergone considerable change in recent years. The shifting lever and quadrant which were formerly on the outside of the motor car body are now inside of it as shown in Fig. 14, the change being a result of the general adoption of "left side drive," or changing the driver's seat from the right to the left side of the vehicle. A long development in control of gear-shifting, from "progressive" to "selective" is described in most books on the subject but is passing into the remoter sphere of mechanical history. Similarly the gradual improvement in shifting forks and jaw clutches in the gearbox. A very recent development is a construction by which all gear wheels remain in mesh, excepting the reverse, the main object being to reduce
the amount of skill required for smooth and silent operation, all clash of gear wheels being avoided. The latest omnibuses in Paris are equipped with gearboxes of this type.

FIG. 14.—Cab of a Motor Car, showing inside driving control (“left side drive”) and the Instrument Board.

To have spur gears operate silently the first requirement is the accurate involute cut of the gear teeth, perfected by grinding and polish, and great improvement in milling machines has been necessary to effect the smooth running and small wear of the gears with which the motoring public is now familiar. Another requirement relates to the circumferential speed dimensions are reduced in the same proportion) strong enough, the use of very strong alloy steel in gears has been necessary, calling for a specific development of metallurgical science and the exercise of painstaking judgment. For, if the gear teeth are made too small, the pressure upon lubricants becomes so large as to squeeze them out, thereby increasing friction and wear, and if the teeth are broadened to avoid this consequence the movements of the shifting forks needed for changing gear become larger than desirable, the gearbox longer and heavier, the shafts more subject to vibration.

Mainly in England the use of silent chains (q.v.) in gearboxes has been resorted to for overcoming these difficulties. Resonance of the aluminum box containing the gears is also to be avoided, so the material is thickened and the shaft bearings in its walls are made as long and large, to postpone wear and looseness, as other dimensions permit. The exterior of an aluminum gearbox mounted separately in the frame is shown in front view in Fig. 15.

FIG. 16.—Universal joint formed of leather and metal discs.

The relations existing in the matters of fuel economy, gear speeds and gear ratio, convenience in driving, vehicle weight, the special qualities of the engine which are indicated by its power and torque curves, form a subject on which the opinions of engineers differ, not so much with regard to the mechanical results of a given set of conditions as with regard to the question of what results are most desirable. The answer varies greatly with the purpose of the vehicle. And thus a great variety of engines are in use, weighing from 15 down to five pounds per horse-power, having a maximum speed from 800 up to 4,000 revolutions per minute and from one to 12 cylinders. The gearbox arrangements vary accordingly. As a rule, the larger the range and resources of the engine, the smaller and simpler the gearbox can be, for given working conditions.

Universal joints, drive shafts, bevel gears and differential gears, of which typical examples are included in preceding illustrations, are mechanical units known in many applications outside of motor cars, but in these they reach their most refined development. Universal joints formed of leather disks on the plan shown in Fig. 16 have been widely tried, with the object of securing silence and avoiding lubrication and wear, as well as the excessive oiling and grease liable to occur in these members if they are entirely metallic, but these substitute arrangements have not proved durable or adapted for
manufacture on a large scale and are now seldom used.

Bevel gears have been so refined that their mechanical efficiency reaches 95 to 96 per cent and pitch are so chosen that they can be operated in one direction but much less readily in the other. Fig. 19 shows a sketch of a differential of this nature which is not yet standard but is not uncommonly preferred to the normal type, especially for motor trucks.

The lubrication of the transmission elements, of springs and shackles, of the steering gear, the wheel bearings, etc., is not yet developed to a system. In nearly all motor cars each casing and bearing must be watched separately and provided with lubricant separately and at irregular intervals. In the isolated instances where a system has been established, it begins with the engine. As it is recognized that the durability of the mechanical construction depends greatly upon having lubrication attended to unfailing, and as constant (but in practice always irregular) attention to lubricating involves a large share in the work of caring for a motor car, a universal development toward an almost automatic and complete system of motor car lubrication, now barely inaugurated, is widely expected. The difficulties lie mainly in rendering it unfailing, so that no false security, with the attending instances of serious damage to parts, may be the result.

While the worm gear sets and internal-gear drives are occasionally used for motor cars, their use for motor trucks and electric vehicles is more common.

Transmission by chain drive from a countershaft is typical for motor wagons and motor trucks and is referred to under these heads below, but it is also still used in a few high-speed motor cars, especially in Germany, having survived from the time, before 1905, when it was the most widely used transmission system for motor vehicles of all classes. It does not differ in principle from the chain drive used for bicycles.

Electric transmission from an automobile engine has been frequently tried for motor cars and motor trucks but has never gained adoption for regular and extensive manufacture. As it admits of dispensing with the shifting of gears and can easily be adapted to the driving of all four wheels, however, it is constantly taken up again, in one place or another, when developments or discoveries in electric science or machinery seem to promise new and superior results. As the features of greatest special interest in these vehicles are electrical and no type of motor car or motor truck with electric transmission is yet widely established industrially, descriptions of the most recently developed systems of this order (represented in the United States by the Lentz transmission, in England by the gas-electric omnibuses operated mainly in Manchester, and on the continent by the Balachowski & Caire gas-electric trucks) are given under ELECTRIC VEHICLES.

Hydraulic transmissions exist sporadically in experimental motor cars and are used in a few motor truck constructions, such as the Manly (American—La France) in the United States, the Hele-Shaw in England, the Hugo Lentz in Germany and France, and the improved Janney-Williams (Delanay-Belleville) in France. As they are not yet important in the automobile industry and the principles employed in them are similar to those applied more extensively and typically for hydraulic marine steering gears and other hydraulic machinery,
descriptions or explanations of hydraulic motor vehicle transmissions are given under HYDRAULIC MACHINES.

Vehicle Springs.— No adequate understanding of the requirements in vehicle springs for motor cars can be gained without a comprehensive study including not only spring materials and spring design but also the relations of the spring action to the auxiliary action obtained from resilient wheel tires, to the length of the wheelbase of the vehicle (the distance between axles), to the distribution of weight between axles, to the average and maximum speeds required of the car, to the nature of the roads over which it is most likely to travel and to several minor factors. On the whole experimentation has dictated the development, and all "springing" is a compromise among more or less conflicting requirements. As the object of "springing" in general is to permit the wheels and axles to bounce over the inequalities of a road surface without communicating severe shocks or much up-and-down movement to the vehicle frame and body, and the springs for this purpose should be as flexible as practicable, and as, on the other hand, very flexible springs oscillate with great amplitude after a shock, and such oscillations in turn are liable to react upon the frame and body, the technical effort in spring design is largely concentrated upon the problem of moderating the rebounds and oscillations of vehicle springs which are flexible and lively. Flexibility, life and strength are combined in the springs by using special alloy steel for the spring leaves, by having each spring made of many thin leaves rather than a smaller number of thick ones (this permitting a reduction of their length) and often by using springs which do not only bend but also rock around a pivot near their middle (cantilever springs). The nature of the cantilever spring, being a type almost exclusively used for motor cars, is illustrated in Fig. 20.

The use of coil springs in lieu of leaf springs has often been attempted but has never yet become general, except for auxiliary purposes, mainly because this type of spring does not in itself possess lateral stability and therefore must be specially braced to prevent the motor car body and frame from swaying from side to side. The means adopted for moderating rebound and oscillations take the form of auxiliary devices which can be coil springs whose periods of oscillation differ from those of the leaf springs and thereby break up the harmonic sequence of movements, but usually they are based on mechanical or hydraulic friction and are called rebound checks or shock absorbers. But for motor cars intended for speeds higher than 20 miles per hour satisfactory results, securing both comfort for occupants and safety for the vehicle structure, are not considered to be obtained without the additional equipment of pneumatic tires for the vehicle wheels.

Most of the elements in the springing of motor cars are also used for other classes of motor vehicles and in part for ordinary horse-drawn carriages and for railway cars and coaches. To avoid repetition more detailed information will therefore be found under VEHICLE SPRINGS; SPRINGS; REBOUND CHECKS; SHOCK ABSORBERS; RUBBER TIRES.
Rear Axles are built up from cast and pressed steel sections on the plan typically shown in Fig. 21. The many variations and

![Fig. 21. — One side of typical rear axle, with brake drum (on the wheel) and brake-operating bars.](image)

the distinction between axles with "floating" and "semi-floating" wheel shafts are elucidated in textbooks. Both types give excellent results when materials and other mechanical details, such as bearings and the provisions for lubrication, are suitable. Front axles are drop-forged from one piece of steel into shapes such as shown with steering knuckles and drag-link added in Fig. 22. The two types indicated in Fig. 23 represent preferred American and European practice, respectively, in front axles.

To convey the driving-thrust from the rear axle of a motor car to its frame it was up to about 1912 universally considered necessary to employ thrust rods, often termed radius rods, extending from the axle to some portion of the frame near its middle, and in the power transmission system a detail of kindred nature is a torsion rod or tube serving to prevent the power thrust upon the teeth of bevel gears from skewing the axle and causing uneven riding of the frame and body on the springs. Torsion rods or bars are still generally used, and in many cases the thrust rods and the torsion rods are combined in the form of a tubular casing for the drive shaft, fork ing into two branches at the front end. Figs. 2 and

![Fig. 22. — Typical front axle, with steering knuckles and drag link.](image)

24 show typical constructions for these purposes. In recent years, however, it has been found practicable to transmit the driving effort through the vehicle springs, and to omit special braces for absorbing torque reaction, in which case the construction may be such as shown in Figs. 2 and 20. For small cars equipped with cross springs only, a pair of radius rods converging toward a transverse girder at the middle of the frame is generally employed for the front axle as well as for the rear.

The Steering Gear of motor cars typically comprises the arrangement shown in Fig. 25 by which the front wheels are turned by turning a nearly vertical pivot pin forged in one piece with the wheel spindle, the turning movement being transmitted from the wheel most directly actuated to its mate by a transverse drag-link connecting the pivot pins and provided with adjustment screws and nuts to secure parallelism of the wheels for driving straight ahead. The nature of the linkage (known as the Ackerman steering system and invented for use with ordinary vehicles more than 100 years ago) causes the wheels to diverge a trifle forwardly when turned — and the more the more they are turned — with the object of making one wheel turn a shorter curve than the other, as required. In some cases the pivot pin is formed upon the axle end and the knuckle in one piece with the wheel spindle. (Fig. 23).

The operating mechanism, as shown in Fig. 25, actuates a wormwheel (or a sector of a wormwheel) by means of a worm with treble or quadruple thread of about 30 to 45 degrees pitch, and the steering arm keyed to the wormwheel or sector is thereby turned forward or backward, its lower end describing a short

![Fig. 23. — Typical steering knuckles, American and European type, respectively.](image)
This end is jointed as in Fig. 26 with the rear end of a lengthwise steering rod whose front end is jointed to a short crank arm on the pivot pin or knuckle. This mechanism is reversible, as the worm and sector are kept well lubricated within the substantial casing enclosing them, and the wheels can readily be turned by applying force against them for that purpose. But in some motor cars, and in a majority of heavy motor trucks and other motor vehicles, a square screwed thread takes the place of the worm, and a large nut is moved obliquely up and down to actuate the steering arm. This arrangement is only semi-reversible, or it may be irreversible if the screwed thread is of low pitch. Jolts received on the sides of the front wheels on rough roads are with this construction transmitted only in slight degree to the driver's hands, but the violence of stresses to which the mechanism is subjected from wheel rim to steering gear is correspondingly greater. These stresses are absorbed to some extent in the buffer springs with which the joints of the steering rod are provided.

In some types of motor cars and in very many motor trucks the steering linkage is arranged crosswise of the vehicle, which arrangement is modified in several ways and can have the advantage, if the front vehicle springs must be of high camber, that the steering action is then less influenced by oscillations of these springs than when the steering rod runs lengthwise.

Fifth-wheel steering, as standardized for vehicles drawn by animals, is scarcely ever used for motor vehicles of any class, excepting only a few, mostly electric, in which a fore-carriage containing the whole power mechanism forms a separate unit coupled to the rest of the vehicle.

Brakes.—The typical system of brakes for motor cars consists of service brakes operated by a pedal and emergency brakes operated by a lever at the right side of the driver's seat. The lever can be locked in any position given it by means of a pawl acting against a notched quadrant secured to the car frame, and the emergency brakes can therefore be used to hold a car on a hill unattended. Linked rods, including an equalizer bar (shown in Fig. 2), transmit movements of brake pedal and lever, separately, to brakes acting on drums secured to the driving wheels. Usually (Fig. 27) the service brakes are brake shoes (faced with friction fabric) which are forced by the turning of a cam against the inside of the drum, and the emergency brakes are steel bands lined with special brake-surfacing material, which are contracted by a similar cam action against the outside of the drum. To permit the cooling of the drum, the latter is in some cases widened and the emergency brakes are made like the service brakes and act side by side with them, both sets on the inside of the drums. In many European cars and some American cars, the service brake is single and is mounted upon the transmission as in Fig. 13, usually upon the gear shaft just behind the gearbox and in front of the universal joint connecting with the drive shaft. In connection with this construction, the emergency brakes are expansion brakes in the rear wheel drums. The use of brakes on all four wheels is practised on a few makes of cars in England and occasionally on a racing car, the systems used in each case being described in the larger textbooks on automobile construction. Hydraulic brakes are used for some heavy motor trucks, largely with a view to the operation of such vehicles on long declivities. For motor cars, hydraulic, pneumatic and electric brakes are in a state of development. Patented systems exist for utilizing the engine as a brake by omitting fuel-charging and ignition and making the pistons work against air charges in the cylinders. But these have not been widely adopted, perhaps mainly for not being subject to finely graduated control of the braking effect.

Wheels.—The wheels of motor cars are either wood wheels or wire wheels, the wire wheel being a development of ordinary vehicle
wheels and the wire wheel of bicycle wheels, and in either case the hub is adapted to be mounted on ball bearings or roller bearings, and the rim is arranged to receive a pneumatic rubber tire. For construction details of wheels, wheel bearings, wheel rims (now usually readily dismountable and called "dismountable rims," a corruption of French d'émonvable), and pneumatic tires, see Wheels; Ball Bearings; Roller Bearings; Rubber Tires.

Motor Car Bodies.—The technical development and construction of carriage bodies has undergone radical changes in its adaptation to the automobile and to mass-manufacturing methods. Wood, steel and aluminum are all largely used for the framework and panels of the bodies, with a growing preference for sheet metal work. The painting which was at first a laborious and time-consuming art is turned more and more into spraying and dipping processes followed by rapid artificial drying by hot air, taking place while the bodies are carried on conveyor belts from one end of a long building to another, and the atmosphere in the building is carefully filtered to exclude dust. Fenders and engine hoods are often made as specialties at outside factories.

A general view of mechanism and arrangement of an elaborately designed motor car of the "touring car" class is given in Fig. 28.

Motor Wagons.—The chassis of motor wagons are frequently almost identical with chassis made for motor cars of the same manufacture. But large numbers are especially designed for delivery of merchandise and express wagon work, and in many of these chassis power transmission is of the chain-drive type, the vehicle springs are less flexible than for motor cars of comparable size, and wheels are larger and are shod with solid rubber instead of pneumatic tires. For technical details, see Sprockets; Sprocket Chains; Silent Chains.

Motor Trucks.—The principal differences in the construction of chassis for motor trucks and those for motor cars are the following, speaking in general and with reference to the preceding account of common motor car construction: The engine is heavier, slower and larger, the maximum engine speed rarely exceeding 1,500 revolutions per minute and frequently not reaching half of that figure. The general type of engine is shown in Fig. 29. Self-starting and electric lighting equipments are usually omitted, though provision is often made for fitting them afterward at the purchaser's option. The frame is usually made of industrial iron shapes but especially designed pressed-steel frames are gradually displacing the cheaper construction. The frame projects from one to three feet in front of the front axle and as far to the rear of the rear axle as necessary for providing load space. In heavy trucks from three-fourths to eight-ninths of the load is carried over the rear axle. (By this system the cost of production can be somewhat reduced, as the front portions of trucks of different load capacities can be made nearly alike, but the better manufacturing practice tends toward providing a complete individual design for each size of truck). As a heavily loaded platform demands a broad support on the vehicle springs, these are generally of the semi-elliptic or platform type at the rear and are often supplemented by overload springs (see Vehicle Springs) which come into action only when full load is carried or severe shocks are received on the road. Rebound checks and shock absorbers are rarely used. Instead of ball bearings or roller bearings in the wheel hubs, parallel bearings are quite generally used, especially in Europe; in England often with floating bushings and special provisions for keeping lubricant from leaking out. Each rear wheel is usually shod with two solid rubber tires, side by side, known as twin tires; each front wheel with a single solid rubber tire. Pneumatic tires in front or on all four wheels are used only for delicate loads, such as pianos, dynamite, glass, crockery.

The transmission system for motor trucks
is sometimes the same as that described as typical for motor cars, but recently worm gear sets are taking the place of bevel gear sets, allowing more gear reduction for a given road clearance under the middle of the rear axle and being credited also with silent running and suitable end-thrust bearings are conditions for the successful use of worm gears in motor vehicle driving systems. A general view of chassis and body arrangements of a motor truck with worm drive is given in Fig. 31.

Another variation of the ordinary shaft drive transmission which is commonly employed in motor trucks is known as the internal-gear drive, of which an example is shown in Fig. 32. A variation less commonly yet not infrequently used is the compound rear axle gear by which two pairs of spur wheels transmit the rotary movement from bevel gear and differential to the wheel shafts within the rear axle housing, in order to effect a reduction of speed. But chain drive, without casing for the chain, is still the type of transmission most numerically represented in this class of vehicles, the general construction of it being the same as for motor wagons. Radius rods for transmitting the driving thrust to the truck frame are always used with this drive and are arranged to be lengthened or shortened by a screwthread adjustment in order to adjust the distance between sprocket wheels and thereby compensate for wear of the chain. Roller chains are generally used. See Sprocket Chains.
AUTOMOBILE ENGINE

The remaining classes of automobile vehicles, which are dealt with in other articles, are the following: Electric trucks and wagens (see Electric Vehicles); electric carriages (see Electric Vehicles); steam trucks (see Steam Vehicles); steam carriages (see Steam Vehicles).

MARIUS C. KRAUP.

AUTOMOBILE ENGINE. Historically and mechanically the automobile engine is derived from the stationary and marine gasoline engines developed before 1890. (See Internal Combustion Engine; Gasoline Engine.) These were either 4-cycle or 2-cycle engines, and automobile engines were developed on both plans, though very unequally. Gottlieb Daimler and Karl Benz selected the 4-cycle type for the small and experimental vehicles built by them in 1884, 1886 and 1888, from which the first automobile constructors in France received their inspirations, and when France soon afterward took a decided lead in production and design the 2-cycle engine was neglected by the majority of engineers in the matter of developing it for vehicle work. It continued in favor for small motor boats in England and America, received the benefits of the rapid improvements in materials and production methods extending to all classes of hydrocarbon engines, and every now and then it has been taken up for use in automobiles. But in nearly every instance of this sort it was eventually abandoned again, falling behind the 4-cycle type, to whose improvement by far the larger resources were devoted. The common prototype of the class of engine primarily to be considered is thus the single-cylinder, 4-cycle engine described and illustrated under Gasoline Engine, Stationary. By taking note of the deficiencies for vehicle work which cropped out from the moment it was applied for this new purpose and by following the efforts made for removing these shortcomings, one arrives at length to any and all of the types now in use, each type representing originally some variation in judgment with regard to the relative importance of different requirements or the means for meeting them. In the prototype of automobile engines the following shortcomings were immediately apparent: The great weight, due to thick castings, large flywheel, large water tank and water supply. Violent shaking and vibration, due to single-cylinder design and unbalanced mass of piston, connecting-rod and crankarms and crankpin of the engine shaft. Failure to operate at more than one speed, due to low efficiency of suitable methods for varying the fuel feed and, in lesser degree to ignition, by high tube or defective electric apparatus. Unreliability at any speed, due to poor castings, wrong composition and weak compression of the explosive charges, overheating, failing lubrication. Small and irregular power development, due to overheating, low maximum speed, small valve ports and gas conduits, poor composition of fuel mixture. Noise and odor of exhaust, due to single-cylinder design, incomplete combustion of explosive mixture and unsuitable mufflers. Noise of engine and coming gears, due to unbalanced mass of rotating and reciprocating parts, poor design and cut of the gears.

As the construction having these faults represented the best knowledge of its day, it could be improved only by degrees, in the measure as knowledge grew among designers and skill and production facilities were developed in the industries supplying new materials and machinery. When one fault was alleviated another one was often aggravated by the remedy. Saving weight by using a smaller flywheel, for example, made shaking and vibrations worse and starting of the engine more laborious and uncertain. Reduction of the water supply made overheating—with dwindling of power and seizure of pistons—for a long period a most common trouble, and while the MOTOR was at once devised to take care of excess heat the improvements in carburetors and ignition, resulting in more power and higher speed kept the generation of surplus heat ahead of the radiator improvements and other improvements for checking it. In more recent days, larger valve ports and lengthened piston stroke doubled and trebled the engine speed and power that could be obtained from a cylinder of a given bore, but resulted also in the return of vibration and difficulties in effecting ignition and lubrication rapidly enough, and these reverting troubles had to be remedied in turn by further lightening and finer balancing of reciprocating parts as well as by subtle changes in valve and cam shapes and settings, so as to get combustion started and dwelled to best advantage, before a practical gain in engine values could be realized from the increased speed and power. To be able to operate this improved engine slowly and with small fuel charges as well as rapidly and with full charges is still an object to be realized in the same degree that was attained in the heavier, larger and slower engines which preceded them in the evolution.

These instances of correlation among

FIG. 32.—Chassis with internal-gear drive for motor truck.

merits and defects — out of many that could be mentioned — are characteristic of the automobile engine as an organism in which success or failure comes from harmonious interaction among all mechanical features as much as from the individual features themselves. 

Carburation, fuel induction, ignition, compression, combustion and explosion and even lubrication — all important and complicated functions — must in the highest type of engine often be performed several thousand times each minute, and in minuteness of control or in minutely regulated time and space relations of one to another, these relations varying moreover according to the engine speed.

Evolution of the automobile engine has for the reasons implied in these facts been a rapid succession of compromises among conflicting factors. Many advanced steps have at first been too boldly conceived and had to be retracted to wait for related improvements not yet ripe, at the time, for mechanical realization.

The simplest single-cylinder motorcycle engine (see Motocycle) cooled directly by the atmosphere represents the simplest engine unit in which every unsuitable feature of the stationary gasoline engine prototype has been changed and made to suit the exigencies of the time and the market. These engines are used for motorcycle and motor car and the requirements for vehicle work on essentially the same plan that has been followed for automobile engines, although the urgent need of lightness has here caused the adoption of cooling by air instead of by water and has reduced the number of cylinders, in most cases, to one or two.

For automobile engines, on the other hand, cooling by water was originally found so much easier to manage that its cost, weight and encumbrance were almost universally accepted as a lesser evil than the unreliability thought to be inseparable from cooling by air alone, and only one American manufacturer of motor cars now employs the latter system, using forced air draft for each cylinder. As a small cylinder is more easily cooled than a large one (having a larger surface to which the cooling medium can be applied in proportion to its volume and capacity for heat generation), and as 6, 8 and 12-cylinder motors with small cylinders are gaining in favor, such motors are more frequently to be used as an engine material for pistons and cylinders and is more readily cooled than iron, having much greater conductivity (see Heat). The possibility of a much wider adoption of air cooling is not excluded, especially in conjunction with a moderation of engine speed; for example, for light vehicles for which the smallest practicable dimensions of a four or six cylinder engine give an abundance of power without pushing the engine speed to the attainable maximum.

