BATES, Samuel Penniman, American historian; b. Mendon, Mass., 29 Jan. 1827; d. 1902. He was principal of schools in Crawford County, Pa., 1857-60; deputy state superintendent of schools, 1860-65; and State historian, 1865-73. Among his publications are the 'Lives of the Governors of Pennsylvania' (1873); 'Lectures on Mental and Moral Culture' (1859); 'History of the Battle of Gettysburg' (1863); 'History of the Battle of Antietam' (1882); 'History of Colleges in Pennsylvania.'

BATE'S CASE, an English historical incident of much significance as marking the opening of the struggle of Parliament with the Stuart kings. John Bate, a London merchant, having refused to pay certain duties levied without consent of Parliament, was sent to prison by the royal officers. The Commons supported Bate, but the king's authority to levy impositions on exports and imports was sustained by the Court of Exchequer.

BATES COLLEGE, Lewiston, Me., was opened in 1863 and chartered in 1864. It grew out of Maine State Seminary, a secondary school opened in 1857. The college was founded by Rev. John Burbank Cheney, D.D. (1863-94), and bears the name of its chief benefactor, Benjamin Edward Bates, a merchant of Boston and one of the founders of the city of Lewiston. Bates is the first Eastern college to afford collegiate education to women and its first woman graduate (1869) became a professor in Vassar College. Bates is monastic and thoroughly Christian. Its faculty represents nine different religious denominations and the leading universities and colleges of the United States. It places primary stress upon character, does not tolerate hazing and makes abstention from intoxicating drinks a condition of student membership. Its course of instruction covers the range of undergraduate studies as pursued in progressive colleges of to-day. The unusual excellence of its courses in English, including argumentation and composition, justified by its 38 victories in 38 intercollegiate debates. Alone among New England colleges, Bates has no secret fraternities. It has chemical, physical and biological laboratories, libraries containing more than 250,000 volumes, a spacious athletic field. Its campus of 45 acres is of rare natural beauty and with its 15 buildings (including a chapel, Carnegie science building and library) has a value of $397,000. Its invested funds amount to $930,000. About 45 per cent of its graduates have become teachers. For the last 20 years the number of its graduates at the head of city high schools in New England is believed to have exceeded those of any other college. Bates has 100 scholarships and it so shapes its plans as to help students of small means to meet their own expenses. The college has 34 officers and instructors and 472 students.

BATESVILLE, Ark., city and county-seat of Independence County, on the White River and on a branch of the St. Louis & S. Railroad, 115 miles northeast of Little Rock. It is the seat of Arkansas College, founded 1872, a Presbyterian institution; also of a Masonic Home and School and of an Odd Fellows' Home and School for Widows and Orphans. The river is navigable for steamboats to this point and the United States government has provided, at a cost of over $3,000,000, a system of locks and dams to ensure navigation for 100 miles above the town. It contains immense quarries of marble and other stone in which it carries on a large export trade and has woolen mills, flouring mills, furniture factories, municipal electric lighting and power plants, waterworks, etc. Pop. (1910) 3,400.

BATEFISH, a sea-fish (Malthevseptilia) of low organization, constituting the family Malthevseptilia, allied to the goosefishes (Lophiidae), which creeps about the bottom like a huge toad and feeds upon whatever comes within its reach. It is numerous in all warm seas and some related forms inhabit the deeper parts of the ocean. See GUSEEISH.

BATH. As the most ancient records of the human race refer to the use of the bath it is probably safe to surmise that the prehistoric peoples early discovered the cleansing effect of water and were eager to enjoy it. To the ancient Egyptians, as to the modern Mohammedans, it is a part of their religious service, while among the early Hebrews it was not only one of the first purificative duties but it was positively prescribed by the Mosaic law in certain specified cases of uncleanness. Thus the Jew who had no bath in the court yard of his house, bathed in the streams, or, later, in the mixed, or public bath, while, besides water, bran was often used for ceremonial cleansing, especially by the women, just as the modern Arabs, when unable to obtain water, rub themselves clean with sand. See ABULATION.

The earliest and most common form of bathing was, of course, that of swimming in rivers, and bathing in such rivers as the Nile and the Ganges was supposed to possess a religious significance which tended to make the practice a very popular one. The use of oils and the greater luxury of perfumes became customary on occasions of sanitary bathing at a very early period. In later times the more wealthy Romans possessed many kinds of oils and pomades which they brought to the baths, that their bodies might be anointed with them, while even the poorest citizens were provided with cold water after the bath.

The first reference to such a convenience as that of a public bath occurs in the Bible, where it is stated that the bathing "pools" were sometimes sheltered by porticoes, but this was a simple invitation when compared to the perfect bathing facilities which were afterward pro-
vided by the Greeks and Romans, while the praise lavished upon the baths of Darius by Alexander the Great indicates that the Persians must also have possessed beautifully appointed baths.

The public baths, which began to be built in Rome shortly after Clodius had succeeded in supplying the city with water from Praeneste, soon became one of the most popular institutions of the day. According to the Greek authors, the Romans had borrowed the idea from the Persians, and even the most able writers of that time admit their inability to describe the magnificence and luxurious appointment of many of these palaces of cleanliness and pleasure. For example, Seneca says, "To such a pitch of luxury have we come that we are dissatisfied if we do not tread on gems in our baths." These baths, or *thermae*, as they were called, contained swimming baths, warm baths, vapor baths and baths of hot and cold air.

Wherever the Romans settled they built public baths, and wherever they found hot springs or natural stufes, they made use of them, thus saving the expense of heating, as at Baiae and Bath. The charge made at a public bath was only a quadrans, or about one-quarter cent.

The delicacy of feeling concerning the bathing together of sexes which is said to have existed in early times certainly did not extend to the days of the empire, when it was not at all uncommon for men and women to make use of the same bath and it was probably due to this practice that the public baths came to be condemned by the early Christians as places of unbounded license. While admitting the usefulness of the bath from the standpoint of cleanliness and health, the Church fathers insisted that baths should be taken for such purposes only and not for pleasure. It was at this time when the bath reached the height of luxuriousness; when rich citizens had magnificent private baths of the kind referred to above and, when elaborate private bathing houses might be had for hire in all the cities; conditions which continued until about the 5th century, when the destruction of Rome's water supply by the Huns and the many disasters which accompanied the downfall of the empire tended to turn popular attention from the delights of the *thermae*. How thoroughly the bath afterward fell into disuse, however, is a matter which historians have been unable to determine. In the East, of course, where the heat and dust make its use obligatory, there has never been any diminution in the practice, and while in Europe, for a time at least, perfumes were used to offset any disagreeable odors that might arise from uncleanliness of the person, this condition could not have existed for many centuries, for, by the latter part of the 12th century, the popularity of the bath had become so well re-established that there was scarcely a town in Europe which did not possess well-patronized hot-air bathing houses. Again in the 17th century, when the Turkish bath was introduced, there was another revival of interest in the matter of personal cleanliness, and people of all classes flocked to the baths, or *Humanns*, as they were called, to enjoy the new luxury that had been imported from the East.

While the Turkish bath, not to mention the Russian and Egyptian baths, are so similar to the hot-air baths of the Romans that many authorities have regarded them as nothing more or less than an outgrowth from the latter, the fact that the principle of the vapor bath has been known to many nations, and has even been found among savages, or races in an early stage of civilization, has led to the more recent and counter theory that the hot-air boxes of the Mexicans, the "medicine sweat" of the American Indians, the small baths of the ancient inhabitants of Scotland and Ireland, and the larger vapor baths of Japan, like those of Turkey and Russia, are of just as independent origin as those of the more ancient Rome. However that may be it is at least certain that while this luxurious form of bathing was largely responsible for the neglect of the cold bath and the sea-bathing, the virtues of which have been appreciated only within comparatively modern times, it is largely due to the pleasureable sensations resulting from this form of bath that the various nations of the world have neglected those principles of cleanliness upon which the good health of a people so vitally depends.

The Cold Bath—The first effect of the cold bath (at a temperature say from 50° to 70°) is to produce a shock to the nerves of the skin. In the case of the cold bath as ordinarily used, the application is short, and the more near to the temperature of 50°F. the water is the shorter it should be. Following the first action is reaction, during which the blood returns to the skin, the blood-vessels of which relax, and a pleasant sensation of glow, spreading rapidly over the surface, is experienced. This reaction is aided by rapid friction of the skin, as by towels, and if, after drying, the body is quickly clothed and exercise engaged in, the total effect of the bath is stimulating, inducing a feeling not only of warmth but also of vigor. The length of time the cold may be applied without interfering with the setting in of a proper reaction depends on the individual. A mere instant's immersion is sufficient for some, others can bear several minutes, while some could not bear complete immersion of the body at all, a feeling of coldness and shivering lasting for hours after it. V arious persons the full cold bath is not suitable, and the cold wet towel, cold wet sponge, wet sheet, etc., may be used instead, and may gradually lead up to the full cold plunge, which may thus be made tolerable and enjoyable. The cold bath is not usually suitable for the old and the delicate. The action of the cold water may be intensified by showering it or spraying it on the body by means of various arrangements of pipes, etc. The morning or early part of the day is the suitable time for all such kinds of baths. Persons who are thus habituated to the use of cold water are less susceptible to the influence of cold and can stand longer exposure than others.

*Teipid Baths* (temperature 85° to 95°) produce neither depression nor excitement, and are therefore suited for all. They are the best when prolonged immersion is desired, as in the treatment of chronic skin and nervous diseases.
The Warm Bath (temperature 95° to 104°) is particularly serviceable in removing feelings of fatigue. It should quench and even abate the circulation, and bring an additional quantity of blood to the skin. It is by this means that it removes the tired feeling from exhausted muscles, for it promotes the removal from the tissues of the waste products, which have accumulated during the period of activity, and whose presence in the muscles is the cause of the feeling of weariness. After prolonged labor, or a long fatiguing walk, or prolonged exposure to damp and cold, or after, for example, the exertion of much dancing, nothing is so restorative and refreshing as a warm bath. When employed for such purposes, the person should end with a spray or douche, or simple sponge of tepid water (70°) if he is about to go to bed, or with a warm spray, quickly reduced to cold, before dressing to go out. Warm baths are largely employed in feverish affections of children for promoting the action of the skin; and they are a safe resort in the complications of cold being at the same time applied to the head.

The Hot Bath (temperature 102° to 110°) acts in a more pronounced way upon the heart and nervous system than the merely warm bath. If very hot it powerfully excites the heart, whose action, indeed, it may stimulate to violence. The brain is also influenced by the more copious flow of blood through it, due to the vigorous action of the heart. These effects, however, are largely counterbalanced by the increased flow of blood to the skin. But the prolonged use of hot baths is weakening, and the temporary strain thrown upon the heart and blood-vessels and brain would be hurtful to many. The bather should be immersed to the chin; the hair is damped with cold water and a thin cold cloth is wrapped about the head. Cold water may be drunk if desired. The bath should last 20 minutes, or less, if oppression is felt. It should conclude, as described for warm bath, with tepid douche or sponging, or with warm spray quickly reduced to cold. The hot bath should not be used in the morning or early part of the day, or at any time except before going to bed, unless the persons are properly cooled down before dressing and going out.

The Hot-air Bath is one of the most powerful ways of stimulating the activity of the skin. The person, unclothed, is placed in an apartment which is heated by means of furnaces, the air being dry. In a longer or shorter time, according to the heat of the air and the condition of the bather, the perspiration bursts out upon the skin, becoming very copious, so that the whole body is bathed in sweat. A very high temperature may be borne so long as air is quite dry, for the sweat passes rapidly off from the body in the form of vapor, removing a large quantity of heat, and thus the temperature of the body does not rise. However, the air is very hot, when the heat of the body usually exceeds or equals, and so at a high temperature could not be borne if the air were moist, as in the case of a vapor bath, for then the air is saturated or nearly so with moisture and cannot take up more, or can take up less moisture. Moisture, by breathing, fullness in the head, faintness, etc., would then speedily arise. When the air is quite dry, however, a high temperature, for example that of 180° F., can usually be endured with ease. Then the heat is used to stimulate the activity of the skin but the action of the heart and of breathing are greatly increased. It is thus not suitable for everyone, certainly not in its full form for anyone with weak heart or vessels and for very full-blooded persons.

The Turkish Bath.—The hot-air bath is usually obtained with other accessories in the form of the Turkish bath. This bath was adopted by the Turks from the Romans, who derived it from the Greeks. The bather enters the dressing-room (Rom. vestitum), which is heated to an ordinarily comfortable temperature. Beyond this room there are, in the fully-equipped Turkish baths, three rooms, separated from the dressing-room by well-padded doors. The first of these corresponds to the Roman tepidarium, the warm room, in which the temperature is from 115° to 120°; beyond this and separated from it by heavy curtains is the hot room, or caldarium, in which the temperature ranges from 120° to 140°; and beyond this is the hottest room, called also the flue room, corresponding to the Roman laconicum. Here the temperature is not below 150°, usually 175° to 180°, but may be 200° and upward. Every Turkish bath has at least two beyond the dressing-room, one in which the temperature may readily be raised to 140° or thereabout, and one beyond it in which the highest temperatures may be obtained.

When a full Turkish bath is taken the following is the usual course: The bather undresses in one of the curtained recesses of the dressing-room, girds a towel or similar cloth round his loins, and carrying a bath-towel over the arm passes into the warm room. Here he stays only long enough to wet the hair with cold water, and perhaps drink of it, and then passes on through the hot room, into the hottest room. Spreading his towel over a chair he reclines on it, sets his head with cold water, and drinks at his pleasure, but not too copiously, of cold water, which the attendant will bring him. Here he remains five or 10 minutes. By this time the whole body will be bedewed with perspiration; and the bather passes out into the room next in temperature, the hot room, where he reclines for another 10 or 15 minutes. Then he passes to the warm room, lower in temperature than the former, and here he reclines till the attendant is ready for him, when he proceeds to the washing room. Here he lies on a table and the attendant goes over the whole body, rubbing the surface, and thus removing all loose effete skin, grasping and kneading the muscles, bending joints and so on. He is then rubbed over with soap, scrubbed and washed down, and lastly drenched with warm and then tepid and cold water. From this room the bather passes out quickly, plunges through a cold bath, and regains the dressing-room, where he is quickly dried down with warm dry towels. He is then enveloped in a dry bath-towel and remains there seated on his couch in the dressing-room, covered over with a light rug or blanket, till his skin assumes its natural degree of warmth. When the skin is cool and dry, usually in 15 or 20 minutes, the bather's dress is put on and he may then go out. The ordinary duration of the full bath, from the flue room to the washing room, is
from 40 minutes to an hour. The full bath, however, is suited chiefly for those accustomed to it, for the healthy and robust.

The vapor bath acts upon the body much as the hot-water bath does, but it acts more powerfully, though the effect of the heat is not so violent. The vapor bath is more soothing than the hot-water bath. This bath can, therefore, be borne hotter than a water bath, but the high temperature cannot be borne long, for the vapor does not permit of the loss of heat from the body as a hot bath does. The temperature of the vapor bath cannot be comfortably endured above 120° F. The vapor bath is characteristic of the Russian baths. It is taken in a chamber filled with vapor, which is thus not only applied to the surface of the body but also inhaled. This makes it still more oppressive. It may be used, however, in a simple form, in which the vapor is not breathed, by the person sitting on a chair, surrounded from the neck downward by blankets, which envelop the chair also and hang over its back. Under the chair is placed a shallow earthenware or metal dish, containing boiling water to the depth of three or four inches. In the water are placed a couple of red-hot bricks. Or under the chair may be placed a stove above it, thus forming a shallow pan containing boiling water. Such baths are very useful for catarh, for rheumatic and neuralgic pains, sciatica, etc., as well as for cases where excessive action of the skin is desired to relieve deeper organs, for example the kidneys. Ten to 15 minutes are long enough for exposure in the vapor bath.

Sea-Bathing.—Ordinary sea-bathing is of course cold, and produces the stimulating effects described in regard to the cold bath. There is besides the additional stimulus due to the salt, so that sea-bathing acts as an invigorating tonic. It is not, however, suited for everyone, and is taken much too indiscriminately. It is also indulged in without due precaution. It is a very common error for persons to remain in the sea too long, the result being shivering, blueness of the skin, difficulty in recovering warmth, headache, etc. Persons who are anemic, that is, of deficient quality of blood, ought not to indulge in sea-bathing without advice, and failing advice had better try first a salt-water bath at home. Persons who have suffered from any internal complaint ought also to refrain. The best time for sea-bathing is in the morning. It should never be indulged in immediately after a meal, when the business of digestion is going actively forward. A good time is before lunch or early dinner, for which the brisk walk home after the bath will prove an excellent appetizer. Neither should sea-bathing be engaged in immediately after very active exercise, when the body is in a state of very active perspiration or in a condition of fatigue. At the same time, moderate exercise before the bath is unobjectionable, and the body ought to be comfortably warm. The person should undress quickly and plunge in bodily, wetting the whole body at once. During the bath exercise should be active, as in continued swimming. Children, because of the little resistance power, are more easily impressed by sea-bathing. They may be gradually accustomed to it; but they ought not to be forcibly immersed to their aversion and terror. Sea-baths may be imitated at home by the addition of common salt or sea salt to water. The benefits of open-air bathing—sea or river—are not limited, of course, to the action of the water, but are increased by the action of the fresh air, the respiration of which is stimulated by the bath, and by the exercise in the open air invariably indulged in afterward.

There are many kinds of medicated baths, which have, or are supposed to have, special properties, valuable for diseased conditions, because of containing various saline substances in solution in them. Such baths may be artificially prepared by the addition of the salts to the water, or natural mineral waters may be used for the purpose. Mud-baths are recommended for special reasons.

Various arrangements are employed for accentuating the effect of the water, whether used hot or cold, or for applying it to particular parts of the body. The spray is one well-known variety of bath. The douche is a jet of water directed upon some part of the body through a 1/2-inch pipe, the force of the water, quantity discharged and temperature being variable and modifiable. It at first lowers the vitality of the part to which it is applied, but reaction sets in quickly, so that its whole effect is stimulating, quickening tissue change. The douche may be used hot or cold, or one after the other in rapid succession, a change which is most stimulating of all. In old-standing complaints, thickenings about joints, stiff joints, etc., it is a very useful application. In the case of the descending douche, the pipe is 10 to 15 feet above the floor level, and for the horizontal douche the pipe is four feet above floor level. In the former case it is played first on the spine, and then shoulders, hips, arms and legs in succession. At the close it is directed on to the chest and head, the force of the water being broken by the hands. In the latter case the back, chest, arms and legs are doused in the order named, while the patient rubs himself vigorously. Before beginning the head is wet with cold water, and is doused last, the force of the water being broken. The process should last scarcely two minutes.

The sitz-bath or hip-bath is a means of limiting the application of the water to the hips and neighboring parts. The form of the bathing-tub is such that the person has to sit in the sitting posture, the limbs and upper part of the body being out of the bath. The sitz-bath, hot or cold according to circumstances, is in much use for abdominal and liver complaints, and specially for female ailments. Its soothing effects used hot in such disorders are marked. Altogether the use of the bath, in association with treatment by medicine, is of the highest value in numerous disorders, rheumatic, gouty, digestive, febrile, etc. In particular, the Turkish bath, under due superintendence, may produce surprising results, from checking a simple cold upward. See also HYDROTHERAPY.

**BATH**, England, city in Somersetshire, 107 miles west of London. It is beautifully situated on the Avon, in a narrow valley bounded on the northeast and southwest by hills and widening on the northwest into rich and extensive meadows. The Avon is navigable from Bath to Bristol. Bath is noted for its places of amusement, its fine streets and the
magnificence of its public buildings. The houses are of superior construction, built of freestone, obtained from the hills about the town. The Abbey Church ranks as one of the finest specimens of perpendicular Gothic architecture. The beauty and sheltered character of its situation, the mildness of its climate and especially the curative efficacy of its hot chalybeate springs have long rendered Bath a favorite fashionable resort. The four principal springs yield no less than 184,000 gallons of water a day; and the baths are both elegant and commodious. The temperature of the springs varies from 109° to 117° F. They contain carbonic acid, chloride of sodium and of magnesium, sulphate of soda, carbonate and sulphate of lime, etc. Bath was founded by the Romans and called by them Aquæ Solis (waters of the sun). Among the Roman remains discovered here have been some fine baths. The height of its prosperity was reached, however, in the 18th century, when Beau Nash was leader of the fashion and master of its ceremonies. Since then, although it still attracts large numbers of visitors, it has become the resort of val- etudinarians chiefly. Jointly with Wells it is the chief of these dioceses and returns two members to the House of Commons. Bath has many handsome public buildings, among them the Guild Hall, technical schools, an art gallery and reference library, and the new Literary and Scientific Institution. There are several fine parks, including the Victoria Park, of about 50 acres, containing a botanical garden and an excellent theatre. It also maintains a museum and public markets. Pop. 30,729.

BATH, Me., city, port of entry, and county-seat of Sagadahoc County, on the Kennebec River and the Maine C. Railroad; 12 miles from the ocean and 36 miles south of Augusta and 36 miles northeast of Portland. It is admirably situated as a commercial port; has regular steamboat connections with Boston and Portland; is principally engaged in shipbuilding, both wood and iron; and manufactures brass and iron goods, oil cloth, shoes and lumber. The Bath Iron Works built the gunboats Muchias and Castine, the ram Katahdin and several of the modern torpedo boats for the United States navy. Bath has a large coastwise and foreign trade in ice, coal, lumber, hay, iron and steel; and contains four national banks, public library, a costly system of waterworks, and property valued at $7,000,000. Bath dates from a mission settlement of 1660. It was incorpo-rated as the town of Bath in 1781 and received a city charter in 1847, revised in 1899, which provides for a one-year term mayor and a bicameral city council. Pop. 9,396.

BATH, N. Y., town and county-seat of Stuben County, on the Cohocton Creek, 36 miles west of Elmira, on the Buffalo branch of the Erie and the Delaware, L. & W. railroads. It is the seat of the New York State Soldiers and Sailors' Home the Davenport Home for Orphan Girls and Haverling Academy; is principally engaged in agriculture and manufac-tures shoes, harness, window shades, cycles, automobile engines and aeroplanes. Bath was settled in 1793 and incorporated in 1816. Pop. 3,884.

BATH, Knights of the, an English order of chivalry established in 1725 by George I. By the book of statutes then prepared, the number of knights was fixed at 38, namely, the sovereign and 37 knights companions. The King allowed the chapel of St. Henry VII, in Westminster Abbey, to be the chapel of the order. The limits of the order were extended by the Prince Regent in 1815, to reward the distinguished services of officers during the wars; and again in 1847, when it was also opened to civil officers. It was first called the Order of the Bath. It now consists of three classes, each of which is subdivided into (1) military members; (2) civil members, and (3) honorary members, consisting of foreign princes and officers. The first class consists of Knights Grand Cross (G.C. B.); the second of Knights Commanders (K.C.B.); and the third of Companions (C.B.). Mr. James W. Gerard, formerly United States Ambassador to Germany, was decorated by King George V, with the G.C.B. in 1917. The title of "Sir," however, can only be assumed after the ceremony of the "accolade" (q.v.) has been performed by the sovereign. The dean of Westminster is dean of the order. The ribbon of the order is crimson, and its motto, "Procjuncta in uno," is the watchword of the order.

BATH HOUSES, Public. Bathing as serving for cleanliness, health and for pleasure, has been almost instinctively practised by nearly every people. The most ancient records mention bathing in the rivers Nile and Ganges. From an early period the Jews bathed in running water and used hot and cold baths; so also did the Greeks. The Persians must have had handsomely equipped baths, for Alexander the Great admired the luxury of the bath of Darius. But the baths of the Greeks and probably of all Eastern nations were on a small scale as compared with those which eventually sprang up among the Romans.

In early times the Romans used, after exercise, to throw themselves into the Tiber. Next, when ample supplies of water were brought into the city, large piscine, or cold swimming baths, were constructed, the earliest of which to have been the piscina publica (312 B.C.) near the Circus Maximus, supplied by the Appian aqueduct, the lavacrum of Agrippina and a bath at the end of the Clivus Capitolinus. Next, small public as well as private baths were built; and with the empire more luxurious forms of bathing were introduced, and warm baths became far more popular than cold baths. Public baths (balnea) were first built in Rome after Claudius brought in the supply of water from Praeneste. After that date, baths began to be common in Rome and in other Italian cities. In fact, private baths gradually came into use, being usually attached to the villas of the wealthy citizens. Maecenas was one of the first who built public baths at his expense. After this time, each emperor, as he wished to ingratiate himself with the people, lavished the revenues of the state in the construction of enormous buildings, which not only contained suites of bathing apartments, but included gymnasiums, and sometimes even theatres and libraries. Such establishments went by the name of Thermae. The principal thermae were those of Agrippa (21 B.C.), of Nero (65 A.D.), of Titus (81 A.D.), of Domitian (95 A.D.), of
Caracalla (217 A.D.), and still later those of Diocletian (302 A.D.) and of Constantine (317 A.D.). There are said to have been 850 baths altogether in Rome at one period. The technical skill displayed by the Romans in rendering their walls and the sides of reservoirs impervious to moisture, in conveying and heating water, and in constructing flues for the conveyance of hot air through the walls, was of the highest order. The Roman baths contained swimming pools, warm-bathed air and vapor baths, cold baths. The piscine were often of immense size—that of Diocletian being 200 feet long—and were adorned with beautiful marbles. Wherever the Romans settled, they built public baths, and the ruins of such have been found in all the countries which at any time were subject to the Roman eagles—Gaul (France), Spain, Germany, England, etc. It may be well to point out that none of those public baths was free; on the contrary they were usually patronized only by the very rich, who had been trained for the modern city to adopt free public baths as part of its service to the public.

Although they never wholly gave up cold-water bathing, the Romans practised chiefly was. This was, of course, more luxurious, but when indulged in to excess is energizing. The unbounded license of the public baths, and their connection with modes of amusement that were condemned, led to their being to a considerable extent proscribed by the early Christians. The early Fathers wrote that bathing might be practised for the sake of cleanliness, but not for pleasure. About the 5th century many of the large thermae in Rome fell into decay. The cutting off of the aqueduct by the Huns, and the gradual decrease in population contributed to this. Public bathing, however, was kept up in full vigor in Alexandria and elsewhere. Hot bathing, and especially hot air and vapor baths, were adopted by the Mohammedans, and the Arabs brought them with them to Spain. The Turks at a later time carried them high up the Danube. The Crusaders also contributed to the spread of baths in Europe, and hot vapor baths were especially recommended for the leprosy so prevalent in Europe. By the commencement of the 13th century, there were few large cities in Europe without vapor baths. According to Erasmus, they were common at the time of the Reformation in France, Germany and Belgium; they seem to have been a common adjunct to towns. After a time they became less common, but the reason for the decline is not clear.

In England the next revival of baths was at the close of the 17th century, under the Eastern name of banios, or the Italian name of bagno. These were avowedly conducted on the principle of the Turkish baths of the present day. But there were several considerable epochs in the history of baths, one in the commencement of the 18th century, when Floyer and others recalled the custom of using cold bathing, of which the virtues had long been overlooked. In the middle of the century also, Russell and others revived sea bathing in England, and were followed by others on the Continent, until the sea bathing system became generally established. Later in the same century, the experiments of James Currie of the action of the complete or of partial baths on the system in disease attracted attention; and though forgotten for a while, they bore abundant fruit in more recent times.

In the 4th decade of the 19th century free cold swimming baths were revived in Germany. In England, since 1842, public swimming baths besides separate baths, have been supplied to the public at very moderate rates, and floating baths in rivers, always known in some German towns, have become common wherever there are flowing streams. The better support given to these baths with water during the 19th century has greatly aided the movement to extend bathing facilities to the public. In 1846, the British Parliament passed the first of a series of acts to encourage the establishment of public baths by the local authorities, but it was not until 1865 only 25 boroughs had cared to provide bathing establishments for their inhabitants. About 1890 the city councils began to take up the matter energetically with authorization from Parliament; but it then increased so rapidly that by 1896 a free borough of 50,000 people now has its public bath open the year round and many smaller communities are similarly equipped. About 50 German cities maintain public baths throughout the year and many of the establishments in the larger cities are models of their kind in construction and equipment. On the Continent generally and in Scandinavia only the large cities are thus provided; but in Russia they are almost universal in places of any size.

In the United States, though public baths have existed since 1866 until about 1895 in a few water-side cities, they were confined to cold swimming-baths sunk in the sea or river near the shore, and open only during warm weather; of excellent service for the comfort of those not too far off, but too limited in scope to be of the highest value to the general public. Not only were they closed for more than half the year, but to those who must walk more than half or three-quarters of a mile to obtain a bath (their utility being for the poor), their value as refreshment in hot weather was neutralized by the needful exertion to reach them. Their use, therefore, depended on their distribution and relation to the water system. Thus, in Boston, where six were established in 1866, with 300,000 patrons during the first season, and extended to 14 in 1897, they were so located on the Charles River, at City Point and on South Bay, that a considerable part of the poorer population were within fairly easy distance of them. Of the United States cities had even these bathing facilities prior to 1895, and the first general movement in favor of year-round hot and cold baths was a reflex from Germany, about 1891. The first city in the United States to establish a free municipal bath supplied with hot and cold water was Chicago, which opened such a bath in 1894. Yonkers was the first city to establish free public baths open all the year. This bath was opened on Labor Day, 1896. Brookline, Mass., established free public baths in 1896, and Boston and Buffalo in 1897. The pioneer in the public bath movement in the country generally was Dr. Simon Baruch. It was he who closely investigated the working of the public bath systems in Germany and other countries and subsequently advocated, despite the strongest official opposition, the introduction of the system into the larger cities of the
BATH HOUSES

United States. In 1890 his plans were adopted by the New York Association for Improving the Condition of the Poor and the following year this Association's "People's Baths" were completed and at once became a great popular success. Some of the most prominent of the Baron de Hirsch Fund erected a public bath on Henry street, New York, and the Demilit Dispensary bath was opened about the same time. In 1895 the Riverside Association opened a public shower bath in West 69th street. About the same time the various charitable and religious organizations for the provision of bathing facilities for the masses may be mentioned the floating hospital of the Saint John Guild, the Wayfarers' Lodge and the municipal lodging-house.

In this connection, a word may be said about what are known as "Mikveh Baths." These are very common in New York city and are usually located in the basement of tenements in the crowded sections. They are conducted as commercial enterprises, the charge for a bath ranging from 5 to 10 cents. It is at certain times of the year (e.g., the Passover) the use of these baths is compelled by religious custom for both men and women; and all women are required to use these pools regularly within seven days after menstruation. The method of using the bath is minutely prescribed in the Hebrew liturgy. The first compulsory legislation was by New York State in April 1895 (though a bathing and washing association was incorporated there in 1849); it obliged all cities, towns, and villages over 50,000 people to establish public baths and comfort stations, keep open the year round, with both hot and cold water, and 14 hours a day, and under such conditions as the local board of health judged proper; river, lake or sea baths not to be deemed a compliance with the act. Cities under 50,000, though not compelled, were permitted to use their funds or credit for the same object.

The first city to comply, and perhaps the first in the United States to furnish such conveniences in their full extent, was Yonkers, N. Y., not within the compulsory section. This town opened one on Labor Day, 1896; and another of brick in 1898, with accommodations for 400 daily baths. Within the act, Buffalo opened its first in 1897; Albany, Rochester, Syracuse and Troy have since completed; and in New York the first one, five years after the act was passed, was opened in Rivington street in a closely-packed quarter, during 1900, at a cost of $100,000. It furnishes 3,000 baths a day of 20 minutes each, from 67 spray baths. In 1902 three additional municipal interior baths were contracted for in Manhattan, providing facilities for each for 103 persons at one time.

At present New York maintains and operates under the jurisdiction of the borough presidents free public interior baths, free floating baths, and a large public bathing beach at Coney Island. For the use of these baths no charge whatever is made (except at the seaside baths, where a fee of 10 cents is charged). In Manhattan there are 12 free public interior baths and 11 free floating baths (all of the latter, however, are not put in commission each year). Brooklyn has eight public interior baths, a large public bath at the seaside, and in normal years two floating baths. The interior baths are open daily to the public from 6 A.M. to 10 P.M. and on Sunday from 6 A.M. to 1 P.M. Swimming pools represent a very important and attractive feature of these public baths. In addition the city provides baths in many of its public schools. Almost all of these are of the outdoor type. At present 67 schools are thus equipped and the High School of Commerce has a swimming pool as has the College of the City of New York. The seaside public bath at Coney Island is a substantial concrete structure containing 1,300 individual dressing rooms for women and 700 dressing rooms, each for eight persons, for men. In this manner 7,000 patrons are accommodated at one time. In a recent year (1914) there were over 10,000,000 free baths given by the city of New York in both floating and permanent baths. The average cost per bather during that year was a little over four cents. In Philadelphia the Public Baths Association was organized in 1895; but the first to be opened was in 1898, in a crowded quarter between Fourth and Fifth streets, containing 1,300 individual dressing rooms, 40 by 60 feet, constructed of brick and iron, with concrete floors and iron partitions. It cost about $30,000. It was built without a swimming pool, having only shower baths — a system favored where economy of space and water is essential; the People's Baths and the Baron de Hirsch Fund Baths in New York adopt the same plan. The Philadelphia establishment has a public laundry in connection with its own suit and towel laundry, where women and men in separate departments, pay a small fee, and single men make much use of it to wash their underclothing. Some of the old warm-season baths have since been made permanent, as in Newark, N. J., which so extended two in 1898, and in 1900 voted a third. Boston from 1897 to 1899 increased its public baths to 33 — 14 floating, 10 beach and 9 others; 17 south of the Common and 16 north; and prepared to erect permanent structures in each industrial section of the city. The first of these was opened at Dover street in 1898, a fine brick and granite structure, with marble partitions and staircases, the whole with land costing $86,000. It has gymnasiums also, and medical directors for each sex to give courses of training, and for cases of accident or sudden illness. The intention is ultimately to make these baths places of public recreation, corresponding to the summer playgrounds; thus reaching in the 20th century the point at which the Romans had arrived in the first. Brookline, adjoining Boston, has a handsomely appointed permanent municipal bath houses. The State of Massachusetts has erected several splendid bath houses at the prominent beaches. Pittsburg, Worcester, Kansas City, Utica, Holyoke, Providence, R. I., and numerous other cities have built substantial public bathing establishments. Saint Paul, Minn., through the public spirit of Dr. Ohage, a German physician, now has a public playground, pavilion, etc., connected with permanent bath houses on what was till recently a waste island in the middle of the Mississippi, near the business centre of the city and between two bathing beaches. Most of the other bath establishments, it is free, save a small charge for soap and towels; has free instruction in swimming, and is open every
day, including Sundays. The expensive amuse-
ment grounds at Puласki Park, Chicago, in-
clude swimming pools and locker houses that
cost $70,000. The deep pool is 40x60 feet and
the shallower pool 60x180 feet. The establish-
ment accommodates 500 bathers an hour. The
installation of baths in public schools began in
Germany, Gёttingen leading the way in 1885
under the headship of the mayor and a pro-
fessor in the university. In the United States
it was first taken up in Boston and suburbs;
in 1900 a number of baths were put into the
Paul Revere School in the north end, and in
Brookline swimming is a regular part of the
school curriculum. But most of the school
baths are confined to shower equipments. Many
Y. M. C. A. branches, gymnasiums, clubs and
hospitals now maintain semi-public bathing
establishments, mostly equipped with showers
but not baths.

Designs of modern municipal bath houses are
credited mainly to Dr. Munnich, an army
surgeon; the late Prof. Oscar Lassar; Good-
win Brown, a lunacy commissioner, and Dr.
Simon Baruch, president of the American As-
sociation of Friends of Public Baths. Low fireproof buildings are preferred,
with an abundant water supply through a main
of at least four and preferably six inches
diameter. The water should always be filtered,
and the piping exposed. Concrete or brick con-
struction is preferred, and the pools require
excellent workmanship. Their sides are best
made of glazed tile or marble. White walls
and good light are desirable. The inflow of
water to a pool should be such as to change
the water in 24 hours. In addition to this regu-
lar flow, the pool should be wholly emptied
once or twice a week. Nude bathing is en-
couraged, as it assists the bathing masters in
excluding the diseased from the pool.

Where funds do not permit complete bath-
ing establishments, tent baths, supplied with
showers, may be utilized, as at Baltimore.
Beach baths consist usually of floating plat-
forms connected with a pier by a bridge. The
centre of the platform is opened for the pool,
which is separated from the outside water by
woodwork. The dressing rooms are on the
margins of the platform. Such baths are in
creasingly used at beaches all over the United
States.

**BATHOLITH, or BATHOLITE.** A
large intrusive mass of igneous rock, irregular
shape, which has melted its way up across
the enclosing beds. They differ from laccoliths
(q.v.) in not being imbied by any, but rather
cross, the beds. They are usually many miles
in extent, and often form the cores of moun-
tain ranges, as in the case of the Sierra Ne-
Vada. Bodies of the same form, but smaller,
are often called stocks or bosses.

**BATHOMETER** an instrument for meas-
uring the depth of the sea or any depth of
water without a sounding line, the name being
derived from bathos, depth. It was invented
by C. W. Siemens after 1859 as an adjunct to
the laying of submarine telegraphic cables, so
as to keep a continuous record of the sea depth
below a moving ship. The principle of the in-
strument is based upon the gravitation of the
earth, total gravitation being represented by a
column of mercury, which rests upon a thin
steel diaphragm immersed in such a way that its
centre can move within a small range freely
up and down under the influence of the mercury
column without encountering any frictional re-
sistance. The column ends in a cup, and mera-
cury is poured into both cup and pipe up to a
particular point, the space being filled with
water, alcohol or a liquid of less density, this
latter terminating in a spiral tube laid upon a
scale at the top of the instrument. The centre
of the diaphragm which supports the column
of mercury is carried by two or more carefully
tempered steel springs, so adjusted that their
elastic pressure balances exactly the dead weight
of the column of mercury resting upon the dia-
phragm, the result being that the diaphragm
 retains its horizontal position. Inclosed in an
air-tight casing closed by a disc of plate glass,
the instrument records by an ingenious compen-
sating arrangement the natural balance of the
elastic gravity forces on the scale, from
which readings are made. Consult Siemens,
'The Bathometer' (1879).

**BATHORY,** bát-o-ri, or **BATTORI,** a
celebrated Hungarian family which in the 15th
century became divided into two branches, one
of which gave Transylvania five princes, and
Poland one of its greatest kings.

1. **STEPHEN:** b. 1532; d. Grodno, 12 Dec.
1586. He entered the army and distinguished
himself that when the death of John Sigismund
Zapolya, nephew of Sigismund II, King of
Poland, in 1571, left a vacancy in the sover-
ignty of Transylvania, Stephen Bathory, with-
out courting the honor, was unanimously
elected. When the throne of Poland became
vacant by Henry of Valois quitting the country
in order to mount the throne of France, Stephen
Bathory was elected to succeed him in 1575,
and was crowned along with his Queen, Anne,
daughter of Sigismund Augustus, at Cracow,
in 1576. He found the kingdom torn asunder
by faction, the people enervated by long peace,
the treasury exhausted and the army without
discipline. He therefore gave his first at-
tention to internal improvement, but had no sooner
affected it than he determined to recede the
Polish territories of which the Tsar of Mus-
covy had managed to possess himself by fo-
menting dissensions. He accordingly declared
war against him, beat him at all points and
compelled him to accept a treaty of amicable
peace. Under Stephen Bathory Poland
enjoyed a comparatively tranquility to which it had
long been a stranger, and he was meditating important constitutional reforms, which promised to make that tranquillity permanent, when he died suddenly.

2. SIGISMUND, nephew of Stephen: b. 1572; d. 1613. He became Voivode or Prince of Transylvania in 1581, but did not assume power till 1588, at the age of 16 years. He shook off the Ottoman yoke, and, by the great talents he displayed, had begun to give hopes of reigning gloriously as an independent sovereign, when, from mere fickleness and eccentricity of character, he voluntarily resigned his dominions to the Emperor Rudolph II in return for two principalities in Silesia, a cardinal's hat and a pension. With the same fickleness, however, he immediately repented of the act, and, availing himself of an invitation by the Transylvanians, returned, and placed himself under the protection of the Porte. The talent which he had displayed, and the good fortune which had followed him in early life, appeared now to have forsaken him; the Imperialists defeated him in every battle, and he was obliged to throw himself on the mercy of the Emperor, who sent him to live out the rest of his days at Prague. Historians attribute inherent insanity to the Bathory family.

BATHS OF AGrippa, the earliest of the Roman thermae; erected by Marcus Agrippa in the reign of Augustus. They stood in the Campus Martius, about 20 feet behind the Pantheon. In 1881, on the removal of some houses, ruins were found of a great hall paved with marble and lined with fluted columns.

BATHS OF CARACALLA, one of the most magnificent of the Roman thermae, in the southeast part of the city, in which 2,300 men could bathe at the same time. They were begun in 206 A.D. by Caracalla, and completed by Severus. There were stadia for the athletes, galleries for the exhibition of paintings and sculpture, libraries, conversation halls, lecture-rooms, etc. The mechanical skill displayed in their construction was very great. The ruins which still remain are among the most remarkable in Rome.

BATHS OF DIOCLETIAN, the most extensive of the Roman thermae; in the northeast part of the city, and covering most of the ground between the Porta Collina and the Porta Viminalis. Over 3,000 persons could bathe in them at the same time. They contained a library, picture-gallery, odeum, etc. Michelangelo transformed the great hall of the Tepidarium into a nave for the Church of Saint Marie degli Angeli. One of the laconica (hot rooms) forms the vestibule of the church.

BATHS OF TITUS, a structure on the Esquilinus Hill in Rome; built by the Emperor Titus. Considerable ruins are found northeast of the Coliseum.

BATHSHEBA, bâth-shē'bah, or bâth-shē-bâ, wife of Uriah, the Hittite, whose story is told in 2 Sam. xi. David committed adultery with her, then caused her husband to be slain, and afterward took her to wife. These sins displeased God, who sent the prophet Nathan to David with the parable of the ewe lamb. David bitterly repented, but yet was punished. Bathsheba was the mother of Solomon, whose succession to the throne she took pains to secure. She is afterward mentioned in the history of Adonijah, in the title of Psalm li, and among the ancestors of Christ (Matt. i, 6).

BATHURST, Allen (EARL), English statesman: b. 1684; d. 1775. He was a zealous opponent of the measures of Sir Robert Walpole's ministry, and the intimate friend of Bolingbroke, Pope, Addison and other great writers of the time. The earldom was created in 1772.

BATHURST, Henry (2d EARL), son of the preceding, English statesman: b. 1714; d. 1794. In 1771 he was made Lord High Chancellor of England. He wrote 'Theory of Evidence,' etc.

BATHURST, Henry (3d EARL), son of the 2d Earl, English statesman: b. 22 May 1762; d. 1834. In 1807 he became president of the board of trade; in 1809 Secretary for Foreign Affairs, and in 1812 Secretary for the Colonies, a post held by him for 16 years. He was also president of the council under Wellington, 1828-30.

BATHURST, Africa, town on the island of Saint Mary's, near the mouth of the Gambia, and capital of the British colony, Gambia. The town is exceptionally clean and contains government houses, barracks and a hospital. Facing the river are the stores of the European merchants. There are a number of expert shipbuilders in Bathurst. Its trade is chiefly in gum, bees' wax, rice, tobacco, cotton, rubber, fruit, ground-nuts, hides, ivory and gold, bartered for clothes and cutlery. The population in 1911 numbered about 5,000, including the Jollofs which tribe inhabits the district in the vicinity of the town.

BATHURST, Australia, the principal town in the western district of the colony of New South Wales on the south bank of the Macquarie River, 144 miles west of Sydney, 2,153 feet above sea-level and surrounded by hills. It has wide, well-laid-out streets crossing each other at right angles, with a central square planted with trees. The public buildings include the Anglican and Roman Catholic cathedrals and churches for Baptists, Congregationalists, Wesleyans, Presbyterians and others; courthouse, jail and town-hall, post and telegraph offices; a hospital, numerous schools, a school of arts, etc. There are several tanneries, a coach factory, railway workshops, breweries and flour mills. Soap, candles, glue, boots and shoes and furniture are also extensively manufactured. The city was founded in 1819 and was the first settlement beyond the Blue Mountains, which were long believed to be impassable. In 1851 there were discovered veins of gold here and this, with copper and silver, is the chief mineral product. Fine statuary marble is quarried. The whole district is admirably adapted to pastoral pursuits, and about 250,000 acres are under cultivation. Corra, barley, wheat, fruit and tobacco are the chief products. It is well watered and, being 2,150 feet above sea-level, has a moderate temperature. Pop. (1911) 8,575.

BATHURST INLET, an inlet of the Polar Sea, projecting due south about 75 miles out of Coronation Gulf. It is in a direct line
BATHURST ISLAND, the name of two islands: (1) An island off the northeast coast of Australia, just west of Melville Island, and separated from the mainland of Australia by Clarence Strait on the south, and from Melville Island by Apsley Strait; (2) an island in the Arctic sea, discovered by Baffin in 1619, lying due south of Grinnell Land, and the most eastern of the group called Parry Islands. It is separated from North Somerset on the south by Barrow Strait, and from North Devon on the east by Wellington Channel.

BATHYBUS, the name given by Huxley, in 1868, to a supposed organism, a bit of unorganized protoplasm, found at the sea-bottom at great depth. It was structureless and contained numerous calcareous concretions. Huxley abandoned the idea that it was a living organism. Afterward Bessels gave the name "protobathybus" to a similar slimy moss dredged in Smith's Sound in 92 fathoms, possibly the remains of protozoa or sponges. Bathybus was not rediscovered by the Challenger expedition, and Sir John Murray suspected that the substance was only a gelatinous precipitate of sulphate of lime from sea water mixed with alcohol.

BATHYCLYES, Greek artist, supposed to have flourished in the time of Solon, in the 7th century B.C. He was a resident of Magnesia in Thessaly, on the Meander, and constructed for the Lacedaemonians the colossal throne of the Amyncale Apollo, at Amyclae, near Sparta. Quatremere de Quincy, in his "Jupiter Olympien," has given an interesting view of the splendid god and his superb throne, designed from the description of Pausanias.

BATHYMETRY, the art of measuring depths in the sea, especially for the purpose of investigating the vertical range of distribution of plants and animals. An extensive series of such bathymetric measurements was made by H. M. S. Challenger (1875-1877), the deepest sounding being 4,575 fathoms. In February 1900 the United States surveying ship Nero reported that in surveying for a proposed telegraphic cable line between Honolulu and Manila by way of Guam and Yokohama, she encountered the greatest ocean depths on record, two casts showing 5,160 and 5,269 fathoms respectively. See Bathimeter.

Batiffol, Pierre Henri, French educator and writer; b. Toulouse, France, 27 Jan. 1861. He was educated at the Seminary of St. Sulpice, Paris; was a professor in Paris and of De Rossi in Rome. He was ordained priest in 1884 and from 1898 to 1907 was rector of the Catholic University of his life. He has devoted the greater part of his life to the study of ancient Christian literature and was an active opponent of Loisy. He has published "Histoire du Breviaire roman" (Paris 1893; new ed., 1911; English trans., London 1898); "L'enseignement de Jésus," a statement of Catholic doctrine as opposed to Harnack's "Die Lehre des Christentums" and Loisy's "L'Evangile et l'Eglise" (Paris 1905); "L'Eglise naissante et le catholicisme," outlining the Catholic theory of Christian origins as against Ritschl, Harnack and others (Paris 1908; English trans., London 1911). This work was commended by Harnack for its depth of scholarship. He was one of the editors of the 'Études d'histoire des dogmes et d'ancienne littérature chrétienne' and 'Tractatus Origenis de Libris Sanctorum Scripturarum,' extracts from Hippolytus, Novatian and Origen.

BATISTE, bā-tēst, a bright, white, very compact linen, distinguished by its delicate, firm and uniform threads from every other linen texture. The name is derived either from the Indian material bastas, or from one of the early manufacturers of it, Baptiste Chambray, who lived in the 13th century, and from whom it was also called the cloth of Chambray, or Cambrai; hence the English word cambric.

BATIJAN, See Batchian.

Batley, England, municipal and parliamentary borough, in the West Riding of York, eight miles south of Leeds, and just north of Dewsbury, with which it is united for parliamentary purposes. The houses are chiefly stone, and rather irregularly built. Batley has an ancient parish church in the Early English style, a townhall, a grammar and a technical school, mechanics' institute, etc. The principal manufactures are heavy woolen cloths, Batley being the chief seat of the manufacture of heavy woolens. There are also iron foundries, machine-works, collieries, etc. The town was incorporated in 1868, and operates its gas and waterworks. It also maintains public baths, markets, a library and a cemetery. Pop. 31,429.

Batna, bāt'nä, Algeria, a town of the department of Constantine, situated at the foot of Mount Tugurt, which is covered with fine cedar wood. The town contains a church and a mosque, and is an important military and trading post between the Sahara and Tull. Pop. (1911) 8,890.

Baton, bāt-on, or bā-tōn, a short staff or truncheon, in some cases used as an official badge, as that of a field marshal. The conductor of an orchestra has the purpose of directing the performers to play together, etc. In heraldry, what is usually called the bastard bar, or bar sinister, is properly a baton sinister.

Baton Rouge, bāt'on rōoz', La., city, parish-seat of East Baton Rouge, and capital of the State. The name is derived from the French, meaning red baton or stick. The city is situated on the eastern bank of the Mississippi River, 90 miles northwest of New Orleans, and is on the Louisiana Railway and Navigation Company, the New Orleans, Texas and Mexico, the Southern Pacific and the Yazoo and Mississippi Valley railroads. It is picturesquely built on a bluff commanding an excellent view of the surrounding country. The houses are mostly of French and Spanish architecture. The river below the city is bordered by sugar-cane plantations, orchards of tropical fruits, private gardens and villas. It was the capital of the State from 1847 to 1864, when the seat of government was removed to New Orleans. On 1 March 1882, Baton Rouge was again selected as the site of the new State capitol building here was completed in 1852 at a cost of $246,000. It was partially burned during the Civil War but was rebuilt in
1882. The Louisiana State University was organized here in 1860. The city also contains various State institutions, orphan asylum, penitentiary, deaf and dumb and blind asylums, State agricultural and mechanical college and agricultural experiment station. There are, among other buildings, the courthouse, city hall, State capitol, Hill Memorial Library, Elks' home, post-office, collegiate institute, high school building and a national soldiers' cemetery.

There are varied and extensive manufacturing interests, including the largest southern refinery of the Standard Oil Company, cotton seed products, lumber, sugar, molasses, brick, artificial ice and agricultural implements. The city has national and State banks, several daily and weekly newspapers. There is a large and growing trade with the surrounding cotton and sugar growing regions, and a flourishing shipping trade is carried on in its excellent harbor. The city has a real property assessed valuation of $20,000,000, annual valuation $5,500,000, exclusive of the valuable city, parish and State property which is exempt from assessment. In addition to the above personal assessed property is $1,000,000, making a total assessment of $3,500,000, real value $5,000,000.

Baton Rouge adopted the commission form of government in 1913. The city was one of the earliest French settlements in Louisiana. A convention which met here 21 Jan. 1861, adopted the Ordinance of Secession on the 26th; the city was taken by the Federal army 7 May 1862. On 5 August the same year a Confederate force numbering 5,000 under command of Gen. John C. Breckenridge attacked the Federal garrison under Gen. Thomas Williams, but was repulsed after a fierce contest lasting two hours. General Williams was killed and both sides lost heavily. The city was shortly afterward evacuated but a month later was reoccupied by the Federal troops who remained until the close of the war. A former government arsenal here was destroyed during the war. Pop. about 17,000.

BATOBI, bā'lōnē, Pompeo Girolamo, Italian painter, b. Rome 1708; d. Rome 1787. The manner in which he executed his paintings was peculiar. He covered his sketch with a cloth and began to paint the upper part on the left hand and proceeded gradually toward the right, never uncovering a new place until the first was entirely finished. Boni, who compares him with Mengs, calls the latter the painter of philosophy; the former the painter of nature. Batoni painted many altar-pieces and numerous portraits, including those of the Emperor Joseph and the Empress Maria Theresa in the imperial gallery. His greatest work is his 'Fall of Simon the Sorcerer,' which was ordered by Cardinal Albani for the church of Saint Peter's at Rome and was intended to be executed in mosaic. His 'Magdalene,' in Dresden, and his 'Return of the Prodigal Son,' in Vienna, are celebrated.

BATRACHIA, the frogs and toads of the Anura order of Amphibia (q.v.), comprising the Ranidae frogs, the Bufonidae ordinary toads, the Hylida tree frogs, the Pipidae Surinam toads and similar reptiles with the distinguishing characteristic of development from the tailed and gilled tadpole stage to a tailless, but leg- and lung-provided adult condition.

BATT, John Herridge, English Methodist divine: b. Taunton, Somerset, 23 June 1845. He was educated at Shebbear College, North Devon, and at Shireland Hall, Birmingham. He entered the ministry in 1864, was president of the Bible Christian Conference in 1887-88 and delegate to the Ecumenical Methodist Conference held at Washington, D. C., in 1891 and to that held in London in 1901. In 1900-07 he was Bible Christian editor and has served as secretary of the Bible Christian Examining Committee for 25 years. In 1910-11 he was chairman of the Bristol and South Wales district. He has published 'Dwight L. Moody: the Life Work of a Modern Evangelist,' 'Dr. Barnardo, the Foster-Father of Nobody's Children,' etc.

BATTA, Sumatra, a district in the northern part of the island, stretching between Sinkell and Tabuyong, on the west and the Bila and the Kakan on the east. Pop. about 300,000.

BATTALION. The unit of organization of troops consisting of several companies, usually four, and so called because it is a multiplicity or a number of men arranged for battle. A battalion of infantry is generally divided into an even number of companies and the companies are equalized by transferring men from the larger to the smaller. In each battalion there is a color-guard, composed of a color-sergeant and seven corporals, which is posted as the left four of the right-centre company. The color-sergeant carries the national color. The regimental color (when present) is carried by a sergeant, who takes the place of the corporal on the left of the color-sergeant. A battalion of cavalry is usually composed of four companies, but may be composed of a less number or a greater number, not exceeding seven. The interval between companies in line is eight yards. In whatever direction the battalion faces the companies are designated numerically from the right to the left in line and from the head to the rear when in column, first company, second company, and so on. In whatever direction the battalion faces the companies to the right of the centre of the battalion in line constitute the right wing; those to the left of the centre constitute the left wing. If there be an odd number of companies in line the centre company belongs to the right wing. A battalion of artillery consists of any number of batteries from two to five. The interval between batteries in line is 28 yards. In horse-batteries the interval is 36 yards. In whatever direction the battalion faces the batteries are designated numerically from the right to the left in line and from the head to the rear when in column, first battery, second battery, and so on. In whatever direction the battalion faces the batteries to the right of the centre of the battalion in line constitute the right wing; those to the left of the centre constitute the left wing. If there be an odd number of batteries the centre battery always belongs to the right wing. After battalion training, the means whereby the smallest number of independent units may be organized for manoeuvre and for combat, should be intensively directed primarily at the instruction of the company officers in the handling of units and
OTHER AMPHIBIA

sub-units in their mutual relationship and should be mainly concerned with the tactical employment of the fighting power of companies in mutual support. The battalion commander should apply in practice the principles of command and tactical leadership, a knowledge of which he has gained through study and experience, and should at times direct, but not command, his battalion in exercises designed to involve specific features of the minor phases of training, the elements of which have previously been subjects of drill-ground training. A concrete case should be stated calling for the actual employment of the troops concerned. The strength and character of the opposition to be expected will be controlled by the battalion commander. Besides the application of appropriate tactical principles adapted to the ground in use, opportunity should be afforded of making incidental and appropriate use of previously acquired knowledge of signaling, of constructing field fortifications or pioneer work, passage of obstacles, of screening from the observation of air craft, etc. The greater the variety of incidents introduced the more instructive will these exercises be.

As the result of trench warfare and intensive training, the tactics of a battalion in defense have changed as drastically as in attack. If the enemy now assaults a position he must first pass through the curtain of fire of artillery. If the range becomes shorter he meets rifle fire and the machine guns, each firing 50 shots a minute. Then at 150 yards from the trench he is met by a second barrage of fire of bombs from the rifle grenades. If there be any survivors they are met at 40 yards by bombs thrown by hand, by close rifle fire and machine guns that spray bullets. If any reach their objective they face bayonets. The whole attack is under a dense white smoke of hundreds of exploding bombs. Each man has his specified work and his particular weapon, in the use of which he has been found to display a special aptitude. Each man has a responsibility which never fell to the share of the individual infantryman in the old-fashioned attack. See Army Organization: Tactics, Military BATTALIONS.

BATTENBERG, bät'tn-bərg, Alexander, Prince, Bulgarian ruler: b. 1857; d. 23 Oct. 1893. He was the second son of the morganatic union between Prince Alexander of Hesse and the Countess von Hauke, who in 1851 received the title of Countess of Battenberg. In 1879 he was chosen Prince of Bulgariar and in 1885, without consulting Russia, proclaimed the union of eastern Rumelia with Bulgaria. This action exasperated both Russia and Serbia and the latter took up arms against Bulgaria. The latter was defeated by Alexander in the space of two weeks. In August 1886, however, Russian partisans overpowered Alexander in his palace at Sofia, forced him to abdicate and carried him off to Reni, in Russian territory. Set free in a few days, he returned; but after a futile attempt to concluclte the Tsar, he abdicated in September, married an actress, and assuming the title of Count Hartenau, retired to Gratz. See Bulgaria.

BATTENBERG, Henry Maurice, Prince, brother of the preceding; British soldier: b. Milan, 5 Oct. 1858; d. 20 Jan. 1896. He was the third son of Prince Alexander of Hesse (see Battenberg, Alexander, above), and in 1885 married the Princess Beatrice of England, youngest daughter of Queen Victoria. He joined the British expedition of 1895 against Ashante and while on this voyage he died at sea of a fever contracted during his military service. His youngest son, Prince Maurice, died of wounds received in action 27 Oct. 1914. His daughter, Princess Victoria, married King Alfonso XIII of Spain in 1900. The eldest son, Prince Alexander of Battenberg, changed his name and title by royal consent (June 1917) to Marquis of Carisbrooke.

BATTENBERG, Louis Alexander, Prince, British admiral: b. Graz, Austria, 24 May 1854. He was the eldest son of Prince Alexander of Hesse (see Battenberg, Alexander, above), and in 1884 married the eldest daughter of the Princess Alice Maud Mary, Grand Duchess of Hesse-Darmstadt, and second daughter of Queen Victoria. A naturalized British subject, he entered the navy in 1865, in which his rise was rapid. He was given naval intelligence, 1902-04, and after holding important commands, was appointed First Sea Lord of the Admiralty in 1912, which post he held at the outbreak of the great European War. Following a campaign in the British press against alien enemies resident in Great Britain, he resigned his office on 30 Oct. 1914, on the ground that his birth and parentage somewhat impaired his usefulness. In accepting this resignation the First Civil Lord of the Admiralty, Mr. Winston Churchill, paid a high tribute to his services, and especially referred to the provision he had made for the immediate concentration of the Grand Fleet at the opening of the war. In June 1917 his title was changed to Marquis of Milford Haven.

BATTENBERG, Prussia, village in the province of Hessé-Nassau, from which the sons of Prince Alexander of Hesse (see Battenberg, Alexander) derive their title of princes of Battenberg. Before 1806 it belonged to Hessé-Cassel. Pop. about 1,000.

BATTERING RAM (Lat. aries), the earliest, simplest, and, until the improved usage of artillery, the most effective machine for destroying stone walls and the ordinary defenses of fortified towns. Its primitive form was a huge beam of seasoned and tough wood, hoisted on the shoulders of men, who, running with it at speed, against the obstacle, wall, gate or palisade, made what impression they might against it. The ancients employed two different machines of this kind—the one suspended, and vibrating after the manner of a pendulum, and the other movable on rollers. The swinging ram resembled in magnitude and form the mast of a large vessel, suspended horizontally at its centre of gravity, by chains or cords, from a movable frame. Ligatures of waxed cord surrounded the beam at short intervals, and cords at the extremity, opposite to the head, served for the purpose of applying human force to give the oscillatory motion. The rolling ram was much the same as the above in its general construction, except that instead of a pendulous motion, it received only a motion of simple alternation, produced by the strength of men.
applied to cords passing over pulleys. This construction seems to have been first employed at the siege of Byzantium. These machines were often extremely ponderous. Appian declares that, at the siege of Carthage, he saw two rams so colossal that 100 men were employed to move each. Vitruvius affirms that the beam was often from 100 to 120 feet in length; and Justus Lipsius describes some as 180 feet long, and two feet four inches in diameter, with an iron head weighing at least a ton and a half. In contrasting the effects of the battering ram with those of the modern artillery, we must not judge of them merely by the measure of their respective momenta. Such a ram as one of those described by Lipsius would weigh more than 45,000 pounds, and its momentum, supposing its velocity be about two yards per second, would be nearly quadruple the momentum of a 40-pound ball moving with a velocity of 1,600 feet per second. But the operation of the two upon a wall would be vastly different. The ball would probably penetrate the opposing substance, and pursue its way for some distance; but the efficacy of the ram would depend almost entirely upon duly apportioning its intervals of oscillation. At full speed it would produce no obvious effect upon the wall; but the judicious repetition of its blows would, in a short time, give motion to the wall itself. There would first be a barely perceptible tremor, then more extensive vibrations; these being diverse, the assailants would adjust the oscillations of the ram to that of the wall, till at length a large portion of it, partaking of the vibratory impulse, would, by a well-timed blow, fall to the earth at once. This recorded effect of the ram has nothing analogous in the results of modern artillery.

BATTERSEA, a metropolitan borough of London, in Surrey, forming, with Clapham, a parliamentary borough, on the right bank of the Thames, opposite Chelsea, across which there is communication by several bridges. Area, 2,160 acres. There is a fine public park in Battersea, extending over 185 acres, containing a subtropical garden of four acres, artificial lakes and other attractions. Clapham and Wandsworth commons are fine areas of unenclosed ground. Battersea and Clapham send two members to Parliament—one for each division. The municipality is most progressive, many of the public utilities, including electricity, being publicly owned. Pop. 167,743. Consult Browning and Kirk, 'Early History of Battersea,' which is reprinted from the collections of the Surrey Archæological Society (1891); Green and Damer, 'Clapham Junction and Its People' (1889); Hammond, 'Bygone Battersea' (1897); Simmonds, 'All About Battersea' (1882).

BATTERSON, James Goodwin: b. Bloomfield, Conn., 23 Feb. 1823; d. Hartford, Conn., 18 Sept. 1901. He was educated in the public schools of Litchfield, Conn., and in 1845 became an importer and dealer in granite and marble, with headquarters in Hartford. His business grew into one of the most extensive of its kind in the States, and he engaged in the development of large granite quarries in Westerly, R. I. He took important contracts for public and private buildings and supplied the stone for the State capitol and Connecticut Mutual buildings in Hartford, the Mutual Life, Equitable Life Insurance companies' buildings and Vanderbilt residence in New York. He was the first to use machinery for polishing granite and devised many other improvements. In 1863 he founded the Travelers' Insurance Company, and was its president until his death. Throughout his life, though never holding political office, he was one of the foremost public figures of his city and State. He was an enthusiastic student of political economy, and wrote numerous articles and pamphlets on economic questions. He taught himself Greek and became an acknowledged master of it; and he was equally accomplished in several of the modern European languages, his versatility and capacity for work being extraordinary. In the last year of his life he wrote a poem of some length, 'The Beginnings,' dealing with the origin of the universe and life.

BATTER, The, a park of 21 acres forming the southernmost point of New York, occupying the site of the original Dutch fortifications. In the early days of the city the vicinity of the Battery was the most prosperous part of the city, and some of the old houses are still standing. The park now contains the Barge Office and the Aquarium, formerly Castle Garden (q.v.).

BATTERY. See Electric Battery.

BATEUX, bāt, Charles, French scholar, honorary canon of Rheims, b. Alandray, 1713; d. 14 July 1780. He displayed his gratitude to this city, in which he received his education, by the ode 'In Civitatem Remense,' which was much admired. In 1739 he was invited to Paris, where he taught rhetoric in the colleges of Lisleux and Navarre. He was afterward appointed professor of Latin and Greek philosophy at the Royal College. In 1754 he became a member of the Academy of Inscriptions, and in 1761 of the French Academy. Bateux left a large number of valuable works. He did much service to literature and the fine arts, by introducing unity and system into the numerous canons of taste, which had gained a standing among the French by the example of many eminent men, particularly in regard to poetry, and must be regarded as indispensable aids in the higher point of view from which this science is now considered. Some of his most valuable works are 'Les Beaux-Arts réduits à un même principe' (1747) and 'Cours de belles-Lettres ou principes de la littérature' (1774). These works were translated into several other languages.

BATHYANYI, bōt'yä-ne, Kasimir, Count, Hungarian statesman, Minister of Foreign Affairs during the Hungarian revolution: b. 4 June 1807; d. Paris, 13 July 1854. From his earliest childhood he took the greatest interest in public affairs, and after having, as member of the Hungarian Diet, opposed the Austrian government, he became at the outbreak of the revolution one of the prominent champions of Hungarian independence, devoting his wealth and influence to the promotion of this cause, and at the same time distinguishing himself on various occasions by his courage and skill on the battlefield. After having officiated as governor of various provinces, he became Minister
of Foreign Affairs, under the administration of Kossuth, and subsequently he shared his exile in Turkey until 1851, when he repaired to Paris, where he lived. Although sympathizing with Kossuth in some respects, he differed from him in others, and addressed, in 1851, a series of letters to the London Times, in which he reflected rather severely upon Kossuth's character as statesman and patriot.

BATTYANYI, Louis, Count, Hungarian patriot: b. Pressburg 1809; d. 6 Oct. 1849. He entered the army as a cadet at the age of 16, and on coming into possession of a large fortune, abandoned a military for a political career, and in process of time attained the rank of leader of the opposition in the Hungarian Diet. Upon the breaking out of the commotions of 1848, Battyanyi took an active part in promoting the national cause, and with a company of armed vassals came forward to assist it in the field. On the entry of Windschgrätz into Budapest in January 1849, he was arrested in the house of his sister-in-law, the Countess Karolyi. After being conveyed to various places he was finally brought back to Budapest, tried by court-martial and condemned to be hanged. The sentence he prevented by inflicting several wounds with a poniard on his neck, and he was accordingly shot.

BATTIADE, a dynasty of Cyrene which reigned from the 7th to the 5th century B.C. The kings of this dynasty were Battus I, the founder of Cyrene; Arcesilus I, his son; Battus II, son of Arcesilus, who greatly increased the power of Cyrene; Arcesilus II, son of Battus II; Battus III, son of Arcesilus II; Arcesilus III, son of Battus III, who submitted to the Persian King; Battus IV, son of Arcesilus III; Arcesilus IV, son of Battus IV, the last king of Cyrene, killed in a revolution. He is celebrated in the fourth and fifth Pindaric odes.

BATTIK, an Oriental production of the natives of the Dutch East Indies, who decorate their clothing with it; also made in The Hague and Batavia. Up to a piece of about two yards and of various designs are outlined with a pencil. When the design is completed, the ornamented parts of the fabric are covered with a liquid which possesses the quality of stiffening after being applied. The parts not ornamented are dyed the desired color. After the entire fabric has been ornamented in this manner, it is boiled in hot water so as to take the hard stuff out of the battik. The dyed parts will then hold the dye and the battik is ready. The Hague people were the first to introduce battik into Europe. It is made on linen, silk, velvet and leather, and is exported to all the principal cities of Europe.

BATTISTI, Cesare, Italian author and patriot: b. Trent, 4 Feb. 1875; d. 13 July 1916. After studying law at Vienna and Graz, he devoted himself to geography and lectured at Florence, where he received the Litt.D. degree in 1897. His topographical, geological and literary researches concerned always the Trentino, that part of Italy irredeemably under Austrian rule. His numerous works on these subjects are regarded as standard authorities. An ardent democrat, he fiercely defended the Italian national cause in the Trentino. He had fought in the ranks of the Liberals until Socialism made its appearance in that part, where he embraced the new creed and became its leading exponent. As socialist daily paper Il Popolo, and as Socialist deputy for Trent in the Austrian Parliament, he conducted the political campaign in favor of autonomy for the Trentino and the establishment of an Italian university in Austria. On various occasions his activities brought him into conflict with the Austrian authorities and also several terms of imprisonment. On the outbreak of the European War Battisti returned to Italy and advocated Italian intervention against Austria. This desire being fulfilled in May 1915, he entered the Italian army as a private soldier and in due course rose to the rank of captain. During an attack on the Passubio sector in the Vallassa on 10 July 1916, in which Battisti commanded a company of the Vicenza Battalion, he was severely wounded and left on the battlefield, where he was found by the Austrians. On 13 July the Italian papers announced that he had been killed in battle; the following day a report by break stated that he was a prisoner in the hands of the Austrians and would be tried by court-martial for high treason. Two days later it was announced that he had been sentenced to death and executed on 13 July. A different complex was given to the story by Signor Arca, an Italian deputy, returned from the front on 17 July. He stated that Battisti, being unable to regain the Italian lines after receiving his wounds, had committed suicide rather than fall into the hands of the enemy. It was then assumed that the Austrians had held a mock trial on the body and afterward hanged it. Public indignation rose high in Italy; on 20 July a procession marched to the Capitol in Rome and adopted a resolution denouncing the execution of Battisti and demanding declaration of war against Germany. A week later an English newspaper correspondent affirmed that Battisti had been sent to Trent and tried and hanged within 40 hours, "though in a dying condition." A year and five months later, on 16 Dec. 1917, the New York Times published a reproduction of a photograph depicting Battisti walking unaided to his execution under military escort. Among his best known works are 'Il Trentino, saggio di geografia, fisica e d'antropografia'; 'Termini geografici raccolti nel Trentino.'

BATTLE, Kemp Plummer, American educator: b. Franklin County, N. C., 19 Dec. 1831. He was graduated at the University of North Carolina, 1849; received the degrees A.B., A.M., LL.D. from Davidson College and from the University of North Carolina. He was a member of the Secession Convention, 1861; State treasurer of North Carolina, 1866-68; president of the University of North Carolina, 1876-91; resigned to become professor of history, 1891-1907; is at present professor of history, University of North Carolina. He has published 'History of the University of North Carolina'; 'History of the Supreme Court of North Carolina'; 'Trials and Judicial Proceedings of the New Testament'; 'Old Schools and Teachers of North Carolina'; and many historical pamphlets.

BATTLE. An encounter between two armies, resulting from an attempt of one of
the armies to attain an object while the other opposes the attack. This encounter is usually a general assault in which all of the divisions of the armies are or may be engaged. Battles are classified as defensive, offensive and mixed. In a purely defensive battle the army selects a position in which to await the enemy and there to give battle with no other end in view than to hold this position and repulse the enemy. In a purely offensive battle an army seeks the enemy and attacks him wherever he is to be found. A mixed battle is a combination of these two. All other things being equal, an offensive battle offers the greatest advantages, as it permits a general to choose his point of attack and gives him time to make all the preparations that he may deem necessary. Notwithstanding the practical application of science in warfare, the inventions of airplanes, wireless telegraphy, etc., battles, though planned and fought almost solely on tactical principles, have in many cases important strategic bearings which it is the province of an able general to see and to take advantage of. Skillfully combined with strategic movement, when ably executed, may alone decide the fate of a campaign, without the necessity of coming into collision with the enemy; but this is a rare case, and a battle is usually the necessary sequence to an important strategic movement, and, if well planned and successfully fought, may prove decisive of the war. Military writers designate by orders of battle the general combinations made to attack one or more points of an enemy's position; while they apply the term line of battle to the disposition of the troops, in their relations to each other for mutual co-operation, acting either offensively or defensively. Whatever may be the disposition of the troops, the line of battle of any considerable force will present a well-defined centre and two wings; thus offering to an assailant one or more of these as his point of attack. This has led to dividing orders of battle into several classes, arising from the necessary disposition of the assaulting force, as it moves to attack one or more of these points. If an equal effort is made to assail every point of the enemy's line, the assaulting force must necessarily advance on a line parallel to the one assailed, and this term has received the name of the parallel order of battle. If the line of the assaulting force is sensibly perpendicular to that of the assailed, the disposition is said to be the perpendicular order. If the main attack is made by one wing, the centre and other wing being held back, as is termed, the positions of the lines of the two parties become naturally oblique to each other, and this is termed the oblique order. In like manner the concave order results from an attack by both wings, the centre being refused, and the convex order from refusing the wings and attacking by the centre, etc. The order of battle should result from the position in which the enemy's forces are presented for attack; and as these, if not confused, so as to take advantage of the points of vantage which the position they occupy offers, the order of battle for assaulting may vary in an infinity of ways. Still it is not to be inferred that one order is not superior to another, or that the choice between them is of no importance. In the parallel order, for example, the opposing forces being supposed equal in all points, there is no reason why one point of the enemy's line should be forced rather than another, and, therefore, success depends either on the whole line, or simply pushing it back; as chance alone will determine a break in any part of his line. In the oblique order, on the contrary, one wing being refused, or merely acting as a menace, the other may be strongly re-enforced, so as to overwhelm the wing opposed to it, and, if this succeeds, the assaulting army, by its simple onward movement, is gradually brought to gain ground on the enemy's rear, and to threaten his line of retreat. Again, in crossing a river on a bridge, or passing through any other defile to assail an enemy opposing this movement, the order of battle becomes necessarily convex, the extremity of the defile itself becoming the centre from which the assaulting forces radiate, to enlarge their front, while they are obliged to secure the defile on each flank. To lay down rules therefore as to what order of battle should, in every case, be employed would be pure pedantry. Talent, skill and experience render it a general's business to decide this point in any given case. As to the distribution of the troops belonging to the separate fractions of the entire force, as an army corps, a division, etc., the rule is to so distribute them that they shall fight under the immediate eye of their respective commanders and support each other. While engineering science is now applied to the emergencies of modern warfare in order to facilitate locomotion and communication, and while the modern battle is largely decided by a superiority of motor transport, transporting men from one part of the battlefield to another, with airmen to guide operations, it must be remembered that even in the highly scientific battle of to-day, with vast and newly-invented war machinery at hand, the infantry is the principal and most important arm, which is charged with the main work on the field of battle and decides the final issue of combat. The rôle of the infantry, whether offensive or defensive, is the rôle of the entire force, and the utilization of this arm gives the entire battle its character. The success of the infantry is essential to the success of the combined arms. If the hostile lines are held by good infantry, properly led and supported by proper artillery, fire action alone will not bring about a decision. For this purpose the assault will be necessary. See Advance Guard; Attack; Outpost; Patrols; Reconnaissance; Strategy; and Tactics.

BATTLE. England, market-town in Sussex, situated in a valley seven miles north-west of Hastings. The church is ancient, and contains some fine specimens of painted glass and numerous antique monuments. Battle was long celebrated for the manufacture of gunpowder. The early name of this place was Senlac, and it received its present name from the battle of Hastings which was fought here. In memory of the brave conflict the Conqueror erected the famous Battle Abbey on the spot where Harold fell. This building, the ruins of which have a circumference of about a mile, has almost entirely disappeared, but interesting remains of a subsequent building exist, including the gateway, a fine specimen of the decorated English style. One portion of this building
forms a mansion, the residence until her death of the Duchess of Cleveland. Consult Walcott, 'History of Battle Abbey' (1867); Duchess of Cleveland, 'The Roll of Battle Abbey' (1889). Pop. 2,996.

**BATTLE, Law of**, the contest between male animals for possession of the females, among barbarous nations. Among certain tribes of the North American Indians the men wrestled for any women to whom they were attached. With the Australians the women were the constant cause of war, both between the individuals of the same tribe and between distinct tribes. In mammals the male, says Darwin, appears to win the female much more through the law of battle than through the display of his charms. The most timid animals, even the hare, will fight desperately, the duel only ending by the death of one of the parties. Male moles, squirrels and beavers have been seen fighting for their mate.

**BATTLE, Trial by, or Wager of**, an obsolete method of deciding cases, whether civil or criminal, by personal combat between the parties or their champions in presence of the court. A woman, a priest, a peer or a person physically incapable of fighting could refuse such a trial. This mode of trial ended in Scotland with the close of the 16th century. Consult Stephen, 'History of the Criminal Law of England' (1883); Neilson, 'Trial by Combat' (1890).

**BATTLE ABOVE THE CLOUDS, The**, the name given to that portion of the battle of Chattanooga fought on Lookout Mountain, Tenn., 24 Nov. 1863. See CHATTANOOGA, BATTLE OF.

**BATTLE AXE**, a military weapon much used in the early part of the Middle Ages, particularly by those who fought on foot. It was not uncommon, however, among the knights, who used also the mace, a species of iron club or hammer. Both are to be seen in the different collections of old arms in Europe. The Greeks and Romans did not employ the battle axe, though it was found among contemporary nations. In fact the axe is one of the earliest weapons, and an instrument of domestic industry naturally suggesting its application for purposes of offense; but, at the same time, it has always been abandoned as soon as the art of fencing, attacking and guarding was cultivated; because the heavier the blow given with this instrument, the more will it expose the fighter. It never would have remained so long in use in the Middle Ages but for the iron armor which protected the body from every thing except heavy blows. In England, Ireland and Scotland the battle axe was much employed. At the battle of Bannockburn, King Robert Bruce clave an English champion down to the chin with one blow of his axe. The Lochaber-axe remained a formidable weapon in the hands of the Highlanders to a recent period and was used by the old city guard of Edinburgh. A pole axe is a long-handled battle axe.

**BATTLE OF THE BLOODY ANGLE.** See SONTSVYLANIA COURT HOUSE, BATTLES OF.

**BATTLE OF THE BOOKS, The**, a famous work by Jonathan Swift, written in 1697, but remaining in manuscript until 1704. It was a travesty on the endless controversy over the relative merits of the ancients and moderns, first raised in France by Perrault. Its immediate cause, however, was the position of Swift's patron, Sir William Temple, as to the genuineness of the 'Letters of Phalaris.' The work was not taken with entire seriousness by Swift's contemporaries.

**BATTLE CREEK, Mich., city of Calhoun County, midway between Detroit and Chicago, located at the junction of the Battle Creek and Kalamazoo rivers and on the main trunk lines of both the Michigan Central and Grand Trunk railways, 48 miles south of Grand Rapids. Battle Creek is in the centre of the best farming district of the State, having within a radius of 15 miles over 425,000 acres of improved land with $25,000,000 invested in farm properties. Battle Creek is known as a manufacturing centre and has a national reputation for its cereal foods. There are 176 manufacturing plants employing 6,200 people. Battle Creek manufactures threshing machines, traction engines and steam pumps and also produces printing presses, bread ovens, stoves, fibre boxes, box board paper, wall registers, steel paper balers, air compressors, brass and aluminum goods, automatic sealing machines, bakers' ovens, hose clamps, high-power drills, electric bath cabinets, candies and cigars. There are several large foundries and one big enameling plant. The weekly pay-roll is $169,000. The engine and repair shops of the Grand Trunk Railroad are also located in this city. It is the divisional point of the Grand Trunk Railroad. Battle Creek has a large sanatorium, with thousands of visitors yearly and nearly 1,000 employees. It is the 9th city in size in the State of Michigan, but the first city in per capita bank deposits, with $13,718,171.22 and the first city in the State in the value of net factory output per capita of population. The city is also a leader in the per capita of savings deposits, there being $484 for every man, woman and child in the city. It is the 4th city in the State in the annual value of manufactured products, having $23,246,000 in 1914. The city is known as a home-owning city, as 72 per cent of the people own their own homes and 98 per cent are American-born. It has over 50 fraternal societies, a woman's club, a charitable union, a women's league, an associated charities, a Y. W. C. A., a Y. M. C. A., the Athelstan Club, a social organization composed of 400 business and professional men, and a Chamber of Commerce. There is a public library costing $70,000, a Y. M. C. A. building costing $40,000, both the gifts of the late Charles Willard; a fine city hospital, the gift of John Nichols; to this has been added a fine addition, the gift of the Rogers family. There are 12 schools with 140 teachers, and a $350,000 central high school, the city having invested $1,000,000 in schools without bonding. There is also a Catholic school, Adventist school and two business colleges. There are three daily papers and a number of monthly publications. Battle Creek, the pioneer fight with Indians, was first settled in 1832 by families from New York and New England. It was incorporated as a village in 1850 and as a city in 1859. Since 1913 it is under a commission form of government.
The city owns a $100,000 dual water system, has a paid fire and police department, electric lights and gas plant and two telephone systems. It has an assessed valuation of $37,890,780. 110 miles of streets, 16 miles of paving, 44 miles of street sewer, 8½ miles of street railway. There are nine parks of 102 acres. Adjoining the city is Lake Goguac, surrounded by beautiful homes and estates. There are 16 lakes in the immediate vicinity that abound with fish, and four highways reach all parts of the county from the city. Battle Creek stands 3d among the cities of the State in the amount of post-office business. Pop. 25,267.

**BATTLE CREEK SANITARIUM, The.** is a philanthropic and humanitarian institution operating under a perpetual charter which compels the use of all the profits gained to foster the spread of humanitarian work. More than 60 branches of the parent institution have been established in or near large cities in different parts of the world, under the title of The Medical Missionary Association, and each of these branches conducts a life-saving business on Good Samaritan principles. The organization began its work in the year 1866, with almost no capital and only one patient, in a small two-story frame house, in the then small village of Battle Creek, Mich. The incorporators believed that Christianity should be expressed in works as much as in faith, in curing the sick and healing the wounded, and thus preparing the unfortunate for the reception of moral and spiritual inspiration. The Golden Rule is the foundation principle of the institution. It has grown from a small beginning to the immense proportions of the present time, with one of its buildings nearly 1,000 feet in length and six stories in height and numerous other buildings radiating from the main one and scattered about it in a finely wooded park. Fire destroyed the old building and all its contents, but it was soon rebuilt larger and better than before, and has grown to its present proportions.

**BATTLE CRY OF FREEDOM, The.** a patriotic song of the American Civil War by the well-known composer, George Frederick Root (1861).

**BATTLE OF DORKING, The.** a realistic, matter-of-fact description of an imaginary invasion of England by a foreign power, by Gen. (then Lieut.-Col.) Sir George Chesney. It appeared anonymously first in Blackwood's Magazine in 1871 and has since been reprinted under the title 'The Fall of England.' After the unomnious defeat of the French at Sedan, Chesney foresaw a similar fate for his own country unless it should reorganize its army. In the story fleet and army are scattered when war is declared, but the government has a surprise in store that British and French will save the country now as hitherto. To universal surprise and consternation, the hostile fleet annihilates the available British squadron and the enemy lands on the south coast; volunteers are called and respond readily; but among them that British missariat is unorganized and the men, though brave, have neither discipline nor endurance. The decisive battle is fought at Dorking, the British are routed and England, without other alternative, is compelled to submit to the humiliating terms of the conqueror.

**BATTLE OF THE FROGS AND MICE, The.** an ancient Greek mock epic, written in hexameters. Formerly attributed to Homer. Modern critics are of the opinion that the credit of authorship should be given to Pindar (q.v.). Only 316 lines are now extant.

**BATTLE-GROUND, Ind., a town in Tippecanoe County, where the famous battle of Tippecanoe was fought between the United States troops under General Harrison and the Indians under Tecumseh and his brother, The Prophet.** 7 Nov. 1811.

**BATTLE HYMN OF THE REPUBLIC, The.** American song, by Julia Ward Howe, published in the Atlantic Monthly in 1862, and sung to the air "John Brown's Body." Mine eyes have seen the glory of the coming of the Lord; He is trumpeting out the vintage where the grapes of wrath are stored; He hath hewed the fateful lightning of His terrible swiftness to the two. His truth is marching on... I have seen Him in the watch-fires of a hundred circling camps; They have builded Him an altar in the evening dews and damp; I can read His righteous sentence by the dim and flaring lamps; His day is marching on... I have read a fiery gospel, writ in burned rows of steel: "As ye deal with my contemporaries, so with me, my grace shall deal; Let the Hero, born of woman, crush the serpent with his heel. Since God is marching on." He has sounded forth the trumpet that shall never call retreat; He is lifting up the hearts of men before His judgment seat; Oh, be swift, my soul, to answer Him! be jubilant, my feet! Our God is marching on... In the beauty of the lilies Christ was born across the sea, With a glory in his bosom that transfigures you and me; As he died to make men holy, let us die to make men free. While God is marching on...

**BATTLE OF THE KEGS, The.** See HOPKINSON, FRANCIS.

**BATTLE OF MALDON, The.** This fragment, consisting of 325 lines of Anglo-Saxon verse, celebrates an historical occurrence of the year 991. A Viking expedition of considerable size, including, among other leaders, the celebrated Olaf Tryggveson, descended upon the east coast of England, and, as the 'Anglo-Saxon Chronicle,' informs us, plundered Ipswich. The Scandinavians then moved down the coast to Essex and landed near Maldon, at the mouth of the river Blackwater. Here they were met by the military forces of Essex under the ealdorman Byrhtnoth. After a spirited struggle, the English were defeated, and Byrhtnoth slain. The 'Chronicle' continues: "In this same year it was resolved that tribute should be given, for the first time, to the Danes, for the great terror they occasioned by the inroads. To this timid and disastrous policy the poem affords the sharpest contrast; it is full of the pride and defiance of the warrior, of the undying allegiance of the thane to his lord, and of the necessity for vigorous defense against the common foe. There is much probability that it was designed not only to record a heroic struggle against overwhelming odds, but also to call the English to a spirited resistance. The piece was probably composed not long after the battle."
Although some three centuries later than ‘Beowulf,’ it preserves the technique and the vigor of the older alliterative poetry. The manuscript is no longer extant, but the lines were copied by Hearne, and published at Oxford in 1726. There is a convenient translation into modern English verse by H. W. Lumshden, printed by Cook and Tinker in ‘Translations From Old English Poetry,’ but it should be observed that the verse-form does not reproduce that of the original.

WILLIAM WITHERLE LAWRENCE.

BATTLE MONUMENT, a monument in Baltimore, Md., erected in memory of those who fell in defense of the city when it was attacked by the English forces in September 1814.

BATTLE OF THE SALIENT. See SPOTSYLVANIA COURT HOUSE, BATTLES OF.

BATTLE OF THE SPURS, (1) defeat of the French by the Flemings at Courtrai, 1302; (2) a battle of Guinegate, 16 Aug. 1513, in which the French cavalry were defeated by the forces of Henry VIII of England and the Emperor Maximilian. It was thus named on account of the numberless gilt spurs gathered by the victors.

BATTLEDORE AND SHUTTLECOCK, a popular game invented in the 14th century. The implements are a bat shaped like a tennis racket and strung with gut or covered with parchment, and a shuttlecock consisting of a cork stuck with feathers, which is batted to and fro between the players.

BATTLEFORD, Canada, a town of Saskatchewan province, on the river Battle near its junction with the North Saskatchewan, about 100 miles from Prince Albert. The Riel insurrection began near Battleford. It was the capital of the Northwest Territory, 1876-83. Pop. (1911) 1,335.

BATTLEMENTS, notched or indented parapets used in fortifications. The rising parts are called merlons; the spaces between them are separated crenels, embrasures and sometimes loops. The object of the device is to enable the soldier to shelter himself behind the merlon, whilst he shoots through the embrasure. The bas-reliefs of Nineveh and the Egyptian paintings testify to the antiquity of this form of structure. There is no nation by which it has not been adopted.

BATTLESHIP. See NAVAL ARCHITECTURE; WARSHIPS, MODERN.

BATWA, bâ'wâ, a tribe of pygmies living in the Wissmann Falls district of southern-central Africa. They are sometimes less than four feet high, but well shapen and well developed. They live in villages and are under the protection of the Bakuba. Their food consists of meat, wild roots and a few vegetables which they cultivate. Their weapons are knives, bows and arrows, poisoned with the juice of the root of a species of Euphorbia. Their household furniture is very simple, and they do not make pottery, weave or work in metals.

BAUAN, bow'an, or BAUANG, Filipinos, a town of Luzon in the province of Batangas, four miles northeast of the town of Batangas. The town manufactures piña cloth embroidery and is a centre for the marketing of agricultural products. Pop. 39,094.

BAUCIS, in mythology, a Phrygian woman, the wife of Philemon. They received Jupiter and Mercury hospitably, after these gods had been denied hospitality in the whole country while traveling in disguise. A deluge destroyed the remainder of the people, but Philemon and Baucis, with their cottage, were saved. They begged the gods to make their cottage a temple, in which they could officiate as priest and priestess, and that they might die together; which was granted. Philemon and Baucis are, therefore, names often used to indicate faithful and attached married people. See PHILEMON.

BAUDELAIRE, bô-lär', Charles Pierre, French poet; b. Paris, 9 April 1821; d. 31 Aug. 1867. In early life he resided for some time in the East Indies, and on his return devoted himself to literature. He first gained some repu-

tation by translations from the works of Edgar Allan Poe, four volumes of which appeared in 1856-65, regarded as masterpieces in their way. A production, however, that caused greater sensation was a collection of poems designated ‘Les Fleurs du Mal’ (1857), which had to be expurgated as the result of proceedings on the part of the police authorities. This work gave Baudelaire a high position as a writer of the romantic school, and reprinted at the same time his curious inclination for repulsive subjects. A work of higher tone was his ‘Petits Poèmes en Prose’; others being ‘Les Paradis Artificialis’; ‘Opium et Haschisch’; a monograph on Théophile Gautier; and ‘R. Wagner et l’Annhauser à Paris.’ Apart from poetry, however Baudelaire’s finest work is contained in his ‘Little Poems in Prose.’ All of these are exquisitely written, and in many of them the beauty of the thought is equal to the beauty of the language. He united a remarkably keen analytical faculty with a powerful, sombre imagination. Brooding melancholy, curiously tinctured with irony inspires the solemn music and dream-like imagery of his best verses. The writer whom in many respects he resembles most strongly is Edgar Allan Poe. Drink and drugs led to paralysis and an early death. Con-
sult James, ‘French Poets and Novelists’ (1884); Asselineau, ‘Charles Baudelaire sa vie et son œuvre’ (1889); Symons, A., ‘Poems in Prose’ (London 1903).

BAUDIN, bo-dân, Nicolas, French sea-
captain and botanist; b. on the island of Ré 1750; d. 16 Sept. 1803. He entered the merchant navy at an early age, and in 1786 went on a botanical expedition to the Indies, sailing from Leghorn under the Austrian flag, with a vessel under his own command. He returned on this expedition in 1787, and in a second which he made to the West Indies, were presented by him, on his return to France, to the gov-

ernment, which promoted him to the rank of captain, and sent him, in 1800, on a scientific
mission to Australia. He failed to penetrate the interior of that country, but made many interesting observations on the coast. Half of his men died of fatigue and exposure, and he himself died at the Isle of France soon after his return. Péron, who accompanied him, wrote an account of the voyage.

BAUDIN DES ARDENNES, bô-dân-dâr-dân, Charles, French vice-admiral: b. Sedan, 21 July 1784; d. Paris, 7 June 1854. In 1812 he conducted a small fleet safely into the harbor of Saint Tropez, though continually pursued by English cruisers. In 1816, he resigned and entered the merchant service, but after the July revolution (1830) re-entered the navy. In 1838, he was promoted to the rank of rear-admiral, and received the command of the expedition against Mexico. His efforts to effect an amicable settlement with the Mexican government proving fruitless, he bombarded, 27 Nov. 1838, the fortress of San Juan de Ulloa, which surrendered on the following day. Baudin treated the inhabitants with great consideration and permitted 1,000 Mexican soldiers to remain in the city to maintain order, but on the Mexican government sending re-enforcements, he was compelled to resort again to hostilities, which, on 5 December of the same year, resulted in the disarming of Vera Cruz, in the complete defeat of the Mexican army and in the restoration of peace between the two countries. On his return to France, he was for a short time minister of Marine under Louis Philippe. In March 1848 he was appointed commander of the French fleet in the Mediterranean, and remained stationed for some time during the Italian outbreak off the Neapolitan and Sicilian coast. In the following year he retired from active service.

