PARTIAL LIST OF CONTRIBUTORS TO VOLUME III

ABBOTT, ALEXANDER C., M.D., Sc.D.
Bacteriologist, University of Pennsylvania
BACTERIA
BACTERIOLOGY

ALEXIS, JOSEPH, A.B., A.M.
Professor of Germanic Languages and Literature,
University of Nebraska
BANKRUPTCY, A

BEACHAM, ROBERT J.
Secretary, Baltimore Merchants and Manufacturers
Association
Baltimore, MD.

BERRY, GEORGE R., Ph.D., D.D.
Professor of Hermeneutics and Old Testament His-
tory and Theology, Colgate University
BIBLICAL CRITICISM

BREWWSTER, WILLIAM T., A.M.
Professor of English, Columbia University
BAB BALLADS, THE
BAGEHOT, WALTER
BARRY LYNDON

BURLESON, ALBERT S.
Postmaster-General, United States
BANKS, POSTAL SAVINGS

CAIRNS, WILLIAM B., Ph.D.
Assistant Professor American Literature, Uni-
versity of Wisconsin
BACKLOG STUDIES

COUMBE, CLEMENT W.
Technical Art Expert
BASILICA
BARDS

CREIGHTON, JAMES E., Ph.D., LL.D.
Professor of Philosophy, Cornell University
BERGSONISM

DARTON, NELSON H.
United States Geological Survey
BAD LANDS

DEL MAR, ALEXANDER
Author "History of Monetary Systems," etc.
BANKS AND BANKING — ORIGIN AND
DEVELOPMENT
BARCELONA, BANK OF

DOLE, NATHAN HASKELL, A.B.
Editor "Tolstoy's Collected Works"
BALMONT, KONSTANTIN DMITRIYEVICH

DOUGLAS, D. S.
Editorial Staff of The Americas, Toronto
BEACONSFIELD

DRURY, WELLS
Secretary, Berkeley Chamber of Commerce
BERKELEY, CAL.

ECCLES, F. Y., A.M.
BALZAC, HONORÉ DE

EGGERT, CARL E., B.PH., Ph.D.
Assistant Professor of German, University of Michi-
gan
BERNHARDI, FRIEDRICH VON

ESCHER, FRANKLIN
Lecturer on Foreign Exchanges
BANKS AND BANKING — FOREIGN
EXCHANGE
BANKING, INVESTMENT

FERRIS, RICHARD, C.E., D.Sc.
Editorial Staff of The Americas
BIMETALLISM

FINCK, HENRY T., A.B.
BACH, JOHANN SEBASTIAN
BEETHOVEN, LUDWIG VON

GLENN, MARIAN R.
Formerly Librarian of the American Bankers Asso-
ciation
BANKERS' ASSOCIATIONS IN THE
UNITED STATES

GOVE, AARON, LL.D.
Representative of the Beet Sugar Industry in the
Ard States
BEET SUGAR

HALPIN, PATRICK A., Ph.D.
Professor of Ethics, New Rochelle College
BENEDICT XV, GIACOMO DELLA
CHIESA

HANFORD, JAMES H., Ph.D.
Associate Professor of English, University of North
Carolina
BIBLE IN SPAIN, THE
BIOGRAPHIA LITERARIA

HERRICK, CLAY
Author of "Trust Companies"
BANKS AND BANKING—TRUST COM-
PANY

HIRSCHBERG, E., Ph.D.
Director of Statistical Bureau of Berlin
BERLIN, GERMANY

INGERSOLL, ERNEST
Naturalist and Author
BASS, CULTURE OF
BIOLOGY
BIRDS
BIRDS, FOSSIL
BIRDS, NESTS OF
BIRDS, PROTECTION OF
Contributors to Volume III—Continued

INGERSOLL, HELEN
Naturalist
BEACH PLANTS
BIRDS, PLANTS ATTRACTIVE TO

ISAACS, LEWIS M., Ph.D., LL.B.
Musical Critic and Composer
BARBER OF SEVILLE, THE (Opera)

KLEIN, HENRI F.
Librarian "London Times," 1898-1905; Editorial Staff "London Standard," 1905-15; and Staff of The Americana
BALKAN LEAGUE
BALKAN PENINSULA
BALKAN WARS
BELGIUM
BELGIUM AND THE WAR

KNIFFIN, WILLIAM H., JR.
Vice-President, Bank of Rockville Centre; formerly Secretary Savings Bank Section, American Bankers' Association
BANKS AND BANKING—COMMERCIAL PAPER
BANKS, SAVINGS

KRAPP, GEORGE P., Ph.D.
Instructor in English, Columbia University
BEDE

LANMAN, CHARLES ROCKWELL, Ph.D.
Professor of Sanskrit, Harvard University
BIDPAI

LAWRENCE, WILLIAM W., Ph.D., Litt.D.
Professor of English, Columbia University
BATTLE OF MALDON, THE BEOWULF

LEONARD-STUART, CHARLES, B.A.
HENRI K. KLEIN
Staff Editors, The Americana
BAVARIA

LIVINGSTON, ARTHUR
Professor of Romance Languages, Western University, London, Ont.
BETROTHED, THE

MACGREGOR, T. D.
Vice-President, Edwin Bird Wilson, Inc.
BANK AND TRUST COMPANY ADVERTISING

McDONNELL, JOHN B.
Editorial Staff, The Americana
BALUCHISTAN

NEILSON, WILLIAM A., Ph.D.
Professor of English, Harvard University
BALLAD

PAINE, WILLIS S., A.B., LL.D.
Author Paine's "Banking Laws"
BANK SUPERVISION

PILLSBURY, WALTER B., Ph.D.
Professor of Psychology, University of Michigan
BEHAVIOR AND BEHAVIORISM

REILH, CHARLES W.
Former Bank and Clearing House Examiner
BANK ORGANIZATION AND MANAGEMENT

RINES, GEORGE EDWIN
Editor of "The Foundation Library"; Co-editor of "The Encyclopedia of Latin America"; Managing Editor of "The German Classics"; "The South in the Building of the Nation," etc.
BANCROFT, GEORGE
BEECHER, HENRY WARD
BEECHER, LYMAN

ROBERTS, GEORGE E.
Assistant to the President, National City Bank, New York
BANKS AND BANKING—WORLD SYSTEMS—TYPES

ROBINSON, FRED N., Ph.D.
Professor of English, Harvard University
BACON, FRANCIS

ROOT, E. R.
Author of "A, B, C of Bee Culture" and Editor of "Gleanings in Bee Culture"
BEE-KEEPING

SHOREY, PAUL, Ph.D., LL.D.
Head of Greek Department, University of Chicago
BIRDS, THE

SLOSSON, GEORGE F.
American Billiard Expert
BILLIARDS

SMITH, WILLIAM BENJAMIN, Ph.D., LL.D.
Emeritus Professor of Philosophy, Tulane University

the second character in our alphabet, holds the same relative place in the alphabet of all European languages except the Russian and two or three others, as Serbian and Bulgarian: in these alphabets the symbol B holds the third place, yet it stands not for our mute B but for a labial (not denti-labial) V or W; while in the second place stands a modified form of B with the same phonetic value as our B. The Russian alphabet is derived from the scheme of the monk Cyril, one of the first evangelists of Bulgaria, who translated into the language of the Scælvanians parts of the Bible. To do this it was necessary to contrive new characters for designation of sounds alien to the Greek language and to modify existing Greek characters. But as in his time, —the 9th century,—and at a much earlier date, the current phonetic value of B was, as it still is, labial V, Cyril retained the symbol B as representing that V sound, while for the mute labial B he devised the symbol b. With this exception the character B has from immemorial time held the second place in the alphabets of all the Aryan languages of Europe, as well as in Hebrew and Arabic, Phœnician, Arabic and Greek. The most ancient form of this symbol, both in Greek and Latin, was B, with two angular loops, which were afterward rounded. The most ancient form of the symbol B among the Phœnicians was not unlike the Arabic figure ٍ, namely, ꞌ. The Greeks not only added a second loop but they reversed the position of the loop by setting it on the right of the upright stem; and they similarly transposed the loop of the Phœnician sign ꞌ, which they made P (rho, our R). The difference between the two labials B and P is that P is an absolute mute, in pronouncing which the voice is completely obstructed before the lips are drawn apart, while B is sonant, though the lips be still compressed: in the effort to pronounce B the voice is heard even before the lips are parted; but in pronouncing P no sound is heard while the lips are compressed; and when they are opened there is emission of breath but no voice. B and P substitute for each other in words common to two or more languages and in transmutations of words within one language. Examples: Latin pila is English and German ball. Bretzel is commonly pronounced Brettzel; but it is of the same origin as the English word bracelet, from Latin brachiale, an armlet, bracelet; and brezel means also handcuffs. B is nearly allied also to F. Th, V and W; thus beech (German buche) is represented in Greek by phegos and in Latin by fagus; whale is from the same source as Greek phalaina and Latin baleana; habere in Latin becomes in French avoir; caballus, Latin is French cheval; German Liebe, English love; Latin labium, French lèvre. V and B are little discriminated in Spanish and we have in one of the epigrams of Martial proof that in his day natives of Vasconia (Navarre) pronounced B as V and vice-versa when he wittily scores the bibulous habits of that people by saying that for them not without reason vivere (to live) is bibere (to drink); so that one of that nature might say vivimus ut bibamus, and the meaning would be either, we live to drink or we drink to live. In the Roman catacombs in sepulchral inscriptions of the 2d and 3d centuries of our era, vixit (lived), is in very many instances written bixit; and the name of a virgin martyr of that age is written Bibiana and that form is retained in the Roman martyrology instead of the correct form Viviana.

B is used also as a symbol and in abbreviations. In chemistry B stands for boron, one of the elements. In music B denotes the seventh or leading tone of the diatonic scale of C. In nautical charts B signifies a "blue sky." In academic degrees B is an abbreviation of Baccalaureus. See Grimm's Law; Philology; Phonetics. Consult Petrie, 'The Formation of the Alphabet' (London 1912); Prou, 'Manuel de paléographie' (3d ed., Paris 1910), and Thompson, E. M., 'Introduction to Greek and Latin Paleography' (Oxford 1912).

B. A. C., the abbreviation used by astronomers in referring to 'The Catalogue of Stars of the British Association for the Advancement of Science,' by Francis Baily, London, 1843.

BAADEr, bäd'r, Benedict Franz Xaver von, German Roman Catholic theologian and philosopher: b. Munich, 27 March 1765; d. there, 21 May 1841. He was the third son of the court physician to the Elector of Bavaria. He studied medicine at Ingolstadt and Vienna, and was graduated in 1784. He assisted his father in medicine, but soon gave up its practice to study engineering in the mining regions. He resided in England in 1791-96, and there became acquainted with rationalistic philosophy,
which did not appeal to him. He became deeply interested in the religious speculations of Eckhart, Saint Martin and Böhme, and was the intimate of Jacobi, and, for a time, of Schelling. He was appointed consulting engineer of the Bavarian mines in 1796 and soon after won a prize for his discovery that Glauber's salt might be substituted for potash in the manufacture of glass. For his valuable services he was ennobled in 1813, and was superintendent of mines in 1787–20. His 'Fermenta Cognitio' (1822–25) combats modern philosophy and advocates that if Böhme. Baeyer became professor of philosophy and speculative theology in the new University of Munich in 1826. In 1838 his opposition to Roman Catholic interference in civil matters led to his interdiction preventing him from lecturing again. He severely criticised the papacy and advocated its abolition, but recanted before his death. He is considered the greatest speculative Roman Catholic theologian of modern times and his influence has exceeded the bounds of his Catholic Church. His works on the principles of philosophy, by F. Hoffman, were published at Leipzig (16 vols., 1851–60). Consult Claassen J., 'Franz von Baader's Leben und theosophische Werke als Inbegriff christlicher Philosophie. Vollständiger, wortgetreuer Abriss in geordneten Einzelsätzen' (Stuttgart 1886–87); Welzer and Welte, 'Kirchenlexikon' (Vol. I, Freiburg 1877).

BAAL, bā-āl, a primitive title of divinities which is found among all branches of the Semitic race, originally signifying "owner" or "possessor." In its primary sense the head of the family was the bāal of the wife, the proprietor, the bāal of his field. As a title of divinity its application is entirely secondary, the bāal in this sense having the same meaning as the other, and probably the possessor also of some attribute. Baals were as numerous as the objects or places or cities which they inhabited. There were baals of springs, trees, animals, mountains, stones and sanctuaries, as well as celestial baals, baals of the sky, or one or other of the heavenly bodies, or of some atmospheric phenomenon. The belief was strong among all Semitic races, as among all primitive and ancient peoples, that every natural object that could do something, or was supposed to be able to do something, should be reverenced as divine. In Lanna and Phemicia, in Syria and south Arabia, in Asia Minor and Mesopotamia, and also among the Greeks and Romans baal-cults sprang up. Mythologists and students of comparative religions were long inclined to the view that Baal is identical with the sun-god — the Bel or Elas of the Babylonians and Assyrians. According to Hastings' 'Dictionary of Religion and Ethics,' while it is admitted that the sun was worshipped as a baal, identification of baal as the sun-god "is without scientific foundation." It is the custom in late theological abstraction, there is no such thing as a god Baal.

After the Israelites had been brought out of Egypt, and had conquered Canaan, the rural districts were chiefly occupied by the invaders, and the cities remained in the hands of the original inhabitants. In process of time race assimilation began, and with it the taking over of the local baals or gods. The domestication of baal-worship among the inhabitants is attested by the frequent words "of a certain land" adopted for the local baals as a component part of the names of towns and cities, as Baalath, Baal-meon, Baal-peor and Baal-tamar. Concurrently with Jahweh, the national god, the local baals were worshipped; indeed Jahweh appears to have been worshipped as one of the local baals. The sanctity of the land was thus endangered, the people splitting up into small communities and worshipping the local deities. The rapid development of the Philistine power awakened consciousness of this peril; the absorption of baal-worship in that of Jahweh began. When King Ahab established the worship of his wife's deity, Melkart, the baal of Tyre, Elijah took issue, thundered his denunciations of the worship of Jahweh and Melkart as mutually exclusive, and sought to free the former of its foreign elements and accretions. The Old Testament records the history of the chosen people as a series of backslidings to the local baals of the land, alternating with penitences and return to the worship of Jahweh. The prophets of the 8th and 7th centuries continued Elijah's work of purging. Jerusalem became the recognized sole sanctuary for the worship of Jahweh, and during the Persian period baal worship disappeared.

Mythologists who regarded Baal as synonymous with the sun-god, associated his worship as having prevailed through ancient Scandia, and it is supposed to have been general in the British Isles. In Ireland and in some parts of Scotland Beltain (1 May O. S.) was one of the festival days. In the former country fires were made early on the tops of the hills, and all cattle were made to pass through them. The sacrifice was supposed to guard them against disease for the year. In Sir John Sinclair's 'Statistical Account of Scotland' he describes the ceremonies observed in that country.

BAALBEK, bāl'betk, a ruined city in Syria, on the lower slope of the Antiilbanus, 3,839 feet above sea-level, 40 miles from Damascus, famous for its magnificent ruins. Irregular in form, and encompassed by a wall 2,740 feet in circumference, it was once the most magnificent of Syrian cities, and is the Heliopolis of the Graeco-Roman world. Of its ruins, the chief is the temple of the Sun, built either by Antonius Pius or by Septimius Severus; a rectangular building 290 by 160 feet. Some of the blocks used in its construction are 60 feet long by 13 thick; and its 54 columns, of which six are still standing, were 72 feet high and 22 in circumference. Near it is a temple of Jupiter, of smaller size, though still larger than the Parthenon at Athens, which has been described as "at once the most perfect and the most magnificent monument of ancient art in Syria." Standing in the village of Baalbek — now a cluster of modern dwellings — 300 yards from the other buildings, is a circular temple containing six columns in the mixed Ionian and Grecian style. The quarries from which the temples were reared are in the immediate vicinity. Originally a centre of the sun-worship, it became a Roman colony in 12 B.C. and was punished by Augustus and under Trajan acquired renown as the seat of an oracle. Under Constantine its temples became churches, but
after being sacked by the Arabs in 748, and more completely pillaged by Tamerlane in 1401, it sank into hopeless decay. The work of destruc-
tion was completed by an earthquake in 1759. The Prussian government began im-
portant excavations in 1862, that of Bandel, *Syria and Palestine*; Frauberger, *Die Akrop-
olos von Baalbek* (1802); Murray's *Hand-
book to Syria and Palestine*; Puchstein, in
*Jahrbuch des deutschen Architekologischen In-
stituts* (Berlin 1902); Führer durch die
Rupinen vor Baalbek* (Berlin 1905); Thomp-
III, New York 1886); -Wood and Dawkins,
*The Ruins of Baalbek* (London 1757).

**BAANITÉS, bā-ā-niتس. See Religious**

**SECTS.**

**BAAR, bār, a plateau in Germany, in**
Baden and Württemberg, formerly constituting a county of the Fürstenberg principalty. It com-
prises the sources of the Danube.

**BAB BALLADS, The.** The *The Bab Ball-
lads* by W. S. Gilbert, the most famous of
British light opera librettists, is one of the most popular collections of humorous and gently
satirical verses in the English language. At first published in the sixties in *Pam* and col-
clected from time to time in book form, with
additions, the ballads in their final editions con-
tain also many of the songs from such well-
known operas as *Pinafore*, *The Gondolier*,
and *The Mikado*. About 170 titles comprise
the collection, which is also enlivened by Gil-
bert's humorous drawings.

In general the humor of the ballads lies in
odd and nonsensical situations and is enhanced
by an unfailing wit and a buoyant mastery of
rhythm and meter. Good examples are such
masterpieces as *General John*, *Ferdinando
and Elvira*, *Lorenzo de Lardi*, *Babette's
Love* and the well-known *Yarn of the Nancy
Bell*. In addition to these, many of the bal-
lads are also satirical in a very mild and good-
humored way. *His feet was felly and his
weapon wit* reads the inscription on the
memorial to Gilbert, and a large number of
folies, affectations and oddities current among
his countrymen are handled in light nonsensical
verse with ridicule or indignation. Characteristic of this group are *The English-
men*, *The Disagreeable Man*, *Bob Polter*,
*The Ästhethe*, *To the Terrestrial Globe* and
*Étiquette*. The mildly satirical turn is per-
haps best illustrated in the well-known first
lord's song from *Pinafore*. *When I was a
lad I served a term,* but the satirical touch,
as well as the purely humorous attitude, is in
nearly all the poems.

**WILLIAM T. BREWSTER,**
Professor of English, Columbia University.

**BABA-MANDEB, bāb-āl-māndēb (Ar-
abic, the gate of tears), so called from the
danger arising to small vessels from strong
currents), the name of the strait between
Arabia and the continent of Africa, by which
the Red Sea is connected with the Gulf of
Aqaba, and the Alexandrian Peninsula here throws out a cape, bearing the
same name as the strait, rising to the height of
865 feet. About 20 miles distant stands the wall-like coast of Africa, rising in Rás-
Sean to the height of over 400 feet. Within

the strait, but nearer to Arabia, lies the bare,
rocky island of Perim, since 1837 occupied by
the British as a fort; its guns commanded
the entrance to the Red Sea. The strait on
the east side of this island is called the Little
Strait, and that on the west the Great Strait.

**BABA, bābā (the old), in Slavonic my-
thology, a thunder-witch (the devil's grand-
mother), represented as a little, ugly old
woman, with a monstrous nose, long teeth
and disheveled hair, flying through the sky in
an iron cauldron. By the Czechs she is called now
the iron, now the golden, Baba. It is also a
Turkish word signifying father, originating,
like our word papa, in the first efforts of chil-
dren to speak. In Persia and Turkey it is
prefix as a title of honor to the names of
ecclesiastics of distinction, especially of such
as devote themselves to an ascetic life; it is
often affixed in courtesy, also, to the names of
other persons, as Ali-Baba. A cape near the
northwest point of Asia Minor is known as
Baba.

**BABA BUDAN, bābā boōdān, a spur of
the West Ghāts, Mysore, India, extending east
for 15 miles, leaving a narrow opening at its
west end for the passage of the Bhadra, and
then south in an unbroken line for 20 miles,
enclosing between itself and the main chain of
the Ghāts a rich, but unhealthy, valley. To
this spur belong three peaks above 6,000 feet
high, among these Mulainā-giri, 6,317 feet, the
highest in the West Ghāts. On the slopes of
Kalbatti, one of these peaks, is a hill station,
a resort of Europeans during the heat.
Cooperative was first planted in India on another
part of this spur toward the close of the 17th
century, by a Mohammedan saint named Bābā
Budan.

**BABA DAGH, bābā-dāţ, Rumania, town in
the district of Tultcha, in the Dobrudja,
31 miles southwest of Ismail. It is situated in
a marshy district and has considerable
commerce with the ports of the Euxine
through the port of Kara-Herman. Sheep
are raised in the district and the wool trade is
considerable. The town was founded by
Bajazet I, who peopled it with Tatars and
named it after a saint, to whose tomb in the
neighborhood pilgrims flock annually. Pop.
about 3,000.

**ABBAGE, Charles,** English mathema-
tician and inventor of a calculating machine:
b. near Teignmouth, England, 26 Dec. 1792;
d. 18 Oct. 1871. He graduated at Peter-
house College, Cambridge. Being in posses-
sion of an independent fortune, Babbage was
in a position to devote all his time and ener-
gies to his favorite studies—mathematics and
mechanics. In 1822 we find him broaching the
idea of a difference engine, by which intric-
ate arithmetical calculations could be cor-
rectly and rapidly performed. Through the
recommendation of the Royal Society he re-
ceived, in 1823, a grant from the government
of £1,500 for the construction of such a ma-
chine. After a series of experiments lasting
eight years and the expenditure of £60,000
(£6,000 of which was sunk by the originator
of the scheme, the balance voted by the gov-
ernment), Babbage abandoned the undertak-
ing in favor of a much more complicated
work, an analytical engine, worked with cards
like the Jacquard loom. The government, alarmed at the probable demands, refused to support Babcock in his last adventure, and as a quarrel ensued with his engineer, who withdrew his tools, the pet project was never completed. The machine, along with some 400 or 500 plans, was presented in 1843 to King's College Museum, London. Among the many tracts on subjects connected with mathematics and mechanics, the most valuable and interesting are 'On the Economy of Machinery and Manufactures'; 'The Decline of Science'; and an autobiographic sketch, 'Passages in the Life of a Philosopher.' In 1828 he was appointed Lucasian professor of mathematics in his university, an office he held for 11 years without, however, delivering lectures. He was one of the founders of the Royal Astronomical and Statistical Societies.

**BABBITT, Irving**, American educator: b. Dayton, Ohio, 2 Aug. 1865. He was graduated at Harvard University in 1889 and studied in Paris in 1891-92. He was instructor in Romance languages at Williams College in 1893, and his latter year was appointed instructor in French at Harvard, becoming assistant professor in 1902 and professor in 1912. He is a member of the Modern Language Association and has published 'Literature and the American College' (1908); 'The New Loacoon' (1910); 'The Masters of Modern French Criticism' (1912). He edited Taine's 'Introduction à l'histoire de la littérature anglaise' (1898); Renan's 'Souvenirs d'enfance et de jeunesse' (1905); Voltaire's 'Zadig' (1905); and Racine's 'Phédre' (1910). He is a frequent contributor to magazines and reviews on literary topics.

**BABBITT, Isaac**, American inventor: b. Taunton, Mass., 26 July 1799; d. 26 May 1862. He learned the goldsmith's trade; early became interested in the production of alloys; and in 1824 manufactured the first Britannia ware in the United States. In 1839 he discovered the well-known anti-friction metal which bears his name. Babbit metal (q.v.) was discovered. For this discovery the Massachusetts Charitable Mechanics' Association awarded him a gold medal in 1841 and subsequently Congress voted him $20,000. Babbitt founded the well-known soap works bearing his name.

**BABBITT METAL**, an alloy of copper, tin and antimony, invented and patented in 1839, by Isaac Babbitt (q.v.) of Boston. It is soft and nearly white and is widely used as an anti-friction metal. The proportions of the constituent metals vary considerably in modern practice. Babbit's original alloy contained 24 parts of tin, 4 parts of copper and 8 parts of antimony. Many engineers prefer a larger proportion of tin and the following mixture is recommended as giving a tough and serviceable material: Tin, 90 parts; copper, 4 parts; antimony, 8 parts. Lead is also added in many cases on account of its cheapness. In small amounts it is not usually objectionable, but the Babbit metal that is sold in the market, ready-mixed, usually contains from 2 to 4 per cent of lead than its price would indicate. The alloy is usually melted and run, while fluid, directly into the bearings on which it is to be used, a space from an eighth to half an inch thick being left for it between the box and the shaft that it is to be supported.

**BABCOCK, Earle Jay**, American educator: b. Saint Charles, Minn., 11 June 1865. After considerable work with the United States Geological Survey he was appointed in 1902 director of the State School of Mines of North Dakota, professor of chemistry and geology and in 1898 dean of the College of Mining Engineering, University of North Dakota. He is the author of many special scientific articles and of geological reports.

**BABCOCK, James Francis**, American chemist: b. End, 23 Feb. 1844; d. Dorchester, Mass., 20 July 1897. He studied at Lawrence Scientific School and became an analytical chemist and chemical expert. He was State assayer and inspector of liquors in Massachusetts, 1875-85, and city inspector of milk in Boston, 1885-89. While State assayer he brought about the insertion in the liquor statutes of the definition of the term 'intoxicating liquor,' known as the 3-per-cent limit. He is the inventor of the fire extinguisher which bears his name; a popular lecturer on scientific subjects; appeared as an expert chemical witness in important trials; and published several reports on sanitation and the chemistry of food.

**BABCOCK, Maltbie Davenport**, American Presbyterian clergyman: b. Syracuse, N. Y., 3 Aug. 1838; d. New York, 11 May 1901. He was graduated at Syracuse University in 1879 and Auburn Theological Seminary in 1883. He filled most successful and popular pastorates at Lockport, N. Y., Baltimore, Md., and at the Presbyterian Church in New York. While on a visit to the Levant in 1901 he was seized with the Mediterranean fever and died in the International Hospital at Naples. A posthumous volume of his prose and verse, edited by his wife, appeared in 1901, entitled 'Thoughts for Every-Day Living' (New York 1901). Consult his life by Robinson (New York 1904) and Stone, 'Footsteps in a Parish' (ib. 1908).

**BABCOCK, Orville E.**, American military officer: b. Franklin, Vt., 25 Dec. 1835; drowned at Mosquito Inlet, Fla., 2 June 1864. He served with distinction in the Civil War, was a member of General Grant's staff and was made a brigadier-general of the regular army at the close of the war for gallant and meritorious service. When Grant was elected President, Babcock became his private secretary, and the superintendent of several important public works. He was indicted in 1876 for taking part in revenue frauds, but on his trial was acquitted.

**BABCOCK, Stephen Moulton**, American educator: b. Bridgewater, N. Y., 22 Oct. 1843. He was graduated at Williams College in 1866; studied at Rensselaer Polytechnic Institute, Cornell University and Göttingen, Germany, where he received the degree Ph.D. in 1879; and L.L.D. at Tufts 1901; instructor at Cornell 1875-77 and 1881-82; chief chemist to the New York Agricultural Department 1878; professor of agricultural chemistry, and chief chemist at the Agricultural Experiment Station,
University of Wisconsin, 1888-1913; emeritus professor University of Wisconsin, since 1913. Assistant director Wisconsin Agricultural Experiment Station 1900-13. He has given special attention to the chemistry of milk and its products, and has contributed many articles relating to dairy problems to the annual reports of the New York and Wisconsin Agricultural Experiment Stations; was awarded the Great Prize at the Paris Exposition in 1900 and also at the Saint Louis Exposition in 1904, for the milk test that bears his name. He is joint author with C. C. Caldwell of 'A Manual of Qualitative Chemical Analysis.'

**BABCOCK, Washington Irving**, American naval architect and shipbuilder: b. Stonington, Conn., 28 Sept. 1858. He was graduated at the Brooklyn Polytechnic Institute in 1876, and at Rensselaer Polytechnic Institute in 1878. He was employed at the Roach Shipyard, Chester, Pa., in 1878-85, with the Providence and Stonington Steamship Company, New York, in 1885-87, with the president of the Union Dry Dock Company, Buffalo, N. Y., in 1887-89; manager of the Chicago Shipbuilding Company. In 1889-99, becoming president of the latter in 1900. He is a member of societies of naval architects at home and abroad, and also of several clubs of professionnaires and marine architects.

**BABCOCK, Winnifred Eaton (Onoro Watanna)**. American author: b. Nagasaki, Japan, 1879. She was educated at Montreal, Canada, and at Columbia University, New York. In 1901 she was married to Bertrand W. Babcock. Since 1893 she has written many short stories for leading magazines. Her first story, 'A Poor Devil,' appeared as a serial in the *Metropolitan Magazine* of Montreal. She went to the West Indies in 1895 and worked as general writer and reporter on the *Jamaica News Letter*. Her first Japanese stories and a serial, 'The Old Jinrikisha,' appeared in *Conkey's Magazine* in 1895. She also contributed serials and short stories to the *Women's Home Companion; Good Housekeeping; The Eclectic; The Leslie Journal; Saturday Evening Post*, etc. Her published volumes include 'Miss Numé of Japan' (1899); 'A Japanese Nightingale' (1901); 'Wooing of Wistaria' (1902); 'Heart of Hyacinth' (1903); 'Daughters of Nijo' (1904); 'Love of Azalea' (1904); 'A Japanese Bonsai' (1906); 'Diary of Delta' (1908); 'Tama' (1910); 'The Honorable Miss Moonlight' (1912); 'Chinese-Japanese Cookbook' (1914), with Sara Bosse.

**BABEL, Tower of**, the name of a structure in the Plain of Shinar, Mesopotamia. According to the 11th chapter of Genesis, it was begun by the descendants of Noah subsequent to the deluge, but not allowed to proceed to completion. It has commonly been identified with the great temple of Belus or Bel, one of the chief edifices in Babylon, and the huge mound called Birs Nimrud is generally regarded as its site, though another mound, which to this day bears the name of Babil, has been assigned by some as its site. Babel means literally "gate of God." The meaning "confusion" assigned to it in the Bible really belongs to a word of similar form. See **BABYLON**.

**BABEBE, bâbèn-bèr**, a princely Franconian family, whose castle occupied the site of the later Bamberg Cathedral in northern Bavaria. They were most prominent in the wars of the 10th century. The Austrian dynasty of 970-1240 was formerly believed to be sprung from them.

**BABER, bâbèr** (or "The Tiger"), the historical surname of Zehir-ed-din-Mohammed, the conqueror of Hindustan and founder of the so-called Mogul dynasty: b. 14 Feb. 1483; d. 26 Dec. 1530. Baber was of mixed Turkish and Mongol origin, but in feeling as in personal characteristics he was a Tartar (Turk), and often in his memoirs speaks most contemptuously of Mongols or Moguls. Yet Hindu ignorance has designated the throne which he established in India as that of the Great Mogul. At the age of 12, on his father's death, he ascended the insecure throne of Ferghana in Turkestan; soon after he was attacked on all sides by his uncles and other neighboring princes, which obliged him, in his turn, to assume the aggressive. Accordingly, at the age of 15, Baber seised on Samarcand, the capital of Timour, but, while thus engaged, a revolution at home deprived him of his sovereignty. After many years of an adventurous and romantic career, he raised an army, entered Hindustan, and was met by Ibrahim, the ruling Sultan of that country. The two armies fought the battle of Paniput, which decided the fate of India, on 21 April 1526. Baber, with his army of 12,000 men, completely overthrew that of Ibrahim, numbering 100,000, and entered Delhi in triumph. Difficulties and fresh foes had still to be encountered and mastered but in the battle of Saki, in February 1527, Baber utterly defeated the opposing Hindu princes, and then proclaimed himself Padishah, or Emperor of Hindustan. Brilliant as a military leader, he was also an enlightened ruler, introduced important reforms in his dominions and had a taste for science and art. Consult his own 'Memoirs' translated by Leyden and Erskine (London 1844), and 'Lives' by Caldecott (London 1844) and Lane-Poole (London 1889).

**BABES IN THE WOOD, a nursery tale and ballad of unknown origin, found in Percy's 'Reliques' and other collections. Two children are left to perish in the forest by a relative who hopes to profit by their death. See **CHILDREN IN THE WOOD**.

**BABEUF, bâ-bèf**, or **BABGUFS, François Noël**, French communist, who called himself Caius Gracchus: b. Saint-Quentin 1760; d. 28 May 1797. He founded in Paris a journal called the *Tribune of the People* (1794), in which he advocated his system of communism, known as Babeuvism, and contemplating absolute equality and community of property. His followers were called Babouvists. Betrayed in a conspiracy against the Directory, aiming to put his theories into practice he was guillotined in Paris. His principal works were 'Perpetual Register of the Survey of Lands' (1790), and 'Of the System of Populism' (1794). See *Advielle, 'Histoire de Babeuf et du Babouvisme'* (1884).

**BÂBÎ, bâ-be**, the name of a modern Persian sect, derived from the title, Báb-ed-Din (gate
of the faith), assumed by its founder, Mirza Ali Mohamed, a native of Shiraz, who in 1843 undertook to establish a new religion from a mixture of Mohammedan, Christian, Jewish and Parsee elements. His controversies with the mollahs shortly led to his confinement to his own house, where he formulated his doctrine, and constructed his disciples and increased his pretensions. The sect soon became numerous; but on the accession of Nasir-ed-Din in 1848, apprehending persecution, they took up arms, proclaiming the advent of the Báb as universal sovereign. The insurgents were reduced by famine, and most of them executed (1849–50). The Báb had held aloof from the revolt, but was arrested and put to death, after a long imprisonment, in 1850. His successor was recognized in the youthful son of the governor of Teheran, who retired to Bagdad, where he afterward lived quietly. An attempt of three believers to assassinate the Shah, in 1852, led to a persecution of the sect; numbers were tortured and burned, among them Qurratu’ll-’Ayn, who at present widely diffused in Persia; its members live in apparent conformity to orthodox Mohammedanism, but privately holding in Báb’s doctrines, which are contained in an Arabic treatise, ‘Bâyán’ (the exposition), written by the founder himself. They form essentially a system of Pantheism, with Gnostic and Buddhist additions. All beings are emanations from the Deity, by whom they will ultimately be reabsorbed. Bábism enjoins few pious acts, and those only on fixed occasions; encourages hospitality and charity; prohibits polygamy, concubinage and divorce; discourages asceticism and mendicancy; and directs women to discard the veil, and share as equals in the intercourse of social life. (See BABISM.) Consult Andreas, ‘Die Babisten in Persien’ (Leipzig 1896); Browne, ‘A Traveller’s Narrative’; Written to Illustrate the Episode of the Báb (Cambridge 1892); Behzadullah, ‘Les Preceptes du Béhaism’ (Paris 1920); Hatcher, ‘La religion de Báb’ (ib; 1889); Dreyfus, ‘Essai sur le Béhaism’ (ib; 1909); Mirzá Huseyn, ‘Le Béyân arabe le livre sacré du Babysme’ (Paris 1905); Phelps, ‘Life and Teachings of Abbas Effendi’ (New York 1903).

BABINGTON, Anthony, English Roman Catholic conspirator: b. Dethick, Derbyshire, 1561; d. 20 Sept. 1586. His father died when he was 10 years of age, leaving him ample estates. He founded in 1580 a society for the protection of the Jesuit missionaries in England, and served for a time as page to Mary Queen of Scots, then a prisoner in England. With Ballard, a Jesuit, and other Catholic emissaries, he planned, in 1586, a plot for the murder of Queen Elizabeth, the rescue of Mary and the re-establishment of the Catholic religion in England. In the working out of the plot Babington behaved with indiscretion prompted by his vanity; he sent letters to Mary, and supplied the money to put them into execution. He was apprehended at the plot. Walsingham, Elizabeth’s secretary, by means of his spies, had all the correspondence of the conspirators intercepted, copied and sent on to their destinations. Then at the Richmond Review the conspirators were arrested and brought to trial, and among others Babington was executed. Babington’s correspondence with Mary in the subsequent trial of that Princess, directly led to her execution in February 1587.

BABINGTON, Churchill, English philologist: b. Leicestershire, 11 March 1821; d. 12 Jan. 1889. He was educated at Saint John’s College, Cambridge, and was Disney professor of archaeology there in 1865–80, and was rector of Cockfield, Suffolk, from 1886 until his death. He was a botanist and ornithologist of high repute, wrote also on archaeology and numismatics, and contributed largely to Smith’s Dictionary of Christian Antiquities.

BABINGTONITE, a native, anhydrous silicate of calcium, iron and manganese, associated with an iron silicate having the composition Fe3(SiO4)2. It is greenish-black in color, with a vitreous lustre, and crystallizes in the triclinic system. It occurs in Norway, Italy, and the British Isles, and in the United States has been found at Gouverneur, N. Y., and at Athol, Mass. Its hardness is 6, and it has a specific gravity of about 3.36. The mineral was named after Dr. William Babington.

BABIRUSSA, bā'ī̄-roo'sa, a wild hog of the East Indies, remarkable for the long, exposed, canine teeth of the male. The upper tusks, instead of growing downward in the usual way, turn and grow upward through the skin on each side of the snout and curve backward until, in old animals, they may be 8 or 10 inches long, and reach nearly to the eye. These hogs, which inhabit Celebes and Borneo, are almost hairless, long-legged and active, and feed upon fallen fruits instead of rooting in the ground. One cannot see that the great tusks are of any present use, but Wallace suggests that they were useful to the ancestors of these pigs under different conditions, and were then kept worn down by service.

BABISM, bā'īzəm. See BABI.

BABOO, bā'boo, or BABU, a Hindu title of respect equivalent to Sir or Mr. It is usually given to wealthy and educated native gentlemen, especially when of the mercantile class.

BABOON, bā'bōon', a large, long-haired, terrestrial monkey of Africa or Arabia, belonging to the genus Cynocephalus. All are of large size, have elongated, blunt muzzles, with nostrils at the extreme end, and great canine teeth which together give the face, when seen in profile, a dog-like aspect. The naked parts of the face, as well as the great callosities upon the buttocks, are often brilliantly colored. Some also have shaggy manes, and all add to their repulsive appearance a fierceness of disposition which makes them more feared than perhaps necessary, for they rarely, if ever, have attacked human beings. All of the species go about in troops under the guidance and protection of several old males. They are rare in wooded regions, preferring rocky and bushy districts, like those in northern Africa, in Arabia and in southeastern Africa. As their fore and hind limbs are of nearly equal length, and very stout, they go mostly on all fours, galloping swiftly and climbing rocks with agility. They climb trees with great difficulty and generally keep on the ground away from forest regions. Their food is principally vegetable—fruits, berries, young sprouts, etc.; but they also eat
insects, worms, snails and such young birds or small animals as they are able to catch. They do great damage to the plantations of the native Africans, ruthlessly spoiling much more than they are able to eat. The ancient Egyptians seem to have trained them to pick fruits, but within recent times their confinement in menageries, where they live and breed without the restraint of their domestication. There is nothing attractive about any of them, either in appearance or disposition.

Among the best known is the great Arabian or sacred baboon, or hamadryad (Cynocephalus hamadryas), the one represented upon Egyptian monuments, and venerated by the primitive Egyptians. It is supposed that their habits of noisy activity at sunrise, as though adoring the sun-god, is the basis of this very ancient form of worship. Mummies of baboons are commonly found in tombs in the Nile Valley; and the species itself is still abundant from the Sudan to southern Arabia. It is ash gray in color, and has a heavy mane. The great baboon of South Africa, common in the wilder mountains, is the chacma (Cynocephalus porcarius), which is dark-brown and has long hair but no mane, and a tail about half the length of the body, terminated by long, black tufts. This is the one most commonly seen in menageries. The mandril (Cynocephalus rutilus) is still larger, exceeding a mastiff in size. It has short legs, a mere stump of a tail and an enormous head, with a crest of greenish hair upon the forehead, and a beard which is orange-yellow; while the naked parts of the face consist mainly of a huge nose, light blue in color, the skin of which is folded into ridges. The naked buttocks are bright scarlet. This ugly brute is one of the most ferocious and justly dreaded animals of the Kongo forests. In the same region lives a second similar species called the drill (Cynocephalus leucopus), which differs mainly in lacking the bright colors and ribs of the nose of the mandril. Several other baboons live in west Africa, but are not well known, although one reddish-brown species, the Guinea baboon (Cynocephalus sphinx) is commonly seen in the hands of showmen. A large monkey of southern Abyssinia, looking like a black, clipped French poodle, is to a substantial degree of a true baboon, although it belongs to another genus; it is the gelada (Theropithecus gelada). Consult 'Cassell's Natural History,' Vol. I (1885); Elliot, 'A Review of the Primates' (New York 1913).

BABRIUS, a Greek fabulist whose fables in verse are variously referred to the time immediately preceding the Augustan Age, and to the 3d century of our era; his name also shows variants, as Babrias, Gabrius. Till 1842 only a few fragments of Babrius were known to be extant; but in that year, in the Laura of Mount Athos, was discovered a manuscript containing 123 of his fables, now in the British Museum. In 1846 Sir George Cornewall Lewis published them together with the pre-existing fragments, and in 1859 or 1860 appeared a good English translation. The fables were evidently from the same hand, were discovered by Knöll in 1877, and by Van Assendelft in 1891. The fables have also been edited by W. G. Rutherford (London 1883) and by Crusius (Leipzig 1897). Consult Conington, 'Miscellaneous Writings' (Vol. II, London 1872); and Fusci, 'Babriano' (1901).

BABSON, Roger Ward, American statistician: b. Gloucester, Mass., 6 July 1875. He was educated at the Massachusetts Institute of Technology. He founded the Babson Statistical Organization of which he was president. It has branch offices in New York, Philadelphia, Chicago and London. He is publisher of 'Moody's Manual of Railroad and Corporation Securities,' vice-president of the Gloucester Safe Deposit and Trust Company, and lecturer on statistics and economics at the Massachusetts Institute of Technology. He is special writer for the Curtis Publishing Company, the New York Times and other periodicals. He has published 'Business Barometers' (1909); 'Selected Investments' (1911); 'Bonds and Stocks' (1912); 'Commercial Paper' (1912), with Ralph May; 'The Future of the Working Classes' (1913). He is a fellow of the Royal Statistical Society of London and member of the executive committee of the American Economic Association.

BABUYANES, ba'boo-yân'ez, or MADJOSIMA ISLANDS, a number of islands lying about 30 miles north of Luzon, and generally considered the most northern of the Philippines. The chief islands are Kamiguin, area 63 square miles; Babuyan Clare, 38 square miles; Calayán, 30 square miles; Fuga 21 square miles; and Dalupiri, 20 square miles. Pop. about 12,000.

BABYLANS or BABYLUS, Saint, a bishop of Antioch between 237 and 250. He declined to admit to public worship the Emperor Philip, who had murdered his brother Gordianus in order to gain the throne. In the Roman calendar his day is celebrated on 24 January; in the Greek on 4 September.

BABYLON. See BABYLONIA.

BABYLON, N. Y., village in Suffolk County, Long Island, 37 miles east of New York on Great South Bay, here crossed by steam ferry to Fire Island and Oak Island Beach, and on the Long Island Railroad; popular as a summer resort on account of its fine beach, and as a rendezvous for sportsmen by reason of its opportunities for fishing. The surrounding region is adapted to general farming. Pop. 2,650.

BABYLONIA. Discoveries of the recent decades seem to confirm the idea that Babylonia was the cradle of civilization. The country, which is nearly enclosed by the Tigris and Euphrates from Bagdad to the Persian Gulf, is bounded on the north by Mesopotamia; on the east by the plain of Elam; on the south by the Persian Gulf; and on the west by the Arabian desert. It constitutes the largest portion of the country now known as Irâq el Arabi. A considerable part of this alluvial plain has been made through deposits by the river. This landmaking process continues at the present time at the rate of about 70 feet per year.

At one time the plain was watered with a complicated network of canals which carried agricultural prosperity to every part of the land. The neglect of these has changed the conditions of the country so completely that instead of a fertility which was once the wonder of the
ancient world, a cheerless waste now greets the eyes. Some months of the year the country is partially covered with swamps and marshes, while the remaining portion is a desolate plain.

Here and there throughout the land are to be seen mounds of debris, every one of which covers the remains of a long forgotten civilization. About the middle of the last century a number of English explorers, Loftus, Layard and Taylor, visited the ruins of some of the important cities. Through their tentative investigations Niffer (Nippur), Warka (Ur or Erech), Senkera (Larsa), Mugayyar (Ur), Abu Shahrain (Eridu), besides Babylon, Borsippa and other cities were located. A few decades later Rassam, also an Englishman, discovered that the ruins known as Abu-Habba represented the ancient Sippara; and decided definitely also that Tell Ibrahim was Kutha (Cutha). The ancient names of most of these cities were known through the Old Testament. For excavations see Assyriology.

The inhabitants of the country, which was known in the early period as Shumer (Biblical Shinar), are called Sumerians. These Sumerians spoke an agglutinative tongue which belongs to that great unclassified group of languages known as Turanian.

Clay was principally used as their writing material. The impression made by the stylus upon the soft clay has the appearance of a wedge, for which the Latin word cuneus is used; hence cuneiform writing. See Assyriology.

Through other sources, particularly the Babylonian duplicates found in Asurbanipal's library at Nineveh, considerable is known concerning the literature of the Babylonians. Notably might be mentioned the Creation and Gilgamesh epics, the Deluge story, which resemble the Biblical accounts; Ishtar's descent into Hades; the Etana legend; Adapa and the South Wind, etc. Here properly should be mentioned also the codes of laws upon which the decisions of the kings and judges were made, particularly the code of Hammurabi (Amraphel, Gen. xiv), discovered by the French, in Susa, under de Morgan. It consists of 282 laws written on a stele which stands about seven feet high. This had been carried away by the old national enemy of Babylonia, the Elamites. Very extensive also is the knowledge of the customs and manners of the people gained through the thousands of contract tablets dated in the reigns of kings of all periods. Practically every kind of legal and domestic contract imaginable, mortgages, deeds of sale, promissory notes, guarantees, etc., the archives of business firms, notably the Egihi House of Babylone, and the Murashu Sons of Nippur, have been found. Most valuable for the decipherment of the inscriptions have been the syllabaries, or sign lists, in which the different values of characters are given. Commentaries; lists of gods, names, places, temples, animals, stones, etc.; incantations, hymns, penitential prayers, are included among the tablets discovered.

The earliest inscriptions reveal a polytheism in a developed state. Most of the gods have Sumerian as well as Semitic names. Until the religion of the Sumerians, or of the Semites, non-Sumerian, comparative knowledge is better known, it will be impossible to ascertain with which people the different gods and religious conceptions originated. The pantheon, which was practically different in every period of Babylonian history, is exceedingly large. Some of the gods mentioned most frequently in the inscriptions are: Anu, Bel and Ea, the important trinity of the early period; Merodach, Shamash, Sin, Ishtar, Nergal, Nebo, Nusku, Ninib, Gula, etc.

Each city had its temple, which was dedicated to some particular god; for example, Ekur, at Nippur, was sacred to Bel; Esagila, in Babylon, to Bel, and Merodach. In addition to the patron deity, shrines to other gods were found in each sanctuary. At Nippur, besides Bel, 24 other gods were worshipped, for whom shrines were set up within the temple precincts. Through the researches of Professor Hilprecht in the trenches at Nippur, and in connection with the inscriptions discovered, the real conception of a Babylonian temple and its tower is made known for the first time. The temple had an inner and outer court, both of which were nearly square, the latter being somewhat smaller than the former. The prominent feature of the temple architecture was the zigurat, or storied-tower, which occupied nearly one-third of the area of the inner court. In close proximity to the tower stood the temple, where the sacrifices were offered. The zigurat consisted of quadrangular platforms, one superimposed upon the other, on the top of which was to be found the shrine. The number of platforms varied according to the period and ability of the builder. In the 3d millennium B.C. the number generally appears to have been three. The zigurat had its origin in the earliest pre-Semitic period, when it was regarded as the tomb of the god. At that time it was the central feature of a fire-necropolis, or cemetery. The Sumerians cremated their dead. In an early stratum at Nippur one of their crematoriums was found. The remains of the incineration were placed in jars, thousands of which were found buried around the zigurat. It is not known what the Semites did with their dead, but when they became the dominant people of the land the conception of the temple and zigurat seems to have been changed, for thereafter no shrines are found within the courts of the temple.

In their cosmology the Semitic Babylonian conception of the earth was a mountain over which the god Bel ruled. This they believed extended down into Ea's region (subterranean waters), and also that it reached up into that of Anu (Heaven). They regarded the zigurat as symbolic of the earth, the dominion of Bel. In their inscriptions, therefore, concerning the building or restorations of their towers, the following expression is properly found: *I laid the foundations of the zigurat in that breast of the earth and built it up so that its head was in the heavens* (compare the story of Babel, Gen. xi), thus showing that the zigurat was a representation of Bel's kingdom, the earth.

In connection with the temple library at Nippur a school or department of instruction was found. Within its rooms were discovered textbooks, and exercises of the students. At Sipara a school similar in character also existed. The combined excavations of all important Babylonian cities will doubtless bring to light a

BABYLONIAN EXILE, or CAPTIVITY. It seems to have been parts of the state of the ancient Assyrians to remove the people of conquered nations and plant them in unoccupied parts of the dominion, as far distant as possible from the home country of the victims. This custom grew out of civil and geographical conditions. The degree of national intercourse requisite for maintaining a proper ascendancy over the subjugated nation could not be maintained if they were allowed to remain in their own land. Consequently, deportation was necessary—a process which has come to be designated in our language by the word captivity. Anciently, deported nations were not treated with that cruelty we are in the habit of associating with the captive. The ancient Assyrians took specially to be treated in this article, demands the preceding remarks in order to aid in a proper understanding of the frequent notices we find in the Scriptures of the consequence to which these people attained in their foreign residences.

There are two Babylonian captivities of the Jews, having their beginning at different times, although their endings were synchronous. In the civil dissensions following the death of Saul and culminating at the death of Solomon, the tribes north of the mountains of Ephraim and those east of Jordan separated from the rest, leaving Judah and Benjamin in the naturally fortified province of the south. To the north of the revolted tribes lay the kingdom of Syria, then powerful and extensive. They had an old feud with Israel before even David had made Damascus, the Syrian capital, tributary to himself. Rezon had regained the city under Solomon, but was an adversary to Israel in the days of Solomon. The attention of Syria was turned by the defenseless condition of the revolted tribes. They had no longer the fortifications and fastnesses from which David had saluted forth to the northern plains at the foot of the Assyrian. The skin of Judah, meanwhile, made a treaty, in the reign of Asa, her third King, with the Syrian power, who, by his counsel and stratagem, had been induced to break a former league with Israel. How Judah also, during a few years from the north, had built two new fortifications in the passes of Benjamin (Geba and Mizpah), and used all her arts to keep herself in favor with Syria and on the other hand turned her pampered ally against the revolted and unprotected tribes at the north, Israel, tired at length of the continual exposures to Syrian invasion and exasperated at the imminence and prosperity of the rival Judah, formed a conspiracy with Syria (during the reign of Pekah in Israel and Ahaz in Judah) against her southern antagonist. In the emergency Judah appealed to the Assyrian power and Tiglath Pileser came against Israel (733), carried captive a portion of its inhabitants, and then marched upon Pekah in their name. In 724 B.C. Sargon, who had succeeded his father, subdued its capital and absorbed it into the Assyrian empire, from which it reappears only in the time of Alexander the Great. The successor of Pileser, exasperated by an attempted conspiracy of Hoshea, the semi-King of Egypt, took Samaria and subdued Israel to a tributary relation, taking away to Babylon the people whom Pileser had left in the first deportation. Thus was accomplished the first captivity of the numerically most powerful branch of the divided house of Israel (721 B.C.). They were first in the subjugation to foreign power from purely geographical considerations.

A little more than a hundred years after, Judah, from her mountain fastnesses, followed Israel into the Assyrian empire, in the second great Babylonian captivity. Disregarding some chronological differences, Judah seems to have been progressively carried into captivity, like Israel, by at least two, and perhaps three successive deportations. The first was 598 B.C., and was probably made with the direct object of colonizing the city of Nineveh, which the Assyrian monarch was then endeavoring to restore. The second was in the reign of Zedekiah. Judah had for three successive reigns been heavily tributary to Assyria. Zede-
kiah rebelled against the tribute and, like Israel, further exasperated her master by call-

ing upon Egypt in her extremity. In revenge, Nebuchadnezzar burnt the temple and city, put out the eyes of Zedekiah and led away the people to Babylon, and so ended the Jewish kingdom (588 B.C.). When, 70 years after the second captivity, the permission to return was given, only a very small part of the Jewish people were in a condition to desire a removal, having become thoroughly naturalized in their foreign dwellings; and even if they had desired it, it would have been only a return to a Medo-Persian satrapy, not to the glory of their ancient kingdom and temple-worship. See DANIÉL; NEBUCHADNEZZAR.

The term 'Babylonian Captivity' is frequently applied by writers of Church history to the residence of the Popes at Avignon for nearly 70 years.

BACA, The Valley of, a vale through which the pilgrims had to pass on the way to Zion (Ps. 84:6). It has been variously identified with the Valley of Acher, the Valley of Rephaim and with a Sinaitic valley of a similar name. The name in Ugaritic is a conjecture, the last station on the caravan route from the north to Jerusalem. Biblical criticism is uncertain as to whether the Valley of Baca is a real place or only used as an emblem of life intended to teach the lesson that perseverance and trust not only overcome difficulties but turn them into blessings.

BACACAY, ba-ka'ki, Philippines, a town in the province of Albay, Luzon island. It is situated in the Gulf of Albay. Pop. about 15,000.

BACALAO, ba'ka-lo'. See Cod.

BACARRA, ba-ka'ra, Philippines, a town of Luzon in the province of Ilocos Norte. Pop. 14,800.

BACCANARISTS. See JESUITS.

BACCARAT, ba-ka'ra', a town of France, in the department of Meurthe-et-Moselle, 10 miles by rail southeast of Lunéville, having the most important plate glass works in France, established here in 1765. Pop. (1911) 7,277.

BACCARAT, a game of Italian origin played with ordinary playing cards; very simple in details and freer from complications than most games at cards. Any number of players may participate and as many packs of cards may be used as necessary, the number being increased to correspond with the number of players. The member of the party selected to act as banker deals out the cards from a box, after they have been shuffled. The face cards in all countries except America, where the face cards and tens have no value and the naturals are 8 and 9, count 10 and the others according to the number of spots. After the bets have been made, the banker deals two cards to each of the players, including himself, but the other players must receive their cards before the banker is served. The aim of players is to make the numbers 9, 19, 29, or as nearly those as possible, as 8, 18 and 28. Any player is at liberty either to "stand" or to be "content" with the two cards at first dealt or to call for more, at the risk of exceeding 29, when his stake is forfeited to the dealer. If, after the first distribution of two cards to each, any player has a "natural,"—that is, a sum making, or next in value, 19,—he declares it wins and the banker pays all who hold superior hands to his own and claims from those holding inferior hands. The money separately, there being, in fact, as many separate games in progress as there are players and the spectators may wager their money on any one of them, all of which must be accepted by the banker. Prior to the banker making his count, he designates the money as belonging to the bank. Any one sitting down at the table has the right to call the whole of the bank, selecting the left or the right on which to pick up the cards. Previous to the banker dealing the cards, it is the duty of two counters, one on the right and the other on the left, to count up the stakes deposited on either side and then make up the bank. Thus the banker knows, to the smallest coin, the exact amount of his liabilities.

BACCHANALIA, bák'ka-ná'il-á, feasts in honor of Bacchus, or Dionysos, characterized by licentiousness and revelry and celebrated in ancient Athens. In the processions were bands of Bacchantes of both sexes, who wandered about rioting and dancing in fawn skins, crowned with ivy and bore in their hands thyrsis, that is, spears entwined with ivy, or having a pine cone stuck on the point. These feasts passed from the Greeks to the Romans, who celebrated them with still greater dissoluteness till the Senate abolished them, 186 B.C. See BACCHUS.

BACCHANTE, bák-kán'té, a person taking part in revels in honor of Bacchus. The name of several British warships.

BACCHIGLIONE, bák'ke-lo'nyen, a river of northern Italy. It rises in the Alps, passes through the towns of Vico, and descends through Padus and enters the Adriatic near Chioggia after a course of about 90 miles.

BACCHUS, bák'kus, or DIONYSOS, the god of wine. His history is one of the most perplexing in the Greek mythology. Semele was pregnant with him by Zeus, but became a victim of the craft of Hera. Zeus hastened to save the unborn fruit of his embrace and concealed it till mature in his own thigh. He afterward committed the infant to Hermes, who carried him to the nymphs of Nysa in India, where he grew and prospered. His teacher was Silenus, afterward his constant companion.

In the vales of Nysa Bacchus invented the preparation of a beverage from grapes and taught the planting of vines. To spread the knowledge of his invention he traveled over almost the whole known world and received in every quarter divine honors. Drawn by lions he began his march, which resembled a triumphal pomp, with a great suite of men and women, Silentiarii, possessed by the presence of the god, rejoicing, brandishing the thyrsus and crowned with vines and ivy, they danced around him, shouting "Evos! Elevati" over hill and valley, accompanied by the tones of Phrygian flutes and timbrels. The Thébans would not acknowledge his divinity and Pentheus armed himself against him. Bacchus resolved to punish the crime and inspired the women with a fury which drove them from their dwellings to wander on Mount Citharon. Pentheus himself was torn in pieces by his own mother and her sisters, to whom he appeared a wild beast. Bacchus punished the daughters of Myrias, who derided his feasts, with frenzy and transformation. At Nysa some Tuscan sailors attempted to carry him off to Italy, supposing him from his purple robe to be the son of a king. They fettered him; but the fetters fell off, vines and ivy entwined the vessel and kept it fixed in the midst of the sea; darkness transformed himself to a lion and the seamen, seized with madness, leaped into the waves, where they were changed into dolphins. On the other hand, he rewarded such as received him hospitably and rendered him worship, as, for instance, Midares, who restored to him the faithful Silenus.
BABOONS

1 Bearded Ape (Cynocephalus silenus)
2 Chacma (Cynocephalus porycius)
3 Tufted Baboon (Cynocephalus niger)
4 Hamadryad (Cynocephalus hamadryas)
5 Gelada (Cynocephalus gelada)
6 Mandrill (Cynocephalus mormon)
His love was shared by several, but Ariadne, whom he found deserted upon Naxos, alone was worthy of his love and became a sharer of his immortality. To confer the same favor on his mother, Semele, he descended into the realms of Pluto and conducted her to Olympus, where she was henceforth called Thame. In Thessaly, Titon bore with the giants he fought heroically and saved the gods from impending ruin. During the rejoicing for victory Zeus joyfully cried to him, "Evan, evo!" (Well done, my son!), with which words Bacchus was afterward usually saluted. We find him represented with the round, soft and graceful form of a maiden rather than that of a young man. An ornament peculiar to him is the tiara. His long waving hair is gathered behind in a knot and wreathed with sprigs of ivy and vine leaves. He is usually naked; sometimes he has an ample mantle hung negligently round his shoulders; sometimes a fawn skin hangs across his breast. The earlier bearded Bacchus is probably of Persian or Egyptian origin. His head is sometimes shown with small horns (the symbol of invincible force). In his hand is borne a thyrsus, or a drinking cup. The bull, panther, ass and goat were symbolically associated with this god.

The feasts consecrated to Bacchus were termed Bacchania, Dionysia, or in general orgia. They were celebrated with peculiar solemnity in Athens, where the years were universally reckoned by them and during their continuance the least violence toward a citizen was a capital crime. The great Dionysia were celebrated in spring. The most important part of the celebration was a procession representing the triumph of Bacchus. This was composed of a train of Bacchantes of both sexes, who were masked, clothed in fawn skins, crowned with ivy and bore in their hands drinking cups and rods entwined with ivy (thyrsi). Amidst this mad crowd marched in beautiful order the deified bodies of the maenads (dancers) and their sacred goats. They bore upon their heads consecrated baskets, which contained first-fruits of every kind, cakes of different shape and various mysterious symbols. This procession was usually in the night-time, and was devoted to spectacular and other recreations. At a very early hour they went to the theatre of Bacchus, where musical or dramatical performances were exhibited. These, known as the inventor of tragedy, is said to have introduced into the Bacchic performance an actor who carried on a dialogue with the corphrasos (leader) regarding the myths narrated of Bacchus or some other divinity. The chorus, surrounding its leader, stood on the steps of the altar of Bacchus, while the actor occupied a table. Some regard this as the origin of the stage. The vintage festivals in rural districts were celebrated by Bacchic processions, ruder in form than those of Athens, but characterized by the same ceremonial and ribaldry. Coarse ridicule of individuals was a marked feature of these occasions. In the course of time the mysteries celebrated became occasions for intoxication and gross licentiousness. The Bacchus, stated to have been aYT about 200 B.C., and at first were celebrated by women only. Later men were admitted, evening cele-

bulations introduced and celebrations held frequently instead of only three times in the year as at first. Gross immoralities were practised and finally in 186 B.C. the Senate ordered the arrest of the priests and forbade further meetings in Italy. Consult Senatus Consultum de Bacchanalibus in Corpus Inscriptionum Latinarum; Frazer, The Golden Bough (1913); Farnell, 'Cults of the Greek States' (Vol. V, Oxford 1910); Gruppe, O., 'Griechische Mythologie und Religionsgeschichte' (Vol. II 1907).

BACCHUS AND ARIADNE, a painting by Titian (1523). It is founded on the Greek story of the appearance of Dionysus, the father of Theseus. It represents Ariadne in a background of sedge and ocean turning away as the leopard-drawn chariot descends, bearing the god and surrounded by satyrs. The picture hangs in the National Gallery, London.

BACCHYLIDES, bák-kīl'i-dēz. Greek poet who flourished about 470 B.C.; a native of Iulis, a town on the Island of Ceos. He was a nephew of the still more famous lyric poet Simonides, with whom he remained for some time at the court of Hiero I in Sicily. He traveled also in the Peloponnesus and is said to have been a rival of Pindar. Until recently this poet was known to the modern world only in fragments of beautiful versification. In 1895, however, a well preserved text was discovered and published by Baccyllides has now taken permanent place as a master of Greek verse. He was master of a style at once per

BACCIOCCI, bā-ch'yō'kē, Felice Pasquale, Corsican captain: b. Corsica, 18 May 1762; d. Bologna, 27 April 1841. In 1797 he married Maria Elisa Bonaparte. In 1805, when Napoleon made his sister Princess of Lucca and Piombino, Bacciocci was crowned with his wife. After the Emperor's fall he lived quietly and in reduced circumstances at Bologna.

BACCIOCCI, Maria Anna Elisa Bonaparte, the eldest sister of Napoleon Bonaparte: b. Ajaccio, Corsica, 1777; d. 7 Aug. 1820. She married Felice Bacciocci and was created by her brother in 1805 Princess of Lucca, Piombino Massa and Carrara and in 1809 Grand Duchess of Tuscany. She shared her brother's fall and spent her last years in Austria, living on her estate near Triebe. Her only son died in 1833 and her only daughter, the Countess Camerata, in 1869.

BACH, bāch, Alexander, Baron, Austrian statesman: b. Loosdrecht, 4 Jan. 1813; d. 13 Nov. 1892. He was Minister of Justice during the troublous period in 1848; of the Interior in 1849-59; and subsequently Ambassador to Rome. In 1855 he negotiated the concordat between Austria and the Roman Church. In 1859-67 he was Ambassador at Rome. As a minister he was an opponent of liberalism and in favor of a strong centralizing policy.

BACH, Heinrich, German musician: b. 16 Sept. 1615; d. 10 July 1691. He was the father
of Johann Christoph and Johann Michael Bach; organist at Arnstadt.

**BACH, Johann Christian**, German musician; b. Erfurt 1640; d. 1682. He was a son of Johannes Bach, the great uncle of Johann Sebastian Bach.

**BACH, Johann Christian**, German musician; b. Leipzig 1735; d. 1782. He was a son of Johann Sebastian Bach and was organist in the Cathedral of Milan 1760-62. From the latter year he resided in London and became music master to the Queen. From his residences at Milan and London he is called the Milanese and the English Bach. The elegance and brilliancy of his pianoforte compositions made him the favorite of amateurs in that instrument; but only in his masses and *Te Deums* are to be heard echoes of the musical genius of his family. Consult M. Schwartz, "Johann Christian Bach" (Leipzig 1900).

**BACH, Johann Christian Friedrich**, German musician; b. Leipzig 1732; d. 1795. He was a son of Johann Sebastian Bach and was for a long period music master to Count Schauburg at Bückeburg.

**BACH, Johann Michael**, German composer and instrument-maker; b. 1648; d. 1694. He was a son of Heinrich Bach and the father-in-law of Johann Sebastian Bach.

**BACH, Johann Sebastian**, German musician and composer; b. Eisenach, 21 March 1685; d. Leipzig, 28 July 1750. Bach was the most profound and original musical thinker the world has ever seen. He is the master of masters; from him most of the great composers have drawn inspiration. When Mozart heard one of his pieces at Leipzig, in 1788, he exclaimed: "Thank Heaven! here at last is something new that I can learn from. Not Bach (brook) but 'Ocean' should be his name," Beethoven exclaimed. Mendelssohn made enthusiastic efforts to revive the interest in Bach. Schumann helped to found the Bach Society and urged students, if they would become thorough musicians, to make Bach their daily bread. Chopin confided that before giving a concert of himself up a fortnight without the view of anything but Bach to play. Franz devoted a great part of his life to adapting this master's works for use in modern concert halls. Liszt and Rubinstein adored and played him. Wagner, as he grew older, played Bach more and more; his vocal compositions he pronounced the most perfect ever written; and he said that the proper interpretation of them was the noblest task of contemporary musicians. The only dissenting voice in this chorus of praise was that of Berlioz but, as Saint-Saëns (one of the principal worshipers) has pointed out, this was due solely to the fact that Berlioz was not familiar with the works of Bach. His pre-eminence is the more remarkable when we remember that he was born as early as 1803; bu it seems perhaps a trifling less astonishing when we bear in mind that Johann Sebastian inherited the accumulated musical gifts of a long line of ancestors. "Throughout six generations," says Forkel, "there were hardly two or three members of the family who were not inherit a natural talent for music, and make the cultivation of this art the principal occupation of their life." For more than a century there were so many representatives of this widely-scattered family that in one place, at any rate (Erfurt), town musicians came to be called "Bachs," even when that family did not happen to be represented among them. After the culmination had been reached, however, in Johann Sebastian, the family-tree came to an end, although some of his sons play a quite considerable rôle in musical history.

At the age of 10, Johann Sebastian was left an orphan, in care of his older brother, John Christoph, who appears to have had little of the boy's musical gifts. Christoph had got together a collection of the best German organ music of the time, which Sebastian was very eager to get at and study. Denied access to it, he managed to smuggle it into the garret, where, for six months, he busied himself making a copy of it on moonlit nights. But the brother at last discovered his secret and took away from him both the copy and the original. This is only one instance of many showing how Sebastian developed his music, and was to be found in himself in all obstacles. Several times he went on foot to Hamburg—a distance of 25 miles—to hear the famous organist Reinken; subsequently he made a similar trip to hear the illustrious organist Buxtehude. This happened when he himself was already busy as organist and choirmaster at Arnstadt. Previously to that he had, as a boy, helped to support himself by joining a choir of boys who sang at funerals and weddings, as well as in church and in the street. He missed no chance to practise on the violin, the organ and the piano—or, rather, the harpsichord and clavichord, which were the predecessors of the pianoforte. To these tasks and in his efforts at composition, he often devoted whole nights. He got his first salaried position (as violinist) in 1703 at Weimar, but left this post after a few months for that of organist at Arnstadt. It was then that he made the trip (a foot tour of over 200 miles) to Lübeck, already referred to, to hear Buxtehude. He had obtained a four weeks' leave of absence, but was so delighted with his opportunities for improvement at Lübeck that he remained four months, until peremptorily called back. The Abbé of Arnstadt took this occasion to reprimand him, not only for prolonging his leave of absence, but for neglecting rehearsals, going to a wine cellar during the sermon, allowing a strange maiden to make music in the choir, and for having made extraordinary variations in the chorals, and intermixing many strange sounds, so that thereby the congregation were confounded. Yet, with all his faults, they loved him still and allowed him to remain at his post, till he left of his own accord, having secured a position as organist at Mühlhausen. Here, too, however, he did not remain long, as still better opportunities presented themselves to him at Weimar, where the Duke Wilhelm Ernst had his court. This duke was interested in the religion of the German Protestant Church and was glad to avail himself of the services of Bach, who was destined to become the chief representative of the music of that church, as Palestrina was of the Catholic Church. Here Bach remained for nine years, during which he wrote many of his master works for organ and church choir. In 1717 he accepted a position in Köthen which involved a complete
change in his activity. Instead of having an organ and choir to occupy his time he had the duty, as Kapellmeister, of writing and rehearsing works for the orchestra as a whole or for groups of string instruments (chamber music). In 1720 he was a candidate for the post of organist at the Jocobi Kirche in Hamburg; but, although he was at this time already famous as an organist, he failed to get the place, an obscure young man having secured it after paying $900 for his funeral service (chamber music). In 1728 he was a candidate for the post of organist at the Thomasschule in Leipzig. The director of the music in the two principal churches; this position he held 27 years, till his death, 28 July 1750, at the age of 65.

Bach was twice married and became the father of 20 children; five sons and five daughters died before him, while six sons and four daughters survived him. His first wife was also a Bach—a cousin; she died in 1720, while he was on a concert tour. Eighteen months after her death he married a girl of 21 who was also musical; yet none of the 13 children by this second marriage attained as high a rank as some of the seven by the first wife. The second marriage was also a failure, and in course of time her handwriting came to resemble his so closely that the two were hard to distinguish. In no way did Bach suffer more widely from his great contemporary. Handel, than in his family life; Handel died a bachelor. There were times when Bach found it difficult to bear the material burden of his large family, but he was not too poor in his lifetime as is usually supposed. His income from various sources was, it is true, only about $500 at the best; but the purchasing power of that sum was equal to $2000 in our day. It was after his death that the punch of poverty was felt; his widow died in an almshouse; he himself was buried in a pauper's grave. For more than a century no one knew the exact place of this grave; the circumstances of its discovery read like a detective story. Some years ago it became necessary to rebuild the old Jussies Church in Leipzig, and, in connection with this, to remove the remains from the Jussies Churchyard in which Bach was believed to have been buried. The director of the archives, Wustmann, took this opportunity to search for Bach's grave. He had found in the books of the Jussies Hospital an item stating that $4 had been paid for Johann Sebastian Bach's oak coffin, which gave him the principal clue, for oak coffins were seldom used in those days. Near the place where Bach was believed to have been buried he found two oak coffins, one containing the remains of a young woman, the other the bones of a man, whose skull was so mique as to arouse the suspicion at once that it was Bach's. It was placed in the hands of the famous anatomist, Professor His, who, after a long series of comparative examinations, came to the conclusion that there could be no doubt whatever that the skull was Bach's. He embodied his argument in a 'lecture, "Forschungen unter Bach's Grabstätte und Grabmahl.' The fact that Bach's coffin contained thus took no note of his burial place convincingly evidence that they never dreamed was destined to rank as the greatest of all musical geniuses. Further evidence of this lies in the circumstance that he really brought about his death by his efforts to save some of his unappreciated MSS. from destruction by engraving them on copper plates. This led to serious trouble with two operations by an English surgeon were followed by total blindness, which made it impossible for him to complete his great work, "The Art of Fugue." He dictated for its final number a chorale, "When we were overwhelmed by Woe," and died not long after. 

The thematic catalogue of his works contains 1,110 instrumental and 1,936 vocal numbers. All of them combined probably never brought him in as much as the $1,175 paid at a Berlin auction sale a few years ago for three of his MSS. Until 1829, when Mendelssohn, after overcoming a good deal of opposition, succeeded in producing the wonderful "Saint Matthew's Passion" in Berlin, for the first time since its composer's death, the great Leipzig Cantor was looked on, in Menel's words, as "a mere old-fashioned big-wig stuffed with learning." That work opened the eyes of the musicians to their colossal stupidity, and from that year to the present time Bach's fame has been growing in S. (while he was constantly revising) and in course of time her handwriting came to resemble his so closely that the two were hard to distinguish.

In no way did Bach suffer more widely from his great contemporary. Handel, than in his family life; Handel died a bachelor. There were times when Bach found it difficult to bear the material burden of his large family, but he was not too poor in his lifetime as is usually supposed. His income from various sources was, it is true, only about $500 at the best; but the purchasing power of that sum was equal to $2000 in our day. It was after his death that the punch of poverty was felt; his widow died in an almshouse; he himself was buried in a pauper's grave. For more than a century no one knew the exact place of this grave; the circumstances of its discovery read like a detective story. Some years ago it became necessary to rebuild the old Jussies Church in Leipzig, and, in connection with this, to remove the remains from the Jussies Churchyard in which Bach was believed to have been buried. The director of the archives, Wustmann, took this opportunity to search for Bach's grave. He had found in the books of the Jussies Hospital an item stating that $4 had been paid for Johann Sebastian Bach's oak coffin, which gave him the principal clue, for oak coffins were seldom used in those days. Near the place where Bach was believed to have been buried he found two oak coffins, one containing the remains of a young woman, the other the bones of a man, whose skull was so mique as to arouse the suspicion at once that it was Bach's. It was placed in the hands of the famous anatomist, Professor His, who, after a long series of comparative examinations, came to the conclusion that there could be no doubt whatever that the skull was Bach's. He embodied his argument in a 'lecture, "Forschungen unter Bach's Grabstätte und Grabmahl.' The fact that Bach's coffin contained thus took no note of his burial place convincingly evidence that they never dreamed was destined to rank as the greatest of all musical geniuses. Further evidence of this lies in the circumstance that he really brought about his death by his efforts to save some of his unappreciated MSS. from destruction by engraving them on copper plates. This led to serious trouble with two operations by an English surgeon were followed by total blindness, which made it impossible for him to complete his great work, "The Art of Fugue." He dictated for its final number a chorale, "When we were overwhelmed by Woe," and died not long after.
The best account of this phase of his art is contained in Pirro's 'Bach, the Organist, and his Works for the Organ'; the author's aim being to make it easier to play Bach 'in the Bach spirit.' He refers to the great composer as 'the man who suddenly surpassed all that had been done before him while at the same time anticipating all that was to be written in the future.' The organ works are contained in Vols. IV, XV, XVIII, XL and XL of the Breitkopf and Härtel edition. Some of them are best known to music lovers through their superb arrangements for pianoforte by Liszt, Busoni, others. Quite as striking is Bach's pre-eminence in choral music. The vocal works make up more than 30 volumes; among them there are four of chamber music with voice, nine of passions, oratorios and masses; and no fewer than 17 of church cantatas. It is known that he wrote five complete sets of these cantatas for all the days and holidays in the year; probably there were about 350 in all, but of those only about 200 have been preserved. The greatest choral works in existence are Bach's 'Saint Matthew Passion' and his Mass in B minor. Schumann preferred the 'Saint John Passion' even to the Saint Matthew.' Three other passions written by Bach are lost. Concerning this class of works Wagner exclaimed: 'What opulence, what fullness of art, what power, clearness, and withal simple purity, speak to us from these unrivalled master-works!' They are made up of arias, recitatives, choral and other choruses, beside the instrumental accompaniment. The arias are sometimes embroidered after the fashion of the time, but usually they are simple, chaste and delightfully melodious. Indeed, Bach was so full of melody that it overflows into his recitatives, which are, at the same time, often highly dramatic and emotional, foreshadowing Wagner's. If Bach had written operas they would have been more dramatic than Handel's; but the opera was (apart from the Lied, or lyric art song, which had not yet been created), the one form of music which Bach avoided. As for the choruses in his works, they are of incomparable grandeur, and at the same time of great difficulty. All the parts are melodious; indeed there is in these works little practical difference between the chorus singers and the soloists. Many of the choruses are stately choral — the hymns introduced into the Church by Luther and perfected by Bach. These were sung by the trained choir, the harmonies being too elaborate for the congregation. In his own churches Bach found the means of execution lamentably inadequate. The singers and students could not master the technique; of the inner spirit they had no conception.

Of Bach's orchestral scores, also, it may be said that all the players are, in turn, soloists. His harmony is 'a manifold melody'; it forms the bridge between the medieval polyphonic and the modern harmonic styles. In his orchestral accompaniments, a favorite device is an obligato part for some string or wind instrument playing a duet with the solo voice. His works for orchestral instruments alone comprise the six concertos. Among his compositions for violin there are three suites and three sonatas that are unique, inasmuch as they have no pianoforte accompaniment but are complete in themselves, the polyphonic or harmonic accompaniment being played together with the melody by the violinist; for the violincello, also, there are six sonatas and suites of this kind. While it is true that in all of his works the organ style prevails more or less, there is nevertheless a keen instinct (far ahead of the time in which he lived) for what is idiomatic, or peculiar to each instrument. This is particularly true in regard to the pianoforte compositions. In these, Bach is more modern than Haydn or even Beethoven. While writing for the imperfect clavichords and harpsichords of his time he had in his mind a prophetic vision of the modern grand piano; on that alone can justice be done to his superb compositions of this class. His preludes and fugues, his inventions, suites, toccatas, fantasias, etc., are, the fountain head of modern music. Of special importance is the 'Well-tempered Clavichord,' a collection of 48 preludes and fugues, two in each key, arranged in the order of chromatic ascent. Heinrich Bülow called this the 'Old Testament in music.' It is indispensable to every student; but it is infinitely more than a group of studies. 'We find these fugues,' wrote Rubinstein, 'of a religious, heroic, melancholy, grand, serious character; in one respect only are they alike — in their beauty! And then the preludes, whose charm, variety, perfection and splendor are simply incomparable! That the same composer who wrote those organ compositions of overwhelming grandeur could also write such delightful humorously avant-garde, bourrées, gigue, such melancholy sarabandes, short piano pieces of such charming simplicity, transcends belief. These remarks refer to his instrumental works alone, but if we do add to them his gigantic vocal compositions, we are led to the conclusion that the time will come when it will be said of Bach as of Homer: 'This was not written by one man but by several.' Rubinstein's reference to the gavottes, etc., calls attention to the fact that Bach was not above writing dance music; a great deal of it. He also did much to improve the technique of pianoforte playing, especially in the matter of fingering (use of thumbs). He would have been the first to adopt all modern improvements, and in playing him, the fingers, for instance, should be used as freely as in playing Chopin. And while it was not customary in Bach's day to write expression marks, it is idiotic to suppose that he played his pieces without changes in loudness and pace. Here students should follow the guidance of Liszt and Bülow. The more Bach's works are studied from this point of view, the more does he seem a modern romanticist, and his works music of the future, even more than music of the past. Mendelssohn all his life furthered the cause of Bach, and his efforts resulted in the erection of the first statue of the Alte Meister, as Bach has been affectionately called, at Leipzig in 1842. In 1884 a fine bronze statue was erected at Eisenach, and in 1900 a full-sized bronze statue was unveiled with imposing ceremonies in Leipzig. In addition to the 40 volumes of Bach published by Härtel and Hauptmann, new volumes have been published annually since 1904 by the Neue Bach Gesellschaft, appearing as the Bach Jahrbuch. In 1907 the Bach birthplace at Eisenach was
opened as a Bach Museum. There are now Bach societies in several countries.

**Bibliography.**—Spitta’s *Bach,* in 2 vols. (English by Bell & Maitland, London 1899) is the most elaborate and authoritative work. Of the shorter books the most serviceable is that by Abdy Williams, which also contains a classified list of Bach’s works and a bibliography. Consult also Parry, *The Evolution of the Art of Music* and *Johann Sebastian Bach* (New York, 1909); *Musician and Music Lovers*; Franz, R., *Gesammelte Schriften über die Wiederbelebung Bach’scher und Händel’scher Werke* (Leipzig 1910); Wolfzum, P., *Johann Sebastian Bach* (2 vols. Leipzig and 1910 of Schweitzer. As, J. S. Bach, le musicien poète* (ib. 1905), and Vol. IV of the *Oxford History of Music;* *The Age of Bach and Handel* by Fuller Maitland.

**Henry T. Finck, Musical Critic, Evening Post, New York.**

**BACH, Karl Philipp Emanuel,** German musician: b. Weimar, 14 March 1714; d. 14 Dec. 1788. He was the son of Johann Sebastian Bach and was reared in the service of Frederick the Great in 1746–68, afterward holding an appointment at Hamburg. He wrote on the theory of piano playing and was a voluminous composer of Passion music, pianoforte concertos and arias for two oratorios, one *Israel in the Wilderness.*

**BACH, Wilhelm Friedemann,** known as the *Halle* Bach, German composer and musician: b. Weimar, 22 Nov. 1710; d. Berlin, 1 July 1784. He was the oldest of the sons of Johann Sebastian Bach, from whom he received his training, and who regarded him as the most brilliant of all his children. He was organist of Saint Sophia, Dresden, from 1733 to 1747, and of Saint Mary’s, Halle, from 1747 to 1764. His irregular habits and addiction to drink led to his dismissal, and he never afterward obtained a position, but wandered from city to city and died in squalor in Berlin. He wrote several works for piano, containing concertos, sonatas, a suite of fantasias; these were edited by Riemann. An organ concerto and fugue were written by Stradella. All his works show an extraordinary talent.

**BACH FESTIVAL;** the annual musical festivals held at Bethlehem, Pa., and resembling in a degree the performances at Bayreuth and Oberammergau. The festival arose in connection with the Moravian church of Bethlehem, the liturgy of which has a strong musical tendency. Early in its history Bethlehem had an orchestra, probably the first in America, and in its churches were employed flutes, horns, violas and trombones, which undoubtedly originated and led up to the gala performances of the present day. Its resemblance to Oberammergau is in its religious character, the Protestant sentiment of which finds its best expression in the music of Bach. In 1901 Bach’s *Christmas Oratorio* was performed for the first time in America in its entirety. Under the direction of J. Frederick Wolf other of Bach’s works have been presented. The choir consists of 110 members, with a separate chorus of 100 boys, and an orchestra of 60 instrumentalists. From 1906 to 1919 annual Bach festivals were given at Berkeley, Cal., by Mr. Wolle, but on his return to Bethlehem in the latter year the festivals were resumed at Bethlehem, Pa.

**BACHARACH, bahn’-rash,** Germany, a town on the Rhine, 12 miles south of Coblenz. The vicinity produces excellent wine, which was once highly esteemed as annual tribute by Emperor Wenzel and the Pope. The view from the ruins of the castle is one of the finest on the Rhine. Pop. about 1,900.

**BACHE, bách, Alexander Dallas,** American scientist: b. Philadelphia, Pa., 19 July 1806; d. 17 Feb. 1867. He was a grandson of Benjamin Franklin, and was graduated at the United States Military Academy, at the head of his class, in 1825; became professor of natural philosophy and chemistry at the University of Pennsylvania 1828–37; was the organizer and first president of the trustees of Girard College 1836, where he established a magnificent meteorological observatory; he bore a prominent part in developing the system of free education in Philadelphia, and was appointed superintendent of the United States Coast Survey in 1843. In the last office he performed services of lasting and invaluable character. He was a member of the Smithsonian Institution in 1846–67; an active member of the United States Sanitary Commission during the Civil War, and president of the National Academy of Sciences in 1863, to which he bequeathed $42,000 for scientific research. Besides a long series of notable annual reports of the United States Coast Survey, he published a report on *Education in Europe* (1839), and *Observations at the Magnetic and Meteorological Observatory at the Girard College* (3 vols., 1840–47).

**BACHE, George M.**, American naval officer: b. in the District of Columbia, 12 Nov. 1840; d. 11 Feb. 1896. He was graduated at the United States Naval Academy, in 1861, and commanded the ironclad *Cincinnati* in the various engagements on the Mississippi River, until she was sunk by the Vicksburg batteries, 22 May 1863. He was highly commended by Admiral Porter, General Sherman and Secretary Welles for his conduct in the last engagement. Subsequently, he took part in the Battle of Fort Fisher, and, in the second one, 15 Jan. 1865, led the naval assault. He retired with the rank of commander, 5 April 1875.

**BACHE, Hartman,** American military engineer: b. Philadelphia, Pa., 3 Sept. 1798; d. 8 Oct. 1872. He entered the United States Topographical Corps; and for 47 years was constantly employed on surveys and on works of hydrography and civil engineering. On 13 March 1855 he was appointed brigadier-general, and 7 March 1867 was retired. His most notable achievements were the building of the Delaware breakwater and the application of iron-screw piles for the foundation of light-houses upon sandy shoals and coral reefs.

**BACHE, Sarah,** American philanthropist: b. Philadelphia, Pa., 11 Sept. 1744; d. 5 Oct. 1808. She was the only daughter of Benjamin Franklin, and the wife of John Bache. During the Revolutionary War she organized and became chief of a band of patriotic ladies who made clothing for the soldiers, and in other ways relieved their sufferings, especially during the severe winter of 1780.
BACHE, Walter, English pianist: b. Birmingham, 19 June 1842; d. London, 26 March 1888. In 1858 he studied music in the Leipzig Conservatorium under Hauptmann, Richter, Piusidy and Mascheles. In 1863 he went to Rome, and from that time till 1865, when he returned to London, studied with Liszt, of whose style and compositions he became an ardent admirer and advocate. In London he instituted annual concerts, at which he put forward Liszt's music, and lived long enough to see the indifference of the public toward his master change to open admiration. For several years Bache was professor of the pianoforte at the Royal Academy of Music, and it was mainly due to his efforts that the Liszt scholarship was established in that institution.

BACHELDER, Nahum Josiah, American politician: b. Andover, N. H., 3 Sept. 1854. Educated at Franklin Academy, Taunton Hill School, Andover, he became a prominent farmer; was nominated by the Republicans and elected governor of New Hampshire in 1897. He was master National Grange, 1905-11, and received degrees from Dartmouth and New Hampshire Colleges.

BACHELET, bash'il, Jean Louis Théodore, French historian: b. Pissy-Pöville, Seine-Inférieure, 1820; d. 1879. He was educated at the École Normale, and after serving as professor of history in various institutions, including the Rouen Lyceum, he became librarian of Rouen. His publications include 'La guerre de cent ans' (1852); 'Cours d'histoire' (3 vols., 1865-76); 'Dictionnaire générale de biographie et d'histoire,' with C. Dezobry (12th ed., 1902); 'Dictionnaire générale des lettres, des beaux-arts, des sciences morales et politiques' (7th ed., 1902).

BACHELLER, Addison Irving, American novelist: b. Pierpont, N. Y., 26 Sept. 1859. He was graduated at the Saint Lawrence University in 1882; 1882-83 was a member of the staff of the Daily Hotel Reporter of New York city and in 1884 became a reporter for the Brooklyn Times. In the latter year he established the Bachecler Syndicate for the purpose of supplying literary matter to periodicals and for the writer of this character. He was for a short time editor of The Pocket Magazine, and subsequently joined the editorial staff of the New York World, but remained in that capacity for a short time only. His novels, the scenes of which are laid in northern New York, include 'The Master of Silence' (1890); 'Eben Holden' (1900); 'Dri and I' (1901); 'Darrel of the Blessed Isles' (1903); 'Virgilius' (1904); 'Silas Strong' (1906); 'Eben Holden's Last Day-a-Fishing' (1907); 'The Hand-Made Gentleman' (1907); 'The Master' (1908); 'In Various Moods' (1908); 'Keeping Up With Lizzie' (1910); 'Charge It' (1911); 'The Turning of Griggsby' (1912); 'The Marryers' (1914); 'The Light in the Clary' (1916).

BACHELOR, a term, anciently applied to a person in the first or probationary stage of knighthood who had not yet raised his standard in the field. A knight bachelor is one who has been raised to the dignity of a knight without being made a member of any of the orders of chivalry such as the Garter or the Thistle. The title 'Sir' of a knight bachelor is not hereditary. It also denotes a person who has taken the first degree in the liberal arts and sciences, or in divinity, law or medicine, at a college or university; it is the degree of any age who has not been married, the most usual meaning of the term. Taken as a class in a community, bachelors have, from the earliest times, been the subjects of much and varied legislation. In nearly every country of the world, and in nearly every respect of history, penalties have been imposed upon male celibates through the legislative branch of the government, the general basis for such legislation being the principle that the citizen was under moral obligation to the state to rear up a family of legitimate children, at least should he be capable, morally, physically and financially. The old Jewish command to be fruitful and multiply was faithfully carried out by the Hebrews who regarded marriage as a duty.

In such nations as Sparta, where individual interests were always subservient to those of the state, the laws were more severe, and criminal proceedings were instituted, under the laws of Lycurgus, both against those who for any unreasonable excuse failed to marry, and against those who through marriage in later life made probable children of unhealthy constitution. At Athens, though formerly regarded as a crime by the laws of Solon, celibacy was not severely punished, and later, though the practice was discouraged, interference with the inclinations of individuals in this respect gradually became of little practical value, and the laws finally fell into disuse.

In Rome, the imposition of heavy penalties upon male celibates was instituted at a very early period, and later even women were subjected to the same rigid laws. As leading to the Lex Julia et Papia Poppaea, penalties were imposed on those who failed to marry after a certain age, and an unmarried person could not come into possession of a legacy unless he be married within a hundred days after the testator's death. The provisions of the law allowed widows a year in which to comply, and divorced women six months from the date of divorce, but these periods were later changed and extended to two years, a year and a half, and one and a half years, respectively. This law did not apply, however, to men above 60 years of age, and women above 50 years. In cases of childless persons (males from 25 to 60 years of age, and females from 20 to 50 years) who should become beneficiaries under a legacy, one-half of the value of such legacy was forfeited. In later years, especially in England, France and the United States, taxes upon bachelors have been proposed more for purposes of state revenue than to compel marriage, but though such legislation has been advanced in some instances with great vigor, the success of the movement has not been marked.

BACHELOR, a local name in the Mississippi Valley for the small bass, more usually called crappie (q.v.).

BACHELOR'S BUTTON, the double yellow buttercup (Ranunculus acris). Similar forms, as R. aconitifolius, are often called white bachelor's buttons. The name is also given to Centaurea cyanus (see CROWFLOWER) and to Gomphrena globosa.
BACHER, bā'ter, Wilhelm, Jewish theologian and Orientalist; b. Lipto-Szent-Miklos, Hungary, 1850; d. 1913. He was educated in the universities of Budapest and Breslau and at the Jewish Theological Seminary of Breslau. He was appointed professor in 1877 and in 1912 director of the rabbinical public schools of Budapest. He published ‘Nizimas Leben und Werke’ (1872); ‘Die Agada der Babylonischen Amoräer’ (1878); ‘Die Agada der Sannaiten’ (3 vols., 1889–90); ‘Die Agada der Palästinensischen Amoräer’ (3 vols., 1889–90); ‘Die Anfänge der Hebräischen Grammatik’ (1895); Ein Herbsässes Wörterbuch aus dem Vierzehnten Jahrhundert’ (1900); ‘Die Agada der Tannaiten und Amoräer, Bibelteilungen’ (1902); ‘Aus dem Wörterbücher Tanchum Jerusalems’ (1903).

BACHIAN, or BATJAN, bāch-yān’, one of the Molucca Islands, immediately south of the equator, and southwest of Giliolo; area, 914 square miles. It is ruled by a council of native chiefs under the Dutch, and has a population of about 13,000.

BACHMAN, bāmān, John, American clergyman and naturalist; b. Dutchess County, N. Y., 4 Feb. 1790; d. 25 Feb. 1874. He became pastor of a Lutheran church in Charleston, S. C., and published, among other works, ‘CharactcrsCorrespondence of Generals and Officers Applied to the Doctrine of the Unity of the Human Race’ (1854). He is best known by reason of his association with Audubon in the making of the ‘Quadrapeds of North America,’ he writing the principal part of the text, which Audubon and his sons illustrated.

BACHMUT, or BAKHMUT, bāch-moot’, Russia, a town of the government of Ekaterinoslav, with a trade in cattle and tallow. It has coal mines and salt wells, and soda is extensively manufactured. Pop. 19,500.

BACHTOLD, Jakob, German literary historian; b. Schleitheim, Switzerland, 1848; d. Zürich, 1897. He was educated at Heidelberg and later studied at Munich, Tübingen, Paris and London, and in 1872 became an instructor in the Sokolthurn Gymnasium. He was appointed professor of the German language and literature at Zürich in 1888. His most important works are ‘Geschichte der deutschen Literatur in der Schweiz’ (1887–92); ‘Deutsche Handschriften aus dem Britischen Museum’ (1873); ‘Gottfried Kellers Leben’ (3 vols., 1884–97). He also edited Goethe’s ‘Götzi von Berlichingen’ (1882) ‘Iphigenia’ (1883); ‘Dichtung und Wahrheit’ (1899–91). With Vetter he edited the ‘Bibliothek alterer Schriftwerke der deutschen Schweiz und ihres Grenzgebietes.’ Vetter published ‘Kleine Schriften von Jakob Bächtold’ (1899).

BACILLUS. See Bacteria.

BACK, Sir George, English explorer; b. Stockport, 6 Nov. 1796; d. London, 23 June 1878. He entered the British navy in 1808, and in 1817 was in the expedition to Spitbergen. He accompanied Sir John Franklin to the Arctic regions in 1819 and again in 1825, and in 1833 led a party in search of Sir John Ross, then in the Arctic Ocean, and in 1836, in command of the Terror, made his last trip to the north. The Geographical Society awarded him a gold medal in 1837, and in 1839 he was knighted. He became admiral in 1867. Among his works are ‘A Narrative of the Arctic Land Expedition’ (1836); ‘A Narrative of the Expedition in Her Majesty’s Ship Terror’ (1838).

BACK BAY, a fashionable residential district in Boston, made by filling in an enlargement of the Charles River, formerly called the Back Bay. See Boston.

BACKLAND, name applied to the region around the Arctic Circle, in British North America. It was explored by Captain Back in 1831.

BACK-STAFF, an instrument invented by Captain Davies, about a.D. 1590, for taking the altitude of the sun at sea. It consisted of two concentric arcs and three vanes. The arc of the longer radius was 30°, and that of the shorter one 60°; thus both together constituted 90°. It is now obsolete, being superseded by the sextant.

BACKBITE, Sir Benjamin, an evil-minded, sharp-tongued character in Sheridan’s comedy, ‘School for Scandal.’

BACKER, Jakob, Dutch painter; b. Haerlingen 1608; d. 1651. He was a pupil of Lambert Jakobsz at Leuwarden and later of Rembrandt at Amsterdam. His work shows the influence of the latter. His greatest masterpieces are ‘Lady Regent of the Amsterdam Orphan Asylum,’ still in place, and the ‘GUILD of Archers’ in the Amsterdam Town Hall.

BACKGAMMON is a game in which two opposing players move symbolic men into or out of each other’s territory on a board, according as they are respectively entitled to do so by the throw of dice. Without question a game of that nature was played among the Aztecs of Mexico centuries before the landing of Cortez, and it is probable that it was brought from Asia to the Pacific coast by the original immigrants. Francisco Lopez de Gomara described it in 1552, and Joan de Torquemada in 1616 gave additional details of the game, mentioning that the little stones of each contestant varied in color. The Iroquois Indians had a dice game of a somewhat similar sort. Backgammon is played by two players who have between them a board, each side of which has alternate black and white angular marking projecting like rays from the rim. Each player has 15 flat tablets (similar to those with which drafts are played) called men. One player’s men are black, the others are white. Each player has a dice box for his own use but the two dice are used alternately by them both. Each die has a number on each face numbered from one spot to six. Each player throws the dice in turn on to the centre of the board; and moves two men, one man according to the distance indicated by one of the dice and the other according to the number on the second die. So the game proceeds in the usual manner, the players throwing and moving their men alternately into and out of each other’s territory, until one player has carried all the men from the opposite home (or inner table) into the outer table; and thence into his own outer table and finally into his own inner table. The simplest textbook on the subject is that of A. Howard Cady. Consult also Pardon and Anderson, ‘Backgammon and Draughts’ (New York 1889).
BACKHAUS, Wilhelm, famous German pianist: b. Leipzig, 26 March, 1884. When seven years of age, he received regular piano instruction from A. Reckendorf. He also spent four years (1894–98) at the Leipzig Conservatory, during which period he continued his studies with Reckendorf. He also studied for a time in Frankfurt under Eugen d’Albert, and began his concert career in 1900, when his success was immediate and complete. He won immediate recognition in England and in 1905 was appointed professor of piano at the Royal College of Music, Manchester. He won the Rubinstein Prize in the same year and thereafter gave all his time to concert tours. He visited America in 1912 and received generous recognition. He is ranked among the most artistic of living pianists.

BACKHUYSSEN, bakh'oi-zen, or BAK-HUYSSEN, Ludolf, celebrated painter of the Dutch school, particularly in sea pieces: b. Emden, 18 Dec. 1631; d. 1709. His most famous picture is a sea piece which the burgomasters of Amsterdam commissioned him to paint as a present to Louis XVI, and which it still is at Paris.

BACKLOG STUDIES, by Charles Dudley Warner, was first published in book form in 1872, though most of the papers had already appeared in Scribner's Monthly. The title of the studies may be misleading, since the pleasant, informal personal essays touch but lightly on any question of literature, art or politics, and do not go deeply into the philosophy of life. They celebrate, as a sort of central theme the joys of the open fire, and they call up for brief comment many of the things that might be discussed by an intelligent family group about the hearth—contemporary fashions in church and in domestic architecture, the ways and the whims of reformers, the influence of costume on acting, etc. Some, though not usually the best, are in the form of conversations in which The Mistress, The Fire-Tender, Our Next Door Neighbor, The Young Lady who is Staying with Us, and others take part; but usually the author speaks in his character as the Fire-Tender, a slightly whimsical New Englander. To readers of American essays the book naturally calls to mind the 'Breakfast-Table' series by Dr. Holmes, and less forcibly the lighter writings of Donald G. Mitchell. Notwithstanding a strong protest in one of the studies against the comparative method in criticism, it may be said that these papers, though sometimes almost over-clever, are less brilliant and less urbane than the 'Autocrat of the Breakfast-Table,' and are freer from excess of sentiment than the 'Reveries of a Bachelor.'

WILLIAM B. CAINRS.

BACKLUND, Johan Oskar, Swedish astronomer: b. Lenghem 1846. In 1875 he was appointed lecturer at the University of Upsala, and in the same year assistant at the Stockholm Observatory 1876, and in the same year observatory at the Dorpat Observatory. Later he became adjunct-astronomer at the Pulkowa Observatory, Russia, and in 1895 was appointed director there. His investigations have been chiefly concerned with the progressive decrease in the period of Encke's comet, and in this connection he has formulated his well-known theory of disturbances. He has published 'Observations de Pulkowa' (1888) and 'The Development of Celestial Mechanics during the Nineteenth Century' (1906).

BACKUS, Azil, first president of Hamilton College, Clinton, N. Y.: b. Norwich, Conn., 13 Oct. 1765; d. 9 Dec. 1817. After graduating at Yale in 1787, he served the church at Bethlehem, Conn., until he became president of Hamilton College in 1812.

BACKUS, Isaac, Baptist clergyman and author: b. Norwich, Conn., 9 Jan. 1724; d. 20 Nov. 1806. He was ordained in 1748 and became pastor of a Congregational church in Middleborough, Mass. Some of his congregations sympathizing with the Baptists he united with them and formed a Baptist church in 1756. Throughout his life he was a persistent advocate of the widest religious freedom, holding open communion for many years. For 34 years he was a trustee of the present Brown University, then Rhode Island College. As a delegate to the convention that adopted the Federal Constitution, he voted in its favor. Of his numerous writings the most important is 'A History of New England with Special Reference to the Baptists' (3 Vols., 1777–78, new ed. by D. Weston, 2 Vols., 1871), a partisan but valuable work. His 'History of Middleborough' is in Massachusetts Historical Society Collections (Vol. III, 1st Series, 1794; repr. 1810).

BACKUS, Truman Jay, American educator: b. Milan, N. Y., 11 Feb. 1842; was graduated at the University of Vermont in 1864, and was professor of English literature at Vassar College, 1867–83; then became president of the Packer Collegiate Institute in Brooklyn, N. Y. After going to Brooklyn, he served on several State commissions. His publications include 'Great English Writers,' 'Outlines of English Literature,' and a revised edition of Shaw's 'History of English Literature.'

BACLER D'ALBE, bahl'kler', dalb', Louis Albert Ghiolain, Baron, French artist, soldier and military cartographer: b. Paris, d. 1824. He served in all of Napoleon's campaigns and attained the rank of brigadier-general. Two celebrated paintings by him, 'The Battle of Arcola,' and 'The Battle of Rivoli,' are in the gallery of Versailles. He published 'Note du theatre de la guerre en Italie' (54 parts, 1802); and 'Souvenirs pittoresques contenant la campagne d'Espagne' (1824), and among other works a series of fine lithographic views.

BACON, Albion Fellows, American social reformer: b. Evansville, Ind., 1865; sister of Annie Fellows Johnston (q.v.). She married Hily E. Bacon, of Evansville, in 1888. She early became noted as an organizer and leader of men's circles of 'Friendly Visitors;' was leader of the Flower Mission for five years, and organizer of the Anti-Tuberculosis League, Monday Night Club, Working Girls' Association; director of the National Housing Association; and closely connected with the District Nurse Circle, Civic Improvement Society, State Federation of Women's Clubs and other similar organizations. She became noted as the author and leader of the State tenement law of 1907, and is known as a lecturer and writer on tenement reforms. Author of 'Songs Ysame' (with her sister, Annie Fellows Johns-
ton, 1897); 'What Bad Housing Means to the Community'; 'The Awakening of the State' (1911).

BACON, Alice Mabel, American educator: b. New Haven, Conn., 26 Feb. 1858; was educated privately and took the Harvard examinations in 1881; taught at the Hampton Normal and Agricultural Institute in 1883-88, and in Tokio, Japan, in 1888-89; returned to the Hampton Institute in 1889, and founded the Dixie Hospital for training colored nurses in 1890. She published 'Japanese Girls and Women,' 'Japanese Interior,' 'In the Land of the Gods' (1905), etc.

BACON, Augustus Octavius, American legislator: b. Bryan County, Ga., 20 Oct. 1839; d. Washington, D. C., 14 Feb. 1914. He was graduated from the University of Georgia in 1859, from the law department of the University in 1860; entered the army of the Confederate States at the beginning of the Civil War, and was adjutant of the 9th Georgia regiment in the Army of Northern Virginia, and later promoted captain and assigned to general staff duty; and in 1866 began the practice of law at Macon, Ga. In 1868 he was president of the State Democratic convention, and in 1884 a delegate from the State at large to the national Democratic convention. He was a member of the Georgia house of representatives in 1871-72, 1892 and 1893, and for the greater part of the time its speaker. Elected to the United States Senate in November 1894, he was re-elected in 1900, 1907 and 1913—the last time by direct popular vote. Upon the death of Vice-President Sherman he was, alternately with Senator Gallinger, president pro tempore of the Senate, in which capacity he presided at the impeachment proceedings against Judge Archbold in 1912. In 1913 he was chairman of the Senate committee on foreign relations, where his conservative attitude toward Mexico was effective in delaying radical action by Congress. He was a trustee of the University of Georgia and a regent of the Smithsonian Institution.

BACON, Benjamin Wiener, American theologian: b. Litchfield, Conn., 15 Jan. 1860; studied in Germany and Switzerland; and was graduated at Yale College in 1881; held several important Congregational pastorates; and in 1896 became professor of New Testament criticism and exegesis in Yale University. Author of 'The Israel of Genesis' (1891) 'Tract in the Tradition of the Exodus' (1894); 'Introduction to the New Testament' (1900); 'The Sermon on the Mount' (1902); 'The Story of St. Paul' (1904); 'Beginning of Gospel Story' (1909); 'Founding of the Church' (1909); 'Galatians' (1910); 'The Fourth Gospel in Research and Debate' (1909); 'Jesus the Son of God' (1911); 'Making of the New Testament' (1912); 'Theodore T. Munger, New England Minister' (1913); 'Christianity Old and New' (1913).

BACON, Delia Salter, American author: b. Tallmadge, Ohio, 2 Feb. 1811; d. 2 Sept. 1859. She was prominent in her day as a teacher, and wrote several stories, but is now remembered as an insistent advocate of the theory that the plays of Shakespeare were written by her namesake, Lord Bacon. She did not originate the idea, but was the first to give it any currency, in her 'Philosophy of the Plays of Shakespeare Unsolved' (1857). The book had the honor of a preface from the pen of Nathaniel Hawthorne, and the theory was accepted by a few persons in both England and the United States. J. Donnelly (q.v.) and others wasted not a little ingenious reasoning in its advocacy.

BACON, Edwin Munroe, American author: b. Providence, R. I., 20 Oct. 1844. He received an academical education; was on the staff of several Boston papers; and wrote 'King's Handbook of Boston;' 'Boston Illustrated;' 'Historic Pilgrimages in New England;' 'Literary Pilgrimages in New England;' 'Boston of To-day'; 'Bacon's Dictionary of Boston;' 'Walks and Rides in the Country Round About Boston;' 'Walks on the North Shore;' 'Massachusetts Bay' (1903); 'Yesterday in Journalism;' 'Direct Election and Law Making by Popular Vote,' etc.

BACON, Francis, English statesman, philosopher and essayist: b. London, 22 Jan. 1561; d. Highgate, London, 9 April 1626. Bacon was commonly called Lord Bacon in accordance with a long literary tradition, though his exact titles in the peerage were Baron Verulam and Viscount Saint Alban. He was the youngest of eight children of Sir Nicholas Bacon, the Lord Keeper, six of whom were by a former marriage. His mother was Ann, daughter of Sir Anthony Cooke, and her sister married Sir William Cecil (Lord Burghley). The family thus stood in a position of exceptional influence at the court of Elizabeth, but Bacon profited little by the fact in his official career. He entered Trinity College, Cambridge, in 1573 and was admitted to Gray's Inn in 1575. In 1576 he went to France as a member of the embassy of Sir Amias Paulet, and remained there until the death of his father in 1579. It then became necessary for him to return to England and take up his legal studies with a view to professional practice. In 1582 he was admitted to the bar. Already before this time he had entertained hopes of a political career and had made unsuccessful appeals to Lord Burghley for support; and in 1584, being elected to Parliament from Melcombe Regis, he began a long and conspicuous service in the House of Commons. He produced at once a political document, entitled 'A Letter of Advice to Queen Elizabeth,' in which the religious situation, and particularly the Catholic question, was discussed with wisdom and moderation. In 1589 he wrote a second paper, 'An Advertisement Concerning the Controversies of the Church of England,' reiterating his policy of moderation with more special reference to Puritanism. Bacon's natural instinct, in both religious and political controversies, was conciliatory, and he exerted himself in favor of moderate measures throughout Elizabeth's reign and after he acceded to the throne of James. He manifested also, at the beginning of his career, some power of acting with disinterested independence,—a capacity which was less evidently displayed in his later life. In 1593 he led the opposition of the Commons to the proposal of the Lords for a joint settlement of a question involving subsidies and thus falling within the prerogatives of the lower House. In his prolonged resistance to the subsidy legislation he earned the disfavor of both Burghley and the Crown. His opposition, which was ap-
BACON

progressing, and Bacon, who clearly saw the danger that attended upon this breach of sympathy, took an earnest part in the struggle. Quite apart from his personal aims, he seems to have been genuinely distrustful of the governmental capacity of the Commons and consequently to have looked to the cause of the monarchy, becoming, as he described himself, a "peremptory royalist." His policy was doomed to failure; but it is only just to recognize that it had elements of moderation and statesmanship in its programme for the royal prerogative, yet aiming at religious toleration, the amelioration of the lot of the humbler classes, and a friendly relation with Parliament. After the death of Salisbury in 1612 he undertook to manage the King's interests, and in the Parliament of 1614 he continued his efforts to reconcile the Crown and the people by the policy to which in "Commentary" he gives the name "e Geminum." But his attempt was unsuccessful; the Parliament was dissolved, and the King and the people took different courses. From this time forth Bacon seems on the whole to have relinquished his higher political aims and to have given himself over to the struggle for personal advancement. In politics, as in friendship, he was an unskillful actor; or at least he always persuaded himself that he could best serve the public good by having due regard to his own interests.

In 1613 he had been promoted to the attorney-generalship. In 1616 he prosecuted Baron St. John for denouncing benevolences, and in the same year he consented to the torture of Edmund Peacham, who was charged with having written a treasonable sermon. He came in the latter case into conflict with his old enemy, Coke, who denied Peacham's guilt, and who also objected to the separate consultation of the judges by the Attorney-General. In 1617 Bacon helped to secure Coke's removal from the King's Bench for insufficient subscrivency to the Crown. Coke's political independence throughout the controversy has been often praised, and stands in favorable contrast with Bacon's self-seeking policy. At the same time it should be remembered that there was involved a real issue between the political powers, and that Bacon, in resisting Coke's effort to make the court an arbiter of the Constitution, was fighting for the principle which actually prevailed, though under changed conditions, in English government.

Bacon took part in 1616 in the prosecution of the Earl of Somerset for the murder of Sir Thomas Overbury, and after Somerset's fall he attached himself with ardor to George Villiers, the King's new favorite, in whom he seemed, along with many others, to be for the time genuinely deceived. Through Villiers (afterward Earl and Duke of Buckingham) Bacon received a succession of royal favors. In 1616 he was made Privy Councillor, in 1617 Lord Keeper and in 1618 Lord Chancellor. In July 1618 he was elevated to the peerage as Baron Verulam, and in 1621 he was made Viscount St. Alban. But his adherence to Buckingham, who was growing steadily unpopular, led at last to disaster. In 1621 the King exonerated by Coke, who had called Bacon to account for defending Buckingham's increase of monopoly patents, if the King had not interfered. Thereupon they sent to the Lords a

parently conscientious, may have been the cause of his failure to obtain the vacant attorney-generalship in 1594 and the solicitor-generalship in 1595, though in the former instance his claim was urged by Essex and in the latter by both Essex and Burghley. The attorney-generalship was therefore given to Sir Edward Coke, who was repeatedly a rival and enemy of Bacon's in later years.

Bacon's association with Essex, which constituted one of the most important of his personal relations, began in 1591. He attached himself to the rising young nobleman in the hope of obtaining political advancement. But it is not necessary to deny him all sentiment of personal attachment or all real belief in the availability of Essex for the public service. He received from Essex earnest patronage, as has been already shown, and when recommendations failed, Essex gave his follower a valuable estate by way of consolation. In 1597 Essex tried to arrange a marriage between Bacon and Lady Hatton, but Coke again proved a successful rival. Bacon, on his side, undertook to advise Essex and to manage his career at court. In 1598 he appears to have urged him (though he afterward denied it) to attempt the suppression of the King's rich relatives which led to the dismissal of Essex from office in disgrace. Bacon's conduct in the investigation is hard to trace, but he may perhaps be granted to have acted in the interests of Essex, though he was formally one of his prosecutors. Later, however, in 1601, when Essex rebelled openly against the throne, Bacon helped to secure his conviction, and after his execution prepared the official declaration of his treasons. For this active, and apparently unnecessary, participation in the prosecution of his friend Bacon has probably received more blame than for any other act of his life. It may be urged in extenuation that Essex was actually a dangerous person to the state, and that Bacon steadily warned him that he would not prefer the claims of friendship to the public good. It is true, too, that Bacon's position was difficult as between such a reckless friend and the jealous and imperious queen whose favor he desired both for his own and his friend's interest. In the last analysis there is little defense to be made for Bacon's willingness to profit by the ruin of Essex.

After the accession of James I Bacon continued his active service in Parliament. He published papers on the religious situation and on the union of the English and Scottish crowns, and he served on a commission to arrange the terms of the union. In 1603 he was knighted, and in 1604 given a pension of £100. In 1605 he offered to King James the very important treatise on the 'Advancement of Learning,' which will be more particularly discussed below among Bacon's writings. In 1606 he married Alice Barnham, a London alderman's daughter, who brought him a substantial dowry. He had no children. Little is known of his domestic life except that it ended unpleasantly. In his last will he revoked "for just and grave causes" such provisions as he had made earlier for his wife's benefit. In July 1607, when his imputed advancement came and he was made Solicitor-General. At this period the unfortunate estrangement between the King and the Commons was steadily
formal accusation that Bacon had taken bribes from suitors in his court. Bacon at first treated the charges with unconcern. Then, when he found that the Lords meant to investigate them seriously, he collapsed and offered no defense. He was fined £40,000, imprisoned and banished from Parliament and the court. In June 1621, he was released from the Tower, and retired to a country house also of Gormanston, but was the September of the same year the King pardoned him, though without restoring him to Parliament and the court. Bacon begged both James and Charles without avail for a further remission of his penalty. While admitting the justice of his condemnation, he protested that there had been no juster judge in England for 50 years; and there is of course an important difference between corruption and perversion of justice. Although he constantly accepted gifts from suitors while their cases were pending, it does not appear that he ever perverted justice for money, and some of the cases urged against him were those in which the suitors had lost after giving him gifts. But there is no record of any case when Buckingham interposed to ask favor for his friends, and in at least one instance he allowed a decision of his court to be practically set aside at that favorite's request.

Forbidden to re-enter the field of politics, Bacon devoted the last years of his life to the literary and scientific labors which had always divided his time and which he had professed to regard as his real and proper work; and he met his death as a result of a scientific experiment. In March 1626, he caught cold while stuffing a fowl with snow in order to observe the effects of refrigeration on the preservation of meat. On 9 April he died of what is now known as bronchitis at the house of Lord Arundel, where he had been carried at the time of his attack. He was buried in Saint Michael's Church, Saint Albans.

Bacon's Writings.—From early youth, if tradition can be trusted, Bacon showed extraordinary mental powers and a keen interest in philosophical pursuits. Throughout his life his labors in authorship kept pace closely with his political work, and prone as he was to yield to the temptations of wealth and power, he seems really to have accorded the first place in life to what he called his "contemplative aims." His strictly philosophical writings may, therefore, properly claim first attention among his works. At the age of 23 he produced an essay which bore the ambitious title, "The Greatest Birth of Time, or the Great Renewal of the Empire of Man Over the Universe." The work is now lost, but the title shows that the young author had already conceived some notion of a "great instauration." The "Partus Masculus Temporis" ("The Male Birth of Time") a fragment which is also of early date, is perhaps a modification of previous work. It contains little more than an attack on the false fancies ("idols") of the older philosophers, and is Bacon's first plea for a rational union between the mind of man and the universe. The "Conference of Pleasure" (written by Essex in 1592), "Gesta Grayorum" (1594), and the "Device on the Queen's Day" (1595) are not primarily philosophical works, but they contain many expressions of Bacon's intellectual ideals; and in the "Gesta Grayorum" there is an elabo-

rate proposal for the endowment of libraries, museums and establishments of research.

Valerius Terminus, of the Interpretation of Nature, with the "De Augmentis Scientiarum" (written about 1603) is a fragmentary treatise anticipating some of the most familiar matter in the later philosophical works. In it Bacon defends the study of science from the charge of impiety, urges the importance of an encyclopedic survey of human knowledge, and mentions for the first time (though without explaining them) the four classes of "idols" which were afterward discussed in the "Novum Organum." In 1605 Bacon presented to King James an English treatise of enduring value, "The Advancement of Learning." This was a splendid attempt to defend and magnify the pursuit of learning and then to survey the existing state of human knowledge. Part of the argument of the first part has lost its coherence, even its relevancy, to-day. But in breadth of view and fertility of suggestion the work is extraordinary. As a statement of intellectual ideals, and a program, or even a prophecy, of their accomplishment, it stands among the most significant productions of the Renaissance. In 1607 Bacon sketched a few years later the plan of his "Great Instauration," he designated the "Advancement of Learning," as a temporary filling of the first place on the "Partitiones scientiarum," and in his last years he made a greatly amplified Latin translation of it ("De Augmentis et Dignitate Scientiarum") to be incorporated in the great work. In 1606-07 he published the "Outline and Argument" ("Delineatio et Argumentum") of the second part of the Instauration, giving a brief general account of his new induction. In 1607 the "Cogitata et Visa de Interpretatione Naturae, sive de Scientia Operativa" were published as an introduction to some investigations on motion. The "Cogitata," cover most of the ground afterward traversed in the first book of the "Novum Organum." The "Redargutio Philosophiarum" (1609), one of the best specimens of Bacon's Latin style, contains an imaginary speech of a French philosopher to his disciples, and sets forth new Author's ideas about the fruitlessness of the older philosophies. The "De Sapientia Veterum," though it lies outside the immediate scheme of the "Instauration," and might perhaps be mentioned rather among Bacon's literary works, is a very characteristic production containing a recollection of his theory of ancient mythology as an allegorical embodiment of moral and scientific wisdom. This primitive wisdom was fond of extolling to the disparagement of the later philosophy of Aristotle, again in revolt. In 1611 and 1612 fall a number of scientific treatises of less importance. Not until 1620, after his long struggle to political power and on the eve of his fall, did Bacon publish the "Novum Organum," though much of its material had been anticipated in his earlier writings. Prefixed to the work is a "distributione operis" for the whole "Instauration," which was planned to contain the following parts: 1. Partitiones Scientiarum (represented temporarily by the "Redargutio Philosophiarum"); 2. Novum Organum (the new instrument of inductive method); 3. Phænomena Universi; 4. Scala Intellectus (by which fanciful title he meant to indicate the operation of the new method in passing gradu-
ally from less general to more general principles (per scalam veram); 5. Prodromi Philosophiae Secundae (to contain some tentative discoveries as Bacon had made without using the new method); 6. Philosophia Secunda, sive Scientia Activa (a final embodiment of the results of the new philosophy). The first book of the ‘Novum Organum’ was still introductory in character, discussing the uses of the older philosophies, the traditional errors of mankind, and the grounds of hope in the future of science. Bacon’s optimistic devotion to science has been not inleptly compared with that of the young Renan. His classification of the ‘idols’ (phantasms or delusions) of the tribe, the cave, the marketplace and the theatre, has become a literary commonplace. In the second book the new induction itself is finally expounded and illustrated by a study of the nature of heat. The exposition is incomplete and falls short, as in the nature of things it was bound to be, of what Bacon himself apparently hoped to achieve, namely, a mechanical method of invention. Bacon never pursued the theory further, and in his latter works he turned from the new method of instrument, toward other parts of his great scheme. The ‘Parasceve ad Historiam Naturalem’ (1620) is a brief and incomplete preparation for the third part of the Instauration, and was followed in 1622 by the ‘Natural and Experimental History for the Foundations of Philosophy, or Phenomena of the Universe, being the Third Part of the Great Instauration.’ This treatise which was to take up winds, density and rarity, gravity, sympathy and antipathy of things, and a variety of other topics, was also left in a fragmentary state. In 1623 appeared the ‘De Augmentis’, which was to supersede the English ‘Advancement of Learning’ as the first portion of the Instauration. Probably about 1624 Bacon wrote the ‘Sylva Sylvarum’ (published in 1627), an ill-classified collection of materials for natural history. Its contents belong in considerable degree to the realm of folklore and superstition, and Bacon’s detractors have found in the work some of their best grounds of attack on his character as a man of science. It was his belief, however, stated in the ‘Advancement of Learning’ that a collection and comparison even of the erroneous opinions of mankind might give useful guidance in the pursuit of truth. Under the titles ‘Scaena Intelectus’ and ‘Prodromi sive Anticipationes Philosophiae Secundae’ Bacon wrote at a later date but uncertain, date two more prefaces which filled the fourth and fifth gaps in the ‘Instauration.’ They were his last philosophical writings.

Bacon’s position in the history of science and of philosophy has been very differently estimated. He constructed no philosophical system, and one would search his writings in vain for much discussion of the great problems which have divided the schools of metaphysics since Descartes. As a man of science his shortcomings are still more notable. He was commonly unsuccessful in his own investigations and ill-informed about the best work of his contemporaries. He was hardly possessed at all of what is now understood by the scientific mind. Yet there is much justification for the traditional view of him as the father of modern philosophy and the primary instigator of modern scientific progress. If not the originator, he made himself at least the leading exponent of the revolt against the Aristotelian, or more properly the scholastic, tradition, and he profoundly influenced the English realists of the next generations. In ethics his distinction between ‘individual or self-good’ and ‘good of communion’ points forward to the doctrine of the later utilitarians. And science certainly owed him a large debt for the formulation and urgent presentation of the ‘great question’. No one, of course, will maintain that Bacon invented induction. Macaulay, in his familiar account of the plain man and the mended pies, has made some sport of his claims to originality in this matter. But a more judicious estimate would recognize the high and lasting educational value of the ‘Novum Organum.’ And Bacon’s broad outlook and fertile imagination enabled him to lay down the lines of scientific progress and to win recruits for the work. He furnished his followers not only with an improved method, but also with a more vital aim—that of practical service. In his revolt against Aristotle and the schoolmen he constantly dwelt upon the fruitlessness of the earlier philosophies, and one of the most eloquent passages in the ‘Advancement of Learning’ sets forth the ideal of human service as the goal of scientific effort. This aim has come to be called Baconian, so much so that Bacon is often charged with having ignored or denied the more purely intellectual purposes. But the charge is extreme. He thought it wise, in view of the sentiment of his time, to emphasize particularly the practical aim; but he recognized veritas et utilitas (‘Novum Organum’, I, Ap. 124) as co-ordinate ends of study. Finally, in spite of his deficiency in investigation, Bacon made some noteworthy discoveries in pure science. His explanation of heat as a mode of motion is quoted by Tyndall as a striking anticipation of the modern doctrine. On the whole, however, it was as a prophet or leader, rather than as a productive scholar, that Bacon served learning best.

By far the greater part of Bacon’s writings (apart from his state papers, legal works and copious personal memoranda) dealt with philosophy and science, and bore directly or indirectly upon the construction of the ‘Great Instauration.’ Some of his more important state papers have been already mentioned in the account of his life. His strictly professional writings (treatises on English law) will be found in the seventh volume of the Spedding and Ellis edition of his collected works. His personal memoranda, which permit an intimate view of his life and character, are published in Spedding’s ‘Letters and Life’ (the highly characteristic ‘Commentarius Solutus’, of the year 1608, in the fourth volume). Besides all these productions of his scholarship and his professional life he made eminent contributions to history and to pure letters. His ‘History of Henry VII’ (1621), which has been accepted by later scholars as essentially sound, ranks with the best historical writing of its age in England. And in his ‘Memoirs of Elizabeth’ (‘In Felicem Memoriam Elizabethe’ (1607), another of Henry, Prince of Wales, who died in 1612, and fragments on the reign of Henry VIII and on the accession of James I. [Footnote: 23 Bacon]
In pure literature Bacon's reputation rests chiefly on three works: the 'Advancement of Learning' (which has been already alluded to), the 'Essays,' and the 'New Atlantis.' The first two of these, curiously enough, he translated, or had translated, into Latin in order to secure them a wider and more permanent public. The 'New Atlantis' (first published by Rawley in 1622 but of course unprinted before 1624), is a fragmentary sketch of an ideal commonwealth, and in particular of an ideal palace of invention called Solomon's House.—a great establishment of scientific research such as Bacon longed to see founded. The book, which expresses the idealistic spirit of the Renaissance, shows Bacon at his best. The description of Solomon's house is said to have led to the establishment of the Royal Society. The 'Essays,' which were designed to come home to men's business and bosoms, are better known than anything else that Bacon wrote. They deal with many subjects and are characterized by ripe reflection and consummate mastery of style. Bacon had them in hand during the last ten years of his life. The last edition published the first edition in 1597, and twice revised and enlarged the collection (in 1612 and 1625). The title is supposed to have been suggested by the 'Essais' of Montaigne, and there are occasional resemblances between the two works in subject matter; but Bacon was not largely indebted to any source, and his conception of the essay was totally different from the personal and leisurely discourses of Montaigne. Brief thoughts, set down rather significantly than curiously, was his own characterization of them in the dedication of the second edition; and although some of the later essays contain passages of adorned and sustained eloquence such as were lacking in the earlier ones, the general type was maintained to the end.

A small number of religious works, in elevated thought and style, remain to be mentioned: the 'Meditationes Sacre' (published in 1597), the 'Confession of Faith' (written before 1603), a prayer, and Bacon's only authorized verse, 'A Translation of Certain Psalms into English Verse' (1624). A poem on 'The World,'—"the world's a bubble, and the life of man less than a span,—is sometimes ascribed to him, but is of doubtful authorship. See Essays of Bacon.

Bibliography.—The dates of Bacon's chief works have been mentioned in the body of the article. The standard collected edition is that of Spedding, Ellis and Heath (London 1857-99). Single works have in several cases been published separately with more elaborate annotation; among the best of such editions being the 'Novum Organum' by T. Fowler (Oxford 1878), the 'Advancement of Learning' by W. A. Wright (Oxford 1890), the 'Essays' by Archibald Whately (London 1856), E. A. Abbott (London 1896) and S. H. Reynolds (Oxford 1890), and the 'New Atlantis' by G. C. Moore Smith (Cambridge 1900). A useful reprint of the three editions of the 'Essays' has been made, 'The Essays of Francis Bacon,' London Reprints, No. 27 (1871). For the life of Bacon the great source of original materials is Spedding's 'Letters and Life of Bacon' (7 vols., 1861). A brief digest of the material was issued in two volumes, 'The Life and Times of Francis Bacon' (Trübner 1878). Short biographies of value have been written by R. W. Church, 'Francis Bacon' (London 1884), Thomas Fowler, 'Francis Bacon' (New York 1881), E. A. Abbott, 'Francis Bacon, an Account of His Life and Works' (London 1885), S. R. Gardiner (in the 'Dictionary of National Biography'), and John Nichol, 'Francis Bacon, His Life and Philosophy' (London 1898-99). Macaulay's essay is still the best of his kind, though by no means just or satisfactory estimate of the man and his work. On Bacon's philosophical doctrines and influence one should consult, besides the standard histories of philosophy, Ellis's general introduction to the philosophical works, Kuno Fischer's 'Francis Bacon of Verulam: Realistic Philosophy and Its Age' (Eng. translation by John Oxenford 1857), Fowler's elaborate commentary on the 'Novum Organum' and his 'Francis Bacon.' The history of Baconianism is discussed by G. David Brewster, 'Memoirs of the Life, Writings, and Discourses of Sir Isaac Newton' (Edinburgh 1855), and Justus von Liebig, 'Ueber Francis Bacon von Verulam und die Methode der Naturforschung' (München 1862).

More recent studies are: Booth, W. S., 'Some Acrostic Signatures of Francis Bacon' (Boston 1909) and Cunningham, G. C., 'Did Bacon Die in 1626?' (Baconiana, series 3, London 1916).

FRED N. ROBINSON, 
Professor of English, Harvard University.

BACON, Henry, American architect: b. Waseka, Ill., 28 Nov. 1866. He was graduated at the University of Illinois in 1888, where he won the Rotch traveling scholarship, under which he spent two years in study in Europe. From 1888 to 1897, with the exception of 1890-91, he was with the firm of McKim, Mead and White. In 1897 he helped form the firm of Brite and Bacon. Since 1903 he has practised alone. He has designed several important buildings and was the winner in the competition for the Lincoln Memorial in 1913. He is a fellow of the American Institute of Architects and member of the National Institute of Arts and Letters.

BACON, John, English sculptor: b. London 1740; d. 4 Aug. 1799. In early life he was employed in modelling small porcelain ornaments, and while yet an apprentice he formed a project for making statuary of earthenware. In 1763 he began to work in marble; and shortly afterward invented an instrument for transferring the form of the model to the marble. In 1768 he became a student of the Royal Academy, and next year he obtained the first gold medal for sculpture given by that society; the following year he was chosen an associate, and in 1778 made a full member. His chief works are two groups for the interior of the Royal Academy, and the statue of Lord Blackstone for All Souls' College, Oxford; another of Henry VI for Eton College; the monument of Lord Chatham in Westminster Abbey; and the statues of Dr. Johnson and the philanthropist Howard in Saint Paul's Cathedral.
BACON, John Edmund, American lawyer: b. Edgefield, S. C., 3 March 1832; d. Columbia, S. C., 17 Feb. 1897. He was graduated at South Carolina College, 1851; Litchfield (Conn.) Law School, and admitted to the bar, 1854. He was secretary of the United States legation at Saint Petersburg, and married a daughter of ex-Governor Pickens, then Minister to Russia. He resigned in 1860, entered the Confederate army, and rose to the rank of major. He was one of the negotiators for the restoration of South Carolina to the Union, 1866; and to him was chiefly due the reopening of South Carolina College by act of the legislature in 1873. In 1886 he was appointed charge d'affaires in Uruguay and Paraguay.

BACON, John Mackenzie, English clergyman and scientist: b. 1846; d. 1904. He was educated at Trinity College, Cambridge, and entered the ministry of the Church of England in 1870. In 1889 his publication, 'The Curse of Conventionalism; a Remonstrance by a Priest of the Church of England,' caused widespread opposition and led to his retirement from the ministry. He at once entered on the study of astronomy and aeronautics. He led two eclipse expeditions for the British Astronomical Association—that to Bundar, India, in 1896, and that to Wadesboro, N. C., in 1900. He made a record voyage in English ballooning in 1899. He demonstrated that sound travels more rapidly downward than upward, and that the ocean floor is visible from great heights and can be photographed. His 'By Land and Sky' (1900) contains accounts of his ballooning investigations and the results of his experiments in acoustics, meteorology and other subjects. He published also 'The Dominion of the Air' (1902).

BACON, John Mosby, American military officer: b. Kentucky, 17 April 1844; d. Portland, Ore., 19 March 1913. He served in the Union army through the Civil War; was appointed captain in the 9th United States Cavalry, in 1866, and colonel of the 8th Cavalry in 1897. On 6 May 1866, he was appointed brigadier general of volunteers and placed in command of the Department of Dakota. Subsequently, he was assigned to duty in Cuba, till 8 May 1899. He was retired in 1902.

BACON, Josephine Dodge Daskam, American author: b. Stamford, Conn., 17 Feb. 1876. She was graduated at Smith College, A.B., 1898, being class orator on graduation, and while in college was editor-in-chief of the Smith College Monthly. Since graduation has been continuously occupied with literature as contributor of stories and poems to magazines, and as author of books: 'A Sister's Vocation, and Other Stories' (1900); 'Smith College Stories' (1900); 'The Imp and the Angel' (1901); 'Fables for the Fair' (1901); 'Whom the Gods Destroyed' (1902); 'Poems' (1903); 'Middle-Aged Love Stories' (1903); 'Memoirs of a Baby' (1904); 'Domestic Adventures' (1907); 'Ten to Seventeen' (1907); 'An Idyll of All Fools' Day' (1908); 'Margarite's Soul' (1909); 'In the Border Country' (1909); 'The Biography of a Boy' (1910); 'While Caroline was Growing' (1911); 'The Inheritance' (1911); 'Strange Case of Dr. Stanchon' (1913); 'To-day's Daughter' (1914); 'Open Market' (1915). She also compiled 'Best Nonsense Verse' (1901).

BACON, Leonard, American clergyman: b. Detroit, Mich., 19 Feb. 1802; d. 24 Dec. 1881. He was graduated at Yale in 1820, and studied theology at Andover, Mass. In 1825 he became pastor of the First Congregational Church in New Haven, a post which he held officially, though not always actively, until his death. He was professor of didactic theology in Yale (1866-71). He was throughout his life an active opponent of slavery. In 1847 he joined with Drs. Storrs and Thompson to found the New York Independent, in the joint editorship of which he continued for; 'History of the New England Churches.'

BACON, Leonard Woolsey, American clergyman: b. New Haven, Conn., 1907. A son of Leonard Bacon, he was graduated at Yale in 1850, and was successively pastor of Congregational churches in Litchfield, Conn., Brooklyn, N. Y., and Stamford, Conn. He spent ten years in Europe, and was engaged in Geneva as a translator, preacher and writer. He returned to America in 1878, and from that year until 1882 was pastor of the Park Congregational Church of Norwich, Conn., and subsequently of other Congregational and Presbyterian churches. He edited Luther's 'Deutsche geistliche Lieder' (New York 1883), and published 'A Life Worth Living: Life of Emily Bliss Gould' (1878); 'Hermes and Polioetes, with Sundry Essays in Church History' (1899); 'The Congregationalists' (1898); 'Young People's Societies,' with C. A. Northrup (1900); 'The Congregationalists' (1904).

BACON, Nathaniel, American insurrectionary leader: b. Friston Hall, Suffolk, England, 2 Jan. 1642; d. 26 Oct. 1675. His great-grandfather was cousin to Sir Brooke, his mother, a Brooke, was daughter of a Suffolk knight. He entered St. Catherine's College, Cambridge, in 1660; took M.A. 1667; studied law at Gray's Inn, London, and traveled on the Continent. He found life in England on the income his father allowed him, and the latter gave him £1,800 outright to emigrate to Virginia, where his cousin, Nicholas Bacon, had been living since 1650. He arrived in the latter part of 1673 with a young wife, daughter of Sir Edward Duke, and soon became a member of the governor's council, as was his cousin; and settled on a plantation some 20 miles below Richmond, on the James, called 'Curle's Wharf.' He was a member of the Virginia Assembly, and part of the site of Richmond, the attack on which by the Indians was part of the raid that brought on the imbroglio known as 'Bacon's Rebellion,' which see for his career and fate.

BACON, Sir Nicholas, English statesman and father of Francis Bacon: b. Chislehurst, 1509; d. 1579. He was graduated at Jesus Christ College, Cambridge, in 1527, and was called to the bar in 1533. He received a large property from confiscated monastery lands and was appointed attorney to the Court of Wards and Liveries. He stood in high favor with Edward VI, and although he was a stanch
Protestant, was not persecuted and even retained his office of attorney during the reign of Mary. From 1558 to 1579 he was Lord High Chancellor and one of the Great Secretaries under Elizabeth. By virtue of his office he presided over Elizabeth's first Parliament. He took a prominent part in the debates preceding the Act of Supremacy. He generally supported the policies of Cecil, his brother-in-law, although he was opposed to the Protestant policy. His able qualities as a statesman were invaluable at the critical period in English history when Elizabeth succeeded to the throne.

**BACON, Robert**, American financier and diplomat; b. Boston, Mass., 5 July 1860. He was graduated at Harvard in 1880, and soon after entered the banking firm of Lee, Higginson & Company of Boston; from 1883 to 1894 he was a member of the firm of E. Rollins Morse & Brother and of J. P. Morgan & Company from 1894 to 1903, when he retired from active business life. He had been long a close student of foreign affairs and in 1905 was appointed first assistant Secretary of State under Elihu Root. When the latter entered the Senate in 1909 Mr. Bacon became Secretary, and in the same year in which he was made President Taft Ambassador to France, serving from 1909 to 1912. He was a member of the board of overseers of Harvard University, 1889-1901 and 1902-06, and was made a fellow of the University in 1912.

**BACON, Roger**, English monk and philosopher; b. near Sandwich about 1214; d. 1294. He first entered the University of Oxford, and afterward went to that of Paris, where he seems to have distinguished himself much by successful study and teaching, and received the degree of doctor of theology. About 1250 he returned to England, where he entered the order of Franciscans, fixed his abode at Oxford, and devoted himself to his studies in natural philosophy, chiefly in alchemy, chemistry and optics. Means were furnished him by generous friends of science, whose contributions enabled him to purchase books, to prepare instruments and to make the necessary experiments. In examining the secrets of nature he made discoveries and deduced results which appeared so extraordinary to the ignorant, that they were believed to be works of magic and he was brought under suspicion as a dealer in the black art. There is clear evidence in his writings that he accepted the Aristotelian theory of stellar influence on the minds and wills of men, not indeed directly, but through the medium of the body. Such views brought him into conflict with the teachings of the Church on free will, and in 1257 he was sent to Paris, where he was kept in confinement for 10 years. In 1267 Bacon wrote a work under the title of 'Opus Majus,'—see article following—giving a connected view of the different branches of human knowledge, supplemented soon after by two other works, namely 'Opus Secundum' and 'Opus Tertium.' Under Clement's successor, Nicholas III, the general of the Franciscans, Jerome of Ascoli, declared himself against Bacon, forbade the reading of his writings, and issued an order for his imprisonment, which was annulled by Pope. This new confinement lasted from 1278-92; and when Jerome of Ascoli was elected Pope, under the name of Nicholas IV, Bacon vainly endeavored to convince him of the innocence and utility of his labors, by sending him a treatise 'On the Means of Avoiding the Infirmities of Old Age.' After the death of Nicholas IV he regained his liberty, and returned to Oxford, where he wrote a 'Compendium of Theology.'

Though an extraordinary man, Bacon was a child of his age, and not free from current errors. He believed in the philosopher's stone and in astrology. There are to be found in his writings new and ingenious views on optics; for example, on the refraction of light, on the apparent magnitude of objects, on the magnified appearance of the sun and moon when in the horizon, etc. He describes very exactly the nature and effects of convex and concave lenses, and speaks of their application to the purposes of reading, and of viewing distant objects, both terrestrial and celestial; and it is easy to prove from his writings that he was either the inventor or improver of the telescope. He also gives descriptions of the camera obscura, and of the burning glass. He made several medical discoveries. The discovery of gunpowder has been attributed to him. His writings contain the chemical formula for it, but it is generally supposed that he obtained it from the Arabs, from whose writings he derived other suggestions. He was acquainted with geography and astronomy, discovered the errors of the calendar and their causes, and made a corrected calendar. In moral philosophy, also, Bacon had a number of excellent precepts. His principal works, edited by Professor Brewer, were published in his 'Opera Inedita' (1859).

**BACON, Roger**, his *Opus Majus* (1267 A.D.). Newly edited and published with introduction and full English analysis of the Latin text, by J. H. Bridges (2 vols., 1897). An adequate publication after 630 years of one of the most remarkable productions of the human mind. The work is an exhortation addressed to Pope Clement urging him to initiate a reform of Christian education in order to establish the ascendancy of the Roman Catholic Church over all nations and religions of the world. Its central theme was the consolidation of the Roman Catholic faith as the supreme agency for the civilization of mankind. Its author wished to see recognition of 'all the sciences, since all are part of one and the same complete wisdom. He first gave experiment the distinct and supreme place which was later revived by Descartes, and carried out in modern science. He formed a clear conception of chemistry, in his day not yet separated from alchemy; and of a science of living things, as resulting with chemistry from physics. In the part of his work dealing with moral philosophy, Bacon makes the first attempt ever made at the comparative study of the religions of the world. His protest against the intellectual prejudices of the time, his forecasts of the art of industry and invention, the prominence given to experiment, alike as to the test of received opinion and the guide to new fields of discovery, render comparison with Francis Bacon unavoidable. In wealth of work, in originality of conception, Francis Bacon was immeasurably his
superior. But Roger Bacon had the sounder estimate and the firmer grasp of that combination of inductive with inductive method which marks the scientific discovery.

BA-CÓN, Philippine Islands, a town in the province of Albay, Island of Luzon. Pop. about 14,540.

BACON, the name given the sides of a pig which have been cured or preserved by salting with salt and saltpetre, and afterward drying with or without wood smoke. By the old process of rubbing in the saline mixture, the curing occupied from three to four months. The method now adopted on a larger scale is to place the prepared flitches in a fluid pickle. The pickling, drying and smoking now occupy not more than six weeks. Bacon may be called the poor as well as the rich man's food. By the former it is prized as a necessary of life; by the latter, for its exquisite flavor. The nitrogenous, or flesh-forming, matter in bacon is small, or pound yield less than one ounce of dry, muscular substance, while the amount of carbon compounds, or heat givers, is large, exceeding 60 per cent. Its digestibility, however, owing to the large proportion of fat it contains is not less than that of beef or mutton.

BACON BEETLE (Dermestes lardarius), an insect, the larva of which destroys bacon, lard and furs.

BACONIAN PHILOSOPHY, the inductive philosophy of which it is sometimes said that Lord Bacon (q.v.) was the founder. This, however, is an exaggerated statement. What Lord Bacon did for this mode of rationation was to elucidate and systematize it; to point out its great value, and to bring it prominently before men's notice; lending it the support of his great name at a time when most of his contemporaries were satisfied with the barren logic of the schools. The triumphs of modern science have arisen from a resolute adherence on the part of its votaries to the Baconian method of inquiry.

BACON'S REBELLION, in Virginia, 1675. The English Navigation Acts of 1661 and 1660, restricting colonial trade to England and its colonies, had produced universal distress in Virginia, forcing it to buy and sell to the home monopolists at their own price; tobacco, not only the chief produce, but the chief currency, became almost worthless. In 1667 the smaller landholders were reported on the brink of rebellion, and in 1673 there were meetings to refuse payment of taxes. Meantime the corrupt civil service of the colony, place-hunters sent over by Charles II to be rid of them, were plundering the planters by means of the export duty, in collusion with the governor, Sir William Berkeley (q.v.); and the latter was fattening on a fur trade with the Indians. To save himself from the opposition of criticism of the masses whom he hated and despised, and the abstention of the group of rich planters who formed his council, he kept his legislature of 1662 strongly royalist from the excitement of the Restoration,—in office till 1676 by annual adjournments without new elections; he had also abolished the university, which substituted a proprietary qualification. This built up a strong opposition, including some of the most solid citizens. In
reciting the colonial grievances. This latter was sent off with a secret note from Berkeley, disavowing it. Bacon within a month had nearly put down the Indian outbreak, especially by a crushing victory at Bloody Run (near Richmond), when he heard that the governor had proclaimed him and his party rebels, and to escape popular wrath he fled across the peninsula to Accomac. Bacon marched back to Middle Plantation (the site of Williamsburg), launched a manifesto against Berkeley, and drew around him a gathering of some prominent men and a vast number of penniless ones (for the movement was largely a democratic revolt against an overweening aristocracy). They agreed to stand by him even against a royal army; feeling that they were compromised beyond retreat at best, and hoping to hold out till the King could be correctly informed and pardon them. Bacon carried on the Indian campaign till September, thoroughly stamping out the danger to the colony; meantime sending an expedition to capture Berkeley, which was its rival in the colony, with about 1,000 militia by promising them the confiscated estates of the rebels, and reoccupied James-town; Bacon marched against him, drove him to Accomac once more, and burnt Jamestown to the ground. But he had taken malaria there, and while invading Gloucester County to attack Major Brent was stricken down, and died 26 October. The rebellion at once collapsed, and Berkeley wreaked a frightful vengeance upon Bacon's adherents. See BERKELEY, Sir WIL- LIAM. For authorities, besides new documents published in *Virginia Magazine of History* (1893-98), consult the *Century Magazine*, Vol. XL, under "Under Nathaniel Bacon," by Edward Eggleston, and John Fish's "Old Virgin and Her Neighbors," 1897, Vol. II.

**BACOOR, bā'kōör,** Philippine Islands, a town of the province of Cavite, on the island of Luzon. Pop. about 12,600.

**BACSANYI, bā'chān-yē,** Janos, Hungarian poet: b. Tapolda, 11 May 1763; d. 12 May 1845. His first work, published in 1785, procured him an appointment in a public office, but a liberal poem cost him this in 1798, as well as his liberty the year after. Some of his finest elegies were composed in prison. In 1796 he went to Vienna, and there he married a few years later the German poet, Gabrielle Baumgarten—an unhappy match. In 1809, Bacsan yi fell under suspicion of translating Napoleon's proclamation to the Hungarians, and was afterward obliged to take refuge in Paris. After the Peace of Paris he lived at Linz, where he died. His collected poems appeared at Budapest in 1827.

**BACTERIA.** Literally the word bacteria, bacteria being its plural, means a tiny rod or thread. However, according to biologists, bacteria constitute a genus of lowly organized microscopic plants having forms other than that indicated by the literal meaning of the word. Briefly defined, bacteria are unicellular vegetation having no tranverse division—they are, therefore, schizomyocytes. In size they are all of microscopic dimensions requiring in most cases to be magnified from 600 to 1,000 diameters before becoming visible and even then they appear in many instances as scarcely more than tiny points. As encountered in nature they assume a variety of forms which may be conveniently arranged into three principal groups, namely: the spheric, the rod-like and the spiral. To the spherical forms the name cocci or micro cocci (cocccus, singular) is given, and, according to the manner in which these tiny spheres develop and their progeny adhere to one another they are further severally designated as staphylococci, that is, cocci clustering irregularly together like grapes in a bunch; streptococci, that is, cocci adhering together like beads or pearls in a strand; diplo-cocci, that is, cocci occurring in pairs; tetracocci, that is, cocci clustered in fours, etc.

To the rod-like group—that is, those which are straight, having one diameter longer than another—the designation bacilli (bacillus, singular) is given. While the structure and mode of multiplication of many of the bacilli is as simple as that of the micro cocci—that is, one cell divides into two, two into four, and so on ad infinitum, without variation—however, there is no species in the group of bacilli that we encounter a number of species provided by nature with a more highly organized and complicated means for propagation and perpetuation. It is here that we encounter a situation of whose life cycle there develops within each rod a single tiny, oval, highly resistant body, a spore as it is called, which may be fairly compared to the seeds of higher plants and which, like the seed, may be gathered and kept for almost indefinite periods, without losing their power of germination. Since such spores of bacteria are markedly tenacious of life even under the most unfavorable of circumstances it is obvious that the power to form spores is an important provision for the preservation of the species. It is of passing interest to know that the ability to form spores is possessed by some, but not many of the disease-producing bacteria, a fact that serves to explain in part the difficulties experienced by the sanitarian in eliminating certain types of infection; for it must be remembered that the infective species capable of entering the spore stage are by virtue of that property much less vulnerable to the action of disinfectants and disinfecting processes than are the species not so endow with this power. The spiral forms, spirils, as they are called, comprise those bacteria having one or more curves in their long axis, that is, those that are twisted like a corkscrew. They are sometimes seen as homogeneous, long spiral threads without segmentation, while again they may consist of short curved segments adhering end to end. Spore formation is not a characteristic of the spiral bacteria.

In structure bacteria are non-nucleated masses of protoplasm surrounded by an enveloping zone allowing in some instances to be but a condensation of the central protoplasm, while in others it partakes somewhat of the nature of mucin. Many of the bacteria exhibit no evidence of independent mobility, while others, by virtue of processes and structures (flagella) move themselves about in fluids in a most energetic manner. As their structure is exceedingly simple, in so far as formed elements are concerned, their mode of nutrition is, physically speaking, correspondingly simple
— that is, the nourishment is absorbed and their waste products discharged directly through the process of osmosis. This being the case it is obvious that bacteria can multiply and perform their physiological functions only under conditions of moisture. Unlike the more highly organized plants bacteria are apparently without special provisions for gaseous exchange; that is, they are devoid of chlorophyll. They obtain their oxygen as such from the free air or from easily decomposable oxygen compounds. In the course of his early investigations in this field Pasteur discovered a group of bacteria that have ever proved to be of the greatest interest — a group that, paradoxical as it may seem, not only does not require free oxygen for its life processes but to the growth of which free oxygen is actually prohibitive. To these species he gave the designation anaerobic to distinguish them from the majority, the aerobic varieties, to which free oxygen is essential. In their relations to higher life bacteria may be regarded as allies or as enemies, according to the nature of the activities under way. Contrary to popular notions that have been more or less prevalent the majority of bacteria have nothing to do with disease production. Their natural role is that of scavengers. They are concerned in nature’s great laboratory, the soil, in working over dead organic matters into forms appropriate to the nourishment of growing vegetation. Since in the course of this conversion dead bodies that would otherwise encumber the earth are caused to disappear they must from both the aesthetic and economic standpoints be regarded as, in the main, benefactors. In this group of saprophytic bacteria, as they are called, is, that those that live on dead matters, we encounter species of the greatest interest and importance. It is here that we perceive the omnipresent forms concerned in the reduction of dead animal and vegetable tissues into such simple forms as carbon dioxide, ammonia and water to be used by higher plants. It is in this group that we find the ever-present nitrifying, denitrifying and nitrogen fixing species—that is, those peculiar kindreds that assist the leguminous plants in assimilating free atmospheric nitrogen; those that oxidize the ammonia of decomposition to the nitrous and nitric acids so essential to plant life, and those that, by their reducing function, reverse this phenomenon; those that convert the objectionable organic matter of sewage and polluted waters into an inert inorganic form and those that, through their specific activities, supply, where circumstances are favorable, the entire commercial world with its supply of saltpetre.

The saprophytic group also comprehends many species used in the arts and industries — such, for instance, as those concerned in the production of certain organic acids; those employed in the manufacture of indigo by the fermentation process and in the preparation of hemp; and those utilized in the manufacture of cheese and butter. In the study of this large group one constantly encounters other species presenting most engaging characteristics — some of these, the chromogenic varieties, have the property of growing very brilliantly in their growth pigments of great beauty — brilliant reds, delicate pinks, rich purples, yellows ranging from the palest lemon to the deepest orange, are those most often encountered. In another group, the photogenic, are species having the emission of light as their most singular peculiarity. When growing these forms glow with a peculiar phosphorescence, and it is significant to note that these luminous varieties have been most frequently encountered on the shores of the sea. The evil odors of putrefaction are the results of saprophytic bacterial development. In the parasitic group of bacteria we encounter those species that exist always at the expense of a living host, either animal or vegetable, and in doing so not only appropriate materials necessary to life, but give off in return waste products that may act as direct poison to the host. Fortunately this is a much smaller group than is the saprophytic mentioned above. In no particulars, save for the fact that they exist at the expense of a living host and cause disease, are the disease-producing bacteria distinguishable from the innocent varieties. The essential difference between the disease-producing and the innocent bacteria lies in the fact that they possess as their most striking physiological peculiarity the power of elaborating poisons, toxins, technically speaking, that have a direct destructive action upon the tissues of their host. In some cases the poisons may properly be regarded as secretions of the bacteria, and under artificial conditions of cultivation, may easily be separated from the living bacteria elaborating them. This is especially true of the poisons of diphtheria and tetanus or lock-jaw. When thus separated such poisons, entirely independent of the living bacteria, retain the specific property of causing the symptoms and many of the pathological changes that characterize the growth of the living bacteria in the tissues. In other cases the poisons cannot be so readily separated; they appear to be an integral constituent of the protoplasm of which the bacteria are composed. This is especially the case with the toxins of bacillus typhosus, bacillus dysenteria and spirillum cholera Asiatica — the organisms concerned in the causation of typhoid fever, epidemic dysentery and Asiatic cholera, respectively. In the case of such other pathogenic species there is little doubt that specific intoxicants are in one way or another elaborated during infection, but as yet they have not been satisfactorily demonstrated. Nevertheless, it may be said that, in general, infection by bacteria is to-day regarded as essentially a chemical phenomenon — that is, as a reaction between the poisons elaborated by the bacteria and the tissues with which they come in contact; the result of the reaction being the partial or complete death of the host in which the phenomenon is in operation.

A. C. Abbott,
Bacteriologist, University of Pennsylvania.

BACTERICIDE, any agent capable of killing bacteria. The older terms, biocide, germicide, etc, are no longer used, and in the word bactericidal has come to mean something more definite and exact than the older terms.
Heat is one of the best bacterial agents. Cold is not bactericidal. Even the lowest temperature do not destroy the life of bacteria. The metallic salts and the phenols are the bactericidal agents most in use. The aldehydes, formaldehydes, benzaldehydes are also efficient. See ANTISEPTIC; GERMICIDES.

BACTERIOLOGY. Though generally considered a modern science, and perhaps properly so regards certain of its most important developmental aspects, bacteriology in reality dates from the observations of the Dutch investigator Leeuwenhoek in the latter part of the 17th century. With simple lenses ground by himself, Leeuwenhoek discovered in the mouth, in the excreta, in water and in other matters examined by him, the presence of countless bodies of smaller dimensions than anything hitherto seen. These "animalcules," as he called them, were often observed to move through as plout in a remarkably energetic manner, and, judging from his text and illustrations, they were doubtless the bodies we now recognize as bacteria. Leeuwenhoek's observations were immediately seized upon by the philosophers of the day as offering an explanation for many hitherto unexplained phenomena. So general became the belief in a casual relation between the "animalcules" and all manner of disease conditions that for a time, we are told, there prevailed almost a "germ mania."

To the investigators of the time the question of greatest fascination in connection with this newly-discovered world was as to its origin. Many believed and stoutly maintained that the "animalcules" were the products of metamorphosis of either living or dead tissues of more highly organized beings; others that they arose de novo in "putrescent atmospheres"; many suspected them of spontaneous generation in some other mysterious way; while a few maintained, on experimental evidence, that they were probably the descendants of pre-existing creatures of the same kind. Singular as it may seem it took nearly two centuries to close finally that debate and to prove that the dictum of Harvey "omne vivum ex uno" or better, its appropriate "omne vivum ex uno" was as applicable to the microscopic as to the world of higher beings. In its modern aspect bacteriology dates from the epoch-making investigations especially of Koch and of Pasteur conducted during the 8th decade of the 19th century. During that period observations were made and methods of work devised that went far toward starting the subject on its career as a science. In the study of bacteria, as of all other forms of life, it is essential to a correct interpretation of its phenomena that the observations be made upon isolated species. Prior to the period mentioned this was not possible, for the methods in vogue were insufficient for the separation of these minute creatures from one another. For the development of the science probably the most important step was, therefore, the introduction by Koch of trustworthy methods for the separation of individual bacterial species from mixtures of them, and for the more or less complete determination of their specific morphological and physiological peculiarities; that is, for the isolation and study of bacteria in "pure cultivation," as it is technically called. Up to the time of Koch's classical research upon the methods of investigating bacteria, their study had been conducted in fluid materials; that is, in infusions of either vegetable or animal matters, in which most bacterial species develop with remarkable activity. Since many totally distinct species are indistinguishable from one another by their size, shape and general appearance, it was obviously impossible, by the methods of study, either to be certain if one were dealing with one or more species in the fluids in which they were growing, or to separate the one from the other in case of confusion. Koch appreciated this defect and suggested the use of solid materials as culture media, hoping thereby to reproduce the conditions so often seen when such organic matters as bread, potato, cheese, etc., become moldy on exposure to air. Here one sees the mold not always as an inextricable mixture of different species, but often as sharply isolated islands of beginning growth—as mold colonies—so to speak. These, on examination, are usually found to consist of single species, and on a slice of moistened bread one may often observe several colonies of distinct species on the same side without, for a time at least, encroaching one upon another. By appropriate methods it is easily possible to transplant such colonies, free from admixture with other forms, and study them as "pure cultures." But such substances as bread, potato, etc., are not in general as well adapted to the study of bacteria as to that of molds. Appreciating this Koch demonstrated that the addition of gelatin to the infusions that had been employed for the successful cultivation of bacteria converted them into practically solid culture media without robbing them of any of their useful properties; and that by the appropriate employment of such solid media it was easily possible to separate as pure cultures the individual species composing the mixtures of bacteria that one desired to analyze. Thus, for example, if a tube of gelatinized beef tea, freed from all living bacteria by heat, be gently warmed until liquefied, and be then inoculated with a mixture of several species of bacteria, growth at once begins and if left in the test-tube progresses in about the same manner as if the beef tea did not contain gelatin; but if while still warm and fluid the contents of the tube be poured out upon a flat, cold surface, the increased area causes the bacteria to become more widely separated from one another and the lower temperature results in the solidification of the gelatin, so that each bacterium is fixed in its new position. It at once begins to germinate, and presently a "colony" results; the surface ultimately becomes studded with such colonies. As the colonies from the different species differ from one another in many ways—in outline, texture, color, effect of their growth on the gelatin, etc.—it is easily possible, after a little practice, to distinguish them by the pure culture method of transplanting them to tubes of sterile culture media to study them without the disturbing presence of other species; that is, in pure culture.

The introduction of this method for the isolation and study of bacterial species in pure culture certainly constitutes the most important stimulus to the development of modern
BACTERIOLOGY

bacteriology. By it results were placed upon a more secure basis than ever before, and a confidence in the work such as had never existed was awakened in the minds of all students of the subject.

The studies that had been made by Pasteur upon fermentation; upon the souring of wines; upon the maladies of silk worms, and upon certain fatal epizootics of fowls and domestic cattle; together with Koch's fundamental studies upon the infections of wounds and the appropriate methods of treating them were rich in suggestion to the pioneers in this new field. Within a comparatively brief period after the adoption of the new methods our knowledge of the exciting causes of many hitherto obscure diseases was greatly extended; it was shown to be possible to determine the modes of their transmission and the channels through which infection occurred. The conditions most favorable to the successful action of a host of substances employed for the purpose of disinfection were accurately determined. And each of the work observations were made that indicated the possibility of successful vaccination against disease through the use of attenuated (weakened) living cultures of specific disease-producing bacteria. One of the most important outgrowths of modern bacteriology has resulted from its application to the problems of the sanitary engineer. As a result of these studies we know that sewage, polluted waters and polluted soils tend naturally to revert to a state of purity if their pollution be checked and that this progressive purification is due in large part to the activities of the bacteria located within them. It has been found that by the appropriate adjustment of conditions the normal activity of the bacteria may be so greatly accentuated as to constitute them the most important factors in the purification of polluted waters and sewage. The utilization of these facts is conspicuously illustrated in the purification of water by the process of natural sand filtration and in the purification of sewage by that of the septic tank process, etc. In these methods living bacteria and other living microscopic organisms, and they alone, are the instruments through which the results are attained. The surface of the soil in the filtration fields serve only as objects to which the micro-organisms can attach themselves and multiply. By the normal life processes of the bacteria the polluting organic matters in the fluids to be purified are used up and inert matters given off as a result.

In the study of agricultural phenomena from the bacteriological standpoint knowledge has been equally extended. At one time it was taught that atmospheric nitrogen representing roughly 80 per cent of the air by volume was of no direct biological significance. This view has in later years been entirely revised. We have learned that the leguminous plants when assisted, symbiotically, by certain soil bacteria, are enabled to make up their nitrogen deficit in large part from the free nitrogen of the air; a fact that sheds important light upon the significance of plants of this type in the practice of rotation of crops. Under normal conditions instead of impoverishing the soil, the legumens — with the aid of the bacteria attached to their roots, may actually enrich it. The application of bacteriological methods to the study of dairy processes has revealed the interesting fact that the delicate flavors to which butters and cheeses owe their commercial value are directly due to the products of growth of certain species or groups of species of bacteria and more highly organized molds. A number of such species have been isolated and are kept in pure cultivation so that by purposely inoculating the fresh cream with them butter of uniform flavor may with comparative ease be produced.

The most important results of applied bacteriology are those in connection with preventive medicine. Early in the course of the work it was discovered by Pasteur that certain virulent pathogenic bacteria when kept under particular conditions gradually lost their disease-producing power, wholly or in part, without their other life properties being conspicuously disturbed. If injected into animals when in this attenuated state the result was a mild, temporary and modified form of infection usually followed by complete cure. And finally, animals so treated were immune from the activities of the fully virulent bacteria of the same species; in other words, they had been protected from the fatal injection by vaccination with an attenuated species. The subsequent developments growing out of this observation have resulted in the annual saving of millions of money through the successful vaccination of sheep, horses and bovines against the fatal infection known as spastic fever or anthrax, and, though less successful, of other domestic animals against other infections also. In the closer analysis of the means by which infective bacteria cause disease it soon became evident that it is through the elaboration of specific poisons; sometimes easily separated from the bacteria, at others so intimately associated with the bacterial tissues as to make their separation difficult or impossible. The question arose as to the effect of the poisons, separated from the living bacteria, upon the animals susceptible to infection by them. The bacteria themselves were found that fatal intoxications often accompanied by the same constitutional symptoms and pathological lesions followed the use of the poisons, just as they would follow inoculations by the hand the particles of the bacteria. In pursuance of this topic it was discovered that if very small, only mildly intoxicating, doses of these specific poisons of bacterial origin were repeatedly injected into susceptible animals, after a while the latter acquired not only a sort of tolerance to them, but a tolerance that was accompanied by the presence in the circulating blood of an antitoxin for these poisons — an antitoxin, as it is called. This reaction has been shown to be possible for a number of specific infections, and in the case of diphtheria has met with such practical success as to be deservedly regarded as the triumph of modern medicine.

BACTERIOLYTIC—BAD LANDS

BACTERIOLYTIC, an agent capable of destroying bacteria and usually applied to some product of the human body or of an animal body, notably blood serum, which when injected into an animal is capable of destroying some form of micro-organism in that animal. The production of specific bacteriolytic sera is one of the great advances in modern medicine and its extension promises much hope for the future treatment of many of the bacterial diseases. Bacteriolytic sera have been made for a number of micro-organisms. See IMMUNITY.

BACTERIUM, a genus of bacteria of the family Bacillaceae, characterized by rod-shaped forms and absence of flagella. They are thus non-motile. A large number of pathogenic bacteria belong to this genus. See BACTERIA; BACILLUS.

BACTRIAN CAMEL. See CAMEL.

BACTRIANA, bak-tri-ä'na, or BACTRIA, a country of the ancient Persian empire, lying north of the Hindu Kush Mountains on the upper Oxus. It corresponded almost with the modern Balkh in Afghanistan. Here many scholars locate the original home of the Aryan or Indo-European family of nations. Its capital, Bactra, or Zariasp, was also the cradle of the Zoroastrian religion. Originally a powerful kingdom, it maintained its independence until the subjugation by Cyrus about 540 B.C., when it became a satrapy of the Persian empire. It was included in the conquests of Alexander and formed a part of the kingdom of the Seleucids until the foundation, about 250 B.C., by Diotitus, of the Greek kingdom of Bactria, which extended to the Indus and which, after a long struggle, was overthrown by the Parthians. Numerous coins with Greek legends have been found in the topes or burial places to the northeast of Kabul.

BACTRIS, a genus of American palms, numbering more than 50 species. The genus is of commercial importance, a tough thread used for net weaving being made from the fibres of Bactris acanthocarpa, and walking-sticks are manufactured from the long, slender stems of Bactris marginata. The fruit of the latter is considered a delicacy.

BACTRITES, bakk-tri'tez, a genus of fossil ammonites, with a straight shell and indented, but not ramified, septa. The genus ranges from the lower Silurian to the Devonian.

BACTRIS, the ancient name of a river in the khanat of Balkh, Afghan Turkestan, upon which Bactria was situated.

BACULITES, bakk'-öl'tez, a genus of fossil ammonites, characteristic of chalk formations, having a straight, tapering shell.

BACUP, bakk'-up, England, town of Lancashire, 18 miles north from Manchester. There are a number of churches, chapels and schools, a mechanics' Institute, courthouse, market-hall, large co-operative stores, etc. The chief manufacturing establishments are connected with cotton spinning and power-loom weaving; there are also iron and brass foundries and machine-shops, dye-works, etc., and in the neighborhood coal-pits and vast stone quarries. Its charter of incorporation was granted in 1882 and since that time great improvements have been made in its condition and appearance. It has a seawage farm for the utilization of town refuse. Pop. about 22,500.

BAD LANDS, a name applied to portions of the arid regions of the west, which present wide areas of hills and ridges of moderate height, bare of sod and intricately broken by numerous gullies and ravines. The principal areas are in the western Dakotas and central Wyoming and smaller examples of bad-land topography are of frequent occurrence in the arid regions in various portions of the world. In the Big Bad Lands of western South Dakota, east of the Black Hills, there is an area of about 2,000 square miles which consists largely of bad lands occupying extensive basins cut in a plateau along the White and Cheyenne rivers. They present wonderfully weird scenery, but are rarely visited by the average sightseer. An extensive area in the valley of the Little Missouri River is crossed by the Northern Pacific Railroad in the vicinity of Medora and many bad-land features are visible near the railroad. Typical bad lands present ridges and mesas from 200 to 400 feet high in greater part, eroded into fantastic shapes and cut by ravines and gullies into an endless variety of rugged buttresses and pinnacles. The materials are mainly light-colored, sandy clays and soft sandstones in nearly bare hills. In their bare slopes are dazzling in the bright sunlight. Most bad land regions were tablelands originally and areas of the old surface remain in level-topped, grass-covered mesas of various sizes, with bad land slopes extending to flat-bottomed valleys of greater or less width. Bad lands exhibit closely the clear relations of topographic form to rock texture, the homogeneous clays being carved into regular slopes in which sandstone layers give rise to benches or protect columns and pinnacles of clay. Bad lands are developed in soft rocks where a region has been so uplifted that there is rapid erosion, under arid or semi-arid climatic conditions. The occasional rains cut gullies which eventually are deepened into ravines and, as the rocks are soft, the erosion progresses more rapidly than vegetation can establish itself. In regions of abundant rainfall, vegetation is so vigorous that it usually forms a protective mantle on all but the steeper slopes, but in arid lands a thin sod is the principal growth and it is quickly removed by the rapid run-off of the torrential rains. The Big Bad Lands of South Dakota have yielded
large numbers of fossil animals of late Eocene age, which have made the region famous as a collecting ground.

N. H. DAFTON.
United States Geological Survey.

BADAGRI, bâ-da-gré, or BADAGRY, a seaport of southern Nigeria, British West Africa. Early in its history it was a noted slave mart, containing important manufactur-
ies, and had a population of 10,000. It was from this place that, in 1825, Clapperton and Lander started to explore the African interior.

BADAJOZ, bâ-da-hôth', the capital of the Spanish province of Badajoz, on the left bank of the Guadiana, which is crossed by a granite bridge of 28 arches. It is a bishop's see and has an interesting cathedral begun in the mid-

tle of the 15th century, its choir richly and finely carved in the Renaissance style. The city, which is only five miles from the Portuguese boundary, is a place of great strength, as be-
fits its stormy history, and with its walls, bastions and forts, presents a noble from.

Almodovar X took it from the Moors in 1235 and it was besieged by the Portuguese in 1600 and 1705. During the Peninsular War Badajoz was besieged by Marshal Soult and taken by him in March 1811 as the result of treach-
ery. An abortive rising took place here in 1812. Badajoz was the birthplace of Morales the painter. Pop. (1910) 35,039.

BADAKSHAN, bâ'dakh-shân', a province of Afghanistan. It has the Oxus on the north and the Hindu Kush on the south; and has lofty mountains and fertile valleys; the chief town is Faizabad. There are lapiz lazuli and ruby mines. The inhabitants—Tajiks and Turks—profess Mohammedanism. Pop. 100,000.

BADALONA, bâ-da-lo'na, Spain, seaport on the Mediterranean, five miles from Barce-

lona. It is situated in a fertile region which produces grapes, oranges and a great variety of vegetables. The town has experienced rapid industrial growth and manufactures wine. There are, besides, shipyards, sugar and petro-

leum refineries and glass works, the latter the largest in Spain. A considerable coastwise trade is carried on. Pop. (1910) 20,957.

BADDECK', a fishing village and summer resort on Cape Breton Island.

BADDERLOCKS (alaria esculenta), an olive-colored sea weed which grows on rocks in deep water on the shores of Europe and Iceland. It has a short cylindrical stem with lateral spore-bearing process and a membra-
nous olive-green frond of 2 to 12 feet long, with a stout midrib. This midrib, together with the fruits, is eaten by the inhabitants of the sea coasts of Iceland, Denmark, Scotland, Ireland, etc., and is said to be the best of the edible tribe "when eaten raw." The name is supposed to be a corruption of balder-locks.

BADEAU, ba'dô', Adam, American military officer: b. New York, 29 Dec. 1831; d. 19 March 1895; was educated at private schools. He served with gallantry in the Union army during the Civil War; was on the staff of Gen-

eral Sherman in 1862-63 and secretary to General Grant in 1864-69; and in the latter year was retired with the rank of captain in the regular army and of brevet brigadier-general of volun-
teeers and was appointed secretary of legation in London. He was consul-general in Lon-
don, 1870-81, and during this period was given leave of absence to accompany General Grant on his tour around the world (1877-78). In 1882-84 he was consul-general in Havana. Af-

ter the death of General Grant he settled against his heirs for payment of services ren-

dered in the preparation of General Grant's "Memoirs," which was satisfactorily settled out of court. His publications include "The Vagabond" (New York 1889); "Military His-
tory of Ulysses S. Grant" (3 vols. 1867-81); "Conspiracy; A Cuban Romance" (1885); "Aristocracy in England" (1886); and "Grant in Peace" (1886).

BADEN, bâ'dên, a grand duchy in the German empire. The Rhine separates it from Alsace on the east and Wurttemberg bounds it on the west. It has an area of 5,823 square miles, with a population of 2,142,833 in 1910. The country is mountainous, being traversed by the lofty plateau of the Schwarzwald, or Black Forest, which attains its highest point in the Feldberg (4,904 feet). The nucleus of this plateau consists of gneiss and granite. In the north it sinks down toward the Oden-

wald, which is, however, of different geological structure, being composed for the most part of red sandstone. The whole of Baden, except a small portion in the southeast, in which the Danube takes its rise, belongs to the basin of the Rhine, which bounds it on the south and west. Numerous tributaries of the Rhine in-

tersect it, the chief being the Neckar. Lakes are numerous and include a considerable part of the lake of Constance. The climate varies much. The hilly parts, especially in the east, are cold and have a long winter, while the val-

ey of the Rhine enjoys the finest climate of Germany. The principal minerals worked are coal, salt, iron, zinc and nickel. The number of mineral springs is remarkably great and of these a few are of considerable extent. The vegetation is peculiarly rich and there are mag-

nificent forests. The cereals comprise wheat, oats, barley and rye. Potatoes, hemp, tobacco, wine and sugar beets are largely produced. Several of the wines, both white and red, rank in the first class. Baden has long been famous for its fruits also. Of the total area, 42 per cent is under cultivation, 37 per cent under forest and 17 per cent under meadows and pas-
tures. The farms are mostly quite small. The manufactures are important. Among them are textiles, tobacco and cigars, chemicals, ma-

chinery, pottery ware, jewelry (especially at Pforzheim), wooden clocks, confined chiefly to the districts of the Black Forest; musical boxes and other musical toys. The mineral production is comparatively unimportant; the chief products are salt and building stone. The capital is Karlsruhe (pop. 135,000), about five miles from the Rhine; the other chief towns are Mannheim, Freiburg-im-Breisgau, and a Roman Catholic university, Baden and Heidelberg. Heidelberg has a university (Protest-
tant), founded in 1386, the oldest in the present German empire. The railways have a length of 1,450 miles and are nearly all state property.
Typical views in Big Badlands of South Dakota, showing pinnacles of hard clay capped by sandstone, the sodless slopes, and in the distance a remnant of the original plateau out of which the Badlands are eroded.
In the time of the Roman empire, southern Baden belonged to the Roman province of Rhaetia. Under the old German empire it was a margravate, which in 1533 was divided into Baden-Baden and Baden-Durlach, but reunited in 1791. The title of grand duke was conferred by Napoleon in 1806 and in the same year Baden was extended to its present limits. The Constitution dates from 22 Aug. 1818 and was modified in 1904. Baden entered the North German Confederation for the founding of the German Empire by treaty of 15 Nov. 1870.

The executive power is vested in the grand duke, the legislative in a house of legisla-
ture, consisting of an upper and a lower chamber. The former consists partly of hered-
ity members, eight members elected for eight years by the landed nobility, the archbishop of Freiburg and the Protestant prelate and two representatives of state universities; the latter consists of elected representatives of the people. The revenue is mainly derived from taxation on land and incomes and the produce of crown-lands, forests and mines. The revenue in 1912 was 105,146,683 marks. Baden sends three members to the German Bundesrat, or Federal Council, and 14 deputies to the Reichstag.

Two-thirds of the population are Roman Catholics, the rest Protestants.

**BADEN**, Switzerland, town in the canton of Aargau. The town (Ober-Baden, or Baden-im-Aargau) is 12 miles northeast of Aarau, on the left bank of the Limmat. It has a town-hall, a handsome Roman Catholic church, a convent, monastery, hospital, etc., and is celebrated for hot sulphurous baths, employed in treatment of gout, rheumatism and cutaneous diseases. The hottest springs have a temperature of 116° F. The Romans were well acquainted with the baths here; and between the 15th and 18th centuries they were the most celebrated in Europe. Pop. about 8,500.

**BADEN-BADEN** (anciently, Civitas Aurelia Aquensis) is a town and a bathing resort in the grand duchy of Baden, 18 miles south-southwest of Karlsruhe. The older part of the town is built on a spur of the Black Forest, overhanging the valley of the little stream Oosbach. The houses here are in general built on the height; the streets mostly narrow and crooked and nearly all steep. The new and larger portion of the town lies below and is rich in fine hotels, elegant villas and handsome private dwellings. The edifices most deserving of notice are the New Palace, standing on an isolated height above the town and surrounded by fine gardens; the town or parish church, containing the tombs of 14 margraves of Baden; the Protestant church, the English church and the new town-hall. Baden has been celebrated from remote antiquity for its thermal baths, which made it a favorite resort of the Romans. The season lasts from 1 May to 31 October and 70,000 visitors arrive annually. Pop. (1910) 22,056.

**BADEN-BEI-WIEN**, bă'den-bé-vin, Austria, a borough of the county of Korneuburg, 7 miles south-southwest of Vienna. It was the Aquis Panoniea, or Cæsarea of the Romans and is still famous for its warm mineral springs, which are frequented during the season by from 12,000 to 15,000 persons, chiefly from the Aus-

**BADEN-POWELL, bă'den-powl', Sir George Smyth**, English politician and political writer: b. Oxford, 24. Dec. 1847; d. 20 Nov. 1896. He was official inquirer for the British government on several important questions, notably on the Bering Sea dispute; was a member of the joint commission in Washington in 1892 and advised in the conduct and preparation of the case before the Bering Sea arbitration tribunal. He was author of 'New Homes for the Old Country: a house of information about Australia; 'Protection and Bad Times' (1879); 'State Aid and State Interference' (1882); 'The Truth About Home Rule' (1888); 'The Land Systems of India' (1892); etc. He was a member of Parliament for Liverpool from 1885 till his death.

**BADEN-POWELL, Sir Robert Stephenson Smyth**, British military officer: b. London, 22 Feb. 1857; was educated at the Charterhouse School; joined the 13th Hussars in 1876; was adjutant in India, Afghanistan and south Africa; assistant military secretary on the staff in South Africa in 1887—89; took part in the operations in Zululand, for which he was highly commended, in 1888; assistant military secretary in Malta in 1890—93; on special service in Ashanti, commanding the native levies, 1895, for which he was brevetted lieutenant-colonel; chief staff officer in the Matabeleland campaign, for which he was brevetted colonel and became lieutenant-colonel commanding the 5th Dragoon Guards in 1897. In the war in South Africa in 1899—1900, he signally distinguished himself by his grand defense of Maleking, Cape Province, holding the town with a small force against repeated attacks, under an almost continuous bombardment, from 15 Oct. 1899 until relieved on 16 May 1900. In recognition of this heroic defense the Queen promoted Baden-Powell to be a major-general. He founded the Boy Scouts organization in 1908. His literary work include: 'Reconnaissance and Scouting' (1890); 'Cavalry Instruction' (1895); 'The Downfall of Prempeh' (1896); 'The Matabele Campaign' (1896); 'Scouting for Boys' (1908); 'My Adventures as a Spy' (1915); 'Indian Reminiscences' (1915).

**BADENI, bă'den-ĕ**, Casimir Felix, Count, Austrian statesman: b. Poland, 14 Oct. 1846; d. Vienna, 9 July 1909. His father, though poor, was a man of intellect and was made a count by the King of Poland just before the birth of Casimir. He also fell heir to a fortune and his two sons received a university education. Casimir entered the Austrian civil service; became district chief at Zolkiw in 1871; Minister of the Interior in 1873; governor of Galicia in 1888; and Prime Minister of
Austria-Hungary, 15 Sept. 1895. In April 1897, because of inability to maintain a Liberal majority in the newly-elected Reichsrath, he resigned with his cabinet, but the Emperor declined to accept his resignation and he remained in office until 28 November, when he again resigned and a new cabinet was organized. The principal feature of his administration and the one which not only led to his retirement from politics but to a long period of political agitation was his introduction of what is known as the "language ordinance," which allowed the official use of the Czech language in Bohemia and Moravia. This measure alienated the Germans and provoked a racial conflict of a most bitter character between them and the Czechs.

BADENWEILER, bā'den-vēlər, Ger-
many, watering place in the grand duchy of Baden, near Mülheim. Its mineral springs are now rated among the indifferent waters and it is of interest chiefly for the ruins of Roman baths which were discovered in 1847. The foundation of the town is referred to the time of Hadrian and the remains of the vapor baths, of which there are excellent specimens, are supposed to be of the same period. The ruins also contain a division for men and for women, each having a large outer court opening into a dressing-room; there is the hot-air bath, the warm bath and the cold bath. The walls and steps are in their original position. The whole structure is 318 feet by 90 feet. There are beautiful promenades and numerous villas in the vicinity and the town contains a grand-
ducal palace dating from the 16th century.

BADGE, a distinctive device, emblem, mark, honorary decoration or special cogni-
zance used originally to identify a knight or distinguish his followers, now worn as a sign of office or licensed employment, as a token of membership in some society or generally as a mark showing the relation of the wearer to any person, occupation or order.

BADGE. George Edmund, American statesman; b. Newbern, N. C., 13 April 1795; d. 13 April 1866; was graduated at Yale College in 1813; became a lawyer at Raleigh; and was judge of the North Carolina Superior Court in 1820-25. He was appointed Secretary of the Navy 14 March 1841, resigning, after the death of President Harrison, and was elected to the United States Senate in 1846 and 1848. In 1853 he was nominated for justice of the United States Supreme Court, but was not confirmed. He served in the State convention called to pass on the question of secession, although opposed to such measure, and after making a strong speech in defense of the Union, was afterward known as a member of the Conservative party.

BADGER, Joseph, American clergyman, one of the earliest missionaries to the country northwest of the Ohio River: b. Wilbraham, Mass., 28 Feb. 1757; d. 5 May 1846. He received his early instruction chiefly from his parents and at the age of 18 joined the Revo-
 lutionary Army. He remained in service for four years, then determined to obtain an education and engage in the Christian ministry. Entered Yale College in 1781, where he main-
tained himself and his scholarship by alternately studying and teaching. He remained a few years in Connecticut, then in 1800 was selected by the missionary society of that State to visit the unsettled parts of Ohio. His work took him from settlement to settlement, often more than a day's journey apart, through a country whose centres were no roads and across rivers without bridges. During the War of 1812 he was appointed by General Harrison chaplain to the army in that district and his knowledge of the country was of great service to General Harrison. On his return to his missionary functions at the close of the war and continued them till 1835, when he re-
tired and lived with his only daughter. During the latter years of his life he received a pension from the United States government.

BADGER, Oscar L., American naval of-
 ficer; b. Windham, Conn., 12 Aug. 1823; d. 20 June 1899; entered the United States navy 9 Sept. 1841; became lieutenant-commander 16 July 1862; commander 25 July 1866; captain 25 Nov. 1872; commodore 15 Nov. 1881; and was retired 12 Aug. 1885. He served on the steamer Mississippi during the Mexican War, taking part in the attack on Alvarado, 1846; led the party that attacked and destroyed the village of Vutia, Fiji Islands, while on the sloop John Adams, 1855-56; and in the Civil War commanded the Alva-
cas flootilla, 1861-62 and the ironclads Patapsco and Montauk, in the operations in Charles-
ton harbor in 1863; and while acting fleet captain on the flagship Wenhawken was se-
verely wounded during the attack on Fort Sumter, 1 Sept. 1863.

BADGER, a stout, burrowing, carnivorous mammal of the fur-bearing sub-family Melina in the family Mustelidae, related to the skunks and weasels, species of which inhabit various parts of the northern hemisphere. Badgers have short legs, elongated toes adapted to digging, heavy jaws with big teeth and great strength, courage and cunning. They wear coats of thick fur usually grizzled in brown and gray, the face is striped and the paws are blackish. The fur is of considerable value and the hairs are used in artists' brushes. The American badger (Taxidea americana) was formerly distributed all over the western part of the United States from the prairie districts of Ohio and Wisconsin to the Pacific coast, but has been exterminated by civilization east of the dry plains, where it is still numerous although not often seen, because it rarely comes abroad except in the night. It dwells in deep burrows which it digs for itself and feeds upon gophers, ground-squirrels, such ground-building birds and their eggs and young as it is able to catch and, in times of scarcity, upon small reptiles and insects. Badgers abound in the vicinity of prairie-dog towns, whose underground homes they can enter or dig out without difficulty. This species is found as far north as Hudson Bay and south to central Mexico, where the local varie-
ty is called "tejon." When by rare chance a badger is surprised during the day too far away from his hole to return, as the writer, who observed, he squats down, withdrawing nose and feet beneath his body, and remains ab-
solutely still, when his gasped back looks so much like a mere hillock of earth that he is likely to escape being seen altogether. The ex-
BADGER STATE—BADOGLIO

Extraordinary breadth and fatness of his form is one of his strongest characteristics. During the coldest part of the winter he retires to his den and passes the time when no food is to be had in deep sleep. The best account of this animal is to be found in Dr. Cuvier's *Furbearing Animals* (Washington 1877). Consult also Ingersoll, Ernest, *Wild Neighborhoods* (New York 1897) and Seton, *Life Histories of Northern Animals* (New York 1909). The European badger (*Meles tarus*) is very similar in general appearance but differs in anatomical details. Its general habits and food are like those of the American badger except that in the absence of open plains it dwells in wooded regions and has a fondness for honey, digging it out of the nests of bumblebees and others which make their homes in the ground. This is the animal formerly used in the cruel sport of badger-baiting. A captive badger was placed in an overturned barrel or some similar place, and dogs were set upon it for the amusement of seeing the fighting that resulted. It required a powerful and active dog to overcome the little animal. Frequently, however, the badger was given no fair chance, but was compelled to face in the open two or three dogs. From this unmanly sport is derived the verb *to badger.* Many references are to be found in early English literature to this amusement, and to the animal itself under the old terms *grey* and *brock,* the latter still in common use in northern England and Scotland (*Celt. broc, badger).*

Various closely related species and varieties of the badger are to be found in Eastern Asia and other relatives exist in India, Malay Islands and Africa. For these see SAND-BADGER; HONEY BADGER; RATEL; TELEPU. Consult Johnston, *British Mammals* (London 1903).

BADGER STATE, a nickname given to the State of Wisconsin.

BADGHIS, bád-géz', a region north of Herat, comprising the country between the Marghab and the Harirud rivers, as far north as the edge of the desert. It lies just to the south of the boundary line between Afghanistan and the Russian territories, as defined in 1887.

BADGLEY, Sidney Rose, Canadian architect: b. near Kingston, Ontario, 28 May 1850. He studied architecture in Toronto, and, after practising some time in Saint Catharines, established himself in Cleveland, Ohio. He has made a specialty of the architecture of churches and public buildings, and has planned and erected churches in almost all parts of Canada and the United States; and, among other structures, the Massey Hall, Toronto; the Sicolum Library and Perkins Observatory, in Ohio; Wesleyan University, in Delaware; and the Medical College, Cleveland. He published an *Architectural Souvenir* (1890).

BADHAM, Charles, English educator: b. Ludlow, 18 July 1813; d. 26 Feb. 1884; was connected with some of the most eminent classical scholars of his day; and after serving for several years as headmaster of King Edward VI's Grammar School at Louth, he became professor of classics and logic in the University of Sydney, Australia, 1867. While in Sydney he established a system of teaching by correspondence, similar to the present university extension scheme. He published a number of works on Greek classics, and *Criticism Applied to Shakespeare* (1846).

BADIA Y LEBLICH, ba-dé-a e lá-blesh', Domingo, Spanish traveler: b. 1766; d. 1818; he visited in 1803 and the four following years the Mohammedan countries bordering on the Mediterranean. During the whole of his tour he professed to be a Mussulman, and traveled under the denomination of "Ali Bey el Abbassi." He was so skillful in carrying out his part that he deceived Moslem rulers and scholars, and was at one time in great favor in the court of Morocco. It is now admitted that he was employed as a political agent by the Spanish government at the instigation of Napoleon. His peculiar situation and religious profession gave him opportunities for making many observations which could not occur to other travelers, and he published an account of his travels, with the title *Voyages d'Ali Beï en Afrique et en Asie pendant les années 1803-07.*

BADINGUET, ba'dân-gâ', afterward RABOT, a Moor, as whom Napoleon III masqueraded to escape from the fortress of Ham in 1846; afterward a nickname for Napoleon III. He died in 1883.

BADIUS, bá'dé-ús, French printer and writer: b. 1462; d. 1535. About 1500 he founded his printing establishment at Paris, and published a number of the classics. He annotated these himself and wrote also a life of *Thomas à Kempis.*

BADLAM, Stephen, American military officer: b. Milton, Mass., 25 March 1748; d. 6 Aug. 1815; entered the Revolutionary army in 1775; became commander of the artillery in the department of Canada. On the announcement of the adoption of the Declaration of Independence, he took possession of the heights opposite Ticonderoga and named the place Mount Independence. Subsequently he rendered good service at Fort Stanwix, and in 1799 was made brigadier-general.

BADMAN, The Life and Death of Mr., an allegory by John Bunyan, published in 1660. It gives a vivid picture of the life of the common people during the time of Charles II.

BADMINTON. The game now called Badminton is in reality a modification of the very ancient game of battledore and shuttlecock; but it is played on a court 44 feet long by 20 wide over a net strung across the centre not less than 18 inches deep, with its lower edge five feet from the ground. The bat is strong, like a racquet bat, and weighs about five ounces. The shuttlecock is feathered after the old fashion and weighs from 73 to 85 grains. The service line is drawn six and one-half feet from the net on either side. A line drawn down the centre, joining the service and base lines, forms two courts at each end. The game can be played by two or four, six or eight players. Each striker scores, or is penalized, according to the result of the rules.

BADOC, ba-dók', Philippine Islands, a town of the province of Ilocos Norte, on the island of Luzon. It is situated near the coast, about 22 miles south of Laoag. Pop. 12,564.

BADOGLIO, Pietro, Italian soldier: b. Piedmont 1871. A skilled artillery officer, he served in the Triapolitan campaign and in the
BADOURA — BAER

European War distinguished himself on various occasions by his resourcefulness at critical moments on the battlefield. The Italian reverses in the great Austro-German drive during October and November 1917 led to a redistribution of commands in the Italian army. General Cadorna was replaced by Gen. Armando Diaz, to whose staff General Badoglio and General Giardina were attached.

BADOURA, bā-doo'ra, the daughter of the King of China, who falls in love with the sleeping prince in the story of Prince Camalrulzaman, in the ‘Arabian Nights’ Entertainment.

BADRINATH, bā-dri'nāth, a peak of the main Himalayan Range, in Garhwal district of the United Provinces, India; 23,210 feet above the sea. On one of its shoulders, at an elevation of 10,400 feet, stands a celebrated temple of Vishnu, which some years attracts as many as 50,000 pilgrims.

BADRULBADUR, Princess, bā-drool'ba-door, the wife of Aladdin, in the ‘Arabian Nights’ Entertainment, story of Aladdin and the lamp.

BÆBIA GENS, be'bi-a jēnz, a piebian clan of ancient Rome. The first member of the family to obtain the consulship was Cn. Bæbius Tamphilus (182 B.C.). The other distinguished ones are known under their family names, Dives, Herrenius, Sulca, etc.

BÄDEKER, bā'dē-kār, Karl, German publisher: b. 1801; d. 1859. His father established a printing and bookselling business in Essen in 1797. Karl set up in Coblenz in 1827. With Murray’s handbooks as a model, he began the issue of guidebooks, the first being one on the Rhine, followed in 1839 by works on Holland and Belgium. The firm removed to Leipzig in 1872: in 1861 translations of the series began to appear in English, and they are also published in French. The name Baedeker is now a synonym for guidebooks.

BAEKELAND, bā'ke-lænd, Leo Hendrik, Belgian-American chemist: b. Ghent, 14 Nov. 1863. He was educated at the University of Ghent, where he was graduated in 1882. Later he studied electro-chemistry at the Polytechnicum, Charlottenburg, Germany. He taught for several years at the University of Ghent and at the Normal School of Science of Bruges. He came to the United States in 1889 and in 1893 founded the Nepera Chemical Company for the manufacture of photographic papers of his invention, including the well-known Velox paper. In 1888 he disposed of his holdings to the Eastman Company and has since engaged in research engineering. His best known invention is bakelite, a chemical synthesis from carbolic acid and formaldehyde, and used as a substitute for hard rubber and amber. He has patented in the United States and abroad many inventions on the subject of organic chemistry, electric insulation, synthetic resins, plastics, lacquers and varnishes, etc. He was awarded the Nichols medal in 1909, and the Willard Gibbs medal in 1913 by the American Chemical Society. In 1910 he was awarded the John Scott medal of the Franklin Institute, in 1914 the Chandler medal, Columbia University and in 1916 the Perkin medal for industrial chemical research. He was president of the American Electro-chemical Society in 1909 and of the American Institute of Chemical Engineers in 1912. He contributes to numerous publications on professional topics.

BAEL, bā-'él, an African tribe dwelling northeast of Lake Tchad. It is nomadic, half-heathen and half-Mohammedan, and owns large herds of cattle, camels, goats and sheep.

BAENA, bā-'ē-nā, Antonio, Portuguese-Brazilian historian and geographer: b. Portugal about 1795; d. 28 March 1850; was an officer in the Portuguese, afterward in the Brazilian army. He studied the geography and history of the Amazon Valley. His principal works were ‘The Ages of Para’ (1838), a historic compend stopping in 1823, and ‘Chorographic Essay on the Province of Para’ (1839), a geographical and statistical work, giving the details of explorations made by himself. These are still standard authorities on that region.

BAENA, bā-'ē-nā, Spain, town in province of Andalusia, 32 miles southeast from Cordova, on the Marbella. It has manufactures of textiles, soap and flour, and horse-breeding is of importance. Large quantities of grain, oil, esparto, fruit and wine are exported. There are a number of interesting Roman remains. Pop. (1910) 14,730.

BAER, bār, George Frederick, American lawyer and capitalist: b. Somerset County, Pa., 26 Sept. 1842; d. 26 April 1914. He was educated at Franklin and Marshall College, served throughout the Civil War, and was admitted to the bar in 1864, becoming afterward a confidential legal adviser to J. Pierpont Morgan. He was counsel, and director and president, successively, of the Philadelphia and Reading Railroad Company after 1870, and reorganized the company in 1893. He became president of the Philadelphia and Reading Coal and Iron Company, and of the Central Railroad of New Jersey. He led the operators in the anthracite coal strike of 1902. Because of his attitude at this time he aroused great animosity among American labor leaders and many social reformers. He was often referred to as “Divine Right” Baer because of his statement that “the rights and interests of the laboring man will be protected and cared for—not by the labor agitators, but by the Christian men to whom God in His infinite wisdom has given the control of the property interests of the country.”

BAER, Karl Ernst von, Russian naturalist: b. Piel, Estonia, 29 Feb. 1792; d. 28 Nov. 1876; was professor of zoology at Köningsberg (1819), and librarian of the Academy of Sciences at Saint Petersburg (1834). His principal works were ‘History of the Evolution of Animals’ (2 vols., 1828-37), and ‘Researches into the Development of Fishes’ (1835). He is one of the founders of the modern science of embryology, and his writings are distinguished for their philosophical teachings.

BAER, William Jacob, American artist: b. Cincinnati, Ohio, 29 Jan. 1860. He was a student of the Munich Royal Academy, 1885-92,
receiving four medals, while one of his works was purchased by the directors of the Academy. He was awarded 1st class medal for miniatures, New York, 1897; 1st class medal Paris Exposition, 1900; 1st class medal, Bremen, 1901; Charleston Exposition, 1902. He was made president American Society Miniature Painters; A.N.A. (1913), and received a gold medal at the Panama Pacific Exposition, 1915. Among the outstanding works of his are: 'Aurora'; 'Summer'; 'Daphne'; and 'Primavera.'

BAERT or BART, Jean, French sailor: b. Dunkirk 1650; d. 1702. He raised himself, under Louis XIV, to the rank of commodore, and made the French navy what it was, at that time. The Dutch, English and Spanish called him the 'French Devil.' Bart brought into port a number of Dutch and English vessels, burned others, landed at Newcastle and laid waste the neighboring country. In 1694, when there was a scarcity of corn in France, he succeeded in penetrating the watchfulness of the English, in bringing into the harbor of Dunkirk ships loaded with this article. Once he delivered a number of such vessels, in the boldest manner, from the Dutch, into which they had fallen, and received, in consequence, letters of nobility. In 1695 he was taken prisoner by the English and brought to Plymouth, but managed to make his escape. In 1696 he met the Dutch fleet from the Baltic and captured the escort with 40 ships; but on his return to Dunkirk 13 Dutch ships of the line appeared, and to avoid a very unequal combat he was obliged to burn the greater part of his captures. From the Peace of Ryswick to the breaking out of the war of the Spanish succession he lived at Dunkirk. There is always a warship in the French navy bearing the name Jean Bart.

BAETHGEN, bɛtˈɡɛn, Friedrich, German theologian: b. Lachen 1849; d. 1905. He was educated at Göttingen, Kiel and Berlin, and held professorships at Kiel, Halle and Greifswald. In 1895 he was called to the chair of Old Testament exegesis and Semitic languages at the University of Berlin. He published 'Untersuchungen über die Psalmen der Peschita' (1876); 'Evangelienfragment und Aretioz' (1888); 'Die Psalmen übersehene und erklärt' (1892).

BECATHA, bɛˈtɔkə, the central division of ancient Spain under Roman rule, famed for its fertility, its mines of iron, gold and silver, and its delightful climate. These advantages gave rise to a number of fabulous stories, which made it the home of Geryon, an assailing of Hercules, and placed there the Elysian Fields. It passed into the hands of the Vandals, and was the first province conquered by the Moors.

BAEYER, bɛˈrə, Adolph von, a pioneer of German chemistry: b. Berlin, 31 Oct. 1835; d. Munich, 24 Aug. 1917. A pupil of Bunsen at Heidelberg, he spent some years in Berlin as a teacher and in 1860 came under the influence of A. W. von Hoffmann, whose pupil, Sir W. H. Perkin, discovered mauve, the first aniline dye. In 1872 Baeyer was appointed professor of chemistry and director of the new chemical laboratories in Strassburg, where many famous chemists studied, such as Emil Fischer, C. Graebe and C. Liebermann — the discoverers of synthetic madder (or alizarine), which effectually killed the French madder industry. In 1875 he succeeded to Liebig's chair in Munich, where he built the new Chemisches Institut, in which European organic chemists of all nationalities have received their training. Baeyer was one of the fathers of modern organic chemistry, much of which rests on the foundations laid by him and the many distinguished chemists trained under his guidance. In the technical world he helped in a marked degree to build up the position which Germany held before the war in the chemical industry. His name is inseparably associated with the artificial production of indigo, on which he began his researches in 1865. His patents were acquired in 1880 by the Badische Anilin und Soda Fabrik and the Hoechst Farbwerke, which concerns carried out conjoint research for 18 years, spending about $5,000,000 on the problem. Two satisfactory processes were finally developed for the manufacture of indigo from coal-tar products, one starting from naphthalene and the other from benzene via aniline. Baeyer was awarded the Davy medal for the Royal Society (England) in 1881 for his researches in indigo and receive the Nobel prize for chemistry in 1905. His works were published at Brunswick (2 vols., 1905).

BAEYER, Johann Jakob, Prussian soldier and geometerian: b. Müggelsheim, 5 Nov. 1794; d. September 1885, was an army volunteer in the War of Liberation, and became a lieutenant-general in 1858. He had charge of a number of geodetic surveys; was elected president of the Geodetic Institute in Berlin in 1870; and was the author of numerous treatises on the refraction of light in the atmosphere, the size and form of the earth, etc.

BAEZ, bɑˈæθ, Buenaventura, Dominican statesman: b. Azua, Haiti, about 1810; d. 21 March 1884; aided in the establishment of the Dominican Republic; was its President in 1849-53; was then expelled by Santa Ana and went to New York; was recalled in 1856 on the expulsion of Santa Ana, and again elected President; and was re-elected President in 1865 and 1868. During his last term he signed treaties with the United States (29 Nov. 1869) for the annexation of Santo Domingo to the United States, and for the cession of Samana Bay. The treaties failed of ratification in the United States Senate, and caused the downfall of Baez.

BAEZA, bɑˈæθa, Spain, town of Andalusia, 22 miles east-northeast from Jaén. It is pleasantly situated on a height amid rich and well-watered plains, and from a distance presents a very striking appearance with its old walls, churches and steep-roofed houses. It has several good streets and three squares, one of which is lined by a range of porticoes. The principal edifices are the cathedral, the old Aliatares tower, the town-hall with a fine façade, and an old monastery, now a theatre. The leading products are barley, wheat, vegetables and oil, and there are manufactories of spirits, soap and leather. Many cattle are raised in the district. Pop. (1910) 13,843.

BAFFIN, William, English navigator: b. about 1584; d. 23 May 1617. He visited the Greenland as a pilot in 1612, again in 1615, and
BAFFIN BAY — BAGDADE made voyages to Spitsbergen in 1613 and 1614. In 1615 he ascertained the limits of that vast inlet of the sea since distinguished by the appellation of Baffin Bay, and also discovered and named Smith’s Sound, Lancaster Sound, etc. In 1617–22 he was in the employment of the East India Company, and on board vessels belonging to them in the Indian seas. He was killed at the siege of Ormus, on the Persian Gulf.

BAFFIN BAY, an inland sea or gulf in North America, part of the extensive strait that separates Greenland from Baffin Land. It is 800 miles long, with an average breadth of 280 miles. Depth, 200 to 1,480 fathoms. The tides do not rise more than 10 feet. The surface of the sea is covered with ice during the greater part of the year, which extends from shore to shore in winter, though possessing a slow, southward movement. In spring and summer the great mass, known as the middle ice, begins to move less slowly southward, leaving navigable passages and occasional channels, or crossings, between the coasts. The coasts are mountainous, barren and deeply indented with gulfs. Whale and seal fishing is followed. Baffin land was discovered by the English navigator, Baffin (q.v.), in 1615, while in search of the North-west Passage.

BAFFIN LAND, a barren island west of Greenland, in the Canadian district of Franklin. Approximate area, 240,000 square miles: the fourth largest island in the world. It is about 1,000 miles in length, the breadth varying from 200 to 500 miles. The eastern side is crowned by an ice-capped plateau, from 5,000 to 8,000 feet high. Bernhard Hantisch, a German scientist, died here in June 1911 while on an exploring expedition, and his account with maps was published in 1913.

BAPULABE, bâertility, a town of the French Sudan, at the junction of two head-streams of the Senegal, connected by railway with Kayes on that river.

BAGAMOYO, bâgama-yâ, German East Africa, a seaport and commercial centre opposite Zanzibar, and north of Dar-es-Salaam. It has few stone houses, as the natives, who constitute the bulk of the population, live mostly in huts. Though it has no harbor and its coast is often swept by hurricanes, it has a considerable trade in ivory, copra, caoutchouc, etc. It has a fort, government house, customshouse, public baths, and a building station of the German East African Association, government school and a park, with a monument to the troops who fell during an uprising of the natives in 1889. The climate is unhealthful for Europeans. Pop. about 25,000.

BAGASSE, bâgas’, the name given to sugar cane in its dry, crushed state, as delivered from the mills, and after the main portion of the juice has been expressed; used as fuel in the sugar factory, and called also cane trash.

BAGATELLE, bâgâ-tel’, a table ball game of the class of billiards, played on a table semi-circular at the top end. The tables vary from 6 to 7 feet in length and are usually about 3 feet 6 inches wide. The game is played by two or more opponents, and at the same time. There are nine balls, eight white and one black, and nine holes sunk in the far end of the table in a diamond shape, numbered respectively 1, 2, 3, 4, 5, 6, 7, 8, 9.

The black ball is placed on a spot * in front of the foremost hole. The player then takes one of the white balls, and placing it within a balk line at the lower end of the table, strikes it with the cue in such a manner that it strikes the black ball; both balls go on their courses and fall, or not, into one or other of the open cups. Whichever cup the black ball falls into counts double the number of points normally allotted to it. Then the player, in like manner, plays the remaining seven balls up the table. For so many cups as he fills he counts up his dots, and that is his score. The highest wins. In France and England the bagatelle balls are four red, four white and one black.