Among the features in the original engine, of which no trace is left in the modern designs shown in the accompanying illustrations, the surface-evaporation carburetor, the automatic inlet valve, the hit-and-miss speed control acting by blocking the exhaust, and the hot-tube ignition were those which were mostly responsible for the immense difficulties in utilizing the engine with equal facility for different vehicle speeds, different loads and different road grades. To change the constant-speed engine into a source of variable power, with the amount of power and the rate of its delivery — the torque and angular speed of the crankshaft — under the required instantaneous control, it was first of all necessary to revolutionize the carburetor. As the engine is the heart of the motor car, so is the carburetor the soul of the engine. Theories on the necessity for complete evaporation delayed the advent of the float chamber and the jet. Years followed, during which the Krebs diaphragm or a sliding sleeve was employed to secure approximately the same composition of the exhaust gases in the cylinder, and in minute regulated time and space relations of one to another, these relations varying moreover according to the engine speed.

The whole subsequent development of carburetor mechanics has been divided between the two objects of securing this fine control for all desired degrees of engine power and speed (high engine speed and high action torque being as frequently wanted, on hard and level roads as maximum torque at low speed to turn the crest of a hill without gear change) and of reconciling it with the constantly decreasing volatility of the fuel and the changing market. Increasing number of cylinders in the engines, all to be supplied from the same carburetor, and rapidly increasing maximum speed of the engines due to other advancement in the construction, made the task an unceasing one. Herein came a demand for rapid acceleration or "pick-up," also to be complied with. The expedients adopted may be classified in groups mechanically, but are so variously modified and combined in the several hundreds of carburetors manufactured for the market that no single scientific principle has been demonstrated as governing the control of carburation when it is undertaken on the basis of a spray-jet from which a variable air current must siphon the fuel. As the volume of the liquid gasoline should be only about one eight-thousandth part of the volume of air with which it is mixed in atomized or vaporized form, the variable features in the control cannot successfully be applied directly to the flow of the liquid, such control must be applied to the air itself, which is made to reduce or enlarge the apertures of the jet, but must be applied to the air, its course and its velocity, and the air current, so varied on one plan or another which has been found suitable, must cause the discharge of liquid to be varied in proportion to the volume of air used. The greatest difficulty arises from the fact that an air current of doubled volume siphons much more than double the amount of fuel from an ordinary tubular jet, and compensation for the excessive siphoning action must be made. Also, when the air current is strong, with the throttle open, and the engine cylinders are filled up completely by the suction stroke, the compression of the charge becomes greater than if the cylinder is only partly filled, and to realize the best fuel economy, the highly compressed fuel mixture should be leaner than one less compressed. To compensate for this factor special devices are sometimes employed which admit air above the throttle to thin the gas mixture at the engine speeds giving the highest torque. The expedients which are normal features in the carburetors are exemplified.
on the constructions shown in Figs. 1, 2, 3 and 4, and are briefly explained in the captions for each of them. In order to produce a noticeably rapid acceleration it has recently become a somewhat general practice to have a plunger connected with the throttle or accelerator lever with poppet valves are of the L-head, the T-head or the top-valve type. The questions involved in the designer’s choice among these, aside from cost of construction and commercial expediency, have changed in the course of years. Sound cylinder castings were hard to obtain

in such a manner that for a moment after the throttle has been opened to cause acceleration, an additional air current is sent from the plunger pot through or past the jet, to produce an action which is at once as strong as that which the same throttle opening otherwise gradually causes by increasing the engine speed.

The arrangement of valves and valve-actuating mechanism largely determines the dimensions of valves that can be used for a cylinder of a given bore, and thereby the maximum engine speed under load. According to what arrangement is adopted, automobile engines for many years, with intricate coring for water jackets, except in symmetrical shapes, and this factor gave the preference to the T-head type before the top-valve type was known. It is now seldom used, the art of casting having advanced, bringing the functional factors of the engine into relatively greater importance.

These functional requirements are (1) compact combustion chamber with a minimum of wall area to get rapid ignition and inflammation from a centrally located spark plug and full benefit of gas expansion against the piston before cooling can take place in appreciable
degree; (2) large valves and direct passages for fuel charges and exhaust gases, these being the main factors in "volumetric efficiency" which is the ability of the engine to take in and discharge gas with a minimum of skin friction and vortex action; (3) minimum weight of valve mechanism, to reduce vibration and noise; (4) accessibility of valves and valve seats, to facilitate inspection and repair; (5) minimum formation and ready removal of carbon deposits, the latter being due mostly to residues from incomplete combustion of lubricating oil on the cylinder walls; and (6) reliable lubrication of the valve actuating mechanism.

In the quest for a small engine with a high maximum power and a wide range of speed these factors are all of importance, and it is usually admitted that the top-valve type, with the camshaft located on top of the cylinders, admits of the highest power development, closely followed however by the L-type arranged with the intake valve in the wing and the exhaust valve in the top and operated by a rocker arm. In all cases the possibility exists of obtaining equal maximum power and greater "flexibility" in operation from a slightly larger and heavier engine with relatively smaller valves. The valve timing can be made nearly correct throughout the smaller range of engine speeds. Thus the L-type with both intake and exhaust valves in the wing (and each of them

![Fig. 3.—Modern American carburetor of design including unusual features. Auxiliary air supplied through ports uncovered at high engine speed by tubular piston P moving in cylinder C having upper and lower ports. "Metering pin" M attached to piston P by ball at its upper end but free to move upward as gasoline is drawn up around it from main jet J, the discharge aperture in which is regulated by the position of metering pin in it. Hot air hose A. Series of holes B admit main supply of air to cylinder C, the air passing through annular channel around spray-jet H. Lever L furnishes adjustment to conform with size and design of engine by raising or lowering jet H, thereby changing its relation to metering pin.]

![Fig. 4.—Widely used American carburetor with dash control (therefore rather small) is commonly employed. A modern instance of the T-type, with two camshafts, for a 6-cylinder engine of high class and cost is shown in Fig. 5, the valve tappet rods being encased by means of aluminum covers on both sides. Though little used now, this type can have large valves and high speed. Fig. 6 shows a sectional view of a 4-cylinder L-type engine, all cylinders cast in one block, as now usually done. Fig. 7 shows a 4-cylinder top-valve engine with details of mechanism in Fig. 8. Fig. 9 an 8-cylinder engine. To make

![Fig. 5.—Left and right side views of 6-cylinder pair-cast, high class automobile engine of T-type.](LEFT)
the power impulses follow one another at equal intervals, one row of cylinders in this engine forms a right angle with the other. In 12-cylinder engines of the same type, which are also used, this angle is reduced to 60 degrees.

Fig. 6.—Four-cylinder, L-type engine, block-cast.

whereby the engine becomes narrower and more easily disposed of under the hood, the parts are more accessible, while the great advancement in the utilization of automatic machinery in the production of engine parts makes the difference in cost less than it could have been a few years ago. A tendency is thereby established toward the use of many small cylinders rather than fewer and larger ones. The crankshaft of a multicylinder engine fully balanced by counterweights at every point to obviate vibration in the last degree is, however, a complicated forging. The ability to produce such shafts by drop-forging from one piece of steel has been developed mainly in the United States, while on the other hand the art of producing complicated and yet sound cylinder castings was first developed in Germany, France and Belgium. In the beginning of the industry, cylinder heads were cast separately from the cylinders and were bolted on.

Fig. 7.—Four-cylinder, top-valve racing engine.

The gasket used at the joint frequently leaked after much exposure to heat, and the practice of casting all in one block was universally adopted. Lately, however, a return to separate casting of cylinder heads is noticed, this being due to considerations of cost, of new valve arrangements, better gasket materials and cheaper and more convenient repairs.

Fig. 10 shows an engine of the sleeve-valve type; in this case having two sleeves for operating the intake and the exhaust by the successive covering and uncovering of valve ports in the upper portions of the cylinder walls. First proposed in 1906 as an adjunct of an automobile exhibition in Chicago, this engine was subsequently perfected in England and France and is now widely used. The silence of its operation stimulated designers of poppet valve engines to the improvements by which the latter have also been made silent, mainly by better gears for camshaft, pump, magneto and fan and by the boxing of valve mechanism.

Another type of sleeve-valve engine, with a single sleeve, is also in successful use, in England, where it is made. Many efforts have been made to produce automobile engines with rotary valves, usually arranged in the nature of a valve tube placed horizontally through the heads of the engine cylinders and arranged to open and close the ports in the cylinder heads by rotation and periodic registry with ports

in the tube; but only one rotary valve engine is in practical use and has a vertical rotating sleeve at the top of each cylinder. It is of Italian manufacture.

By looking over Figs. 6 to 10 one notices in all of them a number of features adapted for removing the shortcomings of the stationary engine. The castings are thin, reducing weight and permitting the heat to escape to the cooling water with the required rapidity. Normally a centrifugal pump is employed to drive the heated water from around the combustion chamber and the valves into the top portion of the radiator and further into the finely subdivided ducts in the latter, where it is exposed to the cooling effect of the atmosphere, the air being drawn rapidly through the interstices, partly by movement of the vehicle and partly by the suction from a fan placed immediately behind the radiator structure. This is either tubular or cellular, the former being more robust and the latter more finely subdivided. Often no centrifugal circulation pump is used and the water is circulated by reason of its
own variations of temperature, this "thermosyphon" system to be effective requiring a consider- able difference in height between the top of the engine and the top of the radiator, on the same principle that makes a high chimney create a stronger draft than a low one.

The ignition has kept pace with the increasing demands made upon it. So long as engine speeds were low, a primary or small storage battery produced a current whose voltage was raised by means of an induction coil with trembler. The magneto gradually took the place of this equipment, being adapted for producing a spark more promptly and always ready to work when mechanically actuated from the engine. Recently the employment of engine starters requiring the use of a storage battery has rendered it possible to dispense with the magneto for ignition, and improved induction coil devices are often used instead of it. See IGNITION; MAGNETO

known as the sump, is usually removable and serves as a reservoir for lubricating oil. The usual system is to lubricate the pistons and cylinder walls by splash; that is, by the oil splashed from a shallow tray placed over the sump by the rapid rotation of the connecting rod ends, which are often provided with small scoops for this purpose. The bearings of the shaft are oiled from a gear pump operated in the lowest part of the sump, the oil being either forced through a continuous duct in the shaft and crankarms and pins or through a pipe above the shaft bearings, whence it is fed to the latter by gravitation.

Pistons and connecting-rods are made as light as possible, the latter either of alloy steel or of aluminum. A steel piston lightened by perforations in its skirt is shown in Fig. 12. Pistons and cylinders of aluminum are the exception but are not uncommon, although this metal expands and contracts about three times as much as iron or steel by changes of temperature. Aluminum cylinders are so far normally lined with thin steel.

Mufflers or silencers for reducing the noise of the exhaust gases formerly consumed an appreciable amount of power by hindering the escape of the gas—sometimes one to two horse-power—and by the back pressure and retarding of the flow contributed greatly to overheating of the engine. The improved constructions, while regulating, cooling and contracting the gases, create less resistance than would be encountered if the gas were released at its first temperature and speed directly against the atmosphere. Yet in most racing machines it is so released, perhaps with an eye to the spectacular effect.

The sum of the development of the automobile engine from its stationary prototype has been that of transforming an engine capable only of turning its crankshaft over with a certain power and at a certain speed into one whose power may be varied from 100 to 3 per cent of its maximum while its speed is varied from 100 to 10 per cent, all by the effortless shifting of air currents in a carburetor to change the rate of fuel and air feed and an accompanying regulation of the spark by which the fuel gas is ignited.

Fig. 11 shows an example of the aluminum crankcase in which the shaft and the connecting-rod knuckles turn and whose lower portion,
engines in their great diversity of design it is necessary to consult some of the numerous treatises and textbooks on this large and intricate subject.

The improvements gradually introduced in automobile engines have reacted strongly upon stationary and marine engines, to the effect that engines of the automobile type are now frequently used for stationary and marine work. In the measure as manufacture of automobile engines on a large scale has reduced their cost, engines for motor boats are becoming very similar to those used for motor trucks in the sizes below 60 horse-powers, and engines for racing boats similar to those for racing cars. The larger boat motor engines are however influenced by Diesel engine design. (See Diesel Engine). To maintain a distinction between the automobile engine and small stationary and marine engines of the most advanced type, it may be said that for the latter the weight of the engine is relatively unimportant while robustness, low cost and suitability for operating with kerosene as fuel are important, and their makers therefore usually follow the continuous development of the automobile engine only to the point where weight reduction becomes costly and where the high engine speed becomes useless or harmful for their purposes. It is to be said, however, that such are the recognized merits of the automobile type of engine and so greatly is its cost reduced by large manufacture and its operation simplified that means are being more and more for employing it without alteration in stationary and marine service, especially by gearing down the speed and utilizing irreversible worm gearing to protect the lightweight engine from injurious shocks incidental to their work, such as may be sustained in marine work, for example, by the impact of waves on propeller blades.

In the matter of operating automobile engines with kerosene or other heavy fuels it is found that the lengthening of the piston stroke — the maximum being now about six inches — and the heating of the carburetor and air intakes greatly facilitate the use of the heavy fuels, including alcohol mixtures, after the cold engine has been started on gasoline, but it still remains doubtful if the heavier fuels can ever be used exclusively and under all circumstances of climate and temperature so long as the fuel mixture is introduced by means of the suction stroke of the piston causing an air current that merely siphons the fuel from the injectors. The experiments for making the automobile engine one adapted for many sorts of fuel still belong in the main to the future.

MARIUS C. KRANUP.

AUTOMOBILE INDUSTRY. Though small and of doubtful stability until about the year 1903, the automobile industry has not only grown to be the first in financial magnitude among all the industries in the United States which turn out finished products, and to a similar position in the leading European countries, but has exerted the strongest formative and stimulating influence in several other metalworking industries and arts which were laid under contribution for materials and parts and driven to efforts the results of which were found so widely applicable as to be at once adopted eagerly and broadly in many other directions, to the effect of greatly increasing and improving the world’s productive facilities in all commodities adapted to be made by automatic machinery wholly or in part. These influences, and especially the widening of the use of jigs, working-jigs, gauges, machine tools and specialized machinery, have been incalculable. They have revolutionized all previous methods in factory organization and have established a new standard for industrial accuracy as well as for the physical testing of materials.

In securing accuracy in the new sense, uniformity in results and method in producing them take precedence over painstaking measurement; specific gauges take the place of adjustable instruments, and the need of subsequent fitting, previously the pride of skilled mechanics, becomes a fault.

In these respects the automobile industry has followed in the footsteps of the bicycle industry, which however was not of sufficient magnitude or industrial scope to make the whole technical world take note and follow, besides representing an earlier stage of the development. It has fallen to the lot of the automobile industry to work wonders, because science and art and finance were ready to be lavish with all their untired resources when this new com-
modity of high price—the automobile—captivated the spirit of the age and promised to repay amply for all that might be spent on perfecting it, offering the first large opportunity of its order, and one which has proved even larger than the most far-sighted could have anticipated 20 years ago. Constantly stimulating initiative and enterprise in new directions, the successes of the automobile industry have inaugurated a new epoch in civilization: The Age of Motor. On land, in the air and on sea and in the atmosphere, in mines, in fisheries and on the farm, in sports and in utilitarian pursuits, in the rapid transportation of persons and mail as in the slower transport of heavy goods, for the requirements of peace as for the destructive activities of war, the engines, the super-steels and the production methods introduced through the automobile industry have become indispensable.

The historical background of the automobile industry is, rightly seen, nothing less comprehensive than the entire scientific, technical, industrial and commercial development following in the wake of the steam engine. Bessmen successfully developed coal-magnetism, metallurgical and organic chemistry, but it is customary to point to early efforts for producing road vehicles driven by steam engines as the historical element of the automobile industry. A currently accepted list includes the following as the more important among these efforts:

N. J. Cugnot's steam tractor, built 1769, intended for hauling artillery.

Richard Trevithick of England developed steam coaches 1801-03.

Oliver Evans of Philadelphia improved steam engines 1784, built vehicle 1804.

William Henry James, water tube boiler in 1823, vehicle seating 20 in 1824, another in 1829.

Pecqueur, 1828, built vehicle with rotary steam engine, chain drive, differential gear and Ackerman steering system (same as now used).

Goldsworthy Gurney, 1825-30, Walter Hancock, 1830-36, F. Hills, and others in England built many steam lorries, many of which ran for thousands of miles without decisive failures but were hard on roads. In response to public opinion Parliament stopped the development by taxation.

In the United States steam road vehicles were built in 1825 by Thomas Blanchard at Springfield, Mass.; by J. K. Fisher of New York in 1840 and 1853; by Richard Dudgeon of New York in 1857 and 1859.

S. H. Risner of Roxbury, Mass., about 1870 developed steam vehicles, tricycles, with firetube boilers, which were used successfully and were improved by his sons and others. And the steam plant in these vehicles, much lighter than any previously produced and much more readily started, with gasoline as fuel, formed the technical foundation for the steam carriages and runabouts of which several thousands were made from 1896 to 1903 and used both here and in Europe.

Gottlieb Daimler of Stuttgart, Germany, by devising a cam system for co-ordinating two cylinders to operate together and by replacing open flame ignition, as used for the first gas and gasoline engines, by hot tube ignition, was enabled to construct the first gasoline engine automobile, a tricycle, and to earn the appellation of "the father of the automobile." The claim for priority he shares with Karl Benz of Mannheim, Germany. Both produced primitive but operative gasoline cars about 1884, 1885 and 1886. Maybach (after Daimler's death in 1900 the leading engineer of the German Daimler company) several years later, about 1897 or 1898, devised the spray-jet carburetor and thereafter the development of automobile construction and the automobile industry progressed rapidly, though with periods of stagnation in improvements and with numerous ups and downs among the rank and file of manufacturers.

With regard to the share of electric automobiles in the history and the subsequent development, see ELECTRIC VEHICLE. The great part played by the closely related rubber tire industry which rivals the parent industry in value of annual output is referred to under RUBBER and RUBBER TIRES.

In a general way the automobile industry is divided into four branches: Manufacture of complete vehicles, manufacture of component parts, manufacture of accessories and manufacture of carriage work and vehicle bodies. The last-mentioned branch has been taken over to a considerable extent by concerns which built vehicles or carriages before the advent of the automobile. The division lines are vague. Many firms whose main product is motor cars make also motor wagons and motor trucks. A considerable number make only commercial motor vehicles and constitute what is often looked upon as a separate motor truck industry and have associations and trade journals apart from the rest. But the Society of Automobile Engineers, which is widely recognized as having the common technical interests of the industry in charge, draws its membership from all branches and is extending its activities to matters related to the technics and production of motor boats, aeroplanes, tractors and self-propelled farm machines. Its most important work has consisted in the establishment of standards in construction elements, being the selection of a limited variety of dimensions and shapes in raw materials as indispensable to meet the needs of the designers in the automobile industry and, coupled herewith, uniting the producers of the materials in an understanding with the designers to the effect that minimum delay and lowest cost are secured on both sides by avoiding departures from the selections made, these being subject to revision, however, from year to year. The value of this "standardization" work for expediting and cheapening production, without interfering greatly with the freedom in new design or the advancement of merits in construction, has been recognized also outside of the United States.

Several large concerns manufacture within their own establishments and from raw materials the frames, axles, leaf springs, wheels, carriage bodies, as well as engines and carburetors which enter into their
completed vehicles, but a much larger number furnish the desired designs to manufacturers of component parts, especially the frames, axles, springs and wheels, and have them made to their order, sometimes under supervision by their inspectors. Many other automobile manufacturers adopt their design to a comprehensive selection of the components which the manufacturers supply, the latter having designed and produced for the market in general and with a view to the needs which, in their opinion, the builders of automobiles have in common. About 50 firms make a specialty of producing engines for the industry. Large manufacturers of complete automobiles have been started on the plan of obtaining all but a few characteristic parts and features from the auxiliary branches of the industry and, in the measure as commercial success was attained, have enlarged the scope of their individual production and finally controlling them in all the essentials.

The manufacturers of components, on the other hand, were usually engaged in forms of metal or steel manufacture having nothing to do with automobiles before they entered this field and, while many of them still continue such unrelated manufacture in other lines, the largest and most successful ones among them have as a rule confined themselves more and more to automobile products and turn these out in ever-increasing quantity. An exception in this respect is the manufacture of electric generators, motors and storage batteries, which remains almost a separate industry with its most important interests in other directions.

From the beginning the American automobile industry adopted the plan of making and selling complete vehicles to the public, while European manufacturers produced only a chassis and left it to the customer to have a carriage body fitted to it by a carriage builder of the customer's own choosing. The American plan was later extended to embrace also the equipment with accessories, such as lamps, odometers, cyclophones, horns or other signal devices, windshield, shock absorbers, storage battery. Finally, an engine-starter equipment is now frequently also included in the outfit to which the selling price applies, and in some instances an engine-driven air-compressor to facilitate the inflation of tires. The European industry follows slowly in adopting these practices. Most of the smaller accessories continue to be made by specialty manufacturers who sell in large lots to the car makers and in smaller lots to the retail trade.

Motor wagons and motor trucks did not begin to be made on a large scale until automobile

PRESENT MAGNITUDE OF THE AUTOMOBILE INDUSTRY

Compiled by Alfred Reeves, General Manager of the National Automobile Chamber of Commerce

MOTOR CAR MANUFACTURERS

| States manufacturers | 550 |
| Passenger vehicle manufacturers | 238 |
| States where factories are located | 32 |
| Complete automobiles | $736,000,000 |
| Workers employed | 280,000 |
| Wages and salaries paid during fiscal year ended 30 June 1917 | $275,000,000 |
| Motor vehicles produced in last fiscal year | 1,986,194 |
| Passenger cars produced | 1,093,994 |
| Commercial cars produced | 112,200 |
| Wholesale value of products produced during fiscal year | $917,470,938 |
| Paid for parts and materials by automobile manufacturers during last fiscal year | $480,000,000 |
| Production passenger cars in calendar year 1917 | 1,795,860 |
| Production of commercial cars in calendar year 1917 | 181,348 |
| Average price of passenger cars produced in 1917 | $720 |

BODY, PARTS AND ACCESSORY MAKERS

| Number of concerns manufacturing some article used in auto trade | 6,789 |
| Bodies, parts and accessory makers in United States | 1,080 |
| Capital invested by body, part and accessory makers | $336,000,000 |
| Workers employed by body, part and accessory makers | 68,000 |
| Wages paid yearly at $900 per man | $288,000,000 |
| Automobile tires manufactured during fiscal year ended 30 June 1917 | 18,500,000 |
| Value of tires manufactured in last fiscal year | $450,000,000 |

DEALERS, GARAGES, ETC.

| Total dealers, garages, repair shops, etc., in United States | 46,000 |
| Automobile and truck dealers is United States | 27,000 |
| Garages | 25,500 |
| Automobile repair shops | 13,500 |
| Tire vulcanizers | 12,000 |
| Automobile supply houses | 3,500 |
| Job of automobile supplies | 2,250 |
| Capital invested by dealers, garages, etc., estimated at $4,000 each | $184,000,000 |
| Workers employed, estimated average of each five each | 230,000 |
| Wages paid, estimated at $800 per man | $184,000,000 |

AUTOMOBILES EXPORTS

| Value of automobiles, trucks, engines, tires and parts exported during fiscal year ended 30 June 1917 | $133,411,217 |
| Number of passenger automobiles exported last fiscal year | 64,834 |
| Value of passenger cars exported | $48,620,928 |
| Number of commercial cars exported last fiscal year | 15,977 |
| Value of commercial cars exported | $42,337,315 |
| Value of automobile engines, tires, and parts exported last fiscal year | $42,452,974 |

MOTOR VEHICLES IN USE

| Number of motor vehicles registered in United States | 4,842,139 |
| Motor vehicles in New York State | 418,000 |
| Motor trucks in use in United States | 435,000 |
| Tons of goods hauled yearly by motor trucks (estimated) | 1,200,000,000 |
| Cost of freightage by motor trucks at 10 cents per ton-mile | $1,080,000,000 |
| Cost of freightage on basis of 24 cents per ton-mile by horse and wagon | $1,440,000,000 |
| Value of passenger service at railroad rate of 2 cents per mile | $1,152,600,000 |
| Number of persons in United States to one motor car | 24 |
| Number of persons to one motor car in 11 Middle West States | 17 |
| Number of persons to one motor car in 11 Eastern States | 26 |
| Percentage of cars sold to farmers in 1917 (estimated) | 40 |
| Number of automobiles in United States to each mile of public road | 1.72 |
| Number of automobiles in United States to each mile of surfaced road | 14.77 |
| Number of automobiles in United States for each square mile | 14.77 |
| Automobiles in use in all countries outside of the United States Jan. 1917 | 719,246 |
| Automobiles in use in Europe Jan. 1917 | 437,558 |
| Automobiles in use in Canada Jan. 1917 | 118,086 |
| Automobiles in use in South America Jan. 1917 | 39,188 |
| Automobiles in use in Australia and Oceania Jan. 1917 | 55,340 |
| Horses in the United States | 24,000,000 |
| Acres of land required to sustain horses | 120,000,000 |
| Horses displaced by motor trucks (estimated) | 2,000,000 |
construction was far enough advanced to make the business world feel assured that they were suited for performing commercial transportation work more economically, in most lines of business, than it could be done by the old system. But since about 1908 the number of trucks and delivery wagons has increased very rapidly, while the number of manufacturers solely producing commercial motor vehicles has fluctuated notably from year to year. The difficulty in the design and production of durable vehicles of this class having been underputed.