BAUDISSIN, Wolf Wilhelm, German theologian: b. Sophienhof, Holstein, 26 Sept. 1847. He was professor at Strassburg, 1876-81, at Marburg, 1881-1900, and at Berlin from 1900. His publications comprise 'Translations Antiquae Arabicae Libri Jobiique Supersunt' (1870); 'Studien zur semitischen Religionsgeschichte' (1870-78); 'Die Geschichte des Altestamentlichen Priesterthums untersucht' (1860); 'Dilmann' (1885); 'Einleitung in die Bücher des Alten Testamentes' (1901); 'Adonis und Esrum, eine Untersuchung zur Geschichte des Glaubens an Auferstehungsgötter und an Helgelötter' (1911).

BAUDRILLART, bô-dre-yar, Henri Joseph Léon, French political economist: b. Paris, 28 Nov. 1821; d. there, 24 Jan. 1892. He edited the Constitutionnel and subsequently the Journal des Economistes, and in 1881 was professor in the Ecole des Ponts et Chaussées. He published 'Des rapports de la Morale et de l’Economie Politique' (1860); 'Manuel d’Economie Politique' (1857); 'Publicistes Modernes' (1862); 'Histoire du Luxe' (1878-80); 'Les Populations Agricoles de la France' (1880-88).

BAUDRY, bô-dre, Paul, French painter: b. La Roche-sur-Yon, 7 Nov. 1828; d. 17 Jan. 1886. He studied in Paris and Rome. Among his best known works are 'Punishment of a Vestal Virgin' (1857), and the 'Assassination of Marat' (1857). He was for 10 years employed in decorating the foyer of the Grand Opéra in Paris. His famous 'Glorification of the Law' on the ceiling of the Palace of Justice gained him the medal of honor in 1881 and is generally ranked as his masterpiece. He was elected a member of the Académie des Beaux-Arts in 1870.

BAUER, bow’er, Bruno, German philosopher, historian and Biblical critic of the rational school: b. Eisenberg, 6 Sept. 1809; d. Berlin, 15 April 1882. Among his works are 'Critique of the Gospel of John' (1840); 'Critique of the Synoptic Gospels' (1840); 'History of the French Revolution to the Founding of the Republic' (1847); 'History of Germany during the French Revolution and the Rule of Napoleon' (1846); 'Critique of the Gospels' (1850-51); 'Critique of the Pauline Epistles' (1850); 'Philos, Strauss, Renan and Primitive Christianity' (1874); 'Christus und die Cäsaren,' in which the foundation of Christianity is attributed to Seneca (1877). His work displays equal learning and industry but his conclusions are far from harmonizing with evangelical thought.

BAUER, Caroline, German actress: b. Heidelberg, 29 March 1807; d. Zürich, 18 Oct. 1878. She made her début on account of her achievement a brilliant success, in comedy and tragedy alike, when in 1829 she married Prince Leopold, afterward King of the Belgians. Their morganatic union was as brief as it was unhappy; in 1831 she returned to the stage, which she quitted only in 1844, on her removal to the Polish count. An English translation of her 'Posthumous Memoirs' appeared in 1884.

BAUER, Edgar, German publicist, brother of Bruno Bauer: b. Charlotteburg, 7 Oct. 1820; d. Hanover, 18 Aug. 1886. He published various works of an historical and polemical nature, strongly tinted with radicalism, and spent five years in prison on account of his 'Streit der Kritik mit Kirche und Staat.' Other books by him are 'Die Rechte des Herzogtums Holstein' (1863); 'Die Deutschen und ihre Nachbarn' (1870).

BAUER, Louis A., American magnetician: b. Cincinnati, Ohio, 28 Jan. 1865. He was astronomical and magnetic computer for the United States Coast and Geodetic Survey, 1887-92; docent in mathematical physics at the University of Chicago, 1895-96; chief of division of terrestrial magnetism of Maryland Geological Survey, 1896-99. He was assistant
professor of mathematics in the University of Cincinnati, 1897-99; chief of division of terrestrial magnetism and inspector of magnetic work, United States Coast and Geodetic Survey, 1899-1906; director of the department of terrestrial magnetism, Carnegie Institution of Washington, since 1904; lecturer in terrestrial magnetism, Johns Hopkins University, since 1899. He is an honorary member of the Societé Scientifique Antonio Alzate of Mexico, and of the Royal Cornwall Polytechnic Society of England, and a member of the permanent committee on terrestrial magnetism and atmospheric electricity of the International Meteorological Conference; also a member of the American Philosophical Society, American Academy of Arts and Sciences and a corresponding member of the Göttingen Royal Academy of Sciences and of the Portugal Academy of Sciences. He was awarded the Lagrange prize for his work in terrestrial magnetism by the Belgium Academy of Arts and Sciences in 1910, and the Neumayer gold medal at Berlin in 1913; author of various publications bearing chiefly on terrestrial magnetism and cospherical physics. He edits and publishes *Terrestrial Magnetism*.

**BAUER, Wilhelm**, German inventor: b. Dillingen 1822; d. Munich, 18 June 1875. He served as a volunteer during the Schleswig-Holstein War (1848), and, meanwhile, conceived the plan of a submarine vessel for coast defense. From 1851 to 1855 he vainly sought means from Austria, France and England to complete his experiment, but Russia finally adopted his scheme. He afterward made improvements in torpedoes and in submarine guns.

**BAUERLE, boi'ër-le, Adolf**, Austrian dramatist and novelist: b. Vienna, 9 April 1786; d. Basel, 20 Sept. 1859. He cultivated with much success the field of popular comedy and local farce in Vienna, where, in 1804, he founded the Vienna Theatre-Gazette, until 1847 the most widely-read paper in the Austrian monarchy, and now a valuable source for the history of the stage in Vienna. Of his numerous plays the following became known also outside of Austria: *The Enchanted Prince* (1818); *The Counterfeit Prima Donna* (1818); *A Deuce of a Fellow* (1820); *The Friend in Need.* Under the pseudonym Orto Hora he wrote the novels *Theresa Krones* (1825) and *Palmand Raimund* (1855), full of the personal element and local anecdote.

**BAUERFELD, bow'ër-fël'd', Karl Maximilian von**, German engineer and geodesist: b. Arzberg, 18 Nov. 1818; d. 1894. He was professor of geodesy and engineering in the engineering school at Munich, and long a director of the Technical School there organized according to his plans. He invented the prismatic cross employed in surveying, and named for him, and wrote 'Elemente der Vermessungskunde' (1856-58); 'Zur Brückenbau- kunde' (1854); 'Zur Wasserbarkunde' (1866).

**BAUERNFELD, bow'ër-fël'd', Eduard von**, Austrian dramatist: b. Vienna, 13 Jan. 1808; d. Vienna, 9 Aug. 1850. He studied law and entered the government service in 1826, but resigned, after the revolutionary events of 1848, to devote himself exclusively to his literary pursuits. A brilliant conversationalist, he soon became a universal favorite in Vienna society. Intimate from childhood with the poet, painter, and composer, Franz Schubert, he also kept up a lifelong intercourse with Grillparzer. Among his comedies, distinguished for their subtle dialogue and sprightly humor, particularly the descriptions of fashionable society and of the theater, is his reputation. The best known and most successful were *Reckless from Love* (1831); *Love's Protocol* (1831); *Confessions* (1834); *Domestic and Romantic* (1835); *Of Age* (1846); *Krisen* (1851); *Aus der Gesellschaft* (1866). His serious dramas were less popular. His collected works were issued (1871-73).

**BAUHN, bō-an', Gaspard**, Swiss botanist and anatomist: b. Basel 1560; d. 1624. He was at first intended for the Protestant ministry, but having manifested a decided inclination for medicine and botany, was allowed to follow it, and studied first at Basel and then at Padua. After finishing his studies he traveled over many parts of Europe, and in 1580 returned to Basel, bringing with him a reputation which immediately secured him the chair of Greek, and in 1589 that of anatomy and botany. His fame rests chiefly on his two works, *Pínax Theatri Botanici* and *Theatrum Anatomicum, Botanicum.* Gaspard and his brother, Jean Bauhin, have been happily commemorated by Linnaeus, who gave the name *Bauhinia* to a genus of plants.

**BAUHN, Jean**, an eminent Swiss botanist: b. Basel 1541; d. 1613. He was a brother of Gaspard Bauhin, and distinguished himself by his arbor in natural history pursuits, in prosecuting which he traveled over the greater part of the Alps, Italy and the south of France, preparing materials for a *Historia Universalis Plantarum Nova et Absolutissima,* which occupied the larger portion of his life but was not published till two or three years after his death. This work, in which he describes 5,000 plants, divided into 40 classes or books, is considered the first in which an attempt was made to give a regular form to systematic botany.

**BAUHNIA, a genus of about 150 species of tropical trees, shrubs or climbers of the family *Casalpinioideae,* with beautiful, showy, white to purple blossoms; named in honor of the brothers John and Gaspar Bauhin (q.v.). Some species are called mountain ebony from their dark-colored wood; *B. racemosa,* the gnarled climber, and several other East Indian climbing species are used for making ropes; *B. variegata,* an Indian species, is used in tanning, dying and medicine, and its flower buds for pickles. In southern Florida and southern California several species are very popular as ornamental plants, but in greenhouses few succeed because of the difficulty of securing a dry enough atmosphere without injury to the plants. *B. natalensis,* *B. variegata* and *B. corymbosa,* probably the most satisfactory greenhouse species, may be treated like oleanders during the winter and planted out of doors in spring.

**BAUM, boum, Friedrich**, German military officer in the British service in the Revolution-
ary War. He arrived in Canada in 1776, and in Burgoyne's expedition acted as lieutenant-colonel of the Brunswick dragoons. He was sent out with 800 men and two pieces of artillery on a foraging expedition. Near Bennington, Vt., he was attacked by the New Hampshire militia under Stark and utterly defeated. He was killed 16 Aug. 1777.

BAUMANN'S (bou'mans) CAVERN (German, Baumanns Höhle), an interesting natural cavern in the Harz, about five miles from Blankenburg, in a limestone mountain. It consists of six principal apartments, besides many smaller ones, everywhere covered with stalactites. The earthy ingredients of these petrifications are held in solution by the water which penetrates the rock and deposits a calcareous stone. The name of this cavern is derived from a miner, who entered it in 1672, with the view of finding ore, but lost his way and wandered about for two days before he could find his way out again.

BAUMBACH, boum'bah, Rudolf, German poet: b. Kranichfeld, Saxe-Meiningen, 28 Sept. 1840; d. 22 Sept. 1905. After studying natural science in Würzburg, Leipzig, Freiburg and Heidelberg, he lived in Austria and then at Trieste, where he devoted himself exclusively to writing. In 1885 he removed to Meiningen. He most successfully cultivated the poetical tale, based upon ancient popular legends. His epics include 'Zlatorg,' a Slovenic Alpine legend (1875, 37th ed., 1882); 'Horand and Hilda' (1877); 'Ladyl Fair' (1881); 'The Godfather of Death' (1884); 'Emperor Maximilian and His Huntsmen' (1888). His lyric collections are 'Songs of a Traveling Journeyman' (1878); 'Minstrel's Songs' (1882); 'From the Highway' (1882); 'Traveling Songs from the Alps' (1883); 'Adventures of the Franks Imitated from Old Masters' (1883); 'Jug and Inkstand' (1887); 'Thuringian Songs' (1891). He also published some excellent prose: 'False Gold' (1878), a historical romance of the 17th century; 'Summer Legends' (1881), a book of fairy tales; and 'Once Upon a Time' (1889).

BAUMÉ, bô-mä', Antoine distinguished French chemist: b. Senlis, 26 Feb. 1728; d. 15 Oct. 1804. He obtained the professorship of chemistry in the College of Pharmacy at Paris about 1752; was admitted a member of the Academy of Sciences, chiefly in return for some excellent memorials communicated to that body; wrote 'Elements of Theoretical and Practical Pharmacy,' which went through nine editions in France and was translated into most European languages, and contributed by his discoveries to numerous important improvements in the arts, particularly in the manufacture of sal ammoniac, soap and porcelain, in gilding and the bleaching of silk. His name is familiar from the areometer which he invented and which is still in use.

BAUMGARTEN, boum'gär-tën, Alexander Gottlieb, German philosopher of the school of Wolff: b. Berlin 1714; d. Frankfort-on-the-Oder 1762. He studied at Halle and was for a time professor-extraordinary there. In 1740 he was made professor of philosophy at Frankfort-on-the-Oder. He is the founder of aesthetes as a science and the inventor of this name. He derived the rules of art from the works of art and their effects. Hereby he distinguished himself advantageously from the theorists of his time. (See Ästhetics). His ideas of this science he first developed in his academical discussion, 'De Nonnullis ad Pseudos Pertinentibus' (1735) George Fr. Meier's 'Principles of all Liberal Sciences' (1748-50) originated from his suggestions. Eight years later, Baumgarten published his 'Ästhetica' (1750-58), a work which greatly prevented him from completing. Consul Schmidt, Leibnitz and Baumgarten' (Halle 1875).

BAUMGARTEN, Hermann, German historian: b. 28 April 1825; d. 19 June 1893. He was a professor of history in the University of Strassburg 1872-89, and published 'Geschichte Spaniens zur Zeit der französischen Revolution' (1861); 'Geschichte Spaniens aus dem Ausbruch der französischen Revolution bis auf unsere Tage' (1865-71); 'Karl V und die deutsche Reformation' (1889).

BAUMGARTEN, Moritz Julius Maximilian Paul Maria, German clergyman and historian: b. Rittershausen, Germany, 25 July 1860. He was educated at the universities of Bonn, Marburg, Breslau, Strassburg and Berlin, and at the Accademia dei Nobili Ecclesiastici, Rome. He began the practice of law in 1885; engaged in historical research work in various libraries and archives of Europe in 1887 and in 1888-89 was assistant at the Royal Prussian Historical Station in Rome. He was ordained to the Catholic priesthood in 1894 and held various ecclesiastical offices in Rome. He traveled Europe and the United States in the interests of scientific research; was president of the seventh section of the second International Congress of Christian Archaeology, Rome 1900; and secretary of the fifth International Congress of Catholic Scholars, Munich 1900. He is a member of several scientific and historical societies and has received numerous decorations and medals. He is the author of 'Die deutschen Hexenprozesse' (1883); 'Hat das System Kneiff eine soziale Bedeutung?' (1892); 'Giovanni Battista de Rossi' (1892). 'Il dizionario di erudizione storica del Moroni ricerche intorno alla proprietà letteraria di esso' (1896); 'Die Katholische Kirche in Deutschland, der Schweiz, Luxemburg, und Oesterreich-Ungarn' (1900; rev. ed., 1907); 'Verfassung und Organisation der Kirche' (1906); 'Die Werke von Henry Charles Lea und verwandte Bücher' (1908); etc. He is editor of 'Die Katholische Kirche unserer Zeit und ihre Diener' (3 vols., 1899-1901) and a contributor to the 'Theologische Revue, Allgemeines Literaturblatt, Literarische Rundschau' and an occasional contributor to various scientific periodicals.

BAUMGARTEN-CRUSIUS, Ludwig Friedrich Otto, German Protestant theologian: b. Merseburg, 31 July 1788; d. Jena, 31 May 1843. He studied theology in Leipzig; became the university preacher in 1815 and professor of theology at Jena, in 1817, and became widely known as a foremost champion of religious liberty. He was a learned and original thinker, but his writing is often obscure. His publications include 'Introduction to the Study of Dogmatics' (1820); 'Manual
of Christian Ethics? (1827); 'Outlines of Biblical Theology? (1828); 'Outlines of Protestant Dogmatics' (1830); 'Text-book of the History of Doctrines? (1832); 'Schleiermacher, His Method of Thought, and His Value' (1834); 'Considerations on Certain Writings of the Fathers' (1834), etc.

BAUMGARTNER, Alexander, Swiss writer; b. Saint Gall 1841. He became a member of the Society of Jesus in 1860, and after completing his theological studies in England, made a study of Scandinavian literature in Stockholm and Copenhagen. He published 'Goethe's Jugend' (1879); 'Longfellow's Dichtungen' (1879); 'Caldecott' (a festival play) (1881); 'Goethe und Schiller' (1886); 'Der Alte von Weimar' (1886); a translation from the old Icelandic of Eystein Asginnson; and a history in eight volumes of the world's literature.

BAUMGARTNER, Andreas von, Austrian statesman; b. 23 Nov. 1793, at Friedberg in Bohemia; d. 1865. He was connected for many years with the teaching of mathematics and physics, especially after 1823, at the University of Vienna, until illness forced him to relinquish his academic pursuits. Subsequently he became connected with the direction of the imperial porcelain, tobacco and other manufactures in 1841, with the establishment of electric telegraphs, and at the end of 1847 with the chief management of the construction of railways. After the revolution of 1848 he occupied for a third time a seat in the Austrian Cabinet as Minister of the Mining Department and of Public Works. In May 1851 he became Minister of Finance and Commerce, and in 1855 was made president of the Austrian Academy of Sciences. In 1861 he entered the House of Peers of the Reichsrath. His principal works are on mechanical science applied to arts and industry. His most popular work is the 'Naturlehre,' which has passed through many editions and was a textbook in all the schools of Austria.

BAUR, bour, Ferdinand Christian, one of the most celebrated theologians of modern Germany, founder of the New Tübingen School of Theology; b. Schmiden, where his father was pastor, 21 June 1792; d. 2 Dec. 1860. At the University of Tübingen, which he entered in 1809, he devoted five years to theological studies, and in 1817 became professor in the seminary at Blaubeuren. While holding this position he published his first work, 'Symbolism and Mythology, or the Natural Religion of Antiquity' (1824-25), by which his eminent theological abilities were so clearly manifested that in 1826 he received a call to Tübingen as ordinary professor in the evangelical faculty of that university. This position he continued to occupy till his death. His chief works belong to the two departments of the history of the Christian dogmas and New Testament criticism, in both of which his views have had the most powerful effect upon the theology of the present day. His most important works belong to the following classes: 'The Christian Gnosis, or the Christian Philosophy of Religion' (1835); 'The Christian Doctrine of the Atonement' (1838); 'The Christian Doctrine of the Trinity and the Incarnation' (1841-43); 'Compendium of the History of Christian Dogmas' (1847). To the second class belong 'The So-called Pastoral Epistles of the Apostle Paul' (1835); 'Paul the Apostle of Jesus Christ, His Life and Labors, His Epistles and His Teaching' (1845); 'Critical Inquiries Concerning the Canonical Gospels, Their Relation to One Another, Their Origin and Character' (1847). He also wrote the 'History of Christian Doctrine from the Origin of Christianity Down to the End of the 18th Century,' a series of volumes between 1853-63. Consult Nash, H. S., 'History of the Higher Criticism of the New Testament' (New York 1901).

BAUR, Frederick Wilhelm von, Russian military engineer; b. Hanau, Germany, 1735; d. Saint Petersburg 1783. He early adopted a military life, entered the British service in 1755 and in 1757 he obtained the rank of general and engineer-in-chief. Frederick II of Prussia ennobled him. In 1769 he entered into the service of Catherine II, Empress of Russia, and was employed against the Turks. The Empress had a high notion of his talents, and employed him in making the aqueduct of Tsarskoe-Selo for supplying Moscow with water, and in superintending the canal near Saint Petersburg, at the end of which he constructed a large harbor, and completed other important undertakings. Baur had for his secretary the celebrated Kotzebue, who directed in his name the German theatre at Saint Petersburg.

BAUR, Gustav Adolf Ludwig, German theologian; b. Hammelbach 1816; d. 1889. He was appointed a professor at Giessen in 1847, and in 1870 at Leipzig. He belonged to the Schleiermacher school and was the author of 'Grundzüge der Homiletik' (1848); 'Boëtius und Dante' (1874); 'Die Vorschristliche Erziehung' (1884).

BAUSMAN, Benjamin, American Reformed (German) clergyman; b. Lancaster, Pa., 28 Jan. 1824; d. Reading, Pa., 8 May 1909. He founded Saint Paul's Reformed Church, Reading, Pa., 1853, and was its pastor until his death. He published 'Sinai and Zion' (1860); '7th ed., 1885); 'Wayside Sermons and Essays' (1876); 'Bible Characters' (1893); 'Catechetics and Catechetical Instruction' (1893); 'Precepts and Practice' (1901); and edited The Guardian (1867-82), and Reformirtter Hausfreund (1882).

BAUSSET, bô-sä, Louis François (Cardinal), French ecclesiastic; b. Pondicherry, India, 14 Dec. 1748; d. Paris, 21 June 1824. His father, who held an important position in the French Indies, sent young Bausset to France when he was but 12 years of age. He was educated by the Jesuits, and became bishop of Alais in 1764. Having signed the protest of the French bishops against the civil constitution of the clergy, he emigrated in 1791, but in the following year returned to France, was soon arrested, and imprisoned in the old Convent of Port Royal, where he remained until after the fall of Robespierre. After the restoration of Louis XVIII, in 1815, he entered the Chamber of Peers; the following year he became a member of the French Academy; and, in 1817, he received the appointment of cardinal. He wrote the 'History of Fénélon'
(1806–09), at the request of the Abbot Emery, who had in his possession the MSS. of the illustrious archbishop of Cambrai. The work had great success, and its author was awarded, in 1810, the second decennial prize of the Institute, for the best biography. His 'History of Bossuet' (1814) was less favorably received.

BAUTAIN, bo-tän', Louis Eugène Marie, French philosopher: b. Paris, 17 Feb. 1796; d. 18 Oct. 1867. He entered the Church, and became a priest in 1825; resigned his professorship in 1830; and later was suspended as a priest because of his work, 'La Morale de l'Evangile comparée à la Morale des Philosophes'; but was reinstated in 1841. He was made dean of the Faculty of Letters at Strassburg in 1838, and subsequently director of the College of Jullly. At a still later period he was transferred to Paris, and made vicar-general of the Metropolitan diocese. He was also appointed a member of the theological faculty of Paris. His writings include 'Philosophie-psychologie-experimental' (1839); 'Philosophie morale' (1842); 'Philosophie du Christianisme' (1845); 'La Religion et la Liberte consideres dans leurs rapports' (1848); 'La Morale de l'Evangile comparee aux divers systemes de morale' (1855), etc.

BAUTZEN, bout-seen, or BAUDISSIN, bow-dez'en, Germany, a manufacturing town in Saxony, noted for its production of textile fabrics, leather, paper, etc. It overlooks the river Spree, 30 miles northeast of Dresden, and is encircled by ancient walls and moat now converted into promenades. The cathedral church of St. Peter is used by both Protestants and Roman Catholics, it being divided into two portions for the purpose. The town contains many schools, a museum, art gallery and three libraries. At Bautzen Napoleon, with 130,000 men, defeated the allied armies of Russia and Prussia, 20–21 May 1813. Pop. 32,760.

BAUXITE, or BEAUXITE, bożit (from Baux, or Beaux, near Arles, France, where it occurs), a native, hydrated oxide of aluminum, having the formula Al₂O₃·H₂O. It has a specific gravity of about 2.5, and its hardness ranges from 1 to 3. It occurs massive, in concretionary grains showing a concentric structure and in clay-like deposits. Sesquioxide of iron is usually present in considerable quantity, sometimes to the extent of 50 per cent, part of it replacing aluminium, and part occurring merely as an impurity. Bauxite is found in many parts of the world. One of the most interesting deposits is at Irish Hill, near Larne, county Antrim, Ireland, where it occurs in the iron measures together with lignite. At this place three layers of it are known, having an aggregate thickness of about 50 feet. The finest grade from Irish Hill is almost free from iron, containing as little of that metal as good china clay. Analyses have shown that the Bauxites occur in considerable quantities of the mineral from iron, since a white variety containing 3.67 per cent of Fe₂O₃ is known, while a certain strongly red variety showed, upon analysis, but 3.75 per cent, and a yellow specimen contained 14.39 per cent. In the United States bauxite occurs in considerable quantities in Saline and Pulaski counties, Ark., and in a deposit extending from Calhoun County, Ala., eastward into Georgia. Bauxite forms the principal ore of the metal aluminum. The American deposits of bauxite are well suited for the second decennial prize of the Institute, for the best biography. His 'History of Bossuet' (1814) was less favorably received.

The American deposits of bauxite are well suited for the second decennial prize of the Institute, for the best biography. His 'History of Bossuet' (1814) was less favorably received.

The sulphate acid is believed to have reacted with shale beds changing the kaolin to aluminium sulphate. As this passed on upward through limestone beds, the reaction freed Al₂O₃ as follows: Al₂O₃ + CaCO₃ = 3CaSO₄ + Al₂O₃ + 3CO₂. The gelatinous Al₂O₃ was then deposited as bauxite. Arkansas deposits are believed to be residual from the weathering of syenite. In addition to its use as an ore of aluminium, bauxite forms an important source of alum. Its clay-like form is known as bauxite, on account of its occurrence at Wochein, in Styria. The world's product of bauxite was in 1910 about 310,000 tons; 1914 about 350,000 tons; and 1915 something over 500,000 tons; the average value in the United States being about $3 per ton. Of the 1915 production the United States is credited with 257,000 tons; France, 180,000; United Kingdom, 20,000; Italy, 10,000; Japan, 250; India, 110; all other countries, 2,600. Consult Hayes, C. Willard, 'Bauxite' (Sixteenth Annual Report of the United States Geological Survey, Part 3, Washington 1896); Branner, 'The Bauxite Deposits of Arkansas' (Journal of Geology, Vol. 5, 1897, p. 283); Mead, J. W., 'Bauxite Deposits of Arkansas' (Ecq. Geol, Vol. X, 1915, p. 28). See ALUMINUM; MINERAL PRODUCTION OF THE UNITED STATES.

BAVARIA (German, Bayern; French, Bavière), a kingdom in the south of Germany, the second largest in the empire. It is composed of two isolated portions, the larger comprising about twelve-thirteenth of the monarchy, bounded on the east by Bohemia and Upper Austria; on the south by Salzburg and the Tyrol; on the west by Württemberg, Baden, Hesse-Darmstadt and Hesse-Nassau; and on the north by Hesse-Nassau, Weimar, Meiningen, Reuss, Coburg-Gotha and the kingdom of Saxony. It lies between lat. 47° 16' and 50° 34' N., and long. 8° 59' and 13° 50' E. The smaller portion, the Pfalz or Palatinate, lies west of the Rhine, which forms its eastern boundary, and is separated from the main body by Württemberg, Baden and Hesse-Darmstadt. It is included between lat. 48° 57' and 49° 50' N., and long. 7° 4' and 8° 31' E.; and is bounded south by Alsace-Lorraine, west by the Prussian Rhine province and north by Hesse-Darmstadt and the Prussian Rhine province. Bavaria is estimated to contain an area of 30,346 English square miles, and is divided into eight circles (Kreise), which were formerly named after the rivers that watered them; but an edict of 20 Nov. 1837 gave the circles new names and new boundaries. The following
The capital is Munich (q.v.), and the other principal cities are Nuremberg, Augsburg, Würzburg, and Stuttgart (q.v.).

Mountains.—Bavaria is a hilly rather than a mountainous country. A large portion, more especially south of the Danube, is a plateau country of considerable elevation, and, indeed, the western portion of the kingdom may be described as an upland valley, averaging about 1,600 feet above the sea-level, intersected by numerous large streams and ridges of low hills. On all sides it is surrounded by hills of a greater or less altitude, either quite upon the plateau or only at small distances from it. The whole southern frontier is formed by a branch of the Noric Alps, offsets from which project far into the southern plateau of Bavaria, forming the Altgäuer Alps, the Bavarian Alps and the Salzburger Alps. Besides numerous peaks which these ranges contain, varying from 4,000 to 8,000 feet high, the following may be named as being above the latter number: The Zugspitze, 9,720 feet; the Watzmann, 8,900 feet; the Hochvogel, 8,460 feet; the Madeler Gabel, 8,650 feet. Passing along the valley of the Inn and across the Danube, we come to the Bohemian frontier, formed by the Böhmerwald Mountains running southeast to northwest and lowering down at the valley of the Eger. The highest peaks in this range are the Rachel, 5,102 feet, and the Arber, 5,185 feet. Crossing the Eger we meet with the Fichtelgebirge, presenting the Schneeberg, 3,455 feet high, and the Ochsenkopf, 3,300 feet. West from this range, and along the frontier of the Saxon ducal territories and Hesse-Cassel, run hills of moderate elevation, under various names, Frankenwald, Rhöngengebirge, etc., no peaks of which attain an elevation of more than 3,327 feet. The western mountain boundary of the Bavarian Valley is formed north of the Main by the Spessartwalt Range, and in the kingdom of Württemberg by the Alb or Alp. The only noteworthy interior ranges are in the northwest the Steigerwald; and in the northeast, running in a southwesterly direction from the Fichtelgebirge, the Franconian Jura; a low limestone range, containing numerous remarkable stalactite caves. The Pfalz or Palatinate is traversed by the northern extremity of the Vosges, the highest table in this locality being the Königstuhl, 2,162 feet.

Lakes.—The lakes of Bavaria are neither very numerous nor of very great extent, though many of them present exceedingly picturesque scenery. The larger are all situated on the upper part of the southern plateau; the smaller within the range of the Noric Alps. The most remarkable of the former are, Lake Ammer, about 10 miles long by three and three-quarters broad, 1,720 feet above the sea; Lake Ammersee, about 7 miles long by three and one-half broad, 1,651 feet above the sea. Of the smaller, the more remarkable are Lake Tegernsee, about three miles long, 2,586 feet; Lake Walchen, 2,597 feet; Königs-See, five miles long, 1,975 feet; and various others upward of 2,000 feet above the sea-level. Most of the lakes are well supplied with fish.

Rivers.—Bavaria belongs wholly to the basins of the Danube and the Rhine, with the exception of a very small portion in the northeast corner, which through the Eger and Thuringian Saale appertains to the basin of the Elbe. The river Danube (q.v.) is the main river of the kingdom from east to west, and is navigable for steam vessels from Bamberg to the Rhine. It is connected with the Danube by the Ludwigs Canal, the most important waterway in Bavaria. Its principal affluents are the Regnitz and the Saale. In the Palatinate there are no streams of any importance, the Rhine being merely a boundary river. Large tracts of marshy land are characteristics of southern Bavaria.

Climate.—If we except the valley of the Rhine, and the valley of the Main in lower Franconia, Bavaria, even including the Palatinate, is, in comparison with other German states, a cold country. The average temperature of the year is about 47° F.; winter, 30°; summer, 54°; summit of Säuling, 62°. The rainfall averages from 23.5 inches in the Rhine Palatinate to over 78 inches in southern Bavaria.

Soil, Vegetation, etc.—Bavaria is one of the most favored countries in Germany in respect of the fruitfulness of its soil, due, no doubt, in a considerable degree, to the undulating nature of the country, to the numerous streams by which it is watered and to being nearly wholly composed of Jurassic limestone. In the plains and valleys the soil is capable of producing all kinds of crops, but not till lately were the natural advantages of the country turned to good account. Ignorance and idleness opposed a barrier to improvement, which it took the utmost efforts of an enlightened government, aided by the general spread of education, to remove. Now a spirit of agricultural enterprise pervades the kingdom, many co-operative societies have been formed, improved methods of cultivation have been introduced and large tracts of waste land have been reclaimed and brought under the plow. To the general productions of the soil may be added tobacco and...
fruit, of which large quantities are grown in the valleys of the Main and the Rhine. In the circles of Mittelfranken and Schwaben-Neuburg, the hop plant is cultivated to a considerable extent. Nearly half of the total crops are now under cultivation and one-sixth under grass. In 1912 the areas under the chief crops were: wheat, 725,937 acres, yielding 489,785 metric tons; rye, 1,417,972 acres, yielding 929,644 metric tons; winter barley, 903,441 acres, yielding 668,780 metric tons; oats, 1,267,388 acres, yielding 744,661 metric tons; potatoes, 927,015 acres, yielding 4,708,746 metric tons; hay, 3,208,037 acres yielding 4,883,742 metric tons.

In 1913 there were 43,690 acres, which yielded 6,658 metric tons of hops. The vine is chiefly grown in the circles of Pfalz and Unterfranken. The latter produces the Franconian wines; the best wines of the former are produced near Deidesheim and Wachenheim. The celebrated Steinwein and Leistenwein are the produce of the southern slope of the Marienburg, near the town of Würzburg. In 1912 there were altogether 51,625 acres under vines, yielding 12,652,622 gallons of wine. The forest floor of Bavaria, composed of 3,600,000 red pine trees, cover nearly a third of its entire surface and yield a large revenue, estimated at about $10,000,000 annually. About 49 per cent belongs to private persons, 34 per cent to the state and the rest chiefly to the communities. Land is rented for grazing and much timber is annually exported, together with potashes, tar, turpentine and other products peculiar to these wooded regions. The principal mineral products are salt, coal and iron. Some of the mining works belong to the state and contribute something to the public revenue; but the minerals are not wrought to the extent they might be. The coal output in 1913 was 1,895,715 metric tons; iron ore, 450,074 tons; pig-iron, 195,606 tons; cast-iron wares, 201,050 tons; steel, 163,343 tons. The chief coal works are at Rosenheim, Graunstein, Reichen-hall and Berchtesgaden. There are celebrated mineral springs at Kissingen and Reichenhall. Plumbago is found in several places and is principally manufactured into pencils. Porelske, a variety of fine porcelain, is found in some localities, the best being obtained in the district of Wunsiedel on the upper Main. Lithographic stones are another important production. In the breeding of live-stock Bavaria is only excelled by Prussia among the German states. In 1912 the number of horses was 401,-990; of mules and asses, 700; cattle, 3,560,723; sheep, 474,000; swine, 1,814,418; goats, 315,122; fowls, 10,319,000. Wild fowl are abundant. The wolves and bears with which the forests of Bavaria were at one time infested are nearly extinct.

Manufactures.—The manufactures of Bavaria are singly not very important, being mostly on a small scale and conducted by individuals of limited capital. The principal articles manufactured are linens, woollens, cottons, silks, leather, paper, glass, earthen, iron and steel ware, jewelry, etc., but the supply of some of these articles is inadequate to the home consumption. Of leather, paper, glass and iron ware rather large quantities are exported. There are also tobacco and beet-sugar factories, tanneries and chemical works. The optical and mathematical instruments made at Munich are the best on the Continent and are prized accordingly. But the most important branch of manufacture in Bavaria is the brewing of beer—the universal and favorite beverage of the country. The per capita production was about 60 gallons in 1912; total amount brewed was 424,605,764 gallons. The amount of alcoholic liquor, 102,008,169 gallons. Beer, however, is not only consumed in the country of its production, but is sent to all parts of Germany and even as far as America and India. A portion of the industrial population maintain themselves by weaving linen and by the manufacture of articles in wood (some of which are of beautiful workmanship), and by the felling and hewing of timber. Among the exports are corn, timber, wine, cattle, leather, glass, hops, fruit, beer, iron and steel wares, machinery, fans, articles of coal, colors, lucifer matches, stoneware, etc. Among the imports are coffee, cacao, tea, cotton, tobacco, drugs, copper, oil, spices, dyestuffs, silk and silk goods, lead, etc.

Transportation.—From its position Bavaria enjoys a great foot of the foreign trade, much facilitated by the good roads that traverse the country in all directions. The means of communication are now very complete. The Danube, the Rhine, the Main, the Regnitz, etc., afford ample scope for inland navigation, besides the König Ludwig Canal, which connects the Main near Bamberg with the Altmühl a short distance above its embouchure in the Danube, thus establishing direct water communication through the Rhine between the North Sea and the Black Sea. The railway system has been carried out on an extensive scale. The lines are partly state property, partly private. The number of miles in operation amounted in 1914 to 5,173 miles, of which 5,102 miles were normal gauge and 71 miles narrow gauge. The total revenue was $485,165,320, and the gross receipts from the state railways $77,083,200. The state also possesses two canals. Bavaria's foreign trade is embraced in that of the German Customs Union. In 1913 there were 19,626 miles of telegraph line, of which about 9,000 miles were electrical.

Education and Art.—The department of education is under the superintendence of the Superior Board of Education and Ecclesiastical Affairs. A complete system of inspection is established throughout the country, the reports of the inspectors including not only the number and proficiency of the scholars, but also the conduct of the teachers, the state of the buildings and the nature and extent of the funds available. It is necessary in Bavaria, before admission can be obtained into any higher school, to have passed a satisfactory examination in the lower school. Not only must all candidates for offices under the state pass examinations, but examinations are held of apprentices in trade who wish to become masters, and even of the officers in the army on promotion. In 1911-12 there were 7,727 elementary schools, with 19,109 teachers and 1,064,579 pupils; 333 agricultural schools, with 6,847 pupils, besides 442 winter schools, with 1,877 pupils. Attendance at school is compulsory from 6 to 16 years of age. There are
three universities in Bavaria—two of which (Munich and Würzburg) are Roman Catholic and one (Erlangen) Protestant. In 1913–14 the University of Munich had 265 professors and instructors and 6,802 pupils; that of Würzburg, 101 professors and instructors and 1,515 pupils; and that of Erlangen, 81 professors and instructors and 1,341 pupils. There are also several lyceae, 43 gymnasia, numerous Latin, normal and polytechnic schools, besides academies of arts and sciences, fine arts, horticulture, etc. The capital, Munich (pop. 1910, about 630,000), contains a library of about 1,100,000 volumes and 50,000 MSS., several scientific and literary institutions, academies and national societies, and extensive collections of works of art.

Bavaria enjoys the honor of having originated a school of painting of a high order of merit, known as the Nuremberg school, founded about the middle of the 16th century by Albert Dürer (q.v.), a native of that town, whose works are little, if at all, inferior in quality to those of his great Italian contemporaries, Hans Holbein (q.v.), who excelled Dürer in portrait, though far behind him in historical painting, was also a native of Bavaria, having been born at Augsburg about 1460. To these celebrated names have been added those of the eminent sculptors Kraft and Vischer (q.q.v.), both also Bavarians; the former born probably at Nuremberg about 1450–55 and the latter about 1460. The masterpiece of the latter distinguishes the famous altar of St. Sebaldus in Nuremberg, esteemed a marvel of art for beauty of design and delicacy of workmanship. The most celebrated of Kraft's works is the remarkable tabernacle in stone affixed against one of the columns of the choir of the church of Saint Lawrence, also in Nuremberg. The restoration of Bavarian pre-eminence in modern times, in connection with the fine arts, is, in a great measure, if not entirely, owing to Louis I, whose love of art and liberal patronage has rendered the capital one of the most celebrated cities in Europe. His grandson, Louis II, was a great patron of music and the protector of Richard Wagner.

Religion.—The religion of the state is Roman Catholicism, which embraces more than seven-tenths of the population. The remainder are principally Protestants and Jews. In 1910 the Roman Catholics numbered 4,862,233; Protestants, 1,942,385; Jews, 55,065. The proportion between Catholics and Protestants has scarcely varied during the last three-quarters of a century. All citizens, whatever their creed, are equally admissible to the same public functions and employments, and possess the same civil and political rights. The articles of the concordat concluded with the Pope are subordinate in their application to the fundamental laws of the land. The Salaries of the two archbishops, of Munich and Bamberg; and six bishops, Augsburg, Ratisbon, Eichstadt, Passau, Würzburg and Speier. The Salaries are paid by the government. The Protestant Church is under a general consistory and three provincial consistories. In Bavaria marriage between individuals having no capital cannot take place without the consent of the principal persons appointed to superintend the poor institutions, who, if they grant such liberty where there are no means of supporting the children that may spring from such marriage, render themselves liable for their maintenance. The law is intended to prevent improvements in marriage.

People.—In personal appearance the Bavarians are stout and vigorous, well adapted to bear the fatigues of war, and are generally considered good soldiers. Of a lighter, gayer temperament than the Prussians, they are sometimes accused of being indolent and somewhat addicted to drinking, but are brave, patriotic and faithful to their word. Their manners and customs toward the close of the 18th century were described as very coarse, and they were said to be deeply imbued with superstitious bigotry; but since the more general diffusion of knowledge a great change for the better has taken place. Many of the peasantry wore long, loose, snuff-colored coats, lined monarch, the pink, and studded in front with silver or white metal buttons, thrown open to display a smart waistcoat of various and brilliant colors; their hats were often ornamented with artificial flowers. Many of the Bavarian women are handsome, lively and graceful. They dress smartly and display much taste in their attire. Some of them wear black silk handkerchiefs, decorated with flowers or ribbons, tied tightly around their heads; some caps of silver or gold tissue; and all have their hair nearly braided. German is the language spoken, with local peculiarities, but Bavarians have never been conspicuous for the cultivation of their native tongue.

Constitution.—Bavaria became a member of the North German Confederation by the Treaty of Versailles, 23 Nov. 1870, and now forms part of the German empire, but possesses certain special privileges in regard to the administration of the army railways and posts, and the collection of revenue for its separate budget. It is a constitutional monarchy, the crown being hereditary in the male line, or if that fails, in the female line. The executive is in the hands of the king, but a ministry of seven members is responsible for his acts, and he is advised by a state council consisting of the seven ministers, nine other members and one royal prince. The executive power is exercised jointly by the king and Parliament, consisting of an upper and lower House. The former is composed of princes of the royal family, the great officers of state, the two archbishops, the head of certain noble families, and about 30 other hereditary councillors, a bishop named by the king, the president of the Protestant General Consistory, and a certain number of life members appointed by the Crown, which must not exceed one-third of the ordinary councillors. The number of deputies, or members of the lower House, is fixed at 163, being at an average rate of one for every 38,000 inhabitants. They are elected for six years, since 6 April 1906, by direct secret vote, to which every citizen over 25 years old, who has paid a direct tax for at least one year, is entitled. Bavaria is represented in the Imperial Bundesrat by six members, and in the Reichstag by 48. In regard to local administra-
tion the country is divided into eight provinces, or government districts, subdivided into administrative districts. Each government district has a provincial government consisting of two boards, one for the management of the police, schools, etc., and the other for the management of financial affairs; and each has a list, consisting of representatives of the districts, towns, clergy, landed nobility and university, if there be one. The budget is voted for two years. The estimates for 1914-15 balanced at $196,267,182. The total debt for 1915 amounted to $506,820,789, of which $478,328,800 were for railways. The army is raised by conscription—every man being liable to serve from 1 January of the year in which he completes his 20th year—and it forms an independent part of the army of the German empire, namely: 1st, 2d, 3d Bavarian army corps. In the time of peace it is under the command of the king of Bavaria, but in time of war it is placed under that of the German Emperor as commander-in-chief of the whole German army. The period of service is two years; in the ranks, five years. The Landwehr or second army line, six, in the Landsturm for home defense, cavalry and horse artillery three, four, three and six. On a peace footing the Bavarian army is between 72,000 and 73,000 men. No Bavarian can settle or marry except by definite appointment, till he has fulfilled his military liabilities.

History.—The earliest inhabitants of what is now known as Bavaria were a Celtic tribe who were conquered by the Romans about 15 B.C. The district became part of the Roman provinces of Noricum and Vindelicia, later incorporated with Raetia. After the fall of the Western empire in the 5th century the territory was overrun by various Germanic tribes; probably descendants of the Marcomanni and Quadi, who were called Boarii, because they came from Bojerland or Bohemia. These Boarii soon were made tributary by the Franks, and were ruled over by dukes of the Agilolfing family, probably of Frankish descent, as early as the 6th century. Electors of the bishops of Salzburg, Freising, Regensburg and Passau were founded or restored. Charlemagne made Bavaria a part of his kingdom, and on the death of the monarch the kings of the Franks and Germans governed it by their lieutenants. In 1070 Bavaria passed into the possession of the family of Guelphs, and in 1180 it was transferred by imperial grant to Otho, Count of Wittelsbach. In 1214 the family came into possession of the Rhenish Palatinate, but this was separated from Bavaria in the following century. In 1623 Duke Maximilian of Bavaria received the title of Imperial Elector, and five years later acquired the upper Palatinate. In 1777, on the extinction of the direct Bavarian line of the Wittelsbach family, Munich passed to the Elector of the Palatinate, Charles Theodore, and thus the Palatinate, to which were added the duiches of Juliers and Berg, was reunited to Bavaria. In 1799 the Duke Maximilian Joseph of Zweibrücken came into possession of all the Bavarian territories. The Peace of Lunéville (1801) actually affected Bavaria. While it lost the Palatinate and the duchies of Zweibrücken and Julich, it obtained, on the other hand, by an imperial edict of 1803 an indemnification by which it gained, in addition to the amount lost, a surplus of 2,109, square miles and 216,000 inhabitants.

In 1805 Bavaria, having espoused the side of Napoleon, was raised, by the Treaty of Pressburg, to the rank of a kingdom, with some further territories, most of which were confirmed by the treaties of 1814 and 1815, by which also a great part of the lands of the Palatinate was restored. In 1818 Bavaria entered on a period of constitutional reform and on 26 May of that year the Constitution was proclaimed. In 1848 the conduct of King Louis I, in maintaining an open liaison with Lola Montez, who became supreme in the state had thoroughly alienated the hearts of his subjects, and quickened that desire of political change which had previously existed. The people, early in March 1848, demanded immediate convocation of the chambers, liberty of the press, public judicial trials; also that electoral reform should be granted, and that the army should take an oath to observe the Constitution. The King refused, and in defiance of the demands, tumults occurred, and King Louis announced his resignation of the sceptre to his son, Maximilian II, under whom the reforms and modifications of the Constitution were carried out. Maximilian died in 1864 and was succeeded by Louis II. In the war of 1866 Bavaria sided with Austria, in consequence of which it was obliged, by the treaty of 22 August in the same year, to cede a small portion of its territory to Prussia, and to pay a war indemnity of $12,150,000. Soon after Bavaria entered into an offensive and defensive alliance with Prussia, and in 1867 joined the Zollverein under Prussian regulations. In the Franco-German War of 1870-71 Bavaria took a prominent part, and since 1871 it has been one of the constituent states of the German empire, represented in the Bundesrat by 6, in the Reichstag by 48 members. In 1886 King Ludwig II committed suicide through alienation of mind. His brother Otto succeeded, but he being also insane, his uncle, the 8th century. In 1912 he was succeeded as regent by his son Louis, who, yielding to popular demand, was proclaimed king as Ludwig III, 5 Nov. 1913. After 40 years' confinement as a lunatic King Otto died in 1916.

reiche Bayern' (Münchens 1900); 'Henry the Lion' (Oxford 1912); Reizler, S., 'Geschichte Bayerns' (Gotha 1878-1914); Rheinhardtstetter, K., editor, 'Forschungen zur Geschichte Bayerns' (Berlin 1893-1908).

CHARLES LEONARD-STUART.

BAVIAD AND MÆVIAD, The, two satires, by William Gifford. It was through these that the author, who later was the first editor of the 'Quarterly Review,' became known. 'The Baviad' (1792) is an attack on a band of English writers, who had formed themselves into a kind of mutual admiration society. It is an imitation of the first satire of Perseus, and in it the author not only attacks the 'Della Cruscas,' but all who sympathize with them. The 'Mœviad' (1795) is an imitation of the 10th satire of Horace, and was called forth, the author says, by the reappearance of some of the scattered enemy.

BAVIECA, ba-wyə'kə, the favorite horse of the Cid.

BAVIUS, MARCUS and MÆVIUS, still notorious as two miserable poets and presumtuous critics, satirized by Virgil. The words are often used to signify bad or malevolent poets.

BAWBE, bór-bé' (French, bas billon, "low" or "debased billon"), a coin originally minted in Scotland from an alloy of copper with a very small amount of silver, called billon, and having at different times a value varying from 1½ to 3 cents. The coin is no longer issued, but the term is used in Scotland to mean a half-penny (a cent) or a very small value.

BAX, Ernest Belfort, English socialistic: b. Leamington, 23 July 1854. He was educated in London and Germany; followed journalism in Germany as foreign correspondent in 1880-81; and returning to England, became one of the founders of the English socialist movement. In 1885 he aided in starting the Socialist League. He has written a large number of works on socialist and historical subjects.

BAXTER, James Phinney, American author: b. Gorham, Me., 23 March 1831. A successful merchant and manufacturer, he was six times mayor of Portland, Me., to which he presented the land and building for a public library. He presented also a memorial library and museum to his native town, erected on his father's estate. A devoted student of the history of his native State, he has published 'George Cleeve of Casco Bay' (1865); 'Journal of Lieutenant W. Digby' (1888); 'Sir Ferdinando Gorges and His Province of Maine' (1890); 'The Pioneers of New France in New England' (1894); 'A Memoir of Jacques Carter with a New Translation of His Voyages' (1895); 'The Greatest Literary Problems' (1915). He published 19 volumes of 'A Documentary History of Maine,' and many other historical and literary monographs. He was long the president of the Portland Savings Bank, and president and director of other institutions. Initiated, organized, and was first president of the Associated Charities of Portland, also the Portland Society of Art; started its first art school in 1884; president of the Maine Historical Society, the Portland Benevolent Society and the New England Historical Genealogical Society; a member of the council of the American Antiquarian Society, member of the American Historical Society, Massachusetts Historical Society the American Society of Arts and Sciences, and other literary societies at home and abroad.

BAXTER, Jeré, American lawyer: b. Nashville, Tenn., 11 Feb. 1852. He traveled in Europe, studied law and reported the decisions of the Supreme Court of Tennessee, 9 volumes. He became prominent in railroad enterprises, particularly in schemes devoted to the opening up of the mineral and timber resources of his State. He was president of the Memphis & Charleston Railroad before reaching the age of 30, and he organized and built the Tennessee Central Railroad, of which corporation he was president. He was instrumental in the founding and extension of industrial towns, and was a member of the Tennessee senate.

BAXTER, Lucy E. (Barnes), English art writer: b. Mere, Wiltshire, about 1835; d. Florence, Italy, 10 Nov. 1902. She was the daughter of William Barnes, the Dean of Canterbury, and wrote over the pen name of Leader Scott. After her marriage to Mr. S. T. Baxter in 1867, she resided in Italy, where she was made an honorary member of the Accademia delle Belle Arti. She was the author of 'The Painter's Ordeal?; 'A Nook in the Apennines' (1879); 'Lives of Fra Bartolommeo, Andrea del Sarto, Fra Angelico and Lucadella Robbia;' 'The Renaissance of Art in Italy' (1882); 'Messer Agnolo's Household, a Unique Cento Florentine Story' (1882); 'Ghirlandaio and D. C. Sassetello' (1882); 'A Bunch of Berries' (1883); 'Sculpture, Renaissance and Modern' (1886); 'Tuscan Studies and Sketches' (1887); 'Life of William Barnes' (1888); 'Vincigliata and Mariano' (1891); 'The Orti Ordinarii' (1894); 'Echoes of Old Florence' (1894); 'The Castle of Vincigliata' (1897); The Cathedral Builders,' her most important work (1899); 'Filippo di Ser Brunellesco' (1901).

BAXTER, Richard, English divine: b. near Shrewsbury 1615; d. 8 Dec. 1691. After receiving a somewhat desultory and defective education he was sent to London under the patronage of Sir Henry Herbert, master of the revels; but he soon returned to the country to study divinity, and in 1638 received ordination in the Church of England. In 1640 he refused to take the oath of universal approbation of the doctrine and discipline of the Church of England, usually known as the et cetera oath, and in the following year he became minister at Kidderminster, with the results to the morality of the town. When the civil war broke out he sided with the Parliament, and after the battle of Naseby accepted the appointment of chaplain to Colonel Whalley's regiment. He is said to have been, the whole of this time, a friend to keeping to his own notions. In 1647 he retired, in consequence of ill health, from his military chaplainship, and when he recovered preached against the Covenant. He even endeavored to persuade the soldiery not to encounter the Scotch troops who came into the kingdom with
Charles II, and did not hesitate to express an open dislike to the usurpation of Cromwell. The fact is that Baxter held civil liberty to be of secondary consequence to what he esteemed true religion, and appears, from a sermon preached before Cromwell, to have deemed the toleration of separatists and sectaries the grand evil of his government. After the Restoration he was made one of the King's chaplains and a commissioner of the Savoy Conference to draw up the reformed liturgy. The active persecution of the Non-Conformists soon followed; and upon the passing of the act against conventicles he retired, and preached more or less openly as the act was more or less rigidly enforced. After the accession of James II, in 1685, he was arrested for some passages in his 'Commentary on the New Testament' supposed to be hostile to Episcopacy, and was tried for sedition. The violence of Jeffrey's, who would hear neither the accused nor his counsel, produced a verdict of guilty on the most frivolous grounds. He was sentenced to two years' imprisonment and a heavy penalty, which, after a short confinement, the King remitted. Henceforward Baxter lived in a retired manner till his death. His wife cheerfully shared all his sufferings on the score of conscience, both in and out of prison. The character of Baxter was formed by his age; his failing was subtle and controversial theology; his excellence, practical piety. In divinity he sought to establish a resting place between strict Calvinism and high-church Arminianism, but the admission of election and the rejection of absolute predestination, quieted some especially and for all generally; that is to say, all possess the means of salvation. A body called Baxterians long acknowledged these distinctions; and the Non-Conformist clergy, after the Revolution, were divided between this body, the pure Calvinists, and the high-church, passive-obedient Arminians. Baxter was a voluminous writer; his 'Saints Everlasting Rest,' and the 'Call to the Unconverted,' have been extraordinarily popular. In 1830 an edition of his 'Practical Works' appeared in 23 octavo volumes. The chief authority for the facts of his life is the 'Reliquiae Baxterianae' of Sylvester, consisting of autobiographical memoirs. Consult Orme, W., 'Life and Writings of Richard Baxter' (London 1830); Tullock, J., 'English Puritanism and its Leaders' (London 3d ed. 1883).

BAXTER, Robert Dudley, English political economist: b. Doncaster, Yorkshire, 1827; d. May 1875. He was educated at Trinity College, Cambridge, and in 1866 became a member of the Statistical Society of London. He wrote and published 'Railway Extension and its Results' (1866); 'National Income of the United Kingdom' (1868); 'Taxation of the United Kingdom' (1869); 'English Parties and Conservatism' (1870); 'National Debts of the World' (1871), etc.

BAXTER, Sylvester, American journalist: b. York County, Mass., 6 Feb. 1831. After several years on the Boston Daily Advertiser, beginning in 1871, was long on the staff of the Boston Herald; was editor of the Mexican Financier, of Outing and of The Automobile, the second motor-vehicle journal started in America; correspondent of Boston Daily Advertiser and Boston Herald in Germany, of Boston Herald and New York Sun in Mexico, of the Outlook in South America. In Boston he was active in organizing the metropolitan park system and was secretary of the preliminary Metropolitan Park Commission. His interest in civic improvements led him to organize the Metropolitan Improvement League, of which he was chairman and secretary; this led to the appointment of the Metropolitan Improvements Commission by State authority and he was its secretary while for two years it studied important problems for Greater Boston. He first suggested the organization of Boston and its suburban communities into a federated metropolis as a Greater Boston, which was realized to the extent of constituting metropoli
tan districts for parks, sewerage and water-supply. In 1888-89, as secretary of the Hemenway Southwestern Archeological Expedition, he was associated with Frank Hamilton Cushing in his important explorations in Arizona, representing the expedition at the Americanist Congress in Berlin in 1888. In 1889 he organized and directed an archeological expedition to the Peruvian coast, and many of the important excavations in the Andes. His writings, beside numerous uncollected contributions to the leading magazines, including essays, sketches, short stories and poems, are 'The Cruise of a Land-Yacht' (a story of travel in Mexico, for boys) ; 'Berlin, a Study; Central Germany in Mexico,' 'The Old New World,' an account of the work of the Hemenway expedition's work in Arizona; 'Greater Boston,' 'Old Marblehead;' and 'The Quest of the Holy Grail.' Also, in association with Charles Eliot, the greater part of the report of the Metropolitan Park Commission for Bos
ton, made in 1893—regarded as an exceptionally important contribution to the literature of public parks.

BAXTERIANS. See BAXTER, RICHARD.

BAY, in architecture, a term used to signify the magnitude of a building. Thus, if a barn consists of a floor and two heads, where they lay corn, they call it a barn of two bays. These bays are from 14 to 20 feet long, and 10 to 12 feet wide, and 10 to 12 bays, which is the breadth of the barn. It is also used to denote the divisions of a church or cathedral from roof to roof, as indicated by the pillars or arches; as, a church of eight bays.

In botany, the name of several trees and shrubs, as sweet bay (Laurus nobilis) the laurel (q.v.) of the poets, used for crowning heroes in ancient times and for church decoration at the present. It has stiff, dull-green leaves sometimes used to flavor culinary dishes. Its sweet, fragrant, aromatic, cherry-like, purple fruits are edible. This tree is widely cultivated for ornament in Europe and America, and is probably the most popular tub-plant used in open-air restaurants, esplanades, etc., on account of its ability to withstand neglect, abuse and shaving. Several hundred thousand specimens are used annually on the two continents. The bay laurel is better known as the bay laurel (Prunus laurocerasus). Its leaves yield a bittersweet extract, the bitter principle of which is a bitter principle of which is bittersweet and is used in cooking.
as a poison. The lobelloy bay (Gordonia lisi- anthus), white bay (Magnolia glauca), and red bay (Persea carolinensis), are well-known natives of the southeastern United States. The name red bay is given to diverse hardwoods of the dogwood family, to oleander and sometimes to Eupatorium angustifolium. The California bay-tree is Umbellularia californica. The bay-tree from which bay rum (q.v.) is distilled is Myrica acrida, Scarlet Laurel; Magnolia. In geology *arm* is a term for the sea, extending into the land. It is generally applied to smaller bodies of water than gulfs, of the same general geographical character, though the terms *gulf* and *bay* are used sometimes interchangably and much to the confusion of geographical science. The word is of Saxon origin and signifies an angle. It should properly be applied only to arms of the sea which are widest at their departure from the main line of sea coast, or mouth, while *gulf* should be applied to such bodies of water as the Gulf of California, whose width is nearly the same throughout a great part of their extent.

**BAY-BIRDS,** or **BEACH-BIRDS,** a sportman's name, in particular use along the south shore of Long Island, N. Y., for snipe, curlew, sandpipers, and other limicoline birds that frequent the shores and bays of estuaries. Compare **SHORE-BIRDS.**

**BAY CITY,** Mich., city, county-seat of Bay County, is located on the south bank of the Saginaw River, four miles from its mouth on Saginaw Bay, from which it takes its name, and is at deep water navigation. It is 108 miles northwest of Detroit and is connected with the Michigan Central, Pere Marquette, Grand Trunk and the Detroit and Mackinac railway systems. It is the principal market town of a large area of the Saginaw Valley and "Thumb" region of the lower peninsula, the most fertile section of the State. The river is navigable for the largest lake vessels up to this point. West Bay City, directly across the river, was added to Bay City 1 April 1905 by a special act of the legislature.

**Manufactures.—** Bay City is an important manufacturing centre, its principal industries being coal, salt, lumber, sugar, alcohol, beer, machinery and chemicals. It has the only alcohol plant in the State which produces proof alcohol from the refuse molasses, a by-product of the manufacture of beet sugar. Its chemical works is one of the largest in the world, producing alkalis, soda ash, salt, etc. There are three large beet sugar refineries, two of them being in West Bay City. Over a dozen coal mines are in operation in the county. It is the port of entry of 150,000,000 feet of lumber, imported annually from Canada, upper Michigan and the Lake Superior district, which is worked up in over a score of local planing mills, box factories and other wood-working plants. It has one machine shop which is one of the biggest in the country and its woodworking factory is the biggest in the world. The United States Census of 1920 recorded 142 industrial establishments of factory grade within the city limits, employing 4,658 persons, of whom 3,771 are wage earners, receiving annually $2,129,000 in wages. The capital invested aggregated $10,615,000, and the value of the year's output was $11,119,000; of this, $4,716,000 was the value added by manufacture.

**Trade and Commerce.—** The commerce of Bay City has changed in character during recent years. Up to 25 years ago the sawing of pine lumber was the chief industry along the Saginaw River, but because of the exhaustion of the pine forests, this industry has declined. Instead of exporting lumber, as it formerly did, its shipments amounting to 850,000,000 feet in some years, Bay City now brings in heavy shipments of mixed timbers, which is later exported in the form of manufactured articles. Fish, coal, alcohol, salt and sugar also form important items in the total shipments. The annual commerce of the city amounts to about $50,000,000.

**Railroads and Water Communication.** Bay City is the division headquarters of the Michigan Central Railroad, the Mackinac, Bay City and Detroit, and Bay City and Jackson divisions centering here. It is also the northern terminal of the C. H. D. and Pere Marquette system, the northern terminal of the Grand Trunk and the southern terminal of the Detroit and Mackinac Railroad. It has 95 miles of street railways and is connected with Saginaw, 14 miles to the south, by electric railway. Two routes, one to Lapper, Pontiac and Detroit; and the other to Caro, Cass City, Bad Axe and Harbor Beach; also a third rail system, going from Bay City directly to Detroit without change.

**City and County Government.** — Being the county seat, Bay City contains the county courthouse and all the county offices, besides a city hall costing $200,000. The charter election is held annually on the first Monday in April. The mayor holds office for two years, the comptroller for four years and the treasurer and recorder for two years. The total expenses of the city during the year ending 1 June 1916 were $560,437. The valuation as assessed for taxation purposes was $26,355,768 in 1916. The public debt of the municipality is $1,281,500, of which $342,500 represents water bonds. The rate of taxation in 1916 was $11.60 on every $1,000 of assessed value.

**Banks and Loan Companies.** Bay City has five banking institutions with an aggregate capital of $950,000 and a surplus of $75,000. In 1915 the undivided profits were $182,313, and the deposits amounted to $10,290,929. There are two building loan associations; the Mutual Building and Loan Association of Bay County (capital $2,000,000) and the Savings, Building and Loan Association of Bay County, capital $1,000,000.

**Education, Religion, etc.** — There are two high schools in the city and nine other school buildings, employing a staff of 216 principals and 229 teachers. The school attendance for 1916 was 13,542. A county normal training school and kindergarten schools are maintained in connection with the public school system. In addition there are the Bay City Business College, the Holy Rosary Academy, the Mercy Hospital Training School for Nurses, the Oral School for the Deaf. There are three libraries, holding a total of nearly 80,000 volumes. Religion and charity in Bay City are represented by its 36 churches and missions: 12 private and parochial schools; three
charitable institutions and three hospitals. Bay City has two daily newspapers and several weekly publications.

The first white settler located here in 1831, being employed by the government to teach the Indians farming, in accordance with a treaty signed with the Chippewas in 1819, whereby they ceded this territory to the United States. There were two reservations, comprising about 3,000 acres within what is now the corporate limits of the municipality. A large part of this land fell into the hands of one Stephen V. R. Riley who lived with the Indians for many years and married one of their women. In 1830 his son, John Riley, sold a large tract of this land to a company of Detroit merchants, who began laying out a settlement. Six years later these pioneers acquired from the Saginaw Bay Company the territory which was then known as lower Saginaw, which considerably enlarged their property. After 1844 the settlement began to develop rapidly with the growing demand for white pine lumber, which could be had along the river from the establishment in unlimited quantities, then the richest pine forests known in the United States. In 1859 the settlement was incorporated, though it did not receive its city charter until 1865.

Population.—According to the Federal court figures of 1890 the population of Bay City was then 27,628. Five years later followed the consolidation with West Bay City, which then gave the municipality a population estimated at 40,000. In 1910 the census figures showed a population of 45,116.

BAY CITY, Tex., town and county-seat of Matagorda County, 25 miles from the Gulf coast, and 85 miles south west by south of Houston, on the Colorado River, and on the Gulf, Colorado and Santa Fe, the Saint Louis, Brownsville and Mexico, and the Galveston, Harrisburg and Antonio railroads. It is situated in a thriving agricultural region, in which the principal crops are cotton, corn, sugar cane, rice and fruit. It has cotton gins, ice-making and dairying establishments, and rice mills. Bay City was settled in 1895. Pop. 3,156.

BAY ISLANDS, Honduras, a group of islands in the Bay of Honduras, 150 miles southeast of Belize, known as Rulatan, Guanaja (or Bonacca), Utila, Babareta, Elena, Morat and the Puerco Islands. They were discovered by Columbus, 30 July 1502, and it was from Guanaja that he first sighted the mainland of America. Their ownership was long a matter of dispute between Spain and England, and later between England and the republic of Honduras. In 1852 the group was declared a colony of Great Britain by royal warrant, and this action involved the United States in the dispute, that government claiming that the seizure was a violation of the Clayton-Bulwer treaty (q.v.). Negotiations dragged along for several years, but finally—1859—recognized the claim of Honduras to the islands. A practical protectorate was, however, maintained by Great Britain over the group, and the inhabitants (who number about 5,000) avowed British allegiance. In 1900 Great Britain formally renounced all jurisdiction over the Bay Islands and the title to the Bay Islands is now clearly vested in Honduras.

BAY LAGOON, Philippines, a fresh-water lake in the northern part of Luzon. This lake is connected with Manila Bay by the Pasig River, and from its centre the chief volcanic island. It is about 20 miles in extent from north to south, and about 47 miles from east to west. In 1899 it was made a naval headquarters for the United States.

BAY PSALM BOOK, the title of the first book published in the American colonies. It was printed by Stephen Day at Cambridge in 1640, and was the product of the joint labors of Revs. Richard Mather, Thomas Wilde and John Elliot. It was revised in 1650 and was long in use in New England.

BAY SAINT LOUIS, Miss., city and county-seat of Hancock County, 55 miles northeast of New Orleans, on the Louisville and Nashville Railroad, and on the Jordan river. It is a favorite summer resort and a shell road along the beach is of great interest. It is the seat of Saint Stanislaus College and the Convent of Saint Joseph. The chief industries are those connected with oyster raising, fishing, fruit-growing and farming. Pop. 3,338.

BAY SALT, the coarse-grained salt found in salt-marshes and along ocean shores, where it is formed by the spontaneous evaporation of sea-water. The name is supposed to refer to the Bay of Biscay, on whose extensive deposits of "bay salt" occur.

BAY STATE, the popular name of Massachusetts, which prior to the adoption of the United States' Constitution had been known as the Massachusetts Bay Colony.

BAYA, or BAYA SPARROW, a sparrow-like weaver-bird (Ploenus philippinus), which the people of India and the Malay countries often keep about their houses, not only in cages, but as a free pet trained to do a variety of clever tricks, even to find small articles, to carry notes to certain places, and to steal ornaments from the hair of visitors. See WEAVER BIRD.

BAYAD, a cat fish, Bagus boyad, a large edible fish found in abundance in the river Nile; distinguished, however from the electric catfish of the same waters.

BAYADERES, bā-ya-dārz, in the East Indies, young girls, from 10 to 17 years of age, who are instructed in dancing, singing and acting little plays. They are trained under the care of women, who are experienced in all female arts, and particularly in that of pleasing. They procure from the lowest classes of the people the most beautiful girls, of seven or eight years of age, and instruct them in all the arts of their profession (especially dancing and singing), the object of which is to amuse the rich and minister to their passions. Their presence is considered necessary even at the smallest public entertainments, though they are known to be mere ninny. After the 17th year, when their charms have faded, they retire to a pagoda under the protection of the Brahmins, who scrape not to pocket the gains of their prostitution. This word is from the Portuguese word bailadera, from bailar, to dance.

BAYAMO, bā-yā’mō, Cuba, a town whose name is indissolubly connected with the Ten
Years' War and the revolution of 1895. Thus this Cuban national war received the name 'Bayamese Hymn.' The republican movement of 1868 originated here and in the neighboring town of Yara; and here General Garcia received the message that Lieutenant Rowan delivered to him before the War of 1898 between the United States and Spain. His son founded in the early years of the Spanish conquest. It is situated on the Rio Bayamo, an affluent of the Canto, Cuba's largest river, in the province of Oriente. It is an agricultural and commercial centre, though formerly its importance was much greater. Pop. about 4,000.

**BAYAMÓN, Porto Rico, town five miles southwest of San Juan, on the American railroad. It has sugar mills, tobacco factories, watch works, iron foundries, brick and ice works, and an oil refinery. Fruit-growing and sugar cultivation are extensively carried on in the neighborhood. The town has a public school, college and several churches. Nearby are the ruins of Puerto Viejo (Old Town) or Caparra the earliest Spanish settlement in Porto Rico, said to have been founded by Ponce de Leon in 1509. Pop. 5,272; municipal district 29,996.

**BAYARD, b'fard, George Dashielh, American soldier: b. Seneca Falls, N. Y., 18 Dec. 1835; d. 14 Dec. 1852. Passing his boyhood in Iowa, he entered West Point, 1852, and became a cavalry lieutenant; then captain in August 1861, colonel of volunteers in September, brigadier-general the following April; and after serving in the Shenandoah and northern Virginia campaigns, was mortally wounded at Fredricksburg.

**BAYARD, James Asheton (1st), American statesman: b. Philadelphia, 28 July 1767; d. 6 Aug. 1815. He was adopted by his uncle, Col. John (q.v.), graduated at Princeton, 1784; studied law, and settled in Wilmington, Del., permanently. In 1795 he was elected a Federalist representative in Congress and became the leader of the party in the House, noted as a constitutional lawyer; and when the peculiar system of presidential elections at that time had tied Jefferson and Burr for the presidency, though Jefferson was the only one really voted for, Bayard threw his vote for Jefferson and elected him as the less obnoxious of the two. John Adams appointed him Minister to France, but he declined. He served in the House till 1803; in 1804 he was elected to the Senate, and held the seat till 1813, voting against the War of 1812. He was made peace commissioner in 1813 by Madison, and, declining the ministry to Russia, was one of those who concluded the Treaty of Ghent, December 1814, but died shortly after his return.

**BAYARD, James Asheton (2d), American statesman, son of the foregoing: b. Wilmington, Del., 15 Nov. 1799; d. there, 13 June 1880. He became a lawyer of high rank in Wilmington, United States attorney for Delaware under Van Buren, and was elected United States senator, 1851, 1857 and 1863, as a Democrat; but in allegiance being required of public officers at that time, Mr. Bayard entered a protest against it as a violation of State rights, and resigned his seat at once on taking it. His successor, George R. Riddle, dying four years later after the war, he accepted an election to fill out his own unexpired term, to March 1869; during most of the time was chairman of the judiciary committee, and gained an honorable celebrity for his punctilious sense of public honor in the matter of the Credit Mobilier (q.v.). His son, Thomas F. (q.v.), was chosen to succeed him by the same legislature which had elected himself, the only instance of the kind in American history. He lived quietly at Wilmington during the remainder of his life.

**BAYARD, John, American patriot: b. Bohemia Manor, Md., 11 Aug. 1738; d. 7 Jan. 1807 (for his descent, see BAYARD FAMILY). He was a prominent Philadelphia merchant, member of the Sons of Liberty, and later of the Provincial Congress, 1774-75, and of the Council of Safety; colonel in the battles of Brandywine, Germantown and Princeton; member of the State board of war, and speaker of its house. He furnished arms to Congress and fitted out one of the earliest efficient privateers. In 1783 he was elected to Congress. Somewhat impatient of his sacrifices in the Revolution, he removed permanently to New Brunswick, N. J., where he was mayor, county judge and leading magistrate. He was a firm Federalist, of high character.

**BAYARD, Nicholas, American colonial official: b. Alphen, Holland, about 1644; d. New York, 1707. (See BAYARD FAMILY). He was a double nephew of Peter Stuyvesant, by blood and marriage; became his private secretary and surveyor of the province, secretary of it after the English conquest, and mayor in 1685. He was commander-in-chief of the militia of the province, and one of the three resident councilors; and had to flee to Albany for his life on Leisler's usurpation after Andros' overthrow, but was made councillor anew on Leisler's downfall. On Kidd's arrest for piracy in 1699, Bayard, like all Governor Bellomont's officials, was accused of complicity, and visited London to clear himself; but the old hates of the Leisler time pursued him, and on charge of attempting to introduce popery, piracy and slavery into New York he was condemned to death for high treason. King William's death intervening, however, he was released and restored to his possessions by an order in council.

**BAYARD, bā-yār', Pierre Terrail (Chev-allier de), French soldier: b. Château Bayard, near Grenoble, about 1475; d. 30 April 1524. He was descended from one of the most noble families in Dauphiny, and at the age of 12 became page to the Duke of Savoy, at that time an ally of France. Charles VIII, struck by his skill and grace in riding, asked that he be transferred to his service, and accordingly, as a preparation to being attached to the royal suite, young Bayard was placed in the household of Paul of Luxembourg, Comte de Ligny, where he was taught all the feats of arms and niceties of chivalry which were then held necessary to constitute a gentleman and a soldier. His first experience in war was in the wild and daring march of Charles VIII with a small unsupported army, through the whole length of Italy, to invade the kingdom of Naples, which was won and lost in a few days with equal
ease; and in that campaign, he greatly distinguished himself, taking with his own hand a stand of colors in the battle of Verona. After this, while serving in an invading army in Italy, after a battle fought near Milan, in the heat of pursuit he entered that city pel-mell with the fugitives, and was made prisoner, but, in consideration of his astonishing valor, was sent back without ransom by Ludovico Sforza, together with his horse and arms. In Apulia he defeated a Spanish corps commanded by Alfonso de Soto-Mayor, who broke his parole, and slandered Bayard, in return for which the latter challenged and slew him in single combat, and afterward, according to some authorities, covered the retreat of the whole French army and defended the bridge over the Liris, now the Garigliano, single-handed against half an army. For this feat he received an augmentation of his armorial bearings, a porcupine bristling with spears, with the motto Vires agimus unus habet.

A real type of the ideal knight-errant of romance, where he was to be found in danger incurred, Bayard was there. Desperately wounded in the assault of Brescia, he was carried to the house of a nobleman who had fled, abandoning his wife and daughters to the fate which befalls women in a sacked city, and from which the wounded enemy alone preserved them. Half-recovered from his wounds, he joined Gaston de Foix before Ravenna, where with his own hand he took two Spanish standards and converted a retreat of the enemy into a rout. In the subsequent wars with Ferdinand the Catholic of Spain he displayed the same chivalric valor and the same generalship among the Pyrenees which he had displayed in his boyhood among the passes of the Alps and Apennines. In the dark days which clouded the latter years of Louis XII, when Henry VIII brought his English archers to back the German Maximilian in Flanders, and Tournoue and Tournay went down, with meek resistance, before the allies, Bayard was the same in adverse as he had been in prosperous fortunes. He was forced to surrender at the disgraceful battle of the Spurs, but again his glory to be taken under circumstances of such honor caused King Henry to set him at liberty with his horse and arms, unarmored. It was, however, in his noon of manhood that his glory shone the brightest. When Francis I invaded Italy after his accession to the throne of France, it was Bayard who was the precursor of his march; who made Prosper Colonna, at the very moment of his belief that he had ambushed and surprised him, his prisoner: who, in a word, paved the King's way to the magnificent battle of Marignano. In that tremendous conflict, he performed prodigies, and contributed more than any or all beside to change what once seemed a lost fight into a victory. At its close his sword conferred the accolade on the shoulder of his King, Francis I, who deemed it honor enough to take knighthood at the hand of such a paladin as Bayard. The fortunes of war, proverbially fickle and changeable, were never more so than at this epoch; and when, a short time later, Charles V invaded Champagne, his wonderful defense of the open town of Mâcon, almost entire, which he poured on the heart of France, of which, by this exploit, he deserved, as he obtained, the name of savior. His next war was his last. Genoa, ever an unwilling conquest of the French arms, revolted; and, under the command of Bonnivet, Bayard was sent to reduce the city to obedience and chastise the rebels. In the first instance success attended their advance; but, after the surrender of Dodi, fortune again changed, and, foot by foot the city of Genoa was captured by the French. In the second instance the war was concluded with a treaty, and Bayard was sent to the court of Francis I, to receive from the King the sword which he had wielded against the Genoese. But Bayard was still not satisfied. He desired to receive the sword, as a relic, which he had used against the French; and, being granted this favor, he was ordered to make a tour of the French provinces, as a Master of the Sword. 

Bayard's life was written by Symphorien Champier in 1525, and two years later by his secretary, Jacques Joffrey, known as the "loyal servitor." Other accounts have been translated by E. Walford (London 1867).

**BAYARD, Thomas Francis**, American statesman, son of James A. (2d) b. Wilmington, Del. 29 Oct. 1828; d. 21 June 1904. He was intended for a business career, and was placed in a New York house, his elder brother being designed to carry on the family succession for public life; but, the latter dying in 1848, Thomas returned to Wilmington, studied law with his father, and was admitted to the bar in 1851. He was appointed United States district attorney, but resigned the next year; removed to Philadelphia 1855 and practised law two years, then returned permanently to Wilmington. He and his father were Peace Democrats, unalterably opposed to the war, publicly denounced it, and gave no help to its prosecution. Elected to the Senate to succeed his father, he took his seat 4 March 1869, and served by successive re-elections till 1885. He was one of the leading Democratic figures and member of the finance, judiciary and other important committees, and its president pro tempore in 1881; was on the Electoral Commission of 1876; continued to champion the party doctrines and was one of the most prominent candidates for the presidential seat in the conventions of 1880 and 1884. On 4 March 1885 he was appointed Secretary of State in the Cabinet of President Cleveland; and in this
position had his share of important and vexa-
tious questions, such as the Bering Sea seal-
fishery matter, and treaties with Great Britain
and Russia. He was United States Ambassador
to Great Britain 1893-97, in Cleveland's second
term, the first minister to hold the title of
ambassador.

**BAYARD FAMILY,** a remarkable succes-
sion of American public leaders, statesmen
and jurists, identified for two and a half centuries
with the Middle States from New York to
Maryland, and for a century and a quarter al-
most continuously in public service. They
descended from a family of French Huguenot
refugees, whose ancestor was a Paris theolog-
ical professor driven to Holland to escape perse-
cution about 1580. His son Samuel became a
wealthy Amsterdam merchant and married the
accomplished, energetic and capable sister
(Ann) of Peter Stuyvesant, the last governor
of the Dutch New Netherlands, who himself
married Bayard's equally accomplished sister
Judith, a great lady of her time. Samuel died
in Holland; and his widow with her three sons
accompanying her brother to Manhattan Island,
where she took up an estate of 200 acres, in-
cluding the site of the Astor Library. Of these
sons, Nicholas became secretary of New
Netherlands and later of English New York
maya, commander-in-chief of the colony's
militia, and practically the head of the colony
—a perilous honor which twice brought him
to the verge of destruction. His brother
Peter, however, though not personally con-
spicuous, became the ancestor of the distin-
guished Bajards of the 18th and 19th centuries.
Peter's son Samuel joined the Labadists (see
Labadie, Jean), a sect of communists other-
wise much like the Quakers, and removed to
Maryland. Of his grandsons, Col. John was a
leading Philadelphia merchant, patriot and
soldier, representative in Congress, a county
magistrate in Maryland till after the Revolu-
tion, later judge and Federalist pillar; his son
Samuel, lawyer, clerk of the Supreme Court,
United States claim agent and judge, was one
John's twin brother, Dr. James A., was father
of James A., the noted Federalist statesman
of Jefferson's and Madison's time, leader of
the Federalists in the House of Represen-
tatives, and the one whose vote gave the presi-
dency to Jefferson instead of Burr, senator
and peace commissioner. The two sons of the
latter James A., Richard H. and James A. (2d),
were both United States senators of distinction
from the State of Delaware, the one a Whig
and the other a Democrat — the only instance
of the kind in the United States history; the
former also chosen chief justice of Delaware.
The son of James A. (2), Thomas F., was also
senator to succeed his father; so that father,
two sons and grandson represented Delaware
in the Senate 47 years between 1805 and 1885.
Thomas F. was further a member of the
Electoral Commission of 1876, and Secretary
of State under Cleveland. This unique record
of distinguished public positions in one fam-
ily is most notable that it has been on the highest
plane of public character as well as capacity —
conspicuous for dignity, probity and scrupulous
sense of those official proprieties which shun
the appearance of evil and therefore bar out its
reality.

**BAYAZID, or BAYEZEED, Turkey in
Asia, a town in the pashalic of, and 140 miles
southeast from, Erzerum, southwest of Mount
Ararat, from the base of which it is separated
by a lava-covered plain 10 miles wide. It is
situated on the declivity of a rugged eminence,
the summit of which is fortified and surrounded
by a wall and ramparts. The town is in a
ruinous state; most of the houses are small and
ill built, and the streets are extremely filthy.
Besides the extensive palace of the Pasha, the
town contains two Christian churches, three
mosques and the famous monastery of Kara-
Keleseh, celebrated for its beautiful architec-
ture and antiquity. Pop. 5,000.

**BAYZIH, bā-yā-zēd', I and II.** See
BAZAZER.

**BAYBAY, bā'ībōy, Philippines, a town
of the province of Leyte, situated on the west
coast, 40 miles southwest of Tanaban. Pop.
17,367.

**BAYBERRY.** **See** CANDLE BERRY.

**BAYER, bi'er, Gottlieb Siegfried, German
philologist, grandson of Johann Bayer: b.
Königsberg 1694; d. Saint Petersburg, 21 Feb.
1738. He displayed from his earliest childhood
a singular passion for Chinese and other East-
ern languages. He studied the Coptic at Ber-
lin, under La Crosse, Arabic at Halle, under
Solomon Negri, and at the same time opened a
correspondence with the missionaries in India,
in order to obtain more information about the
Sanskrit and Hindustani. On the foundation
of the academy of sciences in Saint Petersburg
in 1726, he became professor of Greek and
Roman antiquities. Besides his extraordinary
knowledge of languages, Bayer was an eminent
historical and archaeological scholar. His mon-
ument is his work published in 1730, 'Museum
Sinicum, in quo Sinicae linguae et literaturae
ratio explicatur,' containing a Chinese gram-
mar, a grammar of the dialect of Shin-Shu,
and many interesting notices on Chinese litera-
ture.

**BAYER, Johann, German astronomer: b.
Augsburg 1572; d. 1660. He is celebrated for
a large work published in 1603, under the title
of 'Uranometria;' and republished in 1627
under the title of 'Colom Stellarum Chris-
tianum,' which contains a minute description
and a catalogue of the constellations. He
changed the name because he had withdrawn
the heathen names of the constellations, and
supplied their names by others taken from the
Bible, taking those of the northern constell-
ations from the New, and those of the southern
constellations from the Old Testament, and
giving the names of the 12 apostles to the signs
of the Zodiac. His letters were adopted by
Flamsteed and others, and are now universally
used, but the heathen names have kept their
ground. He contributed much to the simplifi-
cation of astronomical science, by avoiding
the old, unintelligible nomenclature and by deno-
ing the stars in every constellation by the letters
of the Greek alphabet in their order. Bayer was
also a good student of law and an able the-
ologist. He was settled as minister over dif-
ferent parishes, and so zealous in his advocacy
of Protestantism that he was called 'Os Pro-
testantium.* The Emperor Leopold ennobled him.

BAYER, Karl Robert Emerich von, Austro-German novelist, who wrote under the pseudonym of Robert Bvr: b. Bregenz, 15 April 1835; d. 1902. He was a very popular and exceedingly prolific story-teller, and his voluminous fiction largely dealing with military life, had a wide circulation. Among his best-known novels are 'The Struggle for Life'; 'Masks'; 'A Secret Dispatch'; 'The Road to Fortune'; 'Meadow Maidenhair'; 'The Ironworm.'

BAYEUX, baí, an ancient town of France, department Calvados, 18 miles north-west of Caen. It possesses many antique houses of singular appearance, and has a beautiful cathedral dating from the 12th to the 15th century, with a crypt under the choir of several centuries each. Its noble portal and the three towers render it especially noteworthy. The local industries include the manufacture of porcelain and lace, bonnet-making and cotton spinning. There is a public library and museum, in which one of the most interesting relics of the Middle Ages is preserved. See Bayeux Tapestry.

Bayeux Tapestry, a celebrated piece of mediæval embroidery of sewed work, originally found in the cathedral of Bayeux, in the library of which town it is still preserved. The fact that such a tapestry existed was brought to light by M. Lancelot, who communicated a description of an illuminated drawing of a portion of it to the Academy of Inscriptions and Belles-lettres in 1724. This led to the discovery of the tapestry itself in 1728, whereupon various speculations arose as to its date, its origin and its purport. According to tradition it is a contemporary representation of the invasion and conquest of England by the Normans, and the discussions upon it have been valuable as supplying details of the great event which it portrays which are not found in the chronicles of the period, and also gives an exact picture of Norman costumes and manners. It contains 1,512 figures with inscriptions in Latin giving the names and subjects. It was at one time supposed to have been worked by the needle of Matilda, Queen of William the Conqueror, assisted by her attendants, and to have been presented by Odo, bishop of Bayeux, the half-brother of William, to the church in which it was found. But later researches have led to the belief that the tapestry was made to the order of Bishop Odo; of the actual makers, certainly, nothing is known. Whether this be so or not, it is regarded as certain that the tapestry is not later than the 11th century. During the French Revolution the tapestry was in great danger of being destroyed. In 1803 it was removed to Paris by order of Napoleon, and when he was meditating the invasion of Britain he caused it to be carried from town to town and exhibited between 6 and 12 inches, to the greatest. It was brought back to Bayeux in 1804, when it was placed in the hôtel de ville, instead of the cathedral, its former resting-place. The length of the tapestry is 330 feet, and its height 20 inches. It is in an excellent state of preservation. There are good representations of it produced photographically. In his 'Norman Conquest' the late Professor Freeman calls it a contemporary work. Consult J. C. Bruce's 'Bayeux Tapestry' (1885) and Marigman's 'Tapisserie de Bayeux' (Paris 1902). See Tapestry.

Bayeux, bail, Pierre, French critic and philosopher, son of a Calvinist minister: b. Carlat, near F. R. (Languedoc), 16 Nov. 1674; d. Rotterdam, 28 Dec. 1706. At the age of 19 he entered the College of Puylaurens, to finish his studies. All books were eagerly devoured by him; his taste for logic led him particularly to study religious controversies, but Amyot's 'Plistarch' and 'Montaigne' were his favorite works. In Toulouse he studied philosophy with the Jesuits. The arguments of his professors, and still more his friendly discussions with a Catholic priest who dwelt near him, confirmed his doubts of the orthodoxy of Protestantism, so that he resolved to change his religion. His family, however, tried all means to regain him, and after 17 months he returned to his old faith. To escape from the punishment of perpetual excommunication which the Catholic Church then pronounced against apostates, he went to Geneva, and thence to Copet, where Count Dohna intrusted him with the education of his sons, where he studied the philosophy of Descartes. But after some years he returned to France and settled in Rouen, where he was employed in teaching. In 1675 he obtained the philosophical chair at Sedan, where he taught with distinction until the suppression of this academy in 1681. He was afterward invited to discharge the same duties at Rotterdam. The appearance of a comet in 1680 induced him to publish, in 1682, his 'Pensées Diverses sur la Comète,' in which he discussed various subjects of metaphysics, morals, theology, history and politics. It was followed by his 'Critique Générale de l'Histoire du Calvinisme de Maimbourg,' which work received with equal approbation by the Catholics and Protestants, and esteemed by Maimbourg himself, excited the jealousy of his colleague, the theologian Jerieu, whose 'Critique Générale de l'Histoire du Calvinisme de Maimbourg' did not succeed, and involved Bayeux in many disputes. He afterward undertook a periodical work, 'Nouvelles de la République des Lettres,' in 1684. The death of his father and of his two brothers, together with the religious persecutions in France, induced him to write his 'Commentaire Philosophique' on the words of the Gospel: 'Compel them to come in'; which is not equal in merit to his other works. Bayeux himself was unwilling to acknowledge it; but Jerieu, who probably recognized itself, by the zeal with which toleration is defended in this work, attacked it with violence, and his influence was sufficient to lead the magistrates of Rotterdam to remove Bayeux from the office in 1693. He now devoted all his attention to the composition of his 'Dictionnaire Historique et Critique,' which he published in 1695-97. This was the first work which appeared under his name. Jerieu opposed him anew, and caused the consistory, in which he had the greatest influence, to make a severe attack upon him. Bayeux promised to remove everything which the consistory deemed offensive; but finding the public had other views, and preferring the satisfaction of his readers to
that of his judges, he left the work, with the exception of a few trifles, unaltered. He found two new enemies in Jacquelot and Le Clerc, who both attacked his religion: others persecuted him as the enemy of his sect and his new country. The best editions of his 'Dictionnaire Historique' were published in four volumes in 1808, and in folio (Amsterdam and Leyden), and that in 16 volumes, published 1820-24, at Paris. Consult Carzez, A., 'P. Bayle, sa vie, ses idées' . . . (Paris 1905).

BAYLEN, bi-lén, or BAILLEN, Spain, a town in the province of Jaen, at the foot of the Sierra Morena, 22 miles north of Jaen. It commands the road leading from Castile into Andalusia, and derives its celebrity from the events which took place in its vicinity leading to the 'Capitation of Baylen,' signed 20 July 1808, when General Dupont, and about 20,000 French troops under his command, surrendered to the Spaniards on condition of their being conveyed to France by the Spanish government; but the latter stipulation was not carried into effect. The capture of Dupont was mainly instrumental in bringing about this result, which inspired the Spaniards with confidence and was always regarded by Napoleon as the principal source of the French disasters in the Peninsula. Galena and zinc blende are mined in the vicinity. Pop. (1910) 8,334.

BAYLEY, James Roosevelt, American theologian: b. New York, 23 Aug. 1814; d. Newark, N. J., 3 Oct. 1877. He studied at Trinity College, Hartford, and became a minister of the Protestant Episcopal Church; but, in 1842, converted to the Roman Catholic faith; and, after studying at Paris and Rome, was ordained a priest in 1844. He accepted the chair of belles-lettres at St. John's College, Fordham, and was its acting president in 1846. After serving as secretary of the Board of Education, Hughes, he was consecrated the 1st bishop of Newark, N. J., in 1853. In 1872 he became archbishop of Baltimore, Md. He was the founder of Seton Hall College and several other institutions. His 'Pastoral for the People' and 'History of the Catholic Church on the Island of New York,' are his chief writings.

BAYLEY, Richard, American physician: b. Fairfield, Conn., 1745; d. Staten Island, N. Y., 17 Aug. 1801. After studying medicine in England, chiefly in the London hospitals and under Dr. Hunter, he returned to America in 1776 as a surgeon in General Howe's army, but settled in New York the following year. He was the first professor of anatomy in Columbia College (1792) and for a time health officer of the port of New York, where his vigorous advocacy of proper quarantine laws was finally successful. A careful student of his profession, he suggested a new method of treatment for croup and maintained (1797) that in its origin yellow fever was due to local causes and was not contagious. He published 'Cases of the Angina Tracheatis, with the Mode of Cure' (1781); 'Essay on the Yellow Fever' (1797); 'On Yellow Fever' (1798).

BAYLEY, William Shirley, American geologist: b. Barrington, Mass., 18 Nov. 1801. He was graduated at Johns Hopkins in 1883 and received the Ph.D. from the same institution in 1886. He became United States geologist of the Federal Geological Survey and professor of geology at the University of Illinois. For some time he was associate editor of the American Naturalist, and after its establishment in 1905 was the managing editor of Economic Geology. He was also professor of geology at Colby College. He is the author (with C. R. Van Hise) of the 'Report on the Geology of the Marquette Iron District of Michigan,' of the 'Report on the Geology of the Menominee District,' in the same State, and joint author of reports on other iron-bearing districts of the Lake Superior region. He is author also of 'Iron Mines and Mining in New Jersey' and of several textbooks on crystallography and mineralogy and he has been a frequent contributor to scientific journals. He is a member of the Phi Beta Kappa, Sigma Xi, Beta Theta Pi and a fellow in several scientific societies.