BAGAÚDE, or BAGAУDI, a body of Gallic insurrectionists of the rural class, who revolted against the Romans 270 A.D., headed by one Victor, called by the soldiers Mother of Legions. Claudius temporarily quelled them, and Aurelianus, by a remission of their taxes in arrears, and by granting them a general amnesty, made peace with them. Under Diocletian, 280 A.D., they rose again, and their two leaders assumed the title of emperor; but they were soon compelled to capitulate, though they retreated to an island formed by the confluence of the Marne and Seine, and made a desperate stand for the victory. The place of this sanguinary contest was long known as the Fosses des Bagaudes. From this period, the Bagaudes may be considered as gradually transforming their activity into a kind of brigandage, which infested the forests and fastnesses of Gaul until the end of the Western empire.

BAGBY, George William, American physician and humorist: b. Buckingham County, Va., 13 Aug. 1828; d. 29 Nov. 1883; educated at Delaware College; wrote under the pseudonym, Mozius Anonymus. He was editor of the Lynchburg Era and publisher of the Lynchburg Messenger (1859); State librarian of Virginia (1870-78), and contributor to various magazines. He wrote 'John M. Daniel's Latchkey' (1868); 'What I Did With My Fifty Millions' (1875); and 'Meekins' Twines' (1877). His works were collected in three volumes (Richmond 1886). Consult Trent, 'Southern Writers' (1905).

BAGDAD, Turkey, capital of the vilayet of Bagdad, situated on the Tigris. The old Bagdad, the residence of the caliphs, said to have had 2,000,000 inhabitants, was situated on the western bank of the river and was one of the most magnificent cities of the Mohammedan world. The modern city lies mostly on the eastern bank of the river and is surrounded with a brick wall about six miles in circuit, partly in a ruinous condition, and with a ditch from five to six fathoms deep, intended to be filled with water from the Tigris. The houses, mostly built of brick, are but one story high, the streets unpaved, and so narrow that two horsemen can scarcely ride abreast. The houses
of the wealthy are distinguished by a better architecture. Of the mosques, about 100 in number, only a few attract much notice, and many are in ruins. Their architecture is in general inferior to that of other Mohammedan cities, but they have a gaudy appearance from the glazed tiles covering and minarets, and arranged in a kind of mosaic work in various colors. In the vicinity are situated tombs held in high reverence by the natives and visited annually by thousands of pilgrims. The bazars are well stocked with goods. That built by Daoud Pasha still ranks as one of the most splendid in the world. Bagdad long commanded a large part of the traffic between Europe on the one hand, and Persia and India on the other. The Persian and Indian trade is still considerable, as also that with Europe, a large portion of it being carried on by steamers up and down the river. The trade with Europe was formerly more largely by land, passing through the Syrian Desert to Damascus, or Armenia north and. Since the opening of the Suez Canal the sea routes are of far more importance. The traffic from India has declined somewhat, but, owing to development of railway facilities, it is the mart through which pass the imports and exports of Mesopotamia. Wool is the chief export to Europe, others being wheat, gum, galls, dates, horses, various Oriental fabrics, skins, tragacanth, feathers and leather articles. Imports include iron and copper, sugar and coffee. There are numerous manufactures of copper utensils, cloth and felts, etc. The heat of the summer is oppressive in Bagdad, but the winter is cold enough to make a fire necessary. The climate is on the whole agreeable and healthful, though sometimes the plague prevails. Bagdad is inhabited by Turks, Arabs, Persians, Kurds, Armenians, Jews and a small number of Christians. The Turks compose three-fourths of the whole population. The Jews are confined to a certain district of the city, and are in a very oppressed condition. The population of the city, according to the most recent estimate, amounts to between 175,000 and 200,000.

Bagdad was founded in 762 by the Caliph Al-Mansur, and raised to a high degree of splendor in the 9th century by the famous Harun al-Rashid, who figures so often in the Arabian Nights. It then became the chief city in the Moslem world and a great centre of culture and learning, but at present its high schools or medresses are few in number, and its importance rests solely on its commerce. In the 13th century it was stormed by Hulagu (Holagou), grandson of Genghis-Khan, who caused the reigning caliph to be slain and overthrew the caliphate. The descendants of the conqueror were expelled in 1392 by Tamerlane. In the 15th century Shah Ismael, the first sovereign of Persia of the house of Soh, took possession of the city. From that time it was a continual object of contest in the wars between the Turks and Persians. After a memorable siege in 1638 it was conquered by the Turkish Emperor, Murad IV, and Nadir Shah endeavored in vain, in the 18th century, to depose the Turks. Early in 1917 British forces, advancing up the Tigris, took Kut and pushed on toward Bagdad. On 10 March the last Turkish position south of the city was attacked, and that night the Turks evacuated the city, which at daybreak of the 11th was occupied by the British. See War, European; Mesopotamia Campaign.

Bagdad Railway, Asiatic Turkey, an enterprise of international importance in which is bound up the future political control of large regions in Asia Minor, Mesopotamia and the Persian Gulf. The line, over 1,400 miles long, extending from Konieh on the existing Anatolian Railway through the Taurus range, and by way of the valley of the Euphrates, Nisibin, Mosul, Kerkeu, the Tigris, Bagdad, Kerbelia and Nejed is projected eventually to reach Basra on the Persian Gulf, thus establishing through connection from Europe. Engineered by Baron Marschall von Bieberstein, the German diplomat, on 27 Sept. and 4 Oct. 1888, the first German company obtained power to exploit the Haidar-Pasha-Ismidt Railway by the concession for 99 years of a railway to run from Ismidt to Angora. This was financed by the Anatolian Railway, backed by the Deutsche Bank. On 15 Feb. 1893 the company was authorized to extend the railway from Ismidt to Bagdad, its work covering the first 535 kilometres of the Bagdad Railway was completed in 1896. Early in October 1898, Kaiser William II visited the Sultan at Constantinople, and obtained the promise of a concession for a railway from Konieh to the Persian Gulf. Negotiations and surveys led in November 1899 to an irade approving of the German offer and to the convention of 16 Jan. 1902, which definitely revised and brought up to date 5 March 1903, formed the charter of the enterprise. The "Societe Ottomane des Chemins-de-Fer de Bagdad" was established with a capital of $3,000,000, of which only the half was actually paid up. The company acted as broker between the Turkish government, which borrowed the sums necessary for the construction of railways, and the European capitalists. A series of complicated arrangements between the two parties had to be adapted to circumstances from year to year. The entire network of railways from Konieh to Basra was divided into sections of 200 kilometres each. But this was found impracticable and the sections had to be built of unequal lengths. The Ottoman government and the railway company concluded separate agreements for each section, the different financial and technical problems being regulated by such agreements. The first section of 200 kilometres from Konieh to Eregli, regulated by one of the conventions signed 5 March 1903, was completed and ready for service Oct. 1904. The second section of about 840 kilometres from Eregli to El Hejef through the Taurus range, was financed by the agreement of 2 June 1908. For some years technical and financial obstacles prevented its completion, and work owing to great tunneling difficulties was suspended May 1914, the railhead ending at Dorak. A convention signed at Constanti- nople 20 March 1911 provided for the building of the third section of about 600 kilometres from El Hejef to Bagdad, respecting the last section of the line from Bagdad to Basra, about 600 kilometres, being discussed by Turkish and German statesmen when the European War broke out in 1914.

Bagehot, bā'got, Walter, English economist, journalist and critic: b. Langport, Somer-
setshire, England 3 Feb. 1826; d. Langport, 24 March 1877. His father, Thomas Watton Bagehot, was vice-chairman of the Somersetsetshire bank, founded by Samuel Stuckey in the 18th century. His mother, a niece of Stuckey, a woman addicted to a little, lively mind, had, through an earlier marriage, been brought into an excellent intellectual atmosphere from which, says Hutton, "she greatly profited." Bagehot, a boy of naturally keen mind and with a habit of reading with an uncritical, good judgment, began his studies in 1842, in University College, London, graduating B.A., in 1846, and M.A., with much honor in philosophical and political economy, in 1848. He was also distinguished as a mathematician and was widely read in poetry, metaphysics and history. Then he took to reading law, but, though very fond of the study and though called to the bar in 1852, he never practised. Instead he entered the banking business under his father in Langport. He had previously, in 1851, spent some time in Paris during the exciting days of the coup d'état of Napoleon III. His first essays in journalism were accounts of the affairs of France, contributed to the weekly newspaper, the Inquirer. Bagehot astounded his friends by a somewhat youthful cynicism in support of the cause of Napoleon, on the paradoxical ground that the French were too clever to be successful as a self-governing people. Stupidity, according to his views at that time, was, says Hutton, essential to political freedom.

While in business, Bagehot contributed to reviews,—first to the Prospective Review and after 1855 to the National Review,—various biographical and critical articles. These, and also several sketches originally published as "Estimates of Some Englishmen and Scotchmen" (1858), were collected after his death in "Literary Studies" (2 vols., 1878), and "Biographical Studies" (1880). In time they extend from 1852 to Bagehot's death. The essays "which best represent his peculiar genius" (Hutton) are "The First Edinburgh Reviewers," "Hartley Coleridge," and "Bishop Butler," but such essays as those on Gibbon, Shelley, Coleridge, Dickens and Browning, are among the most vigorous pieces of English criticism. All are distinguished by a dash and keenness of phrase and an uncommon faculty for sane and broad generalization.

In 1858 Bagehot married Miss Wilson, eldest daughter of the Right Hon. James Wilson, who had founded the London Economist during the anti-corn law agitation to represent free-trade sentiment. In 1860 Bagehot became editor of the Economist and remained till his death. His practical knowledge of men, his great experience in business and extensive studies enabled him to win success in this field, and also to write the books on which his fame as an economist chiefly rests. These are "The English Constitution" (1867), which is extensively used as a textbook and has been translated into French, German and Italian; "Physics and Politics" (1872), which has been even more widely translated; and "Lombard Street" (1873), a study of the money market. Bagehot named there appeared after Bagehot's death "Economic Studies," a collection of earlier work, and "The Depreciation of Silver." Bagehot's counsel was much sought for in financial and economic questions. He tried on several occasions, with honesty rather than zeal, to be elected to Parliament, but never succeeded.

Bagehot, both as a student of institutions and of mind reached in his bank. To this study he brought, in spite of some natural prejudice in favor of the institutions and men of his native land, a mind of thoroughly scientific bent and much detachment. As a student of life he is interested in fundamental questions rather than in minutiae. His broadest books, "Politics and Finance," "Politics and Britain," and "Politics and Parliament," are examples of this, and may be regarded as an exposition of his main methods and interests. It is an attempt to show how the principle of the survival of the fittest applies to the formation of states. The thesis is that in earliest times and even down nearly to the present, the people who had the faculty of organization and obedience, whether in family, tribe or nation, were bound to prevail over those less organized and that this principle was due to laws or rulers of whatever sort was necessary to political success, until the habit of legality became ingrained. Hence the nation with the best military power could seize the best part of the earth; but, however, the process stopped with organization, the nation would in time present a case of arrested development, and would no longer progress; for the principle of variation, or originality, is also necessary to complete progress. The best instrument for the cultivation of variation is free discussion. Hence arises the explanation of the fact that the western nations of Europe are far in advance of the rest of the world, in that they have tempered the rule of custom with discussion, which has historically been practically limited to peoples of Greek and Germanic origin. And in general, on the other hand, discussion is useful in checking the impulse to hasty action, a relic of primitive civilizations. Bagehot's other longer works are really exemplifications of this principle: "The English Constitution" is substantially an examination of the means of discussion in England and a comparison of it with that in other states; "Lombard Street" is an analysis of one part of the philosophy of Bagehot's work, of expounding and criticising it as an efficient means of progress.

Bagehot's criticism of literature is likewise distinguished by breadth and a fondness for the analysis of causes. It is the criticism, not of taste or of morals, of the beautiful or the good and bad, but of types. The manner in which the mind of his author worked, the type of person he was, are the fundamental questions of interest with Bagehot. The title, for example, of his excellent essay on "The English Art of Poetry," illustrates this: "Wordsworth, Tennyson and Browning; or, Pure, Ornate and Grotesque Art in English Poetry." These poems are treated as examples of the three different types of mind and expression named in the title. Dickens is an example of the "irregular" genius, Hartley Coleridge of the whimsical and wayward mind with a gift for self-revelation, Shakespeare, among other attributes, of the experiencing mind. Bagehot's criticism is, in all these essays, a criticism of the way of thought, the way of life of these great writers, the way of life of the world in general, the way of life of the people in general. His point of view he maintains with great consistency, but always enlivens his criticism with such an
abundance of keen and witty observations that his criticism is unsurpassed in vigor and is never dull. He, however, founded no school as certain other critics have done; for his criticism is essentially that of a lively personality and the impressionism of a scientific and detached mind.

Bibliography.—The chief authority for Baghot, besides his own work, is R. H. Hutton, 'Memoir' prefixed to 'Liberty Studies,' and 'Dictionary of National Biography.'

WILLIAM T. BENGSTER,
Professor of English, Columbia University.

BAGGAGE, probably from the old French word bague, meaning bundle. As ordinarily used it includes trunks, valises, portmanteaus, etc., which a traveler carries with him on a journey. In a military sense the word includes tents, furniture, utensils, etc.

BAGGARA, bāg-gā-rā, an Arabic-speaking Hamitic tribe of the upper Nile Valley. They occupy this valley as far east as the territory of their neighboring negro tribesmen, the Shilluk. They are nomads, Egyptian soldiers, hunters, etc.

BAGGESEN, bāg-gē-sen, Jens, Danish poet, who also wrote much in German: b. Korsør, 15 Feb. 1764; d. Hamburg, 3 Oct. 1826. His 'Comic Tales,' which appeared in 1785 had an instantaneous success; but an opera he produced four years later was a fiasco, and in disgust he left Denmark. He returned in 1791, but shortly withdrew, and spent a wandering life on the Continent for the next 20 years. His work was conservative in its form, and he was intensely jealous of the reception accorded to the romantic poems of Oehnslaeger. He possessed great sensibility and imagination, and his works are said to present a singular mixture of contradictory qualities. His best productions were his smaller poems and songs, several of which are very popular with his countrymen. The 'Labyrinth' (2 vols., 1792-93), a poem descriptive of his travels, is perhaps his most famous work. His Danish works were published in 1827-32.

BAGHELKHAND, bā-gēl-kānd', India, a tract of country comprising the native states of Rewari, Seodh, Maihar, Sowahal and eight of lesser importance, under the governor-general's agent for central India; area, 14,706 square miles; pop. (1911) 1,772,574.

BAGHERIA, bāgā-rē-a, or BAGARIA, Sicily, town in the province of Palermo, eight miles east by south of the city of Palermo by rail. It is beautifully situated at the base of the isthmus which separates the Bay of Palermo from that of Termini and is surrounded by groups of palatial villas of the Sicilian nobility. Among them are the Villa Palagonia, celebrated by Goethe, and the Villa Valguarnera, which has one of the most beautiful prospects in Sicily. Pop. (1911) 21,212.

BAGIMONT'S, bāj-i-mōnts, ROLL, a rent-roll of Scotland made up in 1275 by Baaimourd or Boaimond de Veil, vulgarly called Bagimont, who was sent from Rome by the Pope to verify the tithe of all the Church livings in Scotland for an expedition to the Holy Land. The Scottish clergy opposed its imposition; but their objections were repelled; and it remained the statutory valuation, according to which the benefices were taxed, till the Reformation. A copy of it as it existed in the reign of James V (1513-42) is in the Advocates' Library, Edinburgh. Consult the publications of the Switesse Society, Vol. XII, and Baruta Ecclesiae Scotticane (Bannatyne Club, 1866).

BAGINSKY, ba-gēn'ski, Adolf, German physician: b. Ratiboır 1843. He was educated at Berlin and at Vienna. From 1881 to 1892 he was privydocent on children's diseases at the University, and in 1893 became extraordinary professor at that institution. In 1880 he founded and became coeditor of the Archiv für Kinderheilkunde. In 1890 he became director of the Kaiser- and Kaiserin-Friedrich Krankenhaus at Berlin, an institution devoted principally to the treatment of the infectious diseases of children. He has published 'Handbuch der Schollhygiene' (3d ed., 1896-1900); 'Lehrbuch der Kinderkrankheiten' (3d ed., 1905); 'Heilpflege des gesunden und kranken Kindes' (3d ed., 1885); 'Das Leben des Weibes' (3d ed., 1885); 'Die Antityrise im Kindesalter' (1901); 'Säuglingskrankenpflege und Säuglingskrankheiten' (1906); 'Die Kinderaussage vor Gericht' (1910).

BAGIRMI, ba-gēr'mi, Africa, a Mohammedan negro state, situated partly between Bornu and Wadai, to the southwest of Lake Tchad, and watered by the Shari, which falls into Lake Tchad, and by its tributaries. It has an area of about 65,000 square miles, and about 1,000,000 inhabitants; but both its area and population fluctuate according as it encroaches on or is encroached on by its neighbors. The whole country is a plain 900 feet above the level of the sea, well suited for the cultivation of sorghum, which is accordingly the principal breadstuff. Sesame, beans, cotton and indigo are also cultivated. The government is an absolute monarchy, but the ruler pays tribute to Wadai. An armed force, estimated at over 10,000, is maintained. The prevailing religion is Islam, which was introduced in the 16th century. Bagirimi was formerly included in one state with Bornu and Wadai. An inexhaustible supply of slaves is found in the heathen negro states to the south, at the expense of whom also Bagirimi, by its Mohammedan neighbors, extends its territory. By Great Britain and Germany Bagirimi has latterly been recognized as within the French sphere of influence, and in 1899 a treaty was concluded between the French government and the Sultan. There is a French resident in Chekna, the capital. The former capital, Masenya, was destroyed in 1898. At the end of 1899 Rabah, a usurper of Bornu, invaded the state, but was speedily defeated by the French troops. His sons continued the contest, but by May 1901, the country was completely pacified.

BAGLEY, Worth, American naval officer: b. Raleigh, N. C., 6 April 1874; d. 11 May 1898. He was graduated at the United States Naval Academy in 1895; promoted to ensign 1 July 1897, and was detailed as inspector to the new torpedo-boat Winstow in November following. This boat went into commission the next month, and he was appointed her executive officer. In April 1898 the Winstow was assigned to the American fleet off the coast of Cuba, and on 9 May, while on blockading duty
at the harbor of Cardenas, with the Wilmington and Hudson, drew the fire of several Spanish coast-guard vessels. All the American vessels escaped untouched. Two days afterward the three vessels undertook to force an entrance into the harbor, when they were fired on by Spanish gunboats. The Winslow was disabled, and with difficulty was drawn out of the range of the enemy’s guns. The Wilmington then silenced the Spanish fire, and as the action closed, Ensign Bagley and four sailors on the Winslow were instantly killed by a shell, he being the first American naval officer to fall in the war with Spain.

Baglioni, bā-lyō’ne, a historical family of Perugia in Italy. Perugia contained two parties—an aristocratic and a democratic one. The Baglioni belonged to the former. In the 12th century Ludovico Baglioni was appointed imperial vicar of Perugia by Frederic Barbeis. He exterminated the Baglioni his relative, becoming, like himself, from the ducal house of Swabia. In 1393, 70 Perugian gentlemen, and among them two Baglioni, were killed in a street fight by the populace, and the whole aristocratic party was expelled from the city. In 1423 the family of Baglioni defeated Francisco Sforza, near Lodi, in 1453, and was made lord of Spello by Sixtus IV. Gian Paolo Baglioni began life as a condottiere; then availing himself of the dissensions of his native state he obtained supreme power over it and made alliance with Pandolfo Petrucci, ruler of Sienna. He was driven out of Perugia by Caesar Borgia in 1502. Returning in 1503, after the death of Alexander VI, he was banished again, in 1506, by Julius II. He then entered the service of the Venetians in the war of the league of Cambrai. He resumed his old position as ruler of Perugia in 1513. Here he created so much scandal that Leo X, who at first passed over his usurpation, summoned him to Rome, threw him into the castle of Saint Angelo, had him tried and he was beheaded at Rome in 1520. Malatesta and Orazio, his sons, recovered possession of Perugia after the death of Leo. Orazio turned over to the service of France, and was killed in the Neapolitan expedition of 1528. Malatesta remained in Perugia until 1529, when he was driven out by the Papal and Imperial troops. He died at Perugia in December 1531.

In the 16th century Astorre Baglioni served Charles V in Italy and on the coast of Tunis, and rose high in the favor of Pope Paul III, who restored to him his paternal estates. He then entered the Venetian service, and was governor of Famagusta, in Cyprus when the town was taken in 1570. After a brave defense he was obliged to capitulate on condition of being sent home to Venice with his garrison. But Mustapha Pasha, disregarding the terms, caused Baglioni and the other Venetian officers to be beheaded.

Another family of the name Baglioni, belonging to Florence, produced several sculptors and architects during the 15th and 16th centuries. Giovanni Baglioni, a native of Rome, was a celebrated art historian and painter.

Bagnacavallo, bān’ya-kā’vāl’′la, Bartolomeo Ramenghi, Italian painter; b. 1484; d. 1542; called Bagnacavallo from the village where he was born. At Rome he was a pupil of Raphael and assisted in decorating the gallery of the Vatican. His best works are ‘Disputation of Saint Augustine’ and ‘A Madonna and Child.’ They were taken by the French from the church of Saint Peter at Rome.

Bagnères-de-Bigorre, bān’ya-r′ dē bī-gō’r′r′, France (anciently Aquensis Vicus, Aqua Bigerrum), celebrated watering-place in the department of Hautes-Pyrénées, capital of the arrondissement of the same name, at the entrance of the valley of Campan, on the left bank of the Adour, 13 miles southeast from Tarbes. Its site is one of the most romantic in the Pyrenees. Well-cultivated slopes surround it on all sides, and are terminated in the distance by a mountain range, the most conspicuous summit of which is the Pic du Midi. The town is well built and contains several good squares and numerous spacious, handsome streets. There are about 30 mineral springs of varied temperature and of different chemical composition, each of which is considered a specific for different diseases. Bagneres owes its chief celebrity to its baths, which are sulphurous and saline. There are 10 bathing establishments, of which the principal, known as the Fracassi, is very complete, and is the largest and most healthful of the town. It stands at one of its extremities, immediately under Mount Olivet, and is approached by a long avenue of poplars winding through a verdant valley. About 25,000 or 30,000 invalids and tourists visit the place annually. It is a centre for winter sports, and many races are arranged each year. The inhabitants depend chiefly on the baths, almost every house receiving lodgers; but the manufactures are of some importance. The chief of these are a kind of crape and a fine woollen gauze woven into shawls and scarfs. There are marble quarries in the neighborhood, from which come a high grade of table tops and chimney pieces. The springs here were known to and used by the Romans, and various ancient remains are still in existence. Pop. (1911) 8,455.

Bagnères-de-Luchon, bān’ya-r′ dē lō-shȱn, France, town in the department of Haute-Garonne, one of the principal watering-places of the Pyrenees, having sulphurous thermal waters said to be beneficial in rheumatic and gouty complaints, nervous ailments, skin diseases, etc., and used chiefly as baths. It is divided into an old and a new town, situated in the picturesque valley of Luchon, surrounded by hills covered with wood. The new town has fine streets and promenades, and several villas and gardens. The main street forms a splendid avenue, at the west end of which the large bathing establishment is placed. There is also a large and splendid casino building of recent erection, comprising a theatre, concert and ball rooms, etc., and containing a large scale model of the Pyrenees, giving an excellent idea of the configuration of the range. The neighborhood exhibits some of the most interesting scenery of the Pyrenees. Visitors number from 30,000 to 40,000 annually, and are most numerous in the month of July and August. Bagnères-de-Luchon has 48 mineral springs of varied temperature and composition. It is the Thermes Luxionnais of the Romans, and for many centuries was practically deserted. Mgr. d'Estigny had the waters analyzed in 1751, and at once drew attention to their prop-
erties. As a resort, however, it dates from the early years of the 19th century. Resident pop. (1911) 3,415.

BAGNES, bân', or BAZNE, Val de, Switzerland. picturesque valley in the canton of Vaïas. It is bordered by the Durance, a tributary of the Rhone, and is surrounded by mountains, of which the highest peaks are Grand Combin, 14,164 feet, and Mont Gelé, 11,000 feet. There are glaciers in the valley, and the streams abound along the river, which has sometimes overflowed and inflicted considerable damage. Chable, the chief town of the valley, is often called Bagnes.

BAGNES, the convict prisons of France. Until 1748 serious crimes were punished by terms of service in the galleys; after which convicts were employed in hard labor in arsenals and similar public works. The name Bagnes ("baths") is supposed to have come from the fact that the slave prisons at Constantinople were adjacent to the baths of the Seraglio. In 1792 the sufferings of the convicts were mitigated and the name "travaux publics" substituted for the hated term "galières." Until 1832 criminals continued to be branded with a hot iron. The treatment of convicts at the bagne was always cruel; men were chained in couples; their food was poor, and they were herded together at night like cattle. The latest establishments of the type were at Toulon, Rochefort and Brest, Toulon not being finally emptied until 1870, although these prisons had been abolished in 1854. Consult: Zaccione, "Histoire des bagne" (Paris 1875), also Victor Hugo's "Les misérables."

BAGOT, Sir Charles, British diplomatist: b. 23 Sept. 1781; d. Kingston, Canada, 19 May 1843. He was the second son of William, 1st Baron Bagot of Bagots Bromley. In 1807 he was appointed Under-Secretary of State for Foreign Affairs, and the following year was appointed Consul-General at Nice, and in 1814, Minister to France; in 1815 Minister to the United States, securing by his diplomacy the neutralization of the Great Lakes; in 1820, Ambassador at Saint Petersburg; and in 1824, Ambassador at The Hague. On the death of Lord Palmerston in 1841 he was made governor-in-chief of the Canadas, which office he held till his death.

BAGOT, Richard, English bishop, brother of the preceding: b. 22 Nov. 1782; d. 15 May 1854. In 1829 he was appointed bishop of Oxford, and in 1845 he was translated to the bishopric of Bath and Wells. During the Tractarian controversy he was violently assailed for his alleged Puseyite sympathies, and for his induction of the Rev. M. Bennett into the living of Frome. This had such an effect on Bishop Bagot that his intellect became disturbed.

BAGPIPE, a well known wind instrument, of high antiquity among various nations, and so long a favorite with the natives of the Highlands of Scotland that it may properly be considered as their national instrument. The peculiarity of the bagpipe consists in the fact that the air producing the music is collected into a leathern bag, from which it is forcibly pressed into the pipes by the arm of the performer. The chanter, a pipe into which is inserted a reed for the production of the sounds by the action of the air from the bag, is perforated with holes like the German flute, which are stopped with the fingers. The other parts of the instrument, in the common Highland form, are drones, which are also furnished with reeds. Two of the drones are in unison with D on the chanter, which corresponds with the lowest note of the German flute. The third drone, which is the longest, is an octave below. The tuning of the bagpipe is accomplished by lengthening or shortening the tubes or drones, as may be required. Its compass is from the G of the treble stave to the A above it, but its scale is imperfect. The Highland bagpipe is a powerful instrument, and calls for great exertion of the lungs, the air being forced into the bag by a pipe held between the lips. The Irish bagpipe is smaller, softer in its notes, and is always played with bellows that force the air into the bag. It has a number of keys on the chanter and drones, and is a much more perfect instrument musically than the Highland. A Lowland Scotch form of the bagpipe is also played with bellows. It is not known when the bagpipe first found its way into Scotland, but it is probable that the Norsemen first introduced it into the Hebrides, which islands they long possessed. In England it was common from Anglo-Saxon times, and is familiarly referred to by Chaucer and Shakespeare. The bagpipe is indeed of very ancient origin, as representations of it are to be found on Grecian and Roman sculptures; and it has long been well known among various eastern nations. In Italy to this day, or at least in certain parts of it, the bagpipe (cornamus) is still a popular instrument among the peasantry, but the Italian form of it is more simple than the Highland and Irish.

BAGRATIDÆ, bâgra't-idé, or BAGRATIANS, a line of kings and princes of Armenia that ruled in that country from the year 885 to the 11th century. After the seizure of Asia Minor by the Seljuk Turks, the Bagratid princes retained power as independent lords, holding the possession of mountain fastnesses. The dynasty ended with Leo IV, who was assassinated in 1342.

BAGRATION, bâgra'te-ôn', Peter, Prince, Russian general of the Georgian Bagratide family: b. 1765; d. 7 Oct. 1812. He entered the Russian army in 1782 as a common soldier; and in a long military career rose to the highest grades, and gained a place among those Russian generals the most celebrated for their stubborn, unyielding bravery. Having been created a lieutenant-general, he commanded the vanguard of the Austrian army at Austerlitz, under Prince Lichtenstein. In the Prussian campaign of 1807, his resistance made the battle of Eylau so terrible that even Napoleon shuddered at its bloody results. The same is said of him at the battle of Friedland. In 1808 he made a daring march across the frozen Gulf of Finland, overrunning western Bothnia and the Aland Islands; in 1809 he fought at Sistria, and destroyed an Austrian army brought up from Adrianople to relieve that fortress. In 1812 he fought an unsuccessful battle with Davoust at Mohilef, but succeeded, nevertheless, in joining the Russian main army. He was mortally wounded at the battle of Mojaiašk, or Borodino, 7 Sept. 1812, just a month before he died.
BAGSHAW, Edward. English author: date of birth unknown; d. 1662. He espoused at first the cause of the Puritans, but later became a Royalist, and sat in the Parliament that Charles I convened at Oxford; was taken prisoner by the Parliamentary army, and during his detention composed various books, the most important of which is 'The Right of the Crown of England as Established by Law.'

BAGSHOT HEATH, a level tract in England, now used as a field for military manoeuvres. It is famous as the site of many highway robberies in the 18th century.

BAGSTOCK, Major Joe, an apoplectic, gluttonous character in Dickens' novel, 'Dombey and Son.'

BAGWORM, or BASKETWORM, a common caterpillar of a moth (Thyridopteryx ephemeraeformis), found in large numbers throughout the northern part of the United States. The male has a dark body and light wings, but the female is wingless. The larva lies head downward in a sac or case covered with bits of leaves (so that it looks like a basket), where it finally transforms, the worm-like female remaining in its case, while the male flies sluggishly about, and may be known by its hairy body and small transparent wings. When the young hatch (in May), they crawl on a leaf, gnawing little bits from the surface and fastening them together with a thread. They present a comical sight when the baskets are partly completed, walking about, tail in the air, with the body hidden in the case. As they grow older the body is entirely protected by the sac, which they drag about when in motion. These insects frequent the trees in city parks, especially junipers, in great numbers, and are apt to be detrimental to foliage unless destroyed by scraping off the cocoons. Certain small species occur on the orange in Florida, and others in the tropics. See FAGOTWORM.

BAHADUR, bá-há’door (*Valiant*), the last Great Mogul from the house of Tamerlane; b. 1767; d. 1862. When the British captured Delhi, he was taken prisoner, and sent to Rangoon. He was also a poet and wrote a number of songs.

BAHAIM, a religious movement started by Mirza Ali Mahomet (1819-50) in Persia about the middle of the 19th century. He preached that the Mohammedan religion had become corrupt and needed reformation, that the clergy were ignorant and vicious, that the Koran was not the final revelation, but that a new prophet was to come in the near future who should preach a new gospel to a new generation, which should conform to the needs of modern scientific knowledge and social tendencies and should, therefore, be greater than any previous revelation made to any people at any time. He also proclaimed the spiritual equality of women with men. As his gospel appealed powerfully to the down-trodden masses, his success was immediate and so great that the Mohammedan priesthood became alarmed; and they used their influence with the government to prevent the daring preacher on the charge of hostility to state and religion. Ali Mahomet, who had taken the religious name of 'Bab' (the door or gate), foretold his own death at the hands of the authorities, but, at the same time, he comforted his followers with the assurance that another and greater than himself would soon appear to carry on his work. After a mock trial, in which the mullahs of the Mohammedan Church did the prosecution, he was condemned and shot on the public square at Tabriz, July 1850. The immortality of the soul and the omnipotent love of God extended to every creature upon earth constitute the foundation of Bahai theology; but it reaches out and attempts to reform institutions of all kinds, including those of the state. It teaches that loyalty is due to institutions, causes and religious creeds only so long as they represent the cause of humanity and the progress and evolution of the race. While Bahais proclaims no loyalty to any selfish or outworn creeds and organizations, its prophet issued a stern warning against mistaking the obstruction and destructive for the constructive. He held out the hand of friendship to all creeds, all religions, all societies and all governments, proclaiming, at the same time, the necessity of a get-together movement to regulate the movements of the race and of its institutions and beliefs. He foretold the coming of a new special order in which the development of spiritualized man was to be the primary purpose and all its tendencies essentially creative. The Bahai Church possesses no ecclesiastical organization; it works socially and practically, through a popularly elected *house of justice,* for the spiritual, social and moral betterment of humanity, irrespective of creed, race or social standing. But this *house of justice* has no inherent authority, since it is purely an advisory body in matters of doubt or urgency. Bahaiism is, in no sense, destructive. It countenances all existing creeds, churches, societies, institutions and governments; but urges their reformation. It would work through them, patiently endeavoring to apply the golden rule for their betterment and final perfection. To this end each Bahai temple should have attached to it a college, a hospital, hospice and other social features which should be run as model institutions. It acts upon the sanctity of the individual and the spiritual and social equality of all. In this sense, it proclaims all men (and women) born free and equal, with the personal right and duty to disallow any vicarious spiritual agency. Each individual can develop divine creation not impeached, denied or humbled by specific privileges of any other human being. Self-expression is the supreme privilege and obligation of life; and this is afforded by life itself in the means for beautiful expression, noble conduct and great and inspiring art. The inability to recognize this is a sign of spiritual insufficiency; for Bahaiism proclaims spiritual development as the supreme purpose and obligation of life. The state, as well as the individual, should experience spiritual growth, for without spiritual activity even social effort is sterile and self-destructive. Legislation not derived from religious vision, laws not founded upon unselfish wisdom, obstruct our social evolution; this is why social reformers are arrested on the charge of hostility to state and religion. According to Bahais there is no essential virtue in poverty nor essential evil in great wealth. Wealth used for the spiritual development of the possessor and the betterment of humanity is an exceedingly good thing,
as are also the arts, sciences and forces of legitimate, healthful pleasure which feed the growth of the spiritual soul; for the one great thing in life is to submit all one's activities, talents and possessions to the spiritual agency, thus transferring the centre of consciousness from self to an outside point and thus changing egoism into service and creating the utmost sympathy for others, sundering every tie inherently selfish, destructive or useless. The believers in Bahaiism are enjoined not to withdraw from present religious organizations but to stay in their mid, reinterpreting their functions in the light of social evolution and endeavoring to vitalize their activity and remove their prejudice and ignorance which are walling them off from social unity. As citizens they are bound to obey the laws of the land while endeavoring to improve them. They should labor to unite minor organizations to make them efficient so that their influence may eventually become world-wide. Therefore duty impels them to extend the study of social problems, advanced ideas in science, economics and government, and the creation in his own mind of a living social ideal, a divine civilization. Social ethics should possess the same foundations as personal morality and spirituality, for Bahaiism makes the same appeal to the institution that Christ made to the individual, to put aside self in the interest of love of one's neighbor. Therefore churches should lay aside sectarianism and denominationalism.

Bahaiism appealing through its gospel of equality, fraternity and service, to the masses of down-trodden Asia, has spread with wonderful rapidity over Persia, India, Turkey and southern Russia. Most of its converts have been made among Mohammedans. In Persia alone there are said to be nearly 2,000,000 of the Bahai faith, which numbers several millions more in the other countries mentioned together with the Mohammedan states of northern Africa. Bahaiism has its converts, its societies and its missionaries in almost every civilized country on the globe, including the United States, which has some two score centres of propaganda, proclaiming the doctrine that men should draw together for social and spiritual good and that there is little hope for the race so long as its members continue to live apart from one another, separated through fear, jealousy, shame or social inequality; for every personality overlaps every other person and the teaching that is so great, all-compelling aim and object of life is unity.

BAHAMA BANK—BAHAMAS

BAHAMA BANK, Great and Little, shoals among the West India Islands; the former between 22° and 26° N., 75° and 79° W., having south and west the Bahama old and new channels. On it are the islands of Providence, Andros and Exuma. The Little Bank, north-west of the foregoing, between 26° and 27° N., 77° and 79° W., has on it the Great Bahama and Abaco islands.

BAHAMA CHANNEL, Old and New, two channels of the West Indies; the former separates the Great Bahama Bank and Cuba; the latter, also called the Gulf of Florida, separates between the Great and Little Bahama Banks and Florida, and forms a part of the channel of the great Gulf Stream, which flows here at the rate of from two to five miles an hour.

BAHAMAS, THE, or THE BAHAMA ISLANDS, were formerly known as the Lucayos, from the name of a tribe of aborigines inhabiting them at the time of their discovery by Columbus in 1492. The scene of the first landing was an island on the outer or Atlantic side of this group to which Columbus gave the name San Salvador. By the natives that island was called Chubu, and is now known as Watling Island. The total habitable area of the islands is small, but the extent of the group, including cays and rocks rising from banks near the surface of the water, is very great—nearly six degrees of latitude and more than six degrees of longitude. Stretching through a total distance of 780 miles, these islands and banks form a barrier between the Atlantic and the eastern entrance to the Gulf of Mexico. To reach the Florida Straits, a large vessel must follow one of three channels: the Old Bahama, north of Cuba; the Florida or the Providence. The last passes through the group above Nassau, the capital and only important city, an attractive place with about 12,584 inhabitants.

The researches of Professor Agassiz have shown that the Bahamas are essentially different in geological formation from the Greater and Lesser Antilles, being wind-blowen piles of shell and coral sand,—once much more extensive than now,—whose areas have been restricted by a general residual subsidence of some 300 feet, so that much of their former surface now occurs as shallow banks beneath the water. Mr. Robert T. Hill says: 'The islands are merely the exposed tips of the underwater ridges, having an outline and configuration which would be crudely comparable to the island of Cuba if the latter were so submerged that its highest points merely reached the surface. Their total area is 4,403/4 square miles. The Indian population having been carried away to the pearl fisheries of Panama, or to labor in the fields and mines of other Spanish colonies, the Bahamas remained deserted until, in 1629, an English settlement was begun in the island of New Providence. Twelve years later, Spain asserted her claim, based upon discovery without occupation. The English were expelled, but again attempted colonization; and Charles II, in 1680, actually granted the islands to six English noblemen and gentlemen. Early in the 18th century New Providence was twice raided by French and Spanish forces; and again it became a desert. Bucanneers of all nations made themselves at home, and held undisputed possession until another English settlement was planted in 1718, and British troops were assigned to its defense. Tory emigrants from the English colonies on
the mainland at the time of the Revolution introduced slave labor and the cultivation of cotton—which did not thrive. New Providence was captured and held for a short time by the Americans under Commodore Hopkins in 1776; six years later it fell into the hands of the British by treaty of Greenville but was taken by the loyalist Colonel Deveaux before 12 months had passed. The rights of the old lord proprietors were purchased in 1787, the Bahamas becoming a possession of the British Crown, administered by a colonial government.

During the Civil War in the United States an enormous blockade-running trade swelled the imports of the islands from a little more than $1,000,000 to upward of $26,000,000; the exports from about $50,000 to more than $24,000,000—a period of prosperity both brief and unique. Violent storms and droughts have more than once brought ruin to the natural industries; the cultivation of small fruits, vegetables, oranges, pineapples, cocoanuts, etc., has been carried on as a commercial crop, owing to the tariff laws of the United States and the remoteness of other markets. Other forms of agriculture have been attempted, with moderate success. Sponge-fishing is carried on extensively. At the eastern end of the group are the Turks and Caicos islands, which were separated politically from theBahamas and made a dependency ofJamaica in 1848. Grand Turk is the capital and there the chief executive officer, or commissioner, resides. From these islands, 1,500,000 bushels of salt are exported annually and a large number of sponges are also gathered and exported. The total value of imports to all the islands is about $825,000, the United States supplying nearly three-fourths of that amount. Besides Turks and Caicos, the principal inhabited islands are New Providence, with about 15,000 inhabitants, Abaco, Harbor Island, Eleuthera, Inagua, Mayaguana, Ragged Island, Rum Cay, Exuma, Long Island, Great Guana, Berry Islands, Grand Bahama, Crooked, Acklin, Cat, Watling, Berry and Andros Islands.

The inhabitants of Great Abaco are chiefly descendants of the American Tories, referred to above. Harbor Island has about 300 inhabitants. The descendants of the buccaneers. Largest and most densely wooded are the Andros Islands.

From November to May the temperature ranges between 60° and 75° F.; in the summer months it varies from 75° to 85°. The climate, though subject to greater extremes of heat and cold than that of other groups in the West Indies, is agreeable and health-giving; and Nassau is a favorite resort for tourists in winter. The population (about 58,175) includes a large proportion of negroes, the natural increase among the descendants of former slaves being greater than among the descendants of the white settlers. There is little immigration. Good schools are maintained by the government, and there is a college of England. The administration of the islands is conducted by a governor, an executive council, the representative assembly and a legislative council.

The first discovered of the West Indies proteges of the British in the 17th century, but were taken by the French in the last, with a few exceptions, to become permanently settled, and even to-day little is known of the more remote islands, since very few of them are reached by steamers, connection between the northern and southern being kept up by sailing vessels only. As they are almost uniformly level, the highest elevation not exceeding 300 feet, they do not display that varied vegetation to be seen in the Greater and Lesser Antilles, where the mountain-sides are clothed with a tropical forest; whereas, in the Bahamas the flora embraces more than 100 native flowers and a variety of woods useful in the arts and materia medica, besides many delicious fruits known to dwellers in the tropical zone.

Steamers of the Ward Line (New York and Cuba Mail Steamship Company) leave New York every other Friday for Nassau, returning one week later; and during three months (about 1 January to 1 April), a steamer of the Peninsular and Occidental Steamship Company plies weekly between Miami, Fla., and Nassau, Bahamas.

T., ‘Cuba and Porto Rico, with the other islands of the West Indies’ (New York 1898); Ober, F. A., ‘Guide to the West Indies’ (New York 1908).

BAHAR, bã-hãr’, province and town in India. See Buhar.

BAHAR, or BARRE, the name of certain weights used in several places in the East Indies. They have been distinguished as the great bahar, with which are weighed pepper, cloves, nutmegs, ginger, etc.; and the little bahar, used to weigh quicksilver, vermilion, ivory, silk, etc. But this weight varies much in different parts of the East, being in some places not much above 400 pounds, in others considerably over 500.

BAHAWALPUR, bã-hâ-wal-poor’, India, town and capital of a state of the same name in the Punjab, surrounded by a mud wall and contains the extensive palace of the Nawab, a vast square pile with towers at the corners. It has underground rooms, which afford a more comfortable temperature in the warm summer months. Silk goods are manufactured, also turban, chintz, and other cottons, and the immediate neighborhood is remarkably fertile, producing grain, sugar, indigo, tobacco, with an abundance of mangos, oranges, apples and other fruits. Pop. (1911) 18,176. The state has an area of 17,285 square miles, of which 10,000 is desert, the Only cultivated lands lying along the Indus and Sutlej. Cultivation largely depends upon irrigation, which has been considerably extended in recent times, with a great increase to the state revenue. The chief crops are cereals, cotton and indigo. Beasts of chase, such as tigers and boars, abound; domestic animals, camels, kine, buffaloes, goats and sheep are raised in the exportable. The chief exports are indigo, hides, drugs, dyestuffs and wool. Bahawalpur is traversed by the Punjab Railway. For external commerce it is favorably placed. It stands at the junction of three routes from the east, southeast and south; while toward the north, the Hindu merchants have dealings with Bokhara and even with Astrakhan. The political relations between the British government and the state are regulated by a treaty con-
BAHIA—BAHR

cluded in 1838. No tribute is exacted from the Nawab. Pop. (1911) 780,641.

BAHIA, Brazil, a state of that republic, bounded on the north by the states of Sergipe, Alagoas, Pernambuco and Piauí, on the east by the Atlantic Ocean and Sergipe, on the south by Espírito Santo and Minas Gerais, and on the west by Pernambuco, Piauí, Goiás and Mato Grosso. The larger part of the state is mountainous. The rivers form two systems — the first composed of tributaries to the São Francisco and the second of those streams making their way directly to the Atlantic Ocean. The most noteworthy single feature in the coast-line is the great bay of all the saints, on the northeastern side of which was established, by Tomás de Souza in 1549 the capital of the state. See BAHIA (the city),

BAHÍA, bā'-ē-ā or SÃO SALVADOR

DA BAHIA, so named because it is situated on a large harbor or bay, ranks as the third in population in the Union of the cities of Brazil. (See Rio de Janeiro.) It lies about 740 miles north of Rio, in lat. 13° 1' S., and long 38° 32' W. Amerigo Vespucci visited this port on his voyage of exploration in 1500. Bordered by Bahia, Brazil, and in the 16th century it was the scene of frequent conflicts between the Portuguese and the forces of other European nations. (See Brazil). At present it is the capital of the state of Bahia (area 164,643 square miles and pop. about 3,000,000), which has great natural resources in its mines and forests, as well as in fertile lands devoted largely to the cultivation of sugar-cane. The location of the city is picturesque, its upper portion being built on high ground several hundred feet above the sea-level. On the upper terraces stand churches, the cathedral, convents, a great theatre, the mint and the governor's palace. Below, bordering the port, which has a fine lighthouse and is defended by several forts, are docks and warehouses where the products of the country, coffee, sugar, cotton, dye-woods, tobacco (excellent cigars), rum, hides, horns and tallow — are collected, to be shipped to all parts of the world. Bahia has a public library, which was founded in 1811; its manufactures have received attention in recent years, and formerly it was the headquarters of the diamond trade, before the mines of South Africa and southern Brazil were developed. The author of 'Brazil and the Brazilians' (New York 1914), G. J. Bruce, says in regard to the bay — which, from the bar at the entrance to its head, is 43 miles long and about 40 broad at its widest part — that it is one of the safest harbors in the world, though the entrance looks dangerous and extremely forbidding. Berthing accommodation at the wharves is only provided for the smaller vessels. Steamers of large tonnage anchor out in the bay. A French company has works for the improvement of the port well advanced. Bahia is the starting point for several coasting lines, as well as for traffic from the interior, and is the Fone River junctions. The great feature of the city, he observes, is the number of churches, 365, one for every day in the year. The city's population is somewhat more than 280,000, with an annual increase of nearly 6,000.

BAHÍA BLANCA, Argentina, an important seaport, as well as a commercial and administrative centre, in the province of Buenos Aires. The city is well built and is provided with a good water supply, and with electric light and tramway service. It is the headquarters of judicature for the southern part of the republic. (See Argentina.) The real harbor of Bahía Blanca is Puerto Belgrano, which has several miles of anchorage. Adjoining this are the national dockyards, known as Puerto Militar. Close by is the village of Punta Alta and the naval hospital. Adjacent towns are Puerto Ingeniero White (the terminus of the Great Southern Railway) and Puerto Galvan, terminus of the Buenos Aires and Pacific Railway. Combined populations of the whole group of towns, 76,000.

BAHÍA HONDA, bā'-ē-ā on'đa, Cuba, seaport on the coast of the Gulf of Mexico, and lying on a small bay, bearing the same name, which affords one of the best harbors on the island. The town and bay are about 50 miles west of Havana, being commanded by a small fort. There are mines of coal and copper in the vicinity. A short distance to the south are the sulphur springs of Aguanate. Sugar and tobacco are cultivated to a considerable extent in the vicinity. Pop. Bahia Honda and Aguanate, about 1,300.

BAHÍA AS A OR BEHNESA. See OXY.

RHYNCHUS.

BAHR, Hermann, Austrian author and journalist: b. Linz 1863. He studied in Vienna, Graz, Czernowitz and Berlin, devoting special attention to philosophy, political economy and law. In 1890 he became associate editor of Berliner Freie Bärne, and later became associate editor and critic of the Deutsche Zeitung. In 1894 he began publication of Die Zeit, and was also editor of the Neue Wiener Tagblatt and the Oesterreichische Volkszeitung. He was appointed manager of the Berlin Deutsche Theater in 1906. His critical works include 'Zur Kritik der Moderne' (1890); 'Die Uebewindung des Naturalismus' (1891); 'Neue Studien' (1891); 'Bildung' (1900); 'Secession' (1900); 'Premieren' (1902); and 'Dialog vom Tragischen' (1903). In his 'Zweite neue Menschen' (1887); 'Die Mueter' (1891); 'Die häusliche Frau' (1893); 'Der Apostel' (1901); 'Der Krempus' (1902); 'Der Meister' (1904); 'Sanna' (1905); 'Die Andere' (1905); 'Das Komzert' (1909); 'Die Kinder' (1911); and 'Das Prinzip' (1912). He has written the following novels: 'Die gute Schule' (1890); 'Dora' (1893); 'Neben der Liebe' (1893); and 'Stimmen des Bluts' (1909). Another work, 'Die Einsichtlosigkeit des Herrn Schallke' (1886) is of a political nature; he published also a volume of 'Essays' (1912).

BAHR, bär, Johann Christian Felix, German philologist: b. Darmstadt, 13 June 1798; d. 29 Nov. 1872. Educated at Heidelberg Gymnasium and University, of which last he became ordinary professor of classical philology in 1823. His chief work is the German Edition of the Roman Literature (1828; 4th ed., 1868-70), which is noted for its clearness and comprehensiveness. Three supplements to this work deal with the 'Christian Poets and Historians of Rome' (1836); the 'Christian-Roman Theology'
BAHR — BAHRIM

(1837); and the 'History of Roman Literature
in the Carlovigian Period' (1840). His edition
of 'Herodotus' (2d ed., 1855-61) is also
noteworthy.

BAHR, an Arabic word signifying sea or
large river—Bah-r el-Huleh, the Lake
Merom in Palestine; Bah-r el-Abiad, the White
Nile, Bah-r el-Azrek, the Blue Nile, which to-
gerther unite at Khartum.

BAHR-EL-GHAZAL, bār 'el-gā-zāl (Ga-
zzle River), name of two rivers in central
Africa: one flows from Lake Chad through a
desert region; the other is formed by the union
of several streams near the Kongo Free State
and flows eastward through a very swampy
region, and shortly after leaving Lake N'go unites
with the Bah-r el-Jebel to form the White Nile.
Its banks are apt to be very indefinite owing
to inundations. In 1869 Schweinfurth explored
the greater part of its basin. The head of
steam navigation on the river is Meshra-er-Rec.
The basin of these two rivers is a province of
the same name. A settled government was estab-
lished on the east of Egypt in 1885, but the Mahdist rebellion temporarily severed
its connection with that country. Since the re-
conquest of the Egyptian Sudan by the British
and Egyptian forces under Kitchener, however,
the Bah-r el-Ghazal has been again brought
under a settled administration. It is said to be
rich in ivory, rubber and timber, and suited for
cotton growing. The Ubangi district of the
French Congo lies to the west of the Bah-r
el-Ghazal.

BAHR YUSUF, bār yoo'sūf, or BAHR
EL-YUSUF, an artificial irrigation channel
from the left branch near the Nile below Sint, to
the Fayyum, 270 miles long. According to
Coptic traditions it was constructed during
Joseph's administration.

BAHRRAICH, ba-rich', India, capital of
Bahraich district, Faizabad division, in the
united provinces of Agra and Oudh, and 65
miles northeast of Lucknow. The town is in
a flourishing state; it is drained and lighted,
and carries on a good local trade. It is
situated on the junction line from Gonda to Basti,
and began to flourish when the railway was built.
It manufactures fireworks and native cloth.
The chief edifice of interest is the shrine of
Musand, a warrior and saint of the 11th cen-
tury, which attracts both Hindu and Moham-
medan pilgrims to the number of 150,000 an-
nually. The American Methodist mission has
a station and a school here. Pop. (1911) 26,907.

BAHRAL, bār'al, or BUHREL, a wild
sheep (Ovis nahu of the high plains of
Tibet, which resembles a goat in appearance,
although it has no beard. The rams carry large
flattened and nearly smooth horns, which curve
outward and backward, but do not curl. The
general color is brown, becoming gray in win-
ter, while the abdomen and insides of the legs
tail are white; a stripe along the sides and
on each side of the face, throat and the front
of the legs are black, interrupted by white
patches and above the hoots. The fel-
mas are plainer and have small horns. This
animal, which is a favorite object of sport in
Tibet, passes its whole time above the limit of
forest growth, and clammers about the rocks in
the manner of a goat rather than of a sheep.

It is believed that these animals, which are
often kept captive by the mountaineers, have in-
fuenced the Asiatic races of domestic sheep.
Consult Lydekker, 'Royal Natural History'

BAHRDT, bär', Karl Friedrich, German
1741; d. Halle, 23 April 1792; studied in Schulp-
forte and Leipzig, where he first showed his
great talents. In 1766 he was appointed pro-
fessor in the University of Leipzig. His works
and his talents as a preacher gave him wide ac-
ceptance, but in consequence of immoral conduct
he was obliged to quit that city in 1768. From
this time he led an unsettled life. He was suc-
cessively professor of theology and preacher in
Erlaut (where he was made doctor of theol-
ogy), in Giessen, Switzerland, and in Dürk-
heim, but was obliged to leave each of these
places on account of his severe attacks on the
clergy and the heterodox views manifested in
his writings and sermons, as well as on account
of his irregular life. The Aulic Council de-
declared him disqualified to preach or to publish
unless he would revoke the religious Principles
advanced in his works. In 1779 he went to
Halle, where he published his creed. It is
thoroughly deistical, denying the existence of
God, not insisting on the immortality of the soul.
He lectured in Halle, but soon became involved
in difficulties with the clergy; upon which he
left the city, and established, in a neighboring
village, a tavern, where he had many cus-
tomers, whose vitiated tastes and depraved
habits he made no scruple of gratifying. Ulti-
mately, in consequence of two works which he
wrote, the patience of government was ex-
hausted. He was brought to trial, condemned
and confined in the fortress of Magdeburg.
Here he wrote his life. At the end of a year,
having regained his liberty, he again opened
his tavern at Halle, where he died.

BAHREIN, ba-rēn', or AVAL ISLANDS,
a group of eight islands lying on the south side
of the Persian Gulf, since 1971 under protec-
tion of British Indian government. The prin-
cipal island, usually called Bahrein, is about 27
miles in length and 10 in breadth. It is in
general very flat and low, a mere shal low
area of 400 feet above sea level, and some
there are hills 400 feet high. The soil is not
fertile except in some places, and is often cul-
tivated by means of irrigation. Excellent dates
are produced. A fine breed of donkeys is raised.
Pearl-fishing is the as an important industry,
over 1,000 boats, each manned by from eight
to 60 men, engaging in operations off the shore.
There are thousands of conical mound-tombs
in the interior. The inhabitants are a mixed
race. The capital and commercial centre is
Manamcl or Manama; pop. (1971) 23,800. The
island of Moharrekl separated from Bahrein by a
strait two miles broad and only about three feet
depth at ebb, is much smaller, but contains a
town called also Moharrek, and has a popula-
tion of 25,000. The islands are governed by
a sheik. The total population is estimated at
110,000.

BAHURIM, the place where Michał was
parted from her husband, Phaltiel, as she was
being taken back to David at Hebron. It is
also the village in which Shimeh lived and from
which he came out to curse David when fleeing
BAIE—BAIL

from Jerus toward Jordan. In this village Jonathan and Ahimraz took refuge when carrying news to David from Jerus. There they hid themselves in a well, thus eluding the servants of Absalom who had been sent to capture them. Tradition identifies Bahurim with Almon, the modern Almit, about four miles northeast of Jerus and one mile from Amata near the southern boundary of Benjamin.

BAILE, bâ’î, Italy, a place where wealthy Romans had their summer homes, the favorite abode of the dancing-girls and the buffoons. It is now deserted, and interesting to the stranger only for the ruins of old baths, which are shown as temples and for the remains of former palaces, visible beneath the waves of the sea. Baie owes its fame to its hot baths and its situation on a most charming bay, secured by surrounding hills from the violence of the winds. The life of the town was once particularly luxurious and dissolute. It has now entirely lost its ancient position of importance. Recently it has attained some importance as a naval station. It was situated to the west of Futeoli, the modern Pozzuoli, and about 12 miles from the town of Baiae.

BAIDYABATI, bâ’da’ya-bâ’î, a town of Bengal, situated on the river Hugli, about 15 miles from Calcutta, with an important market for jute and other produce.

BAIF, bâ’î, Jean Antoine de, French poet: b. 1532; d. 1589; one of the literary league known as the "Pliéade," and the chief advocate of its plan of reducing French poetry to the metres of the classic tongues; also a spelling reformer, in favor of the phonetic system. His most meritorious works were translations of Greek and Roman dramas.

BAIKAL, bâ’kal’, Russia-in-Asia, a lake of Siberia, 360 miles long from southwest to northeast, and from 20 to 53 in breadth, interspersed with islands. It has a shore line of 1,220 miles; long. 104° to 110° E.; lat. 51° 20’ to 55° 20’ N. It contains seals and many fish, particularly sturgeons and pikes. In the environs are several sulphurous springs, and in the environs of the mouth of the river Barguzin, it discharges a kind of pitch which the inhabitants purify. The water is sweet, transparent and appears at a distance green, like the sea. It receives the waters of the upper Angara, Selenga, Barguzin and other rivers; but the lower Angara is the only one by which it seems to discharge its waters. It is enclosed by rugged mountains, and the scenery is unusually magnificent. In summer the lake is navigated by steamboats, but in winter by snow. It is frozen from November to April, and trade is carried on over the ice. It has several islands, the largest of which is Olkhon. Baikal forms an important link in the chain of communications between Russia and China, and has several commercial ports, the most important being Listvinichnoe, whence the Angara carries its waters to the Yenisei. The Trans-Siberian Railway passes around its southern end. Its sturgeon, salmon and freshwater seal fisheries are valuable, and large quantities of other fish are taken. A peculiar fish, called the golomyanka, which is almost one mass of fat, yielding train oil, was at one time caught in immense numbers, but is now rather scarce. Besides the Russians settled on the banks of the Selenga and Angara, the shores of Lake Baikal are also inhabited by tribes of the Burias of Turkestan. 

BAIKIE, bâ’ki, William Balfour, English naturalist and traveler: b. Kirkwall, Orkney, 1825; d. Sierra Leone, 12 Dec. 1864. He studied medicine at Edinburgh, and after receiving his degree entered the royal navy as assistant surgeon. He served in the Mediterranean, was assistant surgeon at Haswall, Abyssinia, in 1851-54, and was then appointed surgeon and naturalist to the Niger expedition, which was about to start for the exploration of this river. The death of the captain of the exploring vessel, the Flead, left him in chief command, and he succeeded in reaching a point 250 miles higher up the river than had previously been attained. On a second expedition he was able to establish a settlement at the confluence of the Niger and Benue, and in a few years did much to spread civilization among the natives of the neighboring regions. Baithe translated the 'Book of Common Prayer' and the 'Psalms' into Hausa. He was author of 'Observations on the Haussa and Fululde Languages,' and joint author with R. Hedges of 'Africa: Birds Observed on the Orkney Islands.'

BAIKTASHI, bîk-tâ’she. See Dervish.

BAIL, in law, is the delivery of a person to another for keeping, and is generally given in reference to one arrested, or committed to prison, upon a criminal process, such person being said to be bailed when he is delivered to another (or is supposed to be so, but is simply set free from custody), who becomes his surety (to a greater or less amount according to the crime with which he is charged) for his appearance at court to take his trial. The person who thus becomes surety is said to become bail, and the amount itself is also called bail. Bail may generally be granted except in the case of treason. The word is not used as a plural. When the punishment by the law of the United States is death, bail can be taken only by the Supreme Court, or by a judge of a District Court of the United States. The proceeding attendant on granting bail is substantially the same in England and in all States of the United States. An application is made to the proper officer, and the bond or the names of the bail proposed filed in the proper office and notice is given to the opposite party, who must except within a limited time, or the bail justify and are approved. If exception is taken, notice is given, a hearing takes place, the bail must justify, and will then be approved unless the other party oppose successfully, in which case another bail must be added or substituted. A formal application is in many cases dispensed with, but a notification is given at the time of filing to the opposite party, and unless exceptions are made and notice given within a limited time, the bail justify and are approved. A bail piece at present generally signifies a warrant issued to the surety upon which he may arrest the person for whom bail has been taken. Straw bail signifies bail offered by persons not possessing the necessary, but only willing to swear that they do possess them. The statutes of the States usually require persons giving bail to be possessed of real estate or property not easily removable from the juris-

BAILEY, Florence Augusta Merriam, American author: b. Locust Grove, N. Y., 8 Aug. 1863. She was graduated at Smith College in 1886, and began writing of bird life in the manner of John Burroughs. Her published works include "Birds Through an Opera Glass" (1889); "My Summer in a Mormon Village" (1895); "A-Birding on a Bronco" (1896); "Birds of Village and Field" (1898); "Handbook of Birds of Western United States" (1902).

BAILEY, Gamaliel, American journalist: b. Mount Holly, N. J., 3 Dec. 1807; d. 5 June 1859. He was graduated at the Jefferson Medical College, Philadelphia, in 1827, and for several months, after 1829, was editor of the Methodist Protestant at Baltimore; with J. G. Birney he founded the anti-slavery journal, the Cincinnati Philanthropist (1836), the office of which was destroyed by a mob, though it continued to be published till 1847; after 1843 was also editor of a daily paper, The Herald. He established the well-known anti-slavery newspaper, the Washington National Era (1847), which reached a wide circulation, exerted a powerful influence and was one of the most important organs of the Abolition movement. It numbered among its regular contributors Mrs. Stowe, Whittier, Amos A. Phelps and M. D. Souther, and in it in 1852 the famous novel, "Uncle Tom's Cabin," first appeared. Consult the article "A Pioneer Editor" in The Atlantic Monthly (Vol. XVII, Boston 1866).

BAILEY, Jacob Whitman, American scientist: b. Auburn, Mass., 29 April 1811; d. 26 Feb. 1857; was graduated at the United States Military Academy in 1832; and from 1834 till his death was professor of chemistry, mineralogy and geology at the Military Academy. He was the inventor of the Bailey indicator and of many improvements in the microscope, in the use of which he achieved high distinction; and he is regarded as the pioneer in microscopic investigation. He was president of the American Association for the Advancement of Science in 1857; and was author of numerous papers on the results of his researches, the most important of which was a volume of "The Vegetable Skeletons," containing over 3,000 original figures. He made a large collection of algae and of microscopic objects, which he bequeathed to the Boston Society of Natural History. A biographical sketch appeared in the American Journal of Science and Arts (Vol. XXV, New Haven 1847).

BAILEY, James Montgomery, American humorist: b. Albany, N. Y., 25 Sept. 1841; d. 4 March 1894. He received a common-school education, and learned the trade of carpenter, which he practised at Danbury, Conn., in 1860-61, writing occasional pieces for the newspapers. He served in the 17th Connecticut regiment during the Civil War; returned to Danbury, founded the Danbury News in 1870, for which he wrote numerous humorous sketches of commonplace happenings. He gained a national reputation as the "Danbury News Man" and made his paper known throughout the country. He wrote "There in Danbury" (Boston 1873); "Danbury News Man's Almanac" (1873); "They All Do It" (1877); "The Danbury Boom" (1880); "Engländ from a Back Window" (1878); "Mr. Phillip's Groueness" (1879), etc.

BAILEY, Joseph, American military officer: b. Salem, Ohio, 28 April 1827; d. 21 March 1867; entered the Union army as a 2nd lieutenant in 1861, and signally distinguished himself in the Red River campaign under Gen. N. P. Banks, in 1864 by building a dam and deepening the water in the channel, which enabled Admiral Porter's Mississippi flotilla to pass the Red River rapids in safety and to escape the perilous situation. For this engineering feat, Bailey, who before entering the army was a plain farmer, was brevetted brigadier-general, promoted colonel, voted the thanks of Congress, and presented by the officers of the fleet with a sword and a purse of $3,000. Subsequently, he was promoted to full brigadier-general, and was engaged on engineering duty till his resignation July 7, 1865. He was killed, while acting as sheriff, by two desperadoes in Missouri.

BAILEY, Joseph Weldon, American senator for Texas: b. Copiah County, Miss., 6 Oct. 1863. He studied for the legal profession, was graduated as a lawyer in 1883, and, entering politics, in 1884 served as a district elector on the Cleveland and Hendricks ticket. The following year he removed to Gainesville, Tex., and in 1888 was elected as elector at large on the Democratic ticket. He was elected to the 52d, 53d, 54th, 55th and 56th Congresses, and was the Democratic nominee for speaker of the House of Representatives on the organization of the 56th Congress, 15 March 1897. He was chosen to succeed the Hon. Horace Chilton, United States senator for Texas, 23 Jan. 1901, and was re-elected 22 Jan. 1907. He resigned his seat in the Senate 3 Jan. 1913 and resumed the practice of law.

BAILEY, Liberty Hyde, American horticulturist: b. South Haven, Mich., 15 March 1858; was graduated at the Michigan Agricultural College in 1882; M.S., 1886; was assistant to Dr. Asa Gray at Harvard University in 1882-83; professor of horticulture in Cornell University, 1888-1903; in 1903 was appointed director of the College of Agriculture at Cornell, and retired in 1915, with the degree LL.D. from the University of Wisconsin and Alfred University. He was an associate editor of the revised edition of Johnson's "Universal Cyclopaedia" (1892-96); editor of "American Garden-
BAILEY — BAILLIE

versity 1877–78; professor 1881–1906; and from 1906 till his death, emeritus professor. He published 'Botanical Collector's Handbook' (1881); 'Among Rhode Island Wild Flowers' (1885); 'New England Wild Flowers' (1897); 'Botanizing' (1899); 'Poems' (1910); and was a member of many scientific societies.

BAILEY, Willis Joshua, American statesman; b. Carroll County, Ill., 12 Oct. 1854. He was graduated at the University of Illinois, 1879, and received the degree of L.L.D. from this University in 1904. From 1879 to 1888 he was engaged in farming and stock-raising in Carroll County, Ill. He was elected in the latter year to the Kansas house of representatives; was president of the Republican State League 1893; became a member of the Kansas State Board of Agriculture in 1895; was re-elected member of the 56th Congress (1899–1900) of Kansas, and served as a vice-president and manager of the Exchange National Bank of Atchison, Kan., since 1 March 1907.

BAILLIFF, a name which was introduced into England with William I and came to be applied to various officials representing or acting for the King. He is essentially a person entrusted by a superior with power of superintendence. In the United States the word bailiff has no precise meaning. The term is most frequently used to denote a court officer whose duty it is to take charge of juries and wait upon the court. In England, an officer appointed for the administration of justice in a certain bailiwick or district. The sheriff is the King's bailiff, whose business it is to preserve the rights of the King within his 'bailiwick' or county. (1) The governor of a castle belonging to the King. (2) In the Channel Islands the first civil officer on each island. (3) A sheriff's officer. Bailiffs are either bailiffs of hundreds or special bailiffs. (a) Bailiffs of hundreds are officers appointed by the sheriff over the districts so called, to collect fines, summon juries, to attend the judges and justices at the assizes and quarter sessions and to assist in writing and process. (b) Special bailiffs are men appointed for their adroitness and dexterity in hunting and seizing persons liable to arrest. They assist the bailiffs of hundreds in important work for which the latter have no natural aptitude or acquired skill. Special bailiffs being compelled to enter into an obligation for the proper discharge of their duty are sometimes called bound bailiffs, a term which the common people have corrupted into a more homely appellation. Consult Blackstone's 'Commentaries,' Vol. 1, chap. 9.

BAILLIEWICK, the jurisdiction of a bailiff, from bailie and wick (vicus), a town or village. In the United States it generally refers to a county, or in a jocular way is applied to any territory or place in which a person has authority.

BAILLARGEON, ba'yahrzhōn', Charles François, Canadian prolate; b. Ile aux Grues, Que., 1798; d. 1870. He was consecrated bishop of Tioa and coadjutor to Archbishop Turgeon of Quebec, 23 Feb. 1851; was administrator of the diocese in 1855; and archbishop in 1867.

BAILLARGER, ba'yahrżha', Jules Gabriel, French physician; b. 1809; d. 1891. He made a specialty of mental and nervous diseases and in 1843 joined with Longet and Cerezo to establish a review especially devoted to these subjects, known as the 'Annales Médico-psychologiques du Système Nerveux.' In 1849 he received the medal of the Legion of Honor for his valuable services during the cholera outbreak of that year; in 1852 he received a prize from the Académie Music for his essay on 'Des Hallucinations.'

BAILLET, ba'yat', Adrien, French writer; b. Neuville 1649; d. 21 Jan. 1706. He was ordained priest in 1675 and his love for learning was so intense that after discharging for five years the duties of a parish priest he resigned the position of librarian to Lamoignon, president of Parliament. His first publication was entitled 'Judgments of the Learned upon the Principal Works of Authors,' a book of criticisms which taught better rules than it illustrated. He also produced a book on 'Devotion to the Holy Virgin'; 'The Lives of the Saints' (3 vols., 1701); 'Life of Descartes' (2 vols., 1691); 'Des sottes personelles' (2 vols., 1689).

BAILLEUL, ba'yel', France, town in the department of the Nord, near the Belgian frontier, about 19 miles northwest of Lille. It has manufactures of woolen and cotton stuffs, lace, leather, etc. Pop. (1911) 13,251. A village of the same name in the department of Orne gave its name to the Bailiol family.

BAILLIE, Lady Grizel, Scottish poet; b. Redbraes Castle, 25 Dec. 1665; d. 6 Dec. 1746; daughter of the 1st earl of Marchmont (Sir Patrick Hume); married George Baillie in 1702; published a large number of songs in Ramsay's 'Miscellany' and other collections; the best known is 'Were na My Heart Licht, I wad Dee.'

BAILLIE, Harry, the proprietor of the Tabard Inn, who acts as chairman of the meeting of the pilgrims in Chaucer's 'Canterbury Tales.'

BAILLIE, Joanna, Scottish author; b. Bothwell, near Glasgow, 11 Sept. 1762; d. 23 Feb. 1851. She removed in early life to London, where in 1798 she published the first volume of her well-known 'Plays on the Passions,' in which she attempted to delineate the stronger passions by making each passion the subject of a tragedy and a comedy. These plays were not well adapted for the stage, but gave Miss Baillie a very extended reputation. Her first volume was followed by a second in 1802, a third (of miscellaneous plays) in 1804, and a fourth in 1812. Other plays appeared in 1836 and a complete edition of her whole dramatic works in 1850. The only plays performed on the stage were a tragedy entitled the 'Family Legend,' which was brought out at the Edinburgh Theatre in 1810 under the patronage of Sir Walter Scott and had a run of 14 nights, and one of the plays on the passions entitled 'De Montfort,' which was brought out by John Kemble and played 11 nights, though an attempt to revive it at a later period failed. Miss Baillie also wrote songs and miscellaneous poems. All her productions are full of genius. The language is simple and forcible, the female portraits are particularly beautiful and great knowledge of the human heart is displayed in the deline-
tions of character. She was an intimate friend of Sir Walter Scott, who greatly admired her writings, and her home was frequented by many of the prominent authors of the day.

BAILLIE, Matthew, Scottish physician and anatomist: b. Lanarkshire, Scotland, 27 Oct. 1761; d. 23 Sept. 1823; brother of Joanna Baillie; educated at the universities of Glasgow and Oxford. While at Oxford he began his medical and anatomical studies under his maternal uncle, the celebrated William and John Hunter, then lecturers in London. In 1787 he was elected one of the physicians of Saint George's Hospital and held that office for 13 years. In 1789 he took the degree of M.D. and was admitted a fellow of the Royal College of Physicians. He very soon stood at the head of his profession and in 1810 was made physician to the King by George III. He published 'The Morbid Anatomy of Some of the Most Important Parts of the Human Body'; wrote eleven essays in the 'Transactions of the Society for the Promotion of Medical and Chemical Knowledge', and seven papers in the 'Medical Transactions', published by the London College of Physicians.

BAILLIE, Robert, Scottish Presbyterian clergyman: b. Glasgow 1599; d. 1662; educated at the University of Glasgow. In 1638 he sat in the famous general assembly which met in Glasgow to protest against the thrusting of Episcopacy on an unwilling people. In 1649 he was chosen by the Church to proceed to Holland and to invite Charles II to accept the crown in the north of Scotland. He formed his mission skilfully; after the Restoration, through Lauderdale's influence, he was made principal of Glasgow University.

BAILLIE, Robert, of Jerviswood, Scottish patriot of the reign of Charles II: d. 24 Dec. 1654. He first came into notice in 1676 through his rescue of a brother-in-law, the Rev. Mr. Kirkton, from the clutches of Archbishop Sharp's principal informer. In 1683 he took a prominent part in a scheme of emigration to South Carolina, as he saw no other refuge from Chirurgiastic tyranny and the government. About the same time he corresponded with Monmouth's supporters in London, Russell and Sidney and subsequently repaired there to concert measures for securing adequate reforms. On the discovery of the Ryehouse plot, he was arrested and sent to Scotland. Accused of conspiring against the King's life and of hostility to monarchical government, he was tried at Edinburgh and condemned to death upon evidence at once insignificant and illegal. The sentence was carried into execution on the very day that it was passed.

BAI!LOT, ba-yô', Pierre Marie François de Sales, French violinist: b. Passy 1771; d. Paris, 15 Sept. 1842. He was a professor in the conservatory at Paris; traveled extensively in Italy, Holland and England. He was the last of the old classical Paris school of violin players and unexcelled as an interpreter of chamber music.

BAILLY, ba-yô', Antoine Nicolas, French architect: b. 6 June 1810; d. 1 Jan. 1892; was appointed to an office under the city government of Paris in 1834; in 1844 was made architect to the French government and received the cross of the Legion of Honor in 1853. He was first president of the Société des Artistes Français. The Lycée Saint Louis, Mollière Fountain and the Tribunal of Commerce in Paris and the reconstruction of the Cathedral of Digne are examples of his work.
important is possession at the common law that the ownership of a bailed article is deemed to be divided between the bailor and the bailee, the latter being said to have the "special property" in the bailed article, the former the "general property." At common law it is the bailee and not the bailor is entitled to maintain the ordinary actions, such as trespass, trover and replevin, for an interference with the bailed article while in his possession, but in case of a permanent injury to it the bailor may institute an action "to protect his general property in interest therein." Innkeepers and common carriers are at common law absolutely liable for the safe return of goods entrusted to them, but modifications by statute now permit the innkeeper, by providing a safe deposit and giving proper notice, to limit his liability to that of an ordinary bailor, while common carriers, by proper notice or by reasonable special contract, may only be held responsible for losses and injuries resulting from their own or their servants' negligence. In New York losses resulting from the carrier's own negligence are not to be redeemed by him, and he is only liable for wilful wrongdoing. The contract of a carrier of passengers is not a contract of bailment. Common seal,"Law of Bailments" (London, 1900); Scholler, "Treatise on the Law of Bailments" (3d ed., Boston 1897); Story, "Commentaries on the Law of Bailments" (9th ed., Boston 1878).

Baily, Edward Hodges, English sculptor: b. Bristol, 10 March 1788; d. 22 May 1867. He was brought up with a view to a mercantile career, but ere long gained considerable success as a modeler in wax. He became a pupil of Flaxman in 1807, gained the Academy gold medal in 1811 for his "Hercules Restoring Alcestis to Admetus," and was elected a member of the Royal Academy in 1821. His principal works are "Eye at the Fountain," "Eye Listening to the Voice," "Maternal Affection," "Girl Preparing for the Bath," "The Graces," etc. The last-mentioned is on the south side of the Marble Arch, Hyde Park; the statue of Nelson on the Trafalgar Square monument, and many statues of distinguished men, were executed by him.

Baily, Francis, English astronomer: b. Newbury, in Berkshire, 1774; d. 1844. Entered a London house of business, and traveled two years in America, the literary outcome of which was his curious "Journal of a Town in the Unsettled Parts of North America in 1796 and 1797," published in 1856; then settled in London as a stockbroker and published several works on the doctrine of life annuities and insurance. On retiring from business with an ample fortune in 1825 he turned his attention particularly to astronomy, and became one of the founders of the Astronomical Society; improved the national almanac, and described the phenomenon called Baily's beads (q.v.). Besides many astronomical papers he wrote a "Life of Flamsteed."

Baily's Beads, a phenomenon attending eclipses of the sun, the unobscured edge of which always discontinues and broken immediately before and after the moment of complete obscuration. It is classed as an effect of irradiation and defraction.

Bain, Alexander, Scottish electrician: b. Wattens, Caithness, 1810; d. 1877. After serving an apprenticeship to a clockmaker in Wick, he went to London, and began a series of electrical experiments in 1837; invented electric fire-alarm and sounding-apparatus, and the automatic chemical telegraphy, by which high speed telegraphy was for the first time made possible.

Bainbridge, John, English astronomer and mathematician: b. Ashby-de-la-Zouch, in Leicestershire, 1582; d. 1643. He studied at Cambridge; set up a grammar school in his native place, and at the same time practised physic, devoting his leisure to the science of mathematics. His "Description of the Comet of 1618" was the means of introducing him to Sir Henry Savile, who had founded an astronomical lecture at Oxford, and who in 1619 showed Dr. Bainbridge to the professorship. He died while engaged in publishing corrected editions of the works of the ancient astronomers, an undertaking which was one of the duties enjoined on him as Savilian professor. His other published works are "Periptolemaic De Hypothesibus Planetarum," together with "Periptolemaic Canon Regnorum" (1620); and "Canicularia: A Treatise on the Dog Star" (1648).

Bainbridge, William, American naval officer: b. Princeton, N. J., 7 May 1774; d. 28 July 1833. He entered the merchant service at the age of 15 and became captain within four years. In 1796, while commander of the Hope he defeated an English schooner, whose captain had tried to impress some of the Hope's crew. In 1798, when the United States navy was organized, he was made lieutenant in the given command of the schooner Retaliation. He was captured by the French and kept a prisoner for several months, and on his return to the United States made a report which led to the passage of the Retaliation Act of 1796 against French subjects captured on the high seas; was placed in command of the Norfolk and subsequently appointed to the command of the frigate George Washington, which was ordered to take tribute to Algiers. The Dey of Algiers demanded that Bainbridge convey an Algerian fleet and valuable presents to Constantinople, and Bainbridge was forced to comply to avoid war and the destruction of the unprotected trade in the Mediterranean. The United States government fully approved the course he had pursued. He was soon employed in the Mediterranean again in command of the frigate Essex, and afterward upon the declaration of war against the United States by Tripoli, was appointed to the frigate Philadelphia, one of the vessels of the squadron sent against that power, under the command of Commodore Edward Preble. On 26 Aug. 1803, he captured the Moorish frigate Meshheo, but was himself taken prisoner with his officers and men in October of that year. While pursuing one of the enemy's vessels, the Philadelphia ran aground; every possible effort was made to float her, but she was soon surrounded by gunboats from Tripoli, about three miles distant, and Captain Bainbridge was compelled to surrender, having first taken such measures as it was thought would ensure the final loss of the ship. He remained with his associate prisoners in Tripoli until the conclusion of peace, which took place 3 June 1805. On his return a court of inquiry for the loss
of the Philadelphia gave him honorable acquittal. His next service afloat was in the War of 1812, when he was appointed, with the rank of commodore, to the command of a squadron, consisting of the Constitution (his flagship), Essex and Hornet, and sailed from Boston 25 October for a cruise. On 26 December off San Salvador, while separated from the rest of his squadron, it was his good fortune to fall in with and capture H. M. frigate Java. In 1815 he was appointed to the command of a squadron of 20 sail, intended to act against Algerians, but peace was concluded before it reached the Mediterranean. In 1819 he again commanded in the Mediterranean, and returned from this, his last service afloat, in 1821. From this time until his death he was almost constantly employed in important shore service, commanding at different times the navy yards at Boston and Philadelphia, and holding the position of president of the board of navy commissioners from 1832 to 1833. As an officer he had few superiors. Though he had a nervous temperament, he was cool in danger, and always had the confidence of those under his command. His system of discipline, though rigid, was always consistent and just, and he was remarkable for paying the greatest attention to the formation of his young officers.

BAINES, Sir Edward, English politician: b. 1800; d. 1890. He was the son of Edward Baines (q.v.); was elected to Parliament in 1859, and, like his father, championed various reforms. He opposed Church tests in the universities, advocated the disestablishment of the Irish Church, and in 1861 and 1862 presided over the committee on bills for extending the electoral franchise. He published a 'Life' of his father (1861) and a 'History of the Cotton Manufacture in Great Britain' (1835), besides other works.

BAINES, Thomas, English artist and explorer: b. King's Lynn, Norfolk, 1822; d. Durban, Natal, 1875. In 1842 he went to Cape Colony, where he accompanied the British army in the Kaffir War (1848–51) as artist. He afterward went with Gregory's party to explore northwest Australia; with Livingston to the Zambesi; with Chapman's expedition to Victoria Falls, and finally headed an expedition to the gold fields of Tati. Everywhere he made large numbers of sketches. A handsomely folio of colored lithographs from his drawings at Victoria Falls was published in 1865. His last journey among the Kaffirs was very carefully mapped out and sketched. His works are 'Explorations in Southwestern Africa' (1864); 'The Gold Regions of Southeastern Africa' (1877).

BAINES, Edward, English publicist: b. Walton-le-Dale 1774; d. 1848. He became a printer's apprentice at Preston and later at Leeds. In 1801 he became proprietor of the Leeds Mercury, which he made one of the greatest of the provincial journals. He was the confidant and adviser of many parliamentary leaders and in 1834 succeeded Macaulay as member for Leeds in Parliament until 1841. He was an independent Liberal, advocating the separation of Church and state, the reform of factory laws, and opposing governmental interference in education. He wrote 'History of the County Palatine and Duchy of Lancaster' and 'History of the Reign of George III' (4 vols., 1823). Consult his 'Life' by his son (1861).

lasting three days. This feast begins, like the Ramazan, as soon as the new moon is announced by the persons appointed for that purpose, and during the course of 32 years makes a complete circuit of all the months and seasons, since the Turks reckon by lunar years. It is the custom at this feast for inferiors to make presents to their superiors, a custom formerly extended even to the Europeans. Seventy days after this first or lesser Bajram begins a second season—(the greater) Bajram. These are the two most important feasts whose celebration is prescribed by the Mohammedan religion.

BAIRD, Abasalom, American soldier: b. Washington, Pa., 20 Aug. 1824; d. near Relay, Md., 14 June 1905. He was graduated from the United States Military Academy and assigned to the artillery in 1849. He was commissioned brigadier-general of volunteers 1862, and brevetted major-general four months later for his conduct in the Atlanta campaign. On 13 March 1865 he was brevetted major-general United States army, for meritorious services in the field during the war. He was continuously in the field from the Manassas campaign, in 1861, till after the surrender of General Johnston's army in 1865. He was staff inspector-general from 1885 to 1888 when he retired.

BAIRD, Andrew Wilson, English military engineer: b. Aberdeen, Scotland, 26 April 1842; d. 2 April 1908. He became a colonel in the Royal Engineers Corps in 1893; was special assistant engineer of the harbor defenses of Bombay in 1894; assistant field engineer of the Abyssinian expedition in 1887, and for nearly 20 years thereafter was employed on the great trigonometrical survey of India. His services were rewarded with numerous official commendations, medals and decorations; and he has published a number of important works on his labors in India.

BAIRD, Charles Washington, American historian and religious writer, son of Robert Baird: b. Princeton, N. J., 28 Aug. 1828; d. 10 Feb. 1887. He was a graduate of Union Theological Seminary, and pastor in Brooklyn in 1852, and in Rye, N. Y., 1858. Besides works on the Presbyterian liturgies (which he was the first to collect and investigate) and local histories, he wrote 'History of the Huguenot Emigration to America' (2 vols., 1885), a work especially interesting to the genealogist.

BAIRD, Sir David, British general: b. Newbyth, Scotland, 6 Dec. 1757; d. 29 Aug. 1829. He entered the English army in 1772, and going to India distinguished himself at a disastrous engagement at Perambourcum, 10 Sept. 1780, in which the small British force engaged was nearly cut to pieces after surrendering. His life was spared, but he was kept prisoner for four years. He attained the rank of major in 1787, and in October 1789 obtained leave of absence and returned to Great Britain. In 1791 he joined the army under Cornwallis, and as commander of a brigade of Sepoys he was present at the siege of Seringapatam, in 1791 and 1792; and likewise at the storming of Tippoo Saib's lines in the island of Seringapatam. In 1793 he commanded a brigade of Europeans, and was present at the siege of Pondicherry. On 9 May 1799, he commanded the storming party at the assault of Seringapatam; when, in requital of his brilliant services he was presented by the army, through the commander-in-chief, with the state sword of Tippoo Saib. In 1800 he had a command in Egypt, and with the increased rank of lieutenant-general commanded an expedition which sailed in October 1805, for the Cape of Good Hope, where he defeated the Dutch army; and received the brevet of a general. After a short period of service in Ireland Sir David sailed in command of an armament of 10,000 men for Corunna to assist Sir John Moore. Moore was killed in the battle of Corunna and Sir David succeeded to the chief command. He was created a baronet in 1809. In 1814 he was promoted to the rank of general, and in 1819 became governor of Kinsale, next year commander of the forces in Ireland and in 1827 governor of Fort George in Scotland. Consult Hook, 'Life of Sir David Baird' (1832).

BAIRD, George Washington, American naval officer: b. Washington, D. C., 22 April 1843. He received a public school and academic education and was appointed third assistant engineer in the United States navy in 1862. He was promoted through grades and retired with rank of rear-admiral in 1905. He is president of the Washington Board of Education and is a member of several engineering societies.

BAIRD, Henry Carey, American publisher: b. Bridesburg, Pa., 10 Sept. 1825; d. 31 Dec. 1912. He was a member of the publishing firm of Carey & Baird from 1843 to 1849, when he organized the firm of Henry Carey Baird and Company. He took an interest in politics first as a Whig and later a Republican. He was leader of the Greeley party in 1875, and by it was nominated for State treasurer of Pennsylvania and for mayor of Philadelphia. He declined the former nomination. He was an advocate of free silver and a protective tariff. He published pamphlets and contributions to works of reference and to periodicals on banking and other economic topics.

BAIRD, Henry Martyn, American author and educator: b. Philadelphia, Pa., 17 Jan. 1832; d. Yonkers, N. Y., 11 Nov. 1906. He graduated from New York University in 1850, and later took a course in theology at Union and Princeton. In 1859 he was appointed professor of the Greek languages and literature in the New York University. In 1906 he became a pensioner under the Carnegie fund. He was widely known for his researches in the history of French Protestantism, of which his works, given below, form the best succinct account from 1512 to 1902. He wrote 'History of the Rise of the Huguenots' (1879-1907); 'The Huguenots and Henry of Navarre' (1886); and 'The Huguenots and the Revocation of the Edict of Nantes' (1895); 'Theodore Beza, the Counsellor of the French Reformation' (1899).

BAIRD, Julian William, American chemist: b. Battle Creek, Mich., 14 Feb. 1859. He was graduated from the University of Michigan in 1882; was instructor in chemistry and in charge of the qualitative analysis and assaying
in Lehigh University, 1833–86; and became pro-
Fessor of analytical and organic chemistry in
the Massachusetts College of Pharmacy, Bos-
ton, in 1886, and its dean in 1887.

BAIRD, Robert, American clergyman and
author: b. Fayette County, Pa., 6 Oct. 1798; d.
York, N. Y., 13 March 1863. He was gradu-
ated from Jefferson College in 1818, and at
Princeton Theological Seminary in 1822. He
spent several years in Europe, engaged in tem-
poral work in the area in the revival of evan-
gelical Protestantism. He published 'History of
the Waldenses, Albigenses and Vaudois.'
'History of the Temperance Societies' (1836);
'Religion in America' (1844); 'Protestantism in
Italy' (1845), etc. He was corresponding secre-
tary of the American and Foreign Christian
Union (1849–55, 1861–63). Consult his life by
Henry M. Baird.

BAIRD, Spencer Fullerton, American
naturalist: b. Reading, Pa., 3 Feb. 1823; d.
Woods Hole, Mass., 19 Aug. 1887. He was
graduated from Dickinson College in 1840, and
in 1842 studied at the College of Physicians
and Surgeons in New York City. He was the
intimate of Audubon and Agassiz and aided in
their work. He became professor of natural
sciences at Dickinson College, Carlisle, Pa.,
1845; assistant secretary Smithsonian Institu-
tion, 1850; United States commissioner of fish
and fisheries, 1871; secretary of the Smith-
sonian Institution, 1878; and founder of the
National Museum. Among his more important
works are 'Catalogue of North American Rep-
tiles' (1853); 'Birds of North America' (with
Cassin and Lawrence, 1860); 'Mammals of
North America' (1858); 'History of North
American Birds' (with Brewer and Ridgeway,
1879–84), etc. His work had a beneficent in-
fluence on natural history in the United States.
He trained a great number of men who have
attained great fame in various departments of
scientific and economic natural history. A
complete bibliography of his works and papers
to 1882 was compiled by G. Brown Goode and
published as 'Bulletin No. 20 of the United
States National Museum' (Washington 1883).
It contains 1,063 titles, and other works ap-
peared from his pen from that time until his
death five years later.

BAIRD LECTURES. In 1871 James
Baird, the Scottish ironmaster, founded the
Baird Lectures, for the defense of orthodox
religious teaching. Two years later he made a
gift of £500,000 to the Established Church of
Scotland for the Baird Trust 'to assist in
providing the means of meeting and at least,
as far as possible, promoting the mitigation of
spiritual destitution among the population of
Scotland.' The gift was well intended, but it
was hampered by conditions distasteful to the
members of the establishment, and for this reason it was bitterly attacked by several of the foremost religious journals of Engiand and Scotland and the secular Scot-

BAIREUTH. See BAYREUTH.

BAITER, be'ter, Johann Georg, Swiss
philologist: b. Zürich, 31 May 1801; d. 10 Oct.
1877. He was professor in the University of
Zürich, and for three periods, the last from
1849 to 1865, director in the gymnasium there.
He published, alone and with others, various
editions of the classics, scholastic authors,
' Cicero' of Scholastic,' Oratores Attici' (1838–50), etc. His title to distinction lay in
his skill in textual criticism.

BAIUS, or DE BAY, Michael, Belgian
theologian: b. 1513, at Melin, near Ath, in
Hainaut; educated at Louvain, he was appointed
professor of Scripture at this university in
1562, and was named bishop of Tournai (Charles V) to the Council of Trent, where
he arrived when it was nearly over. Biaus was
one of the greatest theologians of the Roman
Catholic Church in the 16th century.
He founded systematic theology directly upon
the Bible and the Christian fathers, leaving
the scholastic method. He studied specially
the writings of Saint Augustine and had his own
interpretations of that father. The doctrines
that the human will, when left to itself, could
only sin; that even the mother of Jesus was
not free from hereditary and actual sin; that
every action which did not proceed from pure
love of God was sinful; and that no penance
was effectual for the justification of the sinner,
but everything was to be referred back to the
grace of God, through Christ, caused the
superior of the Franciscan Order in Belgium
to submit 18 of his propositions to the Sor-
bonne in Paris. The Sorbonne faculty con-
demned three of the propositions as false and
13 as contrary to Catholic teaching. Biaus
disavowed the condemned sentences, claiming
that some of them had not been taught by him
and that others had been presented incorrectly.
After his return from Trent, he published
theses which contained doctrines that were
rejected by the Spanish and Italian universi-
ties to which they had been submitted. Finally
76 sentences taken from his works were con-
demned by Pius V in 1567 and some dispute
arising about the meaning of this bull, it was
confirmed by Gregory XIII and entrusted to the
Jesuit Cardinal Toletus to deliver to Biaus.
Biaus submitted; yet the opposition still con-
tinued, as did also his defense of some of his
interpretations of Augustinian teachings; and
as the theological faculty at Louvain was
entirely in his favor, he not only remained in
the quiet possession of his dignities, but was
also appointed dean of Saint Peter's in 1575,
and in 1578 chancellor of the university. He
died in 1589, and left the reputation of great
learning, pure morals and a rare modesty.
His interpretations of Augustine, which were
called Biausianism, were adopted by the Jansen-
ists and were defended by them against their
Jesuit opponents. His doctrine that the un-
condoned love of God has also been adopted by
the Quietists. His writings, mostly polemical,
were published at Cologne (4to 1693). Con-
sult Duchesne, 'Histoire du Bayanisme'; Lin-
sermann, 'Bayus und die Grundlegung des
Jansenismus.'

BAJA, be'yŏ, a Hungarian market town
situated near the Danube, 90 miles south of
Budapest. It has important manufactures of
alcohol and shoes, is celebrated for its annual
wine fair and has a considerable trade in

BAJADA DEL PARANA, b'a-ha'da dél
p'a-ra'na'. See PARANA.
BAJAZET, bā′zhət, I, or BAYAZID I, a Turkish sultan: 1347; d. 1403. In 1389 he succeeded his father, Murad of Amurath, who fell in the battle of Kosovo against the Serbs, and caused his brother Jacob, his rival for the throne, to be strangled. He made great and rapid conquests, in three years conquering Bulgaria, the Principality of Serbia, and subduing the states of Asia Minor. From the rapidity of his conquests, he was called Ilderim ("Lightning"). In order to save Constantinople, blockaded by Bajazet, King Sigismund of Hungary (afterward Emperor of Germany) assembled a great army, but Bajazet met them at Nicopolis on the Danube and obtained a decisive victory over the allied Hungarians, Polcs and French, 28 Sept. 1396. He would probably have now overturned the whole Greek empire if Timur had not overthrown Asia Minor in 1400 and defeated him in 1402 in a battle near Angora. He himself fell into the power of the conqueror and died in Timur's camp, in Caramania. He was succeeded by his sons Selim I, Musa, and Mohammed, the last named becoming sole ruler in 1413. Bajazet's reign was marked by great corruption in high and low places. Consult Gibbon, 'Decline and Fall of the Roman Empire' (London, 1900), and Lane-Poole, 'Turkey' (New York 1889).

BAJAZET or BAYAZID II, Sultan of the Ottoman empire: b. 1447; d. 1513. He was the son of Sultan Mohammed II, the conqueror of Constantinople. He became Sultan in 1481, and was continually engaged in wars with Poland, Venice, Persia, and Egypt. He suffered several serious reverses, but managed to strengthen the Ottoman power in Europe. His last years were embittered by disputes among his sons in regard to the succession. In 1512 he abdicated in favor of his son Selim, and died soon after near Adrianople. He was a lover of luxury, but also a patron of learning and the arts, and built several splendid mosques in Constantinople and elsewhere.

BAJAZET, Mosque of, a mosque at Constantinople, built in 1505 by Bajazet II. It is one of the finest specimens of Mohammedan architecture, and displays excellent proportions and great richness of detail in decoration. There are four Persian doorways and an octagonal fountain in the centre of the court.

BAJOCO, bayōk′kō, or BAIOCO, a papal state copper coin, whose value is about one cent. A Neapolitan coin, value about 83 cents, was also called Bajocco in Sicily.

BAJURA, bā-jōo′ra, the banner of Mohammed.

BAJZA, boi′zō, Joseph, Hungarian poet and critic: b. Szucs, 31 Jan. 1804; d. Pesch, 3 March 1858. He devoted himself to history, and edited a 'Historical Library' (1843-45) and the 'New Plutarch' (1845-47). He exerted a strong and salutary influence on Hungarian literature in history, in the development of a national drama, and—in the conduct of two journals—on the Hungarian traditions of literary taste. He also ranks among the best lyric poets of Hungary. His 'Poems' appeared in 1835, and his 'Collected Works' in 1861.

BAKACS, bōkch, Thomas, Hungarian statesman, son of a peasant: b. about the middle of the 15th century; d. 1521. He held several bishoprics in succession, became chancellor of the kingdom, and finally cardinal-archbishop of Hungary. He preached a crusade against the Turks; but his army of peasants and vagabonds turned their arms against the nobility, and a fierce civil war ensued, which ended in the final defeat of the insurgents by John Zapolya.

BAKAI, bākā′i, or BACCAHRY, a Caricibbean tribe of central Brazil, remarkable for their light complexion. The men have assembly houses, where they spend most of their time, which women are forbidden to enter.

BAKAI, Rumania, the capital of the district of the same name in Moldavia, on the Bistritz, 188 miles north of Bucharest, with which it is connected by rail. It contains a gymnasium and has a commerce in the agricultural products of the district. Pop. 16, 187, about one-fourth of which are Jews.

BAKE, bā′kē, Jan, Dutch philologist: b. Leyden, 1 Sept. 1787; d. 26 March 1864. From 1817-5 he was professor of Greek and Roman literature at the University of Leyden. Here he edited and published valuable editions of Posidonius, and of the astronomers and mathematicians of antiquity, and assisted in the large and original work entitled 'Bibliotheca Critica Nova.' He published a series of philological articles, edited some of the works of Cicero and wrote an excellent essay upon the Greek tragedians.

BAKEL, French West Africa, fortified town and capital of the arrondissement of the same name in the colony of Senegal, on the Senegal River. It came into the possession of France in 1820, and was of great strategic importance in the struggles with the natives. It is now a great trade centre and the meeting place of caravans from the upper Senegal basin and the Niger. Dates, bees, gold dust and ivory are the principal articles of trade. In the rainy season it is connected directly by a water route with Saint Louis on the coast. Pop. 1,760.

BAKER, Alfred, Canadian educator: b. Toronto. He was graduated B.A. at Toronto University in 1869, and after holding high school and other appointments became mathematic tutor in University College in 1875, registrar of Toronto University in 1881, professor of mathematics in 1887, and dean of the Faculty of Arts in 1912. He has published two works on geometry, edited treatises on trigonometry and mechanics and was president of the Royal Society of Canada 1915-16.

BAKER, Sir Benjamin, English engineer: b. near Bath 1840; d. Pangbourne, Berks., 19 May 1907. He joined the staff of Sir John Fowler in 1861, becoming his partner in 1875. In 1877 he supervised the removal of Cleopatra's Needle from Egypt to London and was consulting engineer in the construction of the Assouan dam. In 1879 he was engaged in consultation in connection with the design of the Saint Louis bridge across the Mississippi, and on the threatened inundation of the first tunnel across the Hudson he designed a pneumatic shield 2,000 feet in length which enabled the work to be successfully accomplished (1889-
BAKER, Charles Fullcr, American zoologist: b. Lansing, Mich., 22 March 1872. He was graduated at the Michigan Agricultural College in 1892, and for several years taught biological subjects in various secondary schools. From 1904 to 1907 he was chief of the department of botany at the Cuban Agronomical Station, in 1907-08 curator of the botanical garden and herbarium at the Museu Goedli, Para, Brazil. From 1909 to 1912 he was professor of biology at Pomona College, Claremont, Cal., in the latter year he was appointed professor of agronomy at the University of the Philippines. He had charge of the Colorado biological and forestry exhibit at the Chicago Exposition of 1893, and in 1897-98 was zoologist and associate botanist to the Alabama Biological Survey. He was botanist to the H. H. Smith exploring expedition in the Santa Marta Mountains, Colombia, 1898-99, and has himself conducted field explorations in several Western States and in Brazil, Cuba and Nicaragua. He published 'Invertebrata Pacifica' and is co-author of 'Economic Plants of the World.'

BAKER, Charles Whiting, American civil engineer: b. Johnson, Vt., 17 Jan. 1865. He was graduated at the engineering department of the University of Vermont, became managing editor of Engineering News in 1887 and its editor-in-chief since 1895. In the 28 years of his connection with this journal its circulation has increased tenfold. He published in 1889 in Putnam's 'Questions of the Day,' series a study of the trusts and of competition, entitled 'Four Napoleon's of the People,' of which three editions were printed. Many measures advocated in this book have in recent years been enacted into law. He is a member of the American Society of Mechanical Engineers and since 1913 has been one of the commissioners of the Falises Interstate Park of New York and New Jersey.

BAKER, Daniel, American clergyman and author: b. Midway, Ga., 17 Aug. 1791; d. Austin, Tex., 10 Dec. 1857. He gained such a reputation as an effective preacher that his services were in demand as a revivalist. After 1830 he continued as an evangelist, traveling in the South, and at last settled in Austin, Texas, where he founded a college and became its first president. His published works include 'A Scriptural View of Baptism,' 'An Affectionate Address to Mothers, and one to Fathers,' 'Baptism in a Nutshell,' 'Revival Sermons,' 'Consult 'Monarchs' edited by his son (Philadelphia 1859).

BAKER, David (Augustine), Benedictine ascetical writer: h. 1675; d. 1641. The most original and ablest spiritual writer among English Catholics during the first half of the 17th century. Having finished his studies at Oxford he devoted himself to law at Lincoln's Inn and later at Inner Temple. In his 46th year he became a convert to the Catholic faith, and a few years later was ordained priest and was subsequently received into the Benedictine Order by the Italian fathers in England. Dugdale and Dodsworth are indebted to his historical labors for much of the data found in their monumental works. It was Father Baker who discovered that the old English Benedictine monastery of Saint Peter at Westminster was legally continued in the person of an old priest, Dom Robert (Siebert) Bateley, who had suffered 44 years' imprisonment for refusing the oath of supremacy. By this sole survivor David Baker was professed into the monastery of Westminster, and thus became one of the first three priests to form the connecting link between the old and the new congregation in England. It was as spiritual director at Douai and Cambrai that he composed his admirable treatises on the spiritual life. Consult Wood, 'Athææ Oxoniensii'; Taunton, 'English Black Monks of Saint Benedict.' 'Dictionary National Biography' (Vol. III, London 1885).

BAKER, Edward Dickinson, American soldier and politician: b. London, England, 24 Feb. 1811; d. 21 Oct. 1861. He came to the United States in 1816, was elected to the Illinois legislature in 1837, became a State senator in 1840, and was sent to Congress in 1844. He served under General Scott in the war with Mexico and commanded a brigade at the battle of Cerro Gordo, and was elected United States senator from Oregon in 1860. He entered the Federal army at the outbreak of the Civil War and was killed at the battle of Pea Bluff while leading a charge. Consult Glazier, William, 'Heroes of Three Wars' (1880).

BAKER, Frank, American zoologist: b. Pulaski, N. Y., 22 Aug. 1841. He is professor of anatomy in the University of Georgetown since 1888, and superintendent of the National Zoological Park in Washington, D. C.; assistant superintendent of United States life saving service 1899-90. He is a Fellow of the American Association for the Advancement of Science, and a member of the Washington Academy of Sciences and the Anthropological and the Biological Societies, all in Washington. He received the degree of L. D. from Georgetown in 1914. He has contributed articles to the 'Reference Handbook of Medical Sciences,' was a coeditor of 'Billings Medical Dictionary,' and the 'Standard Dictionary.' From 1890 to 1897 he was editor of the 'American Anthropologist.'

BAKER, Frank Collins, American zoologist: b. Warren, R. I., 14 Dec. 1867. He was educated at Brown University and at the Philadelphia Academy of Natural Sciences. The latter institution sent him to Mexico with an exploring expedition in 1890. In 1891-92 he was invertebrate zoologist of Ward's Natural Science Establishment and secretary of the Rochester Academy of Sciences. In the latter year he became curator of a large portion of the Field Columbian Museum of Chicago, and in 1894 curator of the Chicago Academy of Sciences. He has published 'A Naturalist in Mexico' (1895); 'Mollusca of the Chicago Area' (1898-1902); 'Shells of Land and Water' (1895); 'The Lymnoidea of North and Middle Amer-
ica' (1911), and contributions to zoological journals, principally on mollusca.

BAKER, George Pierce, American scholar and educator: b. Providence, R. I., 4 April 1866. He was graduated at Harvard in 1887, and in the following year was appointed instructor in English at that institution, becoming successively instructor in forensics 1889, assistant professor of English 1895, and professor of English 1905. He established and conducted a department of criticism and dramatic writing at Harvard. He has published 'The Principles of Argumentation' (1895–1905); 'The Development of Shakespeare as a Dramatist' (1907), and edited 'Specimens of Argumentation' (1893); 'The Forms of Public Address' (1904); 'Some Unpublished Correspondence of David Garrick' (1907); 'The Correspondence of Charles Dickens and Maria Beadnell' (1913), various Elizabethan plays. In 1907–08 he was Hyde lecturer at the Sorbonne, Paris.

BAKER, Henry, English naturalist and poet: b. May 1698; d. 25 Nov. 1774. Apprenticed to a broker, he afterwards devoted his attention to developing an improved system of education for the education of deaf-mutes, and thus amassed a fortune. He was associated with Defoe in the publication of the 'Universal Sceptator' (1726). In 1744 he obtained the professorship of medicine at the University of London, and his laboratory on this subject was the forerunner of the Royal Institution. He received the degree of D.C.L from Oxford and Cambridge. He was a strong advocate of the abolition of the slave trade. In 1753 he published 'The Microscope Made Easy,' 'Employment for the Microscope,' many scientific papers and several poetical works.

BAKER, Sir Henry Williams, English hymn writer: b. London, 27 May 1821; d. Monkland, 12 Feb. 1877. He was educated at Trinity College, Cambridge, and in 1851 was presented to the vicarage of Monkland near Leominster. He succeeded his father as 3d baronet in 1859. In 1852 he wrote his first hymn, 'Oh, what if we are Christ's.' Two others appeared in 1861: 'Praise, O Praise Our Lord and King' and 'There Is a Blessed Home.' He is chiefly known as the promoter and editor of 'Hymns Ancient and Modern,' first published in 1861. To it he contributed many original hymns as well as several translations of Latin hymns. Strong objection was made to Baker's hymn addressed to the Virgin Mary, 'Shall We Not Love Thee, Mother Dear?' Baker held the doctrine of the celibacy of the clergy. He published also 'Daily Prayers for the Use of Those Who Have to Work Hard,' and a 'Daily Text-book' for the same class, and some pamphlets on religious subjects. Consult the 'Literary Churchman' (24 Feb. 1877).

BAKER, Herbert Brereton, English chemist: b. Blackburn, about 1857. He was educated at the Manchester Grammar School and at Balliol College, Oxford, where he was a demonstrator in chemistry in 1883–85. He was head of the science department of Dulwich College 1885–1902, and headmaster of Alley's School, Dulwich, in 1902–03. He became a Fellow of the Royal Society in 1919, and in 1912 was appointed professor of chemistry in the Imperial College of Science and Technology, London. He has published 'Combustion in Dried Oxygen' (1885); 'Action of Light on Silver Chloride' (1892); 'Influence of Moisture on Chemical Action' (1894); 'Drying of Ammonia and Hydrogen Chloride' (1898); 'Vapor Density of Dried Mercuric Chloride' (1900); 'Union of Hydrogen' (1902); and, in conjunction with Professor Dixon, 'The Chemical Inactivity of Raentgen Rays' (1896); 'Gaseous Nitrogen Trioxide,' with Mrs. Baker (1907).

BAKER, Ira Osborn, American educator: b. Linton, Ind., 23 Sept. 1853. He became professor of civil engineering in the University of Illinois in 1880; is the author of 'Levelling' (1886). 'Engineers' Surveying Instruments' (1892); 'Treatise on Masonry Construction' (1889–1899); 'Durability of Brick Pavements' (1893); 'Treatise on Roads and Pavements' (1903–13). Member American Society of Civil Engineers, Western Society of Engineers, Society for Promotion of Engineering Education.

BAKER, James Heaton, American soldier: b. Monroe, Ohio, 6 May 1829; d. 27 May 1913. He was educated at Ohio Wesleyan University. He was secretary of State of Ohio in 1854–56, and of Minnesota in 1857–61, when he joined the army as a colonel of the 4th Minnesota Volunteer Infantry. He was mustered out of the service in 1865 with the rank of brigadier-general. Afterward he was commissioner of pensions under President Grant, was surveyorgeneral of Minnesota 1875–79, and State railroad commissioner 1883–89. In 1899 he became proprietor of two Republican newspapers which he combined under the name of the Mankato Free Press. He wrote 'Lake Superior' (1879) and 'The Sources of the Mississippi' (1887), both in the 'Collections of the Minnesota Historical Society'; also 'The Lives of the Governors of Minnesota' (1908).

BAKER, James Hutchins, American university president: b. Harmony, Me., 13 Oct. 1848. He was principal of the Denver High School 1875–92; president of University of Colorado 1892–1914, and since the last named date president emeritus. His publications include 'Elementary Psychology' (1890); 'Education and Life,' 'American Problems' (1907); 'Educational Aims and Civic Needs' (1915).

BAKER, John Gilbert, English botanist: b. Guisborough, 1842; d. 1 Jan. 1899, and was appointed assistant curator at the herbarium at Kew in 1866 and was keeper 1890–99. He was gold medalist of the Linnean Society for 1899, and obtained the Veitch gold medal for horticulture in 1907. He is the author of works on the flora of North Yorkshire, the English Lake District, and the Mauritius, of handbooks on ferns, and (with Sir W. J. Hooker) of 'Synopsis Filicum.'

He was graduated at Johns Hopkins University in 1892 and received the degree of LL.B. at Washington and Lee University in 1894. In 1896 he was admitted to the New York bar. In 1897 he was elected to the Board of Education of the City of New York, and in 1898 he was appointed Secretary to the Board of Education. He was also elected a member of the New York State Senate in 1899. In 1902 he was appointed Secretary of War by President Wilson.

BAKER, Osmon Cleander, American clergyman: b. Marlow, N. H., 30 July 1812; d. 20 Dec. 1871. He was educated at Wesleyan University; spent several years in teaching, and was one of the founders of the Methodist Episcopal theological schools. He was professor in the Biblical Institute in Concord, N. H., 1847-52, and in the last named year was elected a bishop. His work, "Guide Book in the Administration of Discipline of the Methodist Episcopal Church" (1853), is a standard authority.

BAKER, Ray Stannard, American author and journalist: b. Lansing, Mich., 17 April 1870. He graduated at the Michigan Agricultural College in 1890, and later took a partial law course and studies in literature at the University of Michigan. He was reporter and sub-editor of the Chicago Record 1892-97, managing editor of McClure's Syndicate 1897-98, and associate editor of McClure's Magazine 1899-1905. From 1906 to 1915 he was one of the editors of the American Magazine. He has contributed to several magazines many articles on social and economic subjects. His published volumes include 'Boys' Book of Inventions' (1899); 'Our New Prosperity' (1900); 'Seen in Germany' (1901); 'Second Boys' Book of Inventions' (1903); 'Following the Color Line' (1908); 'New Ideals in Healing' (1909); 'The Spiritual Unrest' (1910).

BAKER, Sir Richard, English historian: b. Kent 1568; d. 1645. He was educated at Oxford, and knighted in 1603 by James I; in 1620 he filled the office of high sheriff of Oxford for a short time, and afterward he was thrown into Fleet Prison because of having given security for a debt contracted by his wife's family, which he was unable to pay. During his imprisonment he wrote 'Chronicle of the Kings of England,' first published in 1643, and afterward continued by Edward Phillips, the nephew of Milton, and others, a work popular at the time, but not of permanent value. He died in prison.

BAKER, Sir Samuel White, English explorer and author: b. London, 8 June 1821; d. 30 Dec. 1893. He was trained as an engineer, and at the age of 24 went to Ceylon, where he founded an agricultural settlement at Nuwarah Eliya in 1847. In the early part of 1851, accompanied by his wife, he set out for Africa on a journey of exploration. When he had ascended as far as Gondokoro he met Speke and Grant returning after their discovery of the Victoria Nyanza Lake, and learned from them that another large lake in the district had been spoken of by the natives. This lake he set out to discover, and after many adventures he and his wife beheld the Albert Nyanza, on 14 March 1864. On his re-turn home he was received with great honor and was knighted. In 1869 he returned to Africa as head of an expedition sent by the Khedive of Egypt to suppress the slave trade, and to annex and open up the large part of the newly-explored country, being raised to the dignity of pasha. Returning in 1873, he was succeeded by the celebrated Gordon. In 1879 he explored the island of Cyprus and subsequently traveled in Syria. His writings include 'The Rifle and the Hound in Ceylon' (1854); 'Eight Years' Wanderings in Ceylon' (1855); 'The Albert Nyanza' (1866); 'The Nile Tributaries of Abyssinia' (1867); 'Ismailia, a Narrative of the Expedition to Central Africa' (1874); 'Cyprus as I saw It in 1879'; 'Wild Beasts and Their Ways' (1890); 'True Tales for My Grandsons' (1883); also 'Cast up by the Sea,' a story published in 1889.

BAKER, Thomas, English antiquary: b. 1655; d. 1740. His 'Reflections on Learning' (1709-10) went through seven editions. He left in manuscript 42 folio volumes of an 'Athene Cantabrigiensis,' from which a 'History of St. John's College' was edited by Professor Mayor. The former was published in 1867, and the latter in 1869. Constance Walpole, 'Works,' ii, 339; 'Dict. of National Biography' (London 1885).

BAKER, Valentine, English military officer, also known as Baker Pasha: b. 1825; d. Tel-el-Kebir 1887. He was a brother of Sir Samuel White Baker. For his services in the Crimean War he was made colonel of the 10th Hussars. His career was clouded in 1875 by an insult to a young woman, for which he was imprisoned. In the Russo-Turkish War of 1877 he was in the Turkish service, and subsequently served in Egypt. He wrote 'Clounds in the East' (1876); and 'The War in Bulgaria' (1879).

BAKER, William Mumford, American novelist and clergyman: b. Washington, D. C., 27 June 1823; d. South Boston, Mass., 20 Aug. 1883. He was graduated at Princeton 1846, and held Presbyterian pastorates in Texas for 15 years, when he returned to the North and accepted a charge in South Boston. As a writer, one of his most important books was 'Inside: A Chronicle of Secession' (1866), secretly written during the war, and giving an illuminating picture of Southern sentiment. Other works are 'Life and Labors of Rev. D. Baker' (1858); 'The Ten Thenopanies' (1883). His novels, several of which appeared serially, include 'Mose Evans' (1874); 'Carter Quarterman' (1876); 'Colonel Dunwoody' (1878); 'The Virginians in Texas' (1878); 'His Majesty Myself' (1879); and its sequel, 'The Making of a Man' (1894); 'Blessed Saint Certainty' (1881).

BAKER, Mount, an occasionally active volcano in Whatcom County, Wash., belonging to the Cascade Range; elevation, 10,827 feet.

BAKER AND THE BAKER'S WIFE, the names popularly given to Louis XVI of France, and Marie Antoinette, because they gave bread to the starving mob at Versailles on 6 Oct. 1789.

BAKER CITY, Ore., city and county-seat of Baker County, situated on the east fork of
BAKER UNIVERSITY—BAKHYUSEN

the Powder River, 360 miles east of Portland, on the Oregon Railroad. It is the centre of an extensive farming, gold-mining and stock-raising region, and has a considerable export trade. It is governed by a mayor, bimonthly elected, and a city council, and operates the water works. It was settled in 1860, incorporated to have originated in an old practice of bakers who, when a heavy penalty was inflicted for short weight, used to give a surplus number of loaves, called the inbred or make-weight, to avoid all risk of incurring the fine. Until at least quite recently it still was the custom in Great Britain. Thirteen, therefore, became a baker's dozen, and 13 also is assumed to be the number of witches who sat down together at dinner on the Lord's Day, even as it was the number who were at that last Passover supper which immediately preceded the betrayal of Christ. Thirteen was also called the "devil's dozen."

BAKERSFIELD, Cal., town and county-seat of Kern County, on the Kern River and on the Southern Pacific Railroad, 168 miles northwest of Los Angeles. Settled in 1872 in the centre of an oil and mineral and of a stock-raising and fruit-growing region, it has a good trade and active manufacturing interests. The United States census of manufactures for 1914 reported 51 industrial establishments of factory grade, employing 1,046 persons, of whom 895 were wage earners, receiving annually $879,000 in wages. The capital invested aggregated $2,749,000, and the year's output was valued at $2,928,000; of this, $1,305,000 was the value added by manufacture. The city has adopted the commission-manager plan of the commission form of government. Pop. 16,000.

BAKEWELL, Robert, English agriculturist: b. 1725; d. 1795. He succeeded his father in 1760 as occupier of the Dishley farm in Leicestershire, and then began experiments for the improvement of cattle (introducing the celebrated long-horned breed), and also of horses, pigs and sheep. He also introduced into English agriculture the practice of flooding meadows. He never contributed anything to literature, but Arthur Young, in his annals of agriculture, fully described and praised his plans and improvements.

BAKEWELL, England, an ancient town of Derbyshire, on the Wye, 25 miles northwest of Derby. It is situated in a picturesque region, remarkable for its scenic beauty; contains chalybeate springs and warm baths, a museum and a fine old Gothic church. Arkwright first established cotton mills here, and in the neighborhood are black-marble and lime-stone quarries and coal and zinc mines. The town suffered severely from a visitation of the plague in the 17th century. Pop. (1911) 3,078.

BAKHIMUT, bakh'oomt. See BACHMUT.

BAKHITCHESSARAI, bakh'che-sa'-rf, Russia, the capital of the government of Taurida; situated on the Tchoorook, 15 miles south-west of Simferopol. It consists of a single street, built along the banks of the Tchoorook and lined in Oriental fashion with bazaars and workshops. It contains also several mosques, whose tall minarets rise to the sky. In the neighboring houses. Here also is the ancient palace of the khans who ruled over the Taurid state before the rise of Russian power. In one of the old Jewish synagogues a parchment roll of the Bible—the most ancient, according to some Hebrew scholars—was discovered. It is now in the Imperial Library. The principal articles of manufacture are the well-known red and yellow morocco leather, fur coats, boots and shoes, and in the environs is a mart for the products of the neighboring country, such as tobacco, flax, grain, and especially fruits. Its population, principally Mohammedans, number about 13,000, including 3,000 Christians, 1,000 Jews and some Greeks.

BAKITEGAN, bakh'it-eg'an, a salt lake in Persia, 47 miles east of Shiraz; 74 miles long and from 4 to 13 miles wide. Large quantities of salt are gathered from its basin during the summer drought.

BAKHTIARI, bakh'ti-ar'e. (1) A range of mountains in the province of Bakhtiria in Persia extending parallel to the Arva River to the Kirmanian region. (2) A half-civilized nomadic tribe living in the above mountains, estimated to number about 200,000.

BAKHIUIZEN, bakh'hoi-zen, Van Den Brink, Reinier Cornelis, Dutch historian: b. Amsterdam, 28 Feb., 1810; d. The Hague, 15 July, 1865. In 1854 he was appointed keeper of the state archives, and was long connected with Gids, an important monthly publication. His principal works are 'Vondel met Roskam en Krommeloop' (latest ed., 1891); 'Variae Lectiones ex Historiae Philosophiae Antiquae' (1842); 'La retaile de Charles Quint' (1842); 'Het huwelijck van Frins Willem met Anna van Saksen' (1853); 'Het Rijksarchief' (1857); 'Cartons voor de geschiedenis van den nederlandsche Vrijheidsoorlog' (1860).

BAKHYUSEN, Ludolf, Dutch marine painter: b. Emden, 1631; d. 1708. He was for a time a clerk and teacher at Amsterdam. He studied painting under Aldert van Everdingen and Heinrich Dubels, and soon came to be regarded as one of the greatest marine painters of the time. He is contrast to his rival Wilhelm van der Velde, who depicted the sea in its calm moods. He often risked his life and the lives of his companions
in the quest of subjects for his pictures. He did not excel in coloring, but succeeded in capturing the mood of his subjects. Numerous examples of his work are extant. One, depicting a coast scene, is in the Amsterdam Museum; his "Rough Sea at the Mouth of the Maas" hangs in the Louvre, and two of his pictures are in the Museum at The Hague. Seven of his works are preserved in the National Gallery, London. He made several drawings of vessels for Peter the Great, who was his pupil for a time. Late in life he began etching on copper. He also painted several portraits. Consult Van der Willigen, "Les artistes de Haarlem."

BAKI, bâk'kî, the greatest lyric poet of Turkey; d. about 1600. His "Divan" contains almost exclusively odes in praise of the Sultan.

BAKING MACHINERY. See BREAD AND BREAD-MAKING.

BAKING POWDER, a chemical preparation used in the place of yeast to give lightness to bread and other similar articles of diet. Yeast induces a kind of fermentation, accompanied by the generation of bubbles of the gas known to chemists as carbon dioxide; and it is the presence of these bubbles within the dough that causes it to swell (or "rise") and become light. When baking powder is used in the place of yeast, the action is similar, except that the gas is generated by direct chemical action, instead of by fermentation. The best baking powders contain bicarbonate of soda or bicarbonate of ammonia as their alkaline constituent, intimately mixed with tartaric or phosphoric acid, or an acid tartrate or phosphate. So long as the powder is kept dry, its acid and alkaline constituents do not combine with each other; but when moistened, combination takes place, and carbon dioxide is generated, just as in the case of yeast. Owing to the cost of tartrates and phosphates, alum is not infrequently used in the place of the acid constituent in the cheaper powders; but health authorities almost universally condemn this substitution.

BAKBEBAKKE, bâk'kë-bâk'kë, a tribe of African pigmies dwelling in the French Congo territory.

BAKONY WALD, bô'kôn-y'-vâlt, a mountain group in Hungary, between the Raab and Lake Balaton, separating the great and little Hungarian plains. Average elevation, 2,000 feet. It is covered with forests on the mast of which large herds of swine are fed. There are many quarries of marble in the mountains.

BAKSHISH, bâk-shish', or BAKSHISH, an Eastern word, denoting a present or gratuity. In Egypt and other parts of the Turkish empire the traveler has scarcely set foot on shore before clamos for bakshish, on the most frivolous pretenses, or in simple beggary, without pretext at all, assail his ears from every quarter. Bakshish is the first Arabic word with which he becomes acquainted, and he acquires it unwillingly.

BAKST, Leon Nikolajewitsch, Russian decorative designer; b. Petrograd 1880. He was of Jewish parentage and studied in the Petrograd "Academy of Arts" under the patronage of a Russian Grand Duchess continued his studies in Paris. On his return to Russia he settled in Moscow, where he painted genre scenes of Russian life. The authorities were displeased with his intruding of political conditions into his pictures and he withdrew to Paris in 1906, where he soon acquired a great reputation as a designer of stage settings. His principal efforts in this field are the settings for "Cleopatra" and "Schalhazade" for the Russian ballet "1001 Nights" followed by the designs for "Salome," "Narcissus," Daphnis and Chloe; "A Faun's Afternoon," in Greek settings; "The Blue God," "Annamese and Javanese settings; "Thamar," Transcaucasian and Chinese; "The Butterflies," and "The Carnival," the setting for W. R. Tchaikovsky's opera, "The Secret of Suzanne;" and for D'Annunzio's "La Pisanella" and "Saint Sebastian." The ballet for his latest production, "The Orientale," was given in New York in 1914, where an exhibition of his principal designs and drawings was held in 1913-14, being shown later in other American cities.

BAKU, Russia, town in Georgia, on the west coast of the Caspian Sea. The rocky peninsula upon which it is built and the islands in the bay are composed of Tertiary strata, abounding in fossil shells. Below these strata numerous springs of naphtha and petroleum issue, together with streams of inflammable gas, and eruptions of mud from so-called mud volcanoes. These phenomena give to the region the name of the "City of Fire," and formerly made Baku the sacred city of the Guebres or Fire Worshippers. Naphtha is so abundant as to be an article of commerce. The chief product of the region, however, is petroleum. Over 500 oil wells are operated, producing large quantities of petroleum, much of which is carried by pipes directly to the refineries. Baku has a large trade, exporting besides the oil, grain, salt, etc. It has grown very rapidly in recent years, its prosperity being due to the petroleum industry which is chiefly in the hands of foreign capitalists. It has several shipbuilding yards. Along the south side of the city a new quay has been constructed; on this are erected modern stores and bazaars. The older portion has winding, narrow streets and here also are some remains of the palace of the khan, and the mosques of the shah, erected in 1078. The climate is mild; the harbor having been frozen over but once in 80 years. There are also tobacco factories and chemical works. The position of Baku makes it the market-place for the Russo-Persian trade. Cotton, rice, silk, wine, dried fruits and walnut wood pass through from Persia to Russia and western Europe, in exchange for goods of Russian manufacture. The population is mostly Tatar, and constitutes the laboring and small trading elements; Russians fill financial, commercial and official posts; Armenians are among the leading merchants. Baku was in Persian hands from 1509 to 1723; in the latter year it was taken by the Russians, who restored it to the Persians in 1735. In 1806 it again came into possession of Russia and has since remained under her rule. In 1901 it was the scene of a great conflagration, and in 1905 sanguinary conflicts took place here between the Armenians and other races. The oil industry suffered great damage, the losses reaching into the tens of millions of rubles. The commercial and industrial sections

BAKUBA, bá-kóô-bá, a Bantu-speaking people of the Kasai district of the Belgian Congo. They are related to the Baluba, and are also referred to under the name "Bushongo." They are noted among all the Congo peoples for their highly-developed artistic sense, which finds expression in admirable wood-carvings, decorated goblets, toilet boxes, drums, etc., and in the plush-like pillow-cloth woven of raffia-palm fibre by the men and decorated with designs sewed on by the women. Early travelers have described this people briefly, and they have been lately studied by Frobenius, Torday and Joyce. Consult Torday and Joyce, "Les Bushongos" (Publications of the Tervueren Museum, Belgium, 1911), and Johnston, Sir Harry, "George Grenfell and the Congo."

BAKUNIN, ba-koom'-yen, Michel, Russian anarchist: b. 1814; d. Berne, 13 Jan. 1876. He served in the Imperial guard 1832-38. In 1841-43 he was in Germany, engaged in philosophical study. In 1843, he went to Paris, and entered into relations with the Polish exiles, and shortly afterward to Switzerland, where he participated actively in various socialist and communist associations. The Russian government in 1847 ordered him to return home; but he refused, and his estate was confiscated. In the same year during the excitement produced in Paris by the question of parliamentary reform, he made a speech invoking the union of Poles and Russians, for the better and easier revolutionizing of Russia, on account of which the Russian government demanded his expulsion from France. For the next two years he was active in the revolutionary movement at Berlin, and at Prague and at Dresden. He was thrice condemned to death for his participation in the revolutionary movement at Dresden; a second time on being turned over to the Austrians; and a third time on being handed over to the Russian authorities. The sentence was commuted to penal servitude, and he was sent to Siberia in 1855. In 1860, he escaped in an American ship to Japan, and from there went by way of the United States to London. Here he joined the work of the revolutionary socialist movement under Marx and Engels, and in 1869 founded the Social Democratic Alliance, which later joined the International Workingmen's Association. His views were thoroughly anarchistic and when he tried to impose them upon the association he was expelled by The Hague Congress in 1872. He took part in the rising at Lyons in 1870. In 1873 Bakunin stopped active work and lived for the rest of his life in Switzerland. Consult for his writings, Nettlau, "Biographie de l'anarchie" (Paris 1897).

BAKWIRI, ba-kwé'-ri, a Bantu-speaking tribe of Kamerun, west Africa. They are of medium height, well proportioned and with regular features. Drum signaling is much used, and by it news is rapidly conveyed to long distant. Witchcraft and sacrifices still prevail and cannibalism was practised. The Wurby. BALA, bá-lá, a small town of north Wales, at the north end of the Bala Lake, famous for the manufacture of knitted stockings, and gloves of strong and soft texture. At the south end of the town is a large artificial mound, supposed to be of Roman origin. This mound was occupied by the Welsh as a fort in early days to prevent the incursions of the English.

BALA BEDS (also known as the Caradoc group), a local deposit in north Wales, near Bala, which form the upper group in the Lower Silurian of Murchison (now known as Ordovician). The group in the type locality consists of two limestones, separated by about 1,400 feet of sandy and slaty rocks, with many lava flows. The lower limestone, called the Bala limestone, is about 25 feet thick. The graptolites are the dominant fossils of the group.

BALAAM, a Biblical personage, the son of Beor, and a prophet of Pethor by the Euphrates. The children of Israel had reached, in their journey, the plains of Moab. Balak, the King, terrified at seeing so great a host invading his territory, sent, therefore, to Balaam, a well-known prophet and soothsayer, to come and curse these hosts for him, so that, peradventure, he might then smite them and drive them out of the land. Balaam, warned of God in the night, refused to go with the messengers, and sent them away. Balak sent yet others. He at first also refused them, but in the morning he went, with the divine injunction to speak what the Lord should tell him. The angel of the Lord met him in the way; gave the ass she rode a vision in three several instances, and each time Balaam angrily smote the beast for her involuntary manifestations of terror. After the third beating an interlocution ensued between the ass and the master, when the Lord opened the eyes of Balaam, and seeing the angel, he conversed with him instead of the ass. As the result of the conversation, Balaam was permitted to go on, and the charge repeated to speak only that which God should tell him. On the way Balak informed him that he could only speak that which God shall put into his mouth. Balaam refused to curse Israel, but pronounced a blessing upon them, in the three several places to which Balak brought him in the vain hope of securing his purpose. This is the Old Testament history of the transaction, given in Numbers xxii.-xxiv. In Numbers xxxi, 8-16, and Joshua xiii, 22, Balaam is mentioned as advising Balak to lead the children of Israel into idolatry, which, according to his directions, they did, and hence arose a war with Moab.

BALACHONG, an Oriental condiment, composed of small fishes or shrimps, pounded up with salt and spices and then dried.

BALENA, the genus including the Greenland or right whale, type of the family Balaenidae, or whale-bone whales. Hence baleen-whalebone.

BALÆNICEPS ("whale-head"), a genus of African wading birds belonging to the region of the upper Nile, intermediate between the herons and storks, and characterized by an enormous bill, broad and swollen, giving the
only known species (B. res), also called shoe-bird. It feeds on fishes, water-snakes, carrion etc., and makes its nest in reeds or grass ad-joining water. The bill is yellow, blotched with dark brown, the general color of the plumage dusky gray, the head, neck and breast slaty, the legs blackish.

BALAGUER, bə-lə-gər, Victor, Spanish writer; b. Barcelona, 11 Dec. 1824; d. Madrid, 14 Jan. 1901. He became keeper of the archives at Barcelona, professor of history in the university there; and was an active Liberal politician and, in 1888, chief of the council on the Philippine Islands. He wrote 'The Troubadours of Montserrat' (1850); 'Political and Literary History of the Troubadours' (1878-80); 'Poems' (1874); 'Don Juan de Serra-valle' (5th ed. 1875), etc.

BALAHISSAR, bə-la-hi-sər, Turkey-in-Asia. A village in the south-western part of the province of Angora, Asia Minor. It is on the site of the ancient Pessinus, famous for its worship of Cybele. Among fragments of mar-ble columns, friezes, etc., rise the ruins of her gorgeous temple, and remains of a theatre in partial preservation, a castle and a circus. The people of Sirohissar use this region as a quarry, and the ancient ruins are fast disappareing.

BALAK ("making waste or empty"), King of Moab, who, according to a story in Numbers xxii-xxiv, hired the prophet Balaam to come and curse the Israelites before their entry into Canaan. Balaam tried to carry out Balak's wishes, but by divine inspiration, he pronounced a blessing instead of a curse and foretold the increase in the multitudes of the Israelites and the power of their King. See BALAM.

BALAKIREV, Mily Alexeievich, Russian composer: b. Nizhni Novgorod, 13 Dec. 1837 (13 Jan. 1837); d. 30 May 1910. He began studying natural science at Kazan, but having learned the rudiments of music from his mother and displaying considerable aptitude, he was taken in hand by Ulibishv, author of 'Life of Mozart,' who taught him the classical mas-terpieces, and helped in his thinking of instrumentation. In 1855 he appeared in Saint Petersburg (Petrograd) as a pianist and created a sensation with his first compositions. Balakirev speedily became the acknowledged leader of the young Rus-sian composers, headed by a remarkable set of quasi-amateurs who styled themselves the 'Five Neo-Russian innovators,' a coterie united in friendly rivalry and patriotic ambition, consisting of Balakirev, Musorgsky, Cui, Rimsky-Korsakov and Prince Alexander Borodine. Their musical philosophy,门店 being the musical effect of the influence of Glinka (q.v.) and Dargomishsky pervaded their development in one direction; that of Berlioz, Schumann and Liszt in another. From this ensemble they created a new art-ideal which became the model of the whole so-called "Neo-Russian School." Balakirev was the soul of the movement, the teacher of his colleagues, the critical analyst of the masters, the Luther of the musical reformation in Russia. He composed orchestral pieces in the manner of Berlioz and Liszt, and pianoforte pieces in a manner of his own—of which the Oriental fantasia "Is-lamey" is the most ingenious. In 1862 he founded the Music Free School, and conducted its concerts for a number of years; from 1867 to 1870 he also conducted the symphony concerts of the Imperial Russian Musical Society. Among his works the finest are the orchestral fantasia Tamara and the symphony in C major. He collected and recorded a great number of Russian folk-songs. He first became known outside of his own country in 1867, when he conducted Glinka's "Ruslan and Lyndmla" in Prague. All his early companies made their mark: Musorgsky wrote some wild, ecstatic songs; the truculent Cui produced eight operas, 160 songs and a number of piano pieces; Borodine left symphonies, orchestral sketches, string quartets and a dozen songs; and Rimsky-Korsakov wrote about 12 operas, many songs, piano concertos, and published a collection of folk-songs. Consult "Musique en Russie" (Paris 1880); Grove's 'Dictionary of Music'; 'Oxford History of Music'; Pougin, 'Essai historique sur la musique en Russie' (Turin 1897); Riemann, 'Musik-Lexikon' (Leipzig 1909 and 1915).

BALAKLAVA, bə-la-kə'va, or BALA-CLAVA, Russia, a small seaport in the Crimea, eight miles south-southeast of Sebastopol. It consists for the most part of houses perched upon hills, and it has an old castle, built by the Genoese who were expelled in the 15th century by the Turks. On the Crimea by Catherine II of Russia it was made a military station. The harbor has a very narrow entrance, and, though deep, is not capacious. In 1854 Balaklava became the principal landing-place of the British after the battle of the Alma. The battle of Balaklava fought 25 Oct. 1854, when the Russians in over-whelming force were repulsed by a small body of British troops, is one of the most heroic achievements of modern times, the "charge of the light brigade" being the most in-sistent in the conflict. To-day, in spite of its harbor, the town has a population of only about 1,500, mostly Greek fishermen. The surrounding country is devoted to grape growing. Consult Kinglake, 'Invasion of the Crimea'; Puezt, 'The Light Cavalry Brigade in the Crimea.'

BALALAIKA, or Balaboika, bə-la-lə'kə, the national Russian musical instrument. It has the form of a three-stringed guitar, with a triangular sounding board and a finger-board, made generally of pine wood. Six almond-shaped holes on the surface of the sounding board, tending concentrically to form a star, resemble somewhat the S's on the sound box of the violin. In accordance with the investigation of Professor Pyetuhov and Steinberg, made at the Imperial Conservatory of Music in Petrograd, the fundamental frequency of the sounding board is C flat but as the instrument is made most frequently by unskilful hands it is extremely hard to standardize the fundamental tone as has been the case also with the violin. The first two strings are in unison and the third is their quint. W. W. Andrejew in recent years greatly improved the tone of the instrument and organized an orchestra of 30 of these
instruments, which he took on tours through Europe and America, meeting everywhere with great success.

BALAMBAN, bā-lāmˈbān, Philippine Islands, a small town on the west coast of Cebu, on Tanon Strait. It was occupied by a garrison of United States infantry after a battle with Filipino insurgents early in January 1900. It has a native population of some thousands, and a public school in which English is taught. It has a well-sheltered harbor, an active coast trade and a population of about 13,000.

BALAN, bā-lān. (1) A French poem, an early version of 'Fierabras', of which there was also an English version, 'The Sowdan of Babylon.' (2) The brother of Balin, in Arthurian legends.

BALANCE (Latin, bis, *twice,* and lāns, a *dish,* or *pan*), an instrument for determining the mass of a body by comparison with a series of other bodies (called *weights*) whose masses are known. The term is often applied, though somewhat incorrectly, to the familiar instruments in which the weight of a body is determined by observing the extension that it can produce when acting upon a spring whose extensibility has been previously determined by direct experiments with known weights. The *spring balance* is useful in the ordinary affairs of life, where high precision is not essential; but it is seldom employed in accurate scientific work, since it is liable to errors that cannot be eliminated or allowed for — errors that are small enough to be neglected in commercial transactions, but quite intolerable in refined laboratory work.

The *lever balance* consists essentially of a lever (q.v.) having arms of known lengths. The mass to be determined is suspended at the extremity of one of the arms, and the known masses (or weights) are suspended from the extremity of the other one, their number and size being varied until, after repeated trials, a perfect equilibrium, or *balance,* is attained. If the two arms of the lever are equal, the mass of the body under examination is then equal to the sum of the masses of the weights that are balanced against it. In many cases (for example, in the familiar "platform scales") the arms of the lever are intentionally made very unequal, the object to be weighed being suspended from the short arm of the lever, while the weights are suspended from the long arm. To determine the mass of the object it is then necessary to multiply the sum of the masses of the weights by the ratio of the long arm to the short one; but in practical work this calculation does not need to be performed, because the instrument is graduated by the maker so that all necessary allowance for the difference in the arms has been made, and the readings give the corrected mass directly. In many cases the balances (or *scales*) used in commerce are constructed so that equilibrium is attained by varying the length of the lever-arm rather than by varying the load at the extremity of that arm; but the fundamental principles involved are the same in all cases, and are set forth in detail in the article Lever (q.v.).

In the "precision balance" of the chemist and physicist, the lever (called the *beam*) consists of a light but strong and rigid framework, usually made of brass or bronze, and having a shape somewhat like that shown in Fig. 1. It is supported by means of a wedge-shaped piece of steel, technically known as a *knife-edge,* which is hardened and ground to a sharp and accurately straight edge, and which rests, when the balance is in use, upon a flat slab of agate, or other hard, smooth substance, in such a manner as to leave the beam free to tip one way or the other, with practically no frictional resistance. (The agate slab is sug-

[given by the dotted contour, k, in the figure; the pillar that supports k being omitted for the sake of clearness). Knife-edges similar to the central one, but with their edges directed upward instead of downward, are provided at the respective ends of the beam (as shown at A and B) for the support of the pans (only one of which is shown) in which the masses to be compared are placed. The three knife-edges, A, B and C, must be made with great care, and must be set in position so that they shall be accurately parallel to one another. They must, moreover, have their edges all in the same plane, so that a straight line joining any two points in the edges of A and B will likewise pass through the edge of C. The two arms of the beam should also be precisely equal, so that C is exactly half way between A and B, P is a pointer whose free end travels over a graduated scale, so as to indicate the extent of the oscillations of the beam as it swings to and fro on the central knife-edge C. When the beam is horizontal, its centre of gravity (G in Fig. 2) should lie in the same vertical line, ab, with the central knife-edge. Whether this condition is fulfilled or not is easily shown by removing the scale pans and allowing the beam to come to rest. It can only be in equilibrium when its centre of gravity is directly below the knife-edge C; so that if it comes to rest in a horizontal position it is evident that the condition specified above is sensibly realized. If, on the other hand, the beam, when freed from the pans, comes to rest

*[Figure 1 and 2]*
with its right-hand end lower than the left-hand one, it is evident that the centre of gravity of the beam is too far to the right, as is indicated by the point \( q \). The better makes of balance are provided with an adjustment to correct an error of this sort. This adjustment may take the form of a fine jewelled-thread carrying a nut, as suggested at \( E \). If the nut be caused to approach \( B \), the centre of gravity of the beam (considering the nut as a part of the beam) will thereby be shifted toward the left, and after a number of trials the point \( p \) may be made to coincide with \( C \), so that the beam, when free from the pans, comes to rest in a perfectly horizontal position. If it does not remain horizontal when the pans are suspended in their proper places, then it follows that one of the pans is heavier than the other; this defect is easily remedied by the use of a light counterpoise in connection with the lighter pan, or by removing a small portion of the material of the heavier one.

The centre of gravity of the beam being properly adjusted, and the equality of the two pans being assured, it is evident that the beam will set itself in a horizontal position when the pans are empty. The balance may still be defective, however, through the arms not being of precisely equal length. The equality of the arms may be tested in the following manner: Let a mass, \( P \), be placed in one of the pans, and suppose that \( w \) is the mass that has to be placed in the other pan in order to secure a perfect balance. Let \( L \) be the length of the arm from which \( P \) is suspended, and \( l \) be the length of the arm from which \( w \) is suspended, as indicated in Fig. 3.

Fig. 3. Then, by the principle of the lever, we have

\[
P \times L = w \times l.
\]

Next, let \( P \) be placed in the other pan, connected with the arm whose length is \( L \), and let \( W \) be the mass that must be suspended from the arm of length \( L \) in order to secure a perfect balance. We then have the equation

\[
P \times l = W \times l.
\]

Now, if \( P \) be eliminated between these two equations, we have the relation

\[
\frac{L}{l} = \frac{\sqrt{w + W}}{\sqrt{w}};
\]

and since \( W \) and \( w \) are both known, it follows that the ratio of the two arms of the balance is also known. If this ratio does not come out sensibly equal to unity, its value may be carefully determined, and allowance made for the inequality of the arms after a weighing has been performed. The effect of inequality in the arms may also be eliminated by a double weighing, such as has been supposed to be performed, above. For if we eliminate \( L \) (instead of \( P \)) from the foregoing equations, we find

\[
P = \sqrt{W \times w};
\]

that is, the true weight is the geometric mean between \( W \) and \( w \). In practice the arms of a good balance are so nearly equal that the simple arithmetic mean of \( W \) and \( w \) is a sufficiently close approximation to the geometric mean required by theory.

The sensitiveness of a balance depends largely upon the position of the centre of gravity of the beam relatively to the central knife-edge. Thus, if the arms of the balance are precisely equal, and the beam hangs perfectly horizontal with a weight \( P \) in each pan, the angle \( x \), through which the beam turns when the weight in the left-hand pan is increased to \( P + \rho \), may be taken as a measure of the sensitiveness of the balance. Let \( S \) be the weight of the beam itself, and let the centre of gravity of the beam be at a distance, \( h \), below the central knife-edge when the beam is horizontal. Then, if \( x \) is the angle that the beam makes with the horizontal when it comes to rest with \( P + \rho \) in the left-hand pan and \( P \) in the right-hand pan, the theory of the lever gives the equation (see Fig. 4)

\[
(P + \rho) \cdot L \cos x = P \cdot L \cos x + h \cdot S \sin x,
\]

from which we easily obtain

\[
\tan x = \frac{L \times \rho}{h \times S}.
\]

It is evident that \( x \) will be increased as \( h \) is decreased, so that the sensitiveness of the balance becomes greater the nearer the centre of gravity of the beam is caused to approach to the centre of support. The balance should be provided with a thread and nut, \( D \) (see Fig. 1), to facilitate the vertical adjustment of the centre of gravity, in the same way that \( E \) is used in adjusting the horizontal position of that point. The centre of gravity of the beam must always remain below the centre of support, because when it is above that point the beam is unstable, and when it coincides with the centre of support the instrument will remain in equilibrium in any position. When a balance is made very sensitive, by bringing the centre of gravity close to the point of support or by increasing the length of the arms of the beam, the period of oscillation of the beam grows very long, so that the instrument is tedious to use. The experienced chemist or physicist therefore selects a balance whose sensitiveness and period of oscillation can be best adapted to the work he has in hand.

The "precision balance" is a delicate instrument, and should be kept in a glass case, for protection, when not in actual use. The weighings are also performed with the balance enclosed in like manner, in order to avoid error from the effect of air-currents upon the beam. The knife-edges should be kept away from
their bearings, and provision is always made for raising the pans from the ends of the beam, and the beam itself from the central support, by means of a system of stops and levers (not here shown) actuated by a conveniently situated lever or wheel. The beam and pans should always be raised in this manner when changing the weights in the pans, in order to avoid giving the least shock to the knife-edges; for when these are dulled or otherwise injured the accuracy and sensitiveness of the balance are materially lessened.

Weighings may be effected by two general methods. In the first method the position of the pointer, $P$ (in Fig. 1), is noted on the scale at its extremity when the balance is at rest with the pans empty. The position so recorded is called the *zero* of the balance. The object to be weighed is then placed in one of the pans, and weights are added to the other pan until the balance will come to rest with its pointer at the same spot, or zero, as before. The weighing is then complete.

In the second method of conducting the experiment (known as the *method by oscillations* $^9$) the balance is not brought to rest at all, but the reading is taken while the beam is oscillating. The zero reading of the pointer is first obtained (with the pans empty) in the following manner: The empty balance is allowed to oscillate freely for a short time, and then the position attained by the pointer at one of its extreme positions toward the right is noted. The reading of the next following extreme position to the left is then taken, and so on, observing the positions attained at the alternate right and left swings, just as the pointer pauses and begins to return toward the mean position. The last reading is taken on the same side as the first, so that there is an odd number of observations on one side of the zero, and an even number on the other side. The readings on the right are then averaged together, and those on the left are also averaged in the same way; after which the mean reading on the right is averaged with the mean reading on the left, and the result is taken as the position of the zero of the balance. The object to be weighed is then placed in one pan, and the weights in the other, the process of guess and trial being followed here just as in the preceding method until an almost exact balance has been attained. The method of oscillations, with alternate readings to the right and left, is next repeated in precisely the same manner as when the pans were empty, and the reading obtained by the final averaging of these observations is taken as the reading of the balance for the loads that are in the pans at the time. A very small weight is next added to one of the pans, and the oscillations are again observed, under the new conditions, precisely as before. The weight of the object under examination can then be determined by simple proportion. Thus, suppose that the original zero reading of the pointer, with the pans empty, was 11.6. The object to be weighed is then placed in one pan, and weights having a combined mass of $W$ in the other, let the reading of the pointer (as deduced from the oscillation) be 11.0. The next weight being then added to $W$, let the final reading of the pointer be 12.2. The following facts are now known: With empty pans the pointer reads 11.6. With the unknown mass ($\text{which may be denoted by } P$) in one pan, and a mass, $W$, in the other, the pointer reads 11.4. Finally, with $P$ in one pan and $W + w$ in the other, the pointer reads 12.2. The mass $w$ has displaced the reading of the pointer by 1.8 divisions. The weight $x$ added to $W$, would have made the reading of the pointer precisely 11.6, as it was with the empty pans, we have the additional fact that a mass $x$ would alter the reading of the pointer by 1.2 divisions. Hence the simple proportion — $x \times \frac{w}{3} = \frac{2w}{3}$, and therefore the concluded mass of $P$ is $W + \frac{2w}{3}$.

The method of oscillations is favored by many physicists, in the belief that a better value of the zero of the balance can be obtained by studying the free swings in this way than by allowing the instrument to come to rest. Instead of adding very small weights to secure the last adjustments, the *rider* is often a small apparatus consisting of a tiny weight made of wire, and suspended on the beam of the balance, as indicated at $R$ in Fig. 1. The beam is graduated when a rider is to be used, and the final step in the weighing consists in observing what position the rider must have in order to make the balance perfect. The effect of moving the rider one division on the beam being known by previous experiment, the correction to be applied for any given position of the rider is easily calculated. Obviously the rider can be used with equal advantage whether the weighing is conducted by the method of oscillations or not.

The weights used in connection with precision balances must be accurately compared among themselves if refined work is to be done, and a table of corrections prepared, by means of which the proper allowances may be readily found, for any minute inconsistencies that may exist among them. Reference must be made to the standard works on exact science for the details of the process by which these corrections are obtained. Crooke's classical paper on the atomic weight of thallium $^1$ (Philosophical Transactions $^5$ (1873, p. 277), may also be consulted with advantage, as it contains full details on this point, as well as on many others in connection with accurate weighing. (For further information on the theory and use of the precision balance consult Stewart & Gee, 'Lessons on Elementary Practical Physics' $^2$ (Vol. I, London 1889); and Glazebrook & Shaw, 'Practical Physics' (New York 1893). Much advanced information may also be had in the 'Travaux et Mémoires' of the International Bureau of Weights and Measures). Consult also Braver, 'Die Construction der Waage' (3d ed., Leipzig 1906); Fehringer, 'Theorie, Konstruktion und Gebrauch der feineren Hebelwage' (Berlin 1907); Gerland and Traumüller, 'Geschichte der physikalischen Experimentierzentrums'; Kohlrausch, 'Lehrbuch der praktischen Physik' (Leipzig 1905); Sokeland, 'Ancient Desemers or Steelyards', in 'Smithsonian Annual Report for 1900' (Washington 1901). See also CHRONOMETER: INDUCTION BALANCE; TORSION BALANCE.
BALANCE OF POWER, is the system by which greater states are withheld from absorbing smaller ones. It is stated in "Law of Nations" by Vattel: "It is in the nature of things that one power or state shall not be understood such a disposition of things, as that no one potentate or state shall be absolutely to predominate and prescribe to the others. The system of the balance of power is entirely the outward form of the modern political system of Europe, as it began to shape itself in the 15th century; not that it was entirely unknown to the ancients before the irresistible progress of Roman arms put any idea of balance out of the question, but these early efforts after the balance of power were not sustained for a sufficiently long period, from generation to generation, from century to century. They were too transitory and casual to entitle them to be elevated into a system. They must be regarded as apposite epoches in the history of the struggle, which concentrated attention and energy upon international affairs necessary to originate and sustain a system of balance in Christian Europe. In Italy, then so far in advance of the rest of Europe in intellectual, social, and political development, the princes, podestas and republics of that peninsula, from an early period of the 15th century, had built up the institution of an equilibrium for their mutual regulation. But this was too local and on too small a scale to be deemed the parent of our modern system. Not until the war of the Duke of Burgundy and the Italian princes had consumed the dukes of Burgundy and Brittany; not until Ferdinand of Aragon and France had united almost the whole of modern Spain under his sway; not until Maximilian in Germany and Henry VII in England and Ireland had consolidated the monarchical authority, was the time ripe for the application of this idea. The invasion of Italy by Charles VIII of France, and his claim to the kingdom of Naples, in 1494 gave rise to the first great European combination of otherwise hostile powers for the repression of the ambition of one. Almost all the Italian states. Maximilian, the German Emperor, and Ferdinand of Aragon, suspended their animosities, and drove the French out of Italy. The Emperor Charles V of Germany, Spain, Burgundy, the Netherlands, and a vast transatlantic empire 1519-56, caused the jealousy of Europe. Francis I of France actually went so far as to ally himself with the Sultan, Solyma the Magnificent, against Charles from realizing his ambitious schemes. The misfortunes of Philip II, the son of Charles V, in the Dutch Netherlands and in Flanders against England and the English power in Ireland, effectually dissipated the fears Europe entertained concerning the overgrown power of the Spanish branch of the house of Hapsburg. The year before the kingdom had obtained the Peace of Cateau-Cambrésis, 1559, the idea of a European equilibrium, in which he was seconded by Metternich for Austria and Talleyrand for the French legitimate sovereign, but opposed by the representatives of the Russian and Prussian monarchies. The return of Napoleon
from Elba put an end to this difference, and in the renewed conferences after the battle of Waterloo, the western powers did not insist upon the point. From 1815 to 1853, the world was substantially preserved from any war of importance by the five great powers who then presided over the destinies of Europe, namely, France, Great Britain, Russia, Austria, and Prussia. In 1853, the invasion of the trans-Danubian provinces of the Turkish empire by a Russian army was declared by a congress of the great powers at Vienna to be a breach of the political equilibrium. In this declaration France, Great Britain, Austria and Prussia agreed. An Anglo-French alliance was made (1854) to repel the aggression, and the confederation of Turkey, Great Britain and France was reinforced by the King of Sardinia in the spring of the year 1855. After a war of three campaigns, the Treaty of Paris was signed (30 March 1856), by which Russia abandoned her claims, and the principle—of the balance of power was anew vindicated. The Congress of Berlin in 1878 and the settlement of the Russo-Japanese War in 1905 deprived Russia of many benefits gained through the Treaty of San Stefano. Within a generation, the principle of nationalism has arisen in opposition to that of the balance of power. This is exhibited in United Italy, United Germany and the spread of the Pan-Slavism in Russia, but as a set-off to this may be mentioned the extension of European influence in Asia and Africa as regards colonization and trade. Thus the balance of power has become a world question and such nations as Germany and Italy are desirous of acquiring countries to balance the colonial possessions of Russia and England. The sudden rise to power of the Slavic race as a result of the Balkan War in 1912-13 threatened seriously to complicate European policies regarding the maintenance of the balance of power, but when the disagreement among the Balkan States resulted in war among themselves the fears of a Slavic preponderance were seen to have been unwarranted. Numerous international conferences and congresses have been called for the purpose of maintaining the balance of power and these gatherings have set up and removed rulers, have decided boundary controversies, have settled political relations and have passed upon questions of international justice, often without even requesting the attendance or consulting the wishes of those most affected by their action. Consult Lawrence, T. J., 'International Law' (1910); Phillimore, R., 'International Law' (1879-98); Westlake, J., 'International Law' (Pt. I, 1908).

**BALANCE OF TRADE.** The so-called balance of trade is a theory arising from the apparent relation of exports to imports. The protectionist school of political economy holds that excess of exports over imports constitutes what is termed a "favorable balance," which makes us out of gold and silver, this being the profit to the nation on its foreign trade. According to this theory the one desirable thing in foreign commerce is the exportation of merchandise. It should be said that all protectionists do not share in a belief in this theory.

In a great measure and in its more exaggerated form, this doctrine is a survival of the old mercantile theory which down to the time of Adam Smith controlled most of the legislation relating to commerce, and which held that gold and silver were the only wealth. It still retains a firm hold on the popular mind, but it may be said that the full weight of the teachings of orthodox political economy is against the notion that excess of exports constitutes a favorable balance.

The argument of the latter is that if the theory is true there cannot be too great an excess of exports, and that our imports should therefore consist only of gold and silver. In this "reduction to absurdity" (since a country has no more need of an excessive supply of the metals than of any other commodity) the free-trade school of political economy rejects the conclusions based upon the apparent excess of exports over imports.

Opponents of the theory hold that such trade as exists between two countries, exclusive of what is paid as interest, rent or tribute, must show a mutual profit, and represent to each a compensating increase in the value of the national importation. For illustration: A commodity costing in one country $75 will be bought in another for $100, in exchange for a commodity costing $75 in the country of its exportation and $100 in the importing country, such difference representing the degree of desirability of these particular commodities to each country. It will be observed that this precisely reverses the "balance of trade" theory.

Countries may be able to show a favorable balance from two causes, neither of which contributes to their prosperity. It may result from an actual drain, as in the case of Ireland, which used to be sapped of its wealth by absentee landlords, and in India, where the same phenomenon is caused by a similar drain in the form of tribute, official salaries spent outside the country, pensions, etc. But in these instances it is clear that there is a condition unprofitable to both countries. Or, on the other hand, it may result, as in the United States, which has the same favorable balance, by reason of the large sums another country has spent on loans that entered originally into railroad building, industrial improvements, etc. Most of the royal families of Europe, not to mention less exalted individuals, draw large dividends from American investments. Money spent by American tourists abroad helps to swell this favorable balance.

For proof that this theory has no such relation to national prosperity as its friends conceive, its opponents point to England, whose commercial greatness is rivaled by this country alone, and which has a prevailing "unfavorable" balance, because she has been the moneylender of the world, and her excess of imports represents the return received by her people for moneys invested in foreign lands.

It is impossible to account for the growing increase of the own export balance wholly on the explanation that such excess is rent or interest upon loans. Much of such excess is indeed fictitious, and is to be accounted for by undervaluation of imports and overvaluation of exports. In the latter case there is a strong inducement to overvalue, in order to conceal the fact that many of our exporters are selling goods cheaper abroad than at home. The in-
ducement to undervalue imports is quite as strong. In short, customs statistics, with every desire on the part of the Treasury Department to be accurate, are of necessity unreliable. See Political Economy; Free Trade; Protection. Consult Bastable, C. F., 'Theory of International Trade' (4th ed., 1903); Goschen, G. J., 'Theory of the Treasury Department' (3d ed., 1896); Paish, George, 'Trade Balance of the United States' (in 'Reports' of the National Monetary Commission, Sen. Doc. 579, 1910).

BALANCE SHEET. See Bookkeeping.

BALANCED BOWLDERS. See Rocking Stones.

BALANCING OF ENGINES. See Applied Mechanics.

BALANGA, bâ-län′gâ, Philippine Islands, capital of the province of Bataan, on the island of Luzon, and on the west coast of Manila Bay, and about 15 miles southwest of Manila. The town is well built, contains a government house, city hall and prison. It is a telegraph station and owing to its shore location is a place of considerable importance. Pop. about 7,500.

BALANOGLOS'SUS, a worm-like marine animal, the chief representative of the most primitive class of chordate animals, Enteropneusta or Adelocéphala. This remarkable creature, the type of its class, combines characters peculiar to itself, with features reminding us of the nemerteans, annelids, tunicates and the vertebrata ophiihus, while its free-swimming larva was originally supposed to be a young echinoderm. From the fact that the central nervous system lies above a notochond, Bateson placed it next to the vertebrates.

One American species, Balanoglossus aurantiacus, is a long, cylindrical, soft, fleshy worm, footless, without bristles, but with a large, soft, whitish tongue-shaped proboscis in front arising dorsally within the edge of the collar surrounding the mouth. The surface of the body is ciliated. At the beginning of the digestive canal is a series of sac-like folds of which the upper or dorsal portion is respiratory and separated by a constriction from the lower, which is digestive, and leads directly to the intestine branched. The respiratory portion of the digestive canal has on each side, in each segment, a dorsal sac, the two communicating along the median line of the body. The dorsal respiratory sacs each bear in their walls a delicate chitinous gill-support or arch. Between the gill-arches, forming numerous lamellae, are a series of slits leading on each side to openings (spiracles) situated dorsally. The water passes through the mouth into each gill-sac, and out by the spiracles. The nervous system lies above a short sac regarded as a notochond. There is a dorsal blood vessel, which sends branches to the respiratory sacs, and a ventral vessel. The worm lives in sand at low-water mark from Cape Ann to Charleston, S. C., also in the Mediterranean.

The life-history of this worm is most interesting. The young, originally described under the name of Tornaria, was supposed to be an echinoderm larva, though it resembles the larval Polyzoa. It is a transparent, surface-swimming, minute, ciliated, slender, somewhat bell-shaped form, with black eyespecks. When transforming to the worm condition, a pair of gills arise on sac-like outgrowths of the esophagus, and afterward three additional pairs, with their external slits, arise, somewhat as in ascidians. The entire Tornaria directly transforms into the worm, the transitional period being very short. The body lengthens, the collar and proboscis develop, afterward the body lengthens, the end tapers, and becoming more coiled. Consult Agassiz, A., 'The History of Balanoglossus and Tornaria' ('Memoirs of the American Academy of Arts and Sciences,' Vol. IX, Boston 1873); 'The Later Stages in the Development of Balanoglossus Kowalevskyi, etc.' (Quarterly Journal of the Microscopical Society, London 1885-86).

BALANUS ('acorn-shells'), a genus of sessile cirripedes, family Balanidae, of which colonies are to be found on rocks at low water, on submerged timbers, crustaceans, shells of mollusks, etc. They differ from barnacles in having a symmetrical shell and being destitute of a flexible stalk. The shell consists of six plates with an operculum of four valves. They pass through a larval state in which they are not fixed, moving by means of swimming-feet which disappear in the final state. All the Balanidae are hermaphrodites. A South American species (B. psitacus) is eaten on the coast of Chile, the B. tintinabulum by the Chinese. The old Roman epicureans esteemed the larger species.

BALAO, bâ-lâ′ô, a West Indian name, among Spanish-speaking fishermen, for the half-beaks.

BALARD, bâ-lârd', Antoine Jerome, French chemist; b. Montpellier 1802; d. Paris 1876. He was professor of chemistry at the Collège de France, Paris, and discoverer of bromide; also of a process of extracting sulphate of soda directly from sea-water. In 1808 he was made Inspector-General of Superior Instruction.

BALAS RUBY, a variety of ruby spinel.

BALASHOV, bâ-lâ-shôv', Russia, a town in the government of Saratov, situated on the Don, 170 miles west of the city of Saratov. It has a considerable export trade of grain, etc. Pop. about 13,000.

BALASORE, bâ-lâ-sôr′ë, India, a city of Bengal, capital of the district of Balasore. It is situated near the coast and has dry docks and a considerable coasting trade which consists principally of exports of rice and salt, and imports of oil, metal and cloth. The town has been the seat, successively, of Portuguese, Dutch and Danish factories. In 1846 the Danes sold their interest in the place to the English. Pop. (1811) 21,363.

BALATA, bâl′â-ta, a rubber-like exudate derived from the milky juice of Minusops balata and M. schomburgkii. The gum is used widely in the arts, and is sometimes confused with gum chicle, from which much of the chewing gum of commerce is many.

BALATE, bâ-lât′ë, the Philippine name for a kind of trepang (Holothuria atra).

BALATON, bâl′ô-tôn, or PLATTENSEE, a lake in the southwest of Hungary, 55 miles southwest of Budapest, extending from lat. 46° 45′ to 47° 5′ N., and from long. 17° 14′
BALAUANG—BALBO

to 18° 10' E.; area about 400 square miles, including the marshy shores. It receives the waters of more than 30 small streams. It discharges through the Kapos River, the Kapos Canal and the Sio, which empties into the Serviz, an affluent of the Danube. The Balaton is constantly in a state of motion, subject to cause waves. Its waters are perfectly transparent and abound with fine fish, notably one called fogas, a variety of perch frequently 20 pounds in weight, and with delicious flesh of snowy whiteness. Another kind, resembling the herring, swarms in the lake during the winter in such shoals that fishermen sometimes haul 50 cartloads from under the ice in a single day. The northern bank is bounded by vine-clad hills, and the southern bank is low. The average depth of the lake is about 25 feet, although a depth of over 100 feet is found near Tihany. It is the largest lake in Hungary.

BALAUANG, bā-lou-âng', Philippines, a town in the province of La Union, Luzon, north of San Fernando.

BALAUANG'S ADVENTURES, a poem by Robert Browning, describing a Greek girl of Rhodes. 'Aristophanes' Apology' is a continuation of this poem.

BALAWAT, bā-la-wāt', Turkey-in-Asia, a ruined city 10 miles from Nimrud. It is the site of the ancient Imger Bel, a fortified place built by Assurnazirpal II (885-860 B.C.), and its son, Shalmaneser III. The latter began the construction of a fine palace which was completed by his successor. Excavations there have resulted in the finding of the ruins of the palace of Shalmaneser II. The bronze gates that opened into the vestibule of this palace are especially interesting and valuable, and have been placed in the British Museum.

BALAYAN, bā-lā-yān, Philippines, a town of Batangas province, Luzon, situated on the Gulf of Balayan, 30 miles northwest of the town of Batangas. It has a good harbor, and vessels have the town as a base of supplies. The inhabitants are engaged in fishing, cattle raising, agriculture and coast trade. Pop. about 25,000.

BALBEC. See BAALBERK.

BALBI, bāl'bē, Adriano, famous geographer: b. Venice, 25 April 1782; d. Padua, 14 March 1848. In 1808 his first work on geography, procured his appointment as professor of that science in the College of San Michele, at Otranto, and in 1811 he became professor of natural philosophy in the Lyceum at Farino. He went in 1820 to Portugal, where he had free access to the government archives, and from the documents he collected composed two interesting works entitled 'Passi Statistiche sul Re Regno di Portugal e d'Algarve,' and 'Varietà Politique et Statistiques de la Monarchie Portugaise,' which he published at Paris in 1822. Four years later he produced the first part of his 'Atlas Ethnographique du Globe,' a work of superior arrangement, in which he spread before the French public the result of the researches and disquisitions of the German philologists. He published afterward, in concert with several scientific men, statistical tables of Russia, France, the Netherlands; and 'Abrégé de Géographie,' a summary of geographical science which appeared in 1832 and was translated into nearly all the European languages. His works show a great amount of knowledge, thorough research and skilful arrangement of material; but being utterly deficient in style, they are heavy and of difficult reading; however, they may always be advantageously and safely consulted.

BALBI, Gasparo, Venetian dealer in precious stones, who lived in 16th century. He traveled first to Aleppo and thence down the Euphrates and Tigris to the Malabar coast, sailing finally for Pegu, where he remained two years. His 'Viaggio all'India Orientale,' published after his return to Venice in 1590, contains the earliest account of India beyond the Ganges. He is on the whole very reliable in his accounts of what came under his own observation; but there appears to have been no limit to his credulity at second-hand.

BALBI, Giovanni, called Dg Janua of Januensis, from his birthplace, Genoa, a Dominican friar, who lived toward the end of the 13th century. He composed the 'Organum,' a manual of divinity, which he called the 'Catholicon.' This book owes its celebrity principally to the fact that it has become one of the earliest monuments of the art of printing. The original edition is to be found under the title 'Scutum Grammaticalis valde Notabilis quae Catholicon Nominatur' (Moguntiae, per Johannem Faustum, 1460, fol.). It was reprinted at Augsburg, 1469 and 1472, by Schoeffer; at Nuremberg, 1469, by Kolbe; Venice, 1487, revised and improved, by Pietro Gilles.

BALBINUS, Decimus Cælius, Roman senator and poet. After the death of the two Gordiani, killed by the soldiers of Maximinus, he was elected emperor by the Senate, concurrently with Claudius Pupienus Maximus, in opposition to the usurper Maximinus. The two emperors reigned little more than one year, and were assassinated by their soldiers 238 a.d.

BALBO, bāl'bō, Cesare, Count, Italian statesman and author: b. Turin, 21 Nov. 1789; d. 3 June 1853. Through the favor of the Emperor he served in various capacities under the Napoleonic empire. After the downfall of Napoleon became secretary to the first ambassador in London until the outbreak of the Sardinian revolution in 1821, when he returned to his native town in order to devote himself to literary pursuits. His reputation was not firmly established, however, until the year 1821, when his 'Speranze d'Italia' made its appearance. His appeal in favor of national independence found a powerful echo in the popular heart, and paved the way for the revolution in which he was destined to play a prominent part as a champion of the Moderate party. His next work, 'History of Italy, from the Beginning to 1814' (Bastia 1849), was not only inspired by the same patriotic spirit, but also distinguished by historical merit. But although in 1848 and 1849 he had strenuously opposed the Democratic party and unwaveringly adhered to a more conservative policy, he threw the entire weight of his political influence into the scale of patriotism as soon as Austria had been enabled to support the different cabinets which governed Sardinia after the promulgation of the Constitution of 4 March 1848, and, though for a very short time, was president of the first.
He was ardently attached to the house of Savoy; but the resurrected Italy for which he yearned was a kind of theocracy under the papal supremacy. His select works, edited by F. A. Pinelli, began issuing in 1788. Born in 1545, his Consult the ‘Lives’ by Ricotti (1856) and Vismara (1882).

BALBOA, bál-bō’a, VASCO NÚÑES, the discoverer of the Pacific Ocean: b. Jerez de los Caballeros, Spain, 1475; d. 1517. At the age of 25 he went to America to seek his fortune, joining the expedition of Rodrigo de Bastidas (see CENTRAL AMERICA), and returned to Española (Haiti), after exploring with Bastidas a part of the southwestern coast of the Caribbean Sea. At the town of Salavierra in Española he became a planter, but with such indifferent success that, when he resolved to return to Alonzo de Ojeda’s new colony on the mainland of South America, he found difficulty in escaping from his creditors. To elude their vigilance, he hid in a large cask, and thus was carried from his plantation to the landing-place by means of a sloop on board one of Ojeda’s vessels, as a part of the cargo. It is probable that when he emerged from his place of concealment he would have been handed over to the authorities on shore if the expedition had not stood in need of every available fighting-man. Admitted to membership reluctantly, and as a common soldier, Balboa showed his talent for leadership when the undertaking seemed on the point of failure. He suggested transferring the base to Darien, describing more favorable conditions there, as he had seen them on his previous voyage. His advice was taken, and the name Antiqua (Santa Maria de la Antigua del Darien) was given to the new settlement. Here the Spaniards found somewhat more successful and Balboa assumed command.

In the year 1513 he received a letter from a commissioner whom he had sent to Spain, informing him that he might expect to be summoned to court to answer grave charges. Resolving to evade them by royal favor by some striking service, he selected 190 men, the best of his soldiers, and with these and 1,000 native warriors and carriers, and a pack of bloodhounds, sailed from Antigua, 1 Sept. 1513, following the Darien coast, westward until he reached a point opposite the Gulf of San Miguel. This gulf extends far into the south coast from the Pacific, narrowing the isthmus to a width of 50 miles. Accurate information in regard to the southern coast, the ocean that lay beyond, and the superior civilization of the Incas of Peru, whose country was to be reached by way of this ocean, had been obtained from the Indians, especially through Balboa’s favorite Indian mistress, Fulvia.

The march began 6 September. On the 24th reaching an elevated plateau, the Spaniards repulsed an attack by 1,000 Indians and found supplies in the village of Quarequá. The following day, 25 Sept. 1513, Balboa gained the summit of a mountain (from which the waters of Mar de los Bebes) now double to the sea or current of the River State) were visible. The name, Pacific, was not applied to this ocean until seven years later, when it was bestowed by Magellan. On 29 September Balboa took formal possession of the "Southern Sea" by marching into the water, and, in the names of the King and Queen of Castile, claiming "these seas and lands."

The warning received from the Spanish court was justified in the event. Balboa had already been superseded by Alonso de Alvarado (Pedrarias). The reward of the former was an empty title of Adelantado del Mar del Sur, and the appointment as Governor of Panama, Coyba and the lands of the Southern Sea (the Pacific) which he had discovered; while on shore he was made the subaltern of his rival and bitter enemy, Governor Pedrarias. He led many successful expeditions, but the only aroused the jealousy and hatred of Pedrarias Dávila. The Spanish government tried in vain to mediate between them and Balboa’s marriage with the daughter of Pedrarias was arranged; but on an occasion of dispute which arose, Balboa was induced to deliver himself up, was accused of rebellion and on the trumped-up evidence of Sanabria, a false friend, was convicted and beheaded.

MARRION WILCOX.

BALBRIGGAN, Ireland, a watering place in County Dublin, 21 miles north of Dublin. It is a seat of linen, cotton, calico and stocking manufactures. The cotton stockings made there are remarkable for fineness of texture and beauty of open work. Many women are employed in embroidering muslin.

BALBUS, Lucius Cornelius, Roman officer, sometimes surnamed MAJOR, to distinguish him from his nephew (see below); b. Gades, Iberia, in the 1st century B.C. He served in the first campaign under Q. Metellus Pius and Pompey. For his conduct in this war the privileges of a Roman citizen were conferred on him, his brother and his nephews. In 72 B.C. Balbus removed to Rome, and soon became an intimate friend of Cæsar. He was consul in 40 B.C., and is supposed to have been the first adopted citizen to fill that office. He wrote a diary in which he described the chief events in his own and Cæsar’s life.

BALBUS, Lucius Cornelius (Minor), nephew of the above, a Roman officer, who in acknowledgement of a victory gained in Africa was awarded the honor of a triumph, the first ever paid to one not born in Rome.

BALCH, Emily Greene, American economist and author: b. Jamaica Plain, Mass., 8 Jan. 1867. She was graduated at Bryn Mawr in 1889, and in 1890-91 studied political economy in Paris, later she took special work at the University of Chicago, and at Berlin in 1895-96. She was connected with Denison House, a college settlement in Boston, and was active also in child welfare work. She became connected with the economics department of Wellesley College in 1896, and was appointed professor of political economy and political and social science in 1913. She was a member of the Massachusetts State Board of Industrial Education 1908-09, member of the State Commission on Immigration 1913-14, and member of the city planning board of Boston since 1914. In 1915 she was a delegate to the International Congress of Woman at The Hague, and delegate from this Congress to the Scandinavian and Russian governments. She has published ‘Public Assistance of the Poor in France’ (1893); ‘Our Slavic Fellow-Citizens’ (1910); ‘Women at The Hague’ (1915).
BALCH, George Beall, American rear-admiral: b. Tennessee, 3 Jan. 1821; d. 16 April 1893. Appointed to the navy 1837, he was promoted passed midshipman 1843, and served through the Mexican War. He was with Commodore Conner's squadron in the first attack on Alvarado, with the mosquito fleet under Commodore Truxal, and at the bombardment and surrender of Vera Cruz. As a lieutenant on the Plymouth he was with the Asiatic squadron 1851-55, and received a wound in a fight between the rebels and imperialists at Shanghai. During the Civil War he commanded the Pocahontas and Pennsylvania, taking part in numerous engagements with the Confederate batteries, chiefly in South Carolina. He became captain, 25 July 1866; commodore, 13 Aug. 1872; rear-admiral, 5 June 1878; and retired in 1883.

BALCH, Thomas Willing, American lawyer: b. Philadelphia about 1870. He was graduated at Harvard in 1890, and from the law school of the University of Pennsylvania in 1895, and has since practised his profession in Philadelphia. He has written much on international law, including 'Some Facts about Alsace and Lorraine' (1895); 'The Alabama Arbitration' (1900); 'The Alaska-Canadian Frontier' (1902); 'The Alaska Frontier' (1903); 'L'évolution de l'arbitrage international' (1906); 'La question des pêcheries de l'Atlantique' (1909); 'The Arctic and Antarctic Regions and the Law of Nations' (1910); 'La baie d'Hudson, est-elle une mer libre ou une mer fermée?' (1911, Eng. trans., 1912). He is a member of the International Law Association, the American Philosophical Society, the American Antiquarian Society, etc.

BALCONY, a gallery or framework of wood, iron or stone, projecting from the front of a house, generally on a level with the floors of rooms, and supported on cantilevers or brackets, and sometimes on columns of wood or stone. Balconies are often surrounded by iron railings or stone balustrades. The etymology of the word has been frequently traced to the Greek βαλκον, to throw. This rests upon the presumption that balconies were built originally for purposes of defense, the enemy being attacked with missiles thrown upon him from the balcony. The Latin word is balco or pulcus, the Italian balcon, also balco or palco, the Turkish bala-kan, the German balcon. The use of balconies is comparatively modern, although there is no doubt about their existence in times of antiquity. Winckelmann, the German art writer, refers to the fact that in Greece every private dwelling-house had contrivances which, although then designated under different terms, would be called balconies in our day. In Spain, Italy and South America, they are used for sitting, walking and chatting, in warm summer evenings; but they are less common in northern countries, where the nature of the climate does not call for such romantic contrivances. They are, however, often used as miniature gardens for potted plants. Upon Boccaccio and Bandello, the great Italian novelists of the 16th century, the poetical utility of balconies was not lost, and entertaining balconnies abound in their stories. Shakespeare took his plot of Romeo and Juliet from one of Bandello's novels, and the balcony scene exhibits, with that power of genius of which the great English dramatist alone was capable, the beauty of that old balcony when two young lovers like Juliet and Romeo make it the scene of their passion. In modern theatres the term is applied to the first or second gallery or tier of seats above the pit.

BALD CYPRESS. See Cypress.

BALD EAGLE, the American white-headed eagle. See Eagle.

BALD MOUNTAIN, the name of several eminences in the United States, of which the following are the principal: (1) In Colorado, height, 11,493 feet; (2) in California, 8,295 feet; (3) in Utah, 11,975 feet; (4) in Wyoming, in the Wind River Range, 10,760 feet; and (5) in North Carolina, 3,550 feet. The last named was the cause of much excitement in May 1878, because of inexplicable rumblings which lasted for about two weeks. The mountain shook as if in the throes of an earthquake, immense trees and rocks were hurled down its sides, and for a time fears were entertained lest a volcanic eruption should follow. A subsequent examination showed that a large section of the mountain had been split asunder, but no further disturbance occurred.

BALDACHIN, bâl'da-ch'în, originally the rich silks and brocades in the form of a canopy or umbrella-like covering, such as were used in the East over the heads of dignitaries on ceremonial occasions. The word itself is derived from baldaco, the Italian name of Bagdad, where the fabrics were manufactured. The baldachin was in general use among the Byzantine and Mohammedan rulers and their higher functionaries, and were introduced into Europe through the Crusades and also through the commerce of Italy with Constantinople and the near East. The canopy was supported on four poles and was carried over the heads of civil and religious dignitaries in all processions. It is still used in the processions of the Catholic and Greek Churches. Later the baldachin became a fixed covering in royal rooms and in papal and episcopal halls, and over episcopal thrones in cathedrals, and since the Renaissance the term has been applied to permanent structures of marble or metal over altars, tombs, etc. A famous example is the bronze baldachin by Bernini over the high altar of Saint Peter's in Rome. A copy of this may be seen over the altar of the Cathedral of Saint Jacques, Montreal, Canada. In these the draped canopies are imitated in the metal, thus distinguishing the baldachin from the chiborium, in which the treatment is purely architectural.

BALLE, Jakob, bâl'dâ, yâ'kób, German Latin poet: b. Ensisheim, Alsace, 1604; d. Neuburg, on the Danube, 1668. He entered the Jesuit order in 1624, was court-chaplain to the Prince Elector of Bavaria, Maximilian, and after (1654) in a similar capacity at Neuburg. He distinguished himself by the excellence of his Latin poetry. Herder called attention to the beauty and genius of his lyrical productions, many of which he translated. Consult biographies by J. Bachmann (Freiburg 1904) and G. Eiten (Breslau 1863).

BALDER, bâl'der, or BALDUR, in Norse mythology a divinity, represented as the son of
Odion and Friggia, beautiful, wise, amiable, and beloved by all the gods. His mother took an oath from every creature, and even from every inanimate object, that they would not harm Balder. Balder was therefore deemed invulnerable, and the other gods in sport flung stones and shot arrows at him without harming him. But the evil god, Loki, fashioned an arrow from the mistletoe and shot Balder’s blind brother Hodr to shoot it, himself guiding his aim. Balder fell dead, pierced to the heart, to the deep grief of all the gods. He is believed to be a personification of the brightness and beneficence of the sun.

BALDERSTONE, bàl’dré-stôn, Caleb, the old bucol of the master of Ravenswood, in Scott’s "Bride of Lammermoor.'"

BALDI, bàl’dè, Benardino, Italian scholar and poet: b. 1553; d. 1617. He was an accomplished linguist and a very prolific writer, and was abbot of Guastalla for 25 years. Among his numerous works are 'Chronica dei Matematici'; 'La Navicella', a pamphlet on navigation; an Arabic grammar; and a translation of the 'Targum of Onkelos.'

BALDNESS. Under the title ALOPECIA the general types of baldness have been considered. Premature alopecia, or the general afection of the young and middle-aged, deserves greater consideration. Alopecia pre- senilis, or premature baldness, is recognized as of two distinct varieties, the idiopathic and the symptomat. In the idiopathic variety that occurs before the age of 45 there does not seem to be any disease of the scalp or of the general nutrition to explain it. It is a gradual and progressive loss of hair, thinner and thinner hairs replacing those that have fallen out, until the scalp will not produce hair. It is usually symmetrical, beginning at the crown or running back from the temples. The skin is usually left thin and hard.

In the symptomat form some general disorder or a definite disease of the scalp is the cause. This latter is usually a scaly dandruff; the general character may be syphils, tuberculosis, fevers or local destructive conditions. Dandruff is the most frequent accompaniment and cause of baldness. Dandruff is really at least three different diseases of the skin, but the general character is that of a general seborrhoeal dermatitis; that is, a mild inflammation with excessive fatty secretions. This is frequently due to digestive disturbances, and is closely dependent upon the general health of the entire body. The hair falls out as in the idiopathic form. The dandruff usually continues until the hair is gone, and then ceases. Treatment should be begun early, particularly in those whose families have tended to baldness. The details of treatment require professional advice. The large number of hair tonics in the market speaks well for the general inutility of all of them. Cleanliness, frequent dry-brushings, and shampoos once in every two or three weeks, are safe measures, and tend to keep up the general hygiene of the scalp.

Baldric, bàl’drik, a belt or sash worn over the right or left shoulder diagonally across the body, often highly decorated and enriched with gems, and used not only to sustain the sword, dagger or horn, but also for purposes of ornament and as a military or heraldic symbol. The fashion of wearing a baldric appears to have reached its height in the 15th century. In the United States it now forms a part of the uniform of Knights Templar and other fraternal organizations, though it is still in use in European royal courts to indicate certain orders.

BALDUCCI, bàl’dô-chè, Francesco, leading Italian Anacreontic poet: b. Palermo; d. Rome 1642. He wrote 'Sicilian Songs' in the Sicilian dialect, etc.

Baldung, bàl’ðung, Hans, or Hans Grun, German painter and woodcarver: d. 1545. He was a brother of Godfrey of Bouillon, took part in the 1st crusade, retired to Fies, su at the request of its Christian inhabitants, and became soon after Count of Edessa. He was defeated by a force from Egypt in 1102, and made some conquests, including Acre, Caesarea and Sidon. BALDWIN II ('du Bourg'): d. 21 Aug. 1131. He was a
cousin of Baldwin I, whom he succeeded as Count of Edessa, and in 1118 as King of Jerusalem. He reigned until 1131. He took Tyre in 1124, with the aid of the Venetians. He was captured by the Turks, who held him captive for six months. He resigned the crown before his death to his son-in-law, Fulk of Anjou, who reigned until 1142. Baldwin II, Count of Tripoli, governed the kingdom for him, as he was leprous. Baldwin V, the son of Sibylla, sister of Baldwin IV, was called to the throne at the age of five. He died in 1186, and Jerusalem was taken by Saladin the following year. See Crusades and consult the works there referred to. Consult also Cox, ‘History of the Crusades’ (New York 1889), and Gibbon, Edward, ‘Decline and Fall of the Roman Empire.’

Baldwin I, the first Latin Emperor of Constantinople, son of Baldwin VIII, Count of Flanders and Hainault; b. Antwerp, 9 May 1201. He was twice besieged in his imperial city, and, being too weak to defend his dominions, repaired to Italy to seek aid from the Pope. At the court of France Baldwin was favorably received by the King, Saint Louis, to whom he presented a crown of thorns which was held by all Christians to be the genuine relic. Baldwin in 1229 set out for Constantinople with a body of Crusaders, who, however, soon quitted him and took the route to Palestine. He succeeded, ultimately, in raising new forces in the west, and regained his capital; but in 1261 one of the generals of Michael Paleologus, ruler of Nicæa, invested it and entered Constantinople on the 29th of July. Baldwin fled to Sicily, where he died in obscurity. He left son Baldwin who terminated the Latin empire in the east.

Baldwin, Abraham, American statesman: b. Guilford, Conn., 6 Nov. 1754; d. 1807. He was graduated at Yale 1772, and was tutor there, 1775–79. During the American Revolution he was a chaplain in the army and, at the suggestion of General Greene, settled in Savannah, Ga., 1784, where he was admitted to the bar. His efforts as a member of the legislature secured a charter and endowment for the University of Georgia. He was established according to his own plans and ideas, and of which he became president (1786–1801). He took part in the Constitutional Convention of 1787; was a delegate to the Continental Congress 1778–83; III: b. 1677; of Syria, 10 Feb. 1162. He was the son of Fulk of Anjou, whom he succeeded as King of Jerusalem in 1142. Tradition regards him as a model of crusading chivalry. Edessa was lost during his reign. He inflicted several defeats on Nureddin, Sultan of Aleppo. He was held in high esteem even by his enemies and it is said that Saracens served under him. He sought to improve the external and internal defenses of his kingdom, which attained its highest power during his reign. His Queen was Theodora, daughter of the Greek Emperor Manuel. He was succeeded by his brother Amalric, who died in 1173. Baldwin IV (‘the Lepros’), the son and successor of Amalric, reigned until 1182. Baldwin, Count of Tripoli, governed the kingdom for him, as he was leprous. Baldwin V, the son of Sibylla, sister of Baldwin IV, was called to the throne at the age of five. He died in 1186, and Jerusalem was taken by Saladin the following year. See Crusades and consult the works there referred to. Consult also Cox, ‘History of the Crusades’ (New York 1889), and Gibbon, Edward, ‘Decline and Fall of the Roman Empire.’

Baldwin, Charles H., American naval officer: b. New York city, 3 Sept. 1822; d. 17 Nov. 1888. He entered the navy as a midshipman in 1839. Serving on the frigate Congress during the war with Mexico, he figured in several sharp encounters near Mazatlan. He commanded the steamer Clifton at the passage of Forts Jackson and Saint Philip in 1862, and at the first attack on Vicksburg. He became rear-admiral in 1883 in command of the Mediterranean squadron, and retired in 1884.

Baldwin, Charles Sears, American author and educator: b. New York, 21 March 1867. He was graduated at Columbia University in 1888. He was assistant tutor and instructor in English at Columbia 1891–94, instructor in rhetoric 1895. In 1895–98 he was instructor in rhetoric at Yale, assistant professor 1898–1900 and professor in 1910–11, when he returned to Columbia as professor of rhetoric and English composition. He has published ‘The Infections and Syntax of the Morte d’Arthur of Sir Thomas Malory’ (1894); ‘Specimens of Frose Description’ (1895); ‘De Quincey’s ‘Memorials of the Tartars’’ (1896); ‘The Expository Paragraph and Sentence’ (1897); ‘A College Manual of Rhetoric’ (1902; 4th ed. rev., 1905); ‘American Short Stories’ (1904; Ger. ed., 1911); ‘How to Write, a Handbook Based on the English Bible’ (1905); ‘Bunyan’s Pilgrim’s Progress’ (1905); ‘De Quincey’s ‘Joan of Arc and English Mail Coach’’ (1906); ‘Essays out of Hours’ (1907); ‘Writing and Speaking’ (1909); ‘Composition, Oral and Written’ (1909); ‘Introduction to English Medieval Literature’ (1913), also essays and reviews.

Baldwin, Evelyn Briggs, Arctic explorer: b. Springfield, Mo., 22 July 1862. He was graduated from Northwestern College, Naperville, Ill., and engaged chiefly in teaching until 1892, when he entered the United States Weather Bureau service. He is now an inspector-at-large of the signal corps of the United States army. He accompanied, as meteorologist, Peary’s North Greenland expedition 1893–94; joined the Wellman Polar expedition, 1898–99, as second in command, built Fort McKinley, and discovered Graham Bell Land. Securing the co-operation of Mr. William Ziegler of New York he organized and commanded the Baldwin-Ziegler expedition of 1901 for the discovery of the North Pole. The expedition reached Franz-Joseph Land and after depositing several caches of provisions returned in 1902. He has written ‘The Search for the North Pole,’ ‘Auroral Observations, Franz-Joseph Land,’ ‘Meteorological Reports of the North Greenland Expedition’ (1893–94), and meteorological publications in general.

Baldwin, Frank Dwight, major-general United States army: b. Manchester, Mich.,
BALDWIN 77

26 June 1842. He entered the United States volunteer army as second lieutenant of Michigan horse guards, 19 Sept. 1861, engaging at this time upon a long and brilliant military career, in the course of which he served in many battles of the Civil War and was prominent in the long continued Indian troubles in the Far West. He was brevetted captain for gallantry against Indians in Texas, 30 Aug. 1874; and in 1899 was promoted lieutenant-colonel, 4th infantry. From this period he was continually engaged in guerrilla warfare in the Philippines until relieved from further duty 22 Feb. 1903, and transferred to command of the department of the Colorado. He was retired from active service 26 June 1906 by operation of law, at which time he was in command of southwest ern United States with headquarters at Oklahoma City, Okla. He was nominated major-general United States army (retired), 4 March 1915. He received the degree of LL.D. from Hillsdale College, Michigan.

BALDWIN, James, American author and educator; b. Athens, Ohio, 13 Dec. 1841. Largely self-taught, Hon. Ph.D., De Pauw University, 1884. Began teaching in 1866 and was 18 years superintendent of city graded schools in Indiana. He filled an editorial position with Harper & Bros., New York (1887-93), while he became editor of schoolbooks for the American Book Company. He wrote 'The Story of Siegfried' (1882); 'The Book Lover' (1884); 'Old Greek Stories' (1895); 'The Horse Fair' (1896); 'Discovery of the Old Northwest' (1899); 'The School Boy' (1912); and more than 50 other volumes. His books are known and read in every part of the world and are used in the schools of China, Japan and the Philippines, many million copies having been sold. More than half of the school readers used in the United States were produced under his editorship, or were written by him.

BALDWIN, James Mark, American psychologist and philosopher; b. Columbia, S. C. 12 Jan. 1861. He studied at the universities of Princeton, Leipzig, Berlin and Tiibingen; was instructor of German and French (1880-83), professor of philosophy in Lake Forest University (1887-89) and in the University of Toronto (1889-93); professor of psychology (1893-1903); Johns Hopkins (1903-9); National University of Mexico (1915). He was Herbert Spencer lecturer at Oxford; Harvard lecturer (1915-16). He holds the honorary degrees of D.Sci. from Oxford and Geneva, and LL.D. from Glasgow and South Carolina universities. He was vice-president of the International Congress of Psychology (London 1892); president of Criminal Anthropology at Geneva in 1896; president of the American Psychological Association (1897-98); judge of award at the World's Columbian Exposition (1893); was awarded a gold medal by the Royal Academy of Arts and Sciences of Denmark for the best work on the general topic of social ethics; and was elected member of the Institut International de Sociologie in 1898. He was also president of the International Congress of Psychology at Geneva in 1900; member of the Japanese Academy at Tokio; of Italian and British sociological societies; of Belgian and Dutch pedagogical societies, and of the Institute of France, succeeding William James in 1909. With J. McKe. Cattell he founded the Psychological Review in 1894 and was editor-in-chief of the 'Dictionary of Philosophy and Psychology.' In addition to many contributions to various learned journals, Professor Baldwin is author of 'German Psychology of To-Day' (trans. 1886); 'A Handbook of Psychology' (2 vols., 1889-91); 'Elements of Psychology' (1893); 'Mental Development in the Child and Race' (1895, 3rd ed., 1906); 'Social and Ethical Interpretations in Mental Development' (1897; 4th ed., 1906); 'The Story of the Mind' (1898); 'Fragment in Philosophy and Science' (1902); 'Development and Evolution' (1902); 'Thought and Things, or Genetic Logic' (3 vols., 1906-11; 'Darwin and the Humanities' (1909); 'The Individual and Society' (1910); 'History of Psychology' (1912). As editor he has published 'Dictionary of Philosophy and Psychology' (3 vols., 1901-05).

BALDWIN, Maurice Scollard, Canadian clergyman; b. Toronto, 21 June 1836; d. 1904. He was graduated at Trinity College in that city 1856; became rector of Saint Luke's Church in Montreal; was dean of Montreal 1852-55; and bishop of Huron 1883-1904.

BALDWIN, Robert, Canadian statesman: b. Toronto, 12 May 1804; d. there, 9 Dec. 1858. He began to practise law in 1825, and four years later became a member of the assembly of upper Canada. He was solicitor-general for upper Canada in 1841 in the first ministry under the Union, and was joint-premier in the La Fontaine-Baldwin administrations of 1842-43 and 1848-51.

BALDWIN, Simeon Eben, American jurist; b. New Haven, Conn., 5 Feb. 1840. He is a great-grandson of Roger Sherman, a signer of the Declaration of Independence, and great-great-grandson of President Clay, of Yale. His father was a United States senator and governor of Connecticut. Judge Baldwin was graduated from Yale 1861 and Harvard Law School. Settling in New Haven he rapidly acquired a large general practice, in which he continued until 1893. Since 1872 he has held a professorship in the Yale Law School. From 1893 to 1907 he was an associate justice of the Connecticut Supreme Court of Errors; from 1907-10, chief justice; from 1911 to 1915 governor of Connecticut. As a legal writer he has a wide reputation in the United States and abroad through his contributions to leading law journals. He is the author of Digest of Connecticut Reports (2 vols., 1871-82; revision, 2 vols., 1900); 'Illustrated Cases on Railroad Law'; 'Modern Political Institutions' (1899); 'Two Centuries Growth of American Law' (co-author, 1901); 'American Railroad Law' (1904); 'The American Judiciary' (1905); 'Education in Its Relation to Citizenship' (1912); and a member of several learned societies of much importance, both in the United States and abroad.

BALDWIN, Stephen Livingston, American missionary: b. 1835; d. Brooklyn, N. Y., 1903. Graduated at Concord Biblical Institute 1858. He went to China in 1861 under the auspices of the Methodist Episcopal Church, and on his return to the United States he held several pastorates, and was for the last 14
years of his life recording secretary of the Missionary Society of the Methodist Episcopal Church. While in China he translated a large part of the Bible into Chinese, and, it is said, printed the first copy of the Bible in that language. He was the author of 'Foreign Missions of the Protestant Churches' (New York 1900) and was one of the authors of 'The Picket Line of Missions' (New York 1897).

Baldwin, William Henry, American capitalist and philanthropist: b. Boston, Mass., 5 Feb. 1863; d. Locust Valley, L. I., 2 Jan. 1905. He was graduated from Harvard College in 1885 and studied for a year at the Harvard Law School. Entering the Omaha auditor's office of the Union Pacific Railway as a clerk, in less than a year he was promoted general traffic manager at Omaha; in 1888 became assistant general freight agent for the Union Pacific; in 1889-90 he was president of the Montana Union Railroad; and in 1890 was elected assistant vice-president of the Union Pacific. In 1891 he entered the service of the Flint & Pere Marquette Railroad as general manager and in 1894 became third vice-president of the Southern Railway, and in 1895 second vice-president and general traffic manager of the same road. In 1896 he was chosen president of the Long Island Railroad; his administration was particularly efficient and marked by a rapid growth of the road and the completion of a number of improvements. He was actively interested in reform movements in New York city, serving as chairman of the Committee of Fifteen appointed in 1900. He was also a leader in the Southern educational movement, being president of the General Education Board, a member of the Southern Education Board, and a trustee of Tuskegee Institute.

Baldwin City, Kan., town of Douglas County, 15 miles south of Lawrence, on the Atchison, Topeka & Santa Fe Railroad. It is the seat of Baker University, founded in 1858. It is situated near the battlefield of Black Jack, the scene of the first conflict in the slavery troubles before the Civil War. Baldwin City was settled in 1853 and incorporated in 1859. The town is seated in a major, chosen for one year, and a city council. The water works and electric light plant are municipally owned. Pop. (1910) 1,386; (1913) 1,450.

Baldwinsville, N. Y., village of Onondaga County, 12 miles northwest of Syracuse, on the Delaware, Lackawanna & Western Railroad, and on the Barge Canal and Seneca River. It has manufactures of machines, springs, knives and paper. It is situated in a fertile agricultural region, producing corn, dairy products, grain, hay and tobacco. Natural gas abounds in the neighborhood and the water power available renders electric power for manufacturing and lighting at low rates. The village contains a fine high school building and owns the water plant. Pop. 3,009.

Bale, John, an English ecclesiastic: b. Suffolk 1495; d. Canterbury 1563. Although educated a Roman Catholic, he became a Protestant and fled to take refuge in the Netherlands. On the accession of Edward VI he returned to England, was presented to the living of Bishop's Stoke, Southampton, and soon after was nominated bishop of Ossory in Ireland. Here, on preaching the reformed religion, popular fury reached such a pitch that in one tumult five of his domestics were murdered in his presence. On the accession of Mary he lay some time concealed in Dublin. After enduring many hardships he was enabled to reach Spain, where he remained until the death of Mary. On his return to England he contented himself, till his death, with the calm enjoyment of a prebendal stall at Canterbury. He was so little a controversialist that he earned the title of "Illustrious Bale." His only work which has given him distinction among authors is his 'Scriptorum Illuminat Majoris Britanniae Catalogus'; or 'An Account of the Lives of Eminent Writers of Britain.' This account, which, according to the title, commences with Japhet, the son of Noah, reaches to the year 1557, at which time the author was an exile on the Continent. It is compiled from various writers, but chiefly from the antiquary Leland.

Bâlé, bâl, the French version of Basel (q.v.).

Balearic (bâl-ear'ik) Crane. See Crane.

Balearic Islands, a group of four large and 11 small islands southeast of Spain, including Majorca, Minorca, Ibiza and Formentera. They are inhabited by a Spanish race similar to the Catalans. Wheat, grain and fish are the principal products and shoemaking is an important industry. The popular derivation of the ancient name Baleares (Greek Balleis, to throw), has reference to the reputed habits of the inhabitants for their skill in slinging, in which they distinguished themselves both in the army of Hannibal and under the Romans, by whom the islands were annexed in 123 B.C. After being taken by the Vandals under Genseric in 423 A.D., and in the 8th century by the Moors, they were taken by James I, King of Aragon, 1220-32, and constituted a kingdom which in 1349 was united to Spain. The islands now form a Spanish province, with an area of 1,935 square miles. Consult Vuillier, 'The Forgotten Isles' (New York 1896). Pop. (1911) 326,023.

Baléchou, bâ-lâ-sho, Jean Jacques Nicolas, celebrated French engraver: b. Arles 1715; d. Avignon, 18 Aug. 1765. His full-length portrait of Augustus, King of Poland, has been proclaimed the masterpiece of its kind in the 18th century. But Baléchou dishonestly sold the best proofs for his own benefit and was consequently expelled from the Academy of Fine Arts.

Baleen. See Whalebone.

Baleen Whales, the group of whales whose mouths are furnished with a growth of baleen or whalebone (q.v.). They form a sub-order Mysticeti of the Cetacea, which includes the families Balaenopteridae, or orcauals, and Balaenidae, the right whales. These whales are known in all oceans and form an important object of the chase. See HUMPBACK; Right Whale; Right Whale; Bottlenose; Humpback; Cetacea; etc.

Baler, Philippines, a town in the north-east part of Luzon. The population is under 3,000, mainly natives. The most conspicuous edifice is a native Catholic church. The town is noted for the heroic defense of a Spanish
garrison in 1899, during a siege by the Filipinos, lasting 11 months. The Spaniards were commanded by Lieut. Saturnino Martin Cerero, who refused to surrender the town, even when directed to do so by his superiors in Manila. He entrenched himself in the church and heroically resisted the besiegers until his supplies gave out and all the honors of war, 2 July 1899. Baler was occupied by the American troops and garrisoned with two companies of the 34th Volunteer Infantry, under Major Shunk, in 1900.

**BALESTIER,** bā-lēs-tēr', Charles Wolcott, American journalist, author and publisher: b. Rochester, N. Y., 13 Dec. 1861; d. 6 Dec. 1891. He studied at Cornell University and the University of Virginia. He was editor of *Tid-Bits,* a humorous weekly. In 1889 he became junior partner of the publishing firm of Heinemann & Balestier of London and Leipzig. His writings, which dealt largely with frontier life in Colorado, include 'The Nautilus,* written in collaboration with Rudyard Kipling, his brother-in-law; 'Benefits Forgotten,' *A Life of James O. Blaine* (1884); 'A Patent Philtre' (1884); 'A Fair Device' (1884); 'A Victorious Defeat' (1886); 'A Common Story' (1891).

**BALESTRA,** bā-lēs'trā, Antonio, an Italian painter: b. Verona 1666; d. there, 21 April 1746. He became a pupil of Balucci in Venice and subsequently studied in Rome under Carlo Maratti. He executed the 'Defeat of the Giants,' which took the prize at the Academy of Saint Luke in 1694. In 1695 he left Rome for Venice, where he became the head of a school and counted many distinguished names among his pupils. His works are found in many of the galleries and churches of northern Italy. Among his paintings are 'Saint Theresa,' at Bergamo, 'A Vision,' at Mantua, and a portrait of himself, at Florence. He was among the last of the Venetian school of artists.

**BALSE,** bāl's, Michael William, British composer: b. Dublin, 15 May 1808; d. 20 Oct. 1870. He received his first instructions in music from his father and Charles Horn. In his 7th year he composed a concerto before the public; at 16 he performed the part of Caspar in 'Der Freischütz' at Drury Lane. In 1825 he went to Italy, wrote the music for a ballet, 'La Férrouse,' for the Scala at Naples, and in the following year fulfilled an engagement to sing at the Théatre des Italiens, Paris, with moderate success. He returned to Italy, and at Palermo (1830) his first opera, 'I Rivali,' was produced. For five years, with somewhat careless haste, he continued singing and composing sordid operas for the Italian stage, which are now forgotten. In 1835 he came to England and had his 'Siege of Rochelle' brought out at Drury Lane. It hit the popular taste and was quickly followed by others equally banal and prosaic. For nineteen successes there was no doubt due to the great artists who took the leading characters, Malibran, Grisi, Lablache, Rubini and other stars of that time; but the works had high merits of their own, being marked by brilliancy, melody and fertility of invention. As Prefect of the Italian opera at Her Majesty's Theatre, London, if Balse was wanting in depth and dramatic force, he had a very thorough knowledge of effects and command of orchestral resources and his compositions are distinguished by fluency, facility and melodic power. His operas continue popular in England and elsewhere, among the chief being 'The Bohemian Girl' (the most popular of all); 'The Rose of Castile'; 'The Daughter of Saint Mark'; and 'Sanatella.' His posthumous opera, 'The Talisman,' was brought out in London in June 1874, with great success.