The accompanying statistical tables and data give an idea of the magnitude which the industry has reached in the United States, but the war in Europe prevents the presentation of comparable data from the French, British, German, Austrian and Italian industries.

AMERICAN PRODUCTION OF AUTOMOBILES FOR THE FISCAL YEAR ENDING 30 JUNE 1916

<td>157,060,700</td>
</tr>
<tr>
<td></td>
<td>1,303,597</td>
<td>1,069,121,619</td>
</tr>
</tbody>
</table>

Out of this number of passenger vehicles more than 500,000 small cars representing a retail price of about $218,000,000 were made by one manufacturing company employing 31,000 men. This leaves the rest of the production of passenger vehicles at 727,533 and their selling price at $754,000,829. The average price of American automobiles, excepting one make, was thus slightly more than $1,000 between 30 June 1915 and 30 June 1916.

Data on the increase of production of five-year periods, some figures on electric vehicles and on exports, showing especially the influence of the European War on exports of commercial motor vehicles (to be used as war trucks) are compiled mainly from United States census reports as follows:

MOTOR VEHICLE PRODUCTION REPORTED BY UNITED STATES BUREAU OF CENSUS

<table>

</tr>
</tbody>
</table>

The N. A. C. C. reports additionally that in 1912 there were produced 1,351 and in 1913 no less than 2,736 electric commercial vehicles. The value of the exports in 1913 and 1914 was about one-twenty-eighth of the value of the domestic trade and in 1915-16 had risen to one-tenth of the domestic trade, although the latter had more than doubled in the same period. The distribution among the principal countries is shown in the following table:

MARIUS C. KRAUP.
tend for only 10 years in this country, but in that comparatively short period, the business has grown rapidly and has reached substantial proportions. A few companies only ventured into this field of underwriting at first, and for two or three years the business was confined to the larger organizations, but as the demand developed, and the field for this form of protection broadened, other companies essayed the business, until at the close of the year 1916, 43 companies were insuring under a single policy against liability for loss of life or personal injury, against liability for property damage, and against loss or damage resulting from collision. The premiums received and losses paid are unfortunately not available, for the reason that automobile liability is included under the general heading of liability insurance, in the statements and reports of casualty companies, and no separation is made by any of the companies of the figures pertaining to the automobile business alone, excepting in the single case of property damage premiums and losses. Some idea of the volume of business transacted annually by these companies may be gained when it is known that during the year 1916, the premiums received for automobile teams property damage amounted to $9,558,590 and losses paid to $3,853,763. As these figures represent only a relatively small percentage of automobile liability premiums and losses, it is easily conceivable that the volume of such business will in a few years exceed most other forms of liability insurance.

Automobile fire insurance covers the hazards of (1) fire, from external causes, self-ignition, explosion or lightning; (2) transportation; (3) theft; (4) property damage (5) collision damage. Ninety-five companies transacted this kind of insurance during 1916, whereas several years ago such insurance was entirely unknown in this country. An innovation was introduced within the last six years by the issue of a "joint" policy, consisting on one side of a contract of fire insurance, by some well-known company, and of liability insurance, by some equally prominent company, on the other side. The main advantage claimed for this dual contract was that complete coverage was thereby afforded in one policy, but the plan did not meet with unqualified success, and the greater part of the business is now written in separate policies. The fire insurance policy usually includes fire and theft and collision damage and the liability part some injuries and property damage. In 1918 the National Automobile Underwriters' Association recommended that fire and theft motor insurance be included in one policy, with a distinction in rates, and providing that only half the indemnification should be recovered in case of theft, but not affecting the fire insurance for which full value is assured.

The rapid growth of automobile fire insurance and the great possibilities for its future development are best indicated by the results achieved in this line of business. In 1916, which showed net premiums received $17,320,342; net losses incurred $7,829,369. These figures, taken together with the automobile business transacted by the casualty companies during the year, indicate a total volume of premiums received exceeding $50,000,000, and of losses incurred of over $22,000,000.

EDWIN W. DE LEON.

AUTOMOBILE TORPEDO. The self-propelling torpedo, invented and constructed by Whitehead in 1870, did not show its potential power until 1877, in the war between Chile and Peru. Despite numerous and important improvements, it was considered too slow up to the opening of the Russo-Japanese War a weapon of uncertain value. Since that date, however, the opinion of experts has been changed. The first experiments show that the essential quality to develop was speed, and the efforts were largely along that line for a time. Then on account of the continually greater resistance of the armor of ships it was necessary to increase the explosive charge. Then the development of rapid-fire guns made it more difficult for the torpedo boat to approach their adversaries and greater radius of action was necessary in the torpedoes themselves. The different demands led to gradual increase in the calibre of the projectile, but here the question of weight came in. It is necessary not to exceed the weight or dimensions that can easily be handled. Next there was the use of compressed air for motive power. It has been through the combination of all these factors by dint of an enormous amount of ingenious invention and adaptation that the modern torpedo has been possible. See TORPEDO and WHITEHEAD TORPEDO.

AUTOMOBILES IN WAR. Previous to the breaking out of the European War in 1914 the potential value of the automobile in military operations had been recognized by army men, and its use had been tested in manoeuvres, sometimes to the complete exclusion of horse-drawn equipment. In England a certain type of military automobile had been decided upon by the authorities, and in order to have a large number at hand in case of hostilities, the approval was given in the last few years and orders were placed with a "joint" policy, consisting on one side of a contract of fire insurance, by some well-known company, and of liability insurance, by some equally prominent company, on the other side. The main advantage claimed for this dual contract was that complete coverage was thereby afforded in one policy, but the plan did not meet with unqualified success, and the greater part of the business is now written in separate policies. The fire insurance policy usually includes fire and theft and collision damage and the liability part some injuries and property damage. In 1918 the National Automobile Underwriters' Association recommended that fire and theft motor insurance be included in one policy, with a distinction in rates, and providing that only half the indemnification should be recovered in case of theft, but not affecting the fire insurance for which full value is assured.

tion. Many months before war was actually declared, German automobile manufacturers were notified by the authorities to send their machines to designated shops, where holes were bored in frames, and lugs bolted on. When the mobilization occurred every type of machine had its special attachments ready to be put instantly into place. The invading troops were rushed into Belgium and France in squadrons of motor vehicles at a speed three times faster than any recorded in military annals. Perhaps the most sensational fact of the war has been the tremendous speed of the 60,000 vehicles which were hurled overnight to the flank of von Kluck’s advancing army on the Marne. It was accomplished by thousands of motor cars of all descriptions from the city buses to the motorcycle which could carry only one. Another emergency use of unspecialized automobiles in war was the endless chain of 4,000 cars of all sorts which connected the battlefield of Verdun with the railroad station at Bar-le-Duc, 30 miles away, for a space of three months while a railroad was being repaired. The projecting ends of cars 60 feet apart, and moving at the constant rate of three feet per second, carried in the needed supplies of every sort and brought out the wounded.

During the punitive expedition of the United States troops into Mexico whole regiments with their supplies and equipment were moved at a speed of 125 miles per day, four times faster than would have been possible with horses.

On 1 July 1916 it was estimated that on the western battle front the British and French troops had in action about 60,000 automobile vehicles, of which number nearly 25,000 were of American manufacture. Experience with so many machines of so many different types soon led to a decision as to the chief requirements of the war automobile. The machine which has proved most effective has been the 3½-ton truck of French make, and the 3-ton truck of American make. The weight of these machines is about 6,000 pounds. They are of the platform type, the body being 11½ inches by 67 inches, with removable sides 24 inches high. The engine most in favor is of 4 cylinders, averaging about 3.9-inch bore and 5.7-inch stroke, housed under a hood. Gasoline is considered the only dependable fuel. Every variety of drive has been represented, but no superiority has been shown by any particular design. The large-diameter vertical-tube radiator was most successful, the honeycomb type being pronounced a failure. The pump circulation system was definitely proved superior to other systems. Mechanical self-starters were not demanded. The splash system of lubrication won out over the forced circulation method, chiefly because the pump in the latter system was free to pick up and send on to the bearings any kind of harmful dirt which might happen to get into the oil chamber. Ignition by high-tension magneto fulfilled all requirements. Four-speed gears were found necessary to meet working conditions, and the French type is the only one which is quite satisfactory. Where the truck was obliged to travel off the roads and over rough ground, chain-driven wheels were employed; in extreme cases caterpillar track bands were attached. One of the most radical alterations was the spoked wheel made of steel in place of the artillery type of wooden wheel. For lighter cars the steel disc wheel with solid rubber tires was found dependable. The tires adopted after much experience were 36 inches by 6 inches for the front wheels, and dual rear wheels with tires 40 inches by 5 inches. The driver’s seat was fitted with a separate closed hood, generally of canvas but sometimes of leather. The bodies were fitted with heavy hoops and canvas tops, the front and rear hoops being strong enough to carry a load of 650 pounds each, and the middle hoop a double burden. The Parisian taxi trade used the conveyance of wounded soldiers on slung stretchers on the return trips from the battle front.

For the hauling of field pieces the truck with 4-wheel drive was employed. This was heavily built, with a capacity of 12 tons generally with two trailers carrying ammunition and supplies. A few of these had 6-cylinder engines, but the 4-cylinder type predominated, and was favored. The engines were generally of the overhead valve type, of 4½-cubic inch stroke. These heavy trucks are capable of transporting a 75-millimetre gun, and in the French service the trucks were fitted with jacks to take the weight off the wheels when the gun was fired. For hauling the heavy artillery, the 14-inch and 16-inch guns, the motor used was of the simple traction type with road wheels of large diameter driven by internal gearing. The caterpillar tractor of the agriculturist operated at a slow speed was found more expedient and certain in the long run than any other machine. These heavy tractors hauled loads up to 30 tons distributed over two or three trailers, one or more of which might be dropped on grades or where the going was very heavy. One of the recorded accomplishments of an American-built tractor of this type was the transportation of a 20-ton gun 29 feet long a distance of 11 miles in 1½ hours. The muzzle end of the gun was supported by a trailer. For armored cars carrying machine guns representatives of nearly every type of motor vehicle have been employed, from the motorcycle with a sidecar to the big 12-ton truck carrying four machine guns and a field piece. The more common adaptation was based on a powerful 4½-cylinder engine which was built up a single compartment of steel plates about one-third of an inch thick, sometimes with a turret, and generally equipped with a wire-cutting device. The plating covered the engine and radiator, and the wheels were of the steel disc type, with solid rubber tires. These cars were supplied with flanged metal rims which could be quickly adjusted for travel at high speed on railroad tracks. Trailers were used behind nearly all cars, a favorite type being the two-wheeled float with canvas top. These were often fitted with seats to carry a large number of men, and operated up to a speed of 35 miles per hour. The so-called “tanks” of the British army are agricultural tractors of caterpillar model encased in half-inch steel armor, only one model, weighing 15 tons and had engines of 120 horse-power.

Owing to the wide variation in construction of the many makes of motor vehicles in use on the Franco-British battle front, it was a hopeless task to attempt to supply parts to repair a damaged car, and in case of a breakdown the
car was simply abandoned for a new one. The loss was estimated at between 60 and 70 per cent of the car fleet, owing in part to the loading far beyond the burden which the cars were planned to carry. On the German front the cars were largely standardized, and rescue cars loaded with parts cruised about gathering up and repairing even the abandoned cars of the enemy. Some of these rescue cars were fitted up as machine shops, with trailers carrying supplies and parts. Others were derrick cars which lifted the broken-down car to the deck of a trailer and took it to a repair shop in the rear.

Specialized automobile machines appeared in large numbers as the war grew older. Among these were motor plows of 200 horse-power which dug trenches three feet deep faster than could be done by 100 men; roller tractors which not only smoothed newly made roads, but drew a train of loaded trailers behind; observation cars fitted with extension ladders to be run up high into the air; field laundries; sterilizing chambers for clothing; X-ray laboratories; perambulating bath-houses; and even traveling theaters for the diversion of the wounded. One of the more interesting emergency uses of commercial cars was the conversion of the London buses into refrigerated transfer cars for fresh beef. Another was the fitting up of a motorcycle with a side car with a complete wireless outfit.

In the United States regular army service there are battle cars fitted with rapid-fire guns; tank cars for gasoline, oil and water; anti-aircraft cars with guns mounted; 4-ton trucks carrying a 3-inch field gun with caisson—not mounted on the truck, however, as with the French 75's; a machine shop for repairs in the field; and a coffee percolator mounted as a two-wheeled trailer. These are, of course, in addition to the customary ambulances, field kitchens, etc., in general use in all military establishments.

Actual experience in the European War has proved that with the aid of the automobile in all its forms a whole army with its supplies and field equipment can be advanced at the rate of 30-40 miles per day, and a retreat can be conducted at the rate of 50 miles per day.

AUTOMORPHISM. This word is used by Spencer for the use we make of ourselves and our conduct as norms in the judgment of others. There is much in the experience of others that is not directly available to us. John Smith can give me a clear idea of the internal structure of his experience—he can tell me when two things appear of the same or of different colors, when he judges one thing better than another, or he can give me an analysis of his emotional life, but whether red really is to him the same color that it is to me, how he feels when he gives his moral assent, or whether his anger and my anger are qualitatively identical—all these things and many more are a sealed book to me. The only way in which I can fill in the outline which I obtain by conversation and observation is from the stuff of my own mental life. All knowledge of the mind of another, then, in so far as it is a knowledge of its intrinsic quality rather than of its structure, involves the use of automorphism.

AUTONOMY, the self-government of a state. This power may reside within limited bodies of the same people, such as parishes, corporations, religious sects. These districts or communities may be autonomous, if not absolutely, yet within certain defined limits. They may be said to possess independent sovereign action. Recently the word is more specifically used of territories or provinces, which, while subject in some matter to a higher sovereignty, are autonomous in other respects. The self-government enjoyed by the British colonies may be described as a modified form of autonomy.

AUTOPLATE, a machine for making and finishing curved stereotype printing plates for use in printing newspapers, invented by H. A. Wise Wood of New York, and first put into use upon the New York Herald. This machine, after a flexible papier-maché matrix, made from a type page, is inserted therein, proceeds to print printing plates weighing about 50 pounds each, at the rate of four a minute, and to dress their edges and inner surfaces and prepare them for attachment to the printing cylinders, and this is done automatically—all within the compass of one machine. Previous to the advent of the autoplote such work had invariably been done by hand-worked devices, with which the fastest rate of production attainable was at the rate of slightly less than one plate per minute. So great a change did this invention make in the work of stereotyping upon the larger newspapers that not only was the machine generally adopted, but in every case the hand apparatus were entirely dispensed with, and sole dependence placed upon the autoplote.

AUTOPSY, meaning strictly to observe directly with the eyes, but more commonly applied to the close examination of a dead body to determine the cause of death. The autopsy is usually performed by the coroner in cases where death from poisoning is suspected, in which the contents and condition of the stomach are examined and subject to chemical analysis.

AUTOSEE, Battle of, in the War of 1812. While Jackson was fighting the battles of Tallahatchee and Talladega in Alabama, the Georgians sent a force of 940 militia and 300 friendly Creeks under Brig.-Gen. John Floyd into the heart of the Creek country. On 29 Nov. 1813 Floyd drew up his troops in battle order in front of the Indian encampment at Autosee on the Tallapoosa near Tuckaebatchee and though the Indians occupied a strong position, a well-directed artillery fire and a desperate bayonet charge soon drove them out with a loss of about 200 killed, while Floyd lost only 11 killed and 54 wounded. Floyd then retired to Fort Mitchell with the Chattahoochee where he remained until the battle of Tuckaebatchee (q.v.). Consult Adams, 'United States' (Vol. VII, pp. 241-43); Brackenridge, H. M., 'History of the Late War' (p. 191); Fay, H. A., 'Official Accounts' (pp. 161-63); Morgan, 'History of Alabama' (Vol. II, 400); Miller, 'Bench and Bar of Georgia' (Vol. I, App.).

AUTRAN, Î-drôam', Joseph, French poet: b. Marseilles, June 1813; d. there, 6 March 1877.
AUTREFOIS CONVICT—AUVERS

His verse is admired for its purity of form and refined sentiment. He attracted attention in 1833, with an ode to Lamartine, ‘The Departure for the East.’ His works include ‘The Sea,’ poems (1835); ‘Mélanie,’ an epic (1842); ‘Rural Life’ (1856); and ‘The Daughter of Æschylus,’ drama (1848), which won a prize from the French Academy. In 1868 he was elected member of the Academy. His works were collected and published (8 vols., Paris 1881)."
Other important services were the completion of Herschel's nebular observation, heliometric investigations in stellar astronomy, observations of the proper motion of fixed stars. For his services to astronomy he was made a foreign member of the Academy of Sciences at Washington, from which he also received the Watson gold medal. Among his works are 'Neue Reduktion der Bradley'schen Beobachtungen' (1859-62) and 'Katalog von 9,789 Sternen' (1896). In 1903 appeared 'Vierzehn unbekannt gebliebene Königsberger Zonen und Catalog von 1309 darin beobachteten sternen für das Aquinomium 1865.'

AUX CAYES, ɔ-kəˈɛ, Haiti, a seaport town situated on the southwest coast of the island, about 85 miles west of Jacmel. It has an excellent harbor, a good export trade and is the seat of an American consular agent. Pop. about 25,000.

AUXANOMETER, an instrument for recording the growth of plants during intervals too short for direct measurement. A simple form often used consists of a light, well-balanced lever, the fulcrum of which is so placed that the length of the long arm is a multiple of that of the short arm. To the latter a thread from the growing plant is attached. The long arm traverses a graduated arc from which its movement may be read, the growth of the plant being magnified in the ratio of the long arm to the short. A more elaborate instrument has been devised consisting of a wheel with fine bearings and a well-balanced rim grooved to receive a thread. The hub carries a smaller wheel with a grooved rim, whose diameter is one-tenth or one-twentieth that of the larger. The wheel is placed on a stand and the plant placed beneath it. A silk thread is attached to the plant, carried over the smaller rim and weighted sufficiently to rotate the hub as the plant grows. A thread is also placed on the larger rim with a counterweight at one end and a marker at the other. A recording apparatus made of a cylinder bearing smoked paper is driven by clockwork and the marker is placed so as to bear against the paper. Other methods of driving the cylinder are in use, of which one of the best is that in which the cylinder is released at regular intervals and allowed to rotate a short distance. The cylinder release is performed by means of an electro-magnet, the circuit being made by a clock at the proper intervals.

AUXERRE, ɔ-soːʁ, France, capital of the department of Yonne, 90 miles southeast of Paris, on the Yonne. It is irregularly built on the slope of a hill and its streets are narrow. It contains an Episcopal palace, now the residence of the prefecture, also the 13th century cathedral of Saint Etienne, one of the most imposing Gothic structures in France. Other noteworthy churches are those of Saint Germain and Saint Pierre. The town was formerly surrounded by walls but these have been converted into boulevards. A hospital rests on the site of the ancient abbey of Saint Germain and there are a castle and museum of antiquities and a botanical garden. Calico, serge, woolens, leather, earthenware and wine are manufactured and there is considerable trade in these products and also in timber and charcoal. The Yonne is navigable from here and barges transport quantities of Burgundy wines to Paris. Auxerre was flourishing even in the pre-Roman days. It successfully resisted Attila and was taken by Clovis from the Romans. Later it formed part of the kingdom of Burgundy, was taken by the English in 1359, but was retaken by the renowned Du Guesclin. It was united to France by Louis XI. It was bombarded by the Germans in 1870. It is the birthplace of Jacques Amyot, who became bishop of the see and who is best known for his translation of Plutarch. Consult Freeman, 'Sens et Auxerre' (in Archæological Journal, Vol. XXXIX, London 1882). Pop. (1911) 21,929.

AUXONNE, ɔ-soːn, (Latin Aëson or Aussona), France, a town 18 miles east-southeast of Dijon, on the left bank of the Saône, here crossed by a beautiful bridge of 23 arches. Auxonne is well built, the seat of a court of commerce, and has a communal college, and a public library containing 4,000 volumes; a castle, an arsenal and a cannon foundry. Cloth, plaster of Paris, bricks, leather, etc., are manufactured here and there is a large trade in grain, lumber and vegetables. Pop. (1911) 6,303.

AUZOUX, ɔzoo', Adrian, French mathematician: d. 1691, inventor of the chronometer, still in use among astronomers to measure the apparent diameter of celestial bodies. He was the first who thought of applying the telescope to the astronomical quadrant.

AUZOUX, Théodore Louis, French surgeon: b. Saint Aubin d'Écorville, Curé, 1779; d. 1880. He was the inventor, or the first to make those life-size and accurately colored anatomical models which are now used universally all over the world in medical colleges and schools of anatomy.

AVA, aˈva, or AUNGWA, a town in Asia, the former capital of Ava or Birmah, on the Irrawaddy. It has a circuit of about five miles, and consists of an inner and an outer town, each surrounded by a brick wall. The city was reduced to ruins by an earthquake in 1839. Several Buddhist temples with gilded domes are the sole remains of its former glory. Consult Graves and Gurney, 'Ravina' (London 1827). The present population is small.

AVA, ARVA, YAVA or KAVA (Piper methysticum), a plant of the natural order Piperaceae, possessing narcotic properties. It is a shrubby plant, with heart-shaped acuminate leaves, and very short, solitary, axillary spikes of flowers. It is a native of many of the South Sea Islands where the inhabitants intoxicate themselves with a fermented liquor prepared from the upper portion of the root and the base of the stem. The rhizome is thick, woody, rugged and aromatic. The intoxicating liquor is prepared by macerating it in water. The narcotic property is ascribed to an acid resin, kawine, present in the root. The taste is unpleasant to those unaccustomed to it, and has been likened to that of rhubarb and magnesia. The intoxication is not likely to be produced by ardent spirits, but rather a stupification like that caused by opium. It is succeeded by a copious perspiration. The habitual use of ava causes a whitish scurf on the skin, which, among the heathen Tahitians, was
reckoned a badge of nobility, the common people not having the means of indulgence requisite to produce it. Ava is, like cocaine, a local anaesthetic.

AVADHUTA, ᾍ-va-d’-hoo-t’a, a member of a mendicant sect in southern India addicted to self-torture. They abandon all worldly restraints and religious observances and have their faces under complete control.

AVAL ISLANDS. See BAHREIN.