BAYLIES, ba'lis, Francis, American statesman, member of Congress from Massachusetts for several sessions: b. 1784; d. Taunton, Mass., 28 Oct. 1852. In the presidential contest which finally resulted in the election of John Q. Adams, he threw the electoral vote for Jackson that was given from New England. He was for a short time Minister to Brazil. He published in 1828 a history of the old colony of Plymouth.

BAYLIS, Clara Kern, American author and journalist: b. near Kalamazoo, Mich., 5 March 1848. She published 'Bayou' (microscopy); 'Lolami, the Little Cliff-Dweller' (1901) (republished in London); 'Lolami in a Tusayan Pueblo'; 'The Evolution of the Boy' (1905); 'Two Little Algonkin Lads' (1905); 'Old Man Coyote'; 'The Song of the Sky-People'; 'Myths of the Zuani Indians'; 'Significance of the Piassu'; 'An Illinois Sun Myth'; 'Three Philippine Legends'; 'Indian Mounds of Pike County'; talks and articles on the sterilization of detectives and habitual criminals; and various other scientific archaeological and educational articles.

BAYLISS, Sir Wyke, English artist: b. Madeley, 21 Oct. 1835; d. London, 6 April 1906. He was educated at the Royal Academy and was president of the Royal Society of British Artists from 1898. His paintings include 'La Sainte Chapelle' (1865); 'St. Mark's, Venice' (1880); 'Saint Peter's, Rome' (1888); 'The Cathedral, Amiens' (1900); 'The Golden Duomo, Fiesa' (1892), etc. His publications include 'The Witness, of Art' (1891); 'The Enchanted Island' (1888); 'The Likeness of Christ Rex Regum' (1898); 'Five Great Painters of the Victorian Era' (1892).

BAYLOR, Frances Courtenay. See BARNUM, F. C. B.

BAYLOR, Robert Emmett Bledsoe, American lawyer: b. Lincoln County, Ky., 10 May 1893; d. Gay Hill, Tex., 6 Feb. 1931. The War of 1812 he served under Colonel Bowell and took part in the engagement near Fort Meigs. Admitted to the bar in Kentucky, he later removed to Alabama (1820), acquired a large practice and became prominent in politics, being a representative of Alabama in Congress 1829-1831. Later he emigrated to Texas, then a republic, and was a district judge for 25 years. A loyal member of the Baptist denomination, he
gave largely in money and land to establishing one of its colleges at Independence (1845) and in recognition of his munificence it was named Baylor University (q.v.).

BAYLOR UNIVERSITY, a coeducational institution in Waco, Tex., controlled by the Baptist Church. It was founded in 1845 on a charter granted by the republic of Texas and named for Robert E. Baylor (q.v.). Its first location was in Independence, Tex.; it was provided with a university course in 1851; in 1861 President Burleson (who had been its head for 10 years) and the entire faculty resigned and organized a university in Waco, Tex., giving it the name of that city. The two institutions were consolidated in 1868, the earlier one being removed to Waco and President Burleson continuing at the head of the institution. At the close of 1915 the university reported: Professors and instructors, 84; students, 1,209; volumes in the library, 28,570; grounds and buildings valued at $800,000; productive funds, $265,124; income, $125,461. The university maintains an undergraduate college and a preparatory school, known as Baylor Academy, a department of fine arts and a department of medicine and pharmacy at Dallas, Tex.

BAYLY, Ada Ellen, a popular English novelist, best known as Edna Lyall; b. Brightstone, 25 March 1859; d. Eastbourne, 8 Feb. 1903. She has written 'Wond by Waiting' (1879); 'Donovan' (1882); 'Wewou' (1884); 'In the Golden Days' (1885); 'Knight Errant' (1887); 'Autobiography of a Slanderer' (1887); 'Derrick Vaughan, Novelist' (1889); 'A Hardy Norseman' (1889); 'Doreen' (1894); 'How the Children Raised the Wind' (1895); 'Autobiography of a Truth' (1896); 'Wayfarers Men' (1897); 'Hope the Hermit' (1898); 'In Suits of Covered Head' (1901); 'The Hind's Verse' (1902), etc. Although her novels are decidedly romantic, their aim is to depict the development of character.

BAYLY, Lewis, Welsh prelate: d. 26 Oct. 1631. He was the author of 'The Practice of Piety,' a very popular religious book which had great influence in England. It was not only passed through many English editions, but was also translated into the Indian language by John Eliot, and was used by him in his work among the Indians.

BAYLY, Thomas Haynes, English song-writer and author: b. Bath, England, 13 Oct. 1797; d. London, 22 April 1839. He began the study of law under his father, and later went to Saint Mary Hall, Oxford, in order to prepare for the Church; but abandoned both and devoted himself to literature. He gained great popularity with some songs, and several dramatic and novels by him also hit the public taste. With Henry Bishop he published 'Melodies of Various Nations.' Among his songs some of the best-known are 'Isle of Beauty;' 'The Soldier's Tear;' 'We Met — 'twas in a Crowd;' and 'She Wore a Wreath of Roses. His best plays are 'Perfection,' among his novels are 'The Aylmers,' and 'A Legend of Killarney.' 'Loves of the Butterflies;' and 'Songs of the Old Château;' are volumes of songs and ballads; and his other works include 'Kindness in Women,' a collection of tales; 'Parliamentary Letters and other Poems,' and 'Rough Sketches of Bath.'

BAYLY, Thomas Henry, American statesman: b. Accomac County, Va., 1810; d. 22 June 1856. He was admitted to the bar in 1830, and was for several years a member of the general assembly of his state. In 1842 he was elected judge of the Circuit Sutters, an office which he resigned in 1844, when elected a representative in the national Congress; and by successive re-elections he held the latter position till his death. As chairman of the committee on ways and means, he was the leader of the House during many sessions, and was highly respected by men of all parties, as well for his urbanity and dignity, as for his ability. The family home in which he died was established by his ancestors from England in 1666, and it is remarkable that he held just the same public offices that had been filled by his father.

BAYNE, Peter, Scottish writer: b. Fodderit, Scotland, 19 Oct. 1830; d. London, 10 Feb. 1896. He studied theology at Edinburgh and philosophy under Sir William Hamilton, and was editor successively of the Glasgow 'Commonwealth;' Edinburgh 'Witness;' London 'Dial;' and 'Weekly Review;' and associate editor of the 'Christian World.' He was author of 'The Christian Life: Social and Individual' (1855); 'Essays on Geographical, Critical, and Ethical Subjects' (1859); 'Life and Letters of Hugh Miller' (1871); 'Testimony of Christ to Christianity' (1872); 'The Days of Jezebel,' a drama (1872); 'The Chief Actors in the Puritan Revolution' (1878); 'Life of Martin Luther' (1887).

BAYNES, Thomas Spencer, English philosopher: b. Wellington, Somersetshire, March 1823; d. 29 May 1887. He was educated at Bath, Bristol College, and the University of Edinburgh, where he became (1851–55) assistant to Sir William Hamilton, then professor of logic. In 1857 he was appointed examiner in logic and mental philosophy in the University of London; became (1857–64) assistant editor of the 'Daily News,' to which he contributed many noteworthy articles on the American Civil War, and for several literary journals, such as the 'Athenæum' and the 'Literary Gazette.' In 1864 he was elected professor of logic, rhetoric and metaphysics in the University of Saint Andrews. Besides his contributions to review he published a translation of the 'Port Royal Logic,' with notes (1851); and an 'Essay on the New Analytic of Logical Forms' (1852). He was appointed editor of the ninth edition of the 'Encyclopædia Britannica' (being subsequently assisted by Prof. Robertson Smith).

BAYOMBONG, bi-yōm-bōng', Philippines, the capital of the province of Nueva Vizcaya, Luzon, situated on the Magat River. It is the centre of a fertile rice and tobacco region. Pop. 3,691.

BAYONET. A short sword or sharp-pointed weapon (usually triangular in cross-section) fitted on to the muzzle of a musket or similar weapon, so as to serve as an increased means of offense and defense. The name is said to be derived from the town of Bayonne in France, where, it is stated, it was first invented in 1640. The first regiment which
appears to have had bayonets attached to their muskets was the Grenadier Guards, as far back as the year 1693. It is stated by Macaulay that in consequence of the awkward mode of attaching the bayonet the English lost the battle of Killiecrankie, as the Highlanders were upon the troops before they could convert their firelock into pikes. The former men used were called bayonets à manche, and had handles which fitted into the muzzles of the guns, but at a later date were introduced the bayonets à douille or socket-bayonets having sockets which enabled the bayonets so to be used as not to interrupt the firing. The use of pikes went out when that of bayonets came in. It seems very probable that the first bayonet was a dagger, which the musketeer stuck by means of its handle into the muzzle of his weapon to shield him from a cavalry charge, and that the usefulness of the contrivance suggested a permanent arrangement.

Bayonets are now made with great rapidity and the process of manufacture is very simple. Two pieces of metal are first selected, viz., a piece of steel ¾ inch square, and a piece of the best wrought-iron rod, 4 inches long by about 1 inch in thickness. The steel is to form the blade, and the iron the socket-handle. The steel, being properly shaped at one end, is joined to the iron by welding. A forming machine is employed to give a rough outline of the required shape. Then comes the action of a swaging-machine, with dies which come down upon the metal in great force and counter-dies beneath the metal. The metal is then annealed; turned in a cutting-machine to remove a wire-edge thrown up in the act of stamping; cut to a proper length, and the socket-end made square; drilled and bored, to make the socket hollow; shaped and furrowed along the blade; bent at the neck; hardened and tempered; and finished by a numerous train of minor operations. The bayonet-charge is now one of the most terrible maneuvers of trained infantry, in which each nation fancies itself to excel all others. In close-quarter engagements there is no weapon more formidable; from its length and weight the thrust of the bayonet gives a terrible wound, and its force is such that there is great difficulty in parrying the attack. Like other small-arms, it is most serviceable when handled on scientific principles; and the art of using it to advantage is so simple as to be very easily acquired. While the exercise, from the weight of the rifle, admirably aids in developing the muscles of all parts of the body.

A sword-bayonet is quite widely used, especially for the short rifles of the light infantry, the carbines of the artillery, etc. It is a compound of the sword and the bayonet, as its name indicates, having a sword-like blade with only one edge, and being capable of being fastened to the muzzle of the gun like the bayonets. As to the present utility of bayonets, there are many authorities considering them of little importance. While the result of a battle is often determined by the employment of smokeless powder and long-range and rapid-firing rifles in surprises and night attacks, the bayonet may be used to advantage, as was frequently proved in the Boer War.

While the infantry soldier relies mainly on fire action to disable the enemy, he must be instructed in the use of the rifle and bayonet in hand-to-hand encounters, the object of all such instruction being to teach the soldier how to make effective use of the rifle and bayonet in personal combat; to make him quick and proficient in hand-to-hand combat; to give him an accurate eye and a steady hand, and to give him confidence in the bayonet in offense and defense.

**BAYONNE, bá-yón, France, a cathedral town and a fortress of the first class in the department of the Basses-Pyrénées. It is situated at the confluence of the Nive and the Adour, about four miles from the Bay of Biscay. These rivers form a harbor capable of admitting vessels of considerable size. The harbor is safe and commodious, and has three lighthouses at its entrance. They divide the town into three parts, namely, Great Bayonne on the left bank of the Nive, Little Bayonne between the rivers and Saint Esprit on the right bank of the Adour. A citadel, built by Vauban, on the summit of an eminence commanding the suburb, commands the harbor and the city. The cathedral is a beautiful building dating from 1213, restored in the 19th century and furnished with two towers. The arsenal, one of the finest in France, and the mint are among the other buildings of Bayonne. The city has a considerable trade with Spain, Portugal and South America, and masts and timber for shipbuilding, from the Pyrenees, are exported to Brest and other ports of France. Ships are built, and woolens, chocolate, soap, brandy, leather, linen goods, glass, etc., are manufactured. Other exports include wine, tars and resins, minerals, grain, chocolate and the famous Bayonne hams. Among the lower class the ancient Biscayan or Basque language is spoken. Catherine de Medici had an important interview with the Duke of Alva in Bayonne, June 1565, at which it is said the massacre of Saint Bartholomew was arranged. The meeting of Napoleon with the King of Spain, Charles IV, and the Prince of Asturias in May 1808, when the latter transferred their rights to the Spanish territories in Europe and India to the French Emperor. Pop. 27,880.

**BAYONNE, bá-yón, N. J., city in Hudson County on New York harbor, the Kill von Kull, and Newark Bay, the Morris Canal and the Central Railroad of New Jersey, seven miles southwest of New York. It was formed by the union of a number of former villages and early Dutch settlements (Pamrapo, Bayonne, Centerville and Bergen Point), and is principally engaged in coal shipping and the refining and exporting of petroleum, the works for the latter being connected by pipe lines with New York, Philadelphia, Baltimore and other cities. Other industries are the manufacture of motor boats, wire, silk, chemicals, ammonia and colors ready mixed paints, electrical and gas engines, structural iron, galvanized wire, boiler factories and large smelting and refining works. The United States census of manufactures for 1914 recorded 121 industrial establishments of factory grade, employing 11,899 persons, of whom 10,149 were wage earners, receiving $5,771,000 annually in wages. The capital invested aggregated $92,-
653,000, and the value of the year's output was $89,208,000; of this, $20,513,000 was the value added by manufacture. The city has adopted the commission form of government. The residential part is very attractive, containing mansions of many New York business men, and the first city Boulevard terms inates at Bayonne. The city has an important public library, recreation grounds and bathing establishments. Pop. 65,000.

**BAYONNE, Treaty of,** a treaty of peace agreed to 4 May 1808, and signed on the next day, between Napoleon and Charles IV, King of Spain. The latter resigned his kingdom, and Napoleon engaged to maintain its integrity, and to preserve the Roman Catholic religion. His son, Ferdinand VII, confirmed the cession 10 May.

**BAYONNE CONFERENCE,** a conference held at Bayonne, June 1565, between Charles IX of France, the Queen mother, Catherine de Medic, Elizabeth, Queen of Spain, and the Duke of Alva, envoy of Philip II, to arrange plans for the repression of the Huguenots.

**BAYONNE DECREES**. On 17 April 1808, Napoleon directed the capture and sale of all vessels entering the ports of Spain, France, Italy and the Hanse towns, under the American flag, and by the provisions of this declaration, known as the Bayonne Decree, France is supposed to have confiscated more than 300 American vessels. The decree was issued ostensibly with the view of helping the United States to enforce the embargo of 1807 and on the presumption that all such vessels must be sailing under false colors and thus indirectly benefiting the English cause. See Continental System.

**BAYOU, bāˈyo,** probably a corruption of the French word *boyaux,* a "gut" or "channel." Its strict significance is a stream which is not fed by springs, but flows from some other stream or from a lake; but it is not infrequently used in America as synonymous with "creek." The term is very little employed except in the States of Louisiana, Texas and Arkansas.

**BAYOU STATE,** the name often given to the State of Mississippi.

**BAIREUTH, biˈroth,* or **BAIREUTH, Bahˈvar*-ia, on the Red Main, 41 miles northeast of Nuremberg, capital city of the government district of Upper Franconia. The principal edifices are the old palace now occupied by public offices, the new palace, with garden and park open to the public; the opera house, a gymnasium, and the national theatre, constructed after the design of the composer Wagner. Among the interesting private houses are the Villa Wahnfried, the former residence of Richard Wagner, who is buried in its grounds, and the house of Jean Paul Richter. In the Central Cemetery are the graves of Jean Paul Richter and the composer Franz Liszt. Baireuth has numerous educational and charitable institutions. There are manufactures of cotton and woolen goods, sewing machines, leather, earthenware and agricultural and musical instruments. There are also breweries, distilleries and sugar mills. This town is popularly known as the mecca of the Wagnerites. In 1872, partly from funds collected from patrons and partly by the organization of the so-called Wagner societies, there was begun the erection of a theatre for the production of Wagner's works. It was opened in 1876 with a grand performance of his "Ring of the Nibelungen," and since then music lovers have been attracted to Baireuth from all parts of the world. The theatre occupies a site on a hill overlooking the Inn and is reached by a broad avenue of shade trees. In connection with the theatre is a school for the training of voices to participate in the Wagner festivals. Baireuth fell to the Burgrave of Nuremberg in 1248, and after many vicissitudes was ceded to Bavaria in 1810. Pop. (1910) 34,547.

**BAYHOFFER, bāˈhōf-ər,** Karl Theodor, German Hegelian philosopher and radical politician: b. Marburg 1812; d. Jordan, Wis., 3 Feb. 1888. He was professor of philosophy at Marburg, taking the chair in 1845, but in 1846 his radical views caused his expulsion. During the brief rule of liberalism in Hesse he was chosen president of the chamber; but, in 1853, was forced to flee to the United States. Among other works he wrote "On the Hegelianism in Germany"; "Idea and History of Philosophy"; "Fundamental Problems of Metaphysics," etc.

**BAZA, bāˈtha,** Spain (ancient Bastr), a city in the province of and 53 miles east-northeast from Granada, in a valley north of the Sierra Baza. The environs yield wine and hemp, grain, fruit, oil; sheep, cattle and mules are reared; and there are some manufactures, chiefly of leather pottery, sombreros, and flour and oil mills. Baza is famed in Spanish history, more especially in that of Granada. In 1499 it was taken from the Moors by the Spaniards, after a siege of nearly seven months. In 1810 the French, under Marshal Soult, here defeated the Spaniards under Generals Blake and Freire. Pop. 15,964.

**BAZAIN, bāˈzān,** Achille François, French military officer: b. Versailles, 13 Feb. 1811; d. 23 Sept. 1888. He entered the army in 1831, served in Algeria, in Spain against the Carlists and in the Crimean War. He joined the Mexican expedition under General Iturbide, was present at the siege of Puebla, and shortly afterward was the first to enter the City of Mexico. In 1863 he obtained the chief command, was made a Marshal of France in 1864, and remained in Mexico with the Emperor Maximilian. When Napoleon III abandoned the Emperor, Bazaine tried vainly to persuade him to abdicate the throne voluntarily. In 1870, at the outbreak of the Franco-Prussian War, he commanded the 3d army corps, and capitulated at Metz after seven weeks' siege, with an army of 170,000 men. For this act he was tried by court-martial in 1871, found guilty of treason and condemned to death. This sentence was commuted to 20 years' seclusion in the Isle of Saint Marguerite off the coast of France, from which he escaped and returned to Spain, where an attempt was made to assassinate him. His widow, who had clung faithfully to him in his adversity and had plotted successfully for his escape, died in the City of Metz, 8 Jan. 1900. She was a woman of aristrocratic birth and beauty. See La Bruyère, "L'affaire Bazaine" (1874); L'Hérisson, "La légende de Metz" (1888).

BAZAN, ba-zān, Don César de. See Don César de BAZAN.

BAZAN, ba-thān, Emilia Pardo. See Pardo BAZAN, Emilia.

BAZANCOURT, ba-zān-koor, César (Baron DE), French military historian: b. Paris 1810; d. there, 25 Jan. 1865. He was official historiographer to Napoleon III, whom he accompanied in several campaigns. He published 'L'expédition de Crimée jusqu'à la prise de Sebastopol' (1856); 'La campagne d'Italie de 1859'; 'Les expéditions de Chine et Cochinchine' (1861-62); 'Histoire de Sicile sous la domination des Normands' (1846); and the novel 'Georges Montagnard' (1851): 'Noblesse oblige' (1851); 'La Princesse Pallavicini' (1852).

BAZANCOURT, Jean Baptiste Marie Antoine Lecat de, French general: b. Val-de-Molle (Oise), 19 March 1797; d. 17 Jan. 1830. He took an active part in the Italian campaigns; distinguished himself and was wounded at the siege of Saint Jean d'Acce; fought in the battle of Austerlitz, and was a member of the court-martial which, on 21 March 1804, pronounced the sentence of death upon the Duc d'Enghien. In 1806 he was appointed commander of the Legion of Honor, and in 1808 promoted to the rank of brigadier-general, while in the same year he was created baron of the empire, and went as commander to Hamburg with a mission connected with the continental blockade. He withdrew from service in 1815.

BAZAR, or BAZAAR, a market-place in the East, the word being Arabic in origin. Some bazaars are open, some covered over. As the Orientals live almost entirely out of doors, these bazaars, book-stalls and other cantile of importance, are consequence places of social intercourse. In the Oriental tales,— for instance, in the 'Arabian Nights,—the bazaars occupy a very conspicuous place. The word bazar has also been imparted into Europe, where it is used in much the same sense as in the East. Among English-speaking people it is frequently applied to a temporary sale of fancy goods contributed gratuitously and sold to raise a special fund.

BAZAR, ba-zar, Amand, French socialist: b. Paris 1791; d. 29 July 1832. After the Restoration he helped to found the Revolutionary Society of the 'Amis de la Vérité,' and in 1820 an association of French Carbonari. In 1825, impressed with the necessity of a total revolution, he attached himself to the school of Saint-Simon, and became one of the editors of a journal termed Le Producent. In 1828 he delivered at Paris a series of lectures, the substance of which was published as the book 'Les Légendes de la Doctrine de Saint-Simon' (1828-30), of which the first part was by Bazard, the second being chiefly the composition of Enfantin. He and Enfantin became the acknowledged leaders of the school. After the July Revolution (1830), a law was passed the Saint-Simons. The masses were attracted by the doctrine that all social institutions ought to have for their end the moral, intellectual and physical amelioration of the poor. In a short time, Bazard and his friends had created a new society, living in the midst of the old, with peculiar laws, manners and doctrines. But Bazard's connection with it was of short duration. He suffered from Enfantin on the doctrine of the emancipation of women, and in 1831 his efforts to found a school of his own proved unsuccessful, and, during a heated discussion with his former friend, Enfantin, he was struck with apoplexy, from the effects of which he died.

BAZAS, town in the department of Girondes, France, on the Beuve, about 33 miles southeast of Bordeaux, with which it is connected by rail. It overlooks the river from a rocky eminence and was once a well fortified town, the remains of its walls, built in the 13th century, being still visible. In the time of the Romans it was known as Castrum Vasatum. Among its attractions a cathedral of Gothic architecture and an old monastery now used as a college. Until 1792 it was the seat of a bishopric. Leather and woven goods and hats are manufactured here. Pop. (1911) 4,704.

BAZIGARS, bā-zē-gārz', a tribe of nomadic Indians dispersed throughout the whole of Hindustan. They are divided into seven castes; their chief occupation is that of jugglers, acrobats and tumblers, in which both males and females are equally skillful. They present many features analogous to the gypsies of Europe.

BAZIN, René François, French novelist: b. Angers, 26 Dec. 1853. Graduating from a law college in Paris, he became, in 1878, professor of law at the university in his native city. In 1903 he was elected a member of the French Academy. Reading the works of Capt. Mayne Reid influenced him to become a writer. He ranks as one of the foremost of present-day French novelists, but he has also written many plays. Among his most successful novels is 'The Italians of To-day' (1904), which has been widely read among Americans. His novels are 'Stephanette' (1884); 'Les Noëllet' (1890); 'Madame Corentin' (1893); 'Humble amour' (1894); 'De toute son âme' (1897); 'La terre qui meurt' (1899); 'Les Oberlé' (1901); 'Dotation' (1903); 'L'âme alsacienne' (1903); 'L'isolée' (1905); 'Le blé qui lève' (1907); 'Le mariage de Mademoiselle Gimel' (1908); 'En anglais translation 1913). Among his works of non-fiction are 'A l'avenir' (1891); 'Sicile' (1892); 'Terre d'Espagne' (1896); 'Croquis de France et d'Orient' (1901); 'Nord-Sud Amérique, Angleterre, Corse, Spitzberg' (1913).

BAZOQUE, ba-zō'kē, or BASOQUE (corruption of Basilica), a brotherhood formed by the clerks of the Parliament of Paris at the time it ceased to be the Grand Council of the French king. The government of the order was vested in a chief known as Le roi de la Bazoque, who had his retinue after the manner of real kings and maintained a mock court. The organization was divided into chapters, at
the head of each being a captain, who, together with the members of his division, wore a special uniform to distinguish them from the members of the other chapters. Such chapters were also found in other parts of France where local parliaments were maintained. The order was in existence as early as 1303, for in that year King Philip conferred on it the privilege of holding an annual festival at which were presented dramatic performances in which current events were freely satirized. In 1500 the order was granted the permission to hold these performances in the salon of the Royal Palace. The most popular of these farces was a mock trial called "Pathelin," which was first presented in 1480. These crude performances had a powerful influence in the latter development of the French stage, the comedies of Molière being founded on them. On the outbreak of the first agitations that finally had their climax in the great French Revolution, the guild took an active part in politics. It was finally disbanded by the general decree of 13 Feb. 1791. One of its靠ites, "Etudes historiques sur les Bazoches" (2d ed., Paris 1875).

BAZTAN, baz-Äë-n, or BASTAN, a Pyrenean valley in the extreme north of Spain, having a length of nine miles and an average breadth of four miles. It is inhabited by about 8,000 people, who form, under Spanish supervision, a distinct republic, at the head of which is the mayor of Elizondo. The citizens of this republic rank with the Spanish nobility and hold special privileges, which were granted them for former services to the Spanish Crown.

BAZZINI, bat-së-në, Antonio, Italian musician and composer: b. Brescia 1818; d. 1897. Already at the age of 15 he was an accomplished soloist on the violin, and two years later, at the age of 17, he was director of the choir in one of the largest churches of his native city. Beginning in 1843, he studied for four years at Leipzig, though he had already, two years previously, made a concert tour, taking in Germany, France and England. During this period he made the personal acquaintance of Paganini and was deeply influenced by him. Later he devoted himself more to composition, becoming, first, professor of composition at the Conservatory of Milan, then director. Among his chief compositions are an opera, "Turandot" (produced in 1867), a symphonic poem, "Francesca da Rimini" (1890), and five string quartets.

BDELLIUM, dél-lë-üm, an aromatic gum found in different countries, but brought chiefly from Arabia and India. It resembles musk in its appearance, and is hence often fraudulently substituted for it. It is obtained from Commiphora moluk and C. agallocha. It has a sweet smell but bitter taste, softens readily between the fingers before the fire and dissolves partially in alcohol and more in water. A better variety of bdellium is that produced by the west African C. africana; it is used in plasters. The bdellium mentioned in Scripture, in Hebrew bedholachh, is rendered in the Septuagint of Gen. ii, 12, anthrax (literally, "burning coal"). Bitter anthracm (L. acdell and Scott), the red sapphire (Dana); while in Num. xi, 7, it is translated krystallos — rock crystal. Some modern writers, following the Septuagint translation, make it a mineral, as are the two small stones mentioned.

BEACH, Alfred Ely: b. Springfield, Mass., 1 Sept. 1826; d. 1 Jan. 1896. He was a son of Moses Yale Beach, and after receiving an education in the Monson Academy, Monson, Mass., he was associated with his father in the publishing business of the New York Sun. In 1846 he formed a partnership with his life-long friend and schoolmate, Mr. Orson D. Munn, of Monson, Mass., and purchased the Scientific American from Rufus Porter, combining with the business of publishing that of soliciting patents. In 1847 he invented a typewriter which printed raised letters on a strip of paper, intended for the blind, and was awarded a gold medal at the Crystal Palace Exhibition. This machine is noteworthy as the first to cover a principle developed into the modern typewriter, viz., a basket of levers arranged in a circle, and delivering their impression on a common stereotype. In 1867 he constructed a tube eight feet in diameter by 100 feet long, through which passengers were carried back and forth in a tightly fitting car, as the air was exhausted from or forced into the tube by a rotating fan. He also devised means for transporting letters through a tube under the street, by which they could be conveyed directly to the post-office when dropped into a street letter-box.

His most important invention,—a shield for tunneling under streets or rivers without disturbing the surface,—was made in 1868, and became known as the Beach shield. It resembled a gigantic hoghead with the heads removed, the front circular edge being sharp, and the rear end having a thin iron hood. This cylinder is propelled slowly forward through the earth by several hydraulic rams forced out from the rear of the shield, by the operation of a single hydraulic pump, against the completed tunnel in the rear. By this method only the amount of earth to be excavated is excavated. After the shield is forced forward the hydraulic rams are pushed back, and in the thin hood at the rear a new section of the tunnel is constructed. In 1869, by means of such a shield, Mr. Beach constructed a tunnel nine feet in diameter under Broadway, New York, from the corner of Warren street south to a point opposite the lower side of Murray street, and in 1870 a car was sent to and fro on tracks through this tunnel by pneumatic power — the pipes much as its appearance, and is hence often fraudulently substituted for it. It is obtained from Commiphora moluk and C. agallocha. It has a sweet smell but bitter taste, softens readily between the fingers before the fire and dissolves partially in alcohol and more in water. A better variety of bdellium is that produced by the west African C. africana; it is used in plasters. The bdellium mentioned in Scripture, in Hebrew bedholachh, is rendered in the Septuagint of Gen. ii, 12, anthrax (literally, "burning coal"). Bitter anthracm (L. acdell and Scott), the red sapphire (Dana); while in Num. xi, 7, it is translated krystallos — rock crystal. Some modern writers, following the Septuagint translation, make it a mineral, as are the two small stones mentioned.

BEACH, Alfred Ely: b. Springfield, Mass., 1 Sept. 1826; d. 1 Jan. 1896. He was a son of Moses Yale Beach, and after receiving an education in the Monson Academy, Monson, Mass., he was associated with his father in the publishing business of the New York Sun. In 1846 he formed a partnership with his life-long friend and schoolmate, Mr. Orson D. Munn, of Monson, Mass., and purchased the Scientific American from Rufus Porter, combining with the business of publishing that of soliciting patents. In 1847 he invented a typewriter which printed raised letters on a strip of paper, intended for the blind, and was awarded a gold medal at the Crystal Palace Exhibition. This machine is noteworthy as the first to cover a principle developed into the modern typewriter, viz., a basket of levers arranged in a circle, and delivering their impression on a common stereotype. In 1867 he constructed a tube eight feet in diameter by 100 feet long, through which passengers were carried back and forth in a tightly fitting car, as the air was exhausted from or forced into the tube by a rotating fan. He also devised means for transporting letters through a tube under the street, by which they could be conveyed directly to the post-office when dropped into a street letter-box.

His most important invention,—a shield for tunneling under streets or rivers without disturbing the surface,—was made in 1868, and became known as the Beach shield. It resembled a gigantic hoghead with the heads removed, the front circular edge being sharp, and the rear end having a thin iron hood. This cylinder is propelled slowly forward through the earth by several hydraulic rams forced out from the rear of the shield, by the operation of a single hydraulic pump, against the completed tunnel in the rear. By this method only the amount of earth to be excavated is excavated. After the shield is forced forward the hydraulic rams are pushed back, and in the thin hood at the rear a new section of the tunnel is constructed. In 1869, by means of such a shield, Mr. Beach constructed a tunnel nine feet in diameter under Broadway, New York, from the corner of Warren street south to a point opposite the lower side of Murray street, and in 1870 a car was sent to and fro on tracks through this tunnel by pneumatic power — the pipes much as its appearance, and is hence often fraudulently substituted for it. It is obtained from Commiphora moluk and C. agallocha. It has a sweet smell but bitter taste, softens readily between the fingers before the fire and dissolves partially in alcohol and more in water. A better variety of bdellium is that produced by the west African C. africana; it is used in plasters. The bdellium mentioned in Scripture, in Hebrew bedholachh, is rendered in the Septuagint of Gen. ii, 12, anthrax (literally, "burning coal"). Bitter anthracm (L. acdell and Scott), the red sapphire (Dana); while in Num. xi, 7, it is translated krystallos — rock crystal. Some modern writers, following the Septuagint translation, make it a mineral, as are the two small stones mentioned.

BEACH, Charles Fisk, American clergyman: b. Hunter, N. Y., 5 Sept. 1827; d. 25 May 1908. He and gal theological Seminary, N. Y., was pastor of Presbyterian churches 1854-73, editor and publisher National Presbyterian 1873-95. He studied
law and was admitted to the bar 1896. He published 'The Muzzled Ox' (1866); 'The Christian Worker' (1870) on the duties of a Christian in childhood, and made her first appearance in public as a pianist at the Boston Music Hall when 16 years old. She has composed a mass in E flat; 'The Rose of Avontown,' a cantata for female voices; a Gaelic symphony, songs and compositions for various musical instruments and full orchestras.

BEACH, Charles Fisk, Jr., American legal writer: b. Kentucky, 4 Feb. 1854. He was called to the bar in New York 1881, and practised in that city till 1896, but since the last named date has practised in London and Paris. His special field is railway and corporation law, and he has published treatises on 'Railways' (1887); 'Wills' (1888); 'Railways' (1890); 'Private Corporations' (1891); 'Modern Equity Jurisprudence' (1892); 'Public Corporations' (1893); 'Modern Equity Practice' (1894); 'Injunctions' (1895); 'Insurance' (1895); 'Contracts' (1897); 'Contributory Negligence' (3d ed., 1899).

BEACH, David Nelson, American clergyman: b. Orange, N. J., 30 Nov. 1846; graduated from Yale Divinity School 1876. Entering the Congregational ministry he was successively pastor of Congregational churches in Westerly, R. I., 1876-79; Wakefield, Mass., 1879-84; Cambridge, Mass., 1884-90; Minneapolis (1886-98); Denver from 1899. He was active in banishing the saloon from Cambridge and was prominent in advocating a modified Norwegian liquor system in Massachusetts. He has written 'Plain Words on Our Lord's Work' (1890); 'The New Religious Thinking' (1893); 'The Intent of Jesus' (1896); 'Statement of Belief' (1897); all advocating church unity and rational theology.

BEACH, Frederick Converse, American editor: b. New York, 27 March 1848. In 1865 he removed to Stratford, Conn., where he received an education at public and private schools. In 1864, as a pastime, he began the practice of photography with his father, Alfred Ely Beach (q.v.), and has continued his interest in the art ever since. In 1866 he suggested to the commissioner of patents the utility and practicability of photo-lithographing the United States patents, a plan which was subsequently adopted. In 1856 he was graduated from Yale with the degree of Ph.B. In 1869, after engaging in the business of patent solicitor at Washington, D. C., he returned to New York and was appointed assistant superintendent of the construction of the Beach pneumatic tunnel under Broadway, New York (see BEACH, ALFRED ELY). Subsequently he took up the manufacture of electrical instruments. In 1877 he entered the office of the Scientific American, assisting his father, and after the latter's death became one of the editors. He has made extensive experiments in photography and written much relating to the art. In 1884 he founded the Society of Amateur Photographers of New York, the name of which was afterward changed to the Camera Club of New York. In 1885 he assisted in organizing the American Lantern Slide Interchange. In 1889 he was instrumental in establishing a monthly magazine entitled The American Amateur Photographer (now American Book of Photography). He was appointed editor-in-chief of the 'Encyclopedia Americana,' the first edition of which was published in 1903.

BEACH, Mrs. H. H. A. (Amy Marcy Cheney), American composer: b. Hemink, N. H., 5 Sept. 1857; was educated in music from childhood, and made her first appearance in public as a pianist at the Boston Music Hall when 16 years old. She has composed a mass in E flat; 'The Rose of Avontown,' a cantata for female voices; a Gaelic symphony, songs and compositions for various musical instruments and full orchestras.

BEACH, Harlan Page, American missionary: b. South Orange, N. J., 4 April 1854. He was graduated at Yale in 1878 and at Andover Theological Seminary in 1883. During 1878-80 he taught at Phillips Andover Academy; in 1883 he went to China as a missionary, remaining there six years. Soon after his return he became head of the School for Christian Workers, Springfield, Mass., and in 1895 educational secretary of the Student Volunteer Movement for Foreign Missions. Since 1906 he has been professor of theory and practice of missions at Yale University. He has contributed extensively to various journals and was an advisory editor of The Missionary Review of the World and furnishes the annotations for American missionary literature to the International Review of Missions, Edinburgh. His publications include 'Dawn of T'ang' (1898); 'Knights of the Labarum; or Four Typical Missionaries' (1896); 'New Testament Studies in Missions' (1899); 'Geography and Atlas of Protestant Missions' (1902); 'Princely Men in the Heavenly Kingdom' (1903); 'India and Christian Opportunity' (1904).

BEACH, Miles, American jurist: b. 1840; d. 1902. He was graduated at Union College, Schenectady, studied law and practised in Troy. When 27 years of age he removed to New York and in 1879 was elected judge of the Court of Common Pleas, holding that office till 1894, when he passed to the bench of the Supreme Court of the State.

BEACH, Moses Sperry, American inventor and editor: b. Springfield, Mass., 5 Oct. 1822; d. 25 July 1892. He was the son of Moses Yale Beach (q.v.). He married Chloe Buckingham, of Waterbury, Conn., and in the same year became joint proprietor, with George Roberts, of the Boston Daily Times. Soon after this he became associated with his father and brother in the publication of the New York Sun, and acquired the sole ownership of it in 1851, transferring it in 1868 to Charles A. Dana. It was while he was conducting the publication of the Sun that he invented and made several important improvements in printing-presses, which were patented, a few now being in use. Among them were the feeding of roll paper to the press instead of flat sheets, apparatus for wetting the paper prior to printing and another improvement for cutting off sheets after printing. He also invented a method of adapting newspaper presses to print both sides of the sheet at the same time, as is now customary. In 1867 he visited the Holy Land, on the steamer Quaker City, in company with the distinguished party of which Mark Twain was a member, and whose experiences formed the basis of Twain's book, 'The Innocents Abroad.' Mr. Beach brought back an olive-
tree from the Mount of Olives, from which was made a pulpit stand that is at present in Plymouth Church, Brooklyn.

BEACH, Moses Yale, American inventor and publisher: b. Wallingford, Conn., 15 Jan. 1800; d. 17 July 1868. He received a common-school education and before he was 21 married, and with a partner opened a cabinet factory at Northampton, Mass. In 1822 he established himself at Springfield, Mass., where he was very successful. He expended considerable money on a stern-wheel steamboat, the first to ply on the Connecticut River above Hartford. A passenger-engaged for its propulsion for its propulsion proved ineffective. In 1829 he obtained an interest in a paper-mill and removed to Saugerties, N. Y., where his inventive faculty produced a rag-cutting machine, which he patented and which is still used in all paper-mills. In 1835 he purchased from his brother-in-law, Benjamin Day, the New York Sun, the first penny paper (then a comparatively new sheet), and to Mr. Beach was due the subsequent growth and popularity of that newspaper. In 1846 President Polk sent Mr. Beach on a secret mission to Mexico. In 1847 Mr. Beach retired from active business and settled in his native town, where he died.

BEACH, Rex (Ellington), American author: b. Aitwood, Mich., 1 Sept. 1877. After graduating from Rollins College, Winter Park, Fla., he studied law at the Chicago College of Law. His success as a storyteller, however, diverted him from the legal profession. Among his best known works are 'Pardners' (1905); 'The Spoilers' (1906); 'The Barrier' (1907); 'The Hired Hand' (1909); 'Going Somon' (1910); 'The Ne'er-do-well' (1911); 'The Net' (1912); 'The Iron Trail' (1913); 'The Auction Block' (1914); 'The Heart of the Sunset' (1915); 'Rainbow's End' (1916); 'Laughing Bill Hyde' (1917).

BEACH. See COAST; DUNE; OCEAN; LAKE; SHORE; SHORE LINES.

BEACH-FLEA, one of a group of small amphibid crustaceans (Orchestia agilis) which abound under sea wreck near high-water mark. When the dry weed is lifted they will be seen leaping like fleas, by means of the last three pairs of abdominal legs. They are brown, of the same color as the weed and wet sand beneath, about a quarter of an inch in length or about one-half as large as the larger and more southern kind of beach-flea (Talorchestia longicornis), which is nearly an inch long. Consult Arnold, 'Sea Beach at Low Tide.'

BEACH-GRASS. See AMMOPHILA.

BEACH-PEA, a leguminous plant growing on beaches. See also LATHYRUS.

BEACH PLANTS. Plants living normally on shores, particularly of the sea, or on the contiguous dunes and marshy strips, are usually characterized by fleshyness, leatheriness, downiness or dense hairiness. This is true of the maritime members of families otherwise quite different in appearance, and these peculiarities, resembling those of plants living in other saline and arid localities, are devices resulting from adaptation to similar desert conditions, for the beach sands become very hot and naturally receive practically no water from either sea or land, and are unable to conserve the rainwater. Thus the strand might be a strip of desert. The succulence and uncouthness of such common plants as the seaside goldenrod (Solidago), the saltmarsh and smooth aster (Aster), of certain huge tropical moisture-loving (Ipomoea), of the marsh-rosemary (Satureia), of the yellow sand-verbena (Abronia) and others, are evidence of efforts on their part to store such water as may fall upon them, in the cells of their swollen tissues, and also to prevent its evaporation through the stomata. Some plants, as the Polygonella and the marsh-sampire (Salicornia), have further reduced their transpiring surface by assuming a cylindrical shape with scale-like leaves. Terete also are the bases of the leaves of the saltwort (Salicornia) which are armed, against the attacks of animals wishing to forage on their juicy foliage, by stout prickles. Many of these fleshy plants also contain salts in their tissues that are strongly retentive of water; the saltwort having formerly been burned to obtain soda from its ashes. Others, like some tamarisks, exude salts that form a crust over the stomata pits in the daytime but by attracting dew and the moisture in the air and becoming liquefied furnish a certain amount of water at night. The bayberry (Arctostaphylos), the bayberry (Myrica) and the beach plum (Prunus) exhibit the leathery and pubescent type of foliage calculated to resist drought by restraining transpiration by means of the thickened skin and hair. The pale pubescent under-surface of the latter's leaves occurs on plants living near water, and is designed to keep arising moisture from settling in and flooding the stomata. Velvety pubescence on all surfaces attaining to the same end is present in the marshmallow (Althaea) and the clotbur (Xanthium). Many of the salt-marsh plants are decidedly hairy, serving the purpose of controlling evaporation and preserving the leaf from too much moisture. Some of these beach-plants are useful aids in preventing the shifting of sands and dunes, the most important being the coarse grasses, marram (Ammophila) and sea-lyme (Elymus), whose tough long roots anchor the sand, forming a mat that holds it in place. The beach thus reclaimed is gradually settled upon by sundry other sand-binding plants, as the bayberry, bearberry, abrasons, beach plums, etc.; and certain trees as the tamarisk, some species of pines and cedars are also found there or may be planted. Consult Maritain, A. Kerner von, 'Natural History of Plants'; Scrubber, F. L., 'Sand-binding Grasses' (reprint from Yearbook of Agriculture, 1896); and 'Economic Grasses' (United States Division of Agron., Bulletin 14); 'Stock Range of Northwestern California' (Bulletin 12, Bureau of Plant Industry, United States Department of Agriculture).

BEACH-PLUM. See PLUM.

BEACH-ROBIN. See BUCK-THORN.

BEACHES. Raised, terraced, level stretches of land, composed of sand and gravel, and lying at a considerable distance above and away from the sea, but bearing sufficient evidences of having been at one time sea beaches. They are quite common along the coasts of continents in

the higher latitudes. In California such terraces occur as high as 1,500 feet above the present sea-level, while the coasts of Scotland are marked by terraces from 50 to 100 feet high at distances of from 10 to 25 feet. That the materials composing the beaches were deposited beneath the sea is proven by the marine character of the fossils which are often found in abundance. The existence of raised beaches is of importance to the geologist, as it affords direct evidence of changes of level between the sea and the land in comparatively recent times, and explains the widespread occurrence of sedimentary rocks over continental areas. Many large lakes are also fringed by terraces, but in this case they have resulted from a lowering of the water level and not from coastal movements.

BEACHY HEAD, England, a promontory on the coast of Sussex, about three miles southwest of Eastbourne; height 532 feet. Here a combined Dutch and English fleet of 57 vessels under Lord Torrington was defeated by a French fleet under Vaubruville, 1690. In 1838 a revolving light was erected here, 285 feet above the level of the sea, visible in clear weather from a distance of 28 miles. This was superseded in 1902 by a new lighthouse built in the sea, about 600 feet from the cliff, and 123 feet high.

BEACON, N. Y., city of Dutchess County, on the Hudson River, and the New York Central and Hudson River Railroad, 80 miles north of New York City. The city was formed by the merging of the villages of Matteawan and Fishkill Landing. It was incorporated in 1853, and in 1913 holds the first charter under the commission form of government granted in New York State. Lying at the foot of Mount Beacon, on the upper margin of the Highlands of the Hudson, and extending westward to the shores of the river itself at the lower end of Newburgh Bay, its scenery is unrivaled. An inclined railway runs up the western slope to the summit of Mount Beacon, from which a far-famed view of mountain, plain and river is enjoyed, and which affords fine fishing. The city of Newburgh across the bay is connected with Beacon by ferry. Beacon has 11 churches, a hospital, a library, two national banks and two savings banks, and the Sargent Industrial Free School for Girls. The city conducts three grade schools and a high school, paid fire department, municipal waterworks and a sewage disposal works. The industries of the city are varied and important, embracing some of the larger factories along the Hudson. They include chiefly wool and straw hats, rubber goods and embroidery, with smaller plants devoted to making tools and other iron products, silkthrowing, paper boxes and brick. The United States census of manufactures for 1914 showed 41 establishments of factory grade, employing 2,033 persons, 1,806 being wage earners receiving annually $958,000 in wages. The capital invested aggregated $3,849,000, and the year's output was valued at $3,520,000; of this, $1,776,000 was manufactured by manufacturers. There are three newspapers, two daily and one weekly. Pop. (1910) 10,629.

BEACON, a conspicuous mark or signal either used to alarm the country in case of invasion, or as a guide to mariners. The alarm breasten was usually erected on high hills, the flares of which could be seen at a great distance by night, and the smoke by day. They were in great use for rousing the border on an invasion either by Scotch or English. A beacon to mariners is either a land mark erected on an eminence near the shore, or a floating signal moored in shoal water.

BEACON HILL, one of the original three hills of the peninsula of Boston. It is north of Boston Common, and received its name from the fact that the public beacon was fixed upon its summit in the earliest colonial period. It has been much reduced in height, and the State House now occupies its highest position. Beacon street extends in a westerly direction over the hill, skirting the Common and Public Garden. See Boston.

BEACONSFIELD, bék'ôn-sfeld or bé-kôn-sfeld, Benjamin Disraeli (Earl Of), English statesman: b. 21 Dec. 1804; d. 19 April 1881. He was the eldest son of Isaac D'Israeli (see D'ISRAELI, ISAAC), the well-known author of the 'Curiosities of Literature', his mother also being of Jewish race. Little is recorded of his early education, though it is certain he never attended a public school or a university. After the death of his father in 1816, Isaac D'Israeli abandoned the principles of Judaism; and young Benjamin was in 1817 baptized into the Church of England. He was apprenticed to a firm of attorneys, but did not remain long in this uncongenial occupation. His father's position gained him an easy entrance into society, and before he was 20 he was a frequenter of such salons as those of Lady Blessington, and he became a well known man about town.

In 1826 he published 'Vivian Grey,' his first novel, a work which became very popular, and, considering the youth of its author, displays remarkable cleverness and knowledge of the world. He now traveled for some time, visiting Italy, Greece, Turkey and Syria and gaining experiences which were afterward reproduced in his books. In 1831 another novel, 'The Young Duke,' was published. It was followed by 'Contarini Fleming' (1832); 'Alroy' (1833); 'The Revolutionary Epic' (a poem, 1834); 'Henrietta Fleming' (1837); and 'Venetia' (1837). Other writings of this period are 'A Vindication of the English Constitution' (1834); and 'Alarcon, a Tragedy' (1839).

His father having acquired a residence near High Wycombe, Buckinghamshire, young Disraeli attempted to get elected for this borough in 1832. He came forward as a Radical or 'people's' candidate as against the Whigs, and he was supported by the Tories, as well as by Hume and O'Connell, but was defeated. At the general election after the passing of the Reform Bill he again unsuccessfully contested High Wycombe, and the like ill-fortune attended him on another attempt in 1835, as also at Taunton the same year. On the latter occasion he appeared in the character of a decided Tory, and his change of political opinions naturally occasioned a good deal of comment. To this period belongs the noted passage of arms between him and O'Connell, which was signalized
by a strength of language happily rare between public men in these days.

But last, however, he gained an entrance to the House of Commons, being elected for Maidstone in 1837. His first speech was treated with ridicule; he had to stop abruptly and sit down, but he finished with the prophetic declaration that the time would come when the House would hear him. In 1839 he married the widow of his colleague in the representation of Maidstone, a lady 15 years older than himself. The union was a very happy one. At the general election of 1841 he was sent to Parliament by Shrewsbury. He had now gained some reputation, and for some years he was an enthusiastic supporter of Sir Robert Peel. About this time he became leader of what was known as the Young England party, the most prominent characteristic of which was a sort of sentimental advocacy of feudalism. This spirit showed itself in his two novels of Coningsby; or, The New Generation, and Sybil; or, The New Nation, published respectively in 1844 and 1845.

Before the years previous to the downfall of Sir Robert Peel in 1846 he was most persistent and bitter in his hostility to this statesman, whom he had so recently supported, being the advocate of protection against the free-trade policy of Sir Robert. His clever but truculent speeches of this period greatly increased his reputation, and by 1847 he was recognized as one of the leaders of the Tory party. He purchased the manor of Hughenden in Buckinghamshire, was in the above year elected for this county, and retained his seat till raised to the peerage nearly 30 years later. In 1847 he published his novel of Tancred; or, The New Crusade, a somewhat extravagant production containing enigmatic allusions to the great Asian mystery. In 1852 he published Lord George Bentinck, a Political Biography of the Protectionist leader in the Commons.

His first appointment to office was in February 1852, when he became Chancellor of the Exchequer under Lord Derby. In December, however, the ministry was overthrown, and Mr. Disraeli again became leader of a Conservative Opposition. A keen disappointment was experienced on the breakdown of the Aberdeen ministry in 1855, when Lord Derby, who was distrustful of Disraeli, refused to form a ministry. He remained out of office till 1858, when he again became Chancellor of the Exchequer with Lord Derby as his chief. As on the former occasion his tenure of office was but short; a reform bill which he had introduced causing the dismemberment of the government and their resignation after an appeal to the country. During the next six years, while the Palmerston government was in office, Mr. Disraeli led the opposition in the House with conspicuous ability and courage. He strongly counselled a policy of belligerent neutrality during the American Civil War. He spoke vigorously against the Reform Bill brought forward in 1866 by the Russell-Gladstone government; but when, soon after, he came into power along with his chief, Lord Derby, the demand for reform was so urgent that he decided to "the Whigs" and to bring in a reform bill himself. Accordingly, in August 1867, a measure by which the parliamentary representation was reformed became law, being piloted through Parliament by Mr. Disraeli with remarkable tact and dexterity. The Confederation of Canada was also carried through.

In February 1868 he reached the summit of his ambition, becoming Premier on the resignation of Lord Derby, but being in a minority after the general election he had to give up office the following December. In 1874 he again became Prime Minister with a strong Conservative majority, and he remained in power for six years. This period was marked by his elevation to the peerage in 1876 as Earl of Beaconsfield, and by the prominent part he took in regard to the Eastern Question and the conclusion of the Treaty of Berlin in 1878, when he visited the German capital. In the spring of 1880 Parliament was suddenly dissolved, and the new Parliament showing an overwhelming Liberal majority, he resigned office, though he still retained the leadership of his party. Not long after this the publication of a novel called Endymion (1880; his previous one, Lothair, had been published before) showed that his intellect was still vigorous. His physical powers, however, were now giving way, and he died after an illness of some weeks' duration, and was buried at Hughenden. His wife, the Viscountess Beaconsfield in 1868, died in 1872.

The career of Lord Beaconsfield forms one of the most striking romances of the 19th century. Born of an alien and despised race, and at the outset of his career regarded as a mere man of fashion and a fop, by his own talents he raised himself to the head of the aristocratic party in English politics, the leadership in which had always been a preserve for members of the patrician caste. Disraeli was preeminently the architect of his own fortunes, and for the eminence to which he finally attained he had to fight every inch of the ground, and especially against the distrust of his own party which he "educated" in the principles of Tory democracy, much against its own inclinations. He was endowed with great intellectual power, a patient endurance, and a remarkable ability. He was one of the three statesmen in the House of Commons of his own generation, says John Morley, who had the gift of large and spacious conception of the place and power of England in the world, and of the policy by which she could maintain it. The faculty of slow, reflective brooding was his, and he often saw deep and far. Comparison is sometimes made between his legislative output and that of his great rival, Gladstone, which is much larger, but it must be borne in mind that from 1852 to 1895 there was the American Civil War on the stage, whereas it was only in the six years between 1874 and 1880, when Disraeli was a septuagenarian, that he held office with a solid majority at his back. His novels are open to criticism on many grounds, especially on account of the stilted rhetoric which characterizes them; but he had imagination and fancy, wit and epigrammatic power, and is unexcelled as
a portrayer of certain aristocratic types. Their success of persuasion owed something to the art with which he introduced real personages into them under a more or less penetrable disguise.

Bibliography.—The definitive and final Life of Lord Beaverfield is that now issuing under his own direction and other authentic documents. Between 1908–16 four volumes had been issued. The work was placed under the editorship of W. F. Monypenny, whose death occurred after two volumes had been published, when the task was taken up by G. E. Buckle. Disraeli's 'Home Letters and Correspondence with His Sister,' with additional letters and notes by his brother Ralph, were reissued in 1887. 'His Speeches,' edited by T. E. Kebbel, were published in 1881. Biographies have been written, among others, by G. Brandes (translated by Sturge, London 1880); J. A. Froude (London 1890); Theodore Martin (London 1881); W. F. O'connor (London 1903); and an unfriendly one by T. P. O'Connor (London 1904). Consult also Sir William Fraser's 'Disraeli and His Day' (1891). An appreciation of his powers as a novelist appears in the second series of 'Hours in a Library,' in which the Author, Leslie Stephen, laments 'the degradation of a promising novelist into a prime minister.'

D. S. DOUGLAS.

BEACONSFIELD, Africa, town of Cape Colony, in Griqualand West, formerly known as Du Toit's Fan. It lies a little to the east of Kimberley, with which it is connected by tramway. Its growth of the diamond fields. It is well supplied with churches, schools and hotels. Pop. 14,254.

BEACONSFIELD, England, market-town in Buckinghamshire, 24 miles west by north of London. It is situated on high ground, and its name is supposed to have originated from a beacon once set up there. The remains of Edmund Burke, who resided at Gregories in this parish, are deposited in the parish church; and the churchyard contains a monument in honour of the great statesman to whom the site belonged, as it still does to his descendants. It gave its name to the title of Benjamin Disraeli, Earl of Beaconsfield. Pop. 2,751.

BEADLE. (1) An officer in an English university, whose chief duty is to walk with a mace in a public procession. The University of Oxford has four and Cambridge two beadle (or bedels), those in the former being attached to each of the faculties of law, medicine, arts and divinity. (2) An inferior parish officer, whose business is generally to execute the orders of the vestry, by whom he is appointed. These parochial beadles were originally officers given to the rural deans to cite the clergy and church-officers to visitations, and for other purposes. In some parts of Great Britain beadles act as town clerks.

BEADS, small perforated ornaments, generally of a round shape and made of glass, but also of gold, silver and other metals, paste, coral, gems, etc. The use of them as ornaments belongs to very early times, and this use, still continued, has made them an important article of trade. Beads are supposed to have been manufactured by the Phoenicians more than 3,000 years B.C. Beads have been found in the ruins of Assyrian temples, also as decorations of Egyptian mummies, and in the graves of the Romans and Britons. The manufacture of glass beads was introduced into modern Europe by the Italians, and in the neighborhood of Venice it is still an important branch of industry. On the island of Muras, and workmen are employed in this manufacture. Birmingham is the chief seat of the manufacture of beads in Great Britain. For their use in religion see ROSARY.

BEAGLE, a small hunting dog; in general appearance a diminutive fox hound, solidly built, well set upon straight fore legs, with plenty of bone in proportion to its size, good, hard feet and a broad, deep chest with ample lung capacity. It is of good disposition, and clever and industrious in the field. In color and marking it much resembles the fox hound, black, white and tan being the more common colors, and these in more or less solid or pied masses. In its original home, Great Britain, there are both rough and smooth varieties, but the typical American beagle is smooth. Beagles vary in height from 12 to 15 inches, and while excellent trackers are not so fast but that they can be followed on foot, a very common sport in Great Britain. Their voices are exceedingly musical and justify the name sometimes given them of 'buglers.' They are principally used for rabbit-hunting. In former times a very diminutive breed was in favor, according to one authority, no larger than well-grown kittens — so small, in fact, that it is said a whole pack could be carried affixed in a pair of panniers slung across a pony's back.

BEAGLE, The, a small ship of the British navy employed, under the command of Captain (afterward Admiral) Fitzroy, in making surveys of the coast of Patagonia and other South American shores and waters, and later making a voyage around the world. The expedition, which started from Plymouth 27 Dec. 1831 and returned 2 Oct. 1836, had for its naturalist the famous Charles Darwin. It was on board the Beagle that 'the theory of evolution originated.'

BEAGLE ISLAND, an island discovered by Admiral Fitzroy during a voyage in H. M. S. Beagle. The channel of the same name is on the south side of the island of Tierra del Fuego.

BEAK, or BILL, the projecting jaws or snout of a bird or other animal, when prolonged into an instrument for seizing or penetrating objects, and formed of hard materials, as bone, or covered with a rigid envelope, as of horn or chitin. It is most characteristic of birds, where it is called 'bill' or 'nab,' and forms the principal means for obtaining, as well as devouring food (except in most birds of prey), and where it takes on a great variety of shapes and characteristics adapted to special habits and purposes (see BILLS). A more or less similar prolongation of mouth-part occurs in many other animals, however, and receives a similar name. Among mammals, the duckbill (q.v.) is a conspicuous example of a true mammal with the lips formed into a horny bill much like that of a duck, and similarly used. The turtles have a horny, projecting, parrot-like beak; the siren, a similar sort; and a curious imitation of this occurs among cephalopod mollusks. The prolonged
jaw of various fishes, as of gars ("billfish"), sturgeon, etc., receive the term (technically rostrum), and these are often bird-like, as in the case of the spoon-billed catfish. The term is also borrowed by entomologists to describe the elongated mouth-parts of many insects, such as the leaf-sucking plant-bugs, weevils and other forms. The prolonged tubular or trough-like parts (canals) of many gastropod shells protecting the siphon, and the prominent umbos of such bivalve shells as the cockles, clams and fresh-water mussels, are also termed "beaks."

**BEALE, bel, George Lafayette,** American military officer: b. Norway, Me., 21 May 1825; d. 11 Dec. 1896. When the Civil War broke out he was captain of the Norway light infantry, and with this company was mustered into the 1st Maine regiment for the three months' campaign. At the end of this service he was commissioned colonel of the 19th Maine infantry, which took part in the battles of Cedar Mountain and Antietam and covered the retreat of General Banks from Winchester to Williamsport, Va. He was mustered out with his regiment in May 1863; volunteered again; was made colonel of the 29th Maine, and promoted to brigadier-general of volunteers 30 Nov. 1864, for his services in the Red River campaign. On 13 Jan. 1866 he was mustered out of service with the brevet of major-general of volunteers. In 1880-85 he was adjutant-general of Maine, and 1888-94 State treasurer.

**BEALE, Samuel,** English Orientalist: b. Devonport, 27 Nov. 1825; d. 20 Aug. 1889. He was educated at Trinity College, Cambridge, in 1847, was head master of Bramhall College from 1848 to 1850, and ordained priest in 1852. He entered the navy, acting as chaplain and naval instructor between 1852 and 1877, when he retired. He served in the China War, 1856-58. On his retirement he was elected professor of Chinese at University College, London, a post he held till his death. His principal work consisted in tracing the early history of Buddhism in China, which he published in "Fah-Hian and Sung-Yun, Buddhist Pilgrims from China to India, 400 A.D.-518" (1869); "A Catena of Buddhist Scriptures" (1871); "The Legend of Sakya Buddha" (1875); "Abstract of Four Lectures on Buddhist Literature in China" (1882); "Si-Yu-Ki: or Buddhist Records of the Western World" (translated from the Chinese of Huien Tsang, 1885), and several other books.

**BEALE, William James,** American botanist: b. Adrian, Mich., 11 March 1833. He was graduated A.B. at the University of Michigan in 1859; A.M., 1862; S.B., Harvard, 1865; M.S., University of Chicago, 1875; (hon. Ph.D., University of Michigan, 1880; D.Sc., Michigan State Agricultural College, 1905). Teacher natural science, Friends' Academy and Union Institute, Union Springs, N. Y., 1859-68; professor of botany, University of Chicago, 1868-70; lecturer on botany, 1871; professor of botany and horticulture, 1871-81; professor of botany and forestry and curator of botanical museum, 1882-1903; professor of botany, 1903-1910; since emeritus professor, Michigan State Agricultural College; director State Forestry Commission, 1888-92. First president Society for the Promotion of Agriculture; Science, 1881-82; Association of Botanists of United States Experiment Stations, 1888; first president Michigan State Academy Science, 1894; president Michigan State Teachers' Association, 1881; member Botanical Society of America; American Pomological Society; fellow of the American Association for the Advancement of Science. He published "The New Botany" (1881); "Grasses of North America" (Vol. I, 1887; Vol. II, 1896); "Seed Dispersal" (1898); "Glossary of Botanical Term," etc.

**BEALE, Dorothea,** English teacher: b. London, 21 March 1831; d. 9 Nov. 1906. She became mathematical tutor in Queen's College in 1849 and later Latin tutor in the school; and head teacher in the Clergy Daughters' School, Casterton, in 1857. In 1858 she was appointed principal of Cheltenham Ladies' College; the first proprietary girls' school in England, founded four years earlier on a capital of $10,000. When she took up office there were 59 pupils; in 1912 there were 1,000, with 120 teachers. During her term $800,000 had been spent on buildings, and at the close the annual income was $300,000. Her life was given to the college—to which she bequeathed the residue of her estate, amounting to $250,000—and she was a pioneer in the higher education of women. Her publications include "Textbook of English and General History", "Chronological Maps", "Work and Play in Girls' Schools," etc.

**BEALE, Edward Fitzgerald,** American diplomatist: b. Washington, D. C., 4 Feb. 1822; d. 22 April 1893; graduated at the United States Naval Academy 1842 and at the beginning of the Mexican War was assigned to duty in California under Commodore Stockton. After the war he resigned his naval commission and was appointed superintendent of Indian affairs for California and New Mexico. He was commissioned brigadier-general in the army by President Pierce. He served in the Union army in the Civil War, 1861-63, and engaged in stock-raising in Los Angeles, Calif., till 1876, when President Grant appointed him United States Minister to Austria.

**BEALE, Lionel Smith,** English physician and biologist: b. London, 5 Feb. 1828; d. 28 March 1906. He was the son of Lionel John Beale, M.R.C.S. He was educated at King's College School and King's College, London. In 1852 he established a laboratory for chemical and microscopical studies and in the following year became professor of physiology and general and morbid anatomy in King's College, London. In the same college he held in succession the professorships of pathology and of the principles and practice of medicine, but in 1896 he retired from the latter post. He was a fellow of the Royal Society and for some years acted as treasurer of the Royal Microscopical Society. His published works deal with medical, anatomical, physiological and biological subjects, the microscope, etc. Among the most important are "How to Work with the Microscope"; "Protozoa; or, Life, Matter and Mind"; "Life, Health and Disease;" "The Physiological Anatomy and Physiology of Man" (in collaboration with Dr. Todd and Sir W. Bowman);
‘Disease Germs’; ‘Life Theories and Religious Thought’; ‘The Mystery of Life,’ etc.

BEALE, Truxton, American diplomat: b. San Francisco, Cal., 6 March 1856. Graduating from Pennsylvania Military College in 1874, he studied law at Columbia University for two years and then entered the bar. But instead of practising law, he spent the next 13 years in the management of his father’s ranch in California. In 1891 he was sent to Persia as United States Minister. The following year he was sent to Serbia, Rumelia and Greece, where he acted as Minister plenipotentiary. From 1894 to 1896 he traveled in eastern Asia, visiting Chinese Turkestan and Siberia. He has been a frequent contributor to the magazines on international questions. He is the author of ‘The Man Versus the State’ (1916).

BEALL, John Young, Confederate guerrilla: b. Virginia, 1 Jan. 1835; d. 24 Feb. 1865. He was appointed acting master in the Confederate naval service in 1863. On 19 Sept. 1864 he and a number of followers took passage on the Lake Erie steamer Pake Pauw and at a given signal they were among the prisoners of the crew. They also scuttled another boat, the Island Queen, and tried to wreck a railroad train near Buffalo, N. Y. In spite of a proclamation of Jefferson Davis suspending responsibility for the expedition, Beall was hanged on Governor’s Island, N. Y., on the ground that, if acting under orders, he should have shown some badge of authority.

BEAM, in architecture, a long, straight and strong piece of wood, iron or steel, especially one holding an important place in some structure and serving for support or consolidation; often equivalent to girder (q.v.). In a balance it is the part from the ends of which the scales are suspended. In a loom it is a cylindrical piece of wood on which weavers wind the warp before weaving; also the cylinder on which the cloth is rolled as it is woven. In shipbuilding, one of several strong transverse pieces of timber stretching across the ship from one side to the other, to support the decks and retain the sides at their proper distance, with the ends firmly connected by means of strong knees and sometimes of standards. They are sustained at each end by thick stringers on the ship’s side called shelf-pieces. The main-beam is next abaft the main-mast. The greatest beam of all is called the midship beam. A ship is said to be on her beam-ends when she lies entirely on her side, so that the beams are almost at right angles to the surface of the water. An object is said to be a-beam when it is in a line with the beams of the ship and accordingly at right angles to its length.

BEAM ENGINE. See Steam Engine.

BEAM-TREE, White (Prunus arida), a European and Asiatic tree of the family Malacae, rarely exceeding 50 feet in height, often cultivated as an ornamental tree for its ornamental leaves, which are bright dark-green above and light beneath; and for its large terminal corymbs of flowers which appear in late spring, followed by showy orange-red or scarlet fruit. It is a native of Spain and southern Italy, and in the maritime provinces of Cuba, and in other parts, with corn and sunflowers, to make ensilage. It is an annual plant, growing from two
to four feet high, erect, with thick angular stems; flowers usually white with black on the wing. The pods are long. The green seeds, when eaten as a vegetable, or, if allowed to mature, are ground and used as feed for horses and cattle. The straw is fed to cattle.

The kidney-bean of Europe is known in the United States as the bean, Phaseolus vulgaris; it embraces all the common field, garden, snap and string beans, both bush and climbing. The French know it as the haricot. It is probably a native of South America, and was introduced into Europe during the 16th century. Over 15 varieties are in cultivation; the growers usually group them into bush- and pole-beans. The bush-beans embrace the *field beans* grown for dry shelled seeds, also the green-podded and yellow-podded garden, string or snap beans. They are usually grown for use while green. Bush-beans do well on a good warm soil. The yellow-podded varieties and pole-beans require a richer soil. They should not be planted until danger from frost is over, and require constant cultivation while growing. Leading field varieties are white scarlet, yellow, navy or pea bean, medium and the kidnys: in string-beans, early Valentine, stringless green-pod, refugee, etc.; in yellow-podded beans, black wax, golden wax, kidney and white. Consult Bulletins 87 and 115, Cornell Experiment Station. For forcing pole-beans under glass, see Bailey's *Forcing Book*; Bulletin 62, New Hampshire Experiment Station.

The Lima bean (*P. lunatus*) is the most popular pole-bean. It is of South American origin, but is now grown in various parts of this country, most of the seed being raised in California. The short, flat, slightly kidney-shaped seeds are enveloped in flat, broad pods. The soy-bean (q.v.) (*Glycine hispida*) is a bushy, erect, but climbing plant which bears pea-like seeds in small pods. It is a native of China and Japan, where it is largely grown. It is used for forage and soil. The cowpea (q.v.) (*Vigna catjang*) is generally used for forage, soil, hay and green manuring. The scarlet runner (*P. multiflorus*) is a perennial. It is grown largely for ornament, but in England the seeds and pods are eaten as a vegetable. The Adzuki bean (*P. radiatus*) is a native of Japan, and a recent introduction in America. Consult Bulletin 32, Kansas Agricultural Experiment Station. The frijole (*P. spp.*) is grown in the southwestern States and in Mexico, where it is a staple food.

Other important Oriental beans, but not very common here, are: Mungo-beans (*P. mungo*); various species of Dolichos, as the asparagus bean (*D. aspergibulatis*); and the locust or carob bean (*Ceratonia siliqua*), the pods of which are sold by confectioners as Saint John's bread. The sweet pulp which surrounds the seed is eaten, especially in the Mediterranean. The pods and seeds are ground and used extensively as feed for horses and cattle. The velvet-bean (species of *Mucuna*) is often grown for an ornament; also for

age and soil renovation in the southern States. It ripens seed only in the Gulf States. The beans and pods, when ground, are fed to cattle. The cooked green beans have caused illness in those who have eaten them. In 1899, 15,004 acres of green beans were grown, yielding 1,512,642 bushels, or an average of 100.8 bushels per acre. The southern States on bean cultivation are New York, New Jersey, Florida, California and Virginia.

**Uses and Feeding Values.**—The seeds and sometimes the pods are used, either green or dry, as food for man and animals. Some species are grown for forage, hay or green manuring. Owing to their nitrogen-gathering properties they all aid in soil-renovation.

The average percentage composition is:

With man, on an average, 90 per cent of the dry matter is digestible; 80 per cent of the protein; 96 per cent of the nitrogen-free extract; and 80 per cent of the ether extract. String-beans or green shell beans are usually boiled and served in various ways. In composition they compare favorably with other vegetables. Dry beans are baked with salt pork or beef and used for soups and other dishes. They are a cheap, nutritious food, rich in starch and in the protein, legumin; hence they may be used to replace meat in the diet. If the skins are removed they are easier of digestion and are not so liable to cause flatulency; the latter is due to the production of methane by fermentation in the intestines. Shell- and string-beans are preserved by evaporation or canning. String-beans are also preserved with salt. Cooked dry beans are canned. Bean flour consists of beans ground. Bean meal is used in Europe as feed for horses, cattle and hogs. Bean cake is the residue after the oil has been extracted; it is fed to cattle in northern China. Bean curd is eaten by the natives of northern China.

**Bean Diseases.**—Pod-rost; anthracnose (*Colletotrichum lindenmuthianum*), a fungus which attacks the stems, leaves and fruit. The disease may be carried over in the seed, the affected ones being recognized by the yellow or brown discoloration. A black discoloration with ensuing brittleness marks the progress of the disease on the leaves. The selection of sound seed, immediate removal of infected plants and spraying with Bordeaux mixture are recommended. The bean-rust (*Uromyces phaseoli*) appears as small brown, nearly circular and slightly elevated dots on the leaves. These discharges a brown powder, the spores of the disease. Spraying with Bordeaux mixture is recommended. Blight (*Phytophthora phaseoli*) attacks the Lima bean. Spraying with copper compound is recommended. The bean-veeill (*Bruchus oblectus*) may injure the beans when young. They are killed by freezing; two or three times, at intervals of three or four weeks, with carbon bisulphide.
Consult De Candolle, 'Nativity of the Bean'; Gray and Trumbull, "Origin of Cultivated Plants" American Journal of Science, XXVI, 130; Bailey, 'Standard Cyclopedia of Horticulture.'

BEAN, Saint Ignatius, a seed which yields strychnin. See STREYCHNOS.

BEAN-GOOSE (Anser segetum), a species of European wild goose, distinguished from the true wild goose (A. ferus) by its comparatively small and short bill, which, as far as the nostril, is black, and above it of a reddish flesh color, whereas that of the gray lag, or true wild goose, is orange-red, with a touch of grayish-white. They feed generally on high grounds, considerably inland, selecting particularly young wheat, stubbles sown down for grain, and beans. They have a fondness for which is supposed to have given them their name. They breed chiefly within the Arctic Circle, but their nests are often found in large numbers in the Hebrides. The male bears rather less in size than the common wild goose, but having the same color, is sometimes provincially called the small gray goose.

BEAN WEEVIL, a beetle, Bruchus obtectus, which is smaller than the pea-weevil, measuring .15 of an inch in length. Compared with that insect it is lighter and more uniform in color, being of a tawny gray, without the white spots so conspicuous in B. pisi. The uniform tawny gray elytra are spotted with a few oblong dark spots, situated between the stipes, the antennae also differ in having the fourth joint of the gray lag, or in B. pisi, while the terminal joint is red. The legs also are much redder. The eggs are laid on the outside of the bean; the young hatch and bore in, and there may be eight or 10 grubs in a single bean. The larvae live in a cavity in the bean just large enough to receive its body. The best remedy is carefully to examine the beans in the autumn and before sowing time, when the presence of the weevil can be easily detected by the transparent spots made by the larvae under the shell. Many beans as are apparently uninjured should be soaked for a minute in boiling-hot water, so that no beetles be overlooked.

BEAR, or Bere, a species of barley (q.v.).

BEAR FLAG WAR, a rising against the Mexican government in 1846, by a small body of emigrants from the United States who had settled in California, thought to have been incited by Capt. John C. Frémont (q.v.). He was then commanding a small detachment of American troops in California and a few Americans having proclaimed a republic in Sonoma and raised a flag on which was a figure of a bear, Frémont joined the insurgents with his troops. The Mexican War began in the following July and the Bear Flag War then became a part of the American scheme for the conquest of California.

BEAR ISLAND. An arctic island in Barents Sea, about 200 miles north-northwest of North Cape, Norway, discovered by Barents (1596). Deserted with the decadence of whaling, it now becomes a land of economic importance. Extensive deposits of low-grade coal, easily mined, have been found, the strata of the north coast being some six feet thick. The development of the industry has been commenced by a Norwegian corporation, which maintains a permanent colony, with additions in summer. A wireless station is under installation, and the construction of port facilities is planned.

BEAR LAKE, Great, a body of water in Canada, so named on account of its situation directly under the Arctic Circle, and therefore under the constellation Ursa Major. It is of very irregular shape, having five arms projecting out of the main body, and its greatest diameter is 150 miles. The principal supply of the lake is Dease River, which enters it from the northeast. Its outlet is on its southwestern extremity, at the bottom of Keith Bay, through Bear Lake River, which empties into Mackenzie River. The surface of Bear Lake is not more than 200 feet above the Arctic Ocean; consequently its bottom must, like many of the northwestern lakes, lie considerably below the level of the sea. Great Bear Lake abounds in fish of many varieties, among which the herring-salmon is noted. The second land expedition, under Franklin, in 1825, wintered on the western shore of this lake, near its outlet, where they built Fort Franklin. Dr. Richardson, a member of the expedition, mentions a curious circumstance concerning the singing of birds of this lake, that when they first appeared after the long Arctic winter they serenaded their mates at midnight, and were silent during the day. The waters of the lake are so clear that a white substance can be distinctly discerned at the depth of 90 feet. The lake is situated about 250 miles east of the Rocky Mountains, about the same distance south of the Arctic Sea and 400 miles northwest of Slave Lake. It is the basin of a water-shed of about 400 miles diameter.

BEAR MOUNTAIN, the designation of a hill some 750 feet in height, situated in the northeastern part of Dauphin County, Pa. In its vicinity are valuable deposits of anthracite coal.

BEAR RIVER, a river in Utah about 400 miles long, which rises in a spur of the Rocky Mountains, about 75 miles east of Great Salt Lake, takes first a northwesterly and then a southeasterly direction, forming nearly a letter V, of which more than half the entire length is in Oregon State, and finally empties into the Great Salt Lake. Its valley is about 6,000 feet above the sea-level. At the bend of the river in Oregon, and about 45 miles from Lewis River, are found the famous Beer and Steamboat springs, which are highly impregnated with magnesia and other mineral substances, and as a geological formation in the vicinity, of Lower Cretaceous (q.v.) age, which carries some coal.

BEAR STATE. A popular nickname for Arkansas.

BEARBERRY, the name applied to the species of Arctostaphylos, a genus of plants belonging to the family Ericaceae. It includes the two species, A. uva-ursi and A. alpina, both of which are American. The flower is red or rose-colored, the berry of the uva-ursi is red, while that of the other is black. The manzanita of California is A. manzanita or A. pungens. It
BEARDS, Daniel Carter, American artist and author: b. Cincinnati, Ohio, 21 June 1850. He received his academic education at Covington, Ky., and went to New York in 1878. He studied at the Art Students' League, New York, 1884-94; and made illustrations for Harper's Century, Scribner's, Life, books of which the most notable is Mark Twain's 'Connecticut Yankee'), etc. He was originator and instructor of the pioneer class in illustration and teacher of animal drawing in the Woman's School of Applied Design, 1893-1900, believed to be the first organized class in animal drawing in the world. He was editor of Recreation, 1905-6; became a member of the Flushig board of education and of the Queens Borough library board; vice-president of the Mark Twain Library, and Redding, Conn.; member of several zoological societies; president of the Society of Illustrators; president of the Camp Fire Club of America; national scout commissioner of the Boy Scouts of America. An enthusiast in outdoor life he was the originator and founder of the first boy scout society, from which the English scouts and others were modeled, and became chief scout of the department of woodcraft, Culver (Ind.) Military Academy. Mount Beard, the peak adjoining Mount McKinley, discovered by the Browne and Parker expedition, was named after him. He also founded the Dan Beard Outdoor Scout School, with headquarters at Flushig, L. I. Besides his illustrative work he has published: 'American Boys' Handy Book' (1882); 'Moonlight and Six Feet of Romance' (1890); 'Outdoor Handy Book' (1900); 'Jack of All Trades' (1900); 'Field and Forest Handy Book' (1906); 'New Ideas for Out of Doors' (1906); 'Dan Beard's Animal Book' (1907); 'Pioneers and Sons of Daniel Boone' (1909); 'The Buckskin Book and Buckskin Calendar' (1911); 'Boat Building and Boating' (1911); 'Shelters, Shacks and Shanties' (1914); 'Handicraft and Recreation for Girls'; 'What a Girl Can Make and Do'; 'The American Girls' Handy Book'; 'Things Worth Doing and How to Do Them.'

BEARDS, James Henry, American painter: b. Buffalo, N. Y., 1814; d. 4 April 1893. He became a portrait painter in Cincinnati, and painted portraits of Henry Clay and other distinguished men. In 1846 he exhibited his 'Carolina Emigrants' at the National Academy in New York, of which he was elected an honorary member in 1848. In 1870 he removed to New York, and in 1872 was elected a full member of the National Academy. Subsequently he devoted himself to animal painting. Among his better known works are 'Mutual Friend' (1875); 'Consultation' (1877); 'Blood Will Tell' (1878); 'Don Quixote and Sancho Panza' (1878); 'Heirs of Loyalty' (1880); 'What Has Pre-emption?' (1881); 'Detected Poacher' (1884); 'Don't You Come Here' and 'The Mississippi Flood' (1885); 'A Barnyard' and 'If Ye' Gimme Some? Say I' (1886).

BEARDS, Richard, American theologian: b. Sumner County, Tenn., 27 Nov. 1799; d. Lebanon, Tenn., 2 Dec. 1880. He was graduated from Cumberland College, Princeton, Ky., in 1832; was professor of languages there, 1832-38; president 1844-53. In 1854 he was called to the chair of systematic theology in Cumberland University, Lebanon, Tenn., a position held until his death. He was one of the ablest scholars and most conspicuous figures in the Cumberland Presbyterian Church. He published 'Why I Am a Cumberland Presbyterian' (1874); 'Systematic Theology,' a standard work regarded as the crystallization of the Cumberland Presbyterian form of thought and faith.

BEARDS, Thomas Francis, commonly known as Frank Beard, American artist: b. Cincinnati, 6 Feb. 1842; d. 1905. During the Civil War he served in the 7th Ohio regiment, and acted as a special artist for the Harper publications. As an artist he devoted himself especially to character sketches. From the age of 12 he contributed pictures to the leading American magazines. As a lecturer he had great success before Chauncy and other audiences. He accompanied his talks by copies of sketches on a blackboard. The title of his first lecture was 'Chalk-Talk,' whence the word originated. In 1881 he occupied the chair of aesthetics at Syracuse University. He published 'The Blackboard in the Sunday School' (1881); and a number of short stories.

BEARDS, William Holbrook, American painter: b. Painesville, Ohio, 13 April 1825; d. New York, 20 Feb. 1900; brother of James H. Beard. He was a traveling portrait painter from 1846 till 1851, when he settled in Buffalo, N. Y. After several years of foreign study and travel he settled in New York in 1860. In 1862 he was elected a member of the National Academy. His works include genre and allegorical pictures, but he was most popular in painting animals, especially bears, whose actions he humanized in a satirical and pleasing manner. He made many studies of decorative architecture. Among his most popular works are 'Power of Death' (1859); 'Bears on a Bender' (1862); 'Bear Dance' (1865); 'March of Silenus' (1866); 'Flaw in the Title'; 'Darwin Expounding his Theories' and 'Runaway Match' (1876); 'Divorce Court' (1877); 'Bulls and Bears in Wall Street' (1879); 'Voices of the Night' (1880); 'Spreading the Alarm' (1881); 'In the Glen' (1882); 'Cattle Upon a Thousand Hills' (1883); 'Who's Afraid?' (1884); 'His Majesty Receives' and 'Office Seekers' (1886), etc. He published 'Humor in Animals,' a collection of his sketches (1885).

BEARDS, the hair on the chin, cheeks and upper lip of men. It differs from the hair on the head in a great hardness and horror. The beard begins to grow at the time of puberty. The connection between the beard and puberty is evident from this, among other circumstances, that it never grows in the case of men who have been such from childhood, but the castration of adults causes the loss of the beard. According to Caesar, the Germans thought, and perhaps justly, the late
growth of the beard favorable to the development of all the powers. But there are cases in which this circumstance is an indication of feebleness, and frequently the taking place in men of tender constitution, whose pale color indicates little power. The beards of different nations afford an interesting study. Some have hardly any, others a great profusion. The latter group consider it as a great ornament; the former pluck it out; as, for instance, the American Indians. The character of the beard differs with that of the individual, and, in the case of nations, varies with the climate, food, etc. Thus the beard is generally dark, dry, hard and thin in irritating persons of full age; the same is the case with the inhabitants of hot and dry countries, as the Africans, Ethiopians, East Indians, Italians, Spaniards. But persons of very mild disposition have a light-colored, thick and slightly curling beard; the same is the case with inhabitants of cold and humid countries, as Holland, Britain, Sweden. The difference of circumstances causes all shades of variety. The nature of the nourishment likewise causes great variety in the beard. Wholesome, nutritious and digestible food makes the beard soft; but poor, dry and indigestible food renders it hard and bristly.

In general the beard has been considered with all nations as an ornament and often as a mark of the sage and the priest. Moses forbade the Jews to shave their beards. With the ancient Germans the cutting off another's beard was a high offense: with the East Indians it is severely punished. Even now the beard is regarded as a mark of great dignity among many nations in the East, as the Turks. The custom of shaving is said to have come into use in modern times during the reigns of Louis XIII and XIV of France, both of whom ascended the throne without a beard. Courtiers and inhabitants of cities then began to shave, in order to look like the king, and as France soon took the lead in all matters of fashion on the Continent of Europe, shaving became general from the beginning of the 18th century that shaving off the whole beard became common.

The English clergy by and by, probably in imitation of those of western Europe, began to shave the beard and until the time of William the Norman, the whole of whose army shaved the beard, there prevailed a bearded class and a shaven class, in short, a lacy and a clergy, in England. In forbidding the clergy to wear beards Gregory VII (1084) appealed to the custom of antiquity. The higher classes indulged in the moustache, or the entire beard, from the reign of Edward III down to the 17th century. The beard then gradually declined and the code of Charles I was the last in which even a small one was cherished. Shaving, among many ancient nations, was the mark of mourning; with others it was the contrary. Plutarch says that Alexander introduced shaving among the Greeks by ordering his soldiers to shave. In antiquity, a number of them, that this custom had prevailed before among the Macedonians. The Romans began to shave about 296 B.C., when a certain Ticianus Menas, a barber from Sicily, introduced this fashion. Shaving among the Romans sometimes continued every day. The day that a young man first shaved was celebrated and the first hair cut off was sacrificed to a deity. Hadrian, in order to cover some large warts on his chin, renewed the fashion of long beards; but it did not last long. In mounthealthy Romans such a custom, sometimes for years. They used scissors, razors, tweezers, etc., to remove the beard. The public barbers' shops (tonstrinae), where the lower classes went, were much resorted to; rich people kept a shaver (tonstor) among their slaves. Army regulations generally prohibit the wearing of beards, while in the navy beards are permitted. Physicians suggest that the beard should be suffered to grow on the chin and throat where tendencies to throat disease exist.

BEARD MOSS (Usnea barbata), a lichen of gray color. See also USNEA.

BEARDSLEY, Lester Anthony, American naval officer: b. Little Falls, N. Y., 1 Feb. 1838; d. near Augusta, Ga., 11 Nov. 1903. Appointed acting-midshipman 5 March 1850, he served in the East Indies in 1851-55, participating in one battle and several skirmishes with the Chinese army at Shanghai. Graduating from the Naval Academy 1856, he passed through all the grades of the service to rear-admiral 1895 and retired 1 Feb. 1898. During the Civil War he commanded the monitor Nantucket in the attack of the ironclad fleet on the defenses of Charleston Harbor, 7 April 1863, and captured the Confederate steamer Florida at Bahia, Brazil. In 1870 he took the steam-tug Palos to the East Indies, carrying on her the first United States flag through the Suez Canal. In 1879-80 he discovered, surveyed and named Glacier Bay, Alaska. He was the author of a number of valuable official reports, especially those on 'The Strength of Metals,' 'Resources of Alaska' and 'Present Condition of Affairs in Hawaii' (1897), published as Senate executive documents; 'The Strength of Wrought Iron and Chain Cables' (1880).

BEARDSLEY, Aubrey Vincent, English illustrator: b. Brighton, 8 Aug. 1872; d. Mentone, France, 16 March 1898. He was very precocious, drew at four and sold his copied compositions at 11. At the age of 15 he had produced a sketchbook of marked originality. He received no special instruction in drawing, but studied prints and drawings in the British Museum. He was possessed also of extraordinary musical talent and was partial to Wagner. After leaving school he was placed in an architect's office, which ill-health soon obliged him to leave and accept a clerical position. At this time he was befriended by Burne-Jones who gained him admission to the Westminster Art School. He remained there but a few months. In 1892 he began his illustration of 'Le Mort d'Arthur,' these, in the pre-Raphaelite style, were followed by others which showed Japanese and French Rococo influences. In 1894-95 he was art editor of the Yellow Book, in which appeared some of his best work. About this time he applied for admission to the British Library; the 'Pal Mall Budget,' and Oscar Wilde's 'Salome.' In 1896 he illustrated the 'Rape of the Lock,' and 'Lysistrata.' To this year also belongs the famous frontispiece, 'Volpone,' considered one of the world's greatest pen drawings. Beardsley contracted tuberculosis, embraced the Roman Catholic
BEARDSLEY — BEARINGS

faith at Bournemouth in 1897, and visited France in the following year, where he died. His style was original and unique in several respects. He ranks high among the illustrators of his time because of his remarkable execution, conception and line mastery. Collections of his drawings have been issued with the titles 'Book of Fifty Drawings' by Aubrey Beardsley, text by Aymer Vallance (1887); 'Second Book of Fifty Drawings' (1899); 'The Early Work of Aubrey Beardsley' (1899); 'The Late Work of Aubrey Beardsley' (1901). Letters and poems, etc., in 'Under the Hill' (1906). Consult the biographies by Robert Ross (1908) and Arthur Symonds (1905).

BEARDSLEY, John Davis, American soldier and railway official: b. Woodstock, N. B., 1 Jan. 1837. He engaged in mercantile and lumbering pursuits at Grand Trunk Falls. At the outbreak of the Civil War in 1861 he left his lumber mill on the Saint John River to his partner, entered the Maine volunteers and was soon made first lieutenant of the 10th Maine volunteers. He was employed to guard the railroads from Baltimore and Harper's Ferry, was present at the battles of Winchester and Cedar Mountain, being taken prisoner at the latter. After three months in Libby Prison he was exchanged. He was present at Chancellorsville and at Gettysburg and in the fall of 1863 was sent to Tennessee. He was transferred to the 29th Maine, who were soon dispatched by sea from New Orleans to Fortress Monroe to reinforce Grant on the Potomac. The destination was changed to Washington and they were up in time to help in repulsing the Confederate general, Early, from the outskirts of the capital. He was next with Sheridan's corps in the Valley campaign, was promoted major in the 109th regiment in 1864. He resigned in March 1865 to raise a regiment of sharpshooters but before it could be effected the collapse of the Confederacy occurred. In 1897 he was appointed by the governor of Maine a commissioner for the erection of monuments at Gettysburg in commemoration of the soldiers of Maine who fell there. After the war he went into business at Richmond, Va., where he continued until 1873, removing thence to Cairo, W. Va. In 1878 he went to Arkansas, where he built a narrow-gauge railroad from Hope to Washington, Ark. In 1882 he changed the gauge of the road and extended it to Nashville. It is known as the Arkansas and Louisiana Railroad. Beardsley sold it to Jay Gould in 1886 and in 1887 began the construction of the Louisiana and Northwest Railroad from Magnolia, Ark., to Natchitoches, La. This road was sold to a syndicate in 1905. Following this he built an electric system, a light and power plant, an ice plant and an amusement park at Mineral Wells, Tex.

BEARDSLEY, Samuel, American jurist: b. Roswell, Vt., 2 Feb. 1790; d. Utica, N. Y., 6 May 1860. On leaving the common school he took up the study of medicine, but abandoned it for law. In 1813 he was a member of the militia that defended Sackett's Harbor. Two years later he was admitted to the bar and became judge-advocate of the militia. In 1823 he was State senator from the fifth district of New York. He was appointed attorney for the northern district of New York by President Jackson and was a member of Congress in 1831-36 and 1843-45. From 1836 to 1838 he was attorney-general of the State of New York. He became associate judge of the Supreme Court of New York in 1844 and three years later succeeded Judge Bronson as chief justice. In his retirement he devoted himself to the practice of his profession.

BEARDSTOWN, Ill., city in Cass County, 45 miles northwest of Springfield, on the Illinois River and on the Saint Louis division of the Burlington Railroad which has its re- ligious and moral principles, and is the seat of a substantial business. The city has a fine park, two great bridges across the river, municipal waterworks, a Carnegie library, and its city hall is the former courthouse in which in 1854 Abraham Lincoln won the Armstrong murder trial. Named after Thomas Beard, who first settled here in 1820, Beardstown was platted in 1827 and in 1832 was a base of war supplies for the Black Hawk expedition against the Indians. It received a city charter in 1896. Pop. (1910) 6,107.

BEARING, in navigation and surveying, signifies the angle made by any given line with a north and south line. The bearing of an object is the direction of a line from the observer to that object.

In architecture, the space between the two fixed extremities of a piece of timber, or between one of the extremities and a post or wall placed so as to diminish the unsupported length. The bearing of a post is the space or length which the ends of a piece of timber lie upon, or are inserted into, the walls of piers.

In mechanics, (a) The portion of an axle or shaft in contact with the collar or boxing. (b) The portion of the support on which a gudgeon rests and revolves. (c) One of the pieces resting on the axle and supporting the framework of a carriage. (d) One of the chains supporting the framework of a railway carriage or truck.