**BALFOUR,** Sir Andrew, Scottish botanist and physician: b. Fifeshire 1630; d. 1694. After completing his studies at Saint Andrews and London, and traveling on the Continent he settled in Edinburgh, where he planned, with Sir Robert Sibbald, the Royal College of Physicians, and was elected its first president. Shortly before his death he laid the foundation of a hospital in Edinburgh, which, though at first narrow and confined, expanded into the present Royal Infirmary. His familiar 'Letters' were published in 1700.

**BAFAR,** Arthur James, English statesman: b. Scotland (son of James Maitland Balfour of Whittingham, Haddingtonshire, and a daughter of the 2d Marquis of Salisbury), 25 July 1848. He was educated at Eton and Trinity College, Cambridge, where he took his M.A. degree in 1873. He entered the House of Commons in 1874 as member for Hertford, which constituency he represented until 1885. He acted as private secretary to his uncle, the Marquis of Salisbury, at the Foreign Office 1878-80, and accompanied him to Berlin in the negotiations leading up to the Berlin Treaty. He was president of the Local Government Board of 1885-86, was secretary for Scotland 1886-87, and secretary for Ireland 1887-91. His selection by his uncle for the difficult and thankless position of Irish Secretary was regarded as an altogether mistaken choice, and was hailed by the Irish Nationalists with derision, the current opinion then being that he was an indolent, cultured man of fashion who was quite out of his sphere in public life. No idea could have been more mistaken. At the Irish Office he showed that though far from robustly healthy, he could resist the nerves of iron; the continuous contest of wits that went on between him and the Irish members on the floor of the House appeared to act as a tonic to him; and he developed a debating talent that presently brought him into front rank in public life. He administered the repressive Crimes Act with a vigor that engendered an embittered opposition; and he succeeded in passing several ameliorative measures which later culminated in the Land Purchase Act of 1904. So strongly did he increase his hold on his party during his tenure of the Irish Office that, on the retirement of Mr. W. H. Smith, Mr. Balfour was called on to succeed him as First Lord of the Treasury and leader of the House of Commons. He led the opposition during the Liberal administration of 1892-95. On the return of the Unionist party to power in 1895 he resumed his former place in the government. On the resignation of Lord Salisbury in July 1902 he succeeded to the premiership. As Premier he sponsored a comprehensive Education Act of 1902 and the Irish Land Act of 1904 and he created the Commit-
Balfour, Gerald William, English statesman: b. 1853 (brother to the preceding). He was educated at Eton and Trinity College, Cambridge, entered Parliament in 1883, and was chief secretary for Ireland in the Unionist ministry from 1895–1900; president of the Board of Trade, 1900–05; and president of the Local Government Board, 1905–06. He piloted the Irish Local Government Bill of 1898 through the House of Commons.

Balfour, Isaac Bayley, Scottish botanist: b. Edinburgh, 31 March 1831. He was professor of botany in the University of Glasgow 1879–84, at Oxford University 1884–88, and since 1888 at the University of Edinburgh. He explored the island of Socotra in 1880 in behalf of the British Association; and of the Royal Society of Edinburgh. He is King's botanist in Scotland and keeper of the Royal Botanic Garden in Edinburgh.

Balfour, Sir James, Lord Pittenbreich, Scottish judge, and a conspicuous actor in the civil wars which ended in the dethronement of Mary, Queen of Scots: b. Fifeshire, Scotland, about the beginning of the 16th century; d. 1583. He espoused the Protestant cause, and in 1547, for his share in the conspiracy against Cardinal Beaton, he was, with Knox and other reformers, condemned to the galleys. In 1549 he was released, having abjured his heresies, and returned to Scotland. His abilities and tact gained him appointments and he was high in office on the arrival of Mary in Scotland, and was with the Queen at Holywood on the night of Rizzio's murder. He is believed to have drafted the bond in the murder of Lord Darnley, Mary's husband, but contrived to divert suspicion from himself. In 1567 he was appointed captain of Edinburgh castle. A change in Balfour's convictions (if any he had) was forced upon him, for he saw that a powerful party had been formed against Mary and the advantages of an alliance with them overcame all scruples. He held the castle of Edinburgh against the Queen, and was the means of delivering up Mary's letters into the hands of her enemies. He afterward surrendered the castle for various considerations. On the breaking out of the civil war Balfour sided with the regent, Murray, and was with the regent's army at the battle of Langside, but after Mary's imprisonment in England he took part in conspiracies for her restoration, although professing adherence to the regents Murray and Morton. His last public act was furnishing the evidence of Morton's guilt in the murder of Darnley, for which Morton was condemned and executed. His flexibility of adaptation was remarkable, and it was shown in the facility with which he changed sides. He has been described as the "most corrupt man of his
age." *Practicks of Scots Law,* the earliest text-book of Scots law, attributed to him, continued to be used and consulted in manuscript for nearly a century until it was supplanted by the *Institutes of Lord Stair.*

**BALFOUR, John (or Kinlock),** one of the chief actors in the assassination of Archbishop Sharp in 1679, for which his estate was forfeited and a price set on his head. He fought at Drumsag and Bothwell Bridge, and is said afterward to have escaped to Holland. According to one account he died on a homeward voyage to Scotland; by another he never left the country, but settled in the parish of Roseneath, Dumbartonshire, under the name of Salter. He is erroneously described by Scott in *Old Mortality* as "Balfour of Burley," quite a different personage. The Lord Balfour of Burleigh, who succeeded to the title in 1663, spent his youth in France and died in 1688. The title exists to-day.

**BALFRUSH, bál-fróogh’s,** or **BARFURUS,** "man of burdens," a town in the Persian province of Mazanderan, on the river Bhalaw, 12 miles from the Caspian Sea. Balfrush is a centre of trade between Russia and Persia, exporting large quantities of silk, rice and cotton, while the Russians supply iron and naphtha. It has excellent bazaars, numerous caravanserais, and several Mohammedan colleges. Pop. about 50,000.

**BALG, bæl’g,** Gerhard Hubert, American philologist; b. Efferen, near Cologne, Rhinish Prussia, 11 Nov. 1852. He was graduated from the University of Wisconsin. He has translated W. Braune's "Gothic Grammar, with Selections and Glossary" (1883); edited the *First German Bible, and Other Remains of the Gothic Language with Introduction and Glossary* (1891); and compiled a "Comparative Glossary of the Gothic Language, with Special Reference to English and German" (1887-89). He received his doctor's degree at the University of Middlebury (1883) and was one of the editors of the "Standard Dictionary" wherein he was engaged on the etymology of Romano words from a to g.

**BALI, bá-le’,** or **BALLY,** an island of the Indian Archipelago, Dutch East Indies, and lying east of Java, to which it physically belongs. Its greatest length is 85 miles; breadth, 55 miles; area about 2,095 square miles. It consists of a series of volcanic mountains, with alluvial plains, of which the loftiest, Agoong (10,497 feet), became active in 1843 after a long period of quiescence. None of the rivers are navigable. Principal products, rice, cacao, coffee, indigo, cotton, etc. The inhabitants physically and linguistically are akin to the Javanese, are skilful agriculturists and artisans, and excel in sculpture and in the working of gold and iron. The prevailing religion is Brahmanism of an ancient type. Suttee, or the burning of widows, was formerly practised. Bali is divided into eight provinces under native rajahs, and forms one colony with Lombok, the united population being estimated (1913) at 1,207,310. The capital is Buleleng. The island was visited by a disastrous earthquake in January 1917.

**BALIKESIR, bæ-lí’kés-ir’** BALU-KISAR, bæ-lú-kí-sar, Turkey-in-Asia, town of Anatolia, 75 miles southwest from Brusa. It was built of unburnt bricks and contains the tomb of a celebrated Mohammedan saint and a manufractury of felt cloth for military clothing. It is the seat of an annual fair, visited by over 30,000 people. It has considerable trade in silk fabrics, grain, opium, and the region abounds in minerals. Pop. over 25,000.

**BALILING, or BULELENG,** a district of the island of Bali, Dutch East Indies. The exports are rice and bullocks, and the chief trade is with the Bugas and Celebes. In 1847 the Dutch were signally defeated in an attack upon the fort of Djagta Raga in this district.

**BALIOL, bæl’-èl-ol,** Edward, King of Scotland, son of John Baliol of Scotland; d. Doncaster 1367. In 1332, at the head of the barons who had been dispossessed by Bruce, and in opposition to Bruce's son, David II, then a minor, he made a successful invasion of Scotland and on 24 September of that year was crowned King of Scotland at Scone. Having privately rendered homage to Edward III of England, he was routed by a party of Scottish nobles and dispossessed of his crown after a reign of three months. He regained it the next year as an instrument and vassal of Edward. In 1356 he surrendered the kingdom to Edward in return for a pension. He was the last of the Balilos.

**BALIOL, or BALLIOL, John, father of King John Baliol, an English baron in the reign of Henry III:** d. 1269. In 1263 he laid the foundation of Balliol College (q.v.), Oxford, which was completed by his widow, Devorguila or Devorgilla. She was daughter and coheir of Alan of Galloway, a great baron of Scotland, by Margaret, eldest daughter of David, Earl of Huntington, brother of William the Lion. It was on the strength of this genealogy that his son, John Baliol, was, on the accusation of Edward I of England, declared rightful King of Scotland.

**BALIOL, or BALLIOL, John, King of Scotland:** b. about 1249; d. 1315. On the death of Princess Margaret of Norway, grandchild of Alexander III, in 1290, Baliol claimed the vacant throne by virtue of his descent from David, Earl of Huntington, brother to William the Lion, King of Scotland. Robert Bruce (grandfather of the King) opposed Baliol; but Edward I's decision was in favor of Baliol, who did homage to him for the kingdom, 20 Nov. 1292, and was crowned at Scone on the 30th of the same month. Irritated by Edward's harsh exercise of authority, Baliol concluded a treaty with France, then at war with England; but, after Scotland had been overrun by Edward, he did homage to Edward at Montrose 10 July 1296. He was sent with his son to the Tower, but, by the intercession of the Pope in 1299, obtained liberty to retire to his Norman estates, where he died. He was diversely nicknamed by the Scots "Toom Tabard" (Empty Jacket).

**BALIOL, Martha Bethune,** the imaginary narrator of several of Sir Walter Scott's "Chronicles of the Canongate."

**BALIOL COLLEGE.** See Balliol College.

**BALISARDA, bá-le-sárd’da,** a magic sword in Ariosto's *Orlando Furioso,* stolen from
Orlando by Brunello, and afterward given to Rogero.

BALISAIRA, bál-l-sā'oōr (Hindi, balloo-soor), the sand-badger of India, called by Hindus the pig-like badger or "sand-hog," on account of its long snout. See SANT-BADGER.

BALISTA, or BALLISTA, a machine used as a military operations by the ancients for hurling heavy missiles, thus serving in some degree the purpose of the modern cannon. The motive power appears to have been obtained by the torsion of ropes, Fibres, cattag or hair. They are said to have sometimes had an effective range of a quarter of a mile, and to have thrown stones weighing as much as 300 pounds. Balista differed from catapultae, in that the latter were used for throwing darts.

BALIZE, bā-lēz'. See BELIZE.

BALISARNA—BALKAN LEAGUE.

The inner history of the Balkan League presents a curious tangle. The most remarkable circumstance about it is, for the student of Balkan affairs, the fact that the various states were able to come to any agreement. The idea of a Balkan League was no novelty; attempts in that direction had been in the air from time to time since long before the Russo-Turkish War of 1877. It emanated from Serbia, and was favorably discussed between Rumania and Bulgaria after the close of the war in 1878, revived in Greece in 1891, and opposed by Bulgaria, which country reopened the proposal herself in 1897. Jealousy and mistrust among the Balkan states kept them apart, while the long-standing intrigues between Austria and Russia for predominance in the peninsula only tended to increase the volume of mutual suspicions. Bulgarian sentiment was divided between Russia and Austria; Serbia leaned toward Russia and had numerous grievances against Austria, over the annexation of Bosnia and Herzegovina (q.v.) and the prohibitive tariffs against Serbian live stock; Rumania had a grudge against Russia because that power had deprived her of Bessarabia, and another versus Austria on account of the Rumanian districts of Transyl-
BALKAN LEAGUE

vania; and Greece feared the Russian aspirations to Constantinople. Bulgaria and Greece suspected each other because of the old ecclesiastical quarrel over the Patriarchate and the Exarchate, and the perpetual rivalries between their respective komitadjia in Macedonia. Bulgaria had not trusted Serbia since their war in 1885 and looked askance on Russia, because of the Dobruja and the Bulgarian population. Even the Serbs and Montenegrins, though blood-brothers, were not on the best of terms with each other. In addition to this, all of them had reason to fear the Austro-German Donga, which threatened to put an end to their national existence. The only possible bond that could unite them was their common hatred of the Turk, who systematically and indiscriminately ill-treated Bulgars, Serbs, Greeks and Kutschvilach (Rumanians) in Macedonia. That hate united and led them to victory. On the morrow of their triumph, jealousy stepped in and segregated them again; the Balkan League died a premature death and bequeathed to its partners a legacy of bitter hatred and a desire to prove disastrous to all.

It appears that the prime movers in the formation of the Balkan League were the King of Bulgaria and the Greek Premier, M. Venizelos, who came to an understanding in the spring of 1912. But in May Bulgaria and Serbia privately shared Macedonia between themselves, the former to take central Macedonia with Monastir and Ohrida, and the latter the northern or Old Serbian portion, leaving the remainder to be decided upon by Russia at a later date. The arrangement between Bulgaria and Greece was a first of a purely defensive nature against a Turkish attack upon either, which leads to the conclusion that Greece was to be left outside when, if ever, it came to a division of any spoils of war. Curiously enough, the Turkish government was at the same time engaged in an absolute alliance with Greece, a project that was suddenly wrecked by the Kotechana and Berane massacres. Apparently unacquainted with the Serbo-Bulgarian compact and its intentions, Greece found herself called upon a few days later to decide whether she should throw in her lot with or against Turkey. Bulgaria and Serbia notified Greece of their resolve to declare war against Turkey in the event of their demands being rejected. Their determination was encouraged by the fact that Turkey had the Italian war on hand at the moment, and was decidedly getting the worst of it. The great powers realized that trouble was brewing, and the *European Concert* was hastily convoked to avert it. They had every reason to fear the Balkan nightmare on account of the possibilities it opened for a general European conflagration. On 14 Aug. 1912 Count Berchtold (q.v.) announced that he was about to engage in conversation with the great powers with a view to co-ordinate the several efforts made by the powers in the interest of the peace and of the *status quo*. He insisted upon the expedience of giving to the Porte organized European encouragement and to the Balkan peoples equally organized advice to be patient and not to thwart Turkish purposes. This time, however, the inharmonious European Concert was doomed to failure; its diplomatic pressure and threats, more or less successful in the past, were now unheeded. Russia was known to be in sympathy with the Balkan states, and it was feared the Powers would loom the mighty spectre of the conflicting policies of Teuton and Slav. The integrity of the Turkish empire was vital to Austro-German ambitions, hence the fervid insistence of the *status quo*. Pretexts of reforms were forthcoming, but the Balkan Allies were too well acquainted with the temporising quality of Turkish promises; they demanded that the powers should guarantee autonomy for Macedonia, and that they themselves should be included as administrators. On 28 Sept. 1912 they announced that the Balkan League was an accomplished fact; the alliance was signed on the 30th and immediate mobilization ordered. Montenegro declared war on Turkey 8 October and invaded Albania; on the 13th Bulgaria, Serbia and Greece delivered their ultimatum to Turkey at the same time rejecting all outside advice and assistance. Europe stood amazed; the Concert played its strongest notes, which were not even listened to in the Balkans; showers of threats and protests failed to move the Allies who for years had watched with painful self-control the ghastly sufferings of their compatriots under Turkish misrule. As already mentioned, Turkey and Italy were at war over Tripoli (q.v., also Turco-Italian War). To all appearances, Italy would be an ally of the Balkan League. Her fleet kept the best Turkish troops locked up in Tripoli and commanded the western waters of the peninsula, including the direct sea route from Smyrna to Salonica. Clearly the moment seemed propitious for the Allies. But another surprise burst upon Europe when Turkey suddenly made peace with Italy and declared war on Bulgaria and Serbia on 17 October, hoping to frighten Greece and detach her from the Allies; but the Greek government declared war on Turkey the next day, which completed the necessary formalities. The course of the campaign is related under Balkan Wars (q.v.).

It only remains here to trace the short career and ultimate fate of the Balkan League. After the remarkable military successes of the Allies over the Turks during October and November, an armistice was signed with certain conditions on the 3rd of December. Peace negotiations opened between the belligerents on the 16th in London. After an abortive session lasting till 29 Jan. 1913, the Balkan Allies broke off the negotiations and hostilities were resumed on 3 February. Contrary to European expectations, the Turks were defeated all along the line; the Allies had forced him back almost to the gates of his capital, and to save him from extinction in Europe the Triple Alliance (q.v.) insisted on peace. The Treaty of London (30 May 1913) ended the war and delimited the new frontiers. But a quarrel had meanwhile broken out between Bulgaria and Serbia over the spoils. There had been small encounters between them for months, which drove Serbia and Greece to form an alliance against Bulgaria. In the early hours of June 30 the Bulgarians violently attacked the Serbians. Within a week Bulgaria found herself attacked on four sides, by Serbs, Greeks, Turks and a new arrival on the scene—Rumania. Hopelessly defeated, Bulgaria had to surrender and agree to the terms of the Treaty.
of Bucharest (10 Aug. 1913), by which she gained far less than she might have done had she been less irredentist and bold together with her Allies. Thus the Balkan League lived barely a year; could it have been maintained or reconstituted, Germany would never have reached Constantinople in the grips of war. It would follow exactly a year later. Perhaps, even, the war would not have happened, for, with Bulgaria on the side of Serbia, Montenegro, Rumania and Greece, an impassable barrier would have been laid in the path of the Austro-German Allies to the southeast, a barrier that, would have effectively closed all possibility of Turkey joining hands with her Teutonic patrons. For bibliography see end of Balkan Peninsula and Balkan Wars.

BALKAN, bäl-kän', or bāl′kăn, MOUNTAINS (anciently called Haemus), a lofty and rugged mountain range, extending from Cape Eminéh Burun on the Black Sea, in eastern Roumelia, in a westerly direction to the borders of Serbia, and forming the southern boundary of the Danube. In the west it is connected with the much ramified mountain-system of the southeastern peninsula of Europe. Its length is over 200 miles; the average elevation is about 3,000 feet, but the group of the Khoja Balkans in the west have a mean height of 6,000 feet. Crystalline schists alternate with limestone ridges. The highest summit is Jumrukchal, 7,786 feet. The Balkan forms the watershed between the streams flowing northward into the Danube, and those flowing southwest into the Adriatic. The chief of the latter is the Maritsa. The range which has a gradual descent on the north, where it is bordered by a broad zone of partially folded chains of sedimentary rock, presents on the south a somewhat steep escarpment, and has always been considered the greatest natural bulwark of the Ottoman empire against enemies on the European frontiers. Yet in the Russo-Turkish War of 1877–78 the Russian troops managed to cross it without any great difficulty, although they had to encounter a stubborn resistance at Shipka Pass (4,370 feet). Here a Turkish army of 32,000 men surrendered to the Russians. The range is crossed by some 30 passes. The whole of the southeastern peninsula of Europe is known as the Balkan Peninsula. Copper, iron and lead are the chief minerals. See Balkan Peninsula.

BALKAN PENINSULA, a convenient geographical term applied to the easternmost of the three great peninsulas of southern Europe, of which the others are the Pyrenean or Iberian Peninsula (Spain and Portugal), and the Apennine Peninsula (Italy). In all three cases the names are derived from mountain ranges. But whereas the Pyrenees and Apennines separate their respective peninsulas from central Europe, the Balkan range offers no such distinct geographical division. The Balkans are a continuation of the Carpathians of the Danube at the Iron gate, where the frontiers of Hungary, Serbia and Rumania meet. The name Balkan is apparently of Slavonic origin, but the Bulgarians, to whose country the range is mainly limited, use the term Stara Planina. Extending from the river Timok (Serbia) in the west through the heart of Bulgaria to the Black Sea, a distance of 375 miles, the Balkan Mountains extend down to about one third of the northern limits of the peninsula. Assuming that rivers also form a natural boundary, the Balkan Peninsula ends on the right bank of the Danube and its tributaries, the Save and the Tisa, its western limit is near Ploune on the Adriatic, extending down the Ionian Sea to Cape Matapan; on the east it is bounded by the Aegean Sea, the Sea of Marmora and the Black Sea, and by the Mediterranean in the south. Though popularly included within this area, Rumania is not, strictly speaking, a Balkan state. Excluding that country, the area of the peninsula in square miles is 187,764, divided as follows after the redistribution of territories consequent upon the Balkan Wars of 1912-13: Bulgaria, 43,310 square miles; Serbia, 33,891; Greece, 41,933; Turkey (including the vilayet of Constantinople), 10,882; Montenegro, 5,603; Albania, about 11,000; Bosnia and Herzegovina, 19,768; Croatia and Slavonia, 16,421; Dalmatia, 4,556 square miles. If the peninsula within the parallel of 45° north is included, an area of about 25,000 square miles would be added. No other district in Europe is so richly provided as the Balkan Peninsula with gulfs and excellent harbors of commercial and naval strategic value. An archipelago of numberless islands, the Cyclades and Sporades of ancient fame, forms a continuous bridge between the Balkan Peninsula and Asia Minor. The Black Sea is connected with the Sea of Marmora through the Bosphorus, a channel about 20 miles long, and so narrow that Constantinople, at the southwest extremity of the Thracian Bosphorus, is but one mile distant from the Asiatic city of Scutari, eastward across the Bosphorus. The Sea of Marmora is linked with the Aegean by the Dardanelles with an average width of between three and four miles. The Balkan Mountains extend in a varied formation from the Adriatic to the Euxine, breaking up in their advance eastward into several parallel chains with many more or less strong spurs north and south; several ranges extend southward almost to the Aegean: the Perim Dagh and the ancient Rhodope Moutains of Despoto Dagh. The main range is frequently broken by defiles or passes of different degrees of serviceableness as routes. The principal passes are the Nadir-Derbend, Karnabah, the Basardshik-Sophia, the Trajan, Rosalitha and Shipka, the latter famed by the heroic struggles between the Russians and Turks in 1877 and 1878. The principal range of the Balkans is thus divided into several sections, like the Etropol, Khoja and Shipka Balkans, and formed the boundary between Bulgaria and Rumelia before the two were united. The main elevation of the chain is from 4,000 to 5,000 feet, but it rises much higher in various parts, the loftiest elevation of 9,700 feet above sealevel being reached by Mount Scardus in the Char Dagh. The Balkans are rich in minerals, especially chromite, pierced by streams. How- ever, the treasures of the soil are yet very imperfectly known in spite of the geological researches, undertaken by German, French and other travelers and scientists. The mountains are mostly of a granite formation, but the mountain system is very complicated, and its
geological and geostatic connections are hard to determine. There are numerous thermal and sulphurous springs, some of which are renowned and utilized as sanitary watering places. The country is a mountainous and a rugged one, the only waterways running through it being the lower Danube and those of the Vardar and Maritza rivers, or, in other words, the watershed between the Black Sea and the Aegean. On account of the broken and irregular character of the peninsula the rivers are short and little navigable. Albania, separated from Montenegro and Novibazar by the north Albanian Alps, is a mass of parallel mountain ranges, irregularly transversed by the winding rivers, Boyana, Drin, Loum, Voutza and Arta, which flow into the Adriatic and Ionian seas. In Scutari, Monastir and Salonica there are a number of large and deep lakes, pre-eminent among them Scutari, Ochrida, Janina, Prespa and Kastoria. The climate of the peninsula is exceedingly varied; it is mild in the south where heavy snowfalls in the north and the central plateau between Serajevo (Bosnia) and Sofia (Bulgaria), and the tableland of Janina, but becomes mild and sunny toward the south and east temperate by contrast. There is hardly any country in the world inhabited by such a number of different peoples as the Balkan Peninsula. Surviving there are all the races recorded at the beginning of history, with their national languages and distinct racial consciousness. They do not form, however, the whole people, or even the great majority of their particular race in any one district, but are intermingled and live side by side, without ever blending together, so that the process of disentangling their various and conflicting aspirations, tendencies and racial and religious distinctions, etc., is well-nigh impossible. The majority are Slavs, comprising the Bulgarians in the east and centre, the Serbs and Croats in the west, and, in the extreme northwest, between Trieste and Laibach, the Slovenes; these compose the southern branch of the Slavonic race. The other inhabitants of the peninsula are the Albanians in the west, the Greeks in the south, the Turks in the southeast and the Rumanians to the north. In southern Bulgaria (ancient Thrace) and Macedonia, there may be found a Greek, a Bulgarian, a Turkish, an Albanian village, side by side. The Greeks or Byzantines, the Daco-Rumanians, who speak a distinctly Romance or neo-Latin language, and proudly derive their origin from the legionaries of Emperor Trajanus stationed in Dacia, yet undoubtedly from Dacian or Thracian mothers, and the Albanians of Illyrian stock are the most ancient historic races of the Balkans. The Slavs are late-comers by migration and conquest. They became neither Greek nor Roman in speech or customs, political character or national proclivities, but remained distinct in language and racial characteristics. Between the Danube and the Aegean Sea the whole of the eastern part of the Balkan Peninsula was known as Thracia; the western part as Illyricum and the lower basin of the Vardar River as Macedon; the latter being a name of both nations. At periods historically well determined, after the Gothic invaders in those regions had been defeated or absorbed or started on their world-stirring career, after the Turanian Avars had lost their overwhelming power, the Slavic tribes moved in great numbers into central and southeastern Europe. About 630 A.D. the Croats began to occupy the present Croatia, Slavonia, northern Bosnia. In 640 the Serbs of the same race and language from the borders of the Danube and peopled Serbia, South Bosnia, Dalmatia; Montenegro, whose inhabitants are pure-Serbs in blood and language, only deriving their name from their national hero, Ivo the Black (Tasnoki), who gave the name of Tsrnagora (Montenegro) to those desert rocks, a safe retreat to the Serbians, after their defeat at Kossafo in 1389 inflicted by the Turks. The ethnic situation of to-day dates from that epoch. The origin of the Bulgarians is not quite clear. They appear to be of Finnisch-Ugric stock, and therefore related to the Turks and the Hungarians, but were Slavicized early in history. The great apostles of the Slavs, Methodius and Cyril, themselves Bulgarians, even brought Byzantine culture and the Greek-Orthodox religion to the other Slavic races on the peninsula. The battle of Kossafo, already mentioned, made an end to the independence of the highly developed Slavic states, and with the fall of Constanța (Constantinople) the last bulwark of the crumbling Byzantine empire, the Turkish or, more correctly, Osmanli sway over the entire Balkan Peninsula became a reality. Four centuries of racial strife between the Turkish conquerors and the various Greek, Rumanian and Slavic races under their sway resulted in the formation of the Danube states and the Hellenic kingdom, more or less according to races and nationalities, so far as this was possible at all in the case of peoples which are at least as far removed in sympathy and political aspirations from one another as they are from the Turks. The racial antagonisms were always grievously accentuated in the attempted solutions of racial, political and religious problems. While the ancient history of the Balkan Peninsula is bound up with that of the Roman and Byzantine empires, the Middle Ages reveal an unbroken series of invasions and wars for a period of almost a thousand years up to 1453. Within a century of their appearance in the Balkan Peninsula, the Osmanli had established the most civilized and best ordered state of their time. But succeeding generations of the Osmanli *Turks* lost the virtues of their ancestors, and retained only their capacity for governing under military law. They never learned to rule as civilians nor forgot how to rule as soldiers. During the 26 years of his life after the capture of Constantinople, Mohammed II annexed the whole Balkan Peninsula except the inaccessible Black Mountain (Montenegro), the Albanian highlands, and the then Hungarian fortress of Belgrade. That enlightened monarch showed marked favor to Christians and bestowed the higher offices of state upon them; he encouraged literature, art and commerce. The Venetians held a virtual monopoly of the Euxine (Black Sea) and Aegean trade, while both in Asia and Europe the social condition of the peasantry was better at the time under Osmanli rule than it was under the Ottoman army had the best reputation in the world; it was the first to introduce efficient commissariat and medical services, and adventurers from all parts of Europe flocked to learn the art of war from the Turks.
the three immediate successors of Mohammed II sowed the seeds of decay and disruption by misrule and oppression, while a revival of the dormant crusading spirit of Europe only served to reawaken the slumbering fanaticism that characterized the early followers of the Prophet.

Yet the Ottoman empire continued to grow in territory and splendor, attaining the zenith of its glory in the reign of Suliman the Magnificent (1520-66). At the battle of Mohacs (1526) he conquered Hungary, and three years later stood at the gates of Vienna. It was at Mohacs again that the tables were reversed 161 years later against Suliman II by the Austrians under Charles of Lorraine. That decisive victory pushed the Turks back upon the Balkan Peninsula and drove the first nail into the coffin of Turkish dominion in Europe. During the 17th century Russia and the kingdom of Poland also joined the ranks of Turkey's enemies in coalition with Austria, Tuscany, Venice, Malta and the papal forces. The treaty of Carlowitz and Constantinople (1699-1700) brought about a rearrangement of territories and frontiers by which Turkish power in Europe received a severe check. The wars conducted by Austria and Russia against Turkey during the 18th century and the Jena battles between Turkey, Russia and Great Britain against Napoleon, kept the Ottoman rulers and statesmen preoccupied with international affairs and permitted the development of revolutionary aspirations among the subject races of the Balkan Peninsula. The 19th century witnessed remarkable political changes in that stormy region. By a course of wars, revolutions, brigandage and appalling atrocities the grip of the Turk was gradually loosened through the intervention of the powers. Greece was the first to break away in 1829; the Berlin Congress (1878) erected Rumania, Bulgaria, Serbia and Montenegro into semi-independent states under a shadowy suzerainty of the Sultan. The history of these events is related under the headings of the first two congresses. The Balkan Wars (q.v.) formed what may be the last act but one in the 400 years' struggle to expel the Turk from Europe. The Balkan Peninsula has played a tremendous part in the world's history, and has well earned the various uncompromising titles applied to it, such as the "slaughter-house," the "cock-pit," the "bug-bear" and the "powder magazine" of Europe. For many centuries not a year has passed without bloodshed somewhere on its soil. The scene of many brilliant exploits and unexcelled horrors, it arrayed nation against nation, caused innumerable wars and was finally to be the cradle of the greatest conflict of all time. BALKAN WARS, a series of conflicts fought in the Balkan Peninsula (q.v.) during 1912 and 1913. They fall into three distinct divisions: (1) The war of the Balkan League (q.v.), composed of Bulgaria, Serbia, Greece, and Montenegro, against Turkey, in which the Allies conquered Macedonia, Albania and the greater part of Thrace, terminating with the armistice of December 1912; (2) the peace of the war by Greece and the resumption of hostilities by her Allies in February 1913, after the failure of the London negotiations; (3) the second war, which followed the collapse of the Balkan League in June 1913, when Serbia, Greece and Montenegro were arrayed against their quondam ally, Bulgaria; the re-entrance of Turkey and the intervention of Rumania. The avowed object of the Balkan League was the emancipation of Macedonia from Ottoman dominion and the forcible expulsion of Turkey from eastern Europe. Ever since the Treaty of Berlin in 1878 the Christian population of Macedonia — mainly Bulgars, Greeks and Serbs — had been promised reforms by both the European Concert and by successive Turkish governments. By the Treaty of San Stefano (3 March 1878) which Russia forced upon Turkey at the point of the sword, Macedonia was handed over to Bulgaria, but the arrangement was abrogated four months later at Berlin and the territory restored to Turkey, the powers pledging themselves to supervise the introduction of reforms. For 34 years the powers had tinkered at the problem, and for 31 years of that period Abdul Hamid II (q.v.) had pursued an unwavering policy of promises and evasions. Hope dawned momentarily on the horizon when the Turkish revolution of 1908-09 ended with the victory of the Young Turkey party, the downfall of Abdul Hamid and the accession of Reshad Effendi as Mohammed V. But although the new ruler expressed his satisfaction at being the firstultan of a régime of liberty and told his Parliament that "the safety and happiness of the country depend on the constant and serious application of the constitutional régime," which was in conformity with the Sacred Law as with the principles of civilization, it soon became apparent that the more Turkish government changed the more it was the same thing. Toward the end of 1909 steps were taken to pacify Macedonia. In the process of pacification the Turkish commander entrusted with the task, Torgut Pasha, accounted for 12,000 prisoners, 5,000 killed and wounded, 2,000 refugees in Bulgaria and over 1,600 homeless refugees scattered among the hills. The Young Turk government, the "Committee of Union and Progress," adopted a "nationalizing" program that consisted mainly of stamping out all racial and religious sentiments differing from undiluted Turkish citizenship. This ruthless policy led the Turkish League of Nations to inquire into the Causes and Effects of the Balkan Wars, issued by the Carnegie Endowment for International Peace (Oxford and Washington 1914). See also bibliographies under Balkan Wars and the various countries of the peninsula.

HENRI F. KLEIN,
powers. The Grand Vizier had informed the latter that Turkey would not tolerate foreign intervention in her internal affairs, but offered, at the eleventh hour, to revive the Law of the Vilayets framed 1880 by an international commission, but never carried out. The Allies rejected this and demanded the recognition of the frontiers, which were not forthcoming. On 13 Oct. 1912 Bulgaria, Serbia and Greece presented a joint ultimatum to the Porte, demanding reforms in Macedonia within six months and immediate demobilization of the Turkish armies in the Balkans. These demands were refused on the 17th; to the great surprise of Europe, Turkey had made peace with Italy on the 15th, and now not only declined to negotiate further with the Allies, but declared war on Bulgaria and Serbia. In the case of Greece, Turkey attempted to win this country over, but with a refusal followed, the same day, 17 October, by a declaration of war on the part of Greece against Turkey.

The beginning of the war in the Balkans in 1912 saw the Turkish forces consist of eight regular divisions, one cavalry division and numerous reserve organizations. Their total strength was approximately 340,000 men and 800 guns, divided into three armies under Generals Kutinchieff, Ivanoff and Dimitrieff. The supreme command was in the hands of General Savoff. The Serbian forces consisted of four armies, totaling about 250,000 men and 450 guns. They were commanded by the Crown Prince and Generals Putnik, Stefanovitch, Yankovitch and Zikhovitch. Greece had put in the field about 150,000 men, commanded by the Crown Prince and Generals Danglis and Sapuntsakis. Prince Danilo was in chief command of the Montenegro forces, consisting of some 30,000 men in three groups. Against this total of over 750,000 men Turkey mobilized three armies and a number of smaller organizations amounting to about 450,000 men and more than 600 guns. They were directed by Abdullah Pasha, Zekki Pasha, Hassan Tahali Pasha, Esad Pasha, Hangan and Riza Pasha and Ali Riza Pasha, with Nazim Pasha in supreme command. Greece and Bulgaria were the only countries of the Balkan League possessing naval forces, the former one modern cruiser, 21 destroyers and one submarine, the latter six torpedo boats.

The first successes over the Turks were gained by the Montenegrins. They attacked on 9 Oct. 1912 near Podgoritza and captured the Planinitza and Detchitch mountains. The Bulgarian advance began immediately and was declared. By 19 October the Second army had occupied Mustapha Pasha on the Turco-Bulgarian frontier, and from there proceeded to close in against Adrianople from the north and west. The First and Third armies advanced against the fortress of Kirk Kilisse northeast of Adrianople. The Turks attempted to oppose this advance with a force of 70,000 men and a very sanguinary battle was fought north and northwest of Kirk Kilisse 22-24 October. On the latter date Kirk Kilisse fell to the Bulgarians with large booty and the Turks were forced to retreat in disorder. They finally established themselves on a fortified line of about 20 miles between Bunar Hissar on the north and Smirniki on the south. This was later shifted so that the right wing rested on Visa instead of Bunar Hissar.

The Bulgarians followed and attacked on 29 Oct. 1912. In position, guns, equipment and moral the Bulgarians had the advantage over their opponents. The battle lasted for three days. Though making a valiant stand the Turks were forced back everywhere; by 4 November they had fallen back to a new line with Chorlu as its centre. But the Bulgarian advance was irresistible and this position had to be abandoned by the Turks on 7 November. Realizing the danger of Constantinople being threatened the Turkish government had already, on 3 November, appealed to the European Powers for mediation. The Turks meanwhile retreated within the so-called Chaladja lines, a series of strongly fortified positions running about 20 miles west of Constantinople, from the Sea of Marmora to the Black Sea along a chain of heights. It was not till 13 November that the Turkish retreat and establishment at Chaladja was completed. The Bulgars had apparently stretched their resources to the utmost, and did not attack the Turkish flank thus far, as they made no further move of importance for several days. This brief respite enabled the Turks to reorganize and strengthen their weakened ranks by reinforcements from their Asiatic armies, but a serious outbreak of cholera among the troops served to hinder the process of reconstruction. On the 17th the First and Third Bulgarian armies began an attack on the Turkish lines. In some instances the attack succeeded, but the natural strength of the position plus the assistance rendered by the Turkish fleet on the southern flank was more than the Bulgarians could overcome. The latter therefore withdrew their forces to the west of Chaladja village and contented themselves with making impossible any Turkish advance.

The Second Bulgarian army which at the beginning of the war had advanced against Adrianople attacked this city on 22 and 23 Oct. 1912, but had been unable to carry any of the important defensive works. The right wing of the First Bulgarian army, however, was pushed on 23 October to the Tunja Valley north of Adrianople; by the 29th its left wing had reached the Maritza Valley south of Adrianople. The fortress was surrounded. Still another Bulgar force had crossed the Rhodope Range and inflicted a defeat on the Turks at Kirjali on 20 October. Part of this force then advanced and joined the other Bulgar troops before Adrianople. A special division under General Todoroff in the meantime had invaded Macedonia along the Struma and Mesta valleys, captured the Kresna defile and occupied Buk on the Salonica-Dedegatch Railroad. This move completely severed the western flank of the eastern Turkish army. General Todoroff then advanced on Demir Hisar and from there to Salonica; on his arrival, however, that city had already capitulated to the Greeks. Other detachments of his forces occupied Kavalla 15 November and Serres on the 20th. After the victory at Kirjali the Bulgars pursued the Turks in the direction of Jumuljina, captured this town on 22 November and finally forced the Turks who had made a stand north of the village of Meramli to the Burdjer on 27 November, taking 12,000 prisoners.

The siege of Adrianople in the meantime
had been carried on without any definite results. Almost 50,000 men of the First and Second Serbian armies had joined the Bulgars in the beginning of November 1912, but even the combined forces of the two armies, with their ill-equipped and insufficient artillery to compel surrender. Every attempt of the Turks to break out, however, was repelled. Coincident with these Bulgarian successes were equally important successes on the part of the Serbs. On 19 Oct. 1912 they seized the town of Kumanovo. On 24 Nov. 1912, Strazim was occupied by the 22d, Kratovo on the 26th, and on the same day Uskub was abandoned by the Turks, who were so demoralized that they left behind some 120 guns and large quantities of stores and munitions. Both the Third and Fourth Serbian armies had been equally successful. Mitrovitsa and Prishtina were taken on 22 Oct. 1912. Novi Pazar on the 27th, and Durrës, Plevljë on the 28th and Nova Varos on 5 November. After the fall of Uskub the Serbs pushed the Turks further back toward Monastir. Doiran was taken on 5 November, already in the hands of the Greeks, was entered by the Serbs on the 8th. Perlepe, on the road to Monastir, was occupied 6 November after a two days' battle. Two divisions of General Yankovitch's army were dispatched in the middle of November across the snow-covered mountains toward the Adriatic Sea. They captured Alessio on 18 November and reached Durazzo on the 28th (1912). Five divisions of the First Serbian army supported by other detachments resumed their attack on the Turks in the vicinity of Monastir. After a battle lasting four days the Turks were completely routed and Monastir was occupied by the Serbs. Most of the Turkish troops were either killed or captured, and only small bodies succeeded in escaping toward the south.

The Montenegrin forces throughout October and November 1912 were chiefly occupied in operations in northern Albania which finally resulted in the complete investment of Scutari. Although the Turkish troops caught there were prevented from breaking out, the artillery at the disposal of the besiegers was too feeble to reduce the place. During seven weeks of the war the Montenegrins, though fighting against an enemy with great valor and determination, and defeating the Turks in almost every encounter, only succeeded in capturing Tuzi (14 October), Berane (16 October), Ipek (31 October), and the insignificant harbor of San Giovanni di Medusa (16 November). When in the middle of November Serbian detachments appeared in central Albania a Montenegrin brigade was sent south to co-operate with them, but before the end of the month was recalled to assist in the siege of Scutari. When the armistice was signed, Scutari, the objective of the whole Montenegrin campaign, still remained in the hands of its Turkish garrison.

The Greeks, from the commencement of the war, carried on the operations of Salioucica with their chief aim. Crossing the frontier on 18 Oct. 1912, they captured Elassona on the 19th, decisively defeated the Turks on the 22d at the Sarantopoulos Defile, captured Cokljje on the 23d, and Verria on 29th. As the Greeks approached nearer and nearer to Salonica the Turks made one more attempt to make a stand along the line between Yenidje Vardar and Plati bridge. But the effort proved fruitless, and on 8 Nov. 1912, Hassan Tahsin Pasha saw himself compelled to surrender Salonica with its garrison of about 30,000 Turkish troops to the Greek Crown Prince. Five Greek divisions were now detached to assist the Serbian troops fighting near Monastir, where they arrived in time to capture large numbers of Turks who had attempted to flee and surrender before Monastir. During December the main army of the Greeks advanced toward Janina after beating the Turks at the Sangoni Pass. Previous to this the western Greek army had come up from the south by way of Arta, captured Prevesa, a small fortress, on 4 November, Mount Metsovo on the 14th, and reached the vicinity of Janina on 28 Nov. 1912. Throughout December 1912 the Greeks unsuccessfully endeavored to capture this town, though they had no difficulty in repulsing every attempt of the Turks who assumed the offensive.

Naval operations during October, November and December 1912 were restricted chiefly to the Greek fleet. Wherever opportunity offered Greek destroyers assisted the Greek military forces. The main body of the fleet, however, was occupied with the blockade of the Dardanelles and with the capture of the islands of Lemnos, Thasos, Imbros, Samothrace, Tenedos, Ikara, Paros, Chios and Mitylene. The Turkish fleet was primarily engaged with transporting reinforcements from Asia to Europe. It also attempted, with more or less success, to blockade the Bulgarian coast on the Black Sea. In November it was of considerable value in defending the Chataldja line. One Turkish cruiser was seriously damaged on 21 November before Varna by a Bulgarian torpedo and another was sunk by a Greek torpedo boat on 31 October in the harbor of Salonica.

The Turkish appeal to the powers for mediation (3 November) met with no favorable response. On 13 Nov. 1912 Turkey approached Bulgaria for the purpose of opening peace negotiations. For approximately a week military operations were more or less suspended but when on 21 November Turkey declared that she declined to accept the conditions demanded by Bulgaria and her allies hostilities were reopened. Nevertheless, representatives of the belligerents continued to meet a few days later before the Chataldja lines, and on 3 Dec. 1912 an armistice was signed between Turkey and Bulgaria, Serbia and Montenegro. Greece alone declined to be a party to this agreement. As a result representatives of the four parties to the armistice met in London, 16 Dec. 1912, to consider the possibility, in the presence of the ambassadors of the Great Powers, of a settlement of the Balkan question. Sir Edward (now Viscount) Grey, the British Foreign Minister, presided at the conference. Bulgaria demanded Adrianople; Greece insisted on the cession of all the Egadian Islands, and all the other demands included an indemnity from Turkey. The Turkish emissaries rejected all of these demands, and on 6 Jan. 1913 the Allies withdrew from the negotiations. In order to avoid if possible the resumption of hostilities which threatened more and more to involve all Europe, the powers
combined in a note to Turkey advising the cese with a view to attempting the settlement of all the other questions left in the hands of the powers. The utter impossibility of returning to the status quo ante was voiced by Mr. Asquith: *The map of eastern Europe has to be recast... Upon one thing I believe: the future union of Europe will be unanimous—that the victims are not to be robbed of the fruits which have cost them so dear* (9 Nov. 1912). By 22 Jan. 1913 appearances indicated that Turkey would yield to the inevitable, but on the next day a revolution suddenly broke out in Constantinople. Nazim Pasha, Minister for War, was assassinated, and hostilities were resumed a week later.

The position of Turkey was indeed desperate. Of all its former great possessions in Europe nothing was left beyond the small stretch of land between the Bosporus and the Chataldja lines, and the three fortresses of Adrianople, Janina and Scutari. These latter were so closely invested by the superior forces of the Balkan Allies that all hope of escape for them seemed to be cut off. In an attempt to push back the invaders over the Chataldja lines was repulsed, a fact that was not sufficiently counterbalanced by the strength shown by the Turkish lines which held firm against every Bulgarian assault. On 6 March 1913 Janina surrendered to the Greeks with its garrison of 30,000 men. The Turkish position at Adrianopole became more and more untenable; famine and lack of ammunition gradually weakened the resistance in the last and most important Turkish stronghold west of the Chataldja lines. Bulgars and Serbs made a series of determined assaults on the fortress; on 9 March two important forts were stormed and finally, on 26 March, Shukri Pasha, in command at Adrianople, had no other alternative than to capitulate with 33,000 men.

In the meantime the Montenegrins had valiantly continued their attacks on Scutari. They found, however, that in their operations in Albania they had to contend not only with Turkish resistance, but also with the interests of Serbia supported by Russia and of Italy supported by Austria-Hungary. These powers arrived at an understanding over the future of Albania and, on 20 Dec. 1912, had announced their acceptance of the principle of Albanian autonomy and of Serbian right to free commercial access to the sea. To determine the frontiers of the new state to everyone's satisfaction was more difficult. But an agreement was finally reached on 26 March 1913. Serbia received some of the Albanian territory adjacent to Montenegro and Scutari was to become part and parcel of the new state. Both of these arrangements were considered by Montenegro unjust; the little mountain state flatly refused to acquiesce in the arrangement in spite of promises brought to bear by all the European Powers, in spite of the withdrawal of such Serbian forces as assisted in the siege of Scutari, and even in defiance of an actual blockade of the Montenegrin coast instituted by all the powers except Russia, in April 1913. Montenegro's persistence had its reward in the capitulation of Essad Pasha and Scutari on 22 April 1913. However, she was to enjoy the fruit of her victory but a short time. Austria-Hungary and Italy made such strong representations that the agreement of 26 March should be fulfilled, that Russia, in view of a possible intervention by these two powers, exerted powerful pressure on Montenegro to evacuate Scutari. This was done on 14 May 1913, and Scutari was occupied by sailors from the international fleet.

Contemporaneously with the events just described, the European Powers were exerting themselves to bring about peace, not, it must be confessed, in the interests of either Turkey or her enemies. Excepting Germany, who had other objects in view, not a single European country regarded the expulsion of the Turk with anything but satisfaction. The great danger, however, lay in a possible conflict among the powers themselves, according to which side they favored. What centuries of great wars and diplomacy had failed to achieve had been accomplished by the little Balkan states in a few weeks; the Turk had been brought to his knees. Hence the powers had persuaded, first Turkey, on 1 March 1913, and then the Allies on the 13th, to sign a treaty of peace. An armistice was signed between Turkey on the one part, and Bulgaria, Serbia and Greece on the other, at Bulair on 19 April 1913. With the fall of Scutari three days later, Montenegro also became a party to the armistice. When the Montenegrins had evacuated Scutari the way to a peace conference lay clear. Representatives from all the nations involved met again in London 21 May 1913. Representatives of the Powers, Great Britain, France, Russia, Austria-Hungary, Germany and Italy were also present and hastened the proceedings to such an extent that as early as 30 May the Treaty of London was signed by all the belligerents. It provided that the Turkish possessions in Europe should be bounded in the west by a line drawn from Midia on the Black Sea to Enos on the Ægean Sea, the details to be arranged by an international commission; that the powers were to determine the boundaries of the newly-created state of Albania and the future status of Montenegro; that the Crete was to be ceded by Turkey to Greece; and that all financial questions were to be settled by an international commission to meet as soon as possible at Paris.

Unfortunately, the Treaty of London did not decide what was, to the victorious allies, the most vital point of all: the division of the territory wrested from the Turk. Even before that treaty had been signed, ill-feeling of the strongest kind had sprung up between Bulgaria and Serbia, and Bulgaria and Greece. Secret treaties which had been signed before the outbreak of the war were denounced as void owing to "changed conditions." The military forces of each separate country, both during the armistice and the session of the peace conference, were occupying large sections of territory from which the Turks had been driven as they could cover. Recriminations of every type, not unixed with physical violence, were indulged in by the former allies. The natives of the greatest sufferers were the Bulgarians by the thousand and Bulgarian troops butchered Serbian civilians. Military collisions occurred frequently during March,
April and May. Further trouble was fast brewing. The powers demanded, 6 June 1913, that the Balkan states demobilize; they refused. On the 10th Serbia demanded from Bulgaria a revision of the a-gentile treaty of alliance. Russia threw her moral influence on the side of Serbia, while Austria-Hungary was clearly more friendly to Bulgaria. The latter country refused to revise the treaty, and on 22 June the Serbian Minister left Sofia. As the last of the three great powers, Russia, Great Britain, and France, Germany had yet to act. As Turkey. Finally on 29 Sept. 1913, the Treaty of Constantinople fixed the frontiers so that the Enos-Midia line of the other treaty acquired such a spinal curvature that it retained for Turkey Demotika, Adrianople and Yik Kilisse. As the last of the newly-created state of Albania had also been settled by the powers; its boundaries had been agreed upon and an international commission, located at Valona, assumed its government on 1 Oct. 1913. Later in the month they selected a German prince, William of Wied, and appointed him 'Mpret of Albania.' See BALKAN LEAGUE; ALBANIA; BULGARIA; SERBIA, etc.

HENRY F. KLEIN,

BALKH, bāl′kāh, Afghan Turkestan, a district corresponding to ancient Bactria, and is bounded on the north by the river Oxus, on the east by Badakhshan, on the south by the Hindū Kush, and west by the desert. Its length is 250 miles; its breadth 120. Its situation was once important during the overland commerce between India and eastern Europe before the sea route by the Cape of Good Hope was followed. The soil has the general characteristics of a desert land; only a few parts are made fertile by artificial irrigation; and such are the vicissitudes of climate that where grapes and apricots ripen in summer and the mulberry-tree permits the cultivation of silk, in winter the frost is intense and the snow lies deep on the ground. The natives, Tajiks, whose character differs in different districts, from plunderers of caravans to tillers of the soil and artisans.

BALKH, Afghan Turkestan, the capital of the district of the same name, situated in a district intersected by canals and ditches. It is surrounded by a mud wall, but though bearing the imposing title of "Mother of Cities," it has not in recent times had any of the grandeur of ancient Bactria, on the site of which it is built. It was twice destroyed by Genghis Khan and Timur. A terrible outbreak of cholera in 1877 caused the capital of Afghanistan Turkestan to be transferred to Mazar, west of Balkh; since which Balkh has been an insignificant village. It contains a mosque, a citadel and several half-ruined schools. It is reputed to have been at one time the centre of the Zoroastrian religion. There is a new town of the same name a short distance to the north of Balkh. Pop. about 8,000.

BALKHASH, bāl′kāsh, a great inland lake on the eastern border of Russian Central Asia. Lying about 780 feet above sea-level, it extends 323 miles west-southwest; its breadth at the west end is over 30 miles; at the east from nine to four miles; the area is 8,600 square miles. The water is clear but intensely salt. Its principal feeder is the river Ili. The northern edge is well defined; but the south shores of the lake are labyrinths of islands, peninsulas, low sandhills and strips of shallow water. Here grow masses of enormously tall reeds in which wild swine swelter. To the south, stretching toward the base of the Alatau Mountains, is a vast savannah of vegetation. Balkhash seems to have at one time included in its immense area the smaller lakes Sossilik-ul and Ala-kul, now far to the southeast.

BALIKIS, the Arabian name of the Queen of Sheba who visited Solomon. She is the central figure of innumerable Eastern legends and tales.

BALL, Elmer Darwin, American entomologist; b. Athens, Vt., 21 Sept. 1870. He was educated at Iowa State College and the Ohio State University. In 1895-97 he was assistant in zoology and entomology in Iowa State College; in 1898-1902 associate professor of zoology and entomology at the Colorado Agricultural College. From 1902 to 1906 he held the same chairs at the Utah Agricultural College and in the latter year was appointed director of the Utah Experiment Station. In 1909 he became director of the School of Agriculture of the Utah Agricultural College and in 1910 was president of the Utah Academy of Science. He is a member of the Entomological
Society of America and many similar learned bodies. He has written numerous systematic and life-history doctrines of the caterpillar and Fulgoridae, economic studies of the codling moth, grasshoppers and sugar-beat leaf hopper, causing "curly leaf"; also studies on poultry-breeding.

**BALL, John**, English priest of the 14th century, was a disciple of Wycliffe, upon whose religious doctrines he emphasized some political theories resembling the "liberty, equality and fraternity" of later ages. He was several times imprisoned for his indiscreet utterances and twice excommunicated. He was intimately concerned in the Wat Tyler insurrection of 1381 and for his part in the affair was hanged, drawn and quartered at Saint Albans, 15 July 1381, the King witnessing the execution. Consult Morris, 'The Dream of John Ball' and 'Dictionary of National Biography'. (London 1885).

**BALL, Sir Robert Stawell**, distinguished English astronomer: b. Dublin, 1 July 1840; d. Cambridge, 25 Nov. 1913. In 1865 he was appointed Lord Rosse's astronomer at Parsonstown. While there he discovered four spiral nebulae. He has held many posts in connection with astronomy and mathematics, including those of professor of applied mathematics and mechanism at the Royal College of Science for Ireland; Andrews professor of astronomy in the University of Dublin; astronomer-royal of Ireland from 1874 to 1898 and was engaged in measuring the distances of the stars from the earth. Meanwhile he wrote an important work on the mathematical theory of screws, a subject which he popularized at the British Association meeting of 1867 in an address entitled "A Dynamical Parable." Ball had a happy gift of simplicity and could make abstruse problems not only comprehensible but even interesting to young people. He was Lowdean professor of astronomy and geometry in the University of Cambridge and director of the Cambridge Observatory since 1892. The Royal Society elected him a fellow in 1873 and in 1886 he was knighted. His works include 'The Story of the Heavens' (1885); 'Time and Tide' (1889); 'Star-Land' (1889); 'The Story of the Sun' (1893); 'Great Astronomers' (1895); 'The Earth's Beginning' (1901); 'Popular Guide to the Heavens' (1903); etc.

**BALL, Thomas**, American sculptor: b. Charlestown, Mass., 6 March 1819; d. Montclair, N. J., 11 July 1844. He was the son of a house-painter and undertook the support of the family on the early death of his father. He secured employment as a boy-of-all-work at the New England Museum, Boston, where his associations turned him to art and led him to study and practise portrait-painting. He also tried his hand at studies of his native Laurel Hill in this direction being a bust of Jenny Lind. A life-size bust of Daniel Webster brought him great success and enabled him to leave in 1854 for Florence, where he studied two years. Soon after this term of study was finished he was engaged on the celebrated equestrian statue of Washington, which was unveiled in 1869. It was the first equestrian statue in New England and perhaps the best so far produced. He returned to Florence in 1865 and resided there for several years. His later works include Edwin Forrest as "Coriolanus" (1870), now in the Actors' Home, Philadelphia; "Eve Stepping into Life"; "La Petite Pensée;" "Saint John the Evangelist." Of his later works the most important are his "Emancipation Group" in Washington (unveiled 1875), a bronze representation of Lincoln freeing a kneeling slave; the Webster statue in Central Park, New York; the statue of Josiah Quincy before the City Hall, Boston; the Washington monument at Methuen; "Mass Student." He published an autobiography, "My Three-Score Years and Ten" (1891). Consult also Taft, 'History of American Sculpture' (New York 1903).

**BALL, Walter William Rouse**, English mathematician: b. 1850. He received his education at Trinity College, Cambridge, and at University College, London. He became lecturer at Trinity College, Cambridge, in 1878, was appointed director of mathematical studies in 1891 and senior tutor and chairman of the college educational committee. He was the representative of the University of Cambridge on the borough council in 1905, was member of the governing bodies of Westminster School and the Cambridge Perse School. He has examined on various occasions in the Tripos and other examinations and has served on numerous boards and syndicates. He is now one of the largest collection in Great Britain of portraits of mathematicians. His publications include 'A History of Mathematics'; 'The Genesis and History of Newton's Principia' (1893); 'The Student's Guide' (7th ed., 1904); 'History of Trinity College, Cambridge' (1906); 'History of the First Trinity Boat Club' (1908); 'Short Account of the History of Mathematics' (5th ed., 1912); 'Mathematical Recreations and Essays' (5th ed., 1912); 'Records of Admission to Trinity College, 1546-1900'; and various memoirs in mathematical journals.

**BALL, as an article of ammunition, see GUNNERY; ORDNANCE; PROJECTILES; SHOT.**

In connection with sports and games the ball in various sizes has been in universal usage since ancient times. The Greeks regarded ball-games as of much value in adding grace to the figure and giving elasticity to the muscles of the body and the Romans also played a game of ball in connection with their baths for the same purpose. Several of the games then played resembled modern handball, football and polo. Modern tennis and rackets undoubtedly had their beginnings in the jeu-de-paume of the Middle Ages and lacrosse was originally played by the North American Indians, though the historical data concerning these and other games are meagre and new customs and rules have so changed games that their true history cannot be told with exactness. Of varieties of balls used in different sports there are many. The baseball is made of a sphere of rubber, 2½ inches in weight, which is wound with yarn and covered with leather. The basket-ball is an inflated rubber ball, enclosed in leather and from 30 to 32 inches in diameter. The tennis ball is of rubber covered with white flannel, about 2½ inches in diameter and 2 ounces in weight. The lacrosse ball is made of india-rubber and
BALL BEARINGS—BALLAD

is 8 or 9 inches in diameter. The polo ball is of wood and 4 or 5 inches in diameter. The football is a prolate spheroid in shape and consists of a rubber bladder encased in a leather cover. Billiard balls are of ivory and from \( \frac{2}{4}\) to \( \frac{2}{1}\) inches in size. See BASE-
BALL; FOOTBALL; BASKETBALL; LAWN TENNIS; RICKSHOLA; CRICKET; HANDBALL; LACROSSE; POLO; BILLIARDS; ETC.

BALL BEARINGS. See Bearings, Anti-
Friction.

BALL CLAY. See Clay.

BALL COCK, a self-acting stop-cock, opened and shut by means of a hollow metallic sphere attached to the end of a lever con-

nected with the cock. Its use is principally to regulate

the supply of water to cisterns. The ball

floats by reason of its buoyancy and ris-

ing and sinking as the water rises and sinks,

shuts off the water in the one case and lets it

on to the other.

BALL FLOWER, an architectural orna-
ment resembling a ball placed in a circular

flower, the three petals of which form a cup

around it; usually inserted in a hollow mould-

ing and generally characteristic of the Dec-

orated Gothic style of the 14th century.

BALL NOZZLE. See HYDRODYNAMICS.

BALL AND SOCKET, a joint used in

machinery and piping. It consists of a spheri-
cal end of a rod or pipe fitting into a hollow

sphere of the same size on a like piece. The

object of this joint is to provide a close, mov-
able connection and to prevent leakage in pipes. Suspended gas chandeliers are usually fitted with this movement.

BALLAD, a short narrative poem in stan-
zas, originally intended for singing. The name, which is derived from the Latin ballare, to
dance, is frequently used very loosely and ap-
plied to a variety of songs and verse-tales with no real association. But in the strictest sense it belongs to a comparatively small body of anonymous traditional poetry, the produc-
tion of which has practically ceased in English-
speaking countries, though literary imitations of the type are still composed. Its most char-
acteristic quality is impersonality. Not only is the author unknown, but in the pure ballad

there is no trace of his individuality. The

material of the poem is usually popular in ori-

gin and the sentiment and point of view are those, not of a single person, but of the whole

people. 6People, in the sense here used, has

reference not to the lower classes but to so-
ciety in a period when in the matter of cul-

ture the community was homogeneous. Thus
the origins of the kind of poetry of which the

ballad is a survival are to be looked for in a

comparatively primitive stage of society, be-

fore the "poetry of art" came into existence,

when the tribal community could still express

itself in simultaneous utterances accompanying

the rhythmic movements of dance or march.

This view of the origin of ballad poetry is
not universally accepted. Over against it there
is placed the apparently simpler theory that the

ballads are the production of minstrels, from

the 15th century down, who derived from ro-

mances and other sources in artificial litera-
ture stories which they threw into crude stan-
zas, to chant at the courts or in the inns of the

great, sometimes at fairs and other popular
gatherings. But the objections to this view

are serious. First, minstrel ballads such as

are here described were manufactured and

still exist in abundant broadsides and chap-

books, but they are universally lacking in pre-
cisely those qualities of impersonality and un-
consciousness which constitute at once the mark

and the charm of the true popular ballad.

Second, the minstrel theory ignores the exis-
tence of a large mass of ethnologically sound

evidence, showing the indubitable and well-nigh uni-
versal existence of the practice of communal

song and the development in this song of a narra-
tive element. Third, it is a matter of

definite proof that the genuine ballads which

have been collected during the last two cen-
turies have come, with rare exceptions, not

from the mouths or wallets of minstrels, but

from humble unprofessional people, "the spin-

sters and the knitters in the sun,\(^7\) who have

in so many branches of folk testimony been the

best conservators of the heritage of the peo-

ple. A minstrel's addition to his stock of an

occasional piece of more or less degraded pop-

ular verse in no wise overthrows the signifi-

cance of this fact. There is no reason to be-

lieve that, in the centuries before ballad-col-

lecting began, the medium of transmission was

substantially different.

The argument on the other side has al-

ready been partly indicated. First, there ex-
ists the evidence of the wide-spread practice

of accompanying communal activity—in la-

bor, ceremonial or festal dance—with rhyth-

mic utterances; the gradual growth of these

utterances in definiteness of form; the prac-

tice of making them the medium of narrating

some episode known to all—e.g., the story of

some great deed accomplished by the hero

whose death is being lamented, or the manner

of the victory which is being celebrated, or

some ludicrous incident in the season's labor

happily finished,—the contribution of a new

line or stanza now by this, now by that mem-

ber of the dancing troupe; the recurrent re-

frain sung by all; the final creation of a nar-

rative song for which no one individual is re-

sponsible, but which is the expression of the

thought and feeling of all. Second, the un-

individual element is intensified by the method

of transmission. Before any extant ballad

came into the form in which we find it, it had

been handed down from mouth to mouth

through many generations, modified endlessly

in detail, but by this very process losing what-
ever individual elements might at any stage

appear in it, and keeping, with what-
ever change of matter or modernization of dia-

lect, just those qualities of impersonality and

unconsciousness of literary effect which have

been noted as its characteristic. Third, the theory suggested by these facts receives

corroborative from the refrain and from the

characteristic narrative method of the ballad,

the so-called "incremental repetition.\(^8\) The

phrase is used to describe the method of tel-
ing a story by the repetition in a set of stanzas

of the same words with just enough change to

advance the narrative one step. Thus the mo-
The exclusive property of none. Such are the
formulas for sending a messenger,
O whaur will get a bonny boy, etc.;
for ordering a horse,
O saddle me the black, the black,
O saddle me the brown;
for describing a journey,
They hadna' gien a mile, a mile,
A mile but barely three;
for concluding a romantic tragedy,
The lass was buried in Mary's kirk
The usher in Mary's quire,
And out of the aisle there grew a birk,
And out of the isle a brier, etc.

A modern poet seeks novelty of epithet: the
ballad clings to the traditional description;
the gold is red, the lady is fair, her dress is grass-
green, her hair is yellow, her tears are salt,
the moon's light is clear, the porter is proud,
brothers are bold, a bower is 'bigly,' and so on.

Equally characteristic is the treatment of incident
and plot in the ballad. There is seldom
any introduction: we plunge at once into
the midst of the action. The stanza
leap from peak to peak of the narrative, with no attempt
to supply the less important links, yet seldom
with any real sacrifice of clearness. The events
in the uncontaminated ballad are unemotional
and unsentimentalized: the bald fact is left
without comment or criticism from the singer.

Conscious figures of speech are rare and the
background is seldom filled in. Thus the general
result is that of rapidity of motion, directness
and unconscionableness. Effect, an absence
of artistic suggestion. Whenever we find a
moral drawn or a dwelling on the pathetic,
interpolation by a modern would-be artist is to be
suspected.

From what has been said of origins, it is clear
that little can be guessed as to the date
of composition of ballads. Some, notably those
simple, highly typical stories like 'The Twain
Sisters,' written in a two-line stanza with a
refrain, with stress upon situation rather than
upon succession of events, may in some form
be of almost any age. Others have an upper
limit of date fixed by the historical event
which occasionally forms the basis of the plot.
The dates of ballad manuscripts, which are,
of course, an entirely different matter, and a
date of death rather than of birth, are more
easily fixed. The earliest is 'Judas' (No. 23
in Child's collection) from a 13th century MS.;
the next 'Riddles Wisely Expounded' (Child, 1)
about 1443; a little later, 'Robin Hood and the
Monk' (Child, 119), 'St. Stephen and
Herold' (Child, 22), and 'Robyn and Gandylyn'
(Child, 115); two exist in copies of about 1500;
two others about 1550. Less than a dozen are
preserved in MSS. before 1600. The most
important single MS. is the Folio which Bishop
Percy used as a basis for his famous 'Reliques
of Ancient English Poetry,' and it is in a
handwriting of about 1650. A few appear in
early printed forms. 'A Lytell Geste of Robyn
Hode,' was printed about 1500, and a number of
versions, usually in very degraded form, appeared
frequently in the 17th and 18th centuries.
The most important sources after the
Percy Folio are the collections made directly
from the mouths of the people such as those
of David Herd (1776). Mrs. Brown of Falk-
land (1783-1801), Sir Walter Scott (1783-
1830), C. K. Sharpe (c. 1823), Motherwell...
BALLAD

(1825-27), Kinloch (1826), Buchán (1828), MacMath and Child (second half of the 19th century).

Ballads on historical occurrences apart, most of the plots belong to the mass of folk-tale which is the exclusive possession of no one nation or language. Many ballads tell stories, versions of which are preserved in every known tongue. The explanation of this world-wide diffusion of story-material is one of the standing problems of folk-lore; but whatever theory of its cause be adopted, the fact that it is largely from this international treasury that the ballads derive their plots is a strong reason for regarding them as essentially "popular" in matter as well as in manner.

Turning now to the nature of these stories, we find that by far the largest class is concerned with romantic love and its consequences. Many are tragic, the interference of fathers, mothers or brothers being perhaps the commonest cause of the fatal issue. Both in these and in the romantic ballads with happy endings the sympathy of the audience with the lovers is in general assumed, and in cases of illicit love no moral judgment is passed or suggested. Some of the best are ballads of war by land or sea; and the story of the Border war between England and Scotland has given birth to a number justly famous. The largest group connected with a single personality is that of the Robin Hood ballads. Of these, some like 'A yest Geste' and 'Robin Hood and the Monk', represent only the finest of the outlaw group, but rank with the best of all ballads. The later members of this group, however, show serious deterioration, and they finally sink into the degradation of broadsides manufactured by printers' hacks. The 'Geste' itself is of especial interest as showing a significant stage in the process by which ballads are combined in the formation of the popular epic. In it four or more distinguishable ballad plots are woven together into a miniature epic, the interwoven being clearly the work of a conscious artist who at the same time was in full sympathy with the popular spirit. The supernatural also plays an important part in the ballads, and it is possible to infer from the much information as to popular belief on such themes as fairies, witches, the return of the dead, transformation by enchantment and the like.

The number of extant ballads in English may be gathered from the great final collection of Professor Child. Here, ignoring variants, we have 305, most of which are popular in the sense which has been defined, i.e., they fulfil these conditions, that even if written each by an individual author, that author be but a part of the people, drew his material from the common stock of folk-tales, wrote in the popular spirit, and used the traditional method, had his product accepted by the folk and passed on and modified by them through centuries of oral transmission. Some few such as 'The Boy and the Mantle,' 'King Arthur and King Cornwall,' and 'The Marriage of Sir Gawain,' are closely associated with metrical romances, and are usually regarded as written by minstrels for more courtly audiences, but are yet enough in the popular style to justify their inclusion as ballads. More are traditional ballads corrupted for the printing press and represented by broadside versions because no purer form has survived. And in the case of almost every ballad surviving in several versions, some versions show a higher degree of purity from literary editing than others.

The localities from which the ballads have been gathered are widely scattered, versions of several having been picked up in such places as Scotland claims about two-thirds of the whole. Spain possesses the richest ballad literature of all Latin peoples. The Serbians still maintain in popular use ballads of a primitive kind, which have long since disappeared in other Occidental nations more under the influence of modern civilization. In Germany the oldest extant ballad, the 'Huldbrandslied' dates from the 8th century. Ballad literature flourished there, reaching its highest point about the year 1300 and lasting until the 16th century, when a rapid decline set in. It was revived during the 19th century and aroused great literary interest.

Bibliography.—The completion of F. J. Child's exhaustive 'English and Scottish Popular Ballads' (5 vols., Boston 1882-98), with its bibliographies and full account of the sources, makes unnecessary a list of previous less comprehensive collections. Every known version of every extant ballad in any English dialect was intended to be included by the editor, and little or nothing has escaped him. The introductions give an account of parallels and analogues throughout the world. An abridged collection has been edited by H. C. Sargent and G. L. Kittredge (1 vol., Boston 1904). On the question of origins, consult F. B. Gummere, 'Old English Ballads' (Boston 1894); 'The Popular Ballad' (New York 1907); 'Democracy and Poetry' (ib. 1911); 'The Beginnings of Poetry' (ib. 1904); 'The Popular Ballad' (Boston 1907); T. F. Henderson's edition of Scott's 'Minstrelsy of the Scottish Border' (Edinburgh 1902) and his 'Scottish Vernacular Literature' (Chap. xi, London 1896) and Courthope's 'History of English Poetry' (Vol. I). An excellent condensation statement of the whole matter by G. L. Kirttredge forms the introduction to the one-volume edition of Child's collection selected by J. A. Lomax in the volume 'Cowboy Songs' (New York 1911). Of Spanish ballads the best collections are Marin 'Cantos populares españoles' (3 vols., Madrid 1883); 'Biblioteca de las tradiciones populares' (11 vols., Seville 1883). Consult also Böhl von Faber, 'Floresta de rimas antigua Castelanan' (3 vols., Hamburg 1825); Balaguer, 'Historia de los Trovadores' (Madrid 1888); Lockhart, 'Ancient Spanish Ballads' (London 1823); Fitzmaurice Kelly, 'History of Spanish Literature' (New York 1898). For the German consult Bowring, 'Serbian Popular Poetry' (London 1827); Kapper, 'Volklieder der Serben' (Leipzig 1853); Krauss, 'Sagen und Märchen der Süddeutschen' (1884); in the German consult Uhlrand, 'alte hoch und niederdutsche Volkslieder' (4 vols., 3d ed., Leipzig 1892); Robertson, 'History of German Literature' (Edinburgh 1902); Scherer, 'Die schönsten deutschen Volkslieder' (Leipzig 1891); Vogt and Koch, 'Geschichte der deutschen Literatur' (2 vols., ib. 1904).

WILLIAM A. NELSON, Professor of English, Harvard University.
BALLAD. In music, this term has been used at different periods to designate various musical forms. At first ballads were principally literary compositions recited by minstrels with improvised accompaniment on some instrument, usually the harp. This is especially the case with the old ballads of Scotland, England, Spain and Scandinavia. In Italy preceding the growth of instrumental music the ballad appears to have been a dance song, and the same is true of the ballads on France and Germany which reached a high degree of artistic elegance in the 13th century. In the 15th century the ballad divided honors with the rondeau as the popular form of song with musical accompaniment. The decline of the ballad set in about the close of the 16th century, its form becoming more and more simple, and returning to the plain strophic folk song, and even degenerating into the cheap, trivial song sung in the streets. The modern ballad is not a revival of the older form. It is now the title of purely instrumental works for piano or orchestra. The ballads of Bürger, Goethe and Schiller were first set to music by Zumsteeg, but the setting was inadequate. Lowe secured a better characteristic expression for each stanza and welded his compositions into an artistic whole by employing a few pregnant motifs. Brahms, Schubert and Schumann followed in his footsteps and have left unsurpassed examples of the modern vocal ballad. Senta’s ballad from ‘The Flying Dutchman’ is a good example of the modern vocal form, while Chopin’s exquisite ballads are unequalled examples of the modern purely instrumental form, in which the theme is the same as in the vocal ballad, but of which the fundamental mood is decidedly sensuous. Consult Riemann, H., ‘Handbuch der Musikgeschichte’ (Leipzig 1906).

BALLAD OPERA, a form of operetta which had a great vogue in England in the 18th century, in which the usual method of writing music to the words was reversed. Well-known popular airs were pieced together and new words were written to the music. Spoken dialogue was interspersed. The most popular work was ‘The Beggar’s Opera’ of John Gay, produced in London in 1727. The year 1728 saw the production of six works of similar nature by different authors. ‘The Beggar’s Opera’ was produced in New York in 1750, and from then until about 1820 works of its kind were the only kind of opera offered in America. Consult Sarrazin, G., ‘John Gay’s Singspiele’ (Weimar 1898).

BALLADE, ba-lä’de, the earlier and modern French spelling of ‘ballad’, but now limited in its use to a distinct verse-form introduced into English literature of late years from the French and chiefly used by writers of vers de société. It consists of three stanzas of eight lines each, with an envoy or closing stanza of four lines. The rhymes, which are not more than three, fall on each other in the stanzas, thus: a, b, a; b, c, b, c, d, and the same line serves as a refrain to each of the stanzas and to the envoy. There are other varieties, but this may be regarded as the strictest, according to the precedent of Villon and Marot.

BALLAGI, Maurice, or Moritz, Bloch, a Hungarian philologist and Protestant theological author, most widely known for his grammars and dictionaries of the Hungarian language: b. Inocz, of Jewish parents, 18 March 1815; d. 1 Sept. 1891. He was educated at Budapest and Paris; was converted to Protestantism in 1843; studied theology at Tübingen; and was professor of theology at Szárvas from 1844 to 1848 and from 1851 to 1855, and at Budapest from 1855 to 1878. His first large work was the translation of the Bible into the Hungarian language for the purpose of Magyarizing the Jews, but of this work only the Pentateuch and the book of Joshua were published (Budapest 1840–43). The most important of his philological works are: ‘Ausführliche theologisch-praktische Grammatik der ungarischen Sprache’ (1843; 8th ed., 1881); ‘Vollständiges Wörterbuch der ungarischen und deutschen Sprache’ (2 vols., 1854–57; 6th ed., 1890); ‘Sammlung der magyarischen Sprichwörter’ (2 vols., 1850; 2d ed., 1855).

BALLANCHE, ba-länsh’, Pierre Simon, French philosophe: b. Lyon, 8 July 1777; d. 12 June 1847. His great work is the ‘Paléogenèse sociale’ (1828), in which he seeks to illustrate the workings of God in history and sketch how human society may and will be reconstructed so as to attain its highest development. His works are a strange mixture of mysticism, socialism and the philosophy of history. His ‘La vision d’Hébal’ (1832) is a prophetic forecast of the world’s history, Hebal being a second-sighted chief of Scottish clan. He also wrote ‘Le vieillard et le jeune homme’ (1819); and other works.

BALLANTINE, James, Scottish artist and poet: b. Edinburgh, 11 June 1808; d. 18 Dec. 1877. He was brought up as a house painter, but afterward learned drawing under Sir William Allan and was one of the first to revive the art of glass-painting. He was commissioned to execute the stained-glass windows for the House of Lords, and in 1845 published a treatise on glass-staining, which was translated into German. Two prose volumes, ‘The Gaberlunzie’s Wallet’ (1843), and ‘The Miller of Deankagh’ (1845), contain some of his best-known songs and ballads in the vernacular. He was author of ‘Poems’ (1856 and 1865); ‘One Hundred Songs with Music’ (1865); ‘The Life of David Roberts, R.A.’ (1866) and ‘Lillas Lee’ (1871).

BALLANTINE, William Gay, American educator: b. Washington, D. C., 7 Dec. 1848. He was graduated from Marietta College 1868; and at the Union Theological Seminary 1872; studied in Leipzig; was attached to the American Palestine Exploring Expedition of 1873; professor of chemistry and natural science in Ripon College 1874–76; assistant professor of Greek in the University of Indiana 1876–78; professor, Greek and Hebrew, Oberlin Theological Seminary 1878–81; president of Oberlin College 1891–96; and since 1897 professor of the Bible in International Y. M. C. A. College, Springfield, Mass. Author of ‘Inductive Logic.’

BALLANTYNE, Charles Colquhoun, Canadian manufacturer and statesman: b. Colquhoun, Ont., 9 Aug. 1857. He was educated at Colquhoun and Montreal. He became while still a young man managing director of
the Sherwin-Williams Paint Company, Montreal, and was one of its purchasers in 1811. He was some time mayor of Westmount. Although never actively identified with party politics, he has always been regarded as a Liberal, but declared his opposition to the Tatt-Fielding reciprocally agreement of 1911. During the European War he raised a battalion for overseas service. On 3 Oct. 1917 he joined the Union government of Sir Robert Borden as Minister of Public Works, but a week later took over the portolio of marine and fisheries.

**BALLANTYNE, James**, Scottish printer: b. Kelso 1772; d. Edinburgh 1833. Successively a solicitor and a printer in his native town, at the suggestion of Sir Walter Scott he removed to Edinburgh, where the high perfection to which he had brought the art of printing, and his connection with Scott, whose works he printed, secured him a large trade. To a firm of James Ballantyne & Company, included Scott, James Ballantyne and his brother John (who died in 1821). For many years he conducted the Edinburgh Weekly Journal. His firm was involved in the bankruptcy of Constable & Company by which Scott's fortunes were wrecked, but Ballantyne was continued by the creditors' trustee in the literary management of the printing-house. He survived Scott only about four months.

**BALLANTYNE, James Robert**, Scottish Orientalist: b. Kelso, Scotland, 1813; d. 1864. After receiving an education at Haileybury College he was sent to India, where he was placed in charge of the Sanskrit College at Benares. His aim, steadily pursued during his residence in India, was to aid in establishing more intelligent relations between Indian and European thought. On his return to England he was made librarian of the East India office. Among his writings are 'The Practical Oriental Interpreter' (1843); 'Catechism of Sanskrit Grammar'; 'Synopsis of Science in Sanskrit and English', a criticism of the truths to be found in the Nyaya Philosophy' (1856); 'Christianity Contrasted with Hindu Philosophy' (1859).

**BALLARAT**, or **Ballaarat**, Australia, town in the colony of Victoria, the chief centre of the gold-mining industry of the colony, and the place next in importance to Melbourne, from which it is distant west-north-west 74 miles by rail. It owes its present importance and prosperity to its being the centre of one of the richest gold-yielding districts of the world. It consists of two distinct municipalities, Ballarat East and Ballarat West, which are separated by Yarrowee Creek. The town is well lighted with gas, abundantly supplied with water and contains many handsome public edifices, among which may be mentioned the city hall, council chamber, two town halls, a spacious hospital, an orphan asylum, a benevolent asylum, two cathedrals, botanical gardens and an excellent school of mines. Its chief industries are those of the gold mines, iron foundries, woolen and flour mills, breweries and distilleries. Its establishment and rise date from the discovery of gold in 1851. The largest gold nuggets ever unearthed were discovered here. Ballarat East and Ballarat West have been distinct municipalities since 1855, and in 1870 the latter was proclaimed a city. Pop. (1911) 42,403.

**BALLAST.** (1) Heavy matter, as stone, sand, iron or water placed in the bottom of a ship or other vessel, to sink it in the water to such a depth as to enable it to carry sufficient sail without over-sailing. (2) The sand placed in bags in the car of a balloon to steady it and to enable the aeronaut to light the balloon by throwing part of it out. (3) The material used to fill up the space between the rails on a railway in order to make it firm and solid.

**BALLANTYNE, or BALLENDEN, John**, Scottish poet and translator of Boece's 'Latin History,' and of the first five books of Livy into the vernacular language of his time: b. Lothian toward the close of the 15th century; said to have died at Rome 1530. He was in the service of James V from the King's earliest years. At his request he translated Boece's 'History,' which had been published at Paris in 1526, the translation being printed in 1536. It is so much a free translation as to be almost an original work. As a reward he was made archdeacon of Moray and a canon of Ross. He was a bitter opponent of the Reformation.

**BALLENY, bál-lén'e, ISLANDS, a group of five small volcanic islands discovered by Balleney in the Antarctic Ocean in 1839, nearly on the Antarctic Circle. One of the islands, Young Island, contains a very lofty mountain, about 12,000 feet high.

**BALLESTEROS, bál-yés-tár'ós, Don Francisco**, Spanish general: b. Saragossa 1770; d. Paris, 22 June 1832. He first served in Catalonia against the French during the campaigns of 1792 and 1795, and was appointed to a captaincy. Discharged in 1804 on account of embezzlement, he was nevertheless entrusted by the all-powerful Godoy, 'prince of the peace,' with one of the most productive offices in the custom-house, the direction of the resguardo at Oviedo. When the French army invaded Spain in 1808 Ballesteros was promoted to a colonelcy by the provincial junta of Asturias and joined the Castilian army under Castaños and Black. The regency of Cadiz promoted him to the rank of lieutenant-general and put him in command of the army of Andalusia. He had then to fight against some of the most skilful chiefs of the French army, and succeeded in avoiding their pursuit by peculiar tactics. When Wellington in 1812 took over the general command of all the armies in the Peninsula, Ballesteros showed such violent opposition that he was arrested for treason and sent as a prisoner to Ceuta. A few months later he was restored to liberty but was not allowed to re-enter the military service. On the return of Ferdinand VII to Spain Ballesteros evinced such devotion to monarchical principles that he was appointed Secretary of War, but was soon dismissed and sent to Valladolid, where he was placed under the strictest surveillance. When the struggle between the royalists and the constitutionalists commenced he managed so artfully that each party thought Ballesteros was acting in concert with it. Commissioned by the chiefs of the latter to obtain the assent of the King to the Constitution, he succeeded beyond their expectations.
and became a member of the council of state, while he was at the same time admitted in the council of ministers. The academy seemed to be perfectly successful, for in 1823, on the entry of the French into Spain, he was appointed to the command of the army; but instead of showing fight he concluded a capitulation with the Duke of Angoulême, which became the occasion of accusations of such a character that Balstrem thought it imprudent to stay any longer in his own country and took refuge in France, where he died a forgotten exile.

**BALLESTREM, bál'ë-strëm, Franz Xavier, Count von, German statesman:** b. Plauenowitz, in upper Silesia, 1834; d. 1910. Entering the Prussian army he served during the Austro-Prussian War of 1866 and the Franco-Prussian War of 1870–71. At the close of the latter he was elected to the Reichstag, where he soon became prominent in the Centre party. Pius IX appointed him a papal chamberlain for his activity in the Kulturkampf and he was first vice-president of the lower House, 1890–93.

**BALLLET, bál'ët, or bäl'ët** (from balé, from the French baller, and the Italian ballare, to dance), a kind of dance now usually constituting an interlude in a theatrical performance. In its widest sense a ballet is the representation of a series of passionate actions and feelings by means of gestures and dancing. In a more confined sense we call ballets musical pieces, the object of which is to represent, by mimic movements and dances, actions, characters, sentiments, passions and feelings, in which several dancers perform together. According to the analogy of lyrical poetry the which rather represent feelings may be called lyrical ballets; those which imitate actions, dramatic ballets. The lyrical and dramatic ballets, together, constitute the higher art of dancing, in opposition to the lower, the aim of which is only social pleasure. Both ballets are classed as historical, the subject of which is a real event; mythological, in which the subject is some fabulous action; and poetical, founded on poetical fiction, to which belong also the masquerade and the pantomime. A ballet is usually divided into several acts, each of which has several entrées. An entrée, in a ballet, consists of one or several quadrilles of dancers, who, by their steps, gestures and attitudes, represent a certain part of the action. In criticizing a ballet we must consider, first, the choice of the subject, which must have unity of action or of passion, and be capable of being represented in an intelligible manner by means of mimic movements and dancing; secondly, the plan and execution of the single parts, which must have due proportion to each other; and, finally, the music and decorations, which must supply whatever dancing cannot bring before the eye. The ballet is an invention of modern times. Baltazarini, director of music to Catherine de Medicis, probably gave its form to the regular ballet, though pantomimic dances were not unknown to the ancients. The ballet owes much to the French, and particularly to Noverre. During the last century, in the last schools were in their heyday but since 1850 have been eclipsed by the Russians who under Petipa, Fokine, and more recently Bakst, have evolved a school uniting the romanticism of the old-time ballet with modern realism. Anna Pavlova was developed in this school and is regarded the equal of Taglioni, Cerito and Ellis, the greatest danseuses of the French and Italian schools of the first half of the last century. Consult Castil-Blaze, 'La danse et les ballets' (Paris 1832); Flitée, 'Modern Dancers and Dancing' (London 1912); Menestrier, 'Des ballets anciens et modernes' (Paris 1682); Noverre, 'Lettres sur la danse et les ballets' (1760; 1807); Pougin, A., 'Dictionnaire historique du théâtre' (Paris 1885); Voss, 'Der Tanz und seine Geschichte' (Berlin 1868). See OPERA.
German slogan that the war was all for the advantage of the world on the other side of the ocean (the United States), and to "the delight of the yellow race" (Japan). His assertion that Germany was fighting for a free pathway over both land and water was less convincing, from the fact that the actual freedom of the seas existing before the war had enabled him unmolested to build up a gigantic shipping concern.

BALLIN, Hugo, American artist: b. New York, 7 March 1879. He studied at the Art Students' League, New York, and in Rome and Florence. While in Italy he studied mural decoration with Robert Blum. He returned to the United States and established his practice in New York. His work shows a notable ability in the field of decorative painting. His principal works are "Susanna's Bath;" "The Lute Player;" "Three Women Dancing about Cupid," which won the Shaw prize in 1905. Lea won the prize in 1906 with "Mother and Child." Another notable work is his "Portative Organ." He was awarded the Hallgarten prize and the Isidor gold medal in 1907. His work has been reproduced in the Critic, the Studio, and Art and Architecture, and in many private collections. He is an associate of the National Academy since 1905, member of the Architectural League, the Society of Mural Decorators, the National Institute of Arts and Letters and the American Water Color Society.

BALLINGER, Richard Achilles, American lawyer and public official: b. Boonesboro, Iowa, 9 July 1858. He was educated at the University of Kansas and Washburn College, Topeka, and was graduated at Williams College in 1884. He was admitted to the bar in 1886, practised in, and was city attorney of, Kankakee, Ill., and New Decatur, Ala.; and at Port Townsend, Wash. He was United States court commissioner 1890-92, judge of the Superior Court, Jefferson County, Wash., 1894-97. In the latter year he began the practice of law in Seattle and from 1904 to 1906 was mayor of that city. During the next two years he was commissioner of the General Land Office in Washington, and from 1909 to 1911 was Secretary of the Interior in President Taft's Cabinet. His opposition to a radical conservation policy led to a bitter conflict with Gifford Pinchot, the chief forester, and a Congressional inquiry was instituted into his administration of Alaskan coal lands, in which he was completely exonerated. After his resignation as Secretary of the Interior he resumed the practice of law in Seattle. He has published "Ballinger on Community Property" (1895); and "Ballinger's Annotated Codes and Statutes of Washington" (1897).

BALLINGER, Tex., city and county-seat of Runnels County, 225 miles west of Fort Worth, on the Colorado River, and on the Abilene and Southern, the Gulf, Colorado and Santa Fé railroads. It is situated in a rich agricultural region, producing corn, cotton, fruit, peanuts, wheat, etc., and has flour and cottonseed-oil mills. The city contains a Carnegie library, two theatres, several parks and a lake. The water works are municipally owned. An irrigation system has been constructed recently on the Colorado River at this point. Pop. 3,536.

BALLIOl (bål'yol) COLLEGE, Oxford, an important college founded between 1263 and 1268 by John Balliol. The original foundation consisted of 16 poor scholars, and the revenue for their maintenance amounted for many years to only 8s. per week for each. From 1340 to 1830 the college was greatly enriched by various benefactions. The Society consists of a master, 13 fellows and 24 scholars. The master and fellows enjoy the privilege of electing their own visitor. In 1887 Balliol College absorbed New Inn Hall. John Wyclif was master of this college in 1361; among its scholars have been John Evelyn, Bradley the astronomer, Matthew Arnold, Swinburne, Archbishops Tait and Temple, H. H. Asquith and Lord Edward Grey. The Snell exhibitions for students and Glasgow University attract, annually to this college a few distinguished Scotch students.

BALLISTIC GALVANOMETER, a galvanometer (q.v.) designed or used for the measurement of electric currents of very short duration. It does not necessarily differ in any essential particular from other galvanometers, except that the natural period of oscillation of its needle must be long in comparison with the duration of the transient currents that are to be measured. If $C$ is the intensity of the current that is to be measured, and $t$ is the time during which it passes, the general theory of the instrument is as follows: The magnetic moment tending to deflect the needle is proportional to $C$, and the angular velocity that such a magnetic moment can produce when acting upon a freely suspended body like the needle is proportional to $t$. Hence the angular velocity actually communicated to the needle is proportional to $C$ and $t$, or, in other words, it is proportional to the product of $Ct$. But an electric "current" (such as is here denoted by $C$) is defined as the quantity of electricity passing per second; and hence $Ct$ is the quantity of electricity passing in the time $t$. The angular velocity actually communicated to the needle (which is inferred by observing the extent of the swing) is therefore proportional to the total quantity of electricity passed through the galvanometer during the short time $t$, and not to the intensity of the current. This consti- tutes the chief peculiarity of the instrument. The ballistic galvanometer measures the total quantity of electricity passed through the instrument, and its readings are in coulombs; while other galvanometers measure the intensity of the current passing through the galvanometer and the number of ampères. If the needle of the instrument moves sensibly during the passage of the current, the magnetic movement exerted upon the needle will also vary, even though the current itself remains constant. It is for this reason that the period of free swing of the needle must be long if the instrument is to be used ballistically.
BALLISTIC PENDULUM—BALLISTICS

BALLISTIC PENDULUM. This device, first used in 1740, measures the velocity of projectiles and the resistance of the air. If such a pendulum, bearing a body of known weight, and the vibration, which it makes after the blow, is known, the velocity of the striking body may thence be determined. The quantity of motion of the body before impact is equal to that of the pendulum and body after impact. It consists essentially of a strong, large pendulum, which has its axis of suspension secured, and a core or block at its lower part. The projectile is fixed into this core and remains there, causing the pendulum at the same time to swing through a certain angle (α) with the vertical; this is measured by a slider which is pushed along a fixed arc. It is an established fact that the centres of percussion and oscillation are coincident, and the centre of oscillation is readily found by causing the pendulum to vibrate through a small arc; and observing the period (T) taken to perform a number of vibrations (n), then \( T = n \) gives the time (t) of a single vibration with considerable accuracy. The length of the corresponding simple pendulum (l), the distance of the centre of oscillation or percussion from the axis of suspension is then known from the formula, \( l = t \sqrt{\frac{g}{4n-1}} \). If the distance of the centre of the core from the axis of suspension is exactly equal to \( l \), the instrument is in adjustment; but if this is not the case, weights must be pushed up or down the pendulum by trial and error, till the time of oscillation is found to be correct.

BALLISTICS. The name "ballistics" applies to that division of mechanics which treats of the motion of projectiles.

This subject has engaged the attention of mathematicians and scientists for centuries, and approximate determinations of physical relations have been assumed as fundamental laws, and tabulated tables calculated on various hypotheses. A résumé of these contributions to the science will be found under the caption GUNNERY, to which the reader is referred.

As a basis for the simple general discussion of both exterior and interior ballistics, certain general hypotheses, justified by present knowledge derived from careful experiments in each case, will be made. These are:

1. The motion of a projectile in the bore of a gun is such that the velocity, \( v \), when the projectile has traversed a distance \( u \) along the bore is given by the relation

\[ v = au - \frac{bu}{b + u} \]

This relation is derived from the records of measurements of time of recoil of a free carriage, measured by a tuning fork scoring on a blackened ribbon. In all cases the velocity is duplicated by a relation of this form with a fidelity as remarkable as will be found in the case of any accepted experimental law connected with explosives.

2. The motion of a projectile in air is, at any point \( x, y, z \), of its path or trajectory, affected by two forces; namely, the force of gravity acting vertically downward with an acceleration \( g \) feet per second, and the resistance of the air, acting in direct opposition to the motion of the projectile in its path. Experiment shows that the retardation due to air resistance is given by an expression of the form

\[ r = \frac{F(v)}{C} \]

in which \( F(v) \) is dependent on the velocity, \( v \), alone, and increases with it; and \( C \) is given by the formula

\[ C = \frac{d}{\delta} \frac{w}{i} \]

in which \( \delta \) is the density of an atmosphere assumed as standard, \( d \) is the mean density of the air in the particular case under consideration, \( w \) the weight of the projectile in pounds, \( \delta \) the calibre of the projectile in inches; that is, the diameter of the projectile, \( \delta \) the "Coefficient of form" of the projectile, \( C \) the "Ballistic coefficient" of the projectile.

The value of \( i \) is given by the formula

\[ i = \frac{2}{n} \sqrt{\frac{4n-1}{7}} \]

\( n \) being the radius of the arc with which the ogive or head surface is generated, the radius being measured in calibres. \( \delta \) is unity for \( n = 2 \), which is the standard for ballistic tables. Recent developments point to a value \( n = 2.4 \) for projectiles of the future; this gives \( i = 0.50 \), thus practically halving the retardation, or doubling the ballistic efficiency of a projectile otherwise the same.

With these hypotheses, exterior and interior ballistics may be satisfactorily discussed and practical problems may be readily solved.

Interior Ballistics.—If \( v \) be the velocity, in feet per second, corresponding to a travel, \( u \) inches, along the bore, of a projectile of mass \( m \) and weight, \( w \) pounds; propelled by a charge, \( \delta \) pounds of powder, fired in a powder chamber of volume, \( \delta \) cubic inches; the cross section of the bore being \( \delta \) square inches; the total length of the rifled bore being \( U \), and the total volume of the bore and chamber combined being \( C \), the following relations obtain

\[ u = \frac{b}{\delta} \]

\[ P = \frac{16}{9} \frac{ma^2}{b} \]

for which

\[ u = \frac{b}{\delta} \]

For infinite travel

\[ v = a \]

and hence

\[ E = \frac{1}{2} ma^2 \]
represents the total energy of the powder charge pertaining to the translation of the projectile; and, as the powder charge is increased, the waste energy (that is, that used in doing work other than conferring velocity on the projectile) remaining approximately the same, while the total energy increases, it is seen that the efficiency per pound of powder should increase with the charge, other conditions remaining the same. Accordingly it would appear that

\[ \frac{1}{2} m \frac{a^2}{\omega} = E \]

should increase with the powder charge; or, more strictly, with the powder charge per unit of chamber-volume. In metric units this ratio of powder charge to chamber is expressed by dividing the weight of the powder charge by the volume of the chamber; but, as our units are not so related, this ratio, called the density of loading, is defined as the ratio of the weight of the powder charge to a volume of water which will exactly fill the powder chamber; and, as one pound of water occupies 27.68 cubic inches, the density of loading is

\[ \Delta = \frac{27.68 g}{c'} \]

Accordingly,

\[ E = \frac{1}{2} \cdot \frac{w}{g} \cdot \frac{a^2}{\omega} = E_0 \Delta^q \]

\( E_0 \) being the value of \( E \) for a density of loading unity, serves as a measure of the quality of the powder as to force or potential, \( q \) being a small fraction.

It is readily seen that the space in the powder chamber, \( c' \), unoccupied by the powder substance and known as the "initial air space," is

\[ c' \left( 1 - \frac{\Delta}{\delta} \right) \]

in which \( \delta \) is the density of the powder substance, or its "specific gravity," as it is otherwise called. The value of \( \delta \) for all powders is about 1.6, being given for smokeless (nitrocellulose) powders, as

\[ \delta = 1.644 - 0.012 h \]

by Colonel Kissensky, \( h \) being the content of moisture, expressed as a percentage.

When the projectile has advanced along the bore a distance \( u_0 \), the volume of travel, \( a' u_0 \), corresponding to which is the initial air space, one "expansion" is said to have occurred.

The travel to maximum pressure is generally accepted as proportional to the travel, \( u_0 \), corresponding to the initial air space and called the "reduced length of the initial air space."

The value of \( \frac{b}{2} \) or of \( b \) will then contain a factor

\[ 1 - \frac{\Delta}{\delta} \]

As the pressure on the base of the bore is actually moving the mass of the projectile with a velocity \( \omega \) and the mass of the powder charge with a velocity less than that of the projectile, it is doing work represented by

\[ \frac{1}{2} \frac{w^{\omega^2}}{g} + \frac{1}{2} \frac{\omega}{g} \cdot \omega \cdot \omega \]

or

\[ \frac{1}{2} \frac{w^{\omega^2}}{g} \left( 1 + \frac{\omega}{w} \right) \]

in which \( \kappa \) lies between zero and unity. Since \( b \) is inversely proportional to the maximum pressure it follows that, if we are to consider pressures on the base of the bore (the ones measured), the factor

\[ 1 + \kappa \frac{\omega}{w} \]

will occur in the denominator of \( b \). Hence \( b \) will be of the form

\[ b = Q \left( \frac{1 - \frac{\Delta}{\delta}}{1 + \kappa \frac{\omega}{w}} \right) \]

The quantity \( Q \), constant for a given gun, powder and projectile, is found by experiment to be of the form

\[ Q = S \left( \frac{c'}{w} \right)^r \]

The exponent \( r \) is nearly constant and has a mean value \( \frac{1}{3} \) for widely varying conditions.

The coefficient \( S \) has a value dependent on the form and size of the grains and on the inherent speed of combustion of the substance of the powder. The value of \( b \), then, takes the form

\[ b = S \left( \frac{c'}{w} \right) \left( \frac{1 - \frac{\Delta}{\delta}}{1 + \kappa \frac{\omega}{w}} \right) \]

The value of the constants entering \( a \) and \( b \) are found from the values of \( a \) and \( b \) for firings conducted with charges of various weights. The data from such firings should always include

1. The muzzle velocity, \( V \)
2. The maximum pressure, \( \bar{P} \)
3. The length of the rifled bore, \( U \)
4. The weight of the projectile, \( w \)
5. The weight of the powder charge, \( \omega \)
6. The volume of the chamber, \( c' \)
7. The total volume of the bore, \( C \)
8. The description of the powder including the composition, content of moisture, grains, etc.

Then

\[ V = \frac{a U}{b + U} \]

\[ \bar{P} = \frac{16}{9} \cdot \frac{m}{a} \cdot \frac{a^2}{b} \]

or

\[ (C-c') \bar{P} = \frac{16}{9} \cdot \frac{ma^2}{b} \cdot \frac{U}{b} \]

and

\[ a^3 = \frac{V}{U} \left( \frac{b}{U} + 1 \right) \]

so that

\[ \frac{16}{9} \left( \frac{b}{U} + 1 \right)^3 = \frac{b}{U} \cdot \bar{P} (C-c') \]
and

\[ \left( \frac{b}{U} + 1 \right)^2 = \frac{9}{16} \cdot \frac{\bar{P}(C-c)}{mV^2} \cdot \frac{b}{U} = 9 \cdot \frac{\bar{P}(C-c)}{32 \cdot mV^2} \cdot \frac{q}{U} \]

The ratio of \( \bar{P}(C-c) \) to \( \frac{mV^2}{2} \) is that of the work done by a constant pressure equal to the maximum pressure acting over a path equal to the total travel of the projectile, to the actual work done in conferring energy of translation on the projectile over the same path. That is, it is the ratio of the maximum pressure to the mean effective pressure represented by the energy

\[ \frac{1}{2} mV^2 \]

which is the muzzle energy.

Representing the mean effective pressure by \( \bar{P} \), and the velocity corresponding to a constant pressure equaling the maximum pressure by \( \bar{V} \), this ratio is

\[ \frac{\bar{P}}{\bar{P}} = \frac{2\bar{P}(C-c)}{mV^2} = \frac{mV^2}{2} \left( \frac{\bar{V}}{\bar{V}} \right)^2 \]

so that

\[ \bar{V}^2 = \bar{V} \left\{ \frac{2\bar{P}(C-c)}{m} \right\} \]

and

\[ \left( \frac{b}{U} + 1 \right)^2 = \frac{9}{32} \frac{\bar{V}}{\bar{V}} \cdot \frac{b}{U} = 9 \left( \frac{3}{8} \cdot \frac{\bar{V}}{\bar{V}} \right) \cdot \frac{b}{U} \]

Placing

\[ L = \frac{3}{8} \cdot \frac{\bar{V}}{\bar{V}} \]

so that

\[ L^2 = \frac{9}{32} \frac{\bar{P}(C-c)}{mV^2} \]

in which

\[ m = \frac{w}{g} \]

it follows that

\[ \left( \frac{b}{U} + 1 \right)^2 = 2L^2 \cdot \frac{b}{U} \]

whence

\[ \frac{b}{U} = L^2 - 1 - \sqrt{L^2 \cdot (L^2 - 2)} \]

and

\[ b = U \left( L^2 - 1 - \sqrt{L^2 \cdot (L^2 - 2)} \right) \]

\[ a = V \left( L^2 - 1 - \sqrt{L^2 \cdot (L^2 - 2)} \right) \]

Thus \( b \) and \( a \) are readily calculated for each shot fired. The values of \( a^0 \) and of \( b \) are calculated and recorded together with the data for the shot, the charge being varied.

To find the constants:

\[ \frac{1}{2} \cdot \frac{w}{g} \cdot \frac{\bar{P}}{\bar{P}} = \bar{E}a^0 = \bar{E} \]

and, \( \bar{E} \) being calculated for each shot, \( \bar{E} \) and \( q \) are found from the relation

\[ \log \bar{E} = \log \bar{E} + q \log \Delta \]

By plotting this relation on cross-section paper \( \log \bar{E} \) is found to be the value of \( \log \bar{E} \) corresponding to \( \Delta = 1 \) for which \( \log \Delta = 0 \). Then

\[ \log q = \frac{(\log \bar{E} - \log \bar{E}_0)}{\log \Delta} \]

by which means values of \( \log q \) are found for different values of \( \log \Delta \), and a mean value of \( \log q \) is taken.

As regards \( b \)

\[ b = S \left( \frac{c}{w} \right) \theta \left\{ \frac{1 - \Delta}{\theta} \right\} \left( 1 + \frac{\bar{V}}{w} \right) \]

so that

\[ 1 + \frac{\bar{V}}{w} = \frac{S}{b} \cdot \left( \frac{c}{w} \right)^{\theta} \left( 1 - \frac{\Delta}{\bar{V}} \right) \]

and

\[ \frac{1 + \frac{\omega}{w}}{S} = \left( \frac{c}{w} \right)^{\theta} \left( \frac{\Delta - \bar{V}}{b \bar{V}} \right) \]

The values of the second member are known for each value of \( \omega \), the value of \( b \) being about 1.5, but for nitrocellulose powders it is more exactly given by the formula involving the content of moisture. For powders used in the United States its mean value is about 1.584, corresponding to about 5 per cent moisture and volatiles. As the grain diminishes in size the percentage of moisture is less. The values of \( 1 + \frac{\omega}{w} \) are plotted as a function of \( \omega \), and if the graph be produced to a point corresponding to \( \omega = 0 \) the value of \( S \) is the ordinate at that point. Both this graph and the preceding one should be generally taken as straight lines. Having drawn the straight line and knowing the value of \( S \) at any point the value of \( \frac{c}{w} \) and hence of \( \kappa \) is easily found and the inverse problem is completely solved.

The value of \( S \) is dependent on the least dimension of the grain, called the "web thickness," since when this is burned through, the grain is either completely consumed or else disintegrated. As grains, in the United States service, are of nitrocellulose powder and of a standard pattern, it is clear that the value of \( S \) depends on the web thickness alone except that the content of moisture affects \( E \) and also \( S \), and it will cause considerable variations in these, corresponding to variations in moisture.

This method permits the experimental determination of the powder characteristics \( E, S \) and the quantity \( \kappa \).

This latter is of considerable importance, as it is a measure of the work done on the gases themselves in giving to them a motion of translation and also in disturbing the mass of gas. This latter action may involve a great deal of energy and depends, to a large extent, on the shape of the chamber. Accordingly, \( \kappa \) may have a value much greater than unity and its value has a decided bearing on the shape of the chamber, and consequently is important in the design of a gun. The pressures and velocities at any point of the bore may be
readily calculated, thus furnishing valuable data for gun design. Muzzle velocities and maximum pressures may be easily calculated for given conditions of loading. The direct problem is thus completely solved.

This method has been used with great success in the Coast Artillery Service of the United States Army, and a similar method is used at the School of Application at Fontainebleau.

The method is originally due to Captain Leduc, of the French Artillery, though the details of the method as here given have been developed in this country.

**Exterior Ballistics.**—A projectile in flight describes a curve called its trajectory. This trajectory is a curve of which the vertical height is related to the horizontal distance traveled in a manner dependent on the circumstances of its motion. The origin is usually taken as the muzzle of the gun; the horizontal distance to any point on the trajectory being represented by \( x \) and the height above the origin by \( y \), both in feet. The velocity in its path of the projectile at this point is represented by \( v \), the inclination of the path to the horizontal by \( \theta \), the time of flight from the origin to \( (x, y) \) by \( t \). The curve (due to the action of gravity) is convex upwards and has a maximum ordinate or greatest height represented by \( y_h \) corresponding to a horizontal distance or range \( R \).

At this point the inclination is zero. At the origin \( x = 0, y = 0 \), \( \theta \) is represented by \( \Phi \), \( v \) by \( V \); \( t \) is zero. The point at which the projectile again finds itself at the level of the gun is called the "point of fall."

The law of motion already presumed gives the following relations:

\[
\frac{dx}{dt} = \frac{d}{dt} (v \cos \theta) = \frac{-F(v)}{C} \cos \theta
\]

\[
\frac{dy}{dt} = \frac{d}{dt} (v \sin \theta) = \frac{-F(v)}{C} \sin \theta - g.
\]

From these

\[
\frac{d}{dt} (v \cos \theta) = \frac{v F(v)}{C}
\]

\[
v \frac{d \theta}{dt} = -g \cos \theta
\]

\[
dt = \frac{v}{g} \sec \theta \, d\theta
\]

\[
dx = v \cos \theta \, dt = \frac{-v^2}{g} \, d\theta
\]

\[
dy = v \sin \theta \, dt = \frac{-v^2}{g} \tan \theta \, d\theta
\]

As the trajectory is a curve of relation between \( x \) and \( y \), so that

\[
y = f(x)
\]

it is readily shown from the above relations that

\[
y' = \frac{dy}{dx} = \tan \theta
\]

\[
y'' = \frac{d^2y}{dx^2} = -\frac{g}{v^2 \cos^3 \theta}
\]

\[
y''' = \frac{d^3y}{dx^3} = -\frac{2}{g} \frac{y''}{\sqrt{1 + y''}} \frac{F(v)}{C} = -2g \frac{F(v)}{v^2 \cos^3 \theta}
\]

It is thus clear that, with a known relation between \( v \) and \( F(v) \), the trajectory may be theoretically at least, completely defined in terms of \( x, y, \) and constants. On the other hand, if the form of the trajectory is completely defined, \( F(v) \) in its relation to \( v \) will be determined. There are thus two ways of approaching the subject, and the problems involved in the two cases are known as the "direct" and the "inverse" problems. The direct problem is based on values of \( F(v) \) derived from firings through screens, the time of passage being electrically recorded, and the rate of loss of velocity thus found. Determinations of \( F(v) \) in various countries differ considerably; and experimental firings have recently been conducted to further define the law. These firings are all made almost horizontally and the effect of the inclination of the projectile on its presentation to the air is thus not experimentally known. It is certain, however, that in high angle fire (as with mortars, regarding which many data are available), the air resistance is greatly increased,—in many cases almost doubled, and that this effect increases with the inclination. The inverse problem, therefore, is one of great importance for several reasons, among which is the fact that a great mass of data is available, and the additional facts that such data proceeded from actual practical firings and that conclusions deduced by proper methods from such data must duplicate the results obtained in practice.

The theoretical treatment of the subject, however, affords a safe guide in the process of solving the inverse problem and gives a clear indication of the form of the equation of the trajectory. Upon supposing that there is no air resistance a limiting form is secured, affording a minimum number of terms of the expression for \( y \) in terms of \( x \). This is the condition in vacuo.

The equation immediately takes the form

\[
y = x \tan \theta - \frac{gx^2}{2v^2 \cos^2 \theta}
\]

and

\[
y' = \tan \theta = \tan \phi - \frac{2gx}{v^2 \cos^3 \phi}
\]

\[
y'' = \frac{-2g}{v^2 \cos^3 \phi}
\]

\[
y''' = 0
\]

for this condition.

From the equations of motion in air it is clear that any one of the variables \( x, y, t, \theta, v \), may be expressed in terms of any other of them and hence every one of these may be expressed in terms of \( x \). As complete integration is not
always feasible, it follows that in the general case the variable in question will be expressed in terms of ascending powers of \( x \). The equation of the trajectory, then, takes the general form

\[
\begin{align*}
y &= x \tan \phi - \frac{gx^2}{2V^2 \cos^2 \phi} \left( 1 + 3ax + 6bx^2 + etc \right) \\
dy &= \tan \phi - \frac{2gx}{2V^2 \cos^2 \phi} \left( 1 + 3ax + 2bx^2 + etc \right) \\
dy &= \frac{2g}{2V^2 \cos^2 \phi} \left( a + 3ax + 6bx^2 + etc \right) \\
dy &= \frac{2g}{2V^2 \cos^2 \phi} \left( 3a + 12bx + etc \right)
\end{align*}
\]

whence

\[
\tan \theta = \tan \phi - \frac{2gx}{2V^2 \cos^2 \phi} \left( 1 + 3ax + 2bx^2 + etc \right)
\]

\[
V^2 \cos^2 \phi = 1 + 3ax + 6bx^2 + etc
\]

\[
F(\theta) = \frac{v^2 \cos^2 \theta}{2V^2 \cos^2 \phi} \left( 3a + 12bx + etc \right)
\]

By this means a set of actual firings may be used to determine the law of motion of the projectile since the muzzle velocity, \( V \), the angle of departure, \( \phi \), and the values of \( y \) and \( x \) for the point of impact are measured.

The value of \( F(\theta) \) is readily placed in the form

\[
F(\theta) = \frac{2}{C^2} \left( \frac{v^2 \cos^2 \phi}{2V^2 \cos^2 \phi} \right) \left[ a + 4bx + etc \right] \cos \theta
\]

\[
= \frac{3}{2} \left( \frac{a + 4bx + etc}{a + 3ax + 6bx^2 + etc} \right) \cos \theta
\]

Now, \( \cos \theta \) is readily expressed in terms of \( x \), since \( \tan \theta \) is so expressed, and

\[
\cos \theta = \frac{1}{\sqrt{1 + tan^2 \theta}}
\]

Hence \( F(\theta) \) is directly expressed as a function of \( x \).

When \( x \) becomes zero \( \phi = V \), and \( \theta = \phi \), and hence

\[
a = \frac{2}{3} \cdot \frac{F(V)}{V^2} \cdot \frac{\cos \phi}{C}
\]

Hence

\[
F(\theta) = \frac{v^2}{V^2(V)} \left[ 1 + 4b \frac{a}{V^2} + etc \right] \cos \theta \cdot \cos \phi
\]

On taking successive derivatives with respect to \( x \), and noting the relations of \( v \) and \( \theta \) to \( x \), the values of \( b \) and subsequent coefficients are determined in terms of \( F(V) \), \( V \), and the successive derivatives of \( F(V) \) with respect to \( V \). It is quite clear that \( \phi \) will invariably enter each value. This method is general, and finds useful application both in the case of high power guns with small values of \( \phi \) and in the case of howitzers and mortars, since the velocity \( v \), the angle \( \theta \), and all other elements may be directly found. The value of \( t \) is given by the relation,

\[
Vt \cos \phi = \int_0^u \sqrt{(1 + 3ax + 6bx^2 + etc)} \, dx
\]

Whence

\[
\frac{Vt \cos \phi}{x} = 1 + \frac{3}{4} ax + \left( \frac{3}{8} a^2 \right) x^2 + etc
\]

Where the value of \( \phi \) is large the solution of the inverse problem is practically essential, in the light of recent ballistic firings. Where the angle \( \phi \) is less than 15°, however, a method due to the eminent Italian authority, Siacci, greatly simplifies the problem and permits very satisfactory discussion of the trajectories of direct-fire guns. An auxiliary variable known as the "pseudo-velocity" is characteristic of his method. Its value is given by the equation

\[
u = v \cos \theta \sec \phi
\]

In connection with this he assumes the relation

\[
F(\phi) = \beta F(u) \cos \phi \sec \theta
\]

in which \( \beta \) is a quantity which, for direct fire, is very nearly unity. Its values are usually tabulated with the values of \( \phi \) and \( X \) as arguments.

Wherever Siacci's method is used the value of \( C \) will be understood to include the factor \( \beta \) in its denominator. With these modifications the following relations are found:

\[
\frac{du}{u} = \frac{\cos \phi}{C} \, d \tan \theta
\]

\[
dt = -C \sec \phi \frac{du}{F(u)}
\]

\[
dx = -C \frac{udu}{F(u)}
\]

\[
dy = -C \frac{udu}{F(u)} \left( \tan \phi - \frac{C}{2\cos^2 \phi} \{ I(u) - I(V) \} \right)
\]

in which

\[
I(u) = \int_0^u \frac{2gdv}{uF(v)}
\]

Placing

\[
S(u) = \int_0^u \frac{udv}{F(v)}
\]

\[
T(u) = \int_0^u \frac{dv}{F(v)}
\]

\[
A(u) = \int_0^u A(u) \, dS(u)
\]

the solution of the problem appears in the equations

\[
y = x \tan \phi - \frac{C^2}{2\cos^2 \phi} \{ A(u) - A(V) \} \left( S(u) - S(V) \right) - I(V)
\]

\[
\tan \theta = \tan \phi - \frac{C}{2\cos^2 \phi} \{ I(u) - I(V) \}
\]

\[
t = C \sec \phi \left\{ T(u) - T(V) \right\}
\]

\[
x = C \left\{ S(u) - S(V) \right\}
\]
It is clear from the above that the value of \( \frac{1}{F(u)} \)
is more convenient than that of \( F(u) \). Such a value may be found in ascending powers of \( u \) beginning with a term involving \( \frac{1}{u^2} \), or in other words

\[ \frac{1}{F(u)} \]

may be determined by a series the first term of which is a constant; and the other terms involve regularly ascending powers of \( u \). With complete and absolutely satisfactory data the curve of these values may be found and the direct problem for direct fire is completely solved when \( \beta \) is known.

One of the most recent available experimental determinations of \( F(v) \) is that of the G\'ave Commission, and certain broad characteristics are noted. They are:

1. Between zero and 800 feet per second \( F(v) \) is roughly proportional to \( v^2 \).
2. Between 800 and 1,600 feet per second it is roughly proportional to \( v^4 \).
3. Between 1,600 and 3,600 feet per second it is roughly proportional to \( v^4 \).

These three classes correspond respectively to the fire of:

1. Howitzers and mortars
2. Field guns
3. Seacoast guns

In these three cases the character of \( F(v) \) is such that it may be represented, for certain purposes, by

\[ F(v) = Bv^n \]

in which \( B \) and \( n \) are constants. In such cases the equation of Siacci's trajectory is

\[ y = x \tan \phi - \frac{gx^2}{2V^2 \cos^2 \phi} \left\{ 1 + ax + bx^2 + cx^3 + \text{etc.} \right\} \]

in which

\[ a = \frac{2}{3} \frac{B}{C} \frac{1}{n-2} \]
\[ b = \frac{4-n}{6} \left( \frac{B}{C} \right)^{n-2} \]
\[ c = \frac{(4-n)(6-2n)}{30} \left( \frac{B}{C} \right)^{n-2} \]

etc.

For the values \( n = 4 \) and \( n = 4/3 \) the equations take the simple forms:

1. For \( n = 4 \)

\[ y = x \tan \phi - \frac{gx^2}{2V^2 \cos^2 \phi} \left( 1 - \frac{2}{3} \frac{B}{C} x^2 \right) \]

2. For \( n = 4/3 \)

\[ y = x \tan \phi - \frac{gx^2}{2V^2 \cos^2 \phi} \left( 1 - \frac{2}{3} \frac{B}{C} v^{n/2} \right)^{1/2} \]

The first is a cubic parabola and the second an hyperbola. As these two values of \( n \) mark extreme limits of its average values these two trajectories may be regarded as limiting ones between which all others will lie.

Placing

\[ \frac{V^2 \sin^2 \phi}{gX} = M \]

and placing \( y = 0 \) in each of the two cases, the value of \( x_s \) for the summit is given by

\[ \frac{x_s}{X} = \sqrt{M^2 + 3(1-M)} - M \quad \text{for} \quad n = 4 \]
\[ \frac{x_s}{X} = \frac{1}{1 + \sqrt{M}} \quad \text{for} \quad n = 4/3 \]

At the point of fall \( y = 0 \) and

For \( n = 4 \)

\[ \frac{V^2 \sin 2 \phi}{gX} = 1 + \frac{2}{3} \frac{B}{C} v^{-2} \]
\[ \tan \omega = 2 - M \]

For \( n = 4/3 \)

\[ \frac{gX}{g \sin^2 \phi} = M = 1 - \frac{2}{3} \frac{B}{C} v^{-2} \]
\[ \tan \omega = \frac{1}{M} \]

Differential formulae for range changes give the following relations for all values of \( n \):

\[ \frac{dX}{X} = \left( 2-n+n \frac{\tan \phi}{\tan \omega} \right) \frac{dV}{V} + \left( \frac{1}{\tan \phi} \frac{dC}{C} + \frac{\tan \phi}{\tan \omega} \frac{d \sin 2 \phi}{\sin 2 \phi} \right) \]

Placing \( n = 4 \) and \( n = 4/3 \) in this equation together with the corresponding values of \( \tan \phi \) and \( \tan \omega \) the following limiting values are found:

For \( n = 4 \)

\[ \frac{dX}{X} = 2 \frac{M}{2-M} \frac{dV}{V} + \frac{1}{2-M} \frac{d \sin 2 \phi}{\sin 2 \phi} + \frac{1-M}{2-M} \frac{dC}{C} \]

For \( n = 4/3 \)

\[ \frac{dX}{X} = \frac{4M+2}{3} \frac{dV}{V} + M \frac{d \sin 2 \phi}{\sin 2 \phi} + \left( 1-M \right) \frac{dC}{C} \]

For values of \( M \) at intervals of \( 1/6 \) these coefficients, represented in order by \( Q, R \) and \( S \), show the following values:

\[ n = 4 \]
\[ n = 4/3 \]

\[ M \quad Q \quad R \quad S \quad Q \quad R \quad S \]
\[ \frac{1}{6} .500 .600 .400 1.111 .333 .667 \]
\[ \frac{1}{4} .667 .667 .333 1.333 .500 .500 \]
\[ \frac{1}{3} 1.000 .750 .250 1.556 .667 .333 \]
\[ \frac{1}{2} 1.428 .857 .143 1.778 .833 .167 \]
\[ 1 2.000 1.000 .000 2.000 1.000 .000 \]

This shows that there is a wide difference in coefficients in the interpolation formulae, and that the value of \( \tan \phi \) should be found before using these formulae except in making the corrections in the original ranges, when the value of \( n \) may be assumed as indicated for the general class of firings to which it belongs and the coefficients \( Q, R \) and \( S \) found by interpolation for the value of \( M \) under...
consideration. The corrections may be subsequently recalcultated. In correcting the data of firings, corrections for wind are also needed. The correction in feet for a wind in the plane of fire is

\[ dX = n \left( 1 - \frac{\tan \phi}{\tan \theta} \right) W T^{x/n} \]

in which \( n \) is the exponent of \( v \) in the expression

\[ W \]

the wind velocity in miles per hour, if it is in the plane of fire; otherwise \( W \) is the component of the wind in the plane of fire, and \( T \) the time of flight in seconds.

Deflections in degrees due to cross-wind and drift, also in degrees, are given by the formulae:

\[ \text{Wind deflection} = \frac{48W}{V \cos \phi} \left\{ \frac{V T \cos \phi}{X} - 1 \right\} \]

\[ \text{Drift} = \frac{(1 - x)}{\sin^2 \phi + \omega} \left\{ \phi + \omega \right\} \sec \phi \]

in which \( W \) is the cross-wind component in miles per hour; \( V \) the coefficient having a value 0.75 for direct fire and 0.80 for high angle and curved fire, and \( n \) the number of calibres that the projectile passes over in making one turn around its axis due to the action of the rifling.

In the solution of the inverse problem corrections should first be made for all slight variations in conditions from the mean conditions existing at the time of the experiments; so that for each group of shots fired the ranges will be reduced to a common value of \( \phi \), and the whole series to a common muzzle velocity and ballistic coefficient.

ALSTON HAMILTON,
Fort Monroe, Virginia.

BALKON D'ESSAI (Fr., a trial balloon), in diplomatic language denotes an effort to see "which way the wind blows." Balloons d'essai are usually launched unofficially to test public opinion; a "feeler" or "kite."

BALLOON. A lighter-than-air vehicle for rising into the atmosphere and traveling through it. It consists essentially of a bag-like receptacle filled with hydrogen, coal-gas or other gaseous material lighter than air, of such bulk when distilled as to displace a mass of air of greater weight. To this gas-bag is attached a basket or "car" to accommodate the passengers, if any, and the recording instruments. A free balloon floats in the air whither the wind carries it, or it may be driven in a desired direction by suitable screw-propellers. A captive balloon is attached by cable to an anchorage on the ground. Small toy balloons, six feet high by three feet across, are made of paper and the air within them rarified by the heat from a wad of asbestos saturated with alcohol or other inflammable fluid, fixed on cross wires at the centre of a wide mouth. They rise to the height of nearly a mile and in a still atmosphere travel several miles before coming to earth. See AERONAUTICS, HISTORY OF.

BALLOT ("little ball"): essentially, a secret as distinguished from an open vote, to secure the voter from previous intimidation or subsequent revenge. Recent methods of ballot-reform, therefore, are only devices to obtain the result inherent in its very nature, a non-secret ballot being a contradiction in terms and the same as viva voce voting. The various forms of ballot reduce to two in essence: ballots themselves indicating choice— as colored balls, printed tickets or mechanical devices showing names—and depositories indicating the choice. The former is universal in modern times and most general in ancient.

History.—The ballot must be nearly as old as the practice of voting by unenfranchised bodies of citizens; but our first knowledge of it is in classic Greece, where the dikasts (popular courts and juries) voted "yes" or "no" by balls of stone or metal (white or unperforated meaning acquittal, black or pierced indicating condemnation), by marked shells (ostrakoi, whence ostracism or banishment of an unpopular leader), or by olive leaves ("petalism"). In the assemblies the common voting was by show of hands, to secure public responsibility; in cases of privilege or ostracism it was by ballot. In Rome the first ballot law (though far from the first ballotling) was the Gabinean, 139 B.C., and the machinery is very modern: tabella, or tickets, with candidates' names, or "yes" and "no" ballots for changes in laws, in elections, by inspectors and check-lists; but in case of a tie the candidates drew lots. In the mediaeval republics the ballot was a regular machinery; but it has been bitterly fought and slow of introduction in all non-republican countries, the governments and the privileged classes being loath to weaken their power of dragooning their officials or the lower classes into obedience. In Scotland it was used in 1662 under the name of "billeting," to banish political opponents (ostracism); but the English government disallowed the act. In England it was first put forward to protect members of Parliament against government revenge for voting against its bills, not the electors against the classes which furnished the members of Parliament; in 1710 the House of Commons passed a ballot law, but the Lords threw it out.

In the modern world the American colonies of England were by far the first to make the ballot (voting "by papers") the foundation of the government system; they used it from the first, and it was made obligatory in the first of the State Constitutions adopted in 1776. New York, with its great landed aristocracy, was slower, using it only for the governor and lieutenant-governor in 1778, and not extending it to the legislature till 1787. The Southern States held to the viva voce system for many years after, and Kentucky till 1891, its Constitution providing for it, though the United States statutes compelled it to use written or printed ballots for Congressional elections. All the State Constitutions now provide for elections by ballot.

In Great Britain it was not only fought by the privileged classes as overthrowing their leadership of the tenants and artisans, but by a large part even of the Liberals as undermining the manliness of the English character. The vanguard of the movement were the Benthamites, and it stood foremost in the program of reform put forward by the more radical Whigs early in the 19th century. It was in the first draft of the Reform Bill of 1832; in 1833 Grote the historian introduced it, and re-
peated the attempt every year till 1839 with a
fresh speech of immense force and learning.
It was supported by Macaulay with his usual
effectiveness, but was sneered at by so good a
Liberal as Sydney Smith, and heartily sup-
ported by none but the Chartists, whose support
alone would have killed it. They made it one of
the "six points" of their "People's Charter."

In 1851 it was carried in the Commons by 51
majority against Lord John Russell and his
Liberal government, but went no further. In
1857 it was tried at a test, and the scheme
worked well; was adopted at school-board elec-
tions in 1870; and the same year a select com-
mittee of the House, headed by Lord Harting-
ton, reported in its favor as a means of lessening
corruption, "treating," and intimidation.

In 1872 Mr. W. E. Forster's Ballot Act made
printed ballots compulsory at all national and
municipal elections except those of university
candidates for Parliament. This put an end to
the drunken riots attending the previous public
nomination at the hustings, so keenly satirized
by Dickens and others.

In France, Spain, Belgium, Switzerland and
Cisleithan Austria the ballot is now used; in
Hungary it was formerly employed in all elec-
tions, but in 1874 was restricted to municipal
concerns.

Ballot Secrecy.—The interest of govern-
ments and privileged classes in aristocratic
countries to defeat the secrecy of the ballot is
replaced in democratic ones, of which the
United States is chief, by the interest of party
managers, who wish either to prevent inde-
pendent voting through fear of loss of em-
ployment or favor or to make sure of purchased
votes being given as promised; they have there-
fore devised various methods of evading the
nominal secrecy of the ballot, such as ordering
the voter to write his name or some under-sign
on the ballot before depositing it, holding it in
sight of the party watcher while casting it,
having a "friend" accompany him to the polls
on pretense of his illiteracy and inability
particularly to read or sign the legal forms, etc.
These enforce as constant a struggle from the
guardians of political honesty to circumvent
them: the first has been stopped by throwing
out as illegal all ballots with distinguishing
mark or the like; the second by compelling them
to be cast in sealed official envelopes, and by
forbidding any but the official registrars to
come within a certain distance of the polls for
any purpose but to vote, and later by providing
booths in which each voter prepares his ballot
in privacy; the third is practically confined to
certain States and cities with a large percentage
of real illiteracy under which the required article
can cover itself and cannot well be directly
reached by law, but only by the vigilance of
each party in exposing the fraudulent practices
of the ballot itself also has brought in
many frauds for which the viva voce system
gave no opportunity, which are reducible to
three kinds: (1) Counterfeiting, either by print-
ing the name of one party over the candidates
of another, or by substituting one or more
names on the opposite party's ticket; (2) "stuff-
ing" the ballot-box by folding two or more
balls, all but one being sometimes of tissue
paper, to look like one; (3) "repeating," one
man voting at different polling-places more than
once or at the same one under different names.
The first must be defeated by party vigilance;
the second is used only where one party has the
control of ballot inspection, though the law
usually provides that both the chief parties shall
have a share in this; the third and second are
punishable by law.

Another evil, as diminishing individual re-
sponsibility for votes and building up unprin-
cipled and corrupt party dominance though not
direct fraud like the others, is the "party bal-
lot." This act as a test, another group of
candidates to be voted for at one time, and the
consequent cost of printing and distributing
the ballots to voters, which has led to the aban-
donment of the candidates themselves doing
this work, and the forming of party organiza-
tions for it, which, in return for their efforts,
insist on subservience and are apt to have slight
scruples about gaining their ends. All these
evils together—the misuse of ballot methods to
pervert their intent, the only partial secrecy
and the supremacy of party programs—
are due to the multiplication of the ballot
transactions at the elections.

Australian Ballot.—The Australian or
official ballot was first used and developed in
South Australia, and after its introduction in
the United States in 1888 soon replaced the
party ballot in many States. Its essential
feature is that all candidates in the field for
any office shall be placed on one ballot and the
voter compelled to indicate his preference by a
mark opposite the name of one. The ballot is
official, compiled, printed and placed in the poll-
ing places under the direction of public officials
and at public expense. Under the "Australian plan" the voter is compelled to think personally
of each candidate, which invites independence
of judgment, breaks down the tyranny of the
party vote and instils some intelligence into the
brute vote, even though the name of the party
of each candidate be added. The first Australian Ballot Law in the United States was
enacted by Kentucky in 1888, but the law ap-
p lied only to the election of certain officials of
Louisville. In the same year Massachusetts
passed a law which became effective next year providing for the use of this ballot in State
elections. Since that time every State in the
Union, save Georgia and Louisiana, has
adopted some form of the Australian ballot.

Some of the modifications have been im-
portant, due chiefly to struggles of the local
organizations either to defeat the secrecy of the
ballot and keep account of the purchased votes,
or to prevent "scratching" and ensure the vot-
ing of "straight tickets." In short this would
emasculate the system of its vital principle.
Fully 90 per cent. of the States have provided
for an official "blanket ballot," wherein, in one
arrangement or another, are given the names of
all candidates who have been duly nominated
by the various parties or organizations of
voters for the offices to be filled at the ap-
proaching elections. There are a few excep-
tions, however. While Missouri and New
Mexico provide the official ballots at public ex-
 pense, a separate ballot is required for each
party. In Georgia and South Carolina the
preparation and distribution of the ballots are
left entirely to the voters, and in the former it is not even required that the ballots be uniform in size, shape or color.

The States have adopted the official "blanket ballot" but their methods of arranging the names of the candidates on the ballot vary considerably. In 31 States the ballot has a party column, the candidates of each party being arranged vertically under the name of the party. In all but 12 States the column is headed by the party emblem. This was done on the nominal ground that the illiterate voter and a large part of those not technically such do not wish to vote anything but the "straight party ticket," and should not be hindered in their choice, much less deprived of it. Hence in all but two of the party column States (Iowa and Montana) provision is made so that the voter may easily vote "straight"—usually by marking a cross (X) in the square or circle under the party name or emblem at the head of the column which the illiterate voter can be taught to recognize. If a voter desires to "scratch" the ticket (for instance, if he wish to vote for the Republican candidate for governor, the Democratic candidate for lieutenant-governor and the Progressive candidate for comptroller) he either marks a cross (X) in the circle at the head of one party column and then an X after each candidate not on his party ticket; or he omits the cross in the top circle altogether and marks a cross after the name of every candidate for whom he wishes to vote. The "Massachusetts" or "office-group" form of ballot is used in 14 States. On this ballot the names of all candidates for each office (usually in alphabetical order) are grouped together, each name being accompanied by the name of the party nominating him. While the obvious intent of this is to compel the voter to think, Colorado, Nebraska and Pennsylvania, though using the form, have adopted devices making especially easy the voting of a straight party ticket. States which use the Massachusetts form of ballot provide that the name of no candidate for a single office shall be used more than once upon the ballot and in these States this limitation is found in 14 States which have the "party column" ballot and the effect is to discourage fusion in nominations.

Dangers and Problems.—As stated above, the ballot itself has not rid the political system of its many attendant evils. The rapidity with which the Australian ballot was adopted was due to the fact that the politicians believed they could appropriate it to serve their own purposes; and that they have done so shows that good government depends primarily on the intelligence, honor and integrity of the voter and not on the devices that are placed at hand for his use. Undoubtedly there are less open intimidation and coercion and the voting places are not so often the scenes of riot and disorder, but the complexity of ballot legislation has been used by party organizations to their own good advantage. The politician prefers the "party column" ballot since he can easily teach the illiterate element among the voters to look for the party emblem and make his cross in the columns provided. The minimum of thought and effort. With most of the newer voting devices, an effort to scratch the ticket is very liable to render the ballot void and for this reason, if for no other, independent voting is usually light. Party organizations also receive a legal sanction from the Australian ballot and in some States the party leaders thereby are given great power in determining those to receive party recognition either as candidates or voters. Often too the number of votes cast by political groups at some elections is insufficient to meet the prohibitive legal requirements, and thus, though they have the promise of effective leadership, their names would not appear on succeeding ballots.

In numerous places the ballots have assumed immense proportions, that used in New York city election of 1909 being 15 inches wide and 46 inches long and containing 18 party columns (although 13 of these were entitled "Independent Nominations") besides one blank column for the voter to insert the names of those for whom he desired to vote. Several of the columns contained the names of candidates for all 21 offices to be filled, while some contained the name of the mayoralty candidate only and one party had made no nominating place on the ballot because at the preceding election it had polled sufficient votes to meet the legal requirements.

Several States have been experimenting for some time with various forms of ballots, Wisconsin using a coupon ballot, while in Cambridge, Mass., and Grand Junction, Col., a preferential ballot has been used so that a voter could express a "first choice," "second choice" and "other choices." In the Oregon primary elections a candidate may place after his name a concise statement of his principles. The initiative and referendum in many States are making the ballots still more complex and confusing. In 1912 the Oregon ballot contained the names of 177 nominees for 4 National, State, and local offices, besides 37 legislative projects, 14 of which involved amendments to the State Constitution. In many States voting machines (q.v.) are used.

Short Ballot.—It is apparent that some method must be found to do this in a short and simple and also to keep the processes determining its content and arrangement under the control of the voters and not of irresponsible party managers. It is inevitable that blind voting will occur when the ballot contains, as in some instances, 500 names.

As regards the use of the short ballot in cities, the question of government by commission is involved. Under this form of government the mayor and a large council of numerous divided powers are replaced by a small commission. In New Jersey it would apply to county and State. There a small commission having the power of county management is proving its efficiency. The voters of the State elect a governor and a bicameral legislature but do not vote for any other State officer, not even the lieutenant-governor. Thus the responsibility for good administration is centralized in one man instead of being scattered among a number of elected department heads with divided and conflicting powers. Hence the advocates of the "short ballot" urge that it be adopted so as to remove all minor offices and some important ones from the ballot, with
the object of increasing the accountability of the few men who are elected and also of raising the standard of intelligence of the popular vote. See Elections; Electoral Votes; Electoral Qualifications; Electors; Political Science; Suffrage; Naturalization; Woman Suffrage; Primary, Direct; Commission Government — Beginnings of Party Organization; Initiative and Referendum; Corrupt Practices Acts; Vote, Voting.

BALLOU, Hosea, American clergyman and author: b. Richmond, N. H., 30 April 1771; d. Boston, Mass., 7 June 1852. His boyhood was spent in the greatest poverty, but at 21 he began to preach, having adopted the Universalist doctrines. He was successively pastor of congregations in Dana, Mass.; Barnard, Vt.; Portsmouth, N. H., and Boston, Mass., in which latter place he held his pastorate for more than 35 years. He founded the Universalist Magazine, subsequently called The Universalist Expositor, and again the Universalist Quarterly Review. He was active in the organization of the Universalist denomination, and helped greatly to extend its work and influence. A voluminous writer, his chief works are: Notes on the Attributes of God (1807); The Lecture Sermons (1831); Examination of the Doctrine of Future Retribution (1834), his most important contribution to theological literature. His published works would make more than a hundred 12mo volumes. For an account of his life consult the biographies by O. F. Safford (Boston 1889) and T. Whittemore (4 vols., ib. 1855). Consult also Adams, J. C., 'Hosea Ballou and the Gospel Renaissance of the Nineteenth Century' (Chicago 1903).

BALLOU, Maturin Murray, American journalist, son of Hosea Ballou: b. Boston, 14 April 1820; d. 27 March 1895. Besides editing Ballou's Pictorial, The Flag of Our Union, Ballou's Monthly, etc., and making a valuable compilation of quotations, he wrote 'History of Cuba' (1854); 'Biography of Hosea Ballou,' 'Life Work of Hosea Ballou.' Becoming in later life an extensive traveler, he wrote a number of books; they are: 'Roses of the West,' 'Due South,' 'Under the Southern Cross,' 'Footprints of Travel,' etc. In 1872 he became one of the founders and the editor-in-chief of the Boston Globe.

BALL'S BLUFF, Va., a point on the Potomac River, about 33 miles above Washington, where the bank rises about 150 feet above the level of the river. It is noted as the scene of a battle between a Union force under Col. Edward D. Baker, and a Confederate force under the command of General Banks of 20 June, 1861. The battle resulted in the serious defeat of the Union force and the death of Coloner Baker.

BALLSTON SPA, N. Y., county-seat of Saratoga County, on the Delaware & Hudson Railroad, seven miles southwest of Saratoga Springs. It has some reputation as a summer and health resort and is noted for its mineral springs, which rank among the best acidulous chalybeate springs in the country. The water flows from a depth of 650 feet through a tube bored into the solid rock, and is highly effervescent. The village has a county courthouse, fair grounds and track, the Saratoga County almshouse and hospital, and the Spa sanitorium. The industries include a large tannery, foundries and machine shops, a shirt waist and textile factory, extensive pulp and paper mills, and agricultural implement factories. It has two National banks, several churches, public high school and daily and weekly newspapers. Settled in 1787, it was incorporated in 1807. Town meetings are held every two years and charter elections annually. The board of education, the village president and the board of trustees are chosen by popular vote. The water-works are owned and operated by the village.

BALLYMENA, Ireland, a market town in County Antrim, on the river Braid, 33 miles northwest of Belfast. It has a cotton-spinning mill, a distillery, numerous bleach grounds, a church, chapel, large public schools, several branch banks and a United States consular agency. It is an important railway centre. Pop. (1911) 11,381.

BALM (Melissa officinalis), a perennial herb of the family Mentheaceae, native of southern Europe, cultivated for culinary use and found wild as an escape in many countries. It attains a height of about 18 inches, is much branched, has ovate leaves and whorls of white or yellowish axillary flowers rich in nectar, for which the plant is sometimes cultivated as bee- forage. Its foliage, which has a lemon-like odor and slightly aromatic taste, is used to flavor wine and to a small extent in domestic medicine. Some other members of the Mentheaceae are called balm — for instance: Bastard balm (Melitie melissophyllum), a handsome plant, often dried for its long-enduring fragrance; Moldavian balm (Dracocephalum moldavica), a Siberian annual of less pleasant qualities than true balm, largely used in Germany for flavoring Hops (Humulus condensis) and tea balm (Monarda didyma) are American species of little importance. For cultivation see Hems (Culinary).

BALM OF GILEAD, a liquid resinous balsam highly reputed in the East since Bible times for its fragrance and supposed medicinal properties, believed to be derived from Commiphora opobalsamum, a small Abyssinian and Arabian tree. Balm of Mecca, or opobalsam, is a specially high grade of balm of Gilead ob-
tained from incisions in the bark. The wood and fruit are boiled to obtain the inferior grades. The balm of Gilead of the United States is a variety of poplar (Populus balsamifera, var. candidissima). See Poplar.

BALMACEDA, bál-ma-sá' da, José Manuel, Chilean statesman: b. Santiago 1838; d. 18 Sept. 1891 by suicide. He was educated at the Seminario Conciliar in Santiago; early became noted as an orator by urging radical reforms in the Constituent of 1833; and was a founder of the Reform Club in 1868. As deputy for five terms, 1870-85, he urged the separation of church and state and became the leader of the Progressives. He was Chilean Minister at Buenos Ayres in the early part of the Chili-Peruvian War, 1879-83, and secured the neutrality of Argentina. In 1882 he was made Minister of the Interior, and introduced liberalizing bills, as for civil marriage, etc. In 1885 he was elected senator and appointed to the Foreign Affairs. Elected President in 1886, he carried out large schemes of reform and democratization; popular education was extended, civil marriage carried in 1888, railroads and other internal improvements forwarded. But both his measures and men involved him with the clerical oligarchy which not only ruled the state but monopolized the offices, and possessed the bulk of the property and influence; and when he tried to prevent the ruin of his work by influencing the election of a like successor, his opponents blocked the administration. He appointed a ministry of his own stripe and dissolved Congress, virtually making himself dictator; but the Congressionalists, having the naval officers on their side, began war 7 Jan. 1891, secured the nitrate provinces, and, using their revenues to buy the best arms and munitions, utterly routed Balmacaeda’s forces in a decisive battle near Valparaíso, 7 August. He took refuge in the Argentine legation at Santiago, and died there a few weeks later.

BALME, bám, Col de, an Alpine pass, forming the boundary between Savoy and the Valais, 7,218 feet above sea-level. It is much visited, and has a travelers' refuge.

BALMERINO, bál-mer-é'nó, Arthur Ephrathstone, Lord, Scottish Jacobite: b. 1688; d. 1746. He took part in the rebellion of 1715, and fought at Sheriffmuir. Having joined the Young Pretender in 1745, he was taken prisoner at Culloden, tried at Westminster, found guilty and beheaded. His title was from Balmerino, in Fife.

BALMES, bál' méz, Jaime Luciano, Spanish priest and author: b. Catalonia, 28 Aug. 1810; d. 9 July 1848. His works include: "Protestantism Compared with Catholicism in Its Relation to European Civilization" (3 vols., 1848); "Filosofia Fundamental," "Letters to a Sceptic on Religious Matters."

BALTMT, Konstantin Dmitriyevitch, Russian poet: b. on his father’s estate, near the southern Urals, in 1814; died there in 1867. His works include: "Protestantism Compared with Catholicism in Its Relation to European Civilization" (3 vols., 1848); "Filosofia Fundamental," "Letters to a Sceptic on Religious Matters."

BALMACEA, bál-náv’ éz, Henry, Scottish reformer: b. Kirkcaldy 1520; d. 1579. He was educated at Saint Andrews, and though at first a Roman Catholic he became a Protestant and made open profession of his faith in 1542; join-
ing the English against Governor Arran. He was accused of connection with the conspiracy to murmur Cardinal Beaton, and was declared a traitor and excommunicated. In 1547 he was one of the prisoners taken in the Castle of Saint Andrews and exiled to France, where he wrote his 'Confession of Faith.' Recalled in 1550 to assist in the establishment of the reformed faith, assisted in revising the 'Book of Discipline,' and accompanied Murray to England in connection with Darnley's murder.

**BALNEOLOGY.** See Baths; Hydrotherapy.

**Balsa,** bäl'sa, a kind of raft or float, of the nature of a catamaran (q.v.), used on the coasts and rivers of Peru and in other parts of South America for fishing, for landing goods and passengers through a heavy surf and for other purposes where buoyancy is chiefly needed. It is sometimes formed of two inflated hides connected by a sort of platform on which the fisherman, passengers or goods are placed; and sometimes of a very light wood.

**Balsam** (Impatiens balsamina), an East Indian herb of the natural order Geraniaceae, cultivated in gardens for more than 300 years. The plant is an erect free-branching annual sometimes 30 inches tall; bears axillary, diversely tinted yellow, white or red single or often double flowers, the latter of which are called camellia-flowered varieties. The plant is a general favorite of easiest culture.

**Balsamo, Joseph.** See Cagliostro.

**Balsamodendron,** bäl'sa-mô-den'dron, a genus of trees or bushes of the order Amelanchier, species of which yield such balsamic or resinous substances as balm of Gilead, bdellium, myrrh, etc. See Balsams.

**Balsams,** mixtures of resins in volatile oils, the term, however, being popularly applied to any aromatic compound with volatile oils. Balsams are very widely distributed throughout the plant kingdom. They are particularly abundant in the members of the pine family. The araucarias yield a copal that is almost a pure resin; many species of pine yield turpentine and resin; Canada balsam is derived from Aka balsam; the balsam-like sandarach is from a cypress. The Hamamelis family gives balsam of styx and balsam of copaiba is derived from a large number of the legumes and from the Dipsacaceae. Styrax benzoin from the Storax family. The resins and balsams of commerce are very closely allied. They may be divided into three groups: gum resins, such as asafetida and ammoniacum; balsams, and resins, such as turpentine, resin, copaiba, mastic, elemi, copal, dammar and incense; and the resins that contain cinnamic or benzoic acids, from which they derive their aromatic odor. It is to this latter group that the word balsam is popularly applied. These are balsam of tolu, balsam of Peru, storax benzoin, dragon's-blood and xanthorrhoea resin.

These various bodies are for the most part secreted in special passages in the plants. Sometimes they are formed in the leaves, but for the most part the resinous solution collects in specially designed portions of the stem, usually in the woody portion. It is obtained in a variety of ways from simple incision to boiling chips of the wood with water.

In medicine most of these bodies are active. They are energetic oxidizers,—hence the traditions about ozone and pure air in pine-clad hills,—and several of the hydrocarbons in the volatile oils are stimulating to the skin and mucous membranes. Balsam of Peru being an excellent example. It is an excellent external antiseptic, and manifests similar properties on the respiratory, intestinal and genito-urinary tracts. Those resinous or balsamic mixtures containing cinnamic and benzoic acids—notably balsam of tolu (from Toloufera pereira) and balsam of Peru (from Toloufera balansam) possess similar antiseptic and stimulating properties. They are more powerful in proportion to the aromatic acids contained. Balsam of storax is derived from a tree, Liquidambar styraciflua. It has similar properties to the balsam of Peru.

The chrrism (see Sacraments) used for consecration and sacramental services should be made of balsam from Syria or Mecca; when this is difficult to obtain, balsams from Brazil or Peru are used.

**Balta,** bäl'ta, José, Peruvian statesman: b. Lima 1816; d. 20 July 1872. He retired from the army with the rank of colonel in 1855; was Minister of War in 1865; one of the leaders in the insurrection which overthrew the unconstitutinal President, Prado, 1866; and was President of Peru, 1868-72. He was murdered in a military mutiny in Lima.

**Baltard,** bäl-tär, Louis Pierre, French architect and engraver: b. Paris, 9 July 1765; d. 22 Jan. 1846. He was appointed architect of the Pantheon and of the Paris prisons, and designed the chapels of the houses of detention of Saint Lazare and Saint Pelage. The great hall of justice in Lyons, founded in 1834, was devised and almost completely built by him. He also acquired fame as an engraver and as the author of many superb works descriptive of monuments and illustrated by his own plates. Among his most notable works in this line are 'Paris et Its Monuments'; 'La Colonie de la Grande Armée'; and illustrations in Denon's 'Egypt.'

**Baltard,** Victor, French architect: b. Paris, 19 June 1805; d. 14 June 1874. He was son of Louis Pierre Baltard, and became government architect of France and a member of the Academy of Fine Arts. He built the church of Saint Augustine and other beautiful edifices, and was author of 'Monographie de la Villa Melius' (1847); and other works.

**Balthazar,** bäl-thä'zär, (1) one of the wise men of the East who came to worship Jesus at Bethlehem. (2) A character in Eichberg's opera, 'The Doctor of Alcantara.' (3) Chaucer's name for Belshazzar in 'The Monk's Tale.' (4) The name assumed by Portia in Shakespeare's 'Merchant of Venice'; also the name of minor characters in several of Shakespeare's plays.

**Baltic** (bäl'tic) AND NORTH SEA CANAL, or KAISER WILHELM CANAL. See Canals.

**Baltic,** Battle of the, a poem by Thomas Campbell, celebrating the victory of Lord Nelson over the Danish fleet, 2 April 1801. In history this action is generally known as the battle of Copenhagen.
BALTIC PROVINCES (in Russia), a term generally given to the five Russian governments—Livonia, Esthonia, Petrograd and Finland—in a restricted sense it often designates the first three. The Baltic provinces once belonged to Sweden, except Courland, which was a dependent of Poland. The partition of Russia, partly in the beginning of the 18th century, through the conquests of Peter the Great, partly under Alexander in 1809. Peter the Great conceded to the provinces their own administration and guaranteed the inhabitants freedom of conscience. These rights were confirmed anew in 1856, but in spite of this a systematic attempt was made by the Russian government, especially since 1880, to assimilate the provinces with the rest of the empire. The Greek Church endeavored to proselytize the people, the Russian language was substituted for the German in the schools and courts and the press was subjected to censorship. These measures aroused great discontent and the autumn of 1905 witnessed the outbreak of a forceful movement among the Lettish and Estonian peasantry, directed against both the German landowners and the Russian government. A borderland between the Germanic and Slavonic areas, they have been a frequent cause of difficulty between Germany and Russia, and during the great European War were the scene of many land and naval conflicts (see War, European). The bulk of the population is composed of Esths and Letts—the former a Finnish race, the latter akin to the Lithuanians. The higher classes, nobility and burghers, are Germans, who constitute about 7½ per cent of the total population. The inhabitants are nearly all Protestants. Although the soil is not very fertile, agriculture is in a flourishing condition, owing to the improved methods of cultivation and a generally higher intelligence of the people. Commerce and manufactures are also highly developed, favored by the proximity of the Baltic. The five provinces combined have an area of 191,526 square miles, and a population of about 9,427,000.

BALTIC SEA, an enclosure of the North Sea with which it is connected by the Skager- råk and Kattegat. It washes the coasts of Denmark, Germany, Courland, Livonia and other parts of Russia and of Sweden, and extends to lat. 65° 30' N. It is nearly 930 miles long, from 50 to 425 broad, and its superficial extent, together with the contents of the gulfs of Bothnia and Finland, amounts to 160,000 square miles. Its generally small breadth; its depth, amounting on an average to from 40 to 50 fathoms, but in many places hardly half so much; its shallowness toward the Prussian shores, and the rugged nature of the Swedish coasts, where deepest water is soundcd (1,542 feet, south of Stockholm); but above all, the suction and discharge of great rivers, accompanied by violent storms (especially from the east), render this sea dangerous for navigators, although its waves are less powerful than those of the North Sea. A chain of islands separates the southern part from the northern, or the Gulf of Bothnia. In the north-east the Gulf of Finland stretches eastward and separates the province of Finland from Estonia. A third gulf is that of Riga or Livonia. The Kurisches Haff and the Frisches Haff are inlets or bays from the coast. The water of the Baltic is colder and clearer than that of the ocean; it contains a smaller proportion of salt, and ice obstructs the navigation three or four months in the year. The ebb and flow of the tide are considerable, as is the case in other inlets, the difference between high-water and low-water mark being only about a foot; yet the water rises and falls from time to time, probably owing to the varying rainfall and evaporation. In stormy weather amber is often found on the coasts of Prussia and Courland, which the waves wash upon the shore. It forms the drainage basin for a great part of northern Europe. Among rivers that empty into it are the Neva, Dwina, Oder, Vistula, Niemen and a number of Swedish rivers. Between the Kattegat and Baltic are the large Danish islands Zealand and Funen; others in the sea itself are Samsoe, Moen, Bornholm, Langeland, Laaland, which belong to Denmark; the Swedish islands of Gotland and Oland (besides Hven, and the sound, with the ruins of Olandenborg, the observatory built by Tycho Brahe); Rügen, belonging to Prussia; the Aland Islands at the entrance of the Gulf of Bothnia, and Dagoe, together with Oesel, on the coast of Livonia, all of which belong to Russia. The Sound, the Great and the Little Belt lead from the Kattegat into the Baltic. The Baltic and North Sea are now connected by the great ship canal constructed between Brunsbüttel, near the mouth of the Elbe, to Hakena, near Kiel, a distance of 61 miles, and opened in 1895. The canal is a work of the German government, and is intended for the use of war-vessels as well as trading-ships, many of which, bound to or from Baltic ports, are able to effect a saving on the voyage of over 500 miles by means of this waterway. The chief seaports of the Baltic are Petrograd, Kronstadt, Riga, Revel, Narva, Libau, Helsingfors, in Russia; Stockholm, Gof, Karlskrona, Malmo, in Sweden; Memel, Königsberg, Danzig, Stettin, Lübeck and Kiel, in Germany; Copenhagen, in Denmark. During the great international European War, the Baltic Sea was an active field of naval and military operations. See War, European.

BALTIMORE, Md., the chief city of the State, the 7th in population of the United States, and the commercial head of the Atlantic seaboard south of New York; on the Pennsylvania (P. B. & W.), Baltimore and Ohio, Western Maryland, Northern Central and other railroads; 36 miles northeast of Washington, 97 southwest of Philadelphia.

Topography.—The city is admirably situated at the head of tidewater on an arm of the great Chesapeake Bay, in former times known as "Patapsco Bay," 12 miles long by an average of 3 miles wide, forking at the peninsula on which Fort McHenry, a fort, and land-locked harbor known as the Northwest Branch. This celebrated harbor is noted for the ease with which ships of great burden may be docked or moored at any stage of the tide, the tidal movement being from one foot to one foot six inches. The ship channel from this inner harbor to the sea has been for many years of sufficient depth to permit the passage of

vol. 3—8.
ships drawing 35 feet of water and over to the docks and elevators of the Baltimore and Ohio Railroad on the southern side as you enter, and the Pennsylvania Railroad system on the eastern side of the harbor. South of the above mentioned peninsula is another wide fork of the greater harbor, known as the Middle Branch, on which are located the great terminals of the Western Maryland Railroad; this again forks, receiving the waters of the small Patapsco River and Gwynn's Falls, on either hand. Through the centre of the city flows a stream which, rising some distance north of the inner harbor, has its fountain-head at springs which flow 500,000 gallons per day. It is known as "Jones Falls," after David Jones, who built himself a house on its banks about 1680. On its banks are located the union station of the Pennsylvania Railroad Company, whose grounds bordering on the stream are embellished with tasteful gardens, and the city has beautified the other shore by constructing 4.4 miles of road in a beautiful park. The city in 1888 was 13,202 acres, of property annexed in 1888 was 16,939 acres, of the harbor 1,507 acres, making the total area of the present city 31,648 acres.

Transportation.—Baltimore has a very modern and excellent street car service; it can boast of the fact that it had the first electric street railway and the first electric elevated railway in the world. The street railways have 404.5 miles of rails now being operated on the streets and suburban points within the radius of its operations. The Delaware and Chesapeake Ship Canal, across the narrow strip of Delaware, gives it a direct water outlet to Philadelphia. The Baltimore and Ohio Railroad system (q.v.) follows almost without change the route of the old national pipe, which extended from Baltimore to Saint Louis; it was the first road to the Atlantic seacoast and the cornerstone was laid 4 July 1828. The facilities provided by this road are the great terminals located at Locust Point, consisting of freight sheds, elevators, and the proper loading docks with a water depth of 35 feet, connecting with the ship channel to the sea of the same depth. Within recent years an immigration pier and necessary buildings have been erected.

The terminals of the Pennsylvania Railroad are on the eastern or opposite side of the harbor from the Baltimore and Ohio terminals. They have the same depth of water in the freight slips and have direct communication with the 35-foot channel. The principal road of this system passing through this city is the Phila-delphia, Baltimore and Washington Railroad, and its branches. Running a little west of south from this city is still another important feeder, the old Baltimore and Potomac Railroad, so called prior to recent consolidation, which passes through Washington, terminal station at Quantico, Va., branching at Bowie, Md. The Merchants and Manufacturers' Association had much to do with the introduction of another great railway system into this city, in the matter of the sale of the city's interest in the Western Maryland Railroad to what was known as the "Fulcher Syndicate" together with the purchase of the Pittsburgh and West Virginia Central and the acquisition of the Wabash system. The Baltimore and Potomac has a tunnel 7,400 feet long through the west side of the city; the Northern Central one 3,500 feet long through the northeast; the Baltimore and Ohio one 13/4 miles long through the city north to south. The Baltimore and Ohio road draws its trains through by electric motors. Seventeen foreign steamship lines use the docks and piers of the Baltimore and Ohio Railroad or the Pennsylvania Railroad Company. These lines run to Europe and South America and other ports. Besides these there are steamship lines to Boston, Baltimore, New York, Wilmington, N. C., Charleston, Savannah, New Orleans, etc.; and steamboat lines to Philadelphia, Washington, Norfolk, Richmond, Georgetown, Chester, Galveston, Jacksonville, Havana, Cuba, and to points on the Chesapeake Bay and its tributaries.

Shipping, Commerce, Manufactures, Trade.—At the port of Baltimore 31 Dec. 1914, in the coastwise trade for the district of Maryland, 1,939 vessels were documented in the U. S. at Baltimore. The vessels are Chaffe, Annapolis, Washington, D. C., and Alexandria, Va.—more than the number of vessels documented at any other Atlantic seaport, except New York. In addition to these vessels, nearly all the vessels documented at Virginia and North Carolina ports trade on the Chesapeake Bay, making a total (estimated by the collector of the port of Baltimore) of about 4,000 documented vessels trading on the Chesapeake Bay. Most of these vessels, of course, trade at Baltimore. Baltimore has 15 miles of water front suitable for docking purposes (including 63/4 miles in the main inner harbor, 31/4 miles on the Middle Branch within technical city limits, and at least 8 miles more adjacent to the city limits). It has 100 wharves in the main harbor, with 143,700 feet—say 27 1/4 miles—of frontage of wharf room. Adding this amount of wharf frontage to the other water front of the Patapsco River and its tributaries, the total is 120 miles of water front, developed and undeveloped. Of this wharfage the city owns 13 piers, with a total frontage of 26,385 feet—five miles. Baltimore has spent $6,161,000 on municipal docks, and has available $5,000,000 more for extending the system. Baltimore's business operations aggregate more than $1,800,000,000 in manufactures and leading. Total annual value of manufactures, shown by figures assembled recently, exceeds $400,000,000. The largest single interest is clothing at $44,500,000. Copper, tin and sheet iron products come next at $32,000,000. Fertilizer, which is fourth, shows the largest rate of increase. The total is now $16,000,000. Baltimore stands first in the manufacture of cotton duck, straw hats, men's clothing, fertilizers, copper, tin and sheet iron products, canning and preserving oysters, and as a banana market.

There are over a thousand wholesale and jobbing houses in Baltimore. Two hundred of these firms carry over 300,000 accounts in the South alone. A fair minimum estimate of the amount of Baltimore paper sold by agents in the Southern States below the Potomac is $200,000,000. Baltimore's jobbing trade, not including the commission business, reaches $250,000,000. The leading items are dry goods and notions, millinery, clothing, boots and shoes, hats and caps,
1 Washington Monument

2 Johns Hopkins Hospital
drugs, groceries and food products, all of which show large increases over 1910. In addition to the annual jobbing trade of $250,000,000 are the grain trade and shipping figures of over $100,000,000 and the commission business of over $100,000,000. The average freight received and distributed at Baltimore by railroad and boat lines annually is over 48,000,000 tons. Baltimore's receipts in a recent year were 90,171,602 bushels of grain and 1,808,672 barrels of flour, which, together with hay, straw and mill feed handled, aggregated 72,423 tons. Baltimore's imports for a calendar year were $38,941,666; exports, $308,975,629. Baltimore's banking resources are $2,206,338,952. Its national bank deposits in 10 years increased 47.9 per cent. The bank clearings in 10 years increased 72 per cent. Post-office receipts annually aggregate $2,953,388.

Modern Improvements.—In 1904 Baltimore had a fire which up to that time, with the exception of the big Chicago fire, was the most destructive conflagration that ever visited an American city. It destroyed most of the business block and entailed a loss of $125,000,000 or practically one-fifth of the wealth of the community. At first the blow was staggering, but the people responded to the situation with great courage and went so far as to decline the hundreds of thousands of dollars offered, much of it in actual cash, that poured in from other cities. Baltimore's citizens decided over night not only to rebuild but to take their losses and do their construction on their own resources.

Until that time the growth of the city had been along conservative lines. A sentimental as well as an actual connection with the great Southern trade gave it a constant and substantial increase and made its development steady and assured. But the fire stirred it as it had never been affected before and all at once the fine enterprise and broad ideas of its people found an awakening. A Burnt District Commission was created, and to this Commission were entrusted extensive and almost autocratic powers, and it set to work with the reduced grades, the wonderful dock system and improvements of similar kinds that under normal conditions could not have been secured in half a century. After 12 years, practically every trace of the fire had been obliterated. The business district has risen from its ashes into what the building inspectors pronounce the best built and most substantial business section that can be found in any city in America. Baltimore to-day presents a unique superiority in its equipment for the handling of the great business which has been coming to it in constantly increasing volume, while as a city of homes Baltimore has always enjoyed the most enviable reputation. Confined by no limits, its expansion has widened the area of her private real estate and made her the hub of a vast business, but facilitating them by modern and up-to-date street car and motor bus systems.

Public Buildings.—First in municipal importance, though possibly not in the cost or beauty of design, is the city hall, built of Maryland white marble, and styled of architecture being the Renaissance. Cost of construction, $2,271,135.64; cost of furnishing, $104,264.79. The new courthouse is 200 feet front by 325 feet depth. The material is white Maryland marble, and the architectural style is a free Renaissance treatment of the Ionic order. The cost of this building completed was $2,753,003.18. The post-office, located opposite the courthouse is also a recent erection, Italian in general treatment. The building contains the United States and District Courts. The cost was $2,011,835. The custom-house cost over $1,500,000, the style of architecture is Classic and was built of Maryland granite.

Educational Institutions, Art Galleries, Libraries, etc.—The Maryland Institute of Art and Design, which was for many years in the heart of the commercial centre of the city, was incorporated in 1826. The library contains 20,000 volumes relating to the arts and sciences. The new home of this school is located on Mount Royal avenue. It has been most liberally endowed by the Jenkins family of Baltimore and Andrew Carnegie. The Academy of Sciences, located in the fine old mansion of ex-Governor and ex-Senator Thomas Swann, on West Franklin street, contains a large collection of the bird life of business block and entailed a lost of $125,000,000 or practically one-fifth of the wealth of the community. At first the blow was staggering, but the people responded to the situation with great courage and went so far as to decline the hundreds of thousands of dollars offered, much of it in actual cash, that poured in from other cities. Baltimore's citizens decided over night not only to rebuild but to take their losses and do their construction on their own resources.

Until that time the growth of the city had been along conservative lines. A sentimental as well as an actual connection with the great Southern trade gave it a constant and substantial increase and made its development steady and assured. But the fire stirred it as it had never been affected before and all at once the fine enterprise and broad ideas of its people found an awakening. A Burnt District Commission was created, and to this Commission were entrusted extensive and almost autocratic powers, and it set to work with the reduced grades, the wonderful dock system and improvements of similar kinds that under normal conditions could not have been secured in half a century. After 12 years, practically every trace of the fire had been obliterated. The business district has risen from its ashes into what the building inspectors pronounce the best built and most substantial business section that can be found in any city in America. Baltimore to-day presents a unique superiority in its equipment for the handling of the great business which has been coming to it in constantly increasing volume, while as a city of homes Baltimore has always enjoyed the most enviable reputation. Confined by no limits, its expansion has widened the area of her private real estate and made her the hub of a vast business, but facilitating them by modern and up-to-date street car and motor bus systems.

Public Buildings.—First in municipal importance, though possibly not in the cost or beauty of design, is the city hall, built of Maryland white marble, and styled of architecture being the Renaissance. Cost of construction, $2,271,135.64; cost of furnishing, $104,264.79. The new courthouse is 200 feet front by 325 feet depth. The material is white Maryland marble, and the architectural style is a free Renaissance treatment of the Ionic order. The cost of this building completed was $2,753,003.18. The post-office, located opposite the courthouse is also a recent erection, Italian in general treatment. The building contains the United States and District Courts. The cost was $2,011,835. The custom-house cost over $1,500,000, the style of architecture is Classic and was built of Maryland granite.
it overlooks the city and harbor. On North Broadway, facing the west, stands the group of buildings of the Johns Hopkins Hospital. The architectural appearance of the central group of buildings is majestic, standing 114 feet above tide. The cost of the original buildings was $2,250,000, which has been very largely added to by contributions. Among the various charitable institutions are those of the University of Maryland (1807), and the Baltimore Medical College. The oldest dental college in the world is the Baltimore College of Dentistry and Surgery, chartered 1839. The chief law school is that of the University of Maryland.

The Woman's College (Methodist Episcopal, 1888) now known as Goucher College, is another institution of which the citizens are proud. The buildings are throughout in the Romanesque style, of the Lombard variety, with adaptations from that order to which Vitruvius gave the name Tuscan. They are built of dark undressed granite and are surrounded by roofs of Roman-red tiles. The church is the most southern member of the group of buildings, its massive tower the most conspicuous object in the northern part of the city. This tower is almost an exact counterpart of a campanile to be seen just outside of the city of Ravenna, Italy. There are also many other colleges and preparatory schools of good rank, making the city a leading educational centre. Among these are Morgan College (Methodist Episcopal, 1876); Baltimore City College; Bryn Mawr (1885); Baltimore Polytechnic Institute, and four Roman Catholic institutions—Saint Mary's (Seminary of Saint Sulpice, 1791); Loyola (1852), under Jesuit management; Notre Dame of Maryland (1873); Saint Joseph's (1888). The public school system has 108 schools, 2,064 teachers, and 84,000 pupils, and about $2,000,000 is annually expended in its support. The first manual-training schools for white or colored pupils were established here. There is also a State Normal School and an institution for training colored teachers.

Clubs.—Baltimore cannot be called a club city; however, the time-honored Maryland Club is a great social organization occupying a beautiful building on the new broad, modern streets. There are also the younger Baltimore Club, on Charles street, opposite, composed largely of the sons of members of the Maryland Club; the University Club; the Catholic Club; the Charcoal Club; Baltimore Athletic Club; Automobile Club; Germania Club, for German merchants; the Merchants' Club; and the Phoenix Club and Clover Club, both Jewish organizations.

Charitable Institutions.—The city has a body of gentlemen, known as supervisors of city charities, who serve without pay, and who look into every form of charity and direct to a large extent its distribution. There is also a State board of charities, non-paid. Among the institutions to aid suffering humanity are Johns Hopkins Hospital (already mentioned); Maryland Hospital for the Insane; Female House of Refuge; Springfield State Hospital; House of Refuge (male); Aged Men's Home; All Saints Home for Children; Auchentorly House; Baltimore Association for the Improvement of the Condition of the Children of the Poor; Baltimore Orphan Asylum (more than 100 years old); Boys' Home Society; Briasla Help Association; Charity Organization Society; Christian Tract Society; Children's Aid Society; Gentliff Female Orphan Asylum and School; Female Christian Home; and Free Summer Excursion Society. The various charitable institutions are too numerous to merit mention, but there are the blind asylum, a fine white marble building; and the city almshouse, accommodating 1,300 inmates.

Churches.—There are some 489 church buildings in the city, many of great beauty both externally and internally; notably the First Presbyterian Church on Madison street, with its wonderful Gothic spire 300 feet high; the Mount Vernon Methodist Episcopal Church within the shadow of the Washington monument, and the Roman Catholic Cathedral commenced in 1800. The style and decorations of the last named are of the Grecian-Ionic order. The great dome is 207 feet in circumference internally, and 231 feet externally. The side aisles in the church are terminated by two pictures. That on the right is the *Descent from the Cross,* painted by Pauline Guerin—a present from Louis XVI to the archbishop—and that on the left is the *Saint Louis Burying His Officers and Soldiers Slain Before Acre,* the work of Steuben and presented by King Charles X of France. There are also the statical Methodist church described with the Goucher College; the beautiful white marble synagogue, Oheb Shalom, on Eutaw Place, oriental in style, and a short distance away the great Har Sinai temple on Bolton street, and the Byzantine temple on Madison avenue. The Episcopalian have many fine churches, among them Saint Paul's on Charles street and Grace Church on Monument street. The initial work on the Episcopal Cathedral, Saint Paul and University Parkway, has been completed and the Pro-Cathedral is in use. The following is a list of the churches of the various denominations: Baptist, 59; Christian Science, 2; Congregational, 4; Disciples of Christ, 7; Evangelical Association, 4; Evangelical Lutheran, 57; Friends, 2; Orthodox, 2; Independent Roman Catholics, 1; Independent German, 1; Jewish Congregations and 22; Masonic, 111; Methodist, 117; Presbyterian, 1; Roman Catholic, 55; Seventh Day Adventists, 2; Swedenborgian, 3; Union Evangelical, 3; Unitarian, 1; United Brethren in Christ, 7; Universalist, 1.

Monuments and Statues.—The first monument erected in Baltimore was in memory of Christopher Columbus and was dedicated 12 Oct. 1792, the 300th anniversary of his landing. It stands in the grounds of the Ready Asylum on North avenue. One of the grandest monuments in the world stands at the intersection of Monument and Monument streets. The Washington monument, the erection of which was conceived in the year 1809, the design furnished by Robert Mills, and the cornerstone laid on 4 July 1815. It rises above these square almost 200 feet and is in the Greek Doric inspiration. The erection of this monument, the first to be erected by any city in memory of Washington, is what gave Baltimore her designation as "The Monumental
Baltimore

City. The figure of Washington is by Cassius. The next in importance is the "Baltimore Monument," known as the "Battle Monument." It was erected to the memory of those who fell at the battle of Fort McHenry in 1814 and is the work of Maximilian Godefroy. It is 52 1/2 feet high. The principal column represents a fasces upon the bands of which are placed in bronze letters the names of those who fell, the whole being crowned by a female representing the city, holding in her hand a wreath of laurels, capellano. The Thomas Wildey monument on North Broadway is dedicated to him as the founder of the Order of Odd Fellows and may be described as a Greek Doric column 52 feet high, on which stands a figure of Charity. Other monuments are the Wells and McComas monument at Ashland square; that on Federal Hill erected to the gallant soldier Armistead, who defended Fort McHenry at the same time, 1814; the new Armistead monument at Fort McHenry; and the Francis Scott Key monument at Eutaw Place and Louval street; the monument to the Marylanders who fell in Mexico, located in Mount Royal Park, and a monument at the intersection of Mount Royal avenue and Cathedral street, recording the deeds of the Maryland Line, the only troops who fought from Bunker Hill to Savannah during the Revolution; and the monument, by Ruckstuhl, erected by the Daughters of the Confederacy, to the Confederate soldiers of the State. Mr. William T. Walters has given the city the famous bronzes of Barye, including the great lion and the masterful horse Dubois, "Military Courage," the sitting statue of Chief Justice of the United States, Roger Brooke Taney (q.v.) in his official robes; and the equestrian statue of John Eager Howard (q.v.).

Parks and Streets.—The beautiful Druid Hill Park consists of 674.16 acres. Other parks are Clifton Park, 267.26 acres; Clifton Lake, 44 acres; Patterson Park, 128.44 acres; Carroll Park, 176.44 acres; Riverside Park, 17.02 acres; Federal Hill Park, 8.02 acres; Wyman Park, 198.39 acres; Swann Park, 11.31 acres; Latrobe Park, 13.80 acres; Gwynn’s Falls, 374.19 acres; Venable Park, 60.81 acres; New Reservoir Park, 92.65 acres; Herring Run Park, 164.61 acres, besides 32 small squares dispersed all over the city, making a grand total of about 2,277.34 acres. In natural beauty Druid Hill Park is unsurpassed by any in the world. It is filled with springs of pure water, some of which are medicinal. A great artificial lake, a part of the city’s waterworks, with a depth of more than 80 feet, occupies many acres and around it has been constructed a fine drive. Near the head of this lake on the driveway stands the colossal statue of the Scottish hero, Sir William Wallace. In the rear of this is the full-length marble statue of Washington, executed by Bartholomew. A short distance from the latter is a costly and graceful pedestal surmounted by a life-size figure of George Washington, by Canessa. Patterson Park, on the eastern rim of the city, contains 128.44 acres, overlooks the harbor and still retains some of the earthworks thrown up by the American army in the defense of the city 1812-14, some of the guns being still in position. Necessarily a city is judged by what it does to advance its own facilities. According to this standard, Baltimore stands out conspicuously. Within the past few years engineers and municipal experts from every point of the earth have been sent to the city to inspect its new sewerage. This system is the finest ever attempted and cost in the neighborhood of $25,000,000. Many Baltimoreans think their largest gain from the fire was the new dock system. Previously to the fire the city owned very little wharf property. Since the fire the municipality has acquired all of the harbor front burned in the fire and it has been erecting the best system of docks that can be found along the Atlantic coast. The development of its suburbs includes Roland Park and Builford, pronounced by experts to be the finest examples of suburban development in the world. Baltimore’s assessed basis for taxation grew from $336,083,907 in 1901 to $915,433,444 in 1914, an increase of $512,617,247. The total mileage of streets and alleys in the city is 581.93, of which 324 miles are paved with the most modern improved paving, and all cobblestone paving is being replaced by the macadam process.

Water and Fire Departments.—The city owns its waterworks system, which is self-sustaining—777 miles of water mains in the city. The water supply has its source in the Gunpowder River, average daily flow 413,338,092 gallons. The service has two impounding reservoirs—Lock Raven on the Gunpowder River, capacity 2,270,000,000 gallons, and Lake Roland in the bed of Jones’ Falls, capacity 200,000,000 gallons. The department has two stand pipes with a maximum capacity of 530,000 gallons. It has a magnificent filtration system. The expenses of the fire department are about $1,145,114 per annum. Equipment—40 engine companies, 19 truck companies, 2 hose companies, 2 water tower companies, and 2 fireboats. In the business district, Baltimore has one of the best high-pressure water systems to be found in America.

Government.—The charter provides that “the executive power of the mayor and city council of Baltimore shall be vested in the mayor, the departments, sub-departments and municipal officials not embraced in a department herein provided for, and such special commissioners or boards as may hereafter be provided for by law, or ordinances not inconsistent with this article.” The mayor holds office for four years; he has a veto which can be overridden by a three-fourths vote of the council, which is composed of two branches; the lower of 24 members elected from each ward; the upper of nine members, each from two contiguous wards. The bulk of the city officers are appointed by the mayor with the consent of the higher branch. The council has the right to appoint the city register and public printer; and the comptroller and surveyor are elected by popular vote. The principal city officials are the comptroller (head of department of finance); city register; board of estimates; commissioner of public works; collector of water rents and licenses. The chief departments are public safety (fire, health, buildings and street cleaning), public improvements, parks and squares, education, charities and corrections and review and assessments.
Population.—The city stands seventh in population among the cities of the United States the growth being as follows: (1775) 5,924; (1800) 25,514; (1810) 46,454; (1820) 62,738; (1830) 80,620; (1840) 102,513; (1850) 160,-
54; (1860) 212,418; (1870) 262,854; (1880)
322,313; (1890) 434,439; (1900) 508,957; (1910)
558,413; (1917) 600,000. The figures would be
further increased if the two cities on the eastern
boundary, now separated only by a curb line, could be added. They have fully
100,000 inhabitants, but while practically part of
Baltimore, they do not add to its population.

History.—The first settlement of land in-
cluded in the present site of Baltimore was
made in 1662. Charles II was King of Eng-
land and Charles Calvert governor of the
province. The English people had been mak-
ing history very fast and among their most
brilliant achievements was the planting of suc-
cessful colonies in various parts of the world,
notably the Virginia colony, the Massachusetts
plantations and the province of Maryland,
formed in 1634. Small settlements on land within the present city limits was made only 28 years after the landing of the first colonists at Saint Mary's. During the 17th century we find statute books bur-
dered with references to laying out a town or
calling a town on paper, as many as 33 having been
created, three of them being within the bound-
ary of what was then called Baltimore County. By
the act of the general assembly of 1706 a town was to be established on Whetstone Neck or the PatapSCO River. No name was
given to the town in the act. Another town,
called Baltimore, was located near the mouth
of the Bush River on its eastern side. This
town is shown in the map made by Augustus
Herrman, the Bohemian, in 1670, and some 14
years after the actual founding of the present
city the general assembly ordered another
Baltimore to be laid out on Indian River in
Worcester County. Nothing was ever done in
regard to this town, and the county surveyor
refusing to proceed with the work.

Then came the true founding of the city
of Baltimore by the passage of an act entitled
An act for erecting a town on the north side of
the PatapSCO, in Baltimore county, and for
laying out in lots of 60 acres of land in
and about the place where one John Fleming
now lives. (1729, chap. 12). About two years
after the founding of Baltimore town
an act was passed entitled An act for erect-
ing a town on a creek, divided on the east
from the town lately laid out in Baltimore
county, called 'Baltimore Town,' on the land
whereon Edward Fell keeps a store. (1732,
chap. 14). The next step for the enlargement
of the city was the passage by the general assembly of the Act of 1745 (chap.
9), 15 years after the founding. This act was passed on the joint petition of the inhabitants
of Baltimore and Jones' Town, that the two
towns be incorporated into one entire
town and for the same to be called and known by
the name Baltimore Town and by no other
name. The town was again enlarged two years
later by the Act of 1747 (chap. 21), on petition
of the inhabitants by the addition of 18
acres, which is now called Jones' Town nor in Baltimore Town. In 1765 another
addition to the town was made on petition of
Cornelius Howard and other persons, consist-
ing of 35 acres on the west and south sides
of the town which was again enlarged by
the Act of June 1773 by the addition of 80
acres on the east and southeast.

The Revolution brought prosperity by
crippling its rivals and it was a great seat of
privateering. The figures show that in 1776-77 Congress held sessions in one of its
taverns, having fled from Philadelphia in fear of the English. About this period the energy and resources of a couple of immigrant Scotch-
Irishmen, the brothers John and Henry Sthen-
son, began to push the place forward; new
stage and packet lines were established, the
roads improved and turnpikes laid out and
Jones' Falls diked and part of its course filled in. The European wars of the French
Revolution and later threw a large part of
the world's carrying-trade, till Napoleon's
downfall, into American hands; the Baltimore clippers (2) were famous everywhere. In 1792
a large body of French refugees from Haiti
came in the first frigate, and the settlement of Fell's Point was united with it and it re-
cieved a city charter, it having previously been
governed from Annapolis. In the War of 1812
it again became a seat of privateers, in revenge
for what it attempted to capture in 1814, but the attack was repulsed 12 Sep-
tember. To it we owe the Star-Spangled Banner (2) (see Key, Francis Scott) and
the Battle Monument. The end of the Napoleonic
wars in 1815, restoring to England her old
carrying-trade, was a heavy blow to Balti-
more. In 1828 the public-school system was
established. In 1860 all three Anti-Republican
parties held their national conventions there;
and on the outbreak of the Civil War the Union troops passing through there were
mobbed by the citizens and the first blood of
the war was shed in its streets, 19 April 1861.
On 23 May Federal Hill was occupied by a
Union force and the city remained under mar-
tial law till the end of the war. The conver-
tion of 1864, which renominated Lincoln, was
held here. In 1888 The Annex (2) was annexed
to the city, extending its limits two miles
north and west and nearly doubling its size. Since 1880 Baltimore has been one of the
largest cities in the country.

The National Democratic Convention of
1912, which nominated Wilson and Marshall
for President and Vice-President, was held in
Baltimore. The first mercantile submarine to
cross the Atlantic Ocean—a German boat car-
ying a cargo of merchandise—evaded the British and French blockade during the
great European War, and entered the port of Balti-
more 9 July 1916. See DEUTSCHLAND. Consult,
Love, Baltimore: The Old Town and the Modern
City (Baltimore 1895). These are
available for purchase at John Hopkins University Studies, 1896.

ciation.

Baltimore, Barons of, or Lords Baltimore. See Baltimore Family; Colonial Government, Proprietary.

Baltimore, Md., Attack on (War of 1812). When the British had burned Washing-
don in December 1812, they bound the ships and sailed for the mouth of the PatapSCO to at-
tack Baltimore. The approach to the city by water was defended by Fort McHenry with a garrison of 1,000 troops under Lieut.-Col. George Armistead, and to the right of the fort two batteries (Fort Covington and City Battery) were erected to prevent an attack from that side. The total number of men in Baltimore was 13,888 officers and men under the supreme command of Senator Samuel Smith (q.v.), whereas the British numbered not more than 5,000. On 12 Sept. 1814 General Ross began the march toward the city while the fleet sailed to attack the forts, but on striking the American advance of 3,200 troops under Brig.-Gen. John Stricker, Ross was killed. Col. Arthur Broke succeeding to the command. A hot battle then ensued but after a gallant resistance Stricker retired with a loss of 24 killed, 139 wounded and 50 prisoners, whereas the British lost 46 killed and 273 wounded. On 13 September Broke resumed the march, but on viewing the American defenses decided to wait until the fleet had silenced the forts. About sunrise of the 13th five bomb vessels began to bombard Fort McHenry from a distance of two miles. The heavier British ships could not approach within range owing to the shallowness of the river and those of the lighter ships that did approach were driven off quickly. During the day and following night 1,500 shells were thrown into the fort with comparatively little injury and the loss of only four men killed and 24 wounded. Accordingly Admiral Cochrane and Colonel Broke decided the capture of the town would be too costly and retreated to the lower Chesapeake. On 19 September Cochrane sailed for Halifax and on 14 October the troops were transported to Jamaica, later to participate in the battle of New Orleans. Francis Scott Key witnessed the bombardment from the British admirals ship, whither he had gone to obtain the release of some friends, and when at dawn he saw the flag still floating over the fort he wrote 'The Star-Spangled Banner.' Consult 'American State Papers, Military Affairs' (Vol. I. p. 591); Adams, 'Hist. of the United States' (Vol. VII. pp. 166-73); Brackenridge, H. M., 'History of the Late War' (pp. 265-73); Gleig, G. R., 'Campaigns of the British Army at Washington and New Orleans' (pp. 170-98); James, William, 'Military Occurrences' (Vol. II. pp. 308-24); Lossing, 'War of 1812' (pp. 94-57); Scharff, J. T., 'History of Maryland' (Vol. III. pp. 99-137); Wiley and Rice, 'The United States' (Vol. IV. pp. 33-36).

BALTIMORE, Woman's College of. See Goucher College.

BALTIMORE FAMILY, founders and proprietors of Maryland, consisted of seven successive lords of the barony of Baltimore in the Irish peerage, and a cadet who was governor has been added.

GEORGE CALVERT, the 1st lord: b. about 1580, Kipling, near Bolton Castle, Yorkshire; d. 15 April 1632. He graduated from Trinity College, Oxford, 1579; traveled abroad, and after his return became a son-in-law of Robert Cecil (afterward Lord Salisbury), clerk of the Crown of Ireland, 1606, and clerk of the Council, 1608. He assisted James in his controversial writings, had charge of the Spanish and Italian correspondence during the Secretary of State's absence in 1613, was on a committee to investigate Irish Catholic grievances the same year, was knighted 1617, and in 1619 was made Secretary of State by Buckingham's favor. He represented Yorkshire jointly with Sir Thomas Wentworth (afterward Lord Strafford) in the Parliament of 1621, and in the stormy times that followed was a mediator between Parliament and King, with the usual fate of being thought a spy by the one and lukewarm by the other. The French ambassador styled him an honest, sensible, well-intentioned man and zealous patriot, and therefore without influence. He had principal charge of the foreign negotiations while James was chasing the will-o'-the-wisp of the Spanish marriage and making England a nullity in the Thirty Years' War; Calvert's later Catholicism made him suspected as favoring the latter policy, but in fact he wished a more energetic one. On 14 Jan. 1624 he was one of the nine councillors who opposed a breach with Spain. In January 1625 he announced himself a Roman Catholic and a version is credited to Gondomar, the famous Spanish Ambassador, and Lord Arundel of Wardour, his son's father-in-law. On 12 February he resigned his office and was given the barony of Baltimore: which, as James hated *apostasy,* measures his esteem for Calvert. On the accession of Charles I, in 1625, Baltimore refused, from conscientious scruples, to take the oath of supremacy and abjuration, and Charles gave him a handsome letter to the Lord Deputy of Ireland. In 1627 he was summoned to court to consult on the peace with Spain, but thenceforth took no part in public business, devoting himself to colonization. Already in 1621-22 he had planted a colony in Newfoundland, chartered in 1623 as Avalon; in 1627 and 1628-29 he visited it, but the severe climate appointed him and he begged for a grant in a milder one. Without waiting for a reply he attempted to explore Virginia for a settlement; but the Jamestown officials of the old Virginia company refused permission unless he would take the oath above. The region satisfied his ideal, however, and he persisted in asking a grant there against the dissuasions of Charles, who finally assigned him a northeastern tract, now the States of Maryland and Delaware; but the same interests delayed the proceedings, and before the charter was signed, 20 June 1632, Baltimore died. The usual assumption that he intended the colony for a Roman Catholic establishment is refuted by the fact that the charter established the Church of England and did not even specify toleration for other creeds, which was not made a provision of law till 1649, though of course intended, and proclaimed at once on the establishment of the colony. Baltimore thought — wrongly, as it turned out — that the proprietary power of the governor of the chosen colonists would prevent the persecution of his own faith, and had neither wish nor power to persecute others. That he meant it as an asylum and breeding-ground for his religion is a matter of course. It was also to be a feudal aristocracy, but with an assembly of freemen whose consent was necessary to the validity of laws. In a word, Baltimore was a conservative of high principles and moderate temper.
Cicilus or Cecil Calvert, the 2d lord: b. about 1605; d. 30 Nov. 1675. He married Anne Howard, daughter of Lord Arundel of Wardour (after whom Anne Arundel County of Maryland is named), about 1623. The charter of Maryland granted to his father was transferred to him as heritor; but he never visited it during the 43 years of his life thereafter, sending deputies in his place, and managing its business and political affairs judiciously from England, settling disputes of natives or colonists sensibly and placably, and esteemed a worthy successor to his father. Down to the civil war of 1642 he had little to do but support his brother, Leonard, as governor; but his policy then became difficult. He tried to steer a middle course, and avoid either for himself or the colony any pronounced declaration of sympathies or allegiance which might expose it to confiscation; but Ingle’s upset of the colonial government (see Leonard Calvert) and the Parliamentary triumphs at home, showed him at last that this could not be maintained, and that with the Puritans at the head, the Roman Catholic supremacy, though used only to preserve themselves from persecution, was at last given up. On June 1647 Leonard died, after appointing as his provisional successor an ardent churchman and loyalist, Thomas Green; but Lord Baltimore in 1648 appointed Capt. William Stone and had him seize 500 Puritans, harried by the Virginia Cavaliers, in Maryland. When the news of the King’s death arrived, Green, in Stone’s absence, proclaimed Charles II King, as did Virginia; on which William Claiborne (q.v., and below), the treasurer of Virginia, joined the Parliamentary party, obtained a commission to reduce the two rebellious provinces, and, after overthrowing the Virginia government, forced Governor Stone to renounce his allegiance to Lord Baltimore and give it to the keepers of the liberties of England. When Cromwell dispersed the Long Parliament Stone repudiated the agreement; Claiborne marched against him, deposed him and appointed a Puritan government which at once most ungratefully disfranchised all Catholics and repealed the law of Tolerance. In January 1654 Cromwell himself intervened, and forbade the Virginia authorities to molest Lord Baltimore or his officers in Maryland. Baltimore thereupon ordered Stone to overturn the Puritan government, but Stone’s force was defeated and himself captured. Baltimore, however, kept his favor with the Puritan administration; the commissioners of plantation decided that the province was his, and in 1658 it was restored to him. Claiborne’s influence was at an end, and Baltimore had no further troubles over Maryland.

Leonard Calvert, younger brother of Cecilus, was sent out by the latter as first governor of the new colony; b. about 1606; d. June 1647. He set sail 22 Nov. 1633, in the Ark and the Dove, with about 200 Roman Catholic settlers of good families; arrived 24 Feb. 1634, at Point Comfort, landed 25 March on an island in the Potomac, which they named Saint Clement’s, and founded on the site of an abandoned Indian village a town, Saint Mary’s, long since deserted. He met an Englishman, Capt. Henry Fletch, who had lived some years among the Indians and helped him to gain their consent to the settlement. But he found Kent Island in the Chesapeake, the great island opposite Annapolis, settled by one William Claiborne (q.v.), under a grant from the discredited Virginia company, effectively enough to have a representative in the Virginia legislature. Calvert claimed right of property and political jurisdiction over the island. Claiborne denied both, and Calvert refused the fat and the fare that ensued embroiled the two colonies for many years, complicating itself with the issue of Churchmen against Catholics, then (by the 40th which, of fate) with Cavaliers in Virginia against the Puritans who had overthrown the Catholics in Maryland, and finally with a ranking boundary dispute. Claiborne poisoned the Indians’ minds against the Marylanders as a set of treacherous Spaniards; Calvert sent an expedition against him, which captured two boats, with mutual loss of life, in April and May 1635. Claiborne had further losses, and became bankrupt, but in 1637 bought of the Indians Palmer’s Island, at the head of Chesapeake Bay, as beyond Baltimore’s grant, and petitioned for an injunction against Baltimore’s interference. In June 1647 Leonard died, after appointing as his provisional successor an ardent churchman and loyalist, Thomas Green; but Lord Baltimore in 1648 appointed Capt. William Stone and had him seize 500 Puritans, harried by the Virginia Cavaliers, in Maryland. When the news of the King’s death arrived, Green, in Stone’s absence, proclaimed Charles II King, as did Virginia; on which William Claiborne (q.v., and below), the treasurer of Virginia, joined the Parliamentary party, obtained a commission to reduce the two rebellious provinces, and, after overthrowing the Virginia government, forced Governor Stone to renounce his allegiance to Lord Baltimore and give it to the keepers of the liberties of England. When Cromwell dispersed the Long Parliament Stone repudiated the agreement; Claiborne marched against him, deposed him and appointed a Puritan government which at once most ungratefully disfranchised all Catholics and repealed the law of Tolerance. In January 1654 Cromwell himself intervened, and forbade the Virginia authorities to molest Lord Baltimore or his officers in Maryland. Baltimore thereupon ordered Stone to overturn the Puritan government, but Stone’s force was defeated and himself captured. Baltimore, however, kept his favor with the Puritan administration; the commissioners of plantation decided that the province was his, and in 1658 it was restored to him. Claiborne’s influence was at an end, and Baltimore had no further troubles over Maryland.

Leonard Calvert, younger brother of Cecilus, was sent out by the latter as first governor of the new colony; b. about 1606; d. June 1647. He set sail 22 Nov. 1633, in the Ark and the Dove, with about 200 Roman Catholic settlers of good families; arrived 24 Feb. 1634, at Point Comfort, landed 25 March on an island in the Potomac, which they named Saint Clement’s, and founded on the site of an abandoned Indian village a town, Saint Mary’s, long since deserted. He met an Englishman, Capt. Henry Fletch, who had lived some years among the
Baltimore and Ohio Railroad

brood of some ability. The proprietary rights in Maryland were bequeathed to a child, Henry Harford, but four years later were rendered worthless by the Revolution.

**Baltimore and Ohio Railroad, the History.**—The fact that the only use of rails for locomotion in 1827 on either side of the Atlantic was for coal carrying, renders the more remarkable the action of the coterie of merchants and bankers of Baltimore, gathering at Philip Thomas' house on the evening of 18 February of that year, in deciding to proceed forthwith to build a railroad for general purposes. The Ohio, at Wheeling, was made the objective point; the intervening Blue Ridge and Allegheny Mountains evidently suggesting no difficulties that could not be surmounted. But a week elapsed from the time of the initial meeting to the second, at which the committee appointed at the first reported the resolution, namely: *That immediate application be made to the Legislature of Maryland for an act incorporating a joint stock company to be styled the Baltimore and Ohio Railroad Company, and clothing such company with all powers necessary for the construction of a railroad with two or more sets of rails from the City of Baltimore to the Ohio River.* The capital stock was fixed at $5,000,000.

The Baltimore and Ohio's charter, granted of date 28 Feb. 1827, was the first anywhere coming into existence defining and authorizing procedure to completion. Under it the Baltimore and Ohio Railroad Company is still acting, it being the only enactment of the character of the pioneer days of the railroad in this country or Europe remaining fully operative; the B. & O. being the single railroad company of that date, yet retaining, unchanged, its original name and organization.

On 23 April 1827 the Baltimore and Ohio Railroad Company was formally organized, Philip E. Thomas elected president and George Brown treasurer. Preparations were immediately inaugurated to secure a survey of the proposed line, the measures to which end were begun on 2 July. In this the United States government authorities were induced to co-operate to the extent of relieving Col. Stephen H. Long, of the Topographical Corps, from his regular duties, who, with Jonathan Knight, a Quaker civil engineer of repute, forthwith proceeded with the actual work, the date of its formal commencement being 20 November. On 5 April 1828 they submitted the result of their labor to that period; and the line west to the Patapsco and thence via its valley to Point Rock on the Potomac was decided upon as the first section to be undertaken.

But persistent, bitter and vehement opposition by the canal authorities was encountered and this was even carried to legislative chambers and the courts, but despite this trouble and a few adverse decisions by the courts, the Baltimore and Ohio pushed on from Baltimore west, and three miles were completed and experimented upon early in 1829. On 22 May 1830 the first section of the Baltimore and Ohio—that from Baltimore to Ellicott City, a distance of 14 miles—was formally opened for public use. Horse-drawn means of locomotion pending development of the locomotive to a more assuring stage than then reached anywhere from whence reliable information could be obtained. (See Locomotive, The.) *Brigades of cars* were announced to run three times each way daily, the fare named at 25 cents and business commenced in earnest. This was four months in advance of the formal opening of the Liverpool and Manchester, the first railroad abroad for general purposes, its date being 15 Sept. 1830.

Many difficult problems of railroad were decisively solved. Car wheels were first made with the flange on the inside edge, but their causing so many derailments and so frequently breaking led to the change of the flange to the outer edge. But this increased the difficulty on the curves and the conical flange was invented. The anti-friction box on the axles and the practice of placing on the outside of the inside of the wheels were both first introduced by Winans; as was also the eight-wheel car. When the main line of the Baltimore and Ohio was completed its roadbed embodied the highest engineering skill of the period in the traversing of mountain ranges; was the longest continuous railroad in the world, with the greatest bridges, trestles and tunnels. Its track construction throughout, and especially its manner of meeting the curvature and providing against slides from the environsing mountain sides, were lessons in line construction and operation availal of the whole world.

The Baltimore and Ohio was completed to Frederick, 61 miles, 1 Dec. 1831; to Point of Rocks, 69 miles, 1 April 1832; and to Harper's Ferry, 81 miles, 1 Dec. 1834. The initial move toward Washington was the letting of the contract in May 1833 for the construction of the Thomas Viaduct spanning the Patapsco at Relay. This remarkable granite structure, designed and erected under the personal supervision of Benjamin H. Latrobe, was built for the carrying of six- or seven-ton locomotives at the head of 12- to 15-hundred ton trains. It was the marvel in the world railroad circles when constructed. The longest, highest and generally most imposing railroad crossing known, it was the first on a curve and regarded, therefore, as the boldest of departures from the rule.

Two years were required to complete the Washington branch, and it was not until 25 Aug. 1835 that the echoes of the national capital resounded back the locomotive's shrill awakening. With the opening of the branch, the railway postal service came into being, its earliest form the boarded-up end of a baggage car, the two keys of which were held by the postmasters of Washington and Baltimore.
The declaration of the first railroad dividend in history, a semi-annual of the Baltimore and Ohio, was made simultaneously with the opening of the Washington branch, and the securities of the latter were the first of American railway issues marketed abroad.

The greatest of eventualities, however, with which the Washington branch's history is linked was the birth of the telegraph. "What Hath God wrought," the first four words transmitted by wire over a public line, were sent from Baltimore to Washington via the roadbed of the Baltimore and Ohio branch.

Hancock, 123 miles from Baltimore, was reached by the Baltimore and Ohio on 1 June 1842; Cumberland, 178 miles, on 5 Nov. 1842; Piedmont, 206 miles, on 21 July 1851; Fairmont, 302 miles, on 22 June 1852; and the last spike, finishing the great undertaking from Baltimore to Wheeling, 379 miles, was driven on 24 Dec. 1852. The formal opening of the road was marked by a notable demonstration 10 Jan. 1853. There being no rail connection beyond, and the prospects bright for Cincinnati and Louisville business in the one direction and Pittsburgh in the other, a company was organized and a daily steamboat service established superior to anything floating upon western waters.

With the completion of the Parkersburg branch from Grafton—or the mouth of Three Forks, as it was then known—to Parkersburg, 1 May 1857, the Ohio was reached at another point, and a very important one, as through rail connection had been perfected thence to Cincinnati, 10 days before, 20 April. The opening of the Parkersburg bridge, 7 Jan. 1871, was the last link in the continuous rail from the Chesapeake to the Mississippi.

The old Marietta and Cincinnati, the Ohio and Mississippi and other railways, once separately conducted companies, long since became component parts of the Baltimore and Ohio system, which, since the finishing of the Chicago division, 10 Nov. 1874, has been among the foremost in the metropolis of the northwest, as, through being the pioneer into Cincinnati and Saint Louis from the East, it has ever been in those centres.

At Pittsburgh, as well, the Baltimore and Ohio's position is a commanding one. Reaching the great central point from Cumberland in July 1860, later building and acquisitions led to radiating lines to Cleveland, Chicago, Cincinnati, Wheeling and other points of traffic concentration. Eastward from Baltimore the construction of the extension to Philadelphia and its opening, 19 Sept. 1886, together with security holdings in lines through to New York assured important place among the railways centring in the country's leading city.

Mileage.—On 30 June 1915 the Baltimore and Ohio Railroad proper consisted of the following lines:

<table>
<thead>
<tr>
<th>Division</th>

<tr>
<td><strong>Total</strong></td>
<td>14,575</td>
</tr>
</tbody>
</table>

Traffic Statistics.—For the year ending 30 June 1915 the total number of tons of freight carried by the B. & O. system was 64,375,595. The total ton mileage was 12,970,894,074. The number of passenger cars was 6,385,992, or 714,368,423 passengers one mile. The freight earnings for the B. & O. lines were $70,780,808.51 and the passenger earnings were $14,059,940.41.

Finances.—The general income account of the Baltimore and Ohio Railroad Company for the year ending 30 June 1915 was as follows:

<table>
<thead>
<tr>
<th>Description</th>
<th>Amount</th>
</tr>
</thead>
<tbody>
<tr>
<td>Gross earnings</td>
<td>$91,815,797.54</td>

<td><strong>Total</strong></td>
<td>$33,151,137.37</td>
</tr>
</tbody>
</table>

Total payments, including dividends | $32,379,063.51

Surplus | $771,473.86

The capital stock (preferred and common) outstanding on 30 June 1915 was $20,811,885.17; the funded debt was $398,990,159.81; the total capital liabilities $609,611,044.98. The capital assets of the company were $620,109,759.23, consisting of the following: Cost of road, including bonds and stocks held by trustees, $441,810,562.45; real estate, $6,067,735.88; equipment, $93,708,383.33. The company also owned bonds and stocks of railroad and other corporations to the value of $77,923,077.57.

BALTIMORE ORIOLE. See Oriole.

BALTISTAN, bāl-tē-stān', or LITTLE TIBET, an elevated plateau through which the upper Indus flows. It lies below the Karakoram Mountains and the Himalayas, with a mean elevation of 11,000 feet, and contains the nameless peak marked K, 28,278 feet high, next to Everest, the highest on the globe. It is politically a province of Kashmir.

BALTZER, Johann Baptist, German theologian: b. Andernach 1803; d. 1871. He
was educated at the University of Bonn, was ordained to the priesthood in 1829, and in the following year became professor of theology at Bonn. Throughout his life the Church regarded him as a leader and author, but he was soon involved in other difficulties with the ecclesiastical authorities and these differences led to his suspension in 1882. 