AVALANCHE, a mass of snow or ice which slides down steep mountain slopes. On lofty mountains snow would accumulate indefinitely if the excess were not removed by sudden falls or by glaciers which bring it into the valleys, where it melts. Avalanches may occur at any season of the year, but they are most frequent in early spring after the snow has begun to melt from the sun’s rays. The water which collects beneath the snow bank loosens it from the ground, and the whole mass may then be precipitated to the base of the mountain. Some avalanches occur regularly in the Alps, where they are known as grandlawnen. Another type (staudlawinen) occurring in the winter season is characterized by the dry and finely divided condition of the snow, and by the overloading of the snowfields. A third class is the ice-avalanche, occurring along the course of glaciers. Avalanches are often very destructive, sweeping away houses, trees and everything in their path. Their destructive effects are greatly increased by the wind blasts which accompany them. Those occurring in winter usually cause the greatest loss of life, as they develop suddenly and without warning; those that take place in spring generally follow a definite path and are more or less regular in their occurrence. The planting of forests on the high slopes sometimes affords protection from avalanches, but when this is not feasible, stone structures are employed.

AVALLÉNAU, a legendary poem, by some believed to have been written by Merlin. The theme is based on an old tradition, or folklore tale, to the effect that a band of knights were transformed into spirits in the Wood of Celyddon. The name probably has a common origin with Avalon (q.v.), which was the paradise of the heathen Celts.

AVALON, Cal., a summer resort on Santa Catalina Island, one of the “tente cities” peculiar to California, made possible by the long dry seasons. Instead of the seaside cottages familiar in other climates, the dwellings are entirely of canvas, some of them being quite elaborate, with many rooms, running water, etc. Lighting, water, a sewage system and other conveniences are provided as in other communities. During the summer months the population of Avalon sometimes exceeds 1,000, the wintertime decreasing to less than 1,000 during the winter.

AVALON, Pa., borough of Allegheny County, five miles west of Pittsburgh, on the Ohio River, and on the Pittsburgh, Fort Wayne and Chicago Railroad. It is a residential suburb of Pittsburgh. Pop. 4,317.

AVALON: King Harold’s tomb of King Arthur, being his abode after disappearing from the haunts of men; called also Avilion. The name is also identified with Glastonbury, and has been given to the peninsula of Newfoundland. Avalon appears to have been the Celtic paradise. The origin of the name is doubtful. Consult Rhys, J., ‘Studies in the Arthurian Legend’ (Oxford 1891); and Meyer and Nutt, ‘Voyage of Bran’ (2 vols. London 1897).

AVALOS, á’va-lós’, the name of a noble Neapolitan family, which included Ferdinand D’Avalos, Marquis de Pescara: b. Naples 1490; d. 30 Nov. 1525. He served with distinction in the army of Charles V, and was taken prisoner by the French at the battle of Ravenna in 1512. He beguiled the hours of captivity by writing a ‘Dialogue of Love,’ which he dedicated to his wife, the beautiful and accomplished Vittoria Colonna. He soon recovered his liberty, and subsequently displayed extraordinary ability in the wars of Charles V, notably at Pavia in 1525, where he was severely wounded.

AVANCINI, Nicholas, an ascetic writer of the Society of Jesus: b. 1612; d. 1686. His little book of meditations on the life and doctrine of Jesus Christ, which has been translated into several languages, is widely used to-day by members of clergy first appeared in Vienna in 1665. By reason of its arrangement, its scriptural sources, its pithy suggestiveness and its practical character, Cardinal Gibbons states that it has been his Vade Mecum, his book of meditations during all the years of his ministry.

AVARE, L’, là-vár (The Miser), the title of one of the first five of Molière’s prose comedies, first produced 9 Sept. 1668. It is founded on the ‘Aulularia’ of Plautus, and was paraphrased by Fielding in his comedy of ‘The Miser.’ Harpagon is a sexagenarian miser who incarnates the spirit of avarice and has determined to marry a young woman named Mariane, but ultimately prefers her gold to matrimony.

AVARS, á’várz, or AVARES, a nation of Mongolian or Turkish origin, which at an early period migrated to the regions around the Don, the Caspian Sea and the Volga. They served in Justinian’s army, and later moved into the provinces of Dalmatia, pressing into Thuringia and Italy, where they fought with the Franks and Lombards, and extended their dominion over the Slavonians dwelling on the Danube and farther north, as well as over the Bulgarians on the Black Sea. In 640 they were driven out of Dalmatia and confined to Pannonia. They were at length overcome by Charlemagne, and after 827 disappear from history; but the valley of Erlaaf, a small tributary of the Danube in Lower Austria, was called the “land of the Avars” as late as the 10th century. The name is also borne by a tribe estimated to number upward of 100,000, now living in the Caucasus Mountains, noted for the truants from Russia, in which they were led by Schamyl (q.v.). They are followers of Islam and have a written language with Arabic characters. Consult Deniker, ‘Races of Man’ (1900); and Keane, ‘Ethnology’ (London 1896).

AVARY, Myrta Lockett, American writer and sociologist: b. Halifax, Pa. For several years she was an editorial writer on various publications, then became interested in settle-
ment work. She is the author of 'Dixie After the War' (1906); 'Joel Chandler Harris and His Home' (1913); 'Letters and Recollections of Alexander H. Stephens' (edited 1910).

AVATAR, āv-a-tār, in Hindu mythology, an incarnation of the Deity. Ten avatars are peculiarly distinguished, and four of them are the subjects of Parānas, or sacred poems. These 10 are among the incarnations of Vishnu, the supreme God. The Matsya avatar was the most ancient, and was the form of a fish; Kalki, yuga, or Kūrmā, in that of a tortoise; Varāha, as a boar; Nara-sinha, as a monster, half man, half lion; Vāmana, as a dwarf; Parasurama, as the son of Jamadagni. All these took place in the Satya Yuga, or Golden Age. The seventh incarnation was in the form of the four sons of King Dāsarathe, under the names of Rāma, Lakshmana, Bharata and Satrughna, in order to destroy certain demons that infested the earth. The achievements of Rāma form the subject of the celebrated epic called the Rāmāyana. The eighth avatar of Vishnu, in the form of Krishna, is the best known of all, from the fact that it forms the subject of the great Sanskrit epic poem, the Mahābhārata. Its object was to relieve the earth from the Dāsaras, and the wicked men who oppressed it. The ninth was in the form of Buddha. The Kalci, or tenth avatar, is yet to come at the end of the Kali Yuga, or the Iron Age. See Vishnu.

AVATCHA, ā-vā-tcha, a volcano and bay in Kamchatka in lat. 53° 18' N. and long. 156° 47' E. The volcano, 9,000 feet high, was last active in 1855. The largest crater is several hundred yards in circumference. The town of Petropavlovsk is situated on the bay.

AVE-LALLEMENT, a-vlal-ml-man', Friederich Christian Benedict, German criminalist: b. Lübeck, 23 May 1809; d. Berlin 1892. After graduating from Jena, he began practising law in his native town. From 1851 to 1868 he was a police magistrate. His most important work is 'Das deutsche Gaunertum' (4 vols., Leipzig 1858-62). It consists of a detailed history of crime and its punishment in Germany, including a dictionary of all the words used among criminals. He is also the author of some fiction, most of it being in the nature of detective stories.

AVE-LALLEMENT, Robert Christian Berthold, brother of Friederich Christian Benedict Ave-Lallement, German physician and writer: b. Lübeck, 25 July 1812; d. there, 13 Oct. 1884. For the greater part of his life he was a practising physician in Rio de Janeiro, Brazil. He is the author of 'Reise durch Süd- brasilienn' (2 vols., 1859); 'Reise durch Nord- brasilienn' (2 vols., 1860); 'Fata Morgana' (1872); 'Wanderungen durch die Pflanzenwelt der Tropen' (1880).

AVE MARIA, ā-vā ma-ɾ-ta (Latin; hail Mary; from avere); among the Roman Catholics the beginning of a prayer to the Virgin, whence the whole prayer is called Ave Maria. It is the beginning of the salutation which the angel addressed to the Virgin, as he announced to her that she should be the mother of the Saviour and the address to her of her cousin Elizabeth (Luke i. 28, 42; 'Hail, highly favored, the Lord is with thee blessed are thou among women'). See Rosary.

AVEBURY, 'bér-i, 1st baron. See LlU- NUCK, JOHN.

AVEBURY, England, village in Wiltshire, noted for its Druidical temple, which originally consisted of a larger outer circle of 100 stones, from 15 to 17 feet high, and about 40° in circumference, surrounded by a broad ditch and lofty rampart, and enclosing two smaller circles. On the neighboring downs are numerous barrows or artificial tumuli, one of which, called Silbury Hill, rises to the height of 300 feet, with a circumference of 2,027 feet at the base, covering an area of more than five acres. Sir John Lubbock the scientist selected his title of Lord Avebury from the name of this village.

AVEIRO, ā-vē-roo, Portugal, a seaport and the capital of an administrative district, on the Vouga, and the Lisbon-Oporto Railway. Aveiro is built on the southern shore of a marshy lagoon, containing many small islands, and measuring about 15 miles from north to south, with an average breadth of about one miles. The Barra Nova, an artificial canal about 33 feet deep, constructed 1801-08, gives access to the Atlantic Ocean. The local industries include the preparation of sea-salt, the catching and curing of fish, especially sardines and oysters, and the gathering of aquatic plants. The trade is also in wine, oil and fruit; while the Aveiro district contains copper and lead mines, besides much good pastoral land. Pop. 10,000.

AVELING, Francis Arthur Powell, Canadian clergyman and author: b. Saint Catherine's, Ontario, 1875. He was educated at Keble College, Oxford, the Canadian College, Rome, and at Louvain University. Becoming a convert to the Roman Catholic faith in 1896 he was ordained to the priesthood in 1899 and became first rector of the Cathedral Choir School at Westminster. He was also appointed lecturer in analytical psychology at University College, London, and after the outbreak of the great war became chaplain of the forces. He is a fellow of Louvain University; extern examiner in philosophy, National University of Ireland, and lecturer in pedagogical methods, London County Council. He has published 'The Philosophers of the Smoking Room'; 'The God of Philosophy'; 'On the Consciousness of the Universal and the Individual'; etc. He is a contributor to the Dublin Review, the American Catholic Quarterly Review, the Review Neoscholastique, the Nineteenth Century, Journal of Psychology, etc.

AVELLANEDA, ā-vēl-ya-nā-da, Alfonso Fernandes de, the pseudonym of the writer of a sequel to 'Don Quixote,' issued prior to the sequel by Cervantes. The real name of the author is not known but the work has been ascribed to about a dozen different writers. See DON QUIXOTE.

AVELLANEDA, Nicholas, Argentine statesman: b. Tucuman, 1 Oct. 1836; d. 26 Dec. 1885. He was professor of political economy in the University of Buenos Aires, Minister of Public Instruction in 1880-84, and President of the republic in 1874-86. He published several historical and economical works.

AVELLANEDA Y ARTEAGA, ā-vēl-ya-nā-da ē ar-ťa-ťa-ťa, Gertrudis Gomez de, Spanish
poet, dramatist and novelist: b. Puerto Principe, Cuba, 23 March 1814; d. Madrid, 2 Feb. 1873. In 1851 he became the leading contributor to Andalusian journals many 'Lyric Poems' (1851–54), and afterward wrote a series of spirited novels: 'Two Women', 'The Baroness de Joux', 'Dolores', and others. She gained still further distinction with the tragedies 'Alfonso Munio', 'The Hero of which was her own ancestor, and 'The Prince of Vianna'. Her later compositions had a tone of melancholy: among these are Biblical dramas, as 'Saul' and 'Balthasar'; the spiritual song, 'At the Cross', and 'The Last Ascent of My Harp' (1830). In the later years of her life she composed 16 plays which still have a place on the Spanish stage. She is without a rival of her sex among Spanish writers of the 19th century. Some critics hold that she was second only to Christa Rosetti among modern poetesses. Her 'Alvas literarias' begun to appear at Madrid in 1869 but only five volumes have been issued. See SAB (or ESPATILLO).

**AVELLINO**

Francesco Maria, Italian archaeologist: b. Naples, 14 Aug. 1827; d. Rome, 25 April 1900. He was one of the first professors of Greek literature at the University of Naples, and during which period he was also the tutor of the children of Murat. In 1820 he became professor of political economy at the same institution. In 1839 he became director of the Real Museo Borbonico, of whose vast coin collections he had previously prepared a valuable catalogue. He was also the founder of the journal *Bollettino Archeologico*. His chief works are collected under the title 'Opuscoli diversi' (Naples 1831–36, 3 vols.)

**AVELLINO**

a town in Italy, 29 miles east of Naples. It has a square adorned with an obelisk, and possesses several agreeable promenades. Avellino has several fine monuments, an academy and a theatre. Clothes, hats, shoes and chairs are manufactured. Chestnuts and hazel nuts have been gathered in the vicinity since Pliny's day. The ruins of ancient Abellinum are about three miles distant and here also is the famous convent of Monte Vergine, which is visited annually by tens of thousands of pilgrims. Pop. (1911) 23,926.

**AVEMPACE**

Ibn Bajja, Arab philosopher: b. Saragossa, Spain, about the end of the 11th century; d. Fez, 1138. At first he held high office in his native city, but finally lost his position on account of his liberal attitude in regard to religion. After residing at various times in Seville and Granada, he finally arrived in Fez, where he became court physician to the Sultan. Avempace belonged to that broad school of Arabic philosophy which ignored the letter of the Koran. Besides his commentaries on Aristotle, he made known the Peripatetic school of philosophy in Spain. He also wrote several works on medicine and music and composed many original poems. Consult Brockelmann, 'Geschichte der arabischen Litteratur' (Weimar 1899).

**AVENA.** See OATS.

**AVENARIUS, Ferdinand,** German poet and critic, nephew of Richard Wagner: b. Berlin, 20 Dec. 1856. After studying at the universities of Leipzig and Zürich, he founded the art journal *Kunstwart*, which finally became *Deutsche Lyrik der Gegenwart* (2nd ed., 1884); 'Max Klinger's Grifflerkunst' (2nd ed., 1907); 'Das alte Buch aus deutscher Dichter und maler Kunst gesammelt' (1910). His poetical works are the idyl 'Die Kinder von Wohldorf!' (6th ed., 1910); 'Lebe' (8th ed., 1909); 'Schimmen und Bilder' (7th ed., 1910); 'Hausbuch deutscher Lyrik' (10th ed., 1910).

**AVENARIUS, Richard,** German philosopher: b. Paris 1843; d. Zürich 1896. He studied philosophy at the universities of Zürich, Berlin and Leipzig, and from 1877 to his death was professor of philosophy at Zürich. He wrote on Spinoza's pantheism, published a theory of experience and contributed many papers to magazines and reviews, upon philosophical subjects. He also wrote 'Kritik der reinen Erfahrung' (2nd ed., Leipzig 1889, 1907). 'Das alte Buch aus deutscher Dichter und maler Kunst gesammelt' (1910). His poetical works are the idyl 'Die Kinder von Wohldorf!' (6th ed., 1910); 'Lebe' (8th ed., 1909); 'Schimmen und Bilder' (7th ed., 1910); 'Hausbuch deutscher Lyrik' (10th ed., 1910).

**AVENCHES, Switzerland,** a town in the canton of Vaud, seven miles northwest of Friburg. It is the ancient Avenicum, capital of Helvetia under Roman rule, and is noted for its Roman relics, notably the ruins of an amphitheatre, and a Corinthian column belonging to a temple of Apollo. This column, celebrated by Byron in 'Childe Harold' (3rd canto, 65th line), is known as Le Cigognier, from the fact that for centuries storks have used it as a nesting place. In Roman times it was a city of 20,000 inhabitants. Avanches is the German Wiliburg (castle of Wifis, a count of Burgundy of the 7th century). The castle is built on the site of the Roman Capitol, and there is a museum in the amphitheatre. The population now is about 2,000.

**AVENEL, Mary,** a character appearing in Scott's novels, 'The Monastery' and 'The Abbot.'

**AVENGER OF BLOOD,** among primitive peoples the next of kin to a murdered man, upon whom was laid the duty of avenging the crime by killing the murderer. In this custom may be detected the source of the system of criminal law. Primitive law is concerned solely with crimes of violence — homicides, wounding and robbery. The punishment is left to the injured party or to his kinsman. In course of time the right of the kinsman was limited by the doctrine of sanctuary, and by the institution of the wergild, whereby a money payment was made to the avenger of blood in commutation of the natural penalty of the crime. Among the Arabs these primitive customs survive and the laws of tribes, clans and tribes in semi-barbarous countries are survivals of this same institution.

**AVENTINE,** the southernmost of the seven hills of Rome, on the left bank of the Tiber, between the river and the Celian hill. The Circus Maximus lay to the northeast of the Aventine, between it and the Palatine, and
the baths of Caracalla were on the southeast. Servius Tullius included it in the city and it was settled by the plebs in 455 b.c. Consult Plutarch, 'Topography and Movements of Ancient Rome' (New York 1911).

AVENTINUS, the name taken by Johann Fumair, Bavarian historian; b. Abenberg, April 1477; d. Regensburg, 9 Jan. 1534. He studied at Ingolstadt, Vienna, Cracow and Paris, and in 1509 was appointed tutor to Louis and Ernest, the two younger sons of Albert the Wise, the late Duke of Bavaria-Munich. Encouraged by William IV, Duke of Bavaria, he began to write the 'Annales Bojorum' about 1517, and finishing this book in 1521, undertook a German version of it, which he completed some years later. He assisted to found the Sodalitas literaria Anglogradiana, under the auspices of which several old manuscripts were brought to light. The 'Annales' deals with the history of Bavaria in conjunction with general history from the earliest times to 1460. He took immense pains to verify them to a degree anticipated by the modern scientific method of writing history. Aventinus, who has been called the 'Bavarian Herodotus,' wrote other books of minor importance.

AVENTURINE. See Quartz.

AVENZOAR, a'wen-za'ar, or more correctly, ABU-MERWAN-MOHAMMED-BEN-ABD-ALMALEK-BEN-ZOHAR, Arabian physician of the 12th century; b. Seville, Spain, about 1072; d. Morocco 1162. He became eminent in his profession, traveled much, and passed through many adventures, among which was a long imprisonment at Seville. He had the care of a hospital, and composed a work entitled 'Al Theiser, containing a compendium of medical practice, and including many facts and observations not found in the preceding writers, which was probably the result of his own experience. He was an advocate of the experimental method, had a remarkable knowledge of anatomy and tried many experiments. He introduced a silver tube into the human stomach. He influenced Averroes, who attended some of his lectures. His work, 'The Method of Preparing Medicines and Diet' was translated into Hebrew (1280) and into Latin (1490). The report of his having lived to the age of 135 is probably an error arising from his having been confounded with his son, of the same name and profession, who lived at Morocco, and was the author of a treatise on the regimen of health.

AVERAGE, in maritime law, is general, particular or petty. General average (also called gross) consists of expense purposely incurred, sacrifice made or damage sustained for the common safety of the vessel, freight and cargo, or the two of them, at risk, and is to be contributed for by the several interests in the proportion of their respective values exposed to the common danger, and ultimately surviving, including all of the amount of expense, sacrifice or damage so incurred in the contributory value. Indemnity for general average loss is, ordinarily stipulated for in particular risks in navigation, subject, however, to divers modifications and conditions. Under maritime policies in the usual form, insurers are liable for the contributions, for loss by jettison of cargo, sacrifice of cables, anchors, sails, boats, delay for the purpose of refitting, voluntary stranding, etc. Average particular (also called partial loss) is a loss on the ship, cargo or freight, to be borne by the owner of the subject on which it happened and is so called in distinction from general average, and, if not total, it is also called a partial loss. It is insured against in marine policies in the usual forms on ship, cargo or freight, when the action of peril is extraordinary, and the damage is not mere wear or tear, and on the ship covers loss by sails split or blown away, masts sprung, machinery of steamship disabled, planks started, change of shape by strain, loss of boat, breaking of sheathing or upper works or timbers, damage by collision or stranding, by lightning or fire, or in defense against pirates or enemies, or by hostile or piratical plunder. Petty average consists of small charges formerly assessed upon the cargo, to wit: anchorage, piloting, bearetage, towage, quarantine, etc. See Marine Insurance.

AVEREHENKO, Arkadi Timofeyevich, a'ver'en-chen'ko, Russian humorist writer; b. 1881. He was the son of a merchant. He started his career with a position on the staff of some works of mines. In 1907 he edited the periodical Shtik and since 1908 has been editing Satirikon (formerly Strekoza). He contributed to the collection 'Utro' and to the periodicals Zhurnal diya Vsekh, Zritel and others. His works are published under the pseudonym Ave. Part of his humorous tales have been edited in the collection 'Veselul'ya Ustritzi' (Happy Oystres) (6th ed., 1911); 'Tales' (1910); 'Little Hares on the Wall' (1910).

AVERELL, William Woods, American military officer: b. Cameron, N. Y., 5 Nov. 1832; d. Bath, N. Y., 3 Feb. 1900. He was educated at West Point, and was graduated there in 1855, and served on the frontier, and in several Indian campaigns till the beginning of the Civil War, when he was appointed colonel of the 3d Pennsylvania Cavalry, and assigned to the command of the cavalry defenses of Washington. During the war he distinguished himself on numerous occasions as a cavalry raider and commander, and at its close was brevetted major-general of volunteers. In 1863-64 on his raids, he fought numerous skirmishes, destroyed many miles of railroad, captured great quantities of supplies and in various ways greatly hampered the Confederates and aided the Federal commands in carrying out their plans of campaign. He resigned from the regular army while holding the rank of captain, in 1865, and, under an act of Congress, was reappointed captain in August 1888, and was placed on the retired list in the same month. He was United States Consul-General at Montreal in 1866-69. He invented a system of asphalt pavement now quite generally adopted and the Averell insulating conduits for wires and conductors and a method of making cast steel direct from the iron ore in one operation.

AVERNUS, a'ver'nus, a small circular lake, now called Lago d'Averno, in Campania, Italy, between the ancient Cumae and Puteoli.
AVERROES—AVESTA

It is surrounded by hills of a moderate height, which used to be covered with immense woods, while the atmosphere was charged with unhealthy mephitic effluvia, and it occupies the centuries. Ancient Greek writers, subsequent to Homer, it was fabled to be the entrance to the infernal regions, and to have been the place where Ulysses entered in his visit to the shades. It was also thought that the Cimmerians of Homer dwelt on the banks of this lake. The solitude of Cumae is said to have had her grotto here, and Virgil represents her as guiding Æneas when he made his descent ("faucis descensum Averno") to the infernal regions at this place. The lake is about a mile and a half in circumference. Agrippa caused the woods to be thinned and made the lake a naval headquarters, known as Portus Julius. He had it connected by canal with Lacus Lucrinus and Cocceius constructed a famous tunnel to Cumae through the mountains.

AVERROES, avér-réz' (corrupted from Ebn or Ibn Roschd), a renowned Arabian philosopher: b. Cordova, Spain, 1126; d. about 1198. He studied theology and philosophy under Toffal and medicine under Ibn Zuhr at Cordova. In 1169 he became a cadet or judge first in Seville and afterward in Cordova. He was accused of rejecting the established religion, and in consequence deprived of his offices, and fled to Fes. Here he was condemned by a spiritual court to recant and undergo public penance. Upon this he went back to his own country, but was latterly restored to his dignities in Morocco. Averroes regarded Aristotle as the greatest of all philosophers, and explained his writings, with only a slight deviation in his criticisms. Besides commentaries on Aristotle and other philosophical works he wrote also a compendium of physic, called Colleget (a corruption of the Arabic Kulliyat, or summary), and treatises on jurisprudence, astronomy, grammar, etc. His commentaries upon Aristotle, in a Latin translation, were repeatedly printed at Venice in the 15th and 16th centuries. His Colleget also was early translated into Latin, and several times printed. Consult Brockelmann, "Geschichte der arabischen Literatur" (Vol. I, Weimar 1899); De Boor, "History of Philosophy in Islam" (Leyden 1903); Renan, "Averroes et laverroisme" (Paris 1860); Müller, "Philosophie und Theologie von Averroes" (1875).

AVERSA, a-ver'sa, Italy, a town 12 miles north of Naples, on a plain covered with vines and orange trees. It is the seat of a bishop and is famed for a kind of almond-cake, called torrone, in great demand at Naples. It contains a cathedral and monasteries, an insane asylum and a foundling institution. It is also famous for a sparkling white wine, and for oil, fruit and silk. Nearby is the ancient Atella, whence came the coarse farces called Atellana fabula. The modern town was founded by the Normans in 1029. Pop. (1911) 23,203.