In heraldry, a charge; anything included within the escutcheon. Generally in the plural, as armorial bearings.

BEARINGS, Anti-friction. Anti-friction bearings are bearings involving the principle of rolling friction, as distinguished from sliding friction. An ordinary shaft turning in a plain journal slides around on a layer of some lubricating substance. If the lubricant is good and properly applied, little energy or power is lost in the heat produced by rubbing friction. If not, then much heat is produced, often to such an extent that the oil or grease is set on fire, dried up, thereby causing a so-called "hot box" or journal. The starting friction of a plain journal differs very greatly from the friction required with moving parts. Careful tests under a heavy load, the film of the lubricant is penetrated, and contact of metal with metal is established. To overcome this difficulty, until the bearing has moved far enough to drag the film of oil between the points of contact again, and the film is formed to take the load from .09 to .13 as compared with .05 to .06 for the co-
efficient of motion. Bearings involving rolling friction are entirely different in this respect. Sliding lubrication is the order of the day when a "slip-fit" is needed. Between the shaft and the wheel or other bearing is interposed either a series of balls or rollers of hardened metal, usually steel, or a steel alloy, arranged to revolve between the raceways.

Ball bearings came into general use with the advent of the modern bicycle; they have been highly developed in automobile practice, and have come into general use in light machinery to reduce friction, being markedly superior to plain bearings, especially in case of starting. The balls are made in a great number of sizes, and positioned in bearings in numerous ways. Since small pieces of metal heat and cool rapidly, it is a difficult matter to temper steel balls exactly as desired. To have a long life each ball must be uniformly hardened as deeply as possible. Much ingenuity has been displayed in securing accurate tempering, and an exceedingly good average of balls are marketed at surprisingly low cost. In addition to hardness, uniformity of size and surface polish are essential. The only way to know precisely what is the structure and strength of a particular ball is to break it up. However, by microphotography experts are able to judge very accurately the character of balls.

It is apparent that a series of balls, traveling in a circular raceway in a machinery bearing must occasionally strike each other, jam and rub. If the surfaces contact in opposite directions. Except for this, sliding friction is wholly eliminated in a properly designed ball bearing, and the balls simply roll on the surfaces. To produce a good bearing it is essential that the balls shall be as nearly perfect as can be, and in practice good balls will show variations of only 1-10,000 of an inch in diameter. If the balls in a bearing vary in size, the larger balls must bear nearly all the strains and the sooner crystalize and break. The surfaces against which the balls bear are, sometimes flat, but usually at least one surface must be curved to keep the balls in position; often both surfaces are curved. The radius of curvature of the raceway against which the balls bear must always be less than the curvature of the balls, else there will be sliding friction. The less number of balls there are in a bearing the less will be the number of contact points, and the less the friction. But if there is a heavy load to carry, it is necessary to have many balls, and thus distribute the load. It has been demonstrated that the speed of rotation has little effect on the carrying capacity. Marked and numerous variations in speed and load, as in automobile use, reduce the carrying capacity of a ball bearing, hence they are designed with a large margin or surplus of strength. A good ball bearing will have a coefficient of friction of approximately 0.0015.

Ball bearings are made to carry ordinary load or side-friction, to resist end-thrust of a shaft, and sometimes for angular load, the positioning of the bearing surfaces determining how they operate. In designing a ball bearing, the engineer must consider the load or stress to be placed on it consistently, and also in exceptional instances; he must also bear in mind the different speeds of rotation to which it will be subject. If it is a bearing on a vehicle axle, carrying a wheel, he will fix the inner raceway firmly to the axle, but mount the outer raceway loosely on the wheel, with a "slip-fit." By properly shaping his raceway he can make the bearing carry the end-thrust of the axle as well as the supported load.

Designs of ball bearings have been made with alternate small idle balls between the larger working balls, with a view to reducing back rotation or jamming, but these have not been widely adopted. Another arrangement is to stagger the balls—that is arrange them this way: o o o o o. This is accomplished by building parallel raceways that slightly impinge. There are some advantages in such a construction.

For heavy loads roller bearings are superior to ball bearings. Hardened steel rollers of uniform size are mounted in a cylindrical case, that positions them so that they are kept slightly apart. They may then be introduced into the journal box by slipping over the shaft. By extending the length of the journal box, and using a sufficient number of rollers, almost any load can be carried with a minimum of friction. A 24-inch diameter shaft, provided with a 36-inch journal-box, carrying 38 one-and-a-half inch rolls, was made to carry a load of 575,000 pounds. Since 1900 the use of roller bearings has become very common. Both ball bearings and roller bearings require lubrication, though very much less than plain bearings need. It is a mistake to suppose that they can be run absolutely without oil. It is very necessary that such bearings be kept free from grit or dirt, as these will cut the balls or rollers in a short time.

Other anti-friction bearings are made by the use of anti-friction metals, that is, soft alloys, as babbitt metal, which is placed in the bearing to carry the steel or iron shaft.

BÉARN, bārν, a former province of France, at the foot of the Pyrenees, with the title of a principality; about 42 miles long and 36 broad. It now forms part of the department of the Basses-Pyrénées. It belonged, with Navarre, to Henry IV, when he obtained the crown. The plain country is very fertile, and the mountains are covered with fir trees, while within are mines of copper, lead, and iron, and the little hills are planted with vines, which yield good wine. Pau is the chief town. There is a peculiar and well-marked dialect,—the Béarnese,—spoken in this district, which has much more affinity with the Spanish than with the French. It contains a certain number of Greek elements, which some believe to have been derived from the ancient Greek colonists established in Gaul. The people have retained many Old World manners, customs and superstitions, as well as their old costume. Consult Bordenare, 'Histoire de Béarn et Navarre' (1873).

BEARS, a family (Ursidae) of large, heavy, long-haired, plantigrade, carnivorous mammals, scattered throughout all the northern hemisphere and some parts of the tropics. They are absent from Africa (except the Atlas Mountains, which zoologically belong to Europe) and from Australasia. In their structure and dentition they are allied to the dogs on one hand, and to the badgers, weasels,
BEARS

skunks, etc. (*Mustelidae*), on the other. The head is broad, and the jaws extended and rather narrow, but not so powerful as those of dogs or hyenas; while the teeth are complete and large, the molars especially being broad and tuberculous, fitting them well for crushing the vegetable fare so largely eaten by this group. The forelimbs have great strength and furnished with long and powerful claws for digging and use in fighting. The whole sole of the foot rests upon the ground, leaving a footprint much resembling that of a mammal. All move about rather slowly and clumsily, yet all except the heaviest bears climb trees, and the largest scramble over rocks or ice with surprising agility; and all, when urged by rage or fear, can get over the ground at great speed, their gait being a lumbering but effective gallop. Their ears, though small, are highly developed, and their hearing is perhaps of more service to them than is their eye-sight; but neither equals in keenness the nose, which seems to be extremely sensitive. In respect to food, bears are truly omnivorous, taking flesh, fish, or vegetable matter as circumstances or favor. They seize such small animals of the woods as cannot avoid them, and near settlements raid the herds of swine and flocks of sheep and cattle, especially in search of the young ones. All bears eat fish, and some, like the Polar and the Kadiak bear, live almost wholly upon this diet, catching the fishes cleverly from the shore by a stroke of the paw, or going into the water after them. Reptiles, crabs, crayfish, etc., are eaten also; and insects form a large part of their menu, especially ants and honey-making bees and wasps. They dig up ant hills and overturn rotting logs and stumps for the former, and search out and tear to pieces the combs of the latter, well protected against stings by their long hair. They also eat grass, leaves and herbage, certain roots, fruit, and especially sweet corns and berries, of which they are exceedingly fond. The Rocky Mountain Indians used to burn over certain tracts of mountain-side annually in order to keep the oaks low and promote the growth of certain berry-bearing bushes in order to attract the bears. They drink a great deal of water, enjoy going into it and will swim long distances.

Bears are nowhere very numerous, each pair or family occupying a distinct and keeping fairly well to itself. When, as frequently happens, three or four are seen together, they are likely to be old and young of the same family. Their home is usually some cave or crevice among rocks, a hollow tree, a tangle of wind-blown logs or a dense thicket. There, in the early spring, are born the young, usually two, sometimes four; and in the case of the Arctic species, this often happens under the snow, before the female is released from her hibernation. The young remain with the mother until fall, but even then when they are little they are guarded and controlled with great solicitude and will rush at an intruder. At other times bears are rather shy and will usually endeavor to retreat, yet, when brought to bay, fight with great courage and are among the most dangerous animals man can encounter. Their attack is made with both teeth and claw, striking down or clapping the foe in a crushing embrace and then tearing him with the teeth. They can easily be tamed, however, remain friendly and prove Intelligent and docile to a limited extent. They submit well to confinement, endure change of climate and breed readily in captivity. The close family likeness throughout the group has made their distinction into natural species a matter of much dispute and uncertainty. Everyone recognizes the great white *Polar* or *Ice* bear of the Arctic region (*Ursus maritimus*) as distinct. Its elongated body, long, pointed head, slender limbs, large, hairy-sold feet, and cream-colored coat are quite unlike the features of any other. Large specimens are nine feet or more in length and have enormous strength. These bears are numerous throughout the icy circumpolar regions, and wander a vast distance away from the coast on the ice, sometimes swimming many miles. They often winter and their young are born on the floes. They live mainly upon seals, young walruses and fish, which they scoop out of the surf and from the coast rivers where they come to breed, but in summer obtain various other kinds of food. They live entirely on the berries, fruit, and grass and shore vegetation. The writings of Arctic explorers abound in accounts of this wide-spread species and should be read by those who wish to know more of their habits. Another sub-Arctic bear that seems undoubtedly distinct is the glacier or "blue" bear of the Mount Saint Elias Alps on the coast of Alaska, first described by Dall in 1895 and named *Ursus emmonsi*. It is the smallest of all bears—not larger than a half-grown grizzly, and bluish-black, with a dorsal stripe and, some, like the Kadiak bear, white, with a dorsal stripe and, some, like the stein and the white one. The belly is white; the hair bright tan color. Very little is known of its habits or of the extent of its limited range.

The other American bears, called black, grizzly, cinnamon, Barren-Ground, brown, Kadiak, and so on, are so confusingly alike that some conservative naturalists regard them all as merely varieties of one species, altered by climate and food and by the environment; the variation and it has been even said that there was no real specific distinction between them and the Old World bears, which also present differences that blend confusingly together when many specimens are compared. Others regard the differences as not only of specific value, but place some of the forms in separate genera. The latest monographer of the American *Ursidae* recognizes no less than eight species on this continent, besides the Polar bear and the spectacled bear of the Andes (*Ursus ornatus*), which is thought by others to be merely an isolated variety of the black bear that somehow has acquired whistled rings around its eyes. The black bear (*Ursus Americanus*) is the most widespread of these, being found in all but the highest parts of the north of Mexico and still remaining wherever a large patch of forest or a range of mountains or rough hills give it a harbor, whence it may raid the pasture-lots and pig sties of frontier farmers, especially in early spring when wild fruit is scarce and Black bears climb trees easily, travel about a great deal and are often captured and tamed. They are timid and
1 American Black Bear (Ursus Americanus)
2 Brown Bear (Ursus arctos)
3 Black Bear of the Himalayan Mountains (Ursus torquatus)
4 Malay Bear (Ursus Malayanus)
The color of this bear is properly black, but brown, reddish ("cinnamon") or even yellowish examples are frequently seen. The nose is always tan-colored. In size they average about five feet and never reach the dimensions of a large grizzly. The bears of Florida and of Texas are each regarded by some as separate species, but most naturalists consider them to be merely geographical races. The Barren-Ground bear (Ursus occidentalis) is a large, white-shouldered species dwelling on the brushy plains northwest of Hudson Bay, which is good reason to believe is an isolated American race of the European brown bear.

The grizzly bear (Ursus horribilis) of the mountains of western North America is one of the largest, and perhaps the most to be feared, of any of the family. It is found from the Black Hills and the Badlands of Dakota westward to the Pacific coast, and from Mexico to northwestern Canada in summer. It is large, weighing in length and will weigh 1,000 pounds, but the size varies greatly. So does the color, which ranges from reddish-brown to hoary gray. Hence several varieties are recognized by hunters, such as the "brown grizzly," the "broadside," the "tips of the hairs are white" and "grizzlies." The typical form may be described as yellowish-brown, with a reddish mane, black dorsal stripe and dark-colored legs. In form they are massive, with broad, squarish heads and immensely muscular bodies. They cannot, or at any rate, do not, climb trees, but they scramble about the roughest mountains or through a dense forest with surprising agility and can run very rapidly on occasions. They seem rarely, if ever, to hibernate and go about alone or in pairs, eating all sorts of food, but seizing and pulling down large prey when an opportunity offers. In former days even a bull buffalo was unable always to resist their strength and they constantly attacked them and the deer. Among the snows and the springs of the Sierra Nevada and in the high mountains northward from Oregon to Alaska, where the largest ones are now to be obtained. The Kadiak bear is a brownish species or variety (Ursus middendorff) dwelling on Kadiak Island, Alaska, and the neighboring mainland. 

Specimens of this exceeding in size any other bear have been obtained, and weighing 1,200 pounds. Whether it will prove to be a distinct species remains to be seen. The same may be said of Dalli or the Sitka bear (Ursus dalli). Both are dark brown or grizzled and difficult to distinguish externally from other bears of the north.

The bears of the Old World have been divided into many species by earlier naturalists, but are now regarded as more nearly connected. The best known is the common brown bear of Europe and Asia (Ursus arctos). It is of great size, reaching about eight feet in length in the bigger European specimens, and is usually of some shade of yellowish-brown, reddish-brown or black and varies greatly. It is exceedingly difficult to distinguish from the American bear and passes by indeterminate variation into the so-called species of Siberia, Japan and the Himalayan region, the differences being such as might come from varying climate and habitat; thus those of the high Himalaya are smaller and lighter in feet and without the long and low coat of the long ago extinct in Great Britain, it still lingers in the wilder, more mountainous parts of Europe and is numerous in the forests of Russia, the Caucasus, on the Lebanon range of Asia Minor (where which the tips of the hairs are white) and "grizzlies," in the Atlas Mountains of Morocco and throughout Asia north of the Himalayas. The largest are those of Kamchatka, where they are numerous and bold and live in summer almost wholly on salmon, as do the Kadiak and other Alaskan bears east of Bering Sea. This is the bear most often seen in menageries, where it breeds readily, and is also led about by "bear-tamers" and taught certain clumsy "dancing" tricks. The Tibetan or "blue" bear (Ursus pruinosus) is a little-known species regarded as distinct. Two other quite distinct species of bear belong to the Indo-Malayan region. One is the sloth-bear or honey-bear of India, a large animal which in its jungle home is one of the most dangerous carnivores of the Indian forests, yet is often tamed and led about the country by Hindu jugglers, who called it "aswail," etc. It is black, unusually shaggy and has a prolonged mobile snout, a very long tongue and no teeth in the front of the mouth (after the milk teeth drop out, showing his facial grimes very continually. Another very distinctive feature is the large yellowish crescent on its breast. It is an agile climber and exceedingly fond of robbing the nests of honey-making bees. These facts are recorded in its name (Ursus or Helarctos) labiatus. 

The Malay sun bear, or "bruung" (Ursus, or Helarctos, Malayanus), is a smaller species inhabiting the forests of the Malay Peninsula and islands eastward to Borneo. Its coat is short and fine, black in color, marked on the breast with a white or yellow crescent, and the lips and tongue are remarkably long and flexible. It feeds mainly on ants, which it gathers with its glutinous tongue after digging up their hills, for which its long claws are well fitted. 

Fossil bears, commonly called "cave bears," have been found in the Quaternary bone-beds of many caves of Europe, North and South America. Some are closely allied to or identical with living species; others, as the Californian and South American cave bears, are referred to a distinct genus, Arctotherium. In
the Tertiary strata of the Old World occur remains of a series of animals (Amblycinch, *Hymenoptera*, etc.) which appear to connect the bears with primitive *Canidae*, indicating that they are an offshoot of the dog family. See also Cavy Beard.

**BEAS**, *beas*, or **BIAS** (the ancient *Hyphasis*), one of the five great rivers of the Punjab, having its rise at the Ratanki Pass, on the south side of the Santhi Mountains, a branch of the Himalaya system, in lat. 32° 21' N., long. 77° 22' E.; where the former attain an elevation of 13,300 feet. Its entire course is about 250 miles. The Beas has been considered larger than the Sutlej, which it joins 35 miles to the southeast of Amritsar, but it is greatly inferior to that river in the length of its course; and, though they have about the same breadth, the Sutlej has the greater volume of water. The united stream, below the point of junction, is called the Ghara or Gharra.

**BEASTS OF PREY**, is not a scientific term, but, as in the case of the phrase "birds of prey," represents merely the idea of an assemblage of such mammals as prey upon other creatures. The greatest number and most prominent examples belong to the order Carnivora, whose members subsist mainly upon flesh, and some of which, as the cats, bears and wolves, are the most powerful, deadly and dangerous animals of the world. These have acquired bodies with great strength and endurance in chasing and leaping, seizing and holding; teeth adapted to cutting and piercing; sharp, muscular claws, and a high degree of intelligence in the wiles of hunting and of courage and pertinacity in attacking their prey or defending their gains against rivals. Their digestive organs are simplified and adapted to the assimilation of flesh, of which a less quantity is required than in the case of an animal subsisting on vegetable fare, because it is already in a concentrated, partly elaborated form; but as the obtaining of it is occasional and often interrupted by long intervals, all beasts of prey are likely to kill and eat excessively when opportunity offers, in instinctive preparation for a possible fast. To provide against the loss of heat during the periods of famine, rather than as a provision against low temperature, most beasts are partially clad in dense, hairy coats of hair, or "fur." Not all the beasts of prey belong to the Carnivora, for animals with similar structures and adaptations are to be found in other orders of mammals whose basal structure is very different. The blood-sucking bats, for example, have teeth roughly similar to those of a dog, and some of the apes are savage and powerful and have carnassial teeth. The most precise parallel, however, is found in the predatory marsupials of Australia, such as the Zebra wolf, *Tasmanian* devil and several others, which have the equipment and habits of true beasts of prey.

**BEAT**, in music, the beating or pulsation resulting from the joint vibrations of two sounds of the same strength, and all but in unison. Also a short shake or tremble of grace note struck immediately before the note intended to ornament. The Greeks employed the up beat (arrest) to denote the accent, and the down beat (these) to signify the unaccented part of the measure, but in modern practice the down beat denotes the accent and the up beat the unaccented.

**BEATIFIC VISION**, the immediate knowledge of God enjoyed by the angelic spirits and the souls of those who have attained heaven. It is distinguished from the temporal knowledge of God, which the human mind may attain on earth, in that it implies also a visual knowledge. Since such direct knowledge constitutes perfect bliss, the vision is termed "beatific.* Consult "Heaven" in *Catholic Encyclopedia.*

**BEATIFICATION**, in the Roman Catholic Church, an act by which the Pope declares a person beatified, or blessed, after his death. It is sometimes the first step to canonization, or the raising of one to the honor and dignity of a saint. Beatification is said by some to have had its origin in the pagan apotropaic but this is strongly denied by Roman Catholic authorities, who contend that it has its origin in the Catholic doctrine of the worship, invocation and intercession of the saints. In the earlier periods of the history of the Church the worship of saints was local, then was passed from one church to another by authority of the bishops. Two classes of persons were thus honored: martyrs and confessors. The first constituted those who had sacrificed their lives for the faith, while the second comprised those who had lived long lives of self-denial and Christian virtue. Toward the close of the 11th century the Pope found it necessary to restrict the power of the bishops in decreeing who should be held up for public veneratio and worship, and ordered that such honors should not be accorded until they had been approved by a council of the Church. This practice was initiated by Urban II. In 1634 Urban VIII published a bull which reserved to the Holy See the sole right of beatification. Beatification differs from canonization in that it constitutes only a permission to venerate a certain person, with restrictions to certain places and to certain liturgical exercises. Outside the boundaries of the places designated it is unlawful to pay reverence to the person beatified, or to celebrate mass with prayers referring to him unless special indulgences be had. Canonization is universal and also implies a precept: the process by which a person is beatified is long, sometimes requiring over a year. The postulator-general chooses a vice-postulator, whose function it is to promote judicial inquiries outside of Rome. The inquiries are instituted under the supervision of the local episcopal authorities. When completed the results of these inquiries are sent to the Congregation of Rites in Rome. The documents are then published, after which an advocate and a procurator of the cause, the latter being sometimes known by the title of "devil's advocate," are appointed
BEARS

1. Polar Bear (Ursus maritimus)

2. Grizzly Bear (Ursus horribilis)
BEATING THE BOUNDS — BEATTIE

He was a man of great ability, but cruel and of immoral life. Recent historical research has, however, somewhat modified the former severe judgments passed on his character.

BEATRICE, a witty, lively character in Shakespeare's 'Much Ado About Nothing,' who marries Benedick by the contrivance of the friends of each.

BEATRICE, Neb., city and county-seat of Gage County, picturesquely located in a fertile agricultural district in the valley of the Big Blue River and on several railroads, 40 miles south of Lincoln, the State capital. It is the seat of the State Institution for Feeble-Minded Youth; and has a handsome courthouse, United States government building. Holly system of waterworks, electric light and street railway plants, public library, three national banks, excellent water power, flour and planing mills, tile and barbed wire works, creamery, iron foundry and manufactories of gasolene engines, wind mills and farming implements. Beatrice was founded in 1857 when it became the county seat, was incorporated as a town, 1871, as a city, 1873, and received a new civic charter in 1901. The city is administrated by the commission form of government. Pop. 9,356.

BEATRICE CENCI, bę-a-trez'cha chen'che, a 16th century Roman girl whose picture was painted by Guido Reni and whose career is the subject of Shelley's tragedy 'The Cenci.'

BEATRICE PORTINARI, bę-a-trez'cha pore-tse-nare, the Beatrice of Dante's poems: b. about 1266; d. 1290. She was the daughter of a wealthy citizen of Florence, and wife of Simone de Bardi. She was but eight years of age, and Dante nine, when he met her first at the house of her father. He saw her only once or twice and she probably knew little of him. It is even doubtful whether they ever spoke to each other. The story of his love is recounted in the 'Vita Nuova,' which was mostly written after her death. In the 'Divina Commedia' it is the spirit of Beatrice who conducts him through Paradise.

BEATRIX, be-a-trıks, ANTELOPE, an Arabian oryx (Oryx beatrix), resembling the beisa but without black markings on the haunches. See ORYZ.

BEATTIE, bę-te, James, Scotch poet: b. Kincardineshire, 25 Oct. 1735; d. Aberdeen, 18 Aug. 1803. He obtained a scholarship at Aberdeen and subsequently became assistant in the Aberdeen grammar school, and married the daughter of the head schoolmaster, Mary Dunn. After this event he began to be distinguished as a writer, and in 1771 commenced the publication of his work called the 'Minstrel.' This obtained for him the patronage of Lord Errol and caused him to be appointed professor of moral philosophy and logic in Marischal College. In 1765 he published a poem, the 'Judgment of Paris,' which failed of any celebrity. The work which gained him the highest fame was an 'Essay on the Nature and Immutable of Truth,' in opposition to sophistry and skepticism. It was designed as a reply to Hume, and was so much in demand that in four years five large editions were sold; and it was translated into several languages. He was urged by the archbishop of York and the bishop of
BEATTY—BEAUCHAMP

London to take orders in the Church of England, a proposal which he declined. While in London he became intimate with Dr. Johnson, Dr. Porteus, Sir Joshua Reynolds, who painted his portrait, and other distinguished characters. In 1770 he published the ‘Divine, Moral and Critical’ and the ‘Evidences of the Christian Religion,’ written at the request of the bishop of London. In 1790 he published the first volume, and in 1793 the second, of his ‘Elements of Moral Science’, subjoined to the latter was a dissertation against the slave trade. His two sons predeceased him and his wife became insane.

BEATTY, Sir David, K.C.B., M.V.O., D.S.O., British admiral: b. 1871. He entered the navy in 1884 and first saw active service on the Nile as a lieutenant under Kitchener in 1898, when he distinguished himself as second in command of the gunboat Flotilla at the forcing of the dervishes’ batteries at Hafr while exposed to heavy fire. His superior officer being wounded, Beatty took command and bombarded the enemy position at Dougola and dismounted their guns. He was mentioned in despatches and received the D.S.O.; and was again under fire in the battles of Atbara and Khartum. He was made commander and decorated by the Khedive. In the Boxer rebellion of 1900 he showed exceptional tenacity in endeavoring, with 200 blue-jackets, to capture two Chinese guns that were causing considerable trouble to the forces and inhabitants at Tientsin. Though twice wounded, he repeatedly led his men close up to the guns. He rose to captain in 1900, was made M.V.O. in 1905 and rear-admiral in 1910. In 1912 and 1913 he was naval secretary to the First Lord of the Admiralty, and in the latter year was placed in command of the First Battle Cruiser Squadron. The day before Great Britain declared war on Germany he was promoted acting vice-admiral. Beatty’s first action against the navy created by von Tirpitz took place in the Bight of Heligoland in the morning of 28 Aug. 1914. German patrols had caused considerable damage to fishing craft in the North Sea and it was decided to undertake an offensive operation with a view to check the German raiders. The plan consisted of a sweeping movement, by which submarines and destroyers entered the Bight and attracted the enemy’s fire. The German light cruisers were drawn into the action, and at a prearranged period Beatty appeared on the scene with his battle cruisers and destroyed as many ships as were unable to escape under the land fortifications. Though about 60 British craft were engaged, only four were hit. The Germans lost three cruisers and two destroyers, while other vessels were damaged. The British fatalities were 32 killed and 52 wounded; about 700 of the German crews perished and 300 were rescued and taken prisoners. On 24 Jan. 1915 Beatty fought an action in the North Sea off the Dogger Bank, in which the Blücher (German armored cruiser) was sunk and only two British vessels were hit. In the battle of Jutland Beatty engaged the German high sea fleet with his cruiser squadron in unequal combat in a desperate effort to hold up the enemy until the arrival of Sir John Jellicoe. Off Denmark Strait, 31 May–1 June 1916. Two of Beatty’s battle cruisers, Indefatigable and Queen Mary, were sunk and he fought with eight capital ships against at least 19 of the combined fleets of von Hipper and von Scheer. On 29 Nov. 1917 Beatty was appointed commander of the grand fleet in succession to Admiral Jellicoe, who became First Sea Lord. See JUTLAND, BATTLE OF.

BEATTY, John, American legislator: b. Bucks County, Pa., 10 Dec. 1749; d. Trenton, N. J., 30 May 1826. He was educated at Princeton and took up the study of medicine with Dr. Rush of Philadelphia. He fought with distinction through the Revolutionary War, reaching the rank of colonel; was delegate to the Continental Congress in 1783–85; speaker of the House; served in the convention which adopted the Federal Constitution; was a member of Congress in 1793–95; and secretary of State of New Jersey in 1795–1805.

BEAU BRUMMEL. See BRUMMEL, GEORGE BRYAN.

BEAUAIRE, bōár’, Monsieur, the principal figure in a story of the same name by Booth Tarkington (1900), dramatized 1901. Beaucaire is a French provincial town in the fashionable city of Bath, England, near the end of the 18th century.

BEAUAIRE, France, small, well-built, commercial city, in the department of the Gard, on the Rhone opposite Tarascon, with which it communicates by a fine suspension bridge at the commencement of the Beaucaire and Aigues-Mortes Canal, and connected by several lines of railway. It has a commodious harbor for vessels which come up by canals communicating with the Mediterranean, seven leagues distant, and thus avoid the sand banks at the mouth of the Rhone; considerable commerce and some manufactures; but is chiefly famous for its great fair (founded in 1217 by Raymond II, Count of Toulouse), held yearly from 21 to 28 July. In former days, when this fair was free from duties, it was attended by merchants from all parts of Europe, and even from the coast of Africa, with their goods; and almost every kind of article, however rare, was to be purchased here; though silks, wools, cloths, printed cloths, leather, wines, brandy, olive-oil and fruits were and are the chief objects of sale. The numerous imports demanded since 1632, foreign wars and the competition of Marseilles, Lyons and other large places have reduced the traffic of Beaucaire. Pop. about 9,000.

BEAUCHAMP, bō-shām, Alphonse de, French historian and publicist: b. Monaco 1767; d. Paris, 1 June 1832. Under the Directory he had the surveillance of the press, a position which supplied him with materials for his ‘Histoire de La Vendée et des Chouans’ (1806). He contributed to the Moniteur and the Gazette de France. Among his chief works are the ‘History of the Conquest of Peru’ (1807); the ‘History of Brazil’ (1813); ‘The Life of Louis XVIII’ (1821); ‘Life of Julius Caesar’ (1821). The ‘Memoirs of Fouché’ is also with reason ascribed to him.

BEAUCHAMP, bēch’ám, William Martin, American clergyman and author: b. Coldenham, N. Y., 25 March 1830. Ordained in the Protestant Episcopal Church about 1851, he became well known as a lecturer and rectorships at Northville, N. Y., 1863–65 and Baldwinsville, N. Y., 1865–1900. Since 1884 he
BEAULIERK, bô'klärk, Topham, one of Dr. Johnson's favorite friends; b. December 1739; d. 11 March 1780. He was the only son of Lord Sidney Beauclerk, third son of the first Duke of Saint Albans, and in general appearance much resembled his great-grandfather. He studied at Oxford, and his conversational talents so much charmed Johnson that when "The Club" was founded, in 1763, he was one of the nine members who originally formed it. When he went to Italy, in 1762, Johnson wrote to his friend Baretti, wishing Beauclerk to his Endymion. In 1765 he accompanied Johnson on a visit to Cambridge. A short time before his death, Johnson said of him: "He is always ready to talk, and is never exhausted." During his last illness, Johnson said he would "walk to the extent of the diameter of the earth to save Beauclerk;" and when communicating his death to Boswell, he said: "His wit and his folly, his acuteness and maliciousness, his merriment and reasoning, are now over. Such another will not often be found among mankind." Consult Hill, 'Dr. Johnson: His Friends and His Critics' (1878).

BEAUFORT, bô-'fôr, François de Vendôme, Duc de, French naval officer, grandson of Henry IV; b. Paris, January 1616; d. 15 January 1667. He became particularly known by the conspicuous part he took in the civil war of the Fronde. On the accession of Louis XIV, the Queen-regent treated him very favorably, but was soon dissatisfied with his imperious manners. Her displeasure threw him on the side of the king, and he became one of the leaders of the Frondeurs. He was extremely popular with the Parisians and was consequently called le roi des halles; he exercised a powerful influence on the common people against Cardinal Mazarin, who was an enemy of the French. He was so great a favorite that the public subscribed to pay his debts. In 1664 and 1665 he successfully led attacks against the corsairs of Africa; in 1666 he was at the head of the fleet which was dispatched to join the Dutch to make war against England; lastly, in 1669 he went to the assistance of the Venetians, then besieged by the Turks in the island of Candia, fought bravely and was killed in a sally.

BEAUFORT, bô-'fôr, or bô-'fôr, Henry, English CARDINAL, natural son of John of Gaunt and half-brother of Henry IV, King of England; b. about 1377; d. Winchester, 11 April 1447. He became bishop of Lincoln 1398, whence he was translated to Winchester, and in 1403 he was made cardinal. In 1406 he received a cardinal's hat and was appointed legate in Germany, where he spent 1413-1431. In 1431 he crowned Henry VI in Paris. Shakespeare depicts him in his 'Henry VI,' but it is questionable whether the likeness is true to history. Consult Blanford, L. B., 'Henry Beaufort' (London 1908).

BEAUFORT, Margaret, English countess; b. 1441; d. 1509. She was daughter of John, 1st Duke of Somerset, and mother of Henry VII, King of England. She was three times married, to Edward Tudor, Earl of Richmond, in 1453; then to Henry Stafford, son of the Duke of Buckingham, and to Lord Stanley, a minister of Edward IV. In the Wars of the Roses she and her son Henry became more or less dangerous to the Yorkists and were for a long time in retirement or exile.

BEAUFORT, N. C., city, port of entry and county-seat of Carteret County, at the mouth of New River, 166 miles east of Raleigh, on the Norfolk Southern Railroad. The harbor here, defended by Fort Macon, is the finest in the State. Beaufort is a summer resort, has a municipal electric lighting plant, fishing industries and manufactures oil. At Cape Lookout, 11 miles to the southeast, is a lighthouse 156 feet high. Pop. 2,483.

BEAUFORT, S. C., town and county-seat of Beaufort County; on the Beaufort River, which connects with the fine harbor of Port Royal Sound, and on the Charleston & W. C. Railroad; 15 miles from the ocean and 80 miles southwest of Charleston. It is midway between Charleston and Savannah; has an excellent harbor and is the centre of the phosphate and fertilizer trade of the State. It was founded in 1711, and for many years prior to the Civil War was a noted health and pleasure resort, especially for the cotton planters interested in the plantations on the adjoining Sea Islands. It is still a popular summer and winter resort, principally engaged in phosphate mining and salt production, and has a large railway station. The national cemetery and the Old Fort are chief objects of interest. Beaufort was first incorporated in 1803. The town is governed under the commission-manager plan. Pop. 2,483.

BEAUFORT SCALE, an instrument for measuring the apparent size of an object as seen from Admiral Beaufort who introduced it into the English navy about 1805. It is now
in common use among navigators. Thirteen measures are embraced in the scale, ranging from 0 to 12: 0—calm; 1—light breeze; 4—moderate wind; 6—strong wind; 8—gale; 10—storm; 12—hurricane.

BEAUGENCY, bō-zhōn-sē, France, a town in the department of Loir et Cher, 30 miles southwest of Orleans, on a hill above the Loire, here crossed by the bridge of 26 arches. The town was formerly surrounded by a wall flanked by towers and bastions, parts of which still remain. The square donjon tower of Beaugency, 115 feet high, is a remarkable structure of high antiquity, probably of the 10th or 11th century. A statue of Joan of Arc, unveiled in 1896, commemorates her victory over the English in 1429. The articles manufactured here are principally cloth and leather. There are also some distilleries and a considerable trade in wine. In the Franco-German War General Chancy was defeated here by the Grand-Duke of Mecklenburg on 7 and 8 Dec. 1870. Pop. 3,500.

BEAUHARNAIS, bo-ar-nə, Alexandre, Vicomte de, French soldier; b. Island of Martinique, 1760; d. Paris, 23 July 1794. He served with distinction as a major in the French forces under Rochambeau which aided the United States in their Revolutionary War, and married Joséphine Tascher de la Pagerie, afterward the first wife of Napoleon. At the breaking-out of the French Revolution he was chosen a member of the National Assembly, of which he was for some time president, and which he opened, after the King's departure, with the following words: Messeigneur, le roi est parti afin d'exercer l'office du jour.* In 1793 he was general of the army of the Rhine, but retired in 1793 in consequence of the decree removing men of noble birth from the army. He was falsely accused of having promoted the surrender of Mainz, was sentenced to death and finally released. His children, Eugène and Hortense (q.v.), were adopted by Napoleon on the latter's marriage to Beauharnais' widow.

BEAUHARNAIS, Eugène de, French general; b. Paris, 3 Sept. 1781; d. Munich, 21 Feb. 1824. He was the son of Alexandre Beauharnais, who was guillotined in 1794, and Joséphine Tascher de la Pagerie, afterward wife of Napoleon and Empress of France. During the French Revolution Eugène entered the military service, and after his father's death joined Hoche in La Vendée, and subsequently studied for a time in Paris. In 1796 his mother was married to Napoleon Bonaparte, then commander-in-chief of the army of Italy, and Eugène accompanied the great warrior in his campaigns in Italy and Egypt. In 1805 he was created a prince of France and viceroy of Italy, and after the peace of 13 Jan. 1806, married the Princess Augusta Amelia of Bavaria. In 1807 Napoleon made him Prince of Venice and declared him his heir to the kingdom of Italy. He administered the government of Italy with great ability and the condition of the state was much beloved by his subjects. He conducted himself with great prudence on the occasion of the divorce of Napoleon from his mother. In the disastrous retreat from Moscow he gave the wrecks of his division for a moment, but shared its toils and dangers with the soldiers, and encouraged them by his example. To him and to Ney France was indebted for the preservation of the remains of her army during that fatal retreat. On the departure of Napoleon and Murat he was left in the chief command and showed great talent at that dangerous conjuncture, and at the battle of Lützen, 2 May 1813, by surrounding the right wing of the enemy, he decided the fate of the day. Napoleon sent him from Dresden to the defense of Italy, and after the fall of Napoleon he concluded an armistice with Count Bellegarde, by which he delivered Lombardy and all upper Italy to the Austrians. Eugene then went immediately to Paris and thence to his father-in-law at Munich. He was at the Congress of Vienna. On the return of Napoleon from Elba he was obliged to leave Vienna and retire to Baireuth. By an ordinance of the King of Bavaria, his father-in-law, he was created Duke of Leuchtenburg, November 1817. The Bavarian principality of Eichstätt was bestowed upon him and his posterity declared capable of inheriting in case of the failure of the Bavarian line. Prince Eugène, under a simple exterior, concealed a noble character and great talents. Honor, integrity, humanity and love of order and justice were the principal traits of his character. When in the council, undaunted in the field and moderate in the exercise of power, he never appeared greater than in the midst of reverses. Consult Aubriet, Vie politique et militaire d'Eugène Beauharnais, vice-roi d'Italie, préfet de l'Isère, F. 'Napoléon et sa famille' (Paris 1900).

BEAUHARNAIS, François, Marquis de, French nobleman; b. La Rochelle, 12 Aug. 1756; d. Paris, 10 June 1819. He violently opposed the motion of his younger brother, the Viscount Alexandre, to take from the King the chief command of the army, and would not listen to any of the amendments proposed, saying, 'Il n'y a point d'amendement avec l'honneur.' He was called in consequence of this, Le fâch Beauharnais sans amendement. In 1792 he formed the project of a new flight of the royal family; but the arrest of his companion, the Baron Chambon, prevented the execution of the plan. He was appointed major-general in the army of the Prince of Condé, and wrote, in 1792, to the president of the National Assembly, protesting against their unlawful treatment of the King and offering to appear himself among his defenders. When Bonaparte became First Consul the Marquis sent him a letter, in which he exhorted him, by the glory which he would gain by such a course, to restore the sceptre to the House of Bourbon. Having at last recognized the Emperor he was sent by him as ambassador to Florence and Madrid; but having afterward fallen into disgrace he was banished.

BEAUHARNAIS, Hortense Eugenie, wife of Louis Bonaparte and Queen of Holland; b. Paris, 10 April 1783; d. Atenberg, Switzerland, 5 Oct. 1837. She was the daughter of Alexandre Beauharnais and Josephine, afterward wife of Napoleon. She was to have married Desaix; but on 7 Jan. 1802, in compliance with the wish of Napoleon, became the wife of his younger brother Louis, who also had an arranged marriage. The union was not happy and Hortense returned to Paris and lived a dissolute life there.
BEAULIEU — BEAUMARCHAIS

apart from her husband, who vainly endeavored to procure a divorce. Prominent among her lovers was the Comte de Flahaut, for whom she composed her popular air, "Portant pour la Sириe," as he was leaving Paris for Germany, and Admiral Veruel, a Dutch naval officer. The former is believed to have had the marriage with M. de Morphy, universally recognized as the illegitimate half-brother of Napoleon III, whom he greatly aided in becoming emperor; and to the latter is attributed the paternity of Napoleon I himself. It is known that Louis Bonaparte had a warm dispute with his brother, the Emperor, touching this child, which he avowed to be none of his, and that his unwillingness to recognize it as such was only overcome by the most decided measures on the part of Napoleon. The first child of Hortense, Napoleon Charles, died in 1807 at the age of five. After the separation of Napoleon and Joséphine, Hortense remained on intimate terms with the former. When the Bourbons came back in 1814 she alone of all the Bonaparte family remained in Paris. After the Hundred Days she lived at Augsburg, in Italy, and in Switzerland, devoted to her sons and greatly beloved by the people with whom she came in contact, who found her a kind and gentle benefactress. When her sons had to flee, after participating in an unsuccessful attempt at revolution in Italy in 1831, she went for a time to Paris and was kindly received by Louis Philippe. She possessed much literary as well as social talent.

BEAULIEU, bō-l'yē, Jean Pierre, Austrian military officer: b. Namur, 26 Oct. 1725; d. near Linz, Austria, 22 Dec. 1819. He served in the Seven Years' War; was promoted a major-general for his successful operations against the Belgian insurgents in 1759; commanded at Jemappes in 1792; was defeated by Napoleon in 1796, while commander-in-chief of the forces in Italy, in the battles of Montenotte, Millésimo, Montebello, Rondini and Lodri. BEAULIEU, bu'l, England, village in Hampshire, England, six miles southwest of Southampton. It contains the remains of an abbey founded by King John and much visited by students of medieval architecture. Within the limits of Beaulieu Manor exemption from arrest for debt was enjoyed till very recent years.

BEAUMARCHAIS, bō-mär-sha, Pierre Augustin Caron de, French dramatist: b. Paris 1732; d. May 1799. He was the son of a watchmaker named Caron who destined him for his trade. He early gave striking proofs of his mechanical and also of his musical talents. He became teacher of the harp to the daughters of Louis XV and was admitted to their society. A handsome man of good address, he was very fortunate in his love affairs and married two wealthy widows in succession. He added to his wealth by successful commercial ventures. He published in 1762 'Eugenie,' and in 1776, 'Les Deux Amis?' — two dramas of the sentiment-bourgeois type, the former of which still holds a place on the stage. But all his theatrical pieces were merely the recreations of a man of affairs bent on making his fortune and desirous at all hazards to keep himself in front of the public. His rise to literary fame was sudden and resulted from his appearance in a suit for 15,000 livres which he claimed as due to him as surviving partner in a speculation. He made his appeal to the public in four 'Mémoires,' in which humor, serious argument, irony and eloquence were combined with dramatic talent, which added much to the gaiety and eloquence, pointed with wit, fully established its author's fame. By the purchase of official posts he raised himself to the ranks of the nobility. "Nobody can deny my title to noble rank," said he, "because I hold a receipt for it." During the American Revolutionary War he acted as an intermediary between the French and Spanish governments and the American insurgents under the firm name of Rodrigue, Hortalez and Company. He built up a great fleet of ships, of which one vessel, the 'Fier Rodrigue,' took part in an engagement. But this enterprise was by no means profitable; it was only the beginning of a series of losses in business. His fortune was finally recovered from the American government 800,-000 francs for claims which in 1793 had been admitted at 3,000,000. 'The Marriage of Figaro,' a sequel to 'The Barber of Seville,' was completed in 1778, but owing to royal opposition it was not permitted to appear until 1784. Its long proscription had whetted the public appetite to see it performed, and so great was the crowd assembled to witness its first representation that three persons were crushed to death. It depicts the resourcefulness with which a daring valet disputes the claim of a libertine lord for the possession of his betrothed. In Figaro the author drew himself. The established order is ridiculed in a brilliant cascade of wit; the mordant attacks on the nobles and the privileged classes, interpreting the feelings of the people, excited them so much that Beaumarchais, with Voltaire and Rousseau, may be regarded as one of the authors of the Revolution. Napoleon's testimony is emphatic on that point. But Beaumarchais wrote with no political end in view. In 1792 he wrote 'La Mère Coupable,' but never regained his former fame. His last work was 'Mes six Époques,' in which he relates the dangers to which he was exposed in a revolution in which a celebrated name, talent and riches were sufficient causes of proscription. He lost about 1,000,000 livres by his famous edition of the works of Voltaire (1785) and still more at the end of 1792 by his attempt to provide the French army with 60,000 muskets. During his absence his property was confiscated, his third wife imprisoned and he clasped among the émigrés. In 1809 an edition of his works appeared in seven volumes; a later edition in one volume came out in 1835. Beaumarchais was a singular instance of versatility of talent, being at once an artist, politician, projector, merchant and dramatist. See MARRIAGE OF FIGARO, THE; BARBER OF SEVILLE, THE. Consult Loménie, 'Beaumarchais et son temps;' (English translation 1856); 'Beaumarchais et ses œuvres;' (1897); 'Histoire de Beaumarchais;' (1886); 'Lettres de Beaumarchais;' (1887); Bonnefous, 'Etude sur Beaumarchais;' (1887); Hallays, 'Beaumarchais;' (1897).
BEAUMARIS—BEAUMONT

BEAUMARIS, bô-mar’is, north Wales, seaport town Isle of Anglesey. It is situated on the Menai Strait, near its junction with the Irish Sea, where it expands into a good roadstead called Beaumaris Bay. It consists of several well-paved streets; houses in general good, particularly in the principal street terminated by the ancient castle of Beaumaris, erected by Edward I; while many modern dwellings of very handsome appearance have lately been erected. The chief public buildings, exclusive of the churches, are the town-hall, a commodious and handsome edifice; the grammar-school, police office and public library. The chief place of worship is the church of Saint Mary, a spacious and elegant structure in the later style of English architecture, with a lofty, square embattled tower; and several chapels. The harbor is safe and commodious and may be entered at any state of the tide. Beaumaris is now a favorite watering place. It has steamship communication with Liverpool. Pop. 2,231.

BEAUMONT, Sir George Howland, English art patron: b. Dunmow, Essex, 6 Nov. 1735; d. 7 Feb. 1827. He possessed considerable skill as a landscape painter, but was noted more especially as a munificent patron of the arts. The establishment of the National Gallery was mainly owing to his exertions, and 16 of its fine paintings, chiefly landscapes, including one by N. Poussin, three by Claude and the 'Blind Fiddler' of Wilkie, were his gifts. Wordsworth dedicated to him his 'Elegiac Musings' (1830).

BEAUMONT, bô-mon’, Gustave Auguste de la Bonnière de, French publicist: b. 16 Feb. 1802; d. Tours, 6 Feb. 1866. He early entered upon the legal profession, and, in 1831, was sent with De Tocqueville to study the penitentiary system of the United States. He was elected deputy in 1839, and, in 1848, vice-president of the Constituent Assembly. He was subsequently Ambassador to London and Vienna. Beaumont first became known as a writer by his publishing, in conjunction with M. de Tocqueville, 'Traité du système pénitentiaire aux États-Unis et de son application à la France' (1832). Among his other works may be named, 'Marie, ou l'escavalage aux États-Unis' (1835)—a work somewhat resembling 'Uncle Tom's Cabin'; and 'L'Irlande sociale, politique, et religieuse' (1839).

BEAUMONT, Sir John, English poet: elder brother of Francis Beaumont; b. Leicestershire 1583; d. 19 Apr. 1627. He studied at Broadgate Hall (now Pembroke College), Oxford. In 1605 he succeeded to his father's estates on the death of his elder brother. He began writing poetry at a comparatively early age, and in 1602 published anonymously a mock-heroic piece entitled 'The Metamorphosis of Tobacco.' A long poem entitled 'The Crown of Thorns' was lost in manuscript form. He was created a baronet in 1626, died the following year and was buried in Westminster Abbey. In 1620 his son, Sir John, published a collection of his poems under the title 'Bosworth Field, with a Taste of the Variety of Other Poems left by Sir John Beaumont.'

BEAUMONT, Joseph, English poet: b. Hadleigh, Suffolk, 13 March 1616; d. 23 Nov. 1699. He was educated at Peterhouse College, Cambridge, where he gained great distinction. Elected a fellow in 1630, he was ejected with others in 1644 owing to royalist sympathies, and while living in retirement wrote 'Psyche,' an epic poem (1648). On the restoration of the monarchy he became a royal chaplain, and after a brief period as rector of Wrenthorpe, Yorkshire, was appointed, in 1663, master of Peterhouse. He received the Regius professorship of divinity at Cambridge in 1674.

BEAUMONT, Joseph, English Wesleyan clergyman: b. Castle Dowington, 19 March 1794; d. Hull, 21 Jan. 1855. He was educated in the Wesleyan school at Kingswood, was converted there and spent some time in the study of medicine. He soon entered the ministry and in 1813 was received on trial by the conference. An impediment in his speech greatly hindered his success, but by severe exercise he overcame it and became an effective preacher. For many years he was one of the most popular pulpits and platform speakers in Great Britain.

BEAUMONT, William, American surgeon: b. Lebanon, Conn., 1785; d. Saint Louis, 25 April 1853. He is principally noted for his discoveries regarding the laws of digestion and for his experiments upon the body of Alexis St. Martin. In 1822 Beaumont was stationed at Michilimackinac, Mich. On 6 June, St. Martin, a young man 18 years of age, in the service of the American Fur Company, was accidentally shot, receiving the whole charge of a musket in his left side, from a distance of about one yard, carrying with it portions of his clothing and fracturing two ribs, lacerating the lungs and entering the stomach. Notwithstanding the severity of the wound, Beaumont undertook his cure, and by careful and constant treatment and attention the following year found him enjoying good health, with his former strength and spirits. In 1825 Beaumont began a series of experiments upon the stomach of St. Martin, showing its operations, secretions, the action of the gastric juices, etc.; these experiments he was obliged to discontinue after a few months, but renewed them at various intervals until his death; his patient during so many years presenting the remarkable spectacle of a man enjoying good health, appetite and spirits, with an aperture opening into his stomach two and a half inches in circumference, through which the whole action of the stomach might be observed.

BEAUMONT, Texas, city and county-seat of Jefferson County, situated on the west bank of the Neches River, Sabine, and East Texas, Gulf, Colorado and Santa Fé, Gulf and Interstate, Kansas City Southern and Beaumont, Sour Lake and Western railroads, 80 miles northeast of Houston and 22 miles distant from the Gulf of Mexico. Beaumont is an important shipping point, is at the head of tidewater navigation and has a number of important industries, among which are oil refineries, rice mills, stone and iron works and lumber. Oil was discovered in the Beaumont fields in 1901, when there was opened up a series of gushers, the most remarkable in the history of the oil industry. That oil was there had long been known and several
BEAUMONT AND FLETCHER

men had lost fortunes trying to get at it, but it was not until the wells were sunk on Spindle Top that success came. The structure of Spindle Top, a cone with steep sides and rather flat summit. The equipment of the refineries, the pipe lines and transportation and storage facilities for this industry alone represent an investment of over $45,000,000. The oil output now exceeds 360,000,000 feet of yellow pine. The cultivation of rice was begun some years ago; the belt extending along the coast of Louisiana and Texas produces more rice than is consumed in this country, and the largest rice mill in Texas is located at Beaumont. Among the most notable public buildings are the new Federal courthouse and post-office, costing over $1,000,000, the Jefferson County courthouse, city hall, Y. M. C. A. building and the Sisters' Hospital. Religious services are held in churches representing nearly all denominations. A theatre has been erected at a cost of about $100,000. There are four banks, with a combined capital of $1,000,000 and an annual business of $25,000,000. For the public education there are a fine new high school with manual training department and several ward schools. Bell Austin Institute is located there. About 20 miles of street are paved with brick and shell; a complete sewerage system has been installed; a new waterworks system has been completed at a cost of over $300,000; and there are well-appointed fire and police departments. Beaumont was first settled in 1856, being platted by John Grisy, Joseph Pulifer, Henry Millard and Thomas B. Huling. It was incorporated under the general law in 1881 and granted a special charter in 1889, the affairs of the community now being administered by a mayor and council of six members, elected biennially. About 80 per cent of the population are white, the remainder negroes. Pop. 20,640.

BEAUMONT AND FLETCHER. Beaumont, Francis, b. 1584; d. 1616; Fletcher, John, b. 1579; d. 1625: English poets and dramatists, well known for their work in collaboration.

Francis Beaumont, third son of Sir Francis Beaumont of Grace Dieu in Leicester, was of the justices of the Common Pleas, was admitted gentleman commoner at Broadgates Hall, Oxford, in 1597, and was entered at the Inner Temple, London, 3 Nov. 1600. He married Ursula, daughter of Henry Isley of Sundridge, Kent, probably in 1613, and left two daughters, one a posthumous child. He was buried in Westminster Abbey.

John Fletcher, son of Richard Fletcher, bishop of London, was entered as a preacher at Benet's College, Cambridge, 1591. His father, as dean of Peterborough, attended Mary Queen of Scots at Fotheringay, and was later rapidly promoted to the sees of Bristol, Worcester and London. He was a successful courtier and a favorite of the Queen, though he suffered a loss of favor shortly before his death in 1560. The dramatist received by bequest a share in his father's books, but apparently little other property. He was buried 29 Aug. 1625, in Saint Saviour's, Southwark.

Although the biographical details of the friendship and collaboration of the two dramatists are involved in uncertainty, it seems probable that Fletcher began writing plays for the London theatres as early as 1604-05. It is probable that his friendship with Beaumont was established by 1607, when both prefixed commendatory verses to Jonson's 'Volpone,' and 'The Woman Hater,' probably by Beaumont alone, was published. In 1612, in the address to the reader prefixed to the 'Whit Dying,' Fletcher praises 'the no less worthy composures of the both worthy excellent Master Beaumont and Master Fletcher,' ranking them on equal terms with such scholars and experienced dramatists as Chapman and Jonson, and apparently above Shakespeare, Dekker and Heywood. Before 1612, the reputation of Beaumont and Fletcher as dramatists must have been well established. By 1612, indeed, the work of their collaboration was accomplished, for there is no direct evidence that Beaumont wrote anything for the public stage after that date. The most famous collaboration in the history of English literature, therefore, comprises only some half dozen years. During this time the dramatists, as we are told, lived as brothers, sharing the expenses of their business of $25,000,000. For the public education there are a fine new high school with manual training department and several ward schools. Bell Austin Institute is located there. About 20 miles of street are paved with brick and shell; a complete sewerage system has been installed; a new waterworks system has been completed at a cost of over $300,000; and there are well-appointed fire and police departments. popular but by this time falling under Jonson's attacks. Beaumont and Fletcher in their collaboration made no use of the historical matter of the chronicles or of the methods or spectacles of the chronicle play; nor did they use the stock roles of the stage which had been popularized by Kyd in 'The Spanish Tragedy,' transformed by Shakespeare into 'Hamlet,' and was still the prevailing type of tragedy. Some of their earlier plays were experiments that further attest their reforming attitude. Beaumont's 'Woman Hater' was a comedy in Jonson's manner; and his 'Knight of the Burning Pestle,' written under the inspiration of 'Don Quixote,' was a burlesque on contemporary plays of adventure. Fletcher's 'Faithful Shepherdess' was an attempt to replace the abortive pastorals of earlier playwrights by a genuine and elaborate pastoral tragi-comedy on the model of 'Il Pastor Fido.' These plays won the praise of the critical, but even the manifest genius of the two latter was impotent to avert the disapproval of a public unused to such innovations.

Their other plays, though hardly less novel in character, and affording full opportunity for the authors' gifts of invention and language, succeeded in captivating the public. These successes called for a constant attention to theatrical effectiveness, comprised two distinct classes of plays, the comedies and the heroic romances, both immediately popular and both of large influence on the later history of the drama.

Their comedy has its resemblances and connections with preceding drama; but it is a distinct departure from Jonson's comedy of 'humours,' and it marks out a line of development that led to the plays of the Restoration. A lively plot, aboundings in surprises, combines in a love story the manners of the day and the excitements of romance, an overflowing wit and no morals. Its full development belongs to Fletcher's later years; 'The Scornful Lady' is perhaps the best representative of the collaboration.

The romances, sometimes tragic and sometimes tragi-comic, also mark important innovations. The period immediately preceding them had been distinguished by Shakespeare's tragedies, the prevalence of realistic comedy and the absence of sentimental or romantic comedy or tragi-comedy. The return to romance seems to have been established by 'Philaster,' and resulted in six plays that form the most distinctive product of the collaboration.

Other plays of the collaboration and many later written by Fletcher might be grouped with these; but the six plays, 'Four Plays in One,' 'Thierry and Theodoret,' 'Philaster,' 'The Maid's Tragedy,' 'Cupid's Revenge,' 'A King and No King,' serve to define the type and resemble one another so closely in material, construction, characterization and style that a single analysis will serve for all.

Their plots are usually original, and are ingenious complications of suspense and surprise. Like most preceding tragedies, they deal with royal or noble persons, foreign localities, and the passions that cause love and hate, kingdoms; but there are no battles or processes, and the action is mainly confined to the rooms of the palace or an adjoining forest. A story of gross sensual passion is usually contrasted with one of idyllic sentiment: and a great variety of incidents are designed to keep the interest at fever heat. A girl disguised as a page is stabbed by the man whom she loves; a woman accused of adultery defies her accusers; the hero is saved from the tyrant by a timely inscription — such idyllic or melodramatic material as this is skilfully constructed into a number of telling theatrical situations, leading through a series of surprises to startling climaxes. With the addition of their structure even more than in the choice of their material, the romances marked a departure from preceding plays. Their dramatic scenes belong to the impossible and romantic situations, and are usually of certain types — the sentimental or violent hero; his faithful friend, a blunt outspoken soldier; the sentimental heroine, often disguised as a page that she may save the hero; the evil woman who makes most of the trouble; and the pokeroom, usually a comic personage of the character of a king, some persons of the court and some from the lower ranks, the cast is complete. Even at their best such plays afford little that is valuable in the revelation of character or the criticism of life; yet the moral of the class, 'Philaster,' and 'The Maid's Tragedy,' take almost if not quite the highest rank after Shakespeare, because of the skill of their invention and the felicities and vigor of their poetry.

Both romances and comedies delighted their own age, and the young authors were quickly established among the poets of highest rank in both critical and popular estimation. There is evidence that their heroic plays suggested Shakespeare's change from tragedy to romance, and that 'Philaster' led somewhat directly to 'Cymbeline.' Certainly both comedies and romances were much imitated by dramatists of the next 30 years. Their freedom in variation, their emphasis on stage situations rather than interpretation of character, their heedlessness of morality, and their fondness for the abnormal and sensational, all led to the decadence of the drama; but much of what is worthy as well as what is unworthy in the drama of the 17th century may be traced back to their initiative. They were ranked above Shakespeare and Jonson by their contemporaries, and their plays remained the favorites of the theatre during the Restoration. By the beginning of the 17th century, pseudo-classicism brought them into disrepute with critics, and a chastened stage condemned their immorality. During the two centuries since they have never recovered their position on the stage, but numerous editions of their plays testify to their continued favor with the reading public.

After 1612 Fletcher continued for 13 years to write plays with unabated energy, displaying even greater versatility of invention and wit than when writing with Beaumont, but becoming more addicted to his mannerisms and more careless of moral decency. About 1613 he seems to have collaborated with Shakespeare on 'Henry VIII.' and 'The Two Noble Kinsmen,' and the association with the great master brought the passions that cost him kingdoms. He was, indeed, frequently engaged in collaborating with various authors, and especially with Mas- singer. 'The Queen of Corinth,' 'The Double
BIBLIOGRAPHY.—Collective editions of Beaumont and Fletcher were published in 1711; 1750, edited by Theobald; 1773, at the expense of Mr. Dodsley, 18 vols.; 1778, 10 vols.; 1812, ed. Henry Weber, 14 vols.; 1843-46, ed. Alexander Dyce, 11 vols.; and there have been various reprints of these editions. Dyce's edition has long remained the standard, and it has hardly been supplanted by the more critical edition by Dyce and Underwood, under the editorship of A. R. Waller (1905-10).

The most important of recent critical discussions are those by Francis Beaumont, a Critical Study, by G. C. Macaulay (1883); 'The Influence of Beaumont and Fletcher on Shakespeare' by A. H. Thorndike (1901); 'The Chronicle of the English Drama,' by F. G. Fleay (Vol. I, pp. 164-229); and articles by Robert Boyle in *Englishe Studien* (1881-87), and by E. F. Oliphant, *Englishe Studien* (1890-92). Separate plays with critical introductions and notes are published in 'Belles Lettres Series' (Boston).

ASHLEY H. THORNDIKE,
Professor of English, Columbia University.

BEAUNE, bōn, Florimond de, French mathematician; b. Blois, 1542. He materially developed his friend Descartes' method in geometry and was the first to treat systematically the question of superior roots of numerical equations. What is styled 'Beaune's Problem,' solved only by Jean Bernoulli, depends on the determination of a curved line from the property of its tangent. He was the first to treat in a systematic way superior and inferior roots of numerical equations.

BEAUNE, France, a town in the department Côte d'Or, 23 miles southwest of Dijon. As early as the 7th century it was a fortress under the name of Belna. It is surrounded with planted ramparts, which furnish a pleasant promenade, is well built and has a notable church of Notre Dame, dating from the 12th century, and a large hospital founded in 1443 by Nicholas Rollin, chancellor of Philip the Good, Duke of Burgundy. Beaune has also a public library containing over 50,000 volumes with 500 manuscripts, a very fine public garden, a theatre, etc. The trade is chiefly in wines, to one of which the town gives its name, and in agricultural produce. The manufactures include woolen cloth, cutlery and leather. There is a statue, erected in 1849, to the celebrated mathematician Monge, who was born there. Pop. (1911) 13,409.

BEAUPORT, Canada, parish in Quebec County, on the Saint Lawrence, two miles below Quebec city and connected with it by the Quebec Railway, Light and Power Company's line. There is a Roman Catholic church, college and convent. Saw and grist mills, cement works, manufacture of threshing machines and quarrying are the chief industries. The seigniory of Beauport, granted in 1634 to Robert Giffard, was the first to be established in New France. Pop. of parish about 5,000.

BEAUREGARD, bō-té-gärd, Pierre Gustave Toutant, American general; b. New Orleans, 28 May 1819; d. there, 20 Feb. 1893. After studying military science at West Point he joined the artillery, but was afterward transferred to the engineers. In the Mex-
ican War of 1846-47 he distinguished himself and was promoted major. On the outbreak of the Civil War he resigned in order to enter the Confederate army and was placed in command of the city of Charleston, S. C. On 12 April 1861 he reduced Fort Sumter and later in the same year led the Confederates to victory in the battle of Bull Run. At the battle of Shiloh in the following year he assumed the command on the death of Gen. A. S. Johnston, but, though very successful on the first day, he was ultimately compelled to retreat to Corinth, Miss., which he had to evacuate shortly afterward. From September 1862 till April 1864 he defended Charleston against the siege operations of General Gillmore and Admirals Dupont and Dahlgren. October 1864 he became commander of the military division of the West, in which capacity he strove without success to resist Sherman's victorious advance, and in April 1865 he and J. E. Johnston surrendered. He was afterward a railroad director, adjutant-general of Louisiana and manager of the Louisiana State lottery. In 1866 the chief command of the State was tendered him but in 1869 that of the army of the Khedive of Egypt, both of which he declined. He published "The Principles and Maxims of the Art of War" (1863); and "Report on the Defense of Charleston" (1864). Consult Roman, "Military Operations of General Beauregard" (New York 1883).

BEAUREPAIRE-ROHAN, bō-rō-pō-rō−ān, Henriques de, Brazilian geographer of French extraction: b. province of Piauhy, about 1818; d. 1894. He traveled extensively in the Brazilian province of Rio de Janeiro, publishing the results of his tour in a volume called "Descrição de uma viagem de Cuyabá ao Rio de Janeiro" (1846). The Brazilian government subsequently employed him to gather statistics relating to the interior provinces, and he was at one time lieutenant-general in the Brazilian army. His "Estudos acerca da organização da carta geographica e da historia physica e politica do Brazil" (1877) is a work of great importance.

BEASOBE, bō-sohr, Isaac de, French Protestant historian: b. Niort in France, 8 March 1659; d. Berlin, 5 June 1738. He was at first intended for the law, but his own inclinations were decidedly in favor of the Church, and in 1683 he became Protestant minister of Chatillon-sur-Indre. In the persecuting spirit of the time the church had been closed by fixing the royal seal upon the gate. Beasobe held special services in his own house, and being for this reason obliged to flee, sought an asylum at Rotterdam. Shortly after he became chaplain to the Princess of Dessau and in 1694 was appointed minister to French Protestants at Berlin. He enjoyed much of the favor both of Frederick William I and of the Crown-Prince, afterward Frederick the Great. His most remarkable work is the "Histoire critique de Manichée et du Manichéisme" (1734); and he also wrote "Histoire de la Réformation" (1785-86).

BEAUTY. See ÄSTHETICS; ART.

BEAUTY AND THE BEAST, an ancient story very evidently a myth of the Sun and the Dawn. In all the variants the hero and the heroine cannot behold each other without misfortune. One of the earliest forms of the story is the Vedic myth of 'Urvasi and Pururavas.' Another is the Sanskrit Bheda, who marries on condition she shall never see water; thus typifying the dawn, vanishing in the clouds of sunset. In Greek myths we find a resemblance in some form of Bulb Rom. At the battle of Shiloh in the following year he assumed the command on the death of Gen. A. S. Johnston, but, though very successful on the first day, he was ultimately compelled to retreat to Corinth, Miss., which he had to evacuate shortly afterward. From September 1862 till April 1864 he defended Charleston against the siege operations of General Gillmore and Admirals Dupont and Dahlgren. October 1864 he became commander of the military division of the West, in which capacity he strove without success to resist Sherman's victorious advance, and in April 1865 he and J. E. Johnston surrendered. He was afterward a railroad director, adjutant-general of Louisiana and manager of the Louisiana State lottery. In 1866 the chief command of the State was tendered him but in 1869 that of the army of the Khedive of Egypt, both of which he declined. He published "The Principles and Maxims of the Art of War" (1863); and "Report on the Defense of Charleston" (1864). Consult Roman, "Military Operations of General Beauregard" (New York 1883).

BEAUVIS, bō-vā, Ambrose Joseph Palisot de, French naturalist: b. Arras 1752; d. 1820. He visited Africa, the West Indies and America in connection with his favorite pursuits in natural history and was rewarded by the discovery of the jaws and molar teeth of the great mastodon, on the banks of the Ohio. He afterward returned to France and devoted the remainder of his life to the arrangement and publication of his collections. Comparatively few of them had arrived in safety, but out of the wreck he managed to procure materials for the important publications on which his fame chiefly rests. The most valuable is his "Flore d'Oware et de Beulieu." One of the most curious plants contained in it has been named after him Belvisia.

BEAUX, bō, Cecilia, American artist: b. Philadelphia 1863. She studied under William Sartain and at Paris. She four times gained
the Mary Smith prize of the Pennsylvania Academy of the Fine Arts, and was awarded the same academy's gold medal and Temple gold medal. She received similar honors from the National Academy of Design, the Philadelphia Art Club, Carnegie Institute and the Paris Exposition of 1900; the Saltsch gold medal, 1910; and a medal of honor, Panama, 1915.

**BEAUX-ARTS**, bô-zár, Académie des. See Academy of Fine Arts, THE.

**BEAUX-ARTS ARCHITECTS, Society of**, an association organized in 1902 by the American graduates of the École des Beaux-Arts in Paris. The object of the Society is to afford instruction in architecture in the United States on the same principles as in the Paris institution. In various cities and towns now numbering about 50, local groups of students are organized into schools, the work of which is sustained by contributions from the students themselves. The services of the instructor are generally free. In all the schools is more or less under the general supervision of the committee on education of the Society, which issues schedules guiding the courses. Included are various problems which are worked out by the students competitively, designated under two divisions: Class A and Class B. Four prizes are awarded: the Warren prize, for the best plan of a group of buildings; the Pupin prize, for the best decoration of scientific appliances; the Goethe prize, for the best plan of a city block, and the Bacon prize, for the best work done under Class A. Besides the latter prize, offered by Robert Bacon, he also presents a yearly Paris scholarship, which includes $2,500 in cash to enable the winner to study for two and a half years in the École des Beaux-Arts in Paris.

**BEAUX’ STRATAGEM**, a well known comedy by the English dramatist, George Farquhar (q.v.).

**BEAUXITE.** See Bauxite.

**BEAVEN, Robert**, Canadian statesman: b. Leigh, Staffordshire, England, 28 Jan. 1836. He was educated at the College of Upper Canada, went by way of Panama in his early days, and from California went to British Columbia and was successfully engaged in gold mining there for some years. He returned to Toronto and again visited California over the Panama route. Later he removed to Victoria, B.C., and has continued there. He identified himself with the agitation for confederation with the Dominion, took an active part in the organization of the Confederate League and after the consummation of the union in 1871 he was elected member for Victoria; he was re-elected until 1894. In 1892, 1893 and 1897 he was mayor of Victoria. In 1872 he was chief commissioner of lands and works in the De Cosmos cabinet and held the office for several years. In 1878 he was appointed Minister of Finance and Agriculture. Later he became Premier and resigned in February 1883 when his government was defeated. While in office he had largely to do with all important questions of that day, construction of the Canadian Pacific Railway, the building of the Victoria, Esquimalt and Graving Dock, and the establishment of a free non-sectarian system of education, the Law Stamp Act, the Game Protection Acts 1878-80, the Amended Ballot Act 1878. As a parliamentarian, pure and simple, he was versatile; while as an authority on procedure he may be regarded as the equal of any man in Canada.

**BEAVEN, Thomas**, American Roman Catholic prelate: b. Springfield, Mass., 1849. He was educated at the Jesuit colleges of Holy Cross, Worcester, Mass., and Georgetown, D. C. After holding pastorates at St. Peter's and Holyoke, Mass., he was consecrated bishop of Springfield in 1892 where his gifts as an organizer and the application of sound business principles to the temporal affairs of the Church have produced striking results.

**BEAVER, James Addams**, American military officer and statesman: b. Milletown, Pa., 21 Oct. 1837; d. 31 Jan. 1914. He was graduated at Jefferson College, Canonsburg, Pa., in 1856; and for a time practised law. He served in the Federal army, 1861-64; and was retired with the rank of brigadier-general of volunteers (22 Dec. 1864). He then resumed his practice of law; became major-general of the Pennsylvania State militia; was defeated as Republican candidate for governor in 1882; elected in 1887; president of the board of trustees of the Pennsylvania State College; vice-moderator of the Presbyterian General Assembly in 1888 and 1895, and member of the President’s commission on investigation of the War Department in 1898.

**BEAVER, Philip**, English naval officer: b. Lewknor, Oxfordshire, England, 28 Feb. 1766; d. Table Bay, South Africa, 5 April 1813. He served during the American Revolutionary War in the royal navy. After the war he undertook to establish an agricultural colony on Bulama Island, on the west coast of Africa, and in April 1792 left England with three ships and 275 white colonists, expecting that the latter would not only cultivate the soil, but would do much toward civilizing the negroes. The enterprise proved a failure and he returned to England in 1794. Subsequently he distinguished himself in the naval service.

**BEAVER, Pa.,** borough and county-seat of Beaver County, on the Ohio River, and the Pennsylvania and the Pittsburgh and Lake Erie railroads, 28 miles northwest of Pittsburgh. It has natural gas, abundant water power and municipal waterworks, large coal and oil shipping interests, a public park, national bank and daily and weekly newspapers and is the seat of Beaver College (Methodist Episcopal), founded 1853. Beaver dates from a settlement of 1790. The late United States Senator Matthew S. Quay resided here. Pop. 12,191.

**BEAVER, a large aquatic rodent animal of the northern part of the world named by Linnaeus Castor fiber, and representing the family Castoridae.** Some naturalists maintain that the American beaver is specifically different from that of the Old World, and is therefore entitled to its specific name of Castor canadensis. All varieties agree so closely that there is little need of any such classification. It is distinguished from its nearest relatives, the marmots, not only by adaptation to an aquatic life, and the possession of a webbed hind foot, which form the principal instrument for swimming, but especially by its extraordinary tail, which is exceedingly broad and cov-
ered with a horny integument resembling scales. A large beaver is about two feet in length from the root of the tail to the nose, and the tail will be nearly a foot long. Such a one will weigh about 35 pounds. Its flesh is edible, but not particularly good. The fur is exceedingly close and fine, and when freed from the long hairs that are scattered through it and overlies the under coat, forms one of the most valuable furs of commerce and one which is found largely in the trade of North America. It is owing, indeed, to the eagerness with which men have sought for this valuable commodity, going farther and farther into the wilderness in search of the animal, that the beaver has almost disappeared from large regions where it was once numerous. Originally it was widespread throughout Europe and northern Asia, but became extinct in the British Islands in the 13th century, and it remains else-where in Europe only in a few of the wilder streams of Norway and some of the tributaries of the Rhone and the Danube, where it is under royal protection. In some cases colonies of cap- tives have re-established themselves in parks, notably one near London in England. It still exists, however, in eastern Siberia, whence a large number of its skins are annually sent to market.

When America was first entered by Euro- peans, the beaver was found inhabiting almost all of the woodland streams of the whole north- ern continent, from the Arctic Circle down to central Mexico. Its temperament and manner of life made it an easy prey and prevented it from adapting itself to changed conditions as did its neighbor, the muskrat. It rapidly dis- appeared, therefore, wherever civilization pro- gressed or trapping was systematically carried on, and now no beavers are to be found south of the rivers that flow into Hudson Bay, except in the northern parts of the Rocky Mountains and in a few remote and scattered places like the forests of Maine and the Lake Superior region, where they are more or less protected by law. A few survive, nevertheless, in the wild ranges of the southern Alleghenies and along the borders of Mexico. The principal use which beaver fur was put was for the making of hats; and it is probable that had not the method of making hat-coverings from silk been discovered, the animal would long ago have become extinct, and also its South American substitute, the coypu or nutria.

The life of the beaver is remarkably inter- esting on account of the skillful structures by which it keeps itself surrounded with a suffi- cient depth of water, and so maintains access to a continuous supply of food. The food of the beaver consists mainly of the bark of hard- wood trees, such as the maple, linden, birch, poplar and the like. It never eats the bark of the coniferous trees, and, as living in forests composed entirely of coniferous trees, nor are beavers able to live in a treeless country. They are gregarious and dwell in colonies, which in favorable circumstances may persist for centuries. From time to time a pair of beavers will wander away from such a colony and seek a new place in which to start fresh. They will choose a sluggish stream in the woods, preferably where the ground is low and level, and there will dig for themselves a burrow in the bank, the entrance of which is below the surface of the water. The tunnel will lead upward into the earth above the level of high water, and there be enlarged into a chamber in which will be placed a bed of grass, grass, and if the stream is not too large, an opening from this chamber into the air, and, as if for defense or concealment, will pile over this opening a little heap of brush, in which perhaps may be seen the germ of the architectural ability which the species have so highly developed. It is necessary to have a sufficient depth of water in the stream so as not to expose the entrance of the bur- row; moreover, it is necessary that this water should be so deep that in winter the ice will not freeze to the bottom, but that, on the contrary, there shall remain room enough between the ice and the bed of the creek for them to store there a supply of winter food. In order to maintain this requisite level of water the beav- ers throw a dam across the stream below their settlement, holding the water back to a sufficient height. For this purpose they choose a place where the water is not more than 2½ feet deep and the bottom is firm, and beginning in the centre of the place where, length- wise of the current, a number of long sticks which they hold down by piling upon them mud and stones, moved into place with their dex- terous fore feet. They procure these poles by cutting off small trees with their front teeth, which are exceedingly large and strong and are faced with a hard yellow enamel. As the back part of the tooth consists of softer ma- terial, it wears away more rapidly, leaving the front with a chisel-like edge, which is always sharp. Standing on their hind feet, they gnaw round and round the stem of a tree until it falls; and are able to cut down trees 18 inches in diameter, but this is only done in procuring their winter supplies. From its foundation in the centre the dam is carried each way to the shore. As the beavers increase in number and the young ones grow up, they settle in the immediate neighborhood until after a few years a considerable colony will have arisen. During all this time work proceeds, but in the dam each beaver gathering drift-wood, branches and logs from the shore, stones, mud, pieces of sod and everything available for the purpose, and working it into the structure of the dam. The work is carried on only at night and especially on pleasant moonlight nights, when they seem to be extremely busy from sunset till sunrise. There is no superintendence, but each one pos- sessed with an instinct for industry does what- ever seems to it best. The result is a mere tangle of wood, having a long slope and com- paratively tight surface on the upper side, which sometimes in a low, swampy region, will stretch for several hundred feet and hold back a large pond or morass, largely grown up to grass, but having the beavers are not disturbed. Meanwhile each family of beavers has erected for itself upon the bank of the pond or upon some islet adjacent to one of the channels, a conical house or lodge, the interior of which may be a room six or seven feet in breadth, which has a slender chimney, and roofs over from beneath the water by two channels, one of which is commonly used, while the other forms a means of escape in case of invasion by a mink or some other aquatic enemy. These houses are more solidly constructed than even
BEAVER—BEAVER FALLS

the dam; and when frozen in winter are so thick and strong that nothing less than a bear is able to break into them. These houses are largest and strongest in the cold northern regions. During the summer summers, the beavers go ashore and obtain from time to time such bark as they want for food, and also feed largely upon the roots and stems of the aquatic and other water plants. In winter, however, when the pond is covered with ice and the banks with snow, the beavers would be unable to obtain such food, and to escape starvation are obliged to store in the autumn a sufficient supply to last them through the winter. They do this by felling large trees near the water’s edge and cutting them up into such portions as they can manage to roll or drag into the water. These are floated away and sunk at the doors of their houses, where they are weighted or stuck into the mud to prevent their floating away, until a sufficient pile has been procured. Piece by piece this store is taken into the house during the winter, and, having been eaten off, the sticks are thrown out to be used in the spring as material for repairing and extending the dam.

It will be apparent that a colony of beavers would soon exhaust the supply of trees bearing edible bark within reach of the shore of their stream, unless they had some means of reaching new and more distant supplies. In truth, where the banks are steep, this soon happens, and the beavers must then seek a new place. Where the forest is low and level, however, they will excavate canals which are gradually extended farther and farther into the wood on each side of the pond, and so enable themselves to reach more and more fresh trees. In some of the swampy forests about the headwaters of the Mississippi, which was perhaps the head-quarters of beaver life in this country, these canals have been known to extend several hundred feet, and in such places colonies of beavers have maintained an existence of more than 80 years. These channels are kept free from weeds and of a proper depth; and the most important service which the dam renders is to maintain the right level of water in these canals, so that they may always be used as the avenues of the beavers’ community.

The American beaver seems to have carried its architectural work to a higher degree of perfection than the European beaver was ever known to do, although in Siberia, where similar climatic conditions prevail and it is necessary for them to erect houses impervious to the great cold and to the attacks of marauding animals, they come near to equaling their American cousins. There is little record of such structures being made primitively in continental Europe, and the beavers now living in the streams of Germany and Austria make few attempts at either dams or houses but are content to dwell in their bank-burrows.

There are 17 species of beaver, of which there are colonies in the zoological gardens of the larger cities. In 1913 for the first time beavers bred in their pond in the New York Zoological Park.

The substance called castoreum is obtained from two glandular pouches in the beaver, closely connected with the organs of reproduction, and of considerable service in attracting the sexes to one another in the rutting season. It is a secretion having a powerful, peculiar, pungent odor and was formerly in demand for medical purposes. At present it is only used as a scent-bait for traps. Fossil remains of beavers have been found as far back as the middle of the Tertiary period. Fossils of small-sized species with some distinctive peculiarities occur in the Miocene of the western United States; and a huge beaver (Tragontortherium) existed in Europe in the Pliocene age. Consult Harting, ‘British Animals Extinct within Historic Times’ (London 1880); Martin, H. T., ‘Castorologia’ (Montreal 1892); Mills, E. A., ‘In Beaver World’ (Boston 1913); Morgan, ‘The American Beaver and his Works’ (Philadelphia 1868); Ingersoll, ‘Life of Mammals’ (New York 1907); Seton, ‘Northern Mammals’ (New York 1909).

BEAVER DAM, Wis., city of Dodge County, 64 miles northwest of Milwaukee, situated on Beaver Dam Creek, at the outlet of Beave Lake, and on the Chicago, M. & St. P. and C. N. W. railroads. It is the seat of Wayland Academy, Wagner Musical College and also a business college. It has a public library, an armory, opera house, four public schools, and one high school, three banks and taxable property to the value of $4,898,345, and several parks. It is an agricultural district and has considerable trade; it is also well provided with water power and has numerous manufacturing interests, including flour and woolen mills, canning factories and breweries, and manufactures of malleable iron ranges, seeder machines, silo, boxes, shoes and machinery, etc. Beaver Dam was settled in 1841 and incorporated in 1850. The revised charter of 1899 provides for a mayor and a city council, to be elected biennially. Pop. (1910) 6,758.

BEAVER DAMS, Battle of, in the War of 1812. After the battle of Stony Creek (q.v.) the American army remained inactive some time, but on 23 June 1813 Gen. John P. Boyd (q.v.), then in command at Niagara, sent Col. C. G. Boerstler with 400 or 500 troops and two guns to dislodge a British force at Beaver Dam, about 18 miles from Fort George. On 24 June Boerstler began the march but when in the woods found himself surrounded by a force of British and Indians, numbering about 200, according to British authorities Boerstler attempted to retreat but found escape cut off and therefore surrendered his entire force. Practically nothing more was done in this vicinity for many weeks. Consult ‘American State Papers, Military Affairs’ (Vol. I, p. 449); Adams, Henry, ‘The United States’ (Vol. VII, pp. 162–63); Armstrong, John, ‘Notices of the War of 1812’ (Vol. I, p. 142); Pay, ‘Official Accounts’ (pp. 112–13); Lossing, ‘The War of 1812’ (pp. 619–20); Wiley and Rines, ‘The United States’ (Vol. V, pp. 407–08).

BEAVER FALLS, Pa., city in Beaver County, situated on the west bank of the Beaver River, about five miles from its confluence with the Ohio River, 31 miles by rail northwest of Pittsburgh, and seven miles north of Beaver, the county-seat, and on branches of the Pittsburgh & L. E. and Pennsylvania railroads. The water power furnishes excellent facilities for manufactories; there is an abundant supply of coal and natural gas, and the
manufactures consist of iron bridges, axes, saws, glassware, gas engines, steel products, pottery and automobile accessories. The United States Census of manufactures 1914 recorded 59 industrial establishments of factory grade, employing 2,984 persons, of whom 2,639 were wage earners, receiving annually $1,616,000 in wages. The capital invested aggregated $9,401,000, and the value of the year's output was $7,963,000; of this $3,741,000 was the value added by manufacture. There are four banks, a Carnegie library, Providence Hospital and a commodious post-office building. Beaver Falls is also the seat of Geneva College (Reformed Presbyterian). Religious services are held in 17 church edifices. Beaver Falls was settled about 1800 by a few families of pioneers, and was called Brighton until 1868, when it was incorporated as a borough. In 1913 it adopted the commission form of government. Until 1868 the town was only a small village, but in that year the Harmony Society bought up nearly the entire tract of land and laid it out into lots, thus starting the growth in population, until it now is the largest town in Beaver County. Pop. 13,000.

BEAVER ISLANDS, a group of islands situated in the north part of Lake Michigan in Charlevoix County, and interesting as the scene of a short-lived Mormon colony. The largest town, Saint James, on Big Beaver Island, was settled in 1847 by James J. Strang, Mormon elder, driven away from the parent Mormon community because his claims conflicted with those of Brigham Young. In the little colony which he called Saint James, after himself, Strang exercised the authority of king and high priest, and was implicitly obeyed. In 1849 he introduced polygamy, which did not spread rapidly and led to withdrawals and troubles with the "gentiles." Strang was assassinated in 1856 and the colony dispersed. There are several lighthouses on the island. Pop. of Saint James about 651. Of townships, 375.

BEAVER STATE, a popular designation of Oregon.

BEAVERBROOK, Sir William Maxwell Aitken, baron, Canadian financier: b. Newcastle, New Brunswick, 25 May 1879. He is the third son of the Rev. William Aitken, a Presbyterian minister. He received his education at the public school of Newcastle, and afterward took a short course of law at Chatham; engaged for a time in insurance work, and became a member of the Montreal Stock Exchange in 1907. He has been an active force in finance, organized a number of business consolidations and established a private banking firm in 1911. His rise has been meteoric. He is described as a financial genius, and the ablest young man the Canadian financial world has seen in many years. In 1910, after his departure from Canada, he was elected Unionist member for Ashton-under-Lyne, in the British House of Commons, which constituency he continued to represent until his elevation to the peerage in 1917 as Baron Beaverbrook. He was official "eye-witness" with the Canadian Expeditionary forces during the European War, and is author of "Canada in Flanders" (Vol. I, 1915; Vol. II, 1917).

BEAVERWOOD. See MAGNOLIA.

BEAZLEY, Charles Raymond, English historian and geographer: b. Blackheath, 3 April 1886. Graduating from Oxford, he was appointed to the chair of history at the University of Birmingham. His first work of importance was "The Dawn of Modern Geography" (1897-1906), for which he was awarded the Giff Memorial of the Royal Geographical Society in 1907. In 1908 he lectured at several American universities, being Lowell lecturer in Boston. Aside from his many contributions to leading monthly periodicals, he has written "James of Aragon" (1890); "Henry the Navigator" (1895); "John and Sebastian Cabot" (1899); "Voyages of Elizabethan Seamen" (1907); "Introduction to Chronicle of Novgorod" (1915).

BEBERINE, an uncrystallizable basic substance, C_{15}H_{29}NO_{3}, extracted from the bark of the bebeueru or greenheart-tree (Nectandra rodiei), of Guiana. In pharmacy, the sulphate of beberine is a valuable medicine, being used, like caffine, as a tonic and febrifuge. Unfortunately, owing to the supplies of the bark being uncertain, the drug is sometimes scarce and difficult to obtain. Beberine is thought, by some chemists, to be identical with buxine.

BEBEK, a village on the Bosphorus, five miles north of Constantinople, of which city it is a suburb. It stands on the site of ancient Chale; in the adjoining bay once stood a temple to Diana Dicystyna. The picturesque situation of the place and the beauty of the surroundings made Bebek a favorite resort of various sultans. Selim I built a summer palace on the water-side, known to Europeans as the Palace of Conferences, where ambassadors were received in secret audience. On the top of the hill is the college founded by the late Christopher R. Robert of New York, and named for him Robert College (q.v.).

BEBEL, Ferdinand August, German Socialist leader: b. Deutz-Koeln, 22 Feb. 1840; d. Passugg, Switzerland, 14 Aug. 1913. The son of a Prussian-Pole who was a non-commissioned officer in the Prussian infantry, Bebel was born in military barracks and apprenticed as a boy to a wood-turner. Like most German workmen at that time, he traveled extensively in search of work. At Salzburg, where he lived for some time, he joined a Roman Catholic workmen's club. When in Tyrol in 1859 he volunteered for service in the war against Italy, but was rejected; and in his own country he was rejected likewise as physically unfit for the army. In 1860 he settled in Leipzig as a master turner, making horn buttons, and speedily drifted into the political movements which were then beginning, but as a radical, not a socialist. He fell under the influence of Wilhelm Liebknecht (d. 1900), in 1864, and was converted to the doctrines of Marx (q.v.). In 1867 he was returned to the North German Parliament, and two years later helped to found the Social Democratic Party. In 1870 he spoke in Parliament against the continuance of the war with France and subsequently denounced the annexation of Alsace and Lorraine. He was arrested for high treason, but acquitted; in 1872, however, he was again prosecuted and sentenced to two
YEARS' confinement in a fortress, and this and other terms of imprisonment enabled him to make a prodigious advance. He remained a member of the Reichstag from 1871 till his death, except during 1881-83. In 1874 he took a partner and founded a small button factory, for which he acted as drummer, but in 1889 gave up his business to devote himself wholly to politics, and from the death of Liebknecht he had been the head of the party, succeeding him also in the editorial chair of Vorwärts, the often-suppressed socialist organ. Bebel was not a pure pacifist; he admitted that military service was a civic duty. In later years his socialism became more modern. He was unlike the typical demagogue, being small, slight and nervous, but he had an admirable voice and was an exceptionally logical and in- cisive orator. Besides his autobiography he wrote 'Our Aims' (1874); 'The German Peasant War' (1876); 'The Life and Theories of Charles Fourier' (1888); 'Women and Socialism: The Christian Point of View in the Woman Question' (1893).

**BEBEL, Heinrich**, German humanist: b. 1472; d. 1518. He was an alumnus of Cracow and Basel universities, and from 1497 professor of poetry and rhetoric at Tübingen. His fame rests principally on his 'Facetiae' (1506), a curious collection of bits of homely and rather coarse-grained humor and anecdote, directed mainly against the clergy; and on his 'Triumph of Venus,' a keen satire on the depravity of his time.

**BEC, a celebrated abbey of France, in Normandy, near Brienne, now represented only by some ruins. Lanfranc and Anselm were both connected with this abbey.**

**BECCAFICO, bek-á-fék-kó, the Italian name of the small olive-brown garden-warbler (Sylvia hortensis), called in England petty-chaps, which has the habit of pecking holes in the rind of ripening figs and other fruits, in search of small insects. The damage done is very considerable. These birds were eaten with much delight by the ancient Romans, and are still in high favor on Grecian, French and Italian tables, especially in Venice. An annual feast made on beccaficos is called Beccaficata. The term is also applied in continental Europe, rather indiscriminately, to different kinds of sylvan warblers when fat and in condition for the table.**

**BECCAFUMI, Domenico di Pace, bek-ká-foo-mé, dô-mâ-né-kó, surnamed Mechering, Italian painter: b. near Siena 1480; d. Siena 1551. As a shepherd boy amusing himself with drawing figures on the sand, he attracted the attention of a wealthy man, from whom he takes the name of Beccafumi, who, discerning his genius, sent him to Siena and encouraged his industry. Having heard much of Raphael and Michelangelo, obtained means from his patron to travel to Rome. After much study of the masterpieces of the Vatican he returned to Siena and enriched it with frescoes and painted an altar-piece in the museum there. He drew and colored well, possessed strong inventive powers, was thoroughly acquainted with perspective, and excelled particularly in foreshortening, but he was not free from mannerism, and he is generally considered deficient in both dignity and beauty. He was buried with pomp in Siena Cathedral, among some of the finest monuments of his genius. His paintings include 'Saint Catherine receiving the Stigmata' (Siena), 'Madonna and Child' (Berlin), 'Marriage of St. Catherine' (Rome), etc. He also gained distinction as a sculptor and engraver.**

**BECCARIA, Cesare Bonesana, Marchese di, bek-ká-reh-a, chás-a-reh be-ná-sá-ná, már-ká-se de, Italian author: b. Milan 1735 (or 1738); d. 28 Nov. 1794. He was early excited by Montesquieu's 'Persian Letters' to the cultivation of his philosophical talents, and was afterward favorably known as a philosophical writer by his noble philanthropic 'Crimes and Punishments' (1764), and several other works. With the eloquence of true feeling, through a lively imagination he opposes capital punishments and torture. This work led to the establishment of more correct principles of penal law, and contributed to excite a general horror against inhuman punishments. He is best known in Italy as the author of a philosophical grammar and theory of style, 'Ricerche intorno alla Natura dello Stile' (Milan 1770), and of several good treatises on style, rhetorical ornament, etc., contained in the journal Il Caffé, edited by him in conjunction with his friends, Visconti, Verri and others. In 1768 a chair of political philosophy was created for him at Milan.**

**BECCARIA, Giovanni Battista, jô-vá-né bâ-té-tás-tá, Italian philosopher: b. Mondovi 1716; d. 27 April 1781. He went to Rome, aged 22, where he studied, and afterward taught grammar and rhetoric; at the same time applying himself with success to mathematics. He was appointed professor of philosophy at Palermo, and afterward at Rome. Charles Emmanuel, King of Sardinia, invited him to Turin in 1775 to fill the professorship of natural philosophy at the university there. He paid much attention to the subject of electricity, and published 'Natural and Artificial Electricity' (Turin 1735), besides many other valuable works on this subject. In 1759 the King employed him to measure a degree of the meridian in Piedmont.**

**BECERRA, Gasparo, bé-thér-a, gás-pár-ro, Spanish artist: b. Baena, Andalusia, 1520; d. Madrid 1570. He studied for some time in Rome under Michelangelo and others, and on his return became sculptor and painter to Philip II. He adorned the palace of Madrid with several frescoes, and also executed works in sculpture and architecture.**

**BECHE, bást, Sir Henry de la, English geologist: b. 1796; d. 1855. He founded the geological survey of Great Britain, which was soon undertaken by the government, De la Beche being appointed director-general. He also founded the Jermyn Street Museum of Economic or Practical Geology, and the School of Mines. His principal works are 'Geology of Chief Jamaica'; 'Geology of Etruscan Rocks'; 'Geological Manual'; 'Researches in Theoretical Geology'; 'Geology of Cornwall, Devon, and West Somerset,' etc.**
BECHE-DE-MER — BECHUANALAND PROTECTORATE

BÉCHE-DE-MER, bash-dé-már, the French name for the dried flesh of holothurians. It is largely cured in the South Sea Islands.