He opposed the promulgation of papal infallibility and became an ardent promoter of the Old Catholic movement. He wrote 'Die biblische Schöpfungs geschichte' (2 vols., 1867-73) and 'Ueber die Anfänge der Organismen' (4th ed., 1869). Consult the biographical sketches by Friedberg (Leipzig 1875) and by Melzer (Bonn 1875), Balzer's attitude, and Franz (Berlin 1873), representing the opposite side.

BALTZER, Wilhelm Eduard, German theologian: b. Hohenleine 1814; d. Grotzingen 1887. He was educated at Leipzig and Halle, and was ordained to the Lutheran ministry. His liberal views led to his being looked on with disfavor, and in 1847 he founded a free church of his own and soon became the leader of the movement known as the 'Freie Gemeinden,' or free religious communities which arose in opposition to dogmatic and traditional theology. Balzer was the leader of the movement until 1881, when he retired to Grotzingen, and spent his remaining years in the promotion of vegetarianism. He wrote 'Alte und neue Welthanschauung' (4 vols., 1850-59); 'Gott, Welt, und Mensch' (1869); 'Vegetarisches Kochbuch' (14th ed., 1900).

BALUCHI, bay-ooch'e, the language of Baluchistan, one of the Iranian group of languages. There are two dialects, the north Baluchi and the south Baluchi, or Marprani; the latter shows more ancient features.

BALUCHISTAN, bá-oo-chist'an, a country of SW Asia, consisting of the heart of the ancient Persia and the valley of the Indus, having the former on the west, Afghanistan and the Northwest Frontier province on the north, Sind, the Punjab and part of the Frontier province on the east, and the Arabian Sea on the south; area, about 134,638 square miles. It is wholly under British influence and partly under British rule, an area of 9,096 square miles forming part of the Indian empire; the rest of the country is divided into Agency territories under British control (about 45,132 square miles), and the native states of Kalat and Las Belas. The general surface of Baluchistan is rugged and mountainous, with some extensive intervals of barren sandy deserts. In the case of the principal ranges, the general parallelism and uniformity of their formation are somewhat remarkable, one system having an inclination from north to south, another from east to west. Many of these mountains are of great height and are covered with snow. There are several broad and high tablelands, extremely cold in winter and extremely hot in summer. Makran in the south, the ancient Gedrosia, is one of the hottest regions of the globe. Some of the mountain chains are of compact limestone, enclosing marine shells and corals identical with similar objects picked up on the sea-shores at this day. Expecting fragments of mountains formed in Lus, primary formations have not been observed in any part of the Baluchistan Mountains. The mineral wealth of the country is believed to be considerable, but is almost undeveloped; lead, iron, many kinds of mineral salts, coal, asbestos, and bitumen have been found. Throughout Baluchistan there is a great deficiency of water, particularly in summer. In the northeast part are the rivers Bolan and Mula, the courses of which form the celebrated passes bearing their names, leading from the valley of the Indus to Baluchistan and Afghanistan. In the south are the Hingol and the Dasht which flow into the Arabian Sea. The coast has a length of about 600 miles; it is very little inhabited and has no good harbors. The soil is not in general fertile, but by patient industry the plains and valleys can be made productive in wheat, barley and millet. The other chief crops are rice, maize and potatoes. Vegetables are abundant, and excellent fruits are produced in the gardens and orchards of the neighborhood of the towns. Panjgur in Makran is celebrated for its dates. Fine camels are bred in large numbers.

The inhabitants are composed of numerous races, the chief of which are the Baluchis or Baloch, the Pathan and the Brahuis, different in their languages, figures and manners, and each subdivided into a number of minor tribes. The Baluchis are of Arabian, Dravidian and Persian stock, and though essentially robbers and raiders have many fine characteristics. The Brahuis are less addicted to predatory violence. Both races are hospitable, brave and capable of enduring much fatigue. Many of them live in rude tents made of black felt or coarse cloth of goat's or camel's hair stretched over a frame of wickerwork. Both Baluchis and Brahuis are Mohammedans of the Sunnite creed. Both are less violent and bloodthirsty than the Pathan. The Baluchi language resembles the modern Persian, the Brahu presents many points of agreement with the Hindi. The Brahu are mostly confined to coarse fabrics, a few matchlocks and other weapons, and iron work for agricultural purposes. Leather work and pottery are manufactured in certain parts and the Brahu women do excellent needlework. Overland trade with India is carried on by the Sindhi-Pishin Railway and camel caravans, the chief exports being mustard, rope, raw wool and food grains. The chief exports by sea are dates, matting and dried fish. The Khan, so far as his rule extends, has unlimited power over life, person and property. He usually resides at Kalat, and his rule is almost confined to the country around it. Quetta is the largest town. It is occupied by a British garrison and strongly fortified. Southern Baluchistan was the ancient Gedrosia, described by Herodotus and Strabo and Alexander the Great. The country was ruled by Hindu princes until the end of the 17th century when it was subdued by the Brahu under their leader, Kumbar, who had been summoned to assist the Hindu rulers against the tribesmen. A descendant of Kumbar, Nasir Khan, was confirmed in his authority over numerous tribal chiefs by the celebrated Nadir
Shah, ruler of Persia, who overran Baluchistan during his invasion of Hindustan in the middle of the 18th century, as Khan of Kalat. Nasir proved himself the ablest ruler who ever governed the country. On his death in 1795 he left it in a fairly prosperous condition but it suffered later from intestine wars and its boundaries have been curtailed. In 1839 when the British were advancing toward Afghanistan the treacherous conduct of the Khan led to the capture of Kalat by General Willshire. In 1854 a treaty was executed between the British government and Nasir Khan II under which he received a yearly subsidy of 50,000 rupees which was later raised to 100,000 rupees. British residents were appointed to the court of the Khan but the country was considered independent until 1877 when the cantonment of Quetta, now the headquarters of the administration and terminus of the Indian railway system, was occupied by British troops. In 1879 the district was taken over by the administration on behalf of the Khan and in 1883 was made over to the British by the Khan together with the district of Boult for an annual quit-rent. Other districts have also been assigned to Great Britain and go to make up British Baluchistan (about 9,096 square miles), administered by a chief commissioner under the governor-general of India. Other territories under British control have an area of about 45,132 square miles. Kalat and Las Belas, formerly a fief of the Khan of Kalat, are under the control of a British political agent in Kalat. Their combined area is 80,410 square miles. There are 832 miles of metalled and partly metalled roads in the whole of Baluchistan. In 1917 there were 782,646 Mohammedans, 37,602 Hindus, 8,390 Sikhs and 5,085 Christians. In 1916 there were 73 government and aided and unaided schools with 3,263 pupils and 70 private schools with 865 pupils.

BALUCKI, ba-loots'ke, Michael, Polish author, known under the pseudonym ELIPIDON: b. Cracow, 29 Sept. 1837; d. 1901. As a storyteller he had shining gifts — a brilliant style, free and spontaneous humor — and in both novel and comedies held up to a genial ridicule the shortcomings and prejudices of Polish society. Among his principal works of interest may be mentioned: The Awakening (1863); The Young and the Old (1866); Life Among Ruins (1870); The Jewess (1871); For Sins Not Committed (1879); 250,000 (1883). The best among his comedies are The Chase After a Man (1869); The Emancipated (1872); Amateur Theologian (1877); The Town Council (1880); The Open House (1883); Miss Valerie (1891); The Burgomaster of Pidpowska (1894).

BALUSTER, or BALLISTER, a kind of short column, sometimes in the form of an ancient Greek capital, sometimes made after the model of Greek and Roman columns, employed in the construction of balustrades.

BALUSTRADE, a series of balusters surmounted by a rail, and placed as an ornament on large buildings, above the cornice, or as a protection to enclose bridges, stairs, balconies, altars and the like.

BALUZE, ba-loz, Etienne, French scholar and historian: b. Tulle, 24 Dec. 1630; d. Paris, 28 July 1718. He early acquired distinction by his varied and thorough knowledge, and was called to Paris by the celebrated Colbert, who commissioned him to make up his private library. In 1707 he was appointed to the superintendence of the royal college, and dismissed from that office in 1709, being suspected of having in his Histoire Généalogique de la Maison d'Avrigny, designedly established, by documentary evidence, that the princes of Bouillon were descended from the house of Guerre, counts of Avrigny, and therefore owed no allegiance to the king of France. Such an offense could not be forgiven; and Baluze, deprived of nearly all his income, was compelled to reside successively at Blois, Tours and Orleans, and not until after the conclusion of the Peace of Utrecht was he permitted to return to Paris. He was of the most amiable temper, and his wit was equal to his cheerfulness.

BALVANY, the Magyar name for idol, found in mediaeval Latin documents of Hungary, and also in Hungarian geography, applied to various heights which were the last strongholds of paganism in the 11th century.

BALVAS, Antonio, Spanish poet: b. Segovia in the middle of the 10th century; d. 1069. He wrote El poeta Castellano (1027), a work highly praised by Lopez de Vega.

BALLY, William, English physician: b. King's Lynn 1814; killed in a railway accident near Wimbledon, 28 Jan. 1861. He studied at University College and Saint Bartholomew's Hospital, London, in Paris, at Heidelberg and Berlin, where he received his M.D. degree in 1830. He commenced practice in London, and in 1840 was appointed physician to H. Bank penitentiary, where he attained a reputation as an expert in the hygiene of prisons, on dysentery and cholera. He was appointed lecturer at Saint Bartholomew's Hospital; became a fellow of the Royal Society in 1847; in 1859 was chosen as one of the physicians to the royal family, and later became censor to the College of Physicians and Crown representative in the Medical Council. He wrote Diseases of Prisons; Gulsthorian Lectures on Dysentery (1847); translated from the German Muller's Elements of Physiology and Recent Advances in the Physiology of Motion, the Senses, Generation and Development; and, with Gull, wrote Epideemic Cholera (1854).

BALZAC, bahl-zak' Honoré de [French novelist: b. Tours, 16 May 1799; d. Paris, 17 Aug. 1850. His family was of no account, and the aristocratic de adopted perhaps in good faith) dates from 1830 or thereabouts. The surname itself seems to have been properly
spelled Balsa, or Balsas, the first to alter it being the novelist's father, whose parents were peasants in Languedoc. Throughout the earlier Balzac's career, except that he was at one time a lawyer and later an officer in the commissariat; he married past middle age, and at the time of Honoré's birth filled certain municipal offices in the city of Tours. He is represented as a whimsical character, an aristocratic but indulgent, with a wonderful memory, and full of schemes for making millions and reaching the age of 100. His wife, whose name was Sallambier, had good looks and a fortune; she is said to have been pious and imaginative, and devoted to her children's welfare, but by no means outwardly tender to them. At any rate Honoré and his favorite sister Laure (afterward Madame Survile), if not her two younger children also, were brought up very strictly.

He was sent to school early with the Oratorians of Vendôme and was as miserable there as his Louis Lambert. All he learned was by desultory reading, and that in books too deep for his age. His masters thought him dull and his parents, who had expected a brilliant pupil, and at home not only his talents but the ambition to write which had already seized upon him remained quite unsuspected. In 1816 he was put into a lawyer's office and 18 months later began to work with a notary, both his chiefs being intimate friends of the family; at the same time he attended various lectures at the Sorbonne, and was becoming familiar with the great writers of his country. His mind was made up to devote himself to literature, when in 1819, M. de Balzac, who had recently lost money in speculation and was about to retire, announced to Honoré that his friend the notary offered to take him into partnership with the prospect of succeeding to his practice. Honoré resisted, and begged for a chance to show his literary abilities; time to pour in his father's house to give him his way and, while the family made its own home at Villeparisis, he was installed in an attic near the Arsenal Library on a two years' trial of his powers, with an allowance barely sufficient to keep him from starving. Here in cold and hunger and solitude, but supported by his unconquerable gaiety and self-confidence, he set to work first on two tales which were soon to be finished, then a comedy, partly a tragedy in verse, 'Cromwell,' which he firmly believed to be a masterpiece. He brought it home with him in the spring of 1820; the family yawned when he read it, and a friend to whose judgment this first composition was submitted, Andréeux, the academician and professor, recommended the young man to try his hand at anything in the world but literature. He had only spent 15 months of his probation, but his mother insisted that he should now live at home; privations had already told upon his vigor, and he was obliged to recruit in Touraine before settling down at Villeparisis. There, nothing discouraged, in the next five years he wrote, with different collaborators, no less than 31 volumes of fiction, and found publishers for them. Of the entire worthlessness of this early work he was perfectly aware; it appeared under various pseudonyms ("Horace de Saint-Aubin" was the favorite), and when long afterward in great distress for money he allowed it to be republished, he would never acknowledge the paternity.

It was at this time that he became acquainted with the Berny family, then resident at Villeparisis, and formed with Madame de Berny—a woman more than 20 years older than himself—a close friendship which lasted until her death in 1836, and to which he owed perhaps the most generous and disinterested sympathy that he ever received from man or woman.

In 1824, determined to win his independence, young Balzac returned to Paris and set up business as a publisher on borrowed capital. He had a great scheme—the first of many for making a fortune by bringing out one-volume editions of the French classics, and began with Molère and La Fontaine; but chiefly for want of proper advertising the venture failed. He next became a printer, having induced his father to advance him the sum necessary to buy the stock and start a press. He bought and seeing a type-founding offered at a bargain he presently acquired that also. It was a most disastrous speculation; bankruptcy was only averted by the help of his mother and of Mme. de Berny, and this was the beginning of his life-long indebtedness.

Before his business was wound up Balzac was already at work, in a room in the Rue de Tournon, upon the first novel to which he signed his name, 'Les Chouans!' was finished during a visit to Tourange, in the district which is the scene of the historical events it describes, and published in 1829 with some success. The rather cynical manual called 'La Physiologie du Mariage' followed; then a number of shorter stories, and, in 1831, 'La Peau de Chagrin'—with which book his reputation was fairly established. Publishers and editors now sought for his work, and the curiosity and interest his writings already excited are attested by the anonymous correspondence which began at this time. It was this correspondence that in 1830, made the acquaintance of two women, the Marchioness de Castries and Mme. Hanska, whose names cannot be omitted from any account of his life. For Mme. Castries Balzac conceived a transient, but certainly strong passion, which seems to have only gratified the vanity of a rather heartless but very intelligent great lady; she made a playing of him; but he owed to her her most genuine insight into the manners, traditions and ideals of the close society of the Faubourg Saint-Germain. Her portrait, it is conjured, may be found in 'La Duchesse de Langeais.' Mme. Hanska, a Polish lady of noble birth, married to a Russian in the Ukraine, was the object of his deepest and most enduring affection, and finally became his wife. His letters to this 'Etrangère' have in recent years been published; they are discreet, frequent and voluminous, for these friends or lovers were seldom together, even after the death of M. Hanska, until the last two years of Balzac's life. His biographers have little tenderness for Mme. Hanska; hers was certainly an inexhaustible nature; her love for her only child, the Countess
Anna (afterward Mme. Mniszech), seems to have almost excluded other affections; she cared excessively for her rank and her comfort; tortured the great man by long deferring to fulfill her secret engagement with him, and in his last illness appears to have shown herself incredibly calculating. Mme. Honoré de Balzac lived until 1862.

Balzac’s story, from 1830 onward, is mainly the story of his herculean industry; and the most memorable dates in his life are doubtless those of the production of such masterpieces as ‘Le Cousin Pons’ (1834), ‘La Cousine Bette’ (1846), ‘Le Père Goriot’ (1834), ‘La Recherche de l’Absolu’ (1833), ‘Les Paysans’ (1844–45), ‘Illusions Perdues’ (1835–41), ‘Le Cousin Pons’ (1844–45). Between 1830 and 1846 he wrote no less than 79 novels, besides much other literary work. After that date his literary activity slackened somewhat as his health began to fail. But during a considerable number of years, for long periods at a time, never without a professional illness that lasted 12 hours or 24, he labored, often worked for 15 hours, or even for 20 at a stretch, supporting himself on a lean diet in which fruit was always an important element, and drinking as much coffee as the philosopher Kant. But he was never out of harness, even during his frequent absences from Paris — whether staying with friends in the French provinces, or art collecting in the north of Italy, or mine-prospecting in Sardina (one of his most extraordinary ventures), or visiting Mme. Hanska at Genneville in Berlin or St. Petersburg. These travels, a short-lived journalistic enterprise — ‘La Chronique de Paris’ — several excursions into drama, more than one attempt to force the doors of the French Academy, and many quarrels with the press — a lawsuit with the ‘Revue de Paris’ made some stir in 1836 — are the chief outward events of Balzac’s maturity. Throughout his career the money question is distressingly prominent, and the history of Balzac’s liabilities is long and tawdry and complicated. The debts he made by his pen were very considerable; but his optimism was at least as great as his acquisitive faculty. No man was more capable of penurious living; none loved luxury better; but decent comfort and regularity were beneath or beyond him. Spells of asceticism were succeeded by fits of extravagance: the story of his suburban property Les Jardies, of his famous walking-stick, of the financier Goujon’s house in the Rue Fortunée (now Rue de Balzac), which he bought for his future wife and spent half a million in filling with works of art — the very works described in ‘Le Cousin Pons’ — balances the story of his sacrifices, privations and his games of hide-and-seek with creditors. He was a born speculator; he was also the most generous of men, and sometimes unfortunate in the objects of his generosity.

The strain entailed by Balzac’s way of living and by his constant mental agitation was such as no constitution — and his was extraordinarily robust — could bear. Very long illness affected his health; and from 1845 onward he was rarely well. It was during his second stay at Vierzschovnia, Mme. Hanska’s property in the Ukraine, that his health began to give serious anxiety. For a time he improved; but the climate, the uncertainty in which he was kept as to the reward of his long devotion, certain material obstacles to his marriage, the necessity of conducting his literary and other transactions by proxy, the anxieties of the political situation in France, misunderstandings with members of his own family, and the effort to force himself to work when work was beyond his failing physical powers, all hastened his end. His marriage was solemnized at last in March 1850, at Berditchew, in Poland; rather more than two months later Balzac arrived in Paris with his bride. He was a dying man, though he clung almost to the last to the hope of living to finish ‘The Human Comedy’, and extinguish what was left of his debts. Victor Hugo was among those who visited his deathbed, and the same great poet it was who paid a splendid tribute to his friend and peer at the graveside in Père Lachaise. Occurring in the midst of a grave political crisis, his early death might have been expected; but though widely read and fervently admired among his contemporaries — more especially perhaps in foreign countries — it wanted at least another generation to assure his fame; nor (thanks to a combative spirit and an ingenious vanity) did he lack enemies; though the mere dedications of his novels are enough to show that his friends were among the elect of his age, and it is impossible to read his correspondence without a feeling of respect, and even of affection, for a personality so rich, so valiant, so tenacious and so kindly.

It is best, in so slight an estimate of Balzac’s colossal achievement as can be attempted here, to leave out of account not only the worthless fiction of his monograph but also his plays, of which only one, ‘Mercadet’, first called ‘Le Pâquier’, and produced with considerable changes after its author’s death, can be said to have won or deserved success. An exceptional place belongs also to the ‘Merry Tales,’ not so much in virtue of their notorious, guileless and justly satirical humor because, while the form is more essential than in anything else he wrote, they are among the very few skilful parodies in literature — for the lapses they contain from either the language or the atmosphere of the early French Renaissance are astonishingly few — in which the mere erudition does not replace or overshadow other merits. They are memorable for their genuine zest, inventive vigor and shrewd humanity.

Balzac’s glory, of course, is that unfinished series of masterpieces called ‘The Human Comedy,’ which it is necessary to consider as one work in order to appreciate the audacity and breadth and steadiness of aim which are essential titles to his rank, not merely as the father of the modern novel and the supreme master of the craft, but as a genius of the universal order. In its most obvious bearing, it is an imaginative reconstruction of French society in every part and aspect, with all the vicissitudes and variety. From the Revolution and the middle of Louis Philippe’s reign: an heroic design, less comprehensive in regard to time and space than that of the Waverley novels, but more consistently and co-
herently executed out of more copious material. The picturesque, however, was subordinate to the philosophical interest, as he conceived it, of Balzac's undertaking. He intended his work for nothing less than a natural history of civilized man, which should illustrate the war between the passions of the individual and the social instinct or the common interest, the differentiation of types by the action of gregarious life, the reflection of personality in matter and the stamp of habits and calling upon character. The theory outlined by Buffon and bequeathed by Geoffroy Saint Hilaire to the first generation, which supposes a single original pattern of organic creation varied by the mere efforts of environment, fascinated Balzac by a partly chimerical but, at any rate, suggestive analogy with human existence. Does not society, he asked in his general preface of 1842, "make of man, according to the sphere in which his activity develops, as many different men as there are species in zoology?" This conception is enough to explain one great characteristic of his novels — the importance attributed in them to the accidental, the local, the casual conditions, to all that the older novelists had regarded as accidental and accessory. It is Balzac who set the example of bestowing as much care upon things as upon men in works of fiction. The description of streets, houses, furniture and works of art, of implements and equipages, of dress and pastimes, of customs and offices, business and procedure and, in particular, of all that pertains to money, is throughout 'The Human Comedy,' not only exact and elaborate (sometimes to the point of tediousness and disproportion), but above all significant. Séchard's printing-press and Gaudissart's advertisements, the laboratory of Balthazar Claes, the aroma of Maman Vauquer's dining-room, are part and parcel of those famous personages.

The French imagination had tended for some time to desert that psychology in abstracto which had been at once the glory and the limitation of the great classical authors, and to pay more attention to the setting, and the background of fictitious characters. Diderot particularly, who on several grounds might be called a herald of Balzac (and resembled him in vitality, variety of knowledge, fertility, hasty and unequal execution), had done much to carry into pure literature a spirit of curiosity about the common things of life, a new multiplicity of interests and concern for reality, and some of the results of natural science. But the romantic contemporaries of Balzac, most of whom were irresistibly allured by the prestige of the old and the distant, used the extension of imaginative matter to enhance the picturesque value of descriptions, rather than to enrich the definition of human types; for their interest in characters is generally insufficient, being dependent upon an introspection distorted as often as not by a morbid vanity. Balzac is unique in this, that with a searching modernity of outlook which omits none of the sensible elements of life from his imaginary world, he is yet essentially the restorer of the old, patient, constructive psychology and of the drama of internal action. It is remarkable how much of the spirit of the grand siècle survives in his work; how much of La Bruyère in the brilliant pages of moral analysis, of Corneille in some of his heroes of the will, of Molière in the smiling sanity of his attitude toward a necessary imperfect society, of Racine in the sympathetic presentation of absolute passions and their victims! Balzac's personages — even the secondary figures — are at once individuals and types. They live with the intense life of living men and women; and we accept them as great moral symbols. They are highly differentiated, particularized with an unsurpassable sureness of detail; but they are also, one and all, informed by an alta — so that, though there is only one Goriot, he sums up all the tragedy of a primal affection run to seed and despitefully entrapped; and there is only one Baron Hulot, but he contains all the shame of elderly profligacy, bringing disaster on whole families; and César Birotteau is inimitable, but he stands for all that is sterling as well as all that is ridiculous in the middle class.

In the vitality of his creatures Balzac is not inferior to Shakespeare himself. But we believe not only in the people he made, but in the whole world of his novels, which we accept as a rival of reality. This mastery of illusion, the very highest virtue in a writer of fiction, does not depend upon veracity or exactitude of detail (a test which upon the whole he sustains triumphantly), but is simply the power to imagine strongly. It is true that in this case a system of composition which discarded chapters, or rather made of each novel (by the continual reappearance of old friends among the characters) a chapter in the whole work, is a powerful help to illusion; so too is the accumulation of circumstances, and especially perhaps the variety and distribution of interests, in which Balzac's astonishing invention seems to play the part of chance.

The work of Balzac displays at one view the whole capacity of the form of literature called fiction, its scope and possibility of content. The ordinary tone of the French novel had once been heroic and pastoral; then it had tended to caricature and to the parodying of court memoirs; and later had descended into one class by showing the manners of another. The picturesque romance had been succeeded by "realistic" satires upon society and, with the advent of the philosophes, the novel became a pamphlet, a vehicle of moral or political doctrines. Perhaps all these phases are represented in 'La Comédie Humaine'; the novel according to Balzac is simply a universal instrument like Homer's epic or Shakespeare's drama. The ineffaceable mark of his achievement upon his successors is that, since Balzac, the novel in France is not a toy but a serious art. Balzac indeed would not have been content with the qualification; half the preface already referred to is an apology for the novel considered as a work of science and a means of propaganda, and to his mind his chief merit was his adherence to his precept rather than to his practice — must be traced the arrogant pretensions of some modern writers of fiction, their sermons and sociology and what Flaubert so disdainfully called their manie de conclure. A work of imagination does not need the protection of a medical creed or a scientific hypothesis; it is Balzac's weakest side that, while he sinks what we call his personality almost always, he frequently obtrudes fallible
opinions—matter for argument—into the domain of the imagination. His royalism is an interesting fact, but in his novels it is irrelevant; the same is true of many of his political prophecies. It should be added that he seldom intervenes directly in the discussion of scientific theories (which hold a somewhat important place in his novels), though with characteristic credulity he identifies himself expressly with the speculations of the phrenologists! There was a mysticism in Balzac and that section of his work, 'Philosophical Studies,' which deals with the solitary adventures of the mind in regions beyond the world of sense, is strangely original and fascinating.

He was, in some degree reluctantly, an artist—a prodigious though an imperfect artist. His defects of form have been exaggerated. His style, like Saint-Simon's, is vigorous and vivid in default of correctness, and full of fortunate phrases; but he was wanting in the sense of idiom, and the effort to condense his thought often produced a clumsy syntax and obscurity. Haste no doubt accounts for some base coinage, repetition and inadequate expressions. As of other writers of his stature it may be said of him that his fecundity was necessarily wasteful, so that a part of his work is greater than the whole. This exuberance, a certain worship of the excessive, a stupendous confidence for which no design is too large, and a preference for the expressive over the symmetrical, for color over draughtsmanship, are characteristics which he shares with several great Frenchmen of his generation—the generation conceived in camps and lulled by the guns of Austerlitz, which grew up haunted by a vision of heroic accomplishment. Honoré de Balzac stands beside Victor Hugo and Jules Michelet and Hector Berlioz and Eugene Delacroix—a giant among giants, a perennial force among the intellectual forces of the world. See Pére Goriot; Eugenie Grandet; César Birotteau; Magic Skin, The.

Bibliography—The best edition of the complete works of Honoré de Balzac is the 'Edition Définitive' (in 24 volumes, Paris 1869-76). Uniform with it are the letters to Mme. Hanska, 'Lettres à l'Etrangère,' posthumously published in 1869. There are numerous English translations of individual novels. Prof. G. Saintsbury in the general edition of a complete English translation of a 'Human Comedy,' by various hands, in 40 volumes (London 1895-98). The letters to Mme. Hanska have been translated by D. F. Hannigan—'Love Letters of Balzac' (London 1901). Among biographical and critical studies of Balzac the more valuable are the following: L. Gozlau, 'Balzac chez lui' (1862); E. Biré, 'Balzac' (1897); Le Breton, 'Balzac, l'homme et l'œuvre' (1905); F. Brunaire, 'H. de Balzac'; Vicomte Spoeth-Boecher de Louvenjouil, 'Histoire des œuvres de Balzac' (1880); La Genèse d'un Roman de Balzac—Les Paysans (1901); 'Un pays perdu d'H. de Balzac' (1903). The short life of his brother by Mme. Guirville (Laure de Balsac), first published in 1888, is included in the volume of the 'Edition Définitive' containing Balzac's general correspondence. In English Mr. Frederick Wadmore has written a 'Life of Balzac'; and a better-informed study by Miss M. F. Sanders appeared in 1904. Consider also Chapman, J. J., 'Great Genius'—including Euripides, Shakespeare, Balzac (New York 1915); Faguet, E., 'Balzac' (Paris 1913, and trans. with notes Boston 1914); Gillette, F. B., 'Title Index to the Works of Honore de Balzac' (Boston 1909); James H., 'Notes on Novelists' (New York 1914); Lilly, W. S., 'Balzac Re-Read' (Nineteenth Century and After, New York 1916).

F. Y. Eccles.

BALZAC, Jean Louis Guez de, French essayist and letter writer: b. Angoulême 1597; d. 18 Feb. 1654. In his youth he was secretary to Cardinal La Valette at Rome. He returned to Paris, devoted himself to literature, and under Richelieu became councillor and historiographer of France, and was one of the most influential members of the Academy from its foundation, likewise a sort of oracle of the Hôtel Rambouillet. His influence on French prose is ranked with that of Malherbe on poetry. Besides his 'Letters' (1624), which are elaborate epistles with an attempt at style, he wrote 'The Prince' (1631), a glorification of absolute monarchy; 'The Dotard' (1648); 'The Christian Socrates' (1652); and 'Aristippus' (1658); the latter intended to portray the ideal statesman. His 'Letters' were edited by Laroque (1874).

BALZANI, bål-t sø-te, Ugo, Count, Italian historian: b. Rome, 6 Nov. 1847. He received his education at the university of his native city. He soon became distinguished as a brilliant scholar in his chosen field of history and received many honors at home and abroad. He is president of the Reale Società della storia patria, member of the Reale Accademia dei Lincei and of the Instituto Storico Italiano. He received the honorary degree of Litt.D. from the University of Oxford and was elected a corresponding fellow of the British Academy. His publications include 'Le cronache Italiane nel Medio Evo,' 'Il Regesto di Farfa di Gregoriodi Catino' (1879); 'The Popes and the Hohenstaufen; II "Chronicon Farfense"'; 'Il Sisto V'; 'Early Chroniclers of Italy' (1883)—besides many contributions to the transactions of the various institutions, Italian and foreign, of which he is a member.

BALZICO, bål-te'kō, Alfonso, the most prominent Italian sculptor of his time: b. at Cava di Tirreni, near Salerno, 1825; d. 1901. He received his early art education at the Academy of Naples, finishing his studies in Rome. For his royal patron, Victor Emmanuel I, whose capital was then at Turin, he produced his masterpiece in 1867, the equestrian statue in bronze of Duke Ferdinand of Genoa. His subsequent life was spent in Rome, which had become the national capital. His nude 'Cleopatra' received the gold medal at Paris in 1900, and among his other works are 'John the Baptist,' 'The Free,' the marble monument of 'Bellini,' the musical composer, and 'Victor Emmanuel' in bronze, the two latter in Naples.

BAMBARRA, bäm-bär'ra, west Africa, a negro kingdom lying at the point where 5° W. long. and 12° N. lat. cross. It was first visited by Mungo Park. In the east the country is flat and swampy; but in the west there are low chains of granite hills. The climate in some parts is intensely hot, but generally healthful.
The land is well watered and fertile. The rainy season is from June to November. Cotton, maize, yams, corn, rice and many kinds of fruit are raised. The principal towns are Sego, Sansandin, Yamina and Bammako. Many local merchants are very wealthy, and a quite extensive trade is carried on, the natives working in gold, ivory and iron. In 1881 a treaty with the Sultan of Sego opened up the country to French traders. The region is a part of the French West African colony of upper Senegal and Niger. The inhabitants are heathens of mixed negro and Phalan blood and belong to the Mandingo family. They number about 2,000,000, are a mild and industrious people, but, despite the fertile soil and their thrifty habits, they have been reduced to the destitute poverty by their Mohammedan oppressors, the Turco-Shahs.

**BAMBERG, bāmˈbərɡ, Bavaria, town in upper Franconia, on the navigable Regnitz (which here divides into two), three miles above its junction with the Main, partly on a plain, partly on hills, amid vineyards and gardens, 30 miles north of Nuremberg. Its chief edifice is the Roman Catholic Cathedral, built in the 12th century, and forming one of the finest examples of the transition from the Romanesque to the Gothic style with four towers, a noteworthy portal and interesting sculptures and monuments. Other buildings include the old palace or residence; another palace, formerly occupied by King Otto of Greece; the former castle of the prince-bishops of Bamberg, etc. The educational institutions include a college or lyceum, an old and a new gymnasium, a Roman Catholic seminary, an observatory, etc. There is a library containing 300,000 volumes, with valuable manuscripts and early printed books. There are manufactures of cotton and woolens, besides other industries, such as market-gardening and seed-growing, brewing, etc. The industries consist chiefly of the manufacture of beer, cotton, woolens, gloves, furniture, musical instruments, shoes and leather goods, tobacco, sugar, starch, etc. The city's government is in the hands of a municipal council of 42 members and an executive board of 19, elected by the former. The United States is represented by a resident consul. Pop. (1910) 48,063.

**BAMBERGER, bāmˈbərɡ-ər, Heinrich von, Austrian pathologist: b. Prague, 1822; d. 1888. He was graduated in medicine in 1847, and became professor of special pathology and therapeutics, first in the University of Würzburg, and in 1872 in the University of Vienna. Of his numerous publications, two have been held in particularly high esteem, 'On the Diseases of the Chylopoietic System' (1855), and 'Treatise on Diseases of the Heart' (1857).

**BAMBERGER, Ludwig, German statesman: b. Mainz 1823; d. 1899. Born of Jewish parents, he was educated at Giessen, Heidelberg and Göttingen; took part in the revolution of 1849, consequently was driven into exile and returned on the amnesty of 1866, and was a member of the German Reichstag 1873–80. He was an advocate of free trade, and on account of his opposition to Bismarck's economic policy, he left the party and joined the "Secessionists," a group which later became a part of the German Liberal party. His publications include 'Monsieur de Bismarck' (of which there is an English translation); 'The Five Millionists'; 'Germany and Socialism', and a volume of reminiscences.

**BAMBOINO, bāmˈbo-ne, Ital. "child," the figure of our Saviour represented as an infant in swaddling clothes. The 'Santisimo Bamboino' in the Church of Ara Coeli at Rome, a richly decorated figure carved in wood, is specially venerated and is often the object of impressive religious demonstrations.

**BAMBOCCIADIES, bāmˈbo-kə-ıˈdēz, paintings generally grotesque, of common, rustic or low life. The name is derived from the nickname of Peter Van Laer, a Dutch painter of the 17th century, who, on account of his deformity, was called *bamboccio* (cripple). Teniers is the great master of this style.

**BAMBOO, the common name of more than 200 species of about 20 genera of perennial, mostly tree-like, tropical and sub-tropical grasses unevenly distributed throughout the world, but more abundant in southern Asia, where 160 or more species are found from sea-level to altitudes of 10,000 feet or slightly more in the Himalayas; and next most plentiful in America, where there are about 70 species, some of which reach elevations of 15,000 feet in the Andes. Occasional specimens of the larger species attain a height of 120 feet and a girth of three feet. From the jointed rootstock the numerous jointed, usually straight and erect, but sometimes crooked or creeping stems grow without branches until the full height is reached, when a more or less dense thicket of horizontal limbs is developed, and the great panicles of flowers appear.

The number of uses to which these plants are put rivals that of the palms. In fact the various species can be utilized for man's every purpose. The light, elastic hard stems, hollow or slightly pithy, except at the points, which have strong partitions, are used for hedges, masts, poles, posts, fishing-rods, etc.; when the partitions are removed, for waterpipes; when sawed in sections, for pails (the natural partitions serving as bottoms), cooking-utensils, life-preservers, bows, arrows, quivers, walking-canes, flutes and smoking-pipes; for ropes, nets, hats, fishing-rods, wicker-work and umbrellas. Parts of the leaves of some species are used for paper-making, thatch and hats; the young shoots of some are used as food, either boiled or pickled; the seeds, for food and for making a kind of beer; some of the spiny species are planted as hedges for defense against foes, animal and human.

Some species yield "Indian honey" (so called by the Greeks), the air-dried saccharine exudations from the nodes. Sometimes this substance is called tabaris or tabasheer (q.v.), which is properly a phosphorescent substance obtained from other species and from related grasses. Many of the species are of exceedingly rapid growth; even in greenhouses specimens have been known to attain a height of 20 feet in two months or even less time. In arid climates the bamboos are often of great value, since they are among the few plants that will grow in such places. Many species are cultivated for ornament, not only in warm countries, but in greenhouses. Some species thrive in climates where the thermometer does
not fall much below the freezing-point. In general the hardy species do best in deep, rich soil and warm situations protected from severe winter winds. The roots should be given a protective mulch of litter in autumn, and this should be allowed to remain during the summer as a protection against drought. For an account of ornamental bamboo culture in greenhouses and out of doors, and of the ornamental species grown in America, consult Bailey, 'Standard Cyclopedia of Horticulture.'

**BAMBOO RAT**, a name given to several species of mole-rats, of the genus *Rhizomys*, found in the bamboo jungles of India.

**BAMBOUGH, bäm'bûr-ô**, CASTLE, an ancient English castle on the coast of Northumberland, formerly with its connected estate the property of the Forsters, and forfeited to the Crown in 1715, both being purchased by Lord Crewe, bishop of Durham, and bequeathed by him for charitable purposes.

**BAMBOUK, bam-book', or BAMBUK,** west Africa region in the French colony of Senegal, between the Falémé and Senegal rivers, between lat. 12° 30' and 14° 30' N.; long. 10° 30' to 12° 15' W., and estimated to be about 140 miles in length by 80 to 100 in breadth. Besides the Senegal, its tributaries, the Falémé and the Bafing (or upper Senegal), form its natural boundaries. A considerable part is somewhat rugged, though not very elevated, the highest points seldom exceeding 600 feet. The valleys and plains are remarkably fertile. The baobab, calabash, tamarind, with a variety of acacias and palms, reach the utmost limit of their fruitfulness; maize, millet, cotton and a multitude of leguminous plants grow almost without culture, and rice is produced in the lowlands, which are subject to inundation. Its unhealthiness, however, makes it almost uninhabitable by Europeans. The animals comprise lions, leopards, elephants, wild cattle, crocodiles, etc. Gold is found in abundance. It is carelessly worked, and is given to traders in exchange for salt, an article in great demand, and various other goods. Bambook is more sparsely inhabited than the country north of it. Mandingoes and form a considerable number of communities or confederations more or less hostile to each other. They ostensibly profess Islam, but practically they are pagans and of a very ferocious disposition. The country has latterly been fully explored by the French, who are developing its resources and have constructed a railway along the Senegal from Kayes to Batoulâ. In the 15th century the Portuguese, allured by the fame of its gold, invaded Bambook, but ultimately perished almost to a man, partly through intestine dissensions and debauchery, and partly by the weapons of the natives. It has been under French protection since 1858. Pop. about 800,000.

**BAMIAN, bâ-me-'ân', a valley and pass of Afghanistan, the latter at an elevation of 8,496 feet on the main pass over the Hindu Kush for artillery and heavy transport. The valley is one of the chief centres of Buddhist worship and contains two remarkable colossal statues and other ancient monuments.

**BAMMAKO, bâ-mâ'kô.** See Bambarrka.

---

**BAMPTON LECTURES**, a course of lectures established by John Bampton, canon of Salisbury, who bequeathed certain property to the University of Oxford for the endowment of eight annual divinity lectures to be annually delivered. The subjects prescribed are the Confirmation of the Christian faith and practice; the divinity of Christ; the divinity of the Holy Ghost; the Apostles' and Nicene creeds. The lecturer must have the degree of M.A. at Oxford or Cambridge, and the same person may not lecture twice. The first course of lectures was delivered in 1780, and they have been delivered every year since, with the exception of 1834, 1835 and 1841. A list of the lectures will be found in the yearly 'Historical Register of the University of Oxford.'

**BAN, bân, Matija,** Slav poet: b. Dubrovnik, Ragusa, 1818; d. 1903. He received a good education in his native place, including a thorough knowledge of French, Latin, and Greek. He traveled extensively in the Balkans, and in 1844 became tutor to the daughters of Prince Alexander Karageorgievich at Belgrade. He was editor and publisher of the literary-scientific periodical Dubrovnik in the city of the same name in 1849–53. In 1854 he became instructor in French and Italian in the Belgrade Lyceum, but the adverse criticism on his ode addressed to the Sultan obliged him to resign this post and he thereafter devoted himself to literary pursuits and travel. His works include the Italian lyrics, 'Il terremoto di Ragusa'; 'Il Moscovito'; 'Radimiro'; 'The Woman's Educator' (3 vols., Belgrade 1847), written for the young princesses to whom he was tutor; a drama, 'Mejrima'; 'Various Songs' (1834), and the tragedies 'Dobvilo et Milenka'; 'Tsar Lazar'; 'The Death of Prince Dobroslav'; Jan Hus' (1884); 'Martha the Stattholder; or, The Fall of Novgorod the Great' (1881).

**BAN, the title of the governors of certain military districts in the eastern part of Hungary, corresponding to our county. The natives are Magyars who were thrown over the Danube by the Huns and placed under the title of ban of Croatia.** The ban is nominated by the king, swears an oath to the Diet, and formerly had very extensive powers, exercising an almost absolute authority in the political, judicial and military affairs of his district. The progress of Turkish conquests after the unfortunate battle of Mohacs in the 16th century extinguished the most of the banats, and there remains now only the banat of Temesvar, the ban of which is the third great dignitary of the Hungarian kingdom and has the title of ban of Croatia. In Teutonic history the ban was an edict of interdiction or proscription: thus, to put a prince under a ban of the empire was to divest him of his dignities and to interdict all intercourse and all offices of humanity with the offender. Sometimes whole cities have been put under the ban; that is, deprived of their rights and privileges.

**BANA, bâ'na, in Hindu mythology, a thousand-armed demon or giant who was the enemy of Vishnu, but the friend of Siva.**

**BANAK, or BANNOCK, an Indian tribe of Idaho. Its territory formerly extended over**
southern Idaho and eastern Oregon; but the
tribe is now concentrated on the Fort Hall and
Lemhi reservations, Idaho. Those of the latter
reservation are confederated with the Shoshoni.

BANANA. Bà-nà-na, an island in west Af-
erica, north of the mouth of the Congo; also
a seaport of the Kongo Free State, situated on
the island. A few years ago the town was an
important commercial station, but after the
building of the railroad from Matada, and the
establishment of an ocean steamship line direct
to this mouth, its business began to decline, and
at last lost all its trading importance when the
extensive Dutch firms formerly established
there removed their headquarters to Kabinda
and Kisanga, in Portuguese territory.

BANANA. A well-known, edible fruit
produced by herbaceous plants of the same
name, belonging to the genus Musa and sub-
genuss Emusa. More than 60 species have
been described, but four species are of special
importance. Musa sapientum, which includes
the majority of the bananas grown in the west-
ern hemisphere; Musa cavendishii, which is the
species grown in the Canary Islands and in
southern China, and Musa acuminata, the
banana of the East Indies and Malay Archipelago.
Here also should be mentioned Musa paradu-
saica, the, commonly known as the plan-
tain and differing from the banana in taste and in
composition.

The banana is supposed to be a native of the
East Indies or Malay Archipelago, but was
early introduced either by accident or design
into the tropical regions surrounding the Car-
ribbean Sea, and the fruit is now grown in large
quantities in Central America, some portions of
South America and the West Indies, and these
regions constitute the main producing centres
for the American trade and for a portion of
the European trade. The banana is also an
important crop in the Canary Islands, from which
large numbers are shipped to the British Isles.
It grows abundantly through the Pacific
islands. It also grows in the region of the Kongo,
and together with the plantain constitutes one
of the main starchy foods of enormous popula-
tions in all these countries. The bananas of
American commerce are largely of the "Gros
Mâche" type, as it is called, a variety of Musa
sapientum, which produces a firm and finely
flavored fruit with good shipping qualities.
Red bananas are also grown in considerable
quantities. Bananas form one of the principal
articles of export from Costa Rica, Guatemala,
Honduras, northern Panama, northern Colombi-a
and from the island of Jamaica. Nicaragua,
Mexico and Cuba also export bananas in
large quantities. The total number exported
from these regions amounts to from 40,000,000
to 50,000,000 bunches annually.

Cultivation.—Bananas are cultivated on a
large scale in all these countries, differences in
the methods of cultivation depending upon the
soil and climatic conditions. In Central Amer-
ica a new plantation is usually developed from
vegetative shoots, in the rivulets and small
tributary areas by first clearing out the undergrowth,
lining and planting the bits or portions of root
stalk used as seed, then felling the forest,
which in these climates, with abundant rainfall,
quickly undergoes decomposition, adding to the
humus content of the soil. In the course of a
few months the young banana plants will be
several feet high and by that time the smaller
twigs and branches will have broken down
almost completely. Clearing the underbrush
and growth of grass, weeds, etc. from the plant
and in a few months more the banana plants
will have reached almost their full height and
size and occasional cleaning will keep down the
excess of wild growths. The banana plant is
characterized by an underground root stalk on
which occur buds or eyes, which grow out and
up, thus forming a new aerial portion or sucker.
Once the plantation is started, therefore, the
continued development of these buds produces
an over-supply of plants so that the weaker
and less desirable ones are pruned out. In the
course of time there results, therefore, a
large mat of plants surrounding the spot where
the single bit was planted. The banana plant
does not possess a true stem above the ground,
but the pseudo-stem consists of the basal por-
tions of the leaf stalks which overlap one
another and are tightly pressed together, so
that a trunk of from 8 to 15 inches in diam-
eter when matured is produced. When the
plant is fully matured, a bud forms in the root
stalk, grows up through the centre of this mass
of leaf stalks and finally emerges from the
centre of the crown, this emergence being
known as the "shooting." The bud gradually
unfolds and a large number of clusters of
flowers open up. Each of these clusters is
protected in the bud by a thick overlapping
bract. Only the upper clusters of flowers are
fertilized and produce fruit, the lower ones
withering and falling away. The number of
clusters developing fruit is variable, generally
running from 0 to 15. Each cluster is known
as a hand and the individual fruits as fingers.
When the fruit is approaching full develop-
ment cutting takes place, as the fruit is never
allowed to ripen on the plant. The bunch of
fruit is removed and the plant which produced
it is cut down to the ground, as each plant
produces but a single bunch. By a proper
selection and pruning of suckers the cultiva-
tions are, therefore, kept in almost continual
production over a series of years.

The Fruit.—The fruit has a very agreeable
flavor and taste and contains a large amount of
starch and sugar, and is, therefore, of great
value from the food standpoint. Analysis of
the banana shows on the average 75.3 per cent
of water, 1.3 per cent protein, 0.6 per cent fat,
22 per cent carbohydrate and 0.8 per cent ash.
Analysis of the ash shows a high percentage
of alkaline salts, so that from the food stand-
point it is an extremely valuable food, espe-
cially for the production of quick energy. In
calories the banana yields about 450 per pound,
or approximately the same as green, but
higher than any other fresh fruit. Compared with
potatoes, the analysis is nearly the same,
being somewhat higher in fat and lower in
protein, also slightly higher in carbohydrate.
In calories the potato yields 385 per pound
and the banana 460 per pound. The use of the
fruit in the raw condition, it may be used to
advantage as a cooked vegetable.

Other Uses of the Plant.—The tree of the
fruit-producing banana of commerce contains
a certain amount of fibre which might possibly
be utilized in the production of paper and
twine, although up to the present time this has never been developed commercially. The *Musa textilis* of the Philippines, a closely related species, constitutes the main source of the hemp used for cordage and in certain instances the thin leaf blades are used for wrapping purposes.

**BANANA-BIRDS**, any of several small West Indian insect and honey-eating birds that frequent the banana groves, especially the banana-quit (*Certhia florulenta*) of Jamaica, whose pretty ways are described at length by Gosse in his books on the natural history of that island. One species (*C. bahamenstrus*) occasionally visits Florida. All these birds are brilliantly plumaged, usually rich blue with yellow markings, and represent the sun-birds (q.v.) of the Eastern tropics.

**BANANA-FISH.** See *LADY-FISH.*

**BANANAL,** bá-na-nil', also called *SANTA ANNA*, an island in Brazil, formed by the river Araguaya, in the province of Goyaz. Its length is 200 miles, breadth 35 miles. It is covered with dense forests, and has in its middle an extensive lake. Soil, fertile. Also the name of several small villages in Brazil.

**BANAS,** bá-nás', a common name for rivers in Bengal, of which the most important are: (1) a river of Shuita Nagpur, Bengal, having a northwest course of about 70 miles and falling into the Sone, near Rampur; (2) a river which rises in the Arravalli Mountains, and, after a southwesterly course of 180 miles, is lost in the Runn of Cutch; (3) a river of Rajputana, also rising in the Arravalli Mountains, flowing northeast through Mewar for 120 miles, then southeast and falling into the Chambal, after a total course of 300 miles.

**BANAT,** Hungary; Banat, term applied to any district ruled by a ban (q.v.). A large and fertile region, consisting of the counties of Temesvar, Torontal and Krassó-Szörény; principal town, Temesvar. The Banat is one of the most fertile and best cultivated districts of Hungary. To its mild climate and rich soil, abundant crops of grain and fruits are raised, while the mountains contain rich mineral deposits, especially coal. Among its numerous mineral springs, the best known are those of Mehadia, in Krassó-Szörény County. The Banat, which from 1652 to 1716 was under Turkish dominion, became uninhabited and covered with forest and marshes, but was reclaimed under Maria Theresa, who drained the land by means of canals and by free grants of land induced a considerable immigration from Germany, Turkey and Serbia, thereby laying the foundations of its present prosperity. In 1779 it was united with Hungary. It was formed into an Austrian crownland in 1849 but was restored to Hungary in 1860. The population exceeds 1,500,000.

**BANBRIDGE,** Ireland, a market town in County Down, 22 miles southwest of Belfast, situated on the Bann. It has an Episcopal church in the Gothic style, and several other churches. It is a thriving seat of linen manufacture. It is all stage from the preparation of the soil for the flax seed to the finishing of the finest linen. Miles of bleaching-greens exist in the vicinity, while there are numerous factories along the Bann. Pop. (1911) 5,101.

**BANBURY,** England, a municipal borough and parish of Oxfordshire, on the river Cherwell and the Oxford Canal, 22 miles north of Oxford and 86 northwest of London by rail. Its strong castle, built about 1125, was demolished during the Great Rebellion, when Banbury was noted for Puritanical zeal in 1649 the Yorkists were defeated in the vicinity. The town is still famous for its cakes and ale, as in Ben Jonson's day; and it manufactures webbing, agricultural implements and rope. Among the buildings are the parish church (1797) and the town hall (1834). Pop. (1911) 13,458.

**BANC** (Lat. *Bancus*, Ger. Bank, a bench), legally a seat or bench of justice, and in this sense has given rise to the expression in courts of common law, "sitting in banc," or in *banc* —that is, sitting together on the bench of the respective courts.

**BANCA,** bán'ka, *BANKA*, or *BANGKA*, an island of the Malay Archipelago, Dutch East Indies, between Borneo and Sumatra; area, 4,446 square miles. Long and narrow in outline, and hilly in the north and south, the greater part of the area is heavily timbered. The climate is moist and unhealthy for Europeans, the rainfall averaging annually 120 inches. It is celebrated for its excellent tin, obtained in black alluvium in the north end of the island, about 25 feet below the surface, and of which the annual yield is as high as 20,000 tons. These mines are a government monopoly. Banca likewise yields iron, copper, lead, timber, sago, pepper, nutmegs, benzoin, etc. The population was estimated in 1913 at 113,653, of which less than 300 are Europeans and 35,000 Chinese.

**BANCA,** a boat used in the Philippines, made from a single log and furnished with an out-rigger.

**BANCO,** a term designating the money in which the banks of some countries keep or keep their accounts in contradistinction to the current money of the place, which might vary in value or consist of light and foreign coins. The term was applied to the Hamburgh bank accounts before the adoption of 1873 of the new German coinage. The mark banco had a value of 35.43 cents, but there was no corresponding coin.

**BANCROFT, Aaron,** Unitarian clergyman: b. Reading, Mass., 10 Nov. 1755; d. 19 Aug. 1839. He was graduated at Harvard in 1778; became pastor in Worcester in 1785, where he remained nearly 50 years. Besides a great number of sermons, his works include a 'Life of George Washington' (1807). He was the father of the historian, George Bancroft.

**BANCROFT, Cecil Franklin Patch,** educator: b. New Ipswich, N. H., 25 Nov. 1839; d. Andover, Mass., 4 Oct. 1901. He was graduated at Dartmouth in 1860; at Andover Theological Seminary in 1867, and at the University of Halle, Germany. He was ordained to the Congregational ministry in 1867, but has since the preparation of the soil for the flax seed to the finishing of the finest linen. Miles of bleaching-greens exist in the vicinity, while there are numerous factories along the Bann. Pop. (1911) 5,101.
BANCROFT

has frequently contributed religious and educational articles to periodicals.

BANCROFT, Edward, American naturalist and chemist: b. Westfield, Mass., 1744; d. 1820. In his youth he went to Guinea and there practised medicine. He afterward resided in England where he gained the friendship of Franklin, whose influence obtained for him a place on the staff of the Monthly Review. He afterward wrote a number of strong articles in defense of American rights and in vindication of Franklin's connection with the 'Hutchinson Papers' episode. He was charged with arson in 1777, and was obliged to flee to Paris, where the American Commissioners employed him as a spy. It has been often charged, and without much foundation, that he obtained some information from his former teacher, Silas Deane, and sold it to the British government. In 1789 he published 'Natural History of Guiana,' and in 1794 'Experimental Researches Concerning the Philosophy of Permanent Colors,' the first of a series on colors and calico printing. Parliament in 1785 granted him special rights for the importation and use of a certain kind of calico printing. Consult Wharton, 'Diplomatic Correspondence of the American Revolution' (Washington 1889).

BANCROFT, George, American historian: b. Worcester, Mass., 3 Oct. 1800; d. Washington, D. C., 17 Jan. 1891. He was the son of Rev. Aaron Bancroft (q.v.), a Unitarian clergyman, and Lucretia Chandler Bancroft. He fitted for college at Phillips Academy, Exeter, N. H., entered Harvard College at the age of 13, and was graduated before reaching his 17th birthday. In 1826 he became instructor in Greek, having proposed that some young graduate of promise be sent to Germany for purposes of study in order that he might afterward become one of the corps of instructors. Bancroft was chosen, and in the summer of 1828 he embarked for Leipzig. At the end of two years his tutorship, however, expired, and he received his degree of Ph.D. At Göttingen he studied German literature under Benecke; Italian and French literature under Artaud and Bunsen; Oriental languages and New Testament criticism; Sanskrit; natural history under Blumenbach; and the antiquities and literature of Greece and Rome under Dissen, an enthusiastic admirer of Plato, with whom he went through a thorough course of Greek philosophy. But his chief attention was given to history, which he studied under Heeren, the greatest historical critic of that day, and one of the most scientific of all historians. In choosing this special branch, Bancroft gave as a reason his desire to see if facts would not clear up theories and assist in getting out the true one. For a time he also studied at Berlin, where he was warmly received by the leaders in the academic world, notably Wolf, the editor of Homer; Schleiermacher and Hegel, to whom he brought tidings of their fame in the United States. In the meantime his letters from Germany and other countries he met Goethe at Jena, studied for a time with Schlosser at Heidelberg, formed an acquaintance with Manzoni at Milan and a life friendship with Chevalier Bunsen at Rome, where he also met Niebuhr. At Paris he was kindly received by Cousin, Benjamin Constant and Alexander von Humboldt. Returning to America in 1822 he served for a year as tutor in Greek at Harvard. In 1823, in conjunction with J. G. Cogswell, he established a preparatory school at Northampton, Mass., a preparatory school far in advance of its time as to systems of study and classbooks. The teachers were good, the instruction inspiring and the students led a happy, healthy life. He had only proved a failure financially. Bancroft withdrew in 1830, and Cogswell two years later. Many of their students afterward became men of national reputation or prominence, among them being J. L. Motley, Ellery Channing, G. E. Elliot and Theodore Sedgwick. Henceforward his career is best separated into political and literary. During the Round Hill years he had cut loose from the political traditions of the Harvard circle. In a public speech in 1836 he had avowed his principles to be for universal suffrage and uncompromising democracy, and at once became foremost in the councils of the Democratic party, though twice declining nomination or election to the State legislature. Van Buren appointed him collector of the port of Boston (1838-41) and his administration of the office was adverse to his political opponents. While collector he appointed Nathaniel Hawthorne and Orestes Brownson to offices within his jurisdiction. In 1844 he was defeated as the Democratic candidate for governor of Massachusetts, although he received more votes than any previous candidate of his party. In 1845 he became Secretary of the Navy under Polk. It was he who planned and established the Naval Academy at Annapolis, Md.; he gave the first order to take possession of California; and while Acting Secretary of War ordered General Taylor to march into Texas, thus ultimately leading to the annexation of that State. During 1846-49 he was Minister-plenipotentiary to Great Britain and there successfully urged upon the British ministry the necessity of enacting private navigation laws. His reputation as a man of letters put the manuscript treasures of the great English families at his disposal and he combined his public duties with ardent historical researches. He was a member of the bar of New York city, absorbed in literary work. During the Civil War he was a patriotic War Democrat and delivered a powerful speech effectually demolishing the Constitutional plea for slavery. Before both Houses of Congress he delivered a masterly eulogy on Lincoln. Appointed Minister to Prussia in 1867 he achieved a diplomatic triumph in bringing about the adoption of treaties in which England and Germany finally recognized the right of expatriation and abandoned their doctrine of 'once a citizen, always a citizen.' In the northwest boundary treaty, negotiated by Polk, there was an ambiguity concerning a portion of the line. It was decided to submit the point to the German Emperor for arbitration. Bancroft prepared the whole American case and wrote the German reply to the case of the British. The decision was unreservedly in favor of the United States. His first publication was a volume of 'Poems' (1823), all European in theme. This was followed by books for the use of his students, translations of Heeren's 'Politics of Ancient Greece' (1824) and Jacobs' 'Latin Read-
ger' (1825). His first article in the *North American Review* appeared in October 1824, and was a notice of Schiller's 'Minor Poems' with numerous translations. Thenceforward he wrote in almost every volume, but always on classical or German themes, until in January 1831, he took up 'The Bank of the United States,' and in October 1835 'The Documentary History of the American Revolution.' The two latter indicate the direction his historical studies had taken. Then came the beginnings of his great 'History of the United States,' the work which gave him his greatest fame. The first volume appeared in 1834, the second in 1837, the third in 1840, the fourth in 1852, the fifth in 1853 and so onward to the tenth in 1874. The earlier volumes were received with enthusiasm in America, pirated in England, translated into Danish, Italian, German and French, both with and without the author's permission. The 15th edition of Vols. I-III was issued in 1853. The design of the work was as deliberate as Gibbon's, and almost as vast and, like Gibbon, Bancroft lived to see his work accomplished. The history of the United States from 1492 to 1789 is treated in three parts. The first deals with 'Colonial History, 1492-1748.' The second part, 'American Revolution, 1748-82,' is divided into four epochs, called respectively: 'Overture of the European Colonial System, 1748-63;' 'How Great Britain Estranged America, 1763-74;' 'America Declares Itself Independent, 1774-75;' and 'The Independence of America Acknowledged, 1776-82.' The last part, though published as a separate work, entitled 'History of the Formation of the Constitution, 1782-89,' is really a continuation of the 'History.' The work is still the most popular and widely read of the larger American histories. Bancroft's materials and facilities for writing it were better and more extensive than any other writer on our Anglo-American history has enjoyed. His private collection of manuscripts and documents, original and copies (now in the New York Public Library), was by far the best of his day in private hands, and superior to most institutional collections. His merits as a historian are positive and incontestable. For his subject he had a boundless and untiring enthusiasm, and he was permeated with that democratic spirit without which the history of the United States cannot be adequately written. Though his early style is justly open to the charge of being pompous, inflated and over-ornamented, it is essentially picturesque, and the earlier defects were greatly remedied by his successive revisions of the work. His command of his resources was masterly, and a far from favorable critic candidly admits that "one must follow him minutely through the history of the war for independence to appreciate in full the consummate grasp of a mind which can deploy military events in a narrative as a general deploys brigades in a field. Add to this the capacity for occasional maxims in the highest degree profound and lucid, and you certainly combine in one man some of the greatest qualities of the historian."

It has been said that he made no effort to avail himself of the materials and results of other investigators, but nowhere does he claim finality for his work, and his later years were chiefly occupied in weaving into his narrative what he and men of his day had. In 1876 he issued a Centenary edition in six volumes, upon which he had spent a solid year in revision. Again (New York 1884-87) he published what he termed the "author's last revision" in six volumes large octavo. In this he made considerable changes in arrangement and the subdivisions, all tending to a better ordering of the narrative. There were frequent omissions and condensations, and many repetitions and redundancies were cast out. These final changes have, in the judgment of good scholars, better fitted the work for permanent favor. It will remain necessary to the student until another historian, with equal or better facilities, shall rewrite the story in a way to gain wider sympathy. Present tendencies and methods in historical study and writing give little evidence that such another will soon arise. His lesser works include 'Poems' (1823); 'Literary and Historical Miscellanies' (1855); 'Memorial Address on the Life of Lincoln' (1866); 'Joseph Reed, a Historical Character' (1867); 'The Declaration of Independence of the United States Wounded in the House of Its Guardians' (1886); 'Necessity, Reality and Promise of the Progress of the Human Race' (1854); 'Oration, 4 July 1826, Northampton, Mass.'; 'Oration Before the Democracy of Springfield, Mass., 4 July 1836'; 'Address at Hartford, Conn., 18 Feb. 1840'; 'History of the Formation of the Constitution of the United States' (1882); 'Oration Delivered at the Commemoration, in Washington, of the Death of Andrew Jackson, 27 June 1845.' To the American encyclopedia he contributed the article on Jonathan Edwards. Consult Green, 'George Bancroft' (1891); Wallis, 'Mr. Bancroft as a Historian' (1896); West, 'George Bancroft' (1900); Higginson, T. W., 'George Bancroft in Carlyle's Laugh, and Other Surprises' (Boston 1909); Howe, M. A. DeW., 'The Life and Letters of George Bancroft' (New York 1908); 'Report of Committee Charged with Placing the Memorial to Mark the Birthplace of George Bancroft' (Proceedings of the Worcester Society of Antiquity, Vol. XVII, pp. 269-292 Worcester, Mass., 1901); Oliver Hazard Perry and the Battle of Lake Erie' (Rhone Island Education Department, Newport 1912); Stimpel, H. C., 'Galerie of Books and Pamphlets by George Bancroft' (On Howe's 'Life and Letters of Bancroft, mentioned above, New York 1908); Basset, John Spencer, 'The Middle Group of American Historians' (New York 1916).-GEORGE EDWIN RINES.

BANCROFT, Hubert Howe, American historian: b. Granville, Ohio, 5 May 1832; d. Walnut Creek, Cal., 2 March 1918. He worked on his father's farm and attended the academy until 16, when he entered as clerk a bookstore in Buffalo whose years later sent him with a stock of books to open business in San Francisco where he arrived in March 1852. While building up a large bookselling and publishing business the young man became interested in gathering material for the history of this new and fascinating land, until his collections reached 60,000 books, maps and MSS, when he erected for it a library building on Valencia street. Here it
remained until it passed into the possession of the University of California at Berkeley. Ambitious at length to reduce this vast wealth of material to forms of practical utility, Mr. Bancroft put work to a dozen men to classify and extract the essential facts of history and development and place the results in his hands in proper form for writing a series of histories covering the western half of North America, from Alaska to Panama, as he had planned. The work commenced in 1856, and the result was the publication of the following series: 'Native Races of the Pacific States' (5 vols.); 'History of Central America' (3 vols.); 'History of Mexico' (6 vols.); 'North Mexican States' (2 vols.); 'California' (7 vols.); 'Arizona and New Mexico' (1 vol.); 'Utah and Nevada' (1 vol.); 'Colorado and Wyoming' (1 vol.); 'Northwest Coast' (2 vols.); 'Oregon' (2 vols.); 'Washington, Idaho and Montana' (1 vol.); 'British Columbia' (1 vol.); 'Alaska' (1 vol.); 'California Pastoral' (1 vol.); 'California Inter Pocula' (1 vol.); 'Popular Tribunals' (2 vols.); 'Essays' (1 vol.); 'Literary Industries' (1 vol). Other and later works are 'Book of the Fair,' 'Book of Wealth' (1910); 'Resources of Mexico' (1901); 'Cost Cities and San Francisco' (1907); 'Retrospection, Personal and Political' (1912).

BANCROFT, Marie Effie Wilton, Lady, English actress: b. Doncaster 1839. She is a daughter of Robert Pleydell Wilton. After acting as a child in the provinces, she first appeared in London 15 Sept. 1856 at the Lyceum, as the boy in 'Belphégor.' She was very popular in several boy characters, in burlesques at various theatres, and as Pippo in the 'Maids and the Magpie' at the Strand Theatre. She remained at the Strand until 1863, when with H. J. Byron she began the memorable management of the old Prince of Wales' Theatre with the production of the Robertson comedies. She secured Squire Bancroft as leading actor and the production was a success, and was termed noted for its realistic presentation of the English life of the day. Among the successes of those years were 'Society' (1865); 'Ours' (1866); 'Caste' (1867); 'Play' (1888); 'School' (1869), and 'M. P.' (1870). Miss Wilton became Mrs. Bancroft in 1861 and regularly took the leading feminine rôles. Among the prominent actors presented at this theatre during the management of Mrs. Bancroft and Mr. Byron were Coghlan, Hare, the Kendalls and Elinyerry. They migrated to the Haymarket in 1860, and continued the production of modern comedy. Mr. and Mrs. Bancroft retired from the stage in 1885 and have rarely appeared since, a noteworthy occasion was the revival of 'Diplomacy' in 1893 at the Garrick. Mrs. Bancroft is joint-author of 'Mr. and Mrs. Bancroft On and Off the Stage' (1888); and sole author of 'A Riverside Story' (1890); 'My Daughter' (1892); 'A Dream' (1903); 'The Shadow of Neeme' (1912), and with Mr. Bancroft, 'The Bancroft Gallations of Sixty Years' (1909).

BANCROFT, Richard, English divine: b. Farnworth, Lancashire, 1544; d. 12 Nov. 1610. He was educated at Cambridge University, where he received the degree of M.A. in 1570. He was ordained soon afterward and was appointed chaplain to the bishop of Ely, and in 1575 became rector of Teversham, Cambridge. In 1584 he was appointed rector of Saint Andrew's, Holborn, where his great abilities and zeal as a champion of the Church led to his rapid promotion. He became treasurer of Saint Paul's Cathedral in 1588, and the following year became a member of the ecclesiastical commission. On 9 Feb. 1589 he preached at Paul's Cross a sermon which was in substance a passionate attack on the Puritans, an assertion of the divine right of bishops, and urged the theory of the apostolic succession. In 1597 he was consecrated bishop of London and was present at the death of Queen Elizabeth. He took a prominent part in the conference of prelates and Presbyterian divines, held at Hampton Court in 1604, and in the same year became president of the Canterbury Convocation, at which he presented and caused to be passed a book of canons aimed at Puritanism and which forced many clergymen to give up their livings. It was set aside by Parliament two months later. In November 1604, he became archbishop of Canterbury, in which capacity he continued to show the same zeal and severity as before in suppressing heresy and schism. He involved himself in a struggle to make the ecclesiastical courts competent to try cases against the law by speciously magnifying the royal authority over them. In the last few months of his life he took part in the discussion about the consecration of Scottish bishops, and advised their consecration by bishops of the English Church. By this act were laid the foundations of the Scottish Episcopal Church. Bancroft was 'chief overseer' of the authorized version of the Bible. While Bancroft's character was defective by his intemperate zeal, the Anglican Church owes its present constitution and firm position in the state largely to his labors. Consult Usher, 'The Reconstruction of the English Church' (New York 1910).

BANCROFT, Sir Squire, English actor: b. London, 4 May 1841. He was educated at private schools in England and France, and first appeared on the stage at 16 and in 1861. He acted afterward in Dublin and at leading provincial theatres with the most prominent stars of the stage. He became leading man at the Prince of Wales' Theatre in 1865, in association with Effie Wilton, whom he married in 1867. For 20 years he was manager of the Prince of Wales' and Haymarket theatres, during which the modern revival of the stage was started. He retired from the management in 1885. He acted afterward with Irving in 'The Dead Heart' (1889) at the Lyceum, and in 'Diplomacy' at the Garrick in 1893. In 1897 he was knighted by Queen Victoria for notable services to his profession. He has devoted much time to 'reading' for hospitals throughout the country, and is a member of Lord Chamberlain's advisory board for the licensing of plays. Consult 'Mr. and Mrs. Bancroft On and Off the Stage, Written by Themselves' (1888); and 'The Bancrofts: Recollections of Sixty Years' (1909).

BANCROFT, Wilder Dwight, American chemist: b. Middletown, R., 1 Oct. 1867. He was educated at Harvard and abroad, and obtained the degree of Ph.D. at Leipzig in 1892. He was instructor of chemistry at Harvard
1894-95; was appointed assistant professor of chemistry at Cornell in 1895, becoming full professor in 1903. In 1896 he founded the Journal of Physical Chemistry and became its editor. In 1905 he was chosen president of the American Electro-Chemical Society, and in 1910 of the American Chemical Society. He is a member of the Washington Academy of Sciences and of the Franklin Institute. Besides numerous articles in scientific journals, he has published 'The Phase Rule' (1897).

**BANCROFT, William Amos**, American street railway president: b. Groton, Mass., 26 April 1855. He was graduated from Harvard in 1878, elected mayor of Cambridge in 1893 and four times re-elected. He has held other public positions and has been trustee or director in many educational and financial institutions. He has been president of the Boston Elevated Railway Company since 1899; private colonel, 5th Massachusetts Volunteer Militia; brigadier-general, United States Volunteers, Spanish War; chairman Republican State convention (1893); overseer, Harvard (1893-1905), and trustee, Phillips-Exeter Academy, Exeter, N. H., since 1902.

**BAND**, in architecture, any flat fascia or ornament which is continued horizontally along a wall, or by which a building is encircled. Bands often consist of foliage, quatrefoils or of simple bricks. Band of a shaft is the molding or suits of moldings by which the pillars and shafts are encircled in Gothic architecture. Several bands are often placed at equal distances on the body of the shaft, when it is long, in which case they are known as shaft-rings.

*As vestiment*, bands are linen pendants from the neck, forming part of clerical, legal and academic costume. It is a moot question whether they are a survival of the amice or immediate descendants of the wide falling collar which was a part of the ordinary civilian dress in the reign of James I. In the Anglican Church they are seldom worn, except by ultra-low churchmen, but they are in common use with Presbyterian ministers (ordained ministers as distinguished from licentiates). Foreign Catholic ecclesiastics wear black bands with a narrow white border.

In music, a number of trained musicians in a regiment, intended to march in front of the soldiers and play instruments, so as to enable them to keep step as they move forward; also any similarly organized company of musicians, though unconnected with the army; an orchestra. The word is also applied to the subdivisions of an orchestra, as string-band, wind-band, etc. Until the 12th century there was no regular organization of the wandering or roving musicians, but early in the 13th century bands of pipers and trumpeters were formed, and later guilds were developed for the protection of the musicians. These guilds were subjected and influenced by peculiar restrictions defining the social status of every calling during the Middle Ages. It was not until the 18th century, however, that instrumental music had developed into the groups we know today. The full orchestra in combining every element and vehicle of musical expression, appealed to those of cultured musical taste; the brass band was suited to church and community music; and the military band appealed to the people at large. See **BAND, MILITARY**.

The modern so-called concert military band is a development of the brass band, giving preference to instruments which in band compositions the strings are not used at all, the wind instruments being depended on for the interpretation of the piece. In order to secure the desired tone and color, new instruments have been invented and introduced. The concert military band is said to have had its greatest development in the United States, where it appears to have evolved from the Independence Day concerts held annually on Boston Common. These celebrations brought into prominence as a bandmaster Patrick Sarsfield Gilmore. The concert type has been further developed since his time by D. W. Reeves, Victor Herbert and John Philip Sousa. Sousa's organization is regarded as the highest type of concert military band. Its members are very carefully selected. It is modeled on the celebrated band of the French Garde Républicaine.

**BAND, MILITARY**, an organized body of musicians in the army service. In all countries bands are organized and maintained in each infantry regiment, or battalion if the latter is the unit. The strength of these bands and the number and nature of their instruments vary considerably, as also do the rank and status of the bandmaster. Bands in the United States army are recruited generally for that specific purpose, the members being enlisted men, usually 28 in number. Instrumets supplied b the Quartermaster's Department, and a school for army bands is maintained at Governor's Island, N. Y. Bandmasters in England are specially trained at Kneller Hall, receive extra pay and are recruited from boys from military institutions, schools and training ships. The leading military bands of Europe are the Royal Artillery, Royal Marine and Guards Band, of England; the Kaiser-Franz Grenadier Band, of Germany; the Guard Band, of Belgium; the Garde Républicaine Band, of France; the Imperial Guards Band, of Austria; the Ottoman Palace Band, of Turkey; the Bersagliari Band, of Italy; the Cair's Regiment of Guards Band, of Russia. Consult 'United States Army Regulations' for composition and equipment of United States army bands. For band instrumentation consult Clappé, A. A., 'The Wind Band and Its Instruments' (New York 1917). Consult also Grove, 'Dictionary of Music' (London 1903); Rode, 'Musikalisches Konversations-Lexicon' (Berlin 1877).

**BAND-FISH**, a genus in the family Cepolidae, having the body much elongated and compressed, and is covered by very small scales. The dorsal fin is very long and consists like the anal of soft rays. The tail vertebrae are very numerous, and the whole structure of the body exhibits unusual delicacy, so that specimens are seldom obtained in an uninjured state. All the species inhabit quiet depths and are unable to contend with waves and current. The full orchestra, in combining every element and vehicle of musical expression, appealed to those of cultured musical taste; the brass band was suited to church and community music; and the military
BAND-MEETINGS — BAND SAW BLADES

on the British coasts. It is about 15 inches long. Its brilliant appearance, when seen moving in the water, has suggested the names of fireflame and red ribbon, by which it is known at Nice. The home of the genus is in Japanese waters. See OAR-T713H.

BAND-MEETINGS. In early Methodism Wesley encouraged the system of bands. These consisted of not more than five or six persons, and in the main circumstances in life, and to some extent of similar taste, who met together to converse freely touching their Christian experience and their habits of life. The examination of personal character was very strict, and the intention was to promote a more holy and useful life. Each band met weekly for its own religious services; but they also occasionally met in general band-meeting. Band meetings, however, were not enjoined as a rule of discipline, and they were not at any time generally observed. In 1812 the Wesleyan conference endeavored to revive and extend their mission. In America these meetings were never organized to any great extent; they were held in a few of the cities and of the larger towns, but at present they are almost unknown.

BAND SAW BLADES. Owing to the increased value of timber in America more and more attention has been paid to the economical conversion thereof into the sawn product ready for market. The methods in use a few years ago were found to be wasteful and usually crude, and the product turned out of but an indifferent quality so far as sawing was concerned.

The attention of the operator being directed to band saw blades, these have come into quite general use for various purposes. A test of the band saw blade has proven its advantages to be so great that it has displaced not only the small scroll or "jig" saws for bracket sawing and ornamental scroll and curved work, but has also displaced reciprocating saws and circular saws for heavier work.

A band saw consists of a thin band or ribbon of steel with teeth cut in one edge, the two ends being welded together, making it continuous. When in use it is mounted on two wheels, like a belt, and made to travel at a rapid rate of speed by revolving one of the wheels. For scroll work its advantage over the reciprocating and jig saw lies mainly in the increased and uniform speed at which the saw blade travels which enables the operator to better control the work in hand and to feed the material toward the saw constantly, and thus to turn out more and better work than would be possible with a reciprocating saw cutting on the downward stroke only. Its narrower kerf also is more economical of lumber, particularly in resawing.

In sawing logs the advantage of a band saw as compared with a reciprocating saw may be judged when we consider that the band saw blade travels at the rate of from 8,000 to 10,000 feet per minute whereas a reciprocating saw making 200 strokes of 18 inches in the minute would only have a cutting speed of 300 feet per minute. The band saw traveling more than 20 times as fast as the reciprocating saw will naturally perform nearly or quite as much work as 20 reciprocating saws. The single reciprocating saw, because of its limited capacity, was succeeded by what is termed in the United States a gang, in Europe, a log frame, and in Canada a gate. The gang saw mill for log sawing consists of a huge reciprocating saw placed side by side in a frame to saw completely at the one operation an entire log. The advantage of the band log mill over the gang lies in its adaptability to the sawing of each log to the best advantage as but one cut is made at a time, and as the face of the log is exposed to the view of the sawyer, he can judge through what portion of the log the next cut should be made to yield the best results. The circular saw turns out nearly or quite as much product as the band saw, but as it requires a much larger kerf, is far more wasteful and the finish given to the wood by the band saw is much superior. The success of the band saw is due, first, to the skill of the saw maker in turning out saw blades of a temper at once hard and tough, to retain the good cutting edge and at the same time flexible enough to pass over the wheels without cracking; second, to the skill of the saw filer in "fitting" his saws. Band saws require to be "tensioned" from time to time due to the fact that the saw stretches on the cutting edge by the continuous strain on the teeth. By the word "tensioning" is meant the expanding of the central portion and back of the saw blade either by the use of a hammer and anvil or by what are termed "stretching rolls."

The use of the band saw has brought forth an extensive line of saw fitting tools such as saw "swages" which are designed to expand the points of the teeth, "pressure side dressers" or "tooth formers" or "shapers" which are intended to give form to the swaged points of the teeth, automatic saw sharpeners, etc. With the use of these improved appliances it was found that thinner and thinner band saw blades could be used, and for "resawing" purposes, that is, the sawing of planks and boards into two or more thinner pieces, this is especially desirable. The plank or boards to be resaw are fed to the saw by means of rollers. Saws as thin as 0.02 of an inch in thickness have been successfully used. Such saws remove a kerf of practically one thirty-second of an inch. In log mills the band saw blades are usually 12 inches in width and 49 feet long, of 14 gauge, and with teeth three-fourths of an inch long, and spaced 1/4 inches from point to point. The size of the gullet (between the teeth) must be abundantly large to hold all the sawdust gathered during transit through the largest diameter of log to be cut. Too small a gullet causes chattering of the saw. The teeth of the saw is as much as the metal will bear and remain elastic, the object being to have the cutting edge rigid, and yet the band as a whole able to adjust the shock of a sudden obstacle, like a hard knot. For sawing very hard wood the teeth are shorter and spaced farther to the foot and have very little set. For cutting white pine and similar woods the gauges recommended for all widths of saw are as follows: Bands up to 14 feet long, 22 gauge; from 15 to 17 feet, 21 gauge; from 18 to 20 feet, 20 gauge; from 21 to 24 feet, 19 gauge; from 25 to 50 feet, 18 gauge. For hard woods like oak and beech, the thickness should be increased
one number on each length quoted, and the teeth spaced closer. For cutting metal the thickness is increased three numbers in the gauge and the teeth spaced about 20 points to the inch, with little or no set. Consult Grimshaw, R., ‘Saw Filing and Management’ (New York 1901); Johnson, C. L., ‘The Saw Dictionary’ (Seattle 1905).

BANDA ISLANDS, Dutch East Indies, a group belonging to Holland, in the Indian Archipelago, south of Ceram; the largest, Great Banda, being 12 miles long by two broad, while Goenong Api is an active volcano nearly 8,000 feet high. They have a rich soil admirably adapted for the cultivation of the nutmeg, which is their chief product, others being coconuts and sago. The total area of the group is about 19 square miles and the capital of the group is Banda, the seat of the assistant resident. It is well fortified and has a good harbor. Tattic, a ground on the island of Rosingen. Pop. about 9,500, of whom less than 600 are Europeans. The islands were discovered in 1512 by the Portuguese, who were dispossessed by the Dutch in the 17th century.

BANDA ORIENTAL, bánda ò-ré-én-tál, the name formerly given to that region east of the lower part of the Uruguay River, which is now included in the republic of Uruguay. See URUGUAY — HISTORY.

BANDAGE, a surgical wrapper applied to some part of the body. Bandages are employed for a variety of purposes. One of their chief uses is to secure dressings or splints. Another is to give support to a limb or to restrain its movements, or to exert pressure upon it so as to aid in restraining bleeding at some point; or a bandage may be used to promote healing, as in the case of ulcers, or to aid in the removal of swelling. In these latter cases the bandage must be applied with a considerable degree of tightness, and great care must be exercised that it be evenly put on, and that the tightness with which it is drawn does not give rise to disturbances of the circulation by undue and irregular pressure. Suppose, for instance, the arm is bandaged too tight from the hand well up over the upper arm. The arteries which carry the blood down the limb are for the most part deeply seated and well protected by muscles, so that they are practically unaffected by any ordinary degree of pressure on the surface. But many of the veins which carry the blood back to the heart up the limb run immediately under the skin, and will be pressed upon considerably by a bandage applied round the arm. If the bandage is made too tight at the elbow, say, the veins will be compressed and the blood will flow less easily along them at that point than it does lower down where the pressure is less. The consequence will be that the blood will be hindered in passing up from the hand; and as blood is all the time being carried down to the hand in the arteries, which are unaffected, the veins in the forearm and hand will become swollen and gorged with blood. The pressure of blood in the veins will become so great that fluid will be pressed out of the finer vessels into the surrounding tissue and the hand will become swollen, puffy and dropscle, while much pain will be experienced. If the tight turns of the bandage are now loosened the veins will again offer a free passage to the blood and the swelling and pain will gradually subside. The proper method in such a case is not necessarily to bandage loosely, but to bandage uniformly, beginning with the requisite degree of tightness at the very extremity of the limb and continuing evenly and regularly upward. A general rule in bandaging a limb, then, is: Never let the bandage be tighter up the limb than it is at the extremity; apply it firmly and evenly at the extremity and carry it up uniformly. To this may be added, as a second rule, that if a bandage requires to be tightly applied in the course of a limb it must be begun at the extremity. It is specially necessary to follow these rules when the bandage is applied to secure a splint, since it must be tight enough to keep the splint in accurate position, or to keep a pad firmly applied over a wound for the arrest of bleeding. Bandages usually consist of strips of unbleached or bleached calico, linen, flannel, muslin, etc. Elastic bandages and India-rubber bandages are also in use for particular cases. The material should be torn into strips of the requisite breadth and the bandages should have no hem or edging, as this would prevent them stretching equally in all directions. The strips should be rolled up for use into firm rollers, a roller bandage being usually six yards long. They are of different breadth, most commonly 2½ or 3½ inches. For the chest and abdomen the breadth should be 4½ inches; for the fingers three-quarters of an inch. The triangular bandage (Esmarch's) is of all others the one made use of for rendering temporary aid in cases of accident, and, through the training afforded by first aid to the injured associations, is now familiar to almost everyone. The bandage is made of a square yard of linen or calico halved diagonally, each half having of course two sides 36 inches in length, with a base of fully 50 inches. When it is desired to exert very considerable pressure upon a part for a length of time, or when it is desired to keep a limb or a joint motionless for some time longer, may be done without the use of splints by stiffening the bandages with starch or plaster of paris.

BANDAI-SAN, bánd’di-sán’, Japan, a volcano on the island of Nippon, 140 miles north of Tokio. Its summit consists of several peaks, the highest of which is 6,035 feet above the ocean and 4,000 feet above the surrounding plain. On 15 July 1888 there was a terrible explosion of steam which blew out a side of the mountain, making a crater more than a mile in width and holding precipitous walls on three sides. The débris of broken rock and dust poured down the slope and over an area of 27 square miles, killing 461 persons and covering a number of villages.

BANDAJAN, a pass over a range of the Himalayas, in Cashmere, 14,854 feet above sea-level.

BANDANA, a cotton handkerchief, having a dark ground of turkey-red, blue or purple, variegated with simple patterns of white or bright yellow, and bright yellow being the favorite head-covering for Southern negro women. Originally manufactured in the East Indies, the beauty and durability of their colors
caused such a demand that the manufacture of them was established elsewhere. The process is to dye the cloth a dark olive color, or, turkey-red, which serves as a ground. The white spots constituting the pattern are afterward produced by discharging the color with a solution of chlorine. In order to confine the discharging fluid to the exact points to be operated upon, the pattern is cut out in leaden plates, upon which the fluid will not act, and as many handkerchiefs or pieces of cloth as are to be operated upon are enclosed between pairs of these patterns and subjected to enormous pressure, the discharging fluid being run in at the top and permitted by the perforations to spread, so that the pattern is brought out clean on the spots subjected to the action of the fluid.

**BANDE NOIRE**, bánd nwar, an appellation given during the French Revolution to companies of capitalists and speculators who bought up the forfeited estates of the Church and nobility. They were considered by many as hordes of vandals bound to destroy the monuments which kings, nobles and religious orders had erected all over France; and thence the scornful denomination, which as continued nearly up to 1830. But while the Bande Noire removed some castles and monasteries which ought to have been preserved as relics of art and religion, they did much toward the prosperity of the country by improving unproductive lands and disseminating among the people landed property which previously was concentrated in the hands of privileged classes. The term was originally applied to a body of German soldiers who were employed in the Italian wars by Louis XIV of France, and who received the name from carrying black colors after the death of a favorite commander. The appellation was also assumed for the same cause by different Italian and French troops in the 16th century.

**BANDED PEAK, or MOUNT HERSPERUS**, a summit of the San Juan Mountains, in southern Colorado; altitude, 12,860 feet.

**BANDELLER, bánd-ler**, Adolph Francis Alphonse, American archaeologist: b. Berne, 6 Aug. 1840; d. Madrid, 19 March 1914. Settled early in the United States, where he did important work under the direction of the Archaeological Institute of America. His studies were chiefly among the Indians of New Mexico and Arizona, Central America, South America and Mexico. Returning to New York in 1903 he was engaged for the remainder of his life in preparation of works on the history and archaeology of Spanish America. He is also the author of 'Art of War and Mode of Warfare' (1877); 'Social Organization and Government of Ancient Mexicans' (1878); 'Tenure of Lands and Inheritances of Ancient Mexicans' (1878); 'An Archaological Tour into Mexico' (1885); a novel of Pueblo Indian life 'The Delight Makers'; 'The Gilded Man and Other Pictures of the Spanish Occupancy of America' (1893). He contributed over 60 articles to the 'Catholic Encyclopedia,' etc.

**BANDELLO, bánd-yô, Matteo, Italian 1522-1561.** First in the cloth-workers of Venice, he was born in 1522. He studied at Rome and Naples and applied himself almost exclusively to polite literature. In his youth, he was a Dominican monk, and was entrusted with the education of the celebrated Lucrezia Gonzaga. After the battle of Pavia he was banished from Italy as a partisan of the French, and Henry II of France gave him in 1550 the bishopric of Agen. He left the administration of his diocese to the bishop of Grasse, and employed himself, at the advanced age of 70, in the completion of his novels, of which he published three volumes in 1554; a fourth was published in 1573, after his death, which took place in 1561. He also published some poems. His novels are in the style of Boccaccio and are characterized by even greater license. His stories, together with the introductory notes, afford a valuable insight into the social customs of his age. Byron, Lope de Vega and Massinger availed themselves of much of his material. Consult Masi, E., 'Matteo Bandello o vita italiana in un novelliere del' 500' (Bologna 1900). Bandello's tales were edited by J. Payne (London 1890), and the 'Novelle' by Brognoligo (6 vols., Bari 1910-12).

**BANDERAS, Rio de, a river of Mexico, on the east coast; so called from its flags) because when discovered in 1518 by Juan de Grijalva, the natives waved white flags at the end of their spears in token of friendship.

**BANDETTINI, bân-de-tê-ne', Teresa, Italian poet: b. Lucca, 12 Aug. 1763; d. 1837.** Beginning life as a danseuse, she discovered her poetic talent as if by accident, and came to be known and honored in her own country. She was especially gifted in improvising verse. She was called the Amarilla Etrusca. Of her finished poems there remain 'La Morte de Adanoide'; 'Il Poldoro'; 'La Rosmunda'; and some shorter pieces.

**BANDICOOT.** (1) A large dark-colored rat (*Nesokia banded*) of southern India and Ceylon, where it is known as the 'pig-goat' on account of the taste of its flesh, which is a favorite article of food among the natives of the dry hilly districts it frequents. As its food is chiefly grain and roots it does much harm to gardens; and it is also destructive to poultry. It has the habit of storing rice in its underground nests against the famine of the dry season. (2) In Australia, a small marsupial with long, narrow head and muzzle belonging to the family Peramelidae. Many species are scattered throughout Australasia. They live in warm nests underground, and feed upon insects, worms, and vegetable food. The hare-like marsupials of the closely allied genus Peromysa are known as rabbit-bandicoots, and, like the other, frequently injure vegetable gardens. Consult Gould, 'Mammals of Australia' (London 1863).

**BANDIERA, bân-di-ôr'ra, Attilio and Emilio, two brothers of a Venetian family, lieutenants in the Austrian navy, who attempted a rising in favor of Italian independence in 1843. The attempt was a failure and they fled to Corfu; but, misled by false information, they ventured to land in Calabria with 20 companions, believing that their appearance would be the signal for a general insurrection. One of their accomplices had betrayed the plot and the party was captured at once by the Neapolitan police. Attilio and Emilio were shot, along
with seven of their comrades, in the public square of Cosenza, 25 July 1844.

BANDINELLI, bàn-dè-nèl-lè, Baccio, or Bartolommeo, Italian sculptor: b. Florence 1493, the son of a goldsmith; d. 1560. He learned his art under the sculptor Botticini, but modeled his style after that of Michelangelo, whom he vainly attempted to rival and whom he hated with life-long hatred. He was patronized by the Medici, and in honor of the presence of Leo X in Florence he executed the model of a colossal statue of Hercules which was intended to surpass the David of Michelangelo. Another work of his was an inferior copy of the Laocoön group for Francis I. He produced also Hercules and Cacus (at Florence), a somewhat heavy work, 88 figures of apostles, prophets and saints in the choir of the cathedral at Florence, a Bacchus, an Adam and Eve in the Bargello, etc.

BANDIT (It. bandito), originally an exile, banished man or outlaw; and hence, as persons outlawed frequently adopted theprofession of highwayman, the word came to be synonymous with brigand. Of all European countries Italy has perhaps been most infested with banditti. They used to form a kind of society of themselves, subjected to strict laws, and living in open or secret war with the civil authorities. Peter the Calabrian, the most terrible among these robbers, in 1812 named himself, in imitation of the titles of Napoleon, "emperor of the mountains," "king of the woods," "protector of the conscripts," and "mediator of the highways from Florence to Naples." The government of Ferdinand I was compelled to make a compact with this bandit. One of the robbers entered the royal service as a captain in 1818 and engaged to take captive and recover every bandit. Subsequently adventurers of all kinds united with them. The Austrian troops which occupied Naples were obliged to send large detachments to repress them. The bandits used to exact from strangers and natives a sum of money for protection, and give them in return a letter of security. In Sicily the Prince of Villa Franca declared himself, from political and other views, the protector of bandits; he gave them a livery and treated them with much confidence, which they never abused. Banditti are still active in Italy, Sicily, Turkey and elsewhere.

BANDOLIER, a large leather or baldric, to which were attached a bag for balls and a number of pipes or cases of wood or metal covered with leather, each containing a charge of gunpowder. It was worn by ancient musketeers, and hung from the left shoulder under the right arm with the ball bag at the lower extremity, and the pipes suspended on either side. The name is now given to a similar belt in which cartridgees are carried.

BANDON, Ore, city in Coos County, at the mouth of the Coquille River, and 90 miles directly southwest of Eugene. Its manufactures include woolen goods, lumber, shooks, butter, cheese, eggs, milk, railroad ties, poles and matchwood. It has two weekly papers and an agricultural valuation of $843,893. There are two schools embracing grades and high school. The principal buildings are the two local banks, schools, post-office, hotels, restaurants and hospitals.

Bandon has also a shipyard and is a coast guard station. Pop. 2,500.

BANDON, a river of Ireland which rises in the Carberry Mountains, and at its mouth forms the harbor of Kinsale. Spenser describes it as "the pleasant Bandon, crowned by many a wood." It has a course of 40 miles, for 15 of which it is navigable to Innishannon, four miles below Bandon.

BANEERRY. See Actaea.

BANE, bà-nàr, Johan Gustafsson, Swedish general in the Thirty Years' War: b. 1596; d. 1641. He made his first campaigns in Poland and Russia, and accompanied Gustavus Adolphus, who held him in high esteem, to Germany. After the death of Gustavus in 1632 he had the chief command of the Swedish army, and in 1634 invaded Bohemia, defeated the Saxons at Wittstock, 24 Sept. 1636, and took Torgau. He ravaged Saxony again in 1639, gained another victory at Chemnitz, and in 1640 defeated Piccolomini. In January 1641 he very nearly took Ratisbon by surprise.

BANEZ, Dominic, theologian: b. 1528 in the Spanish province of Biscaya; d. 1604 at Medina del Campo. He made rapid progress in philosophy and theology at the University of Salamanca, where he had as teachers the famous Melchior Cano and Peter and Dominic Soto. In 1581 he was appointed professor in this university, which was then dividing the honors and prestige of the Sorbonne. He was recognized as one of the clearest and most acute interpreters of the 'Summa' of Saint Thomas, and his chief works were commentaries on the same. He took a prominent part in the controversy on divine grace, predestination, etc., in which he opposed the theories of Molina. For several years he acted as confessor to Saint Theresa, and at his command she wrote her spiritual treatise, 'Camino de Perfeccion.'

BANFF, bân-f, Canada, popular pleasure resort in southwestern Alberta, on the Bow River and on the Canadian Pacific Railroad. It is picturesquely situated amid the scenery of the Rocky Mountains, and contains a boiling sulphur spring, swimming baths, a sanatorium and a fine hotel. The Banff area is included within the area of the Rocky Mountain National Park of Canada. Consult 'Banff in the Canadian Rockies' (Montreal 1900).

BANFF, Scotland, seaport and county town of Banffshire, at the mouth of the Deveron, 50 miles northwest of Aberdeen, on the Great North of Scotland Railroad. The town is well built, has clean, well-paved streets and contains Banff Castle, an academy, town hall, a museum and several libraries. In the neighborhood to the south is Duff House and park, the seat of the late Duke of Fife, who in 1906 presented the house and the portion of the park surrounding it (about 140 acres) to the towns of Banff and Macduff. There is a seven-arch bridge over the Deveron, uniting Banff with the seaport of Macduff. The principal manufactures are beer, leather, woolens and iron balls and agricultural products, grain, cattle, salmon and herrings are exported. The government is vested in a provost and council; and Banff, with Macduff, Elgin, Cullen, Inveraray, Kintore and Peterhead returns one
member to Parliament. Banff is a place of great antiquity, its first charter having been granted by Malcolm IV in 1163, and further privileges were added by Robert Bruce in 1324 and Robert II in 1372. Archbishop James Sharp was born here in 1618. Consult Cran-

BANFFSHIRE, Scotland, a county in the north, bounded on the north by the Moray Firth, on the east by the county of Elgin and part of Inverness, on the south and east by the county of Aberdeen. The soil is for the most part a rich loam or deep clay. The principal rivers are the Spey and Deveron, with the Isla, a tributary of the former, and the Avon and Fiddich of the latter; besides which there are many other main and tributary streams. The mountains rise in altitude as they recede from the sea, the most celebrated being Cairngorm, which is 4,095 feet high. The principal crops are barley, oats, turnips and potatoes, little wheat being raised. Special attention is paid to the cultivation of turnips, the chief object of the farmer being the rearing and feeding of cattle. The total area of Banffshire is 410,000 acres, of which two-thirds of the total surface is under cultivation, and about one-fifth is occupied by woods and plantations. Since about the middle of the 19th century large tracts of formerly waste land have been reclaimed. Fishing is a staple industry. The salmon caught in the Spey and Deveron constitute an important article of traffic, the valued rental of the Duke of Richmond's salmon fisheries in the former being over £60,000 a year. Banffshire possesses several woollen factories, tanneries, rope and sail works, ship-building yards, breweries, lime works and many distilleries, the whiskey being generally known under the name of Glenlivet, after a glen in the county. Among the natural productions limestone is the most prevalent. Serpentine also abounds in several places, especially at Portsoy, where it is known as 'Portsoy marble'; it is wrought into vases and other ornaments. Ironstone and mangan- nese also occur, and Scotch topazes or cairn-
gems also are found. The highest point of the county is the slopes of Auchnagrow, 1,567 feet above sea level, and is towards the south of the county. The chief towns and villages are Banff, Macduff, Keith and Buckie. Pop. (1911) 61,402.

BANFFY, Baron Desiderius, Hungarian statesman: b. Kolozsvár, Hungary, 1844; d. Budapest, 23 May 1911. He went into politics as a partisan of Koloman Tisza, who gave him an official post in 1875. In 1883 he was ap-

BANG, a drink. See BANGUE.

BANG, bang, Bernhard Laurits Frederik, Danish scientist: b. 1848. He is professor of pathology and therapy in the Royal Veterinary and Agricultural College, Copenhagen. He has made extensive researches in veterinary science, especially in regard to contagious abortion and tuberculosis. In 1892 he originated his method of eradicating tuberculosis from dairy herds by isolating mildly affected animals and artificially feeding their calves with milk free from tubercle bacilli. The results have been favorable in Denmark, Norway and Sweden. In 1896 Bang, in conjunction with Striibolt, discovered the cause of contagious abortion in cattle, and has since devoted much study to its treatment and prevention of the disease. He has published many articles on professional topics in the leading veterinary and other scientific journals of the world.

BANG, Hermann Joachim, Danish novelist: b. on the island of Sconde, 1847; d. 1912. Bang first came into literary notice about 1879, since which time he has published a number of novels and some poems. 'Hopeless Generations' (Haablose Sleeter); 'Eccentric Tales' (Excentriske Noveljer); 'Under the Yoke' (Under Aaget); 'The Yoke' (Aget); 'The Land' (Landet); 'By the Roadside' (Ved Vejen), are the titles of some of them. The last named is considered the masterpiece. A collection of his works, edited by Ettu Fedem, has been published in German (1910).

BANG, Peder Georg, Danish jurist and statesman: b. Copenhagen 1797; d. 1861. He became professor of law at the University of Copenhagen in 1830 and took an active interest in politics, holding several offices in his native city and becoming several times Minister of Agriculture and Maltine. In 1854 he became Prime Minister, and later was Supreme Court justice. He published 'Lære-

BANGALORE, bân-gâ-lôr, Hindustan, a fortifed town in the native state of Mysore, 70 miles northeast of Seringapatam. It stands on a plateau 3,000 feet above sea-level, and is divided into two parts, the old native town and the cantonments. The chief buildings are the government house (where the British resi-
dent lives), and the new public offices, the palace of the maharajah, the central jail, etc. There is a fine public pleasure-garden. In the old town stands the bungalow of the viceroy, built by Hyder Ali in 1761 and captured by Lord Corn-
wallis in 1791. Latterly the town has greatly prospered. There are manufactures of silks, cotton cloth, carpets, etc. Bangalore is noted for its salubrity. There are a number of Euro-

BANFFSHIRE — BANGALORE 141
large British and native force, is to the north-east. Pop. (1911) 189,485.

BANGE, bânzh, Valerand de, French artilleryman, b. Belfort 1833. In 1873, as director of the atelier-de-précision in the Central Dépôt at Paris, he reconstructed both the light and heavy field pieces of the day, and his models were adopted by the French army in 1879. In 1883 he became a successful competitor with Krupp for the contract to supply field pieces to the Serbian government. In 1882-89 he was director of the Cail corporation, whose establishments at Denain, Douai and Grenelle he converted into ordnance factories. His gun has been adopted by England, Sweden and Italy. In 1885 at the Antwerp Exposition he made a 13½-inch gun, 35 feet long, from which were fired two projectiles of 1,320 pounds, employing charges of 40 pounds of powder, and with a range of about 12 miles. The gun burst at the third discharge. He was the first to employ effectively the screw principle in the mechanism of the breech block, and his gas check, which prevents the escape of gases, is now generally used on all new breech-block types. See ORDNANCE. Consult Hennebert, 'L'Artillerie Krupp et l'artillerie de Bange' (1886).

BANGKOK, or BANKOK, Siam, capital of the kingdom, extending for three or four miles on both sides of the Menam, which falls into the Gulf of Siam about 15 miles below. It consists of three parts—the town proper, the floating town and the royal palace. The town proper occupies an island seven or eight miles in circuit, and is surrounded with walls and bastions; situated in the midst of gardens and luxuriant foliage, it presents a very picturesque appearance. The floating town consists of wooden houses erected on bamboo rafts moored to the bank in rows eight or more deep. The palace, occupying an island in the river, is surrounded with walls. Though the general character of the buildings is not imposing, numerous temples, glittering with gilding and terminating in lofty spires, are seen in many quarters. The approach to Bangkok by the Menam, which can be navigated by ships of 350 tons' burden (large sea-going ships anchor at Paknam, below the bar at the mouth of the river), is exceedingly beautiful. As the town is near, numerous temples present themselves, and floating houses become common, and finally the whole city, with its rich gardens and shining temples and palaces, bursts full upon the view. The royal palaces, noblemen's houses, monasteries and dwellings of Europeans are of stone, and much modern improvement has resulted in the extension of well laid-out streets, lined by brick houses, electrically lighted, and traversed by electric street railroads. Four lines of steam railroad connect with the provinces. The circumference of the walls of Bangkok, which are 15 to 30 feet high and 12 broad, is about 6 miles. Bangkok is the constant residence of the king. The palace is surrounded by high walls and is nearly a mile in circumference. It includes temples, public offices, accommodation for officials and for some thousand soldiers, with their necessary equipments, a theatre, apartments for a crowd of female attendants and several Buddhist temples or chapels. Several of the famous white elephants are kept in the courtyard of the palace. Throughout the interior are distributed the most costly articles in gold, silver and precious stones. The temples of Bangkok are innumerable, and decorated in the most gorgeous style, the Siamese taking a pride in lavishing their wealth on them. In the neighborhood of Bangkok are iron mines and forests of teakwood. The trade, both inland and foreign, is very extensive. The foreign trade of Siam centres in Bangkok and is mainly in the hands of the Europeans and Chinese. The chief exports, rice, sugar, pepper, cardamoms, sesame, hides, fine woods, ivory, feathers and edible birds' nests, have reached a total annual value of over $21,000,000. The imports are tea, manufactured silks, and piece goods, opium, hardware, machinery and glass-wares, valued annually at over $16,800,000. The United States has a resident consular agent. The population is about 500,000, nearly half of whom are Chinese, the others including Burmese, Annamese, Cambodians, Malays, Eurasians and Europeans. Bangkok was an unimportant river village prior to 1769, when it was selected by King Paya Tak for his capital.

BANGOR, Ireland, seaport town, county Down, situated on an acclivity on the south side of Belfast Lough, four miles northwest of Donaghadee and 12 miles east of Belfast. It consists of three principal and several smaller streets, and has an Episcopal church, a Methodist and a Roman Catholic chapel, and two Presbyterian churches; an endowed school, six national schools, a Protestant hall and a branch of the Belfast Bank. The male population is chiefly employed in seafaring pursuits, the females in hand-sewing in all its branches. It has manufactures of embroidered muslins and linen goods. Bangor is a favorite bathing resort. Bangor Abbey, a free school, taught by the monks, was founded by Saint Congall in 555 A.D., and had 3,000 students in the 9th century, when it was destroyed by the Danes. The parish church now occupies the site. Consult Healy, 'Ireland's Ancient Schools and Scholars' (1890).

BANGOR, Me., the chief city of eastern Maine, is a port of entry and the seat of Penobscot County. The city is on the west bank of the Penobscot River, across its affluent the Kenduskeag, and at the head of navigation, about 28 miles from Penobscot Bay. It is on the Maine Central, Bangor & Aroostook and several other railroads, with steam and electric lines radiating in all directions; is on the main line from Boston to Saint John and Halifax, and also has direct steamship connection with Boston, being the terminus of the Bangor Division of the Eastern Steamship Company. Bangor is 76 miles northwest of Augusta, 137 miles northeast of Portland and 246 miles from Boston. Pop. (1914), 26,061.

Trade and Commerce.—Situated near the geographical centre of Maine and at the head of navigation on the largest river of the State, Bangor occupies a highly favored position and one destined to be of incalculable advantage in the growth and development of the expansive territory north and east and tributary to her. As the shire town of Penobscot County, as
the trade centre and shipping point of a large and rich agricultural section and for many thriving industrial communities; as a point of connection for numerous important railway and steamship lines, and a consequent tarrying place for great numbers of tourists, sportsmen and commercial travelers; these together with the busy commerce of its port, the metropo-
tization of its street and the compact-
ess of its business section, give to the city a much more populous appearance than the given figures would indicate. Bangor has a fine harbor, easily accessible for vessels of large size. Although nearly 30 miles from the bay and 60 miles from the ocean, the tide rises about 17 feet, and there is a sufficient depth of water to float the largest of ocean steamships. The Penobscot River, whose waters unite with those of the bay of the same name, is a noble water highway, rising 300 miles away amid the mountains and forests of northwestern Maine. In the 8,200 square miles drained by the Penobscot there are 1,604 tribu-
taries. The name is indicated on the State map, and 407 lakes and ponds. Bangor is one of the greatest lumber markets in the North, there being tributary to the city the great forests of spruce traversed by the Penobscot and down which the logs are floated; and has every sort of manufactury of wood and allied products,—saw, planing, wood pulp, and molding mills; factories of furniture, carriages, trunks, valises, agricultural implements, boots, shoes and moccasins, clothing, dairy products, etc., with iron foundries, machine shops, shipyards, flour mills and pork-packing establishments. Ice-cutting is also an important industry, Penobscot ice being exceptionally pure.

Manufactures and Industries.—Bangor's manufacturing establishments number in the vicinity of 300, embracing about 100 different kinds of industries and employing several thousand hands. These figures are, however, inadequate to correctly portray the city's manu-
facturing interests, as many of the important establishments are outside the city's limits. Therefore, while the manufactures of these mills are purely Bangor products, the plants themselves and most of the employees belong properly to other towns. In recent years pulp and paper manufacturing has made great ad-
vance and numerous pulp and paper mills are now in operation along the Penobscot, from those of the Eastern Manufacturing Company at South Brewer to the immense plant of the Great Northern Paper Company at Millinocket.

In recent years diversified manufactures have been multiplying and many and varied are the products of these establishments. Here is located a trunk manufacturing establish-
ment which shipped recently a whole train-
load of trunks, the largest shipment of trunks ever made by one manufacturer in this country or the world. There are located here great woodworking and plate factories; as a point of the country the finest designs in interior decorations and architectural wood-working. The United States census of 1914 recorded 122 manufacturing establishments employing 1,014 persons and paying wages; the city receiving $734,000 annually in wages. The cap-
ital engaged aggregated $3,450,000, and the value of the year's output was $3,557,000; of this, $1,605,000 was the value added by manufac-
ture.

Bangor is a trade centre for eight counties, and is connected with their principal places by steam or electric roads, or by water communication.

Banks, etc.—Bangor has three national banks, two savings banks, two trust and banking companies, two hotel and building associations and two marine insurance companies. There are two daily papers and several weekly and monthly publications. There is a Chamber of Commerce with attractive rooms at the city hall. The Kenduskeag, flowing through the centre of the city, is spanned by several bridges, and the city is connected with Brewer across the Penobscot by a bridge 1,300 feet long. A dam across the Penobscot just above the city furnishes water supply and power, the city owning both its waterworks and municipal lighting plant. The assessed property valuation of Bangor is $24,000,000.

Buildings, etc.—The city has a fine granite custom-house and post-office, the county court-
house which is a credit to the State of Penobscot, of which Bangor is the shire town. Bangor's city hall — the Hersey memorial building—is an imposing edifice which reflects credit upon the city. Bangor suffered a $4,000,- 000 conflagration in 1911 but the city has wholly recovered and the new buildings are modern and substantial structures. The Bangor public library is one of the foremost institu-
tions of its kind. The Bangor Auditorium Association has erected the largest building of its kind in the State, and here each fall are held the eastern Maine musical festivals. The Eastern Maine General Hospital is one of the important institutions here and Bangor is also the home of the Bangor State Hospital for the Insane. The Bangor Theological Seminary is a time-honored institution of learning, and only nine miles away, in the town of Orono, is the University of Maine, the law school of which is located in Bangor.

Government.—Bangor received a city char-
ter 12 Feb. 1834. The city seal is typical, the rising sun in the background illustrating the Sunrise State, and the spruce tree in the centre portraying the great lumber interests, while in the immediate foreground are gear wheel, anchor and plow, emblematic of manufactures, commerce and agriculture. The government is vested in a mayor, who is elected annually, and a council divided into two chambers. The city has seven wards, and one alderman and three councilmen are chosen annually from each ward, the city government comprising the mayor, seven aldermen and 21 councilmen. Most of the appointments and administration offices are subject to the control of the mayor and city council.

History.—Bangor’s present site was in the early days the camping-ground of the Tarra-
tines, a famous tribe of Indians. It was in 1769 that Jacob Buswell, Homer's grandfather, came here from Massachusetts. He was a hunter and boatbuilder, and established his home near the site of Saint John's Roman Catholic Church. The place was for a time known as Kadeguquit, afterward Cothambug, and later as Kenduskeag. The locality had been visited by the French as early as 1605, and was one of the many places identified with the mythical
Norumbega. Kenduskeag plantation was only a small hamlet at the time of the Revolution and during the time when the British had control of the river the hardships were severe. At the instigation of Rev. Seth Noble, Bangor’s first clergyman, the name of Kenduskeag was finally abandoned and Sunbury adopted. With the backsliding of the planters and the impatience of the plantation organization and delegated Parson Noble to proceed to the General Court at Boston and secure an act of incorporation. Minister Noble was a great lover of music, and the hymn tune of Bangor was such a favorite with him that the name was substituted for Sunbury and the act incorporating the town of Bangor was passed Feb. 25, 1791.

Bangor early gave attention to the matter of improving her transportation facilities, and she had her railroad when most of the proud cities of to-day knew nothing of such things. As early as 1836 her enterprising citizens built a railroad to Old Town, a dozen miles up the river, with a view of aiding the development of her natural resources, and this, one of the earliest railroads in America, prospered for nearly a third of a century. Not only did the city have one of the first railroads in the country but the pioneer iron steamship constructed in America was built to run to this port and bore the name Bangor. She was built in 1845 on the Delaware, her owners being the Bangor Steam Navigation Company of Maine, and she was designed for passenger and freight service between Boston and Bangor. Within recent years, through the enterprise of some of Bangor’s public-spirited men, Aroostook County has been brought into direct railroad communication with Bangor through the construction of the Bangor & Aroostook Railroad, this system having numerous branches to important points in northern Maine, it having also absorbed the Bangor & Piscataquis Railroad. In recent years there has been no more important railroad enterprise inaugurated in New England than that of the Bangor & Aroostook, and under its enterprising and progressive management it has become a potent factor in the development of Bangor and the immense territory stretching to the northward. Bangor business men, ever alert to adopt the newest methods, inaugurated in this city the first electric railroad in Maine and more recently electric roads have been constructed reaching Hampden and South Brewer on the south and Old Town and Charleston on the north. These electric lines bring Bangor and the territory immediately contiguous into close touch, and the benefits accruing therefrom are far-reaching.

Located as the city is, on the west bank of the imperial Penobscoot, at its junction with the less pretentious Kenduskeag, the business is largely in the valley, while the surrounding heights afford picturesque sites for residences. The diversified aspect is heightened by the wealth of trees along the residential streets, and few localities are to be found with greater scenic attractions. From the highlands overlooking the city the view is particularly fine, the mountains which fill the eastern horizon make a fitting background to the picture. The Kenduskeag has, through much of its course, very precipitous banks, a notable illustration being the historic Lover’s Leap, a mile above the city; and along this picturesque stream are innumerable gems of scenic beauty.

Bangor enjoys the unique distinction of being the only place of its size on the globe where salmon fly-fishing can be successfully practised within the city’s limits, and in one season a Bangor lumber manufacturer brought to the gaff and successfully landed 27 salmon, aggregating 500 pounds in weight. The Bangor salmon pool, whence are taken all the salmon caught with a fly on the Penobscoot, is situated about a mile above the city and just below the falls that span the river at the Bangor waterworks dam.

Bangor is the home of many sportsmen and is the headquarters in this section for sportsmen’s supplies of all descriptions. Nearly all the parties of sportsmen who in the season visit the great wilderness of northern and eastern Maine make this their rendezvous and procure their outfits here. Moose and deer are multiplying rapidly as the result of wise game laws, and Maine is truly the sportsmen’s paradise.

Population.—In the year 1800 the population of Bangor was 277. From 1830 to 1834 Bangor expanded rapidly and when in the latter year a city charter was adopted the population was about 8,000. The census for 1900 gave Bangor a population of 8,850; the population in 1910 was 24,803, and with the towns immediately environing, including the city of Brewer across the river, about 50,000.

BANGOR, North Wales, episcopal city and parliamentary borough, in Carnarvonshire, near the northern entrance to the Menai Strait, nine miles northeast of Carnarvon and 60 miles west of Chester. It consists chiefly of one principal street about a mile in length, nesting in a narrow valley, but there is also a higher and more modern quarter called Upper Bangor, overlooking the strait. Two miles to the west the Menai suspension bridge and Stephenson’s famous Britannia tubular bridge one mile to the south span the Menai Strait. The principal public buildings are the cathedral, the bishop’s palace, deanery house, University College of North Wales, training college for ministers, &c. Bangor is the oldest bishopric of Wales, having been founded by Saint Deiniol in 550 A.D. He built a cathedral, which the Saxons demolished in 1071, and the new edifice, completed in 1102, was destroyed by fire in 1492. The present structure was in building in 1496–1532; it is of cruciform design, 214 by 60 feet, and has a tower 60 feet in height. Modern improvements have been freely introduced. There are plants for gas and electric lighting and a free public library. There are numerous educational institutions, including the University College of North Wales. Independent, Baptist and Normal colleges. The municipality was incorporated in 1883. The chief local trade is through the Penrhyn slate quarries, in which 3,000 wage earners are employed. The annual fairs are thronged with buyers and sellers. The fact that the harbor is not suited to large vessels makes the trade by sea of small proportions. Pop. about 11,500.

BANGOR, Pa., borough of Northampton County, 15 miles north of Easton; on the Bangor and Portland and New Jersey Central railways. There are numerous slate-quarries, silk mills, machine shops, and the products of the
slate-mills, etc., find an extensive market. Bangor was settled in 1760 and incorporated in 1875. Pop. (1910) 5,369.

BANGOR THEOLOGICAL SEMINARY (Congregational). Originated with the Society for Theological Education, which was established in 1812. The seminary was chartered by the legislature of Massachusetts, of which Maine was then a province, 25 Feb. 1814; opened at Hampden in 1816; moved to Bangor in 1819, and graduated its first class 2 Aug. 1820. It was founded to provide an educated ministry for northern New England, then frontier country and being rapidly settled. It was first formed on the plan of the English Dissenters' schools with two years' classical and two years' theological instruction. In 1827 it was reorganized on the American plan of a three years' theological course. It is governed by an independent board of trustees, having only a friendly though close relationship with the Congregational churches. It has a faculty of five and a library, besides a varying number of lecturers. It has real estate valued at $100,000, about $300,000 worth of productive endowment, including about $60,000 of scholarship funds, and $10,000 as fund for the board lectureship, the latter providing two courses of lectures on scientific and cultural subjects each year. An annual event of wide influence is Convocation Week, consisting of four courses of five lectures by the foremost men of affairs, and free to the public. The seminary is open to students of any denomination and is largely patronized by other than Congregationalists. In the first 100 years of its history, just closing, it has graduated 935 men, educated for a year or more 320 others, furnished a very large proportion of the Congregational ministers now or in the past active in Maine, sent scores of ministers to the churches outside Maine and many missionaries to all quarters of the globe.

BANGORIAN CONTROVERSY, a controversy stirred up by a sermon preached before George I in 1717, by Dr. Hoadly, bishop of Bangor. The text "My kingdom is not of this world" — in which the bishop contended in the most pronounced manner for the spiritual nature of Christ's kingdom. The controversy was carried on with great heat for many years and resulted in an enormous collection of pamphlets. See Hoadly, Benjamin.

BANGS, John Kendrick, American humorist and editor: b. Yonkers, N. Y., 27 May 1862. He was one of the founders of Life, and has long been famed for his light verse and humorous stories, among which may be mentioned "Coffee and Repartee" (1880); "New Waggings of Old Tales," with F. D. Sherman (1887); "The Idiot" (1895); "Mr. Bonaparte of Corsica" (1895); "Water Ghost and Other Stories," "The Mantel-Piece Minstrels," "The Bicyclers and Other Farcies," "A Houseboat on the Styx," and "A Rebelionn Heroine" (1886); "The Pursuit of a Princess" (1881); "Typewriter" (1889); "Uncle Sam, Trustee" (1902); "Andiron Tales" (1908); "The Foot hills of Parnassus" (1914); and "Lady Teaze," a musical comedy version of "The School for Scandal." He became editor of Harper's Weekly in 1900, of the Metropolitan Magazine in 1903 and of Puck in 1904. See Letters to Dead Authors.

BANGS, Lemuel Bolton, American physician: b. New York, 9 Aug. 1842; d. New York, 7 Oct. 1914. He was graduated from the College of Physicians and Surgeons in 1872; was professor of gynecology in the Post-Graduate Medical School and Hospital of New York, and later at Bellevue Hospital Medical College, and was consulting surgeon to various hospitals in New York. He was president of the American Association of Genito-Urinary Surgeons (1893), and editor of the American Text-Book of Genito-Urinary Diseases, etc.

BANGS, Nathan, American clergyman and author: b. Stratford, Conn., 2 May 1778; d. New York, 3 May 1862. He entered the Methodist ministry in 1801, preached for some years in Canada and removed to New York in 1810. In 1820 he became head of the Methodist Book Concern, which he reorganized thoroughly, paying off its debts, extending its business and putting it on a paying basis. He was also charged with the censorship of all its publications. In 1829 he declined the bishopric of Canada. He edited the Christian Advocate and the Methodist Magazine; was founder and secretary of the Methodist Missionary Society; president of Wesleyan University, Middletown, Conn., in 1841; and in pastoral work until his retirement in 1852. His chief work was 'A History of the Methodist Episcopal Church, 1776-1840' (4 vols., 1839-42); others are 'Errors of Hopkinsianism' (1815); 'Predestination Examined' (1817); 'Original Church of Christ' (1836); 'State and Responsibilities of the Methodist Episcopal Church' (1850). Consult his life by A. Stevens' (New York 1863).

BANGUE, or BANG, a drink much used throughout the East as a means of intoxication, prepared from the dried leaves of the Indian hemp, which are also called by this name. See Hashish.

BANGUED, bān-gúd, Philippines, the capital of the province of Abra, Luzon, 236 miles north of Manila. Pop. about 13,500.

BANGWOLO, bāng-wōlō (also called BEMBA), a great central African lake, discovered by Livingstone in 1868, which is 150 miles long by 75 wide, and 3,700 feet above the sea. The Chambere, which flows into it, and the Luapula, which issues from it, constitute the head-stream of the Kongo. The shores are flat, and parts of the lake are mere marsh. In the northwestern part are four large islands inhabited by the Mbohwa, a race of fishermen and herdsmen. On its southern shore Livingstone died.

BANI, or BANYAN (from Sanskrit bani, a merchant), the name commonly given by Europeans to Hindu merchants, brokers, etc., in Bengal and western Hindustan. They are often men of great wealth, and in their extensive dealings, their operations extending as far as the borders of the Russian and Chinese territories, the Persian Gulf and eastern Africa. They are great travelers and have counting-houses in almost every trading town of importance in Asia. English sailors call
BANIAN TREE—BANK

BANIAN DAYS those days on which they have no flesh meat. Probably the name has a reference to the habits of this class; because, before people were acquainted with the abstinence of all the Hindoos, it was thought to be confined to the Banians.

BANIAN TREE. See BANYAN.

BANIM, bā’nim, John, Irish novelist: b. 1798; d. 1842. He early exhibited a taste for literature, and before his 20th year wrote a play called ‘Damon and Pythias,’ which was afterward performed at Covent Garden. His fame rests on his novels, in which his brother Michael (q.v.) collaborated, and particularly on the ‘O’Hara Tales,’ in which Irish life in all its features is admirably portrayed.

BANIM, Michael, Irish novelist: b. Kilkenney, 5 Aug. 1796; d. Booterstown, 30 Aug. 1874. He claimed to have written 13 out of the 24 books of fiction confusedly associated with the names of John and Michael Banim, and called himself the author of ‘Croboore of the Bill Hook,’ one of the most popular of the ‘O’Hara Tales;’ ‘The Ghost Hunter’ (1833); ‘Father Connell’ (1842), and ‘The Town of the Cascades’ (2 vols., 1864).

BANISHMENT (the act of putting under banishment, as an outlaw), a technical term in Scotch criminal law for the punishment of sending out of the country under penalties against return. This punishment was formerly much used in various forms—for example, banishment to the plantations or colonies; to England (even after the Union) from a particular county in Scotland, etc. Sometimes capital punishment was commuted to banishment for service in a foreign war. The old Scotch doom of deportation was gradually merged in transportation under various British statutes.

Banishment is sometimes used in the sense of expulsion or deportation by the political authority on the ground of expediency, as well as in the sense of transportation or exile by way of punishment for crime. 3 Am & Eng. Enc. Law (2d ed.) 770. The United States Supreme Court decided in the case of Fong Yue Ting v. United States, 149 U. S. 698, that the right to exclude or to compel aliens, or any class of aliens, absolutely or upon certain conditions, in war or in peace, is an inherent and inalienable right of every sovereign and independent nation. The idea of banishment occurs in the ostracism and petatism of Greece, and the relegation, exile and deportation of Rome. It was generally accompanied by forfeiture of civil rights. In England, voluntary banishment was called abjuration. Banishment still obtains in Turkey, while the Russian system of banishment to Siberia is well known.

BANISTER, John, Anglo-American scientist: b. England; d. 1692. He settled in the West Indies, and later in Virginia, in the vicinity of Jamestown, where he devoted himself to the study of botany. He was a contributor of a catalogue of Virginia plants to Ray’s ‘History of Plants,’ in 1660. The genus Banisteria was named in his honor. His publications include works on the Natural Productions of Jamaica; ‘The Insects of Virginia’; ‘Curiosities in Virginia,’ etc.

BANISTER, John, son of the preceding: b. Virginia; d. 1787. He was educated in England and studied law there; became colonel in the Virginia militia; was a member of the Virginia assembly, and prominent in the patriotic conventions of the Revolutionary period; was a representative from Virginia in the Continental Congress in 1778-79, and one of the signers of the Articles of Confederation.

BANJARMASSIN, bā-yā-mās’sen, Borno, a town near the southeastern angle of the island, under the government of the Dutch, on an arm of the Banjar, about 14 miles above its mouth. Owing to the marshy ground and frequent inundations of the river the houses are built on piles, and many of them on rafts, the front next the river being used as a shop or stall on which wares are exposed for sale. On market days the water is covered with skiffs, having a single individual in each, moving about selling vegetables, etc. The people are continually on the river, all necessaries being purchased at these floating markets, and all business being done on the water. In every respect it is a floating town, possessing neither carriages nor horses; the only animals kept being pigs, goats, ducks, geese and fowls. The houses of the European functionaries, the government buildings, and the fort, are built partly of stone and partly of wood. The Fort Tatas is surrounded with palisades, and contains the resident’s house, the magazines and barracks. Exports are pepper, benzoine, bezoar, rattans, dragon’s blood, birds’ nests, iron and straw mats very artistically made; and imports rice, salt, sugar, opium, coral, Chinese porcelain, silk, cutlery, gunpowder, etc. Pop. about 53,000.

BANJO (a negro corruption of pandore, Italian, pandora, from Greek pandoura, a three-stringed instrument), the favorite musical instrument of the negroes of the Southern States, and now widely popular elsewhere. It is five-stringed, has a body like a tambourine, covered with vellum or parchment strained to drumhead tension by adjustable clamps set close around the hoop, and tunable like a guitar. The back is open. The strings pass from a tail piece over a low bridge similar to a violin bridge and thence to the tuning pegs. The banjo is played by stopping the strings with the fingers of the left hand and plucking or striking them with the fingers of the right. The upper or octave string, however, is never stopped. This string is inches long, the tuning peg being part way up the neck. The other four strings are inches long. When in position for playing the octave string is held uppermost. It is tuned to E. Next to it is the lowest tuned string, tuned to A, and the other three strings rising in tone, E, G, and B. The music for the banjo is written on the treble clef—an octave above the tones as played. In some countries a 6-string banjo is in use, and there is also a 9-string instrument of the same class.

BANK, Banks, Bankers. The term bank and its derivatives does not occur in classical Latin. It first appears in low Latin about the beginning of the 13th century, when it seems to have been borrowed by the Norsemen and where it displaced the Roman mensa, as applied to the bench, table, counter,
or counting-table, or board upon which the dealer in money sorted and counted his coins. The Greek words for a banker or dealer in moneys were trapezeta and collybia, both of which were adopted by Roman writers. The Romans, in successive ages, had various terms for what would now be called a banker or bankers; and it is under these heads that information must now be sought concerning their rise and development. These Roman terms were mensarius, a sorter and counter of coins; nummularius, a money changer; functarius, a lender of money on interest; negotiator, a lender of money in the provinces, where the usury laws did not prevail. Camsoor nummularius also appears in some works.

The counting-table is still employed, chiefly in national mints. It consists of a wooden board with a hundred or a thousand circular holes, cavities or depressions, suitable to the size of the coins to be counted. A large heap of such coins is thrown upon the board, one end of the board is then raised so as to form an inclined plane from which the surplus coins roll off; and thus the counting of a thousand coins is done in a moment.

It is perhaps owing to the absence of the term "bank" or banker in classical works that banks are commonly supposed to be of medieval or modern origin. This is so far from the truth that the necessity for their adoption has resulted in their establishment in all ages and countries where the government was sufficiently powerful to protect their funds from pilage and sufficient to protect the exercise of their necessary and lawful functions. The earliest governments of this character were pontifical, the sovereign being both king and high priest; for example, the Brahminical code, or Brahminical code, a translation of which, Governor Warren Hastings presented to the East India Company, there occur allusions to Bundhoos, or bankers, and to lenders of money other than pawnbrokers, coupled with the names of several sorts of money — gold, silver, copper and cowrie shells. The governor alludes to this code as of "the remotest antiquity," which is evidently true as to some parts of it, while other parts are as evidently medieval. One of its provisions, a peculiar one, occurs also in the Athenian and Byzantine codes, though which of them was borrowed from the other is difficult to decide. Says the Gentoo Code, iii, 3, "If a man hath borrowed money from another upon agreement for a low rate of interest and afterward, though at his own option consents to an increased rate of interest, the former agreement shall be observed, or held good, by the magistrate. The corresponding Greek rule will be found in our article on Byzantium, Bank of.

Until the capture of Constantinople by the Latin forces in 1204, the prerogative of coinage gold, a heritage from the ordinances of Augustus, was enjoyed exclusively by the Basileus and became a prerogative of Christendom. As a matter of fact there were no gold coins struck in Christian Europe between Charlemagne and the fall of the Greek empire; the only coins of that metal (barring a few counterfeit) being the bezants (and their parts) of Constantinople, the florins, etc., of Saracen mintage. As the principal transactions of commerce were valued in gold coins, there existed no encouragement to establish a bank until the gold prerogative of the Basileus was destroyed and local coinage of gold was permissible. Hence such coinages, together with the establishment of banks of exchange and deposit, and transfer, as well as the open use of bills of exchange, warrants, checks, transferable bank receipts, etc., may all with confidence be dated from 1204, or such other local date as coincided with it, bearing in mind that the Aera Hispanica used in some of the Christian kingdoms of Spain, began 38 B.C., and the Aera Augusta, used in other states, both in Spain and elsewhere, began 15 B.C. The earliest gold coins of Christian Europe after the fall of Constantinople were struck in 10 different principalities between that date and 1257, when Venice struck its first sequin. Among the earliest banks were those of Venice, 1252 (from 1137 to 1252 it was a chamber of loans, not yet a bank); Delft, 1313; Calais, 1329; Geneva, 1346; Florence, 1350; and Barcelona, 1401. For the industrial history of the world's great banks see articles in this Encyclopedia as follows: Ancient banks: Amsterdam, Bank of; Barcelona, Bank of; Byzantium, Bank of; Fugger's, Bank of the; Genoa, Bank of; Hamburg, Bank of; Medicis, Bank of the; Nuremberg, Bank of; Stockholm, Bank of; Tyre, Bank of; Venice, Bank of. Modern banks: Deutsche Bank; Diskonto-Gesellschaft; Dresdener Bank; England, Bank of; France, Bank of; Italy, Bank of; National City Bank of New York. See also Banks and Banking.

BANK HOLIDAYS. weeks during which banks are legally closed. In the United States they are: 1 January, or New Year's Day, a legal or bank holiday in all the States except Arkansas, Delaware, Georgia, Kentucky, Maine, Massachusetts, New Hampshire, Rhode Island, and North and South Carolina, Fourth of July, Independence Day and 25 December, Christmas Day, are bank holidays in all the States and Territories of the Union. Thanksgiving Day and public fast days appointed by the President of the United States are also legal, or bank, holidays. With the 4th of February, the anniversary of the birth of Abraham Lincoln, is a legal holiday in nine States. February 22, the anniversary of the birth of Washington, is a legal holiday in all the States save Arkansas, Iowa and Mississippi. The first Monday in September, Labor Day, is a holiday in nearly all the States. January 9,
anniversary of the battle of New Orleans, and Fireman's Day, 4 March, are legal holidays in Louisiana. Good Friday is a legal holiday in Florida, Louisiana, Minnesota and Pennsylvania; and Shrove Tuesday in Louisiana and Alabama. Decoration Day (North) and Memorial Day (South) are observed in the several States.

In England and Ireland the bank holidays are: Good Friday, Easter Monday, the Monday in Whitsun week, the first Monday in August, and 26 December, called Boxing Day. In Scotland: (1) New Year's Day; (2) the first Monday in May; (3) the first Monday in August; (4) Christmas Day.

When one of these holidays falls on Sunday it is observed on the following day, and a note or check becoming due on a holiday or a Sunday is payable on the first business day following.

BANK OF NORTH AMERICA. See Banking in the United States.

BANK NOTE ISSUES. See Banks and Banking—Bank Note Issues (article 19).

BANK-SWALLOW, a small swallow, familiar not only in all parts of America, but in most other countries, for its habit of breeding in colonies in holes in sand-banks. It is sooty black above, and white on the under surface of the body, with a dusky band across the breast. This swallow comes from its winter home in the tropics, among the earliest birds of spring, and spreads northward even to the borders of the Arctic Ocean. Many, however, remain within the United States, where companies of them seek the banks of streams or exposed cliffs of sand, and bore in close proximity a great number of tunnels, which may be seven or eight feet deep. The bill and feet are both exceedingly weak, yet with these feeble tools each pair, working alternately and with great diligence, complete their excavation in a surprisingly short time. The same bank will be occupied year after year. The inner extremity of the tunnel is furnished with a nest of dry grass and feathers, and there are laid in June four or five pure white eggs. The tunnels are used as roosting places at night by both sexes, and when the young are hatched they will scramble to the mouth of the burrow and may be seen sitting there some days before they obtain strength and courage to launch forth upon their wings. These swallows feed entirely upon small insects caught in the air, and the sight of a crowd of them darting about the neighborhood of their homes, with a constant twittering, is a familiar sight of our country districts. The English sparrows trouble them greatly by seizing upon their burrows and dragging out the furniture; and snakes and mice sometimes enter the holes, but against most enemies these swallows are well protected. Our common species (Clitivula riparia) is also numerous throughout Europe and Asia. Very similar species inhabit the Oriental region and Africa. These birds are well described in all standard works of ornithology, and some special information may be obtained in the 'Monograph of the Hirundinidae' by Sharpe and Wyatt (1885—94); and in 'Bird Watching,' by Edmund Selous (1901). See Swallow.

BANKRUPT, a term derived generally from Italian, banca, a bench, and Latin, ruptus, broken, in allusion to the benches formerly used by the money-lenders in Italy, which were broken in case of their failure. The word in its most general sense signifies an insolvent person, but more strictly an insolvent merchant.

There is perhaps no branch of legislation more difficult, and at the same time more important: a bankrupt signifies the relations of debtors and creditors. One of the first objects of all laws, after the protection of the person, is the enforcement of the obligation of contracts, and among all the contracts made in a community those imposing the obligation to pay money constitute the most numerous class. Some of the first questions in legislation are: By what means shall this obligation be enforced and by what penalties shall the breach of it be punished? In many communities, especially in the earlier stages of civilization, the breach of such a contract or obligation is regarded as a crime, and the insolvent debtor is treated as a criminal. The ancient laws upon this subject in England so regard the insolvent trader. The early laws of the Greeks and Athenians authorized the most rigorous measures for procuring satisfaction of a debt, even permitting the sale of the debtor into slavery for this purpose. The Battas of Sumatra still, it is reported, sell not only the debtor but also his family for the benefit of the creditor. But as civilization advances the laws put a more mild construction upon the debtor's failure to fulfil his contract, and, with certain qualifications, and under certain restrictions, attribute it to misfortune, and, on giving up his property to be divided among his creditors, discharge him from all further liability.

The power of making bankrupt laws in the United States was, by the Constitution, conferred on Congress, which alone had the power to make a bankrupt law applicable to, and binding upon, all creditors in the United States, and for all descriptions of debts. This power was first exercised by Congress in 1800, by the enactment of a bankrupt law limited to five years, and which expired by its own terms in 1805. This act was modeled upon the English statutes of bankruptcy existing at the time, and, like them, was applicable to no debtors except merchants. Both by the English statutes and the French Code, persons capable of becoming bankrupts are such as fall under the description of merchants, which the French describe as commerçants.

A statute in the reign of George III, relating to bankrupts in Scotland, describes a person capable of becoming such to be one who "either for himself, or as an agent, seeks his living by buying and selling, or by the workmanship of goods or commodities; an English statute of the reign of George IV, embodying the previous acts and judicial decisions on this subject, enumerates particular descriptions of persons who are to be considered merchants and capable of becoming bankrupts. See Bankruptcy Laws.

BANKRUPTCY, A, by Björnstjerne Björnson. The appearance of Björnson's 'Bankruptcy' in 1875 marks a new departure in Norwegian literature. For the first time
money becomes the subject of a poetical production, a theme which had previously seemed altogether too prosaic for real poetry, but which Björnson handles with dexterous skill. He deals with the financial situation of a modern business man and does not disdain figuring out his assets and his liabilities. The play is, furthermore, significant because of the fact that it introduces for the first time the modern culture. Norweigan nations. The success of the play is the contrary, and Björnson shows admirably how miserable is the life of a man who tries to avoid fundamental moral law. He shows the influence exerted on the man’s family and home. The success of "Bankruptcy" was spontaneous. The pictures are simply and naturally drawn, and they made an irresistible appeal to the common man. This was no doubt partly due to the sound humor pervading the work. Consult Henrik Jaeger, "Illustreret norsk literaturhistorie" (Vol. II, pp. 589-639 and 711-768); George Brandes, "Det Moderne Gjennembuds Mønd" (pp. 1-69, tr. by Mary Morris in a volume entitled "Henrik Ibsen, Bjørnstjerne Björnson: Critical Studies." By George Brandes, 1899).

JOSEPH ALEXIS,
Professor of Germanic Languages and Literatures, University of Nebraska.

BANKRUPTCY LAWS. When a person is unable to pay his debts in full, the law of civilized countries adopts some means of satisfying the creditors, as far as they can be satisfied, out of the debtor’s estate, and relieving the debtor himself from pressure which, by his own efforts, he would not be likely to overcome. The debtor having been declared a bankrupt, his property vests in his creditors for the purpose of being divided ratably among them, and consequently he starts anew, entirely relieved from the obligations thus partially satisfied. In general terms this is the process of bankruptcy observed in modern societies. The law of bankruptcy is, in fact, a modern creation slowly evolved out of the Criminal Code in answer to the necessities of a widely spread industrial life.

The early law of Rome, while prohibiting contracts of usury, gave the use of credit the savage remedy of dividing the carcass of their debtor or selling him and his family into slavery. The Lex Poetelia (about 326 B.C.) enabled a debtor who could swear to being worth as much as he owed to save his freedom by relinquishing his property to creditors. Many years afterward the legislation of Julius Cesar established the cesso bonorum as an available remedy for all honest insolvents. The bankrupt law was slowly developed in England. The first English statute on bankruptcy (34 and 35 Henry VIII, c. 4.) was directed against fraudulent debtors, and gave power to the lord chancellor and other high officers to seize their estates and divide them among their creditors. In England, before 1841, only a tradesman could be a bankrupt. The distinction was then abolished. It was abolished in the United States in 1869. In the United States, Congress alone has power to pass a bankrupt law which shall have authority throughout the country. The several States may enact such statutes whenever there is law of Congress in operation. The first general bankrupt act in the United States was passed in 1800 and was repealed in 1803. In 1841 another law was put in operation, with a special view of meeting the urgent needs of debtors who had been ruined by the commercial revolution of 1837-38, and who could receive no effective relief from local laws. This act was repealed in 13 months, but in the meantime a large number of cases had been disposed of, amounting to $2,500 in Massachusetts alone. Another bankrupt law was passed which took effect 1 June 1867. It was framed with great care by a committee of the House of Representatives, of which Mr. Jenckes was the chairman and chief working member. Its authors hoped that it would form a permanent addition to the jurisprudence of the country, but it was repealed within a few years.

An act to establish a uniform system of bankruptcy throughout the United States, was passed by both Houses of the 55th Congress, and by the approval of President McKinley became a law on 1 July 1898. The question had been brought before Congress for several years, the issue not being between the political parties, but on the method of legislation, one side favoring the creditor and the other the debtor class. The Nelson bankruptcy bill, which at the first, or special, session of the 55th Congress passed the Senate, failed to receive the consent of the House. The new law was a compromise between the Nelson bill, calculated chiefly to benefit debtors, and the Thayer bill, designed to guard the interests of both creditors and debtors. The adoption of the bill which became a law was mainly through the long-continued efforts of Senator Hoar (Rep. Mass.), aided especially by Senator Nelson (Rep., Minn.), and Senator George W. Hawley (Rep., N. Y.). A conference between the two Houses was held, which reached an agreement on 15 June, the report being adopted by the House, 28 June, by a vote of 133 to 53; present and not voting, 24. All the votes against the bill came from the South and the far West. Slight changes to correct defects in this act have since been made through three supplementary acts approved 5 Feb. 1903, 15 June 1906 and 25 June 1910, and further supplemented by rulings of the Supreme Court, as to matters of practice, and by official forms of the same court.

The provisions under which a man can be thrown into bankruptcy against his will are as follows: (1) where a man has disposed of his property with intent to defraud; (2) where he has disposed of his property to one or more creditors to give a preference, (3) where he has given a preference through legal proceedings; (4) where a man has made a voluntary assignment for the benefit of his creditors generally; (5) where a man admits in writing that he is a bankrupt. The last two
provisions are practically voluntary proceedings. Under the common law a man is considered insolvent when he cannot pay his debts when they are due, even though he is deemed insolvent only when his property, fairly valued, is insufficient to pay his debts. Only two offenses are cited under the new law; one when property is hidden away after proceedings to have been begun, and the other when perjury is discovered. Discharges are to be denied in only two cases; one, in which either of the offenses detailed has been committed, and the other, when it is shown that fraudulent books have been kept. The term of imprisonment for either of these offenses is not to exceed two years.

The law provides a complete system throughout the United States, and for its administration by the United States courts in place of the different systems formerly in existence in the various States administered by State courts. In bankruptcy proceedings a bankrupt debtor may turn over all his property to the court, to be administered for the benefit of his creditors, and then get a complete-discharge from his debts. A bankrupt may of his own motion offer to surrender his property to the administration of the United States court and ask for his discharge in voluntary bankruptcy, or creditors may apply to the court to compel a bankrupt to turn over his property to be administered under the act for the benefit of the creditors in involuntary bankruptcy. The bankrupt who has turned over all his property and conformed to the provisions of the act is entitled to a judgment of court discharging him from any future liability to his creditors. The State laws relating to insolveney are not affected by this law, but remain in full force and effect.

Extended powers are given by the law for the taking possession and the administration of the assets, among others, to allow and disallow all claims against bankrupt estates; appoint receivers and take the necessary measures for the preservation and charge of the property of a bankrupt to assign, try and punish bankrupts, officers and other persons, and the agents, officers and members of the board of directors or trustees, or other similar bodies or corporations for violation of the act; to authorize the business of the bankrupt to be conducted for limited periods; to cause the assets to be collected and reduced to money and distributed, and substantially determine all controversies in relation thereto; to enforce obedience to lawful orders by fine or imprisonment; and to extradite bankrupts from one district to another. As all questions, both of law and fact, in relation to the property of the rights of the various parties, must be decided in the bankruptcy proceeding, it is provided that referees be appointed, who are charged with the duty of hearing the allegations and testimony of all parties, and deciding all such questions as may arise. Each case, as it comes up, is assigned to some referee, whose duty it is to adjudicate and dispose of all the parties to appeal from the decision of the referee to the United States District Court. The duties of the referee are substantially of a judicial character, and he occupies much the position of a judge of primary resort, subject to an appeal of the court, and is required to take the same oath of office as that prescribed for judges of the United States courts.

Provisions are made in the act for allowing bankrupts to compromise or settle their creditors by proceedings known as composition proceedings, whereby, if a bankrupt and a majority of his creditors agree upon some basis of settlement, the same, if approved by the court, shall become binding upon all creditors. The decision of the question as to the approval of compositions and granting discharges to a bankrupt from his debts is specifically reserved by the act to the judges of the United States courts; but the court, by virtue of its general powers, may refer such matters to the referee to take testimony and report to the court his opinion thereon. The aim of the act has been to make the expense of the proceedings depend largely upon the amount of the property involved, and the compensation of the referee is fixed substantially at 1 per cent on the amount distributed to the creditors in ordinary cases, where the assets are distributed by the court; at 1 per cent in composition cases, and the trustees who have charge of the actual management of the bankrupt's property receive as compensation such commissions on accounts paid out by them as dividends as the court may allow, not to exceed, however, 3 per cent on the first $5,000, 2 per cent on the second $5,000, and 1 per cent on all sums in excess of $10,000.

BANKS, a nautical term applied to shelving elevations in the sea or the bed of a river, rising to or near the surface, composed of sand, mud or gravel. When tolerably smooth at the top they constitute shallows, shoals and flats; but when rocky become reefs, ridges, keys, etc. A good chart always defines them, indicating whether they are sands or rocky.

BANKS, Sir Joseph, English naturalist. b. London, 4 Jan. 1743; d. Islesworth, 19 June 1820. At Oxford he began to study botany and other branches of natural history, to which his attention had already been turned from about the age of 14. He formed a volunteer class in the university and brought Mr. Lyons from Cambridge to teach it. In May 1766 he was chosen a member of the Royal Society, and in the following summer he went to Newfoundland and proceeded to Hudson Bay to collect plants. In 1768 he, with Dr. Solander, a pupil of Linnaeus and assistant librarian at the British Museum, accompanied Cook on his voyage of discovery, Banks being appointed naturalist to the expedition. In an expedition into the interior of the desolate Tierra del Fuego, for the purpose of examining the country, the two naturalists narrowly escaped perishing with cold. Banks procured the introductions arising therefrom, and, after returning to England, he wrote the botanical observations in the account of Cook's voyages. In 1772 he visited Iceland with Dr. Solander, in order to make himself acquainted with its natural productions. During this voyage the Hebrides were examined, and the columnar
stratification of the rocks surrounding the caves of Staffa was made known to naturalists for the first time. Banks was elected a member of the Royal Society in 1777. In 1781 he was made a baronet. The French chose him a member of the National Institute in 1802, because to his intercession they owed the recovery of the papers of La Pérouse relating to his voyage which they had taken from the hands of the British. His library and his collections in natural history are celebrated. Besides other contributions he wrote 'A Short Account of the Causes of the Blight, the Mildew, and the Bath Rust' (1803). In 1803 he was sent to Boston University. The genus Banksia, of the natural order Proteaceae, was named in honor of him by the younger Linnaeus.

BANKS, Louis Albert, American clergyman and author: b. Corvallis, Ore., 12 Nov. 1855. He was educated at Phildom College and at Boston University. He entered the Methodist Episcopal ministry in 1879; was pastor of the Independence Avenue Church, Kansas City, in 1909–11 and since then has been engaged as evangelist in union evangelistic campaigns. He was the prohibition candidate for governor of Massachusetts in 1893. Among his numerous writings are 'The People's Christ' (1891); 'The White Slaves' (1892); 'Anecdotes and Moralities' (1894); 'Honeycomb of Life' (1895); 'Christ and His Friends' (1896); 'Live Boys in Oregon' (1897); 'My Young Man' (1899); 'Chats With Young Christians' (1900); 'The Great Saints of the Bible' (1901); 'Youth of Famous Americans' (1901); 'Religious Life of Famous Americans' (1904); 'Spurgeon's Illustrative Anecdotes' (1906); 'Sermons Which Have Won Souls' (1908); 'The Problems of Youth' (1909); 'The World's Childhood' (1910); 'The Great Themes of the Bible' (1911); 'A Summer in Peter's Garden' (1913); etc., etc.

BANKS, Nathaniel Prentiss, American soldier and statesman: b. Waltham, Mass., 30 Jan. 1816; d. there 1 Sept. 1894. Entirely self-taught, he worked himself up from the position of bobbin-boy in a cotton factory to the editorship of a daily newspaper. He read law, was admitted to the bar, and began to practise, but soon became active in politics. Elected to the Massachusetts legislature in 1849, he became speaker in 1851–52. In 1853 he was president of the Massachusetts Constitutional Convention, and the same year was elected to Congress as a Coalition Democrat. The session which began 3 Dec. 1855, was memorable for its bitter speakership contest, the candidates being Banks and William Aiken, a large slaveholder of South Carolina. The contest lasted two months, the President's message being withheld, and all legislative business blocked. The sergeant-at-arms borrowed $20,000 from a Philadelphia bank in order to make advances to needy members of both parties. On the 13th ballot 2 Feb. 1856, Mr. Banks was elected. None of his decisions while speaker were ever reversed by the House. He was governor of Massachusetts, 1857–59. In 1861 President Lincoln appointed him major-general of volunteers. He saw service in active operations in the Shenandoah Valley and fought with credit at Winchester and Cedar Mountain. In co-operation with Admirals Farragut and Porter he invested Port Hudson asident of the Royal Society in 1777. In 1781 he was made a baronet. The French chose him a member of the National Institute in 1802, because to his intercession they owed the recovery of the papers of La Pérouse relating to his voyage which they had taken from the hands of the British. His library and his collections in natural history are celebrated. Besides other contributions he wrote 'A Short Account of the Causes of the Blight, the Mildew, and the Bath Rust' (1803). In 1803 he was sent to Boston University. The genus Banksia, of the natural order Proteaceae, was named in honor of him by the younger Linnaeus.

BANKS, Thomas, English sculptor: b. Lambeth, 29 Dec. 1735; d. 2 Feb. 1805. He studied sculpture in the Royal Academy, and was sent as one of its students, to Italy. Here he executed several excellent pieces, particularly a bas-relief representing Caracalla and his family before Claudius, and a group of a group of a butterfly. Among other works executed by him was a colossal statue showing Achilles enraged for the loss of Briseis, now in the entrance hall of the Royal Academy. He was also the sculptor of the admired monument of Sir Eyre Coote in Westminster Abbey. These works, though some of them were executed at a very advanced age, showed extraordinary power. He was elected a member of the Royal Academy in 1785.

BANKS, Sir William Mitchell, Scottish surgeon and anatomist: b. Edinburgh 1842; d. 1904. He was graduated at Edinburgh University in 1864, was appointed demonstrator of anatomy in the University of Glasgow, and later was consulting and operating surgeon at Liverpool. He originated the modern method of operating for cancer of the breast. He reorganized the Liverpool Medical School and founded University College, where he was for a time professor of anatomy. He was chosen first president of the Liverpool Biological Society in 1886. In 1897 he delivered the address in surgery before the British Medical Association at Montreal. He published numerous papers and addresses.

BANKS LAND, an island in the Arctic Ocean, discovered by Parry in 1819, explored by McClure in 1850, and named by him Baring Island. It is separated by Banks Strait from Melville Island, lying to the northwest, and by Prince of Wales Strait from Prince Albert Land, lying eastward.

BANKS AND BANKING. This department has been developed to give a concise digest of banking, finance, money, history of banking, etc. It is subdivided as follows:

1. Origin and Development of Banking.
2. The Functions of Banks.
3. World Systems—Types.
5. Foreign Exchange.
6. Investment Banking.
10. State Banking System.
11. Private Banks.
21. Trust Companies.
1. ORIGIN AND DEVELOPMENT OF BANKING. Bank (from the mediaeval bancus and banc, the ancient name having been fiscum, a purse for money. (Cicero, Verr. 2). Bancus or banco is commonly traced to the bench whereon money-changers sat, when banking merely consisted in the purchase and sale of uncertain coins; but this, as shown in Madox's 'History of the Exchequer,' this is erroneous. Bancus or banco relates only to the 'Justices' Bench to which, in the 12th century in England, common causes, 'Common Pleas,' began to be removed from the King's Bench to local courts. The point is important, because it disposes of the fable that banks owe their origin to the money changers of the Dark Ages. Primarily a bank or fisc means a place of deposit for money, open to the public. Banks can be traced back to Rome, Greece, Egypt, Babylon, indeed to all parts of the world, which were seized upon, being counted, and whose government was sufficiently powerful to protect their funds from pillage and sufficiently just to permit the exercise by the bankers of their useful and lawful function. The word banco, or bancia, is being used in the Code of Menu (p. 10), but the date is uncertain.

The earliest settled and permanent governments were pontifical, the sovereign being both king and high priest. Hence the earliest banks in the Occident were the national temples, such as Delphi and Delos in Greece, whose activities in this respect date back to the earliest use of coined money. This money they received on deposit and loaned out at rates of interest varying from 10 to 30 per cent per annum.

Following the temple banks, perhaps coeval with them, were those private bankers whom we first hear of in Babylon, tempo Nebuchadnezzar, under the title of 'Egilia and Sons,' about 600 B.C. (Cuneiform inscription). The state bank at Ithion, mentioned by Boecchus, as paying 10 per cent to depositors for money for the public service, must be dated about the 3d or 2d century B.C. About the same period Theocritus, whose 4Hydias 420 B.C., mentions a banker at Alexandria, as paying interest on deposits withdrawn at pleasure of the depositor, and payable not only in business hours, but at any time of day or night. (Epit. XXI, iii). Livy (VII. 21) mentions bankers (argentarii) in Rome, 354 B.C. Tacitus and Suetonius both allude to banks in Rome during the reigns of Augustus and Tiberius. Adam (Rom. Ant.) cites numerous instances of private banks and banking terms and incidents during the early empire, such as the deposit and withdrawal of money, payment of interest, checks or orders for payment, acceptances, bankers' books of account kept by double entry, transfers of accounts, loans, etc. Of late years an iron safe deposit has been dug up of the time of Hadrian, attached to which is a body of regulations, very similar to those now in vogue. It would appear that the emperors had become the sole bankers of the empire. Following the method which he adopted with respect to the pontifical, censorial, tribunitial, consular and other powers of the state, Augustus absorbed in his own person, becoming himself essentially a corporation sole; for of this character was the office inherited and administered by his official successors. The public treasury was called 'Aceraria,' the imperial treasury ('practica'), the national bank, the Fiscus. It received and paid out deposits of money, it loaned money at interest, it accepted inheritances (some persons bequeathed their entire fortunes to it), and it devoted large funds to public purposes.

The functions performed at Rome by the Imperial fisc were permitted to be exercised in the provinces by the Proconsular fiscs, until the weakening of the Central power and encroachments of the Proconsular agents broke down the entire structure of Roman authority. Lamprinidus makes some allusion to bankers in the reign of Alexander Severus; afterward, all mention of banks or bankers ceases for a long period.

In the reign of Alexander Severus the fiscal laws and system of the empire underwent a radical change, yet the evidences of it, as revealed by inscriptions recovered in recent times, are scattered over several centuries; chiefly the 3d, 4th and 5th. The public treasury and Imperial fisc as a bank, is employed to Aurelian. The Lord Treasurer, Sacrarum Largitionum, managed all public funds; while the imperial demesnes and private purse were committed to the Comes rerum praebendarum, both of them being endowed with several titles. (Bury, 1, 44). The interdiction against the taking of interest for money which these changes involved began a new period in the history of banks. The capital of the empire had been transferred to Byzantium (Constantinople), so that Europe, formerly within easy reach, was now far removed from the court. What the government denied, private interest afforded; the Jews braved its displeasure and its penalties by providing a means to relieve the necessities of the poor: a species of poverty banks, or lending houses, first mentioned by Prudentius, as having been established in Italy about A.D. 400. For a period of two or three centuries during the Dark Ages these establishments appear to have been the only means of procuring loans to the public.

About the 8th century the poverty banks were taken over by fraternities of monks and confirmed by the Popes as montes pietatis; the right to exact collateral security and to charge interest being confirmed by several pontiffs, especially Pius II and Sixtus IV. After the fall of Constantinople in 1204 the monks were superseded in this lucrative business by the Lombard goldsmiths and money changers, whose various names of Bardis, Corsini, etc., neither should derive from popular aversion, nor prevented them from driving a lucrative trade. So influential did they become, that in 1311 one of their number, Raoul the goldsmith, was ennobled by his patron, Louis X; the first instance of the sort known to history. In 1313 there was a Lombard's bank at Delft, and in 1320 another one at (probably) Calais, which latter loaned 5,000 marks (about 16,000 gold dollars) to Edward III of England. The banks of Geneva, 1345, and of Florence, circ. 1350, were probably an evolution from the Lombard goldsmiths, just as the latter were evolved from the montes pietatis and these again from the poverty banks of the Jews.

For the first time in 400 years, a circum-
stance entirely overlooked in works of reference, Christian gold coins now began to be struck in Europe outside of Spain, where the privilege had ever been jealously guarded by the Basileus. This had much to do with the progress of banks, for it provided a more portable and reliable money than the heterogeneous and often debased and degraded silver coins of the various principalities and kingdoms which had been erected upon the ruins of the empire. The first Christian gold coins of western Europe were the augustais of Frederick II, 1225, followed by the ducats of Portugal, same year, the pavilions and agnus of Louis IX of France, the ducats of Florence and Genoa, 1253, and the sequins or ducats of Venice, 1276. Consult Del Mar, 'Science of Money,' p. 74.

Confining the term bank to its more modern sense—what may be regarded as one of the earliest, perhaps the earliest, Christian institution of this character, was the Bank of Barcelona, 1401. As the operations of this bank had a bearing upon the affairs of America, they claim to be noticed. As the operation of coinage was in the ordinance of Valencia, made by King John, who conquered the kingdom of Aragon, it is expressly provided that reals shall only be coined in Valencia and that the minters shall be supervised by two well-known citizens; so that no fraud shall be committed as to material or weight (Grimaudet, 'Law of Payment,' New York edition, p. 14). The coin referred to is the familiar Spanish real de plata, of eight to the dollar. This coin was lawful money in the United States down to 1833 and till recently was known to New York traders as a "shilling" and throughout the Southern States and California, as the "bit." The coinage supervision ordered by King John (father of Ferdi-nand, in whose reign Columbus discovered America), was afterward extended to Barcelona, where it furnished the basis for the extensive dealings of its bank in the exchange of full-weighted reals and reals de a ocho (dollar pieces of eight reals) for the heterogeneous coinage in all parts of Europe into that great commercial emporium; among them the coinages of Moslem Spain (Granada).

From Barcelona King John's test of the coins, called in England "The Trial of the Pyx," was carried from Spain into the Spanish-American mints of Mexico and Peru and adopted by the United States government from the period of its inception. This supervision and testing of the coin is still conducted in the American mints under a commission of civilians appointed by the Secretary of the Treasury. It constitutes the groundwork and basis of honest money and banking.

The Bank of Barcelona also received on deposit and disbursed the revenues, or part of them, of the four great ecclesiastic-military orders and kept the accounts of about a dozen other orders of knighthood, like those of Calatrava, Saint James, Golden Fleece, Saint George, etc., some of which were ecclesiastical and some merely chivalric. The royal treasure, formerly deposited in the castle of Segovia, is believed to have been removed to the Bank of Barcelona, because the Contador-General is known to have drawn some of his warrants for public expenses upon that institution. In 1490 Isabella, holding court at Toledo, signed a decree which greatly affected the bank. To support the government of Castille, King IV had issued certain céédulas or certificates of annuities assigned on the public rents, and these by purchase had become the property of the nobles, who in turn had borrowed money on them from the bank. Isabella's decree, denouncing and annulling these certificates—virtually an act of repudiation—was entrusted for execution to her confessor, Ferdinand de Talavera, who performed his task with such fidelity that it "saved" 300,000,000 maravedis annually to the Crown (Frescott). If the bank survived the depletion of its resources in 1490, it could scarcely have weathered the civil war of 1517-22, during which period of turbulence the bank, despairing of a return to peace and security, appears to have quietly discharged its obligations, wound up its affairs and honorably dissolved.

Between the Bank of Barcelona (barring the "Bank" of Saint George at Genoa, 1407), that is to say between 1401 and the formation of the Bank of Amsterdam 1609, the Bank of Barcelona will be searched in vain for any notice of a public bank in Europe. The significant absence of a bank in any kingdom or principality of the civilized world for an interval of over 200 years, is not even commented upon. The so-called Bank of Venice, which is assigned to the year 1157, was not a public bank until 1619, when it was reorganized as the Banco di Rialto, which converted it into a public bank of deposit-and-withdrawal. Meanwhile the Bank of Venice was merely a Chamber of Loans (Camera degli Impresti) into which patriotic capital was invited to assist the government of Venice. Even had it been a public bank it was not in a position to exercise the proper functions of a European bank, namely, the agglomeration of private capital, to be distributed in loans helpful to European commerce and enterprise. How could a Venetian bank promote or assist the trade of Spain, France, England, the Netherlands or Germany? It could not, and in fact it did not do anything of the kind. Between the dissolution of the Bank of Barcelona, rather between the date when its commercial activities ceased, about 1522, and the Bank of Amsterdam, 1609, and Hamburg, 1619, an entire century elapsed. What institution of security and commercial credit or convenience filled the void?

This interval witnessed the greatest of all commercial events, the discovery, conquest and colonization of America, the abstraction and removal of its enormous treasures in gold and silver, their coining into money, the opening to plunder and afterward to commerce of India, China and Japan, the consolidation of the German empire, the rise of prices and the progress of the Reformation. Where are the institutions into whose hands these conquered treasures might be placed, to whom could the impatent European commerce of this period apply for assistance? There seems but one reply.

Charles I, King of Spain and sovereign of America, elected Emperor of Germany as Charles V, in 1519, having been assisted to this elevation by the banking house of the Fuggers of Augsburg, turned over to them the entire
banking business of his extensive empire. He assigned the monopoly of quicksilver (Almaden mines of Spain), the Guadalcana! silver mines and virtual control of many of the mines in America. He transferred to them the vast accounts and balances of the military and episcopal orders. He even granted to them the royal and imperial prerogative of coinage (1534). They conducted the mints of Valencia, Augsburg, Weissenhorn (Bavaria), and other places. They even were privileged to stamp their names and titles upon the golden florins, for example, Ant. Fugger D. in Weissenhorn, 1550–60. For upwards of a century, such of the American treasure as escaped capture by the English, Dutch and French cruisers passed through their hands, leaving them a fortune estimated at 60,000,000 florins or ducats, say $150,000,000. They became bishops, barons, dukes, even princes, and their house survives to the present day. Such was the bank of the 16th century.

Beyond the jurisdiction of England, France, the Netherlands and some of the Italian republics, the sole assistance which commerce enjoyed from the vast stores of the precious metals which flowed into Europe during this period came from or through the house of Fuggers. It was not until the reign of Charles II, 1665, some say Charles III, that Spain was enabled to establish a public bank for the convenience of the public: that of San Carlos. Meanwhile the Inquisition, by burning or banishing the Moors and Jews, had so thoroughly depressed domestic industry that it imparted to this little known institution but a feeble existence. To American readers it is only known through the pages of Blaquier.

Mention has already been made of the banks of Amsterdam and Hamburg. Between them came the Bank of Middleburg, 1616, and after them the banks of Rotterdam, 1635, and the Swedish Riksbank of 1656. All of these institutions were of Protestant origin, opposed to the Catholic house of Fugger, which after the Peace of Westphalia in 1648 lost much of its influence and power.

These northern institutions became the effective promoters of that enormous expansion of commerce, industry and the arts, which bestowed upon the 17th century the name of the Halcyon Age. They promoted and supported the English and Dutch East and West India companies, the African Company and the numerous other cosmopolitan enterprises of a marvelous period; and they imparted to the commerce of the British, French, Dutch and Scandinavian ports an impetus which they have ever since retained. Until 1656, when the Riksbank of Sweden issued circulating notes, their functions consisted almost solely of receiving funds on deposit for safety, and loaning them out upon commercial or governmental bills of exchange, promissory notes or bonds. Some of them were endowed with special privileges or monopolies, as the banks of Amsterdam, England and France (Comptoir des Escomptes). All of them were of great service to commerce, indeed, the Bank of Amsterdam went so far, in its secret loans to the Dutch East India Company, that it became insolvent about 1760 and was liquidated in 1819.

Meanwhile a new empire had arisen beyond the Atlantic, whose growing commerce demanded the convenience of public commercial banks. In 1652 the province of Massachusetts found it necessary (for it was no mere act of wantonness or of profit-seeking by the colony), to defy the Royal authority by erecting a Mint and striking Pine-Tree shillings. The origin of this silver is not known. It is possible some of the silver smuggled out of Mexico or captured from the Spanish galleons, found its way to the Chesapeake and was coined in Maryland. These events presaged a bank. In 1680 a bank was established for the convenience of planters in South Carolina, which William Paterson, afterward promoter of the Bank of England, now fresh from the Darien colony on the Isthmus of Panama, is said to have investigated. Five or six years later, 1686, John Blackwell and his coadjuutors united to establish a bank of issue in Boston, also in defiance of British authority; and on 3 Feb. 1690, the colony of Massachusetts issued its own bills of credit. It has been suggested that these bills were to pay off the soldiers in the Phips campaign to Quebec, whereas in fact the notes were issued before the Phips expedition was dissolved upon. One of these notes is still in existence. (A copy will be found in Del Mar's 'History of Money in America,' p. 79). On 2 July 1692, the colonial government of Massachusetts made these notes legal tenders for the payment of all debts and obligations, except those which had been contracted in special moneys. The amount of these notes outstanding was between $30,000 and $40,000.

The pressing necessity for circulating money and the creation of banks, two subjects unavoidably connected for sustaining and developing the exchanges and commerce of the British-American colonies, manifested itself almost at the outset of their settlement; and had no little to do with their subsequent revolt from royal authority. The position of the Crown, as laid down in the celebrated case of M 'Bryan v. Lascelles, 1604, was that the creation and issuance of money was a royal prerogative, which could not lawfully be exercised by any other power than the King: a prerogative not delegated to the colonies. Hence, whatever coins, or substitutes for coins, were needed for their exchanges, had to come from England. Such, too, had been the position of the Spanish Crown; yet the necessities of Hispaniola, Puerto Rico and other Spanish possessions in America, had compelled their inhabitants, so early as 1586, to employ leather moneys in their dealings. Consult Lewes, Robert, 'Map of Commerce,' London 1711, p. 16.

Strengthened by this example, the attitude of the British colonies was laid down in 1665 no less positively than the Mitz Moneys decision. They say, writes a commissioner of Massachusetts, 'that so long as they pay (to the Crown) a fifth of the gold and silver (found or captured), according to the terms of the Charter, they are not obliged to the King, except by civility.' (Sir J. R. Seeley, 'Expansion of Empire of Amsterdam' p. 376). Such became their justification for the Pine Tree coinage, for John Blackwell's bank and for colonial bills of credit.

The subsequent institution of American
Colonial banks and issues of money are treated under appropriate heads.

2. THE FUNCTIONS OF BANKS. The functions of banks may conveniently be divided into those relating to loans and investments, and those relating to money and the substitutes for coined money provided by banks. Savings banks, the simplest class of banking institutions, are entirely concerned with the first of these functions. The inducement of the interest return brings about a concentration of capital that remains undisturbed for long periods. Safety of principal and the income yield are therefore the considerations which determine the character of the investments of savings banks. State and Provincial banks, the banks of the established public service corporations with a good dividend record and real estate mortgage loans meet these requirements and make up the bulk of the investments of this class of banks. Through the facilities which saving banks encourage, much income which otherwise might be wasted is made available to increase the total capital of the community.

Loans and Investments.—Income yield and safety are as important for other banks, but they must be sought in a narrower investment field. With them the quality of liquidity is also essential, since most of the funds which they employ are payable on demand, and large and unexpected payments must frequently be made. The deposits of these banks, commonly known as commercial or credit banks, consist mainly of cash resources which are being currently used for business purposes, or for personal expenditure. They are therefore subject to continued change, being constantly drawn upon by their owners. To meet this situation the funds of commercial banks must, in large measure, be employed in those investments which can quickly be converted into cash. In other words, they must be liquid.

Securities for which there is a broad market, such as most of those which are listed on stock exchanges, meet this requirement of liquidity. A far more important avenue for the employment of the funds of commercial banks, however, arises from the demand for short periods of time which comes to the banks from everyone engaged in active business. Working capital requirements in many lines of business vary with the seasons and in every line of business with the volume of dealings. In satisfying these requirements the banks secure investments ideally suited to their own needs. At the same time a valuable service is rendered to the community. Capital is economized. It is not necessary for each business to supply itself permanently with sufficient capital to take care of its maximum requirements. The supply of capital is also made more elastic, and finally the trained insight of the banker is exercised in selecting from the mass of would-be borrowers those who have manifested capacity to employ capital wisely and effectively.

Commercial banks, including the banking departments of trust companies, unlike savings banks, do not limit their loans and other investments to the funds received from depositors and shareholders. They lend their credit and thus create a large part of the funds utilized by borrowers. They are able to do this because they provide more or less generally acceptable substitutes for coined money. The bank note, the promise of a bank to pay money on demand, is obviously a credit instrument which is a substitute for money. But partly because of legislation limiting the power to issue notes, and even more because the check has been found more convenient for most purposes, the bank note has become a subordinate and rather special means of extending credit.

Credit.—Banks of course do not extend credit directly by issuing checks, since the check is an order on a bank to pay money, not its promise to pay money. Such orders are based upon obligations to pay money recorded on the books of the bank and upon deposits. Clearly, a bank cannot lend its already existing obligations to pay money on demand.
It may indeed happen that a bank receives, let us say, $1,000 in money from a depositor, and is on that account in position to lend more than might otherwise be advisable; but even here it is not the deposit which it lends but either the $1,000 or (and this is far more likely) a new right to draw $1,000 in the form of deposits — in receipt of the thousand dollars and the loan of the thousand dollars — creating absolutely similar deposit obligations.

It is the general use of the check that makes it possible for banks to create deposits through their lending operations. If borrowers made all payments with money, it would be necessary for them to withdraw the proceeds of their loans from the banks in the form of money. The business of commercial banks, like that of savings banks, would then be limited to the funds received from depositors and shareholders, and possibly some slight amount in addition thereto, since borrowers would presumably not immediately draw out the proceeds of their loans.

It may, however, be objected that even though the borrower does use checks, the bank will be obliged to make payment almost as speedily as if money were used. Checks do not tend to accumulate in the extent they are quickly presented for payment over the counter, or by other banks in which they have been deposited. Assuming that a bank were abruptly to double its deposit obligations by granting many new loans, it would unquestionably be confronted at once with heavy demands for payment of the largely increased number of checks that would certainly be drawn upon it. If, however, this is the usual case, all the banks of a locality increase their loans at the same time with a consequent expansion of deposits, each bank will have a greater number of checks drawn upon it, but it will also receive from its depositors a greater number of checks drawn on the other banks. There would be a greater number of checks outstanding, but not a correspondingly greater amount of cash needed in making settlements between the banks. This increase in loans, if made by the banks of a single locality, would probably lead to increased transactions from producers elsewhere, thus occasioning a balance of indebtedness against the local banks. Sooner or later currency would have to be shipped to the banks in other parts of the country, and this would soon prevent further expansion and might make contraction necessary; but again, if expansion of ban... loans were country wide, this difficulty would not be experienced unless gold exports were stimulated, and even this contingency would not present itself if the expansion of credit were world-wide.

The general expansion of credit cannot continue indefinitely. An increasing volume of checks like an increase in the quantity of money has the same tendency to bring about an advance in prices. Rapidly rising prices invariably stimulate unhealthy business activities. Sooner or later the expansion of credit is checked by the deterioration in the average quality of the loans of the banks; failures become more numerous; confidence, not only in the future of business, but also in the banks, is weakened; a crisis breaks out followed by a period of depression; the volume of credit is then reduced through a slackening in the demand for loans, and through the liquidation of loans previously made.

However universal the use of checks may become, the individual bank does not on that account cease to be subject to constant demands for cash. A bank can exert no control over the use of its deposits in all of its accounts from day to day; checks deposited with it never exactly balance checks presented for payment; there will be wide variation, sometimes favorable, sometimes unfavorable. In the latter contingency reliance may be placed upon a speedy change in favor of the bank. More positive action is, however, certain to become necessary from time to time in the experience of every bank. The requirements of depositors will occasionally result in a succession of unfavorable balances, and further, every bank must face the possibility that unfounded rumors may subject it to a run. It is imperative, therefore, that a bank be able to pay large amounts of money on demand, and also be in position quickly to replenish depleted reserves. Its assets, or at least a considerable portion of them, must be of such a character that they can be quickly converted into money. To serve this purpose the same degree of liquidity is a requisite. Immediate conversion into cash of a portion of the assets of a bank will ordinarily serve for the building up of reserve depleted on account of unusually large requirements on the part of depositors, and the gradual conversion of the remaining assets is all that can be deemed necessary for exceptional contingencies. Experience shows that a bank, all of whose assets can be converted into cash within a few months without loss, is altogether unlikely to be disturbed by lack of confidence, and should it be subjected to unfounded rumors, no difficulty is experienced in securing the necessary funds from other banks.

Central Banks.—In the development of commerce, but not until recent years has there been a distinct tendency toward the establishment of a special class of institutions, the primary function of which is to enable other banks to convert their assets into cash in periods of stress. These special banks, commonly known as central banks, exist in ordinary times in a position of great strength. They endeavor to exercise a restraining influence during periods of rapid credit expansion, but when the emergency presents itself grant loans freely. The Bank of England is the oldest and most famous institution of this kind. The very great advantages secured through its operations and those of similar institutions in other European countries led to the establishment in the United States of the Federal Reserve Banks in 1914. See Federal Reserve System; Federal Farm Loan Act; Land Credit.

The bank notes which these institutions issue are as serviceable and acceptable for all domestic purposes as coined money. In many countries they are a legal tender. Consequently these central banks are able to supply the other banks with such amounts of cash as they may need to meet even the most severe contingencies. In the United States they are required by the necessity of resorting to general loan contraction, a method of strengthening themselves which cannot be carried far without involving
the business community in serious financial difficulties.

OIVER M. W. SPRAGUE,
Professor Banking and Finance, Harvard
University.

3. WORLD SYSTEMS — TYPES. The
banking institutions of Europe, with the in-
crease of capital, the development of industry
and the growth of international relations, have
naturally conformed to these influences, with
the result that there is an approximation every-
where to certain standards or types for the
different classes of banking operations. Such
differences in organization and practice as re-
main are not fundamental, and afford little
occasion for comparison or argument as to
their advantages or desirability, but are ex-
plained by their origin and the established
customs of the people.

Central Banks of Issue.— In every country
there is now a central bank, which is recognized
to be the head of the system, and is charged
with certain responsibilities. It is the fiscal
agent of the government and the custodian of
the national bank of issue; it issues currency
cards, which is raised and lowered to
control the demand for credit. In all European
countries judgment has been given in favor of
confiding the power of note-issue to a single
bank, but in Great Britain, Germany and Italy
there are banks which were in possession of the
right of note-issue when the present system
was determined upon were allowed to retain a
restricted right.

The central banks, by reason of the pe-
culiar responsibilities with which they are
charged, are required to confine their credit
operations in the main to short commercial
loans, usually not exceeding four months, which
further to trade and industry. Bills of
exchange, arising out of specific transactions,
and financing the movement of commodities to
market, constitute the principal class of invest-
ments. Loans to the government, however, are
authorized, and advances upon government se-
curities and approved collateral are made at
a higher rate of interest and in limited
amount. Nothing but gold and short commer-
cial bills are considered a proper cover for
note-issue.

The capital of these central banks, with the
exception of the Russian Imperial Bank, is sup-
plied by private shareholders, but in many cases
the executive officers, and in the case of the
Reichsbank the executive board, are named by
the government. The Bank of England which
it is not the head of the country, but is an
in the demonstration of the most important
functions of a central institution, is a com-
pletely private institution in its organization,
but its policy is none the less governed by a
sense of maintenance and tradition. All of these
institutions are bound to safeguard and pro-
mote the public interest, as their first con-
ideration.

The most noteworthy difference in the
operations of these banks lies in the man-
agement of the note issue. In England a
of 
18,450,000 upon the security of
government bonds and other securities in its
possession, but all issues in excess of this must
be fully covered by gold in its vaults. This
requirement, which was imposed upon it by
the Act of 1844, was prompted by a belief that
excessive note issues had promoted over-ex-
tensions of credit, the exportation of gold and
the recurrence of financial crises. The effect
was to make the note-issue absolutely fixed
save as the stock of gold in the bank was
increased or decreased. This restraint upon
issues occasioned less inconveniences in Eng-
land than it would have caused on the Continent,
for the reason that even before 1844 the use
check had become to a great extent in England
a substitute for the bank note. With
the growth of the joint-stock banks the custom of
keeping bank accounts and making payments
by check has been steadily extended, and on the
Continent it remains the general custom to make
payments in currency. The restriction of the
Act of 1844 not only failed to prevent the
recurrence of crises in England, but it actually
hindered the bank in dealing with them to
such an extent that in 1847, 1857 and 1866, when
confronted by emergencies of this character,
the Ministry requested the bank to disregard
the provisions of the law, and Parliament in
each instance after a few days approval by
passing an act of indemnity. The situation
upon each of these occasions was that public
confidence in the general state of credit, and in
the condition of certain private banking institu-
tions, was shaken, but there was no want of
confidence in the Bank of England. The
latter, by disregarding the law, and issuing its
own notes to the banks and firms which were
able to give security, relieved the pressure and
stopped the panic. This demonstration of the
effectiveness of flexible note issues under the
control of a strong central banking institution
has had a powerful influence in shaping the
banking systems of other countries. In Eng-
land the immediate change in the Bank Act
was made, but an important change was made
in the management of the bank. It was dis-
covered that by raising the discount rate the
tendency to over-expansion could be checked
and the gold reserve of the bank increased,
thus permitting an enlargement of credits,
either by deposit accounts or note issues. Since
1866 this knowledge has been used so skillfully
that the arguments in favor of a liberalization
of note-issues have not been pressed. In 1914,
however, following the outbreak of the
European War, Parliament passed an act giv-
ing the Ministry authority to permit the Bank
to issue notes without the statutory reserve.

The statutes governing the Bank of France
fix a maximum limit upon its issues, but this
has always been high enough to allow a
freedom to the management, which within the
limit named is without restraint. The framers
of the law governing the Reichsbank intro-
duced a novel feature, which has been since
adopted in many countries, including the
United States. This is a provision levying a
tax upon issues in excess of a named amount, which is assumed to be sufficient for normal requirements. This is accompanied, however, by another provision, requiring that at all times a minimum reserve of $33 1/3 per cent against outstanding notes shall be maintained. The German tax upon excess issues is 5 per cent; in the United States, 3 per cent. In the Federal Reserve banks, the tax is a progressive one, increasing as the percentage of reserve diminishes.

In all of the countries where the central banks are owned by private shareholders, the profits are divided with the Treasury or there are other compensations to the Treasury for the charter privileges.

Commercial Banks and Discount Houses. — In all countries the bulk of the banking business with the public is transacted by what are commonly called "joint-stock" banks, although the distinction between these banks and the central banks is not in the fact that they are joint-stock corporations but in their more private character. In England there must be included in any study of the commercial credit system, the discount houses or bill brokers, and the accepting houses which are auxiliaries of the banking system. These are specialists in credit, and intermediaries between the borrowers and the banks, although the discount houses accept deposits and pay interest on them. They borrow largely from the banks, and their chief function is to specialize in the several lines of trade. By doing this, and endorsing the paper they handle, they raise this paper to a higher grade of credit, which will command a lower rate of interest. In this difference between the rate which this paper would have to bear without their endorsement and the rate at which they place it with the banks, they find their compensation. The accepting houses perform a similar function in a different manner. It has long been the custom for the seller of goods to draw a draft on the buyer payable at some date agreed upon in the future, which the buyer "accepts" as soon as it is presented by writing the word "accepted" across its face and signing his name thereunder. The draft when assigned by the drawer to the so-called "accepting house", is usually sold on the market. Evidently much depends upon the character of the names, and if the buyer is not well known he can afford to pay a commission to a house of high standing which will accept for him. This custom developed gradually, first within a trade where the houses knew each other, until it became a regular business. Back of these discount houses and accepting houses are the joint-stock banks, which are usually in the market for high-class paper, and back of all is the Bank of England, which is under obligation to always buy paper at some rate. When the war broke out, and paralyses fell upon credit, so important was it deemed that the fluidity of bills should be maintained, that the government stepped into the situation and guaranteed the Bank of England against loss in the purchase of pre-war bills.

The joint-stock banks of Great Britain cannot accept bills on the part of merchants and manufacturers, although the Bank of England also does to some extent a general banking business. These banks lend to their customers and buy bills in the open market. They also lend upon collateral. In current years the practice has developed among them of accepting bills for houses with whose affairs they are familiar. This shows how the functions of the banks, the discount houses and acceptance houses overlap and dovetail, and how sharp is the competition in the credit field.

The joint-stock banks of Great Britain are organized under the General Companies Act. There are no requirements as to reserves or regulating the character of the business. The practices of the banks have been established by the lessons of experience and the teachings and writings of men recognized as authorities. It has become an accepted doctrine that bank investments must be of a temporary and liquid character, and that banks shall not take a proprietary interest in any business.

On the Continent, as in England, the joint-stock banks other than the central banks are organized under the general incorporation acts, and are quite free as to the character of business they may do. There is no prohibition as to reserves and, in most countries, no governmental inspection or supervision. The joint-stock banks of Germany have developed their business on broader lines than perhaps any other corporate banking institutions, and with practically the freedom of private houses. This has been due largely to the rapid development of German industry and over-seas trade since 1880, and the demands which have fallen upon the banks in connection with it. The need for capital to finance the rapid growth and profitable industries has been before their eyes, and they have gone further than British banks are accustomed to go in supplying capital which could not be readily withdrawn. In doing this they have considered it advisable, instead of restricting their interests to loans, to take at times proprietary interests, evidenced by stock and to be represented in the directorate of such companies. They have organized companies to take over private business, and reorganized companies to increase their capital by offering bonds and shares to the public over their counters, through their branches and upon the stock exchanges. The stock exchanges are for the most part controlled by the banks, and most of the transactions are through the banks. The head of the leading German joint-stock bank stated to the American Monetary Committee in 1908 that that bank had 50 members of the Berlin Stock Exchange to attend to its business. All of this is different from banking in England, and, as to relations with the stock exchange, from banking in the United States, but it is not so different as possibly at first sight appears from common banking practice in America, so far as capital advances are concerned. It is common knowledge that the banks of this country, particularly in the smaller towns, have had a large part of their borrowings in the form of loans which represent fixed investments. The country has been growing rapidly, every branch of industry has required more capital and the only source of supply has been the local credit institutions. As a result few American bankers outside of the country would stand the theoretical test as to liquid conditions any better probably than the German joint-stock banks, and many of them not so
well. The American banks, however, have been prevented by law from taking proprietary interests. The German policy cannot be compared to this. The German banks have not had their capital reduced by disastrous experiences, and, as a result, there have been disasters from it, on the whole it probably has met the conditions existing in Germany, and promoted the development of industries more effectually than a more rigid system of banking would have done. The German banks which have come through the experience have been managed with great ability, have prudently built up large capitals, and in years immediately preceding they were in a condition as to liquid assets that was scarcely open to criticism. In an article written for the National Monetary Commission in 1908, Herr Mueller, a director of the Dresden Bank, and who served upon the Imperial Commission to consider a revision of the law regarding the above banks, stated that in most of great German banks the principle was adhered to of not allowing the total amount of tied-up assets, such as bank sites and other fixed investments and interests, to exceed the bank's own paid-up capital, since the capital accounts in Germany in the United States are called surplus and undivided profits. The great capital of these banks permits them even then to have large fixed investments.

In France there has not been the pressure for capital for industrial purposes which there has been in Germany, and the joint-stock banks or credit societies, as they are called, have confined themselves closely to the financing of current trade. In other countries of Europe the practice varies, and everywhere there is almost complete freedom from legal restraints.

Investment and Mortgage Banks.—The Credit Mobilier, founded in France in 1852, was the original of a type of investment banks. It sold its own debentures or collateral bonds against holdings in its own possession of various securities which it was a master spirit in promoting. It had a successful career for a time, but after about 15 years was forced into liquidation as the result of heavy losses. The type of the Credit Mobilier, the name of which signifies a mobilizing of credit, has been followed to some extent in many countries, but its mistakes have been a warning against the policy of using such an organization to promote new enterprises. The English investment companies issue their own debentures based upon securities which they have purchased, but their purchases are confined to the issues of established enterprises.

The mortgage banks of Europe are organized upon the Fonciere, which has almost a monopoly of the land-mortgage business of France, is a semi-public institution, the capital being supplied by private shareholders, although originally the government gave it a subsidy. The governor and two sub-governors are appointed by the government. It is allowed to receive a limited amount of deposits and these are invested in commercial bills, but its principal business is lending upon mortgage, accepting either urban or rural mortgages as security. The banks have in its own possession it issues bonds. These are issued in series without date for payment, but are called yearly as the amortization payments allow. They are called by a lottery and prizes are given with the drawings, the first prize being as much as 150,000 francs. This lottery feature is a factor in the distribution of the bonds, and accounts for the low rate of interest, usually 3 per cent, which they bear.

In Germany there are about 40 mortgage banks which pursue a similar business but the bulk of their loans are upon urban property. These banks are required by law to deposit their mortgages with a state comptroller, who then gives permission for the issuance of bonds against them. These banks operate upon an exceedingly small margin, the difference between the rate received upon mortgages and the rate paid upon bonds being only about one-fourth of 1 per cent.

Besides these joint-stock mortgage banks, there are the Landschäften, or mutual credit associations, which depend upon their mortgage, their members and, holding them as security, issue their own bonds to the borrower which he may negotiate upon the investment market. This system was established by Frederick the Great in 1769, and originally designed the benefit of the large estate holders only, but it has been developed to include a branch for small properties, and also provide subsidiary companies which write insurance and grant temporary credits to members.

Mutual Banks and Co-operative Societies.—These are known in all the countries of Europe, but are most highly developed in Germany, where they are the common source of banking accommodations for small tradesmen and farmers. The Schulze-Delitzsch societies, so called for the founder and the town in which the first one was established, constitute the leading system. They receive deposits and pay interest upon them, and make short loans upon the promissory notes of members. They extend personal credit only to members but they may receive deposits from others and employ their surplus funds outside the membership. At their inception they were purely mutual societies with unlimited liability for the members, the theory of their organization being similar to that of the mutual insurance societies, or orders, now prevalent in many countries. The unlimited liability of all members helped them to get deposits, but was a deterrent to membership for those who did not want to borrow. Later, societies were organized which issued shares and in which the liability of shareholders was limited in various degrees. It might be double the par value of the stock, or greater, as determined by each society for itself. The societies are independent, but have an association and a central clearing agency. The Schulze-Delitzsch societies do practically a commercial banking business. The Raiffeisen societies are upon much the same plan, and lend money upon several years' time, but the membership is chiefly among farmers. There is a central bank in Berlin for these societies, to which the state of Prussia has subscribed a capital of 50,000,000 marks. It is strictly a state institution. There are similar societies in other states of the empire membership within the empire is nearly 2,000,000; paid-in capital and surplus funds, approximately 350,000,000 marks; deposits, about 2,335,000,000 marks. The Schulze-Delitzsch
and Raiffeisen systems have an extensive development in Austria.

In France the Credit Agricole Mutuel represents a development of the Raiffeisen idea. Small local societies had been doing business with moderate success, but the movement was given recognition and encouraged in 1897, when, upon a renewal of the charter of the Bank of France, a gratuitous loan of 40,000,000 francs, and also a certain share in the annual earnings of that institution, was exacted from it in order to be devoted to the development of agricultural banks. The law provided for the organization of district banks, which lend the available funds to the local societies, the distribution being made by a committee of public men, including the governor of the Bank of France. The peculiarity of the system seems to be that it depends chiefly upon the funds received from the Bank of France, which it is allowed to use gratuitously. These funds are loaned below the ordinary market rate, but as they are limited in amount, the growth of the system is restricted. It lends only to provide temporary credit to farmers.

There are mutual credit associations in Russia, of limited liability, whose capital is created by the payment on the part of each member of a sum equal to one-tenth of the credit granted them. Associations of this kind may be established by the Zemstvos. In 1907, the sum total of these loans and discounts was approximately 245,000,000 rubles. A project is pending for the establishment of a central bank for these associations. See Cooperative Banking; Federal Farm Loan Act; Land Credit.

Savings Banks, Municipal, Postal, Private.

— A system of municipal savings banks has its most important development in Germany and Russia. In both countries the banks are public institutions, supported by the credit of the municipalities and conducted under their supervision. The profits go to the surplus fund of the banks, or may be in part expended for public purposes, such as the support of hospitals, parks, etc. In Russia the banks do not function as a general banking business and also lend money on real estate security, but in Germany the investments are confined to trustee securities, as fixed by law, and to the purchase of a limited amount of commercial bills.

The municipal savings bank is to be found in other countries of Europe, and there are also stock company savings banks, but they are without special features. Mutual societies supply, to a great extent, the facilities for saving. Postal savings banks have been established in many countries, Germany being an exception, due to its high development of the municipal savings banks.

Public Loan Banks.—In France, in 1830 and in 1848, in Prussia in 1848, 1866 and in 1870, and in the German empire in 1914, the governments resorted to the establishment of public loan banks or, more properly, loan offices, as a means of facilitating in an emergency the flotation of public loans. The function of these banks was to purchase directly, usually at a discount, notes of local authorities and to the central banks, by making loans upon collateral security. In Germany, in 1914, one of these banks was established in every city where there was a branch of the Reichsbank. They were authorized to make loans upon collateral or goods, and, in doing so, to issue notes to the maximum aggregate of 3,000,000,000 marks. These notes were not legal tender but were accepted at the Reichsbank and made good as basis for note-issues by the latter. It was an emergency measure, designed to avoid monetizing the financial resources of the nation. These banks are known as Darlehnskassen.*

Assistant to the President, National City Bank,
New York.

4. INTERNATIONAL BANKING.

Prior to the enactment of the Federal Reserve Law (q.v.) under which National banks have obtained authority to establish branches in foreign countries, international banking upon the part of the United States had been mainly confined to investment banking to place American securities in Great Britain and the countries of western Europe. The most ambitious effort to enter the commercial field had been made by the International Banking Corporation, chartered in 1902 by the State of Connecticut, which began business with a paid-up capital of $3,000,000 and surplus fund of $3,000,000. It had at that time 15 offices abroad, most of them in Asiatic countries.

The Need of Foreign Banking Facilities.

— Although the slow development of American banking operations in the foreign field may be attributed in part to the fact that the national banking system, to which most of our large banking institutions in the past have belonged, until recently made no provision for such extension, it is also true that there has been little inclination among American bankers to so extend their business. The fact that branch banking has had small development within the United States will partially explain the seeming lack of interest in branches abroad. The comparatively few branch establishments that are maintained in this country, with few exceptions, are located in the same city with the head office, and the great bulk of the banking business is done by independent, locally owned, institutions which have but a single office. Our people have been inexperienced in branch banking, and not accustomed to entrusting large powers to scattered officials at great distances.

The chief explanation, however, for the indifference of American bankers to international opportunities is to be found in the same general situation which accounts for the slow development of American interest in foreign investments and foreign trade, to-wit: the all-absorbing needs and attractions of the home field. There has been no inducement for banking capital to go from the United States to other fields for the mere profits of commercial banking. All foreign fields are already occupied by domestic banking institutions, which are likely to have the preference for purely domestic business, and by British or European banking corporations which are more or less allied with other important investments in the same countries, and with interests that are active in trade with these countries. It has been evident
that American banks abroad would have little reason for their existence unless they were serviceable to the American capital in the same manner that British and German banks have been serviceable to the trade and investments of those countries.

With the development of this country, the growth in the volume of trade, and the accumulation of capital, the attitude of its people toward trade and investments abroad has been changing. Our exports no longer consist almost exclusively of natural and crude products. The United States has become the leading producer and a heavy exporter of steel and machinery, and is rapidly increasing its exports of a great variety of manufactures. At this stage banking facilities abroad become a factor in the development. If American banks in foreign countries require for their prosperity that there shall be American trade with those countries, so does American trade have need for an extension of its own banking facilities.

The services which a banker can render for his relative in a foreign country are essentially the same that he renders at home, but obviously there is greater dependence upon them abroad than at home, and there are special services incidental to the fact that goods are delivered and collections are made in foreign countries. The distances are great, mails are slow and cables costly; the habits and customs of the people are different, trade conditions are different, the language is usually different, and the chances of misunderstandings and disagreements are more numerous than in trade at home. There is great help to the exporting house in having an interested representative on the ground where deliveries and collections are made, and next in efficiency to his own exclusive agent is the branch office of an American bank. Collections may be, indeed, made through a domestic bank, or through a branch office of one of the European banks, but it is not to be expected that these institutions will feel the same interest in the same transactions that will be felt by an American bank, which realizes that its own future is involved in the development of American trade. It is more than possible that the interests of the American exporter may clash with the interests of older and closer clients of European banks, and in such instances the invoices and terms of important transactions may become known to competitors. In any event, there is a lack of the alert, interested attention that arises from a vital common interest, and from the direct connection through the home bank. There is likely to be a clearer presentation of the exporter's case through the latter channel.

One of the most important services that a bank can render is that of supplying information relative to credits. In many countries this information is difficult to obtain, and those who have it give it up with reluctance, especially in reply to written inquiries. Replies are vague, elusive and unsatisfactory. It cannot be expected that all the information desired will be given frankly and accurately by mail to strangers. No other source can be so trustworthy as a locally established bank which is linked up in every interest with the trade which it is serving. Credits are changing constantly in importations, and the good at one time may be misleading a few months later; the exporter in another country requires an allied advisor upon the spot who will not wait for inquiries but volunteers his counsel. The banker with a knowledge of the credits who will give him assistance in carrying them. In short, he wants the service which his own banker is accustomed to render at home extended to the foreign investment of capital.

The service of the American branch bank does not end with attention to business placed in its hands; it is equally interested in creating new business. It makes itself familiar with all lines of trade; it studies the import and export trade of the country in which it is located, with a view to developing trade with its home country; it takes note of opportunities and reports them to the home institution, which places the information where it will be likely to promote action.

The import trade of growing or developing countries consists to a great extent of equipment and construction materials, for use in new works designed to increase the production of the country, or to improve its facilities for handling the products. These purchases represent investments rather than consumption, and very often they represent an investment of foreign capital, as in the construction of railways and other public utilities, or manufacturing plants. The investments of Great Britain and Germany in South America are very large, and they have been made usually by sending out machinery and equipment which were the product of their home shops. Their manufacture supplied work for the home people and when converted into investments abroad they not only yield good returns but they create new demands for repairs, replacements, extensions, etc.

These investments abroad have not in years past been attractive to the people of the United States, because there were abundant opportunities, as good as any in the world, for similar investments at home. No other country was growing so fast in population as the United States, and so long as there were extensive natural resources to be opened up here it was doubtful policy to place investments abroad. But the United States is no longer a new country; the main railway lines have been constructed, every section of the country is undergoing development, the more easily tilled lands are now under cultivation, the timber lands have advanced greatly in value, the mineral resources are being worked. Both population and wealth are increasing rapidly, but the country has reached the stage where raw materials, once cheap, are becoming dear and affecting the cost of manufactures and the cost of living. The manufacturing industries are affected both by the increasing cost of raw materials and by the increasing cost of food, clothing and other necessities which affect wages. Already the United States has become one of the principal importing nations of wool and hides, and it is probable that our consumption of these articles will steadily increase faster than the home supply. We are also consumers in vast quantities of many articles which we do not produce at all, among which are coffee, rubber and tin, which are obtainable in South America. In this respect we want a point in our own development where we can advantageously spare some of our capital.
to develop the dormant resources of countries not as far advanced as ourselves. There will be an economic gain to ourselves and to the world community in doing so, just as there was an economic gain to New England and the United States from the use of New England capital for the development of the Western States of this country. In like manner, the United States capital in other countries will be guided and stimulated by the development of international banking facilities with headquarters in this country.

Short Loan and Commercial Bills.— There is yet another class of international banking which is comparatively new in this country but which is developing, and that is the class of banking which has made London the chief market of the world for short loans and commercial bills. Here again the defects of our national banking in the past have mili-
tated against us, National banks not being per-
mitted to accept drafts for future payment. Even our own foreign trade, both exports and imports, has been financed through bills upon London. Most of the time there has been no real loss to this country by this process, because it has been possible to carry the drafts at a lower rate of interest in London than in New York. In the future, however, this situation is likely to be different, not so much because of a probable change in the London situation as because of the changes effected here by the Federal Reserve system. In the past the financial banking reserves of the United States have been kept in the large National banks of New York city, which, by custom and as a result of competitive conditions, paid a uniform rate of 2 per cent upon them. This interest burden made it incumbent upon them to keep the funds employed upon the most favorable terms possible, and this employment was commonly found in loans on stock exchange collateral. The Federal Reserve system transfers the banking reserves to the Federal Reserve banks, and forbids their employment in loans upon stock or bonds. They can only be used for rediscounting paper arising out of commercial transactions. Coincident with the creation of this great fund, restricted to commercial paper, has come permission for National banks to accept paper arising out of international trade, a permission which extends not only to our trade with other countries but to trade between all countries. These acceptances are the most desirable paper available for the Federal Reserve banks, and as they pay no interest on deposits, and large earnings with them are subordinated to the policy of having liquid assets and developing a great discount market, it may be expected that the rate on this class of paper will hereafter be as low in New York as in any market of the world. The availability of the New York capital behind the Federal Reserve system behind underwriting bills, ultimate payable elsewhere will of course be affected by other factors as well as the discount rate, and particularly by the general position of New York in the world's exchanges, but it is and can be confidently predicted that with the re-
sources of the Federal Reserve system behind it, and with the United States developing as a creditor country, New York in the future will play a much more important part in interna-
tional banking than in the past.

As a result of the European War, and the closing of European markets for foreign loans, an important aggregate of loans to foreign governments has been made in the American market. Since there is reason to believe that capital will continue to accumulate rapidly in the United States, and there will be less difference in interest rates between New York and European markets than in the past, it is prob-
able that New York will continue to be a fac-
tor in transactions of this class. The develop-
ment of any country in international banking is dependent finally upon the interest of its people to international affairs. There must be an important body of traders and investors with international interests and cosmopolitan views. See Co-operative Banking; Federal Reserve System (article 12); Foreign Ex-
change (article 15); World Systems (article 3).

FRANK A. VANDERLIP, President National City Bank, New York.

5. FOREIGN EXCHANGE. Foreign exchange may best be described as the system by which payments are made in countries having different monetary systems. The terms *Exchange* and *Foreign Exchange* are also used as meaning the drafts drawn by merchants and bankers resident in one country upon merchants and bankers resident in another.

Origin.—Concerning the origin of the foreign exchange system as it exists at present there is a good deal of doubt. The best opinion is that the system as now it came into existence came into being in the Middle Ages as a result of the commercial dealings between the northern Italian republics and the Levant. Venetian merchants, for instance, purchasing goods in Alexandria, found that on account of the prevalence of piracy in the Mediterranean payment for such goods in gold was extremely hazardous. It being the case that the merchants of Alexandria were also purchasers of goods in Venice, a system was devised whereby, instead of actual gold being shipped back and forth, merchants in Venice having money owed to them from Alexandria were able to get it from other merchants in Venice who had payments to make in Alexandria. Gradually it came about, as a result of these arrangements, that Alexandria kept balances in Venice and vice-versa. Payments instead of being made by means of actual gold shipments came gradually to be paid by drafts drawn on such balances.

The Principle Stated.—A clear understand-
ing of the basic principle underlying foreign exchange transactions may probably best be had from consideration of an actual international transaction. A merchant in Mem-
phis, Tenn., we will say, has sold a hundred bales of cotton to a spinner in Liverpool, England. For the merchant in Memphis the important thing is to realize upon his sale, at the earliest possible opportunity, United States currency or credit at bank. This payment he can receive in two ways. Either he can draw a draft upon the buyer of the goods in Liver-
pool in sterling (the currency of the buyer) and sell such draft in Memphis for New York at the current rate of exchange for American dollars, or (2) the buyer of the cotton in Liver-
pool can send to the merchant in Memphis a draft drawn on some point in the United States
and payable in United States currency. Whatever the transaction is arranged, the desired result will be obtained that the seller of the goods in Memphis immediately receives cash in bankable funds.

The banking machinery requisite for the conversion of sterling drafts drawn, for instance, in Memphis, into United States dollars, or for the furnishing of drafts drawn in sterling to American merchants in London, have been described in a previous chapter of this book. They are of relatively simple construction. What consists simply of a number of banks and bankers with the necessary facilities for purchasing the drafts drawn on foreign points in foreign currencies offered to them, and for selling to their clients such drafts drawn on foreign points in foreign currencies as may be desired. It must, however, be clearly understood that the foreign exchange banker is not merely a broker in bills, buying bills from parties who have them to sell and selling the same bills to other parties who want to buy them. Having bought a draft drawn in a foreign currency on a foreign point, the foreign exchange banker does not resell those same bills, but instead sells a draft made by himself upon his correspondent bank abroad. The balance abroad is drawn in which these bankers' drafts are paid is being continually replenished by remittances from this side, of foreign exchange which the banker buys in the regular course of business.

The foreign exchange banker, in other words, maintains a depositary abroad with whom he deposits the bills of exchange he buys and upon whom he draws the drafts which he sells his clients. Daily these balances are being drawn upon and replenished. At all times they are maintained at a certain point, that, of course, depending upon the standing of the banker and the extent of the foreign exchange business in which he is engaged. Some foreign exchange bankers carry balances at only one or two of the more important foreign money centres. Others carry balances at as many as 20 or 30 foreign points.

As a result of the arrangement they have with their foreign correspondents and the balances they carry abroad, foreign exchange bankers at primary points are always in a position to exchange which may be offered them, and to sell any exchange which may be required. A large packing house in Chicago, for instance, may have made a shipment of meat to Amsterdam and as a result be offering its drafts drawn in guilders at 15 days' sight upon the buyer of the goods in Holland, or upon some Dutch bank designated by him. Of these drafts the packer, if his standing is good, will have no difficulty in disposing of whatever happens to be the current rate of exchange at the time for bills of this character. Some banker will readily take them off his hands, knowing that he, the banker, can send the bills to his correspondent bank in Amsterdam for credit of his account, later drawing his own bills upon the overdrawn bank to cover any difference. At the time that he buys the bills drawn against the meat shipment, the foreign exchange banker knows of a place where he can sell drafts drawn by himself at a rate of exchange which will show him a profit on the transaction. Nor does it make any difference whether the drafts he buys are drawn against meat or wheat or copper or whether they are payable at sight or at 15 days' sight or at 90 days' sight. All is gait that comes to the foreign exchange banker's mill. His account with his foreign correspondent is a melting pot into which he can put bills of exchange of every variety, the whole appearing after collection and discount as a cash balance upon which he can draw his own drafts.