AVERY, Elroy McKendree, American writer; b. Erie, Mich., 1844. He served in the Federal army during the Civil War, and has since been prominent in educational matters. Among his many published works are text-books in physics and chemistry, "Words Correctly Spoken" (1887); "A Popular History of the United States, and Its People" (12 vols.); "The Town Meeting" (1904).

AVERY, Samuel Putnam, American art expert; b. New York, 17 March 1852; d. there, 12 Aug. 1904. After having studied engraving he began his business as an art dealer in 1865. Two years later he was appointed commissioner in charge of the American art department at the Paris Exposition. He was one of the founders and for a long time a trustee of the New York Metropolitan Museum of Art (q.v.). He is also the founder of the Avery Architectural Library at Columbia University, which he gave as a memorial to his son, Henry Ogden Avery. Avery Hall, erected on the campus of Columbia University in 1912, is a memorial to both father and son.

AVER'S GORES, the name of several tracts of land in Vermont, granted to Samuel Avery in 1791. One of them is in Addison County, nearly on the summit of the Green Mountains, now forming part of the Green Mountain National Forest.

AVES, à'vez, or BIRD ISLANDS, a group of small islands belonging to Venezuela, valuable for their deposits of guano.

AVES, à'vez, the class of vertebrated animals which contains the birds. They have been defined by Dr. Gadow as "oviparous, warm-blooded, amniotic, birds, which have their anterior extremities transformed into wings." The metacarpus and fingers carry feathers or quills; there is an intertarsal joint, and the feet have not more than four toes, of which the first is the hallux. See Birds.

AVESES, a-va'n, France, the capital of an arrondissement in the department of Nord, on the Halpe, 28 miles southeast of Valenciennes. The town is the seat of a sub-prefecture, and has a tribunal of first instance, a chamber of commerce and a communal college. The chief industry of the town is wool-spinning, and there is trade in wood. It was founded in the 11th century, and formed a cantonship which in the 15th century passed to the house of Burgundy. It was seized by Louis XI. In 1659 it came into the possession of the French, and was fortified by Vauban. It was captured by the Prussians in 1815. Pop. about 6,000.

AVESTA, or ZEND-AVESTA, the Bible of Zoroaster, the sacred book of ancient Iran, and holy scripture of the modern Parsees. The exact meaning of the name "Avesta" is not certain; it may perhaps signify "law," "text," or, more doubtfully, "wisdom," "revelation." The modern familiar designation of the book as Zend-Avesta is not strictly accurate; if used at all, it should rather be Avesta-Zend, like "Bible and Commentary," as zand signifies "explanation," "commentary," and Avesta u Zand is employed in some Persian allusions to the Zoroastrian scriptures as a designation denoting the text of the Avesta accompanied by the Pahlavi version or interpretation. The story of the recovery of the Avesta, or rather the discovery of the Avesta, by the enthusiastic young French scholar, Anquetil du Perron, who was the first to open the western world the ancient records of Zoroastrianism, reads almost like a romance. Du Perron's own account of
his departure for India in 1754, of his experiences with the dasturs (or priests) during a seven years' residence among them, of his various difficulties and annoyances, setbacks and successes, is entertainingly presented in the introductory volume of his work 'Zend-Avesta, Ouvrage de Zoroaстр' (1771). This was the first translation of the ancient Persian books published in a European language. Its appearance formed one of those epochs which are marked by an addition to the literary, religious or philosophical wealth of our time; a new contribution was added to the riches of the West from the treasures of the East. The field thus thrown open, although worked imperfectly at first, has yielded abundant harvests to the hands of later gleaners. With the growth of knowledge of the language of the sacred texts, we have now a clear idea also of the history of Zoroastrian literature, and of the changes and chances through which with varying fortunes the scriptures have passed. The original Zoroastrian Avesta, according to tradition, was in itself, a literature of vast dimensions. Pliny, in his 'Natural History,' speaks of 200,000 verses of Zoroaster; to which may be added an assertion, preserved through Mohammedan writers, that the original copy of the scriptures was written upon 12,000 parchments, with gold illuminated letters, and was deposited in the library at Persepolis. But what was the fate of this archetype? Parsi tradition has an answer. Alexander the Great, the accursed Iskander, as he is called, is responsible for its destruction. At the request of the beautiful Thais, as the story goes, he allowed the palace of Persepolis to be burned, and the precious treasure perished in the flames. Whatever view we may take of the different sides of this story, one thing cannot be denied: the invasion of Alexander and the subjugation of Iran caused, indirectly or directly, certain religious decadence which followed upon the disruption of the Persian Empire, and was answerable for the fact that a great part of the scriptures was forgotten or fell into disuse. Zoroastrian tradition, found in Pahlavi sources, lays at the doors of the Ctesias of the fifth century a.d., or at least one of the ancient texts that existed at Samarkand before Alexander's invasion; but has it any account to give of copies of the prophet's works which Semitic writers say were translated into nearly a dozen different languages. One of these versions was perhaps Greek, as the Pahlavi account states, for it is generally acknowledged that in the 4th century a.d. the philosopher Theopompus spent much time in giving in his own tongue the contents of the sacred Magna tradition.

Tradition is unanimous on one point at least: it is that the original Avesta comprised 21 Nasks, or books, a statement which there is no good reason to doubt. The same tradition which was acquainted with the general character of those Nasks, professes also to tell exactly how many of them survived the inroad of Alexander; for although the sacred text itself was destroyed, its contents were lost only in part, the priests preserving large portions of the precious scriptures. These met with many vicissitudes in the five centuries that intervened between the conquest of Alexander and the great restoration of Zoroastrianism in the 3rd century of our era, under the Sassanian dynasty. At this period all obtainable Zoroastrian scriptures were collected, the compilation was codified, and a detailed notice made of the contents of each of the original Nasks, comprising in all some 825 chapters, compared with the portions then surviving. The original Avesta was, it would appear, a sort of encyclopedic work; not of religion alone, but of useful knowledge relating to law, to the arts, science, the professions, and to every-day life. If we may judge from the existing table of contents of these Nasks, the zealous Sassanians, even in the time of the collecting (226-380 A.D.), were able to restore but a fragment of the archetype, perhaps a fourth part of the original Avesta. Nor was this remnant destined to escape misfortune. The Mohammedan invasion, in the 7th century of our era, added a final and crushing blow. Much of the religion that might otherwise have been handed down to us, despite the accursed Iskander's inquest, now perished through the sword and the Koran. Its loss, we must remember, is in part compensated by the Pahlavi religious literature of Sassanian days.

Fragmentary and disjointed as are the remnants of the Avesta, we are fortunate in possessing even this moiety of the Bible of Zoroaster, whose compass is about one-tenth that of our own sacred book. A grouping of the existing texts is here presented: (1) Yasna (including Gathas); (2) Visperad; (3) Yashts; (4) Vendidad (Videvdapat); (5) Minor Texts; (6) Fragments.

Even these texts no single manuscript in our time contains complete. The present collection is made by combining various Avstean codices. In spite of the great antiquity of the literature, all the existing manuscripts are comparatively young. None is older than the 13th century of our own era, while the direct history of one or two can be followed back to about the 10th century. The external circumstance of course no bearing on the actual early age of the Zoroastrian scriptures. It must be kept in mind that Zoroaster lived at least six centuries before the birth of Christ. Among the post-avestan works, the Yasna, Visperad and Vendidad are closely connected. They are employed in the daily ritual, and they are also accompanied by a version or interpretation in the Pahlavi language, which serves at the same time as a sort of commentary. The three divisions are often found combined into a sort of prayer-book, called Vendidad-Sadah (Vendidad Pure); that is, Avesta text without the Pahlavi rendering. The chapters in this case are arranged with special reference to liturgical usage.

Some idea of the character of the Avesta as it now exists may be derived from the following sketch of its contents and from the illustrative selections presented:

Yasna (sacrifice worship), the chief liturgical work of the sacred canon. It consists mainly of ascriptions of praise and of prayer, and corresponds nearly to our idea of a prayer-book. The Yasna comprises 72 chapters; these fall into three nearly equal parts.

The greater part of the Yasna book is of a liturgic or ritualistic nature, and need not here be further described. Special mention, however, must be made of the middle section con-
sisting of "The Five Gathas" (hymns, psalms), a division containing the 17 sacred psalms, sayings, sermons or teachings of Zarathustra himself. In the latter, that resembles the metres of the Veda, form the oldest part of the entire canon of the Avesta. In them the prophet of the new faith is speaking with the fervor of the Psalmist of the Bible. In them we feel the very essence of a religion that characterizes a new and struggling religious band; we are warmed by the burning zeal of the preacher of a church militant. Now, however, comes a cry of despondency, a moment of saint-heartedness at the present triumph of evil, at the success of the wicked and the misery of the righteous; but this gives way to a clarion burst of hopefulness, the trumpet note of a prophet filled with the promise of ultimate victory, the triumph of good over evil. The end of the world cannot be far away; the final overthrow of Ahirman (Anra Mainyu) by Ormazd (Ahura Mazda) is assured; the establishment of a new order of things is certain; at the founding of this "kingdom of the resurrection," "the peace and the life eternal will be entered upon."

The Vispered (all the masters) is a short collection of prosaic invocations and laudations of sacred things. Its 24 sections form a supplement to the Yasna. Whatever interest this diversification of the Avesta possesses lies entirely on the side of the ritual, and not in the field of literature. In this respect it differs widely from the book of the Yashts, which is next to be mentioned.

Yazhts (worship by prayers and ascriptions of praise) form a poetical book of 21 hymns, in which the angels of the religion, "the worshipful ones" (Yazatas, Isads), are glorified as are also the heroes of former days. Much of the material of the Yazhts is evidently drawn from pre-Zoroastrian sagas which have been remodeled and adopted, worked over, and modified and incorporated into the canon of the new-founded religion. There is a mythological and legendary atmosphere about the Yazhts, and Ferdausi's "Shah Nameh" serves to throw light on many of the events portrayed in them, or allusions that would otherwise be obscure. All the longer Yazhts are in verse, and some of them have poetic merit.

Vendidad, or more correctly Vistadah, "Law against the Demons" is a priestly code comprising 22 chapters and somewhat resembles the Biblical Pentateuch. It consists morally of purificatory rules to be observed for removing defilement especially the pollution incurred through coming into contact with dead matter. It contains likewise some old myths, legends and beliefs.

Minor Texts, as a section of the Avesta, form a small group of liturgical texts containing brief prayers, liturgical blessings, to be recited daily or repeated on special occasions. Fragments of other portions of the Avesta are preserved, like Erpatistarn, Nirmastan and Aşpemadacta, and among them is a noteworthy one describing the fate of the soul after death.

There are several translations of the Avesta. The best (except for the Gathas, where the translation is weak) is the French version by Darmesteter, "Le Zend Avesta," published in the 'Annales du Musée Guimet' (Paris 1892-93). An English rendering by Darmesteter and Mills is contained in the 'Sacred Books of the East' (Vols. IV. X. XII. XI.) and is the result also of the German translation of the Gathas by Bartholomae (Strassburg 1905), forming the basis of the English version by Moulton, "Early Zoroastrianism" (pp. 341-50, London 1913); of a French translation of the "Avesta üversetzt" (Strassburg 1910); and an Italian translation of the Vendidad by Cannizzaro, "II Vendidad" (Messina 1916).

A. V. W. JACKSON,
Professor of Indo-Iranian Languages, Columbia University.

AVEYRON, a-vā-rōn', France, a department in the south. It is extremely mountainous, and is traversed by five considerable rivers, the Aveyron, after which the department is named, the Viaur, the Truyère, the Lot and the Tarn. Of these, the only one navigable within the department is the Lot. It is only in the west that plains of any considerable extent are found. Agriculture, however, is in a considerable measure conducted on a small scale, north of the Lot, only rye and oats are grown, but considerable attention is paid to sheep-breeding. Cheese of an excellent quality is made and exported in large quantities. Aveyron possesses valuable coal, iron and copper mines, besides other minerals. Other leading industries include the manufacture of woolen goods, leather and machinery. Pop. (1911) 369,448. Capital, Rodez.

AVEZAC DE CASTERA MACAYA, a-vä'zák ma-ki-yā, Marie Armand Pascal d', French geographer: b. Tarbes, 18 April 1800; d. 14 Jan. 1875. He began practising law in Paris. He soon gave up this profession for a position in the Ministry of Marine, but soon devoted himself entirely to his favorite study, being especially interested in Africa and the early discoveries on the American continent. He was six times president of the Geographical Society of Paris and one of the founders of the Ethnological Society of Paris. His chief works are: "Essais historiques sur le Bigorre" (1823); "Études de géographie critique sur l'Afrique septentrionale" (1825); "L'esquisse générale de l'Afrique et l'Afrique ancienne" (1844); "Iles de l'Afrique" (1848); "Les îles fantastiques de l'océan occidental au moyen-âge" (1845); "Notice sur le pays et le peuple de Yebous" (1845); "Les voyages d'Amédée Vespucie" (1860); "Le livre de Fernand Colombe" (1873).

AVEZZANO, a-vët-sä'no, Giuseppe, Italian adventurer: b. Chieri, Piedmont, 1789; d. Rome, 25 Dec. 1879. Entering the army in 1805, he fought under Napoleon and in 1814 was made a lieutenant in the Sardinian army. For complicity in the rising of 1821 he was condemned to death, but managed to escape to Spain, where he enlisted under the Constitutional flag. He was finally captured by the French, who exiled him to America. Arriving in Mexico he settled in Tampico and engaged in business. President Santa Anna's attack describing the fate of the soul after death.

There are several translations of the Avesta. The best (except for the Gathas, where the translation is weak) is the French version by Darmesteter, "Le Zend Avesta," published in the 'Annales du Musée Guimet' (Paris 1892-93). An English rendering by Darmesteter and Mills is contained in the 'Sacred Books of the East' (Vols. IV. X. XII. Other leading industries include the manufacture of woolen goods, leather and machinery. Pop. (1911) 369,448. Capital, Rodez.

AVEZAC DE CASTERA MACAYA, a-vä'zák ma-ki-yā, Marie Armand Pascal d', French geographer: b. Tarbes, 18 April 1800; d. 14 Jan. 1875. He began practising law in Paris. He soon gave up this profession for a position in the Ministry of Marine, but soon dev
United States, where he again engaged in business. Later he joined Garibaldi's expedition, and fought under him at Volturno. Later he was a radical deputy in the new Italian Parliament. Before his death he became one of the most active leaders of the Irredentists.

**AVIARY.** A house or enclosure, larger than an ordinary cage, for living birds. Out-of-door aviaries are common in the warm countries of southeastern Europe and in Asia, and are also quite numerous in England. The freedom of motion possible for a bird in a good-sized aviary helps to keep them in good condition, and many species which are unable to bear the close confinement of a cage flourish in the larger enclosures. In a climate like that of the United States, where extremes of temperature are great, outdoor aviaries are uncommon except in zoological gardens. In the New York Zoological Park is an aviary built in 1900, measuring 153 feet long, 72 feet wide and 55 feet high; at present this is the largest in the world. It is a wire cage, in the shape of a pointed arch, supported by steel frames. It stands among trees, and several are enclosed by it. Game birds, herons and other large species live in this aviary, and many smaller species, which would suffer out of doors in winter, dwell there during the summer months. See Cage-Birds.

**AVIATION.** See AERONAUTICS, HISTORY OF.

**AVIATION SICKNESS.** The effect of this sickness is noticed upon the pilots of aeroplanes when flying very high, and when mounting or coming down quickly. When mounting in the air breathing becomes shorter when at 5,000 feet height, and this effect is more noticeable than with ordinary balloons. The heart is noticed to beat faster, but generally there are no palpitations, and there is only a nervous sensation, due to anxiety and the emptiness of space. Buzzing in the ears is noticed only at a greater height, about 6,000 feet. When flying at 10,000 feet and 5,000 feet, the nervous reflex movements of the system have a greater amplitude. This appears to be due to a combination of causes, such as cold, a more rapid breathing, quicker heart-beats, the effect of sunlight and troubles of hearing, to which we must add nervous tension and fatigue. One curious effect is a great tendency to sleep, and this is so strong that the eyes sometimes close, in spite of all efforts to keep them open.

**AVICENNA (Abu 'Ali al-Husain ibn Abdallah ibn Sina),** Arabian philosopher and physician: b. Afsaka, near Bokhara, 980; d. Hamadan 1037. His precocity was extraordinary, at ten he knew the Koran by rote; and much Arabic poetry. He learned the rudiments of medicine, arithmetic and geometry from wandering teachers. At seventeen he received a court appointment as physician to the amir and had access to the library of the Samanids. The dynasty of the latter ended in 1004 and thereafter Avicenna led a very arduous life, wandering from place to place. Finally at Jorgan, near the Caspian Sea, he met with a friend, who secured him a dwelling in which he lived for one year. Later he was imprisoned under Taga Addaula, but escaped and fled to Isphahan, where he was wel-

comed by the prince. His later years were spent in the service of Abu Ya 'far 'Ala Addaula, to whom he acted as physician and literary adviser, and whom he accompanied even on his campaigns. His greatest work is the "Canon of Medicine," based on the existing scientific works. It was long used as a textbook both in the Orient and Occident, and is still highly prized in the former; an Arabic edition of it was published at Rome in 1593, and a Hebrew version at Naples in 1491. About 100 treatises are ascribed to Avicenna. Scarcely any science was left untouched by him. Among his medical works translated into Latin are "Medicamenta Cordialia," "Canticum de Medicina" and "Tractatus de Syrupo Aceto." He followed Aristotle in philosophy. In this field his "Logic," "Metaphysics" and "Sorcology" have gone through several editions. Consult Brockelmann, "Geschichte der arabischen Litteratur" (Weimar 1899); Carra de Vaux, "Avicenne" (Vol. I, Paris 1900); Ibn Khallikan, "Lexicon" (Stone trans., 1842); Westenfeld, "Geschichte der arabischen Arzte" (1840).

**AVID, Sir John, Canadian banker:** b. Longueuil, Quebec province, 15 Nov. 1855. He was educated at Toronto Model School, took up railway work before entering the banking profession; was appointed superintendent of the Central Western branch of the Canadian Bank of Commerce in 1908, assistant general manager in 1911, manager in 1915 and was knighted in 1917.

**AVIGNON, a've-nyon' (ancient Auenio),** France, city, capital of the department Vaucluse, on the left bank of the Rhone 30 miles from the Mediterranean. It consists generally of large antique houses, in narrow, crooked, dirty streets. The principal objects of interest are the large and very ancient cathedral; the papal palace, with lofty massive walls and strong towers, and the chamber of the Inquisition. The Musee Calvet contains Roman and other antiquities and a famous picture gallery. The public library contains 140,000 printed volumes and 32,000 manuscripts. The silk manufacture is the principal source of employment at Avignon, and the rearing of silkworms is carried on extensively in the district. The city has also manufactories of velvet, woolen and other goods, hats, jewelry, etc., with silk dye-stuffs, paper-mills, tanneries, agricultural implements, tin, copper, hardware, chemicals and oil works, etc., and a trade in cotton, wool, grain and other articles, of which it is the entrepôt for Lower Dauphiné, Provence and all Languedoc. Here Petrarch lived several years; here he saw his Laura, who formed the subject of his most beautiful erudition. And whose tomb is still to be found in the Franciscan Church. The fountain of Vaucluse is five leagues from Avignon. It belonged to the papal see from 1348 to 1791, and from March 1309 to September 1376 seven Popes in succession, f. the Clement V to Gregory XI, were compelled to reside in this city. The Catholic historians commonly call this period the Babylonian captivity of the Popes. It is the chief centre of the Felibrige Brotherhood, organized about 70 years ago to promote the revival of the Provençal language and literature. Consult Mintz, "La cour pontificale d'Avignon" (in Revue des questions historiques, Paris 1899);
O'Kay, 'Story of Avignon' (London 1911); Peujon, 'Avignon; la ville et le palais des papes' (Avignon 1905). Pop. (1911) 49,314.

AVILA, a'vē-la, Gil Gonzalez d', Spanish antiquary and biographer; b. Avila 1577; d. 1638. He was made historiographer of Castile in 1612, and of the Indies in 1641. Most valuable works: 'Teatro de las Grandezas de Madrid' (1623); and 'Teatro eclesiástico de la primitiva iglesia de las Indias Occidentales' (1655); 'Teatro eclesiástico de las ciudades españoles (Salamanca 1618); 'Teatro eclesiástico de las iglesias de España' (2 vols., Madrid 1656).

AVILA, Juan d', celebrated Spanish preacher, commonly called the 'Apostle of Andalusia'; b. Almodovar del Campo 1500; d. at Montilla 1569. His missionary labors in Andalusia were prosecuted with singular success, until he was 50, when, with a wonton constitution, he was obliged to desist. His 'Spiritual Letters' have been translated into most European languages.

AVILA, Spain, a province bounded on the north by Valladolid, east by Segovia and Madrid, south by Toledo and Caceres and west by Salamanca. It has an area of 2,570 square miles. Avila is naturally divided into two sections, differing completely in soil, climate, production, and social economy. The northern portion is generally level; the soil is of indifferent quality, strong and marshy in a few places, but rock in all the valleys of the Sierra de Avila, and the climate has extremes of heat and cold. The population of this part is mainly agricultural. The southern division is one mass of rugged granite sierras, interspersed with valleys abounding in rich vegetation. In this region stock-breeding is an important industry. The mountains contain silver, copper, lead, iron and coal, but their mineral wealth has been exhausted and mining has been practically abandoned. Quarries of fine marble and jasper exist in the district of Areces. Except Avila, the capital, there are no important towns. The principal production is the wool of the merino sheep. Olives, chestnuts and grapes are grown, and silk worms are kept. There is little trade and the manufactures are few, consisting chiefly of copper utensils, lime, soap, cloth, paper and combs. Pop. of province 200,000.

AVILA, Spain, city and capital of the province of Avila, a modern division of Old Castile. It was once one of the richest towns of Spain. A university founded here in 1482 but suppressed maintained its existence until the beginning of the 19th century. In 1917 it is still, architecturally, a medieval town, preserving unaltered many of the buildings that were new in the 12th century and the splendid walls built in the last few years of the 11th. Excellent examples of Romanesque are the churches of San Vincente and San Pedro. The west porch of the former is one of the most important creations of medieval art in all Spain. Also very noteworthy is the cathedral, exceedingly Spanish in its picturesque variety (or lack of unity), and with much interesting sculpture, from the 13th century to the Renaissance. This granite-gray city surrounded by beautiful, rugged country, recalls most vividly the great saint of Avila, Santa Teresa, who lived here many uneventful years in the 16th century before starting on her career as a reformer. At the present time the principal employment in the town is spinning. Pop. about 12,500.

AVILA Y ZUNIGA, a'vē-la ˌe ˈθoʊnɪɡə ˌga, Don Luis d', Spanish general, diplomatist and historian; a favorite of Charles V; b. 1500; d. 1564. He was in high favor with the Emperor, accompanied the latter to Africa and was his ambassador to the Popes, Paul IV and Pius IV. His 'Comentarios de la guerra de Alemania, hecho por Carllos V en 1546 y 1547' is a valuable if partial record of Charles' War in Germany. It has been translated into several languages.

AVILES, a'vē-läs, Pedro Menendez d', Spanish seaman and founder of Saint Augustine, Florida: b. Aviles, Asturias, 15 Feb. 1519; d. 17 Sept. 1574. At the age of 14 he ran away to sea, and was engaged till he was 30 in a life of adventure as a corsair. In 1549 he was appointed to command the convoy which guarded ships in the American trade, and executed this commission with great efficiency. He was later engaged in transporting war supplies to the low countries during the war with France. The French Huguenots having established a colony in Florida, in territory which was claimed by Spain on the grounds of prior discovery and settlement, it was decided to remove this menace to the Gulf trade of Spain, and Pedro Menendez was commissioned in 1565 to undertake the task. He reduced the French colony and hanged the French prisoners, whom he regarded as heretics. He discovered and named the bay of Saint Augustine and established on the site of the French colony another which he called San Mateo. He remained in Florida till 1567, busy with his colony. His letters prove him to have been a pious and high-minded officer, who never imagined that he could be supposed by any honest man to have gone too far in massacring the Frenchmen.