BECHER, Johann Joachim, bé-tr, yö-hán yö-á-hm, German chemist: b. Speyer 1635; d. 1682. He traveled and resided in various parts of Germany, Holland, Italy, Sweden and Great Britain, investigating Cornish and Scotch mines. He wrote a number of works on chemistry, the chief of which is entitled 'Physica Subterranea.' In it he expounds his views on the composition of inorganic bodies, the constituents of which, according to him, are three earthy principles, the vitrifiable, the combustible and the mercurial. The metals consist of these three earths in different proportions, and whenever a metal is calcined the combustible and mercurial earths are expelled, and the vitrifiable earth forms the residual calx. When these principles are combined with water they are formed, and a fundamental acid, which exists in all the others. This theory was subsequently developed by Stahl, who, by means of the principle of phlogiston (q.v.), explained not only the calculation of metals, but the phenomena of combustion in general.

BECHER, Siegfried, Bohemian statistician and economist: b. Plan, Bohemia, 28 Feb. 1806; d. Vienna, 4 March 1873. He studied first in Prague, then in Vienna, then, in 1831, entered the government service, but four years later was appointed professor at the Polytechnic Institute in Vienna. In 1848 he became attached to the Ministry of Commerce, for which he made a trip of investigation in Germany and Belgium the following year. Among his important works are 'Das österreichische Minenwesen' (1834) and '1838 in historischer, statistischer und legislativer Hinsicht' (2 vols., Vienna 1838); 'Statistische Übersicht des Handels der österreichischen Monarchie mit dem Auslande während der Jahre 1829-38' (Stuttgart 1840); 'Die europäischen Zoll-und Handelsbeziehungen zur Anbahnung der österreichisch-deutschen Zoll-und Handelseinigung' (Leipzig 1850); 'Die Volkswirtschaft' (Vienna 1853).

BECHSTEIN, Johann Matthias, bé't-stín, yö-hán má-tá-oos, German naturalist: b. Waltershausen, Gotha, 1757; d. 1822. He studied theology for four years at Jena, but never felt in his element unless hunting in the fields or roaming the forest. After teaching for some time he resolved to devote himself to his favorite pursuits, and in 1800 the Duke of Saxe-Meiningen made him director of the Forest Academy of Dreissigacker, in the vicinity of his capital. This academy, under Bechstein's management, became one of the most celebrated establishments of the kind in Germany. His chief work is his 'Natural History of Germany,' in four volumes. In Great Britain he is best known by a treatise on singing-birds.

BECHSTEIN, Ludwig, lood'-vin, German poet and novelist: b. 1801; d. 1860. He is chiefly remembered for 'The Legend Treasure and the Legendary Cycles of Thuringia' (1835-38); 'German Fairy-Tale Book' (1845, 41st ed. 1890); and others. Among his epical poems are 'The Children of Hunding' (1830); 'The Dance of Death' (1831); 'New Natural History of Pet Birds' (1846), a humorous didactic poem; and 'Thuringia's Royal House' (1865).

Of his numerous novels, chiefly historical, the best known is 'Journeys of a Musician' (1836-37).

BECUANALAND, bét-chóo-á-ná-lánd, south Africa, name formerly applied to the region inhabited by the Bechuana. It included (1) the crown colony of Bechuanaland, with an area 51,524 square miles and a population of 99,533, of which about 75,000 belonged to the Cape and 24,533 since 1910 one of the divisions of the province of the Cape of Good Hope in the union of South Africa; (2) the Bechuanaland Protectorate (q.v.).

BECHUANALAND PROTECTORATE, South Africa, the territory lying between the Molopo River on the south and the Zambesi on the north, and extending from the Transvaal province and Matabeleland on the east to (German) southwest Africa. Its area is about 275,000 square miles. The country forms portion of an elevated plateau 4,000 feet above the level of the sea, and though so near the tropics, is very healthful for Europeans. In winter there are sharp frosts and some years snow falls. The rains fall in summer, and then on the rivers are full. Cattle rearing and agriculture (production of cotton and Kaffir corn) are the chief industries. Sheep thrive in some parts, but it is not a wheat country on account of the summer rains. The country takes its name from the widely spread race of people called Bechuana, who belong to the great Kaffir race, and are divided into tribal sections, each of which has a chief. The most important tribes are the Bamangwato (35,000), under the chief Khama, whose capital is Serowe (pop. 17,000); 40 miles west of the railway line at Palapye road; the Bakgatla (11,000) under Lenchwe; the Bakwena (13,000) under Seckhele; the Bangwaketse (18,000) under Gaseitswe; the Batawana under Mathibi; and the Bamiti (4,500) under Baitlotse, who is acting during the minority of Seboko, the eldest son of the late chief Mokgosi. The country can be reached from Cape Town, Port Elizabeth, Durban, Delagoa Bay and Beira, the Rhodesia Railway's section of the 'Cape-to-Cairo' line traversing the country through Vryburg, Moshitlane, Mafeking, Pusani, Kalakanini, Linchwe, Magalipisi, Palachwe, Tato and Buluwayo. There are extensive forests to the northeast, and to the west lies the Kalahari desert, which only requires wells dug to make it inhabitable. The province of Stellaland is inhabited principally by Boers. The Bechuana are a black race possessing a language in common with the Bantu races of south Africa, extending as far north as the equator. Their ancestors are said to have come from the south and progressing southwest, met the Hottentots from the Cape of Good Hope journeying north. Since 1832 they have been at enmity with the Matabele, and in later years the Transvaal Boers on one pretext or another endeavored to occupy their country. During the native risings in 1878 the Bechuana invaded Griaaland West, and were in turn subdued by British volunteers as far as the Molopo. When the British government withdrew from Bechuanaland in 1886, the natives, who had been left to the mercy of the Boers of the Transvaal, whose harsh treatment in 1882 and 1883 led to the Bechuanaland expedition in 1884. At the
beginning of the 19th century the Bechuanas were furthered in advance in civilization than other nations of South Africa and they are still ahead in this respect. In 1885, the territory was declared to be within the British sphere; in 1889 it was included in the sphere of the British South Africa Company, but was never admin-
istered by the company; in 1891 a resident com-
misssioner was appointed, and in 1895, on the annexation of the crown colony of British Bechuanaaland to the Cape of Good Hope, new arrangements were made for the administration of the Protectorate, and special agreements were made in view of the extension of the rail-
way northward from Mafeking. Each of the
chiefs rules his own people as formerly, under the protection of the King, who is represented by a resident commissioner, acting under the high commissioner for South Africa. The
headquarters of the administration are in Mafe-
k ing, in the Cape province, where there is a
reserve for imperial purposes, with ample build-
ings. There are assistant commissioners at Gaberones in the southern, and Francistown in the northern part. The telegraph from the Cape of Good Hope to
Rhodesia passes through the Protectorate, and
is owned by the British South Africa Company. Pop. 125,350, of whom 1,692 are Europeans.
Consult 'Annual Report on the Bechuanaand
Protectorate' (London); MacNab, E., 'On Veldt and Farm' (2d ed., London 1900); Pas-
sarge, 'Die Kalahari' (Berlin 1904).

JOHN B. McDONNELL.

BECHUANAS, an important tribe of
south African negroes, inhabiting the Trans-
vaal. Next to the Kaffirs they are the most
significant of the many native tribes, politically
considered. Though naturally of a peaceful
disposition, they are very far advanced in
military and civil organization. The cultivation of
maize or corn and the herding of cattle are
their main occupations, though they are also
noted as workers in leather and metals. Their
villages are far more advanced structurally than
those of the Zulus, their habitations being
divided into various rooms and constructed with
the object of allowing circulation of air. The
various communities, each under the rule of a
local chief, are federated into powerful king-
doms, at the head of which is a king, or supreme
chief. In color the Bechuanas are about the
complexion of American Indians though con-
siderably smaller in stature. See BECHUANA-
LAND.

BECK, Sir Adam, Canadian statesman: b.
(of German extraction), Baden, Ontario, 20
June 1857. He was educated at Salt Grammar
School; was mayor of London, Ontario, 1902-
04; and has been a member of the Provincial
Parliament since 1902, occupying a place in the
Whitney cabinet of 1905. He introduced into the
legislature the measure for the establish-
ment of the Hydro-Electric Power Commission
of Ontario, of which he has been chairman
since its inception. He is a noted breeder of
horses. He was knighted in 1914.

BECK, Christian Daniel, German scholar
and writer: b. Leipzig, 22 Jan. 1757; d. 13
Dec. 1832. Graduating from the University of Leip-
zig, he was later appointed professor of the
Greek and Latin classics at the same establish-
ment, assuming also the chair of history in 1819.
In that year he also became editor of the
Allgemeines Report der neuesten in- und
außländischen Litteratur, a position he main-
tained until his death. He was also the founder of
the Philological Society, which in 1809 became
the Philologische Seminary. Among his works are 'Anleitung zur Kenntnis der allgemeinen Welt- und Völkergeschichte' (4 vols., 1787-1807); 'Commentarii Historici De-
cretorum Religionis Christianae et Formule Lutherane' (1801); 'Commentarii Societatis Phylologicae Lipsiensis' (1801-9); editions of Euripides, Pede, Plato, Cicero, etc.

BECK, Johann Tobias, German theolo-
gian: b. Balingen, Württemberg, 22 Feb. 1804;
d. Tübingen, 28 Dec. 1878. Graduating from the
University of Tübingen in 1826, he was ordained a minister, but later accepted an ap-
pointment as professor of theology at Basel. In
1843 he went to Tübingen, where he filled the
same position. He was one of the Tübingen
faculty who was strongly opposed to the gen-
eral radical tendency of that university, under
the influence of F. C. Baur, the leader of the
so-called Tübingen school. Beck was and re-
mained absolutely orthodox. Among his works are 'Einleitung in das System der christlichen Lehre' (2d ed., Stuttgart 1870); 'Christliche Reden' (1834-70); 'Erklärung zu Paulus an Timotheus' (1879). Consult Adolf
Schlatter's "J. T. Becks theologische Arbeit-
thologie" in 'Beiträge zur Förderung christ-
lischer Theologie' (4 vols., 1904).

BECK, Karl, Austrian poet: b. Baja, Hun-
gary, 1 May 1817; d. Vienna, 10 April 1879.
His poems reflect the passionate temperament of his Hungarian countrymen in sonorous
verses of consummate finish. Among his works are 'Nights' (1838); 'The Poet Aarrant' (1838); 'Jankó' (1842); a romance in verse; 'Songs of the Poor Man' (1847); 'Words for Words' (1863), a tale in verse; 'Mater Dolorosa' (1854), a novel.

BECK, Lewis Caleb, American scientist: b.
Schenectady, N. Y., 4 Oct. 1796; d. Albany, N.
Y., 20 April 1853. A man of remarkable
and wide scientific attainments, he graduated at
Union College 1817, and became professor of
chemistry and natural history at Rutgers
College 1830-37 and 1838-53; professor of chem-
istry and pharmacy at Albany Medical College
1841-53; and was also state mineralogist of
New York 1835-41. His publications include
'Gazetteer of Illinois and Missouri' (1823);
'Salt Springs at Salina' (1826); 'Mineralogy
of New York' (1842), his most important work;
and 'Botany of the United States North of
Virginia' (1848). Consult Gross, 'American
Medical Biography.'

BECK, Richard, German geologist: b. Aue,
24 Nov. 1858. After finishing the regular
courses at Leipzig and Freiburg, he specialized
in natural science. In 1883 he became a mem-
ber of the geological survey of Saxony. In
1895 he resigned this position to become pro-
fessor of geology at the Mining Academy of
Freiburg. He was by this time becoming
widely known as a specialist on ore deposits, in which department he has made valuable contributions. His ‘Lehre von den Erzlagserstätten’ (1900) is a standard work which has been translated into most European languages, including an American edition in English (New York, 1902). It was one of the physical features and origin of the metalliferous deposits.

BECKE, Friedrich, Austrian mineralogist: b. Prague, 31 Dec. 1855. After studying at Vienna, where he specialized in the natural sciences, he became there a lecturer on geology. In 1882 he was appointed professor at the University of Czernowitz. Eight years later he received a similar appointment at Prague, but soon after went to Vienna, where he became professor of mineralogy, succeeding Tschermak as such, of whose periodical Mineralogische and Petrographische Mittheilungen he became editor. He has published many papers on the science of geology and mineralogy, and he is best known on account of his researches in the field of rock-forming minerals and how they may be determined by means of their light-refractive properties. The results of these studies were published by the Vienna Academy (1893).

BECKE, George Lewis (Louis BEcker), Australian novelist: b. Macquarie, N. S. W., 17 June 1857; d. Sydney, 17 Feb. 1913. He was trader, pilot, labor agent, recruiter for the Kanaka Pacific Islands labor trade, and contributor to the Australian, English and American press. Among his numerous works are ‘By Reef and Palm’ (1894); ‘The Ebbing of the Tide’ (1896); ‘Rodman the Boat-steerer’; ‘Edward Barry’; ‘Tess, the Trader’s Wife’; ‘Ridan the Devil’; ‘Breachley: Black Sheep’; ‘Sketches from Normanby’; ‘Pacific Tales’ (1897); ‘Helen Adair’; ‘York the Adventurer’ (1901); ‘Tom Wallis’ (1900); ‘Wild Life in Southern Seas’ (1897); ‘Adventures of James Shervinton’; ‘The Jalasco Brig’; ‘By Rock and Pool’; ‘Clunkie’s Flat’; ‘His Native Wife’; ‘Under the Tropic Skies’, in which subjective experiences of the Gerards, ‘Notes from My South-Sea Log’; ‘The Tarpir of Banderah’ (1901). He also wrote in collaboration with Walter J. Jefferies, ‘The Mutineers’; ‘A First Fleet Family’ (1896); ‘Admiral Philip’ (1899); ‘The Founder of Australia’; ‘The Mystery of the Laughlin Isles’; and ‘The Naval Pioneers of Australia’.

BECKENHAM, England, town of Kent, situated southeast of London. It is one of the English municipalities which have experimented in “municipal socialism,” as it owns its electric lighting plant and public baths, and has charge of the work of a technical institute. It is a residential suburb of London, and its most noteworthy building is the church of Saint George, the tower of which was completed in 1903, and contains bells in memory of Cecil Rhodes. Pop. 31,692.

BECKER, August, German poet and novelist: b. 1828; d. 1891. He was the author of a lyrical epic; and of the novels ‘The Rabbi’s Bequest’ (1866); ‘Proscribed’ (1868); ‘The Carbuncle’ (1870); ‘My Sister’ (1876), descriptive of the doings of Lola Montez and the events of 1848 in Bavaria; ‘Painter Fairbeard’ (1878); and ‘The Sexton of Horst’ (1889).

BECKER, George Ferdinand, American geologist: b. New York, 5 Jan. 1847. He was graduated at Harvard University in 1868; was instructor of mining and metallurgy in the University of California in 1875–79; was attached to the United States Geological Survey in 1879, and was special agent of the Philippine Islands, 1879–83. He was appointed a special agent to examine into the mineral resources of the Philippine Islands in 1898. His publications include ‘Geology of the Comstock Lode’; ‘Statistics and Technology of the Precious Metals’ (with S. F. Emmons); ‘Geology of the Quicksilver Deposits of the Pacific Slope’; ‘Age of the Earth,’ etc.

BECKER, Karl, German statistician: b. Strohausen, Oldenburg, 2 Oct. 1823; d. 20 June 1896. In 1842 he received a commission in the army, and as such was also instructor in the Oldenburg Military Academy. In 1850 he was on the general staff during the campaign against Denmark. At the close of the war he entered the University of Berlin where he became interested in statistics. In 1855 he organized the statistical bureau of Oldenburg, of which he was director until 1872, when he became chief statistician of the German government. As such he was editor of the Monatshefte zur Statistik des deutschen Reichs and the Statistisches Jahrbuch. He was also the author of ‘Zur Berechnung von Sterbetalen an die Bevölkerungsstatistik zu stellende Anforderungen’ (Berlin 1874).

BECKER, Karl Ferdinand, German philologist: b. Lieser, 14 April 1775; d. Offenbach, 5 Sept. 1849. He first studied in the theological seminary at Hildesheim, then entered and was graduated from the University of Göttingen. In 1815 he began practising as a physician at Offenbach, at the same time establishing a private school. It was as instructor in his own school that he first became interested in philology, which subject he studied with great diligence and became an expert in. In 1843 he was appointed professor of German and classical studies at the University of Erlangen, and in 1844 became professor of philology at the University of Munich. His important works include ‘Die deutsche Wortbildung’ (Frankfort 1824); ‘Organismen der Sprache’ (2d ed., Prague 1844); ‘Deutsche Stil’ (Prague 1848).

BECKER, Karl Ferdinand, German organist and writer on music: b. Leipzig, 17 July 1804; d. there, 26 Oct. 1877. He was a student of Friedrich Schneider, being already an accomplished musician at the age of 14. At the age of 21 he was organist in Saint Peter’s Church in his native city. In 1843 he was appointed professor of organ playing at the Leipzig Conservatory, which position he held for 13 years. It is not, however, so much his talents as a musician that his fame rests on as on his works on the theory of music. Among his important works are ‘Systematisch-chronologische Darstellung der musikalischen Literatur’ (Leipzig 1836); ‘Die Hausmusik in
BECKER, Karl Friedrich, German historian: b. Berlin 1777; d. there, 15 March 1806. He studied philosophy and history at Halle, then was for some time a teacher at Kottbus. On account of continued sickness he was unable for long to follow the profession of teaching, so he gave himself up entirely to historical writing, most of his books being of a popular character. Among his works are 'Erzählungen aus der Alten Welt für die Jugend' (3 vols., Halle 1801-03); 'Weltgeschichte für Kinder und Kinderlehrer' (9 vols., Halle 1801-05). This latter work has been often revised since and many editions have been published.

BECKER, Karl Ludwig Friedrich, German painter: b. Berlin, 18 Dec. 1820; d. there, 20 Dec. 1900. His early training was gained in Rome, Paris and Venice, where he studied under such masters as Von Klöber and Hess. His first original works were historical and mythological, though in his later paintings it is obvious that he was strongly influenced by the Venetian Renaissance. Among his notable works are 'Belisarius Begging' (1850), the frescoes in the Berlin Museum; 'The Doge in Council' (1864); 'Charles V Visiting Titian' (1873); 'In the Picture Gallery' (1874); 'Emperor Maximilian Receiving a Venetian Embassy' (1877).

BECKER, Nikolaus, German poet: b. Bonn, 8 Oct. 1809; d. Hunshoven, 28 Aug. 1845. His early training was in law, and for some years he held a position in a court. He is principally known as the author of the popular song 'Rheinliedere.' The song is addressed to the French: 'You should not have it, the free, German Rhine.' So widespread did this refrain become that French poets replied, Alfred de Musset with 'Nous l'avons eu, votre Rhin allemand.' For this Becker of Prussia awarded the poet a prize of 1,000 thalers. Becker's other poems were published as a collection (Cologne 1841) but none of them attained much popularity and they have not generally been considered of a high order.

BECKER, Oskar, political fanatic: b. Odessa, Russia, 1839; d. Alexandria, Egypt, 1868. In 1861 he attempted, at Baden-Baden, to kill King Wilhelm I of Prussia, by shooting at him with a pistol at a distance of but three paces. The King fortunately escaped with only a slight wound in the neck. Becker's motive for the act was his belief that the King was unable to unite Germany. Though sentenced to 20 years' imprisonment he was pardoned by the King on condition of living out of Germany ever after.

BECKER, Philip Johann, German revolutionist: b. Frankenthal, 1810; d. 1866. Beginning as a simple workingman, he soon became involved in the radical labor movements of his time and for his participation in a revolt he was imprisoned. He then led to Switzerland, which was the haven of revolutionary exiles and refugees. He was very prominent in the revolutionary upheavals that threatened nearly all the European countries during 1848. Becker organized, during that year, a body of fighting men with which to support Hecker, who was attempting to precipitate a revolution in Bavaria. When this failed, Becker led his forces to the support of the revolutionists in Rome and Sicily. This expedition also failed, whereupon he marched into the Palatinate and Baden, where uprisings had taken place, and participated in the thick of the fighting in which he showed himself possessed of not a little military skill. When these violent disturbances had subsided, Becker became attached to the Socialistic Conspiratorial and was one of Karl Marx's strongest adherents. He has written 'Wie und Wann?' (1899).

BECKER, Rudolf Zacharias, German author: b. Erfurt, 9 April 1752; d. 28 March 1822. He first became known by an essay on the theme, 'Is it useful to deceive the people?' which gained a prize from the Berlin Academy of Sciences in 1799. His theory was that happiness depended on the gratification of an innate desire for improvement. In 1782 he took charge of a school at Dessau and published a journal for youth. A work in two volumes, entitled 'A Little Book of Needful Help; or, Instructive Tales of Joy and Sorrow in the Village of Milheim,' became such a favorite with the public that over 500,000 copies were disposed of. He also produced other works and journals, and the extensive transactions in them led him, in 1797, to set up a publishing and bookselling establishment at Gotha, which is still continued by his son. On 30 Nov. 1811 he was arrested by Davout on the suspicion of conspiring against Napoleon, and was imprisoned at Magdeburg till April 1813. On this imprisonment he wrote a book, which still has a historical value.

BECKER, Wilhelm Adolf, German archaelogist: b. Dresden 1792; d. Meissen, 30 Sept. 1846. His early education was planned by his parents with the object of fitting him for a commercial career, but while studying at the University of Leipzig he acquired a strong taste for a life of study. In 1828 he was appointed professor of archaeology at the University of Meissen; in 1842 he was appointed to the chair of classical archaeology at Leipzig University. In his first two books, 'Gallus oder römische Scenen aus der Zeit Augustus' (Leipzig 1838) and 'Charicles oder Bilder altgriechische Sitte' (Leipzig 1840) he portrays the daily life of the ancients in the form of romances, plentifully supplied with footnotes. Both works have been translated into English by Frederick Metcalfe, and each has passed through numerous editions. His chief work, however, is 'Handbuch der römischen Alterthümer' (Leipzig 1843), which he did not live to complete, this being done by Marquardt.

BECKER, Wilhelm Gottlieb, German writer on art antiquities: b. Oberkallenberg, Saxony, 4 Nov. 1753; d. Dresden, 3 June 1813. Graduating from the University of Leipzig, he was appointed professor at the Dresden Ritterakademie in 1782. In 1795 he became director of the Dresden Gallery of Antiques and the Coin Cabinet. In 1805 he was also given charge of the famous Green Vault. His chief work is 'Taschenbuch zum geselligen Verg-
niingen) (Leipzig 1791–1814). He was also the author of ‘Erholungen’ (Leipzig 1790–1810); ‘Augusteum’ (Dresden 1805–09).

Beckerath, Hermann von, German statesman: b. Krefeld, Prussia, 13 Dec. 1801; d. there, 12 May 1870. His youth was spent in banking, after which he became the head of a banking firm which had considerable influence in German financing, especially in the Rhenish provinces. He began his political career by entering the Diet of his native province. In 1847 he served in the Prussian Diet, and the following year went as a deputy to the Frankfort Parliament, where he became one of the firmest advocates of the German confederacy. He became Minister of Finance in the German cabinet organized by the Parliament. When the reactionary Manuteffel Ministry came into power, he continued as a member of the Prussian Second Chamber and ranged himself steadfastly with the opposition. In 1852 he withdrew from politics, but six years later he was again elected to the Second Chamber. His ill-health, however, compelled him to decline the office. Consult Kopstad’s biography, ‘Hermann von Beckerath’ (Brunswick 1875).

Beckers, Hubert, German philosopher: b. Munich, 4 Nov. 1806; d. 11 March 1889. Graduating from the University of Munich, he was, in 1832, appointed professor of philosophy at the Lyceum at Dillingen. In 1847 he was appointed to the chair of the same subject at the University of Munich. Most of his writings are devoted to expounding the theories of Schelling, including ‘Denkrede Schelling’ (Munich 1855); ‘Die Bedeutung der Schellingschen Metaphysik’ (Munich 1861); ‘Cantica Spirituila’ (Munich 1843–47); ‘Aphorismen über Tug und Unsterblichkeit’ (Munich 1859).

Becket, Thomas, archbishop of Canterbury, the Saxon hero, priest and martyr of England in the reign of Henry II: b. London 1119, or, according to some writers, 21 Dec. 1117; d. Canterbury, 29 Dec. 1170. He was the son of Gilbert Becket, a merchant of London. He was first educated at Eton, and continued his studies in the schools of Oxford, London and Paris. On the death of his father he was admitted into the family of Theobald, archbishop of Canterbury, and, with his permission, went to the Continent for the purpose of studying the civil and canon law. He attended the lectures of Gratian at Bologna, and of another celebrated professor at Auxerre. He won high favor with the King through having obtained from the Pope, while acting as agent for Theobald, letters prohibitory of the crowning of Eustace, the son of Stephen, by which that design was defeated (1152). This service not only raised Becket in the esteem of the archbishop, but in that of King Henry II, and to the foundation of his high fortune. In 1155 he was appointed high-chancellor and preceptor to Prince Henry, and at this time was a complete courtier, conforming in every respect to the humor of the King. He went, in fact, his prime companion, had superb hours of eating and gaming to bed, held splendid levees, and courted popular applause. In 1159 he made a campaign with the King in Toulouse, having in his own pay 700 knights and 1,200 horsemen; and it is said he advised Henry to seize the person of Louis, King of France, shut up in Toulouse without an army. This counsel, however, so indicative of a Becket’s energy, being too bold for the lay counsellors of one of the boldest monarchs of the age, was declined. In the next year he visited Paris to treat of an alliance between the eldest daughter of the King of France and Prince Henry, and returned with the young princess to England. He had not enjoyed the chancellorship more than four years when his patron Theobald died, and King Henry was so far mistaken as to raise his favorite to the primacy, on the presumption that he would aid him in those political views, in respect to Church power, which all the sovereigns of the Norman line embraced, and which, in fact, caused a continual struggle in England till its termination by Henry VIII. It is narrated that when Henry announced his intention to Becket promoted to the primacy left vacant by the death of Theobald, Becket prophetically remarked: ‘I am certain that if, by God’s disposal, it were to so happen, the love and favor you now bear towards me, would speedily turn into bitterest hatred.’

Becket was consecrated archbishop in 1162, and immediately assumed an austerity of conduct which formed a very natural prelude to the course which he was to follow. Pope Alexander III held a general council at Tours in 1163, at which Becket attended and made a formal complaint of the infringements by the laity on the rights and immunities of the Church. On his return to England he began to act in the spirit of this representation, and to prosecute several of the nobility and others holding Church possessions, whom he also proceeded to excommunicate. At a council at Woodstock (1163) he successfully opposed the King on a point regarding taxation—the first case of this kind recorded in England. Henry, an able and politic monarch, was anxious to recall certain privileges of the clergy which withdrew them from the jurisdiction of the civil courts; and it was not without a violent struggle that he in the last years of his life and Becket finally acquiesced. The King soon after summoned a convocation or parliament at Clarendon (1164), to the celebrated “constitutions” of which, although the archbishop swore that he would never assent, he at length yielded, but afterward refused to affix his signature, and by way of menace suspended himself from his archiepiscopal functions till the Pope’s absolution could arrive. Finding himself the object of the King’s displeasure, he soon after attempted to escape to Flanders, but, on being intercepted, Henry, in a parliament at Northampton, charged him with a violation of his allegiance, and all his goods were confiscated. A suit was also commenced against him for money lent him during his chancellorship and for the proceeds of the benefices which he had held vacant while in that capacity. In this desperate situation he with great difficulty and danger made his escape to Flanders, and, proceeding to the Pope at Sens, humbly resigned his archbishopric, went to hold splendid levees, and courted popular applause. In 1159 he made a campaign with the King in Toulouse, having in his own pay 700 knights and 1,200 horsemen; and it is said he advised Henry to seize the person of Louis, King of France, shut up in Toulouse without an army. This counsel, however, so indicative of a Becket’s energy, being too bold for the lay counsellors of one of the boldest monarchs of the age, was declined. In the next year he visited Paris to treat of an alliance between the eldest daughter of the King of France and Prince Henry, and returned with the young princess to England. He had not enjoyed the chancellorship more than four years when his patron Theobald died, and King Henry was so far mistaken as to raise his favorite to the primacy, on the presumption that he would aid him in those political views, in respect to Church power, which all the sovereigns of the Norman line embraced, and which, in fact, caused a continual struggle in England till its termination by Henry VIII. It is narrated that when Henry announced his intention to
land, in which he excommunicated all violators of the prerogatives of the Church, and included in the censure the principal officers of the Crown. Henry was so exasperated that he banished all his relations and obliged the Gis- termond to leave him from the abbey of Pontigny; from which he removed, on the recommendation of the King of France, to the abbey of Columbe, and spent four years there in exile.

A After much negotiation a sort of reconciliation was patched up in 1170, which on the whole was to the advantage of Becket, who, being now restored to his see with all its former privileges, forthwith prepared to return. Af- ter a triumphant entry into Canterbury the young Prince Henry, crowned during the lifetime of his father, transmitted him an order to restore the suspended and excommunicated prelates, which he refused to do, for the reason that the Pope alone could grant the request, though the latter had authorized him to inflict the censure on them. The prelates immediately appealed to Henry in Normandy, who in a state of extreme exasperation exclaimed, "What an unhappy prince am I, who have not about me one man of spirit enough to rid me of a single insolent prelate, the perpetual trouble of my life!" These rash and too significant words induced four of the attendant barons, Reginald Fitz-Urske, William de Tracy, Hugh de Mor- ville and Richard Brezo, to resolve to wipe out the King's reproach. Having laid their plans, they forthwith proceeded to Canterbury, and having formally required the archbishop to re- store the suspended prelates, they returned in the evening of the same day (29 Dec. 1170) and, placing soldiers in the courtyard, rushed with their swords drawn into the cathedral, where the archbishop was at vespers, and, ad- vancing toward him, threatened him with death if he still disobeyed the orders of Henry. Becket, without the least token of fear, replied that he was ready to die for the rights of the Church; and magnanimously added, "I charge you in the name of the Almighty not to hurt any other person here, for none of them have been guilty." The confederates then strove to drag him out of the church, but not being able to do so on account of his resolute deportment, they killed him on the spot with repeated wounds, all which he endured without a groan.

The perpetrators of the deed repented and made pilgrimages to the Holy Land. Henry II did penance at the saint's tomb. Thus perished Thomas à Becket in his 52d year, a martyr to the cause which he espoused, and a man of unquestionable virtue and intelligence. He was canonized two years after his death, and miracles abounded at his tomb. In the reign of Henry III his body was taken up and placed in a magnificent shrine erected by Arch- bishop Stephen Langton; and of the popularity of the pilgrimages to his tomb the 'Canterbury Tales' of Chaucer will prove an enduring testi- mony. In September 1538, Henry VIII, who held the veneration with which à Becket was regarded in especial detestation, destroyed the shrine and its appendages. The commit- tement, had the martyr's bones burned. The names of many churches and hospitals, in order to conform to the royal commands, were changed from Saint Thomas the Martyr to Saint Thomas the Apostle. Consult for the sources of the life 'Materials for the History of Archbishop Becket,' edited for the Rolls Series by Robert and Shepherd (London 1875-85) also 'Lives' by A. E. Abbott (London 1885), W. R. Hutton (ib. 1889), John Morris (2d ed. ib. 1885) and R. A. Thompson (ib. 1889). Ten- nynson's drama of 'Becket' has its martyr for its hero; Ward, 'Canterbury Pilgrimages' (London 1904).

BECKETT, Arthur William, a, English journalist and novelist; b. William, 25 Oct. 1844; d. London, 14 Jan. 1909. Besides fulfilling other journalistic engagements he was on the staff of Punch 1874-1902, edited the Sunday Times 1891-95, and the Naval and Mili- tary Magazine 1894. In addition to several comedies he published 'Comic Guide to the Royal Academy,' with his brother Gilbert (1863-64); 'Fallen Amongst Thieves' (1869); 'Our Holiday in the Highlands' (1874); 'The Shadow Witness' and 'The Doom of Saint Quirec,' with Burnand (1875-76); 'The Ghost of Grimstone Grange' (1877); 'The Mystery of Mostyn Manor' (1878); 'Tragedy, Hard Luck'; 'Stone Broke'; 'Papers from Pump Handle Court, by a Briefless Barrister' (1884); 'Modern Arabian Nights' (1885); 'The Member for Wrottesley,' 'Greenroom Recollections' (1896); 'The Modern Adam' (1889); 'London at the End of the Century' (1900).

BECKFORD, William, English writer, famous in his time for his immense wealth, eccentricities and literary talents: b. Fonthill, 29 Sept. 1759; d. Bath, 2 May 1814. Besides fully 10 years old he was in receipt of an income through the death of his father, of more than $500,000 a year. Under the direction of Lord Chatham he received a careful education at the hands of tutors, and at an early age gave evi- dence of unusual abilities. His first work, a satirical essay entitled 'Biographical Memoirs of Extraordinary Painters,' in which he ridicu- lous the English artists of his time, was pub- lished before he was 21 years of age. In 1783 he married Lady Margaret Gordon, daughter of the 4th Earl of Aboyne, who died in 1786. One of his daughters married the 10th Duke of Hamilton. He spent most of his time on the Continent; an account of some of his travels he published half a century later with the title 'Italy, with Sketches of Spain and Portugal' (2 vols., London 1834). He sat in the House of Commons from 1784-94, and from 1806-20, but took no interest in political affairs. He went to Portugal in 1794, where he bought an estate in the neighborhood of Cintra, and lived in familiar intercourse with the royal family of Portugal. After the lapse of some years he appeared again in England, and began in 1796 to erect a splendid edifice upon his estate of Fonthill, which he furnished with more than royal luxury, and continually enlarged with new buildings. He here resided till 1822, when, owing to the loss of two large estates, which had been successfully claimed in chancery by other tenants, he was obliged to sell Fonthill for £330,000. He then settled at Bath, where he began to occupy himself anew with building and collecting works of art. His literary fame rests upon his Eastern tale, 'Vathek,' which he wrote in French, composing it in three days
and two nights, during which he did not take off his clothes. It was published at Lausanne in 1787, and made a remarkable impression upon Byron. See VAETH.

BECKHAM, John Crepps Wickliffe, American statesman: b. Bardstown, Ky., 5 Aug. 1869. He attended school at Roseland Academy, Bardstown, and Central University, Richmond, Ky., receiving degree of L.L.D. from the university in 1902; served as page in the Kentucky house of representatives in the session of 1881-82; in 1888 became principal of the Bardstown public school and taught three years; studied law and began practice in 1893; same year was elected as representative of Nelson County to the general assembly; served as such in the sessions of 1894, 1896, 1897, 1898 and in the latter session was speaker of the house; in 1899 was Democratic nominee for lieutenant-governor on the ticket with William Goebel, candidate for governor, and in the contest before the general assembly of 1900 was declared elected lieutenant-governor at the same time that Goebel was declared elected governor. Upon the death of Governor Goebel, 3 Feb. 1900, he became governor, and at the special election on 6 Nov. 1900, was elected as the Democratic nominee to fill out the unexpired term of Governor Goebel, ending 8 Dec. 1902; in the State primary of 1903 was renominated and in the general election of November 1903 was re-elected for a full term, ending 10 Dec. 1907; in the State primary of November 1906 was nominated as the Democratic candidate for the United States Senate, to succeed J. B. McCreary, but in the general assembly of 1908 was defeated by W. C. Bradley, the Republican nominee; resumed, in 1908, the practice of law in Frankfort, Ky.; in the State primary of 1 Aug. 1914 was nominated by the Democratic party for the United States Senate, and in the general election of 3 Nov. 1914 was elected for the term beginning 4 March 1915. At the Democratic national conventions at Saint Louis, 1904, Denver, 1908, Baltimore, 1912, he was a delegate from the State at large, and member of the committee on resolutions. His term of service will expire 3 March 1921.

BECKMANN, Johann, German writer on agriculture and natural history: b. Hoyan, Hanover, 4 June 1759; d. Göttingen, 3 Feb. 1811. He studied theology at Göttingen, but soon applied himself to natural philosophy and chemistry. For a short time he was professor of natural philosophy and history at a gymnasium in Saint Petersburg. He resigned this, and coming to America through Sweden, made the acquaintance of Linnaeus and was allowed to see how the Swedish mines were worked. Having returned to Göttingen, he was made professor of philosophy there in 1766, and in 1770 ordinary professor of economy, which office he held for 40 years. He published several scientific works, which once were popular, but the best known of his productions is called 'Contributions to the History of Discovery and Inventions,' of which several translations have been published. He published works (with corrections and additions extending it to the present time) it continues to be a favorite work.

BECKWITH, Sir George, English military officer: b. 1753; d. London, 20 March 1823. His scene of action was largely in America — in the United States and the West Indies. He fought with the English in the American Revolution in 1776-82, and was entrusted with important diplomatic commissions in 1782-91, as there was then no British Minister in the United States. In 1804 he was made governor of Saint Vincent, and four years later governor of Barbados. As England was then at war with France he organized an expedition and conquered Martinique, for which he obtained the thanks of the House of Commons. Later (1810) he conquered Guadeloupe, the last possession of the French in that part of the world. When he returned to England, after nine years' service in the West Indies, a set of silver plate was given to him by the legislature of Barbados, and the King conferred upon him armorial distinction.

BECKWITH, James Carroll, American portrait painter: b. Hannibal, Mo., 23 Sept. 1852; d. 24 Oct. 1917. He studied painting in Chicago, where his father was a merchant. In the late autumn of 1871 he became a student at the Academy of Design in New York, where he remained, under the direction of his brother W. A. W. Wilmarth, until 1873, when he sailed for Europe and became a pupil of Carolus-Duran, and also at the École des Beaux Arts, under Yvon. In 1878 he returned to New York, and with William M. Chase opened the new departments of painting and drawing at the recently established Art Students' League, where, for 18 years, he continued his work as instructor. In 1894 he was elected to the National Academy of Design, and is a member of the National Institute of Arts and Letters. Portrait and genre painting gradually absorbed his time and attention, the result of which was that he finally abandoned teaching. He decorated one of the domes of the Manufacturers' Building at the Columbian Exposition of 1893. Among his best-known portraits are those of General Schofield, Judge Palmer, Colonel Appleton, Mark Twain, and the Ogden and Parish families. At the Saint Louis Exposition (1904) he exhibited 'The Nautch' and 'Portrait of Mrs. Beckwith and F. H. Hitch. His portraits hang in many private homes as well as in galleries and institutions throughout the United States; among others, Yale University, Johns Hopkins, West Point Military Academy, the Historical Societies of Massachusetts and New York, the Bar Association of New York, the Union, Union League, City, Racquet and Calumet Clubs of New York. The New York Public Library has a fine collection of his crayon and pencil drawings.

BECKWITH, John Watrus, American Episcopal bishop: b. Raleigh, N. C, 9 Feb. 1831; d. 24 Nov. 1890. He was graduated at Trinity College, Hartford, in 1852; ordained priest in 1855; labored in Mississippi and Alabama till after the close of the Civil War; was then called to the rectoryship of Trinity Church, New Orleans; and while there was elected bishop of Georgia, being consecrated in Savannah, 2 April 1868. He was an eloquent preacher, and published several sermons and addresses.

BECKX, Peter Johann, 22d general of the Jesuits: b. Sichem, near the Flemish province of Brabant, Belgium, 8 Feb. 1795; d. Rome, 4 March 1887. At the age of 24 he entered the order of the Society of Jesus.
BECKY SHARP—BECKKEREK

Upon the Duke Ferdinand of Anhalt-Köthen becoming a convert to Catholicism, he was appointed confessor at the ducal court, where he continued after the Duke’s death with the Duchess Julia. On her removal to Vienna he accompanied her. In 1847 he became prosecutor for the Society in Austria. The following year the Jesuits were expelled from Austria and Beckx returned to Belgium, where he became rector of the Jesuit College at Louvain. Upon the return of the Jesuits to Austria, Father Beckx was made superior of Hungary. On 1 July 1853 he became general of the Order, being the successor of Father Roothan. The marvelous success with which the Jesuits established themselves in Austria and even in non-Catholic countries after the middle of the century was largely due to the abilities of Father Beckx as a diplomat. In 1884, when almost 90 years of age, he resigned his office. He was the founder of the Civitá cattolica in Rome, the chief organ of the Order. He was also the author of the ‘Month of Mary,’ which was widely translated.

BECKY SHARP, the heroine in Thackery’s ‘Vanity Fair.’ She has been accepted as the type of the shrewd, conscienceless adventurer whose sole purpose is to rise in the world and who allows nothing to interfere with it.

BECKE, Henri François, bék, ōn-ré frán-swá, French dramatist; b. Paris, 9 April 1837; d. 1899. He was the pioneer of realism on the Parisian stage producing ‘The Prodigal Son’ (1868); ‘The Abduction’ (1871); ‘The Haunted House’ (1882); ‘The Parisian’ (1885), etc.

BECQUER, Gustavo Adolfo Domínguez, Spanish poet; b. Seville, 17 Feb. 1836; d. Madrid, 22 Dec. 1870. When he was 10 years of age his father, a well-known painter, José Domínguez Becquer, died, leaving the orphan son to the care of a godmother. He was abandoned by his protectress, however, on account of his disinclination to fit himself for any profession. In 1818 he came to Madrid seeking Spanish capital, where he earned a precarious living for 15 years as a free lance journalist and translator of foreign books. During this period he produced some tales and a number of poems which stand out sharply from his general newspaper and hack work. His collected works were published after his death in Madrid (1885) with a biographical introduction by Correa. His prose tales and legends were published under the general title ‘Legendas españolas,’ and are included in the fifth, enlarged edition of his works (3 vols., Madrid 1904). An English translation of the prose stories was made by Cornelia Frances Bates (New York 1899). Consult Mrs. Humphry Ward’s article on Becquer in Macmillan’s Magazine (1883) and Olmsted’s introduction to his edition of Becquer’s ‘Legends, Tales and Poems’ (1907).

BECQUEREL, Alexandre Edmond, bék-ré, ᐅ-lëx-ând rud-món, French physicist; b. Paris (son of Antoine César Becquerel, q.v.), 24 Dec. 1852; d. there, 25 Aug. 1908 (son of Alexandre Edmond, and grandson of Antoine César Becquerel, q.v.). Like his distinguished grandfather, he studied at the Ecole Polytechnique, then became professor of physics at the Museum of Natural History in 1878. In 1885 he was appointed professor of the same subject at the Ecole Polytechnique. In 1889 he became a member of the Institute. After him have been named the rays radiating from uranium compounds, one of which he was awarded the Rumford medal of the Royal Society of London. In 1903 he shared the Nobel prize for physics with M. and Mme. Curie, awarded them because of their researches in radio-activity. His investigations dealt chiefly with such subjects as the magnetic rotation of polarized light, phosphorescence, the ultra-red rays, light absorption, etc.

BECSE, bëch’e, Hungary, the name of two towns situated on the river Theiss. Old Becs is on the right bank, 48 miles south of Szegedin. Pop. about 18,870. It has fisheries and flour mills, and carries on an extensive trade in grain. New Becs is on the left bank, five miles east of Old Becs. Pop. about 7,750. It carries on a trade in fruit and an extensive trade in grain.

BECSEEKEREK, Great and Little, a city and a town in Hungary. The former is in the administrative district of Torontál, of which it is the administrative centre. Situated on the Bega, 45 miles southwest of Temesvár, the two places being connected by canal. It is the centre of an important grain and cattle region and a silk worm industry. An old castle is an
Object of some interest. Pop. (1900) 26,407, about equally divided between Germans, Serbs and Magyars. Little Becskerek, nine miles northwest of Temesvar, is in the administrative district of Temes. Pop. (1900) 3,738.

**BED**. In modern domestic use, a framework (bedstead) supporting a mattress or cushion, with coverings, on which to take repose or to sleep. Originally a bed consisted merely of a hollowed-out place in the earth. Then, in the colder climates, the skins of animals were employed not only to render the spot more comfortable, but as covering for the sake of warmth. In the warmer climates dried leaves or rushes or grass was employed for the same purpose, and at the present day there are tribes of savages whose beds still consist of such primitive arrangements.

Among the Ancients.—With the development of civilization among the ancient peoples came the desire for greater physical comfort, and the bed was naturally one of the first articles of household furniture to be improved upon. The Egyptians were probably the first to discover that greater comfort could be obtained in a warm climate by a free circulation of the air under the bed. The paintings and inscriptions on the monuments indicate that long before the beginning of recorded history the Egyptians slept on elevated frames, or bedsteads, resting on ornamental legs, which were reached by short steps, the mattress, consisting of dried rushes sewn into cloth coverings, resting on an elastic and open wickerwork of palm fibres. And as among peoples in warm climates to-day, the pillow was not soft, but hard, of wood. The prevalence of insects and snakes probably was another reason for the elevation of the bed from the ground.

Later, among the Babylonians and the Assyrians, there was a further development of the bed, corresponding to the increase of luxury among the nobility, for the common people still continued to sleep on bundles of rushes or grass, as they have done through all the ages. Here the framework was made of gold and ivory and fine woods and was richly carved and ornamented. Gradually it became a habit to recline on the bed for rest during the day, so that it devolved into the divan, where the monarch or noble would sit when listening to matters of state. To this day the throne room of the Turkish Sultan is also known as the Divan. Such references to the bed as may be found in the Bible indicate the importance of the bed in those days, as "I have decked my bed with coverings of tapestry, with carved works, with fine work of Egypt" (Prov. vii, 16).

Among the Greeks and Romans.—The ancient Greeks had an elegant kind of beds in the form of open couches, the mattresses being stuffed with feathers or wool. These they used during the day too, much as chairs are used at the present time, and even reclined on them while eating. The luxury of the Orient did not develop in Greece to the same extent, for the Athenians did not feel the need of it. The Greeks did not know how to sleep comfortably. When the Persian King, Artaxerxes, presented one of his magnificent beds to the Athenian envoy, Timogoras, he sent also an attendant skilled in preparing it.

The Romans copied their beds largely after the Greeks, though they added to their comfort by the invention of air cushions. After the downfall of the republic they began adding the reclining frame to the bed. The ancient Orientals. There were two kinds of beds: the "lectus tricliniarii," or couch for reclining on at meals; and the "lectus cubiculariis," which was for sleeping on at night. It is also said that it was the Romans who introduced the first beds into England, for the British invaders of that country taught the barbarian natives how to make straw or rush mattresses.

In the Middle Ages.—In the colder climate of northern Europe the development of the bed adapted itself also to the question of warmth as well as to comfort. Soft feather pillows came into use and the skins of animals gave place to heavy textile materials of wool, though to this day it is not uncommon to find the wealthier classes of northern Russia covering themselves with wolf and bear skins. In Germany large, broad pillows were also used for covering, and are so used to this day. But as modern hygiene has demonstrated that feathers are bad conductors of caloric and do not permit the free radiation of heat from the body, which is essential to health and comfort, feather beds are gradually giving way to modern hair mattresses.

Modern Beds.—Modern mattresses are sometimes made of felt, of pure hair, or of alternate layers of hair and cotton, stuffed more or less tightly into a casing of strongly woven material, called ticking. Pillows are made of materials similar to those of the mattresses, and the bed coverings of almost any fabric suited to the taste and purse of the owner, from coarse cotton sheets or blankets to the finest wool or silk. The heavy canopies of the Middle Ages, probably an evolution of the mosquito-netting of the Orient, have also been abolished for hygienic reasons.

The folding bed is a recent development largely peculiar to America, where city apartments have made space a question of special consideration. They are so arranged that the bottom of the bedstead can be swung upward against the tall headrest and the bed becomes either a dressing table or a bookcase. Trunk, or trunkle, beds were formerly used for similar economic reasons and consisted of a low platform on wheels to admit of its being run under the larger bed by day and was occupied at night by children or servants. Cots are also widely used for the sake of saving space; they are generally very narrow, have very low head- and foot-rests and during the day may be covered over and used for sitting in the place of chairs. There are also folding cots and lounges, constructed over a box body, wherein the bedding may be concealed during the day, sometimes in a drawer.

Special beds have also been contrived for the use of sick or wounded persons, notably mattresses of material impervious to air or water and filled with either the one or the other. In French History (see Bed of Justice), the bed of the Greeks that was known before the Revolution of 1789, the king used to sit when he went to Parliament to look after the affairs of state, the officers of Parliament attending him in scarlet robes. As this interference of the king with Parliament was not compatible with free government, sitting
on the bed of justice came to signify the exertion of arbitrary power.

In Law, a divorce from bed and board is the divorce of husband and wife to the extent of separating them for a time, the wife receiving support, under the name of alimony, during the separation.

In Mechanics, a bed is the foundation piece of a portion of anything on which the body of it rests, as the bed-piece of a steam engine; the lower stone of a grinding-mill; or the box, body or receptacle of a vehicle.

BED AND BEDDING PLANE. A bedding plane is a plane of parting in a sedimentary rock, parallel to the stratification, and along which the rock tends to part more readily than in any other direction. A bed is a unit lying between two successive bedding planes. Laminae are very thin beds. A stratum (q.v.) may consist of one or more beds, but must be of the same kind of rock throughout. Beds of strata may pinch or thin out and disappear in all directions. They are then called lenses or lentils, or are said to be lenticular.

BED CHAMBER. Lords of the, 12 officers in the household of the British sovereign, who act as personal attendants. When the sovereign is a Queen, these officers are the ladies of the bed chamber. It is considered a high honor among the English nobility to be appointed to this office. The salary paid to each of these officials is £1,000 a year. All are under the command of the groom of the stole, who attends on the royal personage only on state occasions.

BED OF JUSTICE (Fr. lit de justice), formerly a solemn ceremony in France, in which the king with the princes of the blood royal, the peers, and the officers of the Crown, state and court proceeded to the Parliament, and there, sitting upon the throne (which in the old French language was called lit, because it consisted of an under cushion, a cushion for the back and two under the lower arms), caused those commands and orders which the Parliament did not approve to be registered in his presence. The Parliament had the right of remonstrating in behalf of the nation against the royal commands and edicts. If the king, however, did not choose to receive from his ministers, he first issued a written command (lettres de jussion) to the Parliament, and if this was not obeyed he held the lit de justice. The Parliament was then, indeed, obliged to submit, but it afterward commonly made a protest against the proceeding. Louis XV held such a lit de justice in 1763, in order to introduce certain impost, but on account of the firm resistance of the parliaments was finally obliged to yield. The last lit de justice were held by Louis XVI at Versailles, 6 Aug. 1787.

BED-SORE, an ulcer due to long-continued pressure on certain bony prominences of the body, due to protracted maintenance of the reclining position. The buttocks, shoulder-blades and heels are the most frequently affected sites. In addition to painful ulcers, or inflammation of the spinal cord, bed-sores may develop very rapidly, within 10 days to two weeks. Here the nerve-fibres governing the tone of the skin are affected. In long-continued diseases, however, necessitating the reclining posture, bed-sores develop largely from lack of careful nursing. A due amount of attention paid to absolute cleanliness, care for the skin, careful turning, and use of air-cushions or the water-bed, are often effective in preventing them. Alcohol and water, equal parts, is one of the best washes. If ulcers develop in spite of all precautions, they should be surgically treated. Oxide of zinc ointment, balsam of Peru, aristol powder, or bismuth powder, may all be used, alone or in combination.

BEDAMAR, bá-da-mar, a character (a Spaniard of noble birth) in Saint Réal's Con[juration des Espagnols contre la République de Venise, the source of Otway's Venice Preserved.

BEDARD, Pierre Stanilaus, French-Canadian publicist; b. at Charlesbourg, near Quebec, 1763; d. 1829. He was educated at the Seminary of Quebec, returned in 1792 to the first legislature of Lower Canada, became leader of the opposition, and was the first to demand responsible government. One of the founders of Le Canadien, established in 1806 as the organ of French-Canadian nationalism, he was, on the seizure of that paper, put in prison and refused a trial. Subsequently he became a judge.

BEDARIEUX, bá-da-re-ü, France, town in the department of Herault on the left bank of the Orb, 18 miles north from Beziers. It is well built and has manufactures of fine and common cloth, woolen stuffs, flax, worsted and cotton stockings, hats, soap, olive-oil, tanneries, dye works, paper and glass works and a brass foundry. It has also a trade in wine and brandy. Pop. 6,186.

BEDBUG, a hemipterous insect (Cimex or Acanthias lectularius). The body is broad, two and a half lines in length, flat and wingless; it is a rust red color with fine brown hairs. By its shape it is adapted for living in cracks between boards in furniture, etc., and by its long, slender beak it sucks the blood of its victim. This insect lays eggs throughout the warmer months of the year, the generation lasting each other as long as the temperature is high enough. The eggs are oval, white and the young bugs hatch in about eight days, escaping by pushing off a lid at one end of the shell. They are white, transparent, differing from the perfect insect in having a broad, triangular head, and short and thick antenna. A species closely related to the bedbug lives as a parasite on domestic birds, such as the dove. A nest of swallows swarming with alleged bedbugs was once found on a courthouse in Nova. Trestwood states that the bedbug is 11 weeks in attaining its full size; it molts about five times. De Geer has kept full-sized individuals in a sealed bottle for more than a year without food. The cockroach is the natural enemy of the bedbug and destroys large numbers, as does also the Reduvius and certain kinds of ants. In Europe a small black ant, Monomorium, is said to clear a house of them in a few days. Houses have been cleaned of them after being thoroughly fumigated with brimstone, or by the use of insect powder blown into the cracks and crevices where they live. They are also easily destroyed by painting the cracks with corrosive sublimate dissolved in alcohol.
Temporary relief may be had by sprinkling insect powder over the sheets of the bed one is to occupy. As the bedbug was known to Aristotle, who supposed it arose spontaneously from sweat, it's probable that it originated about the Mediterranean Sea, for it was not known to have occurred in England before the 17th century. Consult Osborn, 'Insects Affecting Domestic Animals' (Department of Agriculture Bulletin); Sutherland, H., 'The Book of Bugs and Bedbugs'.

BEDDARD, Frank Evers, English zoologist: b. Dudley, 19 June 1858. He graduated from New College, Oxford. In 1882 he joined the Challenger Expedition Commission on its two-year cruise as naturalist and was assistant editor in the preparation of the reports. He next became examiner in zoology and comparative anatomy at the University of London and lectured on biology at Guy's Hospital. In 1884 he was appointed professor of the London Zoological Society. He is the author of 'Animals of the Snow' (1883); 'Descriptions of Oligochaeta' (1885); 'A Textbook of Zoogeography' (1895); 'Structure and Classification of Birds' (1898); 'Book of Whales' (1900); 'Mammalia' (1902); 'Earthworms and Their Allies' (1912).

BEDDED VEIN. See BLANKET VEIN.

BEDDOES, béd-öz, Thomas, English physician and author: b. Shifnal, Shropshire, 13 April 1760; d. 24 Dec. 1808. He distinguished himself both at school and at Oxford by his knowledge of ancient and modern languages and literature. The great discoveries in physics, chemistry and physiology irresistibly attracted him. He continued his studies with success in London and Edinburgh. In his 26th year he took his doctor's degree, afterward visited Paris, and formed an acquaintance with Lavoisier. On his return he was appointed professor of chemistry at Oxford. There he published some excellent chemical treatises and observations on the calculus, scurvy, consumption, catarrh and fever. Dazzled by the splendid promises of the French Revolution, he offended some of his former admirers, and excited such a clamor against him by the publication of his political opinions that he resigned his professorship. He then composed his 'Observations on the Nature of Demonstrative Evidence', in which he endeavored to prove that mathematical reasoning proceeds on the evidence of the senses, and that geometry is founded on experiment. He also published the 'History of Isaac Jenkins', which was intended to impress useful moral lessons on the laboring classes in an attractive manner. After his marriage in 1794 he formed the plan of a pneumatic institution for curing diseases, particularly consumption, by means of factitious airs or gases. With the assistance of the celebrated Josiah Wedgwood, he succeeded in opening this institution in 1798. As superintendent of the whole, he engaged young Humphry Davy, the foundation of whose future fame was laid here. The chief purpose of the institution, however, was never realized, and Beddoes' zeal gradually relaxed, so that he relinquished it a year before his death. In the last years of his life he enjoyed considerable reputation by his 'Hygeia', in three volumes.

BEDDOES, Thomas Lovell, English dramatist and physiologist: b. Clifton, 20 July 1803; d. Basel, 26 Jan. 1849. He published 'The Bride's Tragedy' while an undergraduate at Oxford, and led an erratic life, ultimately committing suicide. His work was largely fragmentary, but his posthumous 'Death's Jest-Book; or, the Fool's Tragedy' (1850) received the high praise of such judges as Landor and Browning. It was begun in 1825, and occupied him till his death. It was written while he was studying medicine in Germany. In 1890 Mr. Gosse edited an edition of his poetic works in two volumes, with a memoir. See DEATH'S JEST-BOOK.

BEDE, BEDA, or BEADA, known as 'The Venerable Bede,' English historian and scholar, was born in 673 in the territory of the double monastery of Wearmouth and Jarrow, in the county of Durham, and died in the monastery at Jarrow in 735. At the age of seven he was entrusted to Benedict Biscop, abbot of Wearmouth-Monadephe in the years of the age, who, together with Ceolfriith, abbot of Jarrow, directed his education. All the rest of Bede's life was spent in the monastery of Wearmouth and Jarrow, which was administered as one foundation though the buildings were some miles apart. In his 30th year he was made dean, and in his 30th year, priest. He never held positions of higher dignity, refusing the office of abbot because its duties would have interfered with his chosen work of learning, teaching and writing. Under Bede, Northumbria became one of the great centres of learning in Europe. He himself gave instruction in Latin, Greek, Hebrew, astronomy, mathematics, grammar, rhetoric and music; in short, in all the subjects which constituted the learning of the Middle Ages. His knowledge was encyclopedic in character, and all, directed toward the service of the Church, is recorded as having been imparted with a vivacity and charm that endeared him greatly to his pupils. Besides attending to his monastic duties and his work as teacher, Bede wrote voluminously. In a brief summary of the main events of his life at the conclusion of his 'Historia Ecclesiastica', finished in 731, he gives a list of his works, 189, of which 94 are of importance and 90 are merely fragments. In all, his writings consist of 490 titles. His activities did not cease, however, with the completion of his great history, and at the very hour of his death, as is narrated by his pupil, Saint Cuthbert, he was engaged in dictating a translation of the Gospel of Saint John, now unfortunately lost. Cuthbert states that Bede was a lover of Anglo-Saxon poetry, but the only extant writings in the vernacular which can be connected with his name are two lines of a poem known as Bede's 'Death Song,' quoted by Cuthbert. The body of his writings consists of exegetical treatises on the books of the Old and New Testaments, and of treatises on scientific, rhetorical and historical subjects, all written in Latin. His reputation as a mathematician was very great, and for five centuries following his death his works were standard throughout Europe. For modern readers, however, Bede's most interesting and important achievements lie in the field of history. His greatest work is his 'Historia Ecclesiastica' (Historia Ecclésiastica Gentis Anglorum), a history of England from the earliest Roman
occupations to the year 731. It is written in a charmingly simple and pure style, and is remarkable for its accuracy. It is still the main source of our information concerning England for the period which it covers.

Bibliography.—For Bede's works, consult Migne's 'Patrologiae Cursus Completus' (Vol. 90); Giles, 'Opera Omnia' (London 1843). The separate edition of the 'Historical Works,' by Plummer (Oxford 1896), contains much valuable material, among other things the letter of Cubbertn narrating Bede's death. The West Saxon translation of the 'Historia' is probably the most ancient; 'Bibliotheke der Angelsächsischen Prosa' (Vol. IV, 1899). For estimates of the character and work of Bede, consult Bright, 'Chapters of Early English Church History' (3d ed., 1897); Brooke, 'English History from the Beginning to the Norman Conquest' (1898); Hunt, 'The English Church from its Foundation to the Norman Conquest' (1899); the Introduction to Plummer's edition of his ' Ecclesiastical History.'

GEORGE P. KRAPP,
Professor of English, Columbia University.

BEDE, Adam. See ADAM BEDE.

BEDEAU, bédô, Marie Alphonse, French general: b. Vertou, near Nantes, 1804; d. Nantes 1863. He won his military fame in Algeria, where he was active in the operations against the Algerians and became general of brigade. In 1847 he was for a short time governor of Algeria. He was in Paris at the outbreak of the revolution of 1848, and was subsequently vice-president of the Constituent Assembly and was made vice-president of it, always voting with the Republican party. As he opposed Louis Napoleon, he went into exile after the coup d'état of December 1851.

BEDEGUAR, béd-gô̌r, or SWEET-BRIAR SPONGE, a mossy roundish gall somewhat resembling a chestnut burr in size and form, but generally more or less reddish or purplish. It is caused by a poisonous fluid injected into the plant by a gall-fly (Rhododex rosa), the larva of which may be found feeding upon the plant juices. Like many other vegetable substances, it was believed to be useful in medicine in cases of sleeplessness, diarrhoea, and dysentery.

BEDEL, bédël, Timothy, American army officer: b. Salem, N. H., about 1740; d. 1787. In the Revolutionary War he was in command of the American force near Montreal, which surrendered without resistance when attacked by Brant's Indians. He was sick at the time, and the surrender was made by the officer second in command, yet Arnold placed the blame on Bedel.

BEDELL, bédël, Frederick, American physicist: b. Brooklyn, N. Y., 12 April 1868. He was graduated at Yale in 1890, and at Cornell (Ph. D.) in 1892, was assistant professor of physics at the last named, 1892-1904, and professor of applied electricity since that time; he is editor of The Physical Review. He has established a high reputation for his investigations in alternating currents of high voltage and numerous special articles on physics and electricity. He contributed the electrical content of W. W. W. J. F. 's 'Dictionary' and the definitions of electrical units in the 'Standard Dictionary.'

BEDELL, Gregory Thurston, American clergyman: b. Hudson, N. Y., 27 Aug. 1817; d. 11 March 1892. In early life he was rector of the Protestant Episcopal Church of the Ascension, New York. In 1859 he was consecrated assistant bishop of Ohio, and in 1873 bishop of that State. He wrote 'The Divinity of Christ'; 'The Profits of Godliness'; 'The Age of Indifference'; 'Episcopacy—Fact and Law'; 'A Canterbury Pilgrimage'; 'A Votive Pillar'; 'Memorial of Bishop McIntavish'; and 'Pastoral Theology.'

BEDELL, William, English clergyman: b. Black Notley, Essex, 1570; d. 1642. He studied at Cambridge, became minister of Saint Edmundsbury in Suffolk, and in 1604 went to Venice as chaplain to the Ambassador, Sir Henry Wotton. Here he remained for eight years and became intimately acquainted with the celebrated Fra Paolo Sarpi, who taught him Italian and was taught theology in return. While here Bedell translated the English prayer-book into Italian. On his return to England he resumed the duties of his curacy, but left it in 1615 for the living of Horingheath. Here he remained for 12 years, and quitted it to become provost of Trinity College, Dublin. He undertook several important reforms, and successfully accomplished them through the admirable manner in which he tempered firmness with prudence. In 1629 he was appointed to the united sees of Kilmore and Ardagh, but thinking the duties of one sufficient, he retained only Kilmore and insisted on resigning Ardagh. He then turned his attention to the Roman Catholics, and labored assiduously to convert them to Protestantism. He caused the prayer-book to be translated into Irish and read regularly every Sunday in the cathedral. The New Testament had already been translated, but Bedell had the honor of perfecting the boon by procuring the translation of the Old Testament. In 1641, on the breaking out of the rebellion, his house was for some time the only English one in the county of Cavan which remained uninjured; but at last he was so far involved in the common fate that he was carried off to the castle of Cloughoughter, where he was imprisoned with many others, the only exception in his favor being that he was not put in irons. His works are few and of comparatively little importance. His biography was written by Bishop Burnet.

BEDEN, the Arabic name, in Palestine, of the local species of ibex (Capra sinnatica), which ranges throughout Palestine and along both shores of the Red Sea. It varies little from other ibexes except in having the great horns of the bucks more compressed, and the knobs on their front more oblong. The general color is yellowish, with conspicu-
ous dark markings on the front of the forelegs, chest and back. See laxx.

BEDESMAN (Saxon, head, a prayer), was a common suffix to the signature at the end of English letters in the 15th and 16th centuries, and equivalent to petitioner. The Pas- ten letters, 1460-80, furnished many examples. Sir Thomas More, writing to Cardinal Wolsey, styles himself "Your humble orator and most bounden bedesman." Margaret Bryan, the gov-
erness of Princess Elizabeth, signs herself, in writing to a superior, "Your daily bede-
woman."

BEDFORD, Gunning, American patriot: b. Philadelphia, Pa., about 1730; d. September 1797. He was a lieutenant in the French war; entered the Revolutionary army with the rank of major; was wounded at White Plains; be-
came muster-master-general in 1776; was a dele-
tate to the Continental Congress; and was elected a delegate to Delaware... 1776.

BEDFORD, Gunning, American lawyer: b. Philadelphia, Pa., 1747; d. 30 March 1812. He was graduated at Princeton in 1771; became a lawyer; acted for a time as aide-de-camp to General Washington; represented Delaware in the Continental Congress in 1783-86, and be-
came attorney-general of the State and United States judge for the district of Delaware.

BEDFORD, Gunning S., American physician: b. Baltimore 1806; d. New York, 5 Sept. 1870. His uncle, Gunning Bedford, was one of the framers of the Constitution, first attorney-
general of Delaware, aide-de-camp to Washing-
ton, and United States judge for the district of Delaware. The nephew was graduated in 1825 at Mount Saint Mary's College, Emmets-
burg, Md. He took his degree in medicine at Rutgers in 1829. The next three years were devoted to study abroad. In 1833 he became professor of obstetrics in Charleston Medical College. He went from there to Albany, N. Y., at the New College foundation. In 1836 he went to New York, and in 1840 founded the University Medical College. In connection with this institution he founded the first free ob-
stetrical clinic in America. His 'Clinical Lectures on the Diseases of Women and Children' (1855), and 'Principles and Practice of Obstet-
rics' (4th ed., 1868) were much used as textbooks.

BEDFORD, John Plantagenet (Duke of), regent of France, third son of Henry IV of England: b. 20 June 1389; d. 1435. Shake-
spere, who calls him Prince John of Lancaster, introduces him in his plays of Henry IV as dis-
busting himself by his youthful courage in the battle of Shrewsbury in 1403, and for-
ing a kind of moral contrast to his more dissipa-
pated brother, the Prince of Wales. During the reign of Henry V he participated in the fame acquired by the conquest of France; but his talents were fully displayed when, after the death of the King, he became regent of France, having been appointed to this post by Henry in his will. At Verneuil, in 1424, he displayed his military talents; and the difficulties he experienced in endeavoring to maintain posses-
sion of the conquered provinces in France, afforded frequent occasion for the mani-
festation of his ability. The greatest blenheim in his character is his cruel execution of the Maid of Orleans in 1431. He survived this event about four years, and dying at Rouen, was buried in the cathedral of that city.

BEDFORD, John Russell (Duke of), English nobleman: b. 1766; d. 1839. He was versed in literature, fond of science, and a pas-
sionate lover of agriculture, to the improvement of which he devoted years of his life and the expenditure of vast sums of money. He was the father of the celebrated statesman, Lord John Russell (q.v.)

BEDFORD, Randolph, Australian author and journalist: b. Sydney 28 July 1868. He led a wandering life, which included working as a supercargo on a river steamer, prospector, re-
porter, journalist free lance and mining en-
gineer. In the latter capacity he wandered over most of the countries bordering on the Mediterranean Sea (1901-05). He is a con-
stant contributor to magazines, reviews and newspapers on a wide variety of subjects. Among his published works are 'True Eyes'; 'The Whirlwind' (1903); 'Snare of Strength' (1905).

BEDFORD, England, a parliamentary and municipal borough, situated on the Ouse, county town of Bedfordshire, 50 miles northwest of London. The chief buildings are the law courts, a range of public schools, a large in-
firmary, county jail, etc., and several churches. The town is rich in charities and educational institutions. The most prominent of these is the Bedford Charity, embracing grammar and other schools, and richly endowed by Sir William Harpur, a native of the borough, who was lord mayor of London in 1561, and left to the institution lands, now of great value, in the heart of London. There is an extensive manu-
factory of agricultural implements, engineer-
ing works and breweries. It was one of the earliest centres of the lace trade, originally introduced by Huguenot refugees. The first mention of Bedford in history is in the 'Anglo-
Saxon Chronicle,' in which it is said that in 757 it was the scene of a battle between the British and Saxons in 571. It was burnt by the Danes in 1010. John Bunyan was born at Elstow, a nearby village, and it was at Bedford that he lived and preached, the 'Fringar's Progress' being written during his long incarceration in Bedford jail. John Howard, the philanthropist, founded the Congregational Church which bears his name, and resided in the vicinity. Pop. (1911) 39,183.

BEDFORD, Ind., city and county-seat of Lawrence County, 65 miles southwest of In-
dianapolis on the Baltimore & O. S. W., the Chicago, Ind. & L., the Bedford & W., the Monon, and the Terre Haute & S. E. railroads. It has 21 large quarries of building-stone, the working of which is in the chief industry, but there are also railroad shops and roundhouse, saw-mills and a foundry and machine shop. There are three banks and one trust company, with resources amounting to $350,000; four schools and six churches. The post-office, pub-
lic library, Elks' home, city hall and cour-
touse are fine stone edifices. Taxable proper-
ity is valued at $5,000,000. Pop. (1910) 8,716; (1916) 12,000.

BEDFORD, Nova Scotia, a village of Hal-
ifax County, situated at the mouth of the Sack-
ville River, on the Intercolonial Railroad, north of and close by the city of Halifax. Its site is very picturesque, and it is a favorite summer resort.

**BEDFORD,** Pa., borough and county-seat of Bedford County, situated on a branch of the Juniata River, and on the Pennsylvania and the Huntington & B. T. M. railroads, 94 miles southwest of Harrisburg. It is a place of considerable importance, for some time an important military post, was once Washington's headquarters, and in 1794 the headquarters of the troops sent to suppress the Whiskey Rebellion. Of interest also are the old court-house and soldiers' monument. Bedford Springs, a favorite summer resort, is located about a mile from Bedford. The chief industry is the mining and manufacture of iron. There are also flour mills, planing mills and a large peanut factory. Bedford's first water grant, in 1795, is still in operation, and provides for a mayor, elected every four years, and a borough council. The municipality owns and operates the waterworks. *Pop. (1910) 2,235; (1914) est. 2,500. Consult History of Bedford and Prince Counties* (New York, 1898).”

**BEDFORD,** Quebec, capital of Missisquoi County, situated near the northern end of Lake Champlain, 60 miles from Montreal, on the Canadian P. Railroad. Its chief manufactures are knitting-needles, stoves and farming implements. *Pop. 1,432.*

**BEDFORD CITY,** Va., town and county-seat of Bedford County, 10 miles from Peaks of Otter, on the Norfolk & W. Railroad, midway between Lynchburg and Roanoke. It has a picturesque situation at the base of the Blue Ridge Mountains, with an elevation of over 1,000 feet. It is the seat of the Randolph Macon Academy for Boys (Methodist Episcopal), of the Belmont Seminary (Presbyterian), of the Saint John's Institute for Girls (Episcopal) and of the Jeter Female Institute (Baptist), and has a high school and public schools. Among the public buildings are the courthouse, new post-office and new National Elks Home. There are three banks. It is in a tobacco-growing region, is the centre of the trade for its district and has tobacco and cigar factories and warehouses, as well as several other industries, including a woolen-mill, flouring-mills, planing-mill, tin can factory and asbestos plant. The value of taxable property is $1,423,120. The government is by common council. *Receipts for 1915 were $55,187; disbursements, $55,337.* The waterworks and hydro-electric power and light plant are owned by the municipality. *Pop. 2,508.*

**BEDFORD LEVEL**, England, a tract of land, comprising about 400,000 acres in Cambridgeshire, Norfolk, Suffolks, Huntingdon, Northampton and Lincoln counties, formerly full of fen and marshes and now covered by water. Most part under water. It derives its name from Francis, Earl of Bedford, who in the 17th century expended large sums of money in attempting to drain the district. Numerous cuts have been made, consisting of a large and deep as well as navigable canals. In the Isle of Ely two of these cuts, the Old and New Bedford rivers, running nearly parallel to each other, are navigable for over 20 miles. A great part of the level is under cultivation and produces grain and some other crops in considerable quantities; but there is still enough fen to form shelter for vast numbers of wild fowl.

**BEDFORD MISSAL,** a book made for John Plantagenet, Duke of Bedford (q.v.) and his duchess. This rich volume is 11 inches long, 7½ broad and 2½ thick, bound in crimson velvet, with gold clasps, on which are engraved the arms of Harley, Cavendish and Hollis, quarterly. It is embellished with 59 large miniature paintings, with over 1,000 of a small size; and among them are to be seen several portraits of persons of eminence. It was purchased by Edward Harley, Earl of Oxford, from Lady Worsley, great-granddaughter to W. Seymour, 2d Duke of Somerset, who figured in the reign of Charles 1; and descended from Lord Oxford to his daughter, the Duchess of Portland. In the year 1786, when the collection of the Duchess was brought to sale, it was purchased by Mr. Edwards for $1,100, and was sold again at the sale of the collection of that gentleman, in the year 1815, when it brought $3,350, and came into the hands of the Duke of Marlborough. On coming to the hammer once more it strongly attracted the attention of book-collectors and antiquaries, and realized the unprecedented sum of $5,350, being sold at that price (June 1833) to Sir John Johnstone of Liverpool. It is now lodged in the collection of the British Museum. In a historical point of view it is interesting on account of its pictorial embellishments, some of which have been engraved by Virtue for his portraits to illustrate the ‘History of England.’ For the antiquarian and the student of the fine arts it is one of the most interesting monuments of that age. The antiquarian Gough published a work describing the Bedford Missal. Dibdin, in his ‘Bibliomaniac,’ gives an account of it.

**BEDFORDSHIRE,** England, a south-midland county, surrounded by Huntingdon, Cambridgeshire, Herts, Buckinghamshire and Nottinghamshire. It is the fourth smallest English county, with an area of 466 square miles. It lies principally in the basin of the river Ouse, which flows through the county, and is divided into the two divisions of Great Ouse and the smaller Little Ouse. It is rich in cornlands. It is mainly flat, varied by a spur of the Chiltens in the south, and by a range of chalk in the northwest. It is the most distinctively agricultural county in England, over 88 per cent of the area being given over to this industry. The lace industry goes back to the time of Catherine of Arragon, and it received marked stimulus from immigrations of Flemings in the 16th century following the persecutions of the Duke of Alva in the Low Countries, and from Huguenots who fled from France on the revocation of the edict of Nantes. Other industries are the making of straw plait for hats, sedge matting, making the manufacture of agricultural implements. The county also produces phosphate of lime, fuller's earth, stone and silver sand. The principal proprietor is the Duke of Bedford, whose seat, Woburn Abbey, dates from the beginning of the 18th century. The county is rich in antiquities, which include the pre-Norman churches of Clapham and Leverington. The county returns two mem-
bers to Parliament, for the Biggleswade and Luton divisions respectively. Pop. (1911) 144,588.

BEDIVERE, béd-i-ver, Sir, in Arthurian legend, one of King Arthur's most trusted knights. It was Sir Bedivere who cast the sword Excalibur into the lake and carried the dying Arthur to the vessel in which he was borne away to Avalon.

BEDLAM, a corruption of Bethlehem, the name of a religious foundation granted in 1547 by Henry VIII to the corporation of London, and by them applied to the purpose of a hospital for the insane. The place was originally within the city boundaries, but in 1814 a new building was erected in Saint George's fields, on the south side of the Thames, which was called New Bethlehem, or vulgarly, Bedlam. The patients, who had been discharged partially cured, and went about begging, were called Bedlam beggars, or Tom-o'-Bedlams. 'What a Bedlam' has become a colloquialism to describe any noisy meeting.

BEDINGTON, England, an urban district of Northumberland, on the river Blyth, five miles southeast of Morpeth. It is an important coal-mining centre, and has iron works and chain and nail-making. It has an important ecclesiastical building in the church of Saint Cuthbert, of Norman architecture, which was one of the traditional resting-places of the body of the saint in its miraculous pilgrimage from Durham to Lindisfarne. Pop. (1911) 25,440.

BEDINGTON TERRIERS. See Terriers.

BEDLOE'S, or LIBERTY, ISLAND, an island in New York harbor; ceded to the United States government in 1800; the site of Port Wood, erected in 1841 and mounted with 77 guns. It is now the location of Bartholdi's colossal statue of 'Liberty Enlightening the World,' presented by France to the United States. See Liberty, Statue of.

BEDMAR, Alfonso de la Cueva (Marquis de), Spanish politician and cardinal: b. 1572; d. Oviedo 1655. He was sent in 1607 by Philip III as Ambassador to Venice, and rendered himself famous by the conspiracy against Venice which St. Real has so well described. Notwithstanding the circumstance with which the details are given by St. Real, the very existence of the conspiracy is still considered by many a very difficult historical problem. The probability is that the conspiracy was real, but that the Senate, satisfied with having discovered it, and not willing to break altogether with Spain, did not think it advisable to give it much publicity. It forms the subject of Otway's tragedy, 'Venice Preserved.' Bedmar was obliged to save himself by flight to avoid the fury of the populace, but he did not lose the favor either of his own sovereign or of the Pope. By the former he was appointed governor of the Low Countries, where his severity and rigor made him universally detested; and from his name he received a cardinal's hat.

BEDNUR, béd-noor', or BEDNORE, India, decayed city, now a village, of Mysore, in the midst of a basin in a rugged tableland of the western Ghats, at an elevation of more than 4,000 feet above the sea, 150 miles northwest of Seringapatam. It was at one time the seat of government of a rajah, and its population exceeded 100,000. In 1763 it was taken by Hyder Ali, who pillaged it of property to the estimated value of $60,000,000, and subsequently established an arsenal here, calling it Hydernagar (Hyder's town). It was taken by the British under General Matthews in 1783, but soon re- taken by Tippeco, at the head of a superior force, when General Matthews and all the principal British officers were put to death. Pop. 1,100.

BEDOTT, Widow, the literary name of Mrs. Francis Miriam Whitcher, author of the once famous 'Widow Bedott Papers.'

BEDOUIN, béd-oo-en or béd-oo-in (Arab, bedaw), the name given to the nomadic Arabs, as distinguished from those settled in towns and villages and engaged in agriculture and manufactures. The Bedouin inhabit the deserts of Arabia and northern Africa, and are lean and short, but very active and capable of enduring great fatigue. They live mainly by hunting and pastoral occupation, and very little agriculture is carried on. Their food consists mostly of the produce of their herds, and they enjoy excellent health. Their temperament is cheerful, and they are honorable in their dealings with one another or with guests. Many of them, however, partly support themselves by robbery, but the statements regarding their marauding propensities seem to have been exaggerated. They live in tents, but frequently when traveling they sleep in the open air. Their religion is professedly Mohammedan, but is of a very simple character. The women grind corn and weave coarse cloths, and many of the tribes barter horses, camels, cattle, etc., for various necessities such as arms and cloth. Some tribes gain part of their subsistence by escorting travelers, pilgrims, etc., across the deserts. They are monogamous, but divorce is easily obtained and frequent. Though generally very ignorant, they are by no means unintelligent; and they possess the lively fancy of most Eastern nations. The head of a tribe is called the sheik, and they have also judges known as cadus. See Burckhardt, 'Notes on Bedouins and Wabans' (1830); Blunt, 'Bedouin Tribes of the Euphrates' (1879).

BEDRED DIN HASSAN, béd-réd-din' hás-san, the hero of the amusing cream tart story in the 'Arabian Nights Entertainments.'

BEDSTRAW, Galium, a genus of about 200 annual or perennial herbs with four-angled stems, natives mostly of the colder climates, whether of latitude or altitude, in the northern hemisphere. The species, which are mostly harsh-feeling weeds, are often attractive for their regular whorls of leaves and their panicles of profuse minute, white, yellow, green or purple blossoms, which in some species are used by florists to add "misty delicacy and airy grace" to bouquets, especially of sweet peas, and to cover rock-work in and out-of-doors. The two species most cultivated for this purpose are G. mollugo (European) sometimes called baby's breath (see Gypsophila), and G. boreale (American). Yellow bedstraw (G. riddellii), a species with yellow flowers, is used for curdling milk. Its flower sprays yield a yellow dye when boiled in alum solutions and its roots a red one, said to rival mad-
der as a wool dye. For this use attempts at cultivation have been made in England. This species, together with G. trifidum and G. boreale, redden the bones and milk of animals that eat them in quantity. Goose grass or cleavers (G. Aparine), a troublesome weed common to Europe, Asia and America, yields a seed sometimes used as a substitute for coffee. It is noted for the black prickles of its stems, fruits and leaves. In China B. tuberosum is cultivated for its farinaceous tubers. Some species, for instance, G. mollugo and G. rigidum, have been tried in cases of epilepsy and other cutaneous disorders.

**BEE, Bernard B., American Confederate general: b. South Carolina 1824; d. 21 July 1861.** Graduating from West Point in 1845, he served in the Mexican War, after which he was assigned to frontier duty in Minnesota and Dakota. On the outbreak of the Civil War he joined the Confederacy and was killed while leading his brigade at the battle of Bull Run.

**BEE, Hamilton Prior.** American Confederate general: b. Charleston, S. C., 1822; d. 1897. In 1839 he acted as representative of Texas on the commission which defined the boundary line between Texas and the United States, from the Red River to the mouth of the Sabine. In March 1843 he was sent by President Houston to Texas to negotiate with the Comanche Indians, which was finally successful. Later he became secretary of the Senate of Texas, but on the outbreak of the Mexican War he joined General McCulloch's command. On the rupture of hostilities between the Confederate States and the United States, he was made a brigadier-general of the provisional army of Texas, joining the Confederate army the year following.

**BEE, any hymenopterous insect belonging to the Apoidea group, the *genus Apis* of Linneus.** It was formerly, until quite recently, regarded as the single family of Apide, or by some naturalists as two families, the Apide and the Andrenide. The name now is applied to all those Hymenoptera whose tongues are capable of sipping the nectar from flowers, whose thorax are covered with a feathery hair and whose hind legs or feet are dilated. They again are subdivided into some 1,500 variations, ranging from the honey bee of highly developed intelligence to the lesser parasitic bee. In the complexity of their social life and the subdivision of their community functions the honey bees show even a higher order of intelligence than the ants, standing at the head of the whole insect world in this regard. Their habitat comprises the whole world, though they are not numerous in the warm and temperate climates.

**Varieties.**—According to the researches of a group of modern naturalists, at the head of which was W. H. Ashmead of the United States National Museum, bees are now classified as a superfamily of Apoidea, of the heterophasous Hymenoptera, and are divided into 14 subdivisions, ranking as families. Of these the chief are the true bees (Apiida) and thebumblebees (Bombidae) which alone live in highly organized colonies. The rest are of non-social habits, each one nesting by itself. These families are the hairy digger bees; the cuckoo bees, which invade the hives of the social bees; the small and the large carpenter bees; the mason bees; the leaf cutter, or potter bees; the parasitic bees, the burrowing bees and others, including the Prosopida, the simplest and the lowest variety, considered the primitive type from which all the other varieties have evolved. Of the solitary varieties the Anthophoridae, or potter bees, are the highest forms. They build their nests in the ground, at the bottom of horizontal burrows with lateral chambers. In all these forms the individuals are divided sharply into the two sexes, male and female, in which they differ markedly from the social bees.

**The Social Bees.**—The honeybees and the bumblebees, constituting the varieties which have developed a highly complex communal life, are described by L. O. Howard in the following words: *"Each species is composed of three classes of individuals—males, females and neuters. They have the power of secreting wax, from which their cells are made and the larvae are fed from time to time by the workers. The outer side of the dilated tibia is smooth and in the workers is hollowed into a shining plate for carrying pollen, which is collected by means of the pollen brushes on the basal joint of the hind tarsi. As a general thing the body is covered with hair."* Of the two families constituting the social bees the bumblebees are the lower, who build their hives underground. Unlike the bumblebees, the honeybees form permanent colonies, storing food for consumption during the winter. The population of one community may sometimes number many thousands. In a wild state they usually build their hives in hollow trees or even in open view among the branches. When their propensity to store food, in the form of honey, was first taken advantage of by man is not known, for there are records of bee-keeping among the early Egyptians and certainly it was an active industry among the Greeks.

**The Keeping of Bees.**—During the long period in which the honeybees have been semi-domesticated, or adapted to the needs of men, several varieties of them have been developed. It is not uncommon for an artificial hive to hold a bee population of 50,000 individuals. These communities are divided into three classes: the drones, or male bees, comparatively few in number; a single individual, a fully developed female, who performs the functions of a communal mother, laying an unlimited number of eggs after only one act of fertilization, commonly called the "queen"; and third, forming the great bulk of the hive's population, the workers, who perform all the labors necessary to the maintenance of the community. Though also known as "neuters," they are in fact females whose reproductive organs are atrophied, though occasionally some of them will lay eggs.

**The Queen Bee.**—A few days after she has emerged from her cell, and if the weather is fine, the queen bee makes her exit from the hive, except when the period of swarming arrives. She stands for a few moments at the entrance of the hive, then, with a buzz, flies rapidly upward, followed by the drones, or males. High in the air she attains a sexual union between the queen and the swiftest and strongest of the male bees takes place. Hardly
has the act been consummated when the father of the coming generation falls back dead in mid-air and drops to the earth, his mission fulfilled. Having been fertilized, the queen returns to the hive and shortly begins the laying of eggs, as many as 3,000 or even 4,000 a day. Meanwhile, the other males are quickly killed off by the workers. On her return to the hive the queen is immediately surrounded by from 12 to 15 of the workers who act as her personal attendants, feeding, cleaning and otherwise attending to all her wants, that she may devote all her energies to the important functions of motherhood.

The Eggs.—The queen now begins depositing her eggs in the waxen walled cells of the comb, of a bluish color and about one-twelfth of an inch in length. Some authorities contend that she can, at will, lay eggs which will hatch out workers or drones, while others are of the opinion that this depends on the kind of food fed by the workers. At any rate, the cells for the eggs of queen bees, workers and drones differ, but never does the mother bee make a mistake in the kind of egg that each cell demands. In about three days the eggs hatch out and the worm-like larve appear. For five days they are carefully fed by the attendent workers. At the end of that period they have grown so large as to completely fill their cells, whereupon they refuse further nourishment and the workers immediately seal them up in their cells. The little larva then spins itself into a silken covering or cocoon and transforms itself into a pupa. Thirteen days later the pupa breaks forth from its cell and emerges a perfect bee. Immediately it is waited upon by the attending workers and for several days, until it makes its first flight, it is fed by its nurses. Meanwhile its cell is thoroughly cleaned out and the queen, making her rounds, deposits another egg in it. The cell in which the coming queen is developing is larger than the others and oval in shape. On nearing maturity the mother makes repeated attempts to break it open, to destroy her coming rival, but the attending workers of her retinue crowd around her and protect the royal infant.

Swarming.—As the population of the hive increases the queen bee becomes restless, and this growing agitation extends itself to the workers throughout the hive. Then, one fine day, the queen rushes forth, as she has done only once before, the centre of the swarming buzzing colony, which throngs out after her. Not far off, on some hanging bough of a tree, she settles and all the swarm settle on her or on each other, hanging in a long, thick bunch. It is then that the experienced apist intruces the swarming bees into their new hive, where they establish themselves anew. Meanwhile the young left in the old hive continue the routine of the communal life in their turn. But in many weeks there is a swarming from the newer generation; often there may be three or four swarms in one season from the one hive.

Wintering.—When cold weather begins, the bees, in the bee communities, begin to subside, the steady hum which can be heard throughout the summer from within dies down and the individuals become sluggish and dull. When the first frosts come they find the bees in a state of semi-hibernation, though not so deep but what they can readily be awakened. A slight jar to the hive, and the low murmure rises and a thermometer placed at the entrance would indicate a steady rise in temperature. During these winter months the life of the hive is in a state of suspended animation and sionally the queen has been known to lay eggs in this period. For other varieties of bees see Bee-keeping; Bumble-bee; Carpenter Bee; Honey-bees; Leaf-cutting Bee; Mason Bee; Stingless Bee; also Insect.

BEE-BIRDS, birds that devour bees, especially the honeybee. Not many birds have this habit, the bees being protected against most birds by their stings. A few fly-catchng birds, however, have learned how to avoid being stung, and catch not only bees but wasps, take them to a perch and beat them, so as to kill them, and probably get rid of the sting before swallowing them. Notable among these are the European and African bee-eaters (q.v.). The American kingbirds (q.v.) also catch bees, but not as frequently as is popularly supposed, and are known in the Southern States as bee-martins.

BEE-EATER, a small, richly plumaged and graceful bird of southern Europe and northern Africa, whose food consists almost wholly of bees and wasps, and which haunts the neighborhood of the hives of honeybees and devours these useful insects in great numbers. The bee-eaters are related to the kingfishers, and like them dig deep nest-holes in earthen banks, and lay pure white eggs.

BEE-KEEPING.—Few persons who see the little boxes of honey in the market realize the importance and extent of the bee-keeping industry of this country. Careful estimates, based on United States statistics, and the output of large factories for the manufacture of bee-hives and honey-boxes, show that at least 125,000,000 pounds of honey is annually produced, making an aggregate of 5,000 car-loads, or a train 35 miles long. The aggregate value of this, at a conservative figure, is $10,000,000. When it is remembered that California alone, in a good year, can produce 500 car-loads of honey, and that a good many of the other States produce more, one can form some idea of the commercial possibilities wrapped up in so small an insect as the bee.

The honey resources of the great West are very largely dependent on alfalfa and mountain
sage. In the North-Central and Eastern States, clover and basswood, in the South-Central, tupelo, palmetto, cat-claw, mesquite, and guajilla.

There are several races of bees—Apis dorsata, or the giant bee of India and the Philippines; A. indica, of India; A. florea, and A. mellifica. From a commercial standpoint, the last mentioned is by all odds the most important. It comprises the black or German bees of this country; the Italians, from the southern part of Italy; the Syrians, of Palestine; the Cyprians, from the island of Cyprus; the Carniolans, from Austria, and the Tunisians, from north Africa. But the most important of all these varieties is the Italian. They are the most industrious and the gentlest. They, together with the black or German bees and their crosses, incorrectly termed "hybrids," are used most extensively in the United States—in fact, throughout almost all the civilized world.

Three Kinds of Hive Bees.—There are three kinds of bees in the hive; namely, the workers, or undeveloped females; the queen, a fully developed female; and the drone, or the male bee. The queen lays all the eggs of the hive, and may lay as many as 3,000 a day. Notwithstanding there may be from 10,000 to 100,000 bees in a single colony, the queen will be the mother of the whole colony. The drones are incapable of gathering honey, and serve only one purpose—that of fertilizing or fecundating the young queens, which act takes place in the air. The workers gather all the honey and pollen, fill all the combs and rear the young or baby bees. As soon as the mating season is over, the drones are shoved out of the hives and allowed to starve.