The profit made by the foreign exchange banker comes from the fact that he can regularly secure a better rate of exchange for the drafts drawn by himself, which he sells to his clients, than he has to pay for the mercantile bills of exchange which he buys from other clients and with which he is continually replenishing his balance abroad. Between bankers' bills and mercantile bills, however good the latter may be, there is always a difference in the rate of exchange. Between the bill drawn by the banker of good standing and the merchant of good standing this difference is comparatively slight, but as between the bill of the banker and the merchant whose paper is not so well known, although it may be perfectly good, there is a very considerable difference in the rates. It is just here that the foreign exchange banker makes the bulk of his profits. The basic of this mercantile house he knows is perfectly good, but because the paper is not particularly well known it does not perhaps command the full market price. This paper the banker buys knowing that it is good and that it will be paid upon maturity, and against this paper he sells his own bills at a considerably higher rate of exchange.

Aside from these trading operations described above, there are, of course, great speculative possibilities in the foreign exchange market for those who choose to take them up. By buying bills, for instance, and accumulating a large balance abroad without selling his own drafts against such balance, the banker puts himself in a position where he will greatly benefit through any rise in rates which may take place—or vice-versa. Foreign exchange bankers, too, sell exchange for future delivery and contract to purchase drafts at fixed times in the future, at rates which the future will show them a profit. These, of course, are only one or two examples. The opportunities for speculative operations in foreign exchange are practically unlimited.

The par of exchange between two countries having different monetary standards as, for instance, Great Britain with the pound sterling and the United States with the dollar, is the price of the gold unit of one country expressed in the currency of the other. In a new pound sterling (sovereign), for instance, there is an amount of gold which, at any subsequent date in the United States, is worth $4.8665. This sum is, therefore, the par of exchange between Great Britain and the United States.

From this par of exchange the rate fluctuates upward and downward according to the relative supply and demand. If American merchants or bankers have large payments to make on the other side and drafts drawn in foreign currencies are in great demand, it naturally follows that the price in dollars which must be paid for each pound sterling, mark or franc, as the case may be, will increase (that the rate of exchange will
rise). If, on the other hand, a large amount of drafts drawn on foreign points in foreign currencies are being offered for sale to bankers engaged in the foreign exchange business, it stands to reason that less American dollars will be paid for each pound sterling, mark or franc, as the case may be (that the rate of exchange will decline).

The principal influences having a tendency to cause the rate of exchange at any given point to rise are as follows:

**Heavy Imports of Merchandise.**—Merchandise imported must be paid for—usually by means of a draft drawn in the currency of the country from which the goods are coming. If, thus, imports run heavy, there is necessarily a big demand for drafts to send over to the shippers from whom the goods are coming. The natural effect is to cause a rise in the rate at which bankers are willing to sell such drafts.

**Heavy Imports of Securities.**—Exactly as merchandise imported into the country must be paid for, so securities imported into the country must be paid for. The moment a market begins to repurchase on a large scale its securities held abroad, or to purchase foreign securities, there is set up a strong demand for bills of exchange drawn on the market where the buying is being done to settle for these securities. A time when New York, for example, is buying stocks heavily in London, is apt to be a time when the demand for sterling drafts is so great as to give the sterling exchange market a strong upward tendency.

**A Decline in Money Rates Below the Level Prevaling at Other Important Foreign Centres.**—As money rates decline there is a strong tendency for capital to seek points at which a better rate is offered for its use. Transfer of capital can be effected only through remittances of exchange to points where the capital is to be employed. A period of extremely low money rates at a point like New York, for example, with London offering a better rate for capital, is likely to be a time when there is a big demand for bills of exchange with which to make remittances to London.

The principal influences tending to cause a decline at any given point in exchange rates are as follows:

**Heavy Exports of Merchandise.**—Payment for merchandise exported from the United States is made largely by drafts drawn in the currency of the country to which the goods are shipped, upon the buyer of the goods or upon some bank abroad designated by him. A time when merchandise is moving freely out of the country is a time when a large amount of such drafts are being offered to foreign exchange bankers. The result is, naturally, to cause a decline in the rate which bankers are willing to pay for such drafts.

**Heavy Exports of Securities.**—Securities shipped out of the country, as is the case with merchandise, are generally paid for by means of a draft drawn by the seller upon the buyer. A time when, for any reason, large amounts of stocks or bonds are being shipped out is, naturally, a time when large amounts of exchange are being drawn and offered, with a consequent decline in the rate of exchange.

**A Rise in the Rate for Money Above That Prevailing at Other Primary Points Abroad.**—Just as banking capital tends to flow out of a market where the money rate is declining, so it tends to flow into a market where the money rate is rising. Let money rates at New York, for instance, rise considerably above those prevailing in London or Paris, and immediately foreign capital begins to flow this way and American bankers begin to recall to this market for their own use a substantial amount of the gold they have been carrying abroad. This recalling of balances is effected by drawing drafts on correspondents abroad and by offering these drafts for sale in this market, the effect being to lower the rate of exchange.

There is, however, a limit beyond which, under normal circumstances, the rate of exchange between two countries having the gold standard cannot rise, and a limit beyond which it cannot fall.

The extent to which the exchange can rise is limited by the point at which it becomes cheaper for parties, having payments to make abroad, to send the actual gold than to send a banker's bill drawn in the currency of the place where the money is to be paid. For instance, a merchant in the United States having a payment to make in Great Britain finds that each pound sterling of the draft he wants to buy will cost him $4.89; he can go to any United States sub-Treasury, purchase the exact amount of gold which, when laid down abroad, will yield one pound sterling, and send it to the other side at a total cost to him of considerably less than $4.89. The American merchant's idea being to discharge his obligation abroad with the least possible expenditure of American dollars, he will elect to send the actual gold rather than to purchase and send a banker's draft.

The extent to which the exchange can fall at a point like New York, for instance, is limited by the point at which a new gold sovereign laid down in New York yields net a greater amount of dollars and cents than each pound sterling of a prime banker's draft drawn on London would yield. A New York bank, for example, has money on deposit in London which it wishes to withdraw. New York will sell its drafts only down to the point at which that process yields more dollars than if gold were imported. Below that point the rate of exchange cannot fall.

The above, however, applies only where there is a free interchange of gold between markets. If for any reason the natural flow of gold one way or the other is obstructed or restricted, exchange may rise far above or fall far below what would be the normal gold export or gold import point. By interfering with the natural outflow of gold from London through raising the discount rate and through buying up all available supplies of gold bullion in the market, the Bank of England, for instance, has on numerous occasions brought about a condition where the rate of exchange in New York on London fell far below the gold import point without any gold being shipped to the United States. Similarly the rate of exchange both at Berlin and at Paris not infrequently rises far above the point at which gold can be profitably exported, for the simple reason that, through the interference of the governmental authorities, no gold for export can be obtained.
Under such circumstances those who have remittances to make can make them only by means of bills of exchange and must pay whatever price is asked.

Gold exports and imports, it must be borne in mind, are exclusively in the hands of the bankers because it is only the banker who has the facilities necessary for dealing in bullion. Upon the exchange rate rising, for instance, to too high a level, he will produce a surplus of gold which take place are not made by merchants but by bankers who through this replenishing of their balances abroad keep themselves in a position to sell to merchants the needed bills of exchange. The rate on London at New York, for example, rises to $4.88, at which rate conditions at the time happen to be such that a remittance made in the form of gold and a remittance made by means of a bill of exchange cost the sender exactly the same amount of gold. At this point bankers will begin to ship gold knowing well that they will be able to sell their drafts against the balances thus created at a slightly higher rate than $4.88, for the simple reason that the bankers, handling bullion, are willing to pay, say, a quarter of a cent in the pound sterling in order to avoid the necessity of having to ship the actual gold themselves. The rise in the exchange to the gold export point thus means the shipping of gold on the part of bankers, and the consequent creation of a fresh supply of bills of exchange out of which mercantile needs are satisfied.

What has been said above applies only to the exchange relationship between countries having the gold standard or the gold exchange standard, i.e., where the government, as in the case of the Philippines or in India, guarantees a gold value to the silver medium of exchange. Where the exchange relationship is between a country on the gold standard and a country on the silver standard, the dominant factor in the rate of exchange is the price of silver. A rise in the price of silver in China, for instance, overshadows everything else as an influence upon the rate of exchange on London, and it is only a fall in the price at which the pound sterling will exchange for the local silver currency. Conversely a fall in silver invariably brings about a rise in the exchange.

6. INVESTMENT BANKING. Investment banking is the system by which investment capital is made available, (1) for the uses of industrial enterprise; (2) for civil loans, i.e., loans to municipalities, states and countries. An enterprise is in need of capital, or a state or municipality may wish to build roads or foundations for new public buildings. It is the function of the investment banker to stand between the clients who have money to lend and the corporation or municipality which wants to borrow, and to see that the needed capital is provided.

The whole system of investment banking as constituted to-day presupposes the ability on the part of those engaged in it to draw capital from their clients for whatever purpose is required. The X Y Z Railroad, we will say, which operates a system of electric lines, decides to spend a million dollars on certain improvements which, it feels, will greatly increase its revenue. The road not having that much free cash on hand appeals to some investment banking house for the money, offering to pay for it such-and-such a rate of interest and, as security, to give to the lenders a mortgage on the property to be acquired. This proposition having been made, the investment banker proceeds to make an independent examination, and, his engineers having satisfied themselves as to the safety and productivity of the loan, informs the railroad that he stands ready to advance the capital required — on other words, that he will purchase from them at a certain price such-and-such an amount of bonds or stock issued under such-and-such conditions. It is not, of course, his own money which the investment banker figures on advancing. Familiarity with the trade and the price of capital and the standing of the concern which wants to borrow enables him to estimate at just about what price he will be able to dispose of the securities to be issued. For a certain type of stock or bond issued by a certain type of borrower, he knows his clientele will be willing to pay just about such-and-such a price. He figures, for instance, that, counting all costs of retailing, he will be able to parcel out a million dollars' worth of bonds at a net price to him of 98. A price somewhere between 90 and 95 would, therefore, be about what he would offer the railroad for the bonds. The difference between what he paid for the bonds and what he got for them by distributing them among his clients would constitute his net profit on the transaction.

In theory, a corporation wanting to borrow money by selling new securities advertises in the investment market for bids and sells the securities to the highest bidder. In practice, nearly every large railroad or industrial concern has its own bankers to whom the business is invariably given. For this there is good reason. The investment house which is going to interest its clients largely in the securities of a corporation assumes a certain moral obligation. To be safe, in other words, the banker has got to be close to the property he is financing and to remain close to it and in close touch with its affairs. He cannot, therefore, spread his efforts in too many directions. Gradually, in consequence, each investment banking house gathers around itself a certain number of enterprises with whose affairs it is particularly familiar and whose securities it becomes particularly fitted to handle.

The methods by which the investment banking house, having purchased and paid for a block of new securities, proceeds to distribute these securities and thus reimburse itself, vary according to the nature of the issue. If the issue is a very large one, the chances are that the bonds will be resold not to the individual investment public direct, but rather to a syndicate of smaller investment houses, by whom the final distribution will be effected. If, on the other hand, the issue is a moderate
one in size, the chances are against its passing through any other bankers' hands. The house probably will not be in the bottle to offer the bonds direct to its own clients. There are a number of ways in which this is done. Circularizing and direct personal salesmanship are the two most important. Every investment banking house of any account has a large list of actual and prospective clients. To this list (which in the case of some of the larger houses runs up to 20,000 or even 30,000 names) the new securities are offered. By no means, however, is the offering necessarily limited to the existing list. Advertising, both in newspapers and magazines, to-day plays an important part in investment banking. Through it countless new names are each year added to investment bankers' lists and through it vast amounts of new securities are each year being actually sold.

In the investment banking business the day of large profits is a thing of the past. It used to be the case that, for the banker bringing out the securities even of a corporation of established credit, there was a profit running over the excess of 10 per cent. The establishment of public service commissions all over the country and the greater degree of supervision now exercised by the Interstate Commerce Commission over the railroads' finances has put a stop to this. Industrial and manufacturing concerns, not being subject to such supervision, are in some instances still being made to pay heavily for their money, but even here the profits of the investment banker are nothing like what they used to be. Investment banking is by no means to be confused with promotion—that is to say the providing of capital for new and untried enterprise. To the investment banker of reputation and who is in the business to stay, the principal consideration is by no means the amount of the profit he is going to make, but rather the safety and desirability of the investment he is offering his clients. A clientele financially strong, and which can be relied upon, is the banker's suggestion to absorb any issue of securities offered, is an asset which can be acquired only by years of careful, patient and intelligent effort. The true investment banker, having established such an outlet for any new securities he may want to handle, takes the greatest care that no securities reach clients which may impair their opinion of his own integrity and judgment.

FRANKLIN ESCHER.

7. THE CLEARING HOUSE. The principle of offset—the application of credits to debits and the settlement of any balance remaining—as applied to banking is defined as the clearing principle. Economically it is an evolution of the ancient system of barter by which goods were exchanged for goods, the trade being made even by giving something in return; that is, to equalize any difference in the value of the goods exchanged. In money exchanges this principle is not involved since the amount of money given can always be made to equalize the value of the goods taken. As soon as negotiable bills of exchange were in general use, this inequality of exchange must again be provided for as is the case with original barter, except that money instead of some other commodity is used to make the trade equal.

History.—The clearing principle now in operation between and among banks must have been employed as early as the general introduction of bills of exchange into the commercial world. The origin of the first clearing house in the modern sense is, however, clouded in some obscurity. London claims the distinction of having the original bank clearing house, which was organized about the year 1773. It was the custom of the early London banks to send messengers from one to the other, presenting checks and other bills payable at their respective counters for payment in money. Two of these messengers, so the legend goes, formed the habit of meeting daily at a convenient coffee-house where they would exchange their items, paying the difference with cash which they had brought along for the purpose. Although considerable time and the handling of much money, the characteristic dislike of the conservative English banker for anything varying from established custom asserted itself and the offending clerks who had thus violated precedent were properly disciplined. The merits of the idea having finally prevailed, the London Bankers' Clearing House was established and is said to be the first such exchange conducted in a building set aside exclusively for that purpose.

Owing to the unsettled state of finance and the lack of a coherent banking system, it was not until 1853 that the first clearing house was established in the United States, the New York Clearing House having been founded in that year. Albert Gallatin, an eminent financier, had proposed such an organization many years earlier, but without success. Following the example of New York similar associations were formed in other large cities and immediately after the National Bank Act had taxed State bank note issues out of existence (1863–64), the deposit-and-check system of banking brought into general use so large an increase of personal checks that clearing houses multiplied very rapidly. The so-called Suffolk system used by the Boston banks from 1818 to 1864 was a clearing plan adopted to facilitate the exchange and redemption of New England State bank notes, but its functions and methods were not those of the true clearing house in the generally accepted meaning of the term.

The Work of the Clearing House.—The clearing house is a plan, rather than a tangible entity, although in one sense the term is used to designate the building in which the actual exchanges take place, and in another the voluntary association of the banks which comprise the membership. As between any two banks, there will be a simple offset of checks which each holds against the other, payment of the difference or balance being included in the following day's transactions or else settled daily in cash. When three or more banks are involved, and the offset is accomplished through a clearing house, the operation
of exchange is identical, except that each member bank assumes in accounting that all checks payable by its neighbors are drawn upon by one fictitious institution — the clearing house bank, and the bank in turn receives all checks on itself from the same source. This result is accomplished by putting all checks on each other member of the clearing house in separate packages, listing each total on the credit side of a single fictitious institution — the clearing house bank, and the bank in turn receives all checks on itself from the same source. The result is accomplished by putting all checks on each other member of the clearing house in separate packages, listing each total on the credit side of a single fictitious institution — the clearing house bank, and the bank in turn receives all checks on itself from the same source. The grand total is then recorded on the bank's books as "Exchanges for the Clearing House." At a fixed time all the banks meet at the clearing house through their representatives, who exchange the packages, one clerk moving around the outside of a series of desks, each of which is occupied by another clerk from the bank whose clearing house number is shown on a brass plate. This clerk records in the debit column the amount of the package of checks received from the distributing messengers. The result is that while each messenger has come to the clearing house with checks on every other member, he returns with checks on his own bank only, and the clerks having made their visits to each institution. The difference between the total amount brought to and taken away from the clearing house is the balance, and since the mere exchange of the items does not alter the sum of them, the total debit balances due to the clearing house by the members who have brought less than they have received must equal the amount of the credit balances which the clearing house owes the members who have brought more than they have received. This casting of total debit and credit balances is done by the manager of the clearing house and is the proof of the correctness of the exchange. With the exception of the manager, who may be an officer of one of the member banks, all the clerical work at the clearing house is done by the bank clerks who make the exchanges. The exchange of the package of the subsequent accounting consumes very little time, 10 to 15 minutes being sufficient to list the totals and strike the balances.

A few hours are allowed the banks after the exchange is over for the settlement of balances. The general hour for the exchange is 10 a.m. and at noon all debtor banks must pay their balances in acceptable funds to the manager of the clearing house. At 1 o'clock all creditor banks send to the clearing house and receive payment for their credit balances. Unpaid items are accounted for directly between the two banks involved and are not returned through the clearing house. The clearing house acts merely as the agent for the debtor banks and is not liable in any way for the payment or genuineness of the checks which have been exchanged. Thus in a few minutes' time vast numbers of checks representing millions of dollars are presented and later settled for with very little actual money being necessary. The ratio of balances to clearings depends upon the rate of business, making the exchanges and as a general average for all clearing houses it may be set down at about 10 per cent. In New York city, which has the most notable clearing house in the country, the average extending over a period of years is less than 3 per cent.

Various methods are used in settling balances, the object being to avoid as far as possible the use of money. Thus drafts may be used by the debtors, which in this case are the clearing house deposits with one member, drawing his own drafts against this deposit in favor of the creditor banks. In many clearing houses actual currency is used, but in others, gold and other money is deposited in the vaults of the clearing house and certificates similar in nature to warehouse receipts are issued in denominations of $5,000 or more. By using these certificates, which cannot be negotiated except by member banks, counting and recounting large sums of money is avoided, nor is there danger of loss in carrying the money through the streets.

In acting as clearing houses for their members as the Federal Reserve banks are required to do under the terms of the Federal Reserve Act, the same accounting principles are employed, with due allowance for the fact that the member banks are separated within their own districts by at least one day's mail time from their clearing house, in this instance the Reserve Bank. The checks are sent by mail instead of by messenger as in a local clearing house and the balances are adjusted by debits and credits to accounts with the Reserve Bank.

The 12 Federal Reserve banks also use the clearing principle in making settlements with each other through the operations of a Gold Settlement Fund held at Washington under the supervision of the Federal Reserve Board. Each reserve bank keeps a portion of its gold reserve in the form of United States gold certificates on deposit in the Settlement Fund. Once a week each reserve bank telegraphs the amount owing by it to every other reserve bank. These totals are then offset and the balances are adjusted by debits and credits in the fund. Settlements representing the exchange transactions between the different sections of the country are thus effected by a change in ownership of the gold which is not in any physical way disturbed. Before the establishment of this National Clearing House it was necessary to transfer large amounts of gold from one section of the country to the other as the trade balance varied in accordance with the seasons.

Government.—In order that the transactions of the clearing house may be properly conducted, certain regulations are adopted. Rules govern the nature of items which may be passed through the exchanges, how they shall be endorsed, the hour of clearing and settlement; fines are imposed for lateness or errors; and the kinds of money which may be used in paying debit balances are agreed upon. This necessity for regulation has led to further clearing house development in which the banks act as an association for uniformity and the common good. Many clearing houses receive out of town checks from their members and make collection. In this way better terms and quicker returns can be secured than if each bank acted independently. Country checks handled by a clearing house are collected and not cleared. The clearing house in this case operates as the agent of all its members and deals with the out-of-town banks much as the member banks do in
collecting checks through individual arrangement with their country correspondents.

Several of the larger clearing house associations employ their own examiners who work independently of State or Federal officials. These local examiners not only make the usual audit and examination of the cash and books of the clearing banks, but they also make a careful investigation of the banks' loans and discounts from the viewpoint of the credit risk. In this way each member bank is assured that other banks in the city are being carefully managed and in position to secure expert advice if it is needed. The records of the clearing house examiner are confidential and cannot be secured by any of the banks. All detail reports are given to the officers and directors of the bank examined and their attention is called to any assets which are of questionable value. The judgment of the clearing house examiner is usually to be depended upon in this connection, for indirectly he represents the combined credit skill of all the officers of the all the banks which he visits. The fact that a no depositor has lost a dollar through the failure of a bank subject to clearing house examinations. This system of examination was first adopted by the Chicago Clearing House in 1906.

It is expected that many of the activities of clearing houses in the United States will gradually give way in favor of the Reserve banks as these institutions develop in their supervisory capacity. The clearing function, however, for which all clearing houses are primarily established is of such importance in banking to insure the continued existence of bank clearing houses under any present or future banking system.

O. Howard Wolfe.

Cashier Philadelphia National Bank; formerly Secretary Clearing House Section, American Bankers Association.

8. BANKING IN THE UNITED STATES. Prior to the adoption of the Constitution in 1787 there was but little banking done, because one of the chief elements of that business—a sound and stable monetary system—was lacking, the Continental currency having depreciated to the point of practical worthlessness. With the enactment of the law of 2 April 1792, establishing a mint and regulating the coins of the United States, a new situation was created. The Constitution itself prohibited the States from coining money, emitting bills of credit and from making anything but gold and silver coin a tender in payment of debts. Upon Congress was conferred, by the same instrument, sole authority to coin money and to regulate the value thereof.

Early Banking in the United States.—The first bank in the United States owed their origin to Robert Morris and Alexander Hamilton. As early as 1763 Morris had conceived the plan for establishing a bank to assist in developing American trade, and in 1779 Hamilton had proposed the “The Company of the Bank of the United States.” Before their plans were put into execution, however, a bank was organized, conceived in a patriotic spirit, but destined to be short-lived.

In 1780, moved by the distressing situation in which Washington’s army was then placed, Thomas Paine, who was a clerk in the assembly of Pennsylvania, wrote to Mr. Blair McClennachan suggesting a subscription to support the army with necessaries, and enclosed $500. At a meeting in Philadelphia on 7 June 1780 subscriptions amounting to $400 in specie and $103,360 in Continental money were raised. On 17 June another meeting was held, and it was resolved to increase the subscription to $300,000 Pennsylvania currency, and the full amount was soon subscribed by 92 persons, Robert Morris and Blair McClennachan each subscribing $10,000. This association was called the Pennsylvania Bank. In the preamble to the resolutions of Congress accepting this patriotic offer of assistance it was recited that the subscribers had established a bank for the sole purpose of obtaining and transporting the said supplies of provisions, clothing, and forage, in short, for the support of the army and defense of the country. And, whereas, on the one hand, the associates, animated to this laudable exertion by a desire to relieve the public necessities, mean not to derive from it the least pecuniary advantage, etc.

The directors were authorized to borrow money on the credit of the bank and to issue notes bearing 6 per cent interest. All the money borrowed or received from Congress was to be used for purchasing supplies for the Continental army and otherwise aiding the patriots. Congress, it was expected, would reimburse the bank for these expenditures. The bank commenced business 17 July 1780 and continued open for about a year and a half. Its affairs were finally wound up in the latter part of 1784. This bank was of great assistance in procuring supplies for the army that could not have been procured otherwise without the greatest difficulty. It furnished the army 3,000,000 rations and 300,000 barrels of rum.

The first bank, as we have seen, had its origin in patriotic impulses, and its establishment appears to have been due to the suggestion of Thomas Paine.

This institution was not a modern commercial bank, however, and it was reserved for Morris and Hamilton to become the founders of the bank whose career was to be perpetuated and that was to live in the history of the country as the first regularly incorporated commercial bank. Like its predecessor, it was established to aid the cause of American independence. Years after its president, writing to the Comptroller of the Currency, referred to this fact by saying: “This bank was created avowedly to aid the United States.”

Early in 1780 Hamilton wrote to Morris strongly urging the establishment of a national bank as one of the steps necessary to put the country on a sound financial footing and to aid in carrying on the war. Hamilton was then but 23 years old, but his was the possession of unusual financial talents which were to win him distinction in later years. His purpose in forming the bank was to unite the moneyed classes in the support of the government credit, for the opinion was to be a great trading and banking corporation in private hands, but backed and partly controlled by the gov-

government. Hamilton's suggestions were re-
newed in later letters to James Duane, a mem-
er of Congress from New York, and to Isaac Sears of New York. To the latter Hamilton wrote: "We must have a bank on the true principles of a bank." In the spring of 1781 he again wrote to Robert Morris renewing his suggestions for a national bank. Morris was then Secretary of the Department of Finance, having been elected to that position 20 Feb. 1781. Hamilton favored a bank with a capital of not less than $3,000,000. Morris, while coinciding with his views in the main, thought a more modestly capitalized institution would better meet the requirements of the times. He accedingly drew up a plan which he presented to Con-
gress on 17 May 1781. It provided for the establishment of the Bank of North America, for which a subscription of $400,000 was to be raised, payable in gold or silver. Its bank notes, payable on demand, were to be receivable for duties and taxes in every State. The plan having been approved by Congress, the Super-
intendent of Finance published it on 28 May, accompanied by an address, in which he said: "The deprecating paper currency has unhap-
pily been the source of infinite private mischief, numberless frauds and the greatest distress. The national calamities have moved with an equal pace, and the public credit has received the deepest injury. The exigencies of the United States require an anticipation of our revenue; while at the same time, there is not such confidence established as will call out, for that purpose, the funds of individual citizens. The use, then, of a bank, is to aid the Gov-
ernment by their moneys and credit, for which they will have every reward and security, to gain from individuals that credit which property, abilities and integrity never failed to command, to supply the last of that paper money which, becoming more and more useless, cries the loud for its final redemption, and to give a new spring to com-
merce, in the moment when, on the removal of all its restrictions, the citizens of America shall enjoy and possess that freedom for which they contend."

The facts above referred to in regard to the depreciation of the paper currency are sub-
stantiated from the following extracts from a newspaper of that period:

"The Congress is finally bankrupt. Last night a large body of the inhabitants, with paper dollars in their hats, by way of cockades, paraded the streets of Philadelphia, carrying colors flying, with a dog tarred, and instead of the usual appendage and ornaments of feather-
ers, his back was covered with the Congress paper dollars. This example was directly fol-
lowed by the jailer, who refused accepting the bills in purchase of a glass of rum, and after-
wards by the traders of the city, who shut up their shops, declining to sell any more goods but for gold and silver."

"The purchasing power of government paper was at an end, and Congress turned to a bank, organized on a specie basis, for relief from the evils of a depreciated currency."

"On 1 Nov. 1782 the Bank of North America was organized. Thomas Willing was chosen president, and a few days later Tench Francis was elected cashier. It began business 7 Jan. 1782, and has continued from that time until the present, a worthy memorial to the genius and wisdom of its founders, an honor to the city of Philadelphia and always a strong sup-
porter of the public credit."

The Bank of North America had a charter from the Federal Congress and from the States of Delaware and Pennsylvania. In 1864 it entered the national banking system. In view of its age, and other circumstances connected with its history, it was permitted to retain its original title. All other national banks are required to have the word "National" as a part of their name.

In the early financial history of the United States no two names occupy a more distin-
guished place than those of Morris and Hamilton. The contributions of the former to relieve the sufferers of the patriots attest alike his patriotism and humanity, and he also pos-
sessed financial genius of a high order.

Alexander Hamilton, as the first Secretary of the Treasury under the Federal Constitu-
tion, laid the foundations of our financial sys-
tem and firmly established the public credit. On his accession to this high office it was to be expected that he would some attempt to carry into effect his views in regard to a government bank.

Hamilton's first aim was to strengthen the Federal Union, and one of his plans for doing this was to put the public credit beyond ques-
tion and thus gain confidence for the new government. He favored the payment of the foreign and domestic debt and the assumption of the State debts by the Federal government. The first proposition was readily agreed to, the latter was carried with some difficulty, and the proposal to assume the State debts was at first defeated, but was afterward carried by an alliance formed between Hamilton and Jefferson, by which Hamilton agreed to use his in-
fluence to secure the permanent location of the capital on the Potomac in return for Jeffer-
son's assistance in getting votes in Congress for the debt assumption plan. This compact was effectual. Hamilton did not consider the location of the capital as a question involving any essential principle, while he regarded the financial policy he had marked out as being necessary to the welfare of the country. Jef-
ferson and he were both members of the cabi-
et, and the differences which were to divide them in later years had not yet developed."

The Bank of New York, located in New York city, is another historic institution. It commenced business on 9 June 1784. The constitution of the bank, which was written by Alexander Hamilton, provided that the capital stock should consist of $500,000 gold or silver. Though the bank commenced business in 1784 it did not get a charter from the New York legislature until 21 March 1791."

"The Massachusetts Bank was incorporated at Boston 7 Feb. 1784 and commenced business on 3 July of that year, $253,500 of its capital of $300,000 being paid in."

"The incorporation of these banks marks the change from the period of depreciated Continental and State currency to a system of bank notes redeemable in specie. This is the beginning of an important epoch in American banking history."
BANKS AND BANKING — BANKING IN THE UNITED STATES (8)

FIRST BANK OF THE UNITED STATES

Hamilton as Secretary of the Treasury proposed a national bank in his report for 1790. Contrasting the superiority of the proposed bank to an emission of United States notes, Hamilton pointed out that the right to issue paper of this character was "so certain of being abused that the wisdom of the government will be shown in never trusting itself with the use of so seducing and dangerous an experiment." 2

The proposed plan was arranged under 24 heads. The capital of the proposed bank was fixed at $10,000,000; one-fourth of all the private and corporate subscriptions was to be paid in gold and silver and three-fourths in United States stock bearing 6 per cent interest. Two million dollars were to be subscribed by the United States, a loan of equal amount being made in return by the bank, which was to be reimbursed in 10 equal annual instalments in money or in the bonds of the government in a manner similar to that pursued by the British government upon the organization of the Bank of England; or, as Mr. Hamilton described the operation, by "borrowing with one hand what is lent with the other." 3 The board of directors of the bank was to consist of 25 persons, not more than three-fourths of them to be eligible for re-election in the next succeeding election, and the bank had authority to loan on real estate security, but could only hold such real estate as was requisite for the erection of suitable banking houses or should be conveyed to it in satisfaction of mortgages or judgments. No stockholder, unless a citizen of the United States, could be a director and the directors were to give their services without compensation. The bills and notes of the bank were made receivable in payment of all debts to the United States. The total amount of debts which the corporation might at any time owe in any way, except for moneys actually deposited in the bank for safe-keeping, was never to exceed $10,000,000 and if this limit was exceeded the directors under whose administration the excess might occur were to be personally liable for the amount. The corporation was allowed to sell the evidences of the public debt subscribed to its stock, but was not to purchase any public debt whatever. Notes were to be issued, payable to any person or persons, assignable and negotiable, or to bearer assignable by delivery. The directors were permitted to establish offices for discount and deposit only, wherever they should think fit in the United States. A report of the condition of the bank was to be furnished whenever the Secretary of the Treasury required it, but not oftener than once a week. The charter was to expire 4 March 1818.

Although the bill for chartering the bank was opposed by Madison and Jefferson, as well as by Randolph, the Attorney-General, Hamilton's wishes prevailed and the bill for chartering the bank became a law 25 Feb. 1791. 4

The average dividends of the bank from its organization to March 1809 were at the rate of 8¼ per cent per annum. The 5,000 shares of $400 each owned by the United States were disposed of in the years 1796 to 1802 at a considerable profit, 2,220 shares having been sold in the last-mentioned year at a premium of 45 per cent. According to the treasury records the government subscription, with the addition of the interest which was paid by the United States on stock issued for it, amounted to $3,200,000, while there was received by the treasury in dividends and from the sale of the bank stock at various times $3,773,580, the profit realized by the government being $573,580, or nearly 28.7 per cent upon the original investment.

In addition to the Act of December 1791, chartering the bank, four supplementary acts were passed by Congress in reference to it: one on 2 March 1781, which varied the manner in which the capital stock was to be subscribed for and paid in; two passed in 1798 and 1807, respectively, having reference to
counterfeiting its notes and papers or otherwise defrauding it; and one in 1804 permitting the establishment of offices of the United States in the Territories and dependencies.

Application for a renewal of the charter of the bank was made in 1808. Secretary Gallatin, in his annual report for 1809, favored the renewal, with certain modifications, but after a protracted debate in both Houses of Congress the application of the bank was rejected.

The banking house and most of the assets of the Bank of the United States, including over $5,000,000 in specie, were purchased by Stephen Girard, of Philadelphia, who at once started the Girard Bank, which, converted to a National bank in 1865, continues to this day. The purchase and transfer came about in this way. In 1810 Girard had large balances with the Barings, amounting to £16,701. In 1811 the indebtedness of that firm to him was nearly £200,000. The difficulties in trade with the Continent were great and the Barings were in danger. Mr. Girard sent two agents to London to do what they could to withdraw the amount due and transmit it to America. Part of the funds in goods and paid in American 6 per cent stocks and United States Bank shares, then at about $430½ (598 10s.) per share. The Barings, it will be remembered, had purchased a large amount of the bank stock from the United States government in 1814. The stock Girard had purchased gave him a large interest in the bank; and, in the spring of 1812, he found by consultation with George Simpson, the cashier of the old institution, that the bank building and cashier's box could be purchased for $120,000, less than one-third of its cost. The purchase was made, the property was transferred to Girard, and his new bank commenced operations on 12 May 1812, with $1,200,000 capital, which was afterward increased to $1,300,000.

Much of the business of the Bank of the United States was transferred to Girard's Bank, together with $5,000,000 in specie. The officers and employees of the old bank were retained at the same salaries. Girard bought the stock entitling him to the charter of the Bank of the United States to be renewed. If this had occurred he would have made a fortune by the rise in stock. But, as it was, he saved himself by the purchase of the old bank. He did not use the old circulating notes, but paid out notes of State banks till his own were printed, which bore the device of a ship under full sail and an American eagle.

The stockholders of the Bank of the United States received, on the final winding up of the institution, $434 per share, which, with dividends averaging about 8 per cent per annum, made it no bad investment. Many, however, had bought and sold at much higher rates some years previous to the expiration of its charter. The United States government sold to the Barings for a premium of 45 per cent in 1802, or $500,000, a bank stock to the extent of $350,000.

In view of the success of the bank, it is interesting to quote some of the expressions in regard to it, appearing in the debates in Congress. Mr. Boyd considered the bank "a great swindling machine;" Mr. Desha referred to the recharter as an "act of revenge on the best interests of our country;" Mr. Wright said the charter was "a cancer upon the body politic." In the press it was referred to as "an hydra," "a cerberus," "a gorgon," and "a vulture." These expressions typify the prejudice then existing, and which still exists, in this country against concentrated banking power, and all the denunciations above quoted can be matched from debates and newspaper articles on banking at the present day.

SECOND BANK OF THE UNITED STATES.

Early in 1814 proposals were made to organize a national bank, and on 10 February of that year a bill was introduced in the House for the incorporation of such an institution with a capital of $30,000,000, but the bill failed, and other attempts were unsuccessful also, until finally a bill based upon the suggestions of Mr. Dallas, the Secretary of the Treasury, became a law by the signature of President Madison 10 April 1816.

Mr. Dallas on 6 Dec. 1815, sent to the speaker of the House a proposition relating to the national circulating medium. He considered four questions: Whether it was practicable to renew the circulation of gold and silver coins; whether the State banks could be successfully employed to furnish a uniform currency; whether a national bank would be more advantageously employed for the purpose; and, last, whether the government itself could supply and maintain a paper medium of exchange. In regard to the State banks, while acknowledging the valuable services and liberality of some of them, he said: "The truth is, that the charter restrictions of some of the banks, the mutual relation and dependence of the banks of the same State, and even of the banks of the different States, and the duty which the directors of each bank conceive they owe to their immediate constituents upon points of security or emolument, interpose an insuperable obstacle to any voluntary arrangement upon national considerations alone for the establishment of a national medium through the agency of the State banks." He concluded against the possibility of specie alone, against government issues, and finally that a national bank was the best and perhaps the only resource. At the request of the National Currency Committee, Mr. Dallas, on 24 Dec. 1815, enclosed an outline of a plan for a national bank. He proposed now a bank for 20 years with a capital of $35,000,000, $7,000,000 of which was to be subscribed by the government. This might be augmented to $50,000,000 by Congress, the increase to be divided among the States. It was to be located in Philadelphia, and could establish branches or employ State banks as branches. It was to pay specie at all times, and not to suspend without authority of Congress. In lieu of the loan, it was to pay the government a bonus of $1,500,000.

A bill was introduced embodying Mr. Dallas' suggestions on 26 Feb. 1816. The debate was chiefly upon a motion to reduce the capital to $20,000,000. In this debate Mr. Clay spoke in favor of the bank, the question for changing his position was that, in 1811, when he voted against the recharter of the old bank, he was instructed by the legislature of his State to do so, and at that time he did not deem a national bank to be necessary in a constitutional sense. He then relied upon the State banks as being able to meet all the wants of
the government financially; it now appeared that the general government could no longer depend upon the national bank, which he regarded as not only not necessary, but indispensable. At one time Philadelphia was struck out and New York selected as the principal seat of the bank by a vote of 70 to 64, but this was reversed and Philadelphia replaced. The bill finally passed the House without important amendment, on 14 March 1816, by a vote of 80 to 71. It was introduced in the Senate on 22 March and passed on 3 April with one or two amendments that, when the bill came to the House next day, Mr. Calhoun pronounced to be slight. Upon 3 April they were concurred in and on 10 April the bill received President Madison's signature.

Provisions of the Charter.—The charter was limited to 20 years, expiring on 3 March 1836. The capital was to be 100 per cent at $5,000,000, or $7,000,000 of which was to be subscribed by the government, payable in coin or in stock of the United States, bearing interest at 5 per cent and redeemable at the pleasure of the govern- ment, or in greenbacks, which was to be sub- scribed for by individuals and corporations, one-fourth being payable in coin and three- fourths in coin or in the funded debt of the United States. Five of the directors were to be appointed by the President, and all of them were required to be resident citizens of the United States, and to serve without compensation. The amount of the indebtedness, exclusive of deposits, was not to exceed the capital of the bank. The directors were empowered to establish branches and the notes of the bank, payable on demand, were receivable in all payments to the United States. The penalty for refusing to pay its notes or deposits in coin, on demand, was 12 per cent per annum until fully paid. The bank was required to give the necessary facilities, without charge, for transferring funds of the government to different portions of the Union and for negotiating public loans. The federal funds were to be deposited in the bank and its branches, unless the Secretary of the Treasury should otherwise direct. No notes were to be issued of a less denomination than $5, and all notes smaller than $100 were to be made payable on demand. The bank was not directly or indirectly to deal in anything except bills of exchange, gold or silver bullion, goods pledged for money lent, or in the sale of goods really and truly pledged for loans, or of the proceeds of its lands. No other bank was to be established by authority of Congress during the continuance of the federal government, except such as might be organized in the District of Columbia with an aggregate capital not exceeding $6,000,000; and, in consideration of all the grants of the charter, the bank was to pay to the United States a bonus of $1,500,000 in three annual installments. Mr. Dallas, whose first plan for a national bank was so unceremoniously rejected, was appointed Secretary of the Treasury by Mr. Madison in February 1814. His predecessor, Mr. Gallatin, who had been appointed Commis- sioner to Russia to negotiate a treaty of commerce and commerce with Russia, left the country in May 1813, and the Treasury without a head. In June the Senate refused to confirm Mr. Gallatin as commissioner, and Madison still regarded him, as head of the Treasury. Under these circumstances Mr. Mason moved a resolution in the Senate on 24 Jan. 1814, declaring the secretaryship of the Treasury vacant, but the subject was postponed inasmuch as it was authoritatively announced that the President would appoint a secretary in a few days, which promise was fulfilled.

The Bank Commences Business.—Section 22 of its charter required the bank to commence operations by the first Monday in April 1817. The bank went into operation on 7 Jan. 1817. This was at the worst stage of the monetary troubles, beginning with the suspension of specie payments in 1814 and continuing until the general crash in 1819 and 1820. At this time lands and agricultural products had fallen to one-half the value obtainable in 1808 and 1810, and to one-third of the value they possessed when the excessive indebtedness of the people was incurred—namely, during the inflation years of the State banks. The circulation and the general failures of the State banks began in 1818. The second United States Bank, therefore, came into existence on the very verge of a great monetary crisis. When it commenced business the first installment of capital, amounting to $1,400,000 in specie and $7,000,000 in United States stocks, had been paid. The subscription had been opened 7 July 1816. The payment of the second installment of capital became due on 7 Jan. 1817. The law required this to be paid $10 in specie and $25 in United States stock or specie. It appears, however, that instead of requiring the stockholders to pay in this installment from outside sources, the bank on 7 January began to discount the notes of stockholders upon the pledge of their stock to the amount required to pay the specie part, and in some cases to the full amount of both specie and United States stock required to make up the whole installment. After a time discounts were made to the full value of the stock, which enabled the stockholders not only to pay up in full, but even to draw out what they had first advanced. The discounts were made in the bank's bills, which were considered equal to specie. Of the $28,000,000 capital subscribed by individuals $7,000,000 was to have been paid in specie and $21,000,000 in United States stock. The bank appears to have actually received nearly $2,000,000 in specie and $13,872,610 in public stocks. The difference represents the amount made up by stock subscriptions, except such as might be organized in the District of Columbia with an aggregate capital not exceeding $6,000,000; and, in consideration of all the grants of the charter, the bank was to pay to the United States a bonus of $1,500,000 in three annual installments. Mr. Dallas, whose first plan for a national bank was so unceremoniously rejected, was appointed Secretary of the Treasury by Mr. Madison in February 1814. His predecessor, Mr. Gallatin, who had been appointed Commissioner to Russia to negotiate a treaty of commerce and commerce with Russia, left the country in May 1813, and the Treasury without a head. In June the Senate refused to confirm Mr. Gallatin as commissioner, and Madison still regarded him, as head of the Treasury. Under these circumstances Mr. Mason moved a resolution in the Senate on 24 Jan. 1814, declaring the secretaryship of the Treasury vacant, but the subject was postponed inasmuch as it was authoritatively announced that the President would appoint a secretary in a few days, which promise was fulfilled.
full market value. One could purchase bank shares without the advance of a cent. It was only necessary to apply for a lot of the shares to be bought, and pay for the stock with the proceeds. When the price of shares rose sufficiently a sale could be made and the difference pocketed. It appears that the president, William Jones, and a number of directors and officers, especially those connected with the Baltimore branch, had directed personal interest in these transactions, which they did not pretend to conceal, but considered as lawful private concerns. The stock rose as high as $156 per share in August 1818, but soon after fell to about $110. While there were no doubt gross irregularities in its management, for which the bank was soon to suffer, it did much good even under these disadvantages. It received upon deposit from the United States the notes of State banks, and in return furnished a uniform currency. It transferred funds whenever needed, and the amount paid in in United States stocks had its effect in enhancing the credit of the government loans. It could influence upon the currency to make itself very unpopular with the State banks during the financial crisis of 1818, although those even who were hostile to it admitted its policy toward the State institutions had been marked by great consideration and leniency. In fact, on this point its enemies were obliged to fall back on the charge that by this very leniency and consideration it had led the State banks to unduly extend their business, had drawn them into temptation and made them unfit to meet the financial storm. It did not accustom the local banks to pay specie soon enough, and by putting off the evil day found them unprepared at last. Up to August 1818 the bank redeemed its notes, both of the parent bank or its branches, at any of its offices where they might be presented, but after that date redeemed its bills only at the office which put them in circulation. This change was made because the bills were largely used for purposes of remittance, and in the localities where a sound local currency was most needed the bills were gathered up and sent off, leaving the field to the inferior State bank circulation. A more important reason was that the change enabled the bank to realize a profit by the sale of its drafts. This change was persevered in and afterward afforded the basis of President Jackson's assertion that the bank did not furnish a uniform currency.

Although some losses were sustained by the Baltimore branch of the bank, the institution went along without encountering any particular political difficulties. General Jackson in his annual message to Congress raised the question of the constitutionality of the bank, claiming at the same time that it has failed in the great end of establishing a uniform and sound currency. He suggested that if a national bank was necessary one might be devised founded upon the credit of the government and its revenues, thus avoiding the question of constitutionality.

At the beginning of the administration of General Jackson, says Mr. Parton, the Bank of the United States was a truly existing institution. Its capital was $35,000,000. The public money deposited in its vaults averaged six or seven millions; its private deposits six millions more; its circulation twelve millions; its discounts more than three millions a year; its annual profits more than three millions. Its capital was, therefore, about one-quarter, and its loans, circulation and deposits about one-fifth of the whole amount held and issued by all the banks of the country. Besides the parent bank at Philadelphia, with its marble palace and 100 clerks, there were 25 branches in the towns and cities of the Union, each of which had its president, cashier and board of directors. The employees of the bank were more than 500 in number, all men of standing and influence, all liberally salaried. In every State of the Union and in many foreign nations of the globe were stockholders of the Bank of the United States. One-fifth of the stock was owned by foreigners. One-tenth of its stock was held by women, orphans and trustees of charity funds. Its bank notes were as good as gold in every part of the country. From Maine to Georgia, from Georgia to Astoria, a man could travel and pass these notes at every point without discount, and it is said that in London, Paris, Rome, Cairo, Calcutta, St. Petersburg, and other prominent cities, the notes of the Bank of the United States were within a fraction more or a fraction less than their value at home, according to the current rate of exchange. They could actually be sold at a premium at the remotest commercial centres. It was not uncommon for the stock of the bank to be sold at a premium of 40 per cent. The directors of the bank were 25 in number, of whom five were appointed by the President of the United States. The bank and its branches received and disbursed the entire revenue of the nation.

The first real attack upon the second Bank of the United States originated in a political controversy. Jeremiah Mason had been elected president of the branch of the bank at Portsmouth, N. H. On his accession to this position he instituted some reforms in the management which rendered him unpopular. This gave to Levi Woodbury, a political antagonist, an opportunity to demand his recall. Mason's friends, against Mason and others of like nature affecting the branches in Kentucky and Louisiana were transmitted by Secretary Ingham to Nicholas Biddle, president of the bank. The attacks upon Mason and the Portsmouth branch continued and grew more violent, and the political hostility of President Jackson was increasing. In his message for 1831 he again called the attention of Congress to the question of recharter. A bill with this object in view passed both Houses of Congress in the following year, but was vetoed by President Jackson on 10 July.

Jackson's inconsistency in his message and in his veto are thus summed up. In 1829, when the charter had yet seven years to run, he calls attention to the necessity of prompt action as to the recharter in order to avoid precipitancy. In 1830 when the charter had yet six years to run, he advocates timely action. In 1831, there being five years more, he reiterates his previous advice; but, in his veto in 1832, when four years only remain to the bank, he says there is no need of haste.

But although the veto was exceedingly vul-
nerable from almost every standpoint, it served its purpose in arousing the popular feeling against the bank and in favor of Jackson. Benton, who in the Senate defended the veto against the attacks of Webster, Clay, Calhoun and Ewing, voiced the whole spirit of the party he represented when he said:

"You may continue to be for a bank and for Jackson, but you cannot be for this bank and for Jackson. The bank is now the open, as it has long been the secret, enemy of Jackson. The war is now upon Jackson, and if he is defeated all the rest will fail an easy prey. What individual could stand in the States against the power of that bank, and that bank flushed with a victory over the conqueror of Bonaparte? The whole Government will fall into the hands of the moneyed power. An oligarchy would be immediately established, and that oligarchy in a few generations would ripen into a monarchy."

The bill for the recharter could not secure the necessary two-thirds vote for the passage over the veto. Nor did any of the stockholders of the bank fully realize, even then, the effect of the President’s opposition. They thought the people would be disgusted at Jackson’s unreasonable attitude. Nicholas Biddle wrote to Clay that he was delighted with the veto. The campaign of 1832 was fought on the bank issue. It was the hero of New Orleans against the “monster monopoly.” It was Jackson like a hero of romance fighting against “Old Nick’s Money” and “Clay’s Rags.” The bank, having foolishly gone into politics, was defeated and Jackson again elected. The support of the people was at once claimed for all past and future warfare on the bank, and the result of the election sealed its doom. The attack promised on the stump began at once.

In his message in 1832, after his re-election in November of that year, the President again fulminated against a recharter of the institution, recommending that the seven millions of stock of the bank held by the United States should be sold, and going further intimates that the United States deposits in the bank were not safe. He either was or affected to be impressed with the idea that so long as the bank was the holder of the public funds it might use them for its own purposes, thus securing an extension of its existence. In consequence of the message bank stock fell from 112 to 104. A Treasury agent who made an examination of the institution reported it solvent and the stock went back to 112. Congress did not coincide with the views expressed by the President, and refusing to sell the bank stock, passed a resolution, by a vote of 110 to 46, of confidence in the safety of the deposits.

The President had made up his mind to cripple the bank by taking away from it the public deposits, and the then Secretary of the Treasury, Mr. Duane, refusing to carry out his wishes, he was superseded by Attorney-General Taney, who, on 26 Sept., 1833, issued the order for the removal. In consequence of this act following, further intimates that the Senate by Mr. Clay: “That the President, in the late executive proceedings in relation to the public revenue, has assumed on himself authority and power not conferred by the Constitution and laws but in derogation thereof.”

This, known as the “censure resolution,” was passed by a vote of 26 to 20. On 28 March, 1834, this resolution was expunged from the records of the Senate.

Jackson’s opposition, on one ground or another, continued, and the bank gave up all hopes of obtaining a new lease of life, but on 13 Feb., 1836, 13 days before the expiration of its charter, obtained a charter from the legislature of Pennsylvania. The subsequent career of the bank was short and disastrous. A constantly increasing amount of loans on stocks gradually tied up its resources, so that by 1840 it was found that the assets of the institution consisted chiefly of all kinds of internal improvement stocks and bonds as well as of State stocks and bonds and bank stocks.

But the United States was not a loser by the bank’s failure.

The $7,000,000 of stock held by the United States, previous to the change to a State charter, was paid back in full, and the government realized a handsome profit on its investment, as will appear. The following table derived from the records of the Treasury Department:

The history of the United States Bank under its Pennsylvania charter, subsequent to the crisis of 1837, was a most disastrous one. It suspended pecuniary payments during the ticklish period from 1837 to 1841 as often as other State banks, and finally went down under circumstances that might, with prudent management, have been turned to its advantage. It made three several assignments in 1841 to secure various liabilities, and the fast and final assignment being on 4 September of that year.

The final result of the liquidation of the bank was briefly stated in a letter from Thomas Robins, Esq., then president of the Philadelphia National Bank who was the last survivor of its numerous assignees:

“All the circulating notes of the Bank of the United States, together with the deposits, were paid in full, principal and interest, and the accounts of the assignees were finally settled in 1856. There were no funds, and no dividend was paid to the stockholders of the bank; the whole twenty-eight millions of dollars were a total loss to them.”

Nicholas Biddle was president of the bank from January 1823 to March 1839, being president of the Bank of the United States until its charter expired in 1836, and for the next three years president of the United States Bank of Pennsylvania. At the time of his resignation, the shares were selling at 111, having in 1837 sold at 137; but, in 1843, after the failure, its shares were quoted at 1½ per cent.

Both the first and second Banks of the United States were killed by the prejudice against banks, which exists to an even greater

extent to-day. The fall of the latter institution was hastened by bad management.

THE SPECIE CIRCULAR.

The order for the removal of the public deposits from the Bank of the United States was dated 26 Sept. 1833. After this date the money collected from customs and other sources of revenue was no longer paid into the Federal bank, but was deposited with selected State banks, called "pet banks" by the opponents of the Administration. The payment of the public debt and the great increase in the sales of public lands caused the surplus of revenue over expenditures to increase in an unprecedented manner. The Bank of the United States in its most prosperous days had never had in its vaults much over $8,000,000 of the public moneys at any one time; but by 1 Nov. 1836, 88 State banks in 24 States with a capital of $77,576,449, held public deposits amounting to $49,377,986. Their ordinary individual deposits at the same time were only a little over $25,000,000. That there was any very clear apprehension of the extent to which this accumulation of wealth would take place may be doubted, but it is certain that as early as 1829 there were calculations made upon an anticipated surplus of revenue as an aid to party advancement, either by means of the bank or in spite of it. The financial stringency of 1834 indicated that the removal of the public funds to the State banks had seriously disturbed the usual course of loans, and the consequent suffering started a demand for the distribution of the accumulating surplus among the several States. The State banks had thrown their influence against the Federal bank in aid of the Administration, and they were allowed to reap their reward by the use of the public moneys entrusted to them as a basis of extending their loans and for enormous issues of their own notes. Banks were started for the sole purpose of issuing notes that might be turned in at the land offices for public land. Good land office money was the test of the credit of a bank bill. Speculators thus obtained vast tracts of valuable land. The notes appeared to go through the hands of innocent third parties. When the bank failed, as it usually did, the Treasury bore the loss. Even in less flagrant cases the bank credit enabled immense territory to be held for speculation, keeping out actual settlers. Under this stipulation the receipts from the sales of public lands rose from about $5,500,000 in 1834 to $24,800,000 in 1836. These later receipts were almost altogether in bills of State banks; and thus the consequent difficulty in securing specie, and the losses incurred from bank failures, impelled the President (Jackson) to cause the Secretary of the Treasury to issue, on 11 July 1836, the celebrated specie circular forbidding the receipt of anything but specie in payment of the public lands. He also pocketed a bill passed by Congress to compel the receipt of the notes of specie-paying banks.

INDEPENDENT TREASURY SYSTEM.

Following experiences with the Bank of the United States and the State banks as custodians of public funds, the Independent Treasury System, by which the government might take charge of its own funds, came into existence by the Act of 4 July 1840, though the law was repealed in the following year, and was not again re-enacted until 6 Aug. 1846. The operations of this law were substantially changed by the National Currency Act of 1863, and the latter in turn by the Federal Reserve Act of 1913.

The method of handling the Treasury receipts has been the subject of much criticism. Instead of depositing the public funds in the banks in the ordinary course of business, to be drawn against as needed, it has long been the practice of the Secretary of the Treasury to make large withdrawals and deposits in bulk. Very often the deposits have been made for the purpose of affording relief to the money market or for assisting in moving the crops and sometimes in the attempt to prevent panic. That the system has worked badly is the belief of those most competent to judge. It has been remedied in part by the Federal Reserve Act (q.v.), but the Secretary of the Treasury is still clothed with large discretionary powers in handling the public funds. Charges have been made at times that the surplus revenues were being employed for the benefit of Wall street speculation, and at others that they were being deposited in banks in certain localities for political effect. Whatever may be said in these charges, it is certain that the alternate deposit and withdrawal of large amounts of public funds have exercised an artificial influence on the money market. This would be obviated were the receipts of the government deposited in the banks and withdrawn in the ordinary course in accordance with usual business practice.

</table>

1 The relatively small amount of deposits reported for stock savings banks is due to the fact that the returns from many States include this class of banks with commercial banks.
2 Includes time deposits, $9,889,107, and commercial deposits amounting to $47,374,709.
3 69 banks, with deposits aggregating $41,806,000 and depositors numbering 334,970, included with figures for stock savings banks in 1916, are included with statistics for State banks for the current year for the reason that State banking departments did not compile the returns separately.

Note.—In the assembling of data in relation to savings banks the classification of banks as made by the State banking departments is closely followed, in consequence of which a number of so-called State savings banks, formerly treated by the comptroller of the currency office as savings banks, are now regarded as commercial banks, and the returns therefrom are combined with the latter.

In the foregoing table the figures for 1903 to 1908, inclusive, but not subsequently, include the number of depositors and the amount of deposits in the State banks of Illinois having savings departments, but not the number of such banks, by reason of the fact that general returns from these institutions are incorporated in State banks' returns.
The 12 Federal reserve banks opened for business on 16 Nov. 1914. Statements of their assets and liabilities are issued weekly. The consolidated statements of the banks for the stated date in November 1914, 1915, 1916 and 1917 are as follows:

**9. The National Banking System.** At the outbreak of the Civil War the statesmen of that epoch were confronted with financial problems of first magnitude. Should they meet them by the usual expedient of resorting to large issues of paper money or adopt some safer method? In his annual report for 1861 Secretary Chase declared against the issue of legal-tender paper and proposed a banking system whose principal features would be a circulation of notes bearing a common impression and authenticated by a common authority; second, the redemption of these notes by the associations and institutions to which they may be delivered for issue; and, third, the security of that redemption by the pledge of United States stocks and an adequate provision of specie. The Secretary declared that the proposed notes would, in his judgment, "form the safest currency which this country has ever enjoyed; while their receivability for all government debts, except customs, would make them, wherever payable, of equal value as a currency in every part of the Union."

The statesmen of the Civil War epoch in formulating the financial policy that was to assist the nation through this perilous period gave full weight to the inherent American preference against concentrated banking power, and instead of establishing a powerful bank of issue, which might have been of inestimable service in steering the lumbering ship of state through the stormy waters, and whose cur-
BANKS AND BANKING—THE NATIONAL BANKING SYSTEM (9)

rency based upon commercial transactions and gold might have stayed the ruinous rise in prices and the war odds. The country was forced to a system of small scattered banks and to the shifting of government paper currency. The policy then adopted was to continue to dominate the banking situation for the past 50 years. An attempt to substitute a bank currency for government paper have proved futile.

No subject connected with the Civil War finances has been more fiercely debated than the departure from what many regarded as sound financial policy in refusing to depend upon the banks and in resorting to the issue of legal-tender Treasury notes. Yet the latter policy was not the one originally contemplated by Secretary Chase and others who had the shaping of the finances of the war. Mr. Chase in his report of 1861 had recommended a system of national banks with note issues based upon the public stocks, and Mr. Spaulding had been asked to draw a bill to carry out this recommendation. He fulfilled this duty, but before the measure was introduced in the House it became evident that it could not be enacted in time to be of service to the government in the dire straits in which it was then placed. A section of Mr. Spaulding's bank bill providing for the incidental issue of Treasury notes was substituted for the banking bill and, in a form slightly altered from the original draft, became a law.

In his introduction to the "Financial History of the War," p. 1, Mr. Spaulding says:

"The first material mistake in the management of the finances occurred when Secretary Chase discarded the use of the bank check and the clearing-house in the fall of 1861. This mistake occurred under the following circumstances:

"Two important loan acts were passed at the extra sessions of Congress in July and August 1861. The first act was approved 17 July and the second 5 August. By section six of the Sub-Treasury act, passed in 1846, was so far suspended as to allow the Secretary of the Treasury to deposit any of the moneys obtained on any of the loans now authorized by law, to the credit of the Treasurer of the United States, in such solvent specie-paying banks as he may select; and the said moneys, so deposited, may be withdrawn from such deposit, for deposit with the regular authorized depositories, or for the payment of public dues, or paid in the redemption of the notes authorized to be issued under this act, or the act to which this is supplementary, payable on demand, as may seem expedient to or be directed by the Secretary of the Treasury.

"The primary object, which Mr. Appleton and myself had in view, in preparing this section, was to relax the rigid requirements of the Sub-Treasury Act in regard to the receipt and disbursement of coin and instead of paying the proceeds directly from the Treasury to allow all the moneys obtained on these loans to be deposited in solvent banks; the United States Treasurer to draw his checks directly on such deposit banks in payment of war expenses, which may be paid in Treasury bank notes then redeemable on demand in gold, or in the ordinary course of business, to a large extent, they would pass through the New York Clearing-House and the clearing-houses of the other cities, and cancelled by offset without drawing large amounts of specie. This mode of payment would have enabled the Secretary more easily to effect such loans and make his large disbursements without materially disturbing the reserves held in the banks, which were then well protected by these reserves in their vaults.

"This mode of making the disbursements for the large war expenses was regarded by me at that early period of the war as of vital consequence to the stability of the finances of both government and people; hence the preparation and adoption of the sixth section of the Act of 5 Aug. 1861, giving the Secretary of the Treasury discretionary power to suspend the Sub-Treasury Law in respect to these loans.

"After the battle of Bull Run, which occurred on the twenty-first day of July of that year, the necessities of the government in clothing, arming and feeding troops—in providing munitions of war—and became so urgent that the banks in New York, Boston and Philadelphia most patriotically came forward and made arrangements in several negotiations with Secretary Chase to loan the government $150,000,000 under the provisions of the two loan acts passed at the extra session. Of this sum $105,000,000 was apportioned to the associated banks in the City of New York, payable by instalments. The banks were then in good condition, transacting their business on a specie basis, and paid coin for all balances at the clearing-house, and redeemed their circulating notes in coin, and the loan to the government was made with the expectation that the money would be deposited in the banks, and be checked out under the direction of the Secretary, in pursuance of the sixth section above referred to. The Secretary of the Treasury refused to use the discretionary power conferred upon him by that section, and would not check on the banks for the expense of the war, so that current bank notes could not be paid or balances settled through the clearing-house, but insisted that the banks should pay the money loaned into the Sub-Treasury in gold or gold Treasury notes, and from thence it was distributed for war purposes at smaller denominations in different parts of the country. By far the greater part of this loan was paid in gold coin, taken from the reserves of the banks, commencing on the nineteenth of August 1861. This unnecessary mode of requiring the payment of the loans so weakened the banks that it brought on a general suspension of specie payments during the last days of December 1861. Notwithstanding the banks commenced making advances to the government about 19 Aug. 1861, yet none of the securities to be issued by the government for the loans was turned over to them until 14 Jan. 1862.

"The banks having been committed to making the loans, and having made partial advances on the loans, they naturally wished to complete the loan notwithstanding the Secretary of the Treasury deemed it incompatible with his views of duty, and the traditions of the Sub-Treasury Law, to use such banks as disbursers and be paid in Treasury notes, the extraordinary exigency under which the loans were made. The call upon the banks for
payment into the government depository of the remaining instalments of the loan, either in coin or gold Treasury notes, was persistently urged by the Secretary until the final closing of the transaction on the third of February, 1862.

"This was the first material mistake of the Secretary of the Treasury, and was the first step in the wrong direction, which combined with other important events, led to the necessity of passing the Legal-Tender Act."

"The Secretary, in breaking the banks, at the same time broke the Sub-Treasury, and both were discredited together."

Mr. Sherman in his 'Recollections,' p. 269, says:

"The Secretary of the Treasury had ample and complete authority given him by the act of July 1861, to borrow money on the credit of the government, but he could not deal with the system of bank credit, which had several States. He was forbidden by the Sub-Treasury Act of 1846 to receive notes of State banks, and was required to receive into and pay from the Treasury only the coin of the United States; but by the Act of 5 Aug. 1861, he was permitted to deposit to the credit of the Treasurer of the United States, in such solvent specie-paying banks as he might select, any of the moneys obtained from loans, the money thus deposited to be withdrawn only for transfer to the regularly authorized depositories, or for the payment of public dues, including certain notes payable on demand, as he might deem expedient. He had, however, no authority to receive from individuals or banks any money but coin.

"The only coin received from the Boston, New York and Philadelphia banks, in payment of their subscription to the government loans, to the amount of nearly $150,000,000, had to be sent to every point in the United States to meet public obligations, and when thus scattered was not readily returnable to the banks, thus exhausting their resources and their ability to loan again."

Mr. Sherman is very positive regarding the necessity of the legal tenders as a war measure. In his 'Recollections' (p. 281), he makes this statement:

"The Legal-Tender Act, with its provision for coin receipts to pay interest on bonds, whatever may be said to the contrary by theorists, was the only measure that could have enabled the government to carry on successfully the vast operations of the war."

Hugh McCulloch, the first Comptroller of the Currency and twice Secretary of the Treasury, in his 'Men and Measures of Half a Century' (p. 135), has this to say of the failure of Secretary Chase to make use of bank checks in disbursing government funds:

"For a considerable time, even after the war had begun, the specie standard was maintained, and hopes were indulged that the war might be prosecuted on a specie basis. These hopes were dissipated by the action of Secretary Chase in his dealings with the New York, Philadelphia and Boston banks, which had agreed to advance to the government on its 73 notes $150,000,000 ($50,000,000 in August, $50,000,000 in October and $50,000,000 in November, 1861) under the expectation that the Treasury drafts for the money would be presented through the clearing-houses and be paid without large reductions of their coin. The Secretary did not, however, feel at liberty to meet their expectations, and the drain upon their coin reserve soon became so heavy that they were forced to suspend specie payments. Their suspension was soon followed by the suspension of nearly all the banks in the country."

"When Chase, as Spaulding said, broke the banks and the sub-Treasury at the same time and discredited both, an urgent necessity arose for strengthening the weakened credit of the country. It soon became apparent that the issue of legal-tender notes alone would not suffice, as the frightful depreciation of these forced instruments of credit foreshadowed a time when they would approximate the same degree of worthlessness reached by the Continental currency in the struggle for independence, and made it incumbent upon Mr. Lincoln's financial advisor to find some means for holding this depreciation in check by a resort to the borrowing powers of the government. The precarious situation in which the country was involved injured its credit abroad, and made it desirable, if bonds were to be sold in large quantities, to save the ruinous depreciation, to create a home demand for them. The device of using the public debt as a basis for currency issued through banks was an old one. It had been proposed by Hamilton who when asked by Washington, "What is to be done with our terrible debt?" answered, "Bank on it as our only available capital, and the best in the world." Many of the States had tried the experiment of chartering banks to issue currency against a pledge of State stocks, often with disastrous results. There were other States — of which New York was a conspicuous example — where the banking laws were good and the banking system sound. It is well known that the law of the State named was relied on largely in framing the act creating the national banking system.

"More than two years before the bill providing for the organization of national banks became a law, the banks of the country had suspended specie payment, not to be resumed until 1879. The effect of this suspension was to link the national bank notes to the legal tenders, in which they were redeemable rather than to gold. Of course, the bank notes were no better and no worse than the money in which they were payable. They were not as good as gold, but neither were the legal-tender notes, the latter and the bank bills substantially keeping together as compared with gold.

"In reality, though nominally issued by banks and bearing on their face the stamps of the bank emitting them, the national bank notes are government paper money. They are secured by bonds of the United States, deposited with the Treasurer at Washington, in which city they are redeemed in lawful money, and though the law provides for redemption of the notes at the counters of the issuing banks this is almost totally unknown in practice. They are not redeemed through the clearings as are the notes of the Canadian banks. The government guarantees the payment of the payments, running no risk whatever in so doing, since it always has in hand an amount of its own securities equal to the face of the notes issued."

"Devised as the national banking system
to give the country sound and uniform currency and to aid in replenishing the Treasury, it hardly succeeded in either of these aims. The national bank currency has been of uniform value and a vast improvement on a great deal of the State bank circulation which it displaced, but it has through its inelasticity developed serious defects. In so far as the new banking system was relied on to furnish currency during the Civil War, the result was not very satisfactory. When the war closed the national bank notes were in the neighborhood of $100,000,000 in amount—only a small fraction of the loans placed to carry on the war. Had the channels of circulation not been so well supplied by legal-tender notes, the national bank notes at the close of the war would have been much greater in volume. After the war, when the government was still for a long time heavily in debt, the national banks were of immense help in sustaining the public credit.

But it is as a system of discount and deposit banks that the national associations have won their greatest success and established themselves firmly in the public confidence. It was, of course, one of the aims of Secretary Chase to establish as a system somewhat inharmonious State banking systems then existing with something having at least uniform laws to govern them and all watched over from Washington, yet he could hardly have foreseen how surprisingly large proportions the national banks were to attain through discount and deposit operations in the first half-century of their existence.

Marvelous as has been the record of national banking growth, it might easily have been much greater had Congress earlier enlarged the functions of the banks, thus forestalling the rapid rise of the trust company and the tremendous accretions of deposits in savings banks.

The history of the national banking system contains few important dates—points that mark any striking growth. There are two exceptions to this statement, however. After the original act was passed in 1863, the growth of the banks was slow until the 10 per cent tax was imposed on State bank notes in 1865. But the notes of national banking was given in 1900, when the minimum capital was reduced from $50,000 to $25,000, and the issue of circulation placed upon a somewhat more liberal basis.

Another landmark in the history of the system was the passage of the Federal Reserve Act (q.v.), 23 Dec. 1913. This act changed completely the method of redepositing reserves, provided for rediscounting and accepting and for a system of note issues based on coin and commercial paper. It also made other important changes in the Banking Law. Perhaps the strongest feature of the new law was in linking all the national banks together for their common defense; that is, a centralization of the reserves whereby they become, in a sense, the common property of all the banks so far as relates to their use.

Elements of safety in the national banking system have been the requirement in regard to the actual paying in of capital, the supervision exercised by the government and the admirable features of the law with regard to loans, and the double liability of shareholders. Compared to the colossal sums handled by these banks, their losses have been trifling, and they are growing proportionally smaller year by year.

The national banks have furnished a remarkably safe and efficient means of extending credit, and have been factors of immense benefit in local development and in the augmentation of the national wealth and prosperity. If they have fallen short, it has been due to the slowness of the government in adapting the law to meet changing conditions.

10. STATE BANKING SYSTEM.

Banking, in the early history of the United States, was the prerogative of the privileged few. Charters were obtained by subterfuges of one kind or another, by favoritism or by bribery. Familiar examples of the devices employed to get banking authority under some other guise are the Chemical Bank of New York, chartered as a chemical company; the Manhattan Company Bank, chartered as a water company; and the Wisconsin Marine and Fire Insurance Company Bank, whose original business is indicated by the title, the word "bank" being an afterthought.

But with the enactment of the Free Banking Law of New York in 1838, banking by special charter gradually disappeared, for the provision of the New York law conferring banking powers on all associations of persons complying with the terms of the act was generally copied in the banking legislation of other States, as it was later in the National Banking Act. From being a monopoly enjoyed by only a favored few, banking became so free as to encourage the rapid multiplication of banks until their number has grown to larger proportions than in any other country. The absolute freedom which was long given to any body of persons complying with the laws in organizing banks has been somewhat restricted in recent years, and the Comptroller of the Currency, in the case of national banks, and the supervising officers of State banks, are generally showing a disposition to encourage the organization of banks where they will tend to cause undue competition, and together applications for authority to organize banks by the professional bank promoter.

While in the early banking history of the country some of the States devised sound banking systems, a great many did not. There was, in many localities, a lack of banking capital or of capital of any kind. Attempts were made to remedy this lack of capital by starting banks for issuing notes, a favorite device being to decide on an extensive policy of public improvements, to issue bonds for this purpose, the bonds being purchased by the banks and notes emitted against them. These efforts nearly all proved disastrous, but the States adhering to sound principles of banking and to correct methods of organizing the banks had different experiences. (See Bank Note Issues, article 19). Indeed, when the national banking system came to be established it was based, in important respects, on the banking laws of New York, Massachusetts and other States whose legislation had been well planned. In turn, the National Banking Act itself became
the model for banking legislation in many of the States, until to-day, with rare exceptions, the standards of banking as formulated by the banking laws of the various States are substantially identical with those of the national banking system. The State banks, in fact, found it advantageous to maintain a position of safety at least approximating that of the national banks, otherwise their growth would have been checked. They could, on the other hand, transact some kinds of business denied their Federal competitors, and this, perhaps, made them better adapted to the needs of rural communities. This difference in the functions of the two classes of banks was greatly modified by the Federal Reserve system (q.v.), inaugurated in 1913. The State banks outnumber the national banks more than two to one—a fact due partly to the larger capital required of the latter (before 1900 it was fixed at a minimum of $50,000 and is now $25,000) and to other causes.

Massachusetts has no State banks of discount and deposit; New York has such institutions as are found in some other States, in their banking laws, authorize corporations to transact discount and deposit banking, savings bank business and trust company business all under one charter. Substantially this principle (department-store banking it is sometimes called) has been embodied in the Federal Reserve Act. Prior to the enactment of the law referred to, relations between National and State banks were generally amicable, their lines of business diverging considerably. With the removal of these differences, at least to an extent, it becomes a question as to whether the State banks may not find it less easy than heretofore to compete with the National institutions.

The distinguishing feature of the banking system of the United States, contrasted with that of nearly all other countries in the world, is that we have a very large number (between 20,000 and 30,000) of small independent banks, locally owned and managed. In the European continent, France and Italy, there are a few large banks with head offices and numerous branches. In the United States the permission to establish branches of either National or State banks is limited in scope, but it has shown a tendency to extension of late years.

ELMER H. YOUNGMAN, Editor The Bankers’ Magazine.

11. PRIVATE BANKS. For the ordinary functions of deposit and discount the private banker in the United States is being rapidly superseded by institutions organized under State and Federal laws. The private banker might engage in business with little or no capital, and what he had he was at liberty to invest as he chose, and this freedom in the manner of investing his capital extended to the investment of deposits entrusted to his keeping. He might employ either in his own business or embark them in any enterprise which appealed to his fancy. The incorporated bank, on the other hand, enjoys no such license. It must have a prescribed capital, which must be paid up, and some of this capital must be maintained unimpaired; and, in addition, the banking laws generally require that a definite surplus fund—so much in proportion to capital—shall be accumulated and maintained. These banks, unlike the private banks, must submit to frequent official visitation and examination and must make and publish detailed reports of condition one or more times a year. Some of the States have found it expedient to prohibit private banking altogether.

As against the objections to private banking as above set forth it may be stated that where the State and national bank stockholders are only liable, in case of insolvency of the bank, for an additional amount equal to their shares, the private banker is liable for the debts of his bank without limitation. (The adoption of the principle of limited liability in England grew out of some disastrous bank failures where the stockholders were heavily assessed, losing in some instances their entire fortunes.) Furthermore, the restrictions on the investments and operations of incorporated banks, while tending to greater safety, yet restrain the banks from opportunities of making profits which may be taken advantage of by the shrewd private banker.

Now, as in the earliest days of banking in Europe, some of the greatest transactions of domestic and foreign finance are carried on by private bankers; but they are not, in the ordinary sense, doing a discount and deposit banking business. They are rather the skilled intermediates of governments and of great corporations, representing their interests among the banks and the investing public, and as such perform a highly useful service. In integrity they compare most favorably with the largest of the incorporated banks, while their operations are not infrequently greater than even the largest of such institutions taken singly. The private banker, in arranging loans for governments and corporations, does not use his own funds, but by his standing and skill is able to mass together the resources of various banks, often in numerous and widely separated localities. He has to do with foreign exchange, the handling of specie on international account and provides the capital for the immense industrial and transportation enterprises which constitute such an important part of the country’s business life.

The private banker of to-day is a financial expert without whose service the operations of trade and finance could hardly be carried on, but in performing this service he uses his reputation and skill rather than his own funds or even the funds of others accumulated in his own particular office. He selects, analyzes and classifies the various lines of sound investments and brings to their support, not his own funds alone nor yet those of individuals committed to his care, but the funds of many groups of investors and of banks that have confidence in his integrity and judgment.

ELMER H. YOUNGMAN, Editor The Bankers’ Magazine.

12. FEDERAL RESERVE SYSTEM, The. The Federal Reserve Act, passed 23 Dec. 1913, is the underlying measure upon which the Federal Reserve system depends. The system itself consists of the Federal Reserve banks and their branches, situated in districts defined as in the accompanying map;
of quiet it was unable to exert any control over the development of credit or to regulate the country's gold supply, in relation to that of other nations.

Although there had been much discussion of the banking question, no definite legislation designed to improve conditions had been adopted since the Civil War, except only the so-called Aldrich-Vreeland Act of 1908. The "Gold Standard Act of 1900" had dealt almost entirely with the monetary, and only incidentally with the banking, problem. In the Aldrich-Vreeland Act, provision was made for informal unions or associations of banks to be known as "national currency associations" whose function it was to issue notes secured by specified collateral on request of their members. Practically no such associations had, however, been organized under the law until after the adoption of the Federal Reserve Act, so that when the latter measure became law partly with other banks. Under the National Bank Act, three classes of banks had been created—country, reserve city, and central reserve city; their reserves varying from 15 to 25 per cent. Only central reserve city banks were required to keep all of their reserves in their own vaults. Particular complaint had long been made of the bank currency furnished by National institutions. The banks bought government bonds, deposited them in trust with the Treasurer of the United States, and received from the Comptroller of the Currency notes for circulation. These notes were "inelastic"—i.e., could not be expanded or contracted at will in response to business requirements, because they depended upon the volume and price of bonds as determining factors governing their own amount. Due to lack of elastic currency and to wide diffusion of reserves the banking system was liable to disorder in times of financial pressure. In times the nation was still on the old basis of banking.

The Federal Reserve Act, however, sought not only to provide the improved and responsive currency which had been called for in the older measures of banking reform, but went much deeper. It recognized that the essential difficulty in American banking lay in its undue decentralization and consequent dissipation of strength. Fundamentally, therefore, it sought to give relief by changing the organization of banking so as to provide for combination of reserves and for joint control of and oversight over banking. To this end it provided for district organizations, which were essentially to be bankers' banks, dealing chiefly with their own members—the commercial banks of the district.

The number of such districts to be created was the subject of much difference of opinion, but ultimately Congress set the number at not
BANKS AND BANKING — FEDERAL RESERVE SYSTEM (12)

less than eight nor more than 12, while it placed in the hands of an organization committee, and of the Treasury, the Secretary of Agriculture and the Comptroller of the Currency the duty of determining how many should first be established and of drawing their outlines. This organization committee was, under the act, to select such persons as it thought fit. Each bank to whose capital national banks must become subscribers in an amount in each case not less than 6 per cent of their own capital (3 per cent to be paid in and 3 per cent to be subject to call). Every such Federal Reserve bank was to have a minimum capitalization of $4,000,000 of which one-half was to be paid up.

The central feature of the act was found in the plan it presented for changing the reserve organization of the country. The old reserve requirements were to be abolished, reserves being transferred, during a period of three years, to the new institutions. Eventually they were to be held only in the member banks and in Federal Reserve banks. By the Act of 21 June 1917 all reserves were transferred to the reserve banks and cash on hand with members was left to the latter's discretion. It was provided that reserve credits with reserve banks could be obtained not merely by depositing money, but by discounting paper of specified kinds with the new institutions. The act made full provision for foreign exchange business, clearance of checks, regulation of commercial paper and other essentials.

It was provided that the governing body of the new system be entitled the Federal Reserve Board and consist of five members (two of them bankers) to be named by the President and confirmed by the Senate, together with the Comptroller of the Currency and the Secretary of the Treasury ex officio. This body was duly appointed and took office on 10 Aug. 1914. The Secretary of the Treasury had been authorized by the act to name the date for the opening of the banks and after preliminaries of organization had been completed by the Board the Secretary accordingly opened the banks on 16 Nov. 1914. Prior to this date the capital of the banks had been duly paid in, largely in gold, and the transfer of a first installment of reserves quickly followed. The act had offered to State banks and trust companies the option of membership, but only a few availed themselves of the opportunity until after the entry of the United States into the European War. The movement then became much more rapid and by the end of 1917 between $4,000,000,000 and $5,000,000,000 of banking assets belonging to State institutions had been brought into the system.

In each Federal Reserve bank the control and operation of the institution is entrusted to a board of directors consisting of nine members. Of these nine, three ("Class A") are representatives of the member banks and three ("Class B") are business men (non-bankers), although chosen by the member banks. In voting for these directors the banks are divided according to capitalization into three classes. The number of the Board is determined by the Board, by one Class A and one Class B director. The remaining directors, three in number ("Class C"), are chosen by the Federal Reserve Board. Each director is chosen for three years and their terms are so arranged as to have three such terms expire at the close of each year.

Of the three government directors one, under the law, is designated by the Federal Reserve Board as Federal Reserve Agent and as chairman of the Board of Directors. As chairman, he presides over meetings and as Federal Reserve Agent he discharges all local duties assigned him by the Board in the operation of the bank. The actual management and conduct of the institution is left to the Board of Directors which names such executive officers as it sees fit. Of these the chief, corresponding to the president of a commercial bank, is called "governor." Under his direction there is developed at each bank the usual staff, including administrative, accounting and credit officers. The Federal Reserve Agent has a separate department under his own jurisdiction, including one or more assistants and a clerical force, which takes charge of the documents and is entrusted with the custody of commercial paper and gold held to protect notes.

Regulations issued from time to time by the Federal Reserve Board, and binding upon all reserve banks, constitute the operating basis of the system and ensure harmony of practice. Under the terms of the act each local board proposes rates of discount which are passed upon by the Federal Reserve Board and go into effect only after being approved by it. Full reports are transmitted daily by each bank and the Board issues a weekly condition report.

Every Federal Reserve bank has its own office arranged much like that of an ordinary bank; and several have purchased or are erecting buildings of their own. Six Federal Reserve banks have established branches equipped like a Federal Reserve bank. Some of these are assigned a sub-district or part of the Federal Reserve district, while others have no definite assignment of territory, but are merely offices for the convenience of member banks. The accompanying tabulation shows the location, capital and chief items of resources of the several banks at a recent date. The outlines of the 12 districts into which the system is divided are presented in the foregoing map which shows the condition at the close of the year 1917. During 1915-16 several changes in boundaries were made by the Board upon petition of member banks and the lines at first drawn by the Organization Committee were accordingly altered; but none of these changes was of much importance to the general structure of the system.

The earliest work of the Federal Reserve system, like so much of its later operations, was of an unexpected nature. The system had not yet been organized when the breaking out of the European War brought unexpected demands upon the country. There was a heavy drain of gold to Europe and Congress hastily revised the Aldrich-Vreeland Act in an effort to prevent panic. Many currency associations were organized and about $400,000,000 of notes were issued during the autumn. When the crisis came into formal existence in November they

(a) Difference between net amounts due to and net amounts due from other Federal Reserve Banks.
found themselves called upon to assist in the operation of retiring these notes—an important function but one that brought little actual profit to them.

Moreover, the abnormal movement of gold out of the country which had occurred during the first days of the European War was followed by an equally abnormal movement of gold into the country. Very great sales of our raw materials and manufactured goods abroad were paid for largely in gold and bank reserves were thus much raised. The change in reserve requirements made by the Federal Reserve Act had also set free a large balance of lending power. Due to these two factors, the demand for accommodation at Federal Reserve banks was not great. It was only after the entry of the United States into the European War that they really became active in their rediscount operations. Earnings for the first two years, 1914–15, were only 2.7 per cent above expenses; for 1916 about 5 per cent; but in 1917 they reached about 18 per cent.

The law requires that the Federal Reserve banks, after paying all necessary expenses, together with 6 per cent cumulative dividends to their stockholders, shall carry one-half of excess profits remaining to their surplus fund until the surplus amounts to 40 per cent of the capital, and shall pay the other half of excess profits to the United States government as a franchise tax, the entire excess profits to be paid to the government after the surplus of a Federal Reserve bank reaches 40 per cent of its capital. The Federal Reserve banks of Boston, New York, Chicago, Atlanta, Richmond and Minneapolis have paid their dividends to stockholders to 31 Dec. 1917 and at the same time paid into the treasury of the United States as a franchise tax the sum of $1,134,234.48, the amounts being paid by the banks as follows:

These banks have also established on their books a surplus fund in amounts equal to the surplus amounts.

It is to be noted, however, that practically since their opening the banks have been subject to very abnormal conditions,—first, in consequence of lack of demand and later because of the existence of unusual and exceptional demand for accommodation based on a very special kind of paper—that secured by government obligations. The banks have not, therefore, had full opportunity to exert their influence upon the commercial paper of the country or to do more than take the preliminary steps toward the creation of an open discount market.

It was with a view to the creation of this discount market that the act gave to the Federal Reserve banks the power to regulate the conditions under which commercial paper should be made and discounted at reserve banks. Pursuant to the permission thus given, the Board early defined the chief types of commercial paper, including the bill of exchange, the acceptance, the discount, the collateralized single-name note and the commodity note—with warehouse receipts as collateral. In all cases the paper was required to be the result of genuine commercial non-speculative transactions and to have a specified degree of liquidity. Acting further in accordance with the terms of the law, the Board authorized the Reserve banks to buy discountable paper in the “open market”—that is, without member bank endorsement, should they desire. This open market power was availed of by the Reserve banks during their first two years of slack earnings. They bought widely of acceptances and also of government and municipal obligations and at one time had thus invested more than $200,000,000 as a means of earning needed revenue.

The first two years' development in commercial paper was, however, notable for the introduction of the acceptance or accepted bill of exchange into American banking practice. Unusual stimulus to our foreign trade gave to the foreign bill or bankers' acceptance in such trade a degree of recognition it could not otherwise have attained. Although only a moderate amount of this paper was bought by reserve banks, the fact that it had entered the market as a distinct type of paper for general investment was rendered possible by the new system.

The bankers' acceptance may be drawn either as a foreign or as a domestic bill. No satisfactory data are as yet available concerning the development of the domestic acceptance, and, whatever the volume in existence may be, it is probably small. The foreign bankers' acceptance has had about two years for development, and we may roughly estimate that at the present time the acceptances of all American banks, whether members of the Federal Reserve system or not, are about $250,000,000—$300,000,000. Every member bank has the right to accept such paper up to 50 per cent of its capital stock, and the Federal Reserve Board has granted to banks the power to accept up to 100 per cent. While the Federal Reserve Act as originally passed gave to the Federal Reserve Board authority to define commercial paper eligible for rediscount at Federal Reserve banks, and the Board in its initial stages desired to discriminate in favor of the two-name paper, it never went so far as to commit itself definitely in that way. Single-name paper has always formed the bulk of that discounted by the Federal Reserve banks, and this has been apparently the result of necessity. The Federal Reserve Act, however, clearly intended to stimulate the “bill of exchange” whether that of the commercial enterprise or of the banker, and the Board has, therefore, very properly endeavored by favoring rates and by special regulations to encourage the development both of the commercial bill of exchange (designated by it as the “trade acceptance”) and of the bankers' accepted “bill of exchange.” The quantity of trade acceptances or commercial bills offering in the New York market has been less than described by the practical banking authority very friendly to the acceptance as “negligible.”

A novel element in the Federal Reserve Act not found in any of the various banking bills by which it had been preceded was its treatment of the warehousing industry. In the past, small banks, the country over, had carried balances with city correspondents.
usually of considerable amount. These city correspondents were frequently members of a local clearing house and here and there country clearing houses had been established, but there was no nation-wide system of clearance. The commercial banks sent such checks on distant points as they might receive to their correspondents and the latter collected them, crediting the proceeds to the remitting banks. This was a wasteful and slow method. The Federal Reserve Act sought to substitute the idea of district clearance on the books of each reserve bank and that of national clearance by creating a central clearing system for the 12 reserve banks at Washington.

The national system was first established, each bank depositing $1,000,000 in gold with the Board, which at once placed it with the Treasury for safe-keeping. A set of books was opened in the offices of the Board and on Wednesday night of each week every Federal Reserve bank telegraphed to Washington the amount of its balance in dealings with other reserve banks. A corresponding entry is made in the books and each bank notified on Thursday of the balance remaining to its credit and all checks of treasurers are made in this way without gold shipment and practically without expense.

The introduction of the district clearance plan was not so easy, but by the middle of 1913 every reserve bank under orders from the Board had established a system of practically uniform character. Under this plan as modified by the Act of 21 June 1917, banks not members of the Reserve System as well as the regular members may deposit with reserve banks checks on other banks for collection. Such checks are not credited at once, but only after the lapse of a period usually two to four days, estimated to be long enough to permit collection. After that period the proceeds are credited and may be drawn upon. Banks which receive such checks for payment must remit without deduction (at par) or else send actual money, but in the latter case the Reserve bank pays the cost of shipping the coin or currency in settlement. The member bank will charge the checks a small fee (1½-2 cents) per item and may in turn make a moderate charge to its depositor if he desires immediate payment without waiting for the collection of the check to be completed. The district collection system now includes some 16,000 banks, State and National, and is slowly increasing in numbers though it can probably never become complete until the banking system of the country has been entirely unified. Some banks continue to collect through correspondents as heretofore, although the fact that balances with correspondents no longer (Act of 21 June 1917) count as reserve, has discouraged the practice. The new district system has tended strongly to unify exchange charges and to reduce those that were formerly unduly high, though such charges will persist where competition is absent owing to the fact that given localities contain no banks that are members of the local reserve system. Taken with the good clearing system in Washington, the district system has, however, immensely improved and simplified exchange conditions the country over.

As seen at an earlier point, the chief trouble currently recognized in the American bank note system prior to the passage of the Federal Reserve Act was "inelasticity." By this was meant that there was no way of enlarging the circulation except through the purchase and deposit of bonds, or the introduction of actual money. Prior to 1908, the national bank notes had so greatly increased in amount as to require almost all of the floating or "free" supply of gold bonds to be lent, to be held by investors and trustees, so that the limit imposed upon their issue was almost absolute. It was currently proposed to relieve the situation by extending the kinds of bonds receivable as deposits to protect note issues and the Aldrich-Vreeland Act had taken steps in that direction. As against this plan or proposal it was pointed out that both the practice of other countries and the general theory of banking indicated that the protection properly to be accorded the notes was identical with that to be given to deposits. The abstract theory of banking, moreover, indicates the liquid short-term assets of banks as the safest and best protection for bank liabilities.

So-called asset currency theory — was accepted as the basis of the original draft of the Federal Reserve Act. Provision was accordingly made for the issue of notes based on the general assets of the reserve banks; while it was sought to protect the old note-issuing banks (the owners of the bonds held to secure the notes) by authorizing the gradual retirement and redemption of the bonds they had purchased. These bonds for the most part bore 2 per cent interest, and as government obligations were then selling on a 3 per cent basis it was ordered that the new refunding bonds should bear 3 per cent.

So-called asset currency has always been the subject of criticism from a certain school of thinkers who have contended that there was serious danger in the use of such paper because of its possible unsoundness. In order to guard against any such danger the Act, therefore, defined "eligible paper" with great care, placing the requirements for short maturity and relation to genuine commercial transactions. Inasmuch as it had been urged by some that the supply of two-name paper available would be too small to serve as a basis for notes it was left to the Federal Reserve Board to determine eligibility of form within the general limits laid down by the Act itself.

The view or theory of currency issue which had been embodied in the original draft of the act was maintained throughout its various changes of form and appears in the final statute. The chief note changes introduced in the course of discussion were as follows: (1) The Federal Reserve notes were made eventual obligations of the government and it was provided that they could be obtained only from the government through the Federal Reserve agent of the bank desiring to issue them; (2) provision was made for a new type of note to be called "Federal Reserve Bank notes" secured by bonds on the same basis as the old national bank notes; (3) the redemption of the bonds held by the national banks was fixed at $25,000,000 a year and the
Federal Reserve Board was authorized to distribute this amount of old bonds among the reserve banks. At that rate it would have required about 30 years to retire the national bank notes and issue either Federal Reserve notes or Federal Reserve bank notes in their place. But with the increase of business, the redemptions proceeded at about this rate, but after the entry of the United States into the European War, 2 per cent bonds fell to a low level and the Reserve Board ceased to make redemptions. The rate of redemption was then raised to 40 per cent, and as before. In the original act of 1913, the outstanding notes had to be covered by gold and paper to 140 per cent of their face value by the act of 21 June 1917, this figure was cut to 100 per cent. Due to this and other causes the issue of Federal Reserve notes rapidly increased during 1917 and at the close of the year was near a billion and a quarter of dollars.

As things stand today, therefore, the Federal Reserve Act provides an elastic currency, based on paper business, and susceptible of increase as business operations increase and require a larger note issue. Reserve banks discount the paper presented to them by member banks in accordance with the act and may supply it business men. Such paper may be turned over to the local Federal Reserve agent who will issue an equal amount of notes in exchange. The Federal Reserve bank must, however, maintain a gold reserve amounting to 40 per cent of the note issues, and of this 40 per cent 5 per cent is deposited with the Treasury as a redemption fund, the other 35 per cent is retained in the Reserve bank's own vaults. The expansive power of the currency thus depends on, and is limited by, the gold holdings in the Reserve banks.

Granting the presence of the necessary gold there is no limit to the volume of notes that may be issued except the limit set by the needs of business and the dictates of sound finance. The question whether to call for notes or to take the proceeds of rediscouts in the form of bank credit depends on the decision of the member banks. Federal Reserve banks could, however, issue unsecured notes in exchange for paper bought in the open market with bank endorsements.

The question of foreign banking facilities is dealt with in several ways in the Federal Reserve Act. (1) Federal Reserve banks may establish agencies abroad or name agents and correspondents. They have thus designated the Banks of England, France and Italy and others, but thus far operations have been small owing to the War and its effects. (2) Member national banks holding capital of $1,000,000 or more may apply for, and under specified conditions receive, permission to establish foreign branches of their own. In this way, a considerable number of branches have been opened in South America. (3) By the act of 7 Sept. 1916, member banks are allowed to subscribe to the capital of banks formed to engage on their behalf in the foreign trade. Several such banks have been incorporated and have begun business.

The most important step in the direction of sound foreign trade finance was not, however, one that had to do with the mere establishment of banking machinery but with the introduction of approved banking methods. Foreign practice had long since recognized the banker's acceptance as the staple method of financing movements of goods. This teaching was embodied in the Reserve Act which provided that paper resulting from commercial transactions in foreign trade and of any maturities might be accepted by national banks to 100 per cent of capital and surplus. Federal Reserve banks were empowered to rediscount or buy such acceptances; while by later legislation domestic acceptances were given similar privileges up to 50 per cent of capital and surplus. Finally Congress adopted a provision permitting national banks to accept drafts, drawn in countries needing a means of remittance to the United States, intended to create a supply of dollar exchange.

An integral element in most of the plans of recent years for banking reform has been the reorganization of relations between the Treasury of the United States and the banks of the nation. As is well known, the sub-Treasury system (dating from 1846 in its present form) and, requiring the actual holding of public funds in cash, is obsolete, being employed by no other country. Deposits of public funds in national banks protected by special security have been made since the Civil War but were only a partial remedy for the evils of the sub-Treasury system. The Federal Reserve Act sought to change the older system by constituting the reserve banks "fiscal agents" and making them also depositories, thus permitting the government to do business at and through the reserve banks just as their banking members may.

When the act was passed the balances of the government were small and there was no haste in carrying into effect this phase of the law. Early in 1916, however, the banks were made depositories of all Treasury balances then on deposit with national banks in the cities where the reserve banks were located, and banks were instructed to purchase Treasury bills to the extent of 10 per cent of the amount of such deposits. Then, during 1916 and the beginning of 1917, the Reserve banks thus became habituated to methods of transacting Treasury business, and so made themselves ready for the great and unexpected expansion of their duties in this field which was to follow, when, at the entry of the United States into the European War in 1917, this small business suddenly assumed new and important proportions. The Secretary of the Treasury had determined to employ each Federal Reserve bank as the head of a district organization designed for the distribution of the bonds whose sale in unprecedented amounts was necessary to the conduct of the war, and in each Federal Reserve district such an organization was quickly developed about the local reserve bank as a centre.

Local bankers and financiers freely gave of their time and assistance to the furtherance of the work, and in each case the Federal Reserve bank proved an efficient basis of organization. The several banks, under instructions issued by the Secretary of the Treasury, received subscriptions to the loan and carried on the immense work of detail and detail, besides taking charge of the deposits in banks and general banking relationships growing out of the operation.
The Federal Reserve Board itself, besides co-operating closely with the authorities of the Treasury Department in efficiently conducting the loan operations of the Federal Reserve banks, further sought to develop a general policy that would support and aid the banking community at large in taking and distributing the new issue of bonds. For this purpose it first established a special rate of 3 per cent per annum for the discount at Federal Reserve banks of the 15-day obligations of member banks secured by the temporary certificates of indebtedness which were issued in order to anticipate the proceeds of the sale of the new bonds.

Carrying further this same policy, it later established a 3½ per cent per discount at Federal Reserve banks intended for the 90-day paper of ordinary bank borrowers, thereby enabling the member banks of the system to extend accommodation to bond buyers in the assurance that they would be able to obtain accommodation from the Federal Reserve banks by discounting these notes. In order to aid the customers of banks not members of the Federal Reserve system, it further authorized the member banks to act as agents for non-member institutions by rediscounting the notes of bond buyers who desired to obtain assistance from their own banks without being obliged to transfer their business to member banks. Savings banks and trust companies were assured that the Board would in every way co-operate with them in avoiding shock or disturbance to existing conditions, and that the Federal Reserve system stood ready to extend to them reasonable accommodation in the event of necessity resulting from withdrawals made by depositors in order to purchase or invest in government bonds.

On the night of 2 May the Secretary of the Treasury issued to the press a statement giving such details of the first "Liberty loan" as had reached him at that time. At the same time he advised the Federal Reserve banks that he had decided to use them as the central agencies for handling the issue. On 10 May the full prospectus was telegraphed the banks made public on Monday, 14 May. The subscriptions were to close on 15 June, so that the Federal Reserve banks had but one month in which to perfect an organization for the sale of the proportion of $2,000,000,000 of bonds allotted to the respective districts, and for the handling of details of the subscriptions. The working out in 20 days of a prospectus covering so large an issue, without a precedent in this country to guide, and the placing of $2,000,000,000 of bonds oversubscribed approximately a billion in a month's time, was a remarkable achievement, but the second loan operation, carried through in October, resulted in the sale of nearly four billions of bonds, the amount offered being three billions, and the total subscriptions nearly five billions.

Not only was there no disturbance to interest rates during either loan operation beyond the necessarily gradual increase which follows upon the withdrawal of such great quantities of funds from the market, but the process was accomplished with great technical ease. In former times under the old sub-Treasury system, the withdrawal of subscribed funds in various parts of the country, or even the operations incident to the transmission of these funds from one part of the country to another, created unavoidable and serious difficulties, due to shortage or plethora of money at various points, where exchange rates and conditions were seriously disturbed. All this has been avoided through the operation of the central gold settlement fund, conducted under the supervision of the Federal Reserve Board at Washington. By utilizing this fund, thousands of millions of dollars involved in current government operations have been received in the form of local bank credits, and the proceeds have been transferred to the point where government payments had to be made. As these payments have been effected, local banks at those places have increased their deposits and the proceeds have again been gradually shifted to different parts of the country where production and manufacture were in progress and where payments for materials and labor had eventually to be liquidated.

The Federal Reserve system has thus succeeded in its first and most immediate objects—the establishment of a co-operative or centralized system of united bank reserves with rediscount arrangements designed for the relief of hard-pressed banks and for the furnishing of an elastic currency. It has further supplied the demand for an efficient and nation-wide system of check collection. The establishment of a genuine discount market is necessarily a much slower process and time will be required for its complete success. The advent of the European War and the entry of the United States into it as a participant have naturally tended to retard the normal development of the system and in some ways to divert it into unexpected channels. The growth and experience it is obtaining in the financing of the war will, however, serve it in good stead when the time comes for a more normal development of its powers, that time, at the same time, the country's banking mainstay and support in the necessary operations incident to the financing of the struggle.

H. Parker Willis,
Secretary Federal Reserve Board, Washington.

13. SAVINGS BANKS. Savings banks are of two kinds, stock and mutual.

Stock banks.—The stock savings bank is to all intents and purposes quite like a bank of discount, having capital stock, and is, therefore, owned and controlled by the stockholders, to whom the profits belong after paying the agreed rate of interest to the depositors. Such banks are to be found largely in the West and South, there being no such institutions in the Eastern States. They are essentially banks of discount with the word *savings* in their title. They transact chiefly a commercial business and carry comparatively few savings accounts. According to the report of the Comptroller of the Currency, there were 1,529 of these institutions reporting as of 23 June 1915, with capital stock of $92,982,798, loans amounting to $850,304,207, deposits of $1,047,039,650.93, of which $754,443,330 were savings deposits. The deposits valued $2,977,968, of which 2,380,496 were savings depositors.

Mutual banks.—The mutual savings bank, with which this article has mainly to do, is of
the idea dates back to one Hugues Delestre in 1610. Such institutions were also formed in Brunswick in 1765; Hamburg in 1778; Berne, Switzerland, in 1787; Basel in 1792; Geneva in 1794. But so far as is known, the savings bank as we know it to-day was the outgrowth of none of these. The movement in England had its inception in the schemes of the Rev. Joseph Smith and Priscilla Wakefield. The former in 1798 conducted a plan whereby it was agreed to receive sums of savings repaying the same at Christmas-time with a bounty subscribed by his rich parishioners. The deposits could be withdrawn at any time.

Mrs. Wakefield's plan (1759) was a sick and aid society rather than a bank. The members paid a certain sum per month, according to age, and received a pension after 60 years of age. Sick and funeral benefits were also paid. There was the *Sunday Bank* (1808) at Hereford, which was also in the nature of a charity and open Sunday mornings only. Jeremy Bentham established his *Frugality Bank* in 1797.

It is obvious that none of these plans had in them the true savings bank idea. They were all essentially charities. It did not, as a rule, make any discounts; buy no commercial paper; issues no bank notes, and honors checks only when accompanied by the passbook of the depositor. It is permitted to ask notification of withdrawal as a protective measure in times of stress, while the bank of discount must pay on demand or suspend. The contract of the savings bank with the depositor is in essence this: That it will accept the funds offered for deposit, invest them according to law in certain prescribed securities, repay the same upon notice (which is, as a rule, waived, although in some instances is enforced in very large banks as a daily procedure), apportion the earnings among the depositors after paying expenses and establishing a surplus or guaranty fund that protects their principal against losses. Out of the foregoing comparisons we may evolve the following as a fair definition of a mutual savings bank: "A savings bank is a mutual institution conducted for the benefit of the depositors, without profit to the managers of the profits, the savings being received on deposit, for safe-keeping and investment, such sums as shall be offered by the depositors, repaying the principal on demand or upon legal notice, and distributing the earnings among the depositors as interest-dividends, after paying expenses and setting the remainder aside as a surplus fund for the protection of all."

The savings bank has well been likened to a reservoir into which pour the little streams for the purpose of receiving and converting them into a larger stream for mutual investment purposes. The savings bank makes capitalists by the welding power it possesses, making the small sums effective by working them together.

**Origin of Savings Banks.**—The origin of savings banks is in doubt, there being various claimants for the honor of first conceiving the savings bank idea. Daniel Defoe, of "Robinson Crusoe" fame, is mentioned as the first to conceive the savings bank, in a plan whereby the government was to receive the deposits of the people. A French writer has asserted that

---

*BANKS AND BANKING — SAVINGS BANKS (13)*
**BANKS AND BANKING — SAVINGS BANKS**

**Organization.**—The organization of a mutual savings bank consists of a body of trustees, named in the original articles of incorporation, or in former acts, and issued by special act of the State legislatures; but under the free banking idea, the statutes now prescribe the process necessary to organize a savings bank, and any body of men who may care to do so may form a savings bank by complying with the statutory requirements and obtaining the sanction of the State official in charge of banks, usually termed "Banking Superintendent," "Banking Commissioner," "State Auditor," "State Bank Examiner," etc., the distinction being in the title and not in the official duties.

**Trustees.**—The trustees are a self-perpetuating body, vacancies being filled by their own votes, and the qualifications are moral rather than financial. Unlike a bank of discount, whose stock ownership carries voting power, money power carries no weight with savings bank elections, the trustee being elected for life, the vacancy caused by his death being filled by vote of the survivors.

As a rule these trustees serve without compensation, the mere attendance at board meetings being without remuneration, except in a few States where the fee is limited to about three dollars. They are permitted to receive fees as appraisers of real estate in making mortgage loans, and as examining members of the board and for other special services, but these fees are in lieu of service and not in payment of their trusteeship.

The duty of the trustee consists in attendance at board meetings, service on committees, such as real estate valuation committees, examining committees, and finance committees, the latter having charge of the investments of the bank. In the early days of the savings bank the trustees also acted as tellers, clergers, etc.

The relation of the trustee to the depositor is that of a *cestui que trust*—one acting for the benefit of another. The relation of the corporation to the depositor, however, is one of contract.

**Capital.**—On the opening of an account, the depositor receives a passbook which not only is evidence of his deposit, but the terms under which it is received, and constitutes the contract between him and the bank. This contract, briefly stated, is, that the bank will invest the funds lawfully, manage wisely, repay the same on demand or on a stated notice and use due care in making payments. The contract of the depositor is that he will take good care of the book and promptly inform the bank of its loss, for its protection against wrongful payment, and abide by the bylaws, copy, or part, of which is always embodied in the passbook, and the mere acceptance of the book evidences his compliance with this contract.

Savings bank accounts are of three kinds: (1) single accounts, the charter being in former days, and at death to the survivor; (2) the joint account, payable to either of the parties during life, and at death to the survivor; (3) the trust account, payable to the trustee during life and at death to the party named as beneficiary.

**Bookkeeping.**—The bookkeeping of a savings bank is simple. A single transaction will indicate its character. Upon making a deposit the depositor signs his name and gives information concerning the deposit, and in many cases a carbon copy is made, for the purpose of identifying him in future payments. The book is then issued to him and a deposit ticket made out, the name indexed, and the signature card filed numerically for reference in making payments. Books are always numbered and for every book there is a corresponding ledger account or card. The accounts are kept in groups of one or two thousand or by ledgers for proving purposes. The deposit tickets of the day are sorted according to groups, and entered on a distribution sheet by number and name, with the amount carried to a perforated column at the side. The postings are made directly from the tickets to the card or ledger space. When all postings have been made the proving clerk checks the card, from which the stub has been detached, leaving only the number and name as a guide. Turning to the number he verifies the name and inserts the amount posted for that day. The total amount must agree with the detached stub, thus showing that the right amount has been posted to the right account. Drafts are put through the same process, but in paying, the signature is compared with the one on file and as a rule the test questions are asked, the purpose of this process being to show in a court of law, if necessary, that due care has been used to identify the depositor. The savings bank is absorbed, in a measure, from the general rule of forgery. If the bank can show that the depositor has written a signature comparing favorably with the original and answered the test questions properly, it is protected against wrongful payment. It is obviously impossible for a savings bank to know personally all its depositors, who, being frequent patrons, are liable to change handwriting, and the test questions act as a measure of protection both to the bank and the depositor.

The big events of the savings bank year are: First, the trial balance, which is a total of all the accounts, which must agree with the general books and in well-ordered banks kept absolutely in agreement by these periodic tests, made as a rule quarterly or semi-annually. In a bank where the transactions run into the millions this is no light task. Second, the interest computations, which involves the labor of ascertaining the periods for which the various deposits are entitled to interest, computing and posting the same to the various accounts within a period of a few weeks.

**Interest.**—Savings banks as a rule pay interest from quarterly periods, or from the first of the month following the deposit, allowing a certain number of days grace; thus, money deposited on or before 10 July and remaining in the bank until 1 January, will draw six months' interest; between 10 July and 3 October—theory being payable to the individual named in the book and at death to his legal representative; (2) the joint account, payable to either of the parties during life, and at death to the survivor; (3) the trust account, payable to the trustee during life and at death to the party named as beneficiary.

**Investments.**—Savings banks are large investors in mortgage loans and municipal and railroad bonds. The law as a rule prescribes the character of bonds which may be purchased,
BANKS AND BANKING—POSTAL SAVINGS BANKS (14)

but in all States, government, State, city, town, village and school district bonds are legal investments. Railroad securities are legal if they conform to the statutory requirements, which for instance in New York are, that the bonds shall be a first mortgage on the property and that the corporation shall have paid at least 4 per cent dividend on all classes of stock for 10 years preceding the investment. The State laws differ as to the detailed requirements, a review of which would be out of place. The limitations of this article. As a rule the bond and mortgage loan is limited to 60 per cent of the appraised value of the property and must be a first mortgage. The proportion of mortgage loans to the total assets is generally stipulated in the law, as for instance in New York, not over 65 per cent of the deposits may be loaned on such security.

Postal Savings Banks.—The postal savings bank is in operation in all large countries excepting Germany. The system in this country dates from 26 June 1910. The fundamental idea of the postal savings bank is the receipt by the government through the post-offices of deposits, the payment of which is guaranteed by the government. For detailed description see Post Office Savings, article I.

School Savings Banks.—The school savings bank in this country is the result of the work of the late John H. Thiry, a Belgian, who in connection with his work as trustee of the public schools of Long Island City became impressed with the improvidence of the American children and determined in some way to combat the tendency to spend. As a result the first school savings bank was opened in connection with the public schools of the above named place in the late eighties. Mr. Thiry wrote and traveled extensively in connection with his pet scheme, with the result that other banks were formed in various parts of the country after his original plan. For many years, he was the only statistician in the movement, and annually issued a report giving the growth of the system. It was not until the matter was taken up by the savings bank section of the American Bankers Association in the year 1911 that the movement reached the aggressive stage, and under the encouragement of the bankers has grown to large proportions.

The Woman's Christian Temperance Union, Young Men's Christian Association and kindred organizations have loaned their support also, the first-mentioned organization being particularly active in spreading the idea. Mrs. S. L. Oberholtzer (q.v.), of Philadelphia, has given much time in promoting the school savings bank and has published periodic statistical matter in connection therewith. The school savings bank is as a rule conducted along one of two lines: (1) Deposits are made through the medium of the teacher who acts as receiving agent for the school. Deposits are permitted at 4 cents, but in some cases 10 cents is the maximum allowed. (2) The pupil is given a pass card as a receipt for the deposit. The deposits from each class are turned in to the principal and by him deposited in a savings bank to the credit of the school savings bank, or himself as trustee. The laws of several States, notably New York and Massachusetts, have legalized this method of procedure, it being deemed unwise to allow the movement to spread without adequate safeguards as to the disposal of the money deposited on deposit. When the deposits on the pupil's card reach one dollar or more, the amount is transferred to a regular savings bank account in the depository bank, in the pupil's name. Withdrawals from the general fund and from the pupil's individual accounts are permitted, but not encouraged, the signature of the principal and parent being required for statistical and restrictive reasons.

(2) The second method contemplates using the pupils of the higher grades as the active managers of the bank. Some schools have a regularly organized bank, with president, cashier, clerks, etc., who manage the school bank, receive all deposits, keep all records and render proper reports to a supervising head, usually one of the teachers. One of the most popular plans consists of a duplicate card with amounts printed in multiples of five cents. As deposits are made the cards are placed together and the amount punched out, thus making the two records simultaneous. This plan was devised by a school principal in Brooklyn and has met with great favor wherever instituted. Large cities like New York and Chicago have taken up the school savings bank plan, the banks cooperating with the school authorities in promoting the spread of the movement.

According to recent statistics gathered by the savings bank section of the American Bankers Association, for the Comptroller of the Currency, there were 280 cities operating the school savings bank in one form or another represented by banks in 1,925 schools, having 928,784 pupils enrolled, of which 398,546 are deposits, having to their credit $1,792,640.10.

William H. Kniffin, Jr.,
Vice-President Bank of Rockville Centre,
Formerly Secretary Savings Bank Section
American Bankers' Association.

14. POSTAL SAVINGS BANKS. Definition.—A governmental agency, operating through the post-offices, for the encouragement of thrift among the masses of the people by providing widely distributed and convenient depositories wherein small sums may be placed at a comparatively low rate of interest, with the faith and credit of the government pledged to the repayment of principal and interest on demand.

History.—'The proposition to use post-offices as depositories for savings was first made in England as long ago as 1807. Mr. Whitbread, a member of Parliament, introduced during that year in the House of Commons a bill for the benefit of the working class and the guiding principle of which was that of self-help. Mr. Whitbread considered it wiser to assist people to advance their own interests than to extend help by the giving of alms. His meritorious scheme, however, was received with almost universal disfavor. The press of the
time ridiculed his ideas and treated them as altogether impracticable and visionary. There was a time when the existence of such banks, only the devil being in existence throughout the civilized world.

In December, 1838, the practice of transmitting money by means of postal money orders throughout the United Kingdom was authorized by an act which made the post office the only depository of postal savings banks had become quite numerous, and they found in the successful workings of the money-order system one of their most telling arguments.

It is interesting to note that the plan of postal savings banks which finally was adopted was proposed by one engaged in commercial banking—Charles W. Sikes, a bookkeeper of the 'joint-stock' bank of Huddersfield, Yorkshire. He presented his composition on the subject to the then Chancellor of the Exchequer, W. E. Gladstone, then Chancellor of the Exchequer. He cited many pertinent facts tending to show the need of postal banks, among them being that, although private savings banks had greatly increased in number and deposits, they did not cover the reaction in the reach to the common or most numerous classes of the people. This, he stated, could be done only by the post-offices, which were accessible to every workman. Mr. Sikes was encouraged, and seconded in his efforts by Mr. Rowland Hill, who had been appointed general secretary of the post-office for life in recognition of his valuable services as a postal reformer. Mr. Gladstone also eloquently supported the bill, which became a law in May, 1861, and on 1 September of the same year the British Post-Office Savings Bank came into being.

It is well known that Mr. Gladstone was before the English public prominently as a constructive statesman for many years. His opinion of the importance and value of postal savings banks is best given in his own words, uttered in the House of Commons in the year 1888 amid universal applause. He said:

'...the post-office savings bank is the most important institution which has been created in the last 50 years for the welfare of the people and the State...I consider the act of 1861 which called the institution into existence as the most useful and fruitful of my long career.'

'Charles Sikes, actively concerned in the adoption by Great Britain of the postal savings bank, was not unrewarded. He was knighted in 1881 upon the recommendation of Mr. Gladstone, then Premier. He was appointed to an important office under the government, and public subscriptions even were made and a valuable gift tendered him in appreciation of his good work.' (United States Senate Report No. 125, 61st Congress, 2d Session).

The Movement for Postal Savings Banks in the United States.— Following the lead of England almost every considerable nation, with the exception of Germany, which has a splendid system of municipal savings banks, established postal savings depositories. The movement for the establishment of postal savings banks in the United States extended over a period of nearly 40 years. The subject was first brought forward officially in this country by Postmaster-General Cranch in 1871, but the immediate approval of the press and the people. Eight succeeding Postmasters-General recommended the establishment of such banks and 80 bills were introduced in Congress between 1871 and 1910 for the establishment of postal savings banks, only the devil being in existence throughout the civilized world.

In December, 1838, the practice of transmitting money by means of postal money orders throughout the United Kingdom was authorized by an act which made the post office the only depository of postal savings banks had become quite numerous, and they found in the successful workings of the money-order system one of their most telling arguments.

It is interesting to note that the plan of postal savings banks which finally was adopted was proposed by one engaged in commercial banking—Charles W. Sikes, a bookkeeper of the 'joint-stock' bank of Huddersfield, Yorkshire. He presented his composition on the subject to the then Chancellor of the Exchequer, W. E. Gladstone, then Chancellor of the Exchequer. He cited many pertinent facts tending to show the need of postal banks, among them being that, although private savings banks had greatly increased in number and deposits, they did not cover the reaction in the reach to the common or most numerous classes of the people. This, he stated, could be done only by the post-offices, which were accessible to every workman. Mr. Sikes was encouraged, and seconded in his efforts by Mr. Rowland Hill, who had been appointed general secretary of the post-office for life in recognition of his valuable services as a postal reformer. Mr. Gladstone also eloquently supported the bill, which became a law in May, 1861, and on 1 September of the same year the British Post-Office Savings Bank came into being.

It is well known that Mr. Gladstone was before the English public prominently as a constructive statesman for many years. His opinion of the importance and value of postal savings banks is best given in his own words, uttered in the House of Commons in the year 1888 amid universal applause. He said:

'The post-office savings bank is the most important institution which has been created in the last 50 years for the welfare of the people and the State. I consider the act of 1861 which called the institution into existence as the most useful and fruitful of my long career.'

'Charles Sikes, actively concerned in the adoption by Great Britain of the postal savings bank, was not unrewarded. He was knighted in 1881 upon the recommendation of Mr. Gladstone, then Premier. He was appointed to an important office under the government, and public subscriptions even were made and a valuable gift tendered him in appreciation of his good work.' (United States Senate Report No. 125, 61st Congress, 2d Session).

The Movement for Postal Savings Banks in the United States.— Following the lead of England almost every considerable nation, with the exception of Germany, which has a splendid system of municipal savings banks, established postal savings depositories. The movement for the establishment of postal savings banks in the United States extended over a period of nearly 40 years. The subject was first brought forward officially in this country by Postmaster-General Cranch in 1871, but the immediate approval of the press and the people. Eight succeeding Postmasters-General recommended the establishment of such banks and 80 bills were introduced in Congress between 1871 and 1910 for the establishment of postal savings banks, only the devil being in existence throughout the civilized world.

The bill which eventually became the law was introduced on 26 Jan, 1910, by Senator Thomas H. Carter, of Montana, and was referred to the Committee on Post-Offices and Post Roads, of which Senator Carter was a member. It was reported back by the committee on the following day. The bill with various amendments passed the Senate on 5 March. It was referred to the House of Representatives on 7 March, where it was extensively amended, and was finally passed on 9 June. The Senate concurred in the House amendments on 22 June, and the bill was signed by the President on 25 June.

The Principal Features of the Postal Savings Law and Regulations.—The organic Postal Savings Act of 25 June 1910 created a board of trustees, and for the control, supervision and administration of the postal savings depository offices designated and established under the provisions of the act, and of the funds received on deposit, consisting of the Postmaster-General, the Secretary of the Treasury, and the Attorney-General. The board was empowered to make all necessary and proper regulations for the receipt, transmission, custody, deposit, investment and repayment of the funds deposited at postal savings depository offices. This provision of the original act was somewhat modified by the Act of 4 March 1911. As the matter now stands the Postmaster-General is charged with the designation of post-offices as postal savings depositories, the supervision of postal savings business transacted at depository post-offices and the conduct of the central administrative office at Washington. The board of trustees is charged with the management and investment of postal savings funds after they leave the custody of postmasters. The Treasurer of the United States is treasurer of the board of trustees.

Any person 10 years old or over may open a postal savings account in his or her own name by depositing one or more dollars in any post-office authorized to accept deposits. No person may at the same time have more than one account either at the same office or at different offices. The account of a married woman is free from any control or interference by her husband. Post-office employees are forbidden to disclose to any person except the depositor the amount of any deposits.

A person may deposit any number of dollars, and at any time, until the balance to his credit amounts to $1,000, exclusive of accumulated interest.

Accounts may be opened by the intending depositor in person, or through a representative. A person residing at a post-office not authorized to accept postal savings deposits may open an account at a depository office by mail, through his local postmaster.

After an account has been opened deposits may be made either in person, through a representative, or by mail. Deposits are acknowledged by certificates, issued in fixed denominations which may be endorsed and re-endorsed by the depositor and serve as receipts. These certificates are not negotiable or transferable.
A depositor may at any time withdraw all or any part of his deposits, upon demand, from the post-office where the deposits were made. Withdrawals may be made in person, through a representative, or by mail. Postal savings certificates bear simple interest at the rate of 2 1/2 per cent a year. Interest begins on the first day of the month in which the certificate is issued and becomes due and payable at the expiration of each full year from the day interest begins as long as the principal remains on deposit. No interest is paid for a fraction of a year.

Amounts less than $1 may be saved by purchasing postal savings cards and stamps at 10 cents each. A savings card with nine stamps affixed will be accepted as a deposit of $1 if opened in an existing account or in adding to an existing account, or it may be redeemed in cash.

A depositor may exchange the whole or a part of his deposits for registered or coupon United States postal savings bonds, bearing 2 1/2 per cent interest, issued in denominations of $100. When deposits are issued in exchange for postal savings deposits the balance to the credit of the depositor is reduced accordingly, and he may make further deposits until his account reaches $1,000.

Postal savings bank funds in most countries are invested in the public debt. In establishing postal savings depositories in the United States a radical departure was made in this respect. The organic law, as amended by the Act of 18 May 1916, provides that the funds received at postal savings depository offices in each city, town, village or other locality shall be deposited, in the order of precedence hereinafter specified, in solvent banks located therein, whether organized under National or State laws, and subject to National or State supervision and examination, willing to receive such deposits under the terms of the act and the regulations made by authority thereof, and the sums deposited shall bear interest at the rate of 2 1/2 per cent. The law requires that 5 per cent of the postal savings funds shall be withdrawn by the board of trustees and kept with the treasurer in lawful money as a reserve. The word "bank" as used in the law includes savings banks and trust companies doing a banking business.

If one or more member banks of the Federal Reserve System exist in any city, town, village or locality where postal savings deposits are made, such deposits are required to be placed in the member banks, provided they qualify to receive them, substantially in proportion to the capital and surplus of each bank, but if the member banks fail to qualify, then other eligible banks located therein may qualify. If no bank eligible to qualify exists in any city, town, village or locality, or if none where such deposits are made will receive them on the terms prescribed, then the funds are deposited under the act in one bank most convenient to the locality. If no bank in any State or Territory is willing to receive the deposits on the terms prescribed, then they are required to be deposited with the treasurer of the board of trustees, and counted as a part of the reserve.

The board of trustees is required to take from the banks such security in public bonds, or other securities, authorized by act of Congress or supported by the taxing power, as the board may prescribe, approve and deem sufficient and necessary to insure the safety and prompt payment of such deposits on demand. If at any time the postal savings deposits in any State or Territory exceed the amount which the qualified banks therein are willing to receive under the terms of the act, and such excess amount is not required to make up the reserve fund of 5 per cent, the board of trustees is authorized to invest all or any part of the excess in bonds or other securities of the United States. When, in the judgment of the President, the general welfare and interest of the United States so require, the board of trustees is authorized to invest all or any part of the postal savings funds, except the reserve fund of 5 per cent, in bonds or other securities of the United States. The board of trustees is authorized to purchase from the holders thereof bonds which have been issued to postal savings depositors in exchange for their deposits. The board of trustees is authorized at any time to dispose of bonds held as postal savings investments and use the proceeds to meet withdrawals by depositors.

Interest and profit accruing from the deposit or investment of postal savings funds is required to be applied to the payment of interest due to postal savings depositors, and the excess thereof, if any, is required to be covered into the Treasury of the United States as a part of the postal revenue.

Statistics for United States System.—The postal savings banks were opened in the United States on 3 Jan. 1911, at 48 second-class post-offices, one in each State of the Union. Following is a statement showing the growth of the system and giving a summary of its transactions at the end of each six months' period:

Statistics for Foreign Countries.—Following is a statement giving the principal numerical facts in connection with postal savings bank systems of countries other than the United States, as shown by Statistical Abstract of the United States for 1916, based on the official reports of the respective countries.
A. S. BURLESON,
Postmaster-General, United States.

15. BANK ORGANIZATION AND MANAGEMENT. There are three classes of banks in the United States—National, State and private. The National banks were organized to the strict commercial banks, but some of them acquired large lines of savings deposits, even though the law did not authorize them to do so. The act of December 1913, however, confirmed their action. By the same act the banks may obtain permission to conduct a trust department. The State banks include four kinds of banks — commercial, savings, trust companies, and the three functions combined in one institution. Private banks, in some of the States where they are allowed to operate, conduct their business apart from legal restriction and protection.

By the average person the National banks are considered the safest and most important. The State banks, as a class, are by many not considered as safe nor so important. The private banks are frequently considered as questionable. Such conclusions, however, are not in accordance with the facts. Whether a bank be a National, a State or private bank is not the vital point; but the character and quality of its management is vital.

National Banks.—The national banking system was organized under the Act of Congress of 25 Feb. 1863, since which time there have been many amendments to the original act. (1) The name of the association. (2) The place where it is to conduct banking business, giving names of State, county and city (or town or village). (3) The amount of the capital and the number of shares. (4) The names and residences of the stockholders, and the number of shares for which each has subscribed. (5) That application is being made to enable the bank to operate under the National Banking Law with its privileges and advantages.

The National Banking Law was originally enacted to make a market for the bonds of the United States government, and though apparently selfish its provisions accomplished a great benefit for the business public by placing the bank notes on a safe basis, and by driving from the market the "wild cat" notes. The Act of 30 June 1864 first imposed taxes on circulating notes of State and private banks; and the laws were changed at various times until 3 March 1865, when the tax was made 10 per cent — and it is still the same.

The law could not properly prohibit the issue of circulating notes by State and private banks, because note-issue is an absolute function of a bank, but it could make the issue prohibitive by high taxation — and it did that.

Bank notes are now issued only by National banks, and as security for these the banks must deposit United States government bonds with the Secretary of the Treasury at Washington, D. C. and a cash deposit of 5 per cent of the outstanding notes to provide for their redemption. The Federal Reserve notes are issued by the Federal Reserve banks.

National banks are frequently organized by men who make a business of forming such organizations. For this service they charge the stock purchasers, or the organization, a commission or percentage. This is equivalent to paying a premium on the stock. The organization can, however, be perfected without the aid of a professional organizer, but can seldom be accomplished without involving some legal or organization expenses.

The capital required depends on the size of
the place where the bank is to operate, and ranges from $25,000 to $200,000 or more. If
the population of the town is less than 3,000
the capital must be $50,000; if between 3,000
and 6,000 then $50,000 capital will be required;
if more than 6,000 and less than 50,000 the
capital must be $100,000 and in every place with
a population above 50,000 the bank's capital is
to be $200,000 or more.
At least 50 per cent of the capital must be
paid in before the bank is authorized to open
for business, and this must be in cash or its
immediate equivalent, not by promissory notes.
The balance may be paid in monthly instal-
ments during the next five months; but it is
advisable to have all paid in before opening for
business. No surplus is required by law to be
paid in by the subscribers, but it has become
the custom for new banks to start with a paid-
in surplus and by doing so the new bank re-
ceives the confidence of its depositors to its
credit. Ten or 25 per cent of the capital
should be sufficient, although 100 per cent is
paid in on some occasions.
Each stockholder of a National bank is li-
bled 10 per cent of the par value of his stock for the liabilities of the
bank. The law reads: "The shareholder
of every national banking association shall be
held individually responsible, equally and rat-
able, and not one for another, for the contracts,
debts, and engagements of such association, to
the extent of the amount of their stock therein,
at the par value thereof, in addition to the
amount invested in such shares." The shares of
certain State banks entering the National
system are exempt from this liability.
State banks can be converted into National
banks, and many banks now in the National sys-
tem were originally organized under State laws.
To enter the National system the State bank
must comply with practically the same require-
ments that are imposed on a new organization.
There are, however, certain advantages offered
to the State banks, but not so many now as in
the early days of the operation of the law.
These are the advantages: if the bank has
branches it may retain them; the stockholders
of the State bank are not liable for more than
100 per cent liability on their stock if the capital of
the bank is not less than $5,000,000, actually
paid in, and if the bank at the time of conver-
sion has a surplus of 20 per cent of the capital,
but the 20 per cent surplus must be maintained.
State Banks.—These are organized under
the laws of the States where they are to oper-
ate, and as the laws of each State differ in
some respects it would be impossible in this
article to give specific statements regarding
the organization requirements of the various
States. Forms for application to organize such
banks and copies of the laws governing the
banks can be obtained from the Banking De-
partment of any State, or from the Secretary
of State, in such States where there is not a
banking department.
In many States the laws have been modeled
after the National Bank Law, and in some
States the laws have been made more advan-
tageous to the bankers than the national law,
and this gives the banks a greater scope in lines
of business that rightfully belong to them. If
a bank is restricted in the lines of business in
which it can operate it is limited in its earn-
ing power as well as its utility to the com-

tunity.
As the National banks were organized or-
originally, to serve the Federal government and
mercantile interests, so the State banks in many
States have laws that were formed with the
purpose of allowing the banks to serve the

general public, and because of these laws they
are better public utility institutions than the
National banks. If a bank is not a public utility
institution in its practice, it becomes narrow in
its views and unaccommodating to its cus-
tomers, and so limits its usefulness.
Private Banks are usually organized by one
man, but sometimes by several men as a firm.
In many States laws have been passed prohib-
iting any one doing the business of banking
without the Federal or State authority. Such
laws were enacted because of men who opened
banking offices with the apparent purpose to
fraud the public. Their success in their evi-
dent purpose led the authorities to try to pro-
tect the innocent public against such men. These
laws, however, are a restriction against private
business and prevent honest men from going
into the banking business privately, as they can
do in any other business. In this respect the
laws are unjust. Some of the very best banking
institutions in the country are private banks,
and some of them have for many years been
conducting their business in a manner above
reproach and criticism. See Private Banks,
article 11.
The Management of Banks is divided into
two main departments — supervisory and active.
The supervisory is that of the governments,
which consists mainly of periodic examina-
tions and requests for statements of condition
with more or less explanation of the items in-
cluded in the statements.
Each National bank, according to the law,
is required to be examined "at least twice in
each calendar year," but this law is not fully
complied with by the examiners. The Com-
troller of the Currency and his assistants are
responsible for these examinations. In some
cases it is known that more than 12 months
have elapsed between the examinations of cer-
tain banks.
In some States the laws require two exami-
nations a year, but the makers of the laws, in
many States, do not provide sufficient funds
for the department having oversight of the
work to make the examinations. Both the Na-
tional and State laws are therefore not com-
plied with in regard to the governmental sup-
ervision. But let it be said to the credit of those
in charge of the various departments, that even
with their handicaps they have, in quite a few
cases, prevented dangerous and questionable
practices from arising and continuing in banks
that otherwise would almost certainly have
resulted in heavy losses to or complete failures
of the banks.
The active management of a bank is lodged
in its board of directors. The National Bank-
ing Law requires five or more directors for
each bank. The position of director is not
simply an honor, or a recognition of success
as a business man; neither is it for the sole
purpose of giving the bank prestige by the use
of the director's name. The directors are in-
tended to be the real and actual managers of the banks. But here also is failure to comply with legal requirements. Probably not one bank in 10 is really managed by the directors. Experience with failed banks has proved that if the directors had done their legal duty the banks would not have failed.

The directors delegate certain duties to the president, vice-president, cashier, assistant cashier, treasurer and assistant treasurer, or other officers, and then in too many cases pay no more attention to the details. The men so appointed must be trusted but the trust reposed in them should not lead the directors to allow them to perform their duties without the active supervision of the board or special committees of members of the board.

The president is the head of the bank, representing the directors to the other officers, employees and customers of the bank, and on the other hand is their representative to the board.

The vice-president is the assistant of the president, if he has any active duties in the bank, and usually has a certain part of the executive work under his supervision.

The cashier or treasurer has special oversight of the cash resources of the bank and of its records, as well as its staff of employees.

The assistant cashiers and assistant treasurers are to assist in the care of the details of the daily work.

In addition to the different kinds of banking institutions mentioned above, as being in the United States, there are two other kinds, the Federal Reserve banks (see Federal Reserve System, article 12) and the Farm Land banks. These have not been dealt with because they are government institutions and the public has practically no voice in the organization and management of such banks. There are 12 Federal Reserve banks and their purpose is to serve the government and the National banks, and the State banks that join the Federal Reserve system. All member banks must be stockholders and depositors in these banks—they have no choice in the matter. These Federal Reserve banks are to furnish aid in the way of loans of currency to member banks when they need it.

There are to be 12 Farm Land banks. Their purpose is to loan money secured by mortgages on farm lands, and the banks are to issue bonds secured by the mortgages. The interest rate on the bonds is not to exceed 5 per cent. In addition to these banks there are to be National Farm Loan Associations formed by men who will borrow from the banks. These associations are stock companies and each applicant for a loan must subscribe for stock equal to 5 per cent of the amount of the loan. The par value of the stock is to be five dollars a share.

The Federal Reserve banks are managed by the Federal Reserve Board and the local officers of each bank. The Farm Loan banks are to be managed by the Farm Loan Board and by the registrars and other officers at the local banks.

The value and utility of these banks have not been demonstrated, and some bankers question both the value and utility of both of these government institutions, while other bankers consider them of great value.

W., 'Literary Remittances by a Banker' (New York 1910); Banking Laws of New York, Ohio and Other States; 'National Bank Organization' (National City Bank, New York); U. S. Treasury Department, National Bank Act (Washington, D. C. 1915).

CHARLES W. REIHL,
Former Bank and Clearing House Examiner.

16. BANK SUPERVISION. About 1860 it became evident that some means must be adopted for repressing the mixed banking system then in vogue and to provide a uniform and safe system in its stead. Federal enactment soon provided for a uniform system, and the provisions subjecting National banks to examination by representatives of the Comptroller of the Currency increased the safety of the system. In many States the State banks are examined by officials of the State Supervisor of Banking. National banks are examined every six months. The examiner comes unannounced and the bank is for the time being under his control. He is obliged to examine the books, verify the cash and examine the investments and securities. The difficulty of passing judgment on the quality of all loans is the loophole through which many imprudent, or worse, operations are carried on, despite the vigilance of the examiners. Private banks are now, in many States, subjected to special State supervision.

Benefits of Banking Institutions.—These institutions afford a permanently safe place where the individual may deposit his moneys. And this is much more of a privilege than may appear on the surface. For not only is the secure place of deposit supplied, which otherwise would be wanting, but the bank practically insures the safety of the funds committed to it: if in any way loss is sustained by robbery or fire or by some other cause, the bank is bound to make good the loss, and this regardless of the fact that the depositor may not be a profitable customer, as many dealers are not.

In fact, the number of depositors who simply use a bank as a convenience, whose deposits are not large and whose multiplicity of small checks are a trouble, as they are the despair of the individual bookkeeper, is legion. Nevertheless the bank takes such accounts, holds the money subject to innumerable little drafts which are made good by new deposits equally numerous and small; and thus the active little account is maintained from year to year, often only a source of trouble and expense to the bank, which actually receives no attention for its services as warden and agent. It is to be noted, too, that in this country the services rendered the individual by the banks differ greatly from those afforded by like corporations in some other countries, notably in France. To cite one instance: In that country every note when due must be paid to the bank officer in hard cash; a check on that or some other bank, duly certified, would not be received. In fact, the bank's messenger visits the payer of the note and demands the exact amount in cash, or protest and legal proceedings follow.

Relation of Banks to the Community.—But leaving this phase of the subject, a glance
will show how vital is the relation of a bank to the community doing business with it. In a word, it may be said to receive all the money that comes, and to charge it out as desired by the customer. Not only so, but when he cannot command the money required to transact his business, the bank may supply the desired amount. Thus it is, estates are cared for, income in the shape of interest is paid, vast sums are committed to its keeping, while by its loans made at times of emergency the bank enables the business of the community to be transacted; and this principle extended stands for the business of the world. It is easy to see that a misfortune to such an institution means a calamity to a community, and a series of them means panic, with its consequences of impoverishment and distress, and sometimes ruin to countless thousands. How disaster in this direction has been wrought in the past those familiar with the history of banking in the earlier days, when banks were not subject to the restrictions of the present time, and when the failure of a bank often meant insolvency to its holders of their circulating notes, will be fully aware. But when we go farther and take the most superficial glance at the great industries of the country, we obtain some conception of what banks and banking mean. Is it too much to say that without credit and banking facilities the unparalleled facilities of our gigantic railway systems, stretching from ocean to ocean and conveying the enormous crops of the country by which we are enabled to feed the world, would be in vain? In the last analysis we shall find that it is not car wheels, but it is money, that moves the great harvests of a continent—as for that matter, of the world. And the money would be lacking but for the banks; these, and not steam or electricity, stand between the nations and starvation.

Safeguarding Depositors.—It would seem that under the circumstances no argument was required to establish not only the necessity for adequate safeguards in the shape of stringent statutes, but that measures should be provided to insure strict conformity on the part of the bank officers and directors to the requirements of the banking laws, thus safeguarding the depositor against abuse of privilege or criminal carelessness. The attainment of this object is sought by the provision in national and State legislation, as the case may be, requiring official examination and the publishing of a statement of a bank's condition from time to time as the authorities may deem expedient. There is but one proper bank supervision, and this includes mental alertness to discover the very best methods for despatching business with celerity, for insuring correctness, for guarding most effectually against errors, and to render tampering with the books most difficult and detection most easy. It means, too, economy in the use of time—the article which so many squander lavishly as if, like the waters that pass out from between the mule lion lips of the Nile, it was to flow on forever. Supervision by a manager thoroughly familiar with the business of the bank, so that he can upon occasion command the fullest information regarding a new department of the business at a moment's notice. The years of a banker's work in the dis-
not warrant them—such facilities carrying guarantee of perfect safety should be utilized by the prudent banker.

Systematic Examinations Essential.—But be supervision ever so thorough, it cannot serve its proper purpose without a system of right examination—rather of examinations. Unceasing watchfulness can only be maintained through proper investigations, not only to detect fraud but errors of judgment. The usual examinations of books are of but two kinds, those of the directors, and those of the official examiners of the National or State government as the case may be. Of these two methods, that of the directors, when rightly conducted, is most important, and for the obvious reason that the directors are better informed as to the value of paper and local securities than the official bank examiner, as a rule, can be. That the examinations made by directors are too often superficial and perfunctory goes without saying. Of course, in the examinations by the directors, the revision of loans is most important, enabling the board as it does, when conducted in a business spirit, to detect improper advances on an insufficient collateral or inadequate endorsement. Here the examination should be most thorough, so that the presence of “weak” paper, which often becomes such after the loan has been made, may be discovered and remedied. Obviously in such an examination every piece of paper must be got to, even as to time of maturity and collateral, which latter should invariably be produced. Collaterals should all be carefully examined with reference to their proper assignments to the bank, so that there may be no question about its ability to exercise a legal ownership, if necessary. The ticklers, the discount book, and all books pertaining to this most important branch of bank, should be carefully investigated, and the precise facts ascertained. The liabilities of the bank, its deposits and cash on hand, the character of the depositors and borrowers, the condition of the individual and general ledgers, the bad debts of the bank, including especially notes past due, overdrafts when permitted—all these and more should be inspected by the board, and this without bias to any officer or employee of the bank; all of them who discharge their duties faithfully will be glad of an examination which will result in enhancing the appreciation and increasing the confidence of the board as to the value of their services.

To insure the correctness of balances on the individual ledgers it would be well to render a monthly statement to depositors having active accounts, and to others at short intervals. A reconciliation bank statement, if the balance is correct, should accompany the same, to be signed by the depositor, and an envelope addressed to the cashier. If there are errors, the depositor may note them, to the end that they may receive official attention immediately; these reconciliations to be filed by the auditor and checked back by the examining committee.

Surplus Nominal and Real.—In some instances it would be advisable for the directors, when making an examination, to employ a trustworthy party to aid them in their investigations, because such an expert may be able to make a more complete analysis of the condition of the bank than can the directors. Here we venture, in the interests of justice to all, to express the conviction that while banks may continue to fail, shortly after they have secured a certificate of soundness from the National or State bank examiner—as they have failed in the past—no such failure should take place from the infallibility of right examination of directors of a bank, though there have been such cases. The official examiner of the National or State government may not be presumed to know the standing of many of the promissory or endorsers of notes. It may be impossible for him to detect worthless paper, though it is supposed to represent thousands upon thousands in value. But no such plea can be accepted for the directors of a bank, some, if not all, of whom should have knowledge of the value of the paper upon which they lend their depositors' money. And what are the directors but trustees of the moneys of others, committed to them in perfect confidence, and to whom no language can too severely be applied, who fail to direct? Here it seems proper to emphasize a practice which is becoming far too common in the management of banking institutions, namely, the practice of carrying on the general ledger a large surplus fund, or undivided profits, through the failure to charge off bad paper which is known to be such. This is a matter to which, in their examination, directors should give their attention, that their bank statement may represent the exact condition of the bank; just such a statement, in fact, as every right-minded director would furnish were the bank his own property. But let us be just to the directors, many of whom are prominent business men, some of them directors in several other institutions and otherwise engaged in business occupations which take all their time, and which make it impossible always for the director to direct and examine, as he would be glad to do. This fact has obtained recognition among leading bankers, who have inaugurated another system of examination, namely, the practice of having the books of the bank examined as often as may be deemed expedient by a committee appointed by the president of the board, competent by the board, and of considerable experience. The committee being notified assemble immediately. Without a moment's warning all the affairs of the bank are put in their hands. They count the cash on hand, examine balances, count all securities, examine and compare the sum total of all discounted bills and their collaterals, verify all accounts in the ledgers—in short, they rigidly scrutinize the condition of the bank. No one—no officer even—is allowed to make any transaction without the knowledge of the committee, who take due account of it. Where, as in the large cities, branch banks exist, the affairs of each branch are also examined in the same manner and at the same moment, that there may be no chance of collusion of balances, borrowing money or securities to make good a deficiency.

How Some Banks Examine Themselves.—The following from a circular letter, convening a committee of examination, will give some idea of the character of work performed. The first line of the instructions to the committee may be read as follows:

On presentation of this order you will at once take charge of the bank, and will not allow
any officer or clerk to do anything without your knowledge.

Then follow specific instructions to the committee: Count the cash in detail. Examine the cash items, and all items composing exchanges, and see if any are irregular, and report the same. Look up the purchases of all discounted bills, their endorsements and callers, and prove the amounts and accompanying securities. Check up all the loans. Verify all extensions and balances of ledgers. Prove all certified checks or deposits kept. Report all certified or deposited checks as well as all outstanding vouchers. Prove the cashier’s account; make a record of all outstanding vouchers and see that all checks drawn on the bank have two signatures. Verify the expense account. Ascertain whether all charges are initialed by an officer. Prove the teller’s difference and submit all items to the president. List all amounts due from banks and verify them, noting any irregularity. Report on amount due from each concern. Scrutinize and report on clearing and margin accounts of the Consolidated, Produce and Cotton exchanges. List all dividend checks unpaid. Check off all stocks, bonds and mortgages. Describe all overdrafts, and see where their certificates or deposits are kept. Report all suspended debts and balances due. Check off, a month back, the discount book and see if all amounts are duly entered. Examine exchange account; see if the entries appear suspiciously low and if there are any debts. Investigate interest account; see if all charges are initialed by an officer. All insurance policies and bonds should be scrutinized and a complete record made of the same. Report on all differences called for on general ledger, and whether they are all known to the officers. State at length your views as to the condition of the bank; report any departure from the method of our system as you understand it. Report any suggestions that may occur in connection with the work of bookkeepers, and of officials toward their improvement. Finally state errors made in the methods pursued in the handling of bills discounted, loans or any other department of business.

The fact that the bank’s investigating committee enter into possession and assume entire control of the bank’s affairs, which they retain without interference or interruption until they have thoroughly satisfied themselves that the books of the bank are correct and its affairs precisely as represented, affords assurance against fraud and clerical errors. It would seem wise that all banks should cause examinations to be held; where this is not expedient the same methods should be pursued by the directors. If any illustration we desired showing the necessity for rigid supervision and thorough examination it may be found in the astonishing story which has appeared in the daily journals. The fact is disclosed that a woman not engaged in business and not known to possess tangible assets was able to obtain from at least one bank, with a reputation for conservatism, loans of four times the capital stock of the institution.

A theft which had wide newspaper publicity, both because of the very large sum stolen and the prominence of the bank in the city of New York, was where a receiving teller was found to be the thief, although the directors had absolute confidence in his integrity. He used part of the proceeds of the theft to cover the shortage of the day preceding.

In one bank two individual bookkeepers were in conspiracy with a dealer. They allowed the depositors to draw out more money than they had deposited by covering up the defalcations by false entries.

The officer in charge of the exchange department in one case entered drafts issued by him for a less amount than the face. To illustrate: A $5,000 draft was entered by him as $1,000, and, as he had charge of the “reconciliation,” the difference was transferred from one account to another. If a ledger is manipulated, or a certificate of deposit register falsified, it is difficult to discover the fraud.

It is a wise practice for all employees to take a vacation without notice each year, so that others may become acquainted with their duties. In this way, sometimes, defalcations have been discovered.

In past experience it has been found no more satisfactory preventive against fraud than the changing of employees, without previous notice, for a short time, from one department to another, at least once a year. A constant inquiry should be made as to the conduct and habits of all persons employed by the bank. Such inquiry may not make a weak man strong, but good resolutions may be strengthened by the knowledge that the penalty of wrong-doing will be surely and promptly inflicted.

It is only a truism to say that good bank management and thorough examination are wholly impossible in the absence of a definite system, which enters into every phase of industry. We find it everywhere. The manufacturer who does not know in detail his stock on hand at any time is in as dangerous a position as an engineer without a steam gauge. His steam may be low, the machinery of his business will suddenly stop, perhaps high—all his capital tied up in stocks means an explosion—and the receiver gets the pieces.

Necessity of Method.—To a right and safe banking system method is a necessary protection. UNSYSTEMATIC banking is not only a paradox, it is a contradiction in terms. System economizes time, excites invention, expands energy, concentrates power and accelerates results. Without system, determination weakens, purpose crumbles; failure is sure. Subtract system from banking and chaos is left. In banking there is no middle ground between order and confusion, between cosmos and chaos. System, applied to banking, should make it easy for the manager to have its condition constantly before him. Emphasis has been placed upon the value of examinations conducted by bank clerks. But in view of the close relationship of these institutions to the public welfare and the further fact that they are virtually the creation of the Federal and State laws, it is evident, not only that banks should be examined by officials of the respective governments, but that the examinations should
be of the most searching character. A good bank will court investigation. Whether it is true or not, as a recent writer has said, that "bank examiners are not called upon to play the detectives," it is assuredly true that they should discharge their duties with thoroughness and with a realizing sense of their duty to the public. So far as practicable they must see to it that collusion at the time of examination, between teller and discount clerk or other officers, is made impossible, and that neither cash nor vouchers are made to give double duty in the hands of the dishonest, as has been done. It may not be assured that either National or State or directors' examinations will form an infallible guarantee against dishonest practices. But what may justly be expected of these examinations, together with such as the bank officials may themselves institute, is that they will reduce losses through error or fraud to a minimum. No known system affords any guarantee of faultless management; but the best system rigidly applied will produce the best results possible; and for this the public have a right to look.

Kinds of Bank Examination.—Official bank examination includes that furnished by the Comptroller of the Currency, the Federal Reserve Board in the case of national banks and the supervising officers of State banks in the case of State banks; there is also examination in many cities by a clearing-house examiner, for banks members of the clearing-house association. Besides, special examinations are provided for, as already stated, by committees of directors, these examinations being made in some cases by accountants selected from the bank's staff and in others special experts. A few banks have thought it wise to have examinations made on behalf of the stockholders generally, in addition to the examinations made by the directors.

Importance of Examination.—What can be of greater importance than the thorough, systematic, exhaustive and regular examination of our great financial institutions — our National and State banks, trust companies and institutions for saving whose capital and deposits are expressed by billions? What can be more essential to the welfare of a community of breadwinners and dependent upon them than the assurance that those institutions with which are lodged the means for conducting the vast enterprises of the country and the earnings which have been won by hard labor are conducted in an honest, businesslike way, prepared to meet the demands that may at any time be made upon them? And the key to such a situation — what is it but such thorough supervision, with rigid examinations, as shall inspire confidence and dissipate alarm in hours of financial stringency and tendency to distrust? A mercantile house may fall and the results may be meagre; but when a great banking institution goes down, credit goes, fortunes disappear, the poor are left heartless and the tale of suffering is long and grievous.

The basis of the modern system of bank regulation to-day is the right kind which is conducted as such institutions were 65 years ago. In like manner we may believe that in future years new methods, new safeguards, enforced by an impartial, effective system of promotion of the personnel, will give increased efficiency in bank management, resulting in a greater volume of business, fewer bank failures and heavier balances on the right side of the ledger.

No institution can run itself — except to ruin — less than a single individual vigilance is no less the price of liberty than of safe banking; and only those institutions can gain and deserve the public confidence and justify the powers conferred upon them which are managed under a supervision that is searching and thorough, that makes examinations which are rigid and relentless.

Willis S. Paine, Author Paine's 'Banking Laws'.

17. COMMERCIAL PAPER. The element of credit in the business world arises from two fundamental causes: (a) The fact that the merchant and the manufacturer can profitably use more capital than he possesses and can make money by borrowing money; and (b) if the time of payment is postponed, the buyer can turn goods into money before the agreed time of payment arrives. Therefore, business men must either borrow money by goods or postpone the date of payment for goods. Out of the first process arises commercial paper, and out of the second the "book account," now the principal form of credit in this country.

The usual methods of borrowing are: (1) Private loans from relatives and friends; (2) loans made directly to the borrower by the home bank, either in the form of loans on his promissory note, or indirectly in the form of bills receivable discounted; (3) loans in the form of commercial paper, which is a floating debt — borrowings in the open market.

The term commercial paper is, therefore, used to designate those instruments of indebtedness — promissory notes — which are issued by business men for the purpose of obtaining funds in the open market or which are given in settlement of business obligations and sold in the open market. They are to be distinguished from the ordinary promissory notes given to settle debts or old money on a deferred payment, in that the transaction is impersonal, and an intermediary is employed to effect the sale. Legally there is no distinction, both being the same obligation in law.

There are two forms of commercial paper: (1) Single-name paper; (2) double or two-name paper, commonly called *receivables.*

Single-name paper is the sole obligation of the issuer, put out in large denominations (usually $2,500 and $5,000) and sold through the medium of a commercial paper broker to banks and bankers. The proceeds of single-name paper are, or are presumed to be, used for the purpose of paying bills promptly in order to obtain the cash discounts, which are generally given for quick settlements.

The two-name paper or the receivable is the note given by the buyer to the seller and by the latter sold in the open market for cash. The payee thus anticipates its due date.

The advantage of single-name paper to the banker lies in the fact that it comes in large and uniform denominations, is of short maturity and the lender is under no obligation to renew, for he purchases the paper strictly on an impartial and impersonal basis.
The very favorable experience that banks the country over have had with commercial paper and its intrinsic soundness have made the item a foremost position in banking circles. In many such banks must keep its funds invested in order to make money, and yet have them in such form as to be readily convertible into cash to meet the demands of its depositors, a body of liquid assets must be maintained, which still produce income and promptly liquidate itself. Commercial paper conforms ideally to this test in that its life is short, and its payment under ordinary conditions certain. Bankers are therefore coming to look upon their commercial paper as next to cash as a quick asset, treating it as a secondary reserve.

In order to purchase paper of firms in all parts of the country intelligently, as well as to have credit information about their own customers, banks have now operating well-organized credit departments whose function is to gather and classify credit information bearing on the firms with which they deal and whose paper they buy.

This information consists of the credit statements, usually digested on the bank's own forms, with provision for setting in apposition the various items from year to year for the purpose of indicating the progress of the firm. In addition there are the reports of the great mercantile agencies, Dun and Bradstreet, which give the history and credit standing of the firm, and reports of judgments, liens, transfers of property, etc., that would affect the credit risk.

To the issuer, the benefit of commercial paper as a borrowing medium lies in the wide and steady market, which the banks of the country afford, the lesser rates of interest obtainable in money centres and the cash discounts explained below.

The great advantage of single-name paper is due, as above stated, to the fact that the proceeds are applied to the payment of bills, which when met within the cash discount period are allowed a deduction. A simple illustration will show the profitableness of such a transaction.

The bank accepts an invoice of goods; the terms are 2 per cent, 10 days, which means that if the bill is paid within 10 days of the date of the invoice he can settle for $980. He has no funds, but good credit. He, therefore, makes a promissory note, due let us say in three months, for $1,000, and through the process subsequently described sells the instrument to a bank or banker at the prevailing rate of discount, which would not ordinarily be as high as 6 per cent; but assuming the latter rate, the discount would be $15 plus the broker's commission, which would still allow a fair margin of profit for him. He has in addition the three months' time in which to turn the stock into money to meet his note. Ordinarily the "best names" as they are called, meaning the fine grade of highest credit standing, are able to borrow at from 3 to 4 per cent making the single-name paper a highly profitable method of borrowing.

The 2 per cent 10 days' discount is equivalent to 72 per cent a year. The merchant in setting the bill within the discount period has saved $20. If he were to make money as fast as this process indicates within that period of time, he would have to employ the fund at the rate of 72 per cent a year; for 2 per cent in 10 days is equivalent to 3 per cent a month.

Single and Two-Name Paper.—Single-name paper is an outgrowth of the Civil War and the Greenback disturbances. Before the war merchants made infrequent trips to the trading centres and stocked up for months ahead, giving notes for their bills with long maturity. Owing to the uncertainty of the amount that would be received for the bill at maturity, due to a depreciating currency, a custom soon arose of allowing the buyer a cash concession for prompt payment. But this necessitated borrowing facilities. The home banks being unable to loan in such large amounts, the merchant conceived the idea of making out a statement of his affairs, and submitting to bankers in the large cities, with his new operating well-organized credit departments whose function is to gather and classify credit information bearing on the firms with which they deal and whose paper they buy.

This information consists of the credit statements, usually digested on the bank's own forms, with provision for setting in apposition the various items from year to year for the purpose of indicating the progress of the firm. In addition there are the reports of the great mercantile agencies, Dun and Bradstreet, which give the history and credit standing of the firm, and reports of judgments, liens, transfers of property, etc., that would affect the credit risk.

To the issuer, the benefit of commercial paper as a borrowing medium lies in the wide and steady market, which the banks of the country afford, the lesser rates of interest obtainable in money centres and the cash discounts explained below.

The great advantage of single-name paper is due, as above stated, to the fact that the proceeds are applied to the payment of bills, which when met within the cash discount period are allowed a deduction. A simple illustration will show the profitableness of such a transaction.

The bank accepts an invoice of goods; the terms are 2 per cent, 10 days, which means that if the bill is paid within 10 days of the date of the invoice he can settle for $980. He has no funds, but good credit. He, therefore, makes a promissory note, due let us say in three months, for $1,000, and through the process subsequently described sells the instrument to a bank or banker at the prevailing rate of discount, which would not ordinarily be as high as 6 per cent; but assuming the latter rate, the discount would be $15 plus the broker's commission, which would still allow a fair margin of profit for him. He has in addition the three months' time in which to turn the stock into money to meet his note. Ordinarily the "best names" as they are called, meaning the fine grade of highest credit standing, are able to borrow at from 3 to 4 per cent making the single-name paper a highly profitable method of borrowing.

The 2 per cent 10 days' discount is equivalent to 72 per cent a year. The merchant in setting the bill within the discount period has saved $20. If he were to make money as fast as this process indicates within that period of time, he would have to employ the fund at the rate of 72 per cent a year; for 2 per cent in 10 days is equivalent to 3 per cent a month.
name paper; then follows the other liabilities of the concern, such as mortgages, stock issues and other obligations.

The purpose of the above arrangement is to enable the banker to readily ascertain the ratio between the quick assets and the quick liabilities, the purpose being to determine the relative safety of the credit risk. It is well settled in all credit circles that a firm should have quickly available at least $2 for every $1 of quick debts, thus allowing for a shrinkage of 50 per cent before the other assets would need to be drawn upon to settle the firm's obligations. In some lines, such as meats, groceries, etc., where the shrinkage is light and a quick sale possible, a narrower margin is permissible—as low as one and one-half-to-one; but in a seasonal or specialty line, such as millinery or ladies' wear, subject to fashion and change of seasons, a large margin is generally desired.

Having the information classified, the broker submits the same to his clients, who, if in the market and satisfied with the rates, will purchase the paper on the credit, that is to say, with the right to return within a certain time, if upon further investigation it is not desired. The investigation is made through bankers, who have either purchased the paper before and are acquainted with its value, or the home banks, which are fully conversant with the borrower's affairs from close observation. Such references, together with mercantile firms with which the borrower has had business dealings, are furnished on the credit statement. This process is called "on the purchase.

In purchasing commercial paper the banker is usually concerned about the following points:

First, the statement should be recent, not over six months past. Second, it should be an audited statement made by a firm of public accountants, whose sole object is to present a correct statement of fact. Third, the ratio of quick assets to quick liabilities should, as a rule, be at least two to one. Fourth, the character of the business. Most bankers prefer single articles to businesses which cater to fashion or seasonal demands. Fifth, to scatter the risks territorially as well as to the various lines of merchandising. Being satisfied on each of these points, he is in a position to purchase with intelligence.

It is a rule of banking that a firm should not issue both single and two-name paper, and one of the surest tests is the presence or absence of odd cents in the item "bills of exchange." If the item is in an even amount it is good evidence that only single-name paper is issued. If there are odd cents it indicates that the firms' bills receivable have been sold, thus parting with one of its quickest and best assets, and is a practice that is frowned upon by bankers who know the science of commercial paper.

Under the Federal Reserve Act, commercial paper has been given a new dignity and standing in the financial world. The Federal Reserve banks are permitted to rediscount paper that conforms to certain qualifications, the essence of these conditions being that the paper should arise from a business transacting and be of short maturity. This process enables a bank to cash in its holdings on a few hours' notice, a very marked advantage in periods of unrest. The Federal Reserve banks may in turn use such paper as the basis of note issues, for as long as the Federal Reserve bank has $40 in gold for every $100 in paper, it may put out $100 in bank notes, thus making commercial paper the foundation of our circulating currency.

**Instruments of Credit**—The instruments of credit in this country are as follows:

1. **Negotiable bills of exchange**, which are unconditional orders in writing addressed by one person to another, signed by the person giving them, requiring the person to whom the order is addressed to pay on demand or at a fixed or determinable future time a sum certain in money to order or to bearer.

2. **Negotiable promissory notes**, which are unconditional promises in writing, made by one person to another, signed by the maker, engaging to pay on demand or at a fixed or determinable future time a sum certain in money to order or to bearer.

3. **Bank checks**, which are bills of exchange, drawn on a bank and payable on demand.

4. Drafts are bills of exchange that are payable at a definite time and are subject to the same rules of law as bills of exchange. An able writer has characterized drafts as follows: "A draft is an order in writing for money, drawn upon the custodian of funds belonging to the drawer, or subject to his order. It does not presuppose any other commercial transaction. A bill of exchange is a similar instrument based usually on a sale or purchase of goods." In this country the word "draft" is commonly applied to all instruments of this type, the paper being payable within the United States, and the term "bill of exchange" to those payable in foreign countries.

**Acceptances.**—The term "acceptance" is defined by the Federal Reserve Board as "a draft or bill of exchange drawn to order, having a definite maturity and payable in dollars, in the United States, the obligation to pay which has been accepted by an acknowledgment written or stamped and signed across the face of the instrument by the party on whom it is drawn; such agreement to be to the effect that the acceptor will pay at maturity according to the tenor of such draft or bill of exchange without qualifying conditions."

A bill of exchange is defined by the English Bills of Exchange Act as "an unconditional order in writing addressed by one person to another, signed by the person giving it, requiring the person to whom it is addressed to pay on demand or at a fixed or determinable future time, a sum certain in money to order or to order of a specified person or to bearer." As an acceptance is, therefore, where A commands B to pay to C, or to his order or to bearer, a sum of money absolutely on demand or at a certain future time. A is the drawer, B the drawee and C the payee. If B agrees to comply with the order, he writes the word "accepted" across the face of the instrument and signs his name, together with the date of the acceptance, the date that it is payable and the place where it is to be paid. Upon so signing, B becomes the acceptor, and the document is an "acceptance." The acceptance thus essentially the promissory note of the acceptor.

The time bill of exchange, or acceptance, has a fundamental purpose which neither the promissory note nor the commercial draft pos-
BANKS AND BANKING.—BANK AND TRUST CO. ADVERTISING (18) 208

sesses. That purpose is to facilitate the mutual offsetting of debts between individuals, as well as enabling time bills of exchange, pass from hand to hand the same as money. They serve the same purpose as the transfer of gold itself in the cancellation of debts. Abroad they have long been considered as the easiest and cheapest form of credit instruments.

Economists regard acceptances as a sort of special currency. Such really has been their use for the last two centuries in the Old World, where acceptances have been employed between business houses in the settlement of debts. They circulate among banks which buy and resell them according to their needs until they are negotiated to the central or government bank of the country.

Briefly stated, the use of the acceptance is as follows: The seller of the goods draws a bill of exchange on the buyer, the buyer ac-

cepting the instrument and returns it to the seller; he negotiates it to a bank or sells it in the open market, thereby receiving payment for his goods after they are delivered. The buyer has the time between his acceptance and the date of payment to turn the goods into money to meet the obligation when it is due, and the seller has his funds as soon as the goods are accepted.

Acceptances are a new form of credit instrument in American banking and business circles. Prior to the inauguration of the Fed-

eral Reserve system they were quite unknown, but the Federal Reserve Act has made specific proviso for such instruments, and the Federal Reserve Board has issued detailed regulations concerning the issuance and the purchase of such paper. They are fast coming into popular favor, being a form of instrument which is readily discounted at the Federal Reserve banks. In January 1918 acceptances constituted 25.9 per cent of the total earning assets of the Federal Reserve Banks.

The parties to such instruments are:

- **Drawee.** The party who signs or executes the bill of exchange, check or draft.
- **Drawer.** The party to whom the bill of exchange or draft is addressed, and who is ordered to pay it.
- **Acceptor.** The drawee after he has signified or promised to pay the bill of exchange or draft. The promise should be in writing and is usually written across the face of the bill or draft.
- **Payee.** The party to whom the bill, note, check, draft or other instrument is made payable.
- **Endorser.** The payee, bearer or other party who writes his name on the back of the instrument for the purpose of transferring it.
- **Endorse.** A technical act of the law merchant, whereby a party writes his name upon a duly executed, negotiable instrument, with or without terms of contract or liability, according to the law merchant.
- **Holder.** The party to whom the endorser transfers the instrument.

Dishonor.—By refusing to promise to pay (accept) or to pay the bill or note it is said to be dishonored.

Protest.—The evidence of dishonor, usually made by a notary public, in the shape of a certificate setting forth presentment, refusal and its reason.

18. BANK AND TRUST COMPANY ADVERTISING. Endeavoring, by forceful, well-planned advertising, to secure new depositors and customers for a banking institution, or to increase the dealings of present customers with it, is a comparatively recent development of the business, both in the United States and abroad.

Formerly, about the only advertising considered proper for a bank and trust company was the publication of its financial statement and a "card" with the names of the management, together with the barest statement of the services rendered by the institution. But of late years, partly on account of the great advances made in general advertising and partly because of increased competition in the banking business, many institutions have gone into the matter of advertising more fundamentally, either putting that branch of their activities into the hands of agencies specializing in that kind of work, or employing a publicity or advertising manager to devote his entire time to the advertising of the institution.

Naturally, it is only the larger banks that can afford such an arrangement. Smaller institutions must either turn the work over to one of their officers or employees or make use of the services of some agency employing a ready-made or specially prepared advertising service for financial institutions.

Banks and trust companies which are most successful in their advertising usually make an annual appropriation in advance to cover all advertising expense, and this item of the budget is subdivided to meet the cost of these various divisions:

- **Management.**—Salary of advertising manager, if one is employed.
- **Space.**—Newspapers, street cars, billboards, moving picture theatre, etc.
- **Copy.**—To pay for the services of an advertising writer or for the work of advertising agencies in the preparation of the subject matter of the advertising.
- **Mechanical.**—Under this head are included the printing, engraving, lithographing, art work, etc., required in producing the bank's advertising matter.

It is difficult to lay down any hard-and-fast rule concerning how much a bank or trust company can legitimately spend for advertising. The trustees of mutual savings institutions feel that they have no right to spend any...
of their depositors' money for this purpose. So they do practically no advertising at all. But other banks are spending a good deal of money in advertising. The sum differs according to the amount of competition, the size of the bank and other local conditions. Investigation has brought out the fact that the average advertising expenditure probably is about in the proportion of $1 for every $200 of deposits, that is, a bank with $2,000,000 deposits will spend $10,000 a year in advertising.

The facts concerning a banking or fiduciary institution and the services it renders the public that may properly be advertised include: capital and surplus, governmental supervision, personnel of directorate and management, physical protection, age and experience, interest on deposits, business or investment counsel, care of property, Trusteeships, execution of wills, loans, discounts, certificates of deposits, banking by mail, foreign and domestic exchange business information, business references, letters of credit, travelers' checks, collections, courteous service, the necessity and value of thrift, the use of safe deposit boxes, co-operation with the government in war financing, etc.

The tried and approved media of bank advertising include daily and weekly newspapers, financial journals and magazines, bank directories, street cars, billboards, moving picture theatre advertising, personal letters, facsimile letters, booklets, *house organs* (i.e., little regularly issued papers or magazines, either *syndicated* or especially prepared by the bank for distribution), financial statement folders, calendars, bank window cards, and a great variety of specialties, novelties or souvenirs.

Of late, a movement has been started toward the co-operative advertising of banks. That is, the banks of a city or county will get together and pool a certain proportion of their advertising appropriations and use the money for a campaign of popular education in thrift or banking functions. Space is used in local newspapers or other media. In some cases the names of all the banks co-operating in the movement appear in connection with the advertising. In others, the articles are not signed but appear as editorial matter.

Banks in some communities have, formed banking publicity associations for mutual benefit, and a Financial Advertisers' Association was established in 1915 as a department of the powerful organization known as the Associated Advertising Clubs of the World.

T. D. MACGREGOR,
Vice-President Edwin Bird Wilson, Inc., 14 Wall Street, New York.

19. BANK NOTE ISSUES. In principle a true bank note does not differ from a bank check. The purpose of either is to transfer credit. The granting of credit on the books of the bank precedes the issuing of notes by the bank or the drawing of checks by the depositor; or, at least, the bank pays out a note in discharge of an obligation of some kind, and this is the usual way in which a depositor employs a check. He may, of course, use it as a means of obtaining currency from the bank for his own needs; but there has been only a transfer of credit from the bank to the depositor in circulating form. If checks were certified, issued in convenient denominations and so engraved and printed as not to be easily counterfeited or raised, they would be substantially the same as a bank note, for a certified check becomes an obligation of the certifying bank. But a bank note ought to be somewhat better secured than a check, and for this reason: a check is accepted or honored as the person receiving elects; but a bank note, though not a legal tender, must be taken in the ordinary course of trade by merchants and other business men, who cannot discriminate between different kinds of money in circulation. Therefore, the note requires some extra security, as a first lien on assets or by a guaranty fund.

Experience in the banking history of the United States and other countries has shown that by employing either of these expedients bank notes can be made safe beyond question. The best provision for current safety, and the best check against inflation, is the test of daily redemption, in the standard metal, applied through the clearings. If banks in the issue of their notes are left unrestricted beyond the simple safeguards above mentioned, the amount of circulating medium in the shape of bank notes will be determined by the wants of trade—that is, by the requirements of those who deal with the banks. In the larger cities it can be checked against will best serve; in the farming communities more currency will be called for. How much currency is needed in any one locality, or whether bank notes or checks are most serviceable, must be left, not to the bank nor to the government, for only the person desiring to use the credit can correctly gauge either its degree or kind.

The early banks in the United States were of diverse kinds, but there were two general systems of note issues, one where the notes were based on bonds, the other where the notes were emitted on the general credit of the issuing banks. The latter—as in Indiana, Iowa, Missouri, Kentucky, Louisiana, Virginia, and especially in New England—were good, the note not being of great service but proving sound. In other States where bonds and stocks were pledged as security, the notes proved unsatisfactory. Generally, in those days, the notes exceeded the deposits in volume. Where, as in New England, under the Suffolk system of redemption, which was a plan whereby the notes were redeemed at Boston through the Suffolk Bank, the notes showed a close correspondence in volume to the demands of trade. It was found, also, in practice that redemption was an effectual check against
GUARANTY OF BANK DEPOSITS (20) — TRUST COMPANY (21) 205

over-issue, and that the banks did not keep the volume of notes up to anywhere near the permissible limit. The experience in New England, as in other sections of the country, established the fact that only simple provisions were necessary to ensure the safety of the notes. Inflation of bank credit — that is, the granting of more credit than prudence sanctions — is possible where the coin reserves are inadequate or the bank management reckless, but inflation of bank notes, under a proper system of redemption, is not easy. Banks cannot keep their notes in circulation any longer than they are needed. Every issuing bank receiving the notes of another bank will want to have that note redeemed to make place in the circulation for one of its own notes on which it will make a profit; moreover, it will want to have the notes of other banks deemed to replenish its own reserves upon which its credit structure is based. Private holders of the notes will deposit them as received in the course of trade. Bank notes save theabrasion incident to circulation of coins and they are more economical than gold certificates, for while the latter are issued only against a like equivalent of the standard metal, bank notes may be issued with safety against a much smaller reserve. Credit bank notes also have one immense advantage over notes issued against United States bonds, for while the latter represent an investment of an equivalent amount of capital, and are therefore a source of expense even when lying idle in the bank's tills, a true bank note while in the possession of the issuing bank represents no more than the cost of the paper and the engraving. When it is paid out, in exchange for the obligation of others, or against checks of depositors, and a reserve set aside against it in the vaults of the issuing bank, it then becomes of value.

The Canadian and Scottish banking systems afford familiar examples of the issue of bank credit notes. From the imposition of the 10 per cent tax on State bank notes in 1865 bank credit currency has been prohibited in the United States. Prior to the adoption of the Federal Reserve system (Q.V.) notes of National banks were issued against a deposit of a like amount of United States bonds. The Federal Reserve Act provides for the issue of notes to member banks against specified commercial papers, the Federal Reserve banks emitting the notes to hold a reserve of 40 per cent against them. These notes, however, are not true bank notes issued by the banks themselves, but obligations of the government, issued only through special institutions under government control.

Editor The Bankers' Magazine.

20. GUARANTY OF BANK DEPOSITS. This has been effected by legislation in some States (Oklahoma, Kansas, Nebraska, Mississippi, South Dakota and Washington), and individual banks in some cases have taken out policies of insurance to protect their depositors. (The Attorney-General of the United States has held that this is a legal use of the funds of a National bank). The United States Supreme Court, on 3 Jan. 1911, in cases coming before it from Kansas, Okla-
homa and Nebraska, decided that the bank deposit guaranty laws of those States were not in conflict with any provisions of the Constitution of the United States, and the court further laid down the principle that the legislature may not only regulate banking but may prohibit it except under such conditions as it may prescribe.

In principle, the guaranty or insurance of bank deposits rests upon mutual responsibility. It is objected to on the ground that it tends to place new and perhaps recklessly managed banks on a par, as regards safety, with old-established and carefully managed banks. To this objection the reply is made that there ought to be no degrees of safety in banking, but that all deposits in banks should be made safe beyond question, and that in point of service the old bank will tend to have the advantage anyway through the friendships and connections created by its long existence.

Experience with the laws now in force would seem to indicate that the results depend upon the character and administration of these laws. Some of them have recognized that where joint responsibility is assumed, greater stringency in the regulation of banks is essential to prevent sound and well-managed banks from being called on to pay the losses of those imprudently managed. In Texas, after six years' trial, the Commissioner of Insurance and Banking found that each share of stock of the par value of $100 had paid only three and one-half cents annually for deposit insurance, and was the states that among deposit fund banks the closing of one of these institutions creates no more panic than the closing of a grocery store. Some of the other States have had less satisfactory experiences, and the fact that after long agitation but few States have adopted the law, and that it has not yet been applied to the National banks, warrants the conclusion that the experiences thus far have not justified the general extension of the plan.

A safety fund, originally designed to protect the noteholders of the State banks of New York, was later made applicable to the deposits of banks, and the system broke down, chiefly because the fund provided was not large enough to protect both noteholders and depositors.

Through clearing-house examinations of member banks, a qualified form of deposit guaranty has been instituted, although direct responsibility is not assumed. The ability, by careful oversight, to detect banking weakness at its inception, renders a bad bank failure almost impossible. A desire to preserve local banking reputation has sometimes led bankers to unite in the protection of depositors in failed banks, the case of the Walsh bank failures in Chicago being the most familiar example.

ELMER H. YOUNGMAN,
Editor The Bankers' Magazine.

21. TRUST COMPANY. Definition.—A corporation authorized by law to act as trustee, or to accept and execute trusts of various descriptions; a corporation empowered to act in a fiduciary capacity. Thus is the primary meaning of the term "trust company," and is expressed in the name given to such a company in Australia,—a "trustee company."
In current usage, the term is applied to any corporation organized under the trust company laws of the several States, whether such corporation actually undertakes any trust business or not. While these laws invariably grant certain powers to accept and execute trusts, including always the power to act as trustee, they also grant other powers, of considerable variety in the different States, of which more or less limited banking powers are always a part. Even the oldest company, with a volume of banking business usually exceeds that of trust business; and it results that to the average person the trust company presents itself as a peculiar kind of bank. In fact, many of the smaller and newer trust companies do practically no trust business, and their actual functions are those of ordinary banks of deposit and discount, or of savings banks, or of a combination of the two. On the basis of the business actually transacted, therefore, the trust company may be defined as a financial corporation authorized to exercise both banking and trust functions.

Functions. 1. Trust Functions.—The function which gives the trust company its name is performing and accepting trusts. In the exercise of this function the trust company performs the same acts and assumes the same responsibilities as an individual acting in like capacity. Trusts are received from natural persons or individuals, from corporations, both public and private, and through appointment or approval of courts of law. It is convenient to consider the trust functions under these heads:

(a) Trusts performed for individuals under private agreement. Most of these trusts involve acting as trustee or agent, but they are of great variety as to purpose and as to duties required. The most common is that of acting as trustee for the management of property, real or personal. In this capacity the trust company takes entire charge of the property, collects income, distributes principal and securities when due, reinvests capital funds if desired. If the property be real it looks after repairs and improvements, keeps the property rented and insured, pays taxes, collects rents. It handles the separate estates of married women; looks after the investment and care of funds of educational or benevolent institutions; acts as custodian of valuable papers and securities; handles escrows; collects income which is receivable at long intervals or at uncertain periods and distributes it per contract in monthly installments; acts as agent for the payment of such regularly recurring items as insurance premiums, rents, taxes, etc.; looks after property interests of professional men, absentee property owners, women, invalids, the aged and others who, from choice or necessity, wish to avoid the care of their property either temporarily or permanently. These illustrate some of the many kinds of individual trusts.

(b) Trusts received through appointment or approval of the courts. In most States trust companies have a large volume of "probate business," consisting of the execution of trusts received by appointment of court or by wills of deceased persons,—acting as administrator, executor, trustee under will, guardian of the property (and in rare instances of the person) of minors, curator or committee for persons of unsound mind, etc. As a rule trust companies are legal depositories for trust funds and for personal funds of personal representatives and for persons acting in fiduciary capacities. Trust companies handle a large amount of "insolvency business," acting as assignees, receivers and trustees in bankruptcy.

(c) Trusts performed for corporations, private and public. These trusts are practically indispensable to the large corporations of to-day, as well as to many of the smaller ones. It acts as trustee under mortgages or deeds of trust securing bond issues, as transfer agent for stock, as registrar for stock or bonds, as custodian or manager of sinking funds, as fiscal or financial agent for various purposes, for States, municipalities, railroad and industrial and other corporations. It pays bonds, coupons, collects, makes charge of the disbursement of dividends and interest, attending to the publication and mailing of notices, etc. For syndicate managers, voting trusts, etc., it issues and collects calls for installment payments and computes and distributes to the proper persons dividends under trust indentures and trust certificates in the proceeds. It acts as depository of cash and securities under varying conditions; as depositary and trustee for underwriting syndicates; as agent to receive subscriptions for securities and to deliver same when issued. Its services are often used in corporate financing and reorganization. It may of course perform for corporations trusts of the kinds already described as undertaken for individuals under private agreement.

2. Banking Functions.—Trust companies have always transacted a large amount of savings banking business, and years ago became formidable rivals of the savings banks in this field. In more recent years they have invaded the field of commercial banking. While the laws of many States formerly limited the functions in the field of commercial banking, more particularly forbidding them to discount commercial paper, and although they are still so restricted in some States, the tendency in recent years has been to remove these restrictions and in many States at present they have all the banking powers of ordinary National or State banks, except the right of note-issue.

3. Safe Deposit Business.—Trust companies very generally maintain safe deposit departments, in which they rent private boxes for the safe-keeping of securities, valuable papers, jewelry, etc., and space for the storage of more bulky valuables.

4. Other Functions.—The three classes of functions above described are those most commonly exercised, in varying proportions, by the average trust company. Some companies maintain bond or investment departments, for the purchase and sale of high-grade securities. Trust companies in some States formerly transacted fidelity or title insurance business; and a few companies still transact such business; but the tendency, both in legislation and in business practice, is to leave this field to companies organized for this special purpose. In a number of States trust companies transact a real estate agency business. Other functions are sometimes found, the extent of powers
being determined by the laws of the different States.

It should be noted that not all trust companies undertake all of the functions above enumerated. The functions actually performed by some States under the general incorporation law of their titles vary widely. There are some trust companies which devote themselves exclusively to trust business; there are many which do no trust business, and are in fact commercial banks or savings banks. The general incorporation laws of States transact trust and savings business, but no commercial banking business. In several of the Southern States there are "trust companies" whose business consists solely of dealing in real estate or insurance or of a combination of the two. There are also some such companies whose business is that of dealers in real estate mortgages or mortgage bonds.

Organization, Regulation and Management. Trust companies are creatures of State legislation, and are organized under the laws of the State in which they are to be located. Formerly they were chartered in many States only by special act of the legislature and in most States under the general incorporation laws. Most of the States now have general trust company laws, which provide specially for the incorporation, powers, government and regulation of such companies. The general trust company laws in most States contain a number of provisions intended to safeguard the business. The capital stock required is usually much larger than that specified for banks in the same locality, and it is generally required that trust companies apply a portion of earnings each year to the building up of a surplus until it reaches a certain proportion (frequently 20 per cent) of the capital. In many States stockholders are subject to double liability. Restrictions of various kinds are placed on the making of loans and investments and the investing bank the trust department are specially restricted. Adequate reserves are required. Practically all of the States stipulate that trust funds must be kept absolutely separate from those of the company and of other departments, and also that securities belonging to specific estates be so marked and recorded as to clearly designate the owner, so that in case of failure of the company the trust funds would not be affected. Many States forbid the transaction of any trust business until the company has made with State authorities a deposit of cash or securities in certain specified amounts as special security for the faithful performance of its fiduciary obligations. Practically all of the States require trust companies to make regular reports to State officials, varying in different States from once to five times each year; and to submit to examination by State officials, usually once or twice each year.

The internal organization of trust companies is quite similar to that of ordinary banks, except that the variety of duties undertaken necessitates the maintenance of separate departments (required by law in many States) for the transaction of trust, savings, general banking, and other business. Subject to the State laws, a trust company is governed by by-laws adopted by the stockholders; is under the general direction of a board of directors; and is administered by a group of officers whose number and duties are determined by the needs of the business.

In addition to the character of its business in the trust department, the typical trust company differs from the ordinary commercial bank in the character of the deposits which it attracts and in the resulting methods in which it invests the funds received in such deposits. The typical commercial bank handles demand deposit accounts of commercial banks and savings banks. Others transact trust and savings business, but no commercial banking business. In several of the Southern States there are "trust companies" whose business consists solely of dealing in real estate or insurance or of a combination of the two. There are also some such companies whose business is that of dealers in real estate mortgages or mortgage bonds.

Historical and Statistical.—The first company in the United States granted the power to do a trust business was The Farmers' Fire Insurance and Loan Company (now The Farmers' Loan and Trust Company) of New York city, to which extensive trust powers were granted in 1822. Similar powers were granted to The New York Life Insurance and Trust Company in 1830. Two companies in Philadelphia,—The Pennsylvania Company for Insurance on Lives and Granting Annuities, and The Girard Life Insurance, Annuity and Trust Company (now The Girard Trust Company),—were granted trust powers in 1836. All four are still in existence.

As is indicated by the names of these early companies, the trust business was at first closely associated with the insurance business, and was not regarded as of sufficient importance to require separate organizations. A few other companies of the same kind flourished for a time during the next 20 years, but went out of business for various reasons. The first company in the country organized to transact exclusively a trust business was The United States Trust Company of New York city, incorporated in 1853. The number of companies authorized to exercise trust functions increased slowly down to the time of the Civil War, immediately following which a number of such companies were organized. By 1875 perhaps 50 trust companies were doing business, located in New York, Pennsylvania, Maryland, Illinois, Iowa, Georgia, all the New England States except Maine, and possibly a few other States.

Prior to 1875 no statistics regarding trust companies are available, but in that year the Comptroller of the Currency began the publication of such statistics in his annual reports. As the trust companies are State institutions and not under the jurisdiction of the comptroller he had no authority to compel the rendering of reports by them, and as a consequence his figures represent only such companies as were willing to report to him. Nevertheless they reveal the relative growth of trust companies from year to year, and in recent years represent the great majority of such companies. For the year 1875 he reports 35 trust companies, with total resources of $122,890,175. During the eighties there was a considerable increase in number of companies, and the trust company as an institution began to attract some attention, particularly from the banks, which saw danger of competition. In 1890 the comptroller's reports showed 149 companies with total resources of $503,803,366. The real development of the trust company began along in the nineties, though the period of most rapid growth did not begin until the first decade of the 20th century. In 1900 the comptroller reported 290 companies with total resources of $1,330,160,343, an increase in resources in 10 years of 164 per cent. At the end of the next decade, in 1910, the comptroller's report showed 1,091 companies with total resources of $4,216,850,062, an increase during the decade in number of companies of 801, or 276 per cent, and in resources of $2,886,689,719, or 217 per cent. The 1915 report shows a further great increase, to 1,664 companies with total resources of $5,873,120,341. The table at top of page shows leading figures of the comptroller's reports from 1875 to 1915 inclusive.

Beginning in 1905, The United States Mortgage and Trust Company of New York has published each year a compilation of trust company statistics which include a great majority of the trust companies of the country. For the year 1915 its figures cover reports from 1,777 companies, besides which it lists over 250 companies from which reports were not received. This indicates that the total number of trust companies in the United States 30 June 1915 was in excess of 2,000. The accompanying tables show the total figures for the 1,777 reporting companies, and the distribution of companies by States.

BANKS AND BANKING — BANKERS' ASSOCIATIONS IN THE U. S. (22) 206

The Federal Reserve Act.—The Federal Reserve Act, as construed by the Federal Reserve Board, directly affects trust companies in two ways. It makes trust companies eligible to membership in the Federal Reserve banks, and it permits National bank members of the Federal Reserve system,—if in conformity with local State laws—to undertake certain trust functions. Up to the present time few trust companies have joined the Federal Reserve system, largely because that system is designed wholly for commercial banks. Authority to National bank members to exercise trust functions applies only to those members which are located in States whose laws permit them to exercise such functions. Some of the States grant that permission, while others have distinctly refused to do so. If the exercise of trust functions by member banks of the Federal Reserve system becomes general, the fact will doubtless have a marked effect upon the growth of trust companies as separate institutions.

CLAY HERRICK, Author of "Trust Companies." 22.

BANKERS' ASSOCIATIONS IN THE UNITED STATES. American Bankers' Association.—Prior to 1875 there was no national organization of American bankers. In that year the American Bankers' Association was organized at a convention held in Saratoga on 20, 21 and 22 July. By 1916 the Association had become the largest organization of bankers in the world, with headquarters at 5 Nassau street, New York. Its membership of 16,000 includes half the total number of banks in the country, and comprises National, State and Federal bank, trust company and clearing houses. Annual dues range from $10 to $75 for banks and trust companies according to capital and surplus invested.

The governing body of the Association is the convention, which meets annually. Administrative details are in charge of a general secretary and an executive council composed of members appointed from State bankers' associations on the basis of State representation. In 1894 the Association began the protection of members against crime and fraud and developed a protective department which works with the W. J. Burns International Detective Agency in the pursuit of offenders against banks. Through its general counsel and a Federal legislative committee, the Association has initiated and promoted laws relating to uniform bills of lading, negotiable instruments, credit practice, currency reform, taxation, the safeguarding of bank depositors and the improving of banking practice.

The interests of special classes of member banks are in charge of secretaries of a Savings Bank Section, a Trust Company Section, a National Bank Section and a Clearing House Section. Through these sections the Association has made efforts to standardize banking practice and check collection; has conducted a national thrift campaign; given publicity to the functions of trust companies; collected statistics of bank transactions; developed country clearing-house organizations; improved clearing-house examinations, and effected closer relations between the banks and the public. It has also compiled a cipher code; copyrighted standard forms of fidelity and bank burglary bonds; devised a numerical system to facilitate check collection, and perfected the A. B. A. travelers' check.

Affiliated with the American Bankers' Association is the American Institute of Banking, an educational section which, since 1890, has given instruction to bank employees. Courses of study in banking law and practice and in elementary economics are given by correspondence as well as in local chapters. The members of the Institute number more than 16,000 and its certificate has become the recognized standard of American banking education.

The Association maintains a reference and traveling library service for its members, and keeps records of American experience in money and banking. A monthly publication called the Journal-Bulletin is issued by a department of public relations, which also acts as a bureau of publicity and edits the printed proceedings of the Association's annual convention.

The Association has always been active in urging currency reform. Since 1906 its efforts in that direction have been expressed through a currency commission, working in close cooperation with other agencies in bringing about and developing the Federal Reserve system. The Association has also done much for the national development of agriculture through its currency commission, which publishes a monthly magazine called the Banker-Farmer. Points of contact with State bankers' associations are maintained through a section known as the Organization of State Secretaries, and through joint efforts in agricultural extension, the revision of banking legislation, the apprehension of bank criminals, and through co-operation between committees.

State Bankers' Associations.—There are 49 State bankers' association, including the District of Columbia. The first to organize was Texas, in 1885; while Illinois, with a membership of 1,755, is the largest. These State organizations have more than 21,000 members, and most of them maintain paid secretaries to further the interests of members through correspondence, protective services, bond and burglary insurance, group meetings, State conventions, legislation and the publication of monthly bulletins. Many associations also have paid attorneys, and most of them are active in agricultural and good roads development.

The Investment Bankers' Association.—The Investment Bankers' Association of America was organized in New York in 1912, in order to promote the general welfare and influence of investment banks, or bankers, likewise banking institutions operating bond departments, and to secure uniformity of action, both in legislation and methods of handling securities. "Any national or State bank, trust company or private banker, banking firm or corporation, in good standing, having a paid-up capital of $50,000 or more, in the practice of buying bonds or investment stocks, and publicly offers the same, as dealers therein" is eligible to membership, but "those who are exclusively brokers" are not admitted.

The Association has headquarters at 111 West Monroe street, Chicago. A bulletin of information is published frequently and the proceedings of the annual convention are
BANNATYNE CLUB—BANQUETS

printed. The associated activities of nearly 500
members are carried on through a board of
governors which meets quarterly, through a
secretary, a legal counsel and committees. The
Association is prominent in legislation relating
to the issuance, standardization and safeguard-
ing of securities and the improvement of the
equality of stock and bond trading. It has given
special attention to raising the status of munic-
ipal and other bonds, and to reforms in
methods of taxation.

Farm Mortgage Bankers' Association.—
In May 1914 the Farm Mortgage Bankers' As-
sociation of America was organized. It has
a membership of more than 150 farm mortgage
firms operating in 25 agricultural States, rep-
resenting outstanding farm mortgages of more
than $600,000,000. The offices of its secretary-
treasurer are at 112 West Adams street, Chi-
cago, where a quarterly Bulletin is published.
Its convention is held annually. Through a
board of governors, committees and the
secretary-treasurer, the organization is direct-
ing its efforts toward the standardization of
mortgage forms and uniformity of practice
among farm mortgage dealers.

Other Bankers' Associations.—New York
State, Massachusetts and Connecticut have sav-
ings bank associations, while New York, New
Jersey and Massachusetts have State-wide trust
company associations. In Oklahoma and Kan-
sas the State banks have separate organizations.
Bank examiners are organized into what is
known as the National Association of the Su-
perintendents of State Banks; there is an Associa-
tion of Reserve City Bankers; bank credit men
are organized into a Robert Morris Club; and
there are numerous local associations of related
banking interests, as well as clubs of city bank-
ers. The Bankers' Club of America has head-
quarters in the Equitable building in New York
City and limits its resident membership to
1,500.

MARIAN R. GLENN.

BANNATYNE CLUB, instituted by Sir
Walter Scott in 1823. Its object was to print
and publish in a uniform manner rare works
of Scottish history, topography, poetry, etc.

BANNEKER, Benjamin, American negro
mathematician: b. Maryland, 9 Nov. 1731; d.
1806. At the age of 50 he began the study of
mathematics for astronomical purposes. He
published annually after 1792 an almanac de-
vised by himself, and aided in determining the
boundaries of the District of Columbia.

BANNERET, an abbreviation of knight
banneret; a member of an ancient order of
knighthood which had the privilege of leading
their retainers to battle under their own flag.
A banneret was entitled to display a banner
instead of a pennon. They ranked as the next
order below the Knights of the Garter, only a
few official dignitaries intervening. This was
not, however, unless they were created by the
King on the field of battle, else they ranked
after baronets. The order is now extinct, the
latter (James Smith) created having been
at the battle of Edgehill, in 1642, for gal-
lantry in rescuing the standard of Charles I.

BANNOCK, a cake once much eaten in
Scotland. It was made of oatmeal, barley-meal
or peasemeal baked on an iron plate or griddle
over the fire. From a supposed resemblance
the turbot is sometimes called in Scotland the
bannock-fluke.

BANNOCK. See BANAK.

BANNOCKBURN, Scotland, village about
two and one-half miles southeast of Stirling, on
Bannock Rivulet. Here on 24 June 1314 Robert
Bruce, with 40,000 Scotch, inflicted a great de-
feat on Edward II at the head of 60,000 Eng-
lish troops. The victory was largely due to the
clever device of Bruce who had
caused the ground in front of his position to
be undermined in all directions. The English
cavalry stumbled onto the hidden pits, were
rendered helpless and the army was thrown
into confusion. The English are said by his-
torians to have lost 10,000 to 4,000 of the
Scotch. By this victory Bruce made his throne
secure and also assured the independence of
Scotland. See SCOTLAND—HISTORY.

BANNS, the announcement of intended
marriage, requiring the hearers to make known
their opinions. It is a legal and customary prac-
tice in matrimony. By the publication of these
banms is meant the legal proclamation or notifi-
cation within the parish, district or chapelry, of
the names and descriptions of the persons who
intend to be there married; the object being to
secure public knowledge of intended marriages,
and that all who have objections to the marriage
may be enabled to state them in time. If the
bridegroom live in a different parish from the
bride, the bans must be proclaimed also in
that parish, and a certificate of such procla-
mation must be produced before the celebration of
the marriage. According to the old English
canon law, the publication of bans might be
made on holidays; but a change was made to
sundays by Lord Bacon's Marriage Act of
1573, and although that act was afterward su-
perseded by the 4 Geo. IV chap. 76, the regula-
tion as to Sundays has been since continued.
Seven days' notice at least must be given to the
clergyman before publication of bans. Bans
were customary in various places before they
were prescribed by the entire Church in the
Fourth Council of Lateran. The Council of Trent ordered pastors to pub-
lish them at the principal mass in the parish
church, or churches, of the parties, on three
successive Sundays or festivals. This publica-
tion should be made within two months
preceding the marriage. For grave reasons the
bishop can dispense from this obligation. By
the English Prayer Book the announcement is
required to be made in the words of the rubric
on each of the three Sundays preceding the
ceremony. If objections are offered by anyone
present, the clergyman cannot proceed further.
Except in the Roman Catholic Church the cus-
tom of thus publishing the bans of marriage
is practically obsolete in the United States.

BANQUETS. It was the famous Mr.
Boswell who first defined man as a cooking
animal, and yet, appropriate as the definition still
is, neither mythology nor tradition offer any
cue to aid the student in discovering when it
was that the human animal first learned to
cook. Of course, it is highly improbable that
this secret was known to prehistoric man. In-
stead of knowing how to cook he undoubtedly
ate his food raw, washing it down with purc
cold water from the springs and brooks, and many years must have elapsed before he made the surprising discovery that the foods that sat beneath his feet would be as wholesome and of better taste if subjected to the influence of heat. All this, however, is little more than mere surmise for our only knowledge regarding the customs of eating in vogue during the remote past has been obtained from the relics unearthed by archaeology. On was now ruined and decayed the hand of the ancient painter and sculptor left a record of the customs of his time and from this source the student has been able to gather some information regarding the gastronomic progress of the human race.

Such records, however valuable they may be in the absence of other facts, are vague and unsatisfactory at best, and so, turning to ancient literature, one finds that the earliest references to food preparation and eating were not without a touch of the Biblical.

In Genesis, when Abraham bade Sarah make ready three measures of fine meal that he might be prepared to entertain the angel, the student finds his first direct reference to breadstuffs, and, from that time, the Scriptures often make mention of various kinds of food. The reader may obtain a more or less correct idea of the slow stages by which this branch of the human race progressed from its habits of primitive simplicity to the stately banquets of King Solomon and the extravagant feasts of Belshazzar.

As our meagre records show the art of feasting was practically contemporaneous with the Egyptians and the Hebrews it is not improbable that the latter race may have learned from the former the secrets of good living from the former during the time of the captivity, for at the period when both Greek and Roman were still content with the simplest fare the Hebrews had been initiated into the pleasures of the table, a fact which explains the many quaint Biblical warnings against the sin of gluttony, as in Esdras, where it is said that "the faces of them that have used abstinence shall shine above the stars."

Among the ancient Jews all festive repasts were held toward the close of the day, after all matters of business had been concluded. If the feast was to be one of great ceremony guests were not only invited long before the occasion, but again, on the day and as near as possible to the hour appointed, servants were sent to their houses to deliver orally the second, or "express" invitation, which announced that the host was now prepared to receive his guests. As this "express" invitation was sent to none but those who had already declared their acceptance, honor and propriety required that they answer the summons at once and in person, a fact which explains and justifies the feelings of resentment which were entertained by the master of the house in the parable of the great supper, on which occasion, as will be remembered, each person invited met the bearer of the "express" with a frivolous apology for his inability to be present at the feast to which he had already accepted an invitation.

Guests at Hebrew banquets were required to bring their cards of invitation and these were presented to servants stationed at the entrance door. Upon being admitted the guests were conducted to the receiving-room where water, oils and perfumes awaited them. If the host desired to exhibit a great mark of courtesy he provided each guest with a richly embroidered garment, light and showy and cut in a flowing fashion, which all were required to wear during the feast.

If the banquet was of a private character the master of the house presided, but on occasions of public festivity a governor of the feast was selected and it was his duty to see that the banquet was not only properly conducted but that the company present preserved at least a semblance of order. Appointment to this office was always regarded as a great honor, and, among the Greeks and Romans, the position was prized so highly that the choice of the individual to fill it was often decided by chance, as by the throw of the dice.

The positions of the guests at the tables were not fixed by inviolable rule. Sometimes they were arranged by seniority of family, or even according to the whim of the host who might desire to assign the most distinguished guests to places near his own person. In the earliest days, as is shown by the fact of the ancient Israelites setting six legged stools around a low table and the custom of reclining while eating was not introduced until about the last of the Old Testament days. At least, it was about this time that the Jews adopted this custom, as well as the habit of having but two-thirds of the table spread with a cloth, the portion where the food was to stand being left bare. In ancient Egypt and Persia the tables were arranged along the sides of the room and guests faced the wall.

At this time such articles as spoons, knives and forks were unknown and those who ate obtained the morsel they desired by dipping their slices of bread in the dish before them, folding the piece of meat or other food substance within it by the use of the thumb and two fingers. Later centuries saw the invention of the spoon but many hundred years elapsed before any other substitute for the fingers was suggested. Naturally the hands became smeared with grease but they were cleaned by being rubbed on slices of bread, kept for that purpose. This bread was then thrown to the dogs who waited beneath the tables for just such morsels from the feast. If the fingers became too badly soiled, however, servants appeared with water and assisted the guests to wash by pouring a stream over the hands into a basin.

When the party was a large one it was the custom for two persons to eat from one dish and the host often showed his spirit of hospitality by dipping his hand into his own dish, lifting a portion of the food, and offering sop to his guest. To decline such an attention was a breach of etiquette that stamped one as being extremely ill-bred. In order that the hands should be always clean from dirt, however the rabbis enjoined the "first water" and the "last water," or the washing before and after eating, and, in the case of travelers at least, the "first water" included the washing of the feet. After the adoption of the reclining table the guests lay with their faces toward the table, the left arm resting upon a cushion and the feet stretched out behind, while during the progress of the banquet both head and feet were frequently sprinkled with perfume to overcome
any unpleasant odor that might arise from too copious perspiration.

The food served at these ancient banquets consisted of flesh, fish, fowl, melted butter, bread, honey and fruit, all of which were brought to the table at one time, the service being accomplished by the use of trays, the number and quality of the dishes varying under different circumstances. In ordinary cases the portion of each guest consisted of four or five dishes, but if the guest was a person of great distinction this portion was increased until the dishes became so numerous that they were piled one upon another, completely covering the table. All this food, which was usually prepared in liquid or with a sauce, as in a stew, had been cut into conveniently small pieces before being served.

From the earliest days within the recollection of historical occasions have always included a banquet, however crude a festival it may have been, and it was the adoption of this custom that gave a religious as well as a social significance to so many of the Hebrew feasts. As the Lord's Supper of the Christians was derived from the Passover, so all the great religious festivals had, as their accompaniment, a domestic feast. On the occasion of the religious banquets, however, the wine was mixed according to rabbinical regulation, or with three parts water; four brief benedictions being pronounced over the cup before it was passed by the master of the feast.

The Greeks, like the Persians, began and ended their feasts with libations of wine, and some idea of the nature of an ancient Greek banquet may be obtained from the following curious account of a dinner given by Achilles in honor of Ulysses:

He cast down a great fleshing block in the fireplace, and laid thereon a sheep's back and a fat goat's and a great hog's choice, with fat. And Automedon held them for him while Achilles carved. Then he sliced well the meat, and pierced it through with spits. Then, when the fire were burned down and the flames waned, he scattered the embers and laid the spits thereupon, after he had sprinkled them with holy salt. Then when he had roasted the meat and apportioned it in platters, Patroclus took bread and dealt it forth in fair baskets, and Achilles dealt the meat; and he himself against prodigal Odysseus and had his comrade Patroclus to sacrifice to the gods, so he cast the first fruits into the fire. Then they put their hands to the good and lying before them.

Later, of course, the Greeks became more delicate eaters and vied with the Romans as to the elaborate character of their feasts. Like the Egyptians and Hebrews they reclined at table and their sumptuous repasts were divided into two courses: the first consisting of fish and meat, accompanied by the vegetables and several hors d'oeuvres or entrees, while the second course comprised the pastry, fruits and other kinds of dessert.

As soon as the regular meal was finished the tables were removed and the floor was cleaned of all fragments. Other tables were then brought in by the servants, tables covered with salted cakes, cheeses and other foods provocative of thirst, as well as the great mixing bowls, the pitchers of wine cooled in snow, and the jugs of unmixed wine, for the Greeks loved to drink heavily after eating, and as they drank, to an accompaniment of music, song and dances, young and handsome slaves garlanded their heads, and breasts and trunks and the flowering vines and flowers, not, as has sometimes been said, as a sign of festivity, but because the garlands were supposed to cool the forehead and counteract the heady effect of the wine.

Like the Hebrews the Greeks obtained their first lessons in cookery from the Egyptians and they soon put them to good account. The Athenians were particularly apt pupils in the kitchen science and they finally came to excel the rest of Greece in gastronomic achievements just as the modern French excel the rest of Europe in this day. An excellent proof of this assertion is to be found in the circumstance that what is regarded as one of the most valuable of the lost works of antiquity is a didactic poem on gastronomy, written by Archestratus, the intimate friend of one of the sons of Pericles. "This great writer," says Athenaeus, "has traversed earth and sea to render himself acquainted with the best things which they produced. He did not, during his travels, inquire concerning the manners of nations, as to which it is useless to inform ourselves, since it is impossible to change them; but he entered the laboratories where the delicacies of the table were prepared, and he held intercourse with none but those who could advance his pleasure. His poem is a treasure of science, every verse is a precept."

Among the great nations of ancient times the Romans were the last to learn the art of cookery. As late as the year 174 B.C. there were neither cooks nor public bakers in Rome, and the people were satisfied with and asked for nothing better than a kind of porridge made of pulse. This in addition to their vegetarian and some leguminous fruits formed their principal articles of diet. The Asiatic wars, however, introduced the Romans to the luxuries of the table and, in a day as it were, Rome, discovering that it had a palate, went mad on the subject of gastronomy. Slaves who could cook, bake or make sweets were brought to Rome in large numbers but, as every man of wealth was eager to please them, they brought the highest of prices.

As this was the dawning of the day of Rome's expansion it was not long before her agents began to supply her capital with dainties from all parts of the world. From the far East to the far West whatever seemed delicate of taste or that might help to tempt a nation of paupers already craving a new flavor was brought to the cooks in the Roman kitchens. To improve the quality of his cuisine the Emperor Vitellius, one of the most enormous eaters the world has ever known, sent his legions to every part of the empire to shoot game for him, while entire fleets were employed in doing nothing but catching the fish that were to grace his table. In fact it seemed as if Rome, so long satisfied with the humblest of fare, could not find a sufficient variety of foods to gratify its desire for novelty.