AVISON, Charles, English composer: b. Newcastle-on-Tyne 1710; d. 1770. He attained his musical training in Italy, after which he was an organist for some years. In his 'Essay on Musical Expression' (1752) he attracted some attention by comparing the French and Italian composers with the Germans, to the disadvantage of the latter. His concerts and sonatas attained great popularity in his time. Browning refers to him in his 'Parleyings with Certain People.'

AVITUS, Marcus Maelius, an emperor of the West. He belonged to a Gaulish family in Auvergne, and gained the favor of Constantius, the colleague of Honorius, and of Theodorico, King of the Visigoths. He served with distinction under Aetius, became prefect of Gaul, and concluded a favorable treaty with the Goths. He afterward retired into private life until the invasion of Attila, when he induced the Goths to join the Romans against the common enemy. Attila was proclaimed emperor in 455, took for his colleague Marcius, and died the year following.

AVITUS, Saint, bishop of Vienne in Burgundy from 490 until his death in 523. He was the leading champion of his day in the
conflict with Arianism and Semi-Pelagianism. A special victory in a public disputation gained for him the esteem and confidence of King Gundobald, whose son Sigismund he received into the Catholic Church and who was afterward canonized as a saint. His writings have given him a prominent place in early Burgundian literature. His chief work is a didactic poem in five books, entitled ‘De Spiritalis Historiae Gestis,’ and deals with such subjects as the origin of the world, original sin, etc. Another poem in praise of chivalry, while inferior in literary merit to his previous work just mentioned, contains much of value from a historical standpoint. Consult Binding, ‘Geschichte des burgundischen Königreiches’ (Leipzig 1868); Frantz, P. N., ‘Avitus von Vienne als Hierarch und Politiker’ (Greifswald 1908); Goëlzer, Henri, ‘La latin de Saint Avit, évêque de Vienne’ (Paris 1909).

AVIZ, a·vash, Order of, a Portuguese order of knighthood, created in 1147 by Alphonso 1. The knights were then called Knights of Evora, but took their present title, in 1287, on their gallant defense of the fortress of Aviz against the Moors. The order was changed from an ecclesiastical to a civil institution in 1789. Membership was given as a reward of merit for marked service to Portugal. In 1823 the order was extended to Brazil and recognized as a national order there. During the empire the emperor was the grand master.

AVLONA, av-lo'na, or VALONA, a seaport in Albania, protected by the island of Sasseno, the ancient Sasos. It carried on considerable trade with Brindisi, etc. The Christian inhabitants, chiefly Italians, are engaged in commerce, exporting oil, wool, salt, pitch, and especially come 40,000 tortoise shells yearly. The inhabitants are employed in the manufacture of flax and woolen fabrics. Valonia, a material exported to England for tanning, is the pericarp of an acorn grown nearby. Up to 1691 the town belonged to the Venetians. In 1913 it was made the seat of government of the new principality of Albania. If the Austrians in the great war which began in 1914, Pop. about 6,500.

AVOCA, Pa., borough in Luzerne County, 10 miles northeast of Wilkesbarre, on the Central of New Jersey, the Delaware and Hudson, the Lehigh Valley and the Erie railroads. It is in the centre of the mining regions and most of its inhabitants are engaged in that industry. Some silk mills are also in operation in the town. Pop. 4,634.

AVOCADO (av'o-kad'o) PEAR, a tropical fruit. See Alligator Pear.

AVOCET, a shore-bird of the limicoline genus Recurvirostra, remarkable for its very slender bill, which curves upward toward the end like a cobbler's awl. It is a near relative of the stiltsand piper, and various species occur throughout the world. The North American species, Recurvirostra americana is found in summer throughout the temperate parts of the country, migrating to the tropics in winter. It is about 17 inches in length, brownish-black above and white below, with the head, neck and chest light cinnamon. Its general habits are those of sandpipers. It is common in the Western States where it is shot as game. Consult Cone, ‘Birds of the Northwest’ (Washington 1874).

AVOGADRO, Amadeo, Conte di Quaregna, Italian physicist and founder of the rule in chemistry which bears his name: b. Turin, 9 June 1776; d. July 1856. In 1820 he was a professor of physics in his native city. He has published much matter on physics, but the one work which made him famous and in which he set forth his rule was ‘Essai d'une maniere de determiner les masses relatives des molecules elementaires des corps, et les proportions selon lesquelles elles entrent dans les combinaisons’ (1811).

AVOGADRO'S HYPOTHESIS. This is the hypothesis given by Avogadro in 1811 to the effect that the number of molecules in a volume v of gas at temperature t and pressure p is independent of the nature of the gas. Though it is sometimes called Avogadro's rule or Avogadro's law, it is strictly speaking neither a rule for a law, but a hypothesis to explain the simple relation of proportionality between the densities of gases and their combining weights. Though Dalton denied the truth of this hypothesis, he saw before the work of Avogadro that it was the consequence of the generally recognized chemical facts. In the early history of this hypothesis much confusion arose for want of a sufficiently clear understanding of the relation between atoms and molecules. Certain vapors which were formerly supposed to form exceptions to Avogadro's hypothesis, such as those of ammonium chloride and phosphorus pentachloride, have been shown to be dissociated by heat into mixtures, and not to be true vapors at all.

AVOIRDUPOIS, av'er-du-poi', (French avoir du poids, to have weight), a system of weights and measures in which a pound contains 7,000 grains or 16 ounces, while a pound troy contains 5,760 grains or 12 ounces. All larger and coarser commodities are weighed by avoirdupois weights. The ounce avoirdupois is less than the troy ounce in proportion of 72 to 79. Avoirdupois is the weight used in the United States, where generally the hundred weight contains only 100 pounds and the ton, 2,000 pounds.

AVON, a'von, the name of several rivers in England, the most important of which are the following: (1) The Upper Avon, rising in Leicestershire, runs southwest, and falls into the Severn at Tewkesbury. Stratford-on-Avon, a town on this river, is the birthplace of Shakespeare; (2) the Lower Avon, which rises near Tewbury, in Gloucestershire, and falls into the Severn northwest of Bristol, being navigable as far as Bath; (3) in Monmouthshire; (4) in Wiltshire and Hampshire, enters the English Channel at Christchurch Bay, in the latter county.

AVON, N. Y., village in Livingston County, 20 miles southwest of Rochester, on the Genesee River, and on the Erie Railroad. It has mineral springs, corn and pea canning establishments, and a bean-shipping plant. The waterworks are owned by the village. Pop. 2,053.

AVON, The. See WASP, REINDEER, AVON AND CASTILLIAN.
AVONDALE — AXE

AVONDALE, a former suburb of Birmingham, Ala., with which it is now incorporated. It was settled in 1884 and has cotton gins and manufactories of building materials.

AVONDALE, Scotland, a parish in the county of Lanark. At the battle of Drumclog, fought near this place 1 June 1679, Graham of Cleverhouse, the famous Viscount Dundee, was defeated by the forces of the Scottish Covenant. A graphic description of this battle is found in Sir Walter Scott's 'Old Mortality.'

AVRANCHES, a-vrânsh', France (the Roman Abbrinca), town of La Manche department, about three miles from the Atlantic, and 30 miles east of Saint Malo. It is pleasantly situated on a hill the summit of which was crowned by a magnificent cathedral, built in the 11th century, and destroyed at the revolution in 1790. In this cathedral Henry II did penance before two of the Pope's legates for the murder of Thomas à Becket. One of its bells was the celebrated Huet, author of the 'Demonstratio Evangelica.' The manufactures are chiefly lace, white thread and wax candles, and there is some trade in agricultural produce. Pop. 7,200.

AVULSION (Latin, a-vul'siō, a tearing off), a legal term denoting the sudden transfer by natural causes of a portion of one man's land to that of another, as when the course of a river is suddenly changed and former boundaries altered. It differs from accretion, which describes a gradual addition to the property of a riparian owner by the action of the water. See alluvion.

AWAJI, a-wā'jē, one of the islands of Japan, situated between the main land and Shikoku. Its area is 218 square miles. Pop. 189,036.

AWARD is the judgment or decision of arbitrators or referees, on a matter submitted to them. The award should be consonant with and follow the submission, to be binding. It must be final and certain. It must be possible to be performed, and must not direct anything illegal. A common law an award could be oral or written, but in some of the States an award to be valid must be in writing. The New York Code of Civil Procedure provides that an award to be valid must be in writing.

AWATA (a-wā'ta) WARE, a yellow faience called "egg-ware" by the Japanese, manufactured in the village of Awata, a suburb of Kyoto, and largely purchased in the United States.

AWE, ā, a narrow Scottish lake in Argyllshire, about 23 miles long, and communicating by the river Awe with Loch Etive. It is of great depth, has sloping and well-cultivated shores, terminated by ranges of lofty mountains, among which that of Ben Cruachan, rising to a height of 3,670 feet, at its northern extremity is most conspicuous. A number of islets are scattered over its surface, and on two of them are some beautiful ruins.

AXAYACATL, a-chā-yâ-kā'tl', or AXAYACATL, a Mexican fly, the eggs of which, deposited abundantly on rushes and flags, are collected and sold as a species of caviare. The use of these as an article of diet was learned by the Spanish settlers from their predecessors, the native Indian Mexicans, who called the dish aimauhi.

AXAYACATL, a-chá-yá-kâ'tl', a Mexican emperor: d. about 1477. He was the father of Montezen, to whom Cortez conquered, and reigned 14 years. He was previously as a warrior when he became Emperor of the Aztecs, and inaugurated his reign by a successful expedition against Tehuantepec and in 1467 conquered anew the cities of Cotaxa and Tochtepec. A little later he expelled the tribes who strove to get possession of the Mexican capital and maintained a vigorous warfare against his neighbors. The palace of Axayacatl, a gigantic pile of stone buildings, became a barracks of the Spaniards. His treasures were discovered by Cortez within a concealed door and the chronicler of the conquest exclaims that "it seemed as if all the riches in the world were in that room." They consisted of gold and silver in bars and in shape of money, of the most rich and beautiful articles of curious workmanship, as imitations of birds, insects or flowers.

AXE (apparently an original Aryan word), a long-handled tool for wood-cutting. Its essential feature is the helve, though a certain shape is imposed by the nature of its service. The chipped flint of the oldest Stone Age was a tool of all work, to crush, dig or cut (rather, bruise off), as occasion demanded, and was too heavy and shapeless to be used except by hand. As soon as one was shaped and sharpened to admit of tying a handle to it, for a heavier stroke, the axe came into being and was probably the earliest implement thus differentiated. So natural a device was separately invented by each race early in its history and made of the material at hand: flint in England and America; whinstone or granite in Ireland and by the lake dwellers of the Continent; bone by the American Indians and Eskimos; while stone axes are still used by some of the cannibals of the South Seas. In all these cases and until the use of metal, the handle was secured with a thong, as piercing with an eye was impracticable. The first copper and bronze "celts" were made in the same way. But when casting had become familiar, it was seen that there was no difficulty in casting a hole to thrust the handle in, making a much surer and heavier stroke; and with this "eye" the modern axe appeared. The bronze axe was lightened and better shaped, and in its turn displaced by iron, for which, with the progress of invention, has been substituted an iron butt inset with a steel cutting part. The old hand forges have for some generations been replaced by immense establishments with developed machinery. The American process consists of cutting the butt from a piece of white-hot iron, punching the eye, then reheating and shaping it by pressure between concave dies; again heating, cutting in the edge, a groove, into which the arched steel edge-piece is set, then welding the two and drawing out the axe to a proper edge by trip-hammers at a white heat. The next process is hammering off the implement by a combination of hand and machine work and reparing the shape lost in
drawing out. It is then ground to symmetry, hung on a revolving table in a furnace and heated over a small coal fire, at a peculiar red heat, determined by the eye; cooled in brine and then in fresh water and removed to another furnace, where it receives the last temper. It is next polished to a finish that shows every flaw and enables it to resist rust and enter wood easily; then stamped, the head painted to prevent rust, weighed, labeled and packed for sale.

AXEL, or ABSALON, Danish prelate, archbishop of Lund: b. near Sorøe, Zealand, 1120; d. 1201. His family name was Axel. In 1157 he was chosen bishop of Roskilde or Rothschild. In that age warlike pursuits were not deemed inconsistent with the clerical office, and Absalon was a renowned warrior by sea and land, as well as a zealous ecclesiastic, his avowed principle being that "both swords, the spiritual and the temporal, were intrusted to the clergy." To his exertions as statesman and soldier Waldemar was largely indebted for the independence and consolidation of his kingdom.

AXEL AND VALBORG, a tragedy in five acts by Oehlenschläger, was written in Paris in 1808 and printed in Copenhagen in 1810, latest English translation by F. S. Kelle. The story is taken from the best known of the Danish romantic ballads. The last verse Oehlenschläger used as a motto:

May God forsake the wicked wretch
Who two like these would part
When one glows with a warm and mutual love
In young and virtuous heart

The ballad was well known throughout the Scandinavian countries long before Oehlenschläger's time. In Holberg's 'Peder Paars,' the balliff's wife was almost drowned in a flood of tears because parts of it had been read to her.

The whole action of the drama takes place in the famous Trondhjem Cathedral, in Norway, during the reign of Haakon Herdebre. Axel and Valborg are cousins who love each other, in spite of the pope's dispensation removing the legal impediment, a scheming monk prevents their marriage. In this tragedy of a Northern woman's true and constant devotion the beauty of the ballad is brought to its full fruitfulness, its pathos and tragic ending, it makes an almost overwhelming impression on the spectator. (Compare Björnson's 'The Fisher Maiden').

In his own generation Oehlenschläger's drama was the most favored and admired of all his writings. Through it, the romantic-sentimental style of poetry gained general favor. When Baggesen, beginning his review in a critical and hostile spirit, reached the famous lines spoken by the pure and innocent Valborg, as she crowns her lover's initials with flowers: "I bid thee, my love, good morning," he was absolutely carried away and praised the work in the highest terms.

Gisle Bothne.

AXELSEN, a powerful Danish family who flourished in the latter half of the 15th century and the members of which figured in the wars of Christian I and John IV of Denmark, and Karl Knutsen and Eric the Pomeronian, kings of Sweden. Peter Axelsson was the head of the family. Of his nine sons, the eldest, Olaf, made himself master of Gothland; the second, Iver, retained that possession and became a corsair; the third, Eac, was governor of Stockholm; and the fourth, Aage, became a Danish councillor of state.

AXHOLME, an island in Lincolnshire, England, formed by the rivers Trent, Don, Idle and Vicarby. Epworth, the home of the Wesleys, is the principal parish. Its area is 47,000 acres. The soil is exceedingly fertile.

AXIL, in botany, the angle between the upper side of a leaf and the stem or branch from which it grows. Buds usually grow out from the stem in axes of leaves and this position is naturally termed axillary. In anatomical terminology, the axilla is the armpit.

AXIM, a-sheng; or ax-im, an important station and port on the African Gold Coast, near the mouth of the Ancobrah River, 70 miles west of Cape Coast Castle. Inland from Axim, in the basin of that river, and in the district between it and the Pra, gold-mining operations have been carried on on a large scale. It was built by the Portuguese, and its harbor is the best on the Gold Coast. The town is picturesque, and is an important point because of large exports of mahogany. In 1642 it was taken by the Dutch, who in 1872 ceded it, with the whole of their possessions in Guinea, to the English. Pop. 2,189.

AXINITE (Greek, "like an axe"), a mineral usually occurring in broad, acute-edged triclinic crystals, suggestive, in shape, of an axe. It has a glassy lustre, brown or yellow in color, and is translucent and strongly pleochroic. It has a hardness of 6.5 to 7, and a specific gravity of about 3.28. Its exact composition is still doubtful, but it may be described as a calcium and aluminum borosilicate, containing also varying amounts of manganese and iron. Its most important deposits are in Dauphine, France, Mount Skopi, Switzerland, in Japan and in the United States near Bethlehem, Pa., and at Franklin Furnace, N. J.

AXINOMANCY, a mode of divination much practised by the ancient Greeks, particularly with the view of discovering the perpetrators of great crimes. An axe poised upon a stake was supposed to move so as to indicate the guilty person; or the names of suspected persons being pronounced, the motion of the axe at a particular name was accepted as a sign of guilt. Another method of axinomancy was by watching the movements of an agate placed upon a cold-hot axe.

AXIOM (an assumption), a universal proposition, which the understanding must perceive to be true as soon as it perceives the meaning of the words, though it cannot be proved. It is, therefore, called a self-evident truth. In mathematics, axioms are those propositions which are assumed without proof, as being in themselves independent of proof, and which are made the basis of all the subsequent reasoning. Euclid has assumed 15 axioms as the basis of geometry. Among these are: "The whole is greater than its part"; "Things that are equal to the same thing are equal to one another"; "Magnitudes which coincide, that is, which exactly fill the same space, are equal to
one another in every respect." Bacon calls axiom a general principle, obtained by experiment and observation, from which we may safely proceed to reason in all other instances; and Newton gives the name of axiom to the laws of motion, which, of course, are ascertained by the investigation of nature; he also terms axioms those general experimental truths or facts which form the groundwork of the science of optics. **AXIS** (in crystallography). See CRISTAL.

**AXIS** (Latin, of unknown origin), a white-spotted deer (*Axis axis*) of India and the East Indies, known locally among the Hindus as "chitra," among the English as the "bog-deer." It resembles the European fallow deer in size and color, and as it is easily domesticated, is a favorite in European parks. The slender, sharp-pointed horns are not palmed and only a little branched, while the female is hornless. It is timid and usually goes in small herds, in which females largely predominate. It is a good food animal. It feeds on nuts, seeds, and grass on the water, and usually feeds in the night. Colored plates, illustrating its varieties, are given in Lydekker's "Deer of All Lands" (1898).

**AXMINSTER**, England, market town of Devonshire, 24 miles east of Exeter, on the side of a hill above the river Axe. The parish church, a very ancient edifice, contains some interesting antique monuments. Axminster was formerly celebrated for its worsted cloth and carpet manufactures, and gave name to a special make of carpet having a thick, soft pile, now made in Salisbury. Brushes are made here, and there are flour and other mills. Pop. 3,000.

**AXOLOTL, or xolotl** (Mex. "play in the water"), a larval salamander regarded as edible. They are numerous in the lakes about the City of Mexico, are six to 10 inches long, and are prepared by either roasting or boiling and eaten with vinegar or cayenne pepper. The most extraordinary thing about them, however, is the fact that they are the young of a species of terrestrial salamander (Ambystoma tigrinum), which is found all the warmer parts of the United States and Mexico, in which these lakes never transform into adults, but remain permanently in the larval condition, yet become sexually mature when about six months old, so that they are able to breed. This astonishing fact was long unknown. The axolotl has bushy, external gills similar to those which permanently characterize the mud-puppy. It was regarded as a distinct animal, and named *Sirex onichnoides*. The discovery of the truth was made accidentally in Paris in 1865, when some axolotls in an aquarium in the Jardin des Plantes lost their gills and were transformed into perfected ambylostatas. A lady, studying in the University of Freiburg, Frl. Marie von Chauvin, then undertook a series of careful experiments with other captives, and worked out the complete history of metamorphosis, which is dependent (at least in Europe) on a very narrow set of favorable circumstances, but differs in no essential degree from that of other salamanders (q.v.). Why the change never takes place in the Mexican lakes is unexplained. The theories in regard to it, and the detailed history of the observation above mentioned, are given by Gadow in "Amphibia and Reptiles" (1901), with many references to other books and periodicals.

**AXON**, that part of the nerve cell that carries the nervous impulses, the axis cylinder process or the nerve fiber proper. See *NERVE CELL; NERVE FIBRE*.

**AXUM, aq-oom**, a town in Abyssinia, capital of the province of Tigré, once the capital of a powerful Ethiopian kingdom, and at one time the great depot of the ivory trade in the Red Sea. The importance of this city and its kings was first made known to us by a stone (*Axumite marble*) with a Greek inscription, first explained by Salt, who discovered it, and afterward by Buttman and Niebuhr. The interest in this inscription was increased by the explanation which it afforded of the second half of the Adulian marble. Axum, the place where it was found, still exhibits many remains of its former greatness. There are here shown the royal throne, and groups of obelisks, originally 55 in number, one of which Salt declared to be the most beautiful that he had seen. Pop. 5,000. Consult Bent, "The Sacred City of the Ethiopians" (1893); Glaser, "Abessinien in Arabien und Afrika" (Munich 1893); Momm- sen, T., "Provinces of the Roman Empire" (New York 1886).

**AYACUCHO, aya-kooch'o**, Peru, the name of a department and also of the departmental capital. The department has an area of about 18,165 square miles, and it is traversed by both chains of the Cordillerias and watered by numerous rivers. It produces cereals, maize, potatoes and a little coffee, sugar, cotton, etc. Cattle and hardy sheep are bred extensively. The provinces are: Lucanas (rich in silver), Ayacucho, Cangallo, Huanta, La Mar, and Parinacochas. The capital, situated on the main road from Lima to Cuzco, has a cathedral and about 20 churches. It was founded by Pizarro in 1539, and long known as Huamanga. A battle that took place here was one of the most celebrated in the history of South America, having been decisive of the independence of upper and lower Peru. (See *AYACUCHO, BAT- TLE OF*). Pop. of town 22,000; of the department, in 1916, about 227,000.

**AYACUCHO, aya-kooch'o. The Battle of**, a decisive engagement in the South American struggle for liberty; was fought on 9 Dec. 1824, at and near the Peruvian town of that name. On the one side was the Spanish viceroy of Peru with nearly all that remained of the Spanish power in its last stronghold upon the continent; on the other General Sucre, second in command to Bolivar (Amazon not being present), with Columbian troops, and Peruvians led by General Lamar. The viceroy was taken prisoner; the utter defeat of his army made possible the independence of Bolivia (realized the following year), and strengthened the republican governments in all the neighboring states.

**AYALA, a-ya-l'a, Adelardo Lopez de, Spanish dramatist**: b. Gualdakanal, Badajoz, March 1820; d. 30 Dec. 1879. After studying law in Seville, he went to Madrid, where he devoted himself entirely to poetry and speedily won national fame. His first drama, "A Statesman" (1851), met with immediate success, and
was followed in the same year by 'The Two Noblemen' and 'Penalty and Pardon.' To the modern comedy of manners, his specific domain, he first contributed 'The Glass Roof,' and in 1861 attained to wide reputation with 'Percentage.' Of his other works the most noteworthy are 'The Modern Don Juan' (1863); and 'Conseulo' (1878), a drama.

AYALA, Lopez de, Spanish historian and poet: b. 1332; d. 1407. He was a prominent statesman and warrior during the reigns of the Castilian kings Pedro the Cruel, Henry II, John I and Henry III, and is known as the author of a 'Chronicle of the Kings of Castile' (his contemporaries), in which the crimes of Pedro the Cruel are detailed and drawn in colors said to be sometimes overcharged.

AYAMONTE, á-ya-món-tä, Spain, seaport town, near the mouth of the Guadiana, which here forms the boundary between Spain and Portugal. It is picturesquely situated on the slope and at the foot of a hill. The upper part of the town consists of narrow and irregular streets; those of the lower part are regular and wide. There are three public squares. The principal occupation of the inhabitants is fishing, shipbuilding and coast trading. Pop. (1910) 9,471.

AYE-AYE, á-ye, (native Malagasy name; from its cry), a lemur (Daubentonia madagascarenisis), about the size of a rabbit, and with teeth like a bat. It is small and brownish, with a long bushy tail. Arboreal and nocturnal in habits, it lives in bamboo jungles, feeding on vegetables and the larvae of certain borers. Its feet, as well as its hands, have opposable thumbs, and exceedingly long, naked, flexible fingers armed with pointed nails, suitable for extracting grubs out of deep crevices. Consult Baron, 'Proceedings Zoological Society' (London 1882); Lydekker, 'Mostly Mammals' (London 1903); Ingersoll, E., 'Life of Mammals' (New York 1896).