How to Handle Bees.—There is a general impression to the effect that the ordinary honeybees are vicious, even in a towering rage, ready to attack any one who comes near their hives. This is a great mistake. Under certain conditions, when their habits are known, they can be handled almost like kittens; will permit one to tear their hives apart, rob them of their months and months of hard earnings—the honey and the wax—without even offering to sting. But an inexperienced or awkward person may infuriate them to fearful vengeance. To bring them into a state of subjection it is only necessary to blow smoke into the entrance and over the combs, when, if the motions about the hive are careful and deliberate, they will offer no attack. Smoke, when intelligently used, disarms opposition, puts the bees in a quiet state and enables their owner to do with them, within reasonable limits, whatsoever he will.

The bee-smoker is simply a small bellows attached to a sort of tin cup having a suitable snout from which the smoke is blown by the action of the bellows, forcing air through the cup in which there is a slow-burning fuel. Besides the bee-smoker, the bee-keeper generally uses a bee-veil made of mosquito netting, Brussels net or any suitable material, the same fastened to the rim of the hat and tucked inside of the coat-collar or under the suspenders. Gloves are sometimes used by very timid persons or beginners, but as a general thing all work with the bees is performed with the bare hand. Stings are, of course, occasionally received, but beyond a sharp, momentary pain no permanent effect will be felt after the first season, for the system of the bee-keeper very soon becomes inoculated so that no swelling takes place. There are many who receive from 10 to 20 stings a day without any ill effects; but if one will work carefully he will receive almost no stings.

 Marketable Products of the Hive.—These are beeswax, comb and extracted honey, propolis or bee-glue (sometimes used for making shoe polishes) and "apis mellifica," a homeopathic preparation taken from the poison sacs at the root of the stings of bees.

Production of Wax.—Beeswax, which is secreted by the bees and used by them for building their combs, is an important commercial product and commands a good price in the United States. There are frequently combs to be melted up, and it pays to take care of even scraps of comb and the cappings taken off in extracting. A common method of taking out the wax is to melt the combs in a solar wax-extractor. Various wax-presses are on the market, but if much wax is produced, it is advisable that the bee-keeper make a careful study of the methods of wax extraction,
as there is usually much wax wasted even after pressing.

Comb Honey Production.—Comb honey is usually put up in little square or oblong boxes, of which something like 50,000,000 are made and used in the United States annually. The honey in these boxes retails all the way from 12 to 20 cents. Extracted honey is in the liquid form, thrown from the combs by means of centrifugal force in a honey-extractor, hence the name. There are bee-keepers who make a specialty of producing honey in the comb and others the same product free from the comb. The first mentioned cannot be adulterated or manufactured, newspaper reports to the contrary. One bee-keeper of considerable standing and prominence has had a standing offer of $1,000 for a single sample of artificial comb honey so perfect as to deceive the ordinary consumer. Notwithstanding that this offer has been broadly published over the United States for over 20 years, no one has ever claimed it.

It may be well to explain that a partial basis for these canards lies in the fact that bee-keepers use a commercial product known as “comb foundation,” which is nothing more or less than sheeted wax, about an eighth of an inch thick, embossed on both sides with indentations having the exact shape and form of the bottom of the cells of honey-comb—hence the name. It is put into the hive, where the bees draw it out into comb. This is as far as the skill of man can go; hence there is no such thing as artificial comb, much less artificial comb honey.

The business of producing comb honey requires some knowledge of the trade. Hives and supers require to be specially constructed and so arranged that the little boxes containing strips of comb foundation shall be accessible to the bees where they can construct the foundation into comb, fill the cells with honey and seal them over. When their owner finds that his little servants are busily at work in the fields; that the combs are beginning to whiten and to be bulged with honey in what is called the brood-nest, he puts on his honey-boxes in the part of the hive he calls the “super.” These are allowed to remain on during the height of the honey-flow until they are filled and capped over, when they are removed and others put in their place.

The business of producing extracted (or liquid) honey requires the same intelligent care and attention. Instead of section-boxes, however, an extra set of combs, or “brood-frames,” as they are called, is put in the upper story, the same being placed above the lower or brood part of the hive. When these are filled with honey and capped over, they are removed from the hive by first shaking the bees off, taken to the extracting-house and extracted. The thin film of wax covering the comb is shaved off with a thin-bladed knife specially designed for the purpose. After the combs are uncapped, they are put in the honey-extractor and revolved at a high rate of speed. The honey flies out of the comb by centrifugal force against the sides of the extractor, when the combs are reversed, exposing the outer surfaces, which are emptied in a like manner. They are next returned to the hive to be filled by the bees.
when the process may be repeated as long as the season lasts.

Swarming.—At the beginning of or during what is called the honey-flow, when the colony has reached a high state of prosperity and the combs are being filled with honey, a swarm is liable to come forth between the hours of 9 and 3 o'clock. Three-fourths of the bees, including the queen, are pretty sure to come out with a rush, filling the air with thousands and thousands of them. The bees hover about in the air for 15 or 20 minutes, when they will in all probability cluster on some bush or tree. They will wait here for two or three hours, or perhaps as many days, at the end of which time they will take wing again and go direct into some hollow tree or cave where they will take up new quarters and start housekeeping anew. The young bees, with one or more young queens, are left to take care of the old hive.

In ordinary practice it is a custom for the bee-keeper to revive the swarm by taking the bunch of bees, as soon as it clusters, and putting it into another hive. Or he can, if he chooses, clip the old queen's wings, preventing her flight with the swarm; and when the bees come forth she will crawl out of the entrance to be captured by her owner, and as soon as her subjects return, which they will do to find their royal mother, they are allowed to go into a new hive on the old stand, while the old hive is carried to another location in the bee-yard.

Prevention of Swarming.—Since crowded and overheated hives are particularly conducive to swarming, this tendency is largely overcome by giving plenty of ventilation and additional room in the hive. Shade is also a good preventive. Frequent examinations of the hive during the swarming season for the purpose of cutting out queen cells is a help, and re-queening with young queens early in the season generally prevents swarming. A better method, according to some, is to remove brood about swarming time and thus reduce the amount of bees in the hive. There are generally colonies in the apiary to which frames of brood can be given to advantage. Various non-swarming devices have been invented, including a non-swarming hive so constructed that there is no opportunity for the bees to form a dense cluster.

Robbing.—There are certain times during the season when no nectar is secreted by the flowers. It is during such periods as this that the bees will rob each other if they can or help themselves at candy-stands or to the housewife's fruit-preserves during the canning season. When sweets can be obtained in considerable quantity, either from a weak colony unable to defend itself or from man, the bees are apt to become furious and their craze is not unlike that of gold-hunters when gold is discovered in large quantities. There is a time when the sweets are suddenly cut off, the bees are inclined to be cross and to sting. The wise and careful bee-keeper will see to it that the entrances of his weak colonies are properly contracted so that the sentinels or guards can protect themselves from intrusion from other bees.

Feeding.—The bee-keeper may, perhaps, take all the honey away from his bees, or nearly so, as his honey will bring two or three times as much as any cheap syrup costs him. Sometimes he finds it profitable to take the honey all away and give them syrup made of granulated sugar. The purpose of this, of course, is to keep them from starving during the time no honey is coming in from natural sources or during the winter.

Transferring.—In increasing the apiary it is sometimes best to buy colonies in box hives on account of their smaller cost, and to transfer them to hives with movable frames. This should be done as soon as possible, for box-hive colonies are of small value as producers. The best time to transfer is in the spring, when the amount of honey and the population of the colony are at a minimum. Transferring need not be delayed until spring merely because that season is best for the work. It may be done at any time during the active season, but, whenever possible, during a honey-flow, to prevent robbing.

Uniting.—After the honey-flow, and just before winter comes on, there are liable to be many weak colonies. It is a common practice to put two or more of these together so as to make one strong stock. The combs from two or three different hives are put into one hive and the bees are confined for several days with wire cloth over the entrance, when they are allowed to fly. Some of them will return to their old stands but the majority of them will remain.

Wintering.—Two methods are in vogue in the colder portions of the United States. One is to put the colonies in double-walled boxes, packed under chaff cushions, and contracting the entrances down to shut out as much cold as possible. The other is to put the summer hives into a dry, dark cellar as soon as cold weather comes on, leaving them there till spring.
Diseases of Bees.—Bees are subject to diseases, like all domestic animals, such as dysentery, paralysis and foul and black brood. Dysentery, as its name signifies, is a sort of bowel trouble due to the retention of the feces for an extended time during winter. If the bees are shut up without a chance for flight (for they never void their feces inside of the hive except when confined), their intestines become distended and this finally results in purging. The only remedy is warm weather and a flight. Paralysis is a form of palsy that seems to affect the adult bees. Their bodies become swollen and shiny, the affected individuals crawling out of the entrance and running into the grass to die. The remedy is to sprinkle powdered sulfur over the combs. Foul brood and black brood are germ-diseases that affect bees in the larval or imago state. The little maggots become brown or black and die, the dead matter finally assuming a sodden, gelatinous or ropy condition. When it attacks a colony, shake the bees into a clean hive and put them on frames of foundation. For three or four days feed them syrup. The old combs, including the frames, must be burned. If the hive has been soiled by the tainted honey or dead matter, it must be scalded out or held over flames for a few seconds. Any honey taken from the hive may be rendered safe to give to the bees by boiling it for an hour.

A number of insects, birds and mammals must be classed as enemies of bees, but of these the larger wax moth, the lesser wax moth and ants are the only ones of importance. Moth larvae often destroy combs. To prevent this the combs are fumigated with sulphur fumes or bisulphide of carbon in tiers of hives or in tight rooms. In warm climates ants are a serious pest. The usual method of keeping them out is to put the hive on a stand, the legs of which rest in vessels containing water or creosote. Another method is to wrap a tape soaked in corrosive sublimate around the bottom board.

E. R. Root,
Author of 'A B C of Bee Culture' and Editor of 'Gleanings in Bee Culture.'

BEE-KILLER, one of the robber-flies (q.v.), of the dipterous family Asilidae, some of which are known to seize with their sharp lancet-shaped beak humblebees and honeybees and suck their blood. Species Trupanea apivora, the bee-killer, captures the honeybee while on the wing, and one such fly has been known to kill a large number of bees. These flies are stout-bodied, hairy or bristly, with a long abdomen; the mouth-parts are much developed and adapted for piercing. The maggots live in the soil, preying on the grubs of beetles, or on the roots of plants.

BEE-LARKSPUR. A well-known flowering plant, Delphinium grandiflorum.

BEE-LINE. The shortest route to any place, that which a bee is assumed to take; though, in fact, it often does differently in its flight through the air.

BEE-LOUSE (Braula coeca), a parasite on the honeybee, occurring on the thorax especially of the queen bee, but not on the drones. Benton states that he has at one time removed as many as 75 from a queen, though the numbers do not generally exceed a dozen. It is the sole member of a family (Braulidae) of flies closely allied to the horse flies (Hippoboscidae) and the bat-ticks (q.v.). The beelouse is about one-twentieth of an inch in length, entirely without wings, and somewhat spider-like in appearance. On the day the maggot or larva hatches from the egg it sheds its skin and turns to an oval puparium of a dark-brown color. It has frequently been imported to this country on queens with attendant bees but has gained no foothold.

BEE-MOTH, or WAX-MOTH, a moth belonging to the family Galleridae; specifically, Galleria mellonella, the larvae of which feed on wax in hives. The worm is yellowish-white with brownish dots. It constructs silken galleries running through the comb of the bee-hive on which it feeds. When about to transform it spins a thick white cocoon. Two broods of the moth appear, one in the spring, the other in August, and the caterpillars mature in about three weeks. It may become a most troublesome pest in the apiary.

BEE-ORCHIS, the name of a species of orchis, the Ophrys apifera. It is so called because a part of the flower resembles a bee. It is large, with the sepals purplish or greenish-white, and the lip brown variegated with yellow.

BEE-TREE, a forest tree inhabited by honey-making bees, which have taken possession of some natural hollow and filled it with combs. Such a tree may be found by accident, or by deliberate hunting. Those in search take to the edge of the woods a box of diluted honey, and when they see bees near them, open the bait to which one by one the bees will be attracted. The direction of their flight is then carefully observed; the bait is moved to another point, and new observations taken, and the converging lines followed until they intersect at the tree. As most of these bee-tree colonies are escaped swarms the capture of the bees themselves is more important than merely to get such honey as may be there. The best plan is therefore to climb to the nest, if possible, and gather the combs and contents to be let down in a pail or basket, or else saw out the whole section of the tree containing the nest and bring it to the great nest. In this case, all directions for this complicated proceeding are given by Root, 'A B C of Bee Culture' (1903).

BEEBE, Charles William, American ornithologist: b. Brooklyn, N. Y., 29 July 1877. Graduating from Columbia University, he was, in 1894, appointed ornithological curator for the New York Zoological Society. As such he founded the collection of living birds at the New York Zoological Gardens, making it one of the best in the world. Later he was at the head of various scientific expeditions to Nova
Scotia, Florida, Mexico, South America, India and China. In his search for data for a monograph of phasianids he made a trip costing the Zoological Society over $100,000. He is the author of 'Notes on the Psychology of Birds' (1903); 'Two Bird Lovers in Mexico' (1905); 'The Bird' (1906); 'The Log of the Sun' (1906); 'Geographic Variations in Birds with Reference to the Evolution of the Hotain' (1907); 'Our Search for a Wilderness' (1910); 'Racket Formation in the Tail Feathers of the Dotmot' (1910); 'Monograph of the Peasants' (1916).

BEECH, a small genus (Fagus) of handsome forest trees of the family Fagaceae. The American beech (Fagus grandifolia), and the European or common beech (F. sylvatica), are closely similar. They often attain heights exceeding 80 feet, and diameters greater than three and one-half feet. The former has smooth, light-gray bark, a broad round head, and leaves which turn yellow before they fall in the autumn; the latter has dark-gray bark, and has shining leaves which persist during most of the winter. The tree scarcely bears fruit before the 50th year of its age, and then not every year. After the 140th year, the woodrings become thinner. The tree lives for about 250 years. Some stems are flushed, some even twisted. The roots stretch far away, near to the surface of the soil, partly above it. Young beeches are useful for live hedges, as they bear pruning, and as their branches coalesce by being tied together, or by rubbing each other. Amputations of limbs, and deep incisions in the tree, soon become obliterated by the bark. The dead leaves are often used by the poor of Europe for stuffing beds and pillows. Both species yield pleasant, edible, three-sided nuts, usually in pairs in prickly involucres. These nuts are eaten by swine, deer and poultry, and in France, and to some extent elsewhere, are pressed to extract a mild culinary long-keeping oil. Both species thrive in light, limy loams, upon which formations they often become the leading species of tree, covering large tracts. Their reddish-brown, solid, hard but brittle wood makes excellent fuel, and is largely used for making tool handles where bending and twisting are not expected. The wood is not durable in contact with soil, but since it is remarkably lasting when immersed in water, it is largely used in dams, water-mills, sluices, etc. The wood of the European species is preferred to that of all other species, except walnut, for making shoes ( sabot), in France, sulfur, and is remarkably resistant to the entrance of water. The bark is sometimes used in tanning. Both species are used in ornamental planting on account of their symmetrical forms, the colors of their bark and foliage, which latter is remarkably free from the attacks of disease and insects. The European species has produced a large number of varieties, of which the copper or purple beech is probably the best known in America. F. sieboldii, a native of eastern Asia, is sometimes planted for ornament. F. coerulea, a Terra del Fuegoian species, is a striking feature of the winter landscape on account of its evergreen foliage. Its wood is used for flooring vessels, and is exported to the Falkland Islands and elsewhere for roofing. Blue or water beech, better known as American hornbeam (Carpinus caroliniana) occurs in damp woods and along streams. It is not a member of this genus. See HORNBEAM.

From the wood of the beech an especially pure form of creosote is obtained that is largely employed in the treatment of chronic lung disorders. See CREOSOTE.

BEECHER, Catherine Esther, American educator and philanthropist, eldest daughter of Lyman Beecher; b. East Hampton, L. I., 6 Sept. 1800; d. Elmira, N. Y., 12 May 1878. Her faith and life were nearly wrecked at 22 by the loss of her betrothed, Prof. A. M. Fisher of Yale, in a shipwreck, and she lived unmarried, plunging into work as a relief; but she had the Beecher energy which could hardly have remained quiet in any case. From 1822 to 1832 she managed a girls' school in Hartford, Conn., with remarkable success and repute; she wrote some of her own classbooks, one on mental and moral philosophy being afterward used in colleges. From 1832 to 1834 she kept a similar school in Cincinnati, in order to meet her father, who was at the head of Lane Seminary; but her health compelled her to abandon it. For the rest of her life she worked with heart and soul to advance the education of women and girls, physical and social, as well as intellectual and moral, for she believed in the full harmony of all inborn human qualities. She organized a 'National Board of Popular Education,' to train women teachers, especially for the South and West, and traveled and wrote extensively in this behalf. As with most persons of much force, she had many 'fads' and eccentricities; but she was a high-minded, accomplished and charming woman, of great wit and executive capacity. Her first work was on the 'Difficulties of Religion' (1836); among others were 'True Remedy for the Wrongs of Women' (1851); 'Physiology and Calisthenics' (1856); 'Common Sense Applied to Religion' (1857); 'Woman's Profession as Mother and Educator, with Views in Opposition to Woman Suffrage' (1871).

BEECHER, Charles, American clergyman, son of Lyman Beecher; b. Litchfield, Conn., 7 Oct. 1815; d. Haverhill, Mass., 21 April 1900. He was educated successively at the Boston Latin School, the Lawrence Academy at Groton, Mass., and at Bowdoin College, graduating in 1834. He then studied theology under his father at Lane Seminary, Ohio, and in 1844 was ordained pastor of a Congregational church at Fort Wayne, Ind. Leaving there in 1851, he was pastor in Newark, N. J., till 1854, and in 1857 took charge of a church in Georgetown, Mass. He lived in Florida, 1870-77, and was State superintendent of public instruction there for two years and was stated supply at Wysox, Pa., in 1885. His best work was in the selection of the music for the famous 'Plymouth Collection of Hymns,' he having fine musical taste. He wrote 'The Incarnation' (1849); 'David and His Throne' (1855); 'Pen Pictures of the Bible' (1855); 'Redeemer and Redeemed' (1864); 'Spiritual Manifestations' (1879); and 'Eden Tableau' (1880). He also edited his father's autobiography and correspondence (1863).

BEECHER, Charles Emerson, American paleontologist; b. Dunkirk, N. Y., 9 Oct. 1856;
d. New Haven, Conn., 14 Feb. 1904. He was graduated at the University of Michigan 1878, studied under Prof. James Hall at Albany, N. Y.; in 1888 was given a position in this department at Yale; in 1892 was made professor of historical geology; and in 1892 succeeded Prof. C. N. Marsh at Yale. Yale and New Haven, and in 1826 was ordained over Park Street Church in Boston; which he left in 1830 to take the presidency of Illinois College, Jacksonville, Ill., a theological school, whence many of Dr. Beecher's pupils went to be pastors and teachers in the New West. He returned to Boston in 1844 as pastor of the Salem Street Church; in 1856 went to the Congregational church at Galesburg, Ill., remaining till 1872, also holding for some years a professorship of exegesis at Chicago Theological Seminary. He had been a regular writer for the Christian Union since 1870, and in 1872 retired from the ministry, removed to Brooklyn and devoted himself entirely to writing and missionary work, contributing to the Christian Union, and editing the Congregationalist for six years. Of his books, the two most discussed were 'The Conflict of Ages' (1853), and 'The Concord of Ages' (1860), a transition into terms of Christian theology of the doctrines of pre-existent and continuously existent souls and the dualism of good and evil, the struggle of the two being prolonged into a future life and good finally triumphant. Besides sermons, etc., he also published a 'History of the Alton Riots' (Cincinnati 1837); 'Baptism' (1850); 'Papal Censure and Excommunication' (1855); 'History of Opinions on the Scriptural Doctrine of Future Retribution' (1878).

BEECHER, Henry Ward, American clergyman, son of Lyman Beecher; b. Litchfield, Conn., 24 June 1813; d. Brooklyn, N. Y., 8 March 1887. He was the offspring of a union which has produced some of the world's greatest influences, and in theory ought always to produce them—of a stern, energetic, high-principled father, with a sweet and beauty-loving mother, giving power and continuity to sentiment and sympathetic emotion. Works of Henry Thoreau and Victor Hugo are notable instances in this respect. Beecher had a rather bare, hard childhood, under a father and stepmother who both considered duty and enjoyment hardly compatible. The great genial orator who stood down and wept when his host mused was a shy and sensitive boy; the editor, author and booklover had a wretched memory, disliked study and wanted to go to sea. But the religious atmosphere was around him; 'converted' in a revival, he decided to train for the ministry, entered the Boston Latin School in 1828, then the Mount Pleasant School at Amherst, graduated from Amherst College in 1834, and began a theological course under his father at Lane Seminary. He revolted at his father's sulphurous theology, but for a short time in 1837 was editor of an anti-slavery paper in Cincinnati, fervid love for humanity holding first place with him then as always. Later in the year he took charge of a country church at Lawrenceburg, Ind., and married Eunice White Bullard of West Sutton, Mass., to whom he had been seven years engaged. In 1839 he was called to a church in Indianapolis, then a town of 4,000 people, remaining there eight years and becoming widely known both as a revivalist of great power and as a preacher of delightful humor and originality. In 1847 he was called to Brooklyn to take charge of a new church of nine members, called Plymouth Church. He held this pastorate for 40 years, lacking a few months; and for the most of the time the church was not only a Mecca to the vast class seeking to retain Christianity while forced to discard very much in the way of theology, but the fountain of strong influence acting powerfully on the moral and social, and sometimes the political, tendencies of the age. He preached on whatever related to the public welfare, probed every evil and championed every reform, especially of impec- lamerence and slavery. His outspoken courage, strength of thought and felicity of expression, his exhaustive wealth of eloquent rhetoric, humor and pathos, dramatic force and apt analogy and illustration, not only drew to hear him one of the largest permanent congregations in the United States—his immense church with its seating capacity of nearly 3,000 being constantly crowded—but made his pulpit one of the most famed and influential of the English-speaking world; his utterances forming a basis of action for many. He was not a theologian in any sense, and his influence rested on his abstinence from creal logic; he was the spokesman of those who fear that if they compute their doctrinal laisses they dis- cover much more than they wish to know, and prefer to keep the fruits of faith by evading exact definition rather than lose them by a rigid self-inquiry. To the orthodox of his day he seemed an underminer, though to many at the present he seems conservative enough. He believed in the divinity of Christ, in immortality, in special providences and miracles, in the Bible as a divine revelation by fallible human instruments; he did not believe in eternal punish- ment (which he publicly denied in 1829), election and reprobation, the fall of Adam, the vicarious atonement, or imputed sin and right- eousness; and he declared the orthodox Deity 'barbaric, heinous, hideous. He gave his whole soul to thinking and writing, delivering several discourses in a single day; but such was his physical and mental vigor that he accomplished work in several other directions sufficient in each case for an able and busy man. He was one of the giants in oratory of the anti-slavery title mots was a shy and sensitive boy; the editor, author and booklover had a wretched memory, disliked study and wanted to go to sea. But the religious atmosphere was around him; 'converted'
announce the Kansas crime, joining the Republican party on its inception and traveling great distances to speak at its meetings. Yet he was not an abolitionist like Phillips and Garrison; and like Lincoln and the mass of the Republicans, held that Congress could not interfere with slavery in the South, though great and its extension. The Pro-Slavery party drew no fine distinctions, however, and the Northern Democratic papers all through this period are filled with denunciation and caricature of him. His series of speeches in England in the fall of 1863 helped to turn the tide of English opinion in favor of the North. The prime element of his success was his enormous physical vitality: he tired out the mobs which attempted to howl him down, by actual bodily endurance and power of lungs, before he began the splendid addresses which made them at least enthusiastic admirers of himself, if not perhaps converted believers in the cause he represented. He had the "rapport of the strike" which Attila knew: he loved to be the target of a ring of opponents as well as John Quincy Adams, though without his bitterness, and was as instant and un- falling in retort; a dozen taunts hurled at him in a breath met a dozen crushing but never maddening in its effect. He was one of the most popular lecturers and after-dinner speakers in America. Of his set orations, those at the Burns centennial of 1859, and by government request at Fort Sumter, in April 1865, on the anniversary of its capture by the Confederates, are most famous. He occupied several editorial positions: editing the Independent 1861-63; founding the Christian Union, editing it 1870-81; was a fertile sketch writer, and wrote a novel and a Life of Christ. Besides this, he was an enthusiastic amateur farmer, and loved outdoor nature passionately, as well as art and the drama. His open, impressive, sensitive nature responded readily to all things that stimulate the intellect, the heart or the soul. He was essentially an impulsive soul; but he gave the spontaneous suggestion of the moment, often not even making notes for a sermon, but like all men who make any impress on the world, kept him from the trap of over-exulating, over-working, on both from books and life. He always lamented that it had not been permitted him to lead a life of scholarship; but in fact he did not lead it because he was not willing to pay the price for it, of abstinence from leadership in the political and social life of the time. He never lacked courage to take a side, right or wrong, and often grieved and alienated large bodies of his friends by doing so when passions were hot. He was a firm adherent of the Seward-Johnson policy of reconstruction in 1866, despite the terrible results to which its prematurity led; sympathized with the Greeley movement in 1872; and braved a threatened disruption of his church in 1884 by voting and speaking for Grover Cleveland. He believed in and advocated free trade and woman suffrage. So brave and impulsive a nature was always shocking the conventions of his order. Naturally, he was forever perpetrating indiscreet comments on the matters of his enemies and the discomfiture of his friends. Tacit was unfortunately not a large inheritance of most of Lyman Beecher's children, and the paucity of Henry Ward's share was the cause of many
BEECHER

GEORGE EDWIN RINES.

BEECHER, James Chaplin, American clergyman, son of Lyman Beecher; b. Boston, Mass., 8 Jan. 1828; d. Elmira, N. Y., 25 Aug. 1886. He was graduated at Dartmouth 1848, studied theology at Andover and in 1856 was ordained a Congregational clergyman; thence till 1861 was chaplain of the Seamen's Bethel in Canton and Hongkong, China. Entering the Civil War as chaplain, he rose to the rank of brevet brigadier-general and subsequently held pastorates in Owego, N. Y., 1867-70, Poughkeepsie 1871-73 and Brookyn 1881-82. After 1884, through personal troubles, his last three years were passed in much distress and he finally committed suicide.

BEECHER, Lyman, American theologian; b. New Haven, Conn., 12 Oct. 1775; d. Brooklyn, N. Y., 10 Jan. 1863. He was a blacksmith's son and himself a blacksmith's helper and farmer's lad in boyhood. Entering Yale College at 18, he graduated in 1797, studying also theology under President Dwight till 1798, when he became supply at East Hampton, L. I., and was ordained there 1799, remaining till 1810. His remarkable pulpit oratory gained national repute from a sermon in 1804 on Alexander Hamilton's death at Burr's hands—an occasion which made more than one reputation, all utterances being eagerly scanned from the excitement and party feeling. In 1810 he was called to Litchfield, Conn., the seat of a celebrated law school and other educational institutions, at a time when New England was the intellectual autocrat of the country and towns were few and small; and soon became recognized not only as the foremost man in the Congregational body, but one of the greatest of American teachers. About 1814 a half-dozen sermons of his against intemperance, then a common vice among even the clergy, were not only widely read in America and England, but were translated into several foreign languages. He also took a foremost part in organizing Bible and missionary societies, etc.; and his courage, power and energy made many look to him for guidance and succor in trouble. This came in a flood during the next decade, when the Unitarian movement, under Channing and its other great early leaders, was sweeping the Congregational churches around Boston off their feet, and Mr. Beecher, in 1826, at the urgency of influential clergymen, accepted a call to the Hanover Street Church in Boston to stem the tide, which his polemic ardor helped to do. In 1832 he accepted the presidency of Lane (Theological) Seminary near Cincinnati, Ohio, which had been endowed on the express condition of his taking charge of it, to strengthen Calvinism in the rapidly-growing West; he remained there till 1852, when he left it, Mr. Beecher, and was its titular president till death. He was also pastor of the Second Presbyterian Church in Cincinnati 1832-42. In 1833 the famous philanthropist, Arthur Tappan, the chief founder of Lane, sent the students a report of the proceedings of the Philadelphia abolition convention of that year; the students, partly Southern, at once fell into disputes on the subject of slavery. The trustees vainly tried to check the meetings and discussions; Kentucky slaveholders came over with and urged violence. The suppression of these meetings and threatened the destruction of the seminary. The trustees in terror forbade all further discussion of slavery and therefore all the students deserted in a body. The most of the anti-slavery wing refused to return, and their supporters founded Oberlin College; a few came back, and Mr. Beecher and his son-in-law, Calvin E. Stowe, tried for many years to build up the seminary again but in vain. Shortly after this, in 1835, he was tried as a heretic and hypocrite, first before his own church and then before the Presbyterian synod, for his 'moderate Calvinism'; he was acquitted, but the Old School and New School controversy finally split the church 1838, Mr. Beecher adhering to the New School party. In 1852 he resigned the presidency of Lane and returned to Boston to prepare his works for publication, but was stricken with a slow paralysis of the brain, which enfeebled his mind for many years before his death. Despite the impressions of the extreme orthodox party, he was of the firmest doctrinal faith, though his theology was of his own make, and his humorous audacities of speech often shocked dignified propriety. His boundless energy, boldness, unconquerable will and personal magnetism were those of a natural leader of men; while his unsurpassed logical power, his intense and compact expression and, above all, his entire sincerity and spirituality of purpose, winged with his racy and picturesque wit, set him above every other American clergyman of his time in popular influence. Consult his 'Autobiography and Correspondence,' edited by his son, Charles Beecher (New York 1863); 'Collected Works' (3 vols., Boston 1871); Hayward, E. F., 'Lyman Beecher' (Boston 1904); White, J. C., 'Personal Reminiscences of Lyman Beecher' (New York 1882).

GEORGE EDWIN RINES.

BEECHER, Thomas Kinncutt, American clergyman, son of Lyman Beecher; b. Litchfield, Conn., 10 Feb. 1824; d. Elmira, N. Y., 14 March 1900. He studied at Illinois College, of which his brother Edward was president, graduating in 1843. He was principal of a Philadelphia grammar-school 1846-48, of the Hartford (Conn.) high school till 1852. He then removed to Williamsburg (Brooklyn), N. Y., and founded a Congregational church, which he left two years later for the pastorate of a church in Elmira, N. Y., where he spent the rest of his life, well known as an unsectarian philanthropist and moral teacher, writer and lecturer, editing for many years a weekly department in Elmira newspapers to discuss current questions, often with rapping originality and always with independence. He was nominated for a variety of offices by nearly every known political party but never elected. He was a studied theologian, and died of the Potters' four months in 1863. In 1870 he published a series of lectures as a book, entitled 'Our Seven Churches' (of Elmira); and in 1901 a
posthumous collection of his juvenile stories was issued, 'In Tune with the Stars.'

BEECHER, Willis Judson, American clergyman and author; b. Hampden, Ohio, 29 April 1838; d. 8 May 1912. He was graduated from Hamilton College in 1858 and from Aurora Theological Seminary in 1864, and filled several Presbyterian pastorates. From 1865-69 he was professor of moral sciences and belles-lettres in Knox College, Ill.; from 1871-1908 became professor of the Hebrew language and literature in Aurora Seminary; in 1902 was stone lecturer at the Charleston Theological Seminary; and in 1904 was president of the Society of Biblical Literature and Exegesis. He published 'Farmer Tompkins and His Bible' (1874); 'Drill Lessons in Hebrew' (1883); 'Index of Presbyterian Ministers in the United States 1706-1861' (1883); 'Old Testament Notes' (1897); 'Prophets and the Promise' (1905); 'The Dated Events of the Old Testament' (1907); 'The Teaching of Jesus concerning the Future Life' (1908); 'Reasonable Biblical Criticism' (1911); and hundreds of articles in newspapers, periodicals, encyclopedias and reference books.

BEECHER FAMILY, The, an extraordinary American family of religious and humanitarian leaders, mostly of such salient and frequently eccentric originality, combined with immense energy and independence of thought, that the human race was once said to consist of "men, women and Beechers." They were all descendants of Lyman Beecher of New Haven, Conn., himself one of the most notable of them; a famous clergyman, orator and controversialist, who had 13 children, so many of whom rose to national or even international distinction that he was said to be "the father of more brains than any other man in America."

Eight of them were boys, seven living to maturity and nearly all of them to extreme old age. All becoming Congregationalists, save the greatest, Henry Ward, said of them that "only one tried to escape the ministry and he did not succeed." But so great was the intrinsic force of the blood that the daughters were no whit inferior in persistence of energy and ideals; that marriage did not lessen their outside work and influence, and that one of them has shown the highest creative genius and left the most enduring memorials of the entire family. The difference in work and sympathies of father and children resulted from difference of generation rather than of spirit. Lyman Beecher's problems were mainly religious. He lived at the threshold of the new material development of the country, when it seemed that the encroaching task was to prevent its progress, to heathenism; at the beginning of the great liberalizing flood of new scientific knowledge, when there seemed a danger of all Christianity being swept away with the cosmology it rested on; and before the humanitarian question in this prosperous country had come to the fore. He was nearly 60 when the slavery problem first showed signs of becoming acute; more than 60 when Father Mathew established his first temperance society across the water; and at no period would he ever have favored woman suffrage, which even one of his notable daugh-
ters wrote against. But his influence was intensely strong in creating the lofty spirit that fed humanitarianism. It was an encouragement to large families, as so often in history, that the greatest of his children were among the younger ones: Mrs. Stowe was the sixth and Henry Ward Beecher seventh, while the most forceful of the others, Isabella (Mrs. Hooker), was the eleventh. In their order, the ones who grew up were Catherine, William Henry, Edward, Mary, George, Harriet, Henry Ward, Charles, Isabella, Thomas and James. Catherine, robbed of the betrothed of her youth, gave herself to work for her sex, though not with quite the aspirations of most recent women of her type, and perhaps did as much good in training cultivated wives and mothers as if they had remained unmarried teachers. William Henry was a home missionary and clergyman in Ohio and a clergyman in the East. Edward was a clergyman, editor and theological writer, who tried to pour antique Zoroastrianism into modern molds. Mary married in Hartford, Conn., and became the mother of Frederick Beecher Perkins and grandmother of Charlotte Perkins Geer. George died by accident at 34, while filling a Western pastorate. Harriet, author of 'Uncle Tom's Cabin' and of other works which would give any other author one of the foremost places in American letters, has a secure immortality from her masterpiece. Henry Ward, creator of the greatness of Plymouth Church, a Moses of liberal congregationalism, anti-slavery and temperance leader, ardent in all work for humanity and the elevation of the mass, need not be further characterized. Charles, clergyman and admirable musician, is gratefully remembered for his work in compiling the 'Plymouth Collection' of hymn-tunes. Isabella married John Hooker, a Hartford lawyer fully in sympathy with her, and for many years one of the staunchest champions of woman's rights and upholder of all good causes. Thomas, for some 40 years located in Elmira, N. Y., was noted as an able and independent thinker on all public questions, which he discussed with ability and high-mindedness. James C. was clergyman, soldier and clergyman again, till the strain of his mind and brought on a tragic death. Altogether, the family is one of the most useful as well as distinguished of the American intellectual aristocracy.

BEECHY, Frederick William, English admiral, the son of Sir William Beechy, the painter; b. London 1796; d. 29 Nov. 1856. He entered the navy at the age of 10, and in 1811 was present in an engagement off Madagascar, in which three French frigates were captured. In 1818 he accompanied Lieutenant (afterward Sir John) Franklin to Guyana to discover the northwest passage, and the following year took part in a similar enterprise with Captain Parry. In 1821 he was commissioned, with his brother, H. W. Beechy, to examine by land the coasts of north Africa. During the years from 1825 to 1828 he was commander of the Blossom in another Arctic expedition, by way of the Pacific and Bering Strait. Of this he published an account, 'Narrative of a Voyage to the Pacific and Bering Strait' (1837), and noticed a great many plants and animals in the botany and zoology of the regions vis-
ited. In 1854 he was raised to the rank of rear-admiral.

BEECHLEY, Sir William, English portrait painter: b. Burford, Oxfordshire, 12 Dec. 1753; d. Hempstead, 28 Jan. 1839. He entered a career of ease, but soon abandoned it and determined to make painting his profession. In 1772 he became a student at the Royal Academy. A large equestrian picture of George III secured his election as a Royal Academician and obtained for him the honor of knighthood in 1780. He was afterward constantly and lucratively employed. He died in 1839 at the advanced age of 86. His portraits *have maintained a respectable second rank*; his attitudes and expression are generally good, but marks of carelessness are apparent in some of his latest pictures. Two portraits by him are contained in the Metropolitan Museum of Art in New York.

BEECHING, Henry Charles, English clergyman and author: b. 15 May 1859. He was educated at Balliol College, Oxford; was rector of Beckington, Berkshire, 1885-1900; professor of theology at King's College, London, from 1900-03; canon of Westminster 1902-11; and was appointed dean of Durham in 1911. He has published editions of Milton, Vaughan, Daniel, Drayton and Bunyan; anthologies of verse, and is author of ‘Seven Sermons to Schoolboys’ (1894); ‘In a Garden and Other Poems’ (1895); ‘Pages from a Private Diary’ (1898); ‘Conferences on Books and Men’ (1900); ‘Inns of Court Sermons’ (1901); ‘RNSH’ (1902); ‘Jane Austen’ (1902); ‘Two Lectures on Poetry’; ‘The Grace of Episcopacy’ (1906); ‘Lectures on the Atonement’ (1907); ‘Lectures on the Doctrine of Sacraments’ (1908); ‘Revision of the Prayer Books’ (1910); ‘Inspiration’ (1914). The Library of the Catheral Church of Norwich (1915).

BEEF. See MEAT PACKING; MEATS AND MEAT PRODUCTION.

BEEF CATTLE. See CATTLE.

BEEF-EATER. See BUFFALO-BIRD.

BEEF-EATERS, a popular name for the yeomen of the guard of the sovereign of Great Britain, a body instituted at the coronation of Henry VIII in 1485. There are now 100 in service, and 70 supernumeraries. They are dressed after the fashion of the time of Henry VII. The warders of the Tower of London, who wear a similar uniform, are also so called. See YEOMEN OF THE GUARD.

BEEF-TEA, a preparation made from raw beef and often employed in nursing. It is serviceable for stimulation or for nourishment, largely according to the method of its preparation. As usually made, or as prepared from ready-made beef extracts, it has very little food value, but is a strong heart stimulant. When fresh beef is finely chopped and its juice squeezed from it and flavored, to take away the raw taste, the extract obtained is rich in the muscle juices and is highly nutritious. It is often thus prepared for infants and invalids. If, however, the juice thus obtained is mixed with water and the concoction not boiled, as is the usual manner, all of the muscle proteins are coagulated, as a scum, and the muscle salts, or extractives, remain in solution. The nutritious portions, the scum, are thrown away and the extractives retained in the tea. In this form the nutritive value is slight, unless the coagulated proteins is retained. Other meat extracts are mixtures of the meat extractables, xanthin, hypoxanthin, creatin, creatinin, etc. These are heart tonics but not nourishing. Their use is contraindicated in irritable hearts, in gout, and in any condition in which it is thought that the patient is not breaking down the normal amount of protein matter. Broths are made of other meats.

BEEF-WOOD, a popular name for the wood of several Australian trees of the genus Casuarina (q.v.), which forms the type of a family Casuarinaceae. The trees have been compared to gigantic horse-tails. They have pendant leafless branches, and apetalous monocious flowers, the male ones being in spikes, and the female in heads. The wood is of a reddish color (whence the name), hard, and close-grained, and used chiefly for fine ornamental work.

BEEFSTEAK CLUBS, a term applied to a number of semi-Bohemian clubs that were a feature of London life during the 18th century. They derived their names from the fact that the members were limited to beefsteak and liquors. One of the most famous of these institutions was the *Sublime Society of Steak,* founded by John Rich in 1735, manager of Covent Garden Theatre. Hogarth, Wilkes, Garrick, Dodington and other men more or less famous were members of this club. It was even joined at a later period by the Prince of Wales. It remained in existence until 1867. There is at the present time a Beefsteak Club in London, which was founded in 1876. The nearest approach to a similar institution in the United States is the Gridiron Club of Washington, D. C. Consult Arnold's 'Life and Death of the Sublime Society of Steaks' (1871).

BEEHIVE HOUSES, the archaeological designation given to ancient dwellings of small size and somewhat conical shape, found in Ireland and Scotland. They are formed of long stones without cement, each course overlapping that on which it rests: Sometimes they occur singly, at other times in clusters, and occasionally have more than one apartment. Some of them are found near ancient oratories, and were therefore probably priests' dwellings, and certain groups are encircled by a stone wall for defense. They are assigned to various dates between the 7th and the 12th century.

BEEKMANTOWN. See CALCIFEROUS.

BEEZLEBUB, bē-džē-bûb (Hebrew, "the god of flies"), a deity of the Moabites or Syrians. This term is applied in the Scriptures to the chief of the evil spirits (Matt. xii. 24; Mark iii. 22, etc.). The correct form is probably Beelzebul, but in the Syriac and Vulgate the final letter is b. The alteration in that letter from b to l may have been due to euphonic reasons, or, as has also been maintained, zebul may have signified "dwelling" or "dung." In order to perceive how this name came to be given to one who is boiled, as is the usual manner, all of the muscle proteins are coagulated, as a scum, and the muscle salts, or extractives, remain in solution. The nutritious portions, the scum, are thrown away and the extractives retained in the tea. In this form the nutritive value is slight, unless the coagulated proteins is retained. Other meat extracts are mixtures of the meat extractables, xanthin, hypoxanthin, creatin, creatinin, etc. These are heart tonics but not nourishing. Their use is contraindicated in irritable hearts, in gout, and in any condition in which it is thought that the patient is not breaking down the normal amount of protein matter. Broths are made of other meats.

BEEZLEBUB, bē-džē-bûb (Hebrew, "the god of flies"), a deity of the Moabites or Syrians. This term is applied in the Scriptures to the chief of the evil spirits (Matt. xii. 24; Mark iii. 22, etc.). The correct form is probably Beelzebul, but in the Syriac and Vulgate the final letter is b. The alteration in that letter from b to l may have been due to euphonic reasons, or, as has also been maintained, zebul may have signified "dwelling" or "dung." In order to perceive how this name came to be given to one who is boiled, as is the usual manner, all of the muscle proteins are coagulated, as a scum, and the muscle salts, or extractives, remain in solution. The nutritious portions, the scum, are thrown away and the extractives retained in the tea. In this form the nutritive value is slight, unless the coagulated proteins is retained. Other meat extracts are mixtures of the meat extractables, xanthin, hypoxanthin, creatin, creatinin, etc. These are heart tonics but not nourishing. Their use is contraindicated in irritable hearts, in gout, and in any condition in which it is thought that the patient is not breaking down the normal amount of protein matter. Broths are made of other meats.
We find that almost all nations who believe in evil spirits represent them as the rulers of disgusting, tormenting or poisonous animals—flies, rats, mice, reptiles, etc. The Greeks worshiped several of their chief deities under the character of protectors against these animals; for instance, Apollo Siminthen, the destroyer of rats. Christ was charged by the Jews with oventing out demons by the power of Beelzebub (Matt. xii, 24). Compare 2 Kings i, 2.

BEER, bär, Adolf, Austrian historian and educational reformer: b. Prossnitz, Moravia, 27 Feb. 1831; d. 1902. His publications include 'History of International Commerce' (1850-64); 'Holland and the Austrian War of Succession' (1871); 'The First Partition of Poland' (1873-74); 'The Austrian Commercial Policy in the Nineteenth Century' (1891).

BEER, George Louis, American historical writer: b. Staten Island, N. Y., 26 July 1872. Graduating from Columbia University in 1892, he engaged in the tobacco business, also delivering lectures during this period on European history at Columbia, as well as writing on similar subjects. He has written 'Commercial Policy of England toward the American Colonies' (1893); 'British Colonial Policy, 1754-65' (1907); 'Origins of the British Colonial System, 1578-1660' (1908); 'Old Colonial System, 1660-1754' (1913).

BEER, Michael, German dramatist, brother of composer Meyerbeer: b. Berlin 1800; d. Munich, 22 March 1833. He became known by five tragedies, of which his 'Struensee,' with overture and incidental music by Meyerbeer, is the best. 'The Pariah' (1823), a one-act tragedy praised by Goethe, depicts the status of the Jew in modern Germany. His complete works were published at Leipzig in 1835, and his 'Correspondence' in 1837.

BEER, Wilhelm, German astronomer: brother of the preceding: b. 4 Feb. 1797; d. 27 March 1850. He was a Berlin banker and in 1849 became a member of the Prussian Diet. His astronomical labors were associated with those of his friend, the astronomer, Mädler. He built an observatory, chiefly devoted to the observation of the planet Mars and the moon. The two-labor of the two astronomers was a map of the moon, published in 1836, upon which the French Academy bestowed the Lalande prize. His writings include 'Der Mond nach seinen komischen und individuellen Verhältnissen' (2 vols., 1837); and 'Die Dreikönigsvorstellung in ihrer Gefahr für Preussen' (1849).

BEER. See Ale and Beer; Brewing and Malting.

BEERBOHM, Max, English author and caricaturist, half-brother of Sir Beerbohm Tree (q.v.): b. 24 Aug. 1872. Graduating from Merton College, Oxford, he at once embarked on a literary career. His talents soon found him employment on the Harmsworth papers, though he also contributed freely to other British publications. His cartoons became very popular; there have been five exhibitions of them since 1901. In 1897 he paid a visit of some months' duration to the United States with Beerbohm Tree, his half-brother, the actor. In 1910 he married an American girl, Florence Khan, of Memphis, Tenn. He has written one novel, 'Zuleika Dobson,' a burlesque of student life at Oxford. His other works between book covers are made up of random contributions to magazines and newspapers, essays, satires, etc. They include 'More'; 'Yet Again'; 'The Happy Hypocrite' (1900); 'The Second Childhood of John Bull'; 'A Book of Caricatures'; 'A Christmas Garland.'

BEERNERT, bärnär, Auguste Marie François, Belgian statesman: b. Ostend, 26 July 1829; d. 1912. He began his political career by being elected a member of the National Chamber of Deputies 1874. Ten years later he became a member as Minister of Agriculture, Industry and Art. Not long afterward he became president of the council and Minister of Finance. In 1895 he was elected president of the Chamber of Deputies. He was on two occasions a prominent member of the International Peace Conference; in 1899 and in 1907. In 1909 he was awarded half of the Nobel prize of that year.

BEERS, Clifford Whittingham, American writer on mental diseases: b. New Haven, Conn., 30 March 1876. Graduating from the Sheffield Scientific School in 1897, suddenly lost his reason from over-study and was for some years an inmate of various insane asylums. He was discharged some years later as cured. In 1908 he published a book which attracted country-wide attention, entitled 'A Mind that Found Itself' (24 ed. 1912), a study of his own mind and experiences during his period of insanity. In 1909 he assisted in the organization of the National Commission for Mental Hygiene, whose purpose is the study of mental disorders and of the care and treatment of insane persons. Later he helped found the Connecticut Society for Mental Hygiene, of which he was executive secretary. He is also the author of 'The Value of Social Service as an Agency in the Prevention of Nervous and Mental Disorders' and 'A Society for Mental Hygiene as an Agency for Social Service and Education.'

BEERS, Ethel Lynn, American poet: b. Goshen, N. Y., 13 Jan. 1827; d. Orange, N. J., 10 Oct. 1879. Her maiden name was Ethelinda Eliot and she was a direct descendant of William Eliot, the apostle to the Indians. Her earlier writings were signed 'Ethel Lynn,' but after her marriage to William H. Beers she wrote under the name by which she is now known. She is chiefly remembered as the author of the war lyric 'All Quiet Along the Potomac,' suggested to her by the dispatch from the front so frequently printed in the papers during the early period of the Civil War. It appeared originally in Harper's Weekly for 30 Nov. 1861, under the caption 'The Picket Guard.' Among her other poems are 'Weighing the Baby'; 'Baby Looking Out for Me'; 'Which Shall it Be?' Her collected works, under the title 'All Quiet Along the Potomac and Other Poems' was published on the day of her death.

BEERS, Henry Augustin, American author and educator: b. Buffalo, N. Y., 2 July 1847. He graduated from Yale in 1869; was admitted to the New York bar, 1874, became a professor at Yale, 1871-74, assistant professor, 1874-80, and professor of English literature in 1880. He has published, among other works: 'A Century of American Literature' (1878); 'Odds and
BEERS—BEET

Ends,' verse (1878); 'Nathaniel Parker Willis' (1885); 'Prose Writings of N. P. Willis' (1885); 'The Thankless Muse,' verse (1885); 'From Chaucer to Tennyson' (1890); 'Initial Studies in American Letters' (1891); 'Selections from the Prose Writings of Samuel Taylor Coleridge' (1893); 'A Suburban Pastoral and Other Tales' (1894); 'The Ways of Yale' (1895); 'A History of English Romanticism in the Eighteenth Century' (1899); 'A History of English Romanticism in the Nineteenth Century' (1901); 'Points at Issue' (1904); 'Milton's Tercentenary' (1910); 'The Ways of Yale,' enlarged edition (1910), and many uncollected contributions in prose and verse to leading reviews and magazines.

BEERS, bé'rz, Nathan, American soldier: b. Stratford, Conn., 1753; d. New Haven, 10 Feb. 1849. While still quite young he went with his father to New Haven and was a member of a military company formed there in 1774, which was commanded by Benedict Arnold. Immedi- ately on the receipt of the news of the battle of Lexington the company was called together by Gen. W. B. Carleton, and Beers with 39 others volunteered to accompany him to the seat of war. They immediately set out, and, as they passed through Pomfret, were joined by General Putnam. Beers received a lieutenant's commission in the army in 1777 and served until 1783. Afterward engaged in mercantile affairs, and in 1798 was chosen steward of Yale College, a position which he resigned in 1819.

BEERSHEBA, bér-ér-sé'ba (now Be-ersheba), "the well of the oath," the place where Abraham made a covenant with Abimelech, King of the Philistines, and planted a tamarisk by the well that he dug. The alliance was renewed by Isaac, who, it would appear, dug a second well (Gen. xxi. 24, 27, 32, 33). Beer- sheba is often mentioned as the southern boundary of Palestine, or the land of Israel (Judges xv. 1, etc.), and was given to Judah (Jos. xv. 23) and later to Simeon (Jos. xix. 2). Here Samuel's sons were judges (1 Sam. vii., iv.). It was in the negeb, or dry country and Eliahah here slept under the desert broom (Gen. xxi. 38). The city, now called Bir es Sebh, is at the foot of the Hebrón hills, 50 miles southwest of Jerusalem, in the open pastoral plateau, which is covered with grass in spring, and supports flocks of goats and cattle. There are two wells, with a constant supply of good water even in autumn, cut in rock in the bed of the boundary valley which runs west to Gerar. There is also a third well, now dry. The largest well is over 12 feet in diameter, is lined with masonry to a depth of 28 feet, and has water at 37 feet. The masonry in the 15th course bears an Arabic tablet with a date (505 A.H.) answering to the year 1112 of our era. The second well is five feet in diameter and 40 feet to the water; the stones are cut to the arc of the circle. Ruins of a Byzant- inian town, or village, including the foundations of a church, exist north of the wells. In Roman days a garrison was stationed here and Beer-sheba was the seat of a bishopric. The place gradually declined and was totally deserted toward the end of the 13th century. In modern times a new town has sprung up to the southwest of the ruins of the old. Under Ot- tomans rule it was the seat of a kaimamak. It has a mosque, a telegraph station and several shops. The populated village of the town was taken from the Turks by the British on 1 Nov. 1917. (See WAR, EUROPEAN—TURKISH CAMPAIGN). Consult Baedeker, K., 'Palestine and Syria' (Leipzig 1912).

BEESLY, Edward Spencer, English his- torical writer: b. 1831. He was graduated from Wadham College, Oxford, and was later ap- pointed professor of Latin at Bedford College, London. From 1850 to 1893 he was professor of history at University College, London. He was also editor of the 'Positivist Review.' In his first work, 'Catale, Clodius and Ti- berius' (1878) he makes an effort to rehabilitate the three men whose names form the title of the book. He was also the author of 'Queen Elizabeth' (1892); 'A Strong Second Chamber' (1907).

BEESWAX, a solid fatty substance secreted by bees, and containing in its purified state three chemical principles—myricin, cerin and cer- olein. It is not collected free from impurities, but elaborated from saccharine food in the body of the bee. It is used for the manufacture of candles, for modeling, and in many minor processes.

BEET, Joseph Agar, English theologian and author: b. Sheffield, 27 Sept. 1840. Gradu- ating from Wesleyan College, Richmond, he engaged in pastoral work, in which he continued for over 20 years. In 1883 he was appointed theological tutor at Wesleyan College, where he remained until 1905. He was also on the faculty of the University of London, of which he was one of the oldest members. In 1896 he came to the United States and delivered a series of lectures at the University of Chicago, at the summer schools of Chautauqua and at Ocean Grove. In his theological works, two of which have been translated into Japanese and have been used as textbooks in Japan, he attempts to use the methods of science in the discussion of his subjects. His works include 'Credentials of the Gospel' (1889); 'Through Christ to God' (1892); 'The New Life of Christ' (1895); 'The Last Things' (1911); 'A Manual of Theology' (1906); 'Church, Churches and Sacraments' (1907); 'The New Testament: Its Authorship, Date and Worth' (1909); 'The Old Testament: Its Contents, Truth and Worth' (1912); 'A Key to Unlock the Bible' (1913); 'A Theologian's Workshop, Tools and Method' (1914).

BEET, William Ernest, English Method- istic divine: b. Winchcombe, Gloucestershire, 25 Aug. 1869. He was graduated at London University in 1893, having entered the ministry the previous year. He has been a member of the Con- nexional Board of Examiners since 1899 and was examiner in classics at Didsbury College in 1909. His publications include 'The Trans- figuration of Jesus and the Roman See in the First Centuries'; 'The Rise of the Papacy'; He is a frequent contributor to periodical literature, including the London Quarterly and the Homiletic Review.
BEET SUGAR

BEET (AS. bete; Lat. beta), Beta vulgaris, a plant of the family Chenopodiaceae. There are two kinds of beet — the sweet or sugar beet, and the common beet, with stalked, smooth, ovalate leaves, with flowers borne on tall leafy stems. The original form, or sea-beet, is found growing wild in sandy soil, near the sea, in Europe and western Asia. It has been in cultivation since 200-300 A.D., and during the numerous varieties may be classified under one of five sections, although the divisions are arbitrary and of no great importance.

Garden Beets.—These usually have small tops, with turnip-shaped to tapering roots of medium size, fine-grained, smooth, regular, generally red but sometimes yellowish or whitish in color. Among popular varieties are Early Blood, Eclipse, Bassano and Egyptian turnip. The soil best suited is a loose, rich, deep, clean, well-tilled loam. Well-rotted barnyard manure with some potassic fertilizer is often applied. Seed is sown as soon as possible in the spring, for the early crop, with other sowings until June to ensure a succession; in rows, varying from six to ten inches apart where the crop is practised, to three feet where horse labor is used. The plants are thinned from four to six inches asunder in the rows, care being taken to leave only one plant in a place. Thinning is often done when the young plants are large enough to sell as “greens.” The late crop, if required for winter use, must be stored before frost. Beets are sometimes forced under glass.

Mangold Wurzels or Mangels are a large, coarse form raised for cattle feeding. Standard varieties include Mammoth long red, Golden tankard and Globe. Seed is sown as early as possible in the spring, in rows two to three feet apart, and the plants allowed to stand 12 to 16 inches asunder in the row. To ensure a good crop the land must be in a high state of cultivation and well supplied with plant-food. They may be grown on alkali soils.

Sugar-Beets.—The varieties are rather small-growing, and nearly always yellowish or whitish in color. They contain a high percentage of sugar, which has been increased by selection and cultivation. They are extensively grown in Europe and in the Northern and Western States. See BEET SUGAR.

Chard or Swiss Beets have comparatively large leaves with succulent leaf-stalks, which are cooked and eaten like asparagus. See CHARD.

Foliage Beets are grown for ornamental purposes. The luxuriant foliage is of many colors and varied in markings. Brazilian, Chilean, Victoria and Dracena-leaved are well-known varieties. They may be raised from seed, like other beets, and the roots lifted in fall and kept over winter.

Uses and Feeding Value.—As a vegetable the root of the garden beet is boiled, pickled, and used as a salad; and the tops are boiled as “greens.” They contain on an average 88.5 per cent water; 1.5 per cent protein; 8 per cent nitrogen-free extract; 1 per cent ash; 0.1 per cent ether extract, and 0.9 per cent crude fibre. Mangels are fed to cattle; they contain from 7 per cent to 15 per cent dry matter, of which about 88 per cent is digestible; an average percentage composition may be taken as: water, 90.9; protein, 1.4; nitrogen-free extract, 5.5; ether extract, 0.2; ash, 1.1; crude fibre, 0.9. About 77 per cent of the protein or 96 per cent of the nitrogen-free extract is digestible. The dry matter of mangels and corn silage are of about equal value for feeding, but as the cost of production in mangels is double that in corn, stockmen in the United States have not paid much attention to the crop.

Enemies.—Beets are sometimes injured by the beet-fly, otherwise, they have few insect enemies. They are sometimes attacked by rust, rot, leaf-spot and scab. Spraying with Bordeaux mixture will prevent the leaf diseases. Scab attacks the roots, and if a large potato these crops should not be grown in succession.

Beet Pulp is a by-product of sugar-beet factories, consisting of sliced sugar-beets after the sugar is removed. It contains about 10 per cent dry matter, the remainder being water, and in the wet condition must be fed at once or held in silos. It may be fed to milch cows, fattening steers and sheep, and ranges in value from half to two-thirds the value of corn silage. Some of the factories have found it feasible to feed large quantities of it to stock with the addition of hay and grain.

BEET SUGAR, the sugar obtained from the beet, similar to cane sugar. The discovery of sugar in the beet was made by a German chemist, Marggraf, as early as 1747. No practical results followed his discovery, however, as the cost of obtaining sugar from the beet by laboratory methods was too high as compared with that of cane sugar. Little progress was accomplished until about 50 years later, when another German chemist, Achard, succeeded in extracting sugar from the beet root on a comparatively large scale. In 1802 a manufactory was in operation in Silesia, in which, under Achard’s direction, about 20 quintals of beets were worked up daily, and about five pounds of raw sugar extracted from every quintal. The high price of sugar prevailing at that time all over the European continent by reason of the blockade, and the great interest and favorable attitude taken by the different continental governments toward the new enterprise, led to its being a success for a short time. Napoleon issued an imperial decree in the early part of his reign, establishing this industry in France, and in 1812 he ordered the building of four factories and placed Chapital in charge. In 1830 efforts were made in the United States to introduce the cultivation of the sugar-beet. It was not, however, till 1870 that the first successful beet-sugar factory was built, at Alvarado, Cal.

The Industry in the United States.—The production of sugar-beet and of beet sugar in the United States is now assuming such proportions that, with the increase of factories and the marked popular interest, it has become one of the leading subjects demanding consideration from agriculturists. There is probably no other industry in this country that has developed so rapidly and now absorbs so large a share of public attention as that of beet sugar.

Attempts were made to establish the industry in Massachusetts in 1839, but there were also efforts in this direction in Illinois, Wisconsin and California between 1863 and 1876, and much was claimed for the industry at this time by newspaper writers, capitalists and leading
BEET SUGAR

farmers. In California, after a long period of unprofitable production, it achieved its first success in 1879. The failure of these early attempts seems now very natural as we look back over the history of agricultural progress in the United States. The beet-sugar industry belongs to the domain of agriculture, and the production of sugar beets is one of the most important of all agricultural industries. The early efforts were simply ahead of their time in the course of agricultural development, and they failed in the establishment of the beet-sugar industry for want of the proper methods of farming and the proper conditions under-lying the farming industry.

At the time of the first attempts at sugar-beet production, agriculture comprehended simply the primary features. Its products were confined mainly to cereals, forage crops and livestock, and the production and marketing of raw materials was its main object. The farmer in those early days did not concern himself with enterprises dependent on the concentration of efforts in the production of finished products. Land could be purchased for a few dollars per acre. If the prospective farmer did not have the money to buy the land he could enter a claim on government land. His whole ambition was to produce something quickly and pay for the lands and primary improvements. This was accomplished by raising corn, wheat, oats, cattle and hogs. The open public domain offered a free pasture. Gradually the Eastern sections became more densely settled, and farm lands became more expensive. Crude production was accomplished more cheaply by the Western farmer. Later, owing to development of transportation facilities, the agriculture of this country had to compete with the cheap labor of Europe. The colonial extension of European countries brought areas into competition with American farms in turning out crude products, and with labor much cheaper even than that of Europe. The problem became, how to turn crude materials into something that would represent not merely the labor but the skill and ingenuity of the American people, thus supplying our own markets and those of the world with finished products. The American farmers found, as the European farmers had found before them, that their success depended upon the superior skill and artisan ability of Americans as compared with Europeans and their colonists. "Necessity is the mother of invention," and demand and necessity united in the evolution of a new system. This began in the East, working westward, in the production of butter, cheese, prepared meats, flour, eggs, poultry, etc. Later came the establishment of other industries, working up crude products of the farm into finished articles. We became producers of syrups, canned vegetables, canned fruit, etc., until manufacturing re-inforced farming from ocean to ocean. When all this was accomplished, the time was ripe for the success of the beet-sugar industry.

Industrial Features.—It is one of the marked features of American industrial life that the people as a mass have always shown a readiness to forego immediate benefits, and, even at considerable expense, to strive to encourage industrial development. As a result this country has made a record among the nations of the earth unparalleled in rapid development, accumulation of wealth and hold on the trade of the world.

One of the chief items of cost in the production of anything is labor. In this country it is contended that the laborer is not only entitled to earn a living, but to live comfortably, to be able to educate his family and to acquire a comfortable home. The success of life, social, financial or political, to which the laboring man may not aspire. While this means much for the citizen, it adds materially to the cost of production. This country to-day is the concern of the nations of the earth in being able to maintain a balance of trade in its favor through its agricultural and industrial productions, and this balance is constantly increasing. The sugar industry is supported by American enterprise and spirit, and under this American policy it is rapidly assuming a prominent position in the list of successful industries.

There are two sides to the proposition of establishing a sugar factory in any particular community; (1) That of the farmer, involving agricultural conditions; and (2) that of the manufacturer or those financially interested in the enterprise.

Problems for the Farmer.—The leading difficulties of the farmer may first be noticed. To begin with, he is unacquainted with the methods of cultivating the sugar-beet plant, and his first experience usually proves unsatisfactory. He is accustomed to certain methods in farming. As a rule he is conservative, and thinks, from his long experience in farming, that he knows how to farm. He undertakes to apply methods successful in the cultivation and production of other crops. He is not inclined to listen to those who are informed in methods applicable to the new crop. Eventually he finds out his mistake. He finds that in growing sugar-beets he must apply principles, in many cases, the reverse of those necessary to other crops. For instance, he has been accustomed to growing large ears of corn, large hogs and large steers; but in the case of sugar-beets he finds that the first question is not one of size, but of quality. He must grow beets of a certain size, purity and sugar content. In order to accomplish this he must give careful attention to the work of preparing the land, planting the seed, bunching, thinning and cultivating. He finds that attention to details counts in results at the harvest in the profits on the crop. He learns that the whole process is a very laborious and expensive one, entirely unlike anything he has attempted before. To be successful he must apply the methods of the gardener to a field crop. He must have a rich soil, and the proper rain conditions at the proper time. These facts can only be learned through experience.

The Question of Labor.—The labor problem is important in the cultivation of sugar-beets. At certain stages of their growth they require a considerable amount of labor. As a rule, the farmer, if he grows beets to any extent, does not have on his farm sufficient labor to do the work of thinning and bunching, hoeing and harvesting the sugar-beets; nor does any farming community provide to any considerable extent the labor necessary to grow the beets that a factory will require in a campaign. It will cost about $30 an acre in sections where sugar-beets are
grown under rainy conditions, and about $40 to $45 an acre in sections where beets are grown by irrigation, to cover the cost of seed, preparation of the soil, seeding, hoeing, cultivating, harvesting and delivering to the factory. These estimates apply to growing sugar-beets when it is properly done. In the farming communities of foreign countries, as a rule, a large amount of suitable labor can be secured at very low rates. The neighborhoods are more thickly settled; the whole population is willing to do the laborious, tedious work required, and whole families work at it, including the father, mother and children. In this country, as a rule, the farmer, his older sons and hired hands must attend to the outdoor work. It has been found necessary for sugar-beet growers to resort to the cities and towns for extra labor required. In the cities live many foreigners from Holland, Russia, Sweden and other places, who are thoroughly familiar with this kind of work. These people are willing to move out into the fields and live in tents; they make contracts at so much per acre for bunching and thinning, hoeing, weeding and the like. In the blooming of the sugar-beet industry in this country, foreigners are coming with a view to securing employment of this kind. While the labor question is a serious one, it is one capable of solution by careful and detailed attention.

Problems for the Manufacturer.—The manufacturer or the capitalist who builds a factory finds that he has even more problems to work out than the farmer, and, like the farmer, he usually discovers that he is entering a field that is entirely new to him. Before establishing his plant the prospective manufacturer must investigate certain conditions: (1) The water supply, for he must have an abundant supply of pure water for the use of the factory. (2) The fuel supply, as the factory must be located in a section where cheap fuel can be secured (the fuel usually used is coal, but on the Pacific coast petroleum is used to a large extent). (3) A market for the product (this factor will be thoroughly canvassed and settled prior to establishing a factory). (4) The supply of lime (the local quarries of lime rock must be investigated to see if the quality is suitable and the supply sufficient, as a large amount will be required).

The general conditions having been found satisfactory, and the factory being built, other problems arise. In the beginning only a limited amount of skilled labor is employed. Eventually every employee of the factory will become skilled in his particular part. After two or three campaigns has passed the factory will have worked out the details of producing the best product at the least cost with the machinery which it has. When this point shall have been reached those interested will be prepared to estimate the cost of production of beet sugar. The difference in cost of production at a new factory and at one operated for a considerable time is much greater than one acquainted with the sugar-beet industry.

Statistics of the Industry.—The first established successful American beet-sugar factory is located at Alvarado, Cal. It was erected in 1870, but success was not attained until 1873. In 1896 in the United States there were seven factories, which produced 42,000 tons of sugar. Since 1896 the expansion has been rapid and there now (1917) are 99 factories, which in 1915 produced 874,220 tons of white granulated sugar, valued at and about $97,000,000. Since 1888, the total output has amounted to 7,613,000 tons, of an estimated value of $760,000,000. From 1889 to 1915 $300,000,000 has been paid to farmers for beets and considerably more than that amount for other supplies, labor, etc. This employs between 30,000 and 40,000 men and annually disburses $75,000,000, nearly one-half of which is paid to farmers for beets.

The factories as at present located, together with their daily beet-slicing capacity, are as follows: California: Alvarado, 800 tons; Chino, 1,100 tons; Los Alamitos, 800 tons; Betteravia, 1,000 tons; Oxnard, 3,000 tons; Spreckels, 4,500 tons; Hamilton City, 700 tons; Manteca, 1,200 tons; Visalia, 400 tons; Corcoran, 600 tons; Santa Anna, 600 tons; Huntington Beach, 1,200 tons; Anaheim, 1,200 tons; Dyre, 1,200 tons; Tracy, 600 tons; Colorado: Brighton, 1,000 tons; Grand Junction, 700 tons; Rocky Ford, 1,800 tons; Sugar City, 600 tons; Loveland, 1,920 tons; Greeley, 1,600 tons; Eaton, 1,200 tons; Fort Collins, 2,150 tons; Longmont, 2,350 tons; Windsor, 1,150 tons; Lamar, 500 tons; Sterling, 1,000 tons; Brush, 1,100 tons; Fort Morgan, 1,200 tons; Swink, 1,200 tons; Las Animas, 1,000 tons; Idaho: Idaho Falls, 900 tons; Shelley, 750 tons; Blackfoot, 800 tons; Sugar City, 900 tons; Burley, 600 tons; Twin Falls, 600 tons; Illinois: Riverdale, 500 tons; Indiana: Decatur, 800 tons; Iowa: Mason City, 1,200 tons; Waverly, 500 tons; Kansas: Garden City, 1,000 tons; Michigan: Bay City, 1,500 tons; West Bay City, 900 tons; Holland, 500 tons; Caro, 1,200 tons; Alma, 1,400 tons; Marine City, 600 tons; Lansing, 600 tons; Bay City (Salzburg), 1,400 tons; Saginaw (Carrollton), 900 tons; Mount Clemens, 600 tons; Crosswell, 750 tons; Saint Louis, 600 tons; Owosso, 1,200 tons; Menominee, 1,200 tons; Blissfield, 868 tons; Sebewaing, 85 tons; Minnesota: Chaska, 800 tons; Montana: Billings, 2,000 tons; Nebraska: Bayard, 1,000 tons; Gretl, 1,300 tons; Grand Island, 500 tons; Scotts Bluff, 2,000 tons; Missoula, 1,000 tons; Nevada: Fallon, 500 tons; Ohio: Fremont, 500 tons; Paulding, 900 tons; Findlay, 871 tons; Ottawa, 600 tons; Toledo, 1,100 tons; Oregon: Grant's Pass, 750 tons; Utah: Brigham City, 500 tons; Delta, 1,000 tons; Lehi, 1,266 tons; Moroni, 400 tons; Ogden, 1,000 tons; Logan, 600 tons; Garland, 900 tons; Lewiston, 800 tons; Elsinore, 750 tons; Payson, 700 tons; Layton, 700 tons; Spanish Fork, 1,000 tons; Smithfield, 500 tons; West Jordan, 750 tons; Cornish, 600 tons; Washington: North Yakima, 750 tons; Waverly, 500 tons; Wisconsin: Menominee Falls, 600 tons; Janesville, 700 tons; Chippewa Falls, 600 tons; Madison, 600 tons; Wyoming: Lovell, 600 tons; Sheridan, 900 tons; Worland, 600 tons.

At many other places preliminary organizations have been formed which are only awaiting developments assuring more settled conditions affecting the sugar industry.

The relative importance of the beet-sugar industry can best be gathered from the following statistics of the sugar production and consumption of the world. The United States is the world's greatest consumer of sugar.
compilation by The National City Bank of New York shows that the consumption of sugar in the United States for the fiscal year 1917 was but 82 pounds per capita against 89 pounds in 1914 (the year preceding the war). The total quantity consumed in 1917 was, however, 8,500,000,000 pounds and we also exported 1,250,000,000 pounds, or 25 times as much as in the year before the war.

His compilation shows that the world's sugar production is now about 12 per cent below that of the year preceding the war. Beet-sugar production in Europe has fallen 43 per cent but cane production in the tropics has increased about 25 per cent. The beet-sugar of Europe, which was 18,500,000,000 pounds in 1912-13, was but 10,500,000,000 pounds in 1916-17, and the world cane production, which was a little more than 20,000,000,000 pounds in 1912-13 was over 25,000,000,000 pounds in 1916-17; world production of cane and beet sugar in 1913-14 was 42,000,000,000 pounds; in 1916-17, 37,000,000,000 pounds. Beets produced one-half of the world's sugar prior to the war, but in 1916-17 supplied only one-third of the world's total. In the United States and its island possessions there has been a rapid increase in production. In every one of the sugar areas under the American flag—Porto Rico, Hawaii, the Philippines, and the cane and beet fields of continental United States—there has been a marked increase, the aggregate product of these areas having grown from about 4,000,000,000 pounds in 1912-13 to practically 5,000,000,000 pounds in 1916-17. The share of our consumption drawn from foreign countries has fallen from 75 per cent in 1897 (20 years ago) to 48 per cent in 1917. In consumption of sugar the United States stands at the head of the list of the world countries, our total consumption being 8,500,000,000 pounds in the fiscal year 1917 against approximately 5,000,000,000 in Germany, 5,000,000,000 in the United Kingdom, and 2,000,000,000 in France, the figures for the other European countries being those for normal years. Our per capita consumption, however, is less than that of certain other countries, Denmark's consumption being 93 pounds per capita, England 90, United States 82, Germany 77. In Sweden the consumption is 62 pounds, France 40, Russia 30, Spain 15 and Italy 10. About 25 per cent of our consumption is drawn from our own fields, 27 per cent from our islands and 48 per cent from foreign countries, chiefly Cuba. The value of the sugar entering continental United States was, in the fiscal year 1914, $155,000,000 and in 1917 $348,000,000, the average import price per pound (including that from the islands) having been, in 1914, 2.3 cents, and, in 1917, 4.6 cents. Our exports of sugar have grown very rapidly during the war. The figures being, in 1914, 50,000,000 pounds in 1915 550,000,000, and in 1917 1,250,000,000 pounds, the value of the exports increasing from less than $2,000,000 in 1914 to over $77,000,000 in 1917. Of the 1,250,000,000 pounds exported in 1917, 450,000,000 went to France, about 150,000,000 to Great Britain, 50,000,000 to Italy, 250,000,000 to neutral Europe and about 150,000,000 pounds to South America. The world's chief producers of cane sugar are Cuba, India, Java, the Hawaiian and Philippine Islands, and Porto Rico; and the chief producers of beet sugar are Germany, Russia, Austria-Hungary, France and the United States. Cuba, from which we draw our chief imports, is now the world's largest producer, her crop in the sugar year 1916-17 having been 1,288,000,000 and Porto Rico 1,006,000,000 pounds, while Germany's beet-sugar production in 1913-14 (the latest accurate year) was 6,093,000,000, Russia 3,598,000,000, Austria-Hungary 2,774,000,000, France 1,749,000,000, the United States production in 1916-17 1,646,000,000 pounds of beet sugar and 613,000,000 pounds of cane. The world's sugar production, as far as can be statistically stated was in 1870 5,000,000,000 pounds, in 1880 7,000,000,000 and in 1890 13,000,000,000, in 1900 20,000,000,000, in 1910 33,000,000,000, in 1914 42,000,000,000, and in 1917 37,000,000,000 pounds, this fall off in 1917 being due to a reduction of product in the beet fields of the European countries at war. Our own consumption has about kept pace with this rapid growth in world production, since we consumed in 1870 23 per cent of the world's output and in 1917 21 per cent of the world total.

Methods of Growing Sugar-Beets.—It would be quite difficult to give general directions and rules for growing sugar-beets applicable to all localities and conditions. Often expert sugar-beet growers, at public meetings and in the agricultural press, give minute directions covering all the details of this intricate process. Others, each well versed in the process of growing sugar-beets, get into arguments and disputes as to the right method. In such cases each may be correct in a measure. The occasion for such disagreements lies in the fact that each person has in mind the right method for a particular locality or set of conditions. A careful study of the different sections of the United States, where sugar-beets are grown will lead to the conclusion that there is no single road to success in growing sugar-beets. Every locality has settled conditions which will materially modify any set of methods that might apply to some other one. There are some settled rules; of course, but it is a fact that the various agricultural districts of this country will have to work out each for itself. A person in the Netherlands must plow the ground must be plowed in the fall in order to receive the benefit of winter frosts is not offering any argument to the Pacific coast, for instance, where many beets are grown, and he who insists that the ground should be rolled in all instances after planting will hazard the crop if his directions are followed in many parts of Nebraska and other sections where the soil is sandy and there are strong winds. In such cases a smooth surface offers an excellent opportunity to carry along the sharp grains of sand, cutting off the plants and destroying the crop.

There can be no general fixed rules applying to the kinds and application of fertilizers. General principles are all right when accompanied with the understanding that the way to carry them must always be modified to meet local conditions.

With the development of the industry in all the sections which have the necessary conditions, and the acquisition of ample experience both by the farmers in the production of beets and by manufacturers in the making
of sugar, there will come many improvements, and especially competition. There are some things settled, however, about growing sugar-beets. It will generally be conceded that the ground should be plowed deep and manured. Before the seed is planted, the ground must be thoroughly pulverized by harrowing and by rolling, even if the surface has to be afterward roughened. Advantage must be taken of the general and prevalent rain conditions. The ground must be moist enough to germinate the seed, either by rainfall or irrigation. Rainfall is best when it can be obtained. In some localities either is used, according to circumstances. Seeds are planted at depths of from half an inch to two inches, according to the prevailing conditions in the particular locality taking into consideration in what size the beets must be planted near enough together to produce a beet of a certain size. This spacing depends, again, upon the locality and the nature and fertility of the soil. The size and quality of the beet depend materially on the right kind of cultivation. The beets must be thoroughly cultivated, hoed and hand-weeded, because cultivation tends to conserve the moisture of the soil, and clean fields permit favorable action of sun and air. This close cultivation should be kept up until the beet tops thoroughly shade the ground and reach a size when it would be injurious to operate among them further with a plow and hoe. The beets should be harvested as soon as possible after they are ripe, because they contain the most sugar and the highest purity. It is evident that the entire crop of beets in the neighborhood of a factory cannot be harvested at once. In many localities some will have to be siloed temporarily in pits in the fields. Harvesting-time will depend a great deal upon circumstances connected with the operation of the factory. The sooner the beet is harvested after it is ripe the better, because further rainfall may start a new growth, producing new lateral roots and new leaves, thus greatly reducing the sugar content and purity of the beets.

Benefits to the Farmer.—No statement of facts with reference to any new crop would be complete or would indicate the advisability of its introduction unless it showed the benefits to be derived. Of course, profit and loss in any enterprise is the first consideration.

It has already been stated that it costs about $30 per acre to produce sugar-beets and to market the crop where rain conditions prevail. This is without taking into consideration the rent of the land, but it includes the farmer's time and everything else that enters into the cost of production. The average United States yield during the five-year period 1911-15 was 10.17 tons per acre and the price paid farmers per ton in 1915 was $5.67, thus giving a gross average cash return of $57.66 per acre. To this amount should be added the feeding value of the leaves and tops, usually estimated at $3 per ton, also the value of the increased yield of other crops for three years from the plowing of a crop of beets. This increased yield amounts to 25 to 60 per cent and is the greatest of all incentives to stimulate beet culture. It must be kept in mind that these are averages of gross and net proceeds. It is never very encouraging to consult the average of agricultural crop statistics; indeed, it is often said that "the average crop does not pay." If one should take the average crop of corn in Iowa, for instance, or the average crop of wheat in Minnesota or Kansas, and compute the proceeds at the average market price, and deduct therefrom the cost of production, the results would show a very small remuneration or an actual loss, quite discouraging to one who has not investigated this subject.

Many growers formerly received as high as $75 and some $100 per acre for their beets, these high results depending upon the superior quality of the land and the superior skill of the one producing the beets. If a farmer has poor land or is an unthrifty farmer, he is not in a position to expect much in planting any kind of crop. These statements are sufficient to give a farmer who is experienced in all other kinds of crops a fair insight into the situation.

Conditions in the sugar marts of the world resulting from the World War have naturally caused a general distillation in the beet sugar field also, where unusually high prices obtain, and under present conditions the future cannot be forecast with any degree of accuracy, but the outlook for the producer is assuring.

There are indirect benefits in sugar-beet growing that the farmer must take into consideration, along with the direct, as follows: He learns that sugar-beets are a very valuable crop to grow for his stock. It is estimated that they are worth two-thirds as much for feeding as for production of sugar. They may enter into a food ration for any kind of stock. A normal acre of sugar-beets furnishes about 2,000 pounds of digestible matter in form of the tops and leaves removed before beets are delivered at the factory. An average acre of corn ensilage contains about 3,600 pounds of digestible matter. Therefore, besides getting a good cash return for his beets the farmer gets from each acre of beets the equivalent of one-half an acre of ensilage.

The high cultivation that must be given to the land through deep plowing, thorough harrowing and constant weeding and cultivating finally makes the land of superior quality for any purpose. It will grow much more and better corn or wheat, and at a less expense, on account of the absence of weeds and grass. Finally, through rotation, other fields are brought under this high state of cultivation, until the whole farm is at its best condition of soil fertility and productiveness.

The method that has brought this about serves as an object-lesson to the farmer and the farming neighborhood. A better cultivation will prevail, and the science of farming will become several degrees higher on account of experience in sugar-beet cultivation.

After the beets are delivered to the factory, and the sugar has been extracted, it is found that the pulp (which will amount to 50 per cent in weight of the beets worked) is almost as valuable for feeding purposes as the original beets themselves to feed and sells for 50 to 75 cents per ton. It enters naturally and profitably into the food
rations of all kinds of stock. It is especially valuable for steers and lambs, but reaches its highest use as animal food when fed to the dairy cow. The farmers in the neighborhood of a beet-sugar factory feed large quantities of it. They appreciate its nutritious and sanitary value. Pulp feeding gives an impetus to animal industry of all kinds. It offers a stimulus to the establishment of butter and cheese factories, to the erection of feeding-pens and to the whole stock-feeding industry. Its use is a strong reason for establishing the industry.

The beet-sugar industry opens up at once a large demand for labor, not only in the factory itself, but on the farm. It is one of the things in which the farmer can invest with the assurance that he has a sure market and a fixed price for his crop to begin with.

Benefits to Other Industries.—The establishment of a beet-sugar factory opens up not only a large field for the employment of labor, but also a field for the employment of capital. It creates once a market for considerable crude material to be used in conducting the business. First and most important it furnishes a market for the beets. Then the factory is a large consumer of coal, and as the factories are often established in communities having local coal fields they become at once local markets for a local product. The amount of coal necessary to work up a certain amount of beets is generally computed at about 20 per cent by weight, or, in case of an ordinary factory of 1,000 tons capacity, about 200 tons of coal per day, or 20,000 tons for a full campaign of 100 days. A factory also consumes a large amount of lime rock, which of necessity must also be a local product. It usually consumes lime rock to the extent of about 8 per cent of the crude weight of beets worked, which in the case of a 1,000-ton factory would be 80 tons of lime rock per day, or 8,000 tons for the campaign. It consumes about one-tenth as much coke as lime, or about 1,000 tons during a campaign.

The establishment of a factory in a community necessitates considerable transportation of crude products—beets, coal and lime rock—to the factory, and in carrying the finished product to market. It stimulates banking and almost all kinds of mercantile business throughout the community.

The total expenditure for beets, manufacturing and transportation by the factory is not far from $100 per acre of beets harvested, most of which is disbursed in local channels and which furnishes one of the best means of an intensification of economical activities in rural communities.

The Future of the Industry. — The present consumption of sugar in the United States is 8,500,000,000 pounds of which beet and Louisiana cane sugar furnish about 25 per cent, 27 per cent comes from our insular possessions and 48 per cent comes from foreign countries, mostly from Cuba.

It has been the ambition of those encouraging the beet-sugar industry to establish factories enough at least to avoid this foreign importation. Making due allowance for failure of factories to reach in actual production their full capacity and ideal conditions, it would require 160 factories having a daily capacity of 1,000 tons of beets to produce the sugar imported, or a sufficient number of cane-sugar factories to produce an equal amount of sugar. To build and equip these factories will require an expenditure of $250,000,000 in labor, building materials and machinery. The annual requirements of these will be as follows:

**ANNUAL REQUIREMENTS OF 160 BEET-SUGAR FACTORIES**

<table>

In addition to the foregoing list, large amounts of money have been paid for mill supplies, transportation, etc. As working capital to operate these factories $135,000,000 was required. This sum being in use, however, for about four months in the year, the interest charged thereon is equal to an interest charge on $45,000,000 for one year. The above estimates do not include capital already invested in the business and operations of the factories already built, the statement of which is as follows:

**PRESENT DEVELOPMENT OF THE BEET-SUGAR INDUSTRY**

| Capital invested in factories, equipment, and grounds | $100,000,000 |
| Beets purchased annually | tons | 7,000,000 |
| Cash paid for beets purchased annually | $38,000,000 |
| Coal consumed annually | tons | 1,400,000 |
| Cash paid for coal annually | $18,000,000 |
| Lime rock purchased annually | tons | 500,000 |
| Cash paid for lime rock annually | $1,500,000 |
| Coke purchased annually | tons | 100,000 |
| Cash paid for coke annually | $170,000 |
| Cash paid for labor annually | $6,000,000 |
| Operating capital annually employed | $23,000,000 |

Also there is a considerable amount annually expended for crude material and various other things. It hardly seems possible that an industry which affects so many people over such a wide scope of country can fail to receive anything but the most friendly, careful and fostering consideration on the part of those who shape industrial affairs.

The immensity of future demands it seems, answers effectively those who feel that the industry might be overdone. Attention should be called to the fact that not only are present demands great, but that the rate of increase of consumption is considerable. According to statistics for the last 19 years, consumption of sugar in the United States has been increasing at the average rate of about 6% per cent annually.

Representative of the Beet Sugar Industry in the Arid States.

**BEETHOVEN, bā-to- fen, Ludvík Van** (1770-1827), the greatest orchestral composer of the 19th century; b. Bonn, 16 Dec. 1770; d. Vienna, 26 March 1827. While classed among the German masters, the Dutch Van in his name (which is not a sign of nobility) indicates his descent from a family in the Netherlands, the world's musical centre in the 15th and 16th centuries. This family moved in 1650 from Louvain to Antwerp. Beethoven's grandfather was a butcher, and his father was a tenor, who did not lead an exemplary life; his income was only $150 a year, wherefore it is not
surprising that he eagerly availed himself of his son's musical talent and exploited it. He personally taught Ludwig to play the violin and the clavier, in the hope of making of him a "wonder-child" like Mozart. While Ludwig was not remarkably precocious (he even shed tears over his music lessons), he is said to have written a funeral cantata at 11, and in the same year was taken on a concert-tour by his father, who, to make his performances seem more remarkable, represented him as being two years younger. But when he had reached the 12th year the organist Neefe spoke of him as "playing with force and finish, reading well at sight, and, to sum up all, playing the greater part of Bach's 'Well-Tempered Clavier,' a feat which will be understood by the initiated. If he goes on as he began, he will certainly become a second Mozart."

Mozart himself appears to have been of this opinion, for when he heard young Beethoven improvise in Vienna he exclaimed to the by-staters, owing to his suggestion that the world something to talk about!" This was in 1787. Beethoven had been sent to Vienna in the hope that he might be able to take lessons of Mozart; apparently he did take a few, but the illness of his teacher made it hasten back to Bonn. Although Bonn was a small town, it had quite a musical atmosphere, and Beethoven had good opportunities to become acquainted with the operas and the concert pieces then in vogue. He was only 13 when he got a position as assistant organist, and subsequently he played the pianoforte accompaniments at the rehearsals of the opera orchestra. He also played the viola. His first salaried position ($63 a year) was as assistant organist under Reicha. The most important occurrence of the Bonn period was the formation of an intimate friendship with Count von Waldstein, to whom he subsequently dedicated one of his best sonatas. The Count had promptly recognized his genius, and it was probably owing to his suggestion that the Elector of Cologne, Max Franz, decided to provide the young musician with the means for going to Vienna again and there continuing his studies with Haydn, to whom Beethoven had already been introduced when Haydn stopped at Bonn, in 1790, on his way to London. It was in November 1792, nearly a year after Mozart's death, that Beethoven entered Vienna, which was to remain his home till the end of his life. The lessons from Haydn were duly arranged for and the first was given in Haydn's house on 12 December, the payment being eight groschen (about 20 cents). But Haydn, like most creators, was not a good teacher and although Beethoven took lessons of him more than a year, he soon began to take his exercises for correctness for Haydn and refused to manifest in his compositions. To these compositions he was so lucky as to be able to devote nearly all his time. From his father he received no pecuniary assistance, but there were several sources of income. Prince Lichnowsky gave him an annual stipend of 600 florins, and when, in 1809, an attempt was made to entice him to Kassel, where a position as Kapellmeister was offered him, some of his princely friends gave him an additional annuity of 4,000 florins, to chain him to Vienna. This lasted until 1811, but at this time he was already deriving a considerable income from the sale of his works. Many of his letters show that he knew how to make a good bargain. Had it not been for a spendthrift nephew, of whom he was very fond, and for whom he had advanced at the time of his death he had even placed 7,000 florins in the bank, he would have never suffered any financial tribulations such as Mozart and Schubert had to endure all their lives.

It was fortunate that the Kassel offer was refused, and that an earlier attempt (in 1796) to win him for Berlin had also led to naught; for Vienna was the proper place for Beethoven. It was at that time the world's musical centre, owing largely to the unusual interest taken in music by the aristocracy, which is the significance of this fact we must bear in mind that at that time there were few public concerts; it was the nobility who maintained the orchestras and patronized the great artists, the audiences being invited guests. Beethoven brought with him from Bonn letters of introduction to leading members of the aristocracy, and thus found himself at once in the swim. He had not yet done anything very remarkable as a composer and was at first admired chiefly for his improvisations on the pianoforte; but gradually a sense of his greatness dawned on his patrons, who bore patiently all his eccentricities. While recognizing the advantage of being intimate in the houses of the aristocracy, he never truckled to rank and refused to submit to the intricate and artificial rules of court etiquette. At the same time he expected the aristocrats to behave like ladies and gentlemen; one day when a young man talked loudly while he was playing, he suddenly stopped and exclaimed: "I play no longer for such hogs!" His attitude toward wealth is illustrated by his once sending back his brother's card on which "Johann van Beethoven, land proprietor" was printed, after writing on the back: "Ludwig van Beethoven, brain proprietor." In the homes of some of his aristocratic friends he gave lessons to the women and girls. He did this unwillingly, looking at the time thus spent as filched from his compositions. He often failed to keep his appointments and was apt to be irascible and bearish; but his fair pupils were only too glad to put up with all this for the sake of the benefit they got from his lessons. He was, at the same time, a great admirer of women and often in love, although none of his infatuations appears to have lasted more than seven months. He was not a talker, although he repeatedly proposed he was each time refused. These love affairs call for mention because they had an influence on not a few of his compositions. A well-regulated household was a blessing he greatly needed. His eccentric habits were certainly far from all change his lodgings and he seldom could keep a servant longer than a few weeks. If his cook brought him a bad egg he threw it at her. He often got angry when the servants laughed at the sight he presented while composing—toss-
ing his hands about, beating time with his feet, and singing or rather, growling. His rooms presented a sight. His gas-tans' habits were unwise, and the dyspepsia they gave rise to was responsible for much melancholy and for many of the outbreaks of ill-temper for which he became notorious as he grew older. While naturally of an affectionate disposition (as instanced in his fondness for his nephew) and always fond of jokes, he would, on occasion, insult and abuse his best friends on slight provocation; but these outbursts of irascibility were usually followed by the most abrupt apology. He was, he stout, like his music, highly emotional and regardless of rules.

The chief cause of his growing m one sness and irritability was the difficulty of hearing which began in 1796 and gradually ended in complete deafness. In 1802 (25 years before his death) he wrote in his last will: 'O ye, who consider or declare to me to be hostile, obstinate, or misanthropic, what injustice ye do me! Ye know not the secret causes of that which to you wears such an appearance:' and he was not to speak his hearing, which had been growing more and more defective for six years, and which made him shun people, as he did not wish to say constantly: 'Speak louder—bawl—for I am deaf.' His last appearance in public in concerted music was in 1814. Two years later he began to experiment with ear-trumpets, his collection of which is now in the Royal Library of Berlin. His attempts to conduct after this usually led to mortifying and pathetic scenes. The last was in 1824, when, although totally deaf, he insisted on conducting his Ninth Symphony. He could not even hear the applause which followed it. All communication with him was, in the last years of his life, carried on with the aid of pencil and paper. The autopsy showed that not only were the auditory nerves practically paralyzed, but there were other advanced troubles (the liver was tough as leather and shrunk to half its normal size), which made it remarkable that he should have retained his vitality so long.