Even as early as Cesar's time, however, the Roman table was liberally provided with a variety of foods sufficient to satisfy almost any appetite. As an example of a feast given in those days one may take the following menu which was served at a pontifical banquet long before the advent of the golden days of Imperial Rome:

The first course, which was intended to merely whet the appetite, consisted of conger eels, oysters, two kinds of mussels, thrushes
served on asparagus, fat fowls, a ragout of oysters and other shell fish, with black and white marrons. The second course included a variety of shell fish and other marine animals, beccaficos, bunches of venison, a wild boar and a pasty of beccaficos and other birds. The third, and principal course, comprised the udder of swine, boar's head, a fricassee of fish, a fricassee of sow's udder, ducks of various kinds, roast fowl, with pastry and Ficentil bread.

As the years passed Rome experienced no deterioration in its love for the good things of the table. In fact, on the other hand, this pontifical menu was really a meagre bill of fare as compared to those which were afterward prepared by the Roman cooks for the delectation of the later Caesars. As an illustration the following description of a banquet in the time of Nero, which is taken from Dean Farrar's 'Darkness and Dawn,' is admitted by students to be a vivid but not exaggerated picture of a feast in the days of Imperial Rome. At this banquet, which was prepared under the directions of Otho, Nero entertained eight guests. The walls of the room 'were inlaid with mother-of-pearl and slabs of ivory... The table was of dark wood stuck with gold and silver, and heaps of gold and silver... among which were scattered amber cups... Although it was winter, garlands of exotic roses were provided for every guest, and none but the most youthful and beautiful of Otho's slaves were permitted to wait upon them. The supper was no supper of Trimalchio, with its coarse and heavy glutonies... The oysters were from Richborough; the lampreys were from the fishponds of a senator who was said to have flung into them more than one slave who had offended him; the mullet came from Tauromenos; the milk cheese from Carsina. There were two tiny dishes which represented the last and most extravagant devices of Roman gourmets, the one composed of the tongues of nightingales, the other of the brains of Samian peacocks and African flamingoes, of which the iridescent and crimson feathers adorned the silver plates on which they lay. Sea and land had been swept with mad prodigality to furnish every delicacy, and the table was covered with the vintages, and whereas four kinds of wine were thought extravagant in the days of Julius Caesar, Otho set 80 different sorts before his guests. Hot mushrooms alternated with bits of icy Perfumes were sprinkled on the hair and feet of the guests, and the amusements that were provided were dancing by Andalusian girls, dice and gambling. Offerings to the gods were not forgotten, however, and these were thrown into the hearth.

If this was a dainty repast, however, Rome was not always so dainty for the wealthy gourmands were not satisfied with eating well. They wanted to glutonize, to eat of everything in moderation until they found it impossible to eat any more, when, by resorting to the ever-conceverent Greek, strange that there were the feast and stuff themselves once more to repletion. On such occasions the more distinguished the company, the earlier began the banquet and the later it lasted.

Nor did the Roman table ever go dry for the want of rare and choice wines. In Greece the juice of the grape was almost invariably mixed with water, but Rome wanted no dilution of its revelling. Wildly extravagant and prodigal in everything, the Romans made no exception in the case of their drink. The wines that they used were preserved in jars or bottles of baked clay, and, as they were prized in proportion to their age, each receptacle bore a label on which it was distinctly stated in what consulship the beverage had been made. Many of these wines came from Italy, the Campania being considered the best, but the wines of Greece were also there, side by side with all the drinks that time or money could gather from every part of the world.

The fact that civilization and cookery go hand in hand was never more strikingly illustrated than in the case of the ancient Britons, for, in the earlier days of their history their cuisine was marked by all the limitations of primitive simplicity. The Roman conquest, however, appears to have applied to the kitchens of the country as thoroughly as to the government, for as the Roman conquerors were unwilling to eat the crude culinary preparations of the native Briton they proceeded to teach the conquered how to cook for them. Then, too, at about the same time, many of the German immigrants, with their own more wholesome cookery, was not without its good effect, and the transformation in Mme. Britannica's methods of cooking may be said to have been almost as wise as it was radical.

The centuries which succeeded the fall of the Roman empire, and which comprised the greater part of the Middle Ages, was as dark a period for gastronomy as it was for all other arts. For a time it seemed as if man had forgotten how to cook; as if he had lost his taste for the well-seasoned dishes which had once been his chief delight, and that he had no desire to get it back again. Even Charlemagne, who, according to his Capitularies, took a warm personal interest in his table, was a trifle both in the art of cooking and in that of service, for his banquets were barbaric affairs composed of huge roasts of meat dripping from the spit, and other crude features that would have put the ancient Roman gourmets to the blush. Personally, too, the great Emperor was extremely abstemious and seldom, even at dinner, permitted himself to be served with more than four dishes.

The reading of the description of Prince John's banquet in Sir Walter Scott's 'Ivanhoe' certainly gives the impression that the Normans, who appeared two or three centuries later, were justified in priding themselves upon their superior taste and discrimination in matters of eating, but even such flashes of light were but faint illuminations for so black a night for art as that of the dark ages.

Highly as the cuisine is esteemed to-day; idolized as it was before the fall of Rome and Greece called a halt upon civilization and placed a check upon progress, it seems somewhat strange that there were no affairs bright enough to detect the fact that the revival in the lost art of cookery had commenced. As the historians of those days dealt in facts, not in manners, however, it is impossible to state at just what period gastronomy began to be cultivated again, although, of course, it is well known that its revival, like
the revival in learning, was brought about in Italy. According to the best authorities, however, it was the merchant-princes of Florence who first thought of importing the cuisine of the country and their experiments met with such success that their efforts were greeted with the most heartfelt encouragement by travelers from foreign countries who were invited to sit at their table. In fact, that the French owed their instructions in the gastronomic art, for when Catherine de Medicis returned to Paris she carried several professors of the new cookery in her train. The effect of their importation was almost immediately noticeable. They improved the pot-au-feu; they expounded a new theory of taste; they expatiated upon the value of sauces, but, and this was more to the purpose so far as the progress of civilization was concerned, they introduced the art of making ices. Even the 16th century Montaigne, whose life was certainly cast in pleasant places, among the people who composed the best French society, was unable to appreciate the estimate that the Italian cooks of that day had so properly put upon their vocation. In one of his contemporaneous, if not somewhat reminiscent studies, he says:

I have been amongst one of those artists who had been in the service of Cardinal Caraffa. He discoursed to me of this science de guenile with a gravity and a magistral air, as if he were speaking of some weighty point of theology. He expounded to me a difference of appetites: that which one has fasting; that which one has after the second or third course; and the different rules of satisfying and then of exciting and picturing it; the police of sauces, first in general, and next in particularising the qualities of the ingredients and their effect; the differences of saints according to their seasons; that which should be warmed, that which should be served cold, with the mode of serving and embellishing them that make them pleasant to the view. He then entered on the order of the service, full of elevated and important considerations—

"Nec minimo sane discrimine refert Quo gesta leporis et quo gallina sequeris." And all this expressed in rich and magnificent terms, in those very terms, indeed, which one employs in treating of the importance of an experiment for my own man.

The period which intervened between the arrival of Catherine de Medicis from Italy and the accession of Louis XIV is one concerning which there is practically no authentic culinary record, although there is not the slightest reason to doubt that prodigious advances were made in the gastronomic art during that time. In fact, one has but to refer to one of the menus from the table of Louis XIV to realize that cookery had ceased to be an experiment, and it is necessary to go but a step further and compare the foods of Paris in Louis' time with those in use in other parts of the world, to realize the progress that had been made by the French cooks by the middle of the 16th century. In Paris, for example, the foods were not dissimilar to those of our own day, to which the following menu of a dinner which was served to Emperor Charles V, by the city of Halle, would certainly be a contrast:

(1) Raisins in malt flour; (2) fried eggs; (3) pancakes; (4) steamed carrot; (5) fried slices of bread; (6) a covered pottage; (7) a pea-soup with marrow, covered richly with peas and eggs; (9) yellow codfish boiled in butter; (10) roast fowl; (11) fried fish, with bitter oranges, spicy; (12) sweet pikes; (13) pulverized kernels, with almonds; (14) maise in almonds' milk; (15) fried fish with small olives; (16) calves' ears and platter.

And during this time England, too, had made some little progress in the improvement of its cuisine, although Henry VIII was one of the first monarchs who exhibited any liberality in rewarding originality in cookery. Henry, however, seemed unable to do enough for those who had not the means to procure the graces of the court or the tables of the nobility. He did not require the new cookery on his own table. We may, however, be justified in saying that the dishes of the French and of the English court were so good, so complete and so perfect that, save for the fact that they were too expensive and did not suit the English palate, and on one occasion, he was so much delighted with the flavor of a new pudding that he presented a manor to its inventor.

From the early days when the housewives of Britain had adopted a cuisine which may quite properly be termed an amalgamation of German and Roman cookery England had maintained a position of her own in the world of gastronomy. By no means as ostentatious as the ancient disciples of the art; less dainty, perhaps, than the more modern disciples in the various European countries, their school of the kitchen was so largely their own that it is not strange that Cardinal Campeggio, one of the legates charged to treat with Henry VIII concerning his divorce from Catherine, should have been requested to draw up a report on the state of English cookery as compared with that of Italy and France, by the express desire and for the especial use of his Holiness the Pope.

There are certain historical documents connected with the Seymour family, the arch-enemy of the Tudor family in London, which throw a most interesting light upon the culinary customs in vogue in England during the reign of the Eighth Henry. They show, for example, the manner in which he was entertained at the small on the occasion of his marriage to Jane Seymour. The facts, presented in a paper prepared by the Duchess of Somerset, are as follows:

The king, with his whole household and nobility, arrived at Wolfield on Saturday, 9 Aug., 1539. They remained Sunday, Monday and Tuesday. How or where so many lodges do not appear, but it is evident that the messengers, as the book called them, were to meet and eat for two hundred the first day. There are only two meals a day accounted for, and it appears that on Saturdays, as well as on Fridays, no meat was served, abstinence from flesh on these days having been ordered by a Royal proclamation, not only for health and discipline, but for the benefit of the commonwealth and the profit of the fishing-trade. The king's happening to be absent, I well remember.

Country places in Wiltshire have been better supplied with fish than they are now, for the bill of fare included pike, eels, salmon, tenches, lobsters, bream, plaice, trout, congers, carp, roach, eels, potted sea-fish and salmon pasties, pickled oysters, salt herring, (which was cod-fish salted at Alderney), sole, and whiting.

The next day being Sunday, there were messes for four hundred, and the provisions amounted to 12 meats, 5 puddings, 21 great capons, 7 good capons, 10 Kentish capons, 3 duxon and 6 coarse capons, 70 poults. 91 chickens, 38 quails, 9 geese, 6 gretas, 2 shields of brown, 7 swans, 2 cranes, 2 storks, 3 phoenaants, 40 partridges, 2 pheasants, 2 snipe, besides larks and breves—whatever they were.

It is scarcely necessary to trace the history of the banquet—which is, of course, but another name for the history of eating—with more close attention to detail. In contrasting the banquets of other days with those of to-day, however, one is struck by the fact that the modern peoples have also made some considerable improvement in the manner of eating and drinking, for one has but to turn to the menus of meals served at the beginning of the 19th century to find that dinner once so frequently burdened by 20 or more entrées.

In the last century before the Christian era stoic, Posidonius of Rhodes, in discussing the methods of cookery, took advantage of the opportunity to preach simplicity. He insisted that man, who had been blessed with good teeth, glands and secretions, a tongue and the usual apparatus for digestion was independent
of the cuisine, and this ancient pagan idea that the object of all repasts should be to take away the desire of eating and to maintain health and vigor has become more acceptable to thoughtful people during the past century. To-day our private banquets at least are simpler than they were when compared with those of even a century ago, and while their somewhat monotonous dreariness of any entertainment except that of eating and drinking, with occasional music, has recently been enlivened by the odd and eccentric, it is so obvious that these banquets are based upon the old desire for notoriety, the wish to dazzle which has inspired so many of the world's great feasts since the days of King Solomon's entertainment of the Queen of Sheba, that no particular attention is paid to such puerile attempts to provide a novelty.

To obtain a correct idea of the modern banquet, however, the public banquet conceived and executed in the most perfect taste, it is only necessary to recall the dinner given at Compiègne by President Loubet of France in honor of the Tsar and Tsarina of Russia. One of the most magnificent and perfectly appointed affairs of modern times, its 500 covers were served upon silver plate. Thomas skin, perhaps something more than $15,000, exclusive of the wines. And as these were the choicest brands and of the most ancient lineage their cost must have been fully as great as that of the dinner itself.

A story is told that upon this occasion the correspondent of one of the great foreign journals interviewed the chef for the purpose of securing some authentic details concerning the dinner. Among other questions he asked: *"And what was the chief novelty of the menu?"

Instantly the great man stood upon his dignity and his voice was strong in its wrath as he replied: *"Novelties! I would have you know that on the table of the guests of our country we lay down second editions."* A reply which might have been made by Vatel, the chef who killed himself, being unable to survive the dishonor of the table for which he was responsible.

In the various descriptions of President Loubet's banquet to the reigning sovereigns of Russia little is said in regard to the decorations or service, the writers confining themselves to the menu, that being the most important feature of the feast. Mention is made, however, that the flags, flowers, ribbons and spun-sugar ornaments united in a decorative scheme with effectively beautiful results.

In regard to the menu, however, it is apparent that it left nothing to be desired. The soups were clear turtle and Creme du Barry, which gave the guests a choice, after which *"came a wonderful dish of soft roes called on the bill of fare 'Caisses de laitances Dieppes' and mother, 'Banque dores en Vatel,' served with a remarkable sauce in which a hundred elements harmonized in a perfect whole. Venison with an acid dressing and braised quail, the most delicate bird of the species, a native of the vineyards of central France, followed, served with salad Potel, named for the chef who invented it and similar delicacies."* The triumphal achievement, however, was a savory entremet which is described as a "small pudding of asparagus heads served with a cream sauce." Hot-house fruits, ices, cheese and coffee comprised the final courses of the feast.

One of the exhibits which attracted the most attention at the last Paris Exposition was a service of Sevres which was admittedly the most beautiful and costly production that the famous potteries had ever attempted. Upon each piece of china was pictured a danseuse, but no two were the same, and in the odd type of loveliness. Realizing that the one "hobby" of the Tsarina was her love for beautiful china, of which she already had a famous collection, including the best specimens of the work of all the great potteries of the world, it was decided to copy this magnificent service in every detail. It was thus used at the banquet and was afterward presented to the first lady of Russia in the name of President Loubet.

The occasion upon which one nation entertains the rulers of another nation is an event when, if at any time, even the most ostentatious display might be regarded as permissible. If contrasted with the seemingly manner of living in vogue among modern diners at ordinary times this banquet of the French President may, in some respects perhaps, have bordered upon ostentation. When compared to the extravagant feasts of other days, however, it seems striking in its simplicity, for nothing could have been in greater contrast to the extravagant luxury of the banquets of the ancients, to say nothing of that of many more modern rulers, that luxury which preceded, if it does not lead to, decadence.

**BANQUETTE**, bän-keť, in fortification, the elevation of earth behind a parapet, on which the garrison of a fortress may stand, on the approach of an enemy, in order to fire upon them. Its dimensions vary and it is frequently made double; that is, a second is made still lower.

**BANQUO**, bän'kwō, a famous Scottish thane of the 11th century. In conjunction with Macbeth, cousin of Duncan, the king, he obtained a victory over the Danes, overlanded on the Scottish coast. Macbeth, shortly afterward, violently dethroned Duncan and caused him to be secretly assassinated. Banquo, though not an accomplice, was a witness of the crime; and being subsequently regarded by Macbeth with fear and suspicion, the latter invited him and his son, Fleance, to supper, and hired assassins to attack them on their return home during the darkness of night. Banquo was slain, but the youth made his escape. Shakespeare has interwoven this occurrence with the theme of his tragedy of 'Macbeth.'

**BANSHEE**, an imaginary female being supposed by some of the peasantry in Ireland and the Scottish Highlands to wail or shriek near a house when one of the inmates is about to die.

**BANTAM**, any one of various breeds of diminutive fowls kept for pleasure and partaking of the characteristics of the several breeds which they imitate in miniature. Thus the game-bantams are miniatures of exhibition game-cocks, and weigh about 22 ounces. The golden and silver Sebright bantams originated in America from a cross between a Polish
fowl and a bantam, and are exceedingly beautiful in plumage. The rose-comb bantams are little birds of Hamburg fowls, and should be either lustrous black or pure white; and the cocks have a rose comb square in front, evenly corrugated, and ending in a spike with a slight upward curve. Booted white bantams are those which have their shanks heavily feathered. The Cochín fowl is imitated in all its varieties by a bantam the cock of which weighs about 28 ounces. Most beautiful of all are the Japanese bantams, of which there are several varieties. The typical one is white with the tail black, and composed of long, sickle-like, white feathers held erect and edged with white. The wing quills are dark slate color edged with white, so that when the wing is folded it shows only white.

**BANTAM**, bán-tám′, or bán′tam, a province occupying the whole of the west end of the island of Java, containing a population of about 520,000. It long formed an independent kingdom governed by its own sultan, but at the beginning of the 19th century it was formally incorporated with the Dutch. Its capital, which bears the same name, was once the principal mart of Java and was surpassed by few towns of the East. It is now very much decayed. Bantam is believed to give name to the well-known small but spirited breed of domestic fowl.

**BANTAYAN**, Philippines, a town on the island of the same name in the province of Cebu, 62 miles north of the town of Cebu. Numerous shoals make navigation difficult. A leper colony inhabits a small island just off shore. Pop. about 14,000.

**BANTENG**, a wild ox (Bos sondaicus) of the mountain forests of the Malay Peninsula and Archipelago (except Sumatra), which greatly resembles the gaur (q.v.), and is by some considered a variety of that animal. These cattle are exceedingly fierce, and are regarded by sportmen as among the most dangerous of game. Nevertheless they have been tamed, and when crossed with the domestic cattle of the region yield a serviceable hybrid.

**BANTOCK**, Granville, English composer. b. London, 7 Aug. 1808. He was educated in London for the Indian civil service. His love of music caused a change in his plans and he took a preparatory course under Dr. Saunders. In 1889 he entered the Royal Academy of Music, where he was first holder of the Macfarren scholarship. He toured the world in 1894–95 as conductor of the Gaiety Company, conducting in the principal cities of America and Australia, and editing meanwhile The New Quarterly Musical Review. In 1896 he joined the G. Edwards' opera company. His London concerts of 1897 attracted wide attention because he confined himself exclusively to English compositions of recent date. He was appointed municipal director of music at New Brighton, in 1896, where he established a choral society. In 1898 he was principal of the Birmingham Music School from 1900 to 1907, and conductor of the Liverpool Orchestral Association after 1903. He was appointed professor of music in Birmingham University in 1908. He is a prolific composer. His chief works are: The Parchment of Caedmawr (1830); The Pearl of Iran (1836); an oratorio, Christ in the Wilderness (1807); the symphonic poems, Dante (1902); 'Fifine at the Fair' (1902); 'The Witch of Atlas' (1903); 'Lalla Rookh' (1903); 'Dante and Beatrice' (1911); vocal works with orchestra, 'Walisman' (1892); 'The Spirit of the Times' (1904); 'Sea-Wanderers' (1905); 'Omar Khayyam' (1907); the choral symphony, 'Atalanta in Calydon' (1912); a string quartet in C minor; serenade for four horns; piano works and songs; and the overtures, 'The Fire-Worshippers' (1892); 'Eugene Aram' (1895); 'Saul' (1907); and 'Overture to a Greek Tragedy' (1911).

**BANTRY**. Ireland, a seaport town in county Cork, 56 miles west-southwest of Cork. It consists of four principal streets and a spacious square, but the town generally has a mean appearance. It is a famous summer resort. It is at the head of Bantry Bay, where in 1796 a French fleet anchored and an abortive attempt was made to land. It has a growing trade in agricultural produce, and fishing is carried on to some extent. Pop. about 3,000.

**BANTRY BAY**, a deep inlet of Cork County, Ireland, remarkable both for its beauties and for its natural advantages, although the latter are turned to but little account. It is about 25 miles long and from three to five miles wide, and is safe and commodious for vessels of any size, the water being deep close to both shores, with a few rocks of shoals. A French force tried to land here in 1796. The entrance is guarded by Crow Head on the northwest and by Sheep's Head on the southeast.

**BANTU**, bán′too, or bá-ntóo, the ethnological name of a virile and prolific group of African races dwelling below lat. 6° N., and including the Kaffirs, Zulus, Bechuanaans, the tribes of the Loango, Kongo, etc., but not the Hot tentots. Their birthplace has not been determined; but they moved south from central Africa by way of the east, and the organization is by means of paramount and lesser chiefs, the one military and the other industrial. In the one case the chief is absolute ruler; in the other his power is limited and he governs through a council of his chiefs and a general assembly of the tribesmen. The system of land tenure is on a communal basis. The tribes occupy settled dwellings; certain articles of dress are worn; and polygamy is recognized. The women perform most of the agricultural labor, and the men are hunters and herdsmen. They are skilful in wood and metal working, weave a coarse cloth from cotton and are capable workers in pottery. Maize is the staple food. The term is also used to denote the homogeneous family of languages spoken in Africa, which form the vast region lying between Kamerun, Zanzibar and the Cape of Good Hope, with the exception of the Hottentot, Bushmen and Pigmy enclaves. Bantu, in almost all of these languages signifies "the people," and hence is applied to the whole linguistic family. The Bantu family, although divided into hundreds of dialects, is evidently derived from one
mother tongue. Consult Deniker, ‘Races of Man’ (London 1900).

BANU, bān’ū, or bān’ū-noo, or BANNU, British India, a district in the Punjab; area 3,888 square miles; pop. over 330,000. It is watered by the Indus, which here, during inundations, becomes a vast body of water many miles wide. Nearly all the inhabitants are Mohammedans. Agriculture thrives, especially in the cultivation of the ordinary cereals, sugarcane, cotton and various oil seeds.

BANVILLE, bān-vël, Théodore Fauchille de, French poet and novelist: b. Moulins, 14 March 1823; d. Paris, 13 March 1891. He was the son of a naval officer and went early in life to Paris, where he devoted himself exclusively to literature, contributed to many journals and reviews and lived in close friendship with some of the foremost artists and men of letters of the day. First known as a poet through two volumes entitled ‘The Cariatides’ (1842) and ‘The Stalactites’ (1846), he established his reputation with the ‘Odes Funambulesques’ (1857), a sort of great lyric parody published under the pseudonym BRACQUEMOND, which immediately found great favor and was followed by ‘New Odes Funambulesques’ (1866), afterward reprinted as ‘Occidentales’, ‘Prussian Idyls’ (1871); ‘Thirty-six Merry Ballads’ (1875), etc. As a poet he was one of the most amusing of lyricists, and from his acrobatic feats in different forms of metre has been called the king of riqueurs. He has also another side. His swinging metres are reminiscent of the anacrountics of Ronsard. His inspiration, however, is purely verbal. His adoption of old forms of verse, such as the ballads, rondel and rondeau, was followed by Austin Dobson and Andrew Lang. As a prose writer he is favorably known by a number of humorous and highly finished tales and sketches like ‘The Poor Mountebanks’ (1853); ‘The Parisians of Paris’ (1866); ‘Tales for Women’ (1881); ‘The Soul of Paris’ (1890). etc. Of considerable literary interest is ‘My Recollections’ (1883). His *Works* were published (8 vols.) 1873-78, and a posthumous volume, ‘Dernières poésies’.

BANYAN, bān’yan, or bān-yān, or BAN-ianTREE (Ficus Benghalensis), an East Indian tree of the natural order Urticaeeae, noted for the roots which descend from the branches and become accessory trunks, thus permitting the original tree to extend over a wide area. In the Calcutta botanical garden one specimen known to be upward of 100 years old has more than 3,000 small trunks, 230 that vary from two to three and one-half feet in diameter, and a main trunk 13 feet in diameter. Among these trunks 7,000 people could stand. The trees often attain a height of more than 70 feet. The leaves are ovate heart-shaped, five to six inches long and as much broad; the leaves are succeeded by cherry-like scarlet fruits which are eaten by monkeys. The seeds seldom germinate on the ground, but usually among the leaf bases of palms, the roots descending its gnarled trunks, penetrating and finally killing them. As the banyan ages its original trunk dies and decays, leaving the younger trunks to support the life of the tree.

The Hindus ascribe various medicinal virtues to this tree, which they regard as sacred. Its light porous wood, its juice and its fruit have no important economic uses. Its close relative, *Ficus indica*, which does not root from the branches, is sometimes erroneously called the banyan-tree.

BANYUMAS, bān-yoo-mās (Javanese, *golden water*), Java, a residency and town situated on the south coast of the island. The area of the residency is 2,100 square miles and its population about 1,300,000. The chief culture is rice; but coffee, tea, sugar, indigo, cinnamon and other exotics are produced by corée labor, as enforced by the Dutch in other parts of Java. The town and seat of the residency is on the river Seraio, 22 miles inland. It has a considerable trade and contains a population of about 6,500.

BANYUWANGI, bān’ yoo-wan’ gē, Java, the extreme eastern district of the island, noted for its extensive coffee gardens and for the remarkably pure sulphur obtained from the Goonong-Marapi volcanic mountain. This is also the name of the capital of the district, an important seaport and Dutch military post, on the Strait of Bali, about 550 English miles east-southeast from Batavia. It has an extensive trade and an estimated population of 9,000.

BANZ, bānts, once one of the richest and most famous of the Benedictine monasteries, on the right bank of the Main, three miles below Lichtenfels, Bavaria. Founded in 1071, and destroyed in the Peasants' War in 1525, it was rebuilt and although plundered again in the Thirty Years' War it gradually became famed for the scientific attainments of its monks. In 1803 it was broken up and its library and collections were divided between the Munich museum and other institutions.

BAOBAB, bā’bah (Adansonia digitata), a tree belonging to the family Bombacoaeae, which was named after the naturalist Adanson. It is also called the monkey-bread tree. The leaves are deep green and are divided into five unequal digitate leaflets. This tree is a native of western and northern Africa; it is cultivated in many of the warmer parts of the world. It is one of the largest known trees, its trunk being sometimes not less than 30 feet in diameter. In Adanson's account of Senegal some calculations are made regarding the growth of this tree, founded on the evidence of the annular layers. The height of its trunk by no means corresponds with the thickness which it attains. Thus, according to his calculations, at one year old its diameter is one inch; and its height five inches; at 32 years old it has attained a diameter of two feet, while its height is only 22 feet, and so on; till at 1,000 years old the baobab is 14 feet broad and 58 feet high; and at 5,000 years the growth literally has so outstripped its perpendicular height that the trunk will be 30 feet in diameter and only 73 feet high. The roots, again, are of a most extraordinary length, so that in a tree with a stem 77 feet in girth the main branch or tap root measures 123 feet in length. It often happens that the profusion of leaves and of drooping boughs almost hide the stem, and the whole forms a hemispherical
mass of verdure 140 to 150 feet in diameter and 60 to 70 feet high. The wood is pale-colored and soft, so that in Abyssinia the wild bees perforate it and lodge their honey in the hollow, which honey is considered the best in the country. The negroes on the western coast apply the trunks to a very extraordinary purpose. The tree is liable to be attacked by a fungus which, vegetation in the woody part without changing the color or appearance, destroys life and renders the part so attacked as soft as the pith of trees in general. Such trunks are then hollowed into chambers, and within these are suspended the dead bodies of those to whom are refused the honor of burial. There they become mummies, perfectly dry and well preserved, without further preparation or embalming, and are known by the name of quirios. The baobab is emollient and mucilaginous; the pulverized leaves constitute lalo, a favorite article with the natives, which they mix with their daily food to diminish excessive perspiration, and which is even used by Europeans in fevers and diarrheas. The flowers are large, white and handsome; and in their expansion bear some resemblance to the white poppy, having snow-white petals and violet-colored stamens. Both flowers and fruit are pendent, and the leaves drop off before the periodical rains come on. The fruit is of an oblong shape, of considerable size, and tastes like gingerbread, with a pleasant acid flavor. The expressed juice, when mixed with sugar, forms a cooling drink much used in putrid fevers; this juice is generally used as a seasoning for corn gruel and other food. The bark furnishes a strong fiber.

BAOUR-LORMIAN — BAPTISME

BAOUR-LORMIAN  bə-oor-lɔr-myän, Louis Pierre Marie François, French poet and dramatist: b. Toulouse 1772; d. 1854. He first attracted wide notice through his 'Poems of Ossian' (1801), an extremely clever imitation of Caledonian verse; and afterward won success with a tragedy, 'Omasia, or Joseph in Egypt' (1807). Other works of his are 'Political and Moral Vigils' (1811), in the manner of Young; 'Duranti or The League in the Province' (1828), a historical novel; and 'Legends, Ballads and Fabliaux' (1829). But his best work is probably a poetical translation of the book of Job, completed after he had lost his eyesight.

BAPAUME, bə-pôm, France, a town in the department of Pas-de-Calais, 12 miles south of Arras. Here, on 2 and 3 Jan. 1871, took place two fierce struggles between the French army of the north and the Prussian army of observation; the French being defeated with a loss of over 2,000. Bapaume fell into German hands early in the European War, but was reconquered by the British on 17 March 1917, an event that marked the close of the great battle of the Somme, begun in June 1916. The first to enter the recaptured town were the Australian troops, who cleared the streets and houses of the retreating enemies. The town had suffered severely; hardly any of the houses were inhabitable. The civilians had left their homes over a year before, and the condition of the town was wretched, as the great offensive, which began on 21 March 1918, the town again fell to the Germans after very sanguinary fighting.

BAPHOMET, the name of a mysterious image which the Knights Templars were charged in Abyssinia that their orders was suppressed by Philip IV of France. It is probably a corruption of Mahomet, and the charge may have arisen from the circumstance that some of the Templars had gone over to the Moslem faith. According to Von Hammer, the word signifies 'Meke, or fire, and is connected with Gnostic rites. Consult Hallam's 'Middle Ages.'

BAPTANODON, an extinct ichthyosaur or fish-lizard of the Jurassic period. Its remains have been found in the marine Jurassic shales of Wyoming and other Western States, which have hence been called 'Baptanodon Beds.' It is distinguished from the true ichthyosaurs (q.v.) (found only in the Old World) by the form of the paddle-bones, which are rounded instead of polygonal, and was incorrectly supposed to be toothless, as its name indicates. The skulls are two to three feet long, so that the entire animal probably measured 10 to 15 feet and resembled the ichthyosaurs in proportions and habits.

BAPTISM (from the Greek bapto, from baptizein, to immerse or dip), the application of water to a person as a sacrament or religious rite. It is generally thought to have been usual with the Jews even before Christ, being administered to proselytes, but was probably nothing more than a ceremony of purification. From this baptism, however, that of John the Baptist differed, because he baptized Jews also as a symbol of the necessity of perfect purification from sin. Christ himself never baptized, but directed his disciples to administer this rite to converts (Matt. xxviii, 19); and baptism, therefore, became a religious ceremony among Christians, taking rank as a sacrament with all sects which acknowledge sacraments.

In the primitive Church the person to be baptized was immersed in a river or in a vessel, with the words which Christ had ordered, and a new name was generally bestowed at this time further to express the change. Sprinkling, or, as it was termed, cinct or pouring, was used only in the case of the sick who could not leave their beds. The Greek Church and various Eastern sects retained the custom of immersion; but the Western Church adopted or allowed the mode of baptism by pouring or sprinkling, since continued by most Protestants. This practice can be traced back certainly to the 3d century, before which its existence is disputed. Since the Reformation there have been various Protestant sects, called Baptists, holding that baptism should be administered only by immersion and to those who can make a personal profession of faith.

The Montanists in Africa baptized even the dead, and in Roman Catholic countries the practice of baptizing church bells has been common of 10th century origine. It continues to this day. Being an initiatory rite, baptism is, therefore, administered only once to the same person. The Roman and Greek Catholics consecrate the water of baptism, but Protestants do not. The practice of baptism has been on the whole largely simplified, the old formula that the person is baptized in the name of the Father, Son and Holy Ghost; but among most Christians it is preceded by a confession
BAPTISM FOR THE DEAD—BAPTISTS

of faith made by the person to be baptized, if an adult, and by his parents or sponsors if he be a child.

The Roman Catholic form of baptism is far more elaborate than the Protestant. This Church holds that baptism is a sacrament which has the effect to remove in the individual the penal consequences of the sin of Adam, to restore him to a state of supernatural grace, and to give him a right to the full vision of God, remitting all actual sins committed by the individual. It also imprints an indelible character, which is both an ornament to the soul and a capacity for receiving the other sacraments. The effect of the sacrament is produced ex opere operato; that is, by an act of the Holy Ghost infallibly accompanying the performance of the external rite. Bishops, priests and deacons are the ordinary ministers of baptism, and all others are forbidden to baptize except in case of necessity. Baptism is, however, valid when duly administered by any person, and any one may lawfully baptize in case of necessity. On the part of children and others who have never attained the use of reason no disposition is necessary. In order to receive the sacrament validly a person who has the use of reason must know what he is doing and intend to receive baptism. In order to receive the grace of the sacrament he must have faith, and, if he has committed mortal sins, repentance; otherwise the grace of the sacrament remains suspended until he acquires the proper dispositions. Besides sacramental baptism, called baptismum fluminis, there are two substitutes which can supply its place, called, in a wide and improper sense, baptismum sanguinis and baptismum fluminis. The former of these is the martyrdom, the second is the desire of baptism, accompanied by faith and perfect contrition or the love of God. These only supply the place of baptism when it cannot be had, and confer sanctifying grace, but not an indelible character. Solemn baptism is accompanied with the application of chrism and holy oil, and several other ceremonies of great antiquity.

BAPTISM FOR THE DEAD, a customary rite for the dead. It probably consisted in the vicarious baptism of a living Christian for a catechumen who had died unbaptized, the latter being thereby accounted as baptized. It is doubtful if the custom was of very primitive antiquity, and it seems to have soon died out in the Church, although kept alive by Marcionites and other heretics. It was forbidden by the Synod of Hippo (393). It is observed by the Mormons at the present day.

BAPTISM OF THE DEAD, a superstitious custom which anciently prevailed among the people of Africa of baptizing the dead. The third council of Carthage (Can. vi. 29) speaks of it as a matter of which ignorant Christians were fond, and forbids "to believe that the dead may be baptized." Gregory Nazianzenus observes that the same view was generally prevailed among some who delayed to be baptized. It is also mentioned by Philastrius as the general error of the Montanists, or Catharaprians, that they baptized men after death.

BAPTIST CHURCH OF CHRIST, The, came into separate existence in Tennessee about the beginning of the 19th century as a reaction against certain features of excessive Calvinism. General redemption and the perseverance of the saints form cardinal articles of their belief; and the washing of feet is by them practised as an ordinance. Congregations of the Baptist Church of Christ are found in Tennessee, their chief stronghold, Arkansas, Alabama, Mississippi, Missouri, North Carolina and Texas. In all there are about 150 churches with a total membership of over 8,000.

BAPTIST YOUNG PEOPLE'S UNION OF AMERICA, an association representing many young people's societies connected with the Baptist churches in the United States and Canada, organized June 1891 in Chicago, which place has since been its headquarters. Upon the formation of the Union, as the withdrawal of the Baptist societies was feared by the Christian Endevor societies, a plan of federation was adopted for the establishment of young people's societies over the Union should be required. Conventions are held yearly. Consult Bacon and Northrop, 'Young People's Societies' (New York 1900).

BAPTISTA, John, Carmelite poet: b. Mantua 1448; d. 1516. His poetical writings were well known throughout Europe during his lifetime; their correctness of form and choice Latinity caused them to be used as texts in the schools. His greatest poem is 'De Calamitate Temporum' ('Of the Evils of the Day'), and is divided into three parts.

BAPTISTERY, that part of the church, or a special building in which is administered the sacrament of baptism. In the earliest ages of Christianity the solemn administration of this sacrament was reserved to the bishop, and to the Episcopal church was generally annexed a special building called the baptistery. As the converts to Christianity increased, it became necessary to set aside for the baptismal ceremonies a small space within the main building of the various parish churches. The large baptisteries were generally circular or polygonal in form and were placed close to the cathedral church. Many were ornamented with their beautiful architectural forms. Northern Italy contains many fine examples, notably at Pisa, Parma, Florence, Cremona, Lucca, Siena, Bologna, Ascoli and elsewhere. Many of these are large buildings capable of holding great throngs of people. About the time of the Renaissance separate baptisteries ceased to be erected, baptismal fonts within the church taking their place.

BAPTISTINES. (1) A religious order of women founded in 1744 in Genoa by Baptista Solimani. Their rule enjoined strictfast throughout the entire year, the chanting of the office at midnight and conversation with friends or relatives restricted to three times during the year. (2) A congregation of secular priests founded in 1755 by Dominic Olivieri and placed under the jurisdiction of the Propagation of the Propagation by Pope Benedict XIV. The congregation ceased to exist at the end of the 18th century.

BAPTISTS, the name of a religious body that sprang from the Separatist movement in England. Though there were groups of Ana-baptists in England in the 16th century, they
were mostly of Dutch origin and made no permanent impression on the English people. One wing of the English Puritans at length deserted of reforming the Church of England in accordance with their ideas, and decided that it was their duty to come out of that institution and establish a "true church," i.e., consisting only of the regenerate. These early Separatists grew into the two modern denominations known as Congregationalists and Baptists.

From about 1593, groups of Separatists gathered in and about Gainsborough, in Lincolnshire. About 1606, persecution drove them to Holland. Part of them, who had met at Scrooby manor, went to Leyden, whence many afterward became the Pilgrims of the Mayflower, who established the colony of Plymouth in 1621. The Gainsborough group went to Amsterdam with their "teacher," the Rev. John Smyth, who had been a clergyman of the Church of England and a lecturer in Lincoln in 1600. Here Smyth first became acquainted with the strictest form of Arminianism, which he soon adopted, and with the Mennonites, whose rejection of infant baptism seemed to him to be according to Scripture. He gave utterance to his new views in a tract called The Character of the Beast (1609), and 36 adherents joined him in establishing a new church on the principle of baptizing believers only. Smyth baptized himself and then his followers, and on this account he is often called the "Se-Baptist." In 1611 members of this sect returned to London, established a church there, and new churches were formed in other places, and these General Baptists (so called because they believed in a general or universal atonement) increased rapidly. In 1644 their opponents estimated their numbers at 47 churches.

In 1616 a congregation of Separatists was gathered in Southwark, London, by Henry Jacob, a former minister of the Church of England. A peaceable division of this church took place in 1633, a part going out to establish a new church and receiving a new charter; this probably meant a baptism on profession of faith. In 1640 a further division occurred, and some of the new group became convinced that baptism should be immersion; so they sent one of their number, Richard Blunt, to Holland, where he was immersed by a Mennonite minister at Rhynsberg, and on his return the members of this church were all immersed. In a few years this became the established practice of all the Baptist churches. In 1644 seven churches issued a "Confession of Faith," in which baptism was for the first time defined as "dipping or plunging the body under water." This group of churches became known as Particular Baptists, because they insisted on the Calvinistic doctrine of an atonement for the elect only. This distinction of Particular Baptists became less significant with the lapse of time, and ceased altogether with the formal union of the two bodies in 1891. Both groups were one in their advocacy of believers' baptism and soul liberty. The Confession of 1644 was the first public document to assert Baptist conscientiousness, as the tenderest thing unto all conscientious men, and most dear unto them, and without which all other liberties will not.

be worth the naming, much less the enjoying. The Revolution, just then beginning, was their opportunity. Baptists were uniformly on the side of Parliament, and several of them rose to high rank in Cromwell's army, while their churches grew rapidly.

It was natural that they should experience their full share of persecution after the Restoration,—long imprisonment, heavy fines and even death rewarded their devotion to civil and religious liberty. One of their preachers, John Bunyan (q.v.), was confined 12 years in Bedford jail for the crime of preaching the gospel, and employed his time in writing the immortal allegory of The Pilgrim's Progress (q.v.). The Revolution of 1688, and the adoption of the Toleration Act in the following year, removed from Baptists the worst of their disabilities, but their growth for a time was checked by the influence of Socinianism among the General Baptists and Hyper-Calvinism among the Particular Baptists. Not until the Wesleyan revival of the 18th century awakened all Englishmen, which he once adopted, and with the Mennonites, whose rejection of infant baptism seemed to him to be according to Scripture. He gave utterance to his new views in a tract called The Character of the Beast (1609), and 36 adherents joined him in establishing a new church on the principle of baptizing believers only. Smyth baptized himself and then his followers, and on this account he is often called the "Se-Baptist." In 1611 members of this sect returned to London, established a church there; soon churches were formed in other places, and these General Baptists (so called because they believed in a general or universal atonement) increased rapidly. In 1644 their opponents estimated their numbers at 47 churches.

In 1616 a congregation of Separatists was gathered in Southwark, London, by Henry Jacob, a former minister of the Church of England. A peaceable division of this church took place in 1633, a part going out to establish a new church and receiving a new charter; this probably meant a baptism on profession of faith. In 1640 a further division occurred, and some of the new group became convinced that baptism should be immersion; so they sent one of their number, Richard Blunt, to Holland, where he was immersed by a Mennonite minister at Rhynsberg, and on his return the members of this church were all immersed. In a few years this became the established practice of all the Baptist churches. In 1644 seven churches issued a "Confession of Faith," in which baptism was for the first time defined as "dipping or plunging the body under water." This group of churches became known as Particular Baptists, because they insisted on the Calvinistic doctrine of an atonement for the elect only. This distinction of Particular Baptists became less significant with the lapse of time, and ceased altogether with the formal union of the two bodies in 1891. Both groups were one in their advocacy of believers' baptism and soul liberty. The Confession of 1644 was the first public document to assert Baptist conscientiousness, as the tenderest thing unto all conscientious men, and most dear unto them, and without which all other liberties will not.
BAPTISTS

now more numerous than those or any other denomination save the Wesleyans, and are mostly of the Calvinistic type. In Scotland the beginning of Baptists was still later, the first church having been formed in 1750. Though some preachers of notable power have risen among the Scotch Baptists, and the Haldanes brothers, they have never made a considerable impression on the Scotch people.

From the beginning, the Baptist churches of Great Britain have been divided on the question of communion with other churches. Most of the early Calvinistic churches and part of the General Baptists insisted on "close" communion, the restriction of the ordinance to the baptized (immersed). Most of the General Baptists and part of the Calvinistic favored "open" communion, or invitation to the eucharist of all Christian people, whether immersed or not. Many churches followed the "open" communion principle to its logical conclusion and admitted the unconverted to membership also, and gave its pastor, both in small and large churches. The number of churches adopting the more "liberal" practices has been steadily increasing.

The number of Baptists in Great Britain in the last accessible report (1916) was England, 1,997 churches, 264,922 members; Wales and Monmouthshire, 940 churches, 124,795 members; Scotland, 151 churches, 21,871 members; besides a few in Ireland, Isle of Man and the Channel Islands, bringing the total to 3,135 churches and 414,923 members.

Baptists in European countries have no historic connection with the Anabaptists of the Reformation period, but began in the 19th century with a mission to France (1832), a church of six members being formed in Paris in 1835. After the Revolution of 1848 there was freedom from persecution and opportunity of growth, and there has been gradual progress, though slow. Before the European War, there were 41 churches, with 1,602 members reported. The lack of a school for the training of a native ministry has been a great barrier to the advance of French Baptists.

In Germany, the Baptist churches were the result of the conversion and labors of John Gerhard Oncken, native of Oldenburg (1800), who spent some years in England and was a colporter in his native land of the British Continental Society. He came to Baptist views of the Church and its ordinances from independent study of the Scriptures, without knowing that a people existed anywhere who held and practiced such principles. Professor Barnas Sears, of the Baptist Theological Seminary at Hamilton, N. Y. (now the theological department of Colgate University), was pursuing studies in Germany. Oncken became acquainted with him and was by him immersed, together with six others, and the first Baptist church of Hamburg was constituted. For some years Baptists were severely persecuted, but gradually were allowed to thrive, and their number increased, until in 1916 they numbered 232 churches and 44,338 members. They have established missions in the surrounding countries: Austria, Belgium, Bulgaria, Denmark, Russia, Switzerland, which have been successful.

In Russia, especially, the Baptist missions have met with great success among the Stundists (q. v.), a large part of whom have adopted the Baptist principles. Russian Baptists in 1916 numbered 839 churches and 60,295 members. With the granting of complete toleration in that country, there is every reason to expect that their development will prove remarkable.

A Triennial Conference formed in 1849 unites the operations of the German churches and their missions (known since 1855 as the German Baptist Union). A theological school was established at Hamburg in 1880, which has given these churches a well-trained ministry, and this fact has had much to do with their progress.

The Baptists of Sweden owe their origin to Gustaf W. Schroeder, a Swedish sailor, baptized at the Mariner's Baptist Church of New York in 1844, and Frederick O. Nilsson, also a converted sailor, baptized in 1847 by Oncken. The first church was so persecuted that most of them emigrated and settled in Minnesota. In 1891 Captain Schroeder built a meeting-house at Gothenburg, and Nilsson became its pastor; both were holding a religious service, but toleration was soon granted and several other churches were formed. In 1857, they organized a Conference, and in 1866 the Bethel Theological Seminary was established at Stockholm. American Baptists assisted in the erection of a new building for this school in 1883, as they also did for the German school at Hamburg. Swedish Baptists were the first Christians to establish Sunday schools, Christian Endeavor Societies and other modern activities in their native land. They have also sent out missions to Norway and Finland, which have been very successful. In Sweden there are now 643 churches with 54,394 members; in Norway 39 churches and 3,588 members; and in Finland 54 churches with 3,179 members.

Baptist missions have been established in other countries: Greece, Spain, Italy. That in Greece was long ago abandoned, and only a mission in Italy by Southern Baptists is conducted at present. That began in 1826 in Rome, where a theological school is maintained, and up to the beginning of the European War flourishing missionary work was maintained in many parts of the kingdom. A strong and intelligent native ministry is rapidly developing, and with the restoration of peace growth should be steady. There are now 46 churches and 1,626 members. Of all European Baptists it is true that their numbers have been constantly depleted by emigration, while membership of churches of the various races in America has been correspondingly increased. The total enumeration of the continental Baptists is: 2,098 churches and 202,682 members.

The first Baptist church in Canada was the result either of emigration thither from the American colonies, or of missionary labors by American missionaries. From 1798 the formation of churches proceeded in both upper and lower Canada. At an even earlier date, Baptists were found in Nova Scotia, and a church at Horton was organized in 1778. A group of churches in the Ottawa Association were composed mainly of Scotch immigrants and among them were converts of the Haldanes. Since 1846 the Baptist Convention of the Maritime Provinces has directed the activities of the churches of Nova Scotia, New Brunswick and Prince Edward's Island; and
in 1888 various former societies were consolidated into the Baptist Convention of Ontario and Quebec, which they found missions and support their educational institutions. Of these the most important are McMaster University, at Toronto, founded in 1880, and Acadia College, at Wolfville, N. S. In the great Western provinces of the Dominion Canadá, Baptists are discovering a fruitful field for their cultivation. They now number: churches, 1,325; members, 137,922.

A Baptist church was organized in Sydney, N. S. W., in 1834, and since that time the work has extended to the principal towns of Australia, and to the adjacent colonies of England, Tasmania and New Zealand. Besides the work among the white people, a mission is maintained among the Maoris. In the seven Australasian states there are now 344 Baptist churches, with 30,168 members. In other English colonies, the institutions of religion have uniformly followed the flag and sometimes preceded it. A church was formed in south Africa in 1820, which was the precursor of various efforts, so that now there are 131 churches and 18,924 members. A Baptist church was established at Kingston in Jamaica, in 1816, and now in the West Indies there are 379 churches and 53,660 members.

BAPTISTS IN THE UNITED STATES.—1. Before the formation of the General Convention.—Among the early settlers of the American colonies were some who were called "Anabaptists," but the first attempt to organize a church was made in the colony of Rhode Island, soon after its foundation (1638). Roger Williams (q.v.), an English Puritan, educated at the University of Cambridge, came to Massachusetts Bay in 1631 and was soon called to be minister of the church at Salem. He taught several things that were regarded as heresies, and was condemned by the General Court, 8 Oct. 1635, to be deported to England, chiefly because he denied the authority of the civil magistrate to punish other than civil offenses. He fled from the jurisdiction of the court, purchased some land from the Narragansett Indians and established the colony of Rhode Island, those who settled with him making a compact to obey the laws duly enacted "only in civil things." This was the first government in the world to be established on the basis of absolute religious liberty. Williams was joined by some of his Salem church, and from their study of the Scriptures they decided that baptism of infants is unwarranted. Williams was baptized by one of the number, Ezekiel Holliman, and then baptized the others, thus constituting a church of 12 members (March 1639). It is not quite certain how the baptism was administered, but there is no record of a later change from immersion to affusion.

At about the same time a colony was begun at Newport, the leader of which was John Clarke, an English physician of Puritan tendencies. The church formed by them soon became, it is not always a Baptist church (the traditional date is 1644, but the early records have perished). A Welsh Baptist church emigrated in a body in 1663, and settled first at Rehoboth, then at Swansea. The church lost with any others who came into their colony, and persecutions of the Baptists were frequent and severe. John Clarke and Obadiah Holmes came from the Newport church and held a religious service in home and foreign missions and support their educational institutions. Of these the most important are McMaster University, at Toronto, founded in 1880, and Acadia College, at Wolfville, N. S. In the great Western provinces of the Dominion Canadá, Baptists are discovering a fruitful field for their cultivation. They now number: churches, 1,325; members, 137,922.

A Baptist church was organized in Sydney, N. S. W., in 1834, and since that time the work has extended to the principal towns of Australia, and to the adjacent colonies of England, Tasmania and New Zealand. Besides the work among the white people, a mission is maintained among the Maoris. In the seven Australasian states there are now 344 Baptist churches, with 30,168 members. In other English colonies, the institutions of religion have uniformly followed the flag and sometimes preceded it. A church was formed in south Africa in 1820, which was the precursor of various efforts, so that now there are 131 churches and 18,924 members. A Baptist church was established at Kingston in Jamaica, in 1816, and now in the West Indies there are 379 churches and 53,660 members.

Another group of Baptist churches gathered about Philadelphia, the first being formed in 1668 at Pennepeck (now within the city limits), while at the same time another church was organized at Middletown, N. J. Within the next decade a number of churches were established in New Jersey and about Philadelphia, which soon came into fraternal relations and held "general meetings" with each church in turn. Out of this custom grew the first Association (1707), a delegated body having no legislative or judicial authority over churches or ministers, but having in its care their common interests and conducting their missionary and benevolent work. As Baptist churches became more numerous other associations were formed, but the Philadelphia was long the leading body and is still one of the most influential. The issue of a Confession of Faith in 1742, in the main a readoption of the English Confession of 1688 (which was essentially the Westminster), determined the theological trend of American Baptists toward Calvinism, rather than Arminianism.

The Baptist churches fully participated in the spiritual results of the Great Awakening (q.v.), and in all the colonies they made rapid advance. In Massachusetts, for example, the number of churches grew in 40 years from 8 to 73, and of members from 200 to over 3,000. In the whole of New England, the increase was tenfold, and even more rapid growth was made in the South Atlantic States. Severe persecutions in Virginia did little to retard this advance, and after the Revolution progress was greatly accelerated. From this time punitive laws were repealed in all the States, and gradually all forms of religious belief were placed on an equal legal footing. The principle of enthrone the first, a Baptist church in law in the colony of Rhode Island, became the accepted principle of the Federal Constitution and was adopted soon in the various State Constitutions. This principle had been advocated in a private house, but never in its beginning, and its incorporation into the fundamental law of the United States has been
followed by practically every American country and is to-day recognized by European jurists and statesmen as the most important contribution of modern times to political philosophy and the science of government. In 1906 France became the first European nation to adopt the same principle.

The settlement of the West after the Revolution offered a great opportunity to the Baptists. The churches and associations of the older communities sent traveling preachers as missionaries among the new settlements. Baptist churches were in many cases the first to be formed in the new States, and in all cases among the first. There are no trustworthy statistics, but an estimate generally accepted is that in 1800 there were 48 associations and 1,200 Baptist churches in all the States, with 100,000 members. The growth of Baptists during this early period far outstripped that of the population.

2. From the Foundation of the General Convention to the Division of the Denomination.

Up to this time the Baptist churches had little cohesion and no common enterprises. They were now led to unite in the work of foreign missions. In 1810 the American Board of Commissioners for Foreign Missions had been formed, mainly by the Congregational churches of Massachusetts, and had sent several missionaries to India, among them Adoniram Judson (q.v.) and his wife and Luther Rice. From study of the Scriptures they became convinced that only believers should be baptized, and that infant baptism was a perversion. So on their arrival at Calcutta they sought out English Baptist missionaries and were immersed. This involved severance of their relations with the Board that had sent them out; so the English Baptists assumed temporary support of the Judsons, and Luther Rice returned to interest American Baptists in this missionary enterprise. He quickly found churches in and about Boston to undertake the support of the Judsons; and then undertook a tour of the country in foreign missions of all Baptist churches. His labors were so extensive and successful that a convention of delegates representing Baptists of all States met at Philadelphia in May 1814 and formed the General Convention of the Baptist Denomination in the United States for Foreign Missions. For a time the convention carried on home missions also, but in 1832 a separate American Baptist Home Mission Society (q.v.) was formed. A Tract Society begun at Washington in 1824 was later removed to Philadelphia and grew into the American Baptist Publication Society. These three national societies became the great bond of unity between the churches — the only bond of unity possible under the congregational polity of Baptists, which insists on the independence of each church in its own affairs — by promoting co-operation in a common work. More than any other assignable cause, this explains the remarkable growth of Baptists during the next three or four decades.

Next to this, the activity of Baptists in Sunday-school work is the key to their progress. The Sunday schools of Robert Raikes (q.v.) were secular schools; the first real Sunday-school work among the Baptists in the United States was that of William Fox. In 1797 the Second Baptist Church of Baltimore began such a school and after 1800 Sunday schools increased rapidly. The progress of missions and Sunday schools caused a great demand for the Bible, both in the English version and in translations made by missionaries. This led to local societies for the circulation of the Scriptures, and at length to a national organization, the American Bible Society, formed in 1816 by representatives of every denominational section. The refusal by the Society to print versions made by Baptist missionaries caused the holding of a convention in Philadelphia in 1837 and the formation of the American and Foreign Bible Society. A controversy in this body about the translation of the Bible into English was the origin of the American Bible Union, in 1850.

The unanimity of Baptists in these new enterprises was soon involved. Violent secession was made to the Sunday schools, missionary and Bible societies, and even to the Convention, as unscriptural. Deeper still, as a cause of disunion, was the drift of the majority of the churches away from the older extreme Calvinism, to which they had remained attached. The result of agitation of these questions was division of the churches, a comparatively small minority withdrawing from co-operation with the others and forming a body since known by the various names of Old School, Primitive or "Hard Shell" Baptists. The churches of this order have shown little capacity of growth in the North, and many of them have become extinct; but they are numerous and even flourishing in some Southern States, especially in the mountainous parts of Tennessee and Georgia. There was another large secession of Baptists in the South and Southwest as a result of the movement led by Alexander Campbell and others, from 1815 to 1835, resulting in the establishment of the Disciples of Christ (q.v.). This did not seriously affect the Baptists of the Middle and New England States, but they suffered almost equally from the agitation known as the Millerite movement, which was the origin of the Adventists (q.v.).

In spite of all hindrances Baptists increased notably in numbers in the period we are considering. They participated in the great revivals that characterized these years. At the beginning of the century, being one in 14 of the population, they came by 1845 to be one in six, having increased in members from 100,000 to 600,007, and in churches from 1,200 to 6,406.

3. From the Division in 1845 to the Formation of the Northern Baptist Convention, 1877.—The controversy regarding slavery effected schisms in nearly every religious body of the United States. From 1825 onward this became a subject of bitter debate everywhere, and could not be kept out of the meetings of religious societies, inasmuch as it was at bottom an ethical and religious question. The compromises proved unworkable, and in May 1845 a convention representing the Baptist churches of the South met at Augusta, Ga., and formed the Southern Baptist Convention. The common missionary enterprises were henceforward carried on by various boards elected by the Convention and responsible to it and
thence to the churches. This has proved to be a very compact, flexible and effective organization, much superior to that of the North. There the old Convention was transformed after the division into the American Baptist Missionary Union, and made an exclusively foreign missionary society, and the Baptist Mission and Publishing Society remained entirely independent. Three organizations instead of one proved to be a complicated and expensive method of doing the business of the churches, besides introducing rivalry and confusion, which became worse rather than better as time went on. The two Bible societies further complicated matters, and at one time threatened another disruption, but a convention held at Saratoga in 1883 effected a settlement of the Bible question by recommending that the work abroad be done through the Missionary Union and that at home through the Publication Society.

During this third period Baptists have prospered in all their enterprises, but their most notable advance has been in educational work. They began before the Revolution to establish schools, Brown University having been opened in 1764, and a number of colleges and theological schools were founded before 1850. Their combined endowments were small, probably less than $50,000, and their students few. There are now (1917) 15 theological schools, with 1,449 students, property valued at over $3,000,000 and endowments of more than $6,000,000; 12 institutions of collegiate grade, with 1,870 students, property valued at nearly $39,000,000 and endowments of over $42,000,000; besides academies to the number of 118, with 18,019 students, nearly $7,000,000 in property, but with endowments less than $2,000,000—most of them having none whatever. These statistics do not include institutions like George Washington (formerly Columbian) University and the University of Chicago, founded by Baptists and largely endowed by them, which are not distinctively Baptist. The inclusion of such would double the figures given above.

During this third period Baptists increased numerically much faster than the population, the latter increasing about three and one-thirdfold, while Baptists increased sixfold. The statistics for 1917 report 1,960 associations, 51,248 churches and 6,107,686 members, or one to every 16 of the population. Of these 2,593,249 are Southern whites and 2,150,929 are negroes. The separate organizations of the latter were formed after the close of the Civil War, their first State convention being in North Carolina, in 1866, and their national convention having been organized in 1880.

The formation of the Northern Baptist Convention in 1907 was the result of agitation for the unifying of the work of Northern Baptists. It is a strictly delegated body from the churches, which elects the officers of the three missionary societies, supervises their work and controls their expenditures. In view of the legal obstacles to actual consolidation, this seems to be the most practicable method of unifying the body. A said budget is voted by the Convention and apportioned to the State conventions, thence to the associations and finally to each church, which is expected to raise or surpass the sum suggested. The practical efficiency of this scheme has not yet been fully demonstrated. In 1910 the Free Baptists decided to merge their missionary work with that of the Northern Baptists, which is as a result of the combined bodies as the Baptist polity admits. The theological and other differences between the two bodies long since virtually disappeared.

The advance of home and foreign missions has also been a marked feature of recent years. Until 1859 Baptist foreign missions were practically confined to India and China. Since that time missions have been established in every Asiatic country, notably in Japan, and the scope of previous labors has been greatly widened. Since the United States acquired the Philippines a mission has been begun there. An already established African mission was taken over in 1884 and has been vigorously prosecuted. Southern Baptists, besides maintaining Asiatic missions, have evangelized some of the countries of South America. In Asia there are now 1,897 Baptist churches, with 213,647 members; in Africa, 131 churches and 18,924 members; and in South America 150 churches and 16,928 members. The contributions for missions have doubled thrice, and now amount for Southern Baptists to $1,300,000, and for the Southern to nearly $700,000. In home missions, besides the usual evangelizing agencies, a very important educational work among the Southern negroes has been conducted since the Civil War; 13 higher schools and 10 normal schools, all maintained, at a cost of $130,000 a year. The work among foreign populations is also of much significance; 356 missionaries and four teachers are engaged in it. The annual income for this work amounts to more than $1,000,000. A similar work is conducted by the Southern Baptists through a Home Mission Board, with an expenditure of $387,000. There has been similar expansion in the work of the American Baptist Publication Society, which publishes 58,982,000 copies of Sunday school periodicals annually, and does a general publishing and book-selling business amounting to $321,000 additional. Besides this, it conducts Bible, colportage and missionary work, with an expenditure of over $600,000. The Sunday School Board of the Southern Baptists carries on similar work, with annual income of $474,000.

In all comparisons of Baptists with other religious bodies, only communicant members should be reckoned. Every Baptist member is necessarily a communicant, since a cardinal principle of all Baptists is that none should be baptized and become members of the Church except on their personal, intelligent profession of faith. However Baptists may differ on other points, they are a unit on this. They are also one on the fundamental principle of baptism, as commanded by Christ and practised by the apostles, was the immersion of such a professor or believer. A third point in which they are united is that the Christian Church is a democracy, in which "there is neither male nor female," and that each church is independent of any external authority in its own affairs. From this they draw a corollary, which may
be reckoned a fourth common principle, that church and state should be absolutely separate. With regard to other matters they have differed so widely, that there are still in the United States 13 distinct varieties of Baptists that maintain separate organizations. All but one of these, often called by way of distinction the "regular" Baptists, are comparatively small in numbers, the whole not numbering more than 400,000 members.

The number of Baptists in the world, as reported for 1916, is: 61,335 churches, with 7,200,324 members.

HENRY CLAY VEDDER, Professor of Church History, Crozer Theological Seminary.

BAPTISTS, Freewill, originated in New Hampshire in 1738, as a strong anti-Calvinistic body. Benjamin Randall, a Congregationalist, left that body and advocated open communion. He was influenced in this step by the prominence given by the Methodists to various of the ideas advocated by him. Randall's first Free will Baptist Church was in New Durham, N. H. In 1841 the Free-Communion Baptists of New York State united with the Freewill Baptists. In 1870 the Free-will Baptists numbered about 60,000, and in 1895 over 86,000. For some years prior to this their organization was known as the "Free Baptists." In 1910 the Free Baptists and the Regular Baptists of the United States consolidated their missionary societies and work and made it possible for the local churches to unite, if they saw fit. In 1912 the Free Baptists had 1,110 churches and over 65,000 adherents. The "Original Freewill Baptists," a distinct organization, similar to the General Baptists of England, date their origin from 1729. In 1912 they had 884 churches and over 57,000 members.

BAPTISTS, German Brethren. See GERMAN BAPTIST BRETHREN.

BAPTISTS, Old School or Primitive. This body split off from the other Baptist denominations about 1835, though they themselves claim to be the "original Baptists." They are opposed to the strict Calvinistic tendencies exhibited by others of the Baptist denominations, and do not countenance paid ministers, and consequently they do not maintain theological seminaries, schools or colleges. They have gradually lost their hold in the Middle States, where education has spread, but they still hold their own in the mountainous regions of Georgia, Tennessee and North Carolina. In all they have nearly 3,000 churches and over 100,000 members.

BAPTISTS, Seventh-Day, who hold that the command to observe the seventh day, the Jewish Sabbath, is incumbent upon all Christians as well as Jews, date the foundation of their society back to 1676, when the first church of the denomination was opened in London by Francis Bampfield, preacher at Exeter Cathedral. Since then various churches professing the same views as Bampfield have come into existence and several of them have disappeared. The original society is still active. The first church of the Seventh-Day Baptists was founded at Newport, R. I., in 1671 by Stephen Mumford. Although this latter is older than the English by a few years it does not appear that the one grew out of the other. The American society, which has its missionary headquarters at Westerly, R. I., is active in missionary work and maintains a publishing house at Plainfield, N. J.; an academy at Salem, W. Va., and two colleges, one at Milton, Wis., and the other at Alfred Centre, N. Y. The 96 churches and more than 8,000 members of the American society are scattered over 24 States.

BAPTISTS, Sixth-Principle, believe that the laying-on of hands is an indispensable ordinance of the Church of Christ. They are a survival of the General Baptists who early made their appearance in Connecticut and Rhode Island. In 1917 the Society had less than 1,000 members.

BAPTISTS, Two-Seed-in-the-Spirit, had their origin in the preaching and ultra-Calvinistic doctrines of Daniel Parker, a Baptist elder and preacher of Tennessee. Parker, who was ordained in 1806 in Tennessee, became one of the strongest opponents of the organized work of the Church. In 1817 he moved to Illinois, where he continued his opposition to the work and organization of the regular Church for 19 years. Later he went to Texas. In various pamphlets (1826-29) Parker made public some very peculiar theories he held concerning the introduction and perpetuation of evil in the human race. According to these beliefs, God, when He created Adam and Eve, infused into them particles of Himself, thus making them altogether good; the devil corrupted them by infusing into them particles of himself. Eve, by predestination, became of a certain number of good and a certain number of bad offsprings; and all her daughters after her were destined to do likewise. The atonement, according to Parker, applies only to those born of the good seed, those born of the bad being absolutely lost. This Baptist sect is uncompromisingly opposed to all human institutions. They are found in 21 States and have nearly 500 churches and nearly 13,000 members.

BAPTISTS, United, were so-called after the union of the Regular and Separate Baptists in Kentucky in 1801. They departed somewhat from the strictly Calvinistic principles laid down by other denominations. The latest census gives the United Baptists 196 churches in Kentucky, Tennessee, Missouri, Alabama and Arkansas with a membership of about 13,000. At one time the Association was much stronger than it is now; but the union of many of the United Baptist churches with other Baptist denominations weakened them greatly.

BAR. In heraldry, one of the charges known as ordinaries. It is formed by two
BAR, Russia, a town in the government of Podolia; so called after the birthplace of its foundress, Bona Sforza, the wife of King Sigismund I of Poland. It is famous as the place where a delegation of the Polish people was held with a view to combating the Russian influence and the adherents of Russia in Poland, 29 Feb. 1768. The Russian fleet then rendezvoused on the following 28 May, together with 1,400 men and 20 pieces of cannon. Eleven fairs are annually held here. Leather-dressing, distilling, brick-making and a trade in grain are carried on. Pop. about 13,000.

BAR HARBOR, Me., a popular summer resort in Eden township, Hancock County, Me., on the east shore of Mount Desert Island. It is on a branch of the Maine Central Railroad and is also served by ship from New York, Boston, Portland and other Atlantic coast ports. The ocean here is often too cold for bathing, even in summer, and a large open-air sea-water swimming pool serves as a substitute. There is a naval coaling station on the north shore of Eastern Bay, and Bar Harbor is frequently the rendezvous of the north Atlantic squadron of the United States navy. It derives its name from a sandy bar which connects Mount Desert with the largest of the Porcupine group. The surrounding scenery is very pleasing, and within a short distance there are many points of interest readily accessible to the tourist. Among these are the summit of Green Mountain, Eagle Lake, Mount Newport, Kebo, The Ovens, Great and Schooner Heads, Spouting Horn, Thunder Cave and Eagle Cliff. It was first discovered by Champlain, Mount Desert was settled in 1608 by French Jesuits, whose colony was destroyed eight years later by an expedition from Virginia. A permanent settlement was effected by the English in 1761. The town of Mount Desert was incorporated in 1789. Since that date the towns of Eden, Cranberry, Tremont and Southwest Harbor have been formed from the original tract. Consult Street, 'Mount Desert: A History' (1905). Pop. about 2,200.

BAR-LE-DUC, bär-le-dük, or BAR-SUR-ORNAL, bär-sur-o-nal, a river called by the French and capital of the department of Meuse, 125 miles east of Paris, known also as the Meuse. River, is an upper and a lower town, the former of which commands a fine view. The lower town extends into the valley traversed by the Orne, here crossed by three stone bridges. The ancient Church of Saint Etienne is of 14th century workmanship; the ruined castle commanded the entrance into Lorraine. The streets are wide and well laid out, but the public buildings are inferior. The chief manufactures are textiles and paper, and there are foundries. The preserved fruits and confectionery, as well as the wines of Bar-leaduc, are in repute. Pop. 17,068.

BAR SHOT, a double-headed shot, made of two half-balls connected by a bar, and formerly used in naval battles for cutting away the masts and rigging of the enemy's ship.

BAR-SUR-AUBE, bär-sür-öb, France, a town 34 miles east of Troyes, in the department of Aube, notable as the scene of a victory of the allied forces commanded by Schwarzenberg over the French, commanded by Macdonald and Oudinot, 27 Feb. 1814. The council
which decided the plan of campaign of the Allies was held here the day before the battle. It is an ill-built, ancient town, numerous old coins and urns attesting that the Romans must have had a camp here. Bar-sur-Aube was destroyed by the Huns in the 5th century, but was rebuilt soon after, when it became a place of commercial importance. A chapel on the bridge over the Aube marks the spot from which the Bastard of Bourbon was hurled into the Seine in 1441.

The leading manufactures include leather, flour and agricultural implements, and there is a trade in grain, wine and wool. Pop. 4,533.

BAR-SUR-SEINE, bär-sûr-sahn, France, an ancient town in the department of Aube, pleasantly situated on the left bank of the Seine, 21 miles by rail southeast of Troyes. The river is crossed here by a double bridge. It is notable as the scene of a victory of the allied forces over the French, in March 1814. Pop. about 3,300.

BARABA, bā-rä-bā’ or BARABA-TAR-TAR, a steppe of Siberia, in the government of Tomsk, more than 100,000 square miles. Covered with salt lakes and marshes, it was colonized in 1730 by the Russians, who have since cultivated parts of it.

BARABAS, bā-räbäs, the principal personage in Marlowe's tragedy, 'The Jew of Malta.'

BARABBAS, the robber released by Pilate at the Passover when Jesus was condemned to death. It was a custom of the Roman government, for the sake of conciliating the Jews, to release one Jewish prisoner, whom they might choose, at the yearly Passover. Pilate desired thus to release Jesus, but the Jews demanded Barabbas (Matt. xxvii., 16-26).

BARABBAS: A DREAM OF THE WORLD'S TRAGEDY, a romance by Marie Corelli. It is the story of the last days of Christ, his passion, and resurrection. The story is dramatically told, florid in style and appeals more to the emotions than to the reason.

BARABINSKI, a Tartar tribe living on the banks of the river Irizh, and engaged in pastoral and agricultural pursuits. Their religion is Shamanistic, but Christianity has made some progress among them.

BARABOO, bārā-bōo, Wis., city and county-seat of Sauk County, on the Baraboo River, and the Chicago & N. W. Railroad, 40 miles northwest of Madison and three miles from Devil's Lake. Settled in 1839 in the center of a scenic and agricultural region, it has important manufacturing interests, which are promoted by excellent water power; is a noted fruit centre; and has a national bank, city hall, water-works, electric light, gas works, daily, weekly and monthly periodicals. It is governed, under an incorporation charter of 1882, by a mayor, elected biennially, and a municipal council. Pop. 7,000.

BARABRA, bā-rābbrā, Africa, a mixed ethnic group—Nubian, Egyptian and Arab—living on both sides of the middle Nile, from Wady Halfa to Assouan. They are about 40,000 in number, and are believed to belong to the same stock as the ancient Egyptians.

BARACOA, bā-rah-kō'ā, Cuba, a seaport near the eastern end of the island, in the province of Santiago de Cuba, about 90 miles east by north of Santiago. It has a land-locked harbor and exports coconuts, bananas and other tropical fruits. The industries include the making of oil from the coconut and the manufacture of chocolate. The first settlement of white men on the island of Cuba was made here by Velasquez in 1511. This town was the capital of Cuba from 1518 to 1521. Near it is the mountain noted as the "Anvil of Baracoa." In the vicinity Maceo and his men began in 1895 the struggle for Cuban independence. Pop. about 6,000.

BARADA, bā-rā'dā, the Abana of the Bible, a river of Syria, rising in the Anti-Libanus and flowing across the plain to the east past Damascus. It loses itself in a lake called Bahret el-Ateibeh. Around Damascus its waters are used for irrigation by means of canals.

BARAGA, bār'ā-ga, Frederic, Austrian Roman Catholic prelate and missionary: b. Tref- fen, Carniola, 29 June 1719; d. Mainz, Germany, 19 Jan. 1868. He came to the United States in 1830 and spent the rest of his life among the Chippewa and Ottawa Indians in Michigan. His Chippewa grammar (1851) and Chippewa dictionary (1851-53) are of philosophical importance, and he was also the author of a work in German on the 'History, Character, Manners and Habits of the North American Indians' (1837).

BARAGUAY D'HILLIERS, bā-rą-ga-de-yā, Achille, Count, marshal of France: b. Paris 1795; d. 1878. He was the son of Louis Baraguay d'Hilliers (q.v.). In 1830 he took part in the expedition to Algeria, in which his success gained him the confidence of the government, which created him a lieutenant-general. In 1841 he was made governor-general of Algeria. On the fall of Louis Philippe in the revolution of 1848 the provisional government appointed him to the command of the military division of Besançon. He replaced Changarnier in the command of the army of Paris, and concurred in the accomplishment of the coup d'état on 2 Dec. 1851. In the war with Russia in 1854 Baraguay d'Hilliers was commander-in-chief of the Baltic expedition, and for his services received the dignity of marshal of France, and later was nominated a senator. He took an active part in the campaign of 1859, when France leagued with Sardinia to free Italy from Austrian domination.

BARAGUAY D'HILLIERS, Louis, French general: b. Paris 1764; d. Berlin, 6 Jan. 1813. Receiving an appointment in the army of Italy from Napoleon, he shared all the success of the campaign of 1796-97. Made general of division and commandant of Venice, in 1798, he accompanied the expedition to Egypt; and afterward successively held appointments on the Rhine, in the Tyrol and in Catalonia. He commanded a division in the Russian campaign of 1812, but during the retreat incurred the displeasure of Napoleon and appears to have died from chagrin and disappointment.

BARAK ("Lightning Flash"), son of Abinom, was the ally of Deborah in the struggle against the Canaanites. He led 10,000 men of
Naphtali and Zebulun in the direction of Mount Tabor while Deborah undertook to attract Sisera’s army toward the same place.

Barak routed the Canaanites and pursued them to Harosheth, where he and Deborah sang the 'Ode of Triumph.' Barak seems to have been a representative Jewish leader of his time. The name Barak is met with in various forms in cypriot languages; I also mention, for example, was the surname of Hamilcar. See DEBORAH.

BARANOFF, Alexander Andreewich, Russian explorer and merchant: b. Kargopol 1747; d. 16 April 1819. A merchant and manufacturer in Irkutsk, Siberia, in 1780, he became manager of the colony previously founded on Three Saints Bay, Kodiak Island, Alaska, in 1791, but soon afterward taking charge he transferred the trading post to Saint Paul's Harbor, Kodiak Island, and established posts in Cook Inlet and in Prince William Sound. At Vosresensky Harbor, now Resurrection Bay, in 1794, he built the first ship constructed north of Boston Harbor on the northern coast of America. In 1796 he placed a colony at Yakutat Bay. Upon the organization of the Russian American Company, in 1799, he was made chief manager, and his jurisdiction included all of Alaska, the Aleutian Islands and the Kuril Islands. In this year he established a post at Old Sitka, on the west side of Baranof Island, which was destroyed by the Indians in 1802. In 1804 he drove the Indians from the site of the present town of Sitka, built a fortified post and named it New Archangel, to which he transferred the headquarters of the company. During Baranoff's administration of the affairs of the company it maintained trading posts only along the southern part of Alaska, from Sitka to Unalaska, including the Chugatch Gulf (Prince William Sound), and the Gulf of Kenai (Cook Inlet). They traded as far north as the Bristol Bay region and took seals on the Pribilof Islands, but had no settlements north of those places. In 1812 he placed a fort at Ross, near Bodega Bay, California, and also maintained a station on the Farallon Islands for several years. He extended the commerce of the company to the Spanish settlements in California, to the Sandwich Islands (Hawaiian Islands) and to China. His administration of the affairs of the company closed in 1818, and in November of that year sailed for Russia by way of the Cape of Good Hope. The ship was detained at Batavia, Java, where Baranoff fell ill of a fever, and a few days after leaving that port he died and was buried in the Straits of Sunda.

BARANOFF ISLAND, the most important of the Alexander Islands, Alaska. It is about 100 miles long and 25 miles broad. On its northwest coast is the town of Sitka. The island derives its name from the Russian trader, Baranoff, who in 1799 took possession of it.

BARANTE, bà-ránt, Amable Guillaume Prosper Brugièr, Baron de, French historian and statesman: b. Riom, Auvergne, 10 June 1782; d. 23 Nov. 1866. After filling some subordinate offices he was appointed in 1809 prefect of La Vendée. In this year he published his 'Tableau de la Littérature Française au XVIIIe Siècle.' In 1815 Louis XVIII made Barante Secretary of the Ministry of the Interior, the same place he had held in 1807 as deputy in the Chamber of Deputies, where he voted with the Moderate Liberals. In 1819 he was raised to the Chamber of Peers. His principal work, 'Histoire des Ducs de Bourgogne de la Maison de Valois, 1354-1477' (1824-28), is a standard history of the Burgundian house. He also published 'Histoire du Directoire' (1855); 'Études Historiques et Biographiques'; 'Études Littéraires et Historiques' (1858). Consult also 'Souvenirs du Baron de Barante' (1890-99).

BARANTEZEVICH, Karimir Stanislavovich, Russian man of letters: b. Saint Petersburg 1851. His father was a descendant of a noble Polish family and his mother was French. At the time of the Polish insurrection (1831), Baranetz's grandfather was hung in the presence of his wife and two sons, but the tradition of revenge was maintained by either the father of the author or any member of the family. Baranetz's style for books was created in him by his own father, who taught him to read and write at the age of five. When the author was eight years old he read eagerly Pushkin's 'Svyatogor' ('The Son of the Country') and under the inspiration received from that classic wrote, a year later, his first essay, 'Ponyatovsky,' glorifying the deeds of a Polish hero who opposed the aggression of the Russian armies. But when he entered the gymnasium he had read a great number of good books in various languages. But the subjects taught in the school interested him in a very small degree and he left the classroom in the fourth year. At that time appeared his poem, 'Zabytaya Dyerevniva' ('Forsaken Village'), which, although obviously a mere imitation of Nekrasov, earned for him a remarkable popularity among the peasantry whose friend he wished to become despite the traditions of his family. When his father died he fell into dire poverty and was obliged to work for his living from morning till late at night. However, despite all these strenuous efforts, he adapted A. Tolstoy's 'Prince Serebranyi' into a drama 'Oprichina' ('Life-Guards') which was produced successfully and which brought to the author an honorarium of 600 rubles. When his mother died he saw no obstacle in marrying his lowly but beautiful fiancée, Dara Niko- laevna Alekseyeva. This marriage, the birth of a child increased the author's burden and the family was obliged to live in the house of a drunken train conductor. It was there that he wrote ' Odin iz nashih starih znameniy' ('One of our Old acquaintances') and the novel. But fame came to him from his novel, 'Porvannyia Struny' ('Broken Strings'), and almost all first-class magazines urged him to contribute to their columns, which he did most successfully. In a series of remarkable short stories ('Under Oppression', 'The Old and the New', 'Short Stories') and his separately published novels, 'Rabia' ('Bondmaid') and 'Chushak' ('Stranger') he has given powerful sketches of
the life of the lowly plebeians which bear the seal of his own struggle in life. The society of Petrograd has not been known to him intimately enough to describe its life with exactness. Men and their forms are uniformity of types and absence of intrigue. Man and his soul form the principal subject of his work, and, while his elaboration could be, and often is, surpassed from the artistic point of view, his stories have thrilled and enthralled the soul of the reader as much as anything that has been written in Russian in the course of the last century.

BARASINGHA, bär-a-sin'ga. See Swamp-deer.

BARATARIA, Pirates of, a company of outlaws under the leadership of a notorious bandit, Jean Lafitte, who established their rendezvous in the Bay of Barataria, 40 miles south of New Orleans. They were the greatest depredations on English and Spanish shipping, but their colony was broken up in 1814 by a United States naval force. Lafitte and some of his men subsequently served under Jackson in the battle of New Orleans.

BARATARIA BAY, a body of water in the southeastern part of Louisiana, extending north from the Gulf of Mexico, between the parishes of Jefferson and Plaquemine. It is about 15 miles long by six wide, and it and the lagoons branching out of it were rendered notorious about the years 1810–12 as being both the headquarters and rendezvous of the celebrated Lafitte and his buccaneers. See New Orleans, Campaign and Battle of.

BARATHRON, the name of a deep gorge near Athens, into which criminals condemned to death were thrown. It was originally a quarry, but was enlarged in order to serve for purposes of punishment. Usually persons were thrown into it after execution, but occasionally while living.

BARATIERI, bär-rä-tyär'e, Oreste, Italian general: b. Condino 1841; d. 1901. He fought under Garibaldi in Sicily in 1860 and joined the regular army in 1866. He was appointed in 1875 governor of Eritrea, Italy's new conquest on the Abyssinian coastland of Africa. Under the schemes of conquest entertained by the Italians Baratieri advanced with an army into the highlands of the interior, capturing Kassala in 1894, and later marching into Tigré, whose prince he twice defeated in January 1895. King Menelik's forces to the number of 100,000 were now sent against Baratieri, who was obliged in consequence to retreat from Adowa, the capital of Tigré, in the direction of Adigrat. Demoralization of the Italians becoming evident, Baratieri, fearing it might become general and hamper his retreat, determined to risk all on a battle with the Abyssinians, and once more turned his forces on Adowa. On 1 March 1896 the battle was fought near Adowa. The Italians were routed with a loss of 250 officers and 7,000 men and all their artillery. Baratieri was court-martialed and was absolved of criminal responsibility but was censured for his conduct of the campaign, and left the army. He published his Mémoire d'Afrique 1892–95 in 1897 as a defense of his method.

BARATYNISKII (properly Boratyniski), Evgenii Abramovich, Russian poet: b. 10 Feb. 1800; d. 29 June 1844. He was educated in the page-corps, from which he was expelled in 1816. Later (1820) he joined an infantry regiment in Finland, where he became an officer. In 1825 he married, retired from military service and traveled extensively through Germany, France and Italy. He started writing poetry very early in life and had the good fortune to become intimately connected with Pushkin, Gnedich, Pletnevyyi and other young and gifted poets whose friendship undoubtedly influenced the development and direction of his talent. His lyric poems soon gained him a prominent place in the number of Pushkin's poetic circle of the so-called "romanticists." In the midst of the savage nature of Finland the romantic nature of the poet grew more powerful, but the predominant quality of his poetry is the elegiac tone, especially to his death. (1829). This poem was soon followed by 'Ball,' 'Orgie,' 'Gypsy-Girl,' in which the poet excels in original simplicity, choice of figures and lively colors, but in which he shows the powerful influence of Pushkin and Byron. In regard to technique he is a master of form and rhyme and some enthusiasts have placed him much higher than Pushkin himself as a versifier. But the main characteristic of his poetry is meditation and absence of true emotion, the chief requisite for a true masterpiece in lyricism; in his poetry there is no trace of that sentimentality that is so abundant in the work of his models. As a thinker he is destitute of the definite and his characters are but shadows in a mirror which leave no deep impression despite their exquisite exterior form. The best of his lyrics are undoubtedly 'Finland,' 'The Last Poet' and 'On the Death of Goethe.' A collective edition of his works appeared for the first time in 1827 (2d ed., Moscow 1833), from which many German and French translations have been made. Consult 'Russki Arkhiv' (1868, pp. 141-47 and 866-72); Koenig, 'Literarische Bilder aus Russland.'

BARB, a horse of the Barbary breed, introduced by the Moors into Spain, and of great speed, endurance and staying power. The breed is said to be a variety of the Arabian, and most of the progenitors of the present thoroughbred horse were of the same strain.

BARBACAN, or BARBICAN, a projecting watch tower or other advanced work before the gate of a castle or fortified town. The term barbacan was more especially applied to the outwork intended to support a bridge, which in modern fortifications is called the tete du pont. At the castles of Warwick and Alnwick the mediaeval barbacans still remain, but the barbicane gate at York is almost entirely of modern construction.

BARBACENA, bär-ba-sä'na, Brazil, a flourishing town in the state of Minas-Geraes, 125 miles northwest of Rio de Janeiro. It is situated in the Mantiqueira Mountains, about 3,500 feet above the sea, and the surrounding district produces cane sugar, coffee and grain. The town is a commercial centre, being the outlet for the product of mines in the district, but much of its importance has been lost with
the development of transportation facilities. Barbacena is noted for its healthfulness and is a popular resort. Pop. 6,000.

BARBADOS, bar'-ha-doz, an island of the West Indies, lying in the Atlantic Ocean more than 100 miles east of the nearest members of the chain of Lesser Antilles, in lat. 13° 4' N. and long. 59° 37' W. (See Antilles). The entire area of the island available for the purpose — 100,000 acres out of a total acreage of 306,470 (about 1006 square miles) — is under cultivation. Some of the white inhabitants are of the best English stock, being descendants of early settlers who were closely allied by the bond of blood or ties of friendship with the colonists of Virginia. The only foreign journey ever taken by George Washington was in 1751 (28 September—22 December), when he visited this island in company with his invalid brother, Lawrence. The rainfall is abundant, and the climate agreeable, thanks to trade-winds blowing steadily across the Atlantic. Barbados is a colony of England, with its own governor, legislature, etc. In addition to many lesser educational institutions, the island has Codrington College, which is affiliated with the University of London, England. Its capital, Bridgetown, hot, dusty and commercially active, is also the see of the bishop of Barbados. There is one narrow-gauge railway, and the highways are excellent. The chief industry is the cultivation of sugar-cane, to which the soil is peculiarly adapted. The successful manufacture of sugar in the island began about the middle of the 17th century. The Sea Island cotton industry was revived in 1902 with success, and the acreage under this form of cultivation amounts to nearly 2,000 acres, from which 900,000 pounds of "lint" are raised. Food supplies are imported largely from the United States, to which country nearly the entire sugar product is sent. The value of the annual exports is about $4,000,000; of the average annual imports about $6,000,000. Like Guadeloupe and its dependencies, and Desirade and Maria Galante, Barbados is a coral island. Its length is 21 miles, and its width 15 miles. The "Book of Barbados" states that Barbados is undoubtedly the healthiest of all the West Indian islands. On the windward side the climate is especially invigorating, and the island is much patronized by residents in neighboring colonies as a health resort. The birth-rate is about 36 and the normal death-rate not more than 26 per thousand. The island has representative institutions without responsible government. They date from the royal charter of Charles I, 2 June 1627. Next to the house of commons and the house of assembly in Bermuda, the Barbados house of assembly is the most ancient legislative body in the British dominions. The government now consists of a nominated legislative council, a house of assembly, consisting of 24 members elected annually by the people; an executive council, which consists of the governor, the colonial secretary and the attorney-general ex officio, and such other persons as may be nominated by the King; and an executive committee. Steamships of at least 14 companies serve the island. (See Bibliography.) In praise of Codrington College: "This famous university, the only one of its class in the British West Indies, is situated in Saint John's parish, 15 miles from Bridgetown. Founded by Sir Christopher Codrington in 1710 and amply endowed, "no more delightful place can be imagined than this as a retreat for students, with vine-covered corridors opening upon avenues of tall and stately palms." Harrington College, founded 23 years later, also does honor to the island.

Spanish discoverers, whose fancy was struck by the beard-like clumps of vines or tendrils hanging from the wild fig trees, named the island Los Barbados ("the bearded"—in plural). They made this immortal observation, but no settlement. The first settlement was made in 1625 by a company of Englishmen. Sir Frederick Treves (see Bibliography) writes: "It is in Barbados that there will be found the most substantial relics of the old West Indian aristocracy, of the planter prince." The number of inhabitants in recent years has varied between 196,000, or about 1,800 to the square mile, and 171,893, or 1,033 + to the square mile: About 11 per cent Caucasians, 84 per cent Indian or Saxon, and 5 per cent colored or country, with the possible exception of some of the provinces of China, is more densely populated.

Bibliography—Aspinall, A. E., 'Pocket Guide to the West Indies' (Chicago and New York 1914), and 'The British West Indies' (London 1912); Ober, F. A., 'Guide to the West Indies' (New York 1908); Treves, F., 'The Cradle of the Deep' (London 1908). See also article West Indies—Bibliography.

MARRION WILCOX.

BARBADOS CEDAR, a cedar or juniper (Juniperus barbadensis). It is found in Florida and the other warm parts of America.

BARBADOS CHERRY, a West Indian shrub or small tree (Malpighia glabra) of the natural order Malpighiaceae, with handsome crimson axillary flowers, cultivated to some extent in warm countries for its acid fruit, inferior to but resembling a white cherry. M. urens also bears an edible but smaller fruit, and is sometimes also called Barbados cherry.

BARBADOS FLOWER FENCE, or BARBADOS PRIDE, the beautiful plant Psidiea pulcherrima. It belongs to the leguminous order, and the sub-order Casaphleae. It is a low, spiny tree with an odor like savin. It is a native of the tropics of both hemispheres, and in Barbados especially it is used for fence purposes.

BARBADOS GOOSEBERRY, BLAD APPLE, or LEMON VINE (Peregrinia aculeata), a shrubby, slender, tropical American cactus which bears lemon-yellow, smooth, edible pear- or egg-shaped fruits as large as olives. The species is widely used in greenhouses as a stock on which to graft other species of cacti. Its more sturdy relative, P. bleo, is similarly used for larger species of cacti.

BARBADOS LEG, a name frequently applied to the disease called elephantiasis. It is common in Barbados, and is endemic in many tropical and semi-tropical countries. See ELEPHANTIASIS.

BARBADOS LILY, the Amaryllis equestris, now called Hippeastrum equestre, an ornamental plant from the West Indies.
BARBARA, Saint, virgin and martyr much honored in the Greek and Roman Catholic Churches who is supposed to have flourished in the 3d or early part of the 4th century. Her history has been related by various chroniclers, but with so many discrepancies that it is difficult to ascertain either the events of her life or the circumstances of her martyrdom. According to Jacobus de Voragine, the author of the 'Aurea Legenda,' she was born at Heliopolis in Egypt, of pagan parents. On arriving at the age of womanhood she was very beautiful, and her father, fearing lest she should be taken from him, confined her in a tower, and in the pictures of this saint the tower is therefore one of her most frequent attributes. In her seclusion she heard of the preaching of Origen, and wrote to him begging for instruction, whereupon he sent one of his disciples who taught and baptized her. On learning this her father was so incensed at what he got her to death. Metaphrastes and Mombrius inform us that she was martyred at Heliopolis in the region of Galerius and their account agrees with the Emperor Basil's Menology and with the Greek Synaxary. Others again hold that she suffered at Nicomedia in 235, under Maximian I. Her festival occurs 4 December.

BARBARA ALLEN'S CRUELTY, an old English ballad preserved in Percy's 'Reliques.' While Barbara's lover, Jimmy Groves, was on his death-bed, her only remark to him was: "Young man, I think you're dying." For this unnatural composure she subsequently endured the pangs of remorse.

BARBARA FRICHTHE, the title of a noted poem by Whittier (1863) founded upon an incident reported to have occurred in Frederick, Md., in the Civil War. Recent investigations have thrown some doubt upon the authenticity of the account. A play upon this theme has been written by the late dramatist Clyde Fitch.

BAREBRELLI, Giorgio. See GIORGIONE.

BARBARIAN, a term used by the Greeks to designate a foreigner; one who could not speak Greek. In the first the Romans who were excluded by the Greeks under the term barbarian; but as the inhabitants of the great Italian city gradually gained imperial power, and, moreover, began to consider the Greek language a desirable if not an indispensable part of a liberal education, they were no longer included in the category of barbarians, nor was their speech deemed barbarous.

BARBAROSSA. See FREDERICK BARBAROSSA.

BARBAROSSA, Arooj, or Horuk, corsair chieftain, styled "Barbarossa" from his red beard. He was the son of a Greek at Mitylene, and in 1516 assisted Selim, King of Algiers, in driving the Spaniards out of that country. Having taken possession of the capital he put Selim to death and mounted the throne himself. He died in 1518.

BARBAROSSA, Khair-ed-Din, the younger brother of the preceding, surrendered the sovereignty of Algiers to Selim I, Sultan of Turkey, in exchange for a force of 2,000 janissaries and the title of dey. He was afterward appointed "captain pasha" or high admiral of the Turkish fleet, conquered Tunis, and in 1538 gained a victory over the imperial fleet under the command of Andreas Doria in the Bay of Ambraica. He died in 1546.

BARBAROUX, bar-bay-roo', Charles Jean Marie, celebrated French revolutionist of the Girondin party: b. Marseilles, 6 March 1767; d. Bordeaux, 25 June 1794. At first an advocate and journalist at Marseilles, he was sent by that city to the Constituent Assembly at Paris. There he opposed the Court party and took part with the minister, Roland, then out of favor. After the events of 10 Aug. 1792 he returned to his native town, where he was received with enthusiasm, and was soon after chosen delegate to the convention. In the convention he adhered to the Girondists, and belonged to the party who at the trial of the King voted for an appeal to the people. He boldly opposed the party of Marat and Robespierre, and even directly accused the latter of aiming at the dictatorship; he was, consequently, in May 1793 proscribed as a royalist and an enemy of the republic. He fled to Calvados, and thence with a few friends to the Gironde, where he wandered about the country, hiding himself as best he could for about 13 months. At last, on the point of being taken, he tried to shoot himself; but the shot miscarried, and he was guillotined at Bordeaux. He was one of the great spirits of the Revolution. There was no loftier-minded dreamer in the Girondist ranks; hardly a nobler head than his fell in that reign of terror.

BARBARY, Africa, a general name for the most northerly portion of the continent, extending about 2,600 miles from Egypt to the Atlantic, with a breadth varying from about 140 to 550 miles; comprising Morocco, Fez, Algeria, Tunis and Libya (including Tripoli, Barca and Fezzan). Bordered by the Mediterranean on the north, and by the Sahara on the south, the temperature of this region is generally moderate and remarkably uniform, seldom descending to the freezing-point, and seldom coming up to sultry. From March to July, the dry season, when the ground is frequently parched as to render walking upon it impracticable. From September to March is the wet season, but the rains are moderate, and almost every day affords a respite of sunshine. The soil is fertile, though sandy and light on the coast, the climate healthy, and agricultural productions are various and abundant. The range of production gives a combination of both tropical and temperate fruits. Agriculture is, nevertheless, greatly neglected, but under European influences has made considerable advance in the present century. For three centuries the inhabitants of the Barbary states rendered themselves the pest of human society by their depredations upon the commerce of the seas until they were finally subdued in the 19th century. See BARBARY POWERS, UNITED STATES TREATIES AND WARS WITH THE.

History.—Anciently, all Africa was comprehended under two divisions—Egypt and Libya—while Libya was subdivided into northern and southern Libya. North Libya comprised mainly what is now known as the Barbary states. Herodotus says that in his day northern Libya was inhabited by the indigenous race of Libyans
and by the foreign Phenicians and Greeks. They latter settled at various points, from Egypt to Carthage, while the indigenous Libyans occupied from the east to the west, throughout the entire country. Of the origin of the Libyans, whom Herodotus calls indigenous, we have no trace. Arabian tradition says they colonized Libya from Yemen. The Phenicians early settled Carthage (869 B.C.) and perhaps the still more western coasts of Mauritania,—at least it appears that Carthage was a powerful state at the invasion of Greece by Xerxes. The Cyrenians, who were Greeks, had colonized at Cyrene, just east of the bay of the Mediterranean called Syrtis Major (Gulf of Sidra), in what is now known as Barca. West of Carthage lay Numidia and Mauritania, even to the Pillars of Hercules; east of Cyrene was Egypt, while between these two foreign colonies stretched the narrow coast line, from the Major to the Minor Syrtis, known as Emporia. The rapidly growing Carthaginian power soon extended along the entire coast from the Pillars of Hercules to Grecian Cyrene. The jealousy of Rome was not long in being awakened against so threatening a rival. The history of the Punic wars is well known. Of the 117 years the Carthaginian power was extinguished, Carthage herself in ruins, and Africa a Roman province from Mauritania to Cyrenaica. The more complete subjugation of Numidia was accomplished in the Jugurthine War, and that of Mauritania in the reign of Claudius. Thus the territory of the Barbary states, from independent native sovereignties and foreign colonies, had come into the hands of Rome. About 400 A.D. several Teutonic tribes, overrunning Gaul and crossing the Pyrenees, settled in Spain. When, in 428, Bonifacius, revolted against Honorius, the Vandals crossed the Fretum Gaditanum into Africa, led by Genseric, drove out the inhabitants, utterly expelled the Roman power from upper Libya, and reigned 100 years. Then came the struggle under Justinian for the re-establishment of the Roman ascendency. By Belisarius it was conducted to a successful issue, and northern Africa was united to the Eastern empire. For over 300 years this relation continued until about the middle of the 7th century, the Saracens overran Numidia and Mauritania to the Atlantic, and, notwithstanding the disastrous death of their leader Ochba, the sceptre of upper Libya passed again from the hands of Rome into that of Arabia. Fifty years later the conquests of Musa and Tarik were pushed across the straits, and a Saracenic empire established in Spain. But the revolution which brought the Abbasides to the caliphate of Arabia and drove the only surviving caliph of the Ommiades into Spain prepared the way for the independence of the western colonies, and Africa began to throw off the Saracen yoke (788). A succession of fortunes now attended the states of upper Libya. For eight centuries they were alternately tributary and independent, passing from hand to hand, like the stakes of a faro bank, till in the 16th century the two brothers Barbarossa conquered the whole territory of Numidia and Carthage, and erected the regencies of Algiers and Tunis. A few years later the Turkish Sultan, whose supremacy the younger Barbarossa had acknowledged, erected the pashalic of Tripoli over the ancient Cyrenaica, while in the west there was a gradual consolidation of power into the hands of Mohammed ben Hamid, and his son, who finally established. Of the origin of the Sherifs in the empire of Morocco, now divided into two protectorates, the district west of Fez under the protection of Spain, and the district east of Fez under the protection of France, while the French erected, between Morocco and the possessions of the Porte, the regency of Ait-Khub, it came under the sovereignty of Italy in 1912. The religion of the Barbary states is generally Islamism. The European settlers are of course Christians, or Jews, while the blacks, who are slaves, are pagans. There seem to be at present six races or tribes of men inhabiting the Barbary states: (1) The Moors. (2) The Arabs. (3) The Berbers, who are indigenous, and from whom the states probably received the appellation Barbary. (4) The Jews. (5) The Turks. (6) The Blacks. The Arabs call the Barbary states Moghreb (west). The language of the people inland differs from that of Arabia and Syria, though not so much as on the coast. See Algeria; Barca; Fezzan; Morocco; Tripoli; Tunis. Consult Dumont, Five Years Slavery and Travels in Africa (London 1819); Edwards A., 'The Barbary Coast' (New York 1913).

BARBARY APE, OR MAGOT, a small species of ape of the genus Macacus, interesting as being the only animal of the monkey kind in Europe. It is found on the rock of Gibraltar, where the individuals are few in number; whence it has been concluded by M. de Blainville that they have sprung from domesticated apes escaped from confinement in the houses of Gibraltar. The Barbary magot is a small tailless monkey completely covered with greenish-brown hair. In its wild state it is lively and intelligent, but becomes sullen and intractable in captivity.

BARBARY POWERS, United States Treaties and Wars with the. The four Mohammedan states of Morocco, Tunis, and Tripoli, though either independent or nominally tributary to Turkey, were for some three centuries, the 16th to the 19th, a common foe to Mediterranean commerce and travel. Almost their entire subsistence was on the produce of piracy, either the avails of captured stores, the ransoms for prisoners held in slavery or the blackmail paid by other powers for immunity. The large states paid them a regular annual tribute—though by joining forces they could have stopped the piracy at any time,—on the express ground that it gave them the monopoly of Mediterranean trade against the small ones which could not afford it; and England, which paid about $280,000 a year, deliberately put the price high to prevent others from bidding up to it. These sums bought only temporary truce, as the pirate state lived on depredations, and the tribute had to be supplemented with constant presents and concessions. A part of this tribute was always devoted to armed vessels, ammunition and naval stores, so that the civilized powers furnished the means for plundering themselves. The ransom of captives from them was a leading object of public and private charity, and collections were taken
up in churches for this end. In 1786 there were 2,200 Christian captives in Algiers alone. When the United States began to send vessels to the Mediterranean no longer protected by the English flag, the pirates at once assailed them; and in July 1785, the Algerines captured two vessels and 21 men. Congress appropriated $80,000 in 1784 to buy immunity after the European model; but it seemed likely to cost nearer $1,000,000, and, reversing their usual parts, John Adams preferred to pay as a cheaper resort than fighting. While Jefferson considered fighting both cheaper, more honorable, and the preparation for a better future. Morocco, for some reason much the most amenable, signed in 1787 a 50-years' peace without tribute, though with the understanding of some presents to the Sultan, and kept it, save for a short time in 1803. The Dey of Algiers asked $59,496 for his captives, or over $2,800 each, though the last French captives ransomed had only cost $300, or with costs, $500; and the matter hung fire for several years, 11 of the 21 dying before the final ransom of 1795. In 1793, by the carelessness or bad faith of an English consul, the Algerine corsairs gained entrance to the open sea beyond the Strait of Gibraltar, and captured 11 United States vessels at a blow, the number of our captives in their hands in November being 115. Negotiations were set on foot, and on 5 Sept. 1795 Congress paid Algiers $92,463.25 for peace and the ransom of all our prisoners — this sum including a 36-gun frigate costing $99,727, and about $100,000 worth of stores and ammunition. It also engaged to pay $21,600 a year thereafter in naval stores, $20,000 on presentation of a consul, biennial presents of $17,000, and other regular and incidental gifts. In 1798 it sent four armed vessels as arrears. A treaty was made with Tripoli in November 1796, on much the same terms save that there were no ransoms; and one with Tunis, in 1799, for $107,000. The cost of immunities and ransoms in 1802 had been over $2,000,000; and of course even this bought nothing permanent. The Pasha of Tripoli broke the treaty in three years and a half, demanding $225,000 with $20,000 annually, and on refusal declared war, 14 May 1801. A squadron under Commodore Dale was sent to the Mediterranean and blockaded Tripoli, also forcing Algiers and Tunis to think better of their threatened alliance with it and to renew their treaties. Morris succeeded his, but was soon recalled. Preble, who took his place, 1803-04, forced Morocco, which had joined Tripoli, to withdraw from the alliance and renew its treaties; carried on a vigorous blockade; and bombarded Tripoli five times. Barron succeeded Preble, but in the midst of 1805 turned over the command to Rodgers, who at once prepared for a grand bombardment and assault. The scale was turned, however, by William Eaton (q.v.), who took up the cause of the Pasha's brother, driven from the throne some years before, organized at Alexandria a singular rabble of cosmopolites, and after a desperate six weeks' march across the desert, captured, with the aid of the natives, the seaport of Derne in Barca, several hundred miles west of Tripoli. The Pasha feared an insurrection as well as Rod- gers' attack; and hastily signed on 3 June 1805, with Tobias Lear, United States consul-general at Algiers, who had come to Tripoli on purpose, a treaty by which the United States paid $60,000 ransom for the prisoners, left Hamet's supporters to the Pasha's procession and Hamet himself to beg the United States for a pension, and allowed the Pasha four years to deliver up Hamet's wife and children. The need and honor of this abject surrender of our government belongs to trivial polemics. The embargo of 1807 prevented further trouble for some years by annihilating our commerce; but after its removal in 1810 the depredations were renewed, and in 1812 Algiers was ready for more gratifications. The Dey had received from us $378,843, but made out a case for $27,000 arrears, forced the United States to borrow it at usurious rates, and then, ordering him out of the country, declared war. The War of 1812, however, having denuded the Mediterranean of our trading-vessels, he captured only one brig and 11 persons; and after the war our naval force under Decatur was turned against Algiers. He found its entire fleet at sea; captured two and cut off the rest from port, entered the city on June 1815, 41 days after sailing; and forced the Dey to sign within three hours, without gift or present, on pain of having his city destroyed and his fleet captured, a treaty abolishing all tribute or presents of any sort thereafter from the United States, delivering up all his captives and agreeing that henceforth prisoners of war should not be made slaves, and paying indemnity for the captured brig. Tunis and Tripoli having allowed English ships to seize American prizes in their harbors, Decatur proceeded to both places and forced their rulers to make similar treaties, pay indemnities and release all their Christian prisoners of whatever nations. This magnificent action of the United States induced the English government to take similar steps the next year, but Tunis and Tripoli did not abandon piracy till 1819, and Algiers was not finally reduced till 1829 by France. It was the United States which first lifted this inculcus of "Algerian" piracy into a system that was compendiously called piracy and slavery from the Christian world. Consult Schuyler, E., 'American Diplomacy' (London 1886); Adams, H., 'History of the United States,' Vols. I, II, IX (1869-90); Felton, C., 'Life of Eaton,' in Sparks, 'American Biography'; Lane-Poole, S. E., 'The Story of the Barbary Corsairs' (New York 1896). See TREATIES; UNITED STATES — DIPLOMACY OF THE.

BARASTRO, bär-bä'-strō, Spain, city of Aragon, 30 miles east-southeast of Huesca. The city has straight and broad streets, a cathedral with paintings by Galera, parish church, college, Latin and three other schools, town-house, session-house, ecclesiasti- cal courthouse, extensive hospital, two prisons, several convents with a church, the palace of the rulers of former days, several palaces, a theatre and bull-ring. It also possesses philosophical, agricultural, commercial and other literary and beneficent associations. The manufactures of Barastro have greatly declined, consisting only of hats, hardware, cutlery, shoes and robes; while the produce is carried on in cattle, horses and mules. It is
the terminus of a branch railway line with a junction at Selgna, 12½ miles distant. Pop. about 7,500.

BARBAULD, Anna Letitia, English writer, daughter of the Rev. John Aikin, b. Kibworth, Leicestershire, 20 June 1743; d. 9 March 1825. Her earliest production was a small volume of miscellaneous poems, printed in 1773. This was succeeded in the same year by a collection of pieces in prose, published in conjunction with her brother. In 1774 she married the Rev. Rochmont Barbauld. Her 'Early Lessons and Hymns for Children,' and various essays and poems, have secured for her a permanent reputation. In 1812 appeared the last of her separate publications, entitled 'Eighteen Hundred and Eleven,' a poem of considerable merit; previous to which she had edited a collection of English novels, with critical and biographical notices. A similar selection followed from the best British essays of the reign of Anne, and another from Richardson's manuscript correspondence, with a memoir and critical essay on his life and writings. She will be longest remembered by her beautiful and much-quoted lyric beginning 'Life, what have I been long together.' Consult Aikin, 'Works of A. L. Barbauld'; Ellis's, 'Life and Letters of Mrs. Barbauld' (1874); Ritchie, Mrs. Thackeray, 'Book of Sibyls' (1883).

BARBAZAN, bár-bá-zän, Arnaud Guilhem, Sire de, French captain, distinguished by Charles VI with the title of 'Chevalier Sans Reproche,' and by Charles VIII with that of 'Restaurateur du Royaume et de la Couronne de France'; b. about the end of the 14th century; killed at Bullogneville 1432. He earned the former of his titles, while yet young, by his successful defense of the national honor in a combat fought in 1404 between six French and six English knights, before the Castle of Montemont; and the latter designation he acquired by extraordinary exertions on the side of the Dauphin, at a time when the cause of native royalty, powerless in presence of the Anglo-Burgundian league, boasted few adherents.

BARBE-MARBOIS, bár-bá-mär-bwa, François, Marquis de, French statesman; b. Metz, 3 Jan. 1745; d. 14 Jan. 1837. After fulfilling diplomatic offices at several German courts he was sent to the United States as consul-general of France. He organized all the French consulates in this country, in which he resided 10 years, and married the daughter of William Moore, governor of Pennsylvania. In 1785 he was appointed by Louis XVI superintendant of Saint Domingo, and introduced many reforms into the administration of justice and of finance in that island. He returned to France in 1790 and was again employed in German diplomacy. During the excitement of the Revolution he was exiled to Guiana as a friend of royalty, but being recalled in 1801 he was made director of the treasuries, which he soon exchanged for that of minister. In 1803 he was appointed to cede Louisiana to the United States for $10,000,000, but had the skill to obtain the price of $15,000,000, a piece of policy for which he was liberally rewarded by Napoleon. In 1813 he entered the Senate, and the next year voted for the forfeiture of the Emperor and the re-establishment of the Bourbon dynasty. He was well received by Louis XVIII, appointed a peer of France and honorary councillor of the university, and confirmed in the office of the first president of the court of accounts, which he had formerly held. He was an object of the indignation of Napoleon after his return to France from Elba, and was ordered to leave Paris. He resigned his offices after the return of the Bourbons, but, moderate in his principles, and an enemy of all reaction, he was not in harmony with the majority of those with whom he associated; and in the Chamber of Peers he succeeded with difficulty in effecting the substitution of banishment for death as a penalty for political offenders. After the revolution of July he exercised the same adulation and took the same oaths of fidelity to Louis Philippe who had formerly given to Napoleon as for the Bourbon princes. The desire to die first president, which had been the motive of all his flexibility, proved at last a vain one, and in 1834, he was succeeded in his office, and as a consolatation received the port of the court of King, accompanied by an autograph letter. His memoirs contain numerous details concerning Saint Domingo, Louisiana and Guiana, which he studied in his exile, and he wrote also upon the treason of Arnold.

BARBECUE, a large gathering of people, generally in the open air, for a social entertainment or a political rally, the leading feature of which is the roasting of meat and the furnishing of the members of the party with food. The word is said to have been employed in Virginia prior to 1700, and the institution of the barbecue is of Southern origin.

BARBEL (Barbæ), a genus of freshwater abdominal malacapterygious fishes, of the family Cyprinidae, or carps, distinguished by the shortness of the dorsal and anal fins, a strong spine replacing the second or third ray of the dorsal, and four fleshy filaments growing from the lips, two at the nose and one at each corner of the mouth, and forming the kind of beard to which the name of the species is due. Of the several species, generally named after the country or river where they are found, the European one, common in most of the rivers of its temperate climates, and hence called B. vulgaris, is most deserving of notice. Its average length is from 12 to 18 inches, but individuals have been taken measuring three feet and weighing from 15 to 18 pounds. The head is smooth and oblong, and the upper jaw is much longer than the lower. Its dorsal spine, which is strong and serrated, often inflicts severe wounds on the fishermen and damages their nets. It lives on small fishes, and also on aquatic plants, worms and insects, which it obtains by boring with its barbels into the banks of the stream and turning up the loose soil. Its flesh is very coarse and unpalatable, and at the time of spawning the fish is dangerous to eat. Another species, common in the Nile, is described as weighing upward of 70 pounds, and has a flesh which is fine, delicate and well-flavored. When caught, the fisherman puts an iron through its jaw and fastens it by a short cord to the bank of the river, where it remains alive till required.
BARBER—BARBER OF SEVILLE

BARBER, Edwin Atlee, American archeologist: b. Baltimore, Md., 13 Aug. 1851. He was graduated at Williston Seminary in 1869, attended Lafayette College 1869–72, afterward received the degrees of A.M. and Ph.D., and was assistant naturalist in the United States Geological Survey in 1874–82. Director of the Pennsylvania Museum, Philadelphia, from 1891. His writings include a large number of magazine articles: 'Genealogies of the Barber and Atlee Families' (1891); 'Pottery and Porcelain of the United States' (1895, 1902, 1903); 'Anglo-American Pottery' (1890–1901); 'American Glassware, Old and New' (1900); 'Tulip Ware of the Pennsylvania-German Potters' (1903); 'Marks of American Potters' (1904); 'Artificial Soft Paste Porcelain' (1907); 'Salt Glazed Stoneware' (1907); 'Tin Enamelled Pottery' (1907); 'Lead Glazed Pottery' (1908); 'The Majolica of Mexico' (1908); 'Hard Paste Porcelain' (Oridental) (1910); 'The Ceramic Collectors' Glossary' (1914); 'Spanish Porcelains and Terra Cotta' (1915); 'Hispano-Moresque Pottery' (1915). Member of the American Philosophical and many other learned societies.

BARBER, Francis, American soldier: b. Princeton, N. J., 1751; d. Newburg, N. Y., 11 Feb. 1783. He was graduated at Princeton in 1770 and was principal of a school in Elizabethtown, where Alexander Hamilton was one of his pupils. He was successively major and lieutenant-colonel of the 3d New Jersey artillery, and assistant inspector-general under Baron von Steuben. He took part in the battles of Trenton, Princeton, Brandywine and Germantown, and was severely wounded at Monmouth and in Sullivan's Indian expedition, 1779. He was of the greatest service to Washington in securing intelligence of the enemy's movements and in putting down the mutiny of New Jersey and Pennsylvania troops. In 1781 he commanded a battalion of infantry in Lafayette's Virginia campaign, and was present at Yorktown. He was killed by a falling tree at the close of the war.

BARBER, one who shaves beards and dresses hair. The occupation of barber is an institution of civilized life, and is only known among those nations that have made a certain progress in civilization. It is referred to by the prophet Ezekiel: "And thou, son of man, take thee a barber's razor, and cause it to pass upon thine head and upon thy beard." (Ezek. vi. 1, 2). We do not read of a barber at Rome till about the year 454 of the city; but there, as elsewhere, when once introduced, they became men of great notoriety, and their shops were the resort of all the loungers and newsmongers in the city. Hence they are alluded to by Horace as most accurately informed in all the minute history, both of families and of the state. But in early times the operations of the barber were not confined, as now, to shaving, hair-dressing and the making of wigs; but included the dressing of wounds, blood-letting and other surgical operations. It seems that in all countries the art of surgery and the art of shaving were not in hand. The title of barber-chirurgeon, or barber-surgeon, was generally applied to barbers. The barbers of London were first incorporated by Edward IV in 1461, and at that time were the only persons who practised surgery. The barbers and the surgeons were separated, and made two distinct corporations—in France, in the time of Louis XIV, and in England in 1745. The sign of the barber-chirurgeon consisted of a striped pole from which was suspended a basin; the fillet round the pole indicating the ribbon of bandage twisted round the arm previous to blood-letting, and the basin the vessel for receiving the blood. This sign has been generally retained by the modern barber. In the United States, however, it is only occasionally that the basin may be seen hanging at the door of a barber's shop. The character of the barbers is amusingly illustrated in one of the tales of the 'Arabian Nights Entertainments,' and has been immortalized by Beaumarchais, Mozart and Rossini, under the name of 'Figaro.'

BARBER-FISH. See Surgeon-Fish.

BARBER OF SEVILLE, The (Le Barbier de Séville), one of the wittiest of all dramas and most mordant of satirical solvents, was written by Beaumarchais, and was the instrument at speculative misadventures in American trade, in 1772, ready for the stage in 1773 and, after two years of prohibition and intrigue, first acted in February 1775. In its first form it was overloaded with allusion to his personal affairs and was ill-received. Revised on the instant it won on the second night a great success. Several passages then suppressed, because they had been hissed, when inserted nine years later in 'The Marriage of Figaro,' were received with applause. The second title of the Barber, 'The Futile Precaution' points to Fatouville's 'La Précution intitule' (1692) as the source of its plot. Something was borrowed also from Sédaine's 'On ne s'avise jamais de tout.' But the ex-valet Figaro, the central figure, is Beaumarchais' sole creation, a marvelous and half-autobiographical combination of gaiety and philosophy, disillusioned shrewdness, deep reflection and lambent wit. The guardian who wishes to marry his ward is a stock figure of bald comedy. But Bartholo is no commonplace old man nor Rosine the conventional ingénue. Duped Bartholo may be, but he is no unworthy antagonist of the young lover Almaviva and counters well on the devices of Figaro from point to point so that the interest of the play is distinctly to the very dénouement. The dialogue throughout sparkles with overflowing wit, unexpected turns of phrase, words of double intent, topsy-turvy application of proverbial wisdom and even quite superfluous jests. The play is still popular in France and in the version given by Rossini in his opera, 'Il Barbiere di Siviglia' (1816), has an international currency. The best edition of 'Le Barbier de Séville' is in 'Théâtre de Beaumarchais,' edited by d'Hoyl and Marescot. For its history, see the notes in the valuable collection of contemporary opinion of it consult Loménie, 'Beaumarchais et ses Temps' (Vol. ii, pp. 231 f.). For the character of Figaro see Brunetiére, 'Époques du théâtre' (pp. 207 f.), and Lintilhac, 'Beaumarchais.' A modern type of Figaro may be seen in Auget's 'Fils de Giboyer' (trans. by A. B. Myrick, New York 1905). See Marriage of Figaro, The.

Benjamin W. Wells.

BARBER OF SEVILLE, opera bouffe in two acts by Gioacchino Rossini (libretto by Sterbini, founded on Beaumarchais' celebrated
BARBER POET—BARBERS' ITCH

play). First produced in Rome 5 Feb. 1816. The work, destined to become one of the most popular in operatic repertory, was at first a dismal failure, due largely to popular resentment at the use of a subject, which had already been turned to account by other composers, especially Paisiello, whose setting had been a favorite with the Italian opera public. It was not long, however, before the tables were turned and Paisiello's 'Barbieri' was forgotten barred, in favor of the newcomer. Authorities differ as to the length of time in which the music was written. In any event, the period was not more than three weeks. The fact is significant of Rossini's immense facility of invention. It is said that when one of his contemporaries was told that Rossini had written the music in 13 days, he replied, 'with a twinkle in his eye: 'It is quite possible; he is so lazy.' The Barber is full of irresistible verve, the music, piquant and graceful, rolling and glittering in turn. The story is a sort of prologue to that of Mozart's 'Figaro,' but, musically, there is little in common between them. Rossini was concerned merely with writing a comic opera which would amuse and charm the senses and he succeeded to perfection. There are 20 distinct musical numbers connected by recitative in the style so common to Italian opera of that period—recitativo secco or dry recitative, as it is called. It approximates speech more nearly than song, but is constantly about to break into music. Its monotonous character is undeniable and it has largely disappeared from operatic writing, supplanted by the more musical song-speech of the modern music drama. Among the individual musical numbers, attention may be focussed on Figaro's buffo aria, Largo al factotum, celebrated the world over, Rossina's cavatina, Una voce poco fa, which has done service for most of the great prima donnas of the 19th century and the 'caminetto' aria of Don Basilio. For the famous music lesson scene, Rossini wrote a concerted number, but it has been lost—providentially, from the viewpoint of the prima donna, who has thus been able to introduce a show piece of her own choice and so at once to pique the curiosity and astonish the ears of her audience.

The Barber remains in the active repertory of most of the opera companies and bears well its century of life. The first performance in America took place in New York on 17 May 1819, in an English translation under the direction of Thomas Phillips; and in 1825 it was produced in the authentic Italian version by Manuel Garcia's Italian Opera Company, which introduced the Italian operas to the American public. Adelina Patti was an unforgettable Rosina, while, in more recent years, Marcella Sembrich found the rôle a grateful one.

LEWIS M. ISAACS.

BARBER POET. The. See JASMIN, JACQUES.

BARBERINI, bär-bär-ré'ne, celebrated Florentine family which became powerful through Cardinals. Mattia, who was elected Pope in 1623 as Urban VIII. Few of the Popes have carried nepotism so far as Urban, who, during his reign of 21 years, seemed intent on only one object, the aggrandizement of his three nephews. Two of them were appointed cardinals, and the third became Prince of Palestrina. The principality of Palestrina continued in the possession of the Colonna branch of the family until 1889, becoming extinct in the male line in that year.

BARBERINI FAUN, a famous piece of Greek sculpture, so called from its having once been in the possession of the Roman family of Barberini. It is now in the Glyptothek at Munich.

BARBERINI PALACE, the residence of the Barberini family in Rome, begun by Pope Urban VIII, its most distinguished member, but not finished till 1640. It contains a famous picture-gallery and a library with over 10,000 volumes and 10,000 manuscripts.

BARBERRY (Berberis), a genus of about 175 species of shrubs of the family Berberidaceae, natives of temperate climates. The yellow flowers are succeeded by red, dark-blue or black fruit which in some species is used for making jellies of beautiful color and distinct flavor; that of some other species is dried and used like raisins. The yellow roots and sometimes the stems of several species are used in dyeing, and the bark of some in tanning. Many of the species are used for ornament and for hedges, but in wheat-growing sections they should not be planted, because they are host-plants for the eridium stage of wheat-rust (Puccinia graminis), which, however, has been known to develop in localities remote from barberry bushes. B. vulgaris and its varieties and B. thunbergii (considered by some botanists a form of vulgaris) are probably the most common species planted in America. The former, an American species, is a rather erect shrub about 10 feet tall, with large leaves and racemes of flowers which are followed by red fruits that persist during the winter and even well into the second summer; the latter, a Japanese species, is a low, spreading, graceful shrub with dainty little leaves which become brilliant red in autumn, and with solitary yellow flowers followed by orange-red persistent fruits. The stamens are wanting in the Japanese species, the sensitive, spring up when touched. Propagation is usually effected by means of seeds or cuttings of green wood, but sometimes by grafts and layers. For description of species cultivated for ornament in America, consult Bailey, 'Standard Cyclopedia of Horticulture' (1914).

BARBERRY BLIGHT or RUST. See RUSTS.

BARBERS' ITCH. Two distinct diseases of the skin are known by this name—one of a parasitic nature, the other not parasitic. In the latter there is an inflammation of the hair follicles characterized by the formation of papules and pustules pierced by hairs. It affects the hairy part of the face and runs a chronic course. It is more inclined to affect the upper lip and upper parts of the face. The more important disease is the Tinea barba, or parasitic disease. Here the hair follicles are infected by a fungus, the trichophyton. It is a form of ringworm of the beard. It affects the lower part of the face and neck, causing itching, scaly eruptions that secret a thick
BARBERTON — BARBIER

mucus and spread out ring-like from the
centre. The disease is always contracted from
another person or sometimes from lower ani-
mals. The barber's implements are the
chief agents in its spread. In the early stages
—the parasitic form—it is readily curable, but
in the chronic stages it may prove very
difficult to treat successfully.

BARBERTON, Ohio, city in Summit
County, seven miles south from Akron, and 39
miles from Cleveland; on the Erie, the Balti-
more & Ohio and the Pennsylvania railroads.
The town was founded in 1803 by O. C. Barber,
president of the Diamond Match Company,
whose works are located here. It is known as the "magic city" having acquired a popula-
tion of 10,000 in about 18 years. It is a pro-
gressive manufacturing centre, having sewer-
pipes mills, rubber works, potteries, iron works,
paint mills, salt wells, strawboard works and
other industries. The United States census
for 1914 reported 34 industrial establish-
ments of factory grade, employing 3,706
persons, of whom 3,110 were wage
earners, receiving $1,734,000 annually in wages.
The manufacturing establishments turn out a
value of the year's output was $8,842,000;
more than this, $4,737,000 was the value added
by manufacture. The city is governed by a mayor
and city council elected biennially. Pop. 12,000.

BARBES, Armand, bâr-bèz', är-mônt',
French politician and revolutionist: b. island of
Chicoupe 1810; d. Paris 1834. After the end of
the war of 1812 he was taken to France, and in 1830 went to Paris
to attend the law classes, where he had an opportuni-
ty of manifesting his political opinions at
that period of public excitement. During the
whole reign of Louis Philippe he was con-
stantly engaged in conspiracies. In conse-
quency of an unsuccessful attempt to over-
throw the government he was condemned to
death, a sentence which was commuted to
perpetual confinement. The revolution of 1848
restored Armand to liberty; he then formed a
club, which took his name, in which the do-
ctrines of socialism were superseded by re-
publicanism. After the insurrection of May
1849, Barbès was sentenced to deportation. In
1850 he was again set at liberty, and left France
by voluntary exile.

BARBET, any of the tropical South Ameri-
can birds of the families Capitonidae and Bu-
conid, both of which are characterized by prominent bristles about the mouth, which as-
sist them in catching flying insects. The birds
of the former family are more usually called
"thickheads," and those of the latter "puff-
birds" (qq.v.).

BARBETTE, bâr-bèt', the platform or ele-
vation of earth behind the breastwork of a
fortification or an intrenchment, from which
artillery can be fired over the parapet or
ascent leads from the interior of the intrench-
ment to the barbette. When the garrison has
much heavy ordnance, or the enemy has opened
his trenches, or when it is determined to can-
nonade the intrenchments of a given point, as,
for example, a bridge or pass,—the direc-
tion of the cannon is not to be materially
changed, it is usual, instead of making a
barbette, to cut embrasures in the parapet; on
the contrary, firing from the barbette is ex-
pedient when one expects to be attacked only
by infantry, or wishes to cannonade the whole
surrounding country. See FORTIFICATION.

BARBETTE GUN. See ORDNANCE.

BARBETTE TURRET. See TURRET.

BARBEY D'AUERVILLY, bâr-bâ-dô-
ër-ve-ye, Jules, French critic and novelist: b.
Saint-Sauveur-le-Vicomte, Manche, 2 Nov. 1819;
d. Paris, 24 April 1889. As a contributor to the
Pays in Paris he created a sensation by the un-
reserved tone and peculiar style of his literary
criticisms. He wrote 'On Dandysm and G. Brummel" (1845); 'The Prophets of the Past'
(1851); 'Goethe and Diderot' (1880); 'Poem-
ics of Yesterday' (1889); 'Nineteenth Cen-
tury: The Works and the Men' (1861–92). Of
his novels the best are 'The Bewitched' (1854);
and 'The Chevalier des Touches' (1864).

BARBIANO, bâr-byâ'nô, Abrecht, an
Italian military officer, who formed the first
regular company of Italian troops organized to
resist foreign mercenaries, about 1379. This
organization, named the "Company of Saint
George," proved to be an admirable school, as
from its ranks sprang many of the future officers
of renown. He became grand constable of Naples
in 1384, and died in 1409.

BARBICAN. See BARBACAN.

BARBIE DU BOCAGE, bâr-byâ-dû-bô-
kazh, Jean Denis, distinguished French geog-
ographer: b. Paris 1760; d. there 1823. He laid
the foundation of his famous office, the pub-
ication of his beautiful Atlas to the 'Voyage
du Jeune Anacharsis,' and was appointed in
1792 keeper of the maps of the Royal Library,
and in 1809 professor at the Sorbonne. In 1821
he founded the Geographical Society, of which
he became president. He was also a member of
the Institute. His maps and plans to the
'Voyage pittoresque en Grèce, de Choiseul
Gouffier,' and to the works of Thucydides,
Xenophon, etc., exhibit much erudition. He
also prepared many modern maps, and pub-
lished excellent dissertations in various scien-
tific collections. Although the progress of time
has necessarily deprived much of his work of
its original value, his labors have not the less
given a decided stimulus to the progress of
science.

BARBIER, bâr-byâ, Antoine Alexandre,
French biographer: b. Coulommiers 1765; d.
1825. In 1794 he went to Paris, where he was
chosen a member of the committee appointed
to collect works of literature and art existing
in the monasteries, which were then suppressed.
This was the cause of his being appointed in
1796 keeper of the library of the Conseil d'État,
collected by himself, and when it was trans-
ported to Fontainebleau in 1807 Napoleon ap-
pointed him his librarian. On the return of
the King he had the care of his private library.
His excellent 'Catalogue de la Bibliothèque du
Conseil d'État' (1801–03) is now very rare. His
'Dictionnaire des ouvrages anonymes et pseu-
donyms' (1806–09, 4 vols.) is a work of
account of its plan, its accuracy and its fullness
(at least in respect to French literature), one
of the best works in this branch of bibliography.

BARBIER, Henri Auguste, French poet:
Having written an historical novel (1830) with
Royer, depicting French medieval society, he
entered his proper sphere, that of poetical satire, in which he obtained a brilliant success with 'The Lambs' (1831); (31st ed., 1882), a series of satirical attacks on the political satirists, in which he exposes the moral depravity of the higher classes,—notably the ignoble scramble for office under the new government, the subject of 'The Quarry,' the most famous among these satires. His next work, 'Lamentation' (1831), bewailing the misfortunes of Italy, and 'Lazarus' (1837), in which he describes the misery of the English and Irish laborer, show a considerable falling off; and in those that followed, the poet of 'The Lambs' is scarcely to be recognized. He was elected to the Academy in 1869.

**BARBIER, Paul Jules**, a prolific French dramatist: b. Paris, 8 March 1825; d. 1901. Having won success with his first effort, 'A Poet' (1847), a drama in verse, he produced the 'Shades of Vaucluse' (1847); 'André Chenier' (1849); 'Willy Nilly,' a comedy (1849); and thereafter in collaboration, mostly with Michel Carré, a number of dramas and vaudevilles, also countless librettos for comic operas. After the war of 1870-71 he published 'The Sheaf, or the Sharecropper's War Songs' (1871), a collection of patriotic poems; and later two other volumes of lyrics, 'The Shadow' (1882) and 'Faded Flowers' (1890); besides 'Plays in Verse' (2 vols., 1879).

**BARBIER DE SEVILLE.** See **Barber of Seville**.

**BARBIZON,** bär-be-zön, France, a village on the skirts of the forest of Fontainbleau, in the department of Seine-et-Marne. Its picturesque situation on the edge of the forest and association have made it a favorite haunt of artists and tourists which has given its name to a school of French landscape painters.

**BARBIZON, The Painters of,** a group of French painters of animal, landscape and peasant subjects who settled in the village of Barbizon about 1844. While often referred to as the Barbizon school, they did not form a school in the usual sense, but were attracted together by similar aims and principles. These principles may be reduced to the one that each painting be studied directly from nature and express a mood or sentiment of the artist. The result was a grasp on truth and life with a poetic character that gave their work permanency and charm. They are of the Romantic school as applied to the landscape. The distinctive note of the school appears in the work of Rousseau and Millet, each of whom made his home in Barbizon. Corot, Diaz, Dupré, Daubigny and Trouin were members of the group. (See articles on these artists). Recognition of their merit came slowly as a result of the conflicts that existed between the classic and romantic schools in the first half of the 19th century. The painters of Barbizon are among the most important in the history of landscape painting, into which they infused new life; their influence was tremendous not only in Europe but in America. They are well represented in American galleries, such as the Metropolitan Museum of Art, and the Vanderbilt collection, New York, and the Shaw collection of Boston. Consult La Farge, 'The Higher Life in Art' (New York 1908); Mollet, 'Painters of Barbizon' (London, 1895); Muther, 'History of Modern Painting' (London 1907); Tomson, Arthur, 'Painters of Barbizon' (ib. 1908); Thompson, D. C., 'Painters of Barbizon' (ib. 1902); Van Dyke, 'Modern French Masters' (New York 1906).

**BARBOUR, bär'boor,** the name of a celebrated French family of painters, the descendants of John Barbou, of Lyons, who lived in the 16th century. From his press issued the beautiful edition of the works of Clement Marot in 1539. His son, Hugh, removed from Lyons to Limoges, where, among other works, his celebrated edition of 'Chretien's Letters to Atticus' appeared in 1580. Joseph Gerard, a descendant of the same family, settled in Paris, and continued in 1755 the series of Latin classics in duodecimo,—rivals to the Elzevirs of an earlier date,—which had been begun in 1743, by Coustelier. This series of classics is much prized for its elegance and correctness.

**BARBOUR, Erwin Hinckley,** American geologist: b. near Oxford, Ohio. He was assistant palentologist in the United States Geological Survey in 1882-88; Stone professor of natural history and geology in Iowa College in 1889-91; became professor of geology in the University of Nebraska, and acting State geologist in 1891; and curator of the Nebraska State Museum since 1891. In 1893 he took charge of the annual Morrill geological expeditions, and since then he has also been engaged in the United States Geological and Hydrographic Surveys.

**BARBOUR, James,** American statesman: b. Orange County, Va., 10 June 1775; d. 8 June 1842. He was admitted to the Bar when 19 years old. He served in the Virginia legislature 1796-1812, becoming governor of the State in the latter year. Three years later he was elected to the United States Senate. He was Secretary of War 1825-27, and Minister to England 1828-29. In politics he was strongly anti-Democratic. He was chairman of the convention which nominated Harrison and Tyler for the presidency and vice-presidency.

**BARBOUR, John,** Scottish poet, of whose life but little is known. He is supposed to have been born about 1316; was educated at Oxford and Paris; he was archdeacon of Aberdeen from 1357 until his death. He traveled in England in 1357 and in 1368 went to France for scholarly purposes. He was a clerk in the household of Robert II who in 1378 gave him a perpetual annuity of 20s, increased in 1388 to £10 a year. He died in Aberdeen, 13 March 1395. His great epic, 'The Bruce,' tells the story of Robert Bruce and the battle of Bannockburn. It was written in 1375 and brought him favor from the King. Its style is clear and pure and compares favorably with contemporary English poets except Chaucer. It is important also as a record of the manners and customs of the time. First printed in Edinburgh in 1571; best modern edition by Skeat (Early English Text Society, London 1870-89). He also wrote 'Legends of the Satellies' (London 1953). The first edition is that by Metcalfe (Scottish Text Society, Edinburgh 1896) and a fragment on the Trojan War. Consult Horstmann, 'Barbour's Legendsammlung, nebst den Fragmenten seines Trojanenleges' (Heilbronn 1865); Lang, Andrew, 'History of Scotland' (1900).
BARBOUR, Philip Pendleton, American jurist: b. Orange County, Va., 25 May 1783; d. 24 Feb. 1841. He studied law at William and Mary College and began to practise in 1802. He led the war party in the Virginia legislature 1812-14, when he was elected to Congress, becoming speaker of the House in 1821. Four years later he was appointed a judge in his native State, returning to Congress (1827); but later resigning through ill-health. He was subsequently appointed a Federal judge, and in 1836 was promoted to the Supreme Court of the United States. In politics he was a Democrat.

BARBOUR, Ralph Henry, American author: b. Cambridge, Mass., 13 Nov. 1870. He was educated at the Highland Military Academy of Worcester, Mass. He is well known as a contributor of verse and short stories to magazines under the pen name of *Richard Stillman Powell,* but has published a number of entertaining boy's stories under his own name. His publications include *The Halfback* (1899); *For the Honor of the School* (1900); *Captain of the Crew* (1901); *Behind the Line* (1902); *The Land of Toy* (1903); *The Weather's Inning* (1903); *The Book of School and College Sports* (1904); *Four in Camp* (1905); *Four Afoot* (1906); *Tom, Dick and Harry* (1907); *Forward Pass* (1908); *Double Play* (1909); *The Golden Age* (1910); *The House in the Hedge* (1911); *The Harbor of Love* (1912); *The Junior Trophy* (1913); *Partners Three* (1913).

BARBOURSVILLE, Ky., town and county-seat of Knox County, 185 miles southeast of Louisville, on the Louisville & N. Railroad. The chief industries are connected with mining, lumbering and oil wells. Pop. 2,000.

BARBOURSVILLE, W. Va., town of Cabell County, situated on the Guyandotte River, and on the Chesapeake & O. and Guyandotte Valley railroads, nine miles east of Hurricane. It is the seat of Barbourville College, a Methodist institution, and of the Kuhn Memorial Hospital, and is of historic interest as the scene of a Federal victory in the Civil War, 13 July 1861. Pop. about 900.

BARBOX BROTHERS, a short story by Dickens, with a second part known as *Barbox Brothers & Co.*

BARBU, bár'bú-da, British West Indies, one of the Leeward Islands, 25 miles north of Antigua. It is of coral formation, has a fertile soil, and produces tobacco, cotton, corn and sugar. There are forts on the west side of the island, and a roadstead, but no port. The population is almost entirely negroes, and numbers about 1,000.

BARBUDO, bár'boó'ó, or BARBU, Spanish names in the West Indian region for the strange fishes of the family Polynemidae. See MANGO FISH.

BARBY, Prussia, a town in the province of Saxony, on the left bank of the Elbe, 16 miles south-southwest of Magdeburg. It is well built and has an old castle, and manufactures of linen and cotton, soap-works, breweries and distilleries. Pop. 5,592.

BARCA, north Africa, an Italian possession, part of Libia Italiana, lying east of Tripoli, about 500 miles long by 400 miles wide. It forms a portion of the ancient Cyrenaica, in its widest sense, where the Greeks had two flourishing colonies. The Greeks were followed in possession of the country by the Romans, and the monuments of both peoples remain in the ruins of their cities. The sides and summits of the hills in the east and north are fertile, and yield abundant crops and extensive pasture. The loftiest heights do not exceed 1,500 feet. Flowering shrubs occur in great variety, including, among others, roses, laurustinus, honeysuckles, etc. The Bedouin inhabitants have numerous camels and other cattle, constituting their principal wealth. Among beasts of prey the most common are hyenas and jackals; noxious insects also abound. There are hardly any permanent streams, most of the water-courses being of the nature of mountain torrents, which lose themselves in the sands of the Libyan Desert. The eastern portion, however, is tolerably well supplied with water by rains and springs. The chief exports of the country consist of grain and meat, along with ostrich feathers and ivory, brought by caravans from the interior. The sponge fisheries are also important. The chief imports are textiles and drugs. Next to Ben-gazi, the capital, the seaport of Derna is the chief town. Barca used to form a dependency of Tripoli, later a separate province under Turkish dominion. By the Treaty of Quichi, signed by the Turkish and Italian delegates 18 Oct. 1912, it was formally recognized as a dependency of Italy; it forms with Tripoli the new Italian colony Libya. The population is variously estimated, but probably does not much exceed 325,000.

BARCAROLLE, bár'kär-ol, a song of the gondoliers at Venice, often composed by themselves, to some simple and pleasing melody, such as may be timed to the stroke of the oar. Such melodies are sometimes reduced into operas, and have been written for the piano.

BARCELLONA, bár-chel'lo-nà, Sicily, a town in the province of Messina, situated on the Longano River, 27 miles west of the town of Messina. It is noted for its sulphur baths which are frequented from March to September. The suburb of Pozzo di Gotto is separated from the main town by a small stream, the Fiume di Castro Reale, supposed to be the Longanus of antiquity. Oil, manna, wine and fruit are the most important products. There are fine forests on the near-by mountains. The chief commerce is in oil and fish. Pop. 26,172.

BARCELONA, bár-thel'lo-nà, Spain, the largest city and second seaport of Spain, 440 miles northeast of Madrid by rail (310 miles direct line). It is the capital of the province of the same name and of the military district of Catalonia, and is handsomely built, in the shape of a half-moon, on the coast of the Mediterranean, between the mouths of the Llobregat and the Besos, in the midst of a spacious fertile valley. It was, even in the Middle Ages, one of the principal commercial places of the sea. On the southwest lies the hill of Montjuich, with a fort which protects the harbor. Barcelona is divided into the old town, the streets of which, with one or two exceptions, notably the broad Rambla, are narrow and medieval but always picturesque and animated;
and the new city, with wide streets and handsome modern houses. The walls of the old city have been converted into boulevards called rondas. In the suburbs are most of the factories. Its manufactures which are the most important in Spain include cottons, silks, woolens, machinery, iron castings, paper, glass, mathematical instruments, chemicals, stoneware and soap. There are also dyeworks, tanneries, etc. Previous to the great war many of the articles needed in commercial production were imported. But as these sources of supply were closed, new industries sprang up; especially to be noted are those of bottle tops, electric wire and cable, enamelled ironware, hardware, needles and buttons, galvanized iron and tinware, grindstones and crucibles, emery products, glass, inks, varnishes, glue, waterproof cloth, etc. New establishments also began making rubber articles, straw hats, shirts, neckties, furniture and toys. Forty-six new textile companies, manufacturing in silk, cotton and wool, have been (1916) begun since the war began, but principally in the food industries (1916). For though not the city but the whole district is noted. But perhaps the greatest growth has been in the line of chemical industries, to supply articles formerly imported from Germany. These include general chemical products, aniline dyes, drugs and essences, oils and soaps, alcohol, glucose and chemical fertilizers; as well as photographic papers and films, carbonic acid gas, liquid ice, cream of tartar and antiseptics. The local tanning industry increased largely owing to the war's demand for leathers, and 12 new tanneries were established to supply this trade. The importation of raw cotton into Barcelona for the campaign year 1915-16 was 396,788 bales, of which 314,855 came from the United States. While this supply was 98,744 bales less than the preceding year it was 5,722 bales more than the ante-war period, and for the United States an increase of 38,400 bales over Barcelona's purchases for the year just previous to the war. In 1916 the total supply of cotton now (1916) reaching Barcelona 80 per cent is grown in the United States, 15 per cent in India and 5 per cent in Egypt. Agriculture and the growing of fruits and nuts showed a marked increase in 1915-16. The harbor is spacious, 305 acres and has an entrance 300 yards wide between two low piers. The entrance is protected by a large mole, which has been recently extended, and there is a large floating drydock. The exports consist largely of manufactured goods, wine and brandy, fruit, cork, etc. The chief imports are coal, grain, cotton, hemp, foodstuffs, etc. In 1910 1,662 ships of 2,463,741 tons burden entered the harbor. The city contains a university founded in 1439, transferred to Cervera in 1714 and reopened here in 1837, now occupying a noble pile of buildings, completed in 1873. It has faculties of law, medicine, philosophy, natural sciences, mathematics and pharmacy, about 1,900 pupils and a library of 150,000 volumes. By law, the kings of Aragon (nearly 4,000,000 documents), two museums, a palace of fine arts, school of architects and engineers, a foundling hospital, a general hospital, large enough to contain 3,000 sick persons, a deaf-and-dumb institution, a large arsenal, a cannon foundry, several large theatres, a bull ring seating 14,500 persons, and a fine Spanish Gothic cathedral dating from the 13th century. It is the seat of a prince-bishopric, a Court, a bishop and the captain-general of Catalonia, and is altogether a beautiful and agreeable town, with various interesting features and highly picturesque surroundings. Electric trams and electric trams have been introduced. Barcelona has been founded by the Carthaginians in the 3d century B.C., and was an important city under the Romans, Goths and Moors. It was from the 9th till the 12th century governed by its own counts; but afterward by the marriage of Raymond IV with the daughter of Ramiro II, King of Aragon, it was united with that kingdom. In 1640 it withdrew, with all Catalonia, from the Spanish government; and submitted to the French Crown; in 1802 it submitted again to the Spanish government; in 1697 it was taken by the French, but restored to Spain at the Peace of Ryswick. In the War of the Spanish Succession Barcelona took the part of the Archduke Charles, but in 1714 was besieged by the troops of Philip V under the command of the Duke of Berwick, and taken after an obstinate resistance. A strong citadel on the east side of the city was then erected to overawe the inhabitants, but was destroyed in 1843. On 16 Feb. 1824 Barcelona was taken by surprise by the French troops under General Duquesne, and remained in the power of the French till, in 1814, all their troops were recalled from Catalonia to defend their own country. In 1821 the yellow fever carried off 40,000 of the inhabitants. The city has been the scene of many serious and sanguinary revolts, particularly in 1832, 1836, 1840 and 1841. Latterly, industry and commerce have rapidly increased, the construction of railways contributing to this result. This city is regarded as the centre of anarchist movements in Spain. It is governed by a council elected for four years by all the citizens over 25 years of age, and presided over by an alcalde chosen by the members among their own number. Pop. 800,000.

BARCELONA, bár·she·lō·nä, Venezuela, the capital of a district and of the state of Bermúdez, near the mouth of the Neveri, 160 miles east of Caracas. The surrounding country is fertile, but the city is hot and unhealthy. Cattle, jerked beef, hides, indigo, cotton and cacao are the chief exports. The district, formerly a separate state, has since 1881 formed one of the divisions of the state of Bermúdez. The city was founded in 1634 by Juan Urpín, and during the long period of Spanish domination was known by the name of Nueva (New) Barcelona. Pop. about 13,000.

BARCELONA, Bank of. In its more modern sense, that is to say, an institution of deposit, loan, discount, domestic and foreign exchange, etc., open to the commercial public, the Bank of Barcelona must be regarded as the elder of the archives of the Pyrenees. As its operation had a bearing upon the affairs of America they possess especial interest. Primarily this relates to the obrus, obrusum, obriso, or test or trial of the pyx. In Spain by the ordinance of Valencia, made by King John, who conquered the kingdom of Aragon,
it is expressly provided that *real* shall only be coined in Valencia, and that the minters shall be supervised by two well-known citizens, so that no money shall be coined in less than double or weight. (Grimaudet, 'Law of Payment,' p. 14). The coin referred to is the well-known Spanish real de plata, of eight to the dollar. It was lawful money in the United States down to 1847. It was current in Spain and in the Spanish American mints of Mexico and Peru and subsequently adopted by the United States government. This supervision and testing of the coins is still conducted in the American mints under a commission of civilians appointed by the Secretary of the Treasury.

Upon returning from his momentous voyage of discovery, Columbus appeared before King Ferdinand and Queen Isabella, then holding court at Barcelona, and their sovereigns and a brilliant throng of nobles and ecclesiastics the particulars of his wonderful achievement, exhibiting among other proofs a number of American natives, specimens of their field products and handiwork, and an attractive show of American gold nuggets.

The second voyage of Columbus, planned upon a royal scale, was especially prepared for the mining of gold, to carry out which object the King had recourse to two financial measures: First, immediate sequestration and sale of the property of heretics, second, a loan from the Bank of Barcelona. This loan furnished an additional point of interest in that institution.

Among its various operations the bank received on deposit and disbursed the revenues, or part of them, of the four great ecclesiastical military orders, and kept the accounts of about a dozen other orders of knighthood, like those of Calatrava, Saint James, Golden Fleece, Saint George, etc., some of which were ecclesiastical and others chivalrous. The royal treasure which during the reign of Henry IV of Castile was deposited in the castle of Segovia was afterward divided and removed by his step-sister, Queen Isabella, who deposited a portion of it in the Bank of Barcelona; because the Contador-General, or Superintendent of Finances, is known to have drawn for public certificates against upon that institution some of his warrants.

In 1480 Isabella, holding court at Toledo, had signed a decree which greatly affected the Bank of Barcelona. 'To support the government of Castile, Henry IV had issued certain edicts for the assessment and collection of the public rents,' these by purchase had become the property of the nobles; who in turn had borrowed money on them from the bank. Isabella's decree denouncing and annulling these certificates—a virtual act of repudiation—was entrusted for execution to her confessor, Fernando de Talavera, who performed his office with such fidelity that it saved 30,000,000 maravedis annually to the Crown, or three-fourths of the entire revenue (Prescott, ' Ferdinand and Isabella,' I, 299). Little more is heard of the bank after this despoilment. The treasure from America went no longer to Barcelona, but to Seville, where it was consigned to the Casa de Contratación, or Board of Trade, and thence sent to the mints, of which there were five, each of them situated in a fortified city of the realm.

After the struggle to survive the depletion of its resources in 1480 the bank was hardly in a condition to weather the civil wars which attended the effort to wrest the crown from Juana and her son Charles. During this period of violence, the old bank, despairing of a return to peace and security, appears to have quietly discharged its obligations, and its affairs and honorably dissolved. For the history of other ancient banks see Byzantium, Bank of; Fugger, Bank of the; Genoa, Bank of; Medicis, Banks of the; Tyre, Bank of; Venice, Bank of; ALEXANDER DEL MAR.

BARCHESTER TOWERS, the second of Anthony Trollope's Chronicles of Barsetshire—'The Warden' (1855), 'Barchester Towers' (1857), 'Dr. Thorne' (1858), 'Framley Parsonage' (1861), 'The Small House at Allington' (1864), 'The Last Chronicle of Barset' (1867)—has been on the whole the most popular of Trollope's many novels and is thoroughly representative of all his best qualities. He took, he said, great delight in writing the story, as he did with the entire series, which, more than any other section of his work, is full both of gusto and the look of reality. Strangely enough, he had never lived in a cathedral city, except London, and had no intimate knowledge of clerical affairs; the idea of 'The Warden,' out of which all the other Barsetshire novels grew, came from a chance observation. But imagination so far took the place of experience that Trollope made the Chronicles, on the whole, the most notable representation in fiction of the lighter phases of English ecclesiastical life. The theme of 'Barchester Towers' is excellently adapted to Trollope's abilities. A new bishop of Barchester, coming into his diocese with tactless com motion, disturbs the deep calm long established there. The book is an account of the confusions and little wars he causes before the community once more settles back into peace. It would have been easy to be merely farcical, and Mr. Slope, the bishop's chaplain and the villain, comes near to farce; but for all the hurrying and scurrying about, all the insistent intrigues and machinations which make up its plot, 'Barchester Towers' is very real. It particularly suggests Hawthorne's comment upon Trollope's books in general: "They precisely suit my taste—solid and substantial, written on the strength of beef and through the inspiration of ale, and just as real as if some giant had hewn a great lump out of the
earth and put it under a glass case, with all its apparatus of bags about their daily business, and not suspecting that they were being made a show of. And these books are just as English as a beefsteak. 'Barchester Towers' is not a book of the spirit, for Trollope cared neither for mysteries nor for doctrines. It is essentially a comic book, with an upstart satire or caricature. The plot is easy and credible, the good humor unflagging, the style, if not distinguished, yet clear; the setting and descriptions are always full of truth. The characters, however, give the book its memorable excellence. It is not only that they think, speak and act naturally. They are presented with a picturesqueness which never distorts them and a comic force which but adds to their verisimilitude. Such personages as Bertie Stanhope and Mrs. Proudie, the particular triumphs of this novel, may reasonably be mentioned with the immortals.

CARL VAN DOREN.

BARCLAY, James, Canadian preacher and educator: b. Paisley, Scotland, 19 June 1844. He was licensed by the Paisley Presbytery in 1870 and was minister of Saint Paul's Church, Montreal, from 1883 to 1910. While in Scotland he was frequently summoned to Balmoral to preach before Queen Victoria. He served through the Riel rebellion in the Northwest Territories, in 1885, and, besides being connected with various local institutions, has been president of Trafalgar Institute since its opening.

BARCLAY, John, Scottish poet: b. Pont-à-Mousson, France, 1582; d. 1621. He accompanied his father to England, where he was much noticed by James I, to whom he dedicated a politico-satirical romance, entitled 'Satyrikon,' in Latin, directed against the Jesuits. He wrote also several other works, among which is a singular romance, in elegant Latin, entitled 'Argenis,' which first appeared at Paris in 1621. It is an allegory, of a character similar to that of Satyrikon, and alludes to the political, the religious, and especially France, during the league. Like the earlier work, it has been several times reprinted, and has also been translated into several of the modern languages, including English.

BARCLAY, John, Scottish clergyman: b. 1734; d. 1798. He was appointed assistant minister at Fettercairn, where he attracted wide attention through his novel doctrines. His advocacy of these led to his dismissal by the Presbytery, whose decision was upheld by the General Assembly. Barclay, however, continued to preach in Edinburgh, London and elsewhere. He founded the sect known by his name as Barclayites or Bereans—the latter name being taken from Acts xvi, 2. Barclay was the author of many tracts, pamphlets, etc., including 'Without Faith, Without God; or An Appeal to God Concerning His Own Existence' (1769). (See Bereans). Consult 'Works of John Barclay,' edited with memoir (1852).

BARCLAY, Robert, a member of the Society of Friends: b. 23 Dec. 1648, at Gordontown, in the county of Moray, of an ancient and honorable family; d. Ury, near Aberdeen, 3 Feb. 1699. He succeeded his father, Colonel Barclay, to send him to Paris, to be educated under the care of his uncle, who was principal of the Scotch College in that capital, and who offered to make him his heir if he would become a convert to the Roman Catholic religion. Barclay refused and soon afterward his father sent him for return home; and Colonel Barclay soon after becoming a Quaker, his son followed his example. Uniting all the advantages of solid learning to great natural abilities, he soon distinguished himself by his talents and zeal in the support of his new opinions. His first treatise in support of his adopted principles was published at Aberdeen in the year 1670, under the title of 'Truth Cleared of Calumnies,' etc. To propagate the doctrines, as well as to maintain the credit he had gained for his sect, he published, in 1675, a regular treatise, in order to explain and defend the system of the Quakers, which production was also very favorably received. These and similar labors involved him in controversies with the leading members of the University of Aberdeen, and others; but he was at the same time busy with his great work in Latin, 'An Apology for the Christian Divinity, as the Same is Preached and Held Forth by the People in Scorn Called Quakers,' published at Amsterdam in 1676; an English translation appeared later in the same year. He traveled with William Penn and George Foxe through the greater part of Holland and Germany, to spread the opinions of the Quakers. He with other Quakers was imprisoned for five months at Ury because of his beliefs, but enjoyed the royal favor after his release, and in 1683 was made nominal governor of East Jersey under patent to the Society of Friends by the Duke of York. He never came to America, however. His estate remained in the possession of his descendants until 1854. His study remained as he left it for about two centuries when it was pulled down. The last of his productions, in defense of the theory of the Quakers, was a long Latin letter addressed, in 1676, to Adrian de Paets, 'On the Possibility and Necessity of an Inward and Immediate Revelation.' It was not published in England until 1696. With few exceptions, the Quakers and opponents unite in the profession of great respect for the character and talents of Barclay. Besides the works already mentioned or alluded to, he wrote 'Catechism and Confession of Faith' (1673); 'Theses Theologicæ' (1673), of which the Apology was a defense; also 'The Anarchy of Ranters' (1676); 'Universal Love Considered and Established Upon Its Right Foundation' (1677); and various replies to the most able opponents of his Apology. In 1692 a collected edition of his works appeared under the title 'Truth Triumphant.' It was republished in 1717-18. The 'Apology,' 'Catechism,' and 'Treatise on Church Government' (formerly called 'The Anarchy of the Ranters') have been issued by the Friends' Book Store at Philadelphia. Consult Armistead, William, 'Life of Robert Barclay' (Manchester 1850). See QUAKERS.

BARCLAY, Robert Heriot, British naval officer: b. Scotland 1785; d. 1837. He served with Nelson at Trafalgar, and lost an arm in the battle. He was sent out to command the British ships of the line and was defeated by Commodore Perry at the battle of Lake Erie on 10 September of that year. He
BARCLAY — BARD

was subsequently court-martialed for the loss of his fleet, but was "fully and honorably acquitted."

BARCLAY, Sir Thomas, English jurist: b. Dumfriesshire, Scotland, 1853. He was educated at University College, London, and at the universities of London, Bonn, Paris and Jena. He went to Paris as a correspondent of the Times in 1876. He resigned this post in 1882 to devote himself exclusively to French law practice. Since 1907 he has identified himself with the active agitation for a good understanding with France. He visited the United States in 1903-04, and there stirred up agitation for an Anglo-American treaty of arbitration and conciliation. In 1905, at the invitation of the Associated Chambers of Germany, he visited Berlin and delivered addresses in favor of improving Anglo-German relations, and in the same year founded the International Brotherhood Alliance (Fraternitas Inter Gentes) for the encouragement of personal relations among the laboring classes of different countries. He was knighted in 1904, and became member of Parliament for Blackburn in 1910. He is an officer of the Legion of Honor and Knight of the Légion d'Honneur. He has published "Problems of International Practice and Diplomacy" (1907); "The Turco-Italian War and Its Problems" (1912); "Companies in France" (2d ed., 1899), and other law books, and the articles on international law in the "Encyclopedia of the Law of England" and the "Encyclopedia Britannica"; "Thirty Years of Anglo-French Reminiscences" (1914); "Law and Usage of War" (1914), and articles in The Nineteenth Century, etc.

BARCLAY DE TOLLY, Michael, Prince, distinguished Russian general: b. Livonia 1761; d. Insterburg, 14 May 1818. He entered the army at an early age, and his long service as a subordinate in campaigns against the Turks, Swedes and Poles laid the basis of a vast and varied experience, and served to develop his great natural capacity for command. In 1810 he was made Minister of War. He occupied this position in 1812, when Napoleon invaded Russia, but was soon appointed to the chief command of the army. He adopted a plan of retreat, which was at first seen as a strict necessity, as the Russian army, officially estimated at more than 500,000, did not greatly exceed 100,000 men. In this difficult campaign Barclay proved no unworthy subordinate of Napoleon himself. Notwithstanding, the Russians became impatient of a policy which seemed to show no active results, while jealousy of the Scottish extraction of Barclay and other causes completed his overthrow, and after the capture of Smolensk by the French he was superseded by Kutusoff. Serving under his successor, he commanded the right wing of the Russian army at the battle of Moscow, maintained his position, and covered the retreat of the rest of the army. After the battle of Bautzen, in 1813, at which he again distinguished himself, he was appointed to the chief command, which he had soon after to resign to Prince Schwarzenberg. He forced the surrender of General Vandamme, who had been detached by Napoleon for some special operations, after the battle of Dresden, and took part in the decisive battle of Leipzig. On crossing the Rhine at the head of the Russian troops he issued a strict proclamation, forbidding all license on the part of his soldiers, and by the maintenance of an exact discipline he conciliated the French as much as possible to the invaders. He was made a field-marshal in Paris. In 1815 he commanded a mixed corps of continental troops. In this year he received from the Emperor the title of prince, and from Louis XVIII the badge of military merit. The Emperor Alexander caused a statue to be erected to him in one of the principal places of Saint Petersburg.

BARCLAY SOUND, an inlet on the west coast of Vancouver Island. It is some 35 miles in extent and the Alberni Canal continues it yet farther inland. It contains several islands and iron ore is found along its shores.

BAR-COCHBEBA, BAR-COCHBA, or BAR KOKBA, the name given to one Simeon, a celebrated Jewish impostor of the 2d century A.D. who pretended to be the Messiah. He called himself, or was called by his followers, Bar-Cochba, meaning Son of the Star, and applied to himself Bakham's prophecy, there shall come a star out of Jacob. He obtained the support of the celebrated Rabbi Akiba, and availing himself of the general dissatisfaction produced among the Jews by Hadrian's attempt to erect a temple to Jupiter on the site of the temple of Jerusalem, raised the standard of revolt, and soon mustered numerous followers. After carrying on a kind of guerilla warfare, he made himself master of Jerusalem about 132, and gained possession of about 50 fortified places. Hadrian, who had at first delayed the insurrection, now saw the necessity of acting more vigorously, and sent to Britain for Julius Severus, one of his ablest generals, who, avoiding a general engagement, gradually made himself master of the different forts which the rebels possessed, and then, though not without great loss, took and destroyed Jerusalem. Bar-cochba retired to a mountain fortress, and perished in the assault of it by the Romans three years after, about 135. Consult Drenbourg, 'Histoire de la Palestine'; Schattauer, 'Geschichte Israels,' and article "Bar Kokba" in the 'Jewish Encyclopedia.'

BARD, John, American physician: b. near Philadelphia, February 1716; d. 30 March 1799. He was of a family which had fled from France upon the revocation of the edict of Nantes. He practised his profession a few years in Philadelphia, but removed to New York in 1746, where he rose to the first rank among physicians. In 1759, the citizens of New York were alarmed by the arrival of a ship, on board which a malignant fever was raging, and Dr. Bard was appointed to take measures to prevent the disease from spreading. He succeeded in keeping the pestilence within the limits of a temporary hospital, but to guard against similar dangers in future, at his suggestion, Bedloe's Island was purchased, and hospital buildings erected thereon, which were placed under his charge. He continued the practice of his profession to an advanced age, and upon the establishment of the New York Medical Society in 1788 was elected its first president.

Hueneme, Cal., 5 March 1915. He engaged in railroading in Maryland 1858-64, when he went to California to attend to the interests of Col. Thomas A. Scott. From this time he resided in Venice, California, engaging in wharfing and warehousing, banking, sheep grazing, real estate and petroleum mining. In 1892 he was the only Republican elector for California. He was elected to the United States Senate 7 Feb. 1900 by the unanimous vote of the Republican majority in the legislature and served until 1905.

BARD, Italy, a fortress and village, about 23 miles southeast of Aosta. The fortress, which stands on a huge mass of rock at an elevation of 1,019 feet, has been thrice taken: in 1052 by Duke Amedeus of Savoy; by the French during the War of the Spanish Succession in 1704; and in 1800, before the Battle of Marengo, when the troops of Napoleon, having crossed the Saint Bernard, found their further advance into Italy checked here by 400 Austrians, who maintained a stubborn defense for a week. Ultimately Napoleon contrived to elude the vigilance of the garrison, and passed by a mountain-track during the night.

BARD, a designation applied to the ancient poets of the Celtic tribes, who in battle raised the war-cry, and in peace sang the exploits of their heroes, celebrated the attributes of their gods and chronicled the history of their nation. Their early history is uncertain. Diodorus tells us that the Celts had bards, who sang to musical instruments; and Strabo testifies that they were treated with respect approaching to veneration. There is a passage in the 'Germania' of Tacitus in which a word occurs that some have read as bardius, and translated "Bard's Song"; but baritus appears to be the true reading, and the true signification merely "War-cry."

The first Welsh bards of whom anything is extant are Taliesin, Aneurin and Llywarch Hen, of the 6th century; but their language has been imperfectly understood. From the days of these early representatives of the bards we have nothing further till the middle of the 10th century, when the reputation of the order was enhanced by the patronage of the monks. A code of laws was framed by that prince to regulate their duties and fix their privileges. They were distributed into three classes, with a fixed allowance; degrees of rank were established, and regular prize contests, known as estieddfoes, were instituted. Their order was frequently honored by the admission of princes, among whom was Llewellyn, last King of Wales. The Britons, kept in awe as they were by the Romans, subsequently harassed by the English, and jealous of the attacks, the encroachment, and the neighborhood of aliens, were, on this account, attached to their Celtic manners. This situation and these circumstances inspired them with a proud and obstinate determination to maintain a national distinction, and preserve their ancient usages, among which the bardic profession is so eminent. Sensible of the influence of their traditional poetry in keeping alive the ideas of military valor and of ancient glory among the people, Edward I is said to have collected all the Welsh bards, and caused them to be hanged by martial law as stirrers up of sedition. On this incident is founded Gray's well-known ode 'The Bard.' We, however, find them existing at a much later period, but confining themselves to the humble task of compiling private genealogies. But little is known of the music and measures of the bards; their prosody depended much on alliteration; their instruments were the harp, the pipe and the cwrth. Attempts have been made in Wales for the revival of bardism, and the Cambrian Society was formed in 1818, for the preservation of the remains of this ancient literature and for the encouragement of the national muse. Within recent years the estieddfoes have again assumed a national importance. The bardic institution of the Irish bears a strong affinity to that of the Welsh. The professional bardic schools only disappeared at the end of the 18th century. The genealogical sonnets of the Irish bards are still the chief foundations of the ancient history of Ireland. Their songs are strongly marked with the traces of Skaldic imagination, which still appears among the 'tale-tellers,' a sort of poetical historians, supposed to be the descendants of the bards. There was also evidently a connection with the Welsh bards. Hence, in the early French romances, we often find the scene laid in Wales; and, on the other hand, many fictions have passed from the Troubadours into the tales of the Welsh. In the Highlands of Scotland bards were in existence down to the 17th century. Considerable remains of compositions supposed to be those of the old bards are still preserved. Consult Jones, 'Relics of the Welsh Bards' (London 1784); Stephens, 'Literature of the Kymry' (London 1873); Hyde, 'Literary History of Ireland' (New York 1906); Hull, 'Irish Literature' (Vol. II, London 1908); Walker, 'Memoirs of the Irish Bards' (London 1786).

BARDE, Frederick Samuel, American writer and naturalist: b. Hannibal, Mo., 25 July 1849; d. Guthrie, Okla., 23 July 1916. After receiving an academic education at Shimer College in Illinois, he began work as a newspaper reporter at that place. In 1894 he joined the staff of the Kansas City Star and, four years later, was sent as its representative to Guthrie, then the capital of Okla. of Howel D. Ha.

The eddfoes, sessions, political conventions and statehood gatherings and visiting all parts of the Indian and Oklahoma Territories, his acquaintance with the people and their history and institutions became very thorough and his remarkable aptitude for discernment and analysis, coupled with his ability as a writer, gave him a hearing and a measure of influence that is seldom exerted by an independent writer. Many of his contributions were published in metropolitan papers and magazines in the Eastern cities. He edited and aided in the publication of several books, among them 'The Life of Billy Dixon' (buffalo hunter), Gen. J. C. Jamison's 'With Walker in Nicaragua' and Doolin's 'Outdoor Oklahoma.' For many years an ardent sportsman, in his later years he turned hunting guide for the camera and became known as one of the most successful wild bird and animal photographers in America. The Oklahoma legislature (1917) made a special appropriation for the purchase of his manuscripts, field-notes, photographs, negatives and other material per-
BARDEEN — BARDSTOWN

BARDEEN, Charles William, American editor and author: b. Groton, Mass., 28 Aug. 1847. He served with the 1st Massachusetts Volunteers in the Civil War, 1862-64, and was graduated at Yale University in 1869. He held several educational positions in the years following and in 1872 became superintendent of schools at Whitestown, N. Y. He has been editor and publisher of the School Bulletin since 1874. He was placed in charge of the educational publications at the International Congress of 1893, was president of the Educational Press Association of America 1900-06. His published works include Manual of School Law (1875); Some Facts About Our Public School System (1878); Educational Journalism (1881); Teaching as a Business for Men (1885); The Teacher As He Should Be (1891); History of Educational Journalism in New York (1893); Geography of the Empire State (1895); Problems of City School Management (1899); Dictionary of Educational Biography (1901); Educational Journalism for the Past Fifty Years (1906); Fables for Teachers (1909); A Shattered Halo (1912); The Trial Balance (1913); The Girl from Groton (1913).

BARDELL, Mrs., the obliging landlady of Mr. Pickwick in Dickens' "Pickwick Papers," and the heroine of the famous "Bardell vs. Pickwick" case.

BARDESANES, bár-de-sá'néz, Syrian poet and theologian, who lived in the latter half of the 2d century, in Edessa, and is memorable for the peculiarity of his doctrines, which were taught through 150 hymns ascribed to him and in use in the Church till the 4th century. He considered the evil in the world only an accidental reaction of matter, and all life as the offspring of male and female atoms. From God, the inscrutable Principle of all substances, and from the consort of this first Principle, proceeded Christ, the Son of the Living, and a female Holy Ghost; from these, the spirits or demiurge of the four elements; this forming the holy eight, or the godlike fullness, whose visible copies he found in the sun, moon and stars, and therefore attributed to these all the changes of nature and of human destiny. The female Holy Ghost, impregnated by the Son of the Living, in accordance to him, the Creator of the world. The human soul, originally of the nature of the atoms, was confined in the material body only as a punishment to its fall, but not subjected to the dominion of the stars. He considered Jesus, the atom, destined for the salvation of souls, only a feigned man, and his death only a feigned death, but his doctrine the sure means to fill the souls of men with ardent desires for their celestial home, and to lead them back to God, to whom they go immediately after death, and without a resurrection of the earthly body. Bardesanes propagated this doctrine in Syrian hymns, and is the first writer of hymns in this language. The Bardesanians did not formally separate themselves from the orthodox Christian Church, and they maintained themselves until the 5th century. A fragment of the work of Bardesanes upon destiny is preserved in the Greek language, by Eusebius, Evang. lib. vii, cap. 103. He led an irreligious life. Consult Helgenfield, "Bardesanes" (1864).

BARDILI, Christoph Gottfried, German metaphysician: b. Blaubeuren, Württemberg, 28 May 1761; d. Stuttgart, 5 June 1808. He was distinguished as a critic and opponent of Kant, and philosophically a forerunner of Schelling and Hegel through his emphasis on the reality of pure abstract thought as a ground of concrete thinking and being.

BARDOLPH, Shakespearean character. He is one of the dissolute comrades of Falstaff and appears in the plays "Henry IV," parts I and II; "Henry V"; and Merry Wives of Windsor.

BARDOWICK, bár'dô-vîk, Germany, town in Hanover, once the commercial centre of northern Germany, but now an insignificant village, famous for the ruins of a one-time magnificent cathedral, dating from before the destruction of the town in 1189. The region is fertile, and the town is a centre for trade in farm products. Pop. (1910) 2,200.

BARD. Spelled variously barde, barde, etc. Horse-armour, often wrongly termed caparisons. The latter is the term for rich coverings (housings) spread over the back of horses on ceremonial occasions, whereas the bardings were to protect the war-horse (destrier) in combat. The ancient Dacian mounted spearmen's (cataphracti) horses were entirely covered with scale armour, including head and feet. The Etruscans used a chest protection (plastron) for war-horses; the Persians and Greeks used a horse frontal. A testiere of leather covering the entire head of the horse was known in very early days in Europe. By the 13th century, chain mail (trapper of mail) for horses was used in Europe; the leather breast-piece is mentioned in 1347. Plate armour for horses was introduced into Europe, piece by piece, in the Middle Ages to become a complete panoply by the middle of the 15th century. The full set (panoply) consisted of chanfron, crinet, peytral, han- chard, croupiere, tail-guard, rein-guard. The purposes for these different pieces were as follows:

- Chanfron (spelled variously chamfron, champfrein, etc.) or frontal, a guard for the forepart of the horse's head (with or without blinkers). Crinet, criniere or crinale, armor for the neck of the horse. Peytral, poltral, poitrail or poitrinal, a breastplate. Flanchard, armor to protect the flanks. Crupper, or croupiere, a protection for the horse's rear. Tail-guard, a tubular appendix to the croupiere, served to protect the tail. Reins-guard, hinged plates protecting the reins.

- The above full panoply became quite general by the middle of the 16th century, but from that time was, piece by piece, discarded till by 1600, horse armor was becoming rare. Armor for the horse's legs was rarely used. In order to reduce the effect of chafing, horse armor was lined with leather.

CLEMENT W. COUMBE.

BARDSTOWN, Ky., city and county-seat of Nelson County, 40 miles southeast of Louisville, on the Louisville and Nashville Railroad.
It is the seat of Bethlehem Academy and of Saint Joseph's College. It contains flour mills, saw mills, chair, broom and concrete works and a barrel factory. The city has a large trade in cattle, grain and hogs. The municipality owns the waterworks and lighting plant. From 1860 to 1881 Bardstown was the seat of a Roman Catholic bishop, who was transferred to Louisville in the latter year. Pop. 2,126.

BARDWAN, bard-wân', India, a division of Bengal, upon the Hugli, about 75 miles from Calcutta. Area, 13,850 square miles; pop. 8,245,000. Apart from its products, rice, grain, hemp, cotton, indigo, etc., it has a noted coal field of about 500 square miles in area, with an annual output of about 500,000 tons. The capital of the same name has a population of about 35,000. It is a miserable place—an aggregate of second-rate suburbs—but contains numerous temples and a large palace.

BAREBONE, or BARBON, Praise-God, the name of a leather seller in Fleet street in London, well known in his day as a prominent preacher among the Baptists: b. about 1596; d. 1679. He made himself notorious as an enemy of the monarchy and in 1660 on Monk's arrival in London, Barebone, at the head of a numerous mob, presented a petition to Parliament against the restoration of the Stuarts. In 1661 he was committed which the Tower and remained for some time in confinement.

BAREBONES PARLIAMENT, a derivative term applied to the "Little Parliament" summoned by Oliver Cromwell 4 July 1653. After the dismissal of the "Rump," 20 April 1653, letters were sent out in name of Cromwell and of the Council of the Army to the Congregational churches in each county, inviting them to nominate fit persons, "with a faithfull, loving God and hating covetousness," to serve in Parliament. These lists were duly sent in, subjected to scrutiny by the army council and many excluded from or additions made to that body. This Parliament consisted of 140 members—129 from England, 6 from Ireland and 5 from Scotland; and to it Cromwell made over his dictatorship. This "Assembly of Nominees" began by abolishing the House of Chancery and was proceeding to abolish tithes when under pressure by the army the majority resigned in a body; Cromwell dissolved Parliament on 12 December of the same year and immediately thereafter assumed the lord protectorate of the kingdom. Its title is taken from one Barebone, a tanner, one of the members for the city of London. Judged by modern standards, some of its proposals showed political wisdom: civil marriages and the due registry were cited as an example. Consult Glass, H. A. 'The Barebones Parliament' (London 1899).

BAREFOOTED FRIARS. See FRIARS.

BARÈGE, bârâzh, a light, open tissue of silk and worsted or cotton and worsted for women's dresses, originally manufactured near Barèges, France, and in that country known as cloth de batz. The fabric is now chiefly manufactured at Bagneères de Bigorre.

BARÈGES (ancient VALLETRIA), France, watering place in the south of France, department of the Hautes-Pyrénées, 22 miles south from Tarbes, and celebrated for its thermal springs. The springs are considered efficient for rheumatism, scrofula and old wounds. It is situated in a valley between two perpendicular chains of mountains, along with numerous other villages. From June to September it is crowded with patients, and the bath establishment is a place of marvellous beauty. There is a hospital and an ecclesiastical charity hospital are also prominent local institutions. Extreme cold and the danger of frequent avalanches almost depopulate the town in winter.

BAREILLY, bârâlî', Hindustan, town in the northwest provinces, capital of a district of the same name, 151 miles east-southeast from Delhi. It has a pleasant and elevated site, and contains one well-built street, an old and a new fort, and cantonments in the environs. The principal manufactures are ornamental furniture, sword-gtily, gold and silver lace and perfumery. There is a brisk and lucrative commerce in grain, cotton and sugar, the tax on which is the chief source of municipal revenue. On the outbreak of the Indian mutiny the native garrison lost possession of the place. It was retaken by Lord Clyde in May 1858. Pop. 129,462.

BARENTZ, William, Dutch navigator: b. about 1560, who discovered Nova Zembla in 1594. While on a third expedition to the same region, in 1596, he discovered Spitzbergen, but had to spend the winter of 1595-97 in Nova Zembla. He and his companions suffered great hardships which led to his death on the homeward journey. Relics of his expedition were discovered undisturbed in 1871.

BÂBÈRE DE VIEUZAC, bârâ dâ vvrâz, Bertrand, French revolutionist and agitator: b. Tarbes, 10 Sept. 1755; d. 14 Jan. 1841. An advocate of Toulouse, he acted as a deputy in the National Assembly, and was sent by the department of the Hautes-Pyrénées to the National Convention in 1792. He became active as a journalist, and attached himself to the Mountain, supporting it with eloquence of such a flowery and poetical style as afterward earned him the name of the "Anacreon of the guillotine." He was president of the convention when the revolution came to an end, in 1793. He rejected the appeal to the people, and gave his vote with these words: "The law is for death, and I am here only as the organ of the law." Though a supporter of Robespierre, he concurred in his downfall, yet this did not save him from being impeached and sentenced to transportation. His sentence was not carried into effect, and he shared in the general amnesty of the 18th Brumaire. Elected a deputy during the Hundred Days, he was banished after the second restoration. He went to Brussels, where he devoted himself to literary work till the revolution of July permitted his return.

BARETTI, bârâ'tet, Giuseppe Marc' Antonio, Italian writer: b. Turin 1719; d. 5 May 1789. In 1751 he took up residence in London. In 1753 he published a 'Dictionary of Italian Poets.' About this time he was introduced to Johnson, then engaged in the compilation of his 'Dictionary,' of which Baretta availed himself to compile an Italian and English dictionary in 1760, much more complete than any which had hitherto appeared, and which established his reputation as a scholar. In this year
he visited his native country, and published at Venice a critical journal, the *Frusta Let-
teraria*, which was soon suppressed. He re-
turned to London in 1606. There he pub-
lished an "Account of the Manners and
Customs of Italy." While defending himself
in a street brawl he mortally wounded one
of his assailants, and was tried for murder at
the Old Bailey but acquitted. On this occa-
sion, however, Burke, Gomville, Garrick and
Reynolds gave testimony to his good character.
In 1770 he published his *Journey from London
to Genoa through England, Portugal, Spain
and France,* and continued to publish intro-
ductive works for students in the Italian and
other modern languages, and superintended an
edition of Machiavelli's works. He was the
author in all of 36 volumes. His *Opere
Scritte in Lingua Italiana* appeared at Milan
in six volumes in 1813-18. Baron Pietri Custodi
published his *Scritti Seclii, Inediti, o Rari* (1822).
Consult L. Collison Morley, *G. Bar-
retti, with an Account of His Literary Friends*
(London 1909).

**BARGE CANAL, The New York State.**
The improvement of the New York State
canal authorized by a vote of the people in
1903 has become popularly known as the Barge Canal.
This phrase is without particular sig-
nificance in itself, being but the shortened form
of "Thousand-ton barge canal," the name which
was first given, based on the proposed size, but
which is now a misnomer, since subsequent
legislation has increased the capacity of the
canal two or three fold.
The Barge Canal is the improvement of four
branches of the State waterway system. These
canals had already undergone various enlarge-
ments, but the Barge Canal is more than an en-
largement, in several respects it is a radical change
in form of construction. Of these changes, three are especially prominent. First,
there is now an @ \textfrac{1}{8} ft. channel, consequently no animal towage. Again, electrically-
driven machinery replaces hand-operation. But
the greatest change is the substitution of river
canalization for independent canals. When the
original State canals were built the best practice of the time was to follow the contours of
the natural streams. Canal-builders naturally
sought the valleys, but they put their waterways
away from and slightly above the stream beds.
Modern practice, because of ability to cope
with floods, boldly chooses the valley bottoms
and makes the natural stream into a canal. This
procedure has largely changed the locations of
canals in New York, in some instances placing
the new channel several miles from the old
waterway. Briefly to summarize the principal
changes—the Barge Canal is a thorough mod-
erization in size, construction and equipment.
The four branches improved are: (1) The
Erie, or main canal, which stretches across the
State from east to west and joins the Hudson
River with Lake Erie; (2) the Champlain,
which runs northerly from the eastern terminus
of the Erie and enters the head of Lake Cham-
plain; (3) the Oswego, which starts north,
midway on the line of the Erie, and reaches
Lake Ontario; (4) the Cayuga and Seneca,
which leaves the Erie a little to the west of the
Oswego junction and extends south, first to
Cayuga Lake and then to Seneca Lake.

The Barge Canal, while differing from the
erlier canals in many respects, is really but a
stage in the development of the State water-
ways. The original Erie and Champlain canals
completed in 1825 and 1823, respectively, were
so successful that a veritable mania for canal-
building spread over both the State and nation.
In New York this agitation resulted in the
building of several additional canals and in the
enlargement of the Erie and Champlain canals
years after its opening, and a few years later in
the enlargement of the three other canals
which are now parts of the Barge Canal
improvement. This first enlargement was pro-
tracted through 26 years and even then was not
entirely finished. About a decade later a popu-
lar feeling of opposition to canals became so
strong as to bring about, within the next half
dozens years, the abandonment of several lateral
branches. However, shortly after this the ad-
verse sentiment gave way to a fairer attitude
and an improvement was undertaken which proved to be the beginning of a reawaken-
ing of interest in canals that has endured until
the present time. This period of reawakening found its first expression in 1884 in the lengthening of locks.
In 1892 came the first official suggestion of an
enlargement similar to what has become the
Barge Canal. The Constitutional Convention
of 1894, recognizing the popular demand for
improved canals, included an article in its pro-
posed amendments whereby such improvement
could be authorized. This enlargement, ordered
by the people in 1895 and calling for nine feet
depth in the Erie and Oswego canals and seven
feet in the Champlain Canal, owing to the ex-
haustion of funds, was but partially completed.
At the beginning of 1899 the State found
itself in a quandary. The old canals were
antiquated; the attempted improvement was
unavailable without considerable additional
outlay. As a result a committee of eminent
citizens was appointed, with authority to study
the whole situation and in effect to formulate a
canal policy for the State. This committee
reported to the legislature of 1900, giving rough
estimates for completing the attempted enlarge-
ment and also for new canals to be built along
top of the old lines substantially like those later adopted, and
recommending for immediate action the making
of careful surveys and estimates for the latter
scheme. Almost contemporaneously with the
work of this committee, two Federal investiga-
tions had been in progress—the Deep Water-
ways survey and a study of relative costs of
transportation between lakes and sea by ships
and by barges. These investigations produced
valuable data and helped mold public sentiment.
The recommended survey was made in 1900,
with a report to the legislature in 1901. In-
ability of canal advocates to concentrate on any
one plan delayed legislative action till 1903.
Then, after a revision of estimates, the meas-
ure was referred for a vote at the fall elec-
tion. It was carried by a substantial major-
ity and authorized the expenditure of $101,-
000,000 for improving the Erie, Champlain and
Oswego canals. Plans were begun at once, but
the undertaking was so enormous that actual
construction did not begin till the spring of
1905. In 1909, after surveys had been made,
the Cayuga and Seneca Canal was ordered to
BARGE CANAL

be enlarged to Barge Canal dimensions by a second referendum, which appropriated $7,000,000. Construction progressed steadily till 1915, when it became necessary to provide $27,000,000 more, for the purpose of completing the three canals first undertaken. This was done by another referendum and was necessitated largely by court awards for damage and property claims and in lesser measure by very greatly increased costs for labor and materials. To provide suitable terminals for the new canals, a fund of $19,500,000 became available by a vote of the people in 1911. Several years’ agitation preceded this action. In 1909 a commission composed of certain State officials had been appointed to investigate and report on the subject. In 1910 this commission was sent to Europe to study the terminals there.

The Barge Canal may be aptly called Nature’s gateway to the heart of the continent. Nature surely prepared the route. The Hudson, which has a safe and commodious harbor at its mouth, is the only navigable Atlantic seaboarding river in the United States, and the coast range of mountains. In the center of the State a second range makes way for a valley. At Little Falls a rocky barrier was pierced during the last glacial overflow by the waters of the Great Lakes. All natural watercourses across the State—one from east to west across the center, one from the extreme south to the extreme north across the eastern side and one almost across from north to south at the center—are provisions which man has augmented and utilized. Westward from the canals the Great Lakes extend a thousand miles inland.

There are 442.6 miles of construction in the new canals. The 388.7 miles of intervening lakes and adjoining rivers make a total of 801.3 miles — the length of the State waterway system of Barge Canal dimensions. Of this whole system about 72 per cent of the length is in river or lake channel. Thus it appears that the Barge Canal is largely a river canalization scheme. A brief description of the route will give force to this statement.

The Hudson River from the ocean to the mouth of the Mohawk is the first link. The bed valley of the Mohawk is utilized from the Hudson to Westmore, where then Wood Creek, Oneida Lake, and Oneida, Seneca and Clyde rivers are used, carrying the channel to the western part of the State, where the streams run north and the alignment of the old channel is retained for the new canal. The branches of the Barge Canal occupy natural streams throughout most of their length. The Champlain branch lying in the canalized Hudson River and Wood Creek, the Oswego branch utilizing Oswego River, and the Cayugan and Seneca Canal occupying the bed of Seneca River. Also Lake Champlain and Onondaga, Cross, Cayuga and Seneca lakes form parts of the waterway system.

There are various *land lines,*9 for passing around dams, cutting off bends and other problematical parts of the State the new channel is largely a widening and deepening of the old canal.

The dimensions of the Barge Canal are the same for all four branches. Briefly, the minimum channel in earth cutting in the independent or artificial canal, or land line, is 75 feet wide at bottom and 123 to 171 feet at water-surface. In rock cutting, with nearly vertical sides, the width is 94 feet. In river and lake channels the width is from 150 to 200 feet. There is a depth of 12 feet throughout. The actual dimensions vary greatly, but the minimum size is fixed by law. The locks are reported to have a length of from 338 to 343 feet between gates (310 feet available length) and a width of 45 feet. However, from actual measurements after construction it has been found that the largest parallelogram to fit all the locks is limited to 300 feet by 44.4 feet. Boats having ends to conform to a certain rounded head-wall may utilize 10 feet more.

The critical points in supplying water to canals are the summit levels. The new Erie Canal has one summit level—in the vicinity of Rome—and one half-summit—at the Lake Erie end. A glance at the profile will show these summits and how the canal descends from them. The natural flow of the stream which carries water to the Erie Canal from the Barge Canals is generally sufficient to maintain the requisite depth of water in the levels between the locks and also to supply the water required for lockage and incidental operations.

The greatest independent water-supply for the Erie Canal is that for the western section. Fortunately an almost unlimited supply is available by tapping the Niagara River. From here it is necessary to carry a continuous supply easterly to the Seneca River. In order to pass this water in requisite volume, the canal bottom on the long levels has been given a proper grade, which provides for carrying at least 1,257 cubic feet per second. It is estimated that this supply is adequate, not only for 10,000,000 tons seasonal traffic, for which the Barge Canal is designed, but also for the maximum traffic which the canal is capable of handling, namely, from 18,500,000 to 20,000,000 tons per season. To furnish the Rome summit level the existing sources of supply are retained and two new reservoirs, Delta and Hinckley, are built. The old Rome level was supplied by an extensive system of reservoirs and feeders, built largely in the Adirondack region. This entire system is retained, together with such portions of the old canal system as are needed to bring the waters to the Barge Canal.

The Champlain Canal has a summit level between Lake Champlain and the Hudson River. The corresponding summit of the old canal was supplied by a feeder which took its water from the Hudson at Glens Falls. This same Glens Falls feeder, improved, supplies the needs of the northern portion of the new Champlain Canal, while the southern portion lies in the channel of the Hudson.

Seneca and Cayuga lakes, lying at the heads of their respective streams of the Cayuga and Seneca Canal, form natural reservoirs to supply both this canal and the Erie branch between its junction with the Cayuga and Seneca Canal and Three Rivers Point. The Oswego Canal begins at Three River Point. Here Oneida and Seneca rivers unite, bringing their natural flow and also a part of the supplies from the Rome level reservoirs and Lake Erie. As the canal is chiefly in the Oswego River, its needs are amply met.
1 A Barge canal lock. First of the Erie canal, locking up out of the Hudson. Three old locks, used now as a by-pass, at the right.

2 Three of series of 6 locks (lock in view above is first of series) within stretch of 1½ miles, forming greatest series of high lift locks in the world; aggregate lift, 169 feet.

3 A dam 2,000 feet long for canalizing the lower Mohawk.
1 A dam 1,100 feet long and 100 feet high, forming a reservoir on Mohawk headwaters for supplying canal
2 Navigation of old-sized boats on typical river canalization
3 Lock and movable dam of bridge type in Mohawk river
BARGE CANAL

Electric equipment on the canal is of the newest design. In general a hydro-electric power station at each lock supplies the needed energy for lighting and operating. Some stations supply more than one lock, substations being provided where necessary. Gasoline electric stations are used at movable dams, where the loss of water needed for developing power is destroyed by the act of raising the dam. The turbines and generators in each station are in duplicate. Also hand-operating devices are available in case both sets of electric installation are disabled.

The Barge Canal locks are built of concrete throughout, both side and cross walls and floor. At a few points, where favorable rock is encountered, the concrete floor has been dispensed with. The lifts range from 6 feet to 40½ feet. Within each side wall runs a culvert for filling and emptying the lock. The culverts are connected with ports that open into the chamber at the bottom of the walls. These culverts vary in size, the dimensions being 5 by 7 feet for lock 13, 5 by 8 feet for lock 12, 6 by 8 feet for lifts between 12 and 23 feet, and 7 by 9 feet when the lift is 23 feet or more. The lock-gates are of the mitering, girder type, carrying the principal load as beams. They are built of steel, with single skin-plates, but have white oak quoin and toe-plates. The quoin-post swings on a cast-steel pivot, set in the concrete, and is held at the top by an adjustable anchorage. The bearing is against cast-iron quoin-plates set in the side walls. The lock-gates are each opened and closed by a steel spar equipped with a heavy coil spring to absorb shock and secured to the gate by a bronze pin. This gate spar is also equipped with a rack actuated by a sevenhorse-power motor acting through a train of gears designed to open or close the gates in about one minute. Movement of the gates is controlled from operating stands, located at each end of each side wall. The valves regulating the flow of water to the culverts are suspended on two chains, which pass over chain wheels near the top of the valve wells to suitable cast-iron counterweights. The chain wheels are mounted on a shaft rotated by a motor operating through a train of gears. The movement of the valves is controlled in a manner similar to the movement of the gates. Electric capstans, one at each end of each lock, are provided to control the movement of boats along the approach walls and to tow them into and out of the lock chamber.

Reinforced concrete power stations, 20 by 30 feet in plan and about 20 feet high, are, in general, constructed adjacent to the various locks. The hydro-electric power stations, operated by the water in the canal, are each equipped with two vertical-shaft turbines, which in all but a few cases are directly connected to 50-kilowatt vertical-shaft generators, supplying direct current at 250 volts. The gasoline electric stations are each equipped with two generators directly connected to gasoline engines designed to operate at a speed of 600 revolutions per minute.

New York has recognized the supreme weakness of most American waterways—the lack of terminals and efficient freight-handling machinery—and is supplying these needs in the Barge Canal. However, it was eight years after the canal was authorized before the terminals were added. But their construction has been pushed with such vigor that they are ready with the opening of the completed canal. These terminals are located at some 50 cities and villages along the canals as well as on some of their connecting natural watercourses. The character of the terminal varies to meet the needs of each particular locality, but in general a terminal consists of a covered warehouse for dockage, the machinery for handling goods quickly and cheaply, a building for temporary storage and in many places connections with adjacent railways. The purpose of the State is to furnish a place where any shipper or boatman may have the advantages of efficient terminal facilities at a reasonable cost. Recent legislation has vested the State Public Service Commission with power to require connections to be built between railroads and canal terminals, as well as authority to regulate freight rates and control combinations of rail and water routes.

Since the Barge Canal lies so largely in lake and river channel, various aids to navigation are needed, such as lighthouses, range towers, beacons, buoys and markings on bridges. Lights, either fixed, flashing or occulting, are displayed by night. The Federal practice of marking channels has been adopted, but with the interpretation that upstream means proceeding away from the ocean toward the interior, irrespective of local conditions of actual upstream or downstream. Thus in going westerly from the Hudson on the Erie Canal or in proceeding away from the Erie Canal on any of the other canals, red lights are on the right or starboard side of the channel and white lights are on the left or port side. The buoys and beacons which show red lights are painted red, while those which show white lights are painted black, but this latter color will probably be changed to white.

A study of the distribution of population in New York State reveals some important conditions. It is discovered that within two miles of the State waterways live 73½ per cent of the people of the State. If the distance is extended so as to include the territory within 5, 10 and 20 miles, the percentages are 77, 82 and 87, respectively. Looking from another angle, it appears that within 20 miles lies 46 per cent of the area of the whole State. If lines are drawn on a map—one at 50 and one at 70 miles from the waterways—we find that 71 and 88 per cent, respectively, of the area lie within them. These are the respective distances which motor trucks of 3½ and 2 tons' capacity can cover in a day's run, going and returning. This fertile field for motor truck operation in connection with the enlarged canals is full of promise. The importance commercially of the conditions revealed by this study is not generally appreciated, but a little consideration will discover what it means to the State and to the country at large that a day or half-hour's walk of the waterways three-quarters of the population of the State, about 7,000,000 people, or 7 per cent of the whole United States population, whose products and whose supplies may have available a means of cheap transportation.
The Barge Canal is the essential connecting link between two extensive and important waterway systems, which are in part existent and in part only projected. To the west lie the Great Lakes. Four noteworthy canals, to connect with these lakes, are in a fair way to be built. At the seaboard a project known as the Illinois canals would give an inside passage along a large portion of our Atlantic Coast. The Federal government has made surveys for most of these canals and some it has already built. Of this whole vast scheme, the mileage now in existence is already great—1,500 miles in the Lakes and 800 miles in New York waterways. The intracoastal chain would add 1,800 miles and the projects adjacent to the Lakes at least 800 miles more.

At the beginning of the 1918 season, the Federal government, as a war measure, assumed control of the Barge Canal in so far as traffic is concerned.

Certain statistical data follow:

Erie Canal—340.7 miles long; 35 locks, 674.45 feet total lockage; 2 guard-locks; 1 terminal lock.

Champlain Canal—62.6 miles long; 11 locks, 168.3 feet total lockage; 2 junction locks.

Oswego Canal—23.8 miles long; 7 locks, 118.6 feet total lockage.

Cayuga and Seneca Canal—92.7 miles long; including Cayuga and Seneca lakes; 4 locks, 71.0 feet total lockage. Fifty-seven locks, 2 guard-locks and 1 terminal lock, all of Barge Canal dimensions, and 12 smaller locks have been built. Construction has included 30 new dams, 5 old dams with new crests and 5 old dams used without change; also 300 bridges and various other structures, including guard-gates, culverts, spillways, bulkheads, waste- weirs, by-passes, flumes, terminals, gate-houses, power-houses, warehouses, lighthouses and range towers. The total number of all kinds of structures exceeds 700. Some entirely new types of structure, siphon spillways and automatic crests on dams, have been originated in Barge Canal construction, and some novel and bold adaptations in design have occurred, such as the bridge type of movable dam, the siphon lock, the sector gate and an enormous Tainter gate.

The first construction was begun on 24 April 1905; the first work on the Erie on 7 June 1905. Many finished portions have been put into use upon completion. The whole canal with full depth, but with isolated parts not yet of full width, is being put into use in 1918. A boat utilizing full lock dimensions can carry about 3,000 tons, but probably not many boats more than half that capacity will be used.

Noble E. Whitford,
Senior Assistant Engineer,Department of State Engineer.

BARHADAD I, King of Damascus from about 895 to 844 B.C. He was the ally of Asia, King of Judah against Israel and also fought against Ahab. He also campaigned against Shalmanezer III. It is probable that he was murdered by the usurper Hazael (2 Kings viii, 9-15).

BARHADAD II, King of Damascus from 804 to 744 B.C. He was the son of the usurper Hazael. He formed a coalition against Zakkir, but was unsuccessful in the siege of Harrak, Zakkir's capital. Damascus was besieged in 803 and Barhadad was obliged to pay tribute to Adam-nirari IV, King of Assyria.

BARHAM, Richard Harris, English humorist: b. Canterbury, 6 Dec. 1788; d. 17 June 1845. Having been ordained a clergyman, he became in 1821 one of the minor canons of St. Paul's Cathedral. In 1824 he was appointed a priest in the monastery of the chapel-royal, and was shortly afterward presented to the rectory of the united parishes of St. Mary Magdalen and Saint Gregory, London. In 1837, on the starting of Bentley's Miscellany, under the editorship of Charles Dickens, he laid the foundation of his literary fame by the publication in that periodical of the Ingoldsby Legends—a series of humorous tales in verse and prose which achieved an immense success, having in a collective form from 1840 onward, been published over and over again in various editions, with many legends added to the original number. His life has been written by his son. See Ingoldsby Legends.

BAR-HEBRAEUS (or YUHANNU ABUL-FARAJ), Syrian bishop and historian: b. Mafatib 1226; d. Maraga, 30 July 1296. His father was a Jew by birth and the son became Bar-Hebraeus, that is, "son of the Hebrew." His father having moved to Antioch Bar-Hebraeus completed his education there. He studied Arabic and Syriac, philosophy, theology and medicine, and acquired distinction among his contemporaries. In 1246 he was ordained at Tripolis as Jacobite bishop of Gubas, near Malatia, and a year later was transferred to the neighboring diocese of Lakabhim, whence in 1253 he passed to be bishop of Aleppo. He was deposed soon after by his superior on account of disputes about the patriarchate, and was restored to his see in 1258. In 1264 he was promoted by the patriarch, Ignatius III, to be maphrius—the next rank below that of patriarch—an office he held for three years. To the modern student Bar-Hebraeus is important as a historian. His Syriac Chronicle is made up of three parts. The first is a history of secular events from the Creation to his own time and gives valuable information regarding the history of southeastern Europe and western Asia. The second and third parts of the Chronicle deal with the history of the Church. For theologians his Ausar Razeel ("Storehouse of Secrets") is of special value as a critical and doctrinal commentary on the texts of the Scriptures. A full list of his other works and of editions of such of them as have been published is contained in W. Wright's Syriac Literature.

The more important of them are: Marsha-bhaddhatha ("Book of the Pupils of the Eyes"), a treatise on logic or dialectics; Hewath Hekhmatha ("Butter of Wisdom"), an exposition of the Aristotelian system of philosophy; Sullaka Haunanya ("Ascent of the Mind"), a treatise on anatomy; various medical works; Kethabhah dhe-Semhe ("Book of Rays"), a treatise on grammar; ethic works, poems and Kethabhah dhe-Thunnayye Meghanhekkhahe ("Book of Entertaining Stories"), edited with translation.
BARGE CANAL

1 A guard-gate — a structure placed at points where a break would seriously damage canal or adjacent territory
2 A lighthouse — one of three used for aiding navigation on Queida lake
3 Barge canal terminal at Albany, ocean schooners and old-sized canal boats lying alongside
by E. A. Budge (London 1897). The grammatical treatises were edited by Abbé Martin under the title "Oeuvres grammaticales d'Aboul Faradj dit Bar Hebræus" (2 vols., Paris 1872). The 'Chronicle,' the first part, was published by Bruns and Kirsch (Leipzig 1789) and in a superior edition by Beijian (Paris 1890). The second and third parts were edited by Abbo de Lamy (3 vols., Paris and Louvain 1872-77). For the Bible commentary consult Göttsberger, 'Barhebræus und seine Scholien zur Heiligen Schrift' (Freiburg 1900).

BARI, a negro people of Africa, dwelling on both sides of the White Nile. Gokolol is their chief town. They practise agriculture and cattle-raising. Their country was conquered by Baker Pasha in 1871 for Egypt.

BARI, bā’rē (ancient Barium), Italy, important seaport of southern Italy, in Apulia, capital of the province of Bari. In the Foggia, and situated on a promontory of the Adriatic. It is 69 miles northwest of Brindisi. It was a place of some importance under the Romans, passed from them to the Saracens, and was afterward selected as the seat of government by the Northmen who conquered Apulia. It has been frequently destroyed and rebuilt on the same site.

The present town, surrounded by walls and defended by a castle, consists of a poorly-built old town with a better part of more recent date. It is the see of an archbishop and possesses a cathedral with a tower 250 feet high, dating from the early half of the 11th century, but largely spoiled by recent alterations. Its dome was renovated in 1905, and other alterations made. It contains paintings by Paolo Veronese, Tintoretti and Calabrese. The church of San Nicola dates from 1087; and there is also a royal lyceum. Bari manufactures cotton and linen goods, organs, pianos, hats, soap, glass and liquors, and has a trade in wine, grain, almonds, oil, etc. It has regular steamboat communication with Venice, Ancona, Trieste, Brindisi, Genoa and Marseilles. A United States consul is stationed here. Pop. 103,168.

BARIATINSKI, bär-ya-tïn’skï, Alexander Ivanovich, Prince, Russian field-marshall: b. 1814; d. Geneva, 9 March 1879. He was educated with the future Tsar Alexander II, and while a young officer in the hussars was transferred to the Caucasus, where his successes against the famous Shamyl secured him, in 1852, the rank of lieutenant-general. On the accession of Alexander II he returned to Saint Petersburg, and in 1856 was appointed to the command of the army of the Caucasus. Three successful campaigns were closed by the storming of Ghuib and the capture of Shamyl. For these services he was made a field-marshall. His health, however, had broken down, and the remainder of his life was passed chiefly abroad.

BARILI, bā-rē’le, Philippines, a town in the province of Cebu, 27 miles from Cebu, its capital. Pop. about 32,000.

BARILLA, bār-ē’lā (Spanish, "impure soda"), the commercial name of a crude variety of soda obtained by burning certain fleshy plants that grow near the ocean and in other salty places. The Salsola soda was largely used for this purpose, and was cultivated in Spain, Sicily, Sardinia and other places on account of the considerable yield of barilla that it furnished. The plants were cut in September, dried for about a month, and then burned on an iron grating, beneath which was a pit into which the fused ashes fell. The burning was continued until a ton or two of the ash had accumulated in the pit, after which the product was allowed to cool, and was then broken up and shipped to market. Barilla contains about 20 per cent of soda, the remainder consisting chiefly of chlorides and sulphates of sodium, calcium and aluminium. It was formerly much used in the manufacture of soap, but has now been almost entirely replaced by purer grades of soda, obtained by chemical means from common salt. See Kelp.

BARING, the family name of one of the most influential financial establishments in the world, the well-known house of Baring Brothers & Company. John Baring, the father of the founders, was a German cloth maker who engaged in business in a small way at Larkbear, Devonshire, England, in the earlier half of the 18th century. His sons, Francis and John, established the firm of Baring Brothers in London in 1770. In November 1890, owing to the collapse of South American securities, the firm was threatened with suspension, and a financial crisis ensued. With liabilities of £20,000,000 and assets of £12,000,000, the position was grave. Goschen, then Chancellor of the Exchequer, was pressed by the governor of the Bank of England to pledge the national security for £1,000,000, which he refused to do for any proprietary firm; but a timely loan from the Bank of France and the co-operation of the Rothschilds and the joint stock banks in raising a guarantee fund of £8,000,000 averted the crisis without government aid or the suspension of the Bank Act. Since that time the bank has been reorganized as a limited banking company.

BARING, Alexander. See ASHBURTON, ALEXANDER BARING, LORD.