AYEHSHA, á-eh-sha, the daughter of Abu-Bekr and favorite wife of Mohammed: b. 610 or 611; d. 677 or 678. After Mohammed's death she opposed the succession of Ali, raised an army against him, and was taken prisoner, but dismissed with that spirit of chivalry which had already arisen among the Arabians.

AYLESBURY, á-lz-bär-i, England, market town in Buckinghamshire, 38 miles northwest of London, in the centre of the fertile valley of Aylesbury. There are many old houses, irregularly but picturesquely built. The parish church of Saint Mary's is a fine early English edifice, and there are various other places of worship, a county-hall, market-house, clock tower and corn exchange. There are also baths, a large county hospital, and the only convict prison for women in England. The chief industries are printing, making condensed milk and poultry-raising for the London market, Aylesbury ducks being widely known, and there are several breweries and flour-mills. Aylesbury is very ancient, having been taken from the Britons by the Saxons in 571. Pop. (1911) 11,048.

AYLESFORD, á-lz-fér'd, England, town in Kent, three miles from Maidstone, and 39 miles southeast of London. Remarkable amongst the many other monuments are a large cromlech, or burying place, known as Kit's Coity, and, in the neighboring chalk hills, large circular sepulchral pits. Pop. (1911) 2,569.

AYLESWORTH, Sir Allen Bristol, Canadian statesman: b. Newburgh, Ontario, 27 Nov. 1854. He graduated at Toronto University in 1874, became a barrister in 1878, and K.C. in 1889. He was returned as a Liberal to the Dominion House of Commons in 1905, occupying the portfolio of postmaster-general in Laurier's cabinet, 1905-06, and minister of justice 1906-11, when he retired from political life. A member of the Alaskan Boundary Commission in 1903, he dissented from and refused to sign the award, which he subjected to a searching criticism. He was British agent before The Hague Tribunal in the fisheries reference of 1910, and was created K.C.M.G. in 1911.

AYLON, l-yön, Lucas Vasquez de, Spanish adventurer: b. about 1475; d. 1526; who, in 1509, occupied the position of consul at the Supreme Court of Saint Domingo, and was subsequently employed by Fernando Cortes on a mission to Velasquez. In 1520, he joined the Spanish expedition to California captained by a great number of natives, and proposed to found a new colony, but was unsuccessful, and is supposed to have lost his life while engaged in a second expedition to Florida.

AYLMER, two lakes in Canada: one, north of Great Slave Lake, is about 50 miles in length and half as wide, the other lies about 70 miles south of Quebec, in Wolfe County, at the headwaters of the Saint Francis River.

AYLMER, îl'mär, John, English prelate: b. Norfolk 1521; d. 1594. He was tutor to Lady Jane Grey. On the accession of Mary, he was forced to leave his country, but when Queen Elizabeth came to the throne he returned to England; and in 1576 was made bishop of London. He wrote a powerful reply to the 'Monstrous Regiment of Women' by John Knox.

AYLMER, Matthew Whitworth, 5th Baron: b. 1775; d. 1850. He entered the army in 1787, serving in the West Indies, in Holland, and in the Peninsula under the Duke of Wellington. He was governor-in-chief of Canada, 1830-35.

AYLOFFE, á-löf, Sir Joseph, an English antiquary: b. about 1709; d. 1781. He was one of the first council of the Society of Antiquaries, a commissioner for the preservation of state papers, and author and editor of several works, of which the best known is his 'Calendars of the Ancient Charters,' etc.

AYMARAS, ímá-rás', an Indian race of Bolivia and Peru, speaking a language akin to the Quichua. They are physically characterized by great chest development, caused by the rarefied air of the region they inhabit.

AYMON, á-mon, the surname of four brothers, called respectively Alard, Richard, Guiscard and Renaud, sons of Aymon or Aymon, Count of Dordogne, who figure among the most illustrious heroes of the chivalric poetry of the Middle Ages; their historic existence was considered problematical until M. Longnon in 1879 established the fact that the Aymards were members of the 14th century. Their career furnished rich material to the romantic narratives of the age of Charles
Martel. A novel, entitled ‘The Four Aymon Brothers,’ by Huon de Villeneuve, a French poet of the 13th century, details very minutely their exploits, and Ariosto conferred a poetical immortalitv to the family by the publication of his ‘Roland,’ in which Renaut, the bravest of the four brothers, plays continuously the most distinguished part.

**AYOUBITES**

**or AYYUBITES,** the Saracenic dynasty founded by Saladin, which in Egypt supplanted the Fatimite caliphs, about 1171 a.d. Several of the descendants, Saladin, known as Ayyubites, afterward ruled in Egypt, Syria, Armenia and Arabia Felix. In the 13th century their power was destroyed by the Mamelukes.

**AYR**, är, Scotland, town on the river Ayr, 34 miles southwest of Glasgow. The principal streets of modern Ayr are spacious and well paved, and many of the buildings handsomely. The most important edifices are several churches of various denominations; the townhall and connected offices, in great part completed in 1881, surmounted by a fine spire of older date, 226 feet high; the county building; the celebrity of the Royal Ayrshire Institute, the buildings of which are handsome and commodious; the Wallace tower, 115 feet high on the site of a more ancient tower; the free library; the railway station and hotel; a hospital, etc. There is a handsome esplanade along the sea front 1,500 yards long. Two bridges connect Ayr with Newton and Wallacetown, incorporated in the burgh. One of these, opened in 1879, occupies the place of the “New Brig” of Burns’ “Brigs of Ayr,” the “Auld Brig” (built 1252) being still serviceable for foot traffic.

There is now also a third bridge farther up the river, besides the railway bridge. Ayr exports manufactured goods, iron, coal, whestones, etc.; and imports iron-ore, grain, timber, slates, bricks, etc. The harbor lies within the mouth of the river, and is enclosed and protected by a north and a south pier and a breakwater; there being also a wet dock and a slip dock. Shipbuilding is carried on, also tanning, boot and shoe making, the manufacture of carpets, lace curtains, etc. The poet Burns was born in Ayr, on the banks of the Doon; a one-half mile of the town, between it and the church of Alloway ("Alloway's auld haunted kirk"), and a monument erected to his memory stands on a height between the church and the bridge over the Doon. Pop. 33,000.

**AYR,** a river of Ayrshire, Scotland, which after a course westward of 18 miles, finally loses itself in the Firth of Clyde below the town of Ayr.

**AYRER,** Frer, Jacob, German dramatist: b. Nuremberg about 1560; d. there, 26 March 1605. Between 1595 and 1605 he wrote more than 100 plays, of which the “Opus Theatricum” (Nuremberg 1618) contains 30 tragedies and comedies, and 36 Shrove-tide plays and vaude-villes. In his dramas the influence of the English stage is apparent.

**AYRES,** är, Alfred. See OSWYN, THOMAS ERASMUS.

**AYRES,** Anne, American author: b. England 1816; d. February 1896. She was the first member of an American sisterhood in the Protestant Episcopal Church. She wrote ‘Evangelical Sisterhood’ (1867); and ‘Life of Augustus Muhlenberg.’

**AYRES,** Brown, American educator: b. Memphis, Tenn., 25 May 1850. His earlier education was attained in private schools, after which he studied engineering, graduating from Stevens Institute of Technology. In 1880 he was appointed professor of physics at Tulane University, where he remained for 24 years, acting at times as dean of the College of Technology and president pro tempore. In 1904 he became president of the University of Tennessee. In 1910 he was president of the National Association of State Universities.

**AYRES,** Leonard Porter, American educator: b. Niantic, Conn., 15 Sept. 1879. He studied at Harvard and Columbia Universities, then, in 1902, went to Porto Rico as one of the first American teachers. Here he became, first, superintendent of schools in the districts of Caguas and San Juan, then general superintendent of all the schools in Porto Rico. In 1908 he became connected with the work of the Sage Foundation, becoming chairman of the committee in charge of the normal school for backward children. He is the author of ‘A Course of Study for the Schools of San Juan’ (1905); ‘Medical Inspection of Schools’ (with Luther H. Gulick, 1906); ‘Laggards in Our Schools’ (1909–13); ‘Open Air Schools’ (1910); ‘Seven Great Foundations’ (1911); ‘The Public Schools of Springfield, Ill.’ (1914); ‘The Measurement of Spelling Ability’ (1915); ‘School Building and Equipment’ (1915); ‘Summary of the School Survey of Cleveland, Ohio’ (1916).

**AYRES,** Romeyn Beck, American soldier: b. East Creek, Montgomery County, N. Y., 20 Dec. 1825; d. 1888. Graduating from West Point in 1847, he entered the artillery arm of the service in time to participate in the Mexican War. When the Civil War broke out he was a captain and as such took part in the first battle of Bull Run. From October 1861 to November 1862 he was chief of artillery under Gen. W. F. Smith. He was with the army of the Potomac in the Peninsular campaign; afterward he was at the fightings in the lines of South Mountain, Antietam, Fredericksburg, Chancellorsville and Gettysburg, being a division commander in this last engagement. In August 1863 he was ordered to New York with command to assist in the suppression of the draft riots. At the end of the war he was brevetted brigadier-general and major-general in the regular service, serving as lieutenant-colonel and colonel in the regular establishment until his death.

**AYRSHIRE,** Scotland, an extensive maritime county about 60 miles in length, with a breadth varying from 10 to 26 miles. Its coast line is about 75 miles in length, has several excellent harbors. The singular rock off the coast, known by the name of Ailsa Craig, belongs to the county, as also do one or two other islets. The surface has no great elevations, the highest summits varying from about 1,200 to 1,900 feet. The principal streams are the Ayr, Stinchar, Girvan, Doon, Irvine and Garnock. The mineral riches are very considerable. Coal is abundant, especially in the middle and north-
ern parts of the county, and there are over 100 collieries. Extensive seams also of blackband ironstone exist, and are now being actively worked, Ayrshire having become the great seat of the iron manufactures of Scotland next to Lanarkshire. Graphite is found in some localities; and lead, antimony and copper. Limestone and freestone abound. Millstones of coarse granite, much esteemed for their hardness and durability, are quarried near the north coast, in the district of Cunningham. The native sheep are bred in great numbers; their wool is coarse and scanty, but the flesh is excellent. The horses of Ayrshire are of superior quality, being strong, hardy, and of large size. The woolen manufactures are extensive, particularly carpets, bonnets and worsted shawls, which are produced in great quantities. There are valuable fisheries and ship yards on the coast. On the coast is the ancient castle of Turnberry, in which Robert Bruce, King of Scotland, is said to have been born, and where he is known to have spent many of his youthful years. It was here that a fire, accidentally kindled, was mistaken by Bruce for an approaching army, and caused him to cross the sea from the island of Arran opposite to attempt the deliverance of his country. Of the ecclesiastical ruins the most interesting is the abbey of Crossraguel, founded in 1244. The chief towns are Ayr, Kilmarnock, Irvine, Stevenston, Dundonald, Troon, Saltcoats, Largs and Ardrossan. Pop. (1911) 268,337. Consult Paterson, 'History of Ayrshire' (1866).

AYRTON, är-tón, William Edward, English electrician and inventor; b. London 1847; died 1908. He entered the Indian telegraph service, having graduated at an early age as engineer with Prof. William Thomson; became electrical superintendent and introduced throughout India the system of determining the position of a fault by electrically testing one end of a line. In 1873-79 he was professor of natural philosophy and telegraphy at the Imperial College of Engineering in Japan; in 1879 became professor of applied physics in London Technical College, and, in 1884, chief professor of physics at the Central Institute, South Kensington. He was elected president of the Institute of Electrical Engineers in 1892. With Professor Perry he invented the ammeter, voltmeter, electric power meter, ohmmeter and dispersion-photometer; and, with Professors Jenkins and Perry, the system of telephergage. He was a voluminous writer and widely known for his 'Practical Electricity' (new ed. 1911).

AYSUCUE, á'skii, Sir George, English admiral who lived during the 17th century and died in 1671. He was knighted by Charles I and attained his first command in 1646. During the English Civil War the navy had largely maintained an attitude of neutrality, but in 1648 the greater part of the British fleet sailed for Holland. Those ships that remained and supported the Parliamentary cause did so largely through the persuasions of Ayscue, for which Parliament appointed him admiral. He then sailed to the fleet in the French Channel and captured it from the loyalist governor. Later followed some severe naval engagements with the Dutch fleets under Tromp and Ruyter. In 1666 Ayscue's flagship was beached during an engagement and the admiral himself was taken prisoner and brought to Holland. The following year he was allowed to return to England.

AYTOUN, á'toon, Sir Robert, Scottish poet; b. 1570; d. London, February 1638, and studied at Saint Andrews. Of Norman descent, his family name was De Vesey; one of his ancestors received from King Robert I grants of lands of Aytoun, in Berwickshire, and changed his name to that of the estate. Sir Robert addressed an elegant panegyric in Latin verse to King James on his accession to the crown of England, which had, no doubt, some influence in securing to the author the favor of that monarch. He was at a later period of his life honored with the appointment of secretary to Henrietta Maria, Queen of Charles I. During his residence abroad, as well as at the court of England, he lived in intimacy with, and secured the esteem of, the most eminent persons of his time. The poems of Sir Robert Aytoun, for the first time published together in the Miscellany of the Banknote Club, are few in number, but are distinguished by some elegance of diction, though he never claimed to be a poet. Several of his Latin poems are preserved in the work called 'Delitiae Poetarum Scotorum.' Dr. C. Rogers, whose first edition of Aytoun's poems appeared in 1844, without any authority included 'Auld Lang Syne' and Raleigh's 'Sweet Emissary.'

AYTOUN, William Edmondstone, a descendant of the foregoing, Scottish poet and prose writer: b. Edinburgh 1813; d. Blackhills, Elgin, 4 Aug. 1865. He studied at the University of Edinburgh and passed as advocate in 1840. His first independent work was the 'Life and Times of Richard I' (1840). In 1848 he published a collection of ballads entitled 'Lays of the Scottish Cavaliers,' which has continued to be the most popular of all his works, and has passed through numerous editions. It was followed in 1854 by 'Firmilian, a Spasmodic Tragedy'; in 1856 by the poem of 'Bothwell'; and in subsequent years by the novel called 'Norman Sinclair,' and various other original works. In 1858 he issued a critical and annotated edition of the 'Ballads of Scotland.' The translation of the poems and ballads of Goethe which he undertook in conjunction with Theodore Martin was less successful than some of his other works. In 1845 he was appointed professor of rhetoric and English literature in the University of Edinburgh—a position which he held till his death. In 1854 he became editor of Blackwood's Magazine. His biography was written by Sir Theodore Martin, 1867.

AYUB KHAN, i-yoo'b'kán, an Afghan prince, youngest son of Shere Ali: b. about 1835. After the abdication of his brother Yakoob, he declared himself openly against the English. On 27 July 1880 he met General Burrows at Kushk-i-Nakhud and severely defeated him, then laid siege to Kandahar. On 1 September General Roberts, who had hurried up from Kabul by forced marches, joined Ayub's forces and relieved them. Ayub and what was left of his army falling back on Herat. The following year he succeeded in taking Kandahar, but the new Ameer, Abd-ur-Rahman, was finally able to overcome him. For a while he was an exile in Persia. In 1897 he organized a
conspiracy to capture Herat, which failed. He finally gave himself up to the British who sent him, a state prisoner, to the Punjab.

**AYUNTAMIENTO,** a-yoon'ia-myan'tó, the name given in Spain to municipal councils. Firmly established during the struggles with the Moors, the ayuntamientos acquired great influence and political power, the nobility being admitted to them without their class privileges. The Cortes, in 1812, adopted the leading features of the system. On the return of Ferdinand VII, the ayuntamientos were abolished, but restored in 1837. The ayuntamientos were empowered to make up the lists of electors and jurors, to organize the national guards, to command the police within their own bounds, to direct the appointment and raising of taxes and to manage the funds of the commune. The municipal law of 1870 deprived them of all political authority, and regulated them as administrative bodies, subject in certain respects to the authorities of the provinces, the law courts and the Cortes.

**AZAIS,** ą'za-éz, Pierre Hyacinthe, French philosopher: b. Sorèze 1766; d. Paris 1845. He spent his early years as a teacher and a village organist. At the outbreak of the Revolution he viewed it with favor, but was soon disgusted at the violence of its methods. A critical pamphlet drew upon him the hatred of the revolutionists, and it was not until 1806 that he was able to settle in Paris. In 1809 he published his great work *Des Compensations dans les destins humains,* which pleased Napoleon so much that he made its author professor at Saint Cyr. In 1811 he became inspector of the public library at Avignon, and from 1812 to 1815 he held the same position at Nancy. The Restoration government at first suspected him as a Bonapartist, but his length granted him a pension. From that time he occupied himself in lecturing and in the publication of philosophical works. In the *Compensations* he sought to prove that, on the whole, happiness and misery are equally balanced, and therefore that men should accept the government which is given them rather than risk the horrors of revolution. His other works are *Système universel* (1812); *Du Sort de l'homme* (1820); *De la phrénologie, du magnétisme, et de la folie* (1843).

**AZALEA,** a genus of about 25 species of shrubs of the family Ericaceae, natives of the northern hemisphere, principally of eastern Asia and North America. By some botanists the genus is united with *Rhododen-tron* (q.v.) as may be seen below. The species have deciduous leaves and showy, often fragrant flowers, usually in terminal umbel-like clusters. They are commonly divided into two groups: the Indian azaleas and the hardy deciduous azaleas, including the Gent hybrid. The Indian azaleas, mostly imported from Holland and forced in greenhouses, are propagated by grafts or cuttings, rarely by seeds. They are planted in loose, moderately fertile soil; sheltered from the sun and watered freely during the summer; not potted in early autumn; and, by special attention, brought into flower as desired from late autumn until early summer. The leading species of the group is *A. indica,* of which two varieties, amena and kamsleri are fairly hardy as far north as New Jersey. The members of the hardy group need some protection in the north and in exposed situations to prevent injury to the flower-buds due to sudden variations of temperature. Named horticultural varieties are usually propagated by grafts or by cuttings. Seedlings are often grown for their own merits, but are generally used for stocks upon which to graft choicer varieties. The following are among the best known species of this group: *A. nudiflora,* pinxterflower, found from Canada to the Gulf of Mexico, has pink, white or sometimes purple flowers in mid-spring; *A. calendulaceae,* found from New York to Georgia, has large, yellow or flame-colored, particularly handsome blossoms in late spring; *A. occidentalis,* a California species, bears fragrant, white, pinkish flowers in early summer; *A. arboreascens,* found in the Alleghenies, has fragrant white or pink flowers in June; *A. viscosa,* clammy azalea or white swamp honeysuckle, is found in swamps from maritime Canada to Florida and westward to Arkansas, and bears fragrant white or pink flowers in June or July. Among the Asiatic members of the genus, the best known are probably: *A. mollis,* *A. rhombica* and *A. ponica.* Consult Halliday, *'Treatise on the Propagation and Cultivation of Azalea Indica';* Van Geert, *'Iconographie des Azalées.'*

**AZAMGARH,** India, a city and district in the Gorakhpur division of the United Provinces. The city is situated on the river Tons, and has a railway station, and a population of about 19,000. The district has an area of 2,207 square miles. The slope of the land is from northwest to southeast, is fertile, and very highly cultivated, bearing magnificent crops of rice, sugar-cane and indigo. There are several indigo factories. In 1857 it became a centre of mutiny, and the scene of fighting between the Gurkhas and the rebels, and was not finally cleared until October 1858 by Colonel Kelly. *Pop. 1,500,000.*

**AZAN** (Arabic for "announcement"), the call or summons to public prayers proclaimed by the muezzin (crier) from the mosque twice daily in all Mohammedan countries.

**AZANCHEVSKY,** Michael von, Russian composer: b. Moscow 1839; d. 24 Jan. 1881. His first musical training was attained at Leipzig, under Richter and Hauptmann. In 1870 he became director of the Conservatory at Petrograd, which position he held for six years. Among his many works the most notable are a *Feet Polonaise,* for two pianofortes; a concert overture and a sonata in B Minor.

**AZARA,** a-thā'ra, José Nicolás de, Spanish diplomat: b. Barbuñales, Aragon, 1731; d. Paris, 26 Jan. 1804. After graduating from Salamanca he was appointed, first resident, then envoy for Spain at the Vatican. Here he attained a very powerful influence, which he used against the Jesuits, until they were suppressed in 1773, and in working for the election of Pope Pius VI. It was in Rome that he acquired a deep enthusiasm for art, in which he was one of the best connoisseurs. Consult Paul Besques, *'La premiere embasade d Don Jose Nicolas de Azara a Paris,'* (in *Bulletin hispanique,* Vol. III, 1901).
AZARIAH, the name of various personages mentioned in the Bible, no less than 24 of them being referred to. (1) The son of Oded, a prophet (2 Chron. xv, 1-8). (2) Azariah, also called Abednego, one of three who were thrown into a fiery furnace (Dan. i, 11). (3) One referred to by the Assyrian King Tiglath-pileser IV in an inscription, who was long believed to be the same King of Judah known as Uzziah. At least four high priests are referred to by this name.

AZARIAS, Brother (Patrick Francis Mullany), b. 29 June 1847, near Killenaule, Tipperary, Ireland; d. 20 Aug. 1893, Platteburgh, N. Y. (Cliff Haven). His father emigrated to the United States in 1851, leaving Patrick, his eldest son, in Ireland a few years on account of his health. At Deerfield, N. Y., near Utica, he attended the public school and later the Christian Brothers’ Academy in Utica. At 14 he decided to become a Brother, and on 29 June 1862, Patrick Mullany received the black habit and white collar of a Christian Brother and henceforth became known to the world as Brother Azarias. At 17 he was put in charge of a large class; and at 19 he was professor of mathematics in Rock Hill College, near Baltimore, Md. Ten years later he was made head of the college. His first book, ‘An Essay Contributing to a Philosophy of Literature’ (1874), won him the respect of scholars. His philosophical articles on literature, published in various magazines, were well received, and he was soon in demand as a lecturer before educational bodies, Catholic and non-Catholic. When in the 80’s he went to Europe, he found friends everywhere; scholars who had read his books, men like Cardinal Newman greeted him as a friend. He was a promoter of the Catholic Summer School of America and of several other educational movements. After finishing his course of lectures at the Catholic Summer School at Cliff Haven, 1893, he was too ill to go home or to any of the other meetings he was expected. His last days were spent in ‘Blue Point Hotel,’ near the Summer School grounds. His published works are ‘Aristotle and the Christian Church’; ‘Books and Reading’; ‘Culture of Spiritual Sense’; ‘Development of Old English Thought’; ‘Essays Educational’; ‘Essays Miscellaneaous’; ‘Essays Philosophical’; ‘Mary, Queen of May’; ‘Mary, Queen of May and Essays’; ‘Phases of Thought and Criticism’; ‘Philosophy of Literature’; ‘Psychological Aspects of Education.’

AZAZEL, az’a-zel, the chief of the angels who married human beings and begat of them wicked men (Lev. xvi, 8, 10, 26). It is also a name which occurs in connection with the sin of the Israelites. In which the high priest had all the sins of Israel confessed over the head of a goat and then had it cast over a cliff, a rite which is supposed to have been the survival of an old demon worship, which was modified by the Jews.