The immediate causes of death were inflammation of the lungs and pneumonia. A week before his death he was still busy with letters and with plans for new compositions, including a tenth symphony, a requiem and music to Faust. He died during a violent thunder and hail storm, about six o'clock on 26 March 1827. The Viennese, who had been neglecting him during the last few years, because of the Rossini furore (in 1823 no operas but Rossini's were sung in Vienna, and the whole musical atmosphere was affected by them), now realized their loss and a crowd of 20,000 persons attended the funeral. He was buried in the Währinger Friedhof, but in 1888 his remains were transferred, with those of Schubert, to the Central Cemetery. Statues of him were erected at Bonn in 1845, in Vienna in 1880, in Brooklyn in 1894, at Dusseldorf (Max Klinger) in 1902. In 1815 the freedom of the city of Vienna had been conferred upon him.

A certain wildness was given to Beethoven's appearance by his long, abundant hair, which was always in a state of disorder. He was strong built and muscular, his forehead broad and high, his complexion ruddy. His friend Schindler wrote that when a musician was in possession of him, "there was an air of inspiration dispelled in his aspect; and his diminutive figure seemed to tower to the gigantic proportions of his mind." Already in Bonn his friends used to note the occasions when he "was in his raptura." These moments of inspiration would come to him at any time and anywhere—in his room, in the streets of Vienna, and particularly in the country. He was extremely fond of nature and country life, and spent his summers in the picturesque surroundings near Vienna. A sketch book was always in his pocket, and into this he jotted his ideas as they came. Afterward he revised and re-revised these sketches. "There is hardly a bar in his music," says Grove, "of which it may not be said with confidence that it has been rewritten a dozen times. Of the air 'O Hoffnung,' in 'Fidelio,' the sketch books show 18 attempts, and of the concluding chorus 10. These sketches have been collected by Nottebohm and printed; they give an interesting insight into the mind of a composer of genius. Another curious fact regarding his creative power is that, like Wagner's, it matured slowly. Mendelssohn wrote his best piece, the 'Midsummer Night's Dream' overture at the age of 17; Schubert was 18 when he wrote his wonderful 'Erlking,' but Wagner was 28 when he wrote his first really original opera ('The Flying Dutchman'), and Beethoven 29 when he composed his first symphony, and that might have been almost as well written by Mozart or Haydn.

It is customary to divide Beethoven's compositions into three groups, following the suggestions of a Russian, W. von Lenz, who, in 1852, issued a book entitled 'Beethoven et ses trois styles.' The first group in which the influence of his predecessors is still more or less obvious includes, among many other things, the first two symphonies, the septet, the first six string quartets, the aria 'Ah Perfido,' the song 'Adelaida,' etc.; the second, which shows Beethoven in the full vigor of his manhood, originated in the years 1800 and includes six symphonies, from the third ('Eroica') to the eighth, the opera 'Fidelio,' the violin concerto, the Coriolan overture, the Egmont music, the Rusalovskoy quartets, the Kreutzer sonata, the 'cello sonata in A, 14 sonatas for pianoforte, etc.; the third, which begins after a period of great tribulation and depression in his life, includes the last five piano-forte sonatas, the string quartets op. 127, 130, 131, 132, 135, the 'Missa solemnis,' etc. Concerning some, at least, of the works of this third period opinion is still divided. There are critics who think that, partly in consequence of his deafness, Beethoven had become garrulous, incoherent and vague, whereas others profess to find in the compositions of this period the highest summit of all musical creativeness.

A better way than Lenz's of considering the achievements of Beethoven's genius is to cast a glance at each class of his compositions by itself. The eminent English critic, Dr. Hue- ter, wrote that 'Beethoven is in music what Shakespeare is in poetry, a name before the greatness of which all other names, however
BEETHOVEN

great, seem to dwindle. This is an exaggeration. There is, in reality, only one department of music—the symphony—in which Beethoven is incontestably pre-eminent; in all the others, he was his equals, and in some his superiors. In the Lied, or art-song, he is far inferior to Schubert and half a dozen other masters; in the grandeur of choral writing he never equaled Bach and Handel; his 'Fidelio' is not equal to 'Il Trovatore' by Verdi; his piano-forte compositions are harmonically less fascinating, and less idiomatic in style, than Chopin's and Schumann's, and in the realm of chamber music there are works of Haydn, Mozart, Brahms, and particularly Schubert and Schumann, quite equal to the best of Beethoven's. His weakest works are in the department of vocal music, especially the Lied. He once said to Rochlitz: 'Songs I do not like to write.' He looked on them as bagatelles into which it was hardly worth while to put his best ideas. Hence, among his songs, there are only a few which show his genius to advantage. The best of these are 'In fidelite', 'De Coventry', and 'In questa tomba.' (Consult Finck's, 'Songs and Song Writers,' pp. 28-34). One of the most judicial biographers, Waselewski, remarks: 'While Beethoven wrote a good deal for the voice, he cannot be considered a vocal composer in the proper sense of the word. Full appreciation of the real nature of the human voice, the subtle knowledge of its resources which we admire in Handel and Mozart, he did not possess. His realm was instrumental music. Nevertheless, there is much that is great beauty in his vocal works, which include the opera 'Fidelio,' the oratorio 'Christus am Oelberg,' two masses, a sonata, 66 songs with piano-forte, 18 canons, 7 books of English, Scotch, Irish, Welsh and Italian songs with piano-forte, violin and 'cello, etc. He himself considered his second mass—'Missa solemnis'—his most successful work, but the musical world is much more enamored of his 'Fidelio,' which, while conventional in the first act, rises in the second to such a sublime level of dramatic expressiveness that it is too much regretted he never found time to execute his other operatic plans, which included a Macbeth, a Faust, and an Alexander. The history of 'Fidelio' and its four overtures is of particular interest, but the limits of space forbid its insertion.

For piano-forte there are 38 sonatas, 5 concertos, 21 sets of variations, and more than 50 short pieces—bagatelles, rondos, preludes, ländlers, etc. Hans von Bülow spoke of Bach's 'Well-Tempered Clavier' as the Old Testament of music and Beethoven's sonatas as the New, 'in both of which we must believe,' and he reckons that the mere technical mastery rises in these sonatas 'is the task of half a lifetime.' They mark a tremendous advance over all his predecessors except Bach. In wealth of melodic ideas and rhythmic variety, as well as in structural finish, and especially in emotional expression, they are unsurpassed works of their kind; yet it was not till several decades after the composer's death that they began to be generally appreciated and played in public. The pendulum then swung to the opposite extreme, and even Beethoven sonatas was supposed to be a peerless masterwork which is far from being true. (Read the admirable comments on all these works in chap. VII of J. S. Shedlock's 'The Piano-forte Sonatas.') In the matter of the form Beethoven was by no means the pedant many of his admirers would have him. The orthodox sonata is supposed to consist of four movements; but of his 38 sonatas only 15 have four movements; 11 have 3, and 6 have only 2; moreover, his two-movement sonatas bear the titles 'torsos,' as some have foolishly called them; they include op. 90 and op. 111, two of his very best works, the op. 111 being, in fact, his last word on the subject.

The chamber music includes 8 trios for piano and 'cello; 5 trios, 16 quartets and 2 quintets for strings; 10 sonatas for piano with violin, 5 with 'cello, 1 with horn, 3 sextets and 1 septet for strings and wind instruments; 2 octets for wind. The quartets have been made tolerably familiar, but among the other works here referred to there are many gems of which the public is still unaware. But it is when we come to the orchestral works—the 11 overtures, and 9 symphonies—that the real grandeur of Beethoven is apparent. Of these works Richard Wagner, who worshipped Beethoven, has written most eloquently (see index to vol. I of Glasepp's 'Wagner Encyclopédie,' or to Ellis's translation of Wagner's prose works; Grove's 'Beethoven's Nine Symphonies' gives an excellent analysis for amateurs). Concerning the symphonic works, Wagner wrote: 'He developed the symphony to such a fascinating fullness of form and filled this form with such an unheard-of wealth of enchanting melody that we stand to-day before the Beethoven symphony as before the boundary line of an entirely new epoch in the history of art; for with them a phenomenon has appeared in the world, with which the art of no time and no nation has had anything to compare even remoter.' It is not only that Beethoven's symphonies are longer than those of Haydn and Mozart, or broader and richer in melody, more varied in rhythm, and fuller in minute details of elaboration; what particularly distinguishes them is their greater emotionality and more powerful contrasts of moods. On the one side we have (as in the piano-forte sonatas) those soulful, tearful adagios which are a specialty of Beethoven; on the other the humorous scherzo, which he put in place of the dainty, graceful minuet of his predecessors. This symphonic scherzo was really a new thing in music, for while there is much fun in Haydn, it is of a much lighter quality. In Beethoven's there are elements of grimness and the grotesque; with an undercurrent of melancholy, as in the scherzos of Chopin. In the art of dyeing the music in deeper and more varied orchestral colors Beethoven's symphonies and overtures also mark a great advance over his predecessors.

While Beethoven stands at the head of composers of the classical school, an almost equal claim to distinction lies in this that in his works are to be found many of the germs which Weber, Schubert, Mendelssohn, Schumann and others developed into the German romantic school. Among these germs are his inclination to shatter the sonata form (particularly in the last movement of the ninth symphony, which is epoch-making in its bold unconventionality); his disposition to allow his ideas to shape the
form in which they are to be uttered; the subjective expressiveness of his music, which has five times as many expression marks as Mozart's; the use of characteristic (realistic) orchestral colors; his way of playing the pianoforte and conducting an orchestra, with tempo rubato, or frequent modification of pace; and above all, his sanctioning of program music by his 'Pastoral Symphony,' which illustrates episodes in the country—a scene by a brook, the merrymaking of the peasants, the song of birds and a thunderstorm. It is also significant of his romantic inclinations that toward the end of his life he conceived a plan of giving poetic titles to all his sonatas and even to the separate movements. The 'Moonlight sonata,' it is well to remember, did not get its inappropriate name from him.

Bibliography.—Several books have already been referred to. Of the biographies the best written in English by the American A. W. Thayer and published, in a German version only (Vols. I-III, Berlin 1866-77; Vols. IV, V, Leipzig 1907-08). Thayer also furnished a useful 'Chronologisches Verzeichniss' of Beethoven's works, of which a smaller version was reprinted by Breitkopf and Härtel in 1864-67. Another important work in this connection is G. Nottebohm's, 'Thematisches Verzeichniss der Werke Beethovens' (Leipzig 1913). Consult also Bekker, 'Beethoven' (Berlin 1910); Kalischer, A. C., 'Beethoven und seine Zeitgenossen' (4 vols., Leipzig 1910); Kerst, F., 'Beethoven im eigenen Wort' (Berlin 1904; English trans. by Henry E. Krehbiel, New York 1905); Nohl, L., 'Beethoven's Leben' (3 vols., Berlin 1887; revised by P. Sakolowski, Berlin 1912); Schindler, A., 'Biographie von Ludwig van Beethoven' (Münster 1840); Marx, A. B., 'Ludwig van Beethoven, Leben und Schaffen' (2 vols., Berlin 1884); Wegeler, F. G., and Ries, F., 'Biographische Notizen über Ludwig van Beethoven' (Coblenz 1838; reprinted by A. C. Kalischer, Leipzig 1906).

For analyses of his sonatas and symphonies consult Grove, G., 'Beethoven and his Nine Symphonies' (London 1896); Helm, Th., 'Gesammelte Schriften' (Leipzig 1910); Lenz, W., 'Beethoven et ses trois styles' (2 vols., Paris 1855; new edition by D. Calvocoressi, Paris 1909); Nieset, R., 'Das goldene Zeitalter der Klaviersonate' (Cologne 1910); Reinecke, C., 'Die Beethoven'schen Klaviersonaten' (Leipzig 1897; English trans., London 1898); Nagel, W., Beethoven und seine Klaviersonaten (2 vols., Langensalza 1904). For Beethoven's correspondence consult the selections by Leichtentritt, H. (Berlin 1912); von Etzmann (Leipzig 1909); Sachs, C. (Berlin 1909); Thomas-San-Galli, W. A. (Halle 1910) and Kalischer, A. C., 'Beethoven's sämtliche Briefe' (5 vols., Berlin 1908; English trans. by J. S. Shedlock, London 1909) and Frelinger, F. 'L. v. Beethoven's sämtliche Briefe und Aufzeichnungen' (4 vols., Vienna 1908). A yearbook entitled 'Beethoven Forschung' has been issued at Vienna since 1911.

HENRY T. FINCK,
Musical Critic, Evening Post, New York.

BEETLE, an insect of the order Coleoptera. Beetles are distinguished from all other insects by the elytra or thickened fore wings, which are not actively used in flight, the hind wings being especially adapted for that purpose. The elytra cover and encase, thus protecting, the posterior segments of the thorax and the abdomen. To the orthorhaphians segments are enlarged, often exarated in front, to receive the head. These characters are very persistent. There are few aberrant forms and the order is remarkably homogeneous and easily limited. The head is in the elytra and the antennae are excluded, or at least narrowed behind, and its position is usually horizontal. The eyes are usually quite large, and there may be one or two ocelli—not more. The antennae are usually inserted just in front of the eyes, and rarely between them. They are either filiform where the joints are cylindrical, as in the ground beetles (Carabidae), not enlarging toward the end, or serrate, as in the Elateridae, where the joints are triangular and compressed, giving thereby a serrate outline to the inner edge; or clavate as in the Silphidae, where the enlarged terminal joints give a rounded, club-shaped termination; or lamellate, when the terminal joints are prolonged internally, forming broad, leaf-like expansions, as in the Scarabaeidae. The elytra in these insects is produced when the second and succeeding joints make an angle with the first. The mandibles are always well developed as biting and chewing organs, becoming abnormally enlarged in the stag-beetles (Lucanidae), while in certain Scarabaeidae they are small and membranous. The maxillae prepare the food to be crushed by the mandibles. The greatly enlarged prothorax is free and movable.

In the running species, as carabidae, the hind wings being useless are aborted, and very rarely in some tropical Lampyridae and Scarabaeidae both pairs of wings are wanting in both sexes, though, as in the glow-worm and some of its allies, the females are apterous. The legs are well developed, as the beetles are among the most powerful running insects, the hindermost pair of legs becoming oar-like in the swimming Dytiscidae and some Hydrophilidae, while in the Gyrinidae both pairs of hind legs become broad and flat. The number of tarsal joints varies from the normal number five, to four and three joints, the terminal joint as usual being two-clawed. These claws are known to be wanting only in Phanaeus, a scarabæid, and the aberrant family, Stylodidae. According to the number of the tarsal joints the families of the Coleoptera have been grouped into the Pentarinae (five-jointed), the Tetramerinae (four-jointed), the Trimerinae (three-jointed), and the Heteromera, which are four-jointed in the hind pair, while the first and second pairs are five-jointed. The abdomen is usually partially concealed by the wings, is sessile, its base broad; in form it is usually somewhat flattened. A few genera are capable of producing sounds by rubbing the limbs or elytra over finely wrinkled surfaces, which in Tropis are situated on the side of the basal segments of the abdomen, and in Stratiomus on the tignum of the penultimate segment of the abdomen, while such a surface is found in Hymenus on the surface of the elytra.

The larvae when active and not permanently enclosed (like the curculio) in the substances that form their food, are elongated, flattened, wormlike, with a large head, well-developed
mouf-parts and three pairs of thoracic feet, either hairy, or fleshy and retractile, while there is often a single terminal prop-leg on the terminal segment of the body and a lateral horn-like process. The pupae of the Cerambycidae are white, soft and more or less cylindrical, while those of the Curculionidae are footless or nearly so, and resemble those of the gall-flies, both the hymenopterous and the dipterous.

The pupae have free limbs, and are either enclosed in cocoons of earth, or, if wood-borers, in rude cocoons of fine chips and dust, united by threads, or a viscid matter supplied by the insect. None are known to be cocarate, though some Cocconela transform within the old larva-skin, not rejecting it, as is usual in the group, while other pupae are enclosed in the cases in which the larva lived. In some Staphylinidae the pupa shows a tendency to become obtect, the limbs being soldered to the body, as if enclosed in a common sheath.

Generally, however, the antennae are folded on each side of the clupeus, and the mandibles, maxille and labial palpi appear as elongated papillae. The wing-pads being small are shaped like those of the adult Meloe, and are laid upon the posterior tergum, thus exposing the meso- and meta-thorax to view. The tarsal joints parallel on each side of the middle line of the body, the hinder pair not reaching to the tips of the abdomen, which ends in a pair of acute, prolonged, forked, incurved horn-like hooks, which must aid the pupa in working its way to the surface when about to transform into the beetle.

The number of known living species is between 100,000 and 200,000, and over 10,000 species are known to inhabit the United States. About 1,000 fossil species are known.

Coleoptera have been the favorites of entomologists. They have been studied when in their perfect state more than any other insects, but owing to the difficulty of finding their larvae and carrying them through the successive stages of growth, the early stages of comparatively few species are known. The metamorphoses are complete, and in this respect the beetles are much in advance of the orders of net-winged insects in which the transformation is incomplete. Many beetles, as the species of Cetonia, etc., visit flowers to collect and eat the pollen, and in doing so bring about the fertilization of those flowers.

Classification.—The systematic arrangement of the Coleoptera is in an unsettled state. The tiger and ground beetles are generally considered to be the highest Coleoptera, but in reality they appeared to be allied to what were the more primitive and generalized types, while what are by some authors regarded as the "lowest" beetles, i.e. the small wood-boring species, are most specialized or most highly modified. As all our classifications begin with the more primitive or earliest forms, and end with the most specialized, we should begin with the Carabidae or ground beetles, as being the nearest representatives of what are supposed to be the earliest beetles. We would, therefore, adopt provisionally Sharp's primary divisions of Coleoptera, with some important changes. His first division of series comprises the lamellicorns (May beetle, etc.), and his second the Adelphaga or ground beetles. This order should be reversed.

Series 1. Adelphaga (Carabidae of some authors). Antennae long, slender, filiform; tarsi five-jointed; maxillipede highly developed, three-lobed, the outer palpus shaped. (Ground and tiger beetles).

Series 2. Lamellicornia. Antennae short, the terminal joints leaf-like; tarsi five-jointed.

Series 3. Polyphora. Antennae either club-like or serrated, variable in shape, as are the number of joints of the tarsus. (Buprestidae, spring-beetles, etc., including many families).

Series 4. Heteromera. Front and middle tarsi five-jointed, hind tarsi four-jointed; other characters very variable. Tenebrionidae, Cantharidae, or blister-beetles (q.v.), etc.

Series 5. Phytophaga. Tarsi four-jointed but with a small additional joint at the base of the fourth joint; sole usually densely pubescent. (Boring or longicorn beetles; Cerambycidae, leaf-beetle, potato beetle).

Series 6. Rhyncophora. (Weevils). Head prolonged in front to form a beak; palpi much reduced; tarsi four-jointed, but with an additional minute joint at the base of the fourth.

The term Isomera was applied by Le Conte and Horn to a combination of series 1, 2, 3 and 5.

Phylogeny.—The Coleoptera are supposed by Bravere and also Packard to have descended from some type allied to a Campodes-like ancestor. The larvae of the ground beetles are allied by their long legs and biting mouth-parts to the common Campodes-like progenitor; they appear to have undergone the least modification from the shape of the primitive coleopterous larva; the footless grubs of boring beetles, longicorn and weevils, being secondary forms. Thus the Curculionidae and next after them the rose-beetles (Staphylinidae) have been regarded as the nearest to the earliest type of beetles.

Fossil Beetles.—The earliest known remains of Coleoptera are five specimens from the carboniferous strata of Silesia, of which four are wing covers and one is a pronotum; these have been referred by Karseh to the families Carabidae or Tenebrionidae. In the lower Jurassic, however, comparatively well-preserved remains of six families (Carabidae, Dytiscidae, Elateridae, Scarabaeidae, Cerambycidae and Chrysomelidae) have been detected, showing that, early in the Mesozoic era, nearly all the principal types of beetles had appeared; whence we naturally suppose that their ancestors evolved during the Carboniferous period, though their remains have not yet been discovered. During the Tertiary age beetles became more abundant, and a greater number of species belonging to existing genera have been found. The Oligocene fresh-water deposits of Aix and Provence, of Florissant, Colo., contain many kinds of beetles, as also do the Miocene amber of the Baltic coast in Prussia and the lignite of Bohemia, as well as the fresh-water marls of Germany, Utah and Wyoming. Of the weevils 350 Tertiary species have been described, their hard bodies accounting for their preserved state.

Bibliography.—The writings of Say, Harris and others; especially Le Conte and Horn; 'Rhyncophora of America north of Mexico,' 'Classification of the Coleoptera of North America.'
BEETLEHEAD. See BLACK-BELIED PLOVER.

BEETS, báts, Nicolaus, Dutch poet and writer: b. Haarlem, 13 Sept. 1814; d. 1903. He studied theology at Leyden, and after serving at Heemstede near Haarlem he was in 1854 appointed to the pastorate of Utrecht and in 1874 to the chair of theology there. His poetical works roll over 12 vols. (4 vols., 1873-81). Through the earlier pieces runs a strong vein of misanthropic sentiment due probably to Byron, some of whose works he translated into Dutch (2 vols., 1835-37). His prose writings include 'Camera Obscura' (13th ed., 1880), a series of tales and sketches of life and scenery in Holland, published under the pseudonym of Hildefbrand; they display keen observation and considerable humor. Besides several critical works, he published in theology notes on the life of Saint Paul (3d ed., 1858), and 'Stichtelijke Uren' (new ed., 8 vols., 1872).

BEEVILLE, Tex., town and county-seat of Bee County, 90 miles southeast of San Antonio, on the San Antonio & Aransas Pass, and the Galveston, Harrisburg & San Antonio railroads. The region is well suited to fruit and vegetable culture, cotton, hemp, and live stock are exported in large quantities. The town has a cottonseed-oil mill and a broom factory. In 1912 the commission form of government was adopted. Pop. 3,269.

BEFANA, bá-fà'na (Italian, Befania, 'Epiphany'), a figure, generally representing an old woman, which is exhibited in Italy on the day of Epiphany by children, or in shops, etc., where things for children are sold. It symbolizes the ancient woman of Palestine who, saying she would see them on their return, would not leave her household duties to view the Three Kings of the Orient passing on their way to bear their rich offerings to the infant Jesus. Unknown to Befana, they returned in a different direction, and she is supposed to be still fruitlessly waiting for them. Her influence watches over little children who, on the eve of Epiphany, hang their stockings before the hearth-fire, go to bed early and wait to hear the cry 'Ecco la Befana,' when up they jump to find the presents awarded for good behavior during the past 12 months. A stockingful of ashes is the award for bad behavior. The parallel custom in the United States, Great Britain, Germany and Protestant communities generally is obviously the visit of Santa Claus on Christmas Eve. In France the children's "fraternités" or gifts are distributed on New Year's Eve; in Russia on Twelfth Night, which is also the eve of Epiphany. (See NICHOLAS, SAINT, OF MYRA.) Among the Hebrews at Hanoukah, the Festival and Dedication of Lights (John x, 22), celebrated 25 December, money is given the children and gifts are exchanged. At Purim — the Feast of Esther (15 Adar — March), a festival of mirth rejoicing and masquerading, "salachmones," a dish of sweet pastries including "humunatash," a sweet three-cornered seed cake, is sent to the homes and friends and relatives by the hands of servants or children, who generally receive "tips." The poor also during this festival are the recipients of generous charity. At the Passover (14 Nisan — April), which includes the Fast of the First-Born and the Festival of Unleavened Bread, a piece of "matzoth" or unleavened bread is given when it is the privilege of the youngest child to seek. When discovered, the finder can ask any favor or gift from the parent, which is granted.

BEG, or BEY, bá, a title of honor among the Turks, meaning "lord." Beg is an inferior title to pasha.

BEGARELLI, bá-gár-yéllé, Antonio, Italian designer, styled Antonio or Modena: b. Modena about 1498; d. 1565. By his contemporaries he was considered the greatest designer of his day. He was a friend of Correggio and co-operated with him in decorating the Church of Parma, furnishing many of the designs and models for the artist's pictures. His groups were commonly of life size or heroic, and were greatly admired by Michelangelo. He influenced strongly the succeeding Lombard artists in the matter of design. His 'Descent from the Cross,' one of his remaining works, still adorns the church of San Francesco at Modena.

BEGAS, bá-gás, Karl, Prussian painter: b. Heinsberg, near Aix-la-Chapelle, 30 April 1794; d. Berlin, 23 Nov. 1854. He studied first under Philippart, and in Paris under Gros. His first work, a copy of the Madonna della Sedia, attracted the attention of the King of Prussia, who appointed him painter of the Prussian court. His productions comprise historical, genre and portrait paintings, of which the most important are 'Henry IV at the Castle of Canossa'; the 'Sermon on the Mount'; 'Christ on the Mount of Olives'; the 'Lorelei'; and the portraits of Humboldt, Schelling, Ritter, Rauch, Cornelius and Meyerbeer. He was a member of the Berlin Academy of Fine Arts.

BEGAS, Karl, German sculptor of German descent (in the preceding): b. 1845. He studied in the studio of his brother Reinhold and at the Berlin Academy of Art. Among his most important works are the Franco-Prussian memorial unveiled at Cassel in 1888; the groups in the Berlin "Siegessäule," of Marey's Obb IV and Frederick William; the statue of Knobelsdorff in the Berlin Museum; those of Columbus and Aristotle in the University of Kiel; of Emperor Wilhelm II in the Hall of Fame at Barmen; and of Empress Augusta Victoria at Utrecht.

BEGAS, Oskar, German artist (eldest son of Karl Begas, q.v.): b. Berlin, 31 July 1826; d. there, 10 Nov. 1883. He received his first tuition in painting from his father, and at the age of 12 could already paint good portraits. In 1852 he won a scholarship at painting, which enabled him to continue his studies in Italy for two years, after which he resided in France and England for a period. While in Rome he gained a gold medal with his 'Deposition from the Cross,' a life-size canvas, and also the title of official painter in the Prussian Academy. Among his best portraits are those of Peter von Cornelius (in the Antwerp Museum, 1861), Pauline Lucca, Crown Prince Frederick, General von Moltke (1868) and William I. Of his historical paintings the best is 'The Hour of Gossip' (National Gallery, Berlin). He also painted some of the mural decorations in the Berlin Rathaus (1870).

BEGAS, Reinhold, German sculptor (son of Karl Begas and brother of Oskar Begas,
BEGGIE — BEGGAR'S OPERA 448

q.v.): b. Berlin, 16 July 1831; d. 3 Aug. 1911. It is generally conceded that he was the leading German sculptor of his own period. Beginning his studies in the Berlin Academy, he later studied under Wichmann and Rauch. Earning a scholarship from the Berlin Academy through a work he had executed, he went to Rome to finish his training. In 1860, after his return, he was appointed professor of the art school at Weimar, but two years later returned to Rome. As is shown in his later work, while in Rome Begas was strongly influenced by the realism of the Baroque School. His 'Pan Consoling a Deserted Nymph' (1857) was one of the first of his works which showed his tendency toward the portrayal of a live vigor in the midst of one, and it made an immediate impression on his countrymen, who were growing tired of the softer contours of the classical school. Only two years after this he was commissioned to execute a group surmounting the Berlin Bourse, which was soon followed by the monument of Frederick William III at Cologny, the Schiller monument in Berlin (1871); and the Strousburg sepulchral monument (1874) which won the Grand Prize at the Paris Exposition in 1900. This was the early period of his career, during which he also modelled the busts of many of the German royalties and heads of officials, including a whole series of the Hohenzollern family. By this time he had been placed in charge of the portrait sculptures of the Berlin arsenal and its Hall of Fame. He was also the chief sculptor of the Prussian court. Among his other notable works performed during this period are the bronze group "Germania," on the Reichstag building; the marble sarcophagus of Frederick II erected in the mausoleum at Potsdam and the colossal "Fountain of Neptune" (1886), surrounded by allegorical figures of the rivers and sea monsters. By many this latter is considered his masterpiece.

In 1892 Emperor William II, without the formality of an official competition, commissioned Begas to execute the national monument to William I, and another to Bismarck (1901) in front of the Reichstag building. These were followed by a marble statue of the Emperor himself in the palace at Potsdam (1904). But in general the works which he performed toward the end of the first and in the beginning of his second periods are considered his best.

BEGGIE, Harold, English author: b. Fornham Saint Martin, Suffolk in 1871. His education was obtained entirely from private tutors and in private schools, at the conclusion of which he immediately embarked on a literary career. His books are largely novels, with a strong didactic tendency. Among his more important works are 'The Political Struwwelpeter Series' (1880-1901); 'The Handy Map' (1900); 'The Fall of the Curtain' (1901); 'Master Workers' (1905); 'The Priest' (1906); 'The Cage' (1909); 'Broken Earthenware' (1909, published in America under the title 'The Old Man' (1910); 'Souls in Action' (1911); 'The Oratory Extraordinary Thing?' (1912); 'Rising Dawn' (1912); 'A Proof God' (1912).

BEGBIE, Sir James, British legal judge: b. Edinburgh, Scotland, 1819; d. 1894. He was educated at Cambridge and called to the English bar in 1844. He was appointed judge in the colony of British Columbia in 1858; and was chief justice of British Columbia, 1870-94.

BEGG, Alexander, Canadian author: b. Quebec, 19 July 1840; d. 1929. He was educated in Aberdeen Scotland; and in Saint John's, P. Q. He was the pioneer of Canadian trade (1867) in Manitoba and the Northwest Territories. During the rebellion of 1869 he advocated representative government for the people. In 1878-84 he was deputy treasurer of the province of Manitoba. His works include 'Dot it Down'; 'The Creation of Manitoba'; 'A Story of the Saskatchewan'; 'A Practical Guide to Manitoba'; 'Ten Years in Winnipeg'; 'A History of the Northwest' (3 vols.), etc.

BEGGAR-MY-NEIGHBOR, a game at cards, usually played by two persons, who share the pack, and, laying their shares face downward, turn up a card alternately until an honor appears. The honor has to be paid for by the less fortunate player at the rate of four cards for an ace, three for a king, two for a queen and one for a knave; but if the next player does not fare any better another honor should be turned up, the late creditor becomes himself a debtor to the amount of its value.

BEGGAR-TICK, a troublesome weed. See Burr Marigold.

BEGGARS, a term first applied to the 300 Protestant deputies under Henri de Brederode and Louis de Nassau, who protested against the establishment of the Inquisition in Holland in April 1566. The Dutch patriots assumed this designation when they rebelled against Spain in 1572.

BEGGAR'S LICE, a coarse weed also called Dog's Tongue.

BEGGAR'S OPERA, The, a play by John Gay, which first presented in 1728, excited a "tempest of laughter." Its object was to satirize the predatory habits of "polite" society in thief-infested London, and to hold up to ridicule Italian opera. The chief characters are thieves and bandits. Gay's language often continues to the coarse taste and low standards of his time; and the opera, still occasionally sung, now appears in expurgated form. Its best-known number is Macbeth's famous song when two of his inamoratas beset him at once:

"How happy could I be with either
Were 't other dear charmer away I!"

has become a popular quotation.

Captain Macbeth, the hero, the leader of a gang of highwaymen, is loved by the ladies and feared by all but his friends — with whom he shares his booty. Peachum, the "respectable" patron of the gang, and the receiver of stolen goods, betrays his confederates from self-interest. Macbeth is married to Polly Peachum, a pretty girl, who really loves her husband, and remains constant under many vicissitudes. Macbeth engages to marry others, but this gets him into trouble. Being betrayed, he is lodged in Newgate. His escape, recapture, trial, condemnation to death, and reprieve, form the leading episodes in his dressing career. After his reprieve he makes tardy acknowledgment of Polly, and promises to re-
BEGGARWEED — BEGONIA

main constant to her for the future. Polly is an interesting dramatic character; at least three actresses attained matrimonial peerages through artistic interpretation of the part.

BEGGARWEED, or TICK TREFOIL (Melilotus), a genus of about 170 species, mostly herbs, of the family Fabaceae, natives of warm and temperate climates. Some of the species, notably the Florida beggarweed (M. tenuifolius), are used in Florida and elsewhere as forage plants and as green manures on light soils. Like the clovers these plants can assimilate free nitrogen from the air. The species mentioned yields heavy crops of highly nutritious hay which is relished by stock. At the Louisiana Experiment Station six tons of hay per acre is reported. The plant is an annual from three to 10 feet tall, has pinnate leaves, small flowers in racemes, and flat, jointed pods which adhere to clothing and animals by their hooked hairs. The plant has been found to do well in the West Indies and as far north as Virginia. About 10 native species have a place in the flower-garden have been offered for sale by dealers in native plants, but not generally by seedsmen. M. pyramis, the telegraph plant, a purple flower perennial, native of southern Asia, is sometimes raised in hot-houses on account of the interesting movements of its leaflets when exposed to favorable temperature and sunshine.

BEGGIATOA, one of the bacteria of the family Beggiatoaceae. They are of sanitary interest as indicating the character of the water in which they grow,—it usually contains sulphur,—and their presence in large quantities in a water supply is usually held to mean that the water is contaminated and should be investigated. Their growth in natural sulphur waters is to be expected.

BEGIN THE QUESTION, in logic, is the assumption of a proposition which in reality involves the conclusion. Thus, to say that parallel lines will never meet because they are parallel is simply to assume as a fact the very thing you profess to prove. The phrase is a form of the Latin petitio principii, and was first used by Aristotle.

BEGIN, societies of laymen in France, Germany and the Netherlands, first appeared in the 13th century, subsisting mostly by begging, and little esteemed. They disappeared in the latter part of the 14th century. Their history is very obscure.

BÉGIN, bā-gān, Louis Nazaire, Canadian cardinal: b. Levis, 10 Jan. 1840; educated at the College of Saint Michael de Bellechasse, the Seminary of Quebec, Laval University and the Grand Seminary of Quebec. About the time of his graduation from the last institution its trustees decided to found a theological department in connection with Laval University, and it was their wish that the faculty of this theological school should be educated in Rome. Therefore Dr. Bégin, who had been elected a member of the faculty, was sent to Rome in 1863 and remained there until 1868. During this time he traveled extensively and studied many branches of theology. On his return to Quebec he was appointed professor of dogmatic theology and ecclesiastical history in Laval University and held the chair till 1894. He became principal of the Laval Normal School in 1885; was appointed bishop of Chicoutimi in 1888; coadjutor to Cardinal Taschereau, with the title of archbishop of Cyrene, in 1891; in 1894 became administrator of the province of Quebec; and in 1898 archbishop. He was elected to the cardinalate in 1914. His works include 'La Primauté et l’Infaillibilité des Souverains Pontiffs,' 'La Sainte Écriture et la règle de foi' (1874); 'Le culte Catholique' (1875); 'Catéchisme de controvérsie' (1902), etc.

BÉGLEDERBEG, bā-lēr,bā’, or more accurately Bělerdebeg, bā-lēr bā’, ‘prince of princes,’ or ‘lord of lords,’ is the title among the Turks given to the governor of a certain province, but is not very commonly employed at the present day. The governors of Rumilii, of Anatolia and of Syria, in particular, have this title. See Bzā.

BÉGON, Michel, bē-gōn, mé-shēl, French administrator: b. Blois, France, 1638; d. Rochefort, 4 March 1710. He was a naval officer, and successively intendant of the French West Indies, of Canada, of Rochelle and of Charente. He is celebrated for his love of science, and the well-known genus of plants, Begonia, was named in his honor.

BÉGON, Michel, French administrator: b. 1674; d. 1740. He was from 1707–10 inspector-general of marines in France; intendant in Canada 1710–26; and subsequently intendant of justice in Bourbon.

BÉGONIA, a genus of 400 to 500 species of succulent tropical herbs or under-shrubs of the family Begoniaceae, most abundant in Mexico and Central and South America. Since the introduction of the first species (B. mitsou) into England in 1777 about 200 species have been utilized by horticulturists, who have produced thousands of varieties noted for the superb coloring of either or both their flowers or foliage. In general the plants are characterized by variable, lobed (except in one group), alternate, entire or lobed leaves; axillary or terminal, usually large flowers, petaloid; fruit usually a capsule, varying in all shades of red, also white and yellow; numerous stamens free or basally united; two to four styles; branched or twisted stigmas; and three-winged capsular, often colored, fruits containing numerous tiny seeds. The cultivated varieties may be grouped into (1) summer-flowering or tuberous-rooted, which produce large single and double flowers; (2) winter-flowering or fibrous-rooted; (3) semi-tuberous, with peltate leaves; (4) ornamental-leaved, or rex, Asian species and their descendants, with remarkably handsome or striking foliage. There are also hybrids between members of these groups. Each group demands somewhat different cultural treatment, but in general the tuberous sorts are started from seeds, and the tubers thereafter used from year to year; other varieties are usually increased by means of cuttings, either of stem or of the leaf, by various methods almost confined to this group of plants. The varieties are usually easy to cultivate, but some, especially the tuberous sorts, are somewhat sensitive to dryness of atmosphere and hot sun, which usually accounts for the poor behavior of these plants in houses heated by hot air, steam or hot water.
BEQUINAGES—BEHAR AND ORISSA

description of species grown in America, and as for details of propagation, cultivation, etc., consult Bailey, 'Standard Cyclopedia of Horticulture' (New York, 1914). Consult also Dyer, 'The Genus Begonias' (in 'Transactions of the Linnean Society,' Vol. I, 1789); Klotzsch, 'Begoniaeae—Gattungen und Arten' (12 plates, 1855); De Candolle, 'Prodomus' (Vol. XV, 1864); Raven, 'Begonia Culture for Amateurs' (1884); Wynne, 'Tuberous Begonias.'

BEQUINAGES, societies of women, called Beguines, in Holland, Belgium and Germany, not bound by vows; their mode of life, like that of the Beghards (q.v.), neither clerical nor lay. Their principal institution is at Ghent in Belgium.

BÉGUIES, beg-èn', BÉGUINES, bég-inx, or BÉGUIERE, bég-wél-nè, the women who live in communities, the members of which dwell not in one household, as in convents, but in a group of small cottages surrounded by a wall, with a chapel in the centre. They vow poverty and chastity as they remain in the béguinage as their village is called. They are the associations of praying women which arose in the Netherlands in the 13th century, the first being formed at Nivelles, Brabant, in 1226, and spread rapidly in the adjoining countries. They said they originated from a certain Saint Begga, Duchess of Brabant, in the 7th century; but it is believed that they were founded by Lambert le Begue, a priest of Liège, in the 12th century. Mosheim rejects both statements. Communities were established in Mechlin in 1207, Louvain 1213, Bruges 1244 and Brussels 1245. They used to weave cloth, live together under a directress and leave on being married, or indeed whenever they pleased. During the religious convulsions of the 16th century, and later at the French Revolution, the communities—which had exercised considerable influence on the religious consciousness of the urban centres—were suppressed; but a few still exist in some of the Belgian towns, notably at Ghent, which has 1,000 members, also in Germany, and at least in one béguinage in France, where they are renowned as makers of lace, though under different rules from those formerly observed. The corresponding communities of men were called Béghards, but having developed heretical tendencies these were suppressed in 1650 by Pope Innocent X.

BÉGUM, bā'gūm, or NAWAB (a feminine form corresponding to beg, or bey), an Indian title of honor equivalent to princess, conferred on the mothers, sisters or wives of native rulers. The Bégum of Oudh is well known in Indian history. The Begum of Bhopal is the regent in behalf of her son, a minor.

BÉHAIM, bā'him, Martin, a famous cosmographer: b. Nuremberg about 1430; d. Fazal, 29 July 1506. He is distinguished as one of the most learned mathematicians and astronomers of his age. He was engaged in commerce, and traveled for the purpose of carrying on his business, from 1455 to 1479; but also devoted himself to the study of the mathematical and natural sciences. He went to Lisbon in 1480, where he received with marks of distinction. He sailed in the fleet of Diego Cam on a voyage of discovery (1484—86), and explored the islands on the coast of Africa as far as the river Zaire. He is also said to have discovered the Cape of Good Hope, the early history of which is somewhat confused. He reached the newly colonized, the island of Fazal, where he remained for several years, and assisted in the discovery of the other Azores. He was afterward knighted, and returned to his native country, where he constructed a terrestrial globe in 1492, which bears the marks of the imperfect acquaintance of that age with the true dimensions of the earth. Some ancient Spanish historians assert that he made many discoveries, and that he gave to his friend Columbus the idea of another hemisphere. Robertson (in his 'History of America') and others contradict this statement. It is also rejected by Irving.

BEHAM, bā'ham, Barthel, German painter and engraver: b. Nuremberg 1502; d. Rome 1540. He began his studies under the tuition of Albrecht Dürer and his brother Sebald (q.v.). On account of their revolutionary agitation he and his brother were banished from Nuremberg in 1525. He settled in Munich, where he became attached to the court of Duke William of Bavaria as official painter. Many paintings that were formerly ascribed to Beham are now believed to have been painted by others. Yet there remains a large number which can with certainty be accredited to him. Among these are the portraits of Chancellor Eck (1527, Weber Collection, Hamburg); Count Palatine Otto Heinrich (1535, Augsburg Gallery); 'The Miracle of the Cross' (his masterpiece, 1530, Munich); and 17 portraits of Bavarian royal princes and dukes, in the palace of Schleissheim. Of his engravings nearly a hundred are still in existence. Consult A. Rosenberg's 'Sebald und Barthel Beham' (Leipzig 1875).

BEHAM, Hans Sebald, German painter and engraver: b. Nuremberg 1500; d. Frankfort, 22 Nov. 1550. He was, for a time, at least, a pupil of Albrecht Dürer. In 1525 he left Nuremberg with his brother Barthel, and from their native city on account of their socialistic doctrines and agitation. After a wandering life of some six years he settled in Frankfort, where he remained for the rest of his life. This marked the beginning of his serious work.

Many of his drawings are in existence and are found in the important German collections. Of all the engravers of his period, he was one of the most industrious, for the most recent catalogue of his works includes 1,074 woodcuts, 252 copper engravings and 18 etchings. His specialty was large wood-cuts designed for mural decorations. Of these the most notable are 'The Fountain of Youth,' 'The Military Pageant in Munich' and 'The Marching Soldiers.' Each of these is almost a yard in width. Of his many illustrations, the most famous are those which he designed for the publisher Egenolff in Frankfort, illustrating the Old Testament (1533). At about that same time he painted the well-known table now in the Louvre.

BEHAR AND ORISSA, province in lower Bengal, British India. It was constituted in 1912 and includes the Behar, Choata-Nagpur,
BEHAVIOR AND BEHAVIORISM

The term behavior was used first to describe the conditions of animal activities, but because of the peculiar relations that exist between the actions of man and animals it has developed into a name for one general explanation of or attitude toward human and animal actions and psychological problems in general. The problem as to how the activities of men and of animals are related has been discussed from the beginning of thought. For the most part it was assumed that one could know directly the mind of man and that all that remained was to determine whether and to what degree animals had a similar mind. As there is no direct method of determining whether animals have mental states, the development of scientific analysis compelled the investigator to raise the more definite question of what the criteria of mental activities in animals might be. This again led away from the problem, since an unambiguous answer could not be given to the more general question of what different kinds of acts is the animal capable and what is the explanation of each.

One can trace the gradual development of the notion of behavior as a separate type of organic activity through stages in the work of the last three decades. The first stage is represented by Loeb, whose experiments on animals led him to the conclusion that one must distinguish two types of control in the response of animals. The lower animals respond as plants respond by heliotropism, geotropism, etc., a response that might very easily be reduced to simple mechanical laws, the contraction of the tissue on the side toward the light and its expansion on the opposite side, e.g., would explain positive heliotropism. The movements of higher animals were explained from the more human analogy as due to "associative memory," the simplest of the learning processes. Bethe a little later made an attempt to explain the actions of animals in purely mechanical and chemical terms. He asserted that movements similar, to those of the ameba were made by drops of liquids and could be explained by the action of the surface film under different conditions. From experiments on ants he argued that they too were merely reflex machines, guided largely by the chemical excitations that we call odors. Jennings, in a long series of experiments, became convinced that there could be no sharp break in the line of causation from lower to higher animals. In attempting to repeat Bethe's experiments he found that the reactions of the lowest organisms were by no means as simple as Bethe had assumed. Traces of learning, i.e., modification of responses as a result of earlier responses could be detected even in unicellular organisms, and it was found that some gain was to be gained by assuming consciousness as a cause. To all forms of action he applied the term "behavior."

Behavior, then, is a term that designates the activities of animals as wholes. It distinguishes their movements from the movements of inanimate objects, and at the same time does not make reference to consciousness or to any mental state. Behavior as the action of the whole is not referred to the action of the parts as in physiology. In this way it leaves room for an explanation of the organism's activity apart from physiology, although the behaviorist assumes that the laws of physiology must hold and be essential for the explanation of the animal's activity. Instead of analyzing the various acts into the members, behavior is explained by reference to the natural endowment of the organism through instinct and particular heredity and to its earlier acts caused by forces in the environment. While originally developed as a negative term, to show how animal movements were not to be explained, the term has gradually taken on a somewhat positive meaning to designate the explanation of these movements in terms of wider influences. This comes in part from the success of the psychologist and zoologist in determining the laws of behavior in animals. Within the last quarter of a century the laws of learning, certain of the instincts and the differential responses to stimuli have been pretty fully determined in many animals ranging from the ameba to the ape. These together give a fairly satisfactory explanation of behavior.

Behaviorism as a psychological and philosophical interpretation of man and mind grew naturally out of the concept of behavior in animals. If one may study the activities of the cat or the ape from the outside, and can by experiments determine the capacities of the animal and how it learns, discriminates between stimuli, and how it reacts in terms of instinct and training, it is easy to take the next step in the assertion that the activities of man are also forms of behavior and can be examined and explained in the same way. They, too, may be treated merely as forms of response to definite stimuli. With that the traditional attempt to understand the lower animals in terms of human characteristics is reversed, and man's acts are explained in terms of the categories of animal behavior. Man is to be studied in terms of his capacities, without any help from the individual under investigation. One discovers what the individual can do under given conditions and from the changes in accomplishment and the antecedents of the changes develops laws that may explain them. Behaviorism makes no use of introspection and omits all consideration of consciousness. Several of its exponents go on to deny that consciousness has any existence.

This attitude toward consciousness is in part due to higher animals being active since the beginning of the century. For several reasons the notion of consciousness has been undergoing transformations during
the intervening years. By earlier writers consciousness was taken for granted as in some way made up of images of the objects thought about, which at the same time were not identical in structure with the things. All objects are in consciousness and the sum total of these images constituted consciousness. Charcot, Galton and others observed that the character of the images was not the same for all individuals, that certain individuals thought largely in terms of one thing, others in terms of another. They used different senses or combinations of senses in the representation of objects. Still Galton assumed that thoughts were these images and that nothing else except perhaps words could constitute the vehicle of thought. Later workers, primarily Külpe and his followers in Germany and Woodworth in this country, noticed that there were many cases in which the mental content bore no relation to the thought represented and that in other instances no appreciable imagery was present during the thinking process. In more abstract forms of reasoning, in reaching decisions and in initiating movements often no imagery may be detected. In consequence the theory developed that imagery was not essential to thinking and therefore that consciousness, if it existed, might have no existence or be very different from what it had been assumed to be. The "New Realists" (q.v.) also reached the conclusion from more abstract considerations that there could be no distinction between the objective reality and the mental state and prefer to call the common experience objective rather than subjective. Both tendencies prepared the way for behaviorism.

Behaviorism as a purely negative doctrine requires little space for the statement of its theses. As a method of investigation it makes positive contributions as has been seen, but as a system of metaphysics it asserts merely that consciousness does not exist, that one can become aware of man only from a point of view and that it is useless to speculate what goes on inside because there is nothing there. The highest mental operations can be distinguished from the lowest reflex activities only by the complexity of the actions that result, the time that is necessary and the character of the response, and by the greater number of stimuli that co-operate in determining the former. As a method behaviorism abandons all attempt to make use of introspection, or to take any account of what the observer may note of the circumstances that may precede or accompany his action. It replaces these by more careful observation of the slightest movements. Thought is to be examined, not by studying what the individual says but by interpreting the slight unconscious movements of the human larynx. As a metaphysics behaviorism is but another attempt at a complete materialism, a system that has always fascinated certain types of mechanically minded individuals. It differs from materialism largely in that the explanations of the movements are reduced to reflexes and to instinct rather than immediately to chemical and mechanical forces.

The behaviorists are not altogether satisfied to eliminate consciousness and leave nothing in its stead to account for internal awareness, as admitted, perhaps unwittingly, in the attempts to identify the sensory excitations from the various muscles of the body with a subjective appreciation of the activities that may be observed from without. The more cognitive processes are in some of the objectivity is obtained from the back stroke from the voluntary muscles, the feelings and emotions to excitations from the visceral and other vital organs. Watson identifies thinking with movements of the larynx, pleasure and pain with various contractions and relaxations of the same and others with any immediate value in the world of behavior, they must have value only for subjective awareness. Whether consciousness is to be replaced by kinesthetic processes, a familiar position, or whether it is merely an inconsistency that has been inadvertently admitted to the system cannot at present be determined.

Any judgment that may be passed upon the value of the system must take into consideration the incomplete development of the formulations. At present it is still little more than a program. There is much more of prophecy than of statement of results. Behaviorism as a method of psychological investigation offers much of promise. That many of the capacities and accomplishments of the individual can be determined objectively is obvious from the ordinary laboratory procedure and an extension of the method is always welcome. It is also true that many explanations of the phenomena ordinarily called mental can be derived quite as well from the related physiological and neurological processes as from the observation of consciousness. How far this can be extended is always a question that can be answered only by the outcome of the attempts. Statements of results can also be given in terms of behavior, but whether the present inconsistencies can best be eliminated by giving over the notion of consciousness altogether is not so clear.

Several obvious objections to the statement that consciousness has no existence in any form at once present themselves. First and most apparent is the conviction of many competent observers that they are actually conscious and that this consciousness takes the form of images. That the behaviorists also feel the necessity of recognizing some object of the kind is evident from the attempt mentioned above to give an internal awareness by means of sensory impulses from muscles and glands. A second objection is that so far they have made no attempt to explain how the observer interprets the movements that constitute the behavior of another. Some attempt should be made to account for the way in which behaviorists appreciate the phenomena in question as well as to explain the phenomena themselves. It might be objected, too, that the activities of man are fully explained in terms of physiological processes, i.e., ultimately in chemical and physical terms. In that case behaviorism becomes but a branch of physiology. In fact Bechterew has developed this point of view in what he calls "the doctrine that reduces human activities exclusively to reflexes of various complexities and orders. Behaviorism must steer a narrow course between physiology on the one side and some sort of psychology on the other, if it is to retain an independent position."
While behaviorism as a final metaphysic is at present but a suggestion with many inconsistencies involved in it, it does offer many advantages as a point and approach of psychological problems and as a means of defining psychology as a science without presupposing controverted positions. This definition need not exclude the use of introspection, or compel one to make use of elaborate roundabout methods of determining simple facts. Thus it is certainly much simpler to study reasoning by means of speech than by slight movements of tongue or larynx. The results are much more certain and easier to interpret. Why speech should not be admitted to be a form of behavior or writing used in place of the labyrinograph is not apparent from logical considerations. Stripped of these unessentials, behaviorism is of value as a method and as a slightly different point of view for the interpretation of the relation of mental and physical.

W. B. PILLSBURY,
Professor of Psychology, University of Michigan.

BEHEMOTH, the name of an animal described in Job xi, 15, to the end. It is evidently an herbivorous animal; but commentators and naturalists are not agreed as to the particular species. Bochart, Gesenius and the generality of English commentators think the description most applicable to the hippopotamus; others think it was the elephant. Nor would it militate much against this interpretation that the elephant is not a native of the country in which the poet of the poem is laid. The author of the book of Job, whether Moses or not, may have been familiar with life in Egypt and Arabia, and if so, would naturally introduce scenery and adjuncts Egyptian or Arabian, or both combined; and that the elephant was well known in Egypt is proved not only by the use of ivory in the arts, specimens of which are preserved in abundance, but also by the representation of the animal itself on early Egyptian monuments.

BEHISTUN, bā-his-toon', a mountain near a village of the same name, not far from Kermanshah, in Persian Kurdistan, celebrated for the sculptures and cuneiform inscriptions cut upon one of its rocky sides, which rises almost perpendicularly to the height of 1,700 feet. These works are about 300 feet from the ground, and were executed by the orders of Darius I, King of Persia. The inscriptions set forth his genealogy, enumerate his 19 victories obtained against the rebels in different provinces of his empire, and proclaim the final pacification of the latter and his gratitude to God.

The sculptures consist of a large tablet, on which are represented a king with his foot upon a prostrate man, two long-spearied warriors behind the captive, and captives chained together by the neck before him, and above the whole a mythological figure. The inscriptions are executed with great neatness, and the whole monument is very well preserved, the rock, which had been carefully polished, having been coated with a thick film of lime and mud. The mountain, indeed, than the limestone beneath. The mountain was well known in ancient times, being mentioned by Diodorus under the name of Bagis-tanon. The same writer states also that an inscription and figures were engraved upon the rock by the orders of Semiramis, but these, if they ever existed, have now disappeared. Rawlinson was the first to copy and decipher the Behistun inscriptions.

BEHM, bīm, Ernst, German geographer and statistician: b. Gotha, 4 Jan. 1830; d. there, 15 March 1894. In 1856 he became Dr. Petermann's chief assistant in editing the famous geographical periodical Mitteilungen, to the editorship of which he succeeded on his chief's death in 1878. In 1866 he founded the Geographisches Jahrbuch. In 1872 he began, in conjunction with H. Wagner, the refereed publication of the Earth, intended as a statistical supplement to the Mitteilungen; and from 1876 he undertook the statistical department of the 'Almanach de Gotha.' His more extended writings of this nature are marked by fullness, accuracy and marked lucidity of arrangement.

BEHN, bān, Aphra, or Aphra, an English novelist and dramatist: b. Wye, Kent, 1640; d. London, 16 April 1689. She was the daughter of John Johnson, a barber; went to Surinam, then an English possession, when she was very young, and remained there some years, during which time she became acquainted with the native prince, Oroonoko, whom she made the subject of a novel, subsequently dramatized by Thomas Southerne. On her return she married Mr. Behn, a London merchant, but was probably a widow when selected by Charles II to acquire intelligence on the Continent, which he desired to bring to England. She took up her residence at Antwerp, and it is said that, by means of one of her admirers, she obtained notice of the intention of the Dutch to sail up the Thames, and transmitted the news to England. This intelligence being discredited, she returned to England, and devoted herself to intrigue and writing for support. She published three volumes of poems, by Rochester, Etheredge, Crisp and others, with some poetry of her own; and wrote 17 plays, the heartless licentiousness of which was disgraceful both to her sex and to the age which tolerated the performance of them. She was also the author of a couple of volumes of novels, and of the celebrated love-letters between a nobleman and his sister-in-law (Lord Gray and Lady Henrietta Berkeley). Pope, in his 'Character of Women,' alludes to Mrs. Behn, under the poetical name of ASTREA:

The stage how loosely does Astrea tread,
Who falsely puts her character to bed.

She was buried in the cloisters of Westminster Abbey. An edition of her works was published in London (1792). Consult Anglia for Jan. 1902.
BEHRENS, bar'ens, Bertha, popular German novelist, who has written over the signature, W. Himmag: b. Thale 1850; d. 1912. She completed ‘Das Eulenhau,’ a posthumous novel by E. Marliett, whose successor as co-author to Die Gartenlaube she became, and among her own novels may be named ‘Aus dem Leben meiner alten Freunde’ (1878; 12th ed., 1908); ‘Lumpenmillers Lieschen’ (1879); ‘Ihr einziger Bruder’ (1882; 15th ed., 1909); ‘Waldblumen’ (1882; 6th ed., 1894); ‘Dauselig! (1883); ‘Dach und Heimat’ (1884); ‘Un fremde Schuld’ (1895); ‘Antons Erben’ (1898); ‘Sette Oldenroths Liebe’ (1902); ‘Gesammelte Romane und Novellen’ (10 vols., 1894–97); ‘Dr. Danz und seine Frau’ (1903); ‘Wie auch wir vergeben’ (1907); ‘Zuobersten Wege’ (1908); ‘Der Stärkere’ (1909); ‘Familie Lorenz’ (1910).

BEHRING, ba'rîng, Emil Adolf, German physician: b. Handsdorf 1854. He received his education in medical science at Berlin; became an army surgeon in 1880, and was appointed to the chair of medicine at Halle in 1894. In the following year he received the appointment of director of the Hygienic Institute, Marburg. Behring became known internationally through his discovery of a diphtheria antitoxin. He also made great progress in the study of immunity in tuberculosis and a new diphtheria serum was brought out by him in 1913. He has published ‘Die Blutserumtherapie’ (1892); ‘Bekämpfung der Infektionskrankheiten’ (1894); ‘Beiträge zur experimentellen Therapie’ (1900). In 1901 he received the Nobel prize in medicine for his discovery of diphtheria serum.

BEHRENS, ba'rîng or ba'ring, Vitus. See BEING.

BEIGE, a light woolen fabric, made of wool of the natural color; that is, neither dyed nor bleached.

BEIJEREN, be'êr-en, Abraham van, Dutch painter: b. The Hague 1620 or 1621; d. 1674. He studied first in his native city, later at Delft. In spite of the fact that he was one of the foremost genre painters of his time, most of his life was spent in abject poverty. His paintings are almost exclusively still life, his favorite subjects being fish and fruit. His canvases are found in great number in many of the principal European galleries, but he is especially well represented in Dresden, Vienna, Berlin, Stockholm, Petrograd and Lille.

BEIJERLAND, be'êr-lant, Holland, a fertile island in the Netherlands province of South Holland, at the mouth of the Maas or Meuse, five miles south of Rotterdam. It is 15½ miles long and 8½ miles wide. It produces great quantities of flax. Pop. 13,300.

BEILAN, ba-lan', Syria, town on the Gulf of Iscanderoon, near the Beilan Pass, not far from Alexandretta. The town is 1,584 feet above the Mediterranean and is a summer resort for the foreign colony of Alexandretta. The pass has more than once been of military importance, and in 1832 was the scene of a battle between Turks and Egyptians. It is supposed to be the Pylae Syriae of the ancients and to have been held by Alexius and the Crusaders in their marches to the East.

BEILSTEIN, bil'stin, Friedrich Konrad, Russian chemist: b. Saint Petersburg 1838; d. 1905. He acquired his knowledge of chemistry at Heidelberg, Göttingen, Munich and Paris; in 1863 he was made assistant to the celebrated Wöhler at Göttingen and six years later was appointed to the chair of chemistry at the Saint Petersberg Institute of Technology. He made extensive original investigations in analytical and organic chemistry. His published works include ‘Anleitung zur qualitativen chemischen Analyse’ (Leipzig 1827); ‘Die Grossindustrie auf der Weltausstellung in Wien 1873’ (1873); ‘Handbuch der organischen Chemie’ (1883), a standard work of which five supplementary volumes were issued by the German Chemical Society (1901–06).

BEIRA, ba'ra', Portugal, a province bounded by the river Douro on the north, by Spain on the east, and by the Tagus and Portuguese Estremadura on the south and by the Atlantic on the west. It was formerly divided into Beira Alta (Upper Beira) and Beira Baixa (Lower Beira). Its extent is 2,228 square miles, and it contained, at the last census of the pop. (1911) 1,626,484. The capital is Coimbra. It is traversed by the Serra d’Estrela, and well watered by the Douro, Tagus, etc. With the exception of the coastal strip the soil is rocky. Chestnuts, grain, hemp, and the principal products of the soil, while coal, iron, marble and salt are mined. Manufactures are at a low ebb, thread-making being about the sole industry at all developed. Commerce is slight, a condition due in great part to inadequate transportation facilities. For purposes of administration the province is subdivided into the districts of Aveiro, Viseu, Coimbra, Guarda and Castello Branco.

BEIRA, Portuguese East Africa, seaport on the coast, at the mouth of the Pungwe River, about 35 miles north of Sofala. It is the nearest port to the gold fields of Mashonaland, and a railway through Fontesville, Chimoio, Massikesse and New Umtali to Salisbury was completed in 1899. Beira has a good harbor. A breakwater guards the town from the encroachments of the river. The principal articles of export are sugar, sugar, tropical fruits, mining products and wax, while cotton manufactures, iron and liquors are among the chief imports. The port was established in 1891, is visited by about 500 vessels annually, and has a total tonnage of 1,000,000 tons. Before the war the annual exports amounted to $2,750,000 and the imports to about $3,000,000. Pop. 3,450, of which 750 are whites.

BEIRAM, ba'râm. See BAIAM.

BEIRUT, or BEYROUT, be'rut', or ba'root' (ancient BEYTYUS), Syria, a flourishing seaport, 60 miles northwest of Damascus. It stands on a tongue of land projecting into an open bay, and spreading out toward the land into a beautiful plain, backed by the mountains of Lebanon. It consists of the old town, composed generally of narrow, dirty streets, the residence of the poorer classes, and the business place of the merchants; and of the new town, which stretches around it. The latter, with its modern houses, carriage roads and gardens,—its churches, colleges, schools and hotels,—has little or nothing of the Oriental in its composition. Beirut has rapidly increased
since 1844 when its population was only 8,000, its rise being largely due to the extension of the silk trade, of which it is the centre. The better protection afforded both to foreigners and natives by its being the residence of the consul in general has also contributed to its prosperity. It is the seat of a consulate of the United States. Besides silk its principal exports are olive oil, cereals, sesame seed, tobacco and wool. Shipbuilding is carried on here; an English company commissioned here in 1875 and great works were built by a French company in 1886. Besides a Scottish mission for Jews, there is an American-Syrian mission in Beirut, printing annually thousands of Arabic Bibles and having a school and hospital connected with it. In ancient times Beirut was a large and important Phoenician city, and under the Romans was long celebrated for its school of jurisprudence. The Byzantine Emperor Theodosius II raised it to the rank of a metropolis. It was destroyed by an earthquake in 551. The Arabs took possession of it in 635, and yielded it to Baldwin I, King of Jerusalem, in 1110. Saladin recaptured it from the Christians in 1187 but it soon fell into the hands of the Druses, who maintained their control of it until the last century. It was bombarded and taken by the British on 29 Aug. 1840. There is a railway to Damascus, Aleppo and Tripoli. A pasha, a Greek bishop, a Maronite archbishop and a papal delegate are stationed here. The population, about 120,000, is composed of 36,000 Mohammedans, 76,000 Christians, 2,500 Jews, 400 Druses and about 4,300 Europeans.

BEISA. b'i'sa, a large Abyssinian antelope (Oryx beisa), differing from the gemsbok principally in lacking the tuft of hair on the throat and by the black patch on the front of the face being completely separated from the cheek stripe. This is probably the animal called oryx by the ancients, and may be the animal from which is derived the legend of the unicorn. Its straight horns (about 30 inches long) when seen in profile might easily appear as one. Herds of oryx are still numerous upon the plains of Somaliland. See also GEMSBOK; ORYX.

BEISSEL, b'i'sel, Johann Conrad, German mystic: b. Eberbach 1600; d. Ephrata, Pa., 1678. He learned the trade of a baker, also studied music and was a successful violinist. Later he studied theology at Halie, but having been banished in 1720 for his Pietistic opinions, he emigrated to Pennsylvania, settling first at Germantown and later in Lancaster County. In 1724 he returned to Germantown and adopted the Dunker faith, but his views as to celibacy and his observance of Saturday as the Sabbath were unacceptable to his neighbors, and he therefore established a sect of Seventh Day Dunkers. He attempted a hermit life, but his fellow believers gathered about him and in 1735 he founded the famous Settlement of Ephrata, Pa. (q.v.), and remained at its head till his death. At the settlement he practised many of his socialistic and religious theories. He was the author of the earliest volume of German poetry published in America, 'Göttliche Liebes- and Liebestöne' (1730), and published several collections of hymns as 'Der Lonely and Forsaken Turtle Dove—that is, of the Christian Church;' by a Peaceable Pilgrim traveling to Tranquil Eternity' (1747), and 'Paradisical Wonder-play' (1766). In the latter are found the 'Brother Song' of the sect with its 213 stanzas, and the 'Sister Song' with 214 stanzas. He was known at Ephrata as Friedsam, and on his tomb may be read the inscription: 'Here rests an outgrowth of the love of God, Friedsam,' a solitary Brother, afterward a leader, ruler, teacher of the Solitary and the Congregation of Christ in and around Ephrata. For an account of his sect consult 'Chronicon Ephratense' (Ephrata 1786); Sachse, 'German Sectarians of Pennsylvania' (1899-1900).

BEIT EL-PAKH, bät-el-'pāke, Arabia, a town in Yemen, 32 miles south-southeast of Hodeidah, 77 northeast of Mocha and about 20 miles from the Red Sea. It is celebrated for its trade in Mocha coffee, which is chiefly grown in the neighborhood, and of which about 12,000,000 pounds are exported annually. Pop. about 8,000. The word Beit, signifying a house or hut, is prefixed to the name of various other small towns and villages in Arabia.

BEITALLAH, bät-al-'lā, (Ar., 'God's House'), the name of the building in Mecca within whose enclosure the Cabba (q.v.) is located. It is also known as 'the holy house' and 'the old house.'

BEITZEKE, bits'kē, Heinrich Ludwig, German historian: b. Münster, 15 Feb. 1806; d. 10 May 1867. His publications include 'History of the German War for Freedom' (1855); 'History of the Russian War—Year of 1812' (1856); 'History of the Year 1815' (1865), etc.

BEJA, bë'ža (anciently Pax Julia), Portugal, town in the province of Alentejo, 8 miles southeast of Lisbon. It stands on a height, surrounded by walls flanked with 40 towers, and is defended by an old fort. It was founded by the Romans, and some Roman remains are still visible. It contains an interesting medieval castle, a cathedral, the notable church of Our Lady of the Assumption and the Roman aqueduct. Two fairs are held here annually. The city has a considerable trade in the cattle and agricultural products of the fertile region adjacent, and there are also tanneries, potteries and olive refineries. Pop. 9,000.

BEJAPUR, bë-jä-pōr' (anciently Vijaya-pura, the impregnable city), Hindustan, a town in the Bombay presidency, near the borders of the Nizam's dominions, about 245 miles southeast of Bombay and near the right bank of an affluent of the Krishna. For many centuries it was the capital of a rich and powerful kingdom, coming under the sway of Hindu and Mussulman alternately. Aurungzebe captured it in 1666 and in the 18th century the Marathas seized it. In 1818 the British gave it to the Rajah of Satara. From the great extent of the ruins here it would seem to have been formerly one of the largest cities of India. In its present state it may be described as two towns adjoining each other—the fort on the east and the old town on the west. The former, though much less than the latter, has one entire and regular street 50 feet wide and nearly three miles long of a mosque. The ancient edifices of Bejapur are elaborately elegant; the prevailing character is solid and massive.
BEJAR—BEL AND THE DRAGON

The great dome of Mahomet Shah's tomb is visible far off. The fretwork on the ceilings and verandahs, the panels covered with patterns of bas-relief, and the stone trellises pierced with a mesh-work of Arabic characters, are all in the richest style of Oriental sculpture. Among the religious structures is a Hindu temple, built in the earliest style of Brahmanical architecture. There are here some guns of enormous size; one cast in 1549 is the largest piece of brass ordnance extant. Bejapur has become the chief town of Kaladgi district, and some of the old palaces are now used for public purposes. Pop. (1911) 27,615. Consult Ferguson, 'Ancient Architecture in Hindustan' (1847); Ferguson, 'The Study of Indian Architecture' (1867).

BEJAR, bê'dar, Spain, town in the province of Salamanca, 41 miles south of the town of that name, on the Cuerdo de Hombre River, on a plateau, 5,150 feet above sea-level. It is an important industrial centre and manufactures cotton and woolen cloths, yarn, thread, ribbons, soap and bread. There is also a large trade in the products of the region, consisting of chestnuts, grain, vegetables and wine. Bejar is the seat of the Duke of Bejar, whose palace is located here. The town also contains three churches of architectural note. Lord Hill defeated a French force here in 1813. In its vicinity are warm sulphur springs. Pop. 9,209.

BEKE, bek, Charles Tilston, English traveler: b. Steeple, Middlesex, 10 Oct., 1680; d. Bromley, Kent, 31 July 1764. In his 20th year he entered on a business career and was thus led to visit Italy. On his return he studied law at Lincoln's Inn and in 1734 he followed up several archaeological articles in periodicals by publishing 'Origines Biblical, or Researches in Primeval History.' In 1740 he set out on his first journey to Abyssinia, in which he not only rendered important services to discovery but collected vocabularies of the native dialects. Returning in 1843 he was awarded the gold medals of the Royal Geographical societies of London and Paris, and again engaged in business. He subsequently made several efforts to open up commercial intercourse with Abyssinia, and traveled in Syria, Palestine and Egypt. When the news of the detention of several British subjects by the King of Abyssinia arrived in 1804, Beke went out to secure their release, and was temporarily successful but ultimately King Theodore had to be coerced by war. In the direction of the military operations Beke's knowledge of the country proved of the utmost value. In 1870 he was awarded a civil list pension of $500 per annum. In 1872 he set out in order to explore the country traversed by the Israelites, and to locate Mount Sinai. His published works comprise 'The Sources of the Nile' (1860); 'The British Captives in Abyssinia' (1865); 'King Theodore and Mr. Rassam' (1869); 'The Idol in Horeh' (1871); 'Jesus the Messiah' (1872); 'Discoveries in Sinai in Arabia, and of Midian' (1878).

BEKES, bê'kash, or BEKES-CASABA, 'chô'bé, Hungary, market town and capital of the county of the same name, at the junction of the Black and White Rivers, 41 miles southwest of Budapest, formerly strongly fortified. There is considerable trade in flax, cattle, wheat, wine and honey. Linen and hemp fabrics are among the chief manufactures. With the exception of Budapest Bekes has the largest Jewish community in Hungary. Of its 42,599 souls, the majority profess the Lutheran faith.

BEKKER, bek'ker, Elizabeth, Dutch novelist: b. Vlissingen, 24 July 1738; d. The Hague, 5 Nov. 1804. She married Adriaan Wolff, a Reformed Church minister at Beemster, who died in 1777, and she lived afterward in closest friendship with Agathe Dama. She collaborated in her most important works, 'History of Sara Burgerhart' (1782); 'History of William Leeved' (1784–85); 'Letters of Abraham Blankaart' (1787–89); 'Cornelia Wildschut' (1793–96).

BEKKER, Immanuel, German scholar, distinguished by his recensions of the texts of Greek classics: b. Berlin, 21 May 1753; d. there, 7 June 1817. He studied in Halle, and, in 1811, became professor of philology in his native city. The results of his researches in the libraries of France, Italy, England and Germany appear in his numerous recensions of texts solely from manuscripts, and independently of printed editions. The writers included in these recensions are Plato, the Attic orators, Aristotle, Thucydides, Theophrasists, Aristophanes, Sextus Empiricus, as well as Livy and Tacitus. He was also a collaborator of 'Corpus Inscriptionum Graecarum,' and edited 25 volumes of the 'Corpus Scriptorum Byzantinorum.' He is the author of 'Anaedona Graeca' (3 vols., 1814–21) and 'Studies in Old French,' and consul of Sandys, 'A History of Classical Scholarship' (Vol. III, 1908).

BEL, bêl, one of the most important gods of the Babylonian mythology and the Phoenician counterpart of Baal; mentioned in Scripture, in Is. xiv. 1; Jer. 1, 2; li. 44; in the Septuagint, in Baruch vi. 46; and in the apocryphal additions to the book of Daniel, as well as by classical authors. See BAAL.

BEL AND THE DRAGON, certain apocryphal chapters added to the canonical Book of Daniel. The Jews do not consider them part of their Scriptures. They were penned probably by an Alexandrian Jew, the language used being not Hebrew or Aramaic, but Greek. The story of Bel and the Dragon consists of two legends recounting (1) how Daniel enlightened Cyrus, represented as having been a devout worshipper of Bel, by proving that the immense supplies of food laid before the idol were really consumed, not by it or by the inhabiting divinity, but by the priests and their families. (2) On Cyrus urging that the dragon, also worshipped, was at least a living god, Daniel poisoned it, for which he was thrown into a lion's den, where the Prophet Habakkuk fed him. Ultimately he was released, and his persecutors put to death. The above narrative must not be confounded with one called also 'Bel and the Dragon,' translated by Fox Talbot from the cuneiform tablets. It believes that the dragon, seven-headed, like the one in Revelation, would, if the tablets were complete, prove the same being that seduced some of the heavenly 'gods,' or angels, from their allegiance (Revel. viii. 9). It weakens the case which he was slain by Bel. The resemblance is not to the apocryphal book now under consid-
eration, but to the combat between Michael and the Dragon in Rev. xii., 7-17.

BELA, bél'a, the name of four Hungarian kings of the Arpad dynasty. BELA I, son of Ladislaw, competed for the crown with his brother Andrew, whom he ultimately defeated, and mounted the throne in 1061. He established a coinage and weights and measures. BELA II, surmised the Blind, because his eyes had been put out in early life by his uncle, succeeded to the throne in 1131, and at first seemed inclined to act with moderation and justice, but the vindictive spirit of his Queen involved him in quarrels with his nobles, and his own intemperate habits brought on a disease which terminated his life in 1141. BELA III, grandson of Bela II, succeeded, in 1173, and held the reins of government with a strong hand, vigorously correcting the abuses and putting down the turbulent spirit which the troubles of previous reigns had engendered. He also repelled incursions of Bohemians, Poles and Austrians, and retaking the towns of which the Venetians had possessed themselves, compelled them to accept of peace in 1189. He died in 1196, and was succeeded by Emeric, one of two sons by his Queen, a sister of Philip Augustus, king of France. BELA IV succeeded his father, Andrew II, in 1235, and was shortly after obliged to collect an army to oppose the Tartars, who had invaded the country. In the battle which ensued he was signally defeated, and obliged to take refuge in Austria, where he was detained prisoner, and only recovered his liberty by the payment of a large ransom. The Tartars having retired in 1242, Bela regained his throne, and made it his object to repair the results of their invasion. He subsequently established his rule over Bosnia and northern Serbia, and died in 1270.

BELAND, Henri Séverin, Canadian physician and statesman: b. Louisville, province of Quebec, 11 Oct. 1869. He graduated B.A. at Three Rivers, and took his medical course at Laval-University (M.D. 1893), afterward practicing his profession at New Bedford, Mass. He was returned to the Quebec legislature in 1897 for the county of Beauce, and since 1901 has represented that constituency in the House of Commons in the Liberal interest. In 1909 he was appointed a member of the commission of conservation, and in 1911 was Postmaster-General in the Laurier administration, until the defeat of that administration in the same year. He was in Belgium when the Great War broke out in 1914, joined the Belgian Hospital Corps, served at Liege and the siege of Antwerp, was wounded by shell fire and taken prisoner by the Germans, and held by them as a prisoner of war.

BELARIUS, a character of prominence in Shakespeare's 'Cymbeline.' Exiled 'by King Cymbeline, he carries away with him the two sons of the monarch and rears them as his own.

BELASCO, David, American dramatist: b. San Francisco, Cal., 25 July 1859. He graduated at Lincoln College in 1875. In 1874 he made his stage début at the Metropolitan, San Francisco, and for a time was stage manager of the house and of Baldwin's Grand Opera. His success in adapting plays to the local needs of his community led him to devote himself exclusively to the latter work. In 1880 he produced 'Hearts of Oak' and toured the country in it with James A. Herne. He became stage manager of the Madison Square Theatre, New York, and later was connected with the Lyceum Theatre. He is now owner and manager of the Belasco Theatre, New York. Of late years he has devoted himself to the betterment of the mechanical details of the stage. Among Mr. Belasco's greatest successes have been 'The Wife' (1887) and 'The Charity Ball' (1889), written jointly with H. C. de Mille; 'Lord Chumley,' with E. H. Sothern in the title rôle (1888); 'The Girl I Left Behind Me,' jointly with F. Fyles (1893); 'The Heart of Maryland,' with Mrs. Leslie Carter in the principal rôle (1895); 'Naughty Anthony' (1899). Among his other plays are 'Zaza' (1895); 'May Blossom' (1894); 'Men and Women' (1890); 'La Belle Russe' (1882); 'Valérie' (1886); 'Du Barry' (1901); 'The Darling of the Gods' (1902); 'Sweet Kittle Bellairs' (1903); 'Adrea' (1904); 'The Music Master' (1904); 'The Rose of the Rancho' (1905); 'The Girl of the Golden West' (1905); 'A Grand Army Man' (1907); 'The Warrens of Virginia' (1908); 'The Fighting Hope' (1908); 'The Easiest Way' (1909); 'The Lily' (1909); 'Is Matrimony a Failure?' (1909); 'The Concert' (1910); 'The Widow' (1910); 'The Woman' (1911); 'The Return of Peter Grimm' (1911); 'The Case of Becky' (1911); 'Years of Discretion' (1912); 'A Good Little Devil' (1912); 'The Secret' (1913); 'The Phantom Rival' (1914); 'Marc Odile' (1915); 'The Boomerang' (1915).

BELBEIS, bél-bás', Egypt, town 20 miles north-northeast of Cairo, near the railway to Suez and on the border of the desert, formerly of some importance as being on the route to the East. The ruins of the ancient Busiris are in its neighborhood. Pop. about 10,000.

BELCH, Sir Toby, a roistering character in Shakespeare's comedy, 'Twelfth Night.'

BELCHER, Sir Edward, English admiral and hydrographer: b. Halifax, N. S., 1799; d. 18 March 1877. Having taken part as midshipman in the defense of Gaeta and the battle of Algiers, he was in 1819 appointed to the 'Myrmidon' sloop, destined for the Arctic coast. In 1825 he became assistant surveyor to the Bering Strait discovery expedition under Captain Beechey. In 1829 he was promoted to the rank of commander, and served on the coast of Africa, and of Portugal, rendering on the latter occasion valuable services to the British residents by protecting their property during the political troubles in Portugal. Subsequently he was engaged for a number of years in a voyage around the world in the surveying vessel, 'Sailor.' In 1841 he explored the inlets of the Canton River, and materially assisted in securing the triumph of the British army. In acknowledgment of these services, he was knighted. Afterward he was employed on board of the 'Samarang,' on surveying service in the East Indies, and was severely wounded while assisting the Rajah of Sarawak, Sir James Brooke, to subdue the pirates of Borneo. From 1852 to 1854 he commanded the expedition in search of Sir Charles H. Dallas, and on the latter's recall to England, he was tried before a court-martial for voluntarily abandoning the ships. The case against him, however, was not legally supported.
he was acquitted, and his sword returned to him, but while some of the other officers were commended, his name was passed over in significant silence. In 1872 he became rear-admiral. He published 'The Last of the Arctic Voyages' (1855); 'Narrative of a Voyage to the

BELCHER, Jonathan, colonial governor of Massachusetts: b. Cambridge, Mass., 8 Jan. 1681; d. Elizabethtown, N. J., 31 Aug. 1757. He was graduated at Harvard, in 1699, and spent six years in Europe before returning to Boston, as a merchant. From 1730 to 1741 he was governor of Massachusetts and New Hampshire, a dispute over his salary causing his removal. In 1747 he was made governor of New Jersey and gave it a successful administration. He enlarged the charter of the College of New Jersey (Princeton) and gave that institution, among other benefactions, his own valuable library. 'The Belcher Papers' were issued by the Massachusetts Historical Society, 1897.

BELCHITE, bel-šé-té, Spain, town 22 miles south-southeast of Saragossa, on the Aguas, a tributary of the Ebro, noted as the scene of a victory gained 18 June 1809, by the French, under Suchet, over the Spanish forces under Blake. Belchite has some manufactories of woolens. Pop. 3,333.

BELCIKOWSKI, běl-tšév'-šké, Adam, Polish writer: b. Cracow 1839; d. 1909. Graduating from Cracow University in 1865, he was, in the following year, appointed instructor in Polish literature at the University of Warsaw. Three years later he was appointed to the same position at Cracow, where he became a member of the Cracow Academy in 1870. His writings are chiefly dramatic and critical. Among his historical dramas are 'Adam Tarlo' (1869); 'Dwunasto' (1870); 'Dwaj Radziwillowie' (1871); 'Franceska da Rimini' (1873); 'Kmita i Bondarowna' (1875); 'Krol Wladyslaw Warneckz' (1877). His collected essays appeared in Warsaw (1886) with a biographical introduction by Chmielowski.

BELCOURT, bé'l-soor', Napoleon Antoine, Canadian lawyer and statesman: b. Toronto, 15 Sept. 1810. He was educated at Three Rivers and Laval University, Montreal (master of laws, 1882). He was called to the Quebec bar, 1882, and to that of Ontario 1884. He represented the city of Ottawa in the House of Commons, 1896-1907, and was speaker from 1904 to 1907, when he was nominated to the Senate. A representative French-Canadian, he has written much on social and educational subjects; took a leading part in the bi-lingual controversy, and pleaded the case of French schools of Ontario in the appeal before the judicial committee of the imperial privy council in 1915.

BELDING, Mich., city in Ionia County, on the Pere Marquette Railroad, 25 miles northeast of Grand Rapids and 139 miles northwest from Detroit. It has silk mills, basket and furniture factories, machine shops, paper box factories and other industries. The first silk mill in the West was erected here. Pop. 5,000.

BELEM, or BELEM DO PARA, the official name of the capital of the Brazilian state of Pará (q.v.).

BELMENITES, a name for straight, solid, tapering, dart-shaped fossils, popularly known as arrow-heads, thunder-bolts, finger-stones, etc., but in reality the internal shell or skeleton of a molluscan animal allied to the squid or sepia, and the type of an extinct family, Belmenitidae. The name was first applied by Agricol in 1546. The fossil remains of the animal (of which 350 species are known) are met with in rocks ranging from the lower Liassic to the uppermost cretaceous, and are most abundant in Europe, Asia and North America. They vary from one to 15 inches in size; and are particularly abundant in the strata of the green sand formation in New Jersey. The part preserved, often detached from the loose strata, is a pointed cone of brown color and stony material, resembling in shape the head of a dart or javelin, whence their name. Belmenites are one of the earliest known fossils.

BELERIUM, or BOLERIUM, the ancient appellation of LAND'S END in Cornwall, England, but the origin of the name is uncertain.

BELFAST, Ireland, the chief commercial and manufacturing city of the island, a parliamentary borough and the capital of the province of Ulster, on the river Lagan at the head of Belfast Lough, about 113 miles by rail north of Dublin. It is the terminal station of the Great Northern and the Belfast and County Down railways, the latter, 80 miles of track, connecting with chief points on the seacoast. The greater part of it is built on low alluvial land on the banks of the Lagan, not more than six feet above high-water mark. The country around is extremely beautiful; the position of the town renders its appearance from a distance by no means imposing, but the Lough itself presents a fine scene; and the slopes of the hills that bound it and partly encircle the town are thickly studded with the villages and country houses of the merchants.

Streets and Bridges.—Many old squallid districts have been destroyed to make way for spacious, regular and well-lighted streets, the finest of which is Royal avenue, where numerous public buildings are situated. An excellent electric tramway service and electric light have been introduced and the sewage system has been improved. There are many handsome houses, but architecturally the city has scarcely kept pace with its commercial prosperity. Four bridges cross the river, one of which, the Queen's Bridge, is an elegant structure of five arches, each of 50 feet span.

Churches, Public and Commercial Buildings, etc.—Many of the churches are handsome buildings. Saint Anne's Cathedral on the site of the oldest Episcopal (Church of Ireland) church had the foundation stone laid in 1699, and was opened for service in 1704; to this church fine specimen of Gothic, and Saint George's, adorned with a beautiful portico, are also deserving of notice among the Episcopal churches. The Presbyterian churches, which outnumber all others in the city, include two fine buildings on Fitzroy avenue and Elmwood avenue. Saint Patrick's serves as the Roman Catholic cathedral, but is architecturally inferior to Saint Malachy's. The secular buildings include the new city hall, costing $1,800,000; Queen's Uni-
versity; a massive pile in the later Gothic style, with a façade 600 feet in length; the Presbyterian Theological College; the Methodist College, a handsome building erected and endowed in 1837 at a cost of $50,000; the municipal buildings; the county courthouse; the commercial buildings and exchange; the buildings for the customs and inland revenues; the post-office; the offices of the Ulster Bank, the Bank of Ireland, the Provincial Bank, the Belfast Bank, the National Bank, the Scottish American, Scottish Provident and North British and Mercantile Assurance companies; the Grand Opera House; the Theatre Royal; the county jail; the Ulster Hall; the Presbyterian Assembly Hall; the Belfast Museum; the Albert Memorial clock tower, 143 feet high, etc.

Educational Institutions.—Of the educational institutions the most prominent is Queen's University, first opened to students in 1849, and raised to the rank of a university in 1908, with 65 teachers and 350 pupils (1913-14). Candidates for the ministry of the Presbyterian Church of Ireland receive a training in the General Assembly's Theological College, founded in 1853. The Methodist College and the Campbell College (a secondary school) are important institutions; while the New Municipal Technical Institute and the Royal Academy and the Royal Academical Institution also deserve mention. There is a free public library belonging to the city.

Newspapers, Charitable Institutions, Parks.—The chief and oldest newspaper in the Belfast News-Letter, established 1737. The charitable institutions are very numerous and important. In the city there are six extensive public parks, besides the borough cemetery.

Trade, Manufactures, Shipping, Harbor, etc.—Belfast is the centre of the Irish linen trade and manufacture, having within itself the great majority of the spinning-mills and powerloom factories in Ireland, some of them of immense size and of imposing appearance. The spinning of flax and weaving of linen are the staple industries. Linen goods to the value of $68,131,000 were exported from Belfast in 1916. The cotton manufacture, which had decreased considerably, showed a considerable increase, importing 23,086,800 pounds of cotton, as against 19,840,000 pounds in 1908. The total value of the cotton manufacture was $15,500,000. The total value of the cotton manufacture was $15,400,000 per annum, exclusive of what passes through the Inland Revenue Department. Much of the inland trade is carried on by the Lagan Navigation, which connects the town with Lough Neagh; the Ulster Canal, connecting Lough Neagh with Enniskillen; and by systems of railways, namely, the Great Northern, the Belfast and County Down.

History and Administration.—Belfast is comparatively modern. In the 16th century it was merely a fishing village with a fortress. In 1613 it was granted a charter by James I., and about 1637 it obtained the privilege of levying certain duties on goods and became a regular seaport; but its prosperity subsequently was much impeded by the civil war. Early in the 18th century it was described as a handsome, thriving town, but its period of prosperity dates from the introduction of the cotton manufacture in 1777, the establishment of ship-building on a large scale in 1791 and the introduction of machinery in the linen industry in 1830. In 1888 Belfast was raised to the status of a county borough. In 1892 the mayor received the title of lord mayor, and in 1896 the city boundaries were extended, the wards were increased from five to 15, and the municipal corporation was made to consist of 15 aldermen instead of 10, and of 45 councillors instead of 30. In 1899 it became a county borough. Belfast has frequently been the scene of riots between the Protestant and Roman Catholic population, the latter of whom are largely outnumbered. The harbor is under the management of an independent board. The city maintains the elementary schools, working-men's dwellings, libraries, museums and fire department, and owns the gas and electric-light plants, abattoirs and tramways. Belfast returns four members to Parliament. An American consul is resident here. The city is bordered by an area of over 2,000 acres, Pop. (1901) 349,180; (1911) 396,097. Consult Benn, G., 'History of Belfast' (Belfast 1877) ; Fisher, 'Trading Centres of the Empire: Belfast' (London 1901); Young R. M., 'Historical Notices of Old Belfast' (Belfast 1896).
BELFAST, Me., city and county-seat of Waldo County, at the head of Penobscot Bay, and on the Maine C. Railroad, 30 miles from the ocean, and 132 miles northeast of Portland. It has a fine harbor, a large domestic trade and important manufactures—hats, clothing, shoes, shoes, shoe factories, lumber mills and chemical works. The public library contains 5,000 volumes. The city contains also a theatre, opera house and several fine bank buildings. The most notable industry is ship-building, begun here in 1793. Belfast was settled in 1770; incorporated as a town and named from Belfast, Ireland, in 1773; was invaded by the British in 1815, and was given a city charter in 1853. Government is vested in a mayor, elected annually and a city council of two chambers. Consult Williamson, 'History of the City of Belfast' (1877). Pop. 4,618.

BELFORT, bél-fôr, France, fortified town in the department of Haut Rhin, on the Savoureuse, commanding the Tronée de Belfort or pass between the Vosges and Jura Mountains, 47 miles from Strasbourg and 105 from Neufchâtel. It has an ancient castle situated on a lofty rock, a fine parish church, barracks, town house, court of primary resort, public library containing 20,000 volumes and a communal college. Manufactures—hats, clocks, wax tapers, iron wire, sheet iron, etc. There are also breweries, tanneries and iron furnaces. The principal trade is in grain, wine, brandy and liquors. Iron is extensively worked in the neighborhood. Austria ceded Belfort to France in 1648 and it was later fortified by the celebrated Vauban. In 1814 Belfort was besieged by the Allies without success. In the Franco-German War it was invaded by the Germans, 3 Nov. 1870, and, after holding out with great bravery, capitulated, 16 Feb. 1871. In recognition of the bravery which the garrison had shown in its defense, it was allowed to march out with full military honors. This defense is commemorated by the huge 'Lion of Belfort' in front of the citadel, the work of Bartholdi. Belfort is, with the district immediately surrounding it, the only part of the department of Haut Rhin, which remained to France on the cession of Alsace to Germany, 26 Feb. 1871. Previous to the Great War Belfort was deemed impregnable because of its extensive system of fortifications. The fate of the Belgian fortresses in the war has, however, caused a revision of this estimate. Pop. 39,371. Consult Bardy, 'Étude historique sur Belfort' (Belfort 1900).

BELFRY, a bell-tower or bell-turret. The term was employed in mediaeval siege-craft for a movable wooden tower of several stages employed in attack; and also for a watch-tower with an alarm bell. A bell-tower may be attached to another building, or may stand apart; a bell-turret usually rises above the roof of a building, and is often placed above the top of the western gable of a church, the terms bell-cote, bell-gable, being also used. The part of a tower containing a bell or bells is also called a belfry. Strictly speaking, belfry is a civil and not an ecclesiastical term, the Med. Age. belfries, the belfies of the municipal belfry, were employed in calling the citizens to arms or to council, and thus became the symbols of popular freedom. The belfry of Bruges, commenced in 1291, is 353 feet high, and has a celebrated carillon of bells. It was not till the 14th century that clocks were placed in belfries. The detached bell tower is of frequent occurrence on the continent of Europe, and in England the Cathedral of Chester and a few parish churches possess such an adjunct. In the United States such structures are inefrequent, but in the town of Watervliet, N. Y., is a detached belfry or clock-tower with quarter chimes, and Brown University at Providence has a handsome detached clock tower erected within its grounds.

BELGAE, a group of German and Celtic tribes who inhabited the country extending from the Atlantic Ocean to the Rhine, and from the Maas and Seine to the southern mouth of the Rhine, which is united with the Meuse. From time to time until the period of Caesar, German nations pushed forward beyond the Rhine, partly expelling the Celts from their seats, partly uniting with them; and from this union sprang a mixed nation, which, in its language as well as in its manners, resembled the Germans more than the Celts. According to the testimony of Caesar, they were the most valiant of the Gauls. Belgic tribes seem also to have settled in early Britain.