BARING, Sir Evelyn. See CROMER, EVELYN BARING.

BARING, Sir Francis, English banker: b. Larkbear, England, 1740; d. 1810. He obtained a commercial training, founded the great financial house of Baring Brothers & Company, became a director of the East India Company, and was created a baronet in 1793. He took an active part in the discussions relative to the Bank Restriction Act of 1797, and at the time of his death was reckoned the first merchant in Europe. His second son, Alexander, became 1st Baron Ashburton (q.v.).

BARING, Sir Francis Thornhill, English banker, son of Sir Thomas: b. 1796; d. 1866. Under successive Whig governments, he was a Lord of the Treasury, Secretary of Trea- sury, Chancellor of the Exchequer and First Lord of the Admiralty. He was created Baron Northbrook in 1866.

BARING, Maurice, English author and journalist: b. 27 April 1874. He was educated at Eton and at Trinity College, Cambridge. He entered the diplomatic service in 1898, was attached to the British Embassy in Paris 1898-1900, third secretary to the British Embassy in Copenhagen 1900-02, and was transferred to
Rome in 1902. He was employed in the Foreign Office 1903-04, and resigned from the service in the latter year. He acted as war correspondent for the Morning Post in Manchuria in 1904, in Russia 1905-08, and was special correspondent for the same journal in Constantinople in 1909. In 1912 he was correspondent for the London Times in the Balkans, was gazetted temporary lieutenant in the British expeditionary force on the outbreak of the European War in 1914, and was promoted staff lieutenant in 1915. He has written novels, essays, narratives and poems, including 'Hildesheim and Quatre Pastiches' (1899); 'The Black Prince' (1902); 'Gaston de Foix' (1903); 'With the Russians in Manchuria' (1903); 'Mahasena' (1905); 'Desiderio' (1906); 'Sonnets and Short Poems' (1906); 'Thoughts on Art and Life of Leonardo da Vinci' (1906); 'A Year in Russia' (1907); 'Proserpine' (1908); 'Russian Essays and Stories' (1909); 'Orpheus in Mayfair' (1909); 'The Story of Forget Me Not' (1909); 'Landmarks of Russian Literature' (1910); 'Dead Letters' (1910); 'The Glass Mender' (1910); 'Diminutive Dramas' (1910); 'Collected Poems' (1911); 'The Russian People' (1911); 'The Grey Stocking and Other Plays' (1912); 'Letters from the Near East' (1913); 'Palamon and Arcite' (1913); 'What I Saw in Russia' (1913); 'Lost Diaries' (1913); 'The Mainsprings of Russia' (1914); 'An Outline of Russian Literature' (1914); 'Round the World in Any Number of Days' (1914), and contributions to the principal reviews.

BARING, Thomas, English banker and politician, brother of the first Lord Northbrook: b. 1799; d. 1873. He devoted himself early to commercial pursuits, and also to politics, in which he was a Conservative, thus taking the opposite side to his brother. He entered Parliament in 1835, representing the borough of Huntingdon from 1844 till his death.

BARING, Thomas George, 1st Earl of Northbrook: b. 1826; d. London, Eng. 15 Nov. 1904. He was successively a Lord of the Admiralty, Under-Secretary of State for India, Under-Secretary of War, governor-general of India (1872-76) and First Lord of the Admiralty (1880-85), and was created an earl in 1876.

BARING-GOULD, Sabine, English clergyman and novelist: b. Exeter, 28 Jan. 1834. He was graduated from Cambridge in 1856, and from 1881 was rector of Lew-Trenchard in Devon. Among his numerous works are 'Iceland: Its Scenes and Sagas' (1864); 'The Book of Werewolves' (1865); 'Curious Myths of the Middle Ages' (1866-67); 'Lives of the Saints' (1872-79); 'Yorkshire Oddities' (1874); 'Germany, Past and Present' (1879). Prominent among his novels and other later books are 'Mehalah: A Story of the Salt Marshes' (1880); 'John Herring' (1883-1913); 'Red Spider' (1887); 'Grettis the Outlaw' (1890); 'The Broom Squire' (1896); 'Outcasts of the Treg' (1897); 'Blodys' (1897); 'Dolilith' (1898); 'Parrot the Historian' (1899); 'A Book of the West' (1899); 'Furze-Bloom' (1899); 'The Crock of Gold' (1899); 'Winefred' (1900); 'A Book of Dartmoor' (1900); 'In a Quiet Village' (1900); 'Virgin Saints and Martyrs' (1900); The Frobishers'; 'A Book of Brittany' (1901); 'Royal Georgie' (1901); 'Miss Quilet' (1901); 'Nebo the Nailer' (1902); 'Cliff Castles and Cave Dwellings of Europe' (1911); 'Village Sermons to Simple Souls' (1912).

BARING ISLAND, an island in the Arctic Archipelago. The name is also given to a bay and strait. They were named by Sir Francis Baring, who was First Lord of the Admiralty at the time of their discovery.

BARINGO, a lake in East Africa, north-east of the Victoria Nyamwe, about 20 miles long, 200 square miles in area, at an altitude of about 3,000 and 4,000 feet above sea-level. Though fed by many streams, it has no visible outlet. It contains several small islands and was discovered by Thomson in 1883.

BARITE, bar'ite (Greek, 'heavy,' in allusion to its high specific gravity), a mineral having the formula BaSO₄ and crystallizing in the orthorhombic system, but also occurring massive, and in granular, earthy and stalactitic forms. It is usually white or nearly so, and has a hardness of from 2.5 to 3.5. Its specific gravity ranges from 4.3 to 4.6, and from this circumstance the mineral is often called 'heavy spar.' Barite was first examined (in 1602) by Cacciororos, a shoemaker of Bologna, who discovered that it becomes phosphorescent when heated with combustible matter, and gave it the name later, without knowing that Barite occurs in many parts of the world, and in large quantities. The commercial sources are usually residual deposits in clay caused by the differential weathering of the enclosing limestone. It also occurs in veins and as a gangue mineral with metallic ores. In the United States it is found abundantly in many States, notably in Virginia, North Carolina, and Missouri. The latter State yields over two-thirds of the total United States production. It constitutes an important source of barium compounds and is used largely in the manufacture of white paints. Barite was mined in the United States to the extent of 51,547 tons in 1914. It is rarely found pure, being generally associated with silica, lime, iron and often containing a percentage of galena. See also BARITUM; MINERAL PRODUCTION OF THE UNITED STATES.

BARTONE, or BARYTONE, a male voice, whose compass partakes of those of the common bass and the tenor, but does not extend so far downward as the one nor to an equal height with the other. Its best tones are from the lower A of the bass clef to the lower E or F in the treble; yet we find Verdi and Meyerbeer exacting G and even A flat from it. This name is also given to the smaller bass saxhorn in B flat or C, used in reed and brass bands.

BARITUM, a metallic element, strongly resembling calcium in its chemical properties. The mineral barite (qu. v.) was the first compound of barium to be examined. In 1750 Marggraf showed that barite contains sulphuric acid, and the subsequent labors of Scheele and Gahn proved that it also contains a previously unrecognized earth, which Bergmann called terra ponderosa, or 'heavy earth.' In 1779 Guyton de Morveau proposed the name 'barite,' (Greek, 'heavy') for this earth, and Lavoisier modified the word to 'baryta,' in
which form it still survives. Subsequently, baryta was found to be the oxide of a new metal, which was isolated by electrolysis in 1808 by Berzelius and Pontin, and afterward by Davy, and named "barium." When absolutely pure, barium is a silver-white metal with the density of 3.78. It is a little harder than lead, melts at 1580° F., and vaporizes at 1760° F. It oxidizes rapidly in the air, and decomposes water readily. It is ductile and somewhat malleable. Powdered barium takes fire spontaneously. Its atomic weight is 137.4 (O = 16), and its chemical symbol is Ba. Its specific gravity appears to be between 3.75 and 4.00. Barium occurs in nature in all primary rocks and in some mineral waters. The most common sources of barium compounds are the carbonate and sulphate, which occur native as witherite and barite (qq.v.), respectively. The nitrate is prepared by acting upon the native carbonate with nitric acid. It is a soluble salt, with the formula Ba(NO₃)₂. The nitrate decomposes upon being heated; hence, the nitric acid being expelled, while barium monoxide (or baryta), BaO, is left behind as a gray, porous mass, strongly caustic and alkaline. When gently heated in air, barium monoxide takes up another molecule of oxygen and forms the dioxide, BaO₂, and on being more strongly heated, the dioxide gives up the extra atom of oxygen again, and returns to the monoxide. It was long ago proposed to make use of this curious property for isolating pure oxygen from the air, by alternately heating the dioxide at a high temperature, and collecting the oxygen given off as it returns to the monoxide and then submitting it, at a lower temperature, to the action of a current of air until it has again passed into the state of dioxide. It was found, however, that the process would work only for a short time, after which a fresh supply of baryta was required. Recent investigations have gone far toward discovering the cause of this loss of activity, and it is now likely that oxygen will sometime be made on a commercial scale by this most ingenious process.

Baryta absorbs water with considerable evolution of heat and the formation of a hydrate, Ba(OH)₂, which crystallizes with eight molecules of water. Barium hydrate is also made, in very large quantities, at Niagara Falls, by the electrolysis of soluble salts of barium. The hydrate is used in refining sugar, being much superior to lime for this purpose. With cane sugar it forms an insoluble compound from which the sugar may afterward be set free by a current of carbon dioxide gas. The hydrate is also likely to be of great use, in the near future, for preventing the formation of boiler scale, by precipitating the carbonates and sulphates in the feed water, in the form of insoluble barium compounds. The value of barium hydrate for this purpose has long been known, but until the development of the electrolytic method of manufacturing it, the expense involved was prohibitive. Barium sulphate (barite) is thrown down as a precipitate when a sulphate solution is added to a solution of any sulphate; and for this reason soluble barium salts are much used by the chemist in testing for sulphuric acid and sulphates. The chloride (BaCl₂) is the salt most commonly employed as a reagent for this purpose. Barium sulphate is one of the most insoluble salts known. The native sulphate, when ground up, was formerly used to adulterate white lead. The artificial sulphate was also used for this purpose and is itself used as a paint, under the name of "permanent white," or "blanc fixe." The artificial sulphate is said to be superior to the natural mineral for use as a paint, as it has more "body." In ready-mixed paints, white, ground and hydrate barite is employed as a pigment. With 30 per cent of zinc sulphate, 70 per cent of barite is mixed to make the white pigment called "lithopone," which is used extensively as a "flat" wall paint. Barite is also used in the manufacture of glazed and coated paper. When barium sulphate is heated with coal it loses its oxygen, and becomes reduced to the sulphide BaS, a salt which is highly phosphorescent, and is known as Bologna phosphorus. After exposure to sunlight or to a strong artificial light, barium sulphide shines for hours with a bright, golden light. It is used in the manufacture of artificial clocks. The sulphide may be heated in an earthenware retort through which moist carbonic acid gas is being passed, and baryta caustic thus obtained. Barium is readily recognized by the spectroscope through a number of characteristic green lines. Its volatile salts communicate a green color to non-luminous flames, and are used (especially the nitrate) in pyrotechny.

In poisoning by the barium salts the symptoms resemble those seen in poisoning by other metals. In the acute forms there is pain and burning in the mouth and stomach, nausea, vomiting and chills. These are followed by diarrhoea, dizziness and chilly feelings. The pulse is slowed, at first large and full, later small and scarcely recognizable. Muscular paralysis supervenes with dyspnoea, loss of consciousness, convulsions and death. The remedial treatment consists of prompt washing of the stomach with a solution of Glauber's salts. This forms the insoluble barium sulphate, which is inert.

Previous to the European War there was no barite industry in the United States. The entire supply was imported from Germany at a price with which the American manufacturers could not compete, although many attempts were made to do so. Within a few weeks after the war began, an idle plant at Sweetwater, Tenn., had started up, and has been working night and day ever since. Mines are in operation in southeastern Missouri, northwestern Georgia, central and western Kentucky, northeastern Alabama, southwestern North Carolina, northwestern South Carolina and southwestern Virginia. The production in 1915 amounted to 108,547 short tons — more than twice the production of 1914. For 1916 the output was double that of 1915, and reached a value of $1,000,000. Barite mines were opened in 1916 in Colorado, Nevada, California and Alaska. The only deposit of witherite of commercial value known in the United States is in Mariposa County, Cal.

About 10 per cent of the output is used in the manufacture of barium salts — the carbonate, nitrate, chloride, chlorate, hydrate and bin-oxide; all heretofore imported from Germany. Of the barium chemicals the most important is
the binoxide on account of its use in the preparation of hydrogen peroxide.

**BAR-JESUS,** or **ELYMAS,** a Jewish sorcerer who opposed Paul before Sergius Paulus at Paphos in Cyprus and was smitten with blindness (Acts xii, 6–12). There is difficulty in regard to his name, as in verse 6 he is called 

BARK, the more or less easily separable layers of tissue surrounding the woody cylinder of trees and shrubs; also, by extension, the annual rings of textile plants such as hemp, jute, ramie, flax, etc., and other annual stems. The layers are divided into three groups which may be readily seen in a yearling stem: (1) the phloem, bast, the inner food-conducting tissue annually thickened from the cambium (q.v.) layer which separates it from the wood; (2) the green zone which generally does not increase in thickness but which in young twigs assists in food elaboration (see **Phytochemistry**); (3) the epidermis or external layer with contiguous cork cells which increase from the phellogen, or cork cambium, a layer of epidermal or cortical cells. These cork cells, which develop mainly at right angles to the direction of the stem, die and become more or less weather-beaten and seamed from cracking and give the characteristic appearance to tree trunks. Many trees can be identified by their bark alone.

The bark of many trees and shrubs is of economic use mainly in tanning, dyeing, medicine and cookery. In tanning (q.v.) such barks as are rich in tannic acid are most in demand; oak, hemlock and chestnut (qq.v.) are general favorites in America and Europe; eucalyptus and acacia in Australia; Larch and willow bark are used for special work. To obtain these barks the trees are felled after the sap has started to flow in the spring, the rough exterior layers removed, the bark of the trunk and limbs peeled off in lengths of about two feet with specially made tools; the bark of the smaller branches, in equal lengths, is loosened with mallets and slipped off. After removal the bark is loosely piled in open sheds to dry or stacked on end in the open air, the larger pieces being placed on the outside to protect the smaller inner ones from rain and sun, which together with mildew are the important agencies that may injure the quality of the product. The barks used in medicine, cookery, etc., are treated under the individual titles. See **Cascara,** **Cinchona** and **Cinnamon**; also Cork.

**BARK, Peruvian.** A bark obtained from several trees belonging to the genus **Cinchona,** which grow spontaneously in many parts of South America, but more particularly of Peru. The trees somewhat resemble a cherry-tree in appearance, and have white or pink flowers. This valuable medicine was formerly called Jesuit's Bark, from having been introduced into Europe by the members of that Order settled in South America. They were instructed in its use by the natives of Peru, and it continued for many years a profit to the Order. Its botanical name was derived from that of the Countess del Chinchon, the lady of a Spanish viceroy, who had been cured by it. The tree from which it is obtained grows abundantly in the forests of Quito and Peru, and the bark is cut by the natives in the months of September, October and November, during which alone the weather is free from rain. The bark is of three kinds—red, yellow and a pale which the yellow and pale barks are the stronger in their quinine properties. The crown-bark, as the highest-priced is termed, is of a pale yellowish-red. The pale is the original Peruvian cinchona, and is produced by several varieties of the Cinchona officinalis. The red is obtained from the C. calisaya, and grows in Bolivia and Peru.

The uses of the bark in medicine are too well known to need description, but some chemical discoveries in relation to it are deserving of more particular mention. Its medicinal properties were found to depend upon the presence of a substance called quinine. This exists, more or less, in all kinds of Peruvian bark, but in quantities very unequal in the various kinds. See **Quinine.**

**BARK, or BARQUE,** a three-masted vessel whose forecast and mainmast are square-rigged, but whose mizenmast has fore-and-aft sails only. The distinction between a bark and a barquentine is that the latter has but one mast square-rigged, the main and mizen being both rigged fore-and-aft.

**BARK-BEETLES,** members of the family **Scolytidae,** and allied to the weevils. They are of an elongate cylindrical form, truncated before and behind. They mine under the bark of trees, running their winding galleries in every direction, but rarely attack the leaves of trees. They are usually brown or black in color. The rounded head does not end in a snout and is deeply sunken in the thorax; the clavate antennae are somewhat elongated, while the palpi are very short; the elytra are often hollowed at the end, and the short stout legs are toothed on the under side of the femora, and the tarsi are slender and narrow. The eggs are laid in the bark, whence the larvae on hatching bore straight into the sap wood, or mine between the bark and the sap wood. They are fleshy, cylindrical, footless larvae, wrinkled on the back. When fully grown in the autumn they gnaw an exit for the beetle, taking care to leave a little space closed in front of their burrow to conceal the pupa. The various species of Scolytus, Tomicus and Xyloterus give rise to a disease similar to fireblight, by their ravages beneath the twigs of fruit trees, causing the bark to shrivel and peel off as if a fire had run through the tree. Xyloterus fuscatus has been found to bore into empty wine casks and spoil them for use. The spruce forests of Maine and other parts of northern New Eng-
BARK-LOUSE—BARKER

land have, since 1818, been devastated by *Dendroctonus piceaepara* of Hopkins. It attacked these pinelands and killed large stands of timber suffering most from its ravages. The estimated number of adult insects which under favorable conditions may emerge from 5,000 to 7,000. Hopkins estimated that an average of 300 pairs of beetles to the square foot of bark on to 15 feet of the trunk of an average-sized tree are sufficient to kill it, and that 6,000 beetles breeding in one tree may be sufficient to kill from 20 to 25 more trees. Two other beetles (*Phyllonorycter alpigenus* and *Tetrocera cinerascens*) also aid the *Dendroctonus* in killing the spruce. Consult Packard, *Report on the Insects Injurious to Forest and Shade Trees* (1890); Hopkins, *Insect Enemies of the Spruce in the Northeast* (Bulnes No. 28, D.S. May, Entomology, United States Department of Agriculture, 1891).

**BARK-LOUSE.** A hemipterous insect of the scale family (*Coccidae*). The bark-lies are very small insects, whose females are wingless, their bodies resembling scales. The female stings the bark of trees with a long slender beak, sucking in the sap, and, when very numerous, life or kill the tree. The males have two wings but no beak, and take no food. The apple bark-louse (*Myiastis pomorum*) is destructive to young apple-trees, while in Florida *M. gloveri* is a pest of the orange, as is also the San José-scale insect (*Q.v.*). The cochineal, the mealy-bug of hothouses, and various other coccid insects, belong to this group. See SCALE-INSECTS, and the names of various species.

**BARKAL, or JEBEL BARKAL.** An isolated sandstone rock, 400 feet high, in Nubia, near the Fourth Cataract of the Nile. It is nearly perpendicular on all sides, but fully so on the side nearest the Nile. There are some remarkable ruins in the vicinity. Excavations here have revealed inscriptions and archaeological remains of great interest and value, an account of which may be found in Lepsius' *Denkmäler,* Vol. V.

**BARKER, Albert Smith,** American naval officer: b. Massachusetts, March 1843. He was graduated at the United States Naval Academy in 1859; served on the frigate *Mississippi* in the operations to open the Mississippi River in 1861–63, taking part in the bombardment and passage of Forts Jackson and Saint Philip and the Chalmette batteries, the capture of New Orleans and the attempted passage of Port Hudson, where his vessel was destroyed. He became a captain May 1892, commanded the cruiser *Newark* during the war with Spain; subsequently succeeded to the command of the battleship *Oregon,* which he took to Manila. He became a rear-admiral, and was placed in command of the Norfolk Navy Yard in 1899; and in July 1900 succeeded the late Rear-Admiral Philip as commandant of the Brooklyn Navy Yard. He was appointed commander-in-chief of the north Atlantic fleet (1903–05); was retired 31 March 1905. He was the first one in the United States to fire high explosives in shells.

**BARKER, Edmund Henry,** English philologist: b. Hohlym, Yorkshire, December 1788; d. London, 21 March 1839. He undertook the labor of reprinting the *Thesaurus Graecus* of H. Stephens, upon which was expended an immense amount of time and money, but owing to severe adverse criticisms, the work did not appear in the form which was originally intended, or under his name. His first work, *Classical Recreations,* appeared in London, 1812; one volume only was published. He also wrote dissertations, essays, etc., for reviews; a work upon the claims of Sir Philip Francis to the authorship of the Junius letters; a Greek and English dictionary, etc. In the latter part of his life he became so reduced through litigation that he was at one time confined in a debtors' prison, and finally died in an obscure lodging-house in extreme want.

**BARKER, George Frederick,** American physician: b. Charlestown, Mass., 14 July 1835; d. 1910. He was graduated from Sheffield Scientific School at Yale, 1858, and Albany Medical College, 1863, and from Harvard and Yale universities, Wheaton College (Ill.) and Western University of Pennsylvania. From 1873 to 1900 he was professor of physics in the University of Pennsylvania. He became professor emeritus in 1900. He was a United States commissioner at the International Electrical Exhibition at Paris, 1881, where he received the Legion of Honor decoration, with rank of commander. He frequently served as an expert in patent and other cases, notably as a government expert in the suit against the American Bell Telephone Company and in the Lydia Sherman poisoning case in 1872. He was president of the American Association for the Advancement of Science in 1875. He was president of the American Chemical Society and vice-president of the American Philosophical Society. His publications have chiefly appeared in the *American Journal of Science, American Chemist* and *Proceedings of the American Philosophical Society.* Others are, besides textbooks on chemistry, *Nitrous-Oxide* (1866); *Correlation of Vital and Physical Forces* (1871); *Progress in Physics* (1892). For several years he contributed to the Smithsonian reports.

**BARKER, Jacob,** American financier: b. Swan Island, Me., 7 Dec. 1779; d. Philadelphia, 26 Dec. 1871. He early displayed business ability, settled in New York, and before he was 21 owned five trading vessels and controlled a large credit. In 1801 he met with heavy reverses, but obtaining a government contract for supplying oil, made up his losses, and at the outbreak of the War of 1812, undertook the raising of a loan of $5,000,000 for the government. He was a founder of Tammany Hall, and a State senator, and established the Exchange Bank in Wall street in 1818, which failed in 1819. His financial methods aroused intense opposition and he was indicted for fraud in 1826 and convicted, but a new trial quashed the indictment. Removing to New Orleans in 1834, he was admitted to the bar and accumulated a large fortune that was mostly lost during the Civil War. He was elected to the United States Senate at the close of the war, but was not allowed to take his seat. In 1867 he was declared bankrupt and during the latter part of his life in Philadelphia with his son, Wharton Barker. He published *The Rebellion: Its Consequences and the Congressional Committee, Denominated*
the Reconstruction Committee, with Their Action (1865); Consultations in the Life of Jacob Barker, 1800-1855 (New York 1855); Turner, 'The Conspiracy Trials of 1826 and 1827: A Chapter in the Life of Jacob Barker' (Philadelphia 1864); 'The Speeches of Jacob Barker and His Counsel on the Trials for Conspiracy' (New York 1855); and 'The Trial of Jacob Barker, Thomas Vermilya and Matthew L. Davis' (ib. 1827).

BARKER, J. Ellis, English author and journalist: b. Cologne, Germany, 9 May 1870. He was educated at Cologne, and after his return to England became known as a contributor to the leading reviews and lectured before the Royal United Service Institution, the Medical Association and the Liberal Union Club. He has published 'The Rise and Decline of the Netherlands' (1906); 'British Socialism' (1907); 'Modern Germany' (1908; 4th ed. rev. 1912); 'Great and Greater Britain: The Problems of Motherland and Empire' (1910); 'Points Against Free Trade'; 'Points for Tariff Reform'; and numerous contributions to the Nineteenth Century Review, Fortnightly Review, National Review and to the leading London and provincial dailies.

BARKER, Lewellys Franklin, Canadian-American anatomist: b. Norwich, Ont., 1867. He was professor and head of the department of anatomy in the Rush Medical College of University of Chicago, 1900-05, and professor of medicine Johns Hopkins University and chief physician Johns Hopkins Hospital since 1905. He is author of 'The Nervous System and Its Constituent Neurones' (1899); 'Laboratory Manual of Human Anatomy' (1904).

BARKER, Thomas Jones, English historical portrait painter: b. Bath 1815; d. 1882. He studied his art in Paris under Hacque Vernet, and exhibited regularly at the Salon from 1835 to 1845, and afterwards at the Royal Academy. He was an eye-witness of many episodes of the Franco-Prussian War of 1870, of which he has left several pictures. His noteworthy works are 'The Bride of Death' (1840); 'The Meeting of Wellington and Blücher' (1851); 'Wellington Crossing the Pyrenees'; 'The Mèlée—Charge of Cuirassiers and Chasseurs' (1872); 'Balaklava—One of the Six Hundred' (1874); 'The Return Through the Valley of Death' (1876).

BARKER, Wharton, American financier and publicist: b. Philadelphia, 1 May 1846. He was graduated at the University of Pennsylvania in 1866, became a member of the banking firm of Wharton and Company, in which capacity he became special financial agent of the Russian government. He supervised the building of four cruisers for Russia and went to that country to advise concerning the development of coal and iron mining. He obtained valuable railroad and telegraph interests in China, but his concessions in that country were soon withdrawn. In 1869 he founded a periodical devoted to political, economic and social conditions, called the Penn Monthly. He proposed the Gold and Harrison for the presidency, and strenuously opposed a third term for General Grant. He joined the Populist party in 1896 and soon gained prominence in the party, becoming its candidate for the presidency in 1900. He is a member of several learned societies. He has traveled extensively in the United States, Europe, China, Japan and South America, and is a leading advocate of a commercial union of all American nations and opponent of all temporary arbitration treaties.

BARKER'S MILL, a form of waterwheel devised by Dr. Barker, some 300 years ago. It turns about a vertical axis, down which the water that is to operate it flows. At the lower extremity of the vertical axis two or more hollow arms project horizontally, like the spokes of a wheel. Water is discharged tangentially from the ends of these hollow arms, and by its reaction causes the wheel to rotate. Barker's mill is now used only as a toy, although a modification of it, invented by White-law, is still used, to some extent, as a source of power in Great Britain, where it is known as the Scotch turbine. See TURBINE.

BARKING, England, town in Essex, on the left bank of the Roding, about two miles above its junction with the Thames, and seven miles northeast from London. It has a parish church, a handsome structure, with a lofty tower, and some fine public buildings. There are also the ruins of Barking Abbey, at one time among the wealthiest nunneries of England. Pop. 22,000.

BARKING WOLF, a name in early American books for the prairie wolf or coyote, on account of the greater resemblance in its voice to the barking of a dog than to the howl of the wolf. See Coyote.

BARKIS, a rustic figure in Dickens' 'David Copperfield.' He proposes to David's nurse, Peggoty, in the since famous phrase 'Barkis is willin.'

BARKLEY, Charles William, navigator: b. 1759; d. North Crescent, Hartford, 1832. He left Ostend for the northwest coast of America in the autumn of 1786 in the Imperial Eagle, and in the succeeding year he discovered the long-lost strait of Juan de Fuca, between Vancouver Island and the mainland of the United States, which he charted under the name of the Greek seaman, its first discoverer. Barkley Sound, Vancouver Island, was also discovered and named by him.

BARLAAM, bår-lä-äm, Italian theologian: b. Seminaria, Calabria; d. about 1348. He was a monk of Saint Basil, noted for his learning, and particularly for his thorough knowledge of the Greek language. In 1327 he visited Constantinople, and in 1331 he was appointed abbot of the convent of Saint Salvator. In 1339 the kings of France and Sicily sent Barlaam in vain to Pope Benedict XII at Avignon, for the purpose of obtaining assistance against the Mohammedans, and of arranging a union between the Greek and Latin Churches. Henceforth he was engaged in various religious controversies, and was defeated in them all. He finally entered the Roman Catholic Church, and through the influence of his friend, Petrarch, received from Pope Clement VI the bishopric of Geraci.

BARLAAM AND JOSAPHAT, one of the most popular of early medieval romances, formerly supposed to have been written by
BARLAAMITES—BARLEY

Saint John of Damascus,—or Damascenus, as he is sometimes called,—a Syrian monk born about the end of the 7th century. According to the narrative Josaphat was the son of a king of India brought up in magnificent seclusion, to be delivered at an advanced age by his father. The education of this prince was entrusted to a holy hermit, who taught him the works of Christ and his holy discourses. Their holy and sublime conversation was so full of the love of God, that he might know nothing of human misery. Despite his father's care, the knowledge of sickness, poverty and death cannot be hidden from him: he is oppressed by the mystery of existence. A Christian hermit, Barlaam, guided his way to him at the risk of his life, and succeeds in converting him to Christianity. The prince uses his influence to promote the new faith among his people. When he has raised his kingdom to high prosperity, he leaves it to spend the remainder of his days as a holy hermit. The story is, with the necessary changes, substantially the story of Buddha. The correspondences of the two stories are most minute, and even the phraseology, in which some of the details of Josaphat's history are described, is almost a literal rendering of the Sanskrit of the 'Laüita Vistara.' Even the very word Josaphat or Joasaph (Arabic, Yudasaat) is a corrupt form of Bodisat, or Bodisattha of the Mahayana. Buddha is the name for the god of which the many birth-stories that clustered round the life of the sage. The identity of the stories of Buddha and Josaphat was first recognized by Diogo do Couto (1542-1616), the historian of Portuguese India. In modern times it was noticed by Laboulaye in the Journal des Débats (July 1859). A year later Dr. Felix Liebrecht made an elaborate treatise of the subject, putting the identity of the stories beyond dispute. Subsequent researches were made by Max Müller, Zotenberg, and others. The original Greek manuscript was first published by M. de Boissonade as a volume of his 'Anecdota' (Paris 1832), and translated into German by Liebrecht (Münster 1847). A Latin version was current in the Middle Ages, and about the 15th century began to appear among the works of Saint John Damascenus. But it is no longer ascribed to him. The legend appeared in the 'Speculum Historiale' of Vincent of Beauvais, and also in the 'Golden Legend' of Jacobus de Veragine. Three poetical versions in French of the 13th century are also extant. There are also Italian and German versions derived from the medieval Latin. The Spanish, Polish and Bohemian versions are also from this source. There are also versions in Icelandic, Swedish, Norwegian and even a version in the Tagalog language of the Philippines (Mañila 1712). The names of Barlaam and Josaphat appear in both the Greek and Roman lists of saints. Their names were inserted by Petrus de Natalibus in his 'Catalogus Sanc- torum' (1380) and Cardinal Baronius included them in the official 'Martyrologium' authorized by Sixtus V (1585-90) under the date of Z Novembris. In the 'Ordines' of Robert of Molesme 'the holy Josaph, son of Abener, King of Indi- a' is allotted the 26th of August. Thus Gautama the Buddha is officially, albeit unwittingly, recognized as a saint in two great branches of Christendom. Josaphat's history is also a church dedicated to Divo Josaphat. The compilers of the 'Gesta Romanorum,' Boccaccio, Gower and Shakespeare have all drawn materials from this romance. Consult Appel, 'Gut von Cambrai und Josaphas nach den Handschriften von Paris und Monte Cas- sino' (Halle 1907); Jacobs, Joseph, 'Barlaam and Josaphat' (London 1896); Liebrecht, 'Zur Volkskunde' (Heilbronn 1879); Müller, Max, 'Selected Essays' (London 1881); Zotenberg, H., 'Notice sur le livre de Barlaam et Josapha' (Paris 1886).

BARLAAMITES, in ecclesiastical history, followers of Barlaam, a Latin monk of the 14th century; known chiefly from their controversy with the Quiets monks of Mount Athos. Consult Gibbon, 'Roman Empire.'

BARLEUS, bár-leus, or BEERLE, Kaspar van, Dutch historian and learned writer: b. Antwerp, 12 Feb. 1584; d. Amsterdam, 14 Jan. 1648. His 'Poems,' mostly Latin, are not forcible, but his 'History of Brazil under Maurice of Nassau' is decidedly so; and he composed also numerous fine orations, the influence he exercised on contemporary thought being very considerable.

BARLETTA, bár-lét'ta, Gabriele, Italian monk: b. perhaps at Barletta, in the kingdom of Naples, in the 15th century. He became celebrated at Naples on account of his sermons, in which he mixed sarcasm and the ludicrous with the sacred; quoting Moses; placing David at the side of Hercules; and commencing a sentence in Italian to continue it in Latin and end it in Greek. Sometimes he forgot himself so far as to use expressions of which he had not considered the significance, as when he asked by what signs the Samaritan knew Jesus was a Jew. Very serious authors, Niceron and others, have given the response of the preacher, but it cannot be reproduced here. There is under his name a collection of Latin sermons, which have gone through more than 20 editions.

BARLETTA, Italy, seaport town on the west shore of the Adriatic, 33 miles northwest of Bari. In the market-place is a colossal bronze statue, about 18 feet high, supposed to represent the Emperor Heraclius. A statue of the statesman Massimo d'Azeglio, who died in 1866, adorns another square. The cathedral is a fine Byzantine edifice, the nave of which is supported by antique granite columns. There are several other churches, convents for both sexes, an orphan institution, a college founded by Ferdinand IV and a theatre. The harbor is formed by a mole running out from the shore. It admits of small vessels only, but good anchorage ground is found in the roadstead. Barletta has a considerable trade in grain, wine, almonds and the other productions of the country, which are exported to the different ports of the Adriatic. Pop. 44,200.

BARLEY (A. S. bærlic, from beside, barley +leac, a leek, plant); genus Hordeum, our fourth most important cereal. It belongs to the Poaceae or grass family, and is one of the oldest of the cultivated members of this family. It was cultivated in ancient Egypt (Exod. ix, 31) by the Greeks and Romans. Pliny regarded it as the most ancient food of mankind. It has been found in the later Neolithic period in land in deposits belonging to the Stone Age. Ears of barley are represented plated in the hair of the goddess Ceres, and are also shown on ancient coins. One of the sacred books of the Chinese claims that it was grown in China 2000 B.C. It grows wild in western Asia, and

VOL. 3 — 17
BARLEY BREAK — BARLEYCORN

this is probably its original home. It is adapted to both warm and cold climates, has a wider range of distribution than any other cereal, being grown all over the region embraced in the temperate zones, from Alaska, Asiad and Norway in the north to Algeria, Egypt, India and other subtropical countries. The Nepaul or Himalaya barley is very hardy, producing good crops at an elevation of 14,000 feet above the sea level. In Chile and Switzerland it thrives at 5,000 feet, but on the plateaus of Peru it rarely ripens.

Barley is divided into several types, of which the following are recognized: Two-rowed barley, Hordeum distichon; four-rowed barley, *H. vulgare*, the common barley, here or bigg; six-rowed barley, *H. hexastichon*; naked barley, *H. distichon* nudum, the scales not adhering to the grain as in other types; fan, spratt, or Brattledore barley, *H. zeorriton*, two-rowed with wide-spreading awns; this is valued in Germany and is sometimes called German rice. These types are further subdivided into varieties, the most popular for malting belonging to the two-rowed type. The best known is the Chevalier, which originated in Suffolk, England. This variety and selections from it constitute the high-priced barley of California. In Europe the two-rowed type predominates. In this country the six-rowed is more common. The four-rowed varieties were formerly used for malting; they are hardy and productive but coarse, and are being replaced by the two-rowed. In northern latitudes well-drained and fertile medium or rather light soils, particularly those of a calcareous nature, are best. Strong loams, heavy clays and soils rich in humus, produce heavy crops, but of inferior quality. In southern latitudes medium to heavy loams are best. Climate and season are of more importance than soil in determining whether the barley will be a good malting variety or not. A rather dry climate suits well. The climate of eastern and southeastern England produces the best malting barley. It may be sown broadcast or drilled, but the latter method is more satisfactory. Fall-sown varieties are handled like fall-sown wheat, but it is grown in the same field. Spring sowing is over. The amount of seed varies from two to three bushels per acre. It germinates quickly, and late spring frosts may injure it. Fertilizers when applied must be evenly distributed or an uneven growth will result. It ripens before spring wheat, and should be fully ripe before it is cut. The color and value of the grain is easily injured by damp weather. From 30 to 40 bushels of grain and 1,500 to 2,200 pounds of straw is a good yield. Sometimes this yield of grain is doubled. A good malting variety must have quick, high and even germinating power; the grains must be plump, heavy, thin-husked and uniform in size; of good bright color, not *steely* or bleached, indicating immaturity when cut, nor musty; must contain a high percentage of starch, mealy not flinty, showing that the starch can be readily transformed during malting. Barley is sometimes attacked by rust and smut, but less so than wheat. (See Wheat.) Wireworms are sometimes troublesome. The production of barley in the United States is increasing. In 1866, 7,916,342 bushels were grown on 492,532 acres. In 1916, 180,927,000 bushels on 7,674,000 acres. The four leading States in 1916 were California, 33,320,000 bushels; Minnesota, 26,125,000 bushels; North Dakota, 26,730,000 bushels; South Dakota, 18,226,000 bushel. The average yield for the year 1916 was 23.6 bushels per acre. The average farm value 88.2c per bushel.

Feeding Value and Uses.—The average percentage composition of barley is: water, 108; proteins, 12.4; nitrogen-free extract, chiefly starch, 69.8; ether extract, 1.8; crude fibre, 27; ash, 2.4. Digestion experiments with pigs showed that 80 per cent of the dry matter, 81 per cent of the protein, 87 per cent of the nitrogen-free extract, and 97 per cent of the ether extract were digestible. Barley is chiefly used for malting, for the preparation of spirits, beer and malted foods. It is also employed in domestic cookery as "pot or hulled barley," in which only the husks are removed; "pearl barley" is the grain deprived of husks and pellice, then ground to a round form and polished; "patent barley" is flour obtained by grinding pearl barley. It is used in soups, for making demulcent and emollient drinks for invalids and for other purposes. Barley bread is darker in color and less nutritious than that from wheat flour; it does not contain gluten, but is fairly rich in other proteins.

Barley, or decoctions of it, are used to modify cows' milk for feeding to infants. Barley meal and the by-products, barley bean, barley feed (from pearled barley), screenings, malt combs and brewers' grains are used as stock feeds. Its use for horse feed in the United States is confined to the Pacific coast. For other stock its use is more general. It may be fed alone or with other grain. Barley hay is grown, the crop being cut before the grain is mature. As a forage crop or pasture it may be grown alone or with peas, vetches or other quick-growing legumes. Barley straw is usually considered as not worth feeding, but may be used as bedding.

BARLEY BREAK, a game once common and often mentioned by old English writers. It was played by six young people, three of either sex, i.e., spring, after spring. There were to be a young woman in each, it being decided by lot which individuals were to be paired together. A piece of ground was then divided into three spaces, of which the central one was profanely termed hell. This was assigned to a couple as their appropriate place. The couples who occupied the other spaces then advanced as near as they dared to the central one to tempt the doomed pair, who with one of their hands locked in that of their partner, endeavored with the other to grasp them and draw them into the central space. If they succeeded, they were then allowed themselves to emerge from it, the couple caught taking their places. That the game might not be too speedily finished, leave was given to the couple in question to once taken to break hands and individually try to escape, while no such liberty was accorded to those attempting to seize them.

BARLEYCORN, John, a personification of the spirit of barley, or malt liquor. It is commonly used jocularly, and in humorous verse. The Dr. Murray's Dictionary quotes a title in the Pepysian Library, about 1630. "A pleas-
ant new ballad... of the bloody murther of Sir John Barleycorn. The ballad on John Barleycorn is well known.

BARLOW, Joel, American poet and diplomatist: b. Redding, Conn., 24 March 1754; d. near Cracow, Poland, 24 Dec. 1812. In 1774 he was placed at Dartmouth College, New Hampshire, and after a short residence entered Yale College, New Haven, where he displayed a talent for versification, which gained him the friendship of Dr. Dwight, then a tutor there. Barlow, more than once during the vacations of the college, served as a volunteer in the army of the Revolution. In 1778 he applied himself to the study of law, but soon after accepted the position of chaplain in the army, which he held till the close of the war (1783). During this period his songs and addresses were said to have animated and encouraged the soldiers; at this time, too, he planned and partly composed his 'Vision of Columbus.' He went to Hartford, where he started a weekly newspaper, continuing at the same time the preparation of this poem for press. It was published in 1787, and some months after in London. To promote the sale of his poem, and that of a new edition of the Psalms adapted by him, Barlow gave up the newspaper and became a bookseller. In 1788 we find him in France as agent for speculators in land, called the Scioto (Ohio) Land Company. The Revolution was then in progress, and Barlow went about lecturing and organizing societies in its favor. He went to England in 1791, and was deputed in the following year by the London Constitutional Society to present an address to the French Convention. In 1795 he was appointed American consul at Algiers, a post he held for only two years. Returning to Paris he made some successful commercial speculations and acquired a considerable fortune. He returned, after an absence of 17 years, to his native country (1805). In 1811 he was appointed Minister-plenipotentiary to France. In the following year, owing to the fatigues and privations of a journey to Wilna to hold a conference with Napoleon, he died at an obscure village near Cracow. His principal poem, the 'Columbias,' has never been popular; it is defective in plan and execution, overloaded with philosophic discourse and political tirades, and disfigured by pedantic and uncouth words of his own coinage. His prose writings bear the stamp of an active and energetic intellect, but lack that ripeness of judgment required by the complex nature of the subjects he examines. Consult Todd, 'Life and Letters of Joel Barlow' (1886).

BARLOW, Peter, English physicist and mathematician: b. Norwich, October 1776; d. 1 March 1862. He was professor of mathematics in the Royal Military Academy at Woolwich for a period of 40 years. His greatest work is the 'Mathematical and Philosophical Dictionary' (1814). He was also the author of an elaborate work on the 'Machinery and Manufactures of Great Britain' (1837); of a treatise on 'Force and Rapidity of Locomotion' (1838); and of an 'Essay on Magnetic Attraction,' one of the first works in which the phenomena of magnetism were enunciated. He invented the Barlow, William Henry, English engineer: b. 10 May 1812; d. 12 Nov. 1902. He was educated for the engineering profession, invented the saddleback form of rail which bears his name, and among his more notable achievements is the Saint Pancras terminal station in London. He was consulted in regard to the reconstruction of the Thames Bridge after its fall in 1879. In 1876 he visited the United States as one of the judges of the Centennial Commission. He published 'Illumination of Lighthouses,' 'Diurnal Electric Tides and Storms,' 'The Resistance of Flexure in Beams,' 'The Logograph.'

BARLOWE, Arthur, English navigator; b. about 1550; d. about 1620. In 1584 he was sent with Philip Amadas to select a suitable location for Raleigh's proposed American colony. They explored the coast of North Carolina and on their return to England Barlowe wrote an enthusiastic description of the attractions of the land they had visited.

BARMECIDES, a celebrated Persian family, whose virtues and splendor form a favorite subject for Mohammedan poets and historians. Two eminent members were Khaled-ben-Barmek, Prime Minister of Caliph Abul Abbas Al-Saffah and tutor of the celebrated Harun al-Rashid, and his son Yahya, Grand Vizier of Harun. The expression 'Barmecides' Feast,' meaning a visionary banquet or make-believe entertainment, originates from a story in the Arabian Nights' Entertainment, of a wealthy Barmecide, to whom a poor man, Schacabac, had applied for charity. On the latter informing him that he was starving, the Barmecide invited him to dinner; and calling for a succession of the most sumptuous viands, although none were provided, urged his guest to fall to and enjoy himself, praising the merits of each dish as it was pretended to arrive on the table. Schacabac, although suffering all the pangs of hunger, entered into the humor of his host, declared his infinite enjoyment of everything set before him and by his patience so won the heart of his eccentric entertainer that better not only provided for him immediately an actual and plenteous repast, but likewise took him into his house and entrusted him with the management of his affairs.

BARMECIDES' FEAST. See BARMECIDES.

BARMEN, Germany, city on the Wupper, in the province of Rhenish Prussia. The town of Barmen is formed by the union of seven villages located in the valley of Barmen, from which it takes its name, and its western border adjoins the city of Elberfeld. It is the seat of the Rhenish Missionary Society, which has here a large seminary. The valley is remarkable for natural beauty. The United States has a resident consul. Barmen contains the principal ribbon manufactories on the Continent and its ribbons are sent into all parts of the world. Next in importance are the important textile manufactures are zanellas or Indian cloths, satin for lining, and lace. Barmen also possesses numerous large dye works, besides manufactures of chemicals, plated and
other metal wares, buttons, yarns, iron, machines, pianos, organs, soap, etc. There are also in the valley numerous bleachfields and Turkey-red dye works. The city has six railway stations and one of its remarkable features is the electric swinging railway over and along the line of the Wupper between Barmen and Sonnborn. Lower Barmen has a mineral spring and a bathing establishment. Pop. 169,214.

BARMOTE COURT (from berg, hill and moly, meeting), a name given to local courts held in the lead-mining portions of Derbyshire, England. Their purpose is the definition of the ancient rights of the inhabitants and the settlement of disputes connected therewith. They are of ancient origin, but their scope has been much restricted during the Victorian period. Consult Bainbridge, 'The Law of Mines and Minerals' (5th ed., 1900).

BARN (Saxon, hearna, from here, barley, and urf, a close place or repository). The word seems originally to have denoted a building for the storing of grain. In modern times it has a wider significance— all structures of any capacity used on a farm for storing corn and sheltering stock being known as barns. In the changeable climate of the United States, with its severe winters, protection to cattle becomes an important item in the operations of husbandry, and as our agriculture becomes more highly developed we construct more expensive, convenient and useful barns. A well-built barn, embracing all the conveniences needed for the easy and safe storing of crops and the comfort and well-being of farm stock, will always be one of the safest and best investments a farmer can make. At one time the barns on many estates were capacious enough to contain all the grain raised on them, but recent years have seen a change in the mode of storing grain, and now it is considered the better plan—building the grain barn of sufficient size to contain one or two ricks of grain at a time and all the necessary appurtenances for threshing. The stacked grain is kept in better condition from having a freer circulation of air and being so disposed as to be free from the attacks of vermin. A regular yard is set apart for stacks, elevated platforms are provided on which the stacks are built and they are so arranged as to prevent vermin from climbing to them from the ground and so far separated as to leave each stack isolated. Many such conveniences are known to the American farmer. The skeleton barn, a building but partially enclosed, spaces being left between the boards for the free ingress of air, with a durable roof and projecting eaves, is most used for grain and for the storing of hay loosely trussed for market. The sheep and stock barns of the United States are generally commodious structures with wide sides, in which the animals find shelter and receive their provender, or, when built on a side hill, the cellar is appropriated to this purpose. Sheds also surround the whole yard in many instances, while stacks of the poorer quality of hay and threshed straw occupy the centre of the yard, their contents being freely used as bedding and partial food for cattle, the greater bulk finding its way into the manure heap. These are both comfortable quarters for the animals and profitable for the farmer. Modifications of this general plan are made by each farmer according to his means and peculiar ideas. As a general rule, stock barns are found most profitable when they afford the most ample accommodations. The greater the comfort of the animals, the more uniform the profit of the farmer. Great care should be used in the selection of a place for the farm buildings. The barns should be easily reached and so arranged as to admit of the economical disposition of both crops and manures. The soil should be dry and porous or should be thoroughly drained. Ample provision should be made for the saving of manures. Side-hill barns afford cellars in which these may be kept without waste, their bulk augmented and those changes produced upon them which are so essential to the highest efficiency. If no good springs, streams or wells can be obtained, cisterns for rain water should be provided. Barns are usually built of wood, some of stone, a few of brick and of concrete or gravel wall. The gravel wall can be made cheaper than stone walls and can be built on farms affording only gravel and small stones of a quality too poor to build ordinary stone walls. Barn floors are usually of wood; and when intended for the threshing or handling of grain should be tight and smooth and kept clean. Oak, beech and yellow pine form excellent floors. The threshing floors described by Columella were formed by wetting the earth with the lees of oil, mixing in some chaff and ramming the whole down firmly; chaff was then trodden on the top, and the whole left to dry in the sun. The lees of oil were said to check vegetation, and to drive away vermin. The preparation of corrugated iron, at a comparatively cheap rate of cost, suggests that material as one of the most suitable for a well-built barn. The roof deserves more attention than it usually receives at the hands of the farmer who wishes to be truly economical in his expenditure for buildings. Finally, let all farmers remember that the establishment of one of the most important things to be secured, especially in stock barns. The plan and construction of a barn varies with the purposes for which it is used. For detailed plans and internal fixtures for both stock and general barns consult Curtis, 'Farm Buildings for Land Owners, Agents, and Tenants' (London 1912); Dolve, 'Barn Plans,' North Dakota Experiment Station Bulletin 97 (Agricultural College, N. D., 1912); Hill, 'Practical Suggestions for Farm Buildings,' United States Department of Agriculture Farmers' Bulletins 126, 190 and 461 (Washington 1901, 1904 and 1912); McConnel, 'Farm Equipment: Buildings and Machinery' (New York 1910); Radford, 'Practical Barn Plans and All Kinds of Farm Buildings' (ibid, 1912); United States Country Buildings (Waukes, Wis., 1912); Fraser, 'Economy of the Round Dairy Barn.' BARN OWL.—BARNABAS

Farm Buildings,1 Michigan Experiment Station Bulletin 250 (East Lansing 1907); 'Farm Buildings' (Chicago 1907); Winder, 'Handbook of Farm Buildings' (London 1908).

BARN OWL, a widespread but rather uncommon owl (Strix flammea) which seems to be known in all parts of the world, and is everywhere recognizable among other owls by the heart-shaped form of the facial discs, which meet in a point below the beak. These give a very quaint expression, which has led to the southerners with eye-faces5 in the Southern States. It is about 17 inches in length, and its plumage is yellowish-red, irregularly marked with lighter and darker tints. The eyes are small and black and surrounded by cream-colored discs, bordered with rust-red. The legs are long and bear short feathers only. It is more numerous in the southern part of the United States than in the northern portion, and is rarely seen even where many exist, since it is more completely nocturnal in its habits than are the hawks or owls. The hawk, perched on a branch of an evergreen tree or on the roof of a house, can easily be detected by the position of the tail feathers, which are raised to a fan. The nest is built in trees, bushes, or hollow stumps. The eggs are white, oval in shape, and measure about 2.3 by 1.8 cm. They are laid in March or April, and the young birds are usually fledged by the end of June. The BARN OWL is a common sight in the southern United States, where it is often seen near human habitations.

BARNABAS, the surname given by the apostles to Joses, or Joseph, a fellow-laborer of Paul, and, like him, ranked as an apostle. He was a Levite and a native of Cyprus; contributed to the community of goods among the disciples (Acts iv. 35-37); was sponsor for Saul, the former persecutor. That he was a man of influence in the early church of Jerusalem is attested by his being commissioned to investigate the church of Antioch. He journeyed thence to Tarsus, where he joined Saul, with whom he was again sent out upon missionary work (Acts xii. 25). With Paul he journeyed through Asia Minor, and wound up his missionary tour at Antioch, where both he and Paul became involved in the contentions of the Judaizing Christians regarding circumcision. They submitted the matter to the apostles and returned to Antioch, where they labored for some time before revisiting the communities established during their first tour of Asia Minor. A difference arose between them in regard to Mark, a nephew of Barnabas, and they separated, Barnabas and Mark going to Cyprus, the native place of the former. From this time the history of Barnabas is obscure. There is mention of him (1 Cor. ix. 6) as being still actively engaged in missionary work, but it would appear that he never rejoined Paul. There are unsuppressed traditions that he preached in Rome; that he was founder and first bishop of the church of Milan, and that he suffered martyrdom at Salamis in his native Cyprus. There is an epistle of 21 chapters ascribed to Barnabas by Tertullian, and other early Christian writers, but without any support of internal evidence. It was probably written in the 2d century by a Gentile who had come under the influence of Alexandrian Judaism. An apocryphal Acts, an apocryphal Gospel also bear his name. Tertullian also ascribes to him the epistle to the Hebrews in the New Testament. Consult 'Barnabas' in Hastings' 'Dictionary of the Bible' (New York 1898); 'Barnabas' in Herzog's 'Encyclopedia Biblica' (3d. 1899); and Harnack, A., 'Chronologie der altchristlichen Literatur' (Leipzig 1897); Kruger, G., 'History of Early Christian Literature' (New York 1897); Lightfoot, J. B., 'Apostolic Fathers' (London 1893).

BARNABAS, Acts, Epistle, and Gospel of. (1) The 'Acts of Barnabas' are clearly apocryphal and of late date. They recount his missionary journeys and his martyrdom in Cyprus. The 'Epistle of Barnabas' is one of the apocryphal books of the New Testament. At the end of the Codex Sinaiticus of the 4th century, there is an epistle of Barnabas. It

broods a season — the first in May, and the second in July. The eggs are four to six in number, white, with red and purple spots and splashes nearly covering the larger end. When the second brood of young are capable of using their wings, the swallows congregate in flocks of thousands, and migrate southward, traveling by daylight, instead of at night, as is the custom of most migratory birds. In the northeastern part of the country, the barn swallows have been nearly exterminated by a sparrow, who seize their nest for their own breeding purposes and destroy their eggs and young in a ruthless way, often, apparently, in a spirit of malicious mischief.
is strongly anti-Jewish in tone, is full of allegorical interpretations of the Old Testament. It once enjoyed quasi-canonical authority, as is borne out by Eusebius and by the commentaries of Clement, Origen and other early Christian writers, who also are unanimous in ascribing it to Barnabas, the coworker of Paul. Internal evidence, however, renders this claim impossible, its authority was greatest at Alexandria, and it is clearly of Alexandrine origin and was directed, as its opening shows, to some body of Christians in lower Egypt. Its date has been much debated as being from 70 to 130 A.D., but Lightfoot's interpretation of the apocalyptic passage in chapter iv is really conclusive for the reign of Vespasian (70-79 A.D.). This epistle is, therefore, the earliest of the Apostolic Fathers and, as such, is of special interest. Its central problem — the relation of Judaism and Christianity — of the old and new forms of a divine covenant — was one which gave the early Church much trouble, and was one which the Church failed to solve satisfactorily. (3) The existence of a 'Gospel of Barnabas' is inferred from references to it in several ancient writings, notably in the 'Decretum Gelasii' (496 A.D.), but we have no knowledge of its contents. There exists, however, in a single Italian manuscript, a long gospel with this title, written from a Mohammedan standpoint, but embodying Gnostic elements. It has been edited, with an English translation by Lonsdale and Ragg (1907), who hold that it was the work of a Christian renegade to Mohammedanism about the 13th-16th century. The work is highly imaginative and at times grotesque, but is pervaded with a high ethical enthusiasm. Consult Braunsberger, O., 'Der Apostel Barnabas, sein Leben und der ihm beigelegte Brief' (Mainz 1876); Cunningham, 'Epistle of Barnabas' (1877); Donaldson, J. 'The Apostolic Fathers?; Lightfoot, J. B. 'Apostolic Fathers' (London 1893); Krüger, G. 'Early Christian Literature' (New York 1897); Reuss, E. 'Théologie chrétienne'; and articles 'Barnabas' in Cheyne, 'Encyclopaedia Biblica' (New York 1889); and Hastings, 'Dictionary of the Bible' (ib. 1898).

BARNABAS, Cape, a headland of Alaska, which the navigator, Captain Cook, discovered on Saint Barnabas Day.

BARNABITES, a congregation of regular clerics in the Roman Catholic Church, founded in 1532 by three priests — Zaccharia of Cremona, Ferrari and Morigia of Milan. They were at first called the Regular Clerks of Saint Paul from their first church, Saint Paul's in Milan, which name they exchanged for Barnabites when, in 1545, they were presented with the church of Saint Barnabas in Milan. A new rule was drawn up and approved in 1579. In addition to the three monastic vows, they took a fourth, never to exert themselves for an office within the congregation or without, and never to accept a dignity out of the congregation except by special permission of the Pope. Their houses are called colleges. The superior is chosen every third year by a General Chapter. The lay brothers have to pass through a novitiate of five years. The extension of their work includes Italy, Austria, Prussia and Spain. The French Revolution and its sequel drove them from France and Spain. They returned to France in 1857, but were again driven out in 1880. Cardinal Lambruschini was the most celebrated member of the order in recent times. The order has about 25 houses altogether. Many Russians of noble ancestry, who had joined the Church of Rome, have joined the order within the last 20 years.

BARNABY, Sir Nathaniel, English naval architect; b. Chatham 1829; d. London, 15 June 1915. He began his career as an apprentice shipwright in Sheerness dockyard at the age of 14, afterward entering the designing office of the admiralty. In 1872 he became chief naval architect, and from 1875-85 was chief naval constructor to the admiralty. He brought about the substitution of steel for iron in shipbuilding, and the subsidising of merchant vessels for use in war. He was created a K.C.B. in 1885.

BARNABY RUDGE, a novel by Charles Dickens, published in 1841. It contains an account of the Gordon riots in London, 2-7 June 1780. The plot is as follows: Some of the most whimsical and amusing of Dickens' character-studies appear in the pages of this novel, while the whole episode of the gathering and march of the mob and the storming of Newgate is surpassed in dramatic intensity by no passage in modern fiction, unless by Dickens' own treatment of the French Revolution in the 'Tale of Two Cities.'

BARNACLE, Lord Decimus Tite, the name of the nobleman whom Dickens in his 'Little Dorrit' places in charge of the circumlocation office.

BARNACLE, a degenerate crustacean of the order Cirripedia, living attached to some foreign object, such as wharf piles, rocks and the bottoms of ships. The barnacles would at first glance hardly be regarded as Crustacea at all, and were considered to be mollusca, until in 1836 Thompson found that the young barnacle was like the larvae of other low Crustacea (Copepoda). The young barnacle is, as in the common sessile form, a shell-like animal; the shell composed of several pieces or valves with a multivalve, conical, movable lid, having an opening through which several many-jointed, hairy appendages are thrust, thus creating a current which sets in toward the mouth. The common barnacle (Balanus balanoides) abounds on every rocky shore from extreme high-water mark to deep water, and the student can, by putting a group of them in sea water, observe the opening and shutting of the valves and the movements of the appendages. The structure of the barnacle may best be observed in dissecting a goose-barnacle (Lepas fascicularis). This barnacle consists of a body (capitulum) and leathery peduncle. There are six pairs of jointed feet, representing the feet of the cyclops. The mouth, with the upper lip, mandibles, and two pairs of maxillae, will be found in the middle of the shell. A short esophagus leads to the pouch-like stomach and tubular intestine. This form, like most barnacles, is hermaphroditic, the ovary lying at the bottom of the shell, or, in the pedunculated forms, in the base of the peduncle, while the male gland is near to or some distance from the ovary. There is also at the base of the shell, or in the peduncle
when developed, a cement-gland, the secretion of which is for the purpose of attaching the barnacle, when in the "cypria" stage, to some rock or weed.

While the sexes are generally united in the same individual, in the genera Balanus and Scaphellina, by the normal hermaphrodite form, there are females, and also males called "complementary males," which are attached parasitically both to the females and the hermaphroditic forms, living just within the valves or fastened to the membranes of the body. These complimentary males are degraded, imperfect forms, with sometimes no mouth or digestive canal. The apparent design in nature of their different sexual forms is to effect cross-fertilization. The eggs pass from the ovaries into the body-cavity, where they are fertilized and remain for some time. They pass through a morula condition, a suppressed gastrula or two-layered state, and hatch in a form called a "Nauplius," from the fact that the free-swimming larva of the Ectonotomastax was at first thought to be an adult Crustacea, and described under the name of Nauplius. The Nauplius of the genuine barnacles has three pairs of legs ending in long bristles, with a single eye and a pair of antennae, the body ending in front in two horns, and posteriorly in a long caudal spine. After swimming about for a while, the Nauplius attaches itself to some object by its antennae, and a strange transformation results. The body is enclosed by two sets of valves, appearing as if bivalved, like a cypria; the peduncle grows out, concealing the rudimentary antennae, and the feet become smaller, and eventually the barnacle shape is attained. The common barnacle (Balanus balanoides) attains its full size, after becoming fixed, in one season; that is, between April and November. Consult monographs on the Crustacea by Charles Darwin (London 1851-54); Challenger Reports (Vol. XXVIII); Hoek, 'Report on the Cirripedia Collected by H. M. S. Challenger' (London 1884); Pilsbury, 'On the Classification of Scaphelliform Barnacles' in Proceedings of the Philadelphia Academy of Natural Sciences (Philadelphia 1908); 'Barnacles of Japan and Bering Sea' (London 1911); Root, 'Fishes of Fancy' (London 1883); Mayer, 'Sea-Shore Life' (New York 1906); Calman, 'Life of Crustacea' (New York 1911).

BARNACLE-EATER. See File Fish.

BARNACLE GOOSE. See Bernacle Goose.

BARNARD, Charles, American miscellaneous writer: b. Boston, Mass., 13 Feb. 1838; author of books on horticulture, music, electricity and other technical subjects, and since 1869 a contributor to the press on a very great variety of subjects. Was contributing editor to the Century Dictionary of Trades and Machines," Author of 'The County Fair' and other plays. Lecturer for board of education, New York, and writer and lecturer on housekeeping efficiency and founder of first housekeeping experiment station. More recently, lecturer on social and educational subjects in Pasadena, Cal.

BARNARD, Mrs. Charlotte Alington, "Claribel," English composer of songs and ballads; b. 1830; d. Dover 1899. She married in 1854 Charles Barnard, and four years later began to compose. She wrote nearly 100 ballads between 1858 and 1868 under the pseudonym of Claribel, many of them becoming very popular, "Won't You Tell Me Why, Robin?" and "Come Back to Erin," being especially well known. In most cases she wrote the words for her songs, and she was also the author of a volume of 'Thoughts, Verses and Songs.'

BARNARD, Edward Emerson, American astronomer: b. Nashville, Tenn., 16 Dec. 1857. He learned photography in a studio as a boy, and began astronomical studies alone. He studied at the Vanderbilt University and University of the Pacific, and received degrees from many sources, including those of hon. Sc.D. from Vanderbilt, LL.D., Queens (Canada). He was in charge of the Vanderbilt University Observatory, 1883-87. He was astronomer in Lick Observatory, California, 1887-95, and then became professor in Chicago University. His principal discoveries are the fifth satellite of Jupiter in 1892 and 16 comets. He has made photographs of the Milky Way, the comets, nebulae, etc. He is professor of practical astronomy, Chicago University, and astronomer at Yerkes Observatory, Williams Bay, Wis., since 1895. He accompanied the United States naval total eclipse expedition to Sumatra (1901); received the Lalande gold medal of the Paris Academy in 1894; received the gold medal in 1893, the Janssen gold medal (1900); the gold medal of the Royal Astronomical Society of Great Britain (1907), and the Janssen prize from the Société Astronomique de France (1906). He is F.A.A. (vice-president, 1898) Astronomical and Astrophysics Society of America; associate fellow, American Academy of Arts and Sciences; fellow of the American Philosophical Society; honor member, Royal Astronomical Society (Canada); former associate and fellow, Royal Astronomical Society; member, Société Astronomique de France; and member of the National Academy of Sciences. He published 'Micrometrical Observations of Eros made during Opposition of 1900-01' (1902).
in the University of Mississippi, 1854-61; its president in 1856-58, and its chancellor in 1858-61. He was president of Columbia College, New York, in 1864-88. In 1860, he was appointed a member of the expedition to observe the eclipse of the sun in Labrador; was engaged in 1862 in reducing observations of the stars in the southern hemisphere; had charge of the publication of charts and maps of the United States Coast Survey in 1863; was named one of the original incorporators of the National Academy of Sciences in 1863; was one of the United States commissioners to the Paris Exposition in 1867; member of the American Philosophical Society, corresponding member of the Royal Society of Liége, and member of many other scientific and literary associations. Among his publications are 'Letters on College Government' (1854); 'Report on Collegiate Education' (1854); 'Art Culture' (1854); 'History of the American Coast Survey' (1857); 'University Education' (1858); 'Undulatory Theory of Light' (1862); 'Machinery and Processes of the Industrial Arts, and Apparatus of Exact Science' (1868); 'Metric System of Weights and Measures' (1871); 'Recent Progress of Science,' etc. Barnard College, affiliated with Columbia University, was named in his honor.

BARNARD, George Grey, American sculptor: b. Bellefonte, Pa., 24 May 1863. He studied at the Chicago Art Institute and the École Nationale des Beaux Arts, Paris, 1884-87. He first exhibited at the salon of 1894. In 1900 he received a gold medal at the Paris Exposition. Was for many years professor of sculpture in the Art Students' League, New York city. His chief works, largely symbolic in character, are 'Brotherly Love,' 'The Two Natures' (in the Metropolitan Museum), 'The God Pan' (Central Park), and 'The Hesper.' His studio is in Paris.

BARNARD, Henry, American educator: b. Hartford, Conn., 24 Jan. 1811; d. 5 July 1900. He was president of the University of Wisconsin (1856-59) and of Saint John's College, Annapolis, Md. (1865-66); founded the 'American Journal of Education,' (1855); was the first United States commissioner of education (1867-70). Among his numerous writings are 'Hints and Methods for Teachers' (1857); 'Pestalozzi and Pestalozzianism' (1861); 'German Educational Reformers' (1862); etc. In 1886 he began to publish the 'American Library of Schools and Education,' a collection of 800 of his own writings, reports, etc.

BARNARD, John Gross, American military engineer: b. Sheffield, Mass., 19 May 1815; d. 14 May 1882; brother of F. A. P. Barnard (q.v.). He was graduated at the United States Military Academy in 1833; served from 1835 to 1832 on the coast of the Gulf of Mexico; and in 1852 in the Mexican War. In the Mexican War he fortified Tampico and became chief of the Tehuan tepac Survey. In 1855-56 he was superintendent of the West Point Military Academy. In the Civil War he was successively chief engineer of the department of Washington, chief engineer of the army of the Potomac, and chief engineer of the staff of General Grant. He subsequently had charge of the fortifications of San Francisco and New York harbors. His published works include 'Phenomena of the Gyroscope' (1858); 'Dangers and Defenses of New York' (1859); 'Notes on Sea-Coast Defense' (1861); 'The Confederate States Army and the Battle of Bull Run' (1862). Consult 'Biographical Memoirs of the National Academy of Sciences' (1905).

BARNARD CASTLE, England, market town of Durham County, on the Tees, 17 miles west of Darlington, on a branch of the North Eastern Railway. It is beautifully situated on the steep left bank of the river, contains a fine hall, dating from 1477, and a number of industrial establishments. It has a large grain market. It contains a number of interesting ruins, the chief of which is the castle built in the 13th century by Guy Baliol. Barnard, King of Scotland. The castle is the principal scene of the Walter Scott's 'Rob Roy.' Pop. 4,757.

BARNARD COLLEGE, the undergraduate college for women of Columbia University. In 1889 a group of men and women who wished to provide for women in New York city a college education fully equal to that offered to men succeeded in obtaining the support of the trustees of Columbia for the establishment of an affiliated women's college. A charter was granted by the State of New York, and promises of subscriptions for the support of the college during the first four years of its existence were secured. Because President Frederick A. P. Barnard of Columbia College had for many years been an ardent advocate of the admission of women to Columbia, the founders of the new college, led by the trustees of Columbia for the establishment of an affiliated women's college. A charter was granted by the State of New York, and promises of subscriptions for the support of the college during the first four years of its existence were secured. Because President Frederick A. 116th and 120th streets, west of Columbia. Mil-
bank quadrangle, the section extending from
116th to 119th street, was given in 1903 by Mrs.
A. A. Anderson. The buildings include Mil-
bank Hall and Brinckerhoff Hall, the gifts of
Mrs. Anderson, Mrs. Josiah T. Fiske and
Mrs. Van Wyck Brinckerhoff, respectively, which
contain the administrative offices, lecture-rooms
and laboratories; Brooks Hall, the hall of resi-
dence; and a new Students Hall, given by Jacob
H. Schiff, which contains the gymnasium, swim-
milling-pool, reading-room, lunch-room, etc. On
the Quadrangle are tennis courts and a prac-
tice field for basketball and athletics. Barnard
owned in 1916, equipment, buildings and grounds
of an estimated value of over $2,000,000 and
held productive funds providing a net income of
$60,000. Barnard has about 700 students, a
staff of over 80 professors and other officers
of instruction, and shares in the services of 23
others who come from Columbia to give
courses.

BARNARDO, Thomas John, English
philanthropist: b. Ireland 1845; d. London, Eng-
land, 19 Sept. 1905. He founded the Barnardo
Homes for homeless children, his attention
being turned in this direction while studying
medicine, by the condition of a boy in a ragged
school in East London in 1866. Follow-
ing up the subject, he began to rescue chil-
dren who found their only shelter at night
under archways, or in courts and alleys. These
were introduced to his homes, where they
received an industrial training, were saved from
a possible career of crime, and enabled to
achieve an honorable position in life. At the
time of his death Dr. Barnardo had under his
direction in the United Kingdom and
the colonies 112 mission branches and
distinct homes dealing with every age and class of
needy and destitute childhood, including an
immigration depot in Ontario, an industrial farm
in Manitoba, a home for babies and a hospital
for sick children, while over 60,000 trained and
tested boys and girls had passed through his
institutions.

BARNATO, BARNEY, or BARNETT,
South African speculator, whose real name is
believed to have been Bernard Isaac: b. Lon-
don, 1817; d. London 15 June 1867. He was
prominent in the diamond trade as a
diamond broker. In 1852 he found a rich diamond in the
colonies, and in 1868, discovered, secured
possession of a great part of the region. He
committed suicide by jumping from the deck of
the steamer Scotchwoman to Cape Town to
Southampton. Consult Isaac's 'Life of Barn-
net Barnett Barnato' (1897).

BARNaul, bár-nôul, Siberia, a mining
town in the government of Tomsk, and 230
miles southwest of the town of that name, and
2,046 miles east-southeast of Moscow, on the
Barnaulski, near its junction with the Obi. It
is well built, and the streets are regular and
spacious and adorned with trees. There is a
mining-school, an observatory, a public
library, a museum, a mint, etc. Lead is
smelted from the mines in the neighbor-
hood; there are lime and brick kilns, a mint
for copper coins and manufactories. It is the
chief town and the administrative seat of
the personal domains of the Tsar in the Altai,
and contains the imperial smelting works, the
annual output of which exceeds 13,000 pounds
of gold and 5,000 pounds of silver (troy).
Pop. about 30,000.

BARNAVE, bär-nay, Antoine Pierre
Joseph Marie, French orator: b. Grenoble,
1761; d. Paris, 29 Nov. 1793. He was chosen
a deputy of the tiers État to the assembly of
the States-General, and showed himself an open
enemy to the court. The Constituent Assembly
appointed him their president Jan. 1791.
After the flight of the King he defended Lafay-
ette against the charge of being privy to this
step, and, upon the arrest of the royal family,
was sent, with Petion and Latour-Maubourg,
to meet them, and to conduct them to Paris.
When the correspondence of the court fell into
the hands of the victorious party, 10 Aug.
1792, they pretended to have found documents
which showed him to have been secretly connected
with it, and he was guillotined. See Salvardy,
'Life of Barnave'; Lamartine, 'History of
the Girondists.'

BARNAY, Ludwig, German actor: b.
Pesth 1842. He made his first stage appearance at Trautenau in 1860, and thereafter appeared
at Pesth, Graz, Maria, Vien, Paris, Riga,
Leipzig and Weimar. From 1870 to 1875 he
was at the Stadt-Theater of Frankfort-on-the-
Main, and from 1875 to 1880 at the Stadt-
Theater of Hamburg. He visited London in
1881 as leading actor of the Meiningen Court
Company, and came to the United States in
1882 where he had a very successful tour. He
managed the Berliner Theater in Berlin
1887–94, and then took up his residence at
Wiesbaden. He excels as a tragedian. His
principal roles are Essex, Uriel Acosta, Othello,
Antony, Tell and Egmont. He helped organize
the stage congress at Weimar in 1871, which
led to the formation of the Bühnengenos-
schaft, which has been of great service to
members of the German theatrical profession.

BARNBURNERS, a nickname for the
progressive section of the New York State
Democracy from about 1844 to 1852, which
retaliated by calling the other party "Hunkers." They were essentially the same party which
from 1835 onward had advocated an extension
of the canal system, while their opponents were
the same who wished it restricted to imme-
diately profitable canals; but under these names
the division was on the slavery question (see
FARM-Soil Party), in which the Barnburners
were the Van Buren or Free-Soil wing. They
also stood for the local control by the "Albany
Regency," as against the Polk "machine"
which the new administration was trying to
build up in New York, and which favored the
extension of slavery into the Territories.
About 1852 the nicknames changed into "Softs" or
"Hards," corresponding with new issues to
the later "Half-breds" and "Stalwarts.
"The origin of the name is usually derived from the familiar campaign slogan of the man who
burned his barn to free it from rats.

BARNBY, Sir Joseph, English composer
and organist: b. York, 12 Aug. 1838; d. London,
28 Jan. 1896. He was chorister in York Min-
er; organist Saint Andrew's, Wells street,
London, 1863–71; precentor and choirmaster
Saint Ann's, Soho, 1871; precentor and director
of musical instruction in Eton College, 1875, and
head of the Guildhall School of Music in London from 1892. His cantatas of "Rebekah," "A Midsummer Night's Dream," and numerous highly interesting services and anthems (such as "King All Glorious"), for the Church, as well as several secular choruses and songs, rendered him famous both in England and the United States. He was knighted in 1892.

BARNEGAT BAY, a bay on the east coast of New Jersey, about 25 miles in length, and separated from the ocean by Squan and Island beaches. Barnegat Inlet connects it with the Atlantic. On the south side of the inlet is a lighthouse 150 feet high.

BARNES, Albert, American theologian: b. Rome, 1 Dec. 1798; d. Philadelphia, 24 Dec. 1870. Until the age of 17 he was employed by his father, who was a tanner, in his own occupation. At the age of 22 he graduated at Hamilton College, and after studying theology at Princeton was licensed to preach in 1824, and ordained pastor to the Presbyterian Church of Morristown, N. J., in February 1825. In 1830 he was removed to the pastoral charge of the First Presbyterian Church in Philadelphia, where he remained till his death. He is chiefly known by his "Notes on the New Testament," published in 11 volumes between 1832 and 1848; and his "Notes on the Old Testament," completed in 1870, which are favorite works with Sunday-school teachers and others engaged in the same subject. Other works of his are: "The Church and Slavery" (1857); "The Atonement in Its Relations to Law and Moral Government" (1859); "Evidences of Christianity" (1868); "Life at ThreeSCORE and Ten" (1869). He was tried for heresy on account of his belief in unlimited atonement, and though acquitted, the eventual result of the trial was to divide the Presbyterian body in the United States into the Old and New School branches in 1837.

BARNES, Charles Reid, American botanist: b. Madison, Ind., 7 Sept. 1858; d. 1910. He was educated at Hanover (Ind.) College, 1877, and pursued graduate studies at Harvard. He held professorships in Purdue University and the University of Wisconsin, 1880-98, and in the latter year became professor of plant physiology in the University of Chicago. He is the author of "Outlines of Plant Life" (1900); joint author of "Plant Dissection" (1880); and "Keys to the Genera and Species of North American Meigetsi" (1907). "Tree Book of Botany," in collaboration with J. Coulter and H. C. Cowles (1910). He contributed many papers to the "Botanical Gazette," of which he was an editor after 1883. He was appointed vice-president of the American Association for the Advancement of Science in 1899 and president of the Botanical Society of America in 1903.

BARNES, Dame Juliana. See BERNERS, Dame Juliana.

BARNES, Earl, American educator and lecturer: b. Martville, N. Y., 15 July 1861. He was graduated at the Oswego Normal School in 1884, and received the degree of A.B. from Indiana University in 1889, and that of M.S. from Cornell in 1891. He was professor of European history at Indiana University, 1890-92, and from then until 1897 professor of education at Stanford University. He has since devoted himself largely to writing. He has published "Studies in Education" (Vol. I, 1899; Vol. II, 1902); "'Where Knowledge Fails'" (1911); "Woman in Modern Society" (1913).

BARNES, Henry Turner, American educator: b. Woburn, Mass., 21 July 1873. He went to Canada with his parents in 1879, and was graduated at McGill University in 1893. While doing post-graduate work he alternated his studies with work as demonstrator in the physics department of the university. In 1898 he was awarded the Joule studenthip by the Royal Society. After further research work in heat he submitted the results to the Royal Society at a special session of that body; these were made the basis of a report to a conference of physicists at the Paris Exposition of 1900. In that year he was appointed lecturer in physics at McGill University; became assistant professor there in 1902, associate professor in 1906 and Macdonald professor of physics in 1908. He has given particular attention to the formation of ice in flowing water, and particularly the form of ice known as "frazil" and "hoar ice." Having read a paper on the "Ice Problem in Engineering Work in Canada" before the British Association for the Advancement of Science in 1907, he subsequently published a work on "Ice Formation and Frazil," which is the first authoritative volume on the subject. In these improvements in the construction of thermometers, and has perfected a pyrometer, which is coming into use in the regulation of furnaces and manufactories.

BARNES, James, American soldier: b. Boston, Mass., 1806; d. Springfield, Mass., 12 Feb. 1879. Appointed to the Military Academy from Massachusetts, he was graduated there in 1829, standing fifth in a class which included R. E. Lee, J. E. Johnston and a number of others who afterward became distinguished. In 1829-30 he was assistant instructor in French at the Military Academy. Resigning from the army after seven years' service, he became a railroad engineer and built, either wholly or in part, the Rome & W., Sacketts' H. & E., the Buffalo, C. & N. Y., the Terre Haute, A. & St. L., and the Potsdam & W. railroads between 1848 and 1857. During the Civil War he was colonel of the 18th Massachusetts Volunteers 1861-62, and brigadier-general of United States Volunteers 1862-65. He was present at the battles of Antietam, Fredericksburg, Chancellorville, and Gettysburg, where he was severely wounded. Exposure and wounds so impaired his constitution that he was unable to engage actively in his profession after the war. In 1865 he was brevetted major-general of volunteers for meritorious services.

BARNES, James, American writer for boys: b. Annapolis, 19 Sept. 1866. He was educated in Saint Paul's School, Concord, N. H., and after two years spent as civil engineer in construction work with the Missouri Pacific Railway, he entered Princeton University, and graduated in 1893. In 1898 he was made an editor of the "Nassau Literary Magazine." After his graduation he was asso-
cated with Scribner's Magazine; was assistant
editor Harper's Weekly (1894-95); special cor-
respondent of the Outlook during the Boer
War, and in 1903 at the Venezuela blockade;
and editor of Appleton's Magazine. He is au-
thor of 'For King or Country' (1895); 'Naval
Actions of 1812' (1896); 'A Princetonian'
(1897); 'Midshipmen Fargnaut' (1896); 'A
Loyal Traitor' (1897); 'Commodore Bain-
bridge' (1897); 'Yankee Ships and Yankee
Sailors' (1898); 'David G. Fargnaut' (1899);
'Drake and His Yeomen' (1899); 'The Great
War Trek' (1901); 'With the Flag in the
Channel' (1902); 'The Giant of Three Wars'
(1903); 'The Unpardonable War' (1904);
'The Son of Light Horse Harry' (1904);
'The Blockade' (1905); 'Outside the Law'
(1906); 'The Clutch of Circumstance' (1898);
'Commodore Perry' (1912); 'Rifle and Car-
avan' (1912); 'Through Central Africa from
Coast to Coast' (1915). In 1913-14 Mr. Barnes
crossed the continent of Africa at the head of
an expedition.

BARNES, Joseph K., American surgeon:
b. Philadelphia, 21 July 1817; d. Washington,
D. C. He was educated at Harvard and in the
medical department of the University of Pennsylvania; became assistant
surgeon in the army in 1840, and served at
various posts through the Mexican War. At
the beginning of the Civil War he was sum-
moned from Oregon and assigned to duty in
the office of the surgeon-general. In 1863 he
was appointed a medical inspector, with
the rank of colonel, and in September of the same
year was promoted to brigadier-general. In
1865 he was brevetted major-general, United
States army. To him was due in great mea-
sure the efficiency of the medical department
during the war. He was surgeon-general of
the army from 1864 to 1882, when he was
retired. He attended Presidents Lincoln and
Garfield on their deathbeds. He founded the
Army Medical Museum and the library of the
surgeon-general's office.

BARNES, Joshua, English classical
1712. He became Regius professor of Greek
at Cambridge in 1695. He published 'Gerania;
or, A New Discovery of a Little Sort of Peo-
lage Called Pygmies' (1675), from which Swift
is said to have drawn material for his 'Voy-
age to Lilliput'; 'Διδασκαλία τοῦ Ἑλληνι
cosmopolita' (1679), a paraphrase of the biblical story of Esther;
'History of that Most Victorious Monarch
Edward II' (1688); editions of Euripides
(1694); of Anacreon (1705); of Homer
(1711). These editions are no longer used.

BARNES, William, English dialect poet
and philologist: b. Rushay, Dorsetshire, 20
March 1801; d. 7 Oct. 1886. Of humble birth,
he first entered a solicitor's office, then taught
a school in Dorchester. He took orders, and
became, in 1862, rector of Winterbourne Came
in his native county, and died there. He ac-
quired a knowledge of many languages, and
published 'An Anglo-Saxon Delectus'; 'A
Philological Grammar, grounded upon Eng-
ish' (1854); 'Grammar and Glossary of the
Dorset Dialect' (1863), etc., but is best known
by his 'Poems of Rural Life in the Dorset
Dialect' (1844), and 'Poems of Rural Life, in
Common English' (1868). As a philologist, he
was distinguished by an intense dislike of Lat-
inized forms. His dialect poems reveal a high
order of genius, placing him in the first flight
of English pastoral poets, and have earned for
him the title of "The Dorsetshire Burns." A
collected edition of these appeared in 1879, and
his 'Life,' edited by his daughter, Lucy Baxter,
was published in London in 1887.

BARNES, William, Jr., American politi-
1866. He graduated at Harvard University
in 1888, and in 1889 became owner and
director of the Albany Journal. He took an
active interest in Republican politics and soon
became prominent in that party in New York
State. He became a member of the Republic-
ian State Committee in 1892, and was its chair-
man in 1911-14. He has never held an elective
office but virtually directed his party in New
York until 1912, when it split into the pro-
gressive and conservative sections. Barnes led
the conservative element at the Chicago con-
vention (1912) in opposing the candidacy of
Theodore Roosevelt for the presidency.

BARNESBORO, Pa., borough of Cam-
bria County, 40 miles northwest of Altoona,
on the Pennsylvania Railroad. It has exten-
sive coal-mining interests and contains lumber
yards, an ice-cream factory, bottling works, a
theatre and numerous churches and hotels.
The waterworks are borough property. Pop.
3,535.

BARNESVILLE, Ga., town of Pike
County, 60 miles southeast of Atlanta, on the
Central of Georgia Railroad. It has manufac-
tories of wagons and buggies and has a large
trade in cotton. There is a Carnegie library
located here. It is also the seat of Gordon In-
stitute. Pop. 3,068.

BARNESVILLE, Minn., city in Clay
County, in the Red River valley, 24 miles from
Moorhead, the county-seat, on the Great North-
ern Railroad. It has a flour mill, creamery,
cigar factory, post office and two banks with
aggregate resources of $865,000. The value of
the taxable property amounts to $331,357. The
city has a fine school building which cost $65-
000. The city owns the electric-light plant, the
waterworks and the telephone system. Pop.
1,550.

BARNESVILLE, Ohio, town in Belmont
County, on the B. & O. Railroad, 32 miles west
of Wheeling. It is the centre of an extensive
tobacco and fruit region and manufactures
glass, carwheels, cigars, bottles, shirts and over-
alls. It was settled in 1808, and was incor-
porated in 1836. The governor is elected in a
mayor, elected biennially, and a council. The
waterworks are owned and operated by the
city. It has a national bank, schools, churches
and several newspapers. Pop. 4,233.

—BARNET, or HIGH BARNET, England,
town in Hertfordshire, 11 miles from London.
Near the town is the site, marked by an obelisk,
of the famous battle, fought 14 April 1471,
between the Yorkists and Lancastrians, in
which the latter were routed, and their leader,
Warwick, "the king-maker," slain. Pop. 10,440.

BARNETT, John, English composer: b.
Bedford 1802; d. 16 April 1890. He was the
son of a Prussian named Bernhard Beer, who changed his name on settling in England as a jeweler. Barnett sang on the stage of the London Lyceum at the age of 11. His good voice led to his being given a musical education under various masters, and he soon began writing songs and lighter pieces for the stage. In 1834 he published a collection of 'Lyric Illustrations of The Modern Sylph' and was accorded a warm welcome when produced at the London Lyceum in 1834 as the first modern English opera. It was followed by another, 'Fair Rosamond' in 1837, which was not so successful. He was by 'Farissol' in 1839. He was long popular as a singing master at Cheltenham, and published 'Systems and Singing masters' (1842), and 'School for the Voice' (1844).

BARNETT, John Francis, English musician and composer. b. London, 16 Oct. 1797. He is a nephew of John Barnett. He studied at the Royal Academy of Music and at the Leipzig Conservatory. He performed the concert at D minor of Mendelssohn at the New Philharmonic Concert of 1852, played a Grand Concert at Leipzig in 1861 and at the London Philharmonic Society 1863. He came into notice as a composer with his symphony in A minor (1804) and followed this with a number of compositions for orchestra, strings or pianoforte. His cantata, 'The Ancient Mariner,' was produced at Birmingham in 1867, and 'Paradise and the Peri' in 1870. His most important work is the oratorio, 'The Raising of Lazarus,' produced at Hereford in 1876. Many other cantatas, pianoforte pieces, etc., were composed by him. He was professor at the Royal College of Music and the Guildhall School of Music, and examiner for the Associated Board.

BARNEVELD, N. Y. See Trenton, N. Y.

BARNEVELDT, bär-né-velt, Jan van Olden, Dutch statesman: b. 1549; d. 13 May 1619. He early showed himself zealous for the independence of the United Provinces, and as advocate-general of the province of Holland displayed profound views and great skill in business. He preserved his country against the ambitions of Leiden; penetrated the secret plans of Maurice of Nassau, whom his fellow-citizens had elevated to the post of stadtholder; and his marked distrust of this prince placed him at the head of the Republican party, which aimed to make the stadtholder subordinate to the legislative power. Spain at that time made proposals for peace through the archduke, governor of the Netherlands. Barneveldt was appointed plenipotentiary on this occasion, and evidenced alike the skill of a statesman and the firmness of a republican. Maurice of Nassau, whose interest led him to prefer war, labored to prevent the establishment of peace; and Barneveldt was induced only by the most urgent solicitations of the states to retain the office which had been assigned to him, concluding an armistice with Spain for the term of 12 years, in which the independence of Holland was acknowledged. His influence now became still greater, and he was more and more an object of jealousy to the house of Nassau. The spirit of the opposite parties in the state was further increased by theological difficulties. In order to prevent a civil war Barneveldt proposed an ecclesiastical council, which resolved upon a general toleration in respect to the points in question. The states assembled at first to this wise measure, but at a later period the Nassau party persuaded them to adopt other views. This party represented the Arminians as secret friends of Spain. Maurice insisted upon a general synod, with a vow, as he pretended, of putting an end to all religious quarrels; but Barneveldt persuaded the states to oppose this measure. Troops were now levied, without the consent of Maurice, to re-establish order in the cities where the Comarists had excited disturbances. On the other side, the Nassau party redoubled its attacks upon Barneveldt, who, in answer to them, published that celebrated memorial in which he warns the United Provinces of the danger which threatened them from the other party. Maurice, however, procured the assembling of a synod at Dort, in 1618, to which almost all the Calvinistic churches of Europe sent deputies. They condemned the Arminians with the most unjust severity, and Maurice was encouraged by their sentences to further measures. He caused Barneveldt and other leading men of the Arminians to be arrested; and 26 bribed judges condemned to death as a traitor the man to whom his country owed its political existence. The old man of 72 ascended the scaffold, and suffered death with the same firmness which he had evinced under all the circumstances of his life. His two sons formed a conspiracy against the tyrant; William escaped, but Reinier was taken and executed. His mother, after his condemnation, threw herself at the feet of Maurice to beg for mercy, and to his question why she humbled herself thus for the sake of her son when she had not done it for her husband, made the memorable reply: 'I did not ask pardon for my husband, because he was innocent; I ask it for my son, because he is guilty.' Consult Motley, 'John of Barneveldt' (1874).

BARNEY, Joshua, American naval officer: b. Baltimore, Md., 6 July 1759; d. 1 Dec. 1818. He was captured by the British in March 1778, but exchanged in August of the same year; was captured again and held a prisoner till he escaped in 1781. In April 1782, he took the British ship General Monk, off Cape May; in November 1782, he carried dispatches to Dr. Price in France, and brought back a sum of money lent by the French government. In 1794 he went with Monroe to France, and for six years served in the French navy. In 1814 he commanded the fleet stationed in Chesapeake Bay.

BARNFIELD, Richard, English poet: b. Norbury, Shropshire, 1574; d. 1627. His lyrics, 'As It Fell Upon a Day' and 'If Music and Sweet Poetry Agree,' were long ascribed to Shakespeare and were included in 'The Passionate Pilgrim' (1599). Barnfield's works include 'The Affectionate Shepherd' (1594); 'Cynthia, with Certain Sonnets and the Legend of Cassandra' (1595); 'The Encomium of Lady Pecunia' (1598).

BARNI, bär-né, Jules Romain, French scholar and critic: b. Lille, 1 June 1818; d. Mers, 4 July 1878. His efforts to propagate the Kantian philosophy through the medium of 'Observations on the Sense of the Sublime
and Beautiful' (1836); 'Foundations of Ethical Metaphysics' (1848), and 'Kantian Philosophy' (1850), earned him distinction; as did also, in another, but contiguous field, a 'History of Moral and Political Ideas in France in the Eighteenth Century' (1856).

**Barnsley, England**, town in the west riding of Yorkshire, 23 miles south by east of Leeds. It occupies the summits and slopes of two hills and is well built. Among the chief buildings are the public hall, built at a cost of over £25,000, and furnishing accommodations for various societies; the offices of the miners' association, the Beckett Hospital, the County Court, the offices of the Barnsley Banking Company, the parish church, Saint George's Church, the Congregational Church, a beautiful edifice and several other places of worship. Its staple industry is the manufacture of linen in a variety of forms, which is carried on to a great extent, both hand-loom and power-loom being used; linens are also printed here in a style similar to the cottons of Lancashire. There are numerous collieries in the neighborhood, among which the Oaks Colliery has been made memorable by several disastrous explosions. The town possesses a beautiful public park containing several monuments. It is on four railway lines and a canal, which facilitates its export of coal, mainly to Hull and London. A United States consul is stationed here.

**Barnstable, Mass.**, town, port of entry and county-seat of Barnstable County, 72 miles southeast of Boston, on the New York, New Haven & Hartford Railroad. Within its corporate limits are 12 villages, several of which, such as Hyannis, Osterville and Cotuit, are well-known summer resorts. The town has several public libraries and a State normal school. Farming, fishing and cranberry culture are the principal industries. The town is governed under the town meetings system. Pop. 5,000.

**Barnstable, England**, a town in Devonshire, 34 miles northwest from Exeter, on the right bank of the Taw, here crossed by a handsome bridge of 16 arches. It is locally styled Barum, and among its public edifices are a large 14th century church, a guildhall, and market buildings, the bridge buildings, Albert clock-tower, etc. Before the silting of the river Barnstaple was a seaport of some importance. Its manufactures consist chiefly of pottery, known as 'Barum ware,' lace, paper, furniture, toys, leather, gloves and collars; and ships and boats are built. The trade chiefly depends on the surrounding district. Barnstaple has existed since the reign of Athelstan in the 10th century, who built a castle here. It was incorporated in the reign of Henry I. Previous to 1885 the town returned two members to Parliament. Pop. 14,485.

**Barnum, Frances Courtenay (Baylor)**, American novelist; b. Fayetteville, Ark., 1848. She has written 'On Both Sides,' an international novel (1886); 'Behind the Blue Ridge'; 'The Pretender'; 'The Man of the Mountains'; 'Claudia Hyde' (1894); 'The Ladder of Fortune' (1899). She has also been a frequent contributor to magazines, and a writer of short stories. Since her marriage she has lived in Savannah, Ga.

**Barnum, Phineas Taylor**, American showman; b. Bethel, Conn., 5 July 1810; d. Bridgeport, 7 April 1891. He was the son of a tavern-keeper and in his boyhood displayed a remarkable propensity for practical jokes upon his father's customers, as well as a decided turn for trade. Having accumulated a small sum of money, he opened a little miscellaneous store. Here he was very successful, and, taking advantage of the mania for lotteries which then prevailed throughout the country, he visited New York and obtained an agency for their management. Returning to his store, he immediately entered into this business upon a large scale, established agencies in various cities and towns, and realized considerable sums from the immense sales of tickets which he thus enabled to make. The predominating trait in his character would not, however, permit him to settle down as a country storekeeper, and we soon hear of him as the editor of the 'Herald of Freedom,' published in Danbury, Conn. In this undertaking he was also very successful from a pecuniary point of view, but his freedom of speech and the boldness of his opinions soon gained him many enemies, and he was several times sued for libel, and once confined in prison for 60 days. In 1834 he removed with his family to New York, having become much reduced in circumstances. Here he tried many ways to obtain a livelihood, but without much success, until 1835, when hearing of Joice Heth, a colored woman, the reputed nurse of George Washington, he visited her owners, and becoming satisfied that here was an opportunity of retrieving his broken fortunes, he became her purchaser for the sum of $1,000, which he had obtained from various friends. By widely advertising this curiosity, considerable excitement was created, and the receipts soon amounted to $1,500 per week. This was Barnum's first attempt as a public showman, and finding the business profitable, he collected a small company and traveled through the country, realizing large sums wherever he halted. In 1836 Joice Heth died, and a post-mortem examination proved her to have been but 75 or 80 years old, instead of 161, which was her reputed age. From 1836 until 1839 Mr. Barnum continued in the exhibiting business, but was then obliged to return to New York, again reduced to poverty. He now barely subsisted by writing occasional articles for Sunday papers, and by petty jobs. In 1841, the establishment known as Scudder's American Museum was announced for sale, and with a boldness almost unparalleled in mercantile transactions, Mr. Barnum negotiated for its purchase; without owning a dollar, he made satisfactory arrangements with its holders and took possession. Here his fortune turned; at the end of a year he was able to pay all the obligations which he had entered into on account of the museum. In 1848 he had added to it two other extensive and valuable collections, beside several minor ones, and single curiosities without number. It now became the most popular place of amusement in the United States. In 1842 he heard of Charles S. Stratton, of Bridgeport, then 5 years old, less than 2 feet high and weighing only 16 pounds. The boy became known to the world as Gen. Tom Thumb, and was exhibited in the United States
with astonishing success until 1844, when Mr. Barnum sailed with him for England. Throughout Great Britain he was received with a popularity surpassing even that of America, and for half a year he received an average of $500 per day. Tom Thumb was presented to the royal families of England, France and Belgium, courted and caressed by the nobility and presented with costly gifts. In Coventry Barnum purchased the 'Happy Family,' a flock of birds and animals for which he paid $2,500. In 1847 he returned to America, where the "General" was again exhibited for a year with increased success, the receipts in the United States and Havana amounting to $150,000. Barnum conceived the idea of inducing Mile. Jenny Lind to visit America, and entered into an agreement with her, by which he engaged her to sing in America for 150 nights at $1,000 per night, the expenses of herself and troupe to be defrayed by him. Jenny Lind arrived in New York 1 Sept. 1850. The success upon this occasion has perhaps never been equalled in America. She gave her first concert at Castle Garden, and from that time until June 1851, gave 93 concerts, which were a succession of triumphs. The gross receipts for the whole amounted to over $700,000. The tickets were generally sold at auction, the highest price paid for one ticket being in Providence, R. I., namely, $650. He continued before the public with varying success until 1855, when having built himself an extensive villa at Bridgeport, Conn., he retired from business and published his life, giving a full account of the various enterprises in which he had been engaged. He also devoted much of his time to farming, and made many improvements in Bridgeport. Two museums of his were burned in 1865 and 1868, and in 1871 he established "The Greatest Show on Earth," a combination of traveling circus and menageries. He was defeated for Congress in 1866, but was four times a member of the Connecticut legislature. Besides his "Autobiography" (1854), he published "The Humbugs of the World" (1865), and "Struggles and Triumphs" (1869).

BARNWELL, Robert Woodward, American statesman: b. Beaufort, S. C., 10 Aug. 1801; d. 25 Nov. 1882. He was graduated from Harvard University in 1821; became a lawyer; was a member of Congress from South Carolina in 1829-33; a United States senator from that State, 1850-51; commissioner from South Carolina to confer with the Federal government regarding the proposed secession of the State in 1860; member of the Provisional Confederate Congress, 1861-62; a Confederate senator in 1862-66; and then president of the University of South Carolina (an office he had held in 1835-41) till 1873.

BARNWELL, Robert Woodward, American bishop of the Episcopal Church: b. Beaufort, S. C., 27 Dec. 1849; d. Selma, Ala., 24 July 1902. He prepared for the Episcopal ministry at the General Theological Seminary in New York, and was rector of Trinity Church, Demopolis, Ala., 1876-80; and of Saint Paul's, Selma, Ala., 1890-1900. In 1900 he was consecrated bishop of Alabama.

BAROCCI, bärôch'ë, or BAROCCIO, Federigo, Italian painter: b. Urbino, 1528; d. 1612. He received instruction from his father, who was a sculptor, and from Battista Franco. He visited Rome, where the genius of Raphael inspired him, and there he painted in fresco and fresco light, according to the manner of Correggio. He spent his life at Urbino, where he executed many paintings, several showing the influence of Correggio. Most of his work is preserved in the churches of Urbino, the most important being his 'Saint Sebastian' in the cathedral. On a second visit to Rome he was employed on the decorations of the Belvedere in the Vatican, where jealous rivals tried to poison him. He suffered from the effects of the poison during the rest of his life. His 'Burning of Troy' is in the Borghese Palace at Rome. Others are in the Vatican and in the Florentine galleries. His 'Christ Crucified,' now in the Genoa cathedral is considered his greatest work. Consult Krommes, R. H., 'Studien zu Federigo Barocci' (Leipzig 1912).

BAROCCO, or BAROQUE, technical term, chiefly applicable to architecture, and household decoration. The term is derived from the Spanish barroco, a large, irregularly-shaped pearl, and was for a time confined to the jeweler's craft. It indicates the more extravagant fashions of design that were common in the 17th and 18th centuries, chiefly in Italy and France, in which everything is fantastic, grotesque, florid or incongruous—irregular shapes, meaningless forms, and a lack of restraint and simplicity. The style may be said to have begun with Michelangelo, and was continued by Lorenzo Bernini, Carlo Maderno, Della Porta, Fontana, Longhena, Gallieli and others. The baroque later developed into the fantastic style of interior detail known as rococo. (See ARCHITECTURE, HISTORY OF.) Consult Gurlitt, 'Geschichte des Barockstiles in Italien' (Stuttgart 1887), and Ricci, 'Baroque Architecture and Sculpture in Italy' (London 1912).

BAROCHÉ, bä'rôsh', Pierre Jules, French statesman: b. Paris 1802; d. Jersey 1870. In 1847 he was elected member of the Chamber of Deputies for the department of Charente-Inférieure, where he steadily opposed the ministry of Guizot. He signed the Acte d'Accession, drawn up by Odiot in 1827, in which they were accused of violating the rights of citizens, and of systematic corruption. On 2 Dec. 1851, Baroche was nominated president of the Council of State, an office in which he exhibited much ability and tact, and subsequently filled the offices of Minister of Foreign Affairs (1860), and Minister of Justice (1863). He was made a senator in 1864.

BARODA, Hindustan, city in the province of Gujarot, capital of the native state of Baroda, 240 miles north of Bombay, on the left bank of the Vavamitra, here spanned by four stone bridges. The city proper is surrounded by a wall, outside of which are large suburbs. The houses in general are very mean, but there are several palaces, some handsome houses belonging to European inhabitants, government offices, a high school and numerous temples. Baroda, because of its importance as a railroad centre between the coast and the interior, has considerable trade in the produce of the surrounding districts, cotton, silk, flax, cotton and tobacco. The town has a

splendid modern system of waterworks since 1892, supplied from a distance of 18 miles by the artificial lake covering 4.71 square miles. Baroda is the residential home of the protected Maratata prince. Pop. (1911) 99,345. The state of Baroda, which has been tributary to Great Britain from 1802, has an area of 8,100 square miles and a population (1911) of 2,032,978.

BAROMETER (Greek, "weight-measure"), an instrument invented by the Italian physicist Torricelli, and used for determining the pressure of the atmosphere. (For an account of its early history see ATMOSPHERE). In its simplest form the mercurial barometer consists essentially of a vertical glass tube about a yard in length, closed at the top and open at the bottom, and partially filled with mercury, into a vessel of which its lower end also dips. In preparing the instrument for use, the tube is first completely filled with mercury; but as soon as it is free to do so the column of mercury in the tube sinks (leaving a vacant space at the top of the tube) until it stands at a height (usually about 30 inches) such that the pressure of the column exactly balances that of the atmosphere. A graduated scale of metal or glass is provided, by means of which the difference in level between the top of the column and the surface of the mercury in the open vessel (called the "cistern") at the bottom can be measured with precision. In the Fortin instrument (the design commonly adopted for all but the most refined work) the cistern is closed below by a piece of flexible leather, which can be raised or lowered by means of a screw, in order to bring the surface of the mercury in the cistern to a certain fixed level, before the reading is taken. A pointed index, k, preferably of ivory, projects downward into the cistern from the upper cover, the position of its tip, with respect to the scale on the barometer tube above, being known. The mercury in the cistern being first brought accurately into contact with the extremity of k, the position of the upper end of the barometric column is read from the scale. The "apparent" height of the barometer is then known; but in order to deduce the "true" height, certain corrections must be applied. The most important of these is the correction for temperature. The scale from which the height of the column is read is longer when the temperature is high than when the temperature is low; and the mercury in the column is also less dense at higher temperatures than at lower ones. These two sources of error partially compensate each other; for at a high temperature the reduced density of the mercury tends to make the column stand too high, while the greater length of the scale at such a temperature tends to make the reading too small. The compensation is not perfect, however, and when the coefficient of expansion of the scale is known, a table of temperature corrections is calculated, to reduce the direct reading to what it would have been if it had been taken at some fixed standard temperature. The temperature of melting ice is adopted, by universal consent, as the standard to which the "apparent" reading is to be reduced. Another important correction must be applied in order to allow for the variations of gravity with the latitude and elevation of the place of observation. Where gravity is relatively weak, a longer column of mercury will be required to balance a given atmospheric pressure than would be required to balance the same pressure in a region where gravity is stronger. All the barometric readings taken at the International Bureau of Weights and Measures, near Paris, are reduced to the values they would have if made at the level of the sea, in latitude 45°; and this practice is growing in favor among physicists generally. To reduce a barometric reading to sea-level and to latitude 45°, it is needed that of the barometer to multiply the observed height of the column (after applying the correction for temperature) by the expression \(1 - 0.00259 \cos \theta \) (1 - 0.0000006 \(H\)), where \(L\) is the latitude of the place of observation, and \(H\) is its height above the sea, in feet. Several secondary corrections have also to be considered, when great refinement is desired. Prominent among these is the correction for "capillarity," which is made necessary by the fact that the mercury does not stand as high in a small barometric tube as it does in a larger one, on account of the surface tension (q.v.) of the liquid. No simple formula for this correction can be given, and it varies somewhat according to the barometer is rising or falling at the time of the observation. Tables for finding the capillary correction are given in Guyot's meteorological and physical tables, published under the direction of the Smithsonian Institution at Washington. An excellent table is also given in Guillaume's "Thermométrie de Précision," where the elaborate precautions taken in filling the modern precision barometer are also described.

The barometer is a simple instrument, and of the greatest use in all meteorological work. The greatest fault of the mercurial instrument is the difficulty of transporting it without breakage and without destroying the vacuum in the upper part of the tube by the admission of air bubbles. Instruments like the Fortin type may be transported by screwing up the leather bottom until both the cistern and the tube are completely filled with mercury, then revising the barometer, and carrying it to its destination bottom side up. The aneroid barometer, although not nearly so accurate as the mercurial instrument, possesses the advantage of portability, since, as its name signifies, it does not contain any liquid; and it is therefore used to a considerable extent in the determination of the height of places above the sea. (See HYPSOMETRY). Various forms of the aneroid exist. One of these consists of a cylindrical metal box, exhausted of air, and having a lid of thin, corrugated metal. The lid, which is highly elastic, yields on every change of atmospheric pressure, and delicate multiplying levers transmit its motions to an index that
moves over a graduated scale, whose divisions are marked on the dial empirically, by comparison with a mercurial barometer. For further information concerning the barometer and its use, consult Stewart and Gee, 'Elementary Practical Physics'; Glazebrook and Shaw, 'Practical Physics'; Abbe, 'Meteorological Apparatus and Methods'; Guillaume, 'Thermométrie de Précision.' See also Meteorology.

BAROMETRIC LIGHT, a name sometimes given to the faint glow (first observed by J. Priestley in 1767) produced in the evacuated space of a mercurial barometer when the instrument is agitated. The light is given off by the mercurial vapor (or other highly attenuated gas) that is present, under the influence of the electricity generated by the friction of the mercury against the glass. Advantage has been taken of this phenomenon in the construction of "self-acting" Geissler tubes, the electricity required to excite them being generated, when they are inverted or shaken, by the friction of a fritip at the ends of the copper wire introduced before the exhaustion. No very brilliant results can be obtained in this way, however.

BAROMETZ. See CIBORIUM.

BARON, bārōn, Michel, or BOYRON, French comedian; b. 1653, and long attached to Molière's company. For nearly 30 years he played with great success, and retired from the stage in 1691 without any apparent reason. In 1717 he again returned, and was received with immense enthusiasm, playing, with great success, even the youthful parts. In 1729 he was taken ill while on the boards, and died shortly after.

BARON. In the feudal system of the Middle Ages, the immediate tenant of any superior was originally called his baron. In old records the citizens of London are so styled, and the members of the House of Commons, elected by the Cinque-Ports, were called barons. This title was introduced into England by William the Conqueror to signify an immediate vassal of the Crown, who had a seat and vote in the royal court and tribunals, and subsequently in the House of Peers. It was the second rank of nobility, until dukes and marquises were created and placed above the earls, and viscounts also set above the barons. It is now the lowest rank of the peerage, and is held by prescription, patent or tenure. The barons were anciently divided into greater barons, or such as held their lands of the king in capite; and lesser barons, such as held their lands of the greater barons by military service. In Germany the ancient barons of the empire were the immediate vassals of the Crown. They appeared in the imperial court and diet, and belonged to the high nobility. But these ancient feudalities were early elevated to the rank of counts or princes. A baron of the United Kingdom has the title of "right honorable lord," etc., and should be addressed as "my lord" or "your lordship." His wife claims also the title of "lady," and may be addressed as "madam," or "your ladyship." The coronation robes of a baron differ from those of the other peers in having but two rows of spots on the mantle; and the parliamentary robes, in having but two guards of white fur, with rows of gold lace. The right of wearing a coronet was first conferred on barons by Charles II. It is adorned with six pearls, set at equal distances, of which four are usually shown. Until the passing of the Judicial Act of 1873—under which it is the duty of the Courts of Judicature to determine in the Supreme Court of Judicature—certain judges in England or Ireland were called barons, the chief baron being president of the Court of Exchequer, the title is thus now extinct as applied to the judiciary.

BARONET, the lowest of the hereditary dignities in Great Britain and Ireland, originally instituted by James I, 22 May 1611. The first person to receive the honor was Sir Nicholas Bacon of Redgrave, whose successors in the title have ever since held the rank of premier baronet of the kingdom. Baronets are created by letters patent under the great seal, and the honor is generally given to the grantee and the heirs male of his body lawfully begotten, though sometimes it is entailed on collaterals and even to heirs female. The order was created nominally to assist in the plantation of Ulster—all baronets are thus entitled to bear on their coats of arms the "bloody hand" of Ulster—but really in order to raise money for the king, and each baronet, on his creation, was obliged to pay into the treasury a sum amounting to a little less than $5,500. According to the terms of its foundation this dignity could be conferred only on those who had the right by inheritance from at least a grandfather to wear coat-armor, and whose income from lands was not less than $5,000 per annum. In 1622 there were 200 baronets in England, this being the number to which the order was originally limited. Charles I and subsequent sovereigns disregarded altogether the original limitation of the number. Precedence is given to baronets before all knights, except those of the Garter, barristers created on the field and privy-councillors. An order of Baronets of Ireland was also instituted by James I, for the same purpose and with the same privileges as the baronets of England. Since the union, in 1801, none have been created otherwise than as baronets of the United Kingdom. Charles I instituted an order of baronets of Scotland and Nova Scotia in 1625 in accordance with the intentions of his father, James I, who had granted (1621) the territory of Acadia to Sir William Alexander, afterward Earl of Stirling, to be held by him as a feudal colony; the number was fixed at 150, and in 10 years 107 were created—34 baronies in what is now New Brunswick, 15 in Nova Scotia, 15 in Cape Breton, and 2 in Anticosti. The colony, theoretically a part of the kingdom of Scotland, was an entire failure, and the territory formally ceded to the French by the Treaty of Breda in 1667. Since the union of the parliaments in 1707 no new baronets specially connected with Scotland have been created.

BARONIUS, Caesar, Italian ecclesiastical historian; b. Sora 1538; d. 30 June 1607. He was educated at Naples; in 1557 went to Rome; was one of the first pupils of Saint Philip Neri, and member of the oratory founded by him; afterward cardinal and librarian of the Vatican Library. He owed these dignities to the services which he rendered the Church by his
edition of the Roman Martyrology, 'Ecclesiastical Annals,' in reply to the Protestant 'Magdeburg Centuries,' comprising valuable documents from the papal archives, on which he labored from the year 1580 until his death. They were continued, though with less power, by other writers, of whom Raynalduis takes the first rank. He has been called, after Eusebius, the Father of Ecclesiastical History.

BARONS' WAR—BARR

BARONS' WAR, the war carried on for several years by Simon de Montfort and other barons of Henry III against the King, beginning in 1263. See also MONTFORT, SIMON DE.

BARONY, the lordship or fee of a baron, either temporal or spiritual. Originally every peer of superior rank had also a barony annexed to his other titles. But now the rule is not universal. Baronies in their first creation emanated from the king. Baronies appertain also to bishops, as formerly to abbots, William de Conqueror having changed the spiritual tenure of frank-almoyn, or free alms, by which they held their lands under the Saxon government, to the Norman or feudal tenure by barony. It was in virtue of this that they obtained seats in the House of Lords. The word is commonly applied in Ireland to a subdivision of a county.

BAROSCOPE, an instrument for showing that bodies are supported by the buoyancy of air, in the same manner as they are by that of water, though in a much less degree.

BAROTSE, bā-rōt'se, a south African people inhabiting a region in the west of Rhodesia, extending from the Chobe River northward to the Kabompo. They are a branch of the Bechuanas who have migrated northward, and it would appear that they were long subject to a Basuto tribe called the Makololo. About 1860, however, they threw off the yoke of their oppressors and almost exterminated them, but they still speak the language of the Makololos. From 1890 King Lawanka acknowledged the virtual supremacy of Great Britain, and in 1898 the British South African Company obtained complete administrative powers. Their country, a treeless alluvial plain east of Barotsealand or northwestern Rhodesia, was amalgamated 4 May 1911 with northeastern Rhodesia under the title of northern Rhodesia. Area 290,000 square miles. Pop. 870,000, including 2,250 Europeans.

BAROUCHE, a four-wheeled carriage with a falling top. There are usually two inside seats in which four persons can sit.

BAREUSSIMETO, bār-e-us-sem'-i-tō, Venezuela, city, capital of the state of Lara; is situated in a high plain, on the Barquisimeto River. It was founded by the Spaniards in 1552. The town is well built, and has wide streets, and among its prominent buildings are the government palace, barracks, market and cathedral. It is the seat of a college and other educational institutions. It is the centre of a fertile agricultural district and, on account of its excellent transportation facilities, controls important commercial interests. Coffee of excellent quality is grown here, and with cocoa, sugar and rum, forms the principal article of trade. It was almost completely destroyed by the great earthquake of 1812 and suffered severely during the War of Independence and the later civil wars. From 1830 to 1881 it was the capital of the state of the same name.

BARR, Amelia Edith (Huddleston), American novelist; b. Ulverstone, Lancashire, 29 March 1831. Educated at the Glasgow High School, Scotland, she married Robert Barr in 1850. In 1854 the family moved to Texas and there, in 1867, her husband and three sons died of yellow fever at Galveston. Soon after this event she removed to New York where she began writing for the Christian Union and other magazines. Her first book, 'Romance and Reality' (1872) was the earliest of more than 60 volumes from her pen. She is the author of 'Jan Vedder's Wife' (1885); 'A Daughter of Fife' (1885); 'A Bow of Orange Ribbon' (1886); 'A Border Shepherdess' (1887); 'Friend Olivia' (1890); 'A Sister of Thau' (1891); 'Remember the Alamo' (1893); 'Prisoners of Conscience' (1897); 'A Poor Man's Other One' (1899); 'Trinity Bells' (1899); 'The Maid of Maiden Lane' (1909); 'The Lion's Whelp' (1901); 'Souls of Passage' (1901); 'Fleet of Clay' (1901); 'Bernicia' (1895); 'The Black Shilleys' (1903); 'The Belle of Bowling Green' (1904); 'Master of His Fate' (1901); 'The Song of a Single Note' (1902); 'Cecilia's Lovers' (1905); 'The Heart of Jessy Laurie' (1907); 'The Strawberry Handkerchief' (1908); 'The House on Cherry Street' (1909); 'The Hands of Compulsion' (1909); 'The Reconstructed Marriage' (1910); 'Sheila Vedder' (1911); 'A Maid of Old New York' (1911); 'All the Days of My Life' (1912); 'Playing with Fire' (1913); 'The Winning of Lucia' (1914); 'The Measure of a Man' (1915); Three Score and Ten' (1915), an autobiography; 'Joan' (1916); 'Christine: A Fife Fisher Girl' (1917).

BARR, James, Canadian author: b. Wallacetown, Ontario, 1862. He engaged in journalism in that province, the United States and in London; and under the pen-name of Angus Evan Abbott has contributed much to magazine literature. Among his separate publications are 'American Humorous Verse' (1891), and the American volume in the 'International Humorous Series' (1893), the last containing a biographical index of nearly 200 American and Canadian humorists, and several novels. He is a brother of the late Robert Barr (q.v.)

BARR, Robert, Scottish novelist: b. Glasgow, 16 Sept. 1850; d. 22 Oct. 1912. He spent his childhood in Canada, drifted into journalism and in 1876 joined the staff of Detroit Free Press, and wrote under the name of Luke Sharp. He went to Europe in 1881 and in 1892 founded The Idler with Jerome K. Jerome, but retired in 1895 to devote himself to fiction. He is author of 'In a Steamer Chair' (1892); 'In the Midst of Alarms' (1894); 'The Face and the Mask' (1895); 'One Day's Courtship' (1896); 'Clevervenes' (1896); 'Countess Tekla' (1899); 'The Unchanging East' (1900); 'The Victors' (1901); 'A Prince of Good Fellows' (1902);
The Tempestuous Petticoat (1905–12); 'Stranleigh's Millions' (1909); 'The Sword Maker' (1910); 'The Palace of Logs' (1912); 'The O'Ruddy,' with Stephen Crane (posthumous, 1913).

**BARRA,** a small Mandingo kingdom of western Africa, near the mouth of the Gambia, with an estimated population of 200,000, its men being remarkable for their fine proportions. The surface, which is fertile, but rather marshy, is well cultivated. The territory is a British protectorate. The English have built the port of Albreda on the south bank, from which considerable trade is carried on. The chief town is Barrinding, where the so-called king resides.

**BARRA,** Scotland, an island forming part of the Outer Hebrides, Inverness-shire, eight miles long and from two to five wide, and almost entirely composed of gneiss, which on the west coast forms huge rocky barriers. On these the Atlantic, beating with all its force, has hollowed out vast caves and fissures. In the Heather not merely the hollows and valleys, but many of the loftiest hills are clothed with fine pasture, on which large herds of cattle and flocks of sheep are reared. The coasts abound with fish, and the island forms a fishing centre of some importance. There are many standing stones and other antiquities. The inhabitants, about 2,500, all speak Gaelic. South of Barra is the islet of Berneray, with the highest lighthouse in Great Britain, 683 feet above high water and visible for 35 miles.

**BARRACAN,** strictly, a thick, strong fabric made in Persia and Armenia, of camel's hair, but the name has been applied to various wool, flax and cotton stuffs.

**BARRACK-ROOM BALLADS.** Mr. Kipling's 'Ballads and Barrack-Room Ballads' (1892) is on the whole a highly original as well as significant volume. Far surpassing his 'Departmental Ditties,' it established his fame as a poet, and contains, indeed, those of his poems which, with the 'Recessional' and a few others, have remained the greatest popular favorites. The collection is made of the Barrack-Room Ballads proper, most of which had already appeared in the *National Observer,* edited by W. E. Henley; of other poems which were reprinted from *Macmillan's Magazine, The Saint James' Gazette,* etc.; and of still others which now were printed for the first time. The 21 Barrack-Room Ballads proper bear somewhat the same relation to 'Soldiers Three' as is borne by 'The Departmental Ditties' to 'The Plain Tales from the Hills.' Written mainly in Cockney dialect, salted with slang and soldier-lingo, they voice the sentiments and experiences of 'Tommy' Atkins as he figures in various parts of the empire. Here the poet's magic has transfigured his material, and has added a new province to poetry. All are singing ballads, with catchy choruses and jingling refrains, combining the large-spectator effect. Their sentiment ranges through the rollicking fun of 'Oonets' and 'Fuzzy-Wuzzy,' the satire of 'Tommy,' the grim tragedy of 'Danny Deever,' and the romantic longing of 'Mandray.' These five, at least, have been sung throughout the English-speaking world.

The narrative ballads of the collection and the other poems in ordinary English are as a whole less successful. Though much of their subject matter is fresh, they often follow conventional and even outworn methods and styles. The Ballad of East and West, which avers that 'the East is East and the West is West and the never the two shall meet,' rather too strongly suggests Macaulay. The highly-mannered 'English Flag,' which asks 'What should they know of England who only England know?' is interesting as perhaps the last of Kipling's poems of imperial sentiment. The poetry of the engine-room, which this poet has since extensively cultivated, appears in the 'Clamperdown' and the 'Bolivar,' the latter truly excellent, and probably the best of the nine ballads. But more famous, perhaps, is 'Tomlinson,' a stinging satire, with its galaxys, comets and suns, its glimpses of heaven and hell, all of which teleological and astronomical accessories have since figured prominently in Mr. Kipling's verse. Yet, with all its limitations, 'Barrack-Room Ballads' is a brilliant, original and, on the whole, delightful volume, which cannot safely be neglected by any lover of poetry. Criticism has run the gamut from unbridled eulogy to hypercritical denunciation. Consult Richard LeGallienne, 'Rudyard Kipling,' Explanatory notes on the poems are given by Durand, 'Handbook to the Works of Rudyard Kipling' (pp. 26–92).

**MARION TUCKER.**

**BARRACKPUR,** bā-rāk-poor, India, a town and cantonment in Bengal, on the Hugli, 15 miles north of Calcutta and on the East Bengal Railway. In the vicinity is the suburban. residence of the Viceregal of India, within a park four miles in circuit. A Sepoy mutiny, the prelude to the great outbreak at Meerut in May, took place here in February 1857. A mutiny had previously taken place in 1824. Barrackpur is also known as North Barrackpur to distinguish it from South Barrackpur or Agartala, midway between it and Calcutta. It is the capital of a sub-district which was formed in 1904. Many inhabitants are employed in the mills, which are just outside the town. From the salubrity of its air Barrackpur is a favorite retreat for Europeans from Calcutta. Pop. 18,000.

**BARRACKS,** a name originally given to temporary accommodation for troops, but now designating permanent and commodious erections, in which troops are lodged. The introduction of barracks into England was opposed as dangerous to liberty, by estranging the soldier from the citizen, and fitting him to become a tool of despotism; but the billeting of soldiers upon citizens had grown to be so burdensome to communities that after the close of the 18th century every attempt was made at convenient stations all over the United Kingdom. Much improvement has been effected in the construction and arrangement of English barracks during the last half-century; and separate quarters are now provided for married soldiers. The construction and repair of barracks is part of the duty of the royal engineers; their equipment and allotment is entrusted to a barracks section of the army service corps. In the United States the term is officially used to designate important military posts, such as the Columbus Barracks, San
BARRACOON — BARRAS

Diego. Barracks, Washington Barracks and others.

BARRACOON, a negro barrack or slave depot, formerly plentiful on the coasts of Africa, Cuba and Brazil.

BARRACUDA, bär-ra-koo’dá, an oceanic fish of the family Sphyraenidae, of which about 20 species inhabit the warm seas of the whole world. All are elongate, pike-like fishes with long, pointed jaws filled with sharp teeth. They are often of large size, are powerful swimmers, active and voracious, and, like the bluefish, prey upon schools of smaller fishes. Several species occur on the American coasts. The great barracuda, or ‘pecuna’ (Sphyraena picuda), is common throughout the West Indies and northward to South Carolina, and reaches a length of six feet. It is the largest and most voracious of the genus, is as fierce as a shark and is sometimes dangerous to bathers. Other West Indian species are those called gua-guanche and picudilla. These are smaller, as is a third species also, which is common along the Atlantic coast of the United States. Two or three species are found on the Pacific coast from California southward. One of these (S. argentea) is a long and slender species, known as the California barracouta, and highly valued for food. It closely resembles the typical Ecuaduran S. spinifer, locally known as ‘speto’ and ‘sennett,’ and one of the important food fishes of the Mediterranean.

BARRAGE, Tir de (Fr.), curtain fire: in artillery attack against a position, as a trench, the enemy position is first ‘prepared,’ i.e., heavily bombarded. The cannon range is then extended to behind the trench, a curtain of fire preventing the survivors of the bombardment from retreating, and also preventing reinforcements from reaching them from the rear. Under cover of the barrage the attacker’s infantry is thrown forward to complete the capture of the position.

BARRAMUNDA, bär-ra-mun’dá, or BURNETT SALMON, names in Australia for a mud-fish (Ceratodus), remarkable as a survival of the very ancient group Dipnoi. See Lungfish.

BARRANDE, bâ-rând, Joachim, French geologist: b. Sangres in the department of Haute Loire, 11 Aug. 1799; d. Vienna, 5 Oct. 1883. His specialty was the Silurian formations in Bohemia, his writings including ‘Système silurien du centre de la Bohême’ (1852 and 1887); ‘Colonie dans le bassin silurien de la Bohème’ (1860); ‘Documents sur la faune primordiale et la Système Taconique en Amerique’ (1861); ‘Représentation de colonies de la Bohème dans le bassin silurien du nord-est de la France’ (1853); ‘Céphalopodes, études générales.’

BARRANQUILLA, bâ-rân-kâ’lyâ, Colombia, the chief fluvial port of Colombia and the capital of the department of Atlanticco, with its harbor at Puerto Colombia, sometimes called Savannah. Situated on the Magdalena River, near its mouth, and in lat. 10°1’, Baranquilla is connected with Puerto Colombia by railway. The climate is hot and damp; nevertheless it is a busy, well-built city, possessing a covered market, theatre, hospital, five churches, two banks, two large flour mills and sugar, chocolate and textile factories, etc. The town has electric light and tramways, telephone service and good water supply. Pop. 49,000.

BARRANTES Y MORENO, bâ-ra-n’tas’é-mô-ra’ño, Vincente, Spanish writer: b. Badajoz, 24 March 1829; d. Pozuelo (Madrid), 16 Oct. 1898. He first studied theology, but in 1848 settled in Madrid to pursue literature; held responsible government offices, and became a member of the Academy in 1872. Among his works are the stories, ‘Always Late’ (1851); ‘Juan de Padilla,’ ‘The Widow of Padilla,’ and a series of historical studies, dealing with local Philippine and Estremaduran topics.

BARRAS, bâ-râz, Paul François Jean Nicolas, Comte de, French statesman: b. Fox-Amphoux (Var), 30 June 1755; d. 29 Jan. 1829. When the Revolution broke out he immediately showed himself an opponent of the court and had a seat in the tiers état, while his brother was sitting among the nobility. He took part in the attacks upon the Bastille and the Tuileries, was elected a jurymen at the tribunal of Orleans, and in September a member of the national convention, where he voted for the death of Louis XVI. After the fall of Robespierre he established his reputation as a patriot, yet he was distasteful to Robespierre whom he suspected as a half-hearted revolutionary, and he resolved to involve him in the great proscription which he then meditated. This therefore joined those determined to overthrow Robespierre, and took an important part in the events of the 9th Thermidor (27 July 1794). He was entrusted with the chief command of the forces of his party, repelled the troops of Henriot, and made himself master of Robespierre. On 4 Feb. 1795 he was elected president of the convention. The 13th Vendémiaire (5 Oct. 1795), when the troops of the sections which favored the royal cause approached the convention, Barras for a second time received the chief command of the troops, and employed Bonaparte in the adoption of rigorous repressive measures. In his report he attributed the victory to this young general, and procured for him the chief command of the army of the interior. His important services promised him to the Directory. Barras soon perceived that Bonaparte would give a decisive superiority to him who should obtain an influence over him; and therefore he displaced Carnot from the War Department and took possession of it himself. This separated them, and Carnot for some time took part with the council, where a party had been formed to restrain the power of the Directory, and particularly that of Barras. The rupture could only terminate with the ruin of one of the parties: that of the council fell by the events of the 18th Fructidor (4 Sept. 1797), in which Barras took a leading part. He arranged the marriage of Bonaparte with the widow Beauharnais. From this time Barras governed absolutely until 13 June 1799, when Siéyès entered the Directory. Nevertheless Barras succeeded in preserving his seat, but he became a victim of the 18th Brumaire when Bonaparte overthrew Barras and declared the coup d’etat (9 Nov. 1799). He afterward retired to Brussels, where he lived for several years; but finally received permission to repair to the south of France. His memoirs (invaluable for the inner history of the Revolu-
tion) were published in French and English (1895–96).

BARRATRY, a law term applied to (1) the offense committed by the master of a vessel of embezzling or injuring goods committed to his charge for a voyage and against which insurance may be effected. Barratry has also been defined as an unlawful or fraudulent act, or very gross or culpable negligence, of the master or mariners of a vessel in violation of their duty as such, and directly prejudicial to the owner, and without his consent; (2) the offense of frequently exciting or stirring up law suits or quarrels among the neighbors or in society generally. An indictment for this offense must charge the offender with being a common barrator, and the proof must show at least three instances of offending. It must be distinguished from "maintenance"—the officious intermeddling with suits which do not concern the party, by lending personal or other assistance; and on the other hand from "champery" an illegal bargain made between one of the parties to a suit and a third party whereby it is agreed that the latter shall share in the proceeds of the act, in return for financial support in its pursuit. An attorney is not liable to indictment for maintaining another in a groundless action. In New York, and in some other States, barratry is defined to be the practice of exciting groundless judicial proceedings, and is a misdemeanor.

BARRE, bär, Antoine Joseph le Fèvre de la, French naval officer: b. about 1600; d. 4 May 1668. He was appointed Governor of Guiana in 1663, and retook Cayenne from the Dutch. In 1667 he learned the English in the Antilles, forcing them to raise the blockade of Saint Christopher. In 1668 he was appointed to the governorship of Canada, taking the place of the Count de Frontenac. He was, however, recalled in 1669, for having by his irresolution caused the failure of the expedition to treat with the savages.

BARRÉ, Isaac, British officer: b. Dublin 1726; d. London, 20 July 1802. He was wounded at Quebec, was beside Wolfe when he fell, and figures in West's picture of The Death of Wolfe. He entered Parliament in 1761, and held office successively under Lord Bute, Pitt, Rockingham and Lord Shelburne. In Pitt's second administration he exposed the corruptions of the ministry, was a strong opponent of Lord North's ministry and opposed the taxation of America. The town of Barre, Mass., was named in his honor.

BARRE, bär'ra, a group of Arawakan tribes dwelling along the upper Rio Negro in northwestern Brazil and the adjoining districts of Venezuela. They are extremely aggressive, and their language is extending rapidly throughout that region.

BARRE, bär're, Mass., town in Worcester County, on the Ware River and on the Boston and Maine and New York Central railroads, 21 miles northwest of Worcester. An institute for feeble-minded children, and the Stetson home for poor boys are established here, and there are cotton, woolen and straw factories, municipal waterworks, a library and museum. Barre was settled about 1775 and was named after Col. Isaac Barre (q.v.). Pop. 3,000.

BARRE, Vt., city in Washington County, on the Central Vermont, the Barre and Chelsea and the Montpelier & W. R. railroads, six miles southeast of Montpelier. Barre has a reputation as one of the most important seats of the granite industry in the United States, engaging 88 of the city's industrial establishments. It contains, besides granite quarries, several industrial plants connected therewith. The United States census of manufactures for 1914 recorded 110 industrial establishments of factory grade, employing 2,608 persons, of whom 2,357 were wage earners, receiving $1,904,000 in wages annually. The capital invested aggregated $2,598,000, and the value of the year's output was $4,292,000; of this, $2,956,000 was the value added by manufacture. There are also a national and two savings banks; a public library; opera house; Goddard Seminary, a home school for young men and women, with four courses of study; Spaulding High School; Burns Monument; daily and weekly newspapers. It was settled about 1788, organized as a town in 1793 and received a city charter in 1894, under which it was incorporated as a mayor elected annually and a city council. The waterworks and sewage system are owned and operated by the city. Pop. (1910) 10,734; (1914) 11,706.

BARREIRO, ba-rě'-rō, Juan Baptista Hernandez, Cuban lawyer: b. Havana about 1842. He acquired a liberal education, and amassed large wealth in the practice of his profession. He was professor of Roman law in the University of Havana for 30 years; and later became dean of the law faculty in the university. In February 1900, while serving as first assistant mayor of Havana, he was appointed a member of the new Cuban Civil Cabinet, and given the portfolio of public education.

BARREL, a hollow vessel made of staves, set on end, arranged around a circle, and bound together with hoops. By each stave being made wider in the middle and tapering a little toward the ends, the barrel is of larger diameter, or bulges, in the middle. The bevelled edges of the staves are brought together, and securely fastened close together, making a tight joint along their length. The ends are closed by circular heads, the edges made thin to fit into a groove cut to receive them near the ends of the staves, in which they are held fast by driving the hoops upon the swell of the barrel. The construction of the barrel is ingeniously adapted for combining great strength with lightness. It resists pressure from without by the arched arrangement of the staves; and the hoops secure it from the expansive force of gases often generated in its contents. Its form is the most convenient for transportation, admitting of the vessel being rolled or rapidly swung by hooks placed under the chine or ends of the staves. In the form of kegs, firkins, liquor casks, butts, hogsheds, etc., they are met with everywhere. Yet the Chinese, with all their ingenuity, it is said, have never made a barrel. Formerly barrels were constructed entirely by hand, the cooper shaving the staves with the draw knife, and shaping them by clamps. But machines are now applied to this purpose, by which the work is done much more expeditiously. See Cooperage.
BARREN GROUNDS — BARRETT

As a measure of capacity, the barrel is of variable dimensions, differing in size with the materials it is designed to hold. In wine measure the barrel must contain 31½ gallons. A barrel of beer in England is equal to 36% imperial gallons. In the United States a barrel of flour must contain 906 3/4 pounds, and a barrel of beef or pork, 200 pounds. The measure of capacity called barrel bulk is five cubic feet. Barrel is also used to express any thing long and hollow, as a gun-barrel. It is also applied to the chamber in a watch, about which the spring is coiled; and in anatomy, to the "cavity of the tympanum" of the ear.

BARREN GROUNDS, the name given to a large tract in the Northwest Territories of Canada, extending northward to the Arctic Ocean and southward to the Great Bear and Great Slave lakes and Hudson Bay. It consists largely of swamps, lakes and bar rock, and a comparatively small part of it is yet well known. The vegetation chiefly consists of dwarf birches and willows, mosses and lichens. The animals include musk-ox, beaver, polar bear, wolves, foxes, etc.

BARREN ISLAND, a volcanic island in the Andaman Sea, about lat. 12° 15' N.; long. 93° 34' E. Its diameter is about two miles, with submarine slopes plunging rapidly to a depth of more than 800 fathoms. There is an ancient crater over a mile in diameter, from the centre of which a newer cone rises to a height of 1,015 feet. The volcano was active in 1789 and 1893, but is now dormant. A small island near Coney Island, New York, is also known as Barren Island.

BARREN MEASURES, the name given to certain groups of strata associated with the coal measures, but which contain no workable deposits. In the United States there are two so-called barren stages, a lower intervening between the lower productive and the upper productive measures, and an upper lying at the base of the Permian System.

BARRÈS, Maurice, French novelist: b. Charmes-sur-Moselle, 1862. His earlier writing as exemplified in his "L'appel au soldat" (1900); "Un bonhomme libre" (1889); and "Le jardin de Bérénice" (1891), is more or less decadent in character, but his later work is much more forceful, and inculcates a healthful spirit of nationalism. "Les déracinés" (1897); "L'appel au soldat" (1900); "Leurs figures," (1902); "Au service de l'Allemagne" (1905); "Ce que j'ai vu à Rennes" (1904); "Le voyage de Sparte" (1906); "La maitresse servante" (1911); "En Italie" (1912); and, his autobiographical "Vingt-cinq années de vie littéraire" (1908) are among the best of his later writings. In 1889 he was elected as a Nationalist to the Chamber of Deputies. In 1906 he was re-elected and was also admitted to membership in the French Academy. "Consult Huneker, J. C.: 'Exists, a book of Supermen' (New York 1909).

BARRETT, Benjamin Fisk, American Swedenborgian clergyman: b. Dresden, Me., 1808; d. Germantown, Pa., 6 Aug. 1892. He was graduated from Bowdoin College in 1832, and held Swedenborgian pastorates in New York, Cincinnati and Philadelphia. He was a voluminous writer and industrious editor of books and periodicals relating to Sweden-borignism. Chief among them are 'Life of Swedenborg' (1841); 'Letters on the Divine Trinity' (1860; 4th ed., 1873); 'Catholicity of the New Church' (1863); 'Episcopalianism' (1871); 'New View of Hell' (1870; 5th ed., 1886); 'Swedenborg and Channing' (1878); 'Heaven Revealed' (1885).

BARRETT, Charles Simon, American agriculturist: b. Pike County, Ga., 28 Jan. 1866. He received a normal school education at Bowling Green, Ky., Lebanon, Ohio, and Valparaiso, Ind. He was engaged in general farming and teaching until 1903, when he began organizing farmers. In 1905 he was called to that position and was a resident of the Georgia Farmers' Union, and since then has been national president of the Farmers' Union, which has a membership of 2,500,000 in 31 States. He was a member of Roosevelt's Corry Life Commission and was appointed by Governor Hoke Smith to represent the State of Georgia at the first governors' conference held in Washington, D. C. He was appointed delegate to the International Agricultural Institute, Rome, and was also a resident of State, Bryan. He is editor of the National Field, the official organ of the National Farmers' Union. He is author of 'Mission, History and Times of the Farmers' Union' (1909).

BARRETT, George Hooker, American actor: b. Exeter, England, 9 June 1794; d. 5 Sept. 1860. He left England with his mother, an actress of some celebrity, and arrived at Boston in October 1796; he made his first appearance the same year in the part of Cora's child, in 'Pizarro,' at the age of two years. He commenced playing in New York in 1806, at the Park Theatre, in the part of "Young Norval," and became manager of the Bowery Theatre, New York, in 1826, in company with E. Gilbert. He afterward visited England, and in 1837 performed at Drury Lane Theatre, London, under the management of Alfred Bunn. He was also manager of the Tremont Theatre, Boston, and in 1847 opened the Broadway Theatre, New York, but he did not retire from the stage. His favorite characters were in genteel comedy, or, as he was called, comic, and low comedy with great success. From his elegance and stateliness he was known by the sobriquet of "Gentleman George."

BARRETT, John, American diplomat and internationalist: b. Grafton, Vt., 28 Nov. 1866. Attended Vermont Academy, Saxton's River, Vt.; Worcester (Mass.) Academy, and was graduated from Dartmouth College, Hanover, N. H., 1889, having in the meantime taken one year's course (1888), at Vanderbilt University, Nashville, Tenn. Professor of English, Hopkins' Academy, Oakland, Calif., 1889-90, and connected with newspapers such as the San Francisco, Seattle, Tacoma, and Portland, Ore., 1890-94. When assistant editor Evening Telegram, Portland, Ore., he was appointed United States Minister to Siam, 1894, where he settled the famous Creek case involving millions of dollars and interpretation of United States treaties in Asia, for which he was specially thanked by the President of the United States. He also made special official visits to Japan, Korea and China, but resigned as Minister in 1898 to go as special correspondent to the Philippines during the Spanish-American War. Appointed delegate United States Second Pan-
BARRETT — BARRICADE

American Conference, Mexico, 1901; Commissioner-General, Saint Louis Exposition, 1904-1905, 1912-1913; United States Minister to Argentina, 1903-1904; United States Minister to Panama, 1904-1905; United States Minister to Colombia, 1906. In 1907 he was elected by unanimous vote of 21 American Governments Director-General of the Pan-American Union (q.v.), the official international organization maintained in Washington by the American republics for the development of commerce, friendship and peace. He was elected first honorary member American Asiatic Society, New York, was founder of Pan-American Society of the United States, and has been given special degrees by universities in the United States and Latin America for work in behalf of Pan-Americanism. Is author of 'Admiral George Dewey' (1899); 'Pan-American Union—Peace, Friendship, Commerce' (1911); 'Panama Canal' (1913), also of books on Asiatic and Latin American subjects.

BARRETT, Lawrence, American actor: b. Paterson, N. J., 4 April 1838; d. 21 March 1891. He was born as Lawrence Stephen Bond, but he appears in 'The French Spy.' In 1856 he appeared as Sir Thomas Clifford in 'The Hunchback' at Chambers Street Theatre, New York, and in 1857 he supported Burton, Charlotte Cushman, Edwin Booth and other eminent actors. He served as a captain in the 28th Massachusetts Infantry in the early part of the Civil War. Later he acted at Philadelphia, Washington, and at Winter Garden, in New York, where he was engaged by Mr. Booth to play Othello to his Iago. In 1870 he became an associate manager of the Varieties Theatre in New Orleans, where for the first time he played the parts of Richelieu, Hamlet and Shylock. In 1864 he secured 'Rosedale' from Lester Wallack, and after appearing in its leading character at New Orleans, began his first tour as a star actor. In 1867 he played at Maguire's Opera House in San Francisco, and was then manager of the California Theatre till 1870. Late in 1870 he went with Mr. Booth, playing in the characters in Booth's Theatre. In 1871-72 he was manager of the New Varieties Theatre in New Orleans, and in December 1872 acted Cassius to Booth's Brutus in New York. During 1873-74 he made tours through the United States. In 1875 he appeared as Cassius in 'Julius Caesar,' in Booth's Theatre, and later as King Lear. He was the first actor to appear as Daniel Druce in the United States in Mr. Gilbert's play. In 1882 he brought out 'Francesca da Rimini' at the Chestnut Street Theatre in Philadelphia. In 1883 this play ran for nine weeks at the Star Theatre, in New York. In 1887 he began his first joint engagement with Edwin Booth in Buffalo. Mr. Barrett's last production of a new play was 'Guido Parani' by Oscar Wilde, brought out in 1890, at the Broadway Theatre, New York. His last appearance was on 18 March 1891, in the character of Adrian du Mauprat to the Richelieu of Mr. Booth. He wrote 'Life of Edwin Forrest'.

BARRETT, Sir William Fletcher, English scientist: b. Jamaica, West Indies, 10 Feb. 1844. He assisted Professor Tyndall at the Royal Institution, London, 1863-66, and was professor of experimental physics in the Royal College of Science, Dublin, 1873-1910. He was one of the United States Psychical Research, and is widely known for his original researches in magnetism and radiant heat. He has published 'Lessons in Science' (1880); 'Early Chapters in Science' (1899); 'A Monograph of the Geneke of the Pan-American Union (q.v.), the official international organization maintained in Washington by the American republics for the development of commerce, friendship and peace. He was elected first honorary member American Asiatic Society, New York, was founder of Pan-American Society of the United States, and has been given special degrees by universities in the United States and Latin America for work in behalf of Pan-Americanism. Is author of 'Admiral George Dewey' (1899); 'Pan-American Union—Peace, Friendship, Commerce' (1911); 'Panama Canal' (1913), also of books on Asiatic and Latin American subjects.

BARRETT, Lawrence, American actor: b. Paterson, N. J., 4 April 1838; d. 21 March 1891. He was born as Lawrence Stephen Bond, but he appears in 'The French Spy.' In 1856 he appeared as Sir Thomas Clifford in 'The Hunchback' at Chambers Street Theatre, New York, and in 1857 he supported Burton, Charlotte Cushman, Edwin Booth and other eminent actors. He served as a captain in the 28th Massachusetts Infantry in the early part of the Civil War. Later he acted at Philadelphia, Washington, and at Winter Garden, in New York, where he was engaged by Mr. Booth to play Othello to his Iago. In 1870 he became an associate manager of the Varieties Theatre in New Orleans, where for the first time he played the parts of Richelieu, Hamlet and Shylock. In 1864 he secured 'Rosedale' from Lester Wallack, and after appearing in its leading character at New Orleans, began his first tour as a star actor. In 1867 he played at Maguire's Opera House in San Francisco, and was then manager of the California Theatre till 1870. Late in 1870 he went with Mr. Booth, playing in the characters in Booth's Theatre. In 1871-72 he was manager of the New Varieties Theatre in New Orleans, and in December 1872 acted Cassius to Booth's Brutus in New York. During 1873-74 he made tours through the United States. In 1875 he appeared as Cassius in 'Julius Caesar,' in Booth's Theatre, and later as King Lear. He was the first actor to appear as Daniel Druce in the United States in Mr. Gilbert's play. In 1882 he brought out 'Francesca da Rimini' at the Chestnut Street Theatre in Philadelphia. In 1883 this play ran for nine weeks at the Star Theatre, in New York. In 1887 he began his first joint engagement with Edwin Booth in Buffalo. Mr. Barrett's last production of a new play was 'Guido Parani' by Oscar Wilde, brought out in 1890, at the Broadway Theatre, New York. His last appearance was on 18 March 1891, in the character of Adrian du Mauprat to the Richelieu of Mr. Booth. He wrote 'Life of Edwin Forrest'.

BARRETT, Sir William Fletcher, English scientist: b. Jamaica, West Indies, 10 Feb. 1844. He assisted Professor Tyndall at the Royal Institution, London, 1863-66, and was pro-
expulsion of the Bourbons from the throne of France, and the election of the citizen-King, Louis Philippe, during the three days which this revolution lasted, the number of barricades erected across the streets amounted to several thousands. They were formed of the most heterogeneous materials—overturned vehicles, trees, scaffolding-poles, piles of fencing-materials and street paving-stones; men, women and children taking part in their erection. In February 1848, the insurrection against Louis Philippe commenced with the erection of barricades; but the most celebrated and bloody barricade-fight was that between the populace and provisional government, which, commencing on the night of the 23 June 1848, lasted throughout the three following days, when the people had to surrender. The national losses by this fight were estimated at 30,000,000 francs; 16,000 persons were killed and wounded, and 8,000 taken prisoners. The Emperor Napoleon III so invaded and macadamized the principal streets of Paris after he ascended the throne as to render the successful erection of barricades next to impossible. There was a remarkable barricade-erection in London in 1821. The ministry desired that the body of Queen Caroline should be conveyed out of the country to Germany, for interment, without the populace having the opportunity of making any demonstration. On the matter becoming known, a vast barricade was erected at the point where the Hampstead road joins the new road; and as nothing but the use of artillery could have forced the way, the officer in charge of the funeral cortège deemed it prudent to change his course and pass through a more central part of the metropolis. During the revolutions of 1848, barricades were successfully carried in Paris, Berlin, Vienna and other places, by abandoning the attack in front and breaking through the houses of contiguous streets, taking their defenders in the rear.

BARRICADES, The Days of the, a phrase employed to denote popular Parisian revolts.

BARRIE, Sir James Matthew, British novelist and dramatist: b. Kirriemuir, Scotland, 9 Jan. 1860; d. Fairlands, near York, 21 Aug. 1937. He was graduated at Edinburgh University in 1882. His sketches and stories of country life in Scotland soon brought him to the attention of the British public and within a few years he was the recognized master in his field. He published 'Auld Licht Idylls' (1888); 'A Widow in Thrums' (1889); 'The Little White Bird' (1892); 'Sentimental Tommy' (1892). These four books assured the success attained earlier by his work in papers and periodicals and gained him a vast host of readers. He is unexcelled in his portrayal of Scottish peasant life, with its tricksy wit and overflowing with pathos and the author’s poetic fancy. Many others in like vein followed such as 'Miss Lady Nicotine' (1890); 'The Little Minister' (1891); 'Margaret Ogilvy' (1896); 'Tommy and Grizel' (1900); 'Peter Pan in Kensington Gardens' (1906); 'Peter and Wendy' (1911). In 1892 he won his first success in another field with his farce, 'Walker, Looker and Street', by many of which were based on his work in fiction. These include 'The Professor's Love Story' (1895); 'The Little Minister' (1897); 'The Wedding Guest' (1900); 'Qual-
BARRING-OUT — BARRIOS

Genoa in 1872. He took part in the campaigns of 1859 and 1866 (with Garibaldi in Tylor) and in the Roman expedition of 1867, and sat in the Chamber of Deputies in 1876-79. He was one of the most prolific writers of modern Italy, and among his numerous stories are 'Elm Tree and Ivy' (1868); 'The Vale of Olives' (1871); 'As in a Dream,' 'The Devil's Portrait' (1882); 'The Eleventh Commandment,' 'A Whimsical Wood.' He has published several volumes of criticism, among which may be named 'Il Rinnovamento Letterario Italiano' (1890).

BARRING-OUT, a practice once common in some English schools and rendered familiar to many from forming the subject of one of the tales in Miss Edgeworth's 'Parent Assistant.' It generally took place a few days before the holidays, when the boys barred the doors of the school and defied the masters from the windows. It was commonly understood that the pupils might dictate terms as to holidays for the ensuing year if they could prevent the masters' entrance for three successive days. The origin of the practice is not known; but its observance is enjoined in the statutes of Witton School, Cheshire, founded in 1588, by Sir John Dene.

BARRINGTON, Daines, English lawyer, antiquary and naturalist: b. 1727; d. 14 March 1800. After preparatory studies at Oxford and the Inner Temple, he was called to the bar. He was successively appointed a Welsh judge (1757), recorder of Bristol (1764) and second justice of Chester (1778-85). His publications were numerous, but his name is now best known as a correspondent of White of Selborne, whose famous letters on natural history he is said to have suggested. He was an eager, curious antiquary, uncritical and the subject of many hoaxes.

BARRINGTON, George, Irishman, noted author and thief, whose real name was Waldron: b. 1755; d. about 1840. His most notable act of thieving was the robbing of a Russian prince in Covent Garden Theatre. He took from him a gold snuff-box said to be worth £150,000; but, as the prince refused to prosecute, he was dismissed from trial. In 1790 he was sentenced to seven years' penal servitude at Botany Bay; but having given information of an intended mutiny of the other convicts on the voyage, at the end of two years he was discharged, on the first warrant of emancipation ever issued. He was made superintendent of convicts, and later high constable at Parramatta. He was a wit, and of some literary genius: one couplet in a prologue he wrote for Young's play 'Revenge,' produced by the convicts on the opening of the Sydney Theatre, remains an enduring classic:

"True patriots we; for be it understood,
We left our country for our country's good."

He wrote also 'Voyage to Botany Bay' (1801); 'History of New South Wales' (1802); 'History of New Holland,' i.e., Australia (1806).

BARRINGTON, John Shute, English lawyer and theologian: b. London 1678; d. Bockenham, Berkshire, 14 Dec. 1734. From 1715 to 1723 he was a member of the House of Commons and was created first Viscount Barrington in 1720. He was a disciple and friend of Locke, a friendship which is thought to have been brought about by the publication of his (Barrington's) work, 'The Interests of England,' etc. He was devoted to theology and wrote extensively in that science. His chief works have been collected under the title 'The Theological Works of the First Viscount Barrington.'

BARRIOS, bar-ryos, Gerardo, Central American statesman: b. about 1810; d. 1865. He became President of Salvador in 1860. During his administration, education, commerce and public works progressed remarkably, but his residential management being unusually liberal. He was deposed by Duenas as the outcome of the war with Guatemala, and, while endeavoring to bring about a revolution in order to become President again, was captured and executed.

BARRIOS, Justo Ruino, son of the foregoing, Guatemalan statesman, of Spanish-Indian blood: b. San Lorenzo, Guatemala, 17 July 1835; d. Chalchuapa, 2 April 1885. He was educated for the law, but the political punishment of his father led him to become a guerrilla revolutionist, and finally chief lieutenant of Garcia Granados, who had been imprisoned by President Vicente Cerna (the decisive battle being fought 29 June 1871) and became President, Barrios being commander-in-chief. The revolution was a democratic and anti-clerical one, and the new government began by expelling the Jesuits; to which Barrios added the suppression of religious orders during an acting presidency, and after he had, on 4 June 1873, succeeded Granados as President. There had been incessant returns of the reactionists, which on Barrio's accession he quelled once for all, establishing a system of terrorism and espionage which at least gave the country quiet and enabled him to carry out his wonderful reforms and improvements. He maintained internal peace and supremacy in Central America by a thorough system of militia drill for all but the pure-blooded Indians; keeping an army of some 30,000 men in constant reserve, with 3,000 to 4,000 in the capital, which he made one of the best ordered in America. He organized the postal and telegraphic service on the reports of men sent to examine the United States systems. He built the first telegraph and the first railroad in Guatemala, and started a line to the coast, compelling every citizen earning over $8 a month to hold stock in it; constructed street railway lines in the capital; improved the roads and built solid bridges. He remodeled the educational system, established collegiate institutes, normal and industrial schools, and made knowledge of French and English a condition of license to practise law or medicine. He built two modern penitentiaries. In a word, he transformed Guatemala into one of the most habitable and progressive countries south of the United States. But the foremost purpose of his life was to form Central America into one united state, for power and prosperity and the ending of the miserable wars that wasted its vitality. On 15 Jan. 1876 he assembled a diet from all the states of the Guatemala city to frame a plan of consolidation; but as it could not agree upon one, he therefore determined to set up governments in the other states favorable to his plans. Honduras was pressed by Barrios, for offered no difficulties, Salvador was too small to resist the
union of the two, and thenceforward till 1884, Barrios disposed of the resources of all three republics. On 1 March 1880, the first Constitution of Guatemala went into operation, and Barrios was re-elected for a six-year term. On 24 Feb. 1883 he issued a circular to the Liberal party, pledging himself to effect the unification only by peaceful means and with the consent of all the republics. In March 1884 he called a meeting of five delegates from each republic, but Costa Rica and Nicaragua still held back. On 29 Feb. 1884, he issued a decree proclaiming the union of the five states, relying on Honduras and Salvador to help him put down resistance in the others. But the President of Salvador refused to employ forces, and on Barrios persisting, joined Nicaragua and Costa Rica in a league to resist him, appealing to Mexico and the United States for help. President Diaz of Mexico remonstrated with Barrios, and the United States viewed the movement with disfavor; but on the Salvadoran troops, which expected Mexican help, invading Guatemala, Barrios drove them back into Salvador, and while entering Chalchuapa was struck down by a sharpshooter's bullet. His widow removed to New York, and his son became a cadet in the United States army.

BARRISTER, in England, an advocate or pleader, who has been admitted by one of the Inns of Court, namely, the Inner Temple, Middle Temple, Lincoln's Inn or Gray's Inn to plead at the bar. Before a student can be admitted to the bar he must have been a member of one of those societies and have kept 12 terms there by dining sufficiently often in the hall of the society to which he belongs, and must also pass a public examination. The examinations, and the bar, have dwindled into mere forms, have in recent years been made more stringent. Barristers are sometimes called utter or outer barristers, to distinguish them from queen's (or king's) counsel, who sit within the bar in the courts, and are distinguished by the robes, which are expensive and spoken of as counsel, as in the phrase "opinion of counsel," that is a written opinion obtained from a barrister before whom the facts of a case have been laid. The duties of a barrister are nominally honorary, and he can maintain no action for his fees. Yet there are few higher-paid professions than that of a successful barrister. It is the barristers who speak before all the higher courts, being instructed in regard to the facts of the case they have in hand by means of the brief which they receive from the solicitor engaging their services. In the United States there is no distinct order of counsel corresponding to the English barrister, the same person performing the duties of attorney, solicitor, counsel or advocate. See also Advocate.

BARRON, James, American naval officer: b. Virginia 1767; d. 21 April 1851. He entered the navy in 1798, and commanded the Chesapeake in 1807, when it was attacked by the British ship Leopard as a result of his refusal to follow the Chesapeake to be searched for deserters. The Chesapeake, which was quite unprepared, discharged one gun previous to striking her colors. She was captured and three alleged deserters were found. Barron was court-martialed for neglect of duty, though only partially to blame for the surrender of his vessel, and suspended for five years. The court closed its finding on the subject of the personal conduct of the accused, in the following language: "No transposition of the specifications, or any other modification of the charges themselves, would alter the opinion of the court as to the firmness and courage of the accused; the evidence on this point is clear and satisfactory." Such was the fate of Commodore Barron, but it is more than probable that under the same public feeling, demanding a victim, those who were really responsible for the inefficiency of the Chesapeake escaped unpunished. Upon his restoration, as the outcome of a long correspondence with his personal enemy, Commodore Decatur, a duel was fought and Decatur was killed. Barron became senior officer in the navy in 1839, though never again in active service and never regained full public esteem. See Chesapeake and Leopard.

BARRON, Samuel, American naval officer: b. Hampton, Va., 1763; d. 29 Oct. 1810. In 1805 he commanded a squadron of 10 vessels in the expedition against Tripoli. On his return to the United States he was appointed commander of the Gosport navy yard, but died immediately afterward.

BARROS, bär-röß, Arana Diego, Chilean scholar and historian: b. Santiago, 16 Aug. 1830. Ill-health obliging him to give up legal studies, he early devoted himself entirely to historical and literary pursuits, and soon became an authority on the history of his native country. The favor with which his historical sketch of the campaigns of 1818-21 was received encouraged him to begin an extensive 'History of Chilean Independence' (1854-58). He spent several years investigating the government archives and private libraries of South America and Europe in search of material bearing on the history of South America. In Simancas he discovered the manuscript of the 'Purén Indomito,' an historical poem on the Araucanian War, and published an edition of it at Leiden in 1860. His chief works in addition to the above are 'Vida y viajes de Hernando de Magallanes' (1864); 'Histoire de la guerre du Pacifique' (1881), written by order of the government; and his 'Historia general de Chile' (12 vols., 1884-93).

BARROS, João de, eminent Portuguese historian: b. Vizeu 1496; d. Pombal 1570. His first work, an historical romance, entitled the 'Emperor Clarimond,' appeared in 1520. Barros presented it to the King, who urged him to undertake the history of the Portuguese in India, which was issued 1552-62. King John III appointed Barros governor of the Portuguese settlements in Guinea, and afterward general agent for these colonies, in which capacities he proved a capable and clean administrator. In 1530 he presented Barros with the province of Maranham in Brazil for the purpose of colonization. Barros lost a great part of his fortune by the enterprise and returned the province to the King, who indemnified him for his losses. His work 'L'Aria Portuguesa,' is much admired for its style, erudition and orderly arrangement; but he lacked the critical faculty necessary to place personalities and events in their true perspective. He wrote besides a
moral dialogue, 'Rhopicancuma,' in which he shows the pernicious consequences of accommodating principles to circumstances; but this work was prohibited by the Inquisition; he also wrote a dialogue on false modesty, and a Portuguese grammar, the first ever published.

BARROSA, or BOROSA, Spain, a village near the southwest coast of Andalusia, 16 miles southeast of Cadiz. On a knoll to the east of it a battle was fought in 1811, in which the English under General Graham, when abandoned by the Spaniards, defeated a superior French force under Victor.

BARROT, ba-ro, Camille Hyacinthe Odilon, French statesman; b. Villefort, Lozére, 19 July 1791; d. Bougival, near Paris, 6 Aug. 1873. At 19 he pleaded before the ordinary tribunals, and at 23, by a special dispensation, before the Court of Cassation, Paris, and early acquired a high reputation for eloquence. In the political arena his oratory soon made him one of the most influential leaders of the liberal opposition. He became president of the 'Aide-toi' in 1830, and in the revolution of 1830, in that year was one of three commissioners appointed to conduct the deposed Charles X to Cherbourg, on his way to England. Returning, he was appointed prefect of the department of the Seine and member of the Council of State, but in a few months resigned his offices to lead the opposition to Casimir Périer and the reactionary ministers who followed him. He supported Thiers from his accession to office in March 1848, to his fall in December, when he returned to the opposition to the ministry of Guizot. He took a conspicuous part in the reform movement of 1847, and spoke eloquently at several of the provincial reform banquets which led to the revolution of February 1848. Made president by Thiers in his short-lived ministry, he advised the King to withdraw his troops and thus remove the last obstacle to the downfall of his throne. In the last sitting of the Chamber of Deputies he supported the claim of the Comte de Paris to the throne and the regency of the Duchess of Orleans. The February revolution considerably abated his ardor for public liberty. He held office for some time under the presidency of Louis Napoleon, but retired from active political life after the coup d'état, 2 Dec. 1851, and accepted no office under the Second Empire. In July 1872 he was made a councillor of state and vice-president of the council, 6 Aug. 1873. His 'Mémoires Posthumes' appeared at Paris (1875–76).

BARROW, or BARROWE, Henry, English ecclesiastical reformer, often considered as one of the founders of Congregationalism; d. 1593. He was a member of Gray's Inn, London, in 1576 and there became interested in the writings of Thomas Browne, the founder of the English Free Church. In 1592, on account of his advocacy of church reform he was imprisoned and with his coreformer, Greenwood, was hanged at Tyburn. He was the author of 'Brief Discourse of the False Church' (1590); See Dexter, 'Concilium of the Last Three Hundred Years' (1880); 'Dictionary of National Biography' (London 1885—).

BARROW, Isaac, English mathematician and theologian; b. London 1630; d. May 1677.

At the Charterhouse, where he was educated, he was chiefly remarkable for fighting and neglect of study, but being removed to a school at Felsted, in Essex, he began to show the earnest of his future great reputation. He was subsequently entered a pensioner of Trinity College, Cambridge, in 1643, of which he was chosen a scholar in 1647. Finding that opinions in church and state opposition prevailed, he proceeded some length in the study of anatomy, botany and chemistry, with a view to the medical profession. He, however, changed his mind, and to the study of divinity joined that of mathematics and astronomy. In 1652 he graduated M.A. at Oxford, and being disappointed in his endeavor to obtain the Greek professorship at Cambridge in 1654, engaged in a scheme of foreign travel. He set out in 1655, and during his absence his first work, an edition of Euclid's 'Elements,' was published at Cambridge. He visited France and Italy, where he embarked for Smyrna, and from Smyrna he proceeded to Constantinople, returning in 1659 by way of Germany and Holland, and the 17th revolution, and finally to Brownrigg. In 1660 he was elected Greek professor at the University of Cambridge; in 1662 professor of geometry in Gresham College; and in 1663 the Royal Society elected him a member of that body in the first choice after their incorporation. The same year he was appointed the first Lucasian professor of mathematics at Cambridge. In 1669, on a conscientious principle of duty, he determined to give up mathematics and adhere to divinity. Accordingly, after publishing his celebrated 'Lec- tiones Opticae,' he resigned his chair to the great Newton. In 1673 the King nominated him to the membership of Trinity College, observing that he had bestowed it on the best scholar in England. He had before this refused a living, given him with a view to secure his services as a tutor to the son of the gentleman who had it to bestow, because he deemed such a contract simoniacal; and he now, with similar conscientiousness, had a clause in his patent of master allowing him to marry erased, because incompatible with the intentions of the founder. In 1675 he was chosen vice-chancellor of the University of Cambridge; but the credit and utility expected from his labors were frustrated by his untimely death.

The works of Barrow, both mathematical and theological, are of the highest class. Of the former the following are the principal: 'Euclidis Elementa' (1655); 'Euclidis Data' (1657); 'Lectio Opticae' (1669); 'Lectio Geometrica' (1676); 'Archimedes Opera' (1675); 'Apollonii Conicorum, lib. iv.'; 'Theo- dosii Spherorum, lib. iii., novo methodo illustrata et succincte demonstrationis'; '1725; Lectio in qua Theorematum Archimedis de Spiralis et Cylindro per Methodum Indivisibilibus Investigata' (1678); 'Mathematicae Lectiones' (1683). All his English works are theological; they were left in manuscript, and published by Mr. Tiltenson (1685). 'Isaac Breviuscula' appeared in 1697. As a mathematician, especially in the higher geometry, Barrow was deemed inferior only to Newton; as a divine he was singularly distinguished for depth and copiousness of thought. A fine specimen of his characteristic copiousness is quoted by Addison from his sermon on 'Vain and Idle Talking'.
in which the various forms and guises of wit, —a faculty for which Dr. Barrow was himself celebrated,—are enumerated with a felicity of expression which might have made a voyage in a whaler to Greenland. He was subsequently employed as a teacher of mathematics in a school at Greenwich, and in that capacity attracted the attention of Sir George Staunton, who appointed him nominally comptroller of the household to Lord Macartney in his embassy to China in 1702, though his real employment was to take charge of the philosophical instruments carried out as presents to the Chinese Emperor. Of this journey he afterward published an account under the title of 'Travels in China' (1804). On Lord Macartney being appointed governor of the Cape of Good Hope in 1797, he made Mr. Barrow his private secretary; and on quitting the Cape in 1798 left him in general charge of public accounts. During his residence there he made several journeys into the interior of South Africa, and on his return to England published an account of them under the title of 'Travels in Southern Africa.' In 1804 Barrow was appointed second secretary to the admiralty which post, with a brief interval, he occupied continuously for 40 years. The duties of this post he discharged with the most exemplary industry and activity, and he took an ardent interest in promoting geographical and scientific discovery, and more especially the expeditions to the Arctic Seas. His leisure hours were employed in literary work, and the numerous volumes published by him attest the profitable use he made of his time. These include, in addition to the books of travel already mentioned, the 'Life of Earl Macartney'; 'Life of Lord Anson'; 'Life of Lord Howe'; 'Voyages of Discovery and Research within the Arctic Regions'; 'Autobiographical Memoir' (1847). In 1835 he was created a baronet. He organized the Geographical Society in 1830 and was its vice-president at the time of his death. Barrow Strait, Cape Barrow and Point Barrow, in the Arctic regions, were named in his honor.

BARROW, a navigable river of Ireland, province of Leinster. Its course is generally southward, and after about 900 miles it joins the Suir to form the estuary called Waterford Harbor. It is navigable for vessels of 200 tons to New Ross, 25 miles from the sea, and for barges to Athy in Kildare County, where it is joined by a branch of the Grand Canal.

BARROW, the name which was given to three prominent localities of the Arctic region, in honor of Sir John Barrow. (1) Point Barrow, on the north coast of Alaska, in lat. 71° 23' N., and long. 156° 31' W.; long considered as the most northerly spot on the American mainland. (2) Cape Barrow, on the coast of Canada, or Coronation Gulf, is in lat. 68° N., long. 111° W. (3) Barrow Strait, the earliest of PARRY's discoveries, leading to the west out of Lancaster Sound, which PARRY's immediate predecessor, Captain, afterward Sir JOHN, Ross, had pronounced to be landlocked in that direction. Besides its main course to Melville Sound, Barrow Strait throws off Prince Regent's Inlet to the south and Wellington Channel to the north. The strait is 50 miles in breadth, extending nearly along the parallel of 74° N., from 85° to 100° W.

BARROW, an artificial mound or tumulus of stones or earth, piled up over the remains of the dead. Such erections were frequently made in ancient times in a large hall and they are met with also in many other countries both in the Old and New World. In Scotland they are called cairns. When opened they are often found to contain stone cysts, calcined bones, etc. Burial in barrows, commencing amid the mists of remote antiquity, seems to have been practiced as late as the 8th century A.D. One of the finest barrows in the world is Silbury Hill, Wiltshire, near Marlborough. It is 170 feet in perpendicular height, 316 along the slope, and covers about five acres of ground. See also Mound Builders.

BARROW-IN-FURNESS, England, seaport, parliamentary and county borough, in the district of Furness, situated opposite to and including the island of Walney, Lancashire, 50 miles northwest of Liverpool. In the middle of the 19th century it was a fishing village with 300 inhabitants; in 1911 its population was 63,770. This extraordinary prosperity is due to the working of the rich mines of red hematite iron-ore which abound in the district, and to the extension of the railway to Barrow, by which its excellent natural position and capabilities of development as a seaport have been taken advantage of. There are now four docks completed, and the depth of water is sufficient to admit the largest ships at present afloat. Much timber is imported from the north of Europe and from Canada and Norway, large numbers of cattle are brought from Belfast, preserved provisions are brought from the United States, and an extensive trade is done in grain and flour. The iron-ore and pig-iron are largely shipped from the port. There is a large passenger traffic with the Isle of Man and Belfast. The chief industrial occupations are the manufacture of iron and Bessemer steel, ship-building, iron-founding, and the making of ropes, sails, bricks, and large jute works, paper-pulp works and salt works have been established. Barrow owes a great deal of its prosperity to the discovery of the Bessemer process of steel-making and to the fact that the hematite ores of the district are specially adapted to this process. Messrs. Vickars, Sons & Maxim, Limited, employ thousands of hands, and have built some of the largest merchant and war-vessels afloat. They also manufacture ordnance and armor plate. The town is laid out on a regular plan, mostly in rectangles, is substantially built and well drained and supplied with gas, water and electricity. It contains a free public library, workmen's institute and a town-hall, built at a cost of over £60,000. The Representation of the People Act of 1885 erected it into a parliamentary borough, returning one member. The interesting ruins of Furness Abbey, which was founded in 1127, lie within two miles of the town. Consult Richardson. "Furness, Past and Present" (1880).

BARROWS, David Prescott, American ethnologist and educator: b. Chicago, 27 June
1873. He was graduated at Pomona College, Claremont, Cal., in 1894, and later studied at the universities of California, Columbia and Chicago. He became superintendent of schools at Manila, P. I., in 1900, chief of the Bureau of New Testament Work in New York, 26 May 1895; d. 1909. After a varied early career he became private secretary to William H. Seward in 1867, went to Utah in 1870 with Chaplain Newman of the United States Senate, and reported the debate with treasured accuracy. He was graduated at Harvard Divinity School in 1875, and while an undergraduate accompanied as correspondent of the New York Tribune General Stanley's Yellowstone expedition in 1873, and General Custer's Black Hills expedition in 1874, taking part in the battle of the Big Horn. He was pastor of the First Unitarian Church, Dorchester, Mass., 1876-81; editor of the Christian Register (1881-97); secretary of the United States delegation to the International Prison Congress, Paris, 1895, and United States delegate to the International Prison Commission, 1896. In 1897 he was elected to Congress from the 10th Massachusetts district. He wrote 'The Doom of the Majority of Mankind' (1883); 'The Shaybacks in Camp' in collaboration with Isabel H. Barrows (1887); 'A Baptist Meeting House' (1885); 'Isles and Shrines of Greece' (1898).

BARBUNIA, bár-roon’dé-a, José Francisco, Central American statesman: b. Guatemala 1779; d. New York, 4 Aug. 1854. He was sentenced to death for treason in 1814, but escaped, and became leader of the Revolutionary party in 1819. In 1823-24, as a member of the Constitutional Convention of Central America, he brought forward the decree for the abolition of slavery. He became President of the Central American republic, retaining office for over a year, and in 1852 was again elected President. He came to the United States in 1854, as Minister from Honduras, to propose the annexation of that territory to the United States, but died suddenly before anything was accomplished.

BARRY, Alfred, English prelate: b. London, 15 Jan. 1826; d. 1 April 1910. He was a son of the architect Sir Charles Barry, and was educated at Cambridge. He was headmaster of Leeds grammar-school 1854-62; principal of Cheltenham College, 1862-68; and of King's College, London, 1868-83. He was canon of Worcester, 1871-81, of Westminster 1881-84. He became bishop of Sydney and primate of Australia in 1884, but resigned his see in 1889 and returning to England was rector of Saint James, Piccadilly, London, 1895-1900, and canon of Saint George's, Windsor, 1901-10. He has published 'Introduction to the Old Testament' (1856); 'Life of Sir C. Barry' (1867); 'Boyle Lectures' (1876-78); 'Christianity and Socialism' (1879); 'England's Mission' (1895); 'Hulsean Lectures' (1895); 'Do We Believe?' (1908). He was a brother of Sir John Wolfe-Barry.

BARRY, Sir Charles, distinguished English architect: b. London, 23 May 1795; d. 12 May 1860. At a very early age he displayed a taste for Oxford College, donning the gown of his youth exhibited at the Royal Academy. Having resolved to devote his energies to architecture, he employed the little means left him in
visiting Italy, Greece and the East. He left
England in 1817, and remained abroad upward
of three years. After his return he entered on
his professional career. He executed numerous
important buildings, such as the Travelers' and
Reform Club-houses, London; King Edward's
School, Birmingham, etc.; and in 1836 was
appointed architect of the new Houses of Par-
liament at Westminster. On this building his
name as an architect rests, and with its execu-
tion he was employed almost uninterruptedly
to the day of his death, extending over a period
of more than 24 years. In 1852 he received the
honour of knighthood. He had been admitted
a Royal Academician in 1841. As an architect
he belonged to the eclectic school, and adopted
indifferently the Gothic or classic styles ac-
 according as he might be required or circum-
stances rendered it expedient. Consult his
"Life and Works," by his son.

BARRY, Edward Middleton, English
architect, third son of Sir Charles Barry (q.v.);
b. 1824; d. 1886. He inherited from his father
himself in his profession, and succeeding to
his father's business, completed his great work,
the Houses of Parliament. He designed a
large number of buildings, many of them of
national importance, such as the Opera
Theatre, the opera house at Malta and the
New National Gallery in London. He was
elected a Royal Academician in 1869, and in
1873 succeeded Sir G. G. Scott as professor of
architecture in the Academy.

BARRY, Elizabeth, English actress: b.
1658; d. London, 7 Nov. 1713. She was said to
be the daughter of Colonel Barry, a prominent
royalist in the civil war. She made her debut
on the stage under the patronage of the Earl
of Rochester; and her first performance was
told to have been witnessed by Charles II and
the Duke and Duchess of York. Her reputa-
tion was won chiefly in the line of tragedy, in
the roles of Monimia in "The Orphan" and
Belifvedera in "Venice Preserved." She was
known as "the great Mrs. Barry," and is said
to have created over 100 roles. Consult Galt,
"Lives of the Players" (1831); and Baker,
"English Actors from Shakespeare to Macready"
(1879).

BARRY, James, Irish painter and writer
1806. By one of his first paintings in oil, "The
Conversion of Saint Patrick," exhibited at
Dublin, he attracted the attention of Burke,
who carried him, in his 23d year, to London.
The brothers Burke provided him with the
means for visiting Paris and Rome, whence he
got to Florence, Bologna and Naples. He
remained about four years in Italy, returning in
1770. Having exhibited some important pic-
tures he was elected an associate of the Royal
Academy in 1776, and a full Academician the
following year. In 1777-83 he executed his
chief work, the six paintings illustrating the
development of "Human Culture" which adorn
the great hall of the Society of Arts. In 1775
he published "An Inquiry into the Real or
Imaginary Obstructions to the Increase of the
Arts in England." He was appointed profes-
sor of painting in the Academy in 1782; but
in 1799, after he had alienated the respect of
his fellow-academicians by his peculiar man-
ners and by his savage attacks upon them, he
was expelled on the occasion of a violent pam-
phlet issued by him under the title of a "Let-
ter to the Society of Dilettanti." He was dis-
tinguished more by vigor of conception than
by accuracy of execution and his paintings
have not maintained their reputation.

BARRY, John, the first American com-
modore: b. Wexford, Ireland, 1745; d. Phila-
delphia, 13 Sept. 1803. He early displayed a great
partiality for the sea and at the age of 11
adopted America as his home and made a
number of voyages in merchant ships until the
commencement of the Revolution. He at once
embraced the cause of the colonies, offered his
services and was one of the first officers com-
missoned by Congress in the naval service.
After a successful cruise in the "Lexington," he
was transferred, in the latter part of 1776, to the
"Effingham," one of three large frigates built in
Philadelphia. When the American vessels
of war were lying near Whitehill, whither they
had been sent when the city and the forts of
the river had fallen into the hands of the
British, Commodore Barry conceived the dar-
ing plan of annoying the enemy by means of
small boats, properly armed, which being sta-
tioned down the river and bay might intercept
supplies and in case of danger take refuge in
the creeks. He accordingly manned the boats
of the frigates, descended the river with muf-
fled cars under cover of the night and ap-
peared unexpectedly before the city. He ef-
ected his object by intercepting a large consign
of provisions and capturing several vessels
laden with military munitions and valuable stores for the British officers. He was after-
ward transferred to the "Alliance," a frigate of
26 guns, which was placed under his orders.
The "Alliance" sailed from Boston 25 Dec. 1781
with the Marquis de la Fayette and Count
de Noailles on board, who were proceeding
to France on public business. During the
rest of the war Barry served with credit to
himself and benefit to his country and after the
cessation of hostilities was appointed to super-
intend the building of the frigate United States
in Philadelphia, which was designed for his
command. He retained the command of the
"United States" until she was laid up.

BARRY, John Arthur, Australian journal-
ist and novelist: b. Torquay, Devon, England,
1850; d. 23 Sept. 1911. He entered the British
merchant service at the age of 14; was in the
Australian gold fields in 1870 and later became
a stock drover in Queensland and New South
Wales. From 1877 to 1880 he returned to sea-
faring life; after which he began to write for
Australian, English, and American magazines
and newspapers while he carried on the busi-
ness of stock drover and manager. In 1898 he
joined the staff of the "Australian Country
Journal," which he left in 1900 to be
come editorial writer on the "Evening News.
Among his published works are "Steve Brown's
Bunyip" (1893); "In the Great Deep" (1895);
"The Luck of the Native Born" (1896); "The
Son of the Sea" (1899); "Against the Tides of
Fate" (1899); "Red Lion and Blue Star"
(1902); "Old and New Sydney" (1903); and
"Sea Yarns" (1910).

BARRY, John Daniel, American journalist
and author: b. Boston, 31 Dec. 1866. He was
graduated at Harvard University in 1888. Since
BARRY

graduation he has devoted himself to journalism, writing novels and plays and lecturing on social and literary subjects. He was for some time dramatic critic for Harper's Weekly and later for Collier's. He was appointed instructor in fiction and interpretation at the American Academy of Dramatic Arts and lecturer for the New York City Board of Education. He has written a daily essay for the San Francisco Bulletin since 1910. His published works include 'The Princess Margaret,' 'The Intrigues,' 'Mademoiselle Blanché,' 'A Daughter of Thespis,' 'The Congressman's Wife' (1903); 'Our Best Society' (1905); 'Intrusions,' essays; 'Outlands,' a volume of short stories (1914); 'The City of Domes,' an illustrated description of the Panama-Pacific Exposition (1915); 'Reactions,' a volume of essays (1915).

BARRY, Sir John Wolfe-Wolfe, English engineer of eminence, youngest son of Sir Charles Barry: b. London, 7 Dec. 1836. He built the present Blackfriars Bridge in London, the Tower Bridge, the Barry Dock at Cardiff, Immingham Dock, New Alexandria Docks, Newport, Natal Harbor, and planned the railways in Argentina from Buenos Aires to San Rosario. He has published 'Railway Appliances' (1876); 'Lectures on Railways and Locomotives' (1882); 'The Tower Bridge,' (1894); 'Barry Genealogy in England and Wales.'

BARRY, Martin, English physiologist: b. Fairton, Hampshire, 1802; d. Beccles, Suffolk, April 55. He studied at the medical schools of London and at several on the Continent and took his degree of M.D. in Edinburgh in 1833. He wrote much on physiological subjects and especially on animal development and embryology. In 1843 he made the discovery of the presence of spermatozoa within the ovum, which he communicated to the Royal Society. His means being ample, he gave his professional services largely to the poor.

BARRY, Spranger, Irish actor, the great rival of Garrick: b. Dublin 1719; d. London, 10 Jan. 1777. He was brought up as a silversmith, but was drawn to the stage. He first appeared (1744) at the Theatre Royal, Smock alley, Dublin; and in 1746 was engaged at Drury Lane, London, as alternate to Garrick in 'Hamlet' and 'Macbeth.' Having aroused Garrick's jealousy by his success as Romeo, he was engaged (1750) at Covent Garden, where his supremacy in 'Romeo and Juliet' was generally conceded. He spent 1754-66 trying to found a theatre at Dublin. In 1767 he reappeared at London in the part of Othello. From 1772 until his death he acted at Covent Garden. Consult Pollock, 'Actors and Actresses of Great Britain' (1886).

BARRY, Thomas Henry, American soldier: b. New York, 13 Oct. 1855. He was graduated at West Point, 1877, and passed through the various grades of the service to his appointment as brigadier-general, United States volunteers, 18 June 1900. From August 1898 to February 1900 he was adjutant-general of the 8th army corps in the Philippines and became chief of staff, division of the Philippines, 1900-01; brigadier-general, 1903; major-general, 1908; commanded in Cuba, 1907-09; and 1910-12 was superintendent of the United States Military Academy.

BARRY, William Farquhar, American military officer: b. New York, 18 Aug. 1818; d. 18 July 1879. He first saw active service in the Florida War (1852-53) and in the Mexican War acted as aide-de-camp to General Worth. At the outbreak of the Civil War he was made chief of artillery and organized the artillery of the Army of the Potomac. He subsequently became chief of artillery to Sherman and took part in the march to the sea. In 1865 he was brevetted major-general. In 1867 he had charge of the Artillery School at Fort Monroe. He was part author with J. G. Barnard of 'Engineer and Artillery Operations of the Army of the Potomac, 1861-62,' and of 'Tactics for the Field Artillery of the United States.'

BARRY, William Francis, English Catholic clergyman and author: b. London, 21 April 1849. From Oscott he passed to the English College at Rome, where he had Cardinals Franzelin and Tarquini for masters in divinity. He was ordained in Rome, where he witnessed the sittings of the Vatican Council and the entry of the Italian troops by the Piazza Pia. A vice-presidency of Birmingham Seminary was followed by his appointment to the chair of divinity at Oscott; later he was engaged in mission work at Wolverhampton and his subsequent charge at Dorchester gave him such leisure for literary labors as freed him from giving up to a parish talents that were meant for mankind. Dr. Barry has lectured in America and at the Royal Institution and was the deliverer of the Armitage lectures at Edmund Burke, both in Dublin and London, in 1897. His first novel, 'The New Antigone,' was published anonymously in 1887 and its success has since been repeated by 'The Place of Dreams,' 'The Two Standards,' and 'Ardent Massiter.' He contributed 'A History of the Papal Monarchy' to the 'Stories of the Nations' series, and has written studies of Newman and Renan. In 'Heralds of Reform' he has collected some of his essays: while the stage as it is. His works have been translated into various languages. He is, perhaps, the most brilliant Quarterly reviewer and Dublin reviewer of his generation. In 1907 he became canon of Birmingham and is now rector of Saint Peter's, Leamington.

BARRY, William Taylor, American statesman: b. Lunenburg, Va., 5 Feb. 1784; d. Liverpool, England, 30 Aug. 1835. He was graduated at William and Mary College (1803), and was soon after admitted to the bar. In 1810 he became a member of Congress from Kentucky. He served in the War of 1812; and from 1814-16 was United States senator from Kentucky. In 1828 he was appointed Postmaster-General under Jackson; and was on his way abroad as Minister to Spain at the time of his death. He was the first Postmaster-General who had a seat in the Cabinet.

BARRY, an urban district and seaport of south Wales, county of Glamorgan, on the British Channel, eight miles southwest of Cardiff. It has been practically brought into ex-
istence by the construction (1884-89) of a dock of 70 acres area here, between Barry Island and the mainland, at a cost of about 2850,000, the entrance being between two breakwaters respectively 2,600 and 700 feet in length. Barry possesses churches and chapels, market-place, public library, public institute, etc, and carries on a large export trade in coal. As a seaport it is markedly progressive. Pop. (1911) 33,763.

BARRY CORNWALL. See PROCTOR, BRYAN WALLER.

BARRY LYNDON. The Memoirs of 'Barry Lyndon,' which began in the January number, 1844, of Fraser's, is perhaps the most important of the works of Thackeray before the publication of the great masterpieces beginning with Vanity Fair, in 1847, which brought Thackeray his great renown. The theme of 'Barry Lyndon' is the adventures of a thorough scoundrel and blackguard, who readily adapts himself to a life of courtly and variegated rascality and finally ends in desultory gambling, from which it belongs to the class of which Fielding's Jonathan Wild is one of the best examples. Barry Lyndon, as the title implies, tells his own story and in whatever situation, whether breaking his wife's heart, gambling on a large or small scale, or engaging in any of his countless villainies, is always treating himself as if he were a gentleman and as if whatever he was doing were in the highest degree 'gentle.' The character is thoroughly well-sustained, from the point of view, throughout the large variety of adventures. In workmanship the novel, though comparatively short, is regarded as one of the most consistent and pointed stories that Thackeray ever wrote. Thackeray's chief motive is largely satirical. He probably had in mind certain stories, like 'Eugene Aram' and 'Paul Clifford' of Bulwer-Lytton, which, according to Thackeray's view, held up as heroic types really detestable characters. Barry is one of these pseudo-heroes far more villainous than most. Trollope's 'Life of Thackeray' (in the 'English Men of Letters Series') gives a short account of 'Barry Lyndon' among Thackeray's works.

WILLIAM T. BREWSTER.

BARRYMORE, Ethel (MRS. RUSSELL GROSVENOR COLT), American actress: b. Philadelphia, 15 A. 1879. She was educated at the Convent of Notre Dame, Philadelphia. She made her début in John Drew's company in 1896. She came into general notice in Clyde Fitch's 'Captain Jinks,' in 1898, played Friscilla in 'Secret Service,' London, where she appeared also in 'Cynthia' in 1904. She starred in 'A Doll's House' in 1905, and in Barrie's 'Alice-Sit-by-the-Fire' (1906), played Mrs. Jones in 'The Silver Box' in 1907, Zoe Blundell in 'Mid-Channel' in 1910, and Stella Dallas in 'The Witness for the Defense' in 1911. In 1912 she appeared in Barrie's 'The Twelve-Pound Look,' and in Chambers' 'Tante' in 1913.

BARRYMORE, Maurice (HERBERT BETHHE), American actor: b. India 1847; d. America, 1 March 1905. He was educated at Cambridge. Having gone upon the stage he came to America and made his first appearance in 1875. Since then he has been most of the time in this country, acting as leading man with Modjeska, Mrs. Langtry, Mrs. Bernard Beere and Olga Nethersole. He has also written several plays, among them 'Nadjeska.'

BARSA BABA, the son of Alpheus, brother of James the Less and of Jude, and one of the candidates nominated to the apostolic office left vacant by the treachery and suicide of Judas. According to tradition he was afterward appointed bishop of Eleutheropolis, a town of Palestine, about 20 miles from Jerusalem, and suffered martyrdom. Another Barsaba, surnamed Judas, and supposed to be the Barsab of the above, is mentioned in the Acts as one of the companions of Paul and Barnabas when they went to preach the gospel at Antioch. He is supposed to have returned to Jerusalem, and died at a very advanced age.

BARSUMA, or BARSUMAS, Nestorian bishop who flourished in the 5th century. He became bishop of Nisibis and metropolitan in 435. He established a theological school which sent out many missionaries, and is regarded as the founder of the Nestorian faith in Persia and eastern Asia.

BARTAS, bär-ta, Guillaume de Salluste du, French soldier, diplomatist, and man of letters: b. Montfort 1544; d. 1590 of wounds received at the battle of Ivry. His chief poem, 'The Divine Week,' gives an account of the creation, and is said to have had considerable influence on Milton's 'Paradise Lost.' Thirty editions of the work passed through the press in six years. Joshua Sylvester (1563-1618) translated into English 'Du Bartas, His Divine Weeks and Works' (1598). To be Anne Bradstreet, the earliest American woman of letters, was an ardent admirer of his strained pedantic style and modeled her own verse upon it.

BARTENSTEIN, bär-tën-stin, Treaty of, a treaty between Prussia and Russia against France, concluded at Bartenstein, Prussia, 26 April 1807, soon after the battle of Eylau. The objects of the alliance were to re-establish Prussia within the limits of 1805; to dissolve the Rhine Confederation; to restore Tyrol and Venice to Austria; to secure the co-operation of England and Sweden; to aggrandize France at the expense of France; to restore the House of Orange; and to obtain from France indemnities to the kings of Sardinia and Naples. The terms of this alliance are chiefly important for their similarity to the terms offered Napoleon at Prague (1813). The town of Bartenstein is situated in east Prussia, on the Alle, 35 miles south of Königsberg. There are manufactures of stoves and wagons, machine shops, iron foundries, breweries and saw mills, and considerable trade in grain. Pop. (1910) 7,343.

BARTER, a term used in commerce and political economy to express the exchange of one commodity for another, as contrasted with the sale of commodities for money. It is simply a primitive form of exchange carried on in countries in which the use of money has not yet been introduced, or is not prevalent. It was an economic stage through which all communities must have passed. Even yet in many rude countries barter is very common; and European travelers find it convenient to take with them weapons, tools and ornaments to exchange with the natives for their commodities. In civ-
BARTFELD — BARTH

In law, barter, or exchange, as it is now more generally called in law books, is a contract for transferring property, the consideration being some other commodity; or it may be described as a contract for the exchange of two subjects or commodities. It thus differs from sale, which is a contract for the transfer of property in consideration of a price in money. See also SALES.

BARTFELD, bar't-fel'd, Hungary, a town 156 miles northeast of Budapest, on a rising ground near the banks of the Tepla and Lauka. It is one of the oldest towns in Hungary, and is well built; has several Roman Catholic churches, a Lutheran church and school, a Frisian seminar, a university, a academy, hospital, theatre, paper-mills, potteries, etc. Some acidulous chalybeate springs and baths, near the town, are much frequented. The trade in wine, hemp, linen cloth and woolen yarn is considerable. Pop. 6,689, mostly Slovaks.

BARTH, Heinrich, distinguished geographer and traveler; b. Hamburg, 16 Feb. 1821; d. 25 Nov. 1865. He received his education partly in his native town and partly at the University of Berlin, and having determined to explore all the countries bordering on the Mediterranean, set out with this intention in the beginning of 1845. After his return in the end of 1847 he wrote an account of his travels, which he published with the title: 'Wanderungen durch die Küstenländer des Mittelmeeres' (1849). In less than two years after his return from his first travels he was invited by the English government to join Dr. Overweg in accompanying the expedition that was about to proceed under James Richardson to central Africa. The expedition having landed at Tripoli in the end of 1849, set out thence for the interior of Africa in February 1850. His explorations, which extended over an area of about 2,000,000 square miles, from Tripoli in the north to Adamawa in the south, and from Bagirmi in the east to Timbuctoo in the west, an area hitherto almost entirely unknown, were continued for more than five years, in spite of the death both of Richardson and Overweg, and he did not return to Tripoli till the autumn of 1855. The chief geographical results of these travels consist in the light they throw on the true nature of the Desert of Sahara, in showing that the eastern upper branch of the Niger, the Bemuwe, is not connected with Lake Chad, and in the information of the course of the Niger between Say and Timbuctoo. The result of those travels, entitled 'Travels and Discoveries in North and Central Africa,' was published in English (1857-8). Immediately after its publication he set out upon a new series of travels through Greece, Turkey, Asia Minor and other countries bordering on the Mediterranean, the last of which occupied the summer of 1865. Besides the works mentioned, he published 'Sammlung und Verarbeitung Central-afrikanischer Nachrichten' (1862-66); 'Reise von Tripoli nach Timbuctoo, en 20. Oct. 1651; d. there, 27 April 1702. He was the son of a fisherman, and at an early age evinced a love of adventure, which led him to follow the sea. He entered the Dutch navy, but on the outbreak of the war between France and Holland, 1672, he entered the service of France, and commanded a priva-

teer. In this position opportunities soon occurred for distinguishing himself, and his name became known to Louis XIV, who commissioned him to cruise in the Mediterranean. His bravery soon raised him in the favor of the King, and he was appointed captain of the squadron in 1697. On one occasion, a famine existing in France, Barth recaptured from the Dutch 100 sail of vessels, loaded with grain. At another time when Dunkirk was blockaded, taking advantage of a fog, he sailed through the Dutch and captured 48 merchantmen; then making a descent near New-

castle, Northumberland, he destroyed 200 houses, and returned safely with property valued at 500,000 crowns. He was on one occasion made prisoner by a superior English force, and taken to Plymouth, but succeeded in escaping in a fishing boat. Barth was rough in manners, and entirely uneducated; indeed, he could with difficulty scrawl his own name; but he was as simple-minded and honest as he was brave. A statue to his memory, by David d'Angers, was erected at Dunkirk in 1845. See Badin, 'Jean Bart' (1867); Landelle, 'Jean Bart et son fils' (1874).

BARTH, Paul, German sociologist; b. Baruth, Silesia, 1 Aug. 1858. He is a professor in the University of Leipzig and in addition to his much-valued work 'Zur Geschichte des Wissenschaftssystems, der Geschichtswissenschaft und der Geschichtsphilosophie' (1859), the first volume of which was published in 1897, is the author of 'Geschichtswissenschaft und die Hegelianer bis auf Marx und Unitarian' (1880); 'Beweisgründe des sicheren Handelns' (1899); 'Tiberius Gracchus' (24 ed., 1893); 'Erziehungs- und Unterrichtslehre' (1906); 'Geschichte der Erziehung in Soziologischer und geistesgeschichtlicher Beleuchtung' (1911).

BARTH, Theodor, German journalist and politician; b. Duderstadt 1844; d. 1909. He studied law at the universities of Heidelberg, Leipzig and Berlin, and in 1871 established his practice at Bremen. He was mayor of Bremen in Bremerhaven for four years and afterward until 1883 was secretary of the Chamber of Commerce in that city. He was elected to the Reichstag as Liberal Unionist member from Haffa in 1881 and later represented other districts until 1898. He founded 'Die Nation' in Berlin in 1883 and remained its editor until it ceased publication in 1907. He was an advocate of free trade and opposed the protectionist policy of Bismarck and the Junkers. In 1898 he joined the Deutschnational party and became a member of the Landtag. He was again in the Reichstag in 1901-03, and was again an opponent of the reactionists in German politics. He visited the United States in 1907. He published 'Gegen den Staats-sozialismus' (1862-66); 'Amerikanisches Wirtschaftsleben' (1887); 'Amerikanische Eindrücke' (1896).

BARTH, Germany, a seaport in the province of Pomerania, Prussia, northwest of Stralsund. Its chief industries are shipbuilding, fishing, curing and packing, beer brewing, and sugar,
leather and cigar manufactories. There are also iron foundries, machine works and saw mills. It has a fine harbor and contains a school of navigation and a home for spinners of high rank, and it has also a good trade in grain and wool. Its church dates from the 13th century.

BARTHÉLEMY, Melchior, German sculptor: b. Dresden 1625; d. 1672. He studied under his father and under Johann Boehme. He spent many years in Italy, including 17 in Venice, and on his return to Dresden was made court sculptor. His chief works are the tomb of the Doge, Giovanni Pesaro in Santa Maria dei Frari, Venice; the statue of John the Baptist in the Oratory of Santa Maria, Nazareth, and a tomb in the church of SS. Giovanni e Paolo, Venice. There are numerous ivory carvings by him in the Green Vault at Dresden, which are regarded as superior to his larger works.

BARTHÉLEMY, bár-tā’l-me, Auguste Marseille, French poet and politician: b. Marseille 1799; d. there, 1867. Educated at the Jesuit College of Juilly, he went to Paris in 1822, and soon made himself famous by a series of vigorous and pointed political satires in verse, directed against the Bourbons, and full of satirical regrets for the glories of the empire. In ‘Napoleon in Egypt’ (1828), and still more in his elegy for Napoleon’s son, ‘The Son of the Man’ (1829), he spoke out his imperialism more boldly, and the publication of the latter poem occasioned his imprisonment on the eve of the revolution of July. His libelation was, of course, immediate; and with his friend Mery, he celebrated the victory of the people in a poem dedicated to the Parisians, entitled ‘The Insurrection.’ During all the changes which followed, Barthélemy was indefatigable as a brilliant versifier on the political events of the day; though in his later years his popularity somewhat declined. He was from the first a warm supporter of the second Napoleonic régime. Some of his sayings are memorable, as the oft-quoted ‘L’homme absurde est celui qui ne change jamais.’ He died in Marseille, of which city he was librarian.

BARTHÉLEMY, François, Marquis de, French diplomatist: b. Aubagne (Provence), 20 Oct. 1747; d. Paris, 3 April 1830. He was brought up by his uncle, the author of ‘Anacharsis,’ and the protection of the Duke of Choiseul established him in diplomacy. The Revolution did not hinder his success in life; in 1793 he was Minister plenipotentiary to Switzerland. He successively negotiated the Peace of Basel with Prussia, Spain and the Elector of Hesse, the first treaties concluded by the French republic. This won for him an enviable reputation; but he was especially popular among the ‘Citizen’ or Royalist party, by which he was, in 1797, elected member of the Directory consequently on the Republican coup d’etat of the 18th Fructidor he was ejected from the government, arrested and transported with Pêcheux and Rameau to Guiana, whence he escaped. He took office again, and was sent to America, and the next year he was in England, and after the 18th Brumaire was recalled by the First Consul, who made him a senator. On the establishment of the empire he received the title of count and showed great devotion to Napoleon during the course of his proscriptions. He was Baron de Barthélémy sided at once with his enemies. He was made Minister of State and a marquis by Louis XVIII, and in 1819 proposed the restriction of the electoral franchise. Consult his ‘Papiers’ (ed. by Kaulek, 4 vols., Paris 1886-88).

BARTHÉLEMY, Jean Jacques, French antiquarian: b. Cassis, near Marseilles, 20 Jan. 1716; d. 30 April 1795. He received a good education from the fathers of the oratory at Marseilles, and was about to prepare himself, under the Jesuits, for holy orders, but becoming disgusted with his teachers declined all offers of clerical promotion, and only accepted the title of abbé in order to show that he belonged to this class. He became deeply interested in the study of Oriental languages and antiquities, and his indefatigable industry and acuteness soon enabled him to communicate to the learned new discoveries in this Oriental study, among which the ‘Alphabet of Palmyra,’ published 1754, holds a principal place. In 1747 he was chosen member of the Academy of Inscriptions at Paris. About this time he became acquainted with the Count Stanislas (afterwards the Count Choiseul), who was on the point of departing as Ambassador for Rome, and who invited Barthélemy to accompany him. Having been appointed director of the Cabinet of Medals in 1753, he accepted the offer and went, in 1754, to Rome. He traveled through Italy, collected antiquities, and occupied himself after his return with learned works and with the arrangement of the cabinet which had been entrusted to his care, and to which he added a great number of costly and rare medals. Among his works none are so distinguished for learning and beauty of description as the ‘Travels of the Younger Anacharsis in Greece,’ on which he had labored 30 years, and which was translated into English, German and other languages. He himself was modest enough to call this an unwieldy compilation, but all the learned men of France and foreign countries received it with the greatest enthusiasm. Barthélemy in his advanced age resolved to compose a complete catalogue of the Royal Cabinet of Medals, but was interrupted in 1788 by the storms of the Revolution. In 1789 he received a place in the Académie Française. In 1793 he was arrested on a charge of aristocratic leanings, but was set at liberty. When the chief librarian of the National Library, the notorious Carra, was executed, 31 Oct. 1793, Barthélemy received the offer of his place but declined it.

BARTHÉLEMY-SAINT-HILAIRE, Jules, French politician and philosopher: b. Paris, 19 Aug. 1803; d. there, 24 Nov. 1885. On completing his studies he received an appointment in the Ministry of Finance, being at that time also on the staff of Le Globe newspaper. After the revolution of 1830 he founded a journal called Rue de Sèze, and continued to support the Liberal party in the press. In 1834 he became examiner in French literature at the École Polytechnique, and four years later he was appointed to the chair of Greek and Latin philosophy in the Collège de France, which he held till his death. He played a part on the side of the Moderate party in the revolution of 1848, and was elected to the Constituent Assembly for Seine-et-Oise. The coup d’etat of December 1852 caused him to forsake political life for a considerable time and to resign his professorship. Retirement he emerged in 1869, the year of his
election as deputy for the first circumcision of Seine-et-Oise. He was shortly afterward sent to the National Assembly as the representative of that department, and during the disastrous times of 1870–71 he was closely associated with M. Thiers. In 1875 he became a life senator, and in the Cabinet of M. Jules Ferry, constituted 1881, he was a Foreign Minister of Foreign Affairs. The chief event of his tenure of this office was the occupation of Tunis. In 1881 he again abandoned public life for study and literary work. His greatest work is his complete French version of Aristotle (1837–92).

BARTHEZ, bár-tás, Paul Joseph, distinguished French physician: b. Montpellier, 11 Dec. 1734; d. 15 Oct. 1806. He was the founder of a medical school at Montpellier which acquired a reputation throughout all Europe. Later he received high honors at the hands of Napoleon. Among his numerous writings may be specially mentioned the ‘Nouvelle Mécanique des Mouvemens de l'Homme et des Animaux.’

BARTHOLDI, bár-töldé, Frédéric Auguste, distinguished French sculptor: b. Colmar, Alsace, 2 April 1834; d. Paris, 4 Oct. 1904. While a student in painting under the celebrated Ary Scheffer, he showed a greater bent and aptitude for sculpture, and devoted his energies to this branch of art, exhibiting numerous works at the salons. After the Franco-German War of 1870–71, in which he fought on the staff of Garibaldi, he came into prominence by the gigantic ‘Lion of Belfort’ carved out of the red rock on the hill which towers over the Alsatian city and commemorates its celebrated siege and defense. His statue of ‘Lafayette Arriving in America,’ now in Union Square, New York city, was presented to the metropolis by France as a mark of gratitude to Americans for sympathy and service during the Franco-German War. During the days of the Commune, when unable to pursue his studio work in Paris, Bartholdi visited the United States, and when arriving in the beautiful harbor of New York conceived the idea of the colossal statue of ‘Liberty Enlightening the World,’ erected on one of the islands of the harbor to welcome with its flaming torch all arrivals in the Land of Liberty. On his return to France he set to work, and a body of distinguished Frenchmen formed a society to carry out his project. Bartholdi gave 20 years of devoted effort to the work, personally superintending the raising of the subscription of $400,000 with which the French nation gave the statue to the United States. The donations came mainly from the pence of the poor, requiring in their collection enormous attention to detail, and when subscriptions lagged, Bartholdi pledged his own private fortune to defray the running expenses and practically impoverished himself over the work. Patiently overcoming all difficulties and obstacles, he had the satisfaction to see the statue, erected on Bedloe’s Island, dedicated with imposing ceremonies by President Cleveland 28 Oct. 1886 (see Lines, Stein, and Von Holzen). He was a prolific sculptor and among the more notable of his other works are the figures of Washington and Lafayette on the Place des Etats-Unis in Paris; the Bartholdi fountain of the Botanical Gardens in Washing- ton; the bronze group of the ‘Lyre Among the Berbers, a Souvenir of the Nile,’ exhibited at the Salon of 1857; ‘Genius in the Talons of Misery,’ Salon of 1857; ‘Traitor of General Schramm, the Modern Martyr’ (1864); ‘Portrait of Laboulaye’ (1866); ‘The Leisures of Peace’ (1868); ‘Young Alsatian Grain Grower’ (1869); an equestrian statue of Ver- cingetorix (1870); portraits of Messieurs Eck- mann-Emile; his well-known ‘Curse of Alsace’ (1872); and ‘Switzerland Assuring the Sorrows of Strassburg, Siege of 1870’ (1873).