AZEGLIO, as-e’gli-o, Massimo Taparelli, Marquis d’, Italian author, artist, diplomatist and statesman; b. Turin, 15 Oct. 1798; d. 16 Jan. 1860. In 1816 he accompanied his father to Rome, and there occupied his time principally with painting and music. He was already favorably known as a painter, when, in 1830, he went to Milan, married the daughter of Manzoni, the great novelist, and wrote several romances. The earliest of these, ‘Eterno Fieramosca,’ was received with great enthusiasm. His next romance, ‘Niccolò de Lapl,’ became equally popular, and is esteemed by Italian critics the best historical novel in any language. Deeply imbued with a sense of Italian nationality, in 1842 Azeglio made a tour through the provinces of Italy, awakening the revolutionary spirit which troubled the last years of Gregory XVI. After the Revolution of 1848 he supported the cause of the King of Piedmont, and, at the head of the Papal troops, fought against the Austrians at Vicenza, where he was wounded. In 1849 Victor Emmanuel appointed him president of the cabinet of ministers, an office which he resigned in 1852 to his political adversary, Count Cavour. In 1859, after the peace of Villafranca, he undertook a confidential mission as Ambassador extraordinary to England; and was afterward appointed governor of the city of Milan. For biographies see Boccardo, ‘Nuova Encyclopaedia Italiana’; Camerini (Turin 1861); Morozzo (Florence 1884).

AZERBAIJAN, a-zér-bé-ján, Persia, the northwestern and most important province of Persia. It is bounded on the north by the Aras, on the east by the Caspian Sea, Gilan and Khamseh, on the south by Buzkashi and Qush and by Asiatic Turkey. Its area is 32,000 square miles. The land is very fertile, the orchards and gardens yield delicious fruits of almost every description, and great quantities, dried, are exported to Russia. Provisions are cheap and abundant, but there is a lack of forests and timber trees. Lead, copper, sulphur, opium, also lignite, are found; also a kind of variegated translucent marble known as Tabriz marble. The climate is healthy, not hot in summer, and cold in winter, and it is able to send a crop to about $1,000,000 annually. The province is divided into a number of administrative districts, each with a hakim, governor, under the governor-general, who is a responsible minister appointed by the Shah. Pop. about 2,000,000, comprising various races, as Persians proper, Turks, Kurds, Syrians, Armenians.

AZEVEDO, a-zé-va’dô, Manoel Antonio Valvres de, Brazilian poet: b. Sao Paulo, 12 Sept., 1831; d. 25 April 1852. He studied law in his native town and practised there. His ‘Obras,’ or collected works, were published the year after his death, a more complete collection, ‘Obras completas,’ appearing 10 years later (1863). The fifth edition of one volume of poems published in his lifetime appeared in 1884, under the title ‘Lyra dos vinte annos.’ He also wrote some minor prose works: the dramatic sketches ‘Bohemos’; ‘Marcario’; ‘Noite na taverna.’

AZEVEDO E CASTRO, João Paulino D’; Roman Catholic missionary bishop: b. Lages, Island of Pico, Azores, 4 Feb. 1852. He was educated at the National Lyceum, Horta, Azores, and at the Seminary of St. Vincent de Coimbra, Portugal. He was ordained priest in 1879; was successively professor of philosophy, theology, Church history, canon law (1879-1902)
AZEVEDO Y ZUNIGA — AZORES

and rector 1888–1902 of the Angra Seminary, Azores. He also served as episcopal deputy to Portugal and held various other diocesan appointments. In 1902 he became bishop of Macao, China. From 1902 to 1910 he was one of the chancellors of the Privy Council of the King of Portugal. As bishop he has built numerous churches and schools and has introduced new religious orders into his diocese and founded a college for girls at Malacca. As member of the government council he defeated the scheme for the granting of a gambling monopoly designed to make Macao the Monte Carlo of the Far East. He visited Europe in 1907 to arrange with the Pope and the French and Portuguese governments matters connected with the change of ecclesiastical jurisdiction in Hainan and Shin Hing.

AZEVEDO Y ZUNIGA, Gaspar de, Count of Monterey, Spanish colonial governor: b. 1521, viceroy of Mexico and Peru from 1595 to 1603, during which period he explored the Pacific coast of North America and founded Monterey, on Monterey Bay, California. Many Spanish-Californian families claim to be his descendants. Many of the lands so much loved by the American occupation were based on his grants.

AZIMUTH, in astronomy, the arc of the horizon comprehended between the meridian of the observer and the vertical circle passing through the star. It is easterly if the star is observed before, westerly if after, and zero if at the time of culmination. It is usual to connect with a graduated, horizontal circle, called the azimuth circle.

AZIO, Greece, a village on the Gulf of Arta, in the district and promontory of the same name. A German archeologist, Dr. Erlinger, succeeded, in 1857, after several years' investigation, in ascertaining the position of the camps of Antony and Augustus, precisely as it was on the site of the battle of Actium. He found the camp of the latter surrounded by a cincture of redoubts about 5½ miles in extent, which were constructed in stone, and protected by a ditch. In advance of the camp were external works, consisting of several small observation forts, one of which served as a telegraph for communicating with the fleet. In the ruins of one of these forts was discovered a tablet in steel, on which signals are traced, resembling somewhat those of the aerial telegraphs.

AZGAR TAWARIK, or TUAREG, an African tribe of the Berber class, who inhabit the desert country between Ghat on the north and the tract of the Kelow After the Tuaregs on the south, between lat. 21° and 26° N. They were first visited and made known to the European world by the British central African expedition of Barth, Overweg and Richardson. The country in the north is a barren plain, with scarcely any vegetation, and with isolated granite peaks, and few or no animals. The southern portion bordering on the Kelow Tuarges, is the uninhabited central region of the great desert. The Tuarges do not belong to the negro race. They are fanatical Mohammedans in religion, hating both Pagan and Christian. They are monogamists. They are a warlike aristocracy divided into five tiyuj, or clans, and subdivided into 30 divisions or fayyar, each of which has a separate chief. See Tuaregs.

AZMARI, the name applied to certain vagrant beggars in Abyssinia, part of whom form the music bands of the Abyssinian army, while the rest exercise their musical voices in the street, especially on religious holidays.

AZO, Porzio, or AZZO, or AZZOLIUS, Portius, an Italian lawyer: d. about 420. He lectured on jurisprudence at Bologna with such success that the college could not contain all his auditors, so that he had to take to the public square. His writings on Roman law superseded all those of his predecessors.

AZOBENZENE. See Benzene.

AZOC COLORS. See Coal Tar Colors.

AZOIC, a name formerly given to the earliest geological period, before the appearance of life on the earth. It includes the oldest rocks, mostly granites, gneisses and schists, in which there are no traces of organic remains.

The term has been variously employed to indicate rocks of Archean and Paleozoic age but has now fallen into disuse in the United States.

AZORES, a-zor-rz, or WESTERN ISLANDS, a Portuguese archipelago, in the mid-Atlantic, between lat. 36° S. and 39° S. N. and between long. 25° 10' and 31° 16' W. Stretching over a distance of 400 miles, their nine islands are divided into three distinct groups—Sta. Maria and São Miguel in the southeast; Terceira, São Jorge, Pico, Graciosa and Fayal in the middle, and Flores and Corvo in the northwest. Of these, Flores lies 1,176 miles west of Cape Roca in Portugal, 1,484 miles southwest of Falmouth and 1,708 miles east-southeast of Halifax. In 1431–53 the Azores were taken possession of by the Portuguese. They were at that time uninhabited; but that they had been visited by the Carthaginians is proved by Punic coins found on Corvo. They seem to have been known to the Arabian geographer Edrisi in the 12th century; and they are marked distinctly on a map of 1351. The Portuguese colonists called the whole group Azores, from Azor, the name of the boat in which they came, and they named two individual islands, Corvo and São Jorge, from Corvi Marini and San Zorze, which, according to a map of 1375, had been previously seen in the western ocean. In 1466 Alfonso V made a life grant of the island of Fayal to his aunt, the Duchess of Burgundy, and from this circumstance many settlers migrated thither from Flanders.

The total area of the group is 922 square miles, and the population about 242,013 (according to official reports before emigration had reduced the aggregate about 8,000). The area, population and maximum altitude of the different islands are as follows: Sta. Maria (38 square miles; 5,880; 1,889 feet); São Miguel (259 square miles; 107,000; 3,854 feet); Terceira (160 square miles; 45,000; 3,435 feet); Graciosa (24 square miles; 8,718); São Jorge (91 square miles; 18,000); Pico (174 square miles; 27,904; 7,613 feet); Fayal (69 square miles; 26,204); Flores (54 square miles; 10,700; 3,087 feet); Corvo (7 square miles; 1,000). The capital is Angra do Heroismo (population 10,057) in Terceira; but Ponta Delgada, in São Miguel in a larger town, with 16,179 inhabitants. The Azores are of volcanic
origin, and with the exception of Corvo, Flores and Graciosa, are still liable to eruptions and violent earthquakes, the worst of 21 shocks since 1444 having been those of 1591, 1638, 1719 and 1841. Hot mineral springs are numerous; and the baths of São Miguel, are much resorted to by invalids. The coast is generally steep and rugged; the interior abounds in ravines and mountains. Perhaps the greatest want of the group is a good harbor. The Azores are regarded as a province, not a colony, of Portugal, and as belonging to Europe. They comprise three districts of the republic and are part of the ecclesiastical province of Lisbon. For their defense they have two line regiments of infantry and two battalions of garrison artillery.

AZOTE, a name formerly given to nitrogen; hence substances containing nitrogen and forming a part of the structure of plants and animals are known as azotized bodies. Such are albumen, fibrine, casein, gelatine, urea, kreatin, etc.

AZOTINE, a substance procured by decomposing with the action of steam at 150° C. under a pressure of five atmospheres; the product, afterward dried by evaporation, contains nitrogen completely soluble in water. Azotine is mixed with dried blood for a fertilizer.

AZOTH, an elixir concocted by Paracelsus, which his adherents regarded as a panacea for all spiritual and bodily ills, the "incure of life."

AZOTURIA, or AZOTEMIA, also known as hemoglobinemias, a disease peculiar to horses, of which the chief symptoms are paralysis of the hind legs and a deep darkening of the urine to a coffee color. It usually occurs from too sudden a rest after heavy exertion or labor, without a corresponding change in rations. The disease is often mistaken for spinal meningitis or colic. There are several causes ascribed to it, the most likely theory being that of auto-intoxication. It is believed that in the muscles which have been heavily exerted some disturbance is formed which exerts a toxic action with a too abrupt period of rest, the formation of this substance being assisted by heavy diet. Cases are often fatal. Bleeding is one of the remedies prescribed, which seems at least to give relief. This should be followed by an injection of a normal salt solution, the administration of cathartics, cardiac stimulants, potassium iodide, fomentations of warm water over the loins, electricity to the affected muscles. But far better is prevention; reduction of rations when the animal ceases its regular work, or keeping in pasture.

AZOV, az-ôv', Russia, a fortified town in the south of Russia, on the Don, seven miles from its mouth. The sand and mud deposited by the river have choked up the port, so that its trade and shipping have dwindled away, and the inhabitants depend mostly on fish-curing. Still an active trade in grain provides an outlet for the southeastern region of Russia. Azov was about nine miles from the site of the ancient Greek colony of Tanais; and when, in the 13th century, it was taken possession of by the Genoese, they altered its name to Tanai.

They were driven out of it by Timur (Tamerlane) in 1392. In 1471 it was taken by the Turks, and in 1696 by Peter the Great; and it was finally ceded to Russia in 1774. In 1855 it was bombarded and greatly damaged by an allied English and French squadron.

AZOV, Sea of (the ancient Palus Mæotis), an arm of the Black Sea, with which it is connected by the Strait of Kertch or Yenikale. Its greatest length is 226 miles and widest breadth 110 miles, with a superficial area of nearly 15,000 miles. To the northeast it narrows into the Gulf of Taganrog, formerly called the Gulf of Azov. The southwestern shore is formed by the *Spit* or Tongue of Arabat—a strip of land, mud and sand 70 miles long and varying from 1,000 yards to 2½ miles in breadth. Behind or inside this strip, and bordering on the Crimean Peninsula, lies the Sivash or 4Putrid Sea,* which connects with the Sea of Azov through the narrow Strait of Genichesk. The odor arising from the decayed vegetation of the marshes and a kind of gas-oil is most unpleasant and unhealthy. Whereas the water in the Sea of Azov is not very salty—in the Gulf of Taganrog it is even potable—that of the Sivash contains more salt than perhaps any other sea. This salt is extracted in large quantities (over 1,000,000 tons per annum) and forms an important industry. Shortly before the outbreak of the European War the Russian government began the task of piercing the Perekop Isthmus, which, when completed, will give the Putrid Sea an outlet into the Black Sea and thereby convert the Crimean Peninsula into an island. This may not improbably produce a wholesome change in the atmosphere. In 1835 the Russians constructed a highway along the Spit of Arabat, since when a considerable population and numerous buildings have sprung up. The ruins of an old Tartar fort, captured by the Russians in 1771, still remain at Arabat, a village where the Spit attaches to the Crimea in the south. The Sea of Azov is very shallow and navigation is difficult in parts. The waters abound with fish. Violent storms occur, and the water level by five feet. There is reason to believe that, thousands of years ago, it was connected with the Caspian Sea. The river Don flows into the Gulf of Taganrog. Of the few scattered islands the largest is the Kurea.

AZPEITIA, ay-pé'-tya, a town in Spain, 18 miles southwest of San Sebastian. A mile from it is the famous convent of Loyola, now converted into a museum and built by the Roman architect, Fontana, in 1683. It includes the tower of the Santa Casa, in which Saint Ignatius of Loyola, the founder of the Society of Jesus, was born in 1491. Here every year in July a great festival is held in his honor, to which pilgrims flock from all quarters. Pop. about 7,000.

AZRAEL, az'rá-él, in Mohammedan mythology, the angel of death.

AZREK, the principal stream of Abyssinia, which, after a winding course through Abyssinia and Semna, falls into the Nile above Geri.

AZTEC CLUB, an organization formed to preserve the memories of the war in Mexico, established in Mexico in 1847.
AZTEC CONFEDERACY. The name Aztecs (properly Aztecas) is currently used for all the Nahua (q.v.) tribes in Mexico at the time of the Conquest, but while it was originally given only to the seven more closely cognate tribes which occupied the valley of Mexico, and is by some restricted to the one tribe which built Tenochtitlan, or Mexico City, and is so used for convenience here. The name is from the undamaged place (generally called northward) whence they came, Aztlán, variously interpreted as "heron place," "heron-clan place," "white place" and "sea-coast"; the best opinion makes it Jalisco or Michoacán, on the west coast of Mexico. Apparently some time from the 9th to the 11th century they invaded the plateau of Anahuac ("waterside," lake district), where tribes of the same stock were already living, and took possession of several commanding points; the chief pueblo being that of the Aztecs or Tollan (now Tula), some 40 miles north of Mexico City, a leading pass from the north into the valley of Mexico. Driven from this by the warfare of the other natives the Aztecs moved southward, about 1300, and under the leadership of the great chief, or "speaker," they defeated and enslaved themselves in the salt marshes where the outlets of lakes Chalco and Xochimilco flow into Lake Texcoco, or Texcoco, amid which in 1325 (the first absolutely sure date in their history) they built Tenochtitlan, now the City of Mexico. They converted it by dikes and causeways into an island, and gradually made it another Venice, a stone town intersected with canals, the strongest position in Mexico. For more than a century, however, they were tributary to the great pueblo of Aztaputzalco, near them on the lower shore of the lake. Gradually they formed a stable military organization and more stable civil society; in 1375 they elected their first "chief of men," war chief and priest in one—Acamapichtli, often styled in books the "founder of the Mexican empire," and under his chief, Izcoatzin, allied themselves with Texcoco on the eastern lake shore. The two destroyed Aztaputzalco about 1430 and deported the surviving inhabitants to Tilcapan, near Mexico, which was made tributary to the latter. Tenochtitlan, Texcoco and Tilcapan formed a league (the Aztec Confederacy, formerly termed the "Aztec empire"), purely for plunder and tribute, not at all for government or incorporation. The league was not of food and similar supplies, a certain amount of land being cultivated for the benefit of the league, and but what was still more coveted, human victims for their gods, to be afterward eaten by themselves; sometimes of warriors for raids on others. The spoil was divided into five parts, Tenochtitlan and Texcoco each taking two and Tilcapan one. In less than a century of life, this league made some 30 pueblo towns tributary, principally to the east toward the gulf and southeast toward the Isthmus of Tehuantepec—a range of 8,000 or 10,000 square miles out of the 767,097 in the present Mexico. Even this was in no sense a military occupation of the country, much less the foundation of a state. Within a few dozen miles were great independent pueblos such as Cholula and Tlaxcala, the latter a strange and warlike settlement of some 30,000 people, who waged war to the knife with the Aztec Confederacy, defeating their plundering assaults and again and again, and aided other pueblos in resistance. Montezuma (q.v.), who acceded 1502, was heavily defeated by them and the towns in Michoacán, but won them on the gulf coast; and when the Spaniards came, the southern Mexican Peninsula was a mass of seething savage hatreds and feuds, no two tribes of the natives having any community of feeling or interest that could prompt them to unite with one another rather than with the foreigner. See Cortés; Mexico; Montezuma.

The Aztec tribe was divided into 20 clans or *calpullis*, each clan occupying several contiguous communal houses, each of which held several hundred persons; besides a clan office building where assemblies were held and strangers entertained. It was governed by an elected council, with a civil and a military head as in Rome, the latter being also constable. Each clan had its special rites, priests and temple. It was divided into four parishes, each having among other duties that of exacting compensation for murders, and each ward had its own precinct, constituting four wards or quarters of the town, its arsenal and its capital. These captives thus called "speakers," "man," "man-slayer," "bloody-shedder" and "chief of the eagle and cactus," the latter being chief executioner, and not eligible for the chieftainship of the tribe. The supreme government of the Aztecs was by a council of 20, one from each clan, who must not be a sashem, but a member of the clan council; he was called the "speaker," and the tribal council the "speech-place" (parliament, literally). It met every 10 days at least, and oftener if called together. Once in 80 days there was a special session attended by all the leading clan and parish officials and priests, to reconsider unpopular decisions. The tribe, too, had a dual executive, civil and religious: a sashem who was civil magistrate and chief judge; and a war chief called "chief of men," and who exercised also some priestly functions, though there was a high priest. He was originally chief only of the Aztecs; but about 1430 (probably on occasion of the destruction of Aztaputzalco), was made chief of the confederate army. He was elected by the tribal council and the war and chiefs and leading priests, and could be deposed by them. Official residence was in the tribal office. From the time of the first chief, Acamapichtli, the office remained in a single family, like the old Aryan kingship.

The social and religious organization was a peculiar mixture of the lowest barbarism and the beginnings of civilization. There was no private property in land or dwellings; each man could keep a garden plot for his use, but it was his no longer than he used it. Family life had emerged from savage promiscuity; descent was reckoned in the male line, marital infidelity was punished, and remaining unmarried was not permitted except by special dispensation, - contumacy being punished by being made an outcast, a serf if a man and a prostitute if a woman. Slavery had thus begun in a small way; but the habitual use of prisoners of war as slaves had not, it being preferable to sacrifice and eat them. Agriculture was still primitive; but irrigation was practiced, to some extent, and horticulture was beginning to develop. The roads were only narrow trails; but they facilitated collection of tribute, and
served military and trading purposes as well. The houses were generally of adobe brick, but many of the great pueblos were of stone, so that the towns looked like castellated cities. There were tessellated marble floors, finely worked and colored tapestries, and beautiful feather-work, vases, goblets and censers of fine marbles and precious metals exquisitely wrought. There were regular weekly markets, which, though trade was by barter, indicated a large development of personal property and of superfluity above subsistence. There were elaborate pleasure-grounds, menageries, and aviaries, baths and fountains and pleasure performances of dramas and singers, acrobats and jugglers. Yet the people were cannibals, and their religion was of the most hideous character, albeit with regularly organized priesthood and temples and altars. Consul Blart, L., 'The Aztecs: Their History, Manners and Customs' (Chicago 1905); Joyce, T. A., 'Mexican Archaeology' (New York and London 1914); Taft, G. E., 'Chimalman' (New York 1916).

MARRION WILCOX.

AZTEC TREASURE-HOUSE. The, a romance by Thomas A. Janvier. It purports to be a narration of the thrilling adventure of Thomas Palgrave, Ph.D., an archaeologist who goes to Mexico to discover, if possible, remains of the early Aztec civilization.

AZTECS. See AZTEC CONFEDERACY.

AZUAY, ò-thoo-i', a province in the mountainous southwestern part of Ecuador, with an area of about 11,150 square miles. The cinchona tree is found here in abundance and the high plains near the Peruvian boundary are well adapted to agriculture. The inhabitants of this province as a whole, including the large Indian element, have long been known for their skill in weaving, lace-making and the potter's art. The provincial capital, Cuenca, is locally famous as a centre of literary activity in the republic. Azuay's climate, throughout the regions that have an elevation of 8,000 to 9,000 feet above sea-level, is excellent. Pop. about 132,400. See articles Cuenca and Ecuador.

AZULAI, ò-zoo-il', Hayim David, 18th century Jewish bibliographer. b. Jerusalem. His life was mainly spent at Leghorn. Of his numerous works, the best known is Shemha-Gedolim ('the names of the great'), a bibliography containing the names of over 1,300 Jewish authors and more than 2,200 of their works.

AZULJEJO, ò-thoo-à-la-bô', a word derived from the Spanish word azul, meaning blue, and applied to a kind of glazed tile manufactured by the Moors in Spain and used in wall decoration. The art of making these tiles was inherited by the Spaniards, some of the patterns or designs used to-day being the same as those employed by the Moors.

AZUNI, àd-zoo'ne, Domenico Alberto, Italian jurist: b. Sassari, Sardinia, 1749; d. 23 June 1818. He became judge of the tribunals of commerce at Nice and in 1795 published a work in which he endeavoured to reduce maritime laws to fixed principles and which appeared in French in 1805, under the title of 'Droit Maritime de l'Europe.' Napoleon appointed him one of the commissioners for compiling the new commercial code.

AZURE, the heraldic term for the color blue, represented in engraving by horizontal lines.

AZURINE, a species of European roach, blue in color.

AZURITE, one of the commonest ores of copper, a basic copper carbonate, having the formula 2CuCO3·Cu(OH)2. Its hardness is 3.5 to 4 and specific gravity about 3.8. It is a mineral of rare beauty, its usual color being a rich Prussian to azure blue, from which fact its name is derived. Its color is, however, often so dark as to appear nearly black, this frequently being true of its crystallized forms. These are very varied and complex and belong to the monoclinic system. They are often transparent and have a most brilliant vitreous to adamantine lustre and are beautifully striated, while their frequent association with bright green malachite adds to the beauty of the specimens. These two minerals sometimes occur in stalactitic forms, the one encircling the other. Such specimens have been extensively cut and polished in cross sections and worked up for various ornamental purposes. The finest material of this kind comes from Morenci, Ariz., this locality also yielding exceptionally fine crystallized specimens rivaling those from its other most celebrated localities, Bisbee, Ariz., Siberia, and Cheshy, France. Its occurrence at the latter locality, which has been famous for many years, has led to the frequent use of the name cheslyite for azurite, especially in Europe. Many other localities yield choice specimens, the copper mines of the western portion of the United States being especially celebrated. In New Mexico curious pseudomorphs of native copper after azurite balls occur in large numbers, while pseudomorphs of malachite after azurite are very common.

AZYMITES (Lat. azymus, unleavened), a term applied by the Eastern to the Western church because the latter used unleavened bread in the administration of the Eucharist. In the Western Church, this custom has never been regarded as of vital importance. The matter was considered at the Council of Florence (1439). The Western Church called the Greek schismatics Pro-zymites.

AZZARKAL, az-ar-kàl', Arabian mathematician and astronomer: b. Cordova in the first half of the 11th century. He was royal astoner of Al-Mamoun, King of Toledo. He invented divers instruments for making observations, constructed a water-clock of extraordinary dimensions, as well as a planisphere and an astrolobe, upon new principles.

AZZUBEYDI, àzoo-bi'dè, Mohammed Ibn el Hassan, Arabian lexicographer: b. Seville 927; d. 982. He was cadiz of Seville and preceptor of Hisceam, son and heir of the Sultan. He wrote an abridgment of the great biography of the Spanish grammarians, by Khalil; a treatise on grammar and a work upon the character of the syntax of the Arabic language.