BARTHOLDY, Jakob Salomo, German diplomat; b. 1779; d. 1825. He was of Jewish parentage, and received his education at the University of Halle. He joined the Austrian army and fought against Napoleon, and later entered the Prussian diplomatic service. He was in Paris with the Allied armies in 1814, and soon after was sent to Rome as Consul-General of Prussia. He was a great patron of the arts, and he had a great influence on the revival of fresco painting. The Berlin Museum of Art secured his remarkable collection of antiques and the frescoes of his mansion in Rome, the Casa Zucari, were transferred to the Berlin National Gallery in 1887.

BARTHOLIN, Thomas, Danish physician, b. Copenhagen, 20 Oct. 1619; d. 4 Dec. 1680. After traveling throughout Europe, he became professor of anatomy in the University of Copenhagen, and made several discoveries in this science. He revised his father’s ‘Anatomy’ and was a firm believer in Harvey’s theory of the circulation of the blood. His son, Kaspar (1654–1704), was a famous anatomist, and his son Thomas (1650–90) was an antiquarian writer whose ‘Antiquitatum Danicaeum Libri Tres’ (1689) is of much value.

BARTHOLIN’S GLANDS (named after their discoverer, Kaspar Bartholin) are the vulvo-vaginal glands, two in number, situated inside the vaginal opening. They secrete a mucous secretion and are subject to infection, forming abscesses.

BARTHOLOMÆ, bár-tö-la-mä, Christian, German philologist: b. Bayreuth, 21 June 1855. He was graduated at the Bayreuth Gymnasium in 1872, and afterward studied philology and general philosophy at Munich, Leipzig and Erlangen. In 1874 he returned to Leipzic to devote himself to comparative philology and Oriental studies. He became a professor at Halle in 1879, and in 1885 was nominated to an extra professorship at Munster. In 1898 he was appointed professor of Sanskrit and Indo-Germanic philology at Giessen, and took the same chair at Heidelberg in 1909. He has made several valuable contributions in the field of Aryan language and literature, including ‘Das altiranische Verbum’ (Munich 1878); ‘Handbuch der altiranischen Dialekte’ (Leipzig 1883); ‘Arische Forschungen’ (3 vols., Halle 1882–87); ‘Studien zur indogermanischen Sprachgeschichte’ (Halle 1891); articles in Heuzey and Kuhn’s ‘Grundzüge der altiranischen Philologie’ (Strassburg 1896); ‘Altiranisches Wörterbuch’ (ib. 1904); ‘Die Gathas des Awesta’ (1905); ‘Über ein Sassanides Recht- buch’ (1910).

BARTHÔLÔMÉ, Paul Albert, French sculptor: b. Thiverval, Seine-et-Oise, 1848. At first he devoted himself to the study of law, but in 1869 abandoned it for painting, which he
pursued successfully until the death of his wife in 1876. He then retired into seclusion and began to study sculpture without a master. In 1877 he erected a beautiful monument to his wife in the cemetery of Boulliant, Oise, the first example of his sculpture. His next work was the monument 'Aux Morts,' designed to represent the grief of humanity for the dead, the model of which was exhibited at the Salon of 1877. At the request of the state and the city of Paris, it was carved in limestone and erected in 1899 at the entrance of Père Lachaise Cemetery, Paris. It is one of the greatest sculptural monuments of modern times. His other notable works include the bronze 'Weeping Child,' in the Luxembourg; a series of female nudes, including that adorning the fountain in the Musée des Arts Decoratifs, Paris; 'The Secret,' Leipzig; and 'Girl Plaiting Her Hair,' in the Albertinum Museum, Dresden. He is represented in the museums of Brussel, Düsseldorf, Dresden, Mülhenhouse and Marseilles, and has carved several beautiful busts and monuments in the Parisian cemeteries. He excels in delineating the nude in the attitude of grief. Consult Demaison, 'M. Bartholomé et le Cenotaph des Morts' (Paris 1900).

BARTHOLOMEW, of the Martyrs, archbishop of Braga in Portugal: b. 1527; d. 1590. He wrote several treatises on spiritual subjects, was an intimate friend of Saint Charles Borromeo, and did for the Church in Portugal what Saint Charles did for religion in Italy. He was one of the most influential members of the Council of Trent, and the enactment of most of the reformatory decrees in that Council was due to his zeal and perseverance. Consult his 'Life' translated by Lady Herbert.

BARTHOLOMEW, Edward Sheffield, American sculptor: b. Colchester, Conn., 1822; d. 2 May 1858. He studied in New York and in Rome, where he lived during the latter part of his life. Among his works are 'Blind Homer, Led by His Daughter,' 'Eve,' 'Youth and Old Age,' 'Ganymede and 'Evening Star.'

BARTHOLOMEW, John George, English cartographer: b. Edinburgh, 22 March 1800. He was educated at the Edinburgh High School and University. He was one of the founders of the Royal Scottish Geographical Society in 1884, and has since acted as its secretary. He introduced the layer system of contour coloring for topographical maps. He was appointed geographer and cartographer to the King, and is chief of the Edinburgh Geographical Institute. He has published 'Survey Atlas of Scotland' (1895-1912); 'Citizens Atlas' (1898-1912); 'Atlas of Meteorology' (1897); 'Survey Gazetteer of the British Isles' (1904); 'Survey Atlas of England and Wales' (1903); 'Atlas of World's Commerce' (1907); 'Imperial Indian Gazetteer Atlas' (1908); 'Atlas of Zoögeography' (1911), and numerous educational atlases and special maps.

BARTHOLOMEW, Saint (son of Tolmai), the apostle, probably the same person as Newman; John as an upright Israelite, and one of the first disciples of Jesus. The name 'Tholmai' was not a patronymic but a surname given to the apostle, a common practice, owing to the well-known scarcity of Hebrew family names. He is said to have taught Christianity in the south of Arabia, into which, according to Eusebius, he carried the Gospel of Saint Matthew in the Hebrew language. Chrysostom mentions that he preached in Armenia and Asia Minor, and tradition tells that he was flayed alive and crucified head downward. His day is the 24th of August.

BARTHOLOMEW, Saint, archbishop of Naksichian, 'Apostle of Persia,' d. 308; Bologna; d. 333. Having learned of his missionary zeal, Pope John XXII consecrated him bishop of Maraga in Armenia. He belonged to the Dominican Order and established a province of the same in Armenia. With the assistance of contréres he translated into Armenian the Psalter, the Missal, the moral tracts of Saint Augustine and Saint Thomas' four books, 'Contra Gentiles.'

BARTHOLOMEW, Saint, a small island of the Lesser Antilles, French West Indies, 130 miles to the northwest of Guadeloupe, nine square miles in area, and rising to the height of about 1,000 feet. It produces tobacco, sugar, cotton, indigo, cassava, drugs, etc. with some excellent woods (including lignum vitae) and limestone. All the fresh water which can be procured is saved in cisterns, as there are no springs. The climate is healthy. The island is encompassed by formidable rocks, which render it dangerous of access to shipping. The only town is Gustavia or Saint Bartholomew. It was first colonized by the French in 1693, was ceded to Sweden in 1784, and again came into possession of France in 1877. Pop. (1911) 2,545. In the south Pacific Ocean are two other islands of the same name.

BARTHOLOMEW, Saint, Massacre of, the slaughter of French Protestants in Paris and other cities in France on various dates between 24 Aug. and 3 Oct. 1572. After the death of Francis II, Catherine de Medici had assumed the regency for her son, Charles IX, then only 10 years old, and in spite of the opposition of the Guises she gave the Protestant party a toleration in favor of the Protestant party, 1562, which she had favored in many ways. The party of the Guises now persuaded the nation that the Roman Catholic religion was in the greatest danger. Religious dissension grew rife, and each party, Roman Catholic and Huguenot, under pretext of religion, treated the other with cruelty. Prince Condé took up arms; the Guises had recourse to the Spaniards, Condé to the English, for assistance. Both parties were guilty of the most atrocious cruelties, but finally a peace was patched up. The Queen-mother caused the King, who had entered his 14th year, to be declared of age, that she might govern more absolutely under his name. Duke Francis de Guise had been assassinated by a Huguenot at Orleans; but his spirit continued in his family, which considered the Admiral Coligny as the author of his murder. The King had been persuaded that the Huguenots had designs on his life, and had conceived an implacable hatred against them. Meanwhile they were not favored to gain time, in order to seize the persons of the prince and the admiral by stratagem, but was disappointed, and hostilities were renewed in 1565, and still again after the Peace of Lon-
jumeau, 1568, this time with greater cruelty than ever. In the battle of Jarnac, 1569, Condé was made prisoner and shot by Captain de Montesquieu. Coligny collected the remains of the routed army; the young Prince Henry de Bourbon (afterwards Henry IV, King of Navarre and France), the head of the Protestant party after the death of Condé, was appointed commander-in-chief, and Coligny commanded in the name of the Prince Henry de Bourbon, who swore to avenge the murder of his father. The advantageous offers of peace at Saint Germain-en-Laye (8 Aug. 1570) satisfied the chiefs of the Huguenots, particularly Admiral Coligny, who was wearied with civil war. The King appeared to have entirely disengaged himself from the influence of the Guises and his mother; he invited the old Coligny, the main support of the Huguenots, to his court, and honored him as a father. The sister of the King was married to the Prince de Beau (1 Aug. 1571); this union opened up a field for the most distinguished Huguenots in Paris. Meanwhile the Queen had allied herself to the Guise family, and jealous of the influence of Coligny with the King, determined to have him put an end to. On August 22 a shot from a window wounded the admiral. The King hastened to visit him and swore to punish the author of the villainy; but on the same day he was induced by his mother to believe that the admiral had designs on his life, "God's death!" he exclaimed; "Kill the Admiral; and not only him, but all the Huguenots; let none remain to disturb us!" The following night Catherine held the bloody council which fixed the execution for the night of Saint Bartholomew, 24 Aug. 1572. After the assassination of Coligny a bell from the tower of the royal palace at midnight gave to the assembled companies of 2,000 burghers the signal for the general massacre of the Huguenots. The Prince of Condé and the King of Navarre saved their lives by choosing the mass rather than death, and pretending to embrace the Roman Catholic religion. Roman Catholics as well as Huguenots fell victims to the political and personal hatred of the slayers. By the King's orders the massacre was extended through the whole kingdom; and if, in some provinces, the officers had honor and humanity enough to disobey the orders to butcher their innocent fellow citizens, yet instruments were always found to continue the bloody work. This horrible slaughter continued over 40 days; the victims are calculated at from 10,000 to 100,000. The Calvinist martyrology cites 786 names; 2,000 is the number computed by late historians. At Rome the massacre was given out as a victory over a great Huguenot conspiracy against the King; it was for this reason the Pope ordered the "Te Deum" to be chanted and a medal struck commemorating the event. Those of the Huguenots who escaped fled into the mountains and to Rochefort. The Duke of Anjou laid siege to that city but, during the siege, received the news that the Poles had elected him their king. He concluded a treaty, 6 July 1573, and the King granted to the Huguenots the exercise of their religion in certain towns. (See also Henry IV of France, King of France) (Vol. VI, Paris 1904). Loughnan, 'The Month' (1892); White, 'The Massacre of Saint Bartholomew' (1867).

BARTHOLOMEW'S HOSPITAL, Saint, London, England, formerly the priory of Saint Bartholomew, founded in 1123, and made a hospital by Henry VIII in 1547. It contains 750 beds, and, on an average, 8,000 patients are annually admitted. Of the 4,000, about 150,000 out-patients are relieved by it. A large medical college is attached to the institution and a resident college for students.

BARTHOLOMITES. See BASILIANS.

BARTHOU, Gär-toor, Louis, French statesman: b. Oloron-Sainte-Marie 1862. He received his education at the Lycee de Pau, entered public life and held various important government positions. He was several times Minister of Public Works, chief in the cabinet of the Minister of the Interior and Minister of the Interior. In 1913 he became Minister of Justice under the premiership of Aristide Briand in President Poincaré's first cabinet. In March of the same year he was appointed Premier with the portfolio of Minister of Public Instruction. He resigned his office the following December. His publications include 'L'action syndicale' (1904); and 'Life of Mira.'

BARTIMEUS (son of Timæus), one of the blind beggars healed by Jesus at the gate of Jericho. He appears to have attracted the attention of the writers of the Gospel narratives from the fact that he was the spokesman of the beggars healed on that occasion and because he addressed Jesus with his Messianic title: "Thou Son of David."

BARTIZAN, a battle-line on the top of a house or castle; a small overhanging turret projecting from the angle on the top of a tower, or from the parapet or other parts of a building; or the battle-line surrounding a spire or steeple, or the roof of a cathedral or church.

BARTLESVILLE, Okla., city and county-seat of Washington County, on the Atchison, Topeka & Santa Fé, and the Missouri, Kansas & Texas railroads, about 125 miles from Oklahoma City. It has a county courthouse, a city hall costing $75,000, Elks Hospital, and library costing $20,000. Bartlesville is the centre of the mid-continent oil field, with 16,000 producing wells, and has important oil interests. Washington County produces about 20,000 barrels a day, a third of the output of the entire region. There are also deposits of natural gas and zinc ore smelting interests. The annual payroll is $3,500,000. There are four banks with deposits of over $4,000,000. The value of city property as assessed is $7,000,000, and the post-office receipts in 1915 were $40,350. The city has a fine school system, with eight excellent buildings worth $30,000, and more than 2,000 school children. Bartlesville has 12 miles of asphalt and brick pavement, 30 miles of sewers and six miles of street railway. It adopted the commission form of government in 1910. Pop. (1910) 6,181; (1916) 15,000.

BARTLET, James Vernon, English author and educator: b. Scarborough, 15 Aug. 1863. He was educated at Exeter College, Oxford. After studying for several years under Dr. Fairbairn, he entered the hospital, and in 1882 he became first fellow of Mansfield College, and began lecturing on church history with the opening of the college buildings in 1889, re-
BARTLETT, Edwin Julius, American chemist: b. Hudson, Ohio, 16 Feb. 1851. He was graduated A.B., Dartmouth College, 1872; A.M., 1875; M.D., Rush Medical College, 1879; appointed associate professor of chemistry at Dartmouth College in 1878 and professor in 1883; is at present head of the department of chemistry. Professor Bartlett is a member of the American Chemical Society, fellow of the A. A. A. S., member of New England Chemical Club, member of the New Hampshire Historical Society, honorary member of the New Hampshire Medical Society, member of Dartmouth Scientific Association and Dartmouth Graduate Club, moderator of the town of Hanover, 1906-12, and sat in the New Hampshire legislature, 1913. He has served in Europe and the Levant, has been expert in many legal cases, and is the author of many papers and addresses on chemical and other subjects.

BARTLETT, Elisha, American physician and author: b. Smithfield, R. I., 1805; d. there, 18 July 1855. He was graduated from the medical department of Brown University in 1826, and delivered the course of lectures on pathological anatomy at the Berkshire Medical Institute in Pittsfield, Mass., in 1832. In 1836 or 1837 he was elected the first mayor of Lowell. He subsequently lectured at Dartmouth College, and in Transylvania University and the universities of Maryland and New York. In 1851 he became professor of materia medica and medical jurisprudence in the College of Physicians and Surgeons in New York, which place he held until his death. He published 'Essay on the Philosophy of Medical Science' (1844); 'Fever of the United States' (1850); and a volume of poems, entitled 'Simple Settings in Verse for Portraits and Pictures in Mr. Dickens' Gallery' (1855).

BARTLETT, Sir Ellis Ashmead. See Ashmead-Bartlett.

BARTLETT, Homer Newton, American composer and organist: b. Olive, N. Y., 28 Dec. 1846; d. 1905. He began his public career when nine years of age, and at 10 composed violin music, piano duos, songs and vocal duets. He wrote a large number of anthems, quartets and glees for vocal rendering, and pieces for the flute, stringed instruments and military bands and orchestras. His best compositions include a three-act opera, 'La Valliere'; a cantata, 'The Last Chieftain'; an oratorio, 'Samuel,' etc.

BARTLETT, Ichabod, American lawyer: b. Salisbury, N. H., 1786; d. 19 Oct. 1853. He was graduated at Dartmouth College in 1808, commenced the practice of the law in Durham, but removed to Portsmouth, where his skill and ability soon commanded success. He is celebrated as an opponent of Webster and Mason. He was frequently a member of the State legislature, and of the United States House of Representatives for three terms, 1823-29.

BARTLETT, John, American author and publisher: b. Plymouth, Mass., 14 June 1820; d. Cambridge, Mass., 3 Dec. 1905. He entered the university book-store, became a publisher in Cambridge in 1836, and senior partner in the house of Little, Brown & Company in 1878. His works include 'Familiar Quotations' (1854; 9th ed., 1891); 'New Method of Chess Induction' (1857); 'The Shakespeare Phrase-Book' (1882); 'Catalogue of Books on Angling, Including Ichthyology, Pisciculture, etc.' (1882); 'The Complete Concordance to Shakespeare's Dramatic Works' (1894); and 'Poems.'

BARTLETT, John R., American naval officer: b. New York 1843; d. Saint Louis, 22 Nov. 1904. He was appointed an acting midshipman in the navy from Rhode Island in 1859; entered the United States Naval Academy, where he remained till the beginning of the Civil War, when he was assigned to the West Gulf blockading squadron. He took part in the bombardment and passage of Ports Saint Philip and Jackson, and the Chalmette batteries, and the capture of New Orleans and attack on Vicksburg in June 1863. He served in Europe and the Levant, has been expert in many legal cases, and is the author of many papers and addresses on chemical and other subjects.

BARTLETT, John Russell, American author: b. Providence, R. I., 23 Oct. 1805; d. 28 May 1886. He was educated for a mercantile career, and after 1837 entered the book-importing trade in New York. In 1850 he was appointed one of the commissioners to determine the Mexican boundary. In 1855 he was made secretary of State of Rhode Island. He published various valuable records, genealogies, local histories, etc., but his best known work is his 'Dictionary of Americanisms' (1850).

BARTLETT, John Sherren, Anglo-American journalist, founder of the Albion newspaper in New York: b. Dorsetshire, England, 1790; d. 24 Aug. 1863. He was educated as a physician in London; was appointed surgeon in the royal navy in 1812; sailed to the West Indies, on board the packet Swallow; was captured by the American frigates President and Congress, under Commodore Rodgers, and remained a prisoner at Boston until discharged in 1813. At the close of the war he married a lady of Boston and established himself there as a physician. The Albion commenced by him in New York, 22 June 1822, as an English organ of conservative politics, gained a wide and profitable circulation. Bartlett subsequently commenced one or two other papers of a similar character at a cheaper price, and on the beginning of Atlantic steam navigation also established at Liverpool the European, a weekly compendium of the latest news for American circulation. Owing to the failure of his paper, he withdrew from the Albion in 1848. He subsequently published the Anglo-Saxon, a weekly paper at Boston, which he continued about two years. In 1857 he served as English consul at Baltimore.
BARTLETT, Joseph, American wit, poet and adventurer: b. Plymouth, Mass., 1763; d. Boston, 27 Oct. 1827. He began the study of law, and after a voyage to England, wrote a play for its stage. He then entered the profession of a merchant, and was shipwrecked on Cape Cod. In 1799 he delivered a poem on "Physiognomy" before the Phi Beta Kappa Society of Harvard, satirical and clever, and said to touch upon the traits of individuals. It was published in 1823, was appended a number of "Aphorisms on Men, Principles and Things," the results of his various experience. The same year he delivered a Fourth of July oration at Boston, and after a poem, entitled the "New Vicar of Bray," which obtained considerable celebrity. His next attempt at the practice of law and of politics in Maine, was elected to the State legislature, and nearly secured a seat in Congress by his active exertions as a speaker and a newspaper writer. He then practised law at Portsmouth, N. H., and finally closed his improvident life, a burden to his friends, at Boston. Consult Ducykink's "Cyclopædia of American Literature."

BARTLETT, Josiah, American statesman: b. Amherst, Mass., November 1729; d. 19 May 1795. He commenced the practice of medicine in 1750, at Kingston, and established a reputation, during the prevalence of the "angina maligna" in 1754, by treatment with Peruvian bark, in opposition to the usage of other physicians. He received several appointments from the royal governor, John Wentworth, but lost them in 1775, for being a zealous Whig. Being chosen delegate to the Continental Congress, he was the first who voted for, and the first, after the Declaration of Independence, his name being first called as representative of the most easterly province. He accompanied Stark in 1777 to Bennington. He was appointed chief justice of the common pleas in 1779, by the Supreme Court in 1784, and chief justice in 1788. He was an active member of the convention called to adopt the Federal Constitution in 1788. In 1790 he was president of New Hampshire, and in 1793 was chosen the first governor under the new State Constitution. He was also president of the medical society established in 1791, by his exertions. In all his various offices his duties were ably and faithfully discharged.

BARTLETT, Paul Wayland, American sculptor: b. New Haven, Conn., 1805. He entered the École des Beaux Arts, Paris, 1880, and won a medal at the Paris Salon of 1887. His principal works are an equestrian statue of General McClellan, "The Dying Lion" and the "Ghost Dancer," in Philadelphia; the equestrian statue of Lafayette in Paris (presented to France by the school children of the United States); a statue of Gen. Joseph Warren in Boston; a statue of Benjamin Franklin at Waterbury, Conn.; statues of Columbus and Michelangelo in the Library of Congress; "The Bethnal Green," at Metropolitan Museum of New York; and the six colossal figures over the central entrance of New York Public Li-

brary. In 1908 he was appointed officer of the Legion of Honor and was selected as a corresponding member of the Institute of France. He became a teacher there and at Andover Theological Seminary. He had charge of a church at Monson, Mass.; subsequently becoming professor of philosophy in Western Reserve University, Ohio. He afterward became pastor of a church in Manchester, N. H., and later of the New England Church, in Chicago. In 1858 he was made professor of public literature in the Chicago Theological Seminary, where he remained until 1873, when he spent a year in travel in the East. In 1877 he became president of Dartmouth College, a post he held until 1892, when he resigned. He was the author of a number of works, including "From Egypt to Palestine" (1879); "Sketches of Missions of the American Board"; "Sources of History in the Pentateuch"; and "The Veracity of the Hexateuch," and also wrote a part of the American edition of "Smith's Dictionary of the Bible."

BARTLETT, William Francis, American military officer: b. Haverhill, Mass., 6 Jan. 1840; d. 17 Dec. 1876. He was a student at Harvard University at the outbreak of the Civil War, but left to enter the army. He was wounded in the battle of Ball's Bluff, suffering the loss of a leg, but continued in the service; was twice wounded at Port Hudson; and in the battles of the Wilderness, while leading the 5th Massachusetts regiment, was again wounded, taken prisoner and sent to Libby Prison. At the close of the war, he was made a major-general of volunteers for distinguished services in the field.

BARTLETT, William Henry, English topographical draughtsman: b. Kentish Town, London, 29 March 1809; d. 13 Sept. 1854. He served an apprenticeship with the distinguished architectural antiquary, John Britton, who employed him to make drawings for his "Cathedral Antiquities," and "Picture of English Cities." Bartlett subsequently traveled extensively abroad, paying four visits to the United States and Canada, and the works which he published, descriptive of the countries visited by him, obtained great success with the public. They include "American Scenery" (1840); "Canadian Scenery" (1842); "Walks About Jerusalem" (1844); "Forty Days in the Desert" (1848); "The Nile Boat, or Glimpses of Egypt" (1849); "Footsteps of the Lord He was the "Apostles" (1851); "The Pilgrim Fathers" (1853); "Jerusalem Revisited" (1855).

BARTLETT, William Holmes Chambers, American soldier and scientist: b. Lancaster County, Pa., 1809; d. 11 Feb. 1893. He was educated at West Point, and as lieutenant of engineering was assistant professor there, 1827-28. He was engaged on the construction of Fort Monroe and Fort Adams; was assistant engineer at Washington, 1832-34, and at West Point as assistant professor, 1834-36. When he resigned his professorships he was made full professor of philosophy at West Point, and held this position until he retired in 1871. He
BARTLEY — BARTOLOMMEO

was a member of the Natural Academy of Sciences and other scientific societies, and wrote several books, including 'Treatise on Optics' (1839); 'Synthetic Mechanics' (1850–58); 'Acoustics and Optics' (1852–59); 'Analytical Mechanics' (1853–59); and 'Spherical Astronomy' (1858–59).

BARTLEY, Elias Hudson, American chemist. b. Bartlett, N. H., 6 Dec. 1849. He was graduated at Cornell University in 1873; was an instructor there in 1874–75; professor of chemistry at Swarthmore College, 1875–78; lecturer at the Franklin Institute, Philadelphia, in 1877–78. He removed to Brooklyn in 1879; graduated at Long Island College Hospital in 1879; was lecturer there on physiological and practical chemistry in 1880–85; and then became professor of chemistry and toxicology. He was made chief chemist of the health department of Brooklyn in 1882. He is the author of several articles in Wood's 'Household Practice of Medicine' (1885) and of 'A Text-Book of Medical Chemistry.'

BARTOL, Cyrus Augustus, American Unitarian clergyman. b. Freeport, Me., 30 April 1820; d. Bowdoin College in 1832 and at Cambridge Divinity School in 1835; became colleague pastor with Dr. Charles Lowell of the West Church (Unitarian) in Boston, 1837, and full pastor in 1861. He was a member of the transcendental club. His works include 'Discourses on the Christian Spirit and Life' (1850); 'Discourses on Christian Body and Form' (1854); 'Pictures of Europe Framed in Ideas' (1855); 'History of the West Church and Its Ministers' (1858); 'Church and Congregation' (1858); 'Word of the Spirit of the Church' (1859); 'Radical Problems' (1872); 'The Rising Faith' (1874); 'Principles and Portraits' (1880).

BARTOLI, bár-töl-le, Adolfo, Italian historian. b. Ferrara, 12 Feb. 1608; d. Rome, 17 Jan. 1685. He was the author of a celebrated history of the order of the Jesuits, published at Rome in six volumes (1650–73). Bartoli had access to many curious manuscripts in the Vatican, of which he availed himself. This gives to his work peculiar interest and portions of it, as for instance that on Asia, passed through several editions. The first edition of 1667 contains also an interesting account of the mission to Mongolia and a sketch of the life of Father Anghiu. He also wrote on physics and philology. His works are marked by erudition, elegance and purity of style. A new edition of his complete works in 50 volumes appeared at Florence in 1826.

BARTOLI, Pietro Santi, sometimes called Pietro Santi Pau, Italian painter. B. about 1635; d. Rome, 1700. He was a pupil of Nicolas Poussin. His engravings, originally over 1,000, are scarce and valuable. His skill as a copyist was so great that he could counterfeit the effects of time on the colors of pictures. The 'Admiranda Romanorum Antiquitatem Vestitum,' a collection of engravings much esteemed archaeologically, is his most important work.

BARTOLINI, bár-töl-le-ne, Lorenzo, celebrated Italian sculptor. b. Verno, 1777; d. Florence, 1850. In his youth he was a pupil of Desmares, a French painter, and made considerable progress; but the bent of his genius leading him rather to handle the chisel than the brush, he proceeded to Paris and entered in 1797 the studio of the sculptor Lemot. Napoleon entrusted him with a multitude of works, among others a colossal bust of the Emperor placed above the entrance of the French Institute and a magnificent statue of him, which, in consequence of the events of the restoration, was never delivered to government and is now in America. On the fall of the empire he returned to Florence, where he continued to exercise his profession. Among his greater works may be mentioned his groups of Charity, and Hercules and Antaeus, a beautiful monument in the cathedral of Lausanne, Switzerland, erected in memory of Lady Stratford Canning, who died there in 1817. Bartolini ranks next to Canova among modern Italian sculptors. 'Compendium,' 'Schools and Masters of Sculpture' (1898).

BARTOLOMMEO, bár-töl-mä'bo, Fra, or BACCIO DELLA PORTA, Florentine painter. b. Savignano 1469; d. Florence, 1517. He learned in Florence the first principles of painting from Cosimo Roselli and acquired a more perfect knowledge of art by studying the works of Leonardo da Vinci. The most important of his early productions is the fresco of the Last Judgment, in which he was assisted by his friend Albertinelli. He was an admirer and follower of Savonarola, on whose death, in consequence of a vow made during the peril of persecution, he took the Dominican habit in 1500 and assumed the name of Fra Bartolomeo. For the space of four years he did not touch a pencil and employed it afterward only on devotional subjects. Raphael visited Florence in 1504 and gave instructions to Bartolomeo in perspective, receiving in return his lessons in coloring and handling of drapery. Some years afterward the latter visited Michelangelo and Raphael at Rome. After his return to Florence he executed several religious pictures, among which were a Saint Mark and Saint Sebastian, which are greatly admired. His style is severe and elevated, but very graceful in youthful figures; his coloring, in vigor and brilliancy, comes near to that of Titian and Giorgione. But he particularly excels in drapery, which none before him represented with equal truth, fulness and ease. Many of his drawings survive in the print collections of the Uffizi, Louvre, Munich, British Museum and Weimar Museum. Among his paintings excellent examples are 'Christ at Emmaus' (1507) in San Marco; 'Madonna with Saints John and Stephen' (1509) and 'Saints Mary Magdalene and Catherine' (1509), both in Luca Cefalda; others are the Madonna and Six Saints (1509) in Santa Maria, Florence; 'The Betrothal of Saint Cather-
BARTOLOZZI, bār-tō-lōt'sē, Francesco, Italian engraver: b. Florence, 21 Sept. 1728; d. Lisbon, Portugal, April 1815. He was the son of a goldsmith and studied at the Florentine Academy, where he excelled particularly in anatomy and drawing. In Venice, Florence, Rome and Milan he etched several pieces on sacred subjects and then on the invitation of Dalton, librarian to George III, went to London, where he received great encouragement and laid himself entirely to the national taste, so as even to work in the popular red dotted manner. His pieces were so universally sought for that a complete collection of them was valued at £1,000. He was elected a member of the Royal Academy of Arts in London. After several years' residence in London, he went to Lisbon to engrave copper the portrait of the Regent, where he received, in 1807, the Order of Christ, and became director of the National Academy. With accuracy of design he exerted great delicacy of execution. Among his best engravings is the "Death of Lord Chatham," after Copley, and the "Virgin and Child." His works, among which are imitations in etching of drawings of the great masters, amount to more than 2,000. Consult Brinton: "Bartolozzi and his Pupils in England" (London 1904); Bailly, "Bartolozzi" (ib. 1907); "Bartolozzi and Other Stipple Engravers," in "Great Engravers Series" (ib. 1906); Clement, "Painters, Sculptors and Engravers" (ib. 1890); Tuer, "Bartolozzi and His Works" (ib. 1882).

BARTOLUS, Osso, or BARTOLOUS DE SAXOFERRATO, a celebrated Italian jurist: b. Sasso Ferrato, in the Marches of Ancona, about 1313; d. Perugia 1356. He took his degree of LL.D. at Bologna, became professor, first at Pisa and then at Perugia, was ennobled and honored with other distinction and privileges by the Emperor Charles IV and not only published many important works such as treatises "On Procedure," "On Evidence," and commentary on the "Code of Justinian," but distinguished himself in various other branches of knowledge.

BARTON, Andrew, Scottish naval commander, who flourished during the reign of James IV and belonged to a family which for two generations had produced able and successful seamen. In 1506 he cleared the Scottish coasts of the Flemish pirates with which they were infested, and as a proof of the thoroughness of his work, sent the King three barrels full of their heads. In 1508 he was sent to assist Denmark against Lübeck. The Dutch, he informed the King, engaged in the English trade aroused great resentment in England and in an engagement between his ship, the Lion, and two ships specially fitted out against him, he was killed (2 Aug. 1511).

BARTON, Benjamin Smith, American naturalist: b. Lancaster, Pa., 10 Feb. 1766; d. Philadelphia, 19 Dec. 1815. He studied the natural sciences and medicine in Philadelphia, Edinburgh and London and spent a considerable time at Göttingen. He practised medicine in Philadelphia and held successively the chairs of botany and natural history, materia medica and theory and practice of medicine in the university there. He became to that work at any learned societies, was a correspondent of Humboldt, and among other works, wrote "Elements of Botany" (1812-14); "Collections for an Essay toward a Materia Medica of the United States" (3d ed., 1810); and "Flora Virginica" (1812).

BARTON, Bernard, English poet, often styled the Quaker poet: b. London, 31 Jan. 1784; d. 19 Feb. 1849. In 1806 he removed to Woodbridge, in Suffolk, where he entered into a business in coals and corn; but subsequently gave up his occupation, and in 1810 became clerk in a bank at Woodbridge, in which he held till shortly before his death. In 1824 a reading society founded by him at Woodbridge presented him with £1,200, and he afterward received a pension of £100 through Sir Robert Peel. His first appearance as an author was in 1812, when he published a small volume of poems under the title of "metrical Effusions," which led to a correspondence with the poet Southey. This was followed in 1818 by "Poems by an Amateur," and in 1820 by a volume entitled simply "Poems," which became popular, and gained him the friendship of Lamb and Byron. Of his other productions the chief were "Napoleon and other Poems" (1822); "Poetic Vigils" (1824); "Devotional Verses" (1826); "A New-Year's Eve, and other Poems" (1828); besides many contributions to the annuals and magazines. His last work was "Household Verses" (1845). His daughter, Lucy, published "Selections from the Poems and Letters of Bernard Barton," in 1849. His poetry, though deficient in force, is pleasing, fluent and graceful, animated by a love of nature and by a pure religious spirit. Consult Lucas, "Bernard Barton and His Friends."
the distribution of work to the poor of Stras-
burg in 1871, after the siege, and in 1872 did a
like work in Paris. At the close of the war she
was decorated with the Golden Cross of Baden
and the Iron Cross of Germany. On the organ-
ization of the American Red Cross Society in
1881 she was made its president, and in that
capacity in 1884 had charge of the measures to
relieve sufferers from the Mississippi and Ohio
floods. In 1883 she was appointed superinten-
dent of the Reformatory Prison for Women at
Mendota, Minn. In 1888 she was appointed
United States representative at the Red Cross
Conference in Geneva. It was her suggestion that
led to an amendment of the rules of the Red Cross
Society permitting relief not only in war
but in times of such other calamities as fam-
ines, floods, earthquakes and pestilence. In 1889
she had charge of movements in behalf of suf-erers from the floods at Johnstown, Pa.; in
1892 distributed relief to the Russian famine
sufferers; in 1896 personally directed relief
work among the Armenian massacres; in 1898, at the request of President Mc-
Kinley, took relief to the Cuban reconcentrados,
and performed field work during the war with
Spain; and in 1900 undertook to direct the re-
 lief of sufferers at Galveston, but broke down
physically. She resigned from the Red Cross
Society in 1904. She published 'History of the
Red Cross' (1883); 'History of the Red Cross
in Peace and War' (1898); 'Story of the Red
Cross' (1904); 'Story of My Childhood'
(1907); 'Consultation and Poster, Heroes of
Modern Progress' (1913).

BARTON, Sir Edmund, Australian jurist
and statesman: b. Glebe, Sydney, 18 Jan.,
1849. He was educated at the Sydney Grammar
School and the University of Sydney. He was
called to the bar in 1871. He became a member
of the legislative council and was speaker of
the legislative assembly of New South Wales
1883-87. He was a member of the Federal
conventions of 1891 and 1897-98. He was
leader of the delegation to London with the
Australian Commonwealth Bill in 1900. He
became first Prime Minister and Minister for
Foreign Affairs in the first Federal Cabinet of
the new Commonwealth, and retired in 1903
to become puisne judge of the High Court of
Australia. He was knighted in 1902.

BARTON, Elizabeth, English religious im-
postor (commonly called the Holy Maid of
Kent): b. about 1506; d. 20 April 1534. She
was used as an instrument by the adherents of
Queen Catherine to excite the English nation
against the proposed divorce of Henry VIII
from his first wife, and the apprehended separa-
tion of the English Church from Rome, with
which the King then threatened the Pope. Her
delirious utterances, in a nervous illness, were
made use of by the parish priest of Aldington,
Richard Maister, and by a canon of Canterbury
named Bocking, to persuade her that she was a
prophetess inspired by God. Among other
things she prophesied that Henry, if he per-
sisted in his purpose of divorce and second
marriage would die a shameful death and be
succeeded by Catherine's daughter. Her rev-
elations, published and distributed by the monk
Dering, produced such a fermentation among
the people that Henry ordered the apprehen-
sion and examination of Elizabeth and her ac-
complices before the star-chamber. After they
had there confessed the imposture they were
condemned to make a public confession and to
imprisonment; and the Maid, Bocking, Maister,
Dering and three others were afterward ad-
judged guilty of high treason for a conspiracy
against the King, and executed. The venerable
Bishop Fisher and Sir Thomas More were
among those accused of holding correspondence
with the Holy Maid; and the former was pro-
nounced guilty of misprision, or concealment,
of treason in consequence of his disaffection.

BARTON, George Aaron, American edu-
cator and author: b. East Farnham, Quebec,
12 Nov. 1859. He was educated at Haverford
College, where he was graduated in 1882, and
at Harvard University. He was appointed min-
ister of the Society of Friends in 1879, was
teacher of higher mathematics and classics at the
Friends' School, Providence, 1884-89, and
has been professor of biblical literature and
Semitic languages at Bryn Mawr College since
1891. In 1902-04 he was director of the Ameri-
can School of Oriental Studies in Jerusalem
in Palestine. He is a member of the American
Oriental Society, the Archaeological Institute
of America and many other learned societies, both
American and foreign. He has published 'A
Sketch of Semitic Origins, Social and Religious'  
(1902); 'Roots of Christian Teaching as
Found in the Old Testament' (1902); 'A Year's
Wandering in Bible Lands' (1904); 'The Hav-
erford Library Collection of Cuneiform Tablets,
Documents from the Cremated Bodies of Tellah'  
(3 parts, 1905-14); 'The Heart of the
Christian Message' (2d ed., 1912); 'The Origin
and Development of Babylonian Writing'
(1913); 'Sumerian Business and Administrative
Documents from the Earliest Times to the
Dynasty of Agade' (1915); 'Archaeology and
the Bible' (1916); 'Commentary on Ecclesias-
tes' (in The International Critical Commentary,
1908); 'Commentary on Job' (in 'Bible for
Home and School,' 1911); and contributions to
'Encyclopaedia Biblica,' 'Jewish Encyclopedia,'
etc.

BARTON, George Hunt, American geol-
ogist: b. Sudbury, Mass., 8 July 1852. He
was assistant on Hawaiian Government Survey,
1881-83; assistant in geology in the Massachu-
setts Institute of Technology in 1883-84; then
assistant professor of geology there; he also
occupied the corresponding chair in Boston Un-
iversity and the Teachers' School of Science;
and was assistant geologist of the United States
Geological Survey. In 1896 he was a member
of the 6th Peary expedition to Greenland. He
is a member of the Boston Society of Natural
History, the National Geological Society and
the Geological Society of America; director of
Teachers' School of Science from 1904; and
member of many other scientific and technical ob-
servations. He has traveled extensively in the
United States, British America, Hawaii,
Newfoundland, Labrador, Greenland and in
Europe. He is the author of 'Outline of Ele-
mentary Lithology' (1900) and of 'Outline of Dy-
namical and Structural Geology.'

BARTON, William, American military of-
icer: b. Warren, R. I., 26 May 1748; d.
Providence, R. I., 22 Oct. 1831. He joined
the Revolutionary army soon after Bunker
Hill, and on the night of 10 July 1777, he per-
formed the exploit which made him famous. Leading a small party of men, in four whale-boats, across Narragansett Bay, he surprised and captured the British general, Prescott, at his headquarters, and hurried him away to Washington’s camp in New Jersey. Barton received a sword from the Congress, and was brevetted colonel. He was afterward a member of the State convention, which adopted the Federal Constitution.

**BARTON, William Eleazar,** American clergyman and author: b. Sublette, Ill., 28 June 1816. He was graduated at Berea College in 1885 and at Oberlin Theological Seminary in 1890. He was ordained to the Congregational ministry in 1885, and held several pastorates in Tennessee and Ohio, then in Shawmut Congregational Church, Boston, 1892-99, and since 1899 the First Church of Oak Park, Ill. He was also associate editor of *Bibliotheca Sacra,* and editor of the pastors’ department of the *Advance* 1904-12, and editor-in-chief since 1913. He has been lecturer on applied theology at the New York Theological Seminary since 1911, and on the staff of the *Youth’s Companion* since 1900. He has been delegate to several national Congregational councils. He has written over 40 volumes, including *A Hero in Homespun* (1897); *When Boston Braved the King* (1909); *What Has Brought Us Out of Egypt* (1900); *Jesus of Nazareth* (1904); *The History and Religion of the Samaritans* (1906); *Into All the World* (1911); *Day by Day with Jesus* (1913); *The Law of Congregational Usage* (1915).

**BARTON, William Paul Crillon,** American botanist: b. Philadelphia, Pa., 17 Nov. 1756; d. 29 Feb. 1856, a nephew of Benjamin Smith Barton (q.v.). He was educated at Princeton College, and in the medical school of the University of Pennsylvania; was surgeon in the United States navy. He succeeded his uncle as professor of botany in the University of Pennsylvania, and became professor of botany and materia medica in Jefferson Medical College, in 1815. He organized the naval bureau of medicine and surgery of the United States, and served with the navy at the time of his death. He was author of *Flora of North America* (1818-24); *Vegetable Materia Medica of the United States* (1817-25); *Compendium Florae Philadelphiensis* (1818).

**BARTOW,** Fla., city and county-seat of Polk County, 45 miles east of Tampa, on the Atlantic Coast Line and Seaboard Air Line railroads. The city’s principal features are the Carnegie library, county jail, courthouse, opera house and Summerlin Institute. Phosphate production is a leading industry. Fruit-growing is also important. The city has marble works, cigar and concrete factories, bottle works, planing and shingle mills and wagon works. The electric-lighting plant and the waterworks are the property of the municipal. Pop. 2,662.

**BARTRAM, John,** an eminent American botanist: b. Chester County, Pa., 23 March 1699; d. 22 Sept. 1777. He is frequently called the “father of American botany,” and he founded at Kingsessing the first botanical garden in America. Linnaeus termed him “the greatest natural botanist in the world.” He published *Observations of the Inhabitants, Climate, Soil, Diverse Productions, Animals, etc., Made in His Travels from Pennsylvania to Lake Ontario,* and a similar volume on eastern Florida (1766). He was in constant correspondence with European botanists, to whom he sent large collections of American plants, and would readily undertake a journey of a hundred miles to see a new plant.

**BARTRAM, William,** American botanist and ornithologist: b. Kingsessing, Pa., 9 Feb. 1739; d. there, 22 July 1823, a son of John Bartram. He spent five years in the Southern States studying natural history, and published the results in *Travels Through North and South Carolina and East and West Florida.* He compiled a list of American birds, which was the best of its kind up to the time of Wilson.

**BARTSCH, bärtsch, Adam von,** Austrian engraver and art writer: b. Vienna, 17 Aug. 1757; d. there 21 Aug. 1821. At the age of 16 he brought himself into the notice of the Austrian government by a series of engravings of the gold and silver medals issued during the reign of Maria Theresa, and in 1781 was appointed keeper of the prints of the royal collection. In 1803 he produced the first volume of his well-known and authoritative work, *Le Peintre-Graveur,* in 21 volumes, giving a description of the principal engravers of Europe and criticisms on their works. He etched upwards of 500 pieces, and published several catalogues of works of art.

**BARTSCH, Karl Friedrich Adolf Konrad,** German philologist: b. Sprottan, Silesia, 25 Feb. 1816; d. 19 Feb. 1888. He was professor at Rostock, where he established the earliest Germanic seminary in Germany 1858-71, and for the remainder of his life was head of the department of German and Romance philology at the University of Heidelberg. He was an extremely brilliant, versatile, industrious scholar whose attention was chiefly given to Middle High German and Provencal poetry, and was an original poet also, publishing a volume of lyrics in 1874. Beside an important study of the history of the German navy, he published *The Song of Roland* (1874); in translation of Burns (1865); and of Dante’s *Divina Commedia* (1867), as well as introductions to the study of Provencal and old French, etc.

**BARU, bá-roo,** Philippines, a town of Leyte, 31 miles from the capital of the province, Tacloban. Pop. about 13,000.

**BARU (Malay),** a woolly material found at the base of the leaves of a sago palm-tree, *saguerus zaccharifer.* It is much used in stuffing cushions and cabling ships.

**BARUCH, bár’ük (Hebrew, “the blessed”),** the name of several individuals, of whom the most celebrated was the son of Neriah, scribe and assistant to the prophet Jeremiah. The brother of Baruch, Seraiah, was chief chamberlain to King Zedekiah. During the reign of Jehoiakim, about 607 B.C., Jeremiah while in prison, having been divinely commissioned to put all his prophecies in writing, dictated them to Baruch, who inserted them in a roll, which he was ordered to read both within and at the entrance to the temple. Possibly Baruch was
BARUCH—BARYE

in doubt about undertaking the task, for the author of the Lamentations ‘spake unto Baruch: seekest thou great things for thyself? Seek them not...’ 1 Jehoiakim on hearing its condemnation cut it in pieces and threw it into the fire. At the captivity, after the destruction of Jerusalem, Jeremiah and Baruch were permitted to remain in Palestine, but were afterward carried into Egypt 588 B.C. According to Josephus, Baruch resided with Jeremiah at Masaphtha when Jerusalem fell 586 B.C. The subsequent life of Baruch is little known. A Hebrew tradition has it that both died in Egypt at about the same time, while yet another story runs that, after the death of Jeremiah, Baruch went to Babylon and died there 574 B.C. One of the apocryphal books bears the name of Baruch. The Council of Trent gave it a place in the canon, but its authenticity was not admitted either by the ancient Jews or the early Christian fathers. See Baruch, Books of.

BARUCH, Books of. In the Apocrypha, the book of Baruch may be found: it is the only apocryphal book written in the style of the Hebrew prophets. While savouring strongly of an attempt at imitation, and possessing but little originality, it nevertheless contains some striking passages of considerable force. It dispenses advice and consolation to the distressed Israelites in a hopeful and encouraging tone, with a promise for the rebuilding of Jerusalem. An apocryphal letter of the prophet Jeremiah is usually given as chapter 6, addressed to the exiled Jews in Babylon. The book is undoubtedly by more than one author; the different styles, of which there are four, and the names for God lead to that belief. The early part is supplicatory, and the later, hortatory. An expert in the Bible critic is much divergence of opinion as to authorship and period, part apparently originating from Hebrew and part bearing the stamp of original Greek. Some commentators believe in a Hebrew original for both parts, and attribute the Greek text to a skillful translator; others again, hold the theory of an Aramaic original up to a certain part, or that the book was entirely composed in Greek. The traditional authorship by Baruch is rarely supported except among Roman Catholic writers. The statement in the Greek Apostolic Constitution, v. 20, that Baruch was read, with Lamentations, in the synagogue on the Day of Atonement, is said to be unsupported by evidence. Baruch was generally regarded as a continuation or appendage to Jeremiah by a large part of the early Christian Church, and writers were naturally attracted by iii. 37, which they quoted as a prophecy of the Messiah. The book was declared canonical by the Council of Trent (1545-63); though not without much hesitation and debate. The Apocalypse of Baruch is a distinct extra-Biblical work, a 6th century document, written in Syriac, and was discovered about 1850 in the Biblioteca Ambrosiana in Milan by Antonio Ceriani, the famous librarian. He published translations of the document in Latin and Italian. It contains at the end a letter addressed to the nine and a half tribes of Israel carried into captivity across the Euphrates. Consult Ceriani, Dr. Ettore, ed. Testimonia e i mass. delle versioni Sirische del Vecchio Testamento (1869), and ‘Canonical Histories and Apocryphal Legends relating to the New Testament’ (London 1873); Charles ‘Apocrypha of Baruch’ (1896); Kneusel, ‘Die hebräischen Baruch’ (Leipzig 1879); Schürer, ‘Geschichte des jüdischen Volks im Zeitalter Jesu Christi’ (Leipzig 1886); ‘Dictionary of the Bible’; ‘Catholic Encyclopedia.’

BARUS, Carl, American physicist: b. Cincinnati, Ohio, 19 Feb. 1856. He studied at Columbia College and the University of Würzburg; was physicist of the United States Geological Survey in 1880-92; professor of meteorology in the United States Weather Bureau, 1892-93; and physicist of the Smithsonian Institution, in 1893-95. In 1895 he became professor of physics at Brown University. He is a member of the National Academy of Sciences; was vice-president and chairman of the section of physics in the American Association for the Advancement of Science in 1897; and is a corresponding member of the British Association for the Advancement of Science. He contributes to the American Journal of Science and has written also valuable monographs for the United States Geological Survey. He is an honorary member of the Royal Institute of Great Britain 1899; Kneusel, ‘Die hebräischen Baruch’ (Leipzig 1879); Schürer, ‘Geschichte des jüdischen Volks im Zeitalter Jesu Christi’ (Leipzig 1886); ‘Dictionary of the Bible’; ‘Catholic Encyclopedia.’

BARWELL, Richard, English surgeon: b. 1826; d. January 1917. The oldest ‘fellow’ of the Royal College of Surgeons, Barwell was for 33 years on the active surgical staff of Charing Cross Hospital in London. In the pre-antiseptic days he introduced important hygienic reforms in hospital procedure. He interested himself in the ligature of the large blood vessels, at that time a most important question in surgery, and devised a ligature material from the aorta of an ox which, though satisfactory, has been displaced by more modern materials. Barwell was one of the first to treat curvature of the spine by exercises, in place of the heavy spinal supports then in vogue. He made numerous contributions to surgical literature.

BARY, bär'e, Heinrich Anton de, German physician and botanist: b. Frankfort-on-the-Main, 26 Jan. 1831; d. 19 Jan. 1888. He was noted for his investigations in cryptogamic botany, and was professor of botany at Freiburg in 1855, at Halle in 1869 and at Strasbourg in 1872. Among his works are ‘Die Mycozyten’ (1859); ‘Vergleichende Morphologie und Biologie der Pilze, Mycetozen und Bakterien’ (1884); ‘Vorlesungen über Bakterien’ (1885).

BARYE, bár're, Antoine Louis, noted French sculptor: b. Paris, 25 Sept. 1795; d. there, 25 June 1875. He studied engraving with Fourrier and a goldsmith named Beinart in 1812 was a topographical engineer and is supposed to have modeled a number of relief maps now in the French war office. In 1816 he studied drawing with the painter Gros, and sculpture with Baco, and in 1819 took the second prize for a ‘Mile di Credona,’ which...
was awarded him at a Concours of the Beaux Arts. From 1823 till 1831 he worked under Fauconnier, jeweler to the Duchesse d'Angouleme. In 1831 he exhibited the celebrated 'Tiger Devouring a Crocodile,' and was then employed by M. Lefuel to make four groups for the pavilion on the Place du Carrousel. He was an officer of the Legion of Honor, a member of the Institute and a professor of the Jardin des Plantes. Consult Brownell, 'French Art' (1892).

BARYTA, barium monoxide. See Barium.

BARYTES, a common name for Barite (q.v.).

BARYTON (viola di Bardone), a chamber instrument, very popular in the 18th century, but now obsolete. It was somewhat like the viol di gamba in tone, but had a broader finger-board, with six or seven gut-strings, while under the neck there were from 9 to 24 strings of brass wire, which were pinched with the point of the thumb to produce a sound, while the gut-string was acted on by a bow.

BARYTONE. See Baritone.

BAS, or BATZ, a French island in the department of Finistere, two and one-half miles from the coast in the English Channel. Although but three miles long and two miles wide it is defended by two forts and four batteries. It has a lighthouse at an elevation of 212 feet, and three fishing villages.

BAS-RELIEF, ba're-lef. (in Italian, bassezzà or bas-relief), as applied to sculpture, a representation of one or more figures, raised on a flat surface or background, in such a manner, however, as that no part of them shall be entirely detached from it. Alto-rilievo, or high relief, is that in which the figures project half of their apparent circumference from the background. Mezzo-rilievo, or middle relief, is a third species, between the two. But generally speaking, the first term is made to comprehend both the others. The term itself was invented in Italy about the 11th or 12th century on the arrival of the arts; for the Greeks called such works simply carved (anaglypta); and to what is now called high relief they only applied the term rounded (toreutiske).

Bas-relief is particularly allied to architecture and under its dominion, since any considerable work of this kind must be made for the pediment, frieze or panel of a building, or for some other architectural work, such as a tomb, sarcophagus, pedestal or column. Bas-reliefs seem to have been invented in the earliest ages by the Egyptian people, for very many of their ancient monuments are covered with them, being executed in the same way as the hieroglyphics on their sepulchral chambers, obelisks and temples. This has been finely illustrated by the drawings and models of the tomb of Sethi I, originally discovered near the ancient Thebes by Belzoni, and which has since become familiar to many persons; all the walls of that famous monument are covered with thousands of figures in low relief, colored, and exhibiting the religious and warlike ceremonies of that wonderful people. Bas-reliefs, too, are found in India, decorating the subterraneous temple of Ellora, and in an astounding profusion. The subjects are, of course, sacred, and in the style of drawing resemble very strongly those of the Egyptian monuments, but are evidently inferior, having larger heads and disportioned bodies and limbs. Both these temples have been well illustrated and described by Thomas Daniell, R.A., and Captain Scaley; and for further information their respective works may be consulted. The Persians, too, like other ancient nations, employed bas-relief as a figure-writing, thereby recording and representing the symbols of the power and energy of the Divinity, their own religious ceremonies and warlike achievements. The sculptures still existing on the ruins of the palace of Persepolis and the royal tombs accord in many striking particulars with those taken to England by Belzoni. In both the figures are arranged in lines, either horizontal or perpendicular, to suit the double purpose of decoration and description. In both of them the natives of Egypt are distinguished by the hood with lappets, the mitre, the full hair artificially curled, the close tunic, the apron of papyrus; the Hindus, by the necklaces, bracelets and anklets; the Hebrews, by their long beards and hair in spiral ringlets, their tunic and tippets, with regular folds and large sleeves; the Medes, again, by their close tunic; while the Persians themselves, in many particulars, resemble the Hebrews. The comparison may be easily made by looking over the plates of Carver, Robert Ker Porter's 'Travels in Persia,' and those in Le Bruyn's 'Travels,' and then the engravings of Denon's and Belzoni's large works.

Since it has been well observed that the Greeks commenced in works of art precisely where the Egyptians left off, we find that the early bas-reliefs of Greece resemble pretty accurately those of Egypt. The objects are represented in the same hard and simple manner, and the marbles taken to England from the temple of ægina serve to fill up the history of sculpture, in the interval between its first introduction into Greece and its full development under Phidias at Athens, when that glorious work, the Parthenon, was produced under the auspices of Pericles.

The draperies in these early bas-reliefs are thin and meagre, showing the forms of the body and limbs; the folds regular, small and distinct, consisting chiefly of perpendicular and zigzag lines. Some of the head-dresses consist of small curls, very like the fashions of barbarous nations; and in a bronze patera in the British Museum the club of Hercules is ornamented with spiral flutes, like one brought by Captain Cook from the Sandwich Islands.

The best examples of bas-relief now in existence are to be found within the walls of the British Museum — those of the Elgin marbles, which are executed in this manner. In the same collection are the tombstones of Xanthippus, and a man curving a horse, both conjectured to be of the age of Phidias and which formed part of the Townley collection. In the collection of the Marquis of Lansdowne are caricatured and caricatured Barberini vase, formerly in the possession of the Duke of Portland, is of dark-blue glass,
bearing figures in bas-relief of white enamel or glass of admirable workmanship. Fragments of bas-reliefs of similar materials have been found in the ruin of Cesar's palace at Rome, where they had been fixed in the walls. The two triumphal columns of Trajan and Antonine are covered with bas-reliefs containing several thousand figures (the first, indeed, has 2,500 human figures, according to Vasi), without reckoning horses, elephants, mules and the implements of war.

BASAITI, bă-să'-ē-tē, Marco, celebrated painter of Greek extraction: b. Friuli about the middle of the 15th century. He settled in Venice, where several of his paintings, remarkable for the brilliancy of their coloring, and distinguished by other excellences, are seen. His masterpiece, now in the Venetian Academy, is 'The Calling of St. Andrew and St. Peter.' He was the contemporary, and not infrequently the successful rival, of Gian Bellini.

BASALT, a class of rocks belonging to the volcanic series, characterized by augite and plagioclase feldspar as essential constituents, and by iron ores (magnetite and ilmenite) as accessory minerals. Olivine is also present in typical basalts; among the rarer minerals are orthohombic pyroxene, black mica, hornblende, quartz, leucite and nepheline. Those varieties which contain notable quantities of olivine are known as olivine basalts, while the presence of leucite and nepheline characterizes the leucite basalts and the nepheline basalts. In texture the basalts vary from a finely crystalline apparently homogeneous mass to coarsely crystalline aggregates; but the normal type is a fine-grained, black rock, in which olivine is the only mineral that can be recognized without the microscope. The ground mass of the denser varieties contains more or less glass, due to the rapid cooling of the magma from the molten state. Basalts are extremely abundant especially in those regions which have undergone very little volcanic disturbance geologically recent times; in fact most of the volcanoes of the present day erupt basaltic materials. In the United States they occur mostly in the region west of the Mississippi River, where great areas have been flooded by fissure eruptions.

BASCINET, or BASNET, a light helmet, sometimes with but more frequently without a visor, and worn by knights at times when, though danger was indeed not actually imminent, it might not have been safe to be altogether unarmed. It resembled a basin, and hence its name. It was a general use for English infantry in the reigns of Edward II and III, and Richard II, and is frequently mentioned in Parliamentary and other public records.

BASCOM, Florence, American geologist: b. Williamsburg, Mass. She was educated at the University of Wisconsin and Johns Hopkins University, receiving from the first the degree of B.A. and B.L. in 1882, B.S. in 1884, and M.A. in 1887; and from the latter that of Ph.D. in 1892. She was the first woman to whom Johns Hopkins granted a degree and the first to receive a Ph.D. from any American college. She had much difficulty in securing admission to Johns Hopkins as a graduate student, the only concession to her sex being that she might attend the lectures on geology, and use the laboratory apparatus in that branch. Her thesis on receiving her Ph.D. was on inorganic geology, paleontology and chemistry being minor subjects. Subsequently she engaged in teaching, was assistant editor of the American Geologist, became professor at Bryn Mawr College, and in 1899 was chosen to supervise the geological survey of Chester County, Pa. She has written many papers for technical journals and been engaged in the preparation of the United States Geological folios which treat of the Piedmont Plateau of Pennsylvania.

BASCOM, Henry Bidleman, American clergyman: b. Hancock, N. Y., 27 May 1796; d. Louisville, Ky., 8 Sept. 1850. He was licensed to preach in 1813, and made chaplain to Congress in 1823; president of Madison College, Pennsylvania (1827–29); agent of the American Colonization Society (1829–32); professor in Augusta College, Kentucky (1832–42), and of the Transylvania University, Kentucky (1842). When the Methodist Episcopal Church was divided in 1844 he went with the Southern portion of the Church. He was one of the leaders in the debate which led to the division and also became a leader in the organization of the new body. In May 1850 he was made a bishop of the Methodist Episcopal Church South. He was the first editor of Quarterly Review of Louisville, now at Nashville (1846–50). His writings were published in 1856 (4 vols., Nashville). Consult his Life written by M. M. Henkle (Nashville 1856).

BASCOM, John, American educator and philosophical writer: b. Geneva, N. Y., 1827; d. Williamstown, Mass., 3 Oct. 1911. He was educated at Williams College and became president of the University of Wisconsin 1874–87, and from 1887–1909 professor of political science in Williams College. He wrote a number of philosophical works, among them 'Philosophy of English Literature' (1874); lectures before the Lowell Institute; 'Comparative Psychology' (1878); 'Sociology' (1887); 'An Historical Interpretation of Philosophy' (1893); 'Growth of Nationality in the United States' (1899); and 'God and His Goodness' (1901).

BASE. In architecture: (a) The part of a column between the bottom of the shaft and the top of the pedestal. In cases in which there is no pedestal, then the base is the part between the bottom of the column and the plinth. (b) A plinth with its moldings constituting the lower part (that which slightly projects) of the wall of a room.

In botany, a term applied to the part of a leaf adjoining the leaf-stalk, to that portion of a pericarp which adjoins the peduncle, or to anything similarly situated.

In chemistry, a body capable of replacing the hydrogen of an acid so as to produce a new compound called a salt, which contains the base and all the elements of the acid except the displaced hydrogen. The name was given by Rouelle in 1744, and is now loosely
used to signify a metal, a salt-forming oxide or hydroxide, or an organic body, such as an alkaloïd, an amide, an amine, pyridine, quinoline, etc., which is capable of combining with an acid to form a salt. When oxides combine with acids their oxygen unites with the liberated hydrogen of the acid to form water. A body (like caustic potash KOH), is said to be strongly basic when it forms salts that are very stable and are not altered by hot or cold water.

In fortification, the exterior side of a polygon is the imaginary line connecting the salient angles of two adjacent bastions.

In geometry: (a) The base of an ordinary triangle is its third side, not necessarily the one drawn at the bottom of the diagram, but the one which has not yet been mentioned, while the two others have (Euclid, book I, prop. 4, Enunciation). (b) The base of an isosceles triangle is the side which is not one of the equal two (ibid. prop. 5, Enunciation). (c) The base of a parallelogram is the straight line on which in any particular proposition the parallelogram is assumed to stand (ibid. prop. 35). It also is not necessarily drawn the lowest in the figure (ibid. prop. 47). (d) The base of a cone is the circle described by that side containing the apex which revolves (Euclid, book xii, def. 20). (e) The bases of a cylinder are the circles described by the two rotary opposite sides of the parallelogram, by the revolution of which it is formed (ibid. def. 23).

In heraldry, the lower part of a shield, or more specifically, the width of a bar parted off from the lower part of a shield by a horizontal line. It is called also base-bar, base and plain point (‘Glossary of Heraldry’).

In military affairs, see Tactics.

In ordnance, the protuberant rear portion of a gun between the knot of the casqued and the base-ring.

In sculpture, the pedestal of a statue.

In trigonometry, surveying and map-making, a base or base-line is a straight line measured on the ground from the two extremities of which angles will be taken with the view of laying down a triangle or series of triangles and so mapping out the country to be surveyed.

In zoology, that portion of anything by which it is attached to anything else of higher value or significance (Dana).

BASE HOSPITAL. See Hospitals, Military.

BASEBALL, a popular sport in the United States, of such general interest as to be known as “the national game.” It had its origin in the old English game of “rounders,” but developed on American soil into a very different sport. In Philadelphia an early form was played under the name of “town-ball,” and a similar game was known in upper Canada as early as 1838. It was in the neighborhood of New York, however, that baseball received its greatest development, regularly organized clubs contesting in the “Elysian Fields,” at what is now the site of the city of Hoboken, N. J., as early as 1845. It was not until 1857, however, that the baseball convention was held for the purpose of framing a code to bring under the united control of the various methods of each district and club, and in the following May the first “National Baseball Association” was organized.

The first real series of games played between organized clubs was that between teams picked from the various clubs of New York and Brooklyn on the old Fashion racecourse at Flushing, L. I., in 1838, the first authorized code of rules being formulated and published for their direction. From the present viewpoint these rules were crude. For instance, the regulation ball weighed 6½ ounces and measured 10½ inches in circumference. It was a lively ball (anticipating by 50 years the latest development of the golf-ball), being made with 2½ ounces of rubber, covered with yarn and leather. The bat was unlimited as to length, but was deen to the size 2½ inches in diameter. In the delivery of the ball there was a greater difference than in any other respect as compared with the later development of the game: for the ball could only be pitched; all throws and throws being prohibited. The pitcher was at liberty to take any number of steps before delivery, and his limbs not to snow beyond a line 12 feet across and 45 feet from the home base. Then, too, he could pitch his ball almost without limitation so long as he pitched as near as possible to the home base.

As then played, none but participants; indeed, no one could represent his club unless he had been a member for 30 days, and “money, place or emolument” was a bar. Games were originally played on free grounds, but on the establishment of the Union Ball Ground and the Capitol Club of Brooklyn in 1863, the admission money went to the proprietor, the players later having a share, and thus was laid the foundation of professional play. So matters drifted for six years, with a gradual tendency to greater restrictions in rules, greater skill in play, and more and more professionalism, until 1869, when for the first time a salaried team, the “Red Stockings of Cincinnati,” began a tour of games, and naturally carried everything before them. Through 1869 and up to June 1870, they played without losing a single game.

The delivery of the pitcher had been gradually developing. As early as 1860 the disguised underhand throw had come into vogue, and by 1869 Arthur Cummings, the junior Nine, introduced a curve delivery. With the advent of the swifter-playing professional, and the reduced size and weight of the ball, came into necessity, and therefore into use, the various safeguard of padded gloves, catchers’ mitts, breast-plates and masks.

By 1871 the game had become so extensive and the professional element so popular that a National Association of Professional Baseball Players was formed, and in 1875 the various club-owners took control of the professional players and organized “The National League of Professional Ball Clubs,” which continued in undisputed possession of the professional field until 1890, when a rival association, “The American League,” was founded. There are several other leagies of minor importance. Baseball naturally found favor in American universities and colleges, but its technique in the early days was crude, even among the best teams. Team play, as now interpreted, was almost unknown. The hitting was a matter of outwitting the various methods of each district and club, and in the following May the first “National Baseball Association” was organized.
team would make over 100. As late as 1867, when two college nines made, respectively, 13 and 8, it was considered a phenomenon. There is no intercollegiate championship in the ordinary sense; each college plays a set of games with other colleges. A full and exact knowledge of the game can be acquired only by a study of the official rules. Briefly, the game is played between two teams of nine men each, on a field in which a diamond-shape with sides of 90 feet each has been marked out according to certain rules, the apaxes of the angles being the home plate and first, second and third bases, reckoning to the right from the home plate. The pitcher's "box" is situated near the centre of the diamond about 60 feet from the batsman's stand, and from that point it is required to deliver balls to the batsman, pitched according to definite rules. The catcher stands behind the batsman; his principal office is to catch unhittable balls and return them to the pitcher, or to throw to the baseman when the batsman is making a run. The fielders are known as the infield, consisting of first, second and third baseman and shortstop; and the outfield, of left, right and centre fielders. The office of the first section is to catch balls and to throw them to the batsman running between bases, or, failing in this, to return the ball to the pitcher; that of the second section may be stated generally as the stopping or catching of batted balls and returning them to the pitcher or throwing them to the baseman for the purpose of putting out running batsmen. The positions and duties of the fielders are defined with strict limitations by the rules. The aim of each team is to make as many runs as possible. To score a run a player must make a complete circuit of the bases, but not necessarily at one hit. With his own hit he may get as far as first base; then may get to second base while the pitcher is delivering a ball to the second batter, and to the third base on the hit of that man, or even on the hit of the third batsman. When three men are put out, one inning is finished; and the other team takes its turn, with three men one after the other, and so on until there have been four outs on each side. A batsman is out who is touched by the ball after leaving one base and before he reaches another, or whose batted ball is caught by one of the fielders before it reaches the ground. The batsman is also declared out when hit by a batted ball; or when being forced to run for a base by reason of all bases being occupied, the ball is held by the fielder at the base for which he is making. The batsman must not step out of his box, and must strike at every ball that crosses the plate on a level between his knees and shoulders — such are called "fair balls." If he fails either to strike at or to hit it counts as a "strike" against him, and if he fails three times he is out, providing the third ball is caught by the fielders of the infield. After the pitcher delivers a ball which does not pass over the plate in the defined zone, it is counted as "one ball" in favor of the batsman, and after four such balls he is entitled to go to the first base. Baseball has been introduced into England, but without much success. In Canada, Australia and Japan it has become popular, while many Chinese also have become expert at the game.

BASEDOW, bä'ze-dö, Johann Bernhard, often called by himself Bernard von Nordalbingen, German educator: b. 11 Sept. 1723; d. 25 July 1790. He had in Dessau an institution for education called Philosophenkolon. The chief features of Basedow's system are the cosmopolitan character which he endeavored to instil into his pupils, and the full development of the faculties of the young at which he aspired, in pursuance of the ideas of Rousseau. With Salzmann, Campe, etc., he established some good institutions, and deserves special credit for his efforts for the education of the lower classes.

BASEDOW'S DISEASE (also called Graves' and Exophthalmic Goiter, a disorder due to excessive thyroid activity, characterized by rapid and irregular heart-action, large, protruding eye-balls, swelling of the neck, extreme nervousness and marked muscular tremor. An autonomic and a sympathetic type are recognizable. The vast majority of the mild cases is due to a faulty handling of the emotions, chiefly bound up in the function of self-preservation, but a not incon siderable group result from acute inflammatory disease of the thyroid, consequent upon an infection. A proper psychotherapy, psychoanalysis, will relieve the milder and psychogenic cases, which are in the majority. Surgical intervention is necessary in the severe inflammatory types. (See Goiter.) Consult Jelliffe and White, 'Diseases of the Nervous System' (1917); Fein, 'Hypothalamus and Gland Diseases'; Sattler, 'Die Morbus Basedowii'.

BASEL, bā'zel, BASLE, or BALE, bäl, Switzerland; one of the largest cities in the federation and capital of canton Baselstadt, 43 miles north of Bern. It consists of two parts, situated on opposite sides of the Rhine, and communicating by three bridges. A new granite structure since 1905 has replaced the old 13th-century wooden bridge so long a feature of the city, while attractive promenades have been laid out on the site of the mediæval walls and ramparts. The city is irregularly though fairly well-built, and has an ancient cathedral, or minster, consecrated in 1019, and the recently restored 16th-century city hall. Among the ancient churches note is made of St. Peter's, founded in 1459; various collections of paintings, a seminary for missionaries and a German Bible Society. In 1849 a large museum was completed, which contains the university library and all the collections belonging to the town. Its manufactures consist principally of ribbons, silk goods, cotton prints, linen, gloves, leather, jewelry and tinsware ware. Its advantageous position on the Rhine, a little below
the point where it becomes navigable, and at the terminus of the French and German railways, has made it a centre of trade and starting point for travel in Southland. It is the seat of a United States consulate. Basel was formerly a free imperial city, but joined the Swiss Confederacy in 1501. Buxtorf, Wetstein, Hermann, the Bernoullis and Euler were born in Basel. Erasmus also lived there several years. He was buried in the cathedral. Pop. about 133,000.

**BASEL, Confession of**, a Calvinistic confession introduced by Cecolampadius at the opening of the Synod of Basel (1531). It was adopted by the Protestants of Basel in 1534. Simple and comparatively moderate in its terms, it occupies an intermediate place between Zwingli and Luther.

**BASEL, Council of**, a council announced at the Council of Constance, and convoked by Pope Martin V and his successor, Eugenius IV. It commenced its sittings 14 Dec. 1431 under the presidency of the cardinal legate, Juliana Cesarini of Saint Angelo. The objects of its deliberations were to extirpate heresies (that of the Hussites in particular), to unite all Christian nations under the Roman Catholic Church, to put an end to wars between Christian princes and to reform the Church. The Pope, having learned that the Fathers were about to reopen a discussion upon Hussite doctrines already definitely pronounced upon, and also because of the expressed wish of the Greek bishops to reopen negotiations for reunion at a council to be held on Italian soil, instructed the cardinal legate to dissolve the Council. That body opposed the claims of the Pope, with severe animadversions, on his neglect of the welfare of the Church, and, notwithstanding his repeated orders to remove to Italy, continued its deliberations under the protection of the Emperor Sigismund, of the German princes and of France.

In order to secure itself against the attacks of Eugenius IV it re-enacted the decrees of the Council of Constance concerning the power of a general council (in matters of faith, of schism and of reformation) to command the Pope, as well as all Christendom, and to punish the proceedings of the clergy, and even of the Pope, by virtue of its judicial character as the representative of the universal Church. It likewise pronounced all the doings and remonstrances of the Pope against its proceedings of no force, and began a formal process against him after he had issued a bull for its dissolution; summoned him, term after term, to appear before its tribunal, and exercised as much as possible the papal prerogatives in France and Germany.

Meanwhile it concluded, in the name of the Church, a peace with the Hussites (whose deputies appeared 6 Jan. 1433, with 300 horse, in Basel), by which the use of the cup in the communion was granted to them. This peace was ratified 1 Nov. 1433 by the Calixtines, the most powerful and finally prevailing party of the Hussites. The Council deviated on this point, indeed, from the decrees of the Council of Constance, but was obliged to do so in order to assist its most faithful protector, the Emperor Sigismund, to the acquisition of Bohemia by this compromise, with the Hussites, who were not to be subdued by force. Eugenius IV revoked in 1433 his decree of dissolution, and at the 16th session, 5 Feb. 1434, was read a document subscribed to by the Pope, in which it was declared that the Council had been lawfully convened. In return the Fathers recalled everything that had been said against the person of the Pope or the dignity of his office. The Council, proud of its victory over the Pope, then attempted to interfere in the quarrels of the German princes, but was reminded by Sigismund, who protested against its interference in the affairs of the Crown, of its proper point—the reformation of the Church. Toward the limitation of the power of the Pope, a proceeding which naturally excited papal opposition, it had already made an important step by depriving him of the disposal of the prebends of cathedral and collegiate churches, which had been obtained by his predecessors; by restoring to the chapters the free election of their officers, and by obliging the Pope to confirm them gratuitously. It proceeded to the reformation of the clergy by ordaining that the excommunicated should not incur the penalties of their sentence before its publication; that interdicts should be granted at the request of single individuals, and that repeated appeals should not be allowed on account of their complaints (20th session, 22 Jan. 1435); that the annates (q.v.), the sums paid for the pallia, etc., should be regarded as simoniacal, and should not, under any pretext, be demanded or paid in future; that the divine service, the mass, and the canonical hours should be regularly observed by the clergy of each class; that disturbances of public worship should be prevented by a good ecclesiastical police; that the Feast of Fools and all irreverent celebrations customary in the Church should be abolished (21st session, 9 June 1435).

In the 23d session (25 March 1436) the form of election, the confession of faith and the official oath of each Pope, by which he bound himself to obey the decrees of the Council, and the annual repetition of the same, were provided for; all pretexts of the right of respite was forbidden, and the college of cardinals was limited to 24 prelates and doctors of all nations, who should be elected by the free votes of the college, should be entitled to half of the revenues of the states of the Church, should watch over the Pope and always sign his bulls. They granted him only the right to dispose of the prebends belonging to the diocese of Rome. and abolished the investiture of Church preferments in reversion.

In the 26th session it again summoned him to appear; on account of his disobedience of his decrees, declared him guilty of contumacy, and, after Eugenius had opened his counter-synod at Ferrara, decreed his suspension from the papal chair in the 31st session (24 Jan. 1438). In the same session it forbade appeal to Rome without resort to the intermediate jurisdictions, left to the papal disposition but one out of 10 and two out of 50 prebends of a church, and destined the third part of all canopies which might become vacant to men who had taken regular degrees. The removal of Eugenius, however, seemed to be so questionable a proceeding that some prelates, who till then had
been the boldest and most influential speakers in the Council (for example, the cardinal legate Juliano, and the great canon Nicholas of Cusa, archdeacon of Liège, with the most of the Italians), left Basel and went over to the party of Eugenius. The archbishop of Arles, Cardinal Louis Allemand, a man of great spirit, courage and eloquence, was now made first president of the Council and directed its proceedings with much vigor.

Although its number was diminished, its mission to the Protestor Eugene Sigmond, deceased, and its authority doubted by several princes and nations on account of its open rupture with the Pope, yet, in the 33d session (16 May 1439), after violent debates, in which the archbishop of Palermo, Nic. Tedeschii (known, under the name of Panormitanus, as the greatest canon of his time), who was the delegate of the King of Aragon and Sicily, took the part of the Pope—it declared Eugenius, on account of his obstinate disobedience to Allemand, or Allamand, and the emperor, deposed him, in the following session, as guilty of simony, perjury, violation of the laws of the Church and bad administration in his office. In the 34th session, June 1439, the Council pronounced his deposition of Eugene. At this session there were but two representatives of Spain and Italy, and the total number of prelates, including abbots, was 39.

Notwithstanding the plague, then raging in Basel, which continually diminished its number, it proceeded in a regular conclave (17 November of the same year) to elect the Duke Amadeus of Savoy to the papal chair. This prince then lived in retirement at Ripaglia, on the Lake of Geneva, and seemed particularly qualified for the office on account of his piety, his riches and his connections. But Felix V—this was the name he adopted—was acknowledged by only a few princes, cities and universities. The chief powers, France and Germany, assented to the decrees of the Council for the reformation of the Church, but they chose to remain neutral in the contest with Eugenius. Meanwhile he acquired new credit by the union concluded with the Greek deputies at Florence (but afterward broken) and the Greek Church, and the friendship of the Emperor Frederic III. The Council, on the other hand, denounced by Eugenius and deserted by its protectors, gradually declined under its feeble Pope, and, consulting only appearances and the personal safety of its members, held its 45th and last session, 16 May 1443, after an inaction of three years interrupted only by a few insignificant decrees. At this session the place of meeting was changed to Lausanne. Here some of the prelates remained together under the Cardinal Louis Allemand until 1449, when, after the death of Eugenius and the resignation of Felix V, they gladly accepted the amnesty offered by the new Pope, Nicholas V, and pronounced the Council closed.

The decrees of the Council of Basel are admitted into none of the Roman or official collections, and by the Roman Church are considered of no authority. They have been regarded, however, as of authority in points of canon law, in France and Germany, as their regulations (July until frost). It is a decidely mucilaginous when cooked. Sometimes it is used as a greenhouse climber. One variety bears edible tubers, and another furnishes a purple dye.

at subsequent dates have modified the application of them but never formally and entirely annulled them. The Council of Basel was one of the most important in the history of the Church. The spirit of the councils of Pisa (1409) and of Constance (1414-18) was formulated in the decrees of Basel, and led to a twofold result: on the one hand the many salutary decrees of reform, on the other the clear expression of many dangerous principles in regard to the organization of the Church. Its history has often been misrepresented by historians, some seeing it in it only an unhappy tendency from the true centre of unity; others regarding it as a great progressive movement, but forgetting that it was simply the growth of an expediency due to exceptional conditions. To know it impartially it must be studied in the original sources. Consult Hardouin, Labbé and Cossart; Mansi's collection consisting of 31 folios; Alzog, 'Church History'; Parsons, 'Studies in Church History'; Pérusse, G., 'Documents relatifs aux trente-trois et quart basiliques et conciles'; (Bulletin hist. et philol., year 1905, Nos. 3-4, pp. 364-398, Paris, 1906).

BASEL, Treaties of Peace at, 5 April and 22 July 1795, between Prussia, Spain and France, in which Prussia and Spain separated themselves from the coalition against France and acknowledged the republic. France retained the Prussian provinces on the left bank of the Rhine until the general peace, and accepted the mediation of Prussia when any German princes wished to conclude separate treaties of peace with it. A secret agreement was made in the treaty, the object of which was to secure compensation to Prussia in case the left bank of the Rhine should remain with France at the general peace. The Landgrave of Hesse-Cassel afterward concluded a treaty with the French republic at Basel 28 Aug. 1795, by which the latter retained possession of the territories of Hesse-Cassel on the left bank of the Rhine until the general peace. By the Peace of Basel all the conquests of France beyond the Pyrenees were restored to Spain, in exchange for which that country ceded to France the Spanish part of the island of San Domingo.

BASEL, University of, situated at Basel, an institution opened in 1460. After the Reformation it became strongly Protestant and exerted a widespread influence in behalf of the new faith. Among its professors were Erasmus, Cecolampadius, Euler and the Bernoullis. It is at present the principal theological school in Switzerland, with departments of medicine, law and philosophy. Its library contains 250,000 volumes and 4,000 MSS, chiefly dealing with the Reformation, besides other valuable collections and museums. There are about 950 students in attendance.

BASELLA, or MALABAR NIGHT-SHADE, a monotypic but very variable genus of tropical herbs of the natural order Chenopodiaceae. B. rubra, a twining annual or biennial plant, native of India, where it is cultivated as a pot herb, is often raised in Europe, and has been introduced into the United States as a substitute for spinach, which it succeeds in seasoning (July until frost). It is a decidely mucilaginous when cooked. Sometimes it is used as a greenhouse climber. One variety bears edible tubers, and another furnishes a purple dye.
BASEMENT, in architecture, the base or lowest story of a building. It should have extra thickness and height proportion to the rest of the edifice; but its height and proportion to the rest of the edifice are very various, depending on the character of the apartments on the ground floor.

BASEY, bà'sá, Philippines, a town in the province of Samar, on the north shore of San Pedro Bay. It has a population of about 14,000.

BASHAIR, one of the Punjab hill states, on the lower slopes of the Himalayas, traversed from east to west by the Sutlej; area, 3,820 square miles. The Rajah and upper classes in the southern parts are Rajputs, and the people generally are of the Hindu race, but their observance of Hinduism is very partial. The government is in the hands of a British resident. Pop. over 80,000.

BASHAN, bā'šàn or bā-shān (meaning uncertain, perhaps "soft, rich soil"), the name in Scripture for a singularly rich tract of country lying beyond the Jordan, between Mount Hermon and the sea of Galilee; it was divided between Reuben and Gad, while Bashan was given to the half-tribe of Manassas. Its forests contain magnificent oaks, and the "strong hulls of Bashan" of ancient times are still represented by vast herds of black cattle. Bashan had been the kingdom of the Canaanite giant Og, whom Moses destroyed; and one district of the country, Argoth, had at that time 60 fenced cities, with walls, gates and bars, besides many unwalled towns, remains of which are yet to be seen. Among the cities of this region were Edrei, Kenath, Golan and Bozran. After the captivity it is mentioned as divided into Trachonitis (the ancient Argoth), Gaulanitis (Golan), Auraniis (Hauran, mentioned by Ezekiel) and Batanea, or Bashan proper.

BASHAW, Edward, English Non-conformist theologian; d. Newgate 1671. He was imprisoned in Newgate because of his refusal to take the oath of allegiance and supremacy. He is the author of 'Antiscionian Dissertations,' and a 'Dissertation on Absolute Monarchy.'

BASHFORD, James Whitford, American clergyman and educator; b. Fayette, Wis., 27 May 1849. He was graduated at the University of Wisconsin in 1873, and at the Theological School of Boston University in 1876; became instructor of Greek at the University of Wisconsin in 1874, and president of the Wesleyan University of Ohio from 1889 until 1904, when he became a bishop of the Methodist Episcopal Church. His works include 'Science of Religion' (1891); 'God's Missionary Plan for the World' (1907); numerous published sermons, and contributions to periodical literature.

BASHI-BAZOUKS, properly BOZOUCKS, irregular in the pay of the Turkish Sultan. The term means "light-headed." They are a wild, turbulent body of men, mostly from Turkey in Asia, and in the duties with which they are entrusted resemble the Cossacks in the former Russian imperial army. In 1876 the Bashi-Bazouks were guilty of great atrocities in checking a threatened insurrection in the district of Sirdi Feth, but its height and proportion to the rest of the edifice are very various, depending on the character of the apartments on the ground floor.

BASI-BAZOUKS, properly BOZOUCKS, irregular in the pay of the Turkish Sultan. The term means "light-headed." They are a wild, turbulent body of men, mostly from Turkey in Asia, and in the duties with which they are entrusted resemble the Cossacks in the former Russian imperial army. In 1876 the Bashi-Bazouks were guilty of great atrocities in checking a threatened insurrection in the district of Sirdi Feth, but its height and proportion to the rest of the edifice are very various, depending on the character of the apartments on the ground floor.

BASIL — BASILIAN MONKS

Tree basil (O. gratissimum). The name basil is also applied to certain species of several other related genera; for instance, Karia and Calamintha. For culture and uses, see Hizana (Culinary).

BASIL, bà'zil or bázil, Saint, surnamed THE GREAT, bishop of Cesarea, Cappadocia; b. Cesarea, in Cappadocia, probably 329; d. 378. He was studying in Athens, and there became the friend of Gregory, afterward Bishop of Nazianzus. He was baptized in 357, and after extensive travels retired to the desert of Pontus and there founded an order of monks named Basilians. He succeeded Eusebius in the see of Cesarea in 370, denounced the apostasy of the Emperor Julian, and by his opposition to Arian doctrines greatly offended the Emperor Valens. The liturgy of Saint Basil—not wholly his—is still used in the Eastern Church, and his rule is still observed in the monastic institutions. In his doctrine he emphasized the trinity rather than the unity of the Godhead, and he declined to admit the claims of the school of Rome to the supremacy, even if he stood out as the champion of orthodoxy in the East, and promoted union between the two great branches of the Church. With Gregory of Nazianzus and his brother Gregory of Nyssa he is considered to be the author of what is called "Cappadocian theology." He was a voluminous writer of theological subjects, "in purity and perspicuity surpassing most of the heathen as well as the Christian writers of his age." Consult Murray's "Dictionary of Christian Biography" (London 1911).

BASIL I, Roman Emperor in the East; b. Macedon, of poor parents, about the beginning of the 9th century; d. 880, from a blow given him by a stag while hunting. In his 25th year he made his way to Constantinople, and gained the favor of an archimandrite, who procured him service with an officer of the court of the Emperor Michael III. Later he was appointed head-chamberlain to the Emperor. Despite intrigues against him he advanced so rapidly in the Emperor's favor that he was adopted as his colossal by his chief rival, Bardas. And knowing that Michael had rendered himself odious by his cruelty and debauchery, he headed a body of conspirators and murdered him in his bed in 807, and usurped the throne. Notwithstanding his criminal acts, he proved an able and equitable sovereign, paid equal attention to the internal administration and the foreign relations of the empire, and not overlooking even its religious interests, sent an archbishop into Russia and laid the foundation of that ascendancy which the Greek Church has so long possessed in that country. He compiled a body of laws called the Basilica, which, augmented by his son and successor, Leo the Philosopher, were in force till the fall of the empire. Basil I deprived Photius of the see of Constantinople, and restored Ignatius; but on the death of the latter he recalled Photius. He successfully carried on war with the Saracens. The versatility, if not the depth of his intellect, is strikingly displayed in his exhortations to his son Leo, which are still extant. Consult Vogt, "Basil I" (Paris 1908).

BASIL II, Roman Emperor in the East; d. 1025. On the death of his father, the Emperor Romanus the Younger, in 963, he was kept out of the succession for 12 years by two usurpers; the first, Nicephorus II (Phocus), who died in 969, and the second, Johannes (John) Zimisces, who associated Basil and his brother Constantine with him in the empire in 975, and died the following year, leaving the whole power to Basil although Constantine was still his colleague in name. His reign was almost a continuous warfare, in which the contending parties seemed to vie with each other in committing deeds of cruelty. In 1014, after a great victory over the Bulgarians, in which he had taken 15,000 prisoners, he had 99 out of every 100 deprived of their eyes and thus sent home. The sight of this horrible cruelty perpetrated on his soldiery caused the death of Samuel, King of the Bulgarians. The war ended in 1018 by the complete conquest of Bulgaria.

BASILEAN MANUSCRIPTS, two manuscripts of the Greek New Testament, now in the library of Basel: (1) a nearly complete uncial copy of the Gospels of the 8th century; (2) a cursive copy of the whole New Testament except the Apocalypse, of the 10th century.

BASILIAN, bá-šé-lé-an, Philippines, the largest island of the Sulu Archipelago. It is of oblong form, about 36 miles long and situated south of Mindanao, from which it is separated by a strait nine miles wide. The island is mountainous, and most of it is covered by virgin forests. The soil is rich and produces a variety of valuable crops, including cotton, coffee, sugar, chocolate, tobacco, indigo and spices of all sorts. Basilian has about 8,000 inhabitants and three excellent harbors. The name is also applied to the whole group of 34 adjacent islets; total area, 350 square miles. The leading port is Isabella, on Basilian Strait, 550 miles from Manila.

BASILIAN LITURGY, that form for celebrating the eucharist drawn up, toward the close of the 4th century, by Basil the Great, still used in the Greek Church.

BASILIAN MONKS, a monastic order, chiefly belonging to the Greek Church, who strictly follow the rules of Basil, the great Saint Basil (q.v.), who, after visiting the monasteries of Egypt, Syria and Palestine, induced many to enter the monastic life and even to found convents. His rule, which was founded in 358, was confirmed by Pope Liberius in 363. In 379 there were at least 80,000 in the eastern monasteries. Many convents were dispersed in the 8th century during the Iconoclast persecutions, and all began to languish about the time of the eastern schism. The order now comprises priests, lay-brothers, cenobites living in community, anchorites in cells and hermits in solitude. They are governed by an archimandrite who has several convents under his jurisdiction, and by exarchs deputed by the archimandrite to visit the convents. The order has developed more extensively in Russia than in other countries. In Austria, Poland and Hungary there are many communities, known as Ruthenians, in union with the Roman Catholic Church. In Italy also they have centers in Calabria, Sicily and Naples. In Spain they flourished for nearly two centuries until 1835, when they were suppressed. The communities
of Sisters of Saint Basil were founded by Saint Maerian, sister of Saint Basil. Other communities following the rule of Saint Basil are the Melchites in Libanus; the Bartholomites of the Armenian rites, so called because, after taking refuge in Genoa in 1307, they had possession of Saint Bartholomew's Church there until 1809.

Saint Basil, in the monastery which he founded near Neocaesarea, set his face against the very ascetic tendencies which had already asserted themselves in monastic life in the Catholic Church. While strongly insisting on fasting and prayer he maintained that neither should be allowed to interfere with work, which should always form an integral part of the life of every monastery. He taught that monasteries should be near towns in order to permit the monks to extend aid to all those who required it, which it was the duty and obligation, he asserted, of every monk to give. His program insisted upon common meals, common work and common prayer, the latter seven times a day, under the unquestioned obedience to the superior, self-denial, chastity, renouncing of all wealth and property were exacted by Saint Basil of all who entered his monastery. During his life the members of the order were cenobites, never hermits, for whom he had little respect. So strong became the influence of the Basilians that they practically drove the hermit orders out of Cappadocia and the neighboring provinces and finally established their order as the all-prevailing form of monasticism throughout the Greek and Slavonic countries. About the beginning of the 9th century Theodore, abbot of the monastery of Studium, in Constantinople, gave a real constitution and codified laws to the order of the Basilians. These were gradually adopted by all the monasteries of the order throughout Greece and, later on, by all those in the Slavonic countries. This explains the statement often made that the Rules of Basil and the Constitution of Theodore the Suidet, with the Canons of the Councils comprise the greater and most important part of the monastic law of the Greek Church. Theodore made the sphere of action and the aims of the order very definite, dividing the day time between work, reading, liturgical services of the Church and prayer. The work element tended to make the order very popular so that Theodore had in his own monastery over 1,000 monks, many of whom were counted among the most famous抄者 of manuscripts in Constantinople, then the most celebrated centre of learning in the East.

The first Russian monastery was founded at Kiev about 1050 by a monk from the great Basilian centre of Mount Athos, in Greece; and in less than a century the order had spread pretty well over the domains of the Tsar, from which it was rapidly extended to all the other Slavonic countries. In Russia there exist today nearly 500 monasteries, in Turkey over 100, and in all the Slavonic countries outside Russia over 300. In Turkey Among the 4,000,000 people following the Rutenian rites there are numerous Basilian monasteries which, while owing allegiance to Rome, follow, in practically every other respect, the rules and customs of the Greek Church. In all the salons on their calendar are those of the East and not those of the West, and they adhere strictly to the rules of the order as laid down by Basil and Theodore. Most of the adherents of the Lithuanian faith are to be found in Galicia; but there are more than half a million of them in Austria, principally in the Polish part. In fact, the order is represented in every part of ancient Poland. In Hungary, where the Basilian order was once strong, it now has but little influence. The monasteries among the Armenians are nearly all under the rule of Saint Basil.

**BASILICA.** The word basilica (meaning a kingly or magnificent building) is of Greek derivation, but the buildings so termed appear to have originated with the Romans. The basilica edifices of the Greeks and Romans were the courts of justice and commercial meeting places of the people. The judicial court was presided over by the archon basilicus. As its title describes, it was a building of magnificence, complying with the importance it held in the civic functions. The basilica style of construction was that used for the earliest of the churches of the primitive Christians, and it is claimed by some authorities that the first Christian worship in public (on Constantine's accepting the Christian creed) was held in the pagan basilicas.

The typical basilica was an oblong edifice surrounded by a colonnade (peristyle) and the interior also was divided by rows of columns. Vitruvius says the old Roman basilica was closed in by a wall having a doorway within it, or was freely open like the Greek Colonnades. The interior of the building was divided lengthways, by two rows of columns, into three naves, the central one being the widest. At one end was the tribunal where the seated judges presided over the public court, and the opposite end was the entrance. The early Christian basilica was planned on the above lines. The interior of the Constantine style of basilica has been described as being divided into the three following open sections or spaces: Starting with the pronaos, destined for the catechumens, next came the chorus, where the choristers, instrumentalists, and exorcists performed their functions. Lastly, beyond, was the sacrarium, where the altar was located, near which the deacons and sub-deacons were seated. The abside (apse) or presbyterium held the ordained priests on a semi-circular bench (constitutium) interrupted in the middle by a more elevated seat (sagistus) reserved for the bishop. The side aisles received the congregation (men at the right, women at the left). Most basilicas had an atrium or narthex (covered vestibule supported by columns) as entrance. The early buildings were covered with a flat, wooden roof.

About the first innovation in basilica structure made by the early Christian Church was the extension from the main building of the apsis, usually in semi-circular form. The roof over the central nave was also raised a story higher than the side walls (clerestory), affording light from windows in the extended walls. Other excrescences crept in from time to time, such as side chapels for special functions, and even towers on the front walls. Some authorities define the basilica period as from 300 to 800 A.D.
Pagan Basilicas.—Probably the first basilica was that erected in Rome by Cato Censorinus (184 B.C.)—the basilica Porcia. Other noted ancient pagan basilicas in Rome were: Basilica Semproniana, erected by Tiberius Sempronius Gracchus; basilica Opimii, by Consul Quintus Opimus (151 B.C.); basilica ΆEmilia, by ΆEmilius Paulus; basilica Julia, commenced by Julius Caesar and finished by Augustus (about 25 A.D.). Three moderate-sized basilicas were discovered in Pompeii. Vitruvius wrote a description of the basilica built by him at Favo.

Christian Basilicas.—Of basilicas that were in ancient Rome we know of: Saint Peter’s, Saint Paul’s, those of Saint John Lateran, Saint Clement, Sta. Maria in Trastevere and Saint Lawrence. Present existing basiliicas in Rome are: Saint Peter’s, Saint Paul’s, those of Saint John Lateran, Saint Clement, Saint Nereo and Achilleo, Sta. Maria Maggiore, Saint Paul’s without the walls (reconstructed 19th century). Other noted basilicas are: Saint Apollinaris in Classe, near Ravenna; Saint Apollinaris in Ravenna; Torcello Cathedral, near Venice; Saint Anabrose, Milan; Saint Restitua, Naples. In Germany are: The Cathedral at Treves, built about 4th century (has one story and flat roof); Saint Godhard and Saint Michael in Hildesheim; the Abbey Church in Quedlinburg. In England are, notably: Saint Barnabas at Oxford and Saint James at Leicester. Saint Jean-Baptiste Church, Lexington avenue and 76th street, New York city (recently erected), is said to best represent the basilica style of any edifice in the United States.

CLEMENT W. COUMBE.

BASILICA, a code of laws founded on the code of Justinian, supposed to have been named
BASILICATA — BASILISK

after the Greek Emperor Basilus I, in whose reign its compilation was begun. It was finished by Leo the Philosopher and revised by order of his son Constantine Porphyrogenitus in 945. It consisted of 60 books, but we no longer possess them in a complete form. The principal editions are those of Fabrot (7 vols., Paris 1647), and Heimbach (Vols. I–V, Leipzig 1833–50).

BASILICATA, bā-zil'i-kā-tā, the ancient Lucania, in southern Italy, composed solely of the province of Potenza; so called after the Emperor Basilus II, who reconquered it from the Saracens and Lombards in the 11th century. It is mountainous, several peaks rising to upwards of 4,500 feet (Monte Pollino, 7,375 feet). The Apennines here divide into two parts, which branch off to the east and west. From these the rivers Bradano, Basento, Sandlerella, Agri and Sinni take their source, and after draining this fertile district, fall into the Gulf of Taranto in the Ionian Sea. There are also many lakes, some of volcanic origin. The chief are Monticchio, Pesole, Maorno, and Santa Palagiana. The bulk of the people are poor and ignorant, and talk a dialect called basilisco. Its coast line being for the most part marshy, and, as a consequence, unhealthful, the province derives next to no commercial benefit from it. The orange and lemon grow well near the coast. Other products are cotton, flax, silk, hemp, wax, licorice, dried fruit, saffron, tobacco, etc. Most of the woods are Leon, chiefly sulphurous. There are marble quarries at Avigliano, Latronico, Muro, Lucano and Picerno; chalk at Mauro Forte and Montemuro; transparent quartz at Lagonegro; tufa at Matera; and excellent lignite at San Chirico Raparo and Rotonda. Area, 3,845 square miles; pop. about 490,800.

BASILICON, bā-zil'i-kōn, a name of several ointments, the chief ingredients of which are wax, pitch, resin and olive oil.

BASILICON DORON (the royal gift), the title of a book written by King James I in 1591, and printed in Edinburgh in 1603, containing a collection of precepts on the art of government, and maintaining the claim of the king to be sole head of the Church.

BASILIDES, bā-zil'i-dēz, founder of one of the most remarkable sects of ancient Alexandria. He lived under the reigns of Trajan, Adrian and Antoninus, but the place of his birth, supposed to be in Persia, Syria or Egypt, is unknown. He was well acquainted with Christianity, but, under the pretense of freeing it from corruption, corrupted it still more by mixing it up with the wildest dreams of the Gnostics and polluting the earth and the air with multitudes of demons. He had numerous followers who spread from Syria and Egypt into Italy, and even as far as France, but they suddenly sank into obscurity and are scarcely heard of after the 4th century.

BASILIO DA GAMA, José, Brazilian poet; b. San José 1740; d. Lisbon 1795. His principal poem gives a picturesque and romantic account of the bloody wars which the Portuguese waged, in 1756, against the natives of Paraguay. He was a protégé of the Brazilian Minister Pombal, who gave him employment in his Cabinet. He shared Pombal's exile, and also dedicated verses to him in token of his gratitude. On his return to Rio de Janeiro he was favorably received by the authorities, and the poet, with the subscription collected by the literary notabilities, and with their co-operation he became one of the founders of the first Brazilian Academy. In 1790 he again had to resort to flight, and he succeeded in escaping to Lisbon. He was the author of many lyrical pieces and sonnets, and of a prose poem, "Quintilha," written in honor of a chieftain whose devotion to Portugal engaged the poet's sympathy; but the most abiding monument of his genius is his "Urugua," which is still popular wherever the Portuguese language is known.

BASILISCUS, brother of Verina, wife of Leo, Emperor of the East; d. a.p. 477. In his youth he obtained some successes against the Scythians, and in 468, through the influence of his sister, was appointed to command the immense armament fitted out at Constantinople against Genseric, King of the Vandals in Africa. This expedition consisted of upward of 1,100 vessels, conveying soldiers and sailors to the number of more than 100,000 men, and its equipment is said to have cost about $25,000,000. But the marshy and unhealthy coast of Africa in safety, was altogether destroyed or dispersed by Genseric, through the incapacity or treachery of its leader. Basiliscus escaped to Constantinople, and obtained the pardon of the Emperor, partly by the earnest intercession of the Empress. After the death of Leo, and of his successor, Leo II, in 474, Basiliscus usurped the imperial throne. But he was unable to sustain himself in this position, and was not long after overthrown and put to death by Zeno, the legitimate heir.

BASILISK, bā-zil'isk, according to Pliny (lib. viii. c. 21), a kind of serpent found in the African deserts, named basiliskos, or little king, because its body was marked with bright spots, and those on the head had the appearance of a crown or diadem. It had a very pointed head, with fiery eyes, and was of a dark color, varying to blackness. All other snakes were said to fly from the sound of its hissing; and instead of trailing along like other serpents the basilisk raised its body nearly erect, and, as it passed along killed the herbs and flowers with its heat and even by its breath. Yet this monster was destroyed by weasels. If these fables had reference to any real animal, it is probable that it was a species somewhat similar to the cobras de capello, or the asp viper. Both are accustomed to erect a very considerable part of the body, though not to move forward in this way. It is highly probable that the basilisk of the ancients was merely a creature of fiction. The name is now applied to one of the Central and South American lizards of the family Iguanidae and genus Basiliscus, remarkable for the high and erectile crests which are developed along the back and tail of the males. They have long legs and long flexible toes, enabling them to climb trees with great acuteness, and prefer such trees as overhang the water, into which they plunge at any sign of danger. They feed entirely upon vegetable matter. The best-known species is Basiliscus americanus, which has a length of nearly three feet, three-fifths of which is the tail. In color the basilisks are green and brown, with dark cross-bars on the back.
and the crest of the males is red. In early spring they lay about a dozen eggs in a hole among the roots of a tree. See also Iguana.

BASILOSAURUS. See ZEUGLODON.

'BASIN, in physical geography, the whole tract of country drained by a river and its tributaries. The line dividing one river basin from another is the watershed, and by tracing the various watersheds of each country you divide it into its constituent basins. The basin of a lake or sea comprises as well all the territory drained by the rivers which run into it. Such hydrographic basins owe their origin either to erosive action or to a depression of the earth's crust. When rivers become established upon a new land surface they proceed to deepen and widen their channels, and in course of time may appreciably lower the level of the drainage area. Glaciers are also important agents in the establishment of hydrographic basins, as is illustrated by the numerous rock basins (now occupied by lakes) that were hollowed out by the great ice-sheets that once invaded northern North America and Europe. Other depressions have been formed by vertical movements of the strata comprising the earth's crust. The Great Basin lying between the Rocky Mountains and the coast ranges, and many of the lake basins of central Africa, originated in this way. In geology a basin is the synclinal arrangement of strata so that they dip or are inclined toward a common centre. The Paris Basin and the London Basin are familiar instances. See River; Lake; Valley, etc.

BASINGSTOKE, England, town and parish of Hampshire, situated near the source of the Loddon, 13 miles north-northeast from Winchester. It streets are well built, paved and lighted, and the town is amply supplied with water. It has a town-hall, containing a spacious corn-market and ballroom. It has also a fine Gothic church, erected in the time of Henry VIII, of several other places of worship; a mechanics' institute, with good library; and numerous charities. A considerable trade is carried on in corn, coal, timber and malt, and it has manufactures of agricultural implements, malt, liquors, etc. In the neighborhood are the ruins of Basing House, belonging to the Marquis of Winchester, which withstood the forces of the Commonwealth for four years, but was at last taken by Cromwell and burned to the ground in 1645. Pop. 11,540.

BASKERVILLE, Charles, American chemist; b. Noxubee County, Miss., 18 June 1870. In 1886–87 he studied at the University of Mississippi and in 1890 was graduated at the University of Virginia. He also studied at Vanderbilt University and at the University of Berlin. From 1891 to 1904 he was successively instructor, assistant professor and professor of chemistry and director of the chemical laboratory at the University of North Carolina. In 1904 he was appointed professor of chemistry at the City College of New York. Professor Baskerville discovered the chemical elements of carbolinium and berzelium and has invented processes for refining oils, etc. He has made extensive investigations in the chemistry of anesthetics and in the applications of radium in medicine. He has written 'School Chemistry' (1898); 'Radium and its Applications in Medicine' (1909); 'General Organic Chemistry' (1909); 'Laboratory Exercises,' with R. W. Curtis (1909); 'Progressive Problems in Chemistry,' with W. L. Estabrooke; 'Qualitative Analysis,' with L. J. Curtman; collaborator in 'Municipal Chemistry'; 'Anaesthetics,' with J. T. Gwathmey; also scientific and educational and technological articles in various periodicals.

BASKERVILLE, John, English printer and artist; b. Wolverley, Worcestershire, 1700; d. 1775. Inheriting a small estate, he was brought up to no profession, but, in the 1st century skill in penmanship and carving letters on stone, at the age of 20 he settled at Birmingham as a writing-master. He subsequently engaged in the manufacture of japanned works, and in 1750 entered up his business in his productions. His first great work was an edition of Virgil, in royal quarto, 1756, which was followed by many of the Latin classics, and English works, in quarto and smaller sizes. After his death his types and matrices were sold to Beaumarchais at Paris for £3,700. Baskerville prints are in continuous demand in England to-day.

BASKET, a vessel made of osier twigs or other flexible materials, as rushes, strips of wood, splits of bamboo, rattan, etc., and used for holding and carrying all sorts of commodities. The word is of Britanno-Celtic origin and still subsists in the Welsh language in the form Bagwad, from Bagw, plaiting, net-work: it was adopted into the Latin language in the 1st century with form little altered—Bascauda. The baskets made in Britain were highly prized by the Romans, and the poets Juvenal and Martial make mention of them as articles of no trifling value. They were evidently regarded as rare exotic curios in Juvenal's day, for the poet, in drawing an exaggerated picture of the shipwreck in which his friend Catullus threw overboard his most cherished possessions, couples Bascaudae (baskets) with articles of chased silver wrought by famous artists (Sat. i, 114). And Martial (xiv, 99) makes the British basket say of itself:—

"Barbara de pictis venit bascauda Britannia,

Sed me jam navat dicens Romae

"The Basket Barbaric, I'm come from the painted Britann, But Rome now would choose rather to title me Roman."

In primaeval times basket-making was a branch of the art of weaving, and both of these arts grew out of the still more primitive one of wattling, first employed in making enclosures. Tylor ('Early History of Mankind') notes the existence of wicker-weaving among primitive tribes throughout the world. This is the first step in the art of weaving textile fabrics. It is practised, or rather was practised, by the natives of New Zealand and of northwestern America, and as late as 1856 by an Indian tribe living northwest of Lake Huron. In the lake habitations of Switzerland and Germany have been found small wicker-weaving work consisting of strands of untwisted fibre, probably hemp, bound together by transverse strands wattled in among them; and in the same localities have been found specimens of the same kind of weaving but of progressively higher and finer type. There is even a genetic relation between the arts of
basket-making and pottery, proved by specimens of rude pottery found in all quarters of the world; in these are seen the impresses of the basket-work on which the clay was spread, and which was burnt away in the kiln. Even after the art of molding the clay without the basket-work frame was invented, the potters seem to have imitated the markins left by it. Among the Indians of the Mississippi Valley along the Gulf, all pottery vessels of large size used to be modeled in baskets of willow or splints, which, being burnt off, their markings remained. Shields of basket-work covered with hide were in use among the Britons at the time of Caesar's invasion, and similar shields are still employed by primitive peoples wherever they live in savage isolation. Boats, too, of basket-work, with a covering of hide (coracles), were used by the ancient Britons, and boats of the same type were seen by Herodotus (4, 194) navigating the Euphrates. These were of round form, without distinction of bow and stern, and similar boats are still in use on some rivers in India. On account of its lightness, combined with strength and durability, basket-work is preferred to joinery in the manufacture of various commodities, as window-screens, pony-carriage bodies, chairs, tables, etc. In South America the natives weave baskets of rushes capable of holding liquids, and those of Tasmania, now extinct, used to weave of leaves water-tight vessels. The material most commonly employed in basket-making is the willow or osier twig, and the production of this material is an important industry in France, Germany, Belgium, Holland and Britain. The product of France and Britain is the most highly esteemed for firmness, toughness and evenness; that of Germany is reputed inferior to the French; the Dutch product is in least esteem, being soft and pithy. Besides osier twigs, a great variety of other materials are employed in basket-making. In this country coarse, strong baskets are made of shavings or long broad splits of various tough woods. In China and Japan the usual materials are bamboo and rattan, and the Chinese and Japanese excel in the manufacture of water-jugs, and their products being unrivalled for fineness, elegance and finish; and some of their work, as in the encasing of the egg-shell porcelain of the Japanese, is marvelous for the delicacy of the manipulation; even the examples seen in our marts, of core mon while porcelain saucers so encased in basket-work, are worthy of admiration for painstaking workmanship. The fronds of the Palmira palm, originally employed in India in making "Cajon" baskets, now afford a staple material for use in the art throughout the world. So, too, Phormium tenax, native of New Zealand, which yielded to the natives of that country their peculiar basket-making material, is now employed in all countries for the same purpose.

Basket-making is one of the simplest of the mechanic arts; and the workman, in making baskets designed for use, not for ornament or to please the fancy, has no absolute need of tools or apparatus beyond those requisite for cutting the rods and interlacing them — a knife and a bodkin, with a mallet to beat them into place. The process can be learned in principle by inspection of a basket-maker at work in fashioning a basket from the foundation to the rim. Having provided a sufficient quantity of rods or splints of much greater length than the proposed dimensions of the finished work, he lays a number of them on the floor in parallel pairs at small intervals in the direction of the longer diameter of the basket; this is the wool, so to speak. Then these are crossed at right angles by two of the largest osiers, with their thick ends toward the man, who places his foot upon them; next, each of these is woven alternately over and under the lengthwise parallel pieces, and thus the parallel pieces are held fast; this is the *slat*—the foundation. Now the end of one of the two transverse rods is woven over and under the lengthwise rods all round the bottom till that whole rod is worked in; and the same is done with the other transverse rod, and then additional long osiers are woven in till the bottom is of the required size. The bottom is now finished and work begins on the superstructure by driving the sharpened large ends of a sufficient number of long, stout osiers between the rods at the bottom from the edge toward the centre; these are the ribs or skeleton, being in the direction of the sides; between these ribs other rods are woven in till the structure reaches the desired height. To finish the edge the ends of the ribs are turned down over each other and thus compactly united. A handle is added by forcing two or three sharpened rods of the requisite length down through the weaving of the sides, close together, and pinning them fast a little below the rim; the rods are then either bound or plaited in any way the workman chooses.

Our North American Indians were once among the most expert basket-weavers in the world. Now only the older Indians know the art, and certain tribes whose work was incomparably fine and beautiful have already lost it. After much pauperizing under the abominable reservation system, it was decided that the Indians needed an industry to save them from sinking still lower. Lace-making, after Brussels and French patterns, was first superimposed on a Minnesota reservation, and is there it has spread. Now, lace-making, which has been developed by the European woman, fits her like a glove; and quite as truly, basket-making fits the Indian like a moccasin. Yet the Indians have succeeded at making lace, for the most part, with remarkable skill with the fingers. An enlightened administrator of Indian affairs has taken up the task of human development in the right way and has made plans to revive basket-making by introducing it into the government Indian schools, where the children, who now know nothing of this beautiful art, may learn from the only masters capable of teaching them — their own people, directed by white teachers who know the needs of the constantly changing market. Hundreds of thousands of dollars' worth of baskets are imported from Japan and Germany every year — money which by every right should be earned by our capable and needy Indians; and better than the money they will earn is the satisfaction of doing what they do with surpassing skill.

**BASKET-BALL**, a distinctly American game. Its history begins in 1891, when a lecturer in psychology at the Young Men's Christian Association Training School, in Springfield, Mass, suggested, as an
exercise of inventiveness a game that would comply with certain conditions. One of his pupils, James Naismith, taking note of the hypothetical conditions indoors — limited area, limited number of contestants, equally applicable to either sex, etc. — applied his mind to meet those conditions, and invented "basket-ball." It is played on a marked oblong square containing not more than 3,500 feet of actual playing-space, by teams of five each, known respectively as centre, left and right forwards, and left and right backs. The ball is round and inflated, not less than 30 or more than 32 inches in circumference, and very like that with which Association football is played. The goals are hammock nets of cord, suspended from metal rings 18 inches in diameter, and placed four feet apart, in the centre of the ends of the playing-space. The time of playing, for seniors, is two halves of 20 minutes, with an interval of 10 minutes; and for juniors, two halves of 15 minutes, with a similar interval. No kicking of the ball, with the foot or hitting with the fists, is permitted. The ball must be held by the hands only. Consult Naismith and Gulick, 'Basket Ball'; Spalding's Athletic Library, New York 1894; Fisher, H. A. (Ed.), Official Collegiate Basketball Guide (Spalding's Athletic Library, New York, annual); Smith, T. H., Official Basketball Guide (Fox's Athletic Library, New York 1906).

BASKET-FISH, a name given about 1670 by John Winthrop, governor of Connecticut, to the Astrophyton ogasmani. It belongs to the greater is allied to the sand-stars but differs in the arms being much branched and ending in long, slender tendrils which are so much interlaced as to suggest basket-work. It is very large, the disc being two inches across, and the entire animal often a foot in diameter. It lives off the coast of New England in from 10 to 100 fathoms of water. Other names are "Medusa's-head" and "Sea-basket."

BASKET-WORM. See Bag-Worm.

BASKETT, James Newton, American zoologist and novelist: b. Nicholas County, Ky., 1 Nov. 1849. He was graduated Ph.B. at University of Missouri in 1872, and M.A. in 1893. Later he became well known as a civil engineer and historian, and as the author of accounts of Spanish expeditions in the south and southwest of early dates. His papers include the 'Route of Cabeza de Vaca' (Texas Historical Society); 'Route of Coronado to Quivira' (Report Kansas Historical Society); and of numerous contributions in journals and magazines bearing on natural history. He has been a special student of the diving rod and other submerged endowsments, is a lecturer on many subjects, especially birds, and the author of 'The Story of the Birds' (1896); 'The Story of the Fishes' (1899); 'The Story of the Reptiles and Amphibians' (1902); 'At You-All's House' (1896); 'As the Light Lea' (1900); 'Sweetwater and Twistedleg' (1902).

BASKING-FISH, or BASKING-SHARK. See Shark.

BASLE. See Basel.

BASNAGE, bā-näzh, a family of French Protestants, remarkable for the number of able men and eminent writers whom it has produced. 1. NICOLAS, who, having espoused the doctrines of the Reformation, was compelled by persecution to take refuge in England, where he became the minister of a congregation at Norwich. When, by the accession of Henry IV, a better era began to dawn, he returned to his country and officiated, till his death, as minister of a church at Carentan. 2. BENJAMIN, son of the former: b. 1580; d. 1652. He succeeded his father in his charge, and held it for the long period of 51 years. He long held a prominent place among the Reformers of France; presided in the assembly held at Rochelle in 1622; undertook the dangerous task of negotiating for English aid; traveled into Scotland to arouse the Protestant feeling in that country; and on his return took the lead in the important synods held at Charenton in 1623 and 1631, and at Aleuçon in 1637. His principal work, entitled 'Treatise on the Church,' is a good specimen of his talents. 3. HENRI DE FRANQUENAY: b. 1615; d. 1695. He was the youngest son of Benjamin, studied for the bar, and as a provincial, the ball must be held by the hands only. Consult Naismith and Gulick, 'Basket Ball'; Spalding's Athletic Library, New York 1894; Fisher, H. A. (Ed.), Official Collegiate Basketball Guide (Spalding's Athletic Library, New York annual); Smith, T. H., Official Basketball Guide (Fox's Athletic Library, New York 1906).

BASQUE PROVINCES (Spanish Provincias Vascongadas), in northeastern Spain, the three provinces of Alava, Vizcaya, and Guipuzcoa. These will be found under their separate headings. The total area is 2,739 square miles, and the total population was estimated (31 Dec. 1914) at 706,249. Lying on the northern versant of the Cantabrian Mountains, these provinces present a reasonable contrast to the arid table-land of Castile, being covered with green all the year round. Bears, chamois, capercaillie and hazel-grouse abound in the waving forests of oak, birch, ash and beech trees; there are great chestnut and walnut groves, bountiful orchards, vineyards and luxuriant meadows alternating with fields of maize, rye, potatoes, flax and hemp. Salmon and trout streams race through the verdant mountain gorges; from Corunna to the Bidassoa, on the French frontier, the country is dotted with isolated farmsteads, villages consisting of little else besides a church and a tavern, the rest of the houses scattered over a wide area. Though tolerably straight and uniform, the north coast is broken by several small harbors where much commerce is carried on in merchant vessels. The Basque provinces are the centre of the iron mining district of Spain, where the
most active extraction of this metal is in progress, nearly 6,000,000 tons being produced annually. In the province of Guipuzcoa is the town of Loyola, the birthplace (1491) of Inigo Lopez de Recalde, who became famous as the founder of the Jesuit order under the name of Ignatius of Loyola. In that village, also, the Basques have their sacred tree called the *Guarnica,* the emblem of their liberties. See BASQUES.

**BASQUES,** basks, or **BISCAYANS,** in their own language, **EUSCALDUNA,** the Spaniards call them *Vascos y Gaidos,* A remarkable, very ancient race inhabiting both sides of the Pyrenees, the southwest corner of France and the north of Spain. They represent the remnant of a people once spread over the whole of the Iberian Peninsula and southern Gaul in prehistoric times. They are probably the descendents of the ancient Iberi, who occupied Spain before the Celts, though this is by no means a decided point among ethnologists. For the early days of history they constituted small republics, ruled by duly elected chiefs and according to special codes (fueros), breathing fierce independence, parochial exclusiveness and stern but patriarchal regulations. The French Basques (Gascons) settled on the north side of the Pyrenees about the end of the 6th century, between the mountains and the Garonne. Under the Carlovingians they elected their own dukes, but after the extinction of that family they fell under the dominion of Aquitania in the 10th century. In 1100 they purchased the Labourd for 3,306 gold florins, and were incorporated with it under France in 1453, by Charles VII, but continued to enjoy certain exemptions from taxes, enlistment in the army, etc. Their number is estimated at about 300,000. The ultramontane Basques have not played any important part in Spanish history. Their distinct national code has been respected at all times and by every ruler, forming a kind of *imperium in imperio* with their special parliament, *Disputacion Provincial,* tariffs, tolls, and, until recent years, even their own army and police. After the close of the second Carlist war in 1876 the powers and privileges of the Basque *Disputaciones* were considerably curtailed by the Spanish government, though the provinces retained entire control of their municipal affairs. They collect their own taxes and pay an annual tribute to Spain, the amount of which is fixed periodically and generally for 20 years in advance. The tribute for the years 1915–16 was fixed at 9,000,000 pesetas ($1,800,000), while the province of Guipuzcoa contributes an additional tax of 700,000 pesetas ($120,000). The Basques preserve their ancient language, former manners and customs and their national dances. The rhythm of their music differs altogether from that of other parts of Spain; it possesses its own essential characteristics, so pronounced that none in Spain can imitate it and few outside can understand. Their national anthem, the *Guarnica,* named after their sacred tree in Loyola, is said to be capable of rousing the Basques to a fierce degree of patriotism. They make admirable soldiers, especially in guerrilla warfare, to which their native temperament inclines. They furnish a prescribed quota of recruits to the Spanish army annually. The people of the Basque provinces and Navarre were the strongest supporters of the pretender, Don Carlos, and supplied the best leaders in the Carlist wars. In personal appearance the Basques resemble the Spanish but more rugged and muscular; of fair complexion in general, they bear some resemblance to certain Tartar tribes of the Caucasus. They are faithful and honest, kind and hospitable to strangers. Their mental equipment is said to be somewhat dull, though illiteracy is comparatively rare among them. In his *Bible in Spain* George Borrow tells us that no people on earth are prouder than the Basques, *but theirs is a kind of republican pride.* They have no nobility amongst them, and no one will acknowledge a superior. They are good seamen, and were the first Europeans who engaged in the whale fishery, when whales were plentiful in the Bay of Biscay.

The Basques are the mystery people of Europe; much controversy has been around the question of their origin. The Romans mention a tribe called *Vascones,* who lived somewhere in the present Basque provinces. Gascons is the same word, the letters b and g being often interchanged. Not all the Basque-speaking people are Basques. The old Gascons and the present Bearnais speak a Basque dialect, but they differ widely from the Spanish Basques. These French people have dark curly hair and brown eyes; they are round-headed and short of stature, whereas the true Basques are long-headed and short-faced, with light hair, and generally blue or gray eyes. They are also taller and high-shouldered. Borrow decided that the Basques were of Mongolian origin. He discovered many Sanskrit roots in their language, and was *inclined to rank the Basque rather amongst the Tartar than the Sanskrit dialects.* Modern scientists, however, have completely discarded Borrow's theory, and not a few have sought to place the cradle of the Basque race in northern and northeastern Africa, from the similarity of their language to the old Berber and Tuareg languages. In any case it is certain that Basque is neither an Aryan nor Indo-Germanic language; its affinities with Berberic point to Egypt and to Somaliland. On the other hand, the language of the old Mediterranean race also has affinities with Basque, and points eastward into Asia Minor. Our whole knowledge of the so-called Basque language being based entirely upon the living Basque dialects, it is probable that the mystery will long remain unsolved. According to some authorities it contains only about 40 foreign words, while others emphatically assert that more than half the words in the whole language are borrowed. The following stanza, *noted from recitation* by George Borrow, may serve as an example of Basque poetry:

\[
\begin{align*}
\text{Ichaosa urae sindi,} \\
\text{Etu onderi aqueri} \\
\text{Pamco ninaqueni endic} \\
\text{Maitae icutaes gatuc.}
\end{align*}
\]

This means, *The waters of the sea are vast, and their bottom cannot be seen; but over them I will pass that I may behold my love.* As stated above, the Basques call themselves Euscaldunac: *eusk* = language, sound; *al* from *aldea* = part or side; *duzu* = full of, plenty; *a=x* = adjectival ending, t e being the sign of the plural. Thus the whole word signifies *those with a language.* The language itself is called
"Euscara," and the country Euscalleria, Euska-Herria or Eusquerrieta, from the word erra, land. The Spanish group of Basque dialects are the Guipuscoan Navarrése and Biscayan; the French group are the Labourdin, lower Navarrése and Souletin. See ALAVA; BISCAY; BASQUE PROVINCES; GUIPUZCOA; NAVARRE; SPAIN.

BASRAH. See BASSORA.

BASS, Edward, first Protestant Episcopal bishop of Massachusetts: b. Dorchester, Mass., 23 Nov. 1726; d. Newburyport, Mass., 10 Sept. 1803. He was graduated at Harvard in 1744; was ordained in England in 1752; and later became pastor of the church at Newburyport, Mass. During the Revolution he omitted from the records all reference to the royal family and the British government. For this he was expelled from the Society for the Propagation of the Gospel. In 1797 he was consecrated bishop of Massachusetts, and finally also of New Hampshire and Rhode Island.

BASS, Michael Thomas, English brewer: b. 1799; d. 1864. He became head of the Burton brewing firm of Bass & Company upon the death of his father and was a member of Parliament from 1848 to 1883. His benefactions were very numerous, and included the building and endowing of Saint Paul's Church, Burton (the total expenditure on the parish being about $500,000); and the establishment of recreation grounds, a free library, and swimming baths for Derby, at a cost of $185,000. Of simple tastes, he more than once declared a baronetcy and a peerage.

BASS, bás (It. basso, deep, low), (1) the lowest male voice, with the average compass of from 15 to 20 notes, and it is generally doubled by the violoncellos. Bass-counter or contra-bass, the under bass; that part which, when there are two basses in a composition, is performed by the double basses, the violoncellos taking the upper bass or basso concitante. Basso ripieno (It.), the bass of the grand chorus; that bass which joins in the full parts of a composition, and, by its depth of tone and energy of stroke, affords a powerful contrast to the lighter and softer passages or movements. Figured bass, a bass written according to a certain chord or harmony which is continued by the parts above, moves in notes of the same harmony. Fundamental bass, that bass which forms the tone or natural foundation of the harmony, and from which that harmony is derived. Ground bass, a bass which starts with some subject of its own, and continues to be repeated throughout the movement, while the upper parts present separate air and supply the harmony. Thorough bass, the system in which words are denoted by placing figures over the bass note. Bass clef, the character put at the beginning of the stave, in which the bass or lower notes of the composition are placed, and serving to determine the pitch and names of those notes.

BASS, the name of various trimly shaped, active, gamy fishes of both fresh and salt water, mostly in northern regions. The term was originally applied to the Morone labrax of the west coast of Europe, and was thence transferred to many other fishes having a real or fancied likeness to this in appearance and qualities. This fish represents the sea-perch family. Serranidae, is perch-like in form, usually 12 to 18 inches long, and frequents the shoals or waters in great numbers, being noted for its fierceness and voracity. Its flesh is excellent. The same family and genus are represented in North America by many species, of which the nearest relative is the yellow bass (of. interrupia) of the southern Mississippi Valley. It is a brassy-yellow with seven very distinct black longitudinal lines, those below the lateral line being interrupted posteriorly, the posterior parts alternating with the anterior. Its body is oblong-ovate with the back much arched. The dorsal fin and anal spines are stout. It is a light fish for its length, ordinarily weighing one to two pounds, but often measuring 12 to 18 inches, and weighing five pounds. It is very game, and is esteemed by some anglers the equal of the black bass in this respect.

In the same family falls the well-known striped bass or rock fish (Roccus lineatus), of the northeastern Atlantic, which approaches the coast and enters fresh water only at spawning-time when it ascends the rivers. It is absent from the Pacific coast until planted there artificially, since when it has multiplied from Puget Sound to Lower California. The largest fish are to be found in Chesapeake Bay, where they average from 30 to 50 pounds in weight, and occasionally reach double that. In color they are brassy-olive, the fins and sides rather pale, and the latter marked with seven or eight blackish stripes. The favorite way of fishing for the striped bass is by casting a "squid" through the surf, using as a bait pieces of clam shrimp or crab; but they will rise to a fly; and on the Pacific coast are easily lured by a shining spoon-bait.

The white bass (R. chrysops) is a near relative of the striped bass, and inhabits the Great Lakes from the Saint Lawrence to Manitoba, and southward in the Mississippi Valley to Arkansas. Its preference is for still waters, and it is even lighter in weight for length than the yellow bass. It is generally taken with bait, though it will rise to the fly. It is silvery in its color, tinged with golden below, with dusky lines along the sides.

The most important of the American fresh-water bass is the black bass—two species of Perciform game fish, the American bass family Centropodidae, which also contains the various sunfish (q.v.). One is the "big-mouthed" and the other the "small-mouthed" black bass. Both were originally confined to
the waters of the upper Mississippi Valley, and Greene County, in Pennsylvania, but in 1853 they were introduced into the high waters of the Potomac River, whence they have spread into all the rivers that empty into Chesapeake Bay. More recently bass have been introduced into New England and into many of the far Western States; as well as into England and France, Germany and other countries. The body is oblong, compressed, the back not much elevated, head oblong-conic, lower jaw prominent, teeth on jaws, vomer and pterygoids, broad and villiform bands, the lower depressible, usually without teeth or tongue. Black bass vary greatly in size in different waters. The small-mouthed, however, seldom exceeds six pounds in weight, while the large-mouthed, especially in the South, is larger, running as high as 14 pounds. In color both are dull golden-green with a bronze lustre, the scales on the cheeks are more minute than those on the body, and the dorsal fin is deeply notched. In the small-mouthed species (Micropterus dolomieu) the mouth does not extend beyond the eye, and the scales on the cheek are arranged in 17 rows. In the large-mouthed (M. salmoides) the maxillary extends beyond the eye and there are but 10 rows of scales on the cheeks. The lateral line in both is nearly straight, passing from the upper edge of the gill-cover to the centre of the base of the caudal fin. The small-mouthed has the wider range, extending from the Red River of the North to Texas and Mexico. Both varieties are free, but capricious, easier, and both are game fighters. They are taken with artificial flies, such as the "Rube Wood," "Seth Green," "silver doctor," and "Parmachenee bell," as well as by casting with a wide range of natural baits, such as crayfish, minnows, worms and small frogs; or they may be taken by trolling from a boat, using a stiff rod, especially in lakes, with any standard silver or golden spoon-bait. In some districts the large-mouthed bass is called "straw" bass; in others "slough," "lake," "marsh," or Oswego bass, or "green trout," "welchman," etc. Another species deserving mention is the "rock-bass," one of the sunfish (Ambloplites rupestris), found in practically every lake, pond and stream east of the dry plains. It does not usually attain more than half a pound in eight or nine inches, is easily caught and is the least persistent fighter of any of the family. In color it is mottled-olive or brassy-green. Consult Henshall, (Book of the Bass) (1885); and Jordan and Evermann, (American Food and Game Fishes) (New York, 1902).

**BASS, Culture of.** The artificial culture of American bass is of recent growth, owing principally to ignorance of the proper methods. Considerable pond-space is required, certainty that the water is clean and that the temperature is not likely to fall much below 50° F. during the spawning season. Bass will not spawn in water colder than 50°. A good pond an acre in extent ought to yield 50,000 to 75,000 young fish; four or five acres is about the limit in size. Every pond should be of even depth (about three feet) over the entire part, with a deep place (the "kettle") near the outlet; on the shallow "shelf" the fish will nest and may be hatched and cared for. This main, or "brood," pond, should contain aquatic plants. In addition there should be many separate small shallow "fry ponds" for the segregation and rearing of young fish sorted according to age. Wild-caught bass may be caught and introduced at any time of the year; but the small-mouthed breeding-stock (to which most of what is to be said applies) must be introduced only in the autumn. They are then supplied from day to day with minnows and crayfish, and also are gradually accustomed to take chopped beef, liver and lungs or other food, but this artificial feeding must be artfully done or it will not succeed.

Bass lay their eggs in May in saucer-like nests constructed of pebbles on the bottom of ponds. These nests are made and kept clean by the male fish, until he can induce a gravid female to deposit her eggs therein. They are then kept clean and guarded until they hatch. When hatching the young cluster on the nest in a compact mass, but soon begin to rise toward the surface, and at last the male, which has theretofore herded and protected them, drives them into a jungle of water-weeds and abandons them to their fate. They then become the prey not only of every other fish in the pond, but the smaller are killed and eaten by the larger among themselves. Hence very few reach maturity. To avoid this, breeders of small-mouthed bass furnish the pond with a large number of artificial nests, consisting of shallow, open boxes half-filled with sand and pebbles. These are occupied and arranged as nests by the fish. When the fry appear a "crib" consisting of a framework of iron, covered with cheese-cloth, is placed on the one to enclose the nest-box, and tall enough to reach a little above the surface of the water, is set around the nest and firmly anchored. The next-box is then lifted out, and the fry left to grow within the crib, safe from molestation. Such cribs are also placed around any natural nests found in the pond. These young fish are fed until they have absorbed the yolk-sac, and then are captured in scoop-nests and transferred to the proper fry-pond. Artificial nests are not used for the hardier and slower large-mouthed bass, but cribs may be placed around their natural nests.

Success in bass-culture depends on a good site and good water for the ponds; but even more of the proper care and feeding of the young. Full directions in both these particulars are to be found in W. E. Meehan's, (Fish-Culture in Ponds) (New York 1913).

**ERNEST INGERSOLL.**

**BASS (bás) ROCK, a remarkable traprock island, at the mouth of the Firth of Forth, three miles from North Berwick. It is of circular shape, about a mile in circumference, and rises precipitously to a height of 350 feet. It is inaccessible except on one flat shelving point on the southeast. Its summit is estimated at about 300 feet. On the southeast are sheep, the mutton of which is considered a great delicacy. Solan geese and other sea-fowl in myriads cover its rocks, and fly around it in clouds. The surrounding water is of great depth on the northeast, but shallow on the south. Among the historic ruins on the island are the remains of a fortalice commanding the landing-place, capable of accommodating upward of 100 men, formerly accessible only by ladders or buckets and chains; and the ruins of a chapel about halfway up the acclivity.
BASS, BAT FISH, BALLOON FISH, ETC.

1 Bellowe Fish (Centriscus scolopax)
2 Cave Fish (Amblyopsis spelaea)
3 Bill Fish (Lepidosteus osseus)
4 Balloon Fish (Tetrodon fahaka)
5 Bat Fish (Malthe vespertilio)
6 Skeleton of a Bass (Perca fluviatilia)
The Bass was purchased by the English government in 1671, and its castle, long since demolished, was converted into a state prison in which several eminent Covenanters were confined. It was the last place in Britain that held out against William III, its small band of garrison defenders yielding only to starvation. The island anciently belonged to a family of the name of Luder, whose head was styled Luder of the Bass.

**BASS STRAIT**, a channel beset with islands, which separates Australia from Tasmania, 120 miles broad, discovered by George Bass, a surgeon in the British navy, in 1798.

**BASS** (bäs) VIOL, a stringed instrument resembling the violin in form, but much larger. It has four strings and eight stops, which are subdivided into semi-stops, and is played with a bow. See VIOL.

**BASSANO, bäs-sä’ño**, the lover of Portia in Shakespeare's 'Merchant of Venice.'

**BASSANO, bäs-sä’ño**, Hugues Bernard Mareet, Duc de, French publicist and statesman: b. Dijon 1763; d. 1839. On the first outbreak of the French Revolution he enthusiastically embraced its principles, published the *Bulletin de l’Assemblee*, and soon after was appointed editor of the *Moniteur*. He became acquainted with Bonaparte, and was made by him chief of division in the Ministry of Foreign Affairs. In 1811 he was created Duke of Bassano and appointed Minister of Foreign Affairs; and in 1812 he conducted and signed the treaties between France, Austria and Prussia, preparatory to the fatal expedition to Russia. When the Emperor was sent to Elba in 1814, Bassano retired from public life; but immediately after Napoleon's return he joined him, and was very nearly taken prisoner at Waterloo. On the Emperor's final overthrow Bassano was banished from France, but at the Revolution of July 1830 he was recalled and restored to all his honors. In 1838 he was made Minister of the Interior and president of the council, but the ministry of which he formed a part survived only three days.

**BASSANO, Jacopo,** (real name GIACOMO DA PONTE), Italian painter: b. Bassano (whence his surname) 1510; d. 1592. He painted historical subjects, flowers, and portraits; among the latter those of the Doge of Venice, of Ariosto, Tasso and other persons of eminence. Several of his best works are in the churches of Bassano, Venice, Vicenza and other towns of Italy. He left four sons, all painters, of whom Francesco was the most distinguished.

**BASSANO, bäs-sä'-nä**, Italy, city in the province of Vicenza, on the Brenta, 30 miles north of Padua (long. 11° 43' E.; lat. 45° 46' N.). Its 30 churches contain beautiful paintings. A stone bridge, 182 feet long, unites the towns of Bassano and the village of Vincenzo. Vine and olives are cultivated in the vicinity and there is considerable trade in silk, cloth and leather, oil, wine and asparagus. Its principal manufactures are straw hats, porcelain and wax. Napoleon made Bassano a duchy, with 50,000 francs yearly income, and granted it to his Minister of Foreign Affairs, Mareet (see BASSANO, HUGUES). Near Bassano, 8 Sept. 1796, Bonaparte defeated the Austrian general Wurmser. Bassano was the birthplace of the famous printer Mauritius, as well as of the historical painter Giacomo da Ponte (see BASSANO, JACOPO), and a short distance away lies the village of Possagno, the birthplace of Canova. In the Austro-German invasion of north Italy in November-December 1917, Bassano was in immediate danger for a few days. The enemy driving on it from the north and east. The timely arrival of Anglo-French troops improved the shattered morale of the Italians and the Teutonic hosts were halted at the Piave, less than 15 miles distant. See WAR, EUROPEAN. Pop. (1911) 17,130.

**BASSEIN, bäs-sä’ñö**, India, a decayed town in the presidency of Bombay, at the south end of a small island of the same name, 28 miles north of Bombay, and separated from the island of Salsette by a narrow channel. It was fortified by the Portuguese in 1536, and remained in their possession until captured by the Mahrattas in 1739. During this period it rose to be a fine and wealthy city of over 60,000 inhabitants, with many stately buildings, including a cathedral, 5 convents, 13 synagogues and handsome private residences. Through war, plague and other causes it has decayed until its population had dwindled to 9,598 in 1911. It still exports considerable quantities of rice.

**BASSEIN, Burma, town in the Irrawaddy division on the left bank of the Bassin River, one of the mouths of the Irrawaddy, with a suburb on the right bank; lat. 16° 46' N.; long. 94° 48' E. The English fort with the court-houses, treasury, police-office, etc., are on the left bank. In the suburb on the right bank are the rice-mills and store-yards of the principal merchants. Its inland water connection and the opening of a railway in 1903 have enhanced its importance as a centre of commerce. The river is navigable up to the town for ships of the largest burden, and there is a considerable trade in exporting large quantities of rice, and importing coal, salt, cottons, etc. The place is of military importance also, as it commands the navigation of the river. It was captured by the British in 1852. It is the seat of a consul of the United States. Pop. 37,081.

**BASSELIN, bäs-lähn,** or BACHELIN, bäs-lähn, Oliver, French poet: b. Val-de-Vire, Normandy, about 1350; d. about 1419. He has been asserted that the vocabulary of theatrical and poetical literature is indebted to him for the word 'vaudeville.' He seems to have been a cloth fuller or presser, much given to versified narration and iteration of convivial themes in rhymed fragments dubbed *vaux-de-vire* in honor of the poet's birthplace. In the 'Book of New Songs and Vaux-de-Vire' (1610) appears a collection of these bacchanalian stanzas, the most touching of which is addressed by the singer 'To My Nose,' the rubricence thereof being tastefully and exquisitely celebrated.

**BASSES-ALPES, bäs-älp** ('lower Alps'), a department of France, on the Italian border. See Alps.

**BASSES-PYRÉNÉES, bäs-pär-räh-nä** ('lower Pyrenees'), a French department bordering on Spain and the Bay of Biscay. See Pyrénées.

**BASSET, a game of cards, formerly much played, especially in France. It is very similar to the modern faro. Severe edicts were issued against it by Louis XIV, and it was afterward
played under the name of *pour et contre*. De Moivre, in his *Doctrine of Chances,* has calculated many problems connected with this game.

**Basset-Horn**, a wooden wind-instrument (called also *Cornet* by reason of its curvatures), however, to a sheet forward in Passau in 1770. It was afterward perfected by Theodore Lotz in Presburg. It is, properly considered, an enlarged clarinet; and, notwithstanding the difference of its form, it resembles that, not only in its qualities and tone, but also in regards its intonation, the mode of holding it and fingering; so that every clarinet player can perform on it. Besides the mouthpiece it is formed of five pieces—the head-piece, two middle pieces, the trunk and the bell, the last of which is usually of brass. It differs from the clarinet chiefly in having four additional low keys worked by the thumb of the right hand. Its compass is three and a half octaves, from lower F in the bass to double C of the treble.

**Basset-Hound**, a dog with many hound-like characteristics, somewhat used for rabbit-hunting, clumsy in shape, and allied to the dachshund (q.v.). Its head is as massive and solemn-looking as that of a bloodhound, which it also resembles in the length of its ears. Its body is also as slender as that of a foxhound, to which it is also similar as regards color, hair and form, save that its fore legs are but four inches high and crooked at the knee. Below this point is a wrinkled ankle terminating in a massive paw, each toe of which stands out distinctly. Its coat is short, smooth and fine, with the gloss of a thoroughbred race-horse; and its colors are black and white and tan. In weight it varies from 40 to 45 pounds. It is probably of French origin.

**Bassetere, băs-tă, West Indies, the name of two towns.** (1) The capital of the British West Indian island of Saint Christopher's, a seaport situated at the mouth of a small river, on the south side of the island, and on the edge of the fertile vale of Bassetere, a tract yielding rich crops of sugar and fruits. The town was destroyed by fire in 1867, but has been rebuilt with better houses and wider streets than before. It is of considerable commercial importance, with a population of about 8,000. (2) The capital of the French West Indian island of Guadeloupe, situated near the south end of the island, and consisting of one principal long street stretching along the seashore. It is defended by Forts Royal and Matilda. The anchorage is unsheltered and exposed to a constant swell. Pop. about 8,000.

**Basset, James, American missionary:** b. Hamilton, Canada, 31 Jan. 1834; d. 1906. He was graduated at Wabash College 1856, and at Lane Theological Seminary 1859; was chaplain in the Union army 1862-63; and later pastor of Presbyterian churches in Newark and Englewood, N. J. In 1871 he went to Persia as a missionary, and in 1876 formed a familiarity with the language that he composed a volume of hymns in Persian (*Theheran,* 1875, 1884). Other of his writings are *Among the Turcomans* (contributed to the *Leisure Hour,* 1879-80); *Note on the Simmuni Dialects* (*Journal of the Royal Asiatic Society,* 1884); *Persia, the Land of the Imāms* (1886).

**Basset, John Spencer, American historian:** b. Tarboro, N. C., 18 Sept. 1867. He graduated from Trinity College, Durham, N. C., in 1888, and took the degree of Ph.D. at Johns Hopkins University in 1894; was appointed professor of history at the first named institution in 1893 and in 1906 became professor of history at Smith College. His writings relate chiefly to North Carolina history and comprise *Constitutional Beginnings of North Carolina, 1633-1720* (1894); *Slavery and Servitude in the Colony of North Carolina* (1899); *Anti-Abolition Leaders of North Carolina*; *Slavery in the State of North Carolina*; *The War of the Regulation*; *The Federalist System* (1906); *Life of Andrew Jackson* (2 vols., 1911); *A Short History of the United States* (1913); *The Plain Story of American History* (1916). These works are nearly all included in the *Johns Hopkins University Studies in Historical and Political Science,* *The Middle Group of American Historians* (New York 1916).

**Bassi, bassè, Laura Maria Caterina, Italian philosopher:** b. Bologna, 29 Oct. 1711; d. 20 Feb. 1778. She received a doctor’s degree as an acknowledgment of her attainments, and delivered public lectures on experimental philosophy. She also lectured in the Philosophical College, where she was appointed professor. Her correspondence with the most eminent scholars of Europe was very extensive. She married Giuseppe Verrati in 1738 and had several children.

**Bassi, bassè, Ugo, Barnabite monk, and distinguished Italian patriot:** b. 1804 at Cento, in the Roman states, of an Italian father and Greek mother. He was much distinguished among the brethren for his extraordinary learning and talents. The liberality of his political opinions, however, rendered him obnoxious to the papal court, and he was sent into exile in Sicily, from which he returned on the accession of Pius IX in 1846. On the breaking out of the Lombard revolution in 1848 he greatly distinguished himself by his valor in battle and his untiring services in the hospitals. On the capitulation of Trapanese he was ordered to leave, where he fought in the ranks against her Austrian besiegers. Thence he went to Rome and joined Garibaldi’s legion as chaplain. On the fall of Rome he was one of those who followed Garibaldi when he made a last attempt to establish himself in Sicily, from which he was driven into exile, where he lived in poverty and obscurity until his death. He was a man of exquisite forms and very refined in manner. He was a man of the world, with a keen eye for looking up to things. He was a man of the world, with a keen eye for looking up to things. He was a man of the world, with a keen eye for looking up to things.
of reciting the whole of Dante's 'Divina Commedia.'

**BASSOMPIERRE, bās-sōm-pē-ār, François (frān-swa) de, marshal of France, one of the most distinguished men of the courts of Henry IV and Louis XIII, descended from a branch of the house of Clèves; b. Lorraine 1579; d. 1660. In his youth he studied philosophy, jurisprudence, medicine and the military art. After traveling through Italy he appeared at the court of Henry IV, where his taste for splendor, play and gallantry soon made him conspicuous. In 1600 he made his first campaign against the Duke of Savoy, and fought with equal distinction in the following year against the Turks. His love of France soon called him back; he aspired to the hand of the daughter of the Constable de Montmorency, whose charms had excited the most violent passion in Henry IV. Bassompierre yielded to the solicitations of his King and pronounced his intended union with her. In 1622 Louis XIII appointed him marshal of France, and became so much attached to him that Luynes, the declared favorite, alarmed at his growing influence, insisted upon his removal from court. Bassompierre, however, continued to hold his position successively in Spain, Switzerland and England. After his return he entered again into the military service and was present at the siege of Rochelle and Montauban. Cardinal Richelieu, who was at that time the minister of the King, obtained entire control of the King and the country, feared the boldness of Bassompierre and his secret connection with the house of Lorraine; and the machinations of the latter served him as a pretext for sending Bassompierre, in 1631, to the Bastille, from which he was not released till 1643, after the death of the cardinal. During his detention he occupied himself with his memoirs (first published at Cologne 1665; and Paris 1877); and the history of his embassies in Spain, Switzerland and England, which sheds much light on the events of that time.

**BASSOON, a wooden reed instrument which forms the natural bass to the oboe, serving as a continuation of its scale downward. The reed is fixed to a crooked mouthpiece issuing from the side of the bassoon. The holes are partly closed by the fingers, partly by means of keys. It was formerly used as an accompaniment to the oboe, but it is now so far improved with keys as to be susceptible of being played solo. Its compass is more than three octaves, from low B flat to A flat in the treble; but its scale is complicated, and much depends upon the player and even upon the individual instrument. It consists of four tubes (besides the mouthpiece); bound together somewhat like a fagot. Hence the Italians term it fagotto, and from them the Germans fagott. It forms, when put together, a continuous tube nearly eight feet long, but as the bore is bent abruptly back on itself its height is only about four feet. The instrument is well arranged for wind-instruments, and it often forms the bass. It is capable of very fine and also grotesque effects, and has been much employed by some of the best composers, sometimes as a tenor or even alto instrument.

**BASSORA, bās-sōrā, or BASRAH, bās'rā, Turkey in Asia, a city situated between two and three miles on the west side of and on a navigable canal leading about two miles from the Shat-el-Arab, as the united stream of the Tigris and Euphrates is called, about three hundred miles from the Persian Gulf and the junction of the two rivers. Merchants from Arabia, Turkey, Armenia and Greece, also Jews and Indians, reside here, and it is the station of a United States consul. The Arabs are more numerous than the Turks, and their language is chiefly spoken. The city is surrounded by a wall about 10 miles in circuit, 20 to 25 feet thick. The houses are generally mean, partly constructed of clay, and the bazaars are miserable edifices. A considerable trade is carried on. Mail steamers run between Bombay and Bassora, and there are also other steamers trading here. Dates form the principal export; camels and horses, galls, gum, carpets, wool and wheat are also exported; total exports over $5,000,000 annually. The imports are coffee, rice, spices, textiles, etc. The trade of the interior is conducted by means of caravans. The town is dirty and unhealthy; the environs are very fertile. The modern Bassora arose in the 17th century, and does not occupy the site of the older town, whose ruins lie about nine miles southwest of it. Turkey entered the war 1 Nov. 1914, and on the 5th Great Britain declared war. A contingent of English and native troops sent by the government of India were already waiting in the Persian Gulf. On 7 November the British landed at Fao, on the Shatt-el-Arab, and occupied the village. Sailing 30 miles farther up the estuary they disembarked at Sanijeh, occupied that place and Sahnah, and encountered the main Turkish force at Sahil, 14 miles from Basrah, on 17 November. The Turks were routed in a sharp battle, with heavy loss, and on 23 Nov. 1914 the British entered Basrah unopposed. See War, European: Turkish Campaign. Pop. about 80,000. The vilayet of Bassora has an area of 53,580 square miles, and a population of about 600,000.

**BASSORA GUM, a gum brought from Bassora; supposed to be derived either from a cactus or a mesembryanthemum.

**BASSORIN, a kind of mucilage found in gum tragacanth (sometimes called adraganthin), which forms a jelly with water but does not dissolve in it. A clear, aqueous-looking liquid, apparently of the nature of Bassorin, exists in the large cells of the tuberous roots of some terrestrial orchids of the section Ophryea. It is formed of minute cells, each with its cytoblast; the whole being compactly aggregated in the interior of the parent cell.

**BASSVILLE, bās-vēl, Nicolas Jean Hugon de, French journalist and diplomatist. As editor of the Mercure National he attracted attention to himself and was appointed secretary to the legation at Naples in 1792. Soon after this he was despatched to Rome, where he was killed, in 1793, by the populace for attempting, under orders of the French government, to oblige all French residents to wear the tricolor cockade. The death of Bassville has furnished the subject for many compositions in both prose and verse, in French and Italian.

**BASSWOOD, the American linden, or lime-tree (q.v.).**
BAST, or BASS, the thin layer of fibrous tissue formed by, but outside the layer of, cambium (q.v.), or in popular phrase the inner bark of dicotyledonous shrubs and trees. Less fre- quent plants and ferns. For the plant, as well as for mercantile purposes, bast is highly important, for until it becomes changed into wood, it conducts the elaborated food from the green tissue to regions of use or storage. The bast cells are disposed and developed variously in different plants; occurring in rows, wreaths, more or less spread bundles, or single within the parenchyma. In some plants bast is formed but once, in others every year. Some fibres are simple, others branched; some primary, others secondarily, and some change to wood. They are most developed toward the outside of the stem. While young they contain a granular liquid, which disappears by the thickening of their walls. Young bast cells with their walls covered by a solution of iodine of which chloride of zinc become pale blue, the older ones violet, the full-grown pink. Thickenened cells are plainly stratified, and their walls often become contiguous by the disappearance of the cavity. The walls exhibit various designs, spiral or other lines, more or less constantly, according to the species of the plant. By micro- scopical examination and chemical analysis the nature of the various fabrics made of bast may be determined. Thomson and F. Baur have thus demonstrated the sheets around Egyptian mummies to be of linen. The degree of con- traction, of twisting, the length, density and form of the single cells of the bast vary in different plants. They are very long in flax, hemp, in some nettles, spurgers, etc., very short in abaca. Cotyledon consists of long hairs, and not of bast cells, which it very much resembles otherwise. The bast cells of monocotyledonous plants are mostly lignified. They conduct elaborated food but a short time, become filled with air and thus dead and thus able to be handled. The un- lignified are very hygroscopic and often contain chlorophyll. No bast cell has pits, but the conifer have sieve pores or canals. The uses of bast are manifold. Flax bast is soft, flexible, seldom with swellings; hemp bast is very long, stiffer and thicker than flax, more stratified; nettle (Urtica dioica) bast resembles cotton, has swellings and is thicker than hemp. Branched and lignified bast cells of great beauty are found in the mangrove tree (Rhizophora mangle) and the secondary ones of Abies pectinata. Among the monocotyledonous bast fibres, those of the New Zealand flax (Phor- mium tenax) are the most remarkable, being formed in bundles near the margin of leaves. They resemble hemp, are very white, sometimes yellowish, very long, and contain much lignin, in consequence of which they are somewhat stiff, but very tough and fit for stout ropes. In palms a highly developed body of lignified bast surrounds the vascular bundles, while bast becomes the leaves and interior of the stem. A similar disposition exists in the Dracaena reflexa, and in some Aroidæ. Everybody knows the tenacity of the bast of the lime tree, which is hence called bass-wood. The Chinese grass-cloth is made of Boehmeria nivea or B. tenacissima. Manila hemp comes from Musa textilis; rice bags are made in East India from Antartis toxicarpa. From the use of bast in ancient times or writing upon, the Latin name of bast, liber, has been applied to designate book. See also Fibre; Flax; Hemp; Jute; Ramie.

BAST, in Egyptian mythology, a goddess represented with the head of a cat or lioness. Babastis, in Egypt, was the city where she held a high place, similar to that of Neith in Sais. Nearly a million Egyptians made annual pilgrimages to her shrine. Great numbers of bronze images of Bast were purchased in Babastis.

BASTAR, a feudatory state of British India, joined with the Gaundia district of the Central Provinces. It has an area of 13,062 square miles and a population (1911) of 433,310.

BASTARD, one begotten and born out of lawful wedlock, or born during wedlock where the husband was under the age of puberty, or where the husband had died at such a time that there was no possibility of his conception or where there was no possibility of access on the part of the husband on account of his absence from the country, or where the husband labored under a disability due to some natural infirmity.

The Romans distinguished two kinds of natural children — nothi, the issue of concubinage, and spurii, the children of prostitutes; the former could inherit from the mother, and were entitled to support from the father; the latter had no claims whatever to support. Both were often raised to all the rights of legitimate children by affiliation. The Athenians treated all bastards with extreme rigor. By the laws of Solon, they were denied the rights of citizenship, and a law of Pericles ordered the sale of 5,000 bastards as slaves. What rendered these regulations more severe was, that not only the issue of concubinage and adultery, but all children whose parents were not both Athenians, were considered bastards at Athens. Thus Themistocles, whose father was a native of Halicarnassus, was deemed a bastard. The law, as might be expected, was often set aside by the influence of powerful citizens. Pericles himself had it repealed in favor of his son by Aspasia, after he had lost his legitimate children by the plague. The condition of bastards has been different in various periods of modern history. Among the Goths and Franks, they were permitted to inherit from the father. Thierry, the natural son of Clovis, inherited a share of his father's conquests. William the Conqueror, natural son of Robert I, Duke of Normandy, and of Arlette, daughter of a furrier of Falaise, inherited his father's dom- inions. He called himself Willelmus, cognomen Batardus. The celebrated Dunois styled himself, in his letters, the Bastard of Orleans. In Spain, bastards have always been capable of inheriting. The bastardy of Henry of Trastamare did not prevent his accession to the throne of Castile. In France, the condition of bastards was formerly very different in the different provinces. Since the Revolu- tion, it has been regulated in a uniform manner by the general law of the kingdom. The code
BASTARD BAR — BASTIAN

Civil thus fixes their rights: If the father or mother leave legitimate descendants, the bastard is entitled to one-third of the portion he would have inherited had he been a lawful child; if the father or mother die without descendants, but leave ascendants, or brothers or sisters, he is then entitled to one-half of such a portion; if the father or mother leave no ascendants or descendants, no brothers or sisters, he is entitled to three-quarters of such a portion; and if the father or mother leave no relations within the degrees of succession, he is entitled to the whole property. These regulations do not apply to the issue of an incestuous or adulterous connection.

By the common law of England, a child born after marriage, however soon, is legitimate, or at least born out of wedlock, and long enough after the marriage to admit of the period of gestation, may still be proved illegitimate, under some circumstances, and this is the general rule in the law. But, according to the common law, a bastard is not the heir of any one: and, on the other hand, his only heirs are his children born in wedlock, and their descendants. According to the Roman law, one born out of wedlock might be legitimated by a subsequent marriage, and acknowledgment of his parents. In 1236 the English prelates proposed the introduction of the Roman law, in this respect, into England, to which the nobility made the celebrated reply, Novumus leges Angliae mutare (We are unwilling to change the laws of England). But that law exists in Scotland to-day, though not in England, Ireland or Wales. Consult Schouler, 'Treatise on the Law of Domestic Relations.' See illegitimacy.

BASTARD BAR, the ordinary name given to the heraldic mark used to indicate illegitimate descent. Properly speaking, it is not a bar at all, which is a band stretching horizontally across the shield, but a baton sinister; that is, it stretches diagonally across the shield in the direction of the sinister chief and the dexter base, but is curved or cut short at the ends, so as not to touch the corners of the shield. This circumstance serves to distinguish the bastard bar from the bend sinister, as well as the fact that the former is only one-fourth of the latter. When belonging to the illegitimate descendants of royalty it may be of metal; but in other cases it must be of color, even when on another color. This mark in heraldry is of comparatively recent origin, the bastard bar in heraldry having not having been allowed to bear the arms of their fathers. It cannot be removed until three generations have borne it, and not even then unless replaced by some other mark assigned by the king of arms, or unless the coat is changed. Sometimes permission was granted to a bastard or one of his descendants to bear it dexter instead of sinister, although he was not allowed to cancel it altogether.

BASTARD OF ORLEANS, the name given to the natural son of Louis, brother of Charles VI of France. Jean Dunois; b. 1402; d. 1449. On account of his exploits in the Hundred Years' War he was created Count of Orleans.

BASTARNAE, the earliest Teutonic people mentioned in history. They migrated from the region of the Vistula to the lower Danube about 200 B.C. Consult Keane, 'Man: Past and Present' (1899).

BASTIA, Corsica, the former capital of the island, 96 miles northeast of Ajaccio by rail. It is badly built, has narrow streets, a strong citadel near the sea, two harbors, the new and the old, and a fine marine parade, adorned with a marble statue of Napoleon by Bartolini. The citadel and cathedral are noteworthy. Its public institutions are a lyceum, a library of over 30,000 volumes and fine collections of natural history. The inhabitants carry on a considerable trade in manufactured hides, wines, tobacco, oil, wax candles, liqueurs and macaroni. Marble quarries, tanneries and dye works give employment to many operatives. It is an important trade centre and exports fruit, vegetables, minerals, fish. The stilettos manufactured here are held in great esteem by the Italians. In 1745 Bastia was taken by the British, and in 1768 was united with France. On the new division of the French territories (1791) Bastia was made the capital of the department of Corsica, of which Ajaccio is the capital. Bastia is still, however, the commercial and industrial capital of the island and a United States consul is stationed here. Pop. 29,412.

BASTIAN, Adolf, German traveler and anthropologist; b. Bremen, 26 June 1826; d. 1905. He made extended journeys throughout Australia, Asia, America and west Africa at various periods of his career, and his explorations were carried on in such widely scattered countries as Yucatan, New Zealand and Persia. At the age of 70 he started on a fascinating voyage to the Malay Archipelago. He was professor of ethnology in the University of Berlin, director of the Museum für Völkerkunde, and in 1901 became editor of the Ethnographisches Nachblatt, published in Berlin. His nearly 60 works deal with the various aspects of anthropology, his range being broad and his services in behalf of science of the greatest value. Among his many volumes may be named 'Der Mensch in der Geschichte' (1860), 'Ethnographische Forschungen' (1871-73), 'Der Buddhismus in seiner Psychologie' (1882), 'Der Fetsich an der Küste Guineas' (1884), 'Vorgeschichtliche Schöpfungslieder' (1893), 'Die Nölkensischen Kolonien' (1899-1900), 'Die Völkerkunde und der Völkerverkehr' (1900).

BASTIAN, Henry Charlton, English physiician and biologist; b. Truro, 26 April 1837. He obtained the degree of M.A. in 1861 from the University of London, graduating subsequently in medicine at the same university. In 1866 was appointed lecturer on pathology and assistant physician in Saint Mary's Hospital, London. In 1867 he became professor of pathological anatomy in University College, and in 1878 he was also appointed professor of clinical medicine. In 1887-93 he was president of the principles and practice of medicine. Apart from numerous contributions to medical and other periodicals, and to Quain's 'Dictionary of Medicine,' his works include 'The Modes of Origin of Lowest Organism' (1861); 'The Beginnings of Life' (1872); 'Evolution and the Origin of Life' (1874); 'Lectures on Paralysis from Brain Disease' (1875); 'The Brain as an
Organ of Mind\(^1\) (1880), which has been translated into French and German; 'Paralysis: Cerebral, Bulbar and Spinal\(^2\) (1886); 'A Treatise on Aphasia and other Speech Defects' (1888); 'Studies in Heterogenesis' (1904); 'Nature and Origin of Living Matter' (1905); 'The Evolution of Life' (1907); 'The Origin of Life' (1911). He is a recognized authority in the pathology of the nervous system and an advocate of the doctrine of spontaneous generation.

BASTIAT, ba-stya\(^a\), Frédéric, a distinguished French political economist: b. Bayonne, 19 June 1801; d. Rome, 24 Dec. 1850. He entered in 1818 the counting-house of his uncle at Bayonne, but he felt no enjoyment in the routine of mercantile life, and in 1825 retired to a property at Mugron, of which he became possessor on the death of his grandfather. Thus withdrawn from society he devoted himself with eagerness to meditation and study, mastering the English and Italian languages and literatures, speculating on the problems of philosophy and politics and digesting the doctrines of Adam Smith and Say, of Charles Compte and Dunoyer. His first publication appeared in 1844 under the title 'De l'influence des tarifs français et anglais sur l'avenir des deux peuples'. In 1843 he came to Paris in order to superintend the publication of his 'Cobden et la ligue, ou l'agitation anglaise pour la liberté des échanges', and was very cordially received by the economists of the capital; from Paris he went to London and Manchester, and made the personal acquaintance of Cobden, Bright and other leaders of the league. When he returned to France he found that his writings had been exerting a powerful influence; and in 1846 he assisted in organizing at Bordeaux the first French Free Trade Association. He wrote in rapid succession a series of brilliant and effective pamphlets and essays, showing how socialism was connected with protection, and exposing the delusions on which it rested. While thus occupied he was meditating the composition of a great constructive work, meant to renovate economical science by basing it on the principle that 'interests left to themselves tend to harmonious combinations, and to the progressive progress of the general good.' The first volume of this work, 'Les Harmonies économiques,' was published in the beginning of 1850. He was a member successively of the Constituent and Legislative assemblies. He also published 'Propriété et Loi'; 'Justice et Fraternité'; 'Propriétarisme et Communisme'; and many other treatises. The life work of Bastiat, in order to be fairly appreciated, requires to be considered in three aspects. (1) He was the advocate of free trade, the opponent of protection. The cameral theory of free trade had, of course, been clearly stated and solidly established before he was born, and his desire to see its principles acted on in France was quickened and confirmed by the agitation of the Anti-Corn-Law League for their realization in England, but as no one denies it to have been a great merit in Cobden to have seen so distinctly and comprehensively the bearing of economical truths which he did not discover, no one should deny it to have been also a great merit in Bastiat. He did far more than merely restate the already familiar truths of free trade. He showed as no one before him had done how they were applicable in the various spheres of French agriculture, trade and commerce. Now the abstract theory of free trade is of comparatively little value; its elaboration so as to cover details, its application and its varied illustration are equally essential. And in these respects it owes more, perhaps, to Bastiat than to any other economist. In the 'Sophismes Economiques' we have the most perfect and most effective, the wisest and the wittiest exposure of this system of principles, reasons and consequences which exists in any language. (2) He was the opponent of socialism. In this respect also he had no equal among the economists of France. He alone fought socialism hand to hand, body to body, as it were, not caricaturing it, not denouncing it, not criticizing under its name some merely abstract theory, but taking it as actually presented by its most popular representatives, considering patiently their proposals and arguments, and proving that they proceed on false principles, reasoned badly and sought to realize genuine aims by foolish and harmful means. Nowhere will reason find a richer armoury of weapons available against socialism than in the pamphlets published by Bastiat between 1848 and 1850. These pamphlets will live, it is to be hoped, at least as long as the errors which they expose. (3) He attempted to expound in an original and independent manner political economy as a science. In combating first the protectionists and afterward the socialists, there gradually rose on his mind a conception which seemed to him to shed a flood of light over the whole of economical doctrine, and, indeed, over the whole theory of society, namely, the harmony of the essential tendencies of human nature. The radical error, he became always more convinced both of protectionism and socialism, was the assumption that human interests, if left to themselves, would inevitably prove antagonistic and anti-social, capital robbing labor, manufactures robbing agriculture, the foreigner injuring the native, the consumer the producer, etc.; and the chief weakness of the various schools of political economy, he believed he had discovered in their failure to appreciate the fact that human interests, when left to themselves, when not arbitrarily and forcibly interfered with, tend to harmonious combination, to the general good. Such was the point of view from which Bastiat sought to expound the whole of economical science. The sphere of that science he limited to exchange, and he drew a sharp distinction between utility and value. Political economy he defined as the theory of value, and value as 'the relation of two services exchanged.' The latter definition he deemed of supreme importance. It appeared to him to correct what was defective or erroneous in the conflicting definitions of value given by Adam Smith, Say, Ricardo, Senior, Storch, etc., to preserve and combine what was true in them, and to afford a base on which to develop an economical theory than had previously been presented. It has, however, found little acceptance, and Roscher, Cairnes and others seem to have shown it to be ambiguous and misleading. A consequence of it on which he laid great stress was that the gratuitous gifts of nature,
whatever be their utility, are incapable of acquiring value — what is gratuitous for man in an isolated state remaining gratuitous in a social condition. Thus, land, according to Bastiat, is as gratuitous to men the present day as to their first parents, the rent which is paid for it,—its so-called value,—being merely the return for the labor and capital which have been expended on its improvement. In the general opinion of economists, he has failed to establish this doctrine, failed to show that the properties and force of nature cannot be so appropriated as to acquire value. His theory of rent is nearly the same as Carey's, that is, decidedly anti-Ricardian. His views on the growth of capital and interest, on landed property, competition, consumption, wages and population, are independent, and, if not unfavourably, at least truly suggestive. His works were published in seven volumes (Paris 1881). Consult Baudrand, 'Oeuvres de Bastiat' (1879); and Von Leesen, 'Frédéric Bastiat' (Munich 1904). See Economics.

**BASTIDE, Jules**, French statesman: b. Paris, 21 Nov. 1800; d. 1879. Early a Democrat, he never ceased to labor for the downfall of the Bourbon monarchy, and fought hard in the revolution of July 1830. He was also opposed to the Orleanist monarchy. Condemned to death for his share in the insurrection of 5 June 1832, he escaped from prison and fled to England, where he resided two years. He returned in 1834, and was acquitted. After the death of Armand Carrel he became chief editor of the *National* newspaper in 1836. This place he resigned in 1846 and founded the *Revue Nationale* in 1847. He rendered great assistance to Lamartine in the office of the Ministry of Foreign Affairs, and was Minister for Foreign Affairs from 10 May to 20 Dec. 1848. He retired to private life after the coup d'état of 1851. He was the author of 'La république française et l'Italie en 1848' (1858); 'Guerres de religion en France' (1859).

**BASTIEN-LEPAGE, bast-yan'-le-pah**, Jules, French painter: b. Damvilliers, 1 Nov. 1848; d. 10 Nov. 1884. He studied under Cabanel, and early began to attract notice by his impressionist pictures in the Salon. Some of his more important works were 'In Spring,' 'The First Communion,' 'The Shepherds,' 'The Potato Harvest,' 'The Wheat-field,' 'The Beggar,' and 'Joan of Arc Listening to the Voices.' His most striking portraits were those of his grandfather, his father and mother, Sarah Bernhardt, André Thuret and the Prince of Wales (Edward VII). He was made a chevalier of the Legion d'Honneur in 1879. Consult Thuret, 'J. Bastien-Lepage, l'homme et l'artiste' (1885).

**BASTILLE, bas-tell'** (from med. Fr. bastir, to build), the French designation for an armory or fortified building constructed for military purposes. The word is popularly associated with the Bastille, or the state prison and citadel of Paris, built to protect the palace of Charles V against the incursions of the Burgundians, and destroyed by the mob in the beginning of the Revolution in 1789, after an existence of over four centuries. It was founded by Hugues d'Aubriot in 1389, and completed by the addition of four towers in 1383.

The building became notorious for imprisonment by *lettres de cachet*, or secret warrants issued in the name of the king, but the names of the individuals were inserted by the ministers, who were the depositaries of the royal signature. Of the origin of this custom we may perhaps find the explanation in Montesquieu's 'Esprit des Lois,' where it is said, "Honor is the virtue of monarachies, and often supplies its place." A nobleman was unwilling to be dishonored by a member of his family. Filial disobedience and unworthy conduct were probably not more uncommon among the nobility of France than elsewhere. But in such cases fathers and relations often requested the confinement of the offender until the head of the family should express a wish for his release. At first this privilege was limited to the chief families of the country. The next step was, that the ministers of government considered themselves entitled to the same privileges as the great families among the nobility. If an offense was committed in their offices or households, which, if known, would have cast a shadow upon the ministers themselves, they arrested, *motu proprio*, the obnoxious individuals, and made use of their privilege to put out of sight persons whose honest discharge of duty had excited their displeasure, or who were acquainted with facts disgraceful to the ministers themselves. It sometimes happened that no further examination of the prisoners was held, and the cause of their detention nowhere recorded. In such cases an individual remained in prison sometimes 30 or 40 years or even till his death, because successive governments took it for granted that he had been properly confined, or that his imprisonment was required for reasons of state. The invention of the *lettres de cachet* immediately opened the door to the tyranny of ministers and the intrigues of favorites, who supplied themselves with these orders, in order to confine individuals who had become obnoxious to them. These arrests became continually more arbitrary, and men of the greatest merit were liable to be thrown into prison whenever they happened to displease a minister, a favorite or a mistress. On 14 July 1789 the Bastille was surrounded by a tumultuous mob, who first attempted to negotiate with the governor, Delaunay, but when these negotiations failed, began to attack the fortress. For several hours the mob continued their siege without being able to effect anything more than an entrance into the outer court of the Bastille; but at last the arrival of some of the Royal Guard with a few pieces of artillery forced the governor to let down the second drawbridge and admit the populace. The governor was seized, but on the way to the hôtel de ville was torn from his capts and put to death. The next day the destruction of the Bastille began, and a bronze column now marks the site of an event considered by itself was of no great national importance, but it marked the beginning of the French Revolution.

Much exaggeration took place in relation to the discoveries said to have been made in its destruction, especially in relation to one Count de Lorges; but it is sufficiently established that there was no such person in existence, certainly not in the Bastille. No exaggeration, however, was needed. Seven persons only were found in its cells and dungeons; one, the Count de
BASTINADO — BASUTOLAND

Solage, a prisoner since his 11th year; another, Tavernier, the son of Paris Duverney, who, after 10 years at the Isles Marguerites, had passed 30 years in the Bastille, and who re-appeared on his liberation, bewildered, with a broken intellect, like a man awakened from a sleep of 40 years, to a world new compared with that on which he had closed his eyes.

Records of horrors even worse than this were found recorded on the registers of the prison. Two will suffice. They are the names of Father Theodore Fleurd, of Brandenburg, a Capuchin, retained many years on suspicion of being a spy; and of one Lebar, arrested at 76 and dead at 90 years. Nearly 50 years before Caggistero scrawled on the walls of his cell: "The Bastille shall be demolished, and the people shall dance on the area where it stood." This prophecy, at least, of the empiric and impostor, was realized to the letter. It was the Carignano which they danced about the liberty trees to the tune of the 'Ça IRA.'

BASTINADO, a punishment employed by the Turks, which consists of blows upon the back or soles of the feet, applied with a light wooden stick or with a knotted string.

BASTION, a flanking tower in mediaeval fortification, from which archers and war machines could direct their projectiles on the storming enemy while he was held in check by the ditch. On the introduction of artillery into Europe towers were made considerably larger than formerly, and ultimately, in the beginning of the 16th century, the Italian engineers made them polygonal instead of round or square, thus forming a bastion. This is an irregular pentagon, one side of which is turned inward toward the tower, so that the opposite salient angle faces the open field. The two longer sides, enclosing the salient angle, are called the faces; the two shorter ones, connecting them with the town wall or rampart, are called the flanks. The faces are destined to reply to the distant fire of the enemy, the flanks to protect the ditch by their fire. The first Italian bastions still showed their descent from the ancient towers. They kept close to the main walls; the salient angle was very obtuse, the faces short, and the parapet revetted with masonry to the very top. Bastions are built in very different ways. Some are entirely filled with earth; some have a void space inside; some are straight, some curved, some double, some have even three or four flanks, one over the other; some have faussebroyes, or low ramparts of earth outside; sometimes they have casemates, destined for the retreat of the garrison, or for barbicans, or curtals, or both.

In modern times, among the fortifications built according to the system of bastions, those on the plan of Cormontaigne and the modern French works are considered best adapted for defense. They are spacious; the flank of the side bulwark, which is perpendicular to the prolongation of the face of the principal bulwark, is not farther distant than 300 paces from its point; it is also straight, and orillons and other artificial contrivances are banished. See FORTIFICATION.

BASTWICK, John, English physician; b. Writtle in Essex 1593; d. 1654. He settled at Colchester, but instead of confining himself to his profession entered keenly into theological controversy, and in 1624 procured the publication in Holland of a treatise which he had written, entitled 'Elenchus Religious Papists,' which, as he declares on the titlepage, he proves to be neither apostolic nor catholic, nay, not even Roman. He afterward published 'Flagellum Pontificis et Episcoporum Latinum,' which acquired some notoriety as a sedition attack on Episcopacy in general, and attracted the attention of the High-Commission Court, who called the author before them, and condemned him to a fine and two years' imprisonment. Bastwick became more zealous than before, however, and presented a defense addressed to the English prelates and a new "litany," in which his former offenses were boldly repeated. A second sentence mercilessly condemned him to a much heavier fine, to exposure to the pillory, and a prolonged imprisonment for life. The ascendency of the Parliament in 1640 procured his freedom; the sentence was formally repealed, and the amount of the fines imposed on him was afterward refunded. He appears to have been a staunch Presbyterian, for in 1648 we find him attacking the Independents.

BASUTOLAND, South Africa, an English Crown colony, lying to the east of the Orange River Colony, and on the northeast of Cape Colony. The Basutos belong chiefly to the great family of the Bantu, out of one of the chief branches of whom, along with the survivors of various other Kaffir tribes, they have arisen. Their countenance is better formed than that of the negroes, although they have the flat nose, protruding lips, and woolly hair poorly proportioned; the color of their skin a very dark brown, and their disposition cheerful, mild, and pacific. Their land, called by themselves Lesuto, is very fertile, and is cultivated with great industry; but its fertility has long exposed them to the encroachments of their neighbors. Under their chief Moshesh, who died in 1869, they were raised from a state of utter barbarism to a certain degree of civilization, and the land was thrown open to missionarYes. Being exposed, however, to constant attacks of their warlike neighbors, Moshesh was at last induced to request the English government to adopt them as subjects. This was acceded to, and in 1868 Basutoland was declared English territory, being annexed to Cape Colony in 1871. In 1884, however, Basutoland was placed under the direct authority of the home government. Since 1903 Basutoland is a member of the South African Customs Union. The imports consist chiefly of clothing and agricultural implements, metal products and groceries. The yearly imports average about $1,250,000 and the exports about $1,000,000. Basutoland is administered by a resident commissioner, under the advising commissioner of South Africa. It is divided into seven
districts, subdivided into wards administered by hereditary chiefs. The administration of justice is, however, to a very large extent, in the hands of native magistrates. A railway from Maseru connects with the South African railway system. It has an area of about 10,300 square miles. Pop. (1911) 404,507. Consult Widdicombe, 'Fourteen Years in Basutoland' (1896); H. G. Bailey, 'Arms and Cattle in the Transvaal' (1900); Bryce, ' Impressions of South Africa' (1889); Ellenberger, 'History of the Basuto' (1912).

**BASVILLE. See Monti, Vincenzo.**

**BAT.** One of a group (order Chiroptera) of small mammals adapted to life in the air by the possession of wings formed of a membrane stretched between the greatly prolonged bones of the arm and hand. The general organization of bats allies them to the Insectivora. The bones of the spine, hinder limbs and tail are of a normal character; the chest is much enlarged to admit of the increased size of the lungs and heart, which possesses a much more perfect diaphragm than in any other mammal. The arm and forelimbs are greatly elongated, especially those of the fingers, which are so lengthened out as often to be equal to the total length of the spine. The thumb, however, is comparatively small, stands at right angles to the other bones, and terminates in a strong claw of great service in clinging to supports. The whole extent of the arm and hand in the bats is enclosed within a membrane which consists of leathery skin more or less furry upon the outside, which stretches between the fingers, arm bones and body, forming an extensible membrane or parachute, and constituting an effective instrument of flight. In some bats a similar membrane (which is only an extension of the skin and is of double thickness) stretches from the heel of each hind foot to the tip of the tail, but in many bats the tail is free from any such membrane. The tail is very variable in length, but is never prehensile nor bushy. The hind limbs are very short and peculiar in being twisted in such a way that the knee bends backward, making walking very difficult.

The membranous wings of the bat are not only an organ of flight, enabling it to perform feats in the air probably not exceeded by any bird or insect, but are also a means of informing the creature as to its surroundings. Bats are mainly nocturnal and their eyes, though highly organized, are very small, embedded in fur and comparatively useless in the dark, yet no animal seems more thoroughly wide awake and able to take care of itself, even in almost complete darkness, than this one, which habitually lives in gloomy caves and seeks its food only after daylight has departed. The ability which bats have in catching their prey by extraordinary agility in the air and in avoiding obstacles as it darts about among the trees, seem to be due largely to an extreme sensitiveness in the wings. These are not only supplied with a great number of blood vessels and nerves, but are provided with very sensitive sense-organs, each the terminus of a nerve fibrilla. This armature has evidently arisen as an added means of information, giving the animal a sense of touch more exquisite than we know of elsewhere in the animal kingdom. The well-known experiments of the Italian Spallanzani toward the end of the 18th century, which have been verified by more recent investigations, make it plain that bats depend very largely upon these sense organs in their flight through the darkness. It was found that bats whose eyes were scaled up with varnish, or even completely destroyed, made their way with apparent ease not only through dark rooms but in places where strings had been stretched across the path in various directions, and other obstacles had to be avoided. These blinded bats never collided with such obstructions, but seemed able to approach a wall at ease, alight upon a perch, or even find a small cavity without apparently searching for it.

For a similar purpose of information many bats are furnished with extraordinary membranous appendages upon the nostrils and ears, which give to some of them a most amazing appearance. In the large fruit-eating fox-headed bats of the East Indies, which are more nearly diurnal than any others, the ears are of no great size, and the nose is defended only by long hairs about the nostrils and eyestalks; but in all the smaller, insect-eating, nocturnal bats, there arise upon the nostrils leaf-like appendages, sometimes very large and complicated which resemble the leathery substance of the wings and in such species, the ears are often several times larger in area than all the rest of the face. These great ears must not only collect sounds far too faint for us to hear, but their membranes are as nervous and sensitive as those of the wings, probably being able to feel degrees of density in the air entirely imperceptible to most other creatures.

Bats are divisible into two groups or suborders, the Megachiroptera, and the Microchiroptera. The first group contains the fruit-eating bats whose large size, reddish fur and fox-like head have given them the name of flying foxes (q.v.). Their chief distinguishing feature, however, is that the molar teeth are not tubercular but are marked with a longitudinal furrow. They are able to mash up fruit and are confined to the tropics of the Old World, and are all included in a single family, *Pteropodidae*. The Microchiroptera have molars with sharp cusps adapted to cutting and crushing the insects upon which they mainly subsist. This group includes all of the ordinary bats, of which those most familiar in North America and Europe belong to the large and typical family Vespertilionidae, of which nearly 200 species are named. Among the most numerous and widespread of the North American bats are the large hoary bat (*Lasius cinereus*) of the Northeastern States; but it keeps to the woods and is not often seen; it migrates to the southern States in winter. It is about 5.50 inches long. Another common bat of the woods is the small, light-colored (*Lasionycteris noctivagans*). The red bat (length 4.40 inches) is numerous in the Alleghanian region, inhabiting caves in great companies; but the *common* bat of the whole country east of the Rockies is the little, glossy brown familiar of our homes and gardens, as well as of the woods, which remains with us
the year round, hibernating during cold weather in the hollow trees, caves and crevices about buildings, where they make their home, and when it is quiet, to seek their prey about our farmyards and gardens. As the insects caught are mainly mosquitoes and similar pests, and as they do no harm, they should be encouraged, rather than feared and persecuted. *Awake at the last,* says Cram, *some four out of every 24 hours of their drowsy little lives, they never make any nests or even attempt to fix over the crumbs where they hide. These helpless little things are not left at home at the mercy of foraging rats and mice. When the old bat flies off into the twilight, the youngsters often go with her, clinging about her neck. At times, she deposits them on the branch of a tree where they hang, sheltered by the leaves.*

**BAT-PARASITES.** Besides bugs (see BED-BUG) certain very strangely modified wingless flies are in rare cases found living on bats in Africa and the East Indies. They are somewhat spider-like, with a narrow eyeless head, though four ocelli are present in some species, which rests on the back of the thorax, while the legs are large, long, and sprawling, ending in large claws. They are only a line or two in length. The larva is, like that of the sheep-tick (q.v.) and horse-fly (*Hippobosca*), very small, the maggot being probably nourished in the dilated oviduct of the fly, then attaining its full growth, when it is expelled in the shape of a broad, short puparium, the skin being hardened by the excretion of chitin.

**BATABANO,** bā-tā-bā-no', Cuba, town in the province of Havana near the south coast, 37 miles from Havana, by rail. This port is one at which coasting steamers touch, and is the nearest point in Cuba to the Isle of Pines. The natives are engaged in sponge fishing. San Cristobal de la Habana was founded on the site of the modern Batabano by Diego Velasquez in 1514. Pop. about 6,500.

**BATAK,** bā-tāk', or **BATAG,** Philippines, an island about one and a half miles off the northeast coast of Samar, the most northerly of that portion of the Philippine Islands which goes under the designation of Visaya, or Bisaya. Area, 18 square miles.

**BATIC,** or **BATAG.** Philippines, a town of Luzon, the largest in the province of Ilocos Norte, founded in 1587. It is situated 10 miles south of Laog and is a flourishing trade centre. Pop. about 15,900.

**BATAN** or Batak, Bulgaria, a district and town southwest of Philippopolis. The region became prominent in European history in the time of the Bulgarian insurrection against Turkey in 1876. In May of that year the villagers of Batak were preparing to take part in the insurrection, when the place was attacked by a force of Bashi-Bazouks under the command of Achmet Agha of Dapat. After a short struggle the village was surrendered and the inhabitants gave up their weapons, on the assurance of the Turkish commander that "not a hair of their heads should be touched." On May 9, 1876 the Turks began one of the most cruel massacres recorded in history; the inhabitants of the unfortunate village were butchered and those who took refuge in the church were burned to death by the Turkish se Navigare, the English commissioner, visiting the place two months later, found but one survivor, an old woman. The Turkish government rewarded Achmet with a decoration of honor. The news of the massacre at Batak *Bulgarian atrocities* aroused all Europe and furnished Russia with an excellent pretext for declaring war against Turkey in 1877. It suffered heavily in the war against the Turks in 1912-13 and in the second Balkan War in 1913. See also BULGARIA; SAN STEFANO, TREATY OF; TURKEY.

**BATALEUR,** bā-tā-lər', a large, voluminously created eagle of Africa, named *Heliornus equidatus* with reference to the unusual shortness of its tail. It has the handsomest plumage of all the eagles, presenting bold contrasts of rich maroon, black and gray, with brassy reflections from the wings. It feeds mainly on lizards and snakes, attacking the latter, even when venomous, by blows of its powerful beak. Its breeding season, which is at the commencement of the hot weather when other birds are busy at other things, seems to be placed with reference to the greater ease with which snakes can then be captured, when the grass lies down or burns off, exposing them to view.

**BATALHA,** bā-tāl'ya, Portugal, village 68 miles north of Lisbon, famed for its Dominican convent, founded by King John I, in commemoration of a victory over the king of Castile in the year 1385. This convent, one of the most splendid buildings in Europe, is 576 feet long and 443 wide. Its church, in which lie the remains of the founder and the following three kings of the house of Aviz, as well as those of many other mythical kings, is a beautiful edifice, adorned with many art treasures. Pop. 3,830.

**BATAN,** bā'tan, Philippines, a province of the island of Luzon, forming the peninsula between the bay of Manila and the China Sea: area, 450 square miles; chief town, Bataan. It is noted for many excellent varieties of marble, which are extensively used in the churches and public buildings of Manila and other towns of the Philippines. The inhabitants of the towns and coasts of this province are of the Tagalog race, but, besides these, the mountain fastnesses are inhabited by numerous tribes of Negritos.
1 Flap-nose Bat (Rhinopoma microphyllum)
2 Pigmy Bat (Vesperugo pipistrellus) (natural size)
3 Water Bat (Vespertilio daubentonii)
4 Horse-shoe Nose Bat (Rhinolophus ferrum-equinum)
BATAN, Philippines, a town on the island of Panay, in the province of Capiz, 21 miles west of Ozamiz. Pop. (1898) 12,000.

BATAN, or BASHI ISLANDS, Philippines, a group of small islands in the Chinese Sea, discovered by Dampier in 1687, now a dependency of the Philippines, north of which they are situated, midway between Luzon and Formosa. The government control was established over these islands in March 1900, with Teofil Cosntillejo as first governor. The Batans are bounded on the north by Bashi Channel, which divides the Philippines from the Japanese insular territory, and have an area of 125 square miles and a population estimated at 9,500. The principal islands in the group are Ibvalay, Basay, Saptan and Huijos. Santo Domingo de Basco, the principal town and port, is about 500 miles from Manila and has a population of about 3,000. The other towns are San Bartolome de Calayan, San Carlos de Marigaota, San Jose de Ibana, Santa Maria de Mayan and San Vicente de Saptan. Under Spanish rule Santo Domingo was the residence of a political military governor, a judge and an attorney-general.

BATANEA, or BASAN, a district of ancient Palestine, corresponding to that now called Hauran. It reached from Mount Hermon on the north to the brook of Jabbok (the modern Nahar el Zerka) on the south, and from the Jordan on the west to the Gheshurite and Maachathite boundaries on the east. Its chief towns were Ashtaroth, Edreï, Golam and Salchah. It was a rich pasture land, fabled for its sheep and oxen. In Roman times with Ituraea, Gaulanitis Trachonitis and Auranitis, Batanea formed one of the five divisions of the country. For its part in the history of Israel consult Num. xxx, 33-35; Deut. iii., 1-3; Josh. xiii, 29-31; Amos iv, 1; Ezek. xxxvii, 6; Isa. ii, 13.

BATANGAS, ba-tān'gas, Philippines, a town on the island of Luzon, the capital of the province of the same name, 58 miles south of Manila, founded in 1831, and situated on the large bay of Batangas, opening into the Strait of Mindoro. It is well built, containing several spacious streets, in which are many elegant mansions. A number of annual expositions are held in the city. The city has an excellent harbor, and prior to the war between the United States and Spain was the seat of a large commerce. The province is one of the richest sugar growing districts in the Philippines; but the industry is far inferior to its possibilities owing to the lack of proper machinery and modern methods of treatment. There are forests of pine wood on the mountains, and the region is rich in mineral waters. The only important industry is the manufacture of dyestuffs, and silk, abaca and cotton fabrics. It is also notable for its large production of cocoanut oil, the larger part of which is used for domestic purposes, oil and lubricating machinery. Such of it as is exported to Europe, after being solidified, is manufactured into soap and candles. Pop. 39,358.

BATATAS, ba-tā'tas. See Sweet Potato.

BATAVI, an old German nation which inhabited a part of the present Holland, especially the island called Batavia, formed by that branch of the Rhine which empties itself into the sea near Leyden, together with the Waal and the Meuse. Their territories, however, extended much beyond the Waal. Their bravery was commended by Tacitus. According to him, they were originally the same as the Catii, a German tribe which had emigrated from their country on account of domestic troubles. This must have happened before the time of Caesar. When Germanics was about to invade Germany from the sea, he made their island the rendezvous of his fleet being subjected by the Romans, they served them with such courage and fidelity as to obtain the title of their friends and brethren. They were exempted from duties and taxes, and permitted to choose their own laws. Their cavalry was particularly excellent. During the reign of Vespasian they revolted, under the command of Civilis, from the Romans, and extorted from them favorable terms of peace. Trajan and Adrian accepted them again. At the end of the 3d century the Salian Franks obtained possession of the island of Batavia. See BATAVIAN REPUBLIC.

BATAVIA, properly the name of the island occupied by the ancient Batavi, but a later date the Latin name for Holland and the whole kingdom of the Netherlands. The name Batavian Republic (q.v.) was given to the Netherlands on their new organization, 16 May 1795, and they continued to bear it till the establishment of the kingdom of Holland, under Louis Bonaparte, 8 June 1806.

BATAVIA, Java, city and seaport on the north coast of the island, near the west end, and the capital of all the Dutch East Indies; long. 106° 50' E.; lat. 6° 8' S. It is situated on a wide, deep bay, in which are interspersed many low, green islets, within which ships find safe anchorage, the roadstead being sheltered from the northwest monsoon. The largest of these islets is Onrust, on which all ships above 300 tons burden lay to anchor. The town consists of two portions. The old is situated in a low, marshy plain near the sea, and intersected by the Great River and sundry canals, is exceedingly unhealthy, and subject to an intermittent fever, very fatal to strangers. Much has been done, however, to diminish the unhealthiness by draining the marshes, and letting currents of water into the stagnant canals. The old is still the business quarter and contains the principal warehouses and offices of the Europeans, the Java Bank and the exchange. On the west side of the Great River is the Chinese quarter, inhabited entirely by Chinese. Batavia is the chief mart among the islands of the Asiatic Archipelago for the products of the Eastern seas and the manufactures of the West, and its commerce is correspondingly important. The chief products are coffee, sugar, tea, rice, different spices, timber, dyewoods, diamonds, drugs, minerals, etc. Batavia was founded by the Dutch in 1619 and attained its greatest prosperity in the beginning of the 18th century, when it had about 150,000 inhabitants. The most important edifices are an American Calvinistic, Lutheran and Portuguese churches, some Mohammedan mosques and Chinese temples. Among its educational institutions are a gymnasium, a number of government
and private schools, an orphan asylum, a medical school for natives connected with the military hospital, and a number of scientific societies. Pop. about 140,000, of whom 9,500 are Europeans, 28,000 Chinese and about 3,000 Arabs.
The inhabitants are chiefly of Malay extraction, with a considerable admixture of Chinese, and a small number of Europeans (Dutch, English and Portuguese). A United States consul resides here. See JAVA.

BATAVIA, Ill., town in Kane County, on the Fox River, and on Chicago & N. W. and Chicago, B. & Q. railroads, 37 miles west of Chicago. Here is the State Asylum for the Insane. Batavia has fine churches and public schools and a public library. Among the industries are stone quarries and foundries, and manufactories of farm implements, wagons, pumps, engines and windmill factories. Batavia was settled in 1834 and incorporated in 1850. It is governed, under a charter of 1902, by a mayor, elected every two years, and a unicameral council. Pop. 5,000.

BATAVIA, N. Y., town and county-seat of Genesee County, 37 miles east of Buffalo and 33 miles west of Rochester, on Tonawanda Creek, and on the New York Central, the Lehigh Valley and Lake Erie and Western railroads. It is in an agricultural region; has manufactories of plows, threshers and agricultural implements, rubber goods, shoes, cut-glass, sheet metal goods, paper-boxes, monuments, electrical equipment, shot-guns, stampings and metal specialties, and there are also flour mills and canning factories. In 1914 there were in operation 57 establishments, employing 2,833 persons, who received $1,733,000 for their services. The capital invested in these enterprises totalled $7,847,000; the raw materials used were valued at $2,423,000 and the finished products at $5,340,000. It has three banks and taxable property valued at $11,252,827. Batavia is the home of individual instruction in public schools, of which there are seven besides one high school. Public buildings are the courthouse, county jail, surrogate's office, county clerk's office, Holland Purchase museum and land office, containing interesting historical relics, the State Institution for the Blind and the Harry H. Shaw Memorial Library. There are daily and weekly newspapers. Batavia has the charter form of government; the waterworks and electric-light plant are owned by the municipality. A new filtration plant for sewage disposal is about to be constructed. The village was founded in 1811, and first incorporated in 1826. It was the home of William Morgan, made famous through the Anti-Masonic excitement in 1826. Pop. (1910) 11,615; (1916) 13,581. Consult Scawen, 'Historical Sketch of the Village of Batavia' (Batavia 1849).

BATAVIAN REPUBLIC, the name adopted by the Seven United Provinces of the Netherlands soon after the French Revolution, and acknowledged by the powers of Europe. The whole republic was declared one and indivisible; all members of the society were declared equal in the eye of the law, without respect to rank or birth; all religious societies, acknowledging a Supreme Being, equally protected by law. Feudality was abolished, all fiefs declared alodial and possessors of lordships to be indemnified. In 1806 the form of government was changed into that of a kingdom, under the name of Holland; and the Batavian republic fell nominally under the sway of Louis Bonaparte as its sovereign, but really under that of his brother, Napoleon I. of France.

BATECHELLOR, George Sherman, American jurist; b. Batchellerville, N. Y., 25 July 1837; d. Paris, France, 2 July 1908. He was admitted to the bar in 1858; entered the Union army in 1862; was taken prisoner at Harper's Ferry, and exchanged in 1863. He was appointed deputy provost-marshal-general of the department of the South; and in 1865-70 was inspector-general on the staff of Governor Fen- ton of New York. He was president of the International Tribunal of Egypt 1883-85; assisted Secretary of the United States Treasury 1889-91; United States Minister-resident and Consul-General to Portugal 1891-93; and in 1898, again a member of the International Tribunal of Egypt. In May 1902 he was promoted to the Supreme Court of Appeals. In 1879 King Humbert decorated him with the great cross of the Order of the Crown of Italy, in recognition of his services as president of the Universal Postal Congress of 1897.

BATCHelor, George, American Unitarian clergyman; b. Southbury, Conn, 1836. He was secretary of the American Unitarian Association 1893-97, and has since been editor of the Christian Register, published in Boston. He has also been secretary of the National Unitarian Conference 1870-80, and its chairman 1893-94. He is the author of 'Social Em- ployment.' During the last 50 years he has served three parishes, in Salem, Mass., Chicago, Ill., and Lowell, Mass. He has given lectures on ethics at the schools of theology at Meadville, Pa., and at Harvard University. In his eightieth year he is on the retire list, but during the last year has contributed articles to The Christian Register, The Harvard Theological Review and The Harvard Graduates' Magazine. While a junior in Harvard College he spent a winter as acting solicitor of the United States Sanitary Commission at Sheridan's headquarters at Winchester, Va. In recognition of this service he was made a member of The Union Society of the Civil War and also of The United States Sanitary Commission of America. In 1911 he was elected a doctor of divinity by the Meadville Theological School.

BATCHIAN, bat-shy'än, or BATJIAN, one of the Molucca Islands, west of the southern peninsula of the large island of Halmahera or Gilolo. Area, 914 square miles; pop. about 13,000. It belongs to the Dutch district of Ternate, consists of two peninsulas joined by a narrow isthmus, and has many mountains. Batchian produces gold, copper, coal, sago, coconut trees, rice, cloves and fine timber.

BATE, William Brimage, American legislator; b. near Castalian Springs, Tenn., 7 Oct. 1826; d. Washington, D. C., 9 March 1905. He served as a volunteer three years in the Mexican War stationed at the Lebanon Law School in 1852; elected attorney-general of the Nashville district in 1854; and was presidential elector in 1860. In the Civil War he rose from private to the rank of major-general in the Confederate army, and was three times dangerously wounded. He was an elector-at-large for Tennessee in 1860.
nessse on the Democratic ticket in 1876; was elected governor in 1882 and 1884, and a United States Senator in 1887, 1893 and 1899.

BATEMAN, Newton, American educator: b. Fairfield, N. J., 27 July 1822; d. Galesburg, Ill., 21 Oct. 1897. He graduated from Illinois College, 1843, and studied at Lane Theological Seminary, but began to teach instead of entering the ministry. He was professor of mathematics at Carleton College, 1847-51; State superintendent of public instruction, 1858-63; member of the State board of health, 1877-97; and president of Knox College, 1877-93, when ill-health caused his retirement. His official reports are of high value in educational literature, and much of the excellence of the Illinois school laws is due to his wisdom and foresight. He published 'School Laws of Illinois' (1865, 12th ed., 1886); 'School Laws and Common School Decisions of the State of Illinois'; revised by W. L. Pillsbury (1889).

BATES, Arlo, American author: b. East Machias, Me., 16 Dec. 1850. He graduated from Bowdoin in 1876, when he engaged in literary work in Boston, editing the Sunday Courier, 1880-93; and afterward became professor of English literature in the Massachusetts Institute of Technology. He is author of poems and novels, including 'The Pagans' (New York 1884); 'A Lad's Love,' 'The Wheel of Fire' (1885); 'The Philistines' (1888); 'Berries of the Brier' (1889), poems; 'Toil in the Gate' (1892); 'Talks on Writing English' (1892) on the Study of Literature (1897); 'The Puritans' (1899); 'Under the Beech Tree' (1899); 'Diary of a Saint' (1902); 'The Intoxicated Ghost' (1908); and an introduction to E. P. Whipple's 'Charles Dickens' (1912).

BATES, Barnabas, American clergyman: an active promoter of cheap postage in the United States: b. Edmonton, England, 1785; d. Boston, Mass., 11 Oct. 1853. He came to America at an early age, became a Baptist preacher in Rhode Island, and was, for a time, a collector of the port of Bristol. In 1825, having become a Unitarian, he established a weekly journal in New York called the Christian Inquirer. During Jackson's administration he received an appointment under Samuel Gouverneur, postmaster of New York, and for some time performed the duties of postmaster himself. The information gained in this capacity first interested him in the question of cheap postage. He investigated the subject for years, wrote, published pamphlets and lectured throughout the country, and finally effected a material reduction in the rates of land postage. He was endeavoring to obtain a corresponding reform in ocean postage at the time of his death.

BATES, Blanche, American actress: b. Portland, Ore., 1873. She made her first appearance in 1894 in San Francisco, taking a part in Brander Matthews' one-act play, 'This Picture and That.' Her first success was as Mrs. Hillary in 'The Senator,' and she has played the leading comedy rôle in 'The Last Word,' 'The Railroad of Love,' 'Transit of Leo' and 'The International Match.' Her acting of Nora in 'A Doll's House' (the first Ibsen play presented on the Pacific coast) was a distinctive artistic triumph. She has also taken leading parts in 'The Charity Ball,' 'Sweet Lavender,' 'The Dancing Girls' and others. Her phenomenal success in 'The Great Ruby' (1899); as Miladi in 'The Three Musketeers' (1899); in Long and Belasco's 'Darling of the Gods' (1902-03), and 'The Girl of the Golden West' (1905) has given her a place of assured prominence on the American stage. Condit Strang, 'Famous Actresses of the Day' (Boston 1899).

BATES, Charlotte Fiske (Madame A. Rock), American poet and miscellaneous prose-writer: b. New York, 30 Nov. 1838. She was educated in Cambridge, Mass.; assisted Longfellow in compiling 'Poems of Places'; edited the 'Cambridge Book of Poetry and Song' (Boston 1882); 'The Longfellow Birthday Book'; and 'Seven Voices of Sympathy'; has contributed to magazines and published 'Risks and Other Poems,' a volume of original verse (1879). She married in 1891 M. Adolphe Rogé, who died in 1896.

BATES, Edward, American lawyer: b. Belmont, Va., 4 Sept. 1793; d. 25 March 1869. Having settled in Missouri, he served in the legislature and Constitutional Convention, and in Congress in 1827-29. He was Attorney-General of the United States in Lincoln's first administration; and had been a candidate for the presidential nomination in 1860.

BATES, John Coalter, American military officer: b. Saint Charles County, Mo., 26 Aug. 1842. He entered the regular army as a lieutenant in the 11th United States infantry, 14 May 1861, and served on the staff of General Meade from the battle of Gettysburg to the close of the war. On 4 May 1898 he was appointed a brigadier-general of volunteers for the war with Spain, and on 8 July was promoted to major-general for his services in the Santiago campaign. In February 1899 he was appointed military governor of the province of Santa Clara, Cuba, and in April following, was ordered to duty in the Philippines. In March 1900 he was assigned to the command of the department of southern Philippines; for his eminent services there and on the Sulu group was promoted major-general, 9 June 1902. In February 1906 he became lieutenant-general succeeding General Chaffee as chief of staff, and in April 1906 he retired.

BATES, Joshua, American financier: b. Weymouth, Mass., 1788; d. 24 Sept. 1864. In 1828 he became a member of the house of Baring Brothers & Company, in London, and subsequently its senior partner. In 1854 he was appointed undersecretary to the joint British and American Commission for the settlement of claims arising from the War of 1812. He was the principal founder of the Boston Public Library, and in 1852, the first year of its existence, he made it a gift of $50,000, and later gave it 30,000 volumes. Its reading-room is named "Bates Hall" in his honor.

BATES, Katharine Lee, American poet and educator: b. Falmouth, Mass., 12 Aug. 1859. A.B. Wellesley College, 1880; A.M. 1891; Litt.D. Middlebury College, 1914. She was called to the English literature department of Wellesley College, 1885, made associate professor in 1888, professor in 1891. She has edited various English classics, includ-
ing the Heywood volume in the Belles Lettres Series (1916) and written other books on professional lines, as 'The English Religious Drama' (1898) and 'History of American Literature' (1898); has traveled in Europe, Egypt, Palestine, and published several books as fruit of these travels: 'Spanish Highways and Byways' (1900); 'From Greta to Land's End' (1907); 'In Sunny Spain, a Story' (1913). Her volumes of poetry are 'The College Beautiful' (1887); 'Sunshine' (1890); 'The Story of Chaucer's Canterbury Pilgrims Retold for Children' (1909); 'America the Beautiful' (1911).