BELGAUM, bél-gam', India, town in the district of Belgaum, Bombay presidency, on the eastern slope of the western Ghats, 2,500 feet above the sea. It consists of a native town, fort and cantonments, and contains the usual courts and offices, two schools for the children of natives of rank and various other schools. In 1818 the fort and town were taken by the British after a gallant resistance by the Peishwa's forces. The place has progressed under British rule and its citizens have not been backward in furthering various public enterprises. In 1848 they subscribed a large sum for the betterment of the means of communication, of which their community has continued to reap the fruits. From the salubrity of the climate and the purity of the water, Belgaum has been selected as a permanent military station. Belgaum manufactures cotton cloth and carries on a trade in salt, dried fish, dates, coin, etc. Pop. 42,623. Area of district 4,656 square miles; pop. 943,820.

BELGIC CONFESSION, a credal statement put forth in French in 1561 by Guido de Bres of Brabant and others, and sent to Philip II of Spain to persuade him to tolerate the Calvinistic faith. In 1562 it was published in the vernacular and subsequently in Dutch and German, and was acknowledged by the synods of Antwerp (1556) and Dort (1619). A translation appears in Schaaff's 'Creeds.'

BELGIOJOSE, bél-jo-ýo'sô, Cristina (Princess of), Italian patriot; b. Milan, 28 June 1808; d. there, 5 July 1871. She took a prominent part in the revolution of 1830 and was exiled by the Austrian government. She lived in Paris for several years and then returned to Italy in 1847, and in the revolution of 1848 offered her whole fortune to the patriot cause and equipped several hundred volunteers at her own expense. Atrocities were committed by the Austrian troops on the occupation of Rome by the French in 1849, but she returned under the amnesty of 1856 and supported the policy of Cavour. She edited periodicals in the interest of Italian liberty and was the author of several books.
among them 'Souvenirs of Exile' (1850); 'History of the House of Savoy' (1860); and 'Reflections on the Actual Condition of Italy' (1869).

BELGIOJOSO, Italy, town in the province and eight miles southeast of Pavia. It is situated in a beautiful and fertile plain between the Pó and the Olona, and is well built, containing a parish and a suburban church. The old castle, in which Francis I was temporarily lodged after being taken prisoner at the battle of Pavia, in 1525, has been converted into a magnificent château, surrounded by fine gardens.

BELGIUM (Flemish, Belgie; French, Belgique; German, Belgien), a kingdom of Europe, bounded north by Holland, northwest by the North Sea, west and south by France, and east by the duchy of Luxembourg, Rhenish Prussia and Dutch Limburg. Its greatest length, northwest to southeast, is 165 miles; greatest breadth, north to south, 120 miles; area, 11,373 square miles. The country is triangular in shape, having its vertex in the west, the base resting on Germany in the east, the shorter side on the North Sea, and the sea and the larger forming the frontier of France. For administrative purposes Belgium is divided into nine provinces—Brabant, Antwerp, East Flanders, West Flanders, Hainaut, Liège, Limburg, Luxembourg and Namur. Differing little in area, these provinces are arranged to form a compact and commodious division of the country. Brussels, the capital, is situated in Brabant, which occupies the centre and may be considered the metropolitan province. The following table gives the areas of the provinces, with their estimated population, 31 Dec. 1912:

The populations of the principal towns in 1912 were:

- Brussels: 663,647
- Antwerp: 527,884
- Liège: 170,634
- Ghent: 167,477
- Malines: 59,735
- Bruges: 63,635
- Verviers: 45,964
- Ostend: 43,002
- Louvain: 42,482

The last census, taken 31 Dec. 1910, placed the population at 7,423,784; the above official estimate reveals an increase of 147,603 in two years. The 1912 figures gave 3,756,872 males; 3,814,505 females. Excluding immigrants, the census (1910) showed that 2,833,334 spoke only French; 3,220,662 only Flemish; 31,415 only German; 871,288 both French and Flemish; 74,993 both French and German; 85,628 both German and Flemish; and 52,547 who were conversant with all three languages. At the same time there were 254,547 foreigners residing in Belgium, distributed as follows: French, 80,765; Dutch, 70,950; Ger-

mans, 57,010; Luxemburgers, 10,367; Russians, 7,491; British, 6,974; Austrians, 5,927; Italians, 4,498; Swiss, 2,335, and 8,238 of other nationalities. Statistics of Belgian emigration show 13,492 in 1900; 14,752 in 1904; in 1908 these figures were more than doubled, namely, 32,294; in 1909 they were 38,190 and in 1912 a total of 35,775. The immigration of foreigners into Belgium, on the other hand, exceeded the emigration of the natives to other countries. The latest available figures are: in 1910, 44,950; in 1911, 41,062; and 42,980 in 1912. The majority of the population is Roman Catholic, but as no inquiries on the subject of religious belief are made in the census enumeration, there are no figures available to show the distribution of creeds. The government impartially subsidizes Roman Catholic, Protestant and Jewish places of worship by contributing to the stipends of ministers. So far back as 1831, when religious tolerance was still an almost unknown quantity in Europe, the Belgian Congress made a declaration of conscience and religious equality fundamental parts of their Constitution. The Belgian population is the densest in Europe and is composed of two distinct races—Flemish, who are of German, and Walloon, who are of French extraction. The former, by far the more numerous, have their principal locality in Flanders; but also prevail throughout Antwerp, Limburg and part of Brabant. The latter are found chiefly in Hainaut, Liège, Namur and part of Luxembourg. The language of each corresponds with their origin—the Flemings speaking a Germanic dialect and the Walloons a dialect, or rather a corruption, of French, with a considerable infusion of words and phrases from Spanish and other languages. This distinct mixture of races, and the repeated changes of masters to which they have been subjected, have necessarily been very unfavorable to the formation of a national character. Still, in some leading features, there is a remarkable uniformity in the population. Though the position of the country between France and Germany has made it the battlefield of Europe, the inhabitants show few warlike tendencies and are unwearied in peace. The fact bears strong testimony to the patient endurance of the Belgian people, but does not, as the European War has shown, preclude the courage or the ability to fight when called on. French is the official language of Belgium and in general use among the educated classes. Of late years, however, patriotic feelings have acquired new strength; and one of its first manifestations has been an eager desire to cultivate the vernacular Flemish, which differs little from Dutch.

The population generally is industrious and apparently in comfortable circumstances. The far larger proportion of it is rural; and though landed property is very much subdivided, the Belgian farmer, 6,974, is not so well off as the English farmer. Agricultural and industrial establishments, to which the country is so well adapted, are not few and not a few of the comforts of life. It is not to be denied, however, that in some of the smaller and less industrial districts, population, in so far at least as it can be maintained by agricultural resources, had reached its limit and that a deficiency of other employment, particularly spinning and hand-loom.
weaving, had placed large numbers on the verge of pauperism.

Physiographic Features.—The surface of Belgium may be described as a rugged, inclined plane, elevated in the southeast and sloping gradually toward north and west till it sinks into low plains only a few feet above the sea-level. In some parts it is even several feet below that level. The coast line is about 42 miles; a frontier of 60 miles faces German territory; 384 miles borders on the northeast of France, and a curve of 80 miles separates Belgium from the grand duchy of Luxembourg. The elevated districts are formed by ramifications of the Ardennes, which, entering Belgium from France, stretch along the south of Namur, occupy the greater part of Luxembourg, and attain their culminating point in the southeast of Liège at Stavelot, near Spa, where the height exceeds 2,000 feet. The rocks appear to rest on primary formations; but those which reach the surface generally consist of slate, old red sandstone and mountain limestone. Printing landscapes. Their speed slackens on dip, these rocks take a cover and the coal formation becomes fully developed. This coal field is a continuation of that of the north of France and stretches through Belgium in a northeastly direction, occupying the greater part of the province of Hainaut and a considerable part of that of Liège, and skirting the provinces of Namur and Luxembourg. It contains numerous workable seams of coal and iron. North and west, beyond the limits of this coal field, are deep beds of clay and sand. In parts, the clay is suitable for the manufacture of fine pottery; in others, for coarser earthenware or bricks.

The main streams of Belgium have a northern direction; and the whole country lies within the basin of the North Sea. In the elevated and broken surface of the southeast numerous torrents descend with rapidity; becoming confined within rocky, precipitous and richly-wooded banks, they often furnish enchanting landscapes. Their speed slackens on reaching the lower country and their augmented volume flows along in a slow, winding course. Only two of them are entitled to the name of rivers—the Meuse and the Scheldt—and their importance is greatly enhanced by numerous tributaries, so that no country in Europe is more lavishly provided with internal water communication. Other navigable streams are the Amblève, Dender, Darme, Dyle, Lys, Great Nethe, Little Nethe, Ourthe, Rupel, Sambre, Waël, and Yser. Though subject to sudden changes, the climate of Belgium is on the whole temperate and agreeable, resembling that of the same latitudes in England. In the higher regions of Namur and Luxembourg the air is keen, pure and healthy; on the low flats which occur in Flanders and over the reclaimed tracts in Antwerp, a humid and sluggish atmosphere prevails.

Woods and Forests.—Nearly one-fifth of the whole surface of Belgium is covered with wood. Where the East and West Flanders fall far below the average amount, Luxembourg and Namur rise far above it. In the two latter are extensive tracts of natural forest, still sheltering wolves and wild boars. They are the remains of the ancient forest of Ardennes which Caesar described as stretching far out into France from the banks of the Rhine. This provided large quantities of valuable hard wood, principally oak. By the most scientific methods of sylviculture and reemitting industry the Belgians exploit these natural resources to their fullest capacity. The total value of timber produced annually is about 22,000,000 francs ($4,400,000). The less valuable grades of wood are converted into charcoal and the bark is largely exported to England.

Agriculture.—It would be more appropriate, in describing the trade, commerce and domestic industries of Belgium, to employ the past tense in all verbs. At the present moment, 1917, Belgium is a devastated, war-ravaged land, bleeding under the heel of an invader; her commerce and industries have vanished; her former prosperity no longer exists: fire, destitution and starvation have taken its place. The physical—if not the spiritual—activities of Belgium to-day are one with those of Nineveh and Tyre. Hence of the life and labor of the Belgian people should be read—for the time being, at least—as a record of things that once were; of the brighter days before the plow and the artisan's tools yielded to the overwhelming strength of cannon and bayonet.

The greater part of Belgium is well adapted for agriculture and the inhabitants had so industriously availed themselves of their natural advantages that they were regarded as the model farmers of Europe. Those parts where climate and soil were unfavorable for raising crops have been converted into pasturages. Here is raised a hardy breed of horses admirably adapted for light cavalry and largely exported to France for that purpose, while vast herds of swine are fed almost at no expense on the mast of the forests. No part of the arable soil is allowed to lie waste, but is carefully applied to its appropriate uses. Vineyards adorn the sunny slopes and an inferior kind of tobacco is raised in the Ardennes valleys. In the province of Antwerp and partly in that of Limburg occurs a vast, dreary expanse of moorland waste known as the Campine, composed mainly of barren sand, and apparently destined to remain forever in its wild, natural state. Yet wherever a patch of more promising appearance occurs, the hand of industry has transformed it into corn fields and green pastures. Agricultural colonies, partly free and partly compulsory, have been planted in different parts of the district. The former consist of persons generally in poor circumstances who have voluntarily engaged in reclaiming barren tracts as the means of procuring a maintenance and saving them from the degradation of pauperism. The latter consist of convicts, who, having forfeited their liberty, give compulsory labor as the penalty of their offenses. By the united exertions of both a wondrous improvement has been made and on parts of this waste some of the finest cattle of the country are raised and much dairy produce of excellent quality is obtained.

Beyond the districts mentioned, there is no part of Belgium in which agriculture does not flourish; but the skill in husbandry is seen at its best in the two Flanders. Its excellence is
due entirely to an innate spirit of economy and industry—an economy which carefully appropriates every gain, however small, and an industry which grudges no labor, however great, provided it is possible, by means of science, to obtain an additional amount of valuable produce. In fact, the Flemish husbandry partakes more of the nature of garden than of field culture. In many of its operations, no docks, horse labor is employed. The plow and the harrow are in frequent requisition, but the implement on which the greatest dependence is placed is the earliest and simplest of all—the spade. To give full scope for the use of it, the ground is parcelled out into small fields of a square form, which have their highest point in the centre and slope gently from it in all directions toward the sides, where ditches of sufficient size carry off the superfluous water as it filters into them. To promote this filtration the ground is trenched to a uniform depth, so that the slope of the subsoil corresponds as nearly as possible to that of the surface. In performing this trenching a considerable degree of skill and ingenuity is displayed.

The performance of the whole at once would be a formidable and not a very efficient process. In a few years a new subsoil would be formed and the trenching would require to be renewed. This is rendered unnecessary in the following manner: The land is laid out in ridges about five feet wide and when the seed is sown it is not covered as usual by the harrow, but by earth dug from the furrows to the depth of two spits and spread evenly over the surface. By changing the ridges and throwing the furrow of the previous year into the ridge of the next the whole ground becomes furrow in the course of five successive crops and is consequently trenched to the depth of about 18 inches. This process of trenching never ceases and is unquestionably one of the most important characteristics of the Flemish husbandry.

Of the only other process particularly deserving of notice is the care and skill manifested in securing an adequate supply of manure. Every farm is fully stocked and the cattle, instead of being grazed in the fields, are fed at homesteads, which are raised to furnish a supply of rich, succulent food. In addition to this every homestead has a tank, built and roughly arched with brick, into which all the liquids of the cattle sheds are conveyed and have their fertilizing properties increased by the dissolution of large quantities of rape cake. This liquid manure is of singular efficacy in promoting the growth of flax, which enters regularly into the Flemish rotation and is perhaps the most valuable crop of all. As this crop is one of the most exhausting which can be grown and requires the richest manure, while it yields none, the growth of it to any great extent must, without the aid of manure, be impracticable.

About two-thirds of the whole kingdom is under cultivation and nearly eight-ninths profitably occupied, leaving only about one-ninth waste. Of this last the far greater part belongs to the comparatively barren districts of the southeast and northeast; and, hence, in the more favored provinces, particularly those of Brabant, the two Flanders and Hainaut, the quantity of waste is so very small that the whole surface may be regarded as one vast garden. Considerable attention has been paid to the cultivation and the breeds of cattle and horses are of a superior description. The horses of Flanders in particular are admirably suited for draught and an infusion of their blood has contributed not a little to form the magnificent teams of the London draymen. In general, however, Belgian stock of all kinds is inferior to that of England. Every province has an agricultural commission and a special council to advise the government on all questions of national industries.

Mines.—The mineral riches of Belgium are great and, after agriculture, form the most important of her national interests. They are almost entirely confined to the four provinces of Hainaut, Liège, Namur and Luxembourg, and consist as to lead, manganese, calamine or zinc, iron and coal. The former has its seat in the country at some extent at Védrine, in Liège; but the quantity obtained forms only a small part of the actual consumption. Manganese, well known for its important bleaching properties, is obtained both in Liège and Namur. The principal field of calamine is at Liège, where it is worked to an extent which not only supplies the home demand, but leaves a large surplus for export. All these minerals, however, are insignificant compared with the coal. The former has its seat in the country between the Sambre and the Meuse and also in the province of Liège. The largest quantity of ore is mined in that of Namur. The coal field, already described, has an area of about 300 square miles. The export is about 5,000,000 tons, forming one of the largest and most valuable of all the Belgian exports. Nearly the whole of the coal thus exported is taken by France. There cannot be a doubt that this export adds largely to the national wealth; but a question has been raised as to the policy of thus lavish disposing of raw material which is absolutely essential to the existence of a manufacturing community, and the quantity of which, though great, is by no means inexhaustible. One obvious effect and other causes which, to raise the price and thus place some of the most important manufacturing interests of the country in an unfavorable position for competing successfully with so formidable a rival as Great Britain. Besides minerals, properly so called, Belgium is abundantly supplied with building stone, pavement, limestone, roofing slate and marble. Of the last, the black marble of Dinant is the most celebrated.

Manufactures.—The industrial products of Belgium are very numerous and the superiority of many of them to those of most other countries is confessed. The fine linens of Flanders and lace of Brabant are of European reputation. Scarcely less celebrated are the carpets and porcelain of Tournay, the cloth of Ver- viers, the extensive foundries, steel works and other iron and steel establishments of Liège. Seraing and other places. The cotton and woolen manufactures, confined chiefly to Flanders and the province of Antwerp, have been extended with much success to other parts of the country and include silks, glass and glassware, hosiery, paper, beer and sugar. There were 17 pig-iron works in
operation in 1912: 39 iron manufactories, 29 steelworks; besides 89 sugar factories, 21 refineries and 125 distilleries. There were also over 600 fishing vessels.

Trade and Commerce.—The geographical position, the admirable facilities of transport, and the industry of the inhabitants early combined to place Belgium at the very head of the trading countries of Europe. The gradual rise of competitors still more highly favored has deprived her of this pre-eminence, and with the likelihood, to which her coast is not to be expected that she can ever take high rank as a naval state, but her trade is still of great importance and within recent years has made a rapid advance. Her coal and iron and the numerous products of her manufactures furnish in themselves the materials of extensive traffic; while the possession of one of the best harbors in the world (Antwerp), situated on a magnificent river, which directly, or by canals, stretches its arms into every part of the kingdom and now made accessible by a system of railways with every kingdom of central Europe, naturally renders Belgium the seat of a transit trade even more important than that which it monopolized during the Middle Ages. The former absolute system of railway communication, which, in the exercise of an enlightened policy, was early established throughout the kingdom. This system has its centre at Malines, from which a line proceeds north to Antwerp; another west to Ostend; another southwest through Mons and on to the Northern Railroad of France, which communicates directly with Paris, and another southeast to Liége, and on into Prussia, where it first communicates with the Rhine at Cologne, and thence by that river and by rail gains access both east and south to all the countries of central Europe. In addition to these great trunks, one important branch connects Liége with Namur and Mons; another from the river Meuse, after crossing the west trunk at Ghent, passes Courtrai, and proceeds directly toward Lille. The ramiﬁcation is thus complete; and there is not a town in Belgium of any importance which may not now, with the most moderate expense, communicate by this industry, by the safest and swiftest of all means of transport. The railways have a length of 5,401 miles, of which 2,708 are state-owned; private lines, 190 miles, and 2,503 miles of light railways. In 1911 the navigable rivers and canals had a total length of 1,238 miles. The value of the general commerce in 1913 was $1,632,000,000, of which sum $916,725,000 represented imports and $715,365,000 exports. Germany, France, and Great Britain, respectively, were Belgium’s best customers.

The articles of import for home consumption include grain and flour, raw cotton, wool, hides, coffee, tobacco, chemicals, oil-seeds, yarn, timber, petroleum, etc. The exports are principally coal, yarn (chiefly linen and woolen), cereals, machinery, ﬂax, woolens and cottons, chemicals, steel and iron, glass and glassware, sugar (raw and reﬁned), zinc, manure, eggs, etc. The trade with Great Britain has greatly increased in late years, the chief exports being silks, wooden yarn, cottons, ﬂax, glass, eggs; the chief imports cottons, woolens, raw cotton, metals and machinery. The external trade is chiefly carried on by means of foreign (British) vessels and the great bulk of the shipping enters and clears from the port of Antwerp. The total burden of the Belgian mercantile marine is over 180,000 tons.

Important results are expected from the Association Belgo-Hollandaise, and international association of Belgian and Dutch manufacturers and business men, founded in 1903 to effect a closer commercial union between the two countries. The trade with the United States is important, Belgium being classed as fifth in the value of its imports from that country. A demand in the exports it sends hither.

Education.—As already stated, almost the entire population of Belgium adheres to the Roman Catholic Church. Protestantism, though fully tolerated and recognized, does not count more than a mere fraction of the people among its adherents. For nearly a century there has raged an incessant struggle over the question of education between the Clerical party on the one side and the Liberals on the other. During numerous political crises the Socialists have thrown their weight into the scale against the Clericals. The position of the Church toward the state is based on the Constitution and certain unrepealed laws dating back to 1830. By the former absolute system, the Church in decay, in compulsion in regard to religious observances, no state interference with appointment of ministers, all religious marriage ceremonies to be preceded by a civil marriage and salaries of ministers of all creeds to be defrayed by the state. By the older law provincial councils were to provide for the maintenance of cathedrals, episcopal palaces and diocesan seminaries, and the state to provide funds for the construction of churches and the expenses of religious services. At various intervals these prescriptions have been altered to meet modern conditions, Belgium being no longer a French possession, as she was at the time those laws were passed. During the first decade of Belgian independence the Catholics had gathered the whole educational system into their hands, when the Liberals began to raise their voices. A compromise was effected between the parties by the Education Act of 1842, by which religious teaching began to be given in the schools, with a contracting-out provision for children of other beliefs. This arrangement worked smoothly for the next 25 years, during which the Catholic party appropriated ever-increasing sums for the upkeep of “ofﬁcial” schools, and matters came to a climax with the fall of the Catholic ministry in 1878. Radicals, Freemasons and Socialists united to secularize education; the power of appointing teachers passed into their hands, and anti-clericalists were frequently chosen. The administration created a Department of Public Instruction on the basis that public education must depend exclusively on the civil authorities. An education bill was introduced in 1879 aiming at the abolition of religious instruction and substituting therefor a “universal morality.” The measure provoked violent opposition; many thousands signed petitions of protest to Parliament; the intervention of the Pope was solicited, but the ministry remained obstinate and the bill became law. M. Frère-Orban, the Premier, severed diplomatic relations with the Vatican; the Belgian bishops prohibited Catholic children from attending the schools and
Belgium

Catholic teachers from giving instruction in them. Thousands of teachers and children deserted the schools, and new schools and buildings were speedily erected by public subscriptions, the artisans giving their services free to the task. Within a year the Catholics had established over 2,000 free schools with close on 9,000 teachers, while the state schools had to compete with the new. Though resorting to all kinds of tyrannical devices the government was unable to force parents to send their children; even lavish offers of prizes and clothing failed to produce the desired effect. A government commission of inquiry proved equally futile, and the Liberal ministry suffered a crushing defeat in the elections of 1884.

On their return to power the Catholics repealed the education bill and restored the old system with additional improvements. Stormy scenes were enacted in the chamber. At the ensuing communal elections the Liberals received increased majorities and claimed that public opinion was on their side. Yielding to the clamor the King dismissed his leading ministers, for the time being, and restored. Since then the Catholic party has remained in power, revising the educational code in 1895, 1911 and, finally, introducing compulsory education in 1913. But the conflict over religious or secular education has never been definitely decided. Up to the outbreak of the war the schools were performing valuable service, and the high rate of illiteracy was rapidly diminishing. At the census of 1890 nearly 4 per cent of the people were 15 years of age could neither read nor write; in 1913 it had fallen to slightly over 3 per cent. Colleges and middle-class schools have been established, where a superior education may be obtained. A complete course for the learned profession is provided by four universities, two of them at Ghent and Liège respectively, established and supported by the state; one at Brussels, called the Free University, founded by voluntary association; and one at Louvain, called the Catholic University, controlled by the clergy.

Newspapers and Literature.— There were 2,245 newspapers in Belgium in 1911; of these 112 were daily and 1,061 weekly papers, and 1,072 others. The Belgian newspaper press is not highly spoken of by those who know it best. Baron d’Anethan told the Senate in 1870 that the management of native newspapers was in the hands of strangers, as were also, in great part, their editorial departments. It was falsely said, that to consider the language of the newspapers an expression of public opinion. Their language causes sentiment and preferences which are not ours to be attributed to us in foreign countries. As but few Belgian newspapers make enough profit to pay their way, most of them do not themselves of this or that political party. While many have a right to make this claim there are others with large foreign circulation. As long as they were merely the mouthpieces of foreign governments and not by any means friendly to Belgium. After the Franco-Prussian War French journalists swarmed into the country and gained control of many papers, using their position as a means calculated to injure Belgian interests. In recent years a number of journalists, neither Belgian by birth nor adoption, obtained control of journals considered to be one authority. J. de C. MacDonnell, “Belgium, Her Kings, Kingdom and People” that these journalistic intruders were mercenaries in the pay of England’s enemies, and succeeded in damaging Belgium as well as England by violently attacking their country’s causes, and attacking England as the foe of Belgium. This statement was written the year before the war, 1913.

Belgian literature, regarded from a national point of view, is a very modern creation dating from the erection of Belgium as an independent kingdom in 1830. But a purely Flemish literature has existed since the 13th century, when that language and the Walloon dialect were spoken throughout the Low Countries. (See FLEMISH LANGUAGE AND LITERATURE). After the separation from Holland (1830) a strong sentiment of nationality arose in Belgium, together with a desire to break away from Dutch traditions. The language was adopted, and a literary renaissance inaugurated under the leadership of Jan Frans Willems, a freethinker, and the Abbé David, a clergyman. This strange combination worked separately for the same object, and each founded a society to promote it. The memory of both is still honored by two of the most famous literary funds bearing their respective names. At the death of Willems in 1846, his mantle fell upon Henri Conscience, a romantic story-writer. Though his tales were of a somewhat childish nature, it is said that he “retold his countrymen to read.” The publication of his de Leeuw van Vlanderen (The Lion of Flanders), gave an enormous stimulus to the literary renaissance, which has grown and flourished in Belgium to this day. Quite a number of Belgian authors write in French; the most celebrated of these is Maurice Maeterlinck (q.v.). The modern school of Belgian writers have largely emancipated themselves from the powerful influence of French style and form and created a distinct type of literature purely national in spirit and atmosphere. The strongest incentive to the “emancipation movement” was given in 1846 by the poet Ledeganck, who protested against neglecting the national character and language for those of another country. Belgian authors cover the whole field of literary activity—history, biography, philosophy, economics, poetry, fiction, drama and belles-lettres. Louis Gachard (d. 1885) wrote a history of the Netherlands; Charles Rahlenbeck (d. 1903) published a history of Protestantism in Belgium; Baron Kervyn de Lettenhove wrote a big history of Flanders; Alphonse Wauters was a famous archaeologist; Émile de Lavayle was a learned exponent of economics; F. A. Gevertz wrote a history and theory of ancient music; Joseph Delbouë was celebrated for his writings on psychology; Baron de Gerlache wrote a history of the Netherlands; Ernest Nys is recognized as an expert on international law; and so on. All of these men were — or at least until recent times — that well-known work Bruges la Mortel; the Abbé David already referred to wrote a history of Belgium in Flemish; van Rijswijck was a patriotic song writer in the vernacular; Jan Bleckney was a renowned dramatist, novelist and literary critic; and many may also be mentioned Charles van Lerberghe.
Max Eikamp, Albert Giraud, Jan van Beers, Prudens van Duyse, Edouard Picard, Edouard Smits, Julius de Geyter, André van Hasselt, Julius Vuytsleste, Ivan Gilkin, Charles Potvin, Emile van Oppennegem, Emil Verhaeren and a host of others. M. Henry Carton de Wiart, Belgian Minister of Justice, is a famous novelist whose masterpiece, "Cité Ardente," should be read by lovers of beautiful (French) prose. There are many learned societies in Belgium, which have in turn contributed to the world's knowledge. The Belgian Academy, which is modelled on the lines of the Académie Française, has performed most valuable services in the propagation and encouragement of useful knowledge in Belgium. A number of literary reviews, written and published by Belgians, attain a high standard of excellence that is quite comparable with their French and Dutch contemporaries.

Defense.—The question of national defense has long been a knotty problem in Belgium and it was not until 1913—on the eve of the war—that Baron de Broquerville, the Prime Minister, carried an army bill through Parliament, involving compulsory service. Although in 1800 the Belgian army, which had assumed an acute form, when the government categorically refused to introduce that system, notwithstanding that it met with general favor from the Liberal party and the working classes generally and was, besides, strongly supported by all native competent authorities. At that time Lieutenant-General Van der Smissen, one of the ablest Belgian officers seized the first available opportunity to express openly and loudly his formal disapproval of the conduct of the Minister of War, General Pontus, on the subject of personal service. For this freedom of speech the general was promptly dismissed, a circumstance that was regarded as a great loss to the Belgian army. The bill of 1913 called all young Belgians who were physically fit to serve in the army, which would have doubled its nominal strength and raised the number of effectives to 300,000 men. But the measure arrived too late; the war clouds but gathered round Belgium. The Belgian army was carried out. The total available was 263,000, of which number nearly half were required to garrison the fortifications, leaving only 132,000 for service in the field. To bring the latter force up to the necessary strength the government had perforce to call up the old Civic National Guard. At the outbreak of the Franco-Prussian War in 1870 the Belgian army was immediately placed on a war footing, and undoubtedly saved the country from once more being "the battle-field of Europe." It is an open secret that the French, on the eve of Sedan, meditated a raid through Belgium; the Emperor Napoleon III was only prevented from taking the step when one of his generals pointed out that it would mean 70,000 more enemies for France. Under the old law of 1902 the Belgian army was recruited by voluntary enlistment augmented, in case of necessity, by annual levies of young men who had completed their 19th year and who, it was claimed, might provide a substitute, for which, of course, he would have to pay. The period of service was fixed at eight years with the colors and five years in the reserve. About 14,000 men were required annually, while the war strength was calculated at 180,000. While the new law of 1913 retains the same legal period of service, it drafts about half of the number of the total available. The men receive an excellent, all-tourned training, having to be in all the branches in rotation, viz., infantry, fortress artillery, engineers, field artillery and cavalry. Besides the standing army there is a garde civi que, numbering close on 50,000 men in time of peace, in addition to which there were over 90,000 non-active militia a part of the reserve. Belgium has no navy beyond a small flotilla of gunboats for river and coast service.

The principal means of defense to which the Belgians had long pinned their faith was the elaborate system of fortifications that guarded their frontiers. These forts were destined, in the early stage of the European War in 1914, to play a prominent and instructive part. On the one hand, they stemmed the German invading avalanche for a week; on the other, they proved the utter uselessness of fortifications against modern artillery if the enemy is once permitted to approach within range. Ever since Belgium had gained her independence, plans for fortified defenses had engaged the attention of the Belgian military engineers. The first proposal was laid before a military committee by General Chazel in 1845. Besides a reorganization of the army, he advocated the demolition of existing defenses that were in the wrong places, and the establishment of powerful entrenchments at Antwerp. Years later, when the plans were about to be put into execution, Napoleon III, who had climbed to power in the interim, vetoed the plan on the ground that he might some day be obliged to enter Belgium himself, in which case the forts it was proposed to demolish would be his last support. It was not till four years after the close of the Franco-Prussian War, when Brialmont became inspector-general of fortifications, and Napoleon had fallen, that the task was begun. He had already fortified Antwerp in 1868; by 1892 he had completed the forts at Liège and Namur. In his designs he broke away from the old French star-shaped forts with bastioned ramparts and the German type of long front and detached forts. Before the advent of artillery, forts were high as castles; thereafter they were made as low as possible, burrowing underground, and showing only a mound hardly visible, cased and roofed in concrete and covered with earth. The guns within were of the "disappearing" type, which were raised just high enough to "peep" over the level, fire and sink out of sight again. The sections between the forts were supposed to be provided with infantry and artillery trenches, but this most important point was apparently overlooked, and thus the passages between the forts were left defended against night attacks by infantry. Liège was defended by 12 forts, six main and six smaller ones, called fortins; between two of them lay an undefended gap of five or six miles, presenting an open entrance to the Dutch frontier. Across the Meuse, to the southeast, was Fort Barneveld; farther south stood Fort Fléron, which commanded one of the railroad lines to Aix; the

* The German attack on Vizé was directed against this gap; by forcing it they could have avoided all the other Liège forts.
two fortins Chaudfontaine and Embourg, on opposite banks of the Vesdre, controlled the line to Germany via Verviers; Fort Boncelles to the west commanded the elevated ground between the Meuse and the Ourthe; while north of Boncelles stood Forts Fiemalle, Hologne and Lontzen, and between the latter and Fontisse lay two more fortins, Lantin and Liérs. This irregular circle around Liége was considered a safe, double line of defense; the forts being from 4,000 to 7,000 yards apart toward the German frontier, an enemy would still be under fire from right and left even if a fort fell into his hands. As it happened in actual experience, in 1914, by the capture of Fort Loncin, a vital spot, by the Germans, the whole railway system of Belgium was laid open to the invading forces, and the fall of Namur and Antwerp (neither of which could hinder their progress to French territory after that), was only a question of time after the world had seen with what comparative ease the Liége forts had been demolished. See ANTWERP; NAMUR.

Belgium, more than to her army and fortifications, Belgium trusted in the protective influence of international treaties among the Great Powers guaranteeing her independence and neutrality. The Treaties of 1831 and 1839 framed between Great Britain, France, Austria, and Prussia provided that "Belgium shall form an independent and perpetually neutral state." In 1867 the same powers, with the addition of Italy and Holland, collectively guaranteed the neutrality of Luxembourg. In 1870, on the outbreak of the Franco-Prussian War, Great Britain immediately made separate treaties with both France and Prussia by which the neutrality of Belgium was specially guaranteed during the war. At the same time Great Britain pledged herself to co-operate against either of the belligerents that might violate that neutrality. In addition, the Treaty of 1839 was positively reaffirmed. When Germany declared war against France in 1914, Great Britain again called upon the two powers to forswear any violation of Belgian territory; France readily gave the desired promise, and Germany refused it.

Government.—The Belgian Constitution combines monarchial with a strong infusion of the democratic principle. Contrary to the custom obtaining in constitutional countries, the king of the Belgians has the power to initiate legislation. The executive power is vested in a hereditary king; the legislative in the king and two chambers—the Senate and the Chamber of Representatives—the former elected for eight years, the latter for four, but one-half of the former renewable every four years and one-half of the latter every two years. The senators (of whom there are 120) are elected partly directly, partly indirectly (by the provincial councils), and must be 40 years of age. Their numbers depend on population. The deputies or representatives are elected directly, one for every 40,000 inhabitants at most. All citizens of 25 years of age are electors, and, according to certain qualifications, one elector may cast three votes. Abstention from voting is punishable by law. Each deputy is allowed $800 per annum and a free railway pass between his place of residence and the capital. In 1913 the Senate was composed of 70 Catho-

lics, 35 Liberals and 45 Socialists. In the Chamber of Representatives there were 101 Catholics, 44 Liberals, 39 Socialists and two Christian Socialists. On the fall of Brussels, 20 Aug. 1914, the Belgian government was removed to Havre, France. The estimated revenue for 1913, chiefly from railways, customs, excise and direct taxation, was $151,531,000; the estimated expenditure $151,108,000. About one-fourth of the expenditure is in payment of the interest of the national debt, the total of which in 1913 was $747,830,727. The coins, weights and measures are the same, both in name and value, as those of France.

History.—The history of Belgium as a separate kingdom, beginning in 1830, when it was constituted an independent European state, would not truly represent the life of the people or account even for the events of the period embraced in it. Situated between the two leading states of Europe, and deeply interested in all the political agitations resulting alike from their rivalries and their alliances, the Belgian people changed masters of their country. Belgian territory contained within itself one leading element of the divisions which raged around it. The two great races of different origin and habits, the Celtic and Teutonic, or Latin and German-speaking peoples, whose different policies have divided Europe from the time of the Romans, were combined in its population; the Walloon provinces, Hainaut, Namur, Luxembourg, being nearly allied to the French, while Flanders, Brabant and Limburg by their language and character to the Germans. Thus not only were the great rivalries of Europe represented here in miniature, but their compression within the narrow limits of what is now one of the smallest of European states has resulted in the formation of a distinct national character. While, therefore, the chief events in which Belgium was interested prior to 1830 are matters of European history, a brief outline of them is needed here to give a distinct conception of the character of the people which they contributed to form.

The territory anciently known as Belgenland differed considerably from that which has assumed the name in modern times. According to Cæsar, the territory of the Belgae, who were one of the principal tribes of ancient Gaul, was extended from the right bank of the Seine to the left bank of the Rhine and to the ocean. We have it on the authority of Strabo that there were 15 Belgian tribes. This district continued under Roman sway till the decline of the empire and subsequently formed part of the kingdom of Clovis, who subdued nearly the whole of Gaul from the Rhine to the Mediterranean. The Franks at this time did not recognize the law of primogeniture. On the death of a monarch his dominions were divided among his sons, the more ambitious of whom again strove to unite them under their own sway. Thus the Frankish kingdoms under the descendants of Clovis were subject to continual vicissitudes, in which the Belgian territory shared, forming in its various portions the kingdoms of Metz, Soisson and Austrasia, till the whole was reunited under Charles the Great. This great conqueror and administrator, the first who strove to unite the
states of Europe in a civilized commonwealth, was of Belgian extraction. It lay at the foot of the Ardennes, that his predecessors, the great mayors of the palace, held sway, while his own capital was established at Aix. Charlemagne in great measure destroyed his own work by adopting the Frankish custom of dividing his kingdom among his sons at his death. This practice, which had proved so disastrous to the dynasty of Clovis, was continued for some time in his family, but was ultimately abolished in France. It long prevailed among the principalities of Germany, hindering their unity and contributing to the ascendancy of France in Europe. Thus Belgium fell to Lothaire, the grandson of Charlemagne, forming part of the kingdom of Lotharingia, which was dependent on the German Empire; but by the Treaty of Verdun (943) Artois and Flanders were united to France.

For more than a century this kingdom was contended for by the kings of France and the emperors of Germany. In 953 it was conferred by Charles the Bald on Othon of Cologne, who assumed the title of archduke and divided it into two duchies—Upper Lorraine, containing modern Lorraine, Luxemburg and the dioceses of Metz, Toul, Verdun and the Palatinate; and Lower Lorraine, containing Brabant, Guelders, the bishoprics of Cologne, Liége and Cambray. These duchies were temporarily reunited under Gonthelain, Duke of Lower Lorraine, who acquired Upper Lorraine in 1033. Among the dukes of Lower Lorraine may also be mentioned Godfrey of Bouillon, the great Crusade leader, who, in 1099, was crowned King of Jerusalem.

The feudal system, which had established itself over the greater part of Europe, likewise prevailed in the Belgian territory, which in the 11th century was divided into duchies, counties and marquisates, under the sway of chiefs owing allegiance to the empire or other of the greater princes, but exercising an almost absolute dominion over their own subjects. There were formed the counties of Holland, Brabant, Zealand, Friesland, Namur, Hainaut and Liége were usually found siding with France, while Brabant, Holland and Flanders commonly took the side of Germany. The princes and the people, however, particularly of Flanders, were not always found on the same side.

The 12th and 13th centuries were distinguished by a general uprising of the industrial communities, which had begun to grow in importance throughout Europe, against the feudal system. This movement was very strongly manifested throughout the Netherlands, less strongly perhaps in Belgium than in Holland. In both countries prosperous municipalities began to arise and assert their freedom; but the spirit of centralization, more strongly developed among the Latin-speaking races in the southern provinces, while the love of individual liberty was more strongly manifested in the north. Many of the towns of Flanders and Brabant, however, became extremely democratic. Ghent in particular distinguished itself by the violence and frequency of its revolts against its rulers.

From this time the popular and civic element began to count for something in political combinations. If one potentate secured the alliance of a count, another might strengthen himself by secretly encouraging insurrection in his towns. The people of Flanders often allied themselves with the English, with whom their commercial intercourse and their love of freedom gave them many common interests and feelings, and both their commercial and the French monarchy often felt the effects of this alliance.

The battle of Courtrai in 1302 greatly weakened the feudal authority, but the ascendancy of the popular element led to various excesses. The organization of popular power was reserved for a later age, and the battle of Rosebeque, 1382, in which the Ghentese under Philip van Artevelde (who had offered the crown of France to Richard II of England as the price of his assistance) were totally defeated, restored the authority of the crown. In 1383 the dukes of Brabant and Artois fell to the house of Burgundy by the marriage of the Duke, a scion of the French Crown, with Margaret, daughter of Louis II, Count of Nevers, the last ruler of these provinces. By a succession of happy marriages, by purchase or by force, Holland, Zeeland, Hainaut, Brabant, Limburg, Antwerp and Namur had all by 1430 become the inheritance of the same house. In 1442 the duchy of Luxemburg was acquired, and in 1470 Guelders and Friesland. This extraordinary prosperity induced Charles the Bold, who succeeded in 1467, to attempt to unite his territories by the conquest of Alsace, Lorraine and Liége, and raise his duchy to a kingdom. The details of this enterprise, which forms one of the most exciting episodes in European history, belong more immediately to the history of France. It ended in his defeat and death at the battle of Nancy in 1477. His daughter Mary, who succeeded him, married the fortunes of her house still higher, or rather she carried them into a more prosperous condition than hers, by her union with the Archduke Maximilian, son of the Emperor Frederick. Her splendid possessions had been coveted by many potentates and there were five candidates for her hand, among whom the most important were the Dauphin, son of Louis XI, and the Archduke.

It now became the part of France to excite troubles in Flanders. The policy of Maximilian, conformably to the traditions of the house of Austria, was directed to the aggrandizement of this house. He was frequently at feud with his Netherlandish subjects, whose manners he took little pains to understand, and for whose liberties he had little respect. Wars and leagues succeeded each other, which belong to the history of the great states of Europe. The Netherlands were by this union again brought under the German empire, and especially under the house of Austria, destined soon to become the most powerful in Europe. In 1512 they were formed into a divided monarchy under the title of the circle of Burgundy. East Friesland was included in the circle of Westphalia. On being called to the empire, Maximilian conferred the government of the Netherlands on
his son, Philip the Fair, under whom they began to experience the material advantages of an alliance with the house of Austria. The vast European possessions of this house opened up to its subjects the greatest facilities of the age for commercial intercourse, while the discovery of America gave them in addition the commerce of a new world. The industrial skill and enterprise of the Netherlands fitted them much more than the Spaniards, whose haughty disposition made them apt to substitute capacity for industry, to derive permanent benefit from these opportunities. Margaret, the aunt, and Mary, the sister of Charles V, who succeeded to the government of the Low Countries, exercised it in many respects wisely and well. The former, a patroness of arts and letters, kept her court surrounded with poets, artists and men of learning. A council of state, consisting of the governors or stadholders of the 17 provinces, assisted them in the administration of affairs, and such was the prosperity of the country that the cities of the Netherlands rivaled in extent and opulence the capitals of the greatest European kingdoms. This bright day was too soon clouded. The reign of Charles V is less distinguished for the political struggles excited by a too prosperous ambition, which shook nearly every nation of Europe, than for the religious dissensions and the social troubles resulting from them which attended the dawn of the Reformation. The Reformed opinions made great progress in the Netherlands; but here again a remarkable illustration was afforded of the strength of those differences of race, language and sentiment which divided their populations. In Holland, as in Germany, the Reformation triumphed. On the Belgian territory, especially where the Walloon or French element of the population prevailed, although these opinions spread widely, they yielded at length, as in France, to the force of authority or the sentiment of unity. In 1535 Mary published at Brussels an edict condemning all heretics to death. An insurrection excited by persecution was suppressed by Charles V in 1540, and the Netherlands were inseparably united by the law of primogeniture with the crown of Spain. No union could have been more unfortunate. The bigotry of the Spanish branch of the Austrian family has become proverbial, and a country torn with religious dissensions could not have found itself under a worse rule.

Charles V, himself a Netherlander, born in Ghent, and still more his son, Philip II, of Spain, strove to extinguish the Reformed opinions among the Netherlands subjects in seas of blood. Philip discarded all respect for the liberties of the Netherlands and subjected them under his governors, particularly the Duke of Alva, to the horrors of a hostile military rule. Thousands of victims perished by every variety of execution which a barbarous cruelty could devise—hanging, beheading, burning, drowning, interring alive, to which tortures and imprisonments were added in still greater numbers of artisans, abandoning their country, carried elsewhere, especially to England and Germany, which sympathized with their opinions, the arts that had enriched their own country and which now acquired through them a wider scope, and contributed to the industrial progress of Europe. William of Orange, the Silent, now made himself the champion of the liberties of his country. Supported chiefly by the northern states, thwarted by the jealousy of the Flemish nobles and opposed by the Walloon provinces, which remained faithful to Spain and even supplied her with troops, he at length succeeded in freeing the seven northern states and forming them into the confederation of the United Provinces, whose independence, declared in 1581, was ultimately acknowledged by Spain. These events belonged chiefly to the history of Holland.

Reqiuesens, the successor of Alva, had tried too late a more humane policy. At Antwerp and Ghent the Spanish soldiers broke out into excesses. The confederates assembled in the latter town signed the pacification of Ghent, proclaiming liberty of conscience and convoking the Estates-General. The Estates called in the aid of France and offered the crown to Henry of Nassau. In 1714 they were again the Roman Catholic League in his own country. It is a special feature of the history of those days that while the great rulers, particularly those of France and Germany, persecuted their Reformed subjects, each was ready to protect the Protestant subjects of the others who were opposed to their political policy. The success of the revolutionary party, consummated in the north, was at length checked in the southern provinces by the ability of Alexander Farnese, Duke of Parma, the Spanish commander, and by the reactionary spirit evoked in the provinces themselves, strengthened by the emigration of many influential reformers to the northern states, and the Belgian Netherlands remained attached to Spain. From 1596 to 1633 the Spanish Netherlands were transferred to the Austrian branch of the family by the marriage of Isabella, daughter of Philip II, with the Archduke Albert of Austria. On the death of Isabella they reverted to Spain. By the Treaty of Wabern in 1714 the Spanish Netherlands were placed under the dominion of Austria. During this period they were the subject of continual intrigues and frequently of open warfare among the European states. Twice conquered by Louis XIV, conquered again by Marlborough, coveted by Holland, Spain, Germany, France and England, they lay continually open to the invasions and struggles of foreign armies, and it was at this period especially that they were, as they have been called, the battlefield of Europe. Some portions of maritime Flanders, Brabant and Limburg which had remained to Spain were during this period conquered and annexed by Holland, while France acquired Artois and Walloon Flanders, the south of Hainaut and part of Namur and Luxembourg, including the Duchy of Arenberg and the county of Valenciennes, Dunkirk and many others. From 1714 Austria was left in undisturbed possession of the remainder of the northern Netherlands. Joseph II, styled the Philosophical Emperor, excited by his reforms a revolt, headed or stimulated by the tumults of the others whom he had dispossessed of their convents. The Estates of the two provinces refused to vote the imposts and were dissolved. The populace took to arms. The Virgin was proclaimed the generalissimo of the patriot army. The Aus-
tian army concentrated at Turnhout was totally defeated. After applying in vain for assistance to France and the people of the army, it was expected to have much sympathy with their movement, the insurgents were at length subdued and the Austrians re-entered Brussels October 1790. Soon after the whole Netherlands were conquered by the revolutionary armies of France and the country was divided into French departments, a change which, as might be expected, provoked as much resistance as the people were able to offer. When Napoleon ruled France, his brother Louis became King of Holland, in 1806. Before long, however, the two brothers quarreled, and when Napoleon sent an army against the Dutch capital in 1810 Louis fled to Bohemia. The latter's son, Charles Louis, afterward became Napoleon III.

Just before the battle of Waterloo, fought on Belgian territory, had once more changed the face of Europe, Belgium was united by the congress of Vienna to Holland, under the title of the kingdom of the Netherlands. The new rulers regarded French as the official language, who commanded Dutch and Belgian troops at Waterloo. This fusion had much to recommend it. The ports and colonies of the north formed a suitable complement to the arts and industry of the south. The Flemings and the Dutch spoke the same language and had the same origin; but there remained outside of this harmony the Walloon provinces, French in language and extraction. A most injudicious measure was taken by the French government of which to assimilate the language of the provinces by prohibiting the use of French in the courts of justice, excited an opposition which, encouraged by the success of the French Revolution of 1830, broke out into revolt. The electoral system, moreover, gave the preponderance to the northern provinces, though inferior in population, and the interests of the provinces were diametrically opposed in matters of taxation. Belgium was agricultural and manufacturing, Holland commercial; the one wished to tax imports and exports, the other property and industry. Three different languages were spoken in the Chamber—Dutch, German and French; frequently, indeed, the members did not understand each other. Nothing but the most skilful government could have overcome these fundamental differences, and no statesman appeared fitted to grapple with them. The King, Willem, was far too bigoted and autocratic to reconcile his Flemish subjects to Dutch preponderance. The Belgians, though insisting upon a separate government, offered to accept the King's son as viceroy, but the tactless conduct of that prince snapped the link that might have held the two countries together. The revolutionary movement, which broke out in Brussels on 25 Aug. 1830, became general in the south, and the Dutch troops, at first successful before Brussels, were finally repulsed and compelled by the ever swelling ranks of the insurgents to retire. Austria, England, Prussia and Russia each threatened armed intervention to maintain the union, but France stood behind the Belgian revolutionaries. A seven hours' bombardment of Antwerp by the Dutch was horrified and enraged the Belgians that reconciliation passed beyond the bounds of human possibility. Undeterred by the mutterings of the powers, the provisional government draw up its plans for a new constitution and to fight the Dutch. They offered the crown to the Duc de Nemours, second son of Louis Philippe; but the father refusing his consent, they next offered it, on the recommendation of England, to Leopold, fourth son of the Duke of Saxe-Coburg-Saalfeld, who accepted it 4 June 1831 under the title of Leopold I (q.v.). In the following year Leopold married, as his second wife, the daughter of Louis Philippe, a circumstance that no doubt contributed toward curing the French King's designs on the annexation of Belgium to his own dominions. A convention of the powers was held in London to determine the affairs of the Netherlands and stop the effusion of blood. It favored the separation of the provinces and drew up a treaty to regulate the change. The powers divided Luxemburg, Limburg and the national debt between Holland and Belgium, awarded Antwerp to the latter, declared the Scheldt open to both countries, and, a neutral, independent state. But the Dutch king refused to accept these terms and insisted on holding Antwerp. A combined French and British fleet sailed for Holland and a French army was sent to besiege Antwerp. These manoeuvres had the desired effect; the Dutch evacuated Antwerp but retained two forts commanding the Scheldt. In retaliation, the Belgians held on to Limburg and Luxemburg. Not until 1833 did King William signify his acquiescence to the terms laid down by the powers, and in 1839 the Belgians yielded, most reluctantly and under pressure, the portions of Limburg and Luxemburg—which they had retained since 1832—to Holland.

Under the wise and enlightened reign of Leopold I, a prosperous period of 34 years, Belgium became a united and patriotic community. Arts and commerce flourished, and a place was taken in the family of nations upon which the Belgian people could look with unalloyed satisfaction. During this period the revolution of 1848 Leopold was supposed to have declared his willingness to resign the crown if his subjects wished it, but there is no historical foundation for that statement although many Belgians believed it. Yet the fact that the crisis which shook most of the thrones of Europe passed harmlessly over Belgium confirmed the stability of the monarchy at a critical moment. The explanation may perhaps be found in the intensely democratic character of the Constitution framed in 1830–31. By its provisions the King, while nominally endowed with all the prerogatives of executive power and even the rights of initiative, is nevertheless so strictly hand-tied by ministerial control that his power is practically non-existent. Our Constitution... breathed hatred of the past King and fear of the future King. It snatched from the Crown the faculty of doing good or evil. Leopold I died in 1865, regretted and respected. He began the task of molding the Belgian people; it was continued with equal prudence by his eldest son and successor, Leopold II. Leopold I had ruled for 34 years; notwithstanding all constitutional limitations, it was
his will, and not that of his ministers, which prevailed on important occasions. Leopold II (q.v.) was destined to reign 10 years longer than his father, and to illustrate the political theory of a "benevolent despotism." A man of iron resolution, shrewd business sense and not overburdened with ethical ballast, he widened the narrow vision of his people, built up an amazing degree of prosperity, carried the Belgian flag far beyond the narrow confines of his kingdom by commerce and colonization, and literally fulfilled the grandiose promises he made on taking the accession oath. The outstanding feature of his reign is the acquisition and development of that rich territory now known as the Belgian Congo (q.v.). Between 1886 and 1894 Belgium was convulsed with labor strikes, socialist risings and universal clamor for electoral reforms. The working men's party threatened to organize a general strike if their grievances were not speedily recognized. At the end of 1889 the 25,000 workers in the industrial district of Charleroi joined the movement without abandoning for a moment a perfectly calm and legal attitude, and gained a complete victory on economic points in dispute. From this developed a political strike, and a few weeks later an assembly in Brussels of 50,000 workmen from every part of the country demanded, with all the calm that the knowledge of their power gave them, an extension of electoral rights. For nearly five years the struggle raged in the country and in the Parliament before a modified system of universal suffrage was adopted. Leopold II died in 1909. His only son had died in childhood, since when the succession devolved upon Leopold's brother, Philippe Eugène, Count of Flanders, who immediately renounced his right of succession when his first son, Prince Baldwin (Baudoin), was born. To prepare him for his eventual inheritance the young prince was carefully educated, but he died suddenly of pneumonia in 1891, at the age of 21. The second son of the Count of Flanders, Prince Albert, then 16 years of age, became heir-presumptive to the throne, and succeeded his uncle, Leopold II, on 17 Dec. 1909. See Albert I, King of the Belgians.

The new King proved himself a monarch of a different type from his predecessors. Of great stature and masterful will like his uncle, his character and demeanor run in entirely different channels. Before he had been five years on the throne he became a king without a court, an exile with his family and government. The main events of his short reign before the war were inherited troubles—the religious strife and the question of military reforms.

BELGIUM AND THE WAR. Whereas the variously-described "causes" of which the war was the effect may long remain the subject of controversy among historians — according to the national viewpoint of each, the manner in which Belgium was swept into the conflict is comparatively clear and simple of explanation. The political status of Belgium was one of "perpetual neutrality," imposed upon her by the great powers without her consent or consent by violent neighbors. The historic instrument which guaranteed the independence, integrity and perpetual neutrality of the kingdom, dated London, 19 April 1839, bears the seals and signatures of the plenipotentiaries of Austria, Belgium, France, Great Britain, Prussia and Russia. In the name of the Most Holy and Indivisible Trinity 9 the sovereignty of Belgium was strictly circumscribed at her birth; being held to observe the same neutrality toward all the other states, she was not permitted to enter into political agreements with any other state, and was only entitled to call for help if one of the guarantors broke faith and invaded her territory. Of this solitary privilege Belgium duly availed itself when Baron von der Elst, the Belgian Foreign Secretary, and informed him that French dirigibles had dropped bombs and French cavalry patrol had crossed the frontier in violation of international law, as war had not been declared. The Belgian official asked where these incidents had happened, and was told that it was in Germany. Baron von der Elst then observed that in that case he could not understand the object of this communication, to which the German Minister replied that these acts were contrary to international law and were calculated to lead to the supposition that other acts, contrary to international law, would be committed by France.9 During the same day the Belgian representatives at Paris, London, St. Petersburg, Vienna, Berlin and The Hague were instructed to announce the terms of the German demands and the Belgian reply thereto: "Our answer has been that this infringement of our neutrality would be a flagrant violation of international law. To accept the German proposal would be to sacrifice the honor of the nation. Conscious of her duty, Belgium is firmly resolved to repel any attack by all means in her power." At the same time the king of the Belgians telegraphed to King George making a "supreme appeal" to the British government to safeguard the neutrality of Belgium.9 The British government had (31 July) requested the German government to state whether, in the event of war, both countries would be "prepared to engage to respect the neutrality of Belgium so long as no other power violates it." France gave a ready guarantee; Germany did not reply. On receipt of the Belgian King's appeal the British government again requested from Germany an assurance that Belgian neutrality would be respected. Later in the day news came that German troops were at Gemmenich inside the Belgian frontier opposite Aix-la-Chapelle. The British Ambassador was instructed to demand a reply before midnight. The telegram reached Berlin at 7 P.M., and the German government, without waiting for the full time to expire, handed the Ambassador his passports. The invasion of Belgium had begun. In a speech to the Belgian Chamber of Deputies King Albert said: "if we are called upon to resist the invasion of our soil and to defend our threatened hearths, this duty, however hard it may be, will find us armed and ready for the greatest sacrifices . . . one vision alone fills our thoughts — our menace independence; one
duty alone presents itself to our wills—stubborn resistance. In these grave circumstances two virtues are requisite, a courage that is calm and steadfast, and complete unity among all Belgians. If the foreigner violates our territory, in contempt of the neutrality whose claims we have always scrupulously ob-served, he will find all Belgians grouped around their Sovereign, who will never betray his con-stitutional oath, and around the government which enjoys the full confidence of the entire nation. . . . A country which defends itself with the respect of all . . . That country does not perish." See Albert, King of the Belgians; Bethmann-Hollweg, von Theo-bald; War, European—Diplomatic History.

BELGIUM, Princess Dowager Marie of, Countess of Flanders and mother of the reigning King Albert: b. 1845; d. 26 Nov. 1912; daughter of Prince Charles Anton of Hohen-zollern-Sigmaringen. She married, 1867, Philip, Count of Flanders and third son of Leo-pold I. Her husband, who became very deaf, died in 1905, having renounced his right of succession, and her eldest son, Prince Baldwin, died unmarried in 1891. She was known as 'La Mariee,' and was an accomplished painter, etcher and musician.

BELGRAD, byĕl'gō-rŏt', or BIELGO-ROD, Russia, town in the government of, and 87 miles south from the town of, Kursk, on the Donetz. It is the seat of an archbishop's see and has important fairs. Belgorod, which derives its name from a neighboring chalk hill, is divided into two—the old and new—towns. It has manufactures of leather and soap, and is a center of agricultural industries. There is a considerable trade in wax, apples, tallow candles and especially of chalk, of which about 1,300 tons are produced annually within the city limits. Pop. about 22,000.

BELGRADE, Serbia, the capital of the kingdom, situated in the angle formed by the junction of the Save with the Danube, overlooked by a citadel on a rocky eminence about 160 feet high. The town has been almost entirely transformed in recent times and now contains a number of fine buildings and wide streets, being provided with the electric light tramways, telephones, waterworks, etc., and having generally the aspect of any modern European town. It contains the royal palace, residences of various ambassadors or ministers, the chief courts and government departments, archiepiscopal cathedral, Piarist College, high school, high school or college, gymnasium, military school, national library of 80,000 volumes, national museum, etc.; also very fine parks and an old Turkish kiosk. At the head of the educational institutions is a university with faculties of philosophy, jurisprudence and engineering. It is the seat of the Royal Serbian Academy of Sciences. The most numerous places of worship are the Greek Catholic. There are no industries of any importance, but trade, however, is active. Belgrade being the chief emporium of the kingdom, to the place to which most of the imports and exports of Serbia are brought, and through which a large transit trade passes between Austria and Turkey. It is now connected by railway with Budapest and with Constantinople and Salonica, and carries on a large shipping trade by the Danube and also the Save. Under the name of Singidunum, Belgrade was the station of a Roman legion, and in later years it was sometimes destroyed in the contests of the Byzantine, Bulgarians and Hungarians. Being the key of Hungary, it was long an object of fierce contention between the Austrians and the Turks. It was taken in the latter in 1521, but held by them till 1688, when it was retaken by the imperial army. Two years afterward it was again captured by the Turks, who perpetrated every sort of atrocity in the conquered city, besides killing 1,200 of the garrison. From this period it remained in possession of the Turks till 1717, when it was besieged by Prince Eugene. After a desperate conflict between the contending armies the Turks were defeated. In 1739 the Turks came into possession of Belgrade by treaty, retaining it till 1789, when it was taken by the Austrians. It was restored by treaty to the Turks in 1791; since which time it has shared the varying fortunes of Serbia. Though Serbia became practically independent in the latter part of the 19th century, the garrison was not withdrawn till 1877. In consequence of a quarrel with the Serbians it was bombarded by the Turkish garrison in 1862. In 1867 it was evacuated by the Turks altogether and from the Treaty of Berlin (July 1878) until 1914, the capital of an independent Serbia. On 9 Oct. 1915, it was occupied by Austro-
German troops, and after the Austro-Bulgarian occupation of the country, completed 2 Dec. 1915, the Serbian government was established at Corfu. An American consul resides here. See SERBIA; WAR, EUROPEAN. Pop. 90,890.

**BELGRADE,** forest of, is the only forest on the European shore of the Bosporus. It has an area of about 20 square miles and is preserved untouched by the axe to attract rain.

**BELGRAND, bel-grănd, Marie François Eugène, a French civil engineer:** b. Evry, 23 April 1810; d. 8 April 1878. He designed the gigantic sewerage system and water supply system of Paris, and published 'La Seine'; 'Les travaux souterrains de Paris'; 'Les eaux anciennes de Paris'; 'Les eaux nouvelles,' etc.

**BELGRAVIA,** the name given to the fashionable quarter of London south and west of Belgrave Square. Till the early part of the 19th century the district was a marshy farm. The district was drained and filled in about 1825.

**BELHAVEN, N. C., town in Beaufort County, 120 miles east of Raleigh, located at the mouth of the Pungo River on Pamlico Sound and on the Norfolk Southern Railroad. It is in the centre of an agricultural region whose products are chiefly cotton, corn and potatoes. Another industry of some importance having its centre here is fishing and dredging for oysters in the Sound. In the town are a number of large saw mills and cooperage shops. Pop. 3,200.**

**BELIAL, bel'il or běl'ěyal.** By the translators of the English Bible, this word which occurs 27 times in the Old Testament is often treated as a proper noun, as in the expression 'daughter of Belial,' which the translators of the Revised version translate as 'wicked woman.' Cheyne in the *Expositor* for 1895, pp. 435-39, gives as its equivalent (1) subterranean waters (and so connected with Belie, a goddess of the underworld in Babylonian mythology); (2) a hopeless ruin; and (3) a worthless scoundrel. To the later Jews Belial seems to have become what Pluto was to the Greeks, the name of the ruler of the infernal regions; and in 2 Cor. vi, 15 it seems to be used as a name of Satan, as the personification of all that is bad.

**BELIEF.** In a general sense belief is the assent of the understanding to the truth of a proposition, but in a technical and theological sense has come to be used as a mental exercise somewhat depending upon the volition of the individual. The word is used to mean the acceptance of a proposition, statement or fact as true on the ground of evidence, authority or irresistible mental predisposition; the state of trust in and reliance on a person, thing or principle; as also for the fact believed, and sometimes specifically for the Apostles' Creed. Belief is the same distinction of B. in the latter rests on evidence, while belief rests on authority. Belief should, some say, not be used of facts occurring in one's own experience, or principles of which the opposite implies absurdity, such as the law of contradiction of Russian literature we know, and, according to this view, the term should be limited to cases where a proposition is accepted without evidence, or where such evidence as is available implies only probability. On the other hand, certain psychologists are accustomed to regard as beliefs the fundamental data on which reasoning rests; and to say that all knowledge rests ultimately on belief. Belief, they say, may admit of all degrees of confidence, from a slight suspicion to full assurance. There are many operations of mind in which it is an ingredient—consciousness, remembrance, perception. Kant defined opinion as a judgment which is insufficiently based, subjectively as well as objectively; belief, as subjectively sufficient but objectively inadequate; knowledge, as both subjectively and objectively sufficient. The strongest beliefs may, of course, be false; beliefs in ghosts, astrological prognostications, etc., are usually treated as superstitions. Beliefs as such rest on grounds regarded as sufficient by the person believing, who is prepared to act on his belief; but their grounds may have absolutely no validity for any other person. Such beliefs are nevertheless very real. On the other hand there are many propositions accepted traditionally, and by authority, which are not real, vital abiding truths for those who nominally accept them; which have no influence on character or mental tone, and on which those who hold them would not be prepared to act. Faith is a word of very wide and very different meanings the same sense as belief, but especially signifies the acceptance of and reliance on the truths of religion.

**BELINDA,** a novel by Maria Edgeworth. Belinda Portman goes to spend the winter in London with Lady Delacour, a brilliant and fashionable woman; at her house she meets Clarence Hervey for the first time. Various obstacles keep the lovers apart, but the story ends happily with the marriage of Hervey and Belinda. Despite a didactic vein, apparent here as in others of her novels, Belinda is an interesting work and secures for its author her prominent place in English fiction.

**BELINSKY,** Vissarion Grigorevitch, Russian writer and critic: b. Tchernob, government of Penza, 1810; d. Saint Petersburg, 28 May 1848. Entered the University of B. but was expelled before graduation on account of a drama he had written which fiercely attacked the institution of serfdom. His first important work, however, was his 'Literary Revolutions' (1834), a critical review of the development of Russian literature. In 1835 Belinsky went to Saint Petersburg, where he became prominent as a critic, especially after the appearance of his essays on the Russian writers of his time,
BELISARIUS—BELIZE

the last of these, on Pushkin, constituting a volume of over 500 pages (1848). His last important work was his 'Literary Review for 1847,' in which he strongly expressed the radical views that tinged all his works. His collected works were published in 12 volumes in 1862. Belinsky is even considered to be the foremost critic of Russian literature, his fame having augmented considerably since his death. Consult Pypin, 'Belinsky: His Life and Correspondence' (Saint Petersburg 1876).

BELISARIUS, Byzantine general: b. about 505; d. 565. To him the Emperor Justinian chiefly owed the splendor of his reign. Belisarius first served in the bodyguard of the Emperor, soon after obtained the chief command of an army of 25,000 men stationed on the Persian frontiers, and in the year 530 gained a complete victory over a Persian army of not less than 40,000 soldiers. The historian Procopius was at this time secretary of Belisarius. In 531, however, he lost the battle of Callinicum against the same enemy, who had forced his way into Syria—the only battle which he lost during his whole career. He was recalled from the army and soon became at home the support of his master, the Emperor. In the year 532 civil commotions, proceeding from two rival parties, who called themselves the green and the blue and who caused great disorders in Constantinople, brought the life and reign of Justinian into the utmost peril, and Hypatius was already chosen emperor, when Belisarius with a small body of faithful adherents restored order. Justinian, with a view of conquering the dominions of Gelimer, king of the Vandals, sent Belisarius with an army of 15,000 men to Africa. After two victories he secured the person and treasures of the Vandal King. Gelimer was led in triumph through the streets of Constantinople, and Justinian ordered a medal to be struck with the inscription 'Belisarius gloriosus,' which has descended to our times. By reason of the dissensions existing in the royal family of the Ostrogoths in Italy, Justinian was induced to attempt to bring Italy and Rome under his sceptre. Belisarius received the appointment in 535 and in the following year received the submission of the cities of lower Italy, with the exception of Naples, which he carried by storm. In December of the same year he entered Rome, where he was besieged by the Goths for an entire year. The latter were finally compelled to raise the siege. In 538 Belisarius was reinforced by Narses, but the latter failed to co-operate with him and Milan was sacked by the Goths under Braia. Narses was recalled and both armies were placed under the command of Belisarius. In 540 Belisarius pushed the Goths back to Ravenna, and here vanquished their army and captured their king, Vitiges, whom, together with many other Goths, he conducted to Constantinople. The war in Italy against the Goths continued, but Belisarius, not being sufficiently supplied with money and troops by the Emperor, demanded his recall in 548. Narses, his rival, was appointed to the command. He afterward commanded in the war against the Bulgarians, whom he conquered in the year 559. Upon his return to Constantinople he was accused of having taken part in a conspiracy. But Justinian was convinced of his innocence, and is said to have restored to him his property and dignities, of which he had been deprived. His history has been much colored by the poets, and particularly by Marmontel, in his otherwise admirable politico-philosophical romance. According to his narrative, the Emperor caused the eyes of the Empress to be put out. This is not true, for Belisarius was compelled to beg his bread in the streets of Constantinople. Other writers say that Justinian had him thrown into a prison, which is still shown under the appellation of the Tower of Belisarius. From this tower he is reported to have let down a bag fastened to a rope and to have addressed the passers-by in these words: 'Give an obolus to Belisarius, whom virtue exalted, and envy has oppressed.' Of this, however, no contemporary writer makes any mention. The blind Belisarius forms the subject of a noted painting by Gérard. Tzetzes, a slightly esteemed writer of the 12th century, was the first who related this fable. Certain it is that, through too great indulgence toward his wife, Antonina, Belisarius was impeled to many acts of which he evidently had been a servile submissiveness to the detestable Theodora, the wife of Justinian. Consult Gibbon, E., 'Decline and Fall of the Roman Empire' (edited by Bury, Vol. IV. London 1889); 'The Cambridge Medieval History' (Vol. I, New York 1911); Hodgkin, 'Italy and Her Invaders' (Oxford 1880-85); Bury, 'Later Roman Empire' (London 1893).

BELIZE, bé-léζ (sometimes written BELICE or BALIZE), British Honduras, the capital of the colony. Lat. 17° 29' N.; long. 88° 8' W. It has been suggested that the name is derived from the French balice, a beacon, but more probably it is a corruption of Wallace, a Scotch buccaneer named Peter Wallace, with 80 companions, having erected houses enclosed with a rude palisade at this point after the Spaniards abandoned Bacala, leaving a large part of the rugged, uninviting north coast of the Gulf of Honduras unoccupied, save by freebooters, during the latter half of the 17th century. According to the name Wallis, Balis or Belize was applied by the natives and Spaniards to the settlement which gradually spread and subsequently to the whole region occupied by the English. (Consult Bancroft's 'History of Central America,' Vol. II, p. 624). Woodcutting was the chief occupation of the establishment. The value of the forests attracting other settlers, Belize was attacked by the authorities of Yucatan, who sought to expel them as trespassers in 1733. Various unsuccessful attempts with the same object were made in subsequent years, the most formidable in 1754. Again in 1779, war existing between England and Spain, the governor of Yucatan organized an expedition against Belize; and Spain's last effort to regain possession by force was made in 1798. Before that time the settlers had organized a government. In 1859, the governing fact that originating as it did, the town has become, since its population of more than 5,000, its church, schools and hospital, a centre for the maintenance of good order. It has the characteristic features of a small English colonial capital—the governor's house, etc., the Coral reefs forming a natural breakwater for the harbor. Large vessels are loaded and unloaded by means of tenders. Logwood and mahogany are the chief
BELKNAP — BELL

471

BELKNAP, George Eugene, American naval officer: b. Newport, R. I., 22 Jan., 1832; d. 7 Apr., 1903. He was appointed midshipman in the navy in 1847; became lieutenant-commander in 1862; commodore in 1885; and rear-admiral in 1889, and was retired in 1894. He took part in the capture of the Barrier Forts on the Canton River, China, in 1856; and in the Civil War commanded the \textit{New Ironsides} at the bombardment of the forts and batteries in Charleston Harbor, and in both of the attacks on Fort Fisher. In 1873, as commander of the \textit{ Tuscarora}, while engaged in deep-sea sounding in the north Pacific Ocean, he made discoveries concerning the topography of the bed of the ocean that found high favor among scientists. He was appointed superintendent of the United States Naval Observatory in 1885 and, among other works, published \textit{Deep Sea Soundings}.

BELKNAP, Jeremy, American Congregational clergyman: b. Boston, Mass., 4 June 1744; d. there, 20 June 1798. He was graduated at Harvard in 1762; was pastor of the Congregational Church in Dover, N. H., 1767-86, and of the Federal Street Church in Boston, 1787-98; and was active for the American cause during the Revolution. The Massachusetts Historical Society, organized in 1790, recognizes him as its founder; he became an overseer of Harvard College. A very great part of his time was spent in biographical and historical research. He was the author of a \textit{History of New Hampshire} (3 vols., 1784-92); \textit{A Discourse Intended to Commemorate the Discovery of America by Columbus, with Four Dissertations} (1792); \textit{An Historical Account of Those Persons Who Have Been Distinguished in America}, generally known as the \textit{American Biography} (2 vols., 1792-95); \textit{The Forerunners: An American Tale} (1796); \textit{Collection of Psalms and Hymns} (1795). Consult his \textit{Life}, (New York 1847).

BELKNAP, William Worth, American military officer, son of Gen. W. G. Belknapp: b. Newburgh, N. Y., 22 Sept., 1829; d. Washington, D. C., 13 Oct., 1890. In 1861 he entered the Union army as major of the 15th Iowa Volunteers and was engaged at Shiloh, Corinth and Vicksburg; but became most prominent in Sherman's Atlanta campaign. He was promoted to brigadier-general, 30 July 1864, and major-general, 13 March 1865. He was collector of internal revenue in Iowa from 1865 to 13 Oct. 1869, when he was appointed Secretary of War, which office he occupied till 7 March 1876. He resigned in consequence of accusations of official corruption. Subsequently he was tried and acquitted.

BELL, Acton. See BRONTE, ANNE.

BELL, Alexander Graham, American scientist, inventor of the telephone: b. Edinburgh, Scotland, 3 March 1847. He was a son of Alexander M. Bell (q.v.), and was taught at home by his parents, more especially by his mother, who taught him to read and write; and by August Benoit Berri, a musical authority and composer. He entered McLaren's Academy in Edinburgh and, a year later, the Royal High School, graduating shortly after his 13th birthday. Then he went to London, received instruction in elocution, and the mechanism of speech from his grandfather, Alexander Bell (b. 1790; d. 1865), a recognized authority on these subjects. Returning home, he was further trained along the same lines by his father, with a view to following the family profession. Was then employed during a year as pupil-teacher at Weston-House Academy, Elgin, Scotland, after which he entered the University of Edinburgh and attended lectures upon Latin under Doctor Sellers and upon Greek under Professor Blake. Then he returned to Elgin as resident master and teacher of elocution and music, and remained two years. Was instructor in Somersetshire College, Bath, England, during a year, then became assistant to his father in London (the latter having removed there and received the appointment of lecturer on elocution in University College). In 1868 he taught several deaf-born children to speak, and from July to December had entire charge of his father's professional affairs, including the giving of lessons and lectures at the different schools and the correcting of defects in speech, while the father was delivering lectures in America. Early the next year he was taken into partnership with his father. During 1868-70 he attended courses on anatomy and physiology at University College, London, joined the college medical society and matriculated as an undergraduate at the London University. Owing to the death of two of his sons by tuberculosis, and the fear that his only remaining son might fall a victim, Graham's father resigned his lectureships, disposed of his practice in London and, with his family, moved to Canada and secured a country place at Tutelo Heights, near Brantford, Ontario. Through living out-of-doors as much as possible, Graham Bell regained his health.

Beginning 1 April 1871, Alexander Graham Bell gave special instruction to teachers of deaf children in the use of his father's physiological symbols of visible speech. He also settled at Northampton, Mass., Hartford, Conn., and other cities. In 1872 he opened in Boston a normal training school, known as the School of Vocal Physiology, for teachers of the deaf and for instruction in the mechanism of speech, faults of speech, etc. In 1873 he was appointed professor of vocal physiology in the school of oratory of the Boston University. Here he remained until 1877, when he went abroad to lecture on the telephone. Before he was 17 years of age he devised a method for removing the husks from wheat, and he and his brother made a speaking automaton. Among the more important inventions are the harmonic multiple telegraph (1874); the fundamental method that underlies the electric transmission of speech in any form in any part of the world (1875); the magneto-electric speaking-telephone (1875); the photophone for transmitting speech and other sounds to a distance by means of a beam of light (1880); an induction-balance with magneto-electric telephone for painlessly locating bullets or other metallic masses lodged in the human body (1881); the telephone probe
to determine the position and depth of metallic masses in the human body (1881); the spectrophone for determining the range of audibility of different substances in the spectrum (1881); joint inventor of the graphophone and flat disc records for recording and reproducing speech, music and other sounds; "the commercial origin of the sound-reproducing art" (1884-86); tetrahedral kite and kite structures (1903); joint inventor in a number of improvements designed to promote aerial locomotion in connection with the Aerial Experiment Association (1903-08).

Among the medals awarded to Alexander Graham Bell are the following: Centennial Exposition, Philadelphia, gold medal for speaking-telephone, gold medal for visible speech (1876); Royal Cornwall Polytechnic Society, the James Watt silver medal for the telephone (1877); Massachusetts Charitable Mechanics Association, gold medal for the telephone, gold medal for visible speech (1878); Society of Arts, London, Royal Albert silver medal for his paper on the telephone (1878); République Française Exposition Universelle Internationale, Paris, gold medal for the telephone and a silver medal (1878); Society of Arts, London, Royal Albert silver medal for his paper on the photophone (1881); the Karl Koenig von Wuertemberg gold medal; Society of Arts, London, Royal Albert gold medal for his invention of the telephone (1902); John Fritz gold medal; Franklin Institute of Philadelphia, Elliott Cresson gold medal for the electrical transmission of speech (1912); David Edward Hughes gold medal and a silver medal (1913); American Institute of Electrical Engineers, Thomas Alva Edison gold medal (1914). Among the honorary degrees conferred upon Alexander Graham Bell are the following: Doctor of Laws, Illinois College (1881), Harvard College (1896), Amherst College (1901), Saint Andrew's University (1902), Edinburgh University (1906), Queen's University, Canada (1906), University of Washington (1913), Dartmouth College (1914); Doctor of Philosophy, National Deaf-Mute College (now Gallaudet College) (1880), Würzburg University (1882); Doctor of Science, Oxford University (1884); Doctor of Medicine, Heidelberg, Germany (1886). To him was awarded by the government of France the Volta prize of 50,000 francs for the electrical transmission of speech (1880); he was also decorated and created an officer of the Legion of Honor of France (1881).

Among the societies of which Alexander Graham Bell is a member are the following: Boston Society of Natural History; American Academy of Arts and Sciences, Boston; Royal Society of London (corresponding); Society of Telegraph Engineers and Electricians, London; Institute of Electrical Engineers, London; American Association for the Advancement of Science (life); Philosophical Society of Washington; American Philosophical Society, Philadelphia; National Academy of Sciences; National Educational Association (life); Société de Physique (corresponding), Paris; American Otological Society (honorary); American Institute of Electrical Engineers (ex-president); American Association to Promote the Teaching of Speech to the Deaf (founder, endower and ex-president); Antiquarian Society of Massachusetts; Anthropological Society of Washington; Washington Academy of Sciences; National Geographic Society (ex-president); Association for the Improved Instruction of Deaf-Mutes (honorary); Technical Association of Pioneers of America; American Anthropological Society; American Senetic Association; American Laryngological, Rhinological and Otological Society (honorary). In 1887 he founded and endowed the "Vocal Bureau for the Increase and Diffusion of Knowledge Relating to the Deaf," Washington, D. C. In 1900 he assisted in the formation of the American Association to Promote the Teaching of Speech to the Deaf and endowed the association. As special agent of the Bureau of the Census he determined the scope of that part of the 12th census relating to the deaf of the United States living on 1 June 1900, initiated the inquiry, specified the tabulations to be made from the data secured, conducted the correspondence to represent the respective positions in the special report of 200 pages that is valued highly by all who are investigating any phase of deafness. He was appointed by Congress a regent of the Smithsonian Institution in 1898 and has been reappointed since. In January 1904 he brought the remains of James Smithson, founder of the Smithsonian Institution, from Genoa, Italy, to New York, where they were received with national honors and conveyed to Washington.

BELL, Alexander Melville, Scottish-American educator: b. Edinburgh, 1 March 1819; d. Washington, D. C., 7 Aug. 1905. He was a distinguished teacher of elocution at the university of his native city; in 1865 removed to London to act as a lecturer in University College, and in 1867 went to Canada and became connected with Queen's College, Kingston. He invented the system of "visible speech," in which all the possible articulations of the human voice have corresponding characters designed to represent the respective positions of the vocal organs. This system has been successfully employed in teaching the deaf and dumb to speak. Besides writing on this subject he wrote on elocution, stenography, etc. He was the brother of Alexander Graham Bell, the inventor of the telephone.

BELL, Andrew, Scottish educator, author of the mutual instruction or "Madras" system of education: b. Saint Andrews, 27 March 1753; d. Cheltenham, England, 27 Jan. 1832. He was educated at the university of his native town, resided for seven years in Virginia as tutor to a planter's family, and on returning took orders in the Church of England. In 1787 he went to India, where he held eight years army chaplainships simultaneously and became manager of the institution for the education of the orphan children of European soldiers at Madras, established by the East India Company. The superintendence of this asylum was undertaken by Dr. Bell, who, though the love of money was his besetting weakness, refused the salary of 1,200 pagoda (1480) which was attached to it. Failing to retain the services of properly qualified ushers he resorted to the expedient of conducting his school through the medium of the scholars themselves. It was in the mode of conducting a school by means of mutual in-
struction that the new method of Dr. Bell consisted; and its value as an abbreviation of the mechanical part of teaching, and the large numbers to be taught economically, could not be easily overestimated at the time. His system, however, is now abandoned. From the commencement of his experiment he made the school as far as possible, do everything for themselves; they ruled their own paper, made their own pens, etc., while the teacher only directed them. The maxim of the school was that no boy could do anything right the first time, but he must learn when he first set about it, by means of his teacher, so as to be able to do it himself ever afterward. After superintending the school for seven years he found it necessary for his health to return to Europe. On his arrival he published in 1797 a pamphlet entitled 'An Experiment in Education made at the Male Asylum of Madras,' in which he gave an account of his system. He founded a national society for the education of poor children by means of his system, to be supported by the sale of school books. The first place in England where the system was adopted was the charity school of Saint Bodolph's, Alldgate, and gradually, especially through the influence of Joseph Lancaster, who founded a rival society on non-sectarian lines, it was widely carried out in England, and indeed in almost every other civilized country. Dr. Bell became in 1801 rector of Swanage, Dorset, and in 1819 acquired the dignity of a prebendary of Westminster and was master of Sherburn Hospital, Durham. He employed himself during his later years in writing several works on education, among which the most valuable were 'The Elements of Tuition,' 'The English School' and 'Brief Manual of Mutual Instruction and Discipline.' Before his death he gave over to trustees £12,000 3 per cent stock for education, half of it for the purpose of founding an academy in his native city. His method was the forerunner of the pupil-teacher system. Consult 'Life by Southey (1844); Meiklejohn, 'An Old Educational Reformer' (1881).

BELL, Sir Charles, Scottish anatomist: b. Edinburgh November 1774; d. near Worcester, England, 28 April 1842. He studied anatomy under his brother, John Bell (q.v.), and had scarcely reached manhood before he had proved himself to be a first-rate anatomist as well as an excellent lecturer. In 1804, being already known by his published works, he went to London, and in 1811 published an essay entitled 'A New Idea of the Anatomy of the Brain,' containing the important discovery of the distinction between sensory and motor nerves, on which his fame chiefly rests. In 1812, he was appointed surgeon to the Middlesex Hospital, to whose prosperity he afterward greatly contributed. In 1824 he accepted the chair of medicine and surgery to the London College of Surgeons, and in 1836 that of surgery in the University of Edinburgh. His principal works are 'Anatomy of Expression' (1806); 'System of Operative Surgery'; 'Anatomy and Physiology,' with his brother John; 'Anatomy of the Nervous System' (1830); and the 'Bridgewater Treatise on the Hand' (1833); 'The Institutes of Surgery' (1838), and 'Practical Essays' (1841). He was knighted in 1831. There is a life in French by Pichot (1882), and in 1870 a selection from Sir Charles Bell's correspondence was published.

BELL, Charles Frederick Moberly, English journalist, managing director of the London Times: b. Alexandria, Egypt, 2 April 1847; d. London, 5 April 1911. Started a young man on a commercial career in Egypt, in 1865, aged 18, he took a vacation in walking along the entire length of the Suez Canal (103 miles) then in course of construction, and sent a glowing account of his trip to the London Times, pointing out the enormous advantage and brilliant prospects of the undertaking. At that time the venture was still decried in England as a colossal folly, and Bell's article was received with a shower of reproach. When the canal was opened, four years later, and speedily became one of the world's most important highways, the young correspondent's prophecy was amply fulfilled. He was appointed by The Times to send reports of news from Egypt, which he did for many years while on his business as a cotton merchant. He kept the outside world in close touch with Egyptian affairs, especially the profligate rule of the Khedive Ismail. The Arabi Pasha rebellion in 1882 gave him his chance. With unerring finger he pointed out the real instigators of the revolt, who were using Arabi as a tool to further their own purposes. The Anglo-French intervention was directly due to Bell's writings in The Times; it was he who drove Gladstone into the only act of foreign aggression that statesman was ever guilty of. When the French fleet withdrew from the harbor of Alexandria, the British squadron remained and bombarded the rebel positions in the forts, afterward landing troops. This proceeding led to the British occupation and ultimate absorption (17 Dec. 1914) of Egypt. Bell was an attentive eyewitness of these historic events, and his descriptions of them were masterpieces of journalistic composition. In 1900 Bell was invited to come to London and take over the management of The Times. That paper had just passed through a critical period. The disastrous Parnell case (q.v.) had cost The Times over a million dollars and a strong hand was needed to guide the business side of the concern. For 21 years Bell labored with terrific energy in that post and finally died in his office chair while writing a letter respecting newspaper copyright. He led the paper into avenues distinct from journalism, such as publishing the 9th and 10th editions of the 'Encyclopedia Britannica,' The Times 'Atlas,' The Times 'History of the War in South Africa,' and instituted The Times Book Club. He chartered a steamer for a Times correspondent to follow the naval operations of the Russo-Japanese War; established a private wireless system and inaugurated the first service of wireless press messages across the Atlantic. A man of immense stature, with a keen, hot, quick driving force, he spared neither himself nor those who worked under him. He had the gift of choosing the right men for allotted positions, and never failed to encourage merit and reward those who had achieved any success for the paper. He published three books on Egypt.
BELL, Clark, American writer on medical jurisprudence: b. Whitesville, N. Y., 12 March 1832. After practising law for eight years he became, in 1861, assistant district attorney of Steuben County, N. Y. Later he became attorney of the Pacific Railroad and as such drew up the act by which Congress authorized its construction. In 1883 he became editor of the Medico-Legal Journal, in which position he continued for many years. He was president of the Medico-Legal Society for 10 terms and organized its Congress on Tuberculosis. In 1900 and in 1906 he was a delegate to the International Medical Congress, held respectively at Paris and Lisbon. Among his works are 'Bell's Medico-Legal Studies' (11 vols. 1893); 'Judicial History of the Supreme Court of the United States and Provinces of North America' (1895); 'Spiritism, Telepathy and Hypnotism' (1902, 2d ed., 1904).

BELL, Currer. See Bronte, Charlotte.

BELL, Digby (Valentine), American actor and singer in comic opera: b. Milwaukee, Wis., 1849; d. 20 June 1917. His earlier years were spent in the steamship business, but later he was converted to take up the cultivation of his voice in Naples. His first appearance was made in Malta, in 1876. Since then he has been prominent on the American comic opera stage, touring the United States and Canada with Augustin Daly's, the McCaul Opera Company and the Duff Opera Company. His most notable successes have been in the Gilbert and Sullivan operas, especially as the Admiral in 'Pinafore,' as Ko-Ko in 'Mikado' and in 'Patience.' He played Sam Wolfe with De Wolf Hopper in 'Mr. Pickwick' and also starred in 'Tar and Tartar.' In 1912 he appeared in a revival of 'The Mikado.' Since then he has become a motion picture star.

BELL, Ellis. See Bronte, Emily Jane.

BELL, George Joseph, Scottish lawyer, brother of Sir Charles and John Bell: b. Edinburgh, 26 March 1770; d. 1843. He passed as advocate in 1791, and became one of the first authorities on the subject of mercantile jurisprudence and the law of bankruptcy. This distinction he earned for himself by the publication of a work which first appeared in 1804, under the title of 'Commentaries on the Laws of Bankruptcy,' but in subsequent editions was extended and appeared as 'Commentaries on the Laws of Scotland and on the Principles of Mercantile Jurisprudence.' This work, notwithstanding recent changes in the law, is still a standard. Besides the work above mentioned, he published 'Principles of the Law of Scotland,' the 10th edition of which was issued in 1897; and other works.

BELL, Henry, Scottish engineer, the first successful applier of steam to the purposes of navigation in Europe: b. Torphichen, Linlithgowshire, 2 April 1767; d. Helensburgh, 14 Nov. 1830. He practised for several years, at Glasgow, the craft of a house carpenter, but in 1808 removed to Helensburgh, where he continued to prosecute his favorite task of mechanical scheming, without much regard to the ordinary affairs of the world, though he became proprietor of baths there. The application of steam to navigation had already been attempted by Mr. Miller of Dalswinton (among others), who, in 1788, had a vessel constructed, propelled by a small engine and paddle-wheel, the scene of operations being a loch on his own property in Dumfriesshire. Some further experiments were made, yet the scheme had no practical result for a long time. Henry Bell, however, have turned his attention to the subject before the end of the century, and in January 1812 produced the Comet, a vessel 40 feet long, which was found in a great measure to answer the purpose contemplated. This vessel could make with a head tide in the river at the rate of five miles an hour, and continued to ply on the Clyde for a number of years. It may be mentioned that Mr. Robert Fulton, an American engineer, had launched a boat upon this principle in 1807, and that it performed long voyages upon the Hudson River; but it has been proved that Fulton had derived assistance in the construction of his vessel from Bell, who must therefore be allowed the praise of having done, in his own country, what all other men, notwithstanding the superior advantages of skill and capital, had failed in doing. Bell lived to see the bosom of the Clyde dotted far and wide by innumerable copies of his own invention; to know that steamboats promised to give a new turn to the art of general warfare; and yet he reaped for himself little advantage. While mankind at large were enjoying the blessings which he had pointed out to them, he approached the confines of old age with the prospect of hardly the average comforts which attended that stage of existence in the humbler walks of society. Touched by his condition, a number of benevolent individuals instituted a subscription in his behalf, and it is creditable to the good feeling of the citizens of Glasgow and other places that a considerable sum was raised. The trustees on the river Clyde also gave him an annuity of £100, which he enjoyed for several years, the half of which sum was continued to his widow. A monument was erected to his memory at Dumbarton Point on the Clyde. See Steam Vessels.

BELL, Henry Glassford, Scottish lawyer and author: b. Glasgow 1803; d. 1874. He founded the 'Edinburgh Literary Journal' 1828, was admitted to the bar in 1832, became one of the most esteemed Scottish mercantile lawyers of his day and sheriff of Lanarkshire 1867-74. He published a spirited defense of Mary Queen of Scots (1830), 'Summer and Winter Hours' (1831); 'My Old Portfolio' (1832); 'Romances and Minor Poems' (1866).

BELL, Henry Haywood, American naval officer: b. North Carolina 1808; d. 11 Jan. 1868. He was appointed a midshipman in 1823, and served on the Grampus when she was engaged in clearing the Cuban coast of pirates. For many years he served with the East Indian squadron, and commanded one of the vessels that captured the Hannibal, which, on 14 Nov. 1811, destroyed four forts near Canton, China. Shortly after the outbreak of the Civil War he became fleet captain of the Western Gulf squadron. He commanded one of the three divisions of the fleet which captured New Orleans. In 1865 he took command of the fleet, and, with the rank of commodore; in 1866 was promoted to rear-admiral and, after resigning his command, he was drowned at the mouth of the Osaka River, Japan.
BELL, Isaac, American philanthropist: b. New York, 4 Aug. 1814; d. there, 30 Sept. 1897. In 1832 he was admitted to the bar, and when 14 years old, and in 1836 became interested in large financial and other concerns. About this time he began to devote himself to the work of benevolent institutions, and was president of the department of charities and correction 1857-73. It was principally through his efforts that the Bellevue Hospital, and also the Bellevue Hospital Medical College, were founded. In connection with the first institution he established the system of ambulance service. He was also largely instrumental in the establishment of the Normal College, and was responsible for the schoolship Mercury, which came under the control of the department of charities and correction, and of the Saint Mary's, as well, loaned by the Navy Department to the Department of Education, of which he was also for a long time a member. During the Civil War he was active in raising and disbursing money for the benefit of New York veterans, and in aiding soldiers' wives, widows and orphans.

BELL, James, Scottish geographer: b. Jedburgh 1769; d. 1833. After receiving a liberal education he served an apprenticeship to the weaving business, and in 1790 commenced the manufacturing of cotton goods upon a large and respectable scale. In the depression occasioned by the shock of the French Revolution in 1793, he was reduced to the condition of a common warer; but having relinquished that line of life, he was about the year 1815 engaged to improve the 'Glasgow System of Geography,' a work which had met with considerable encouragement, and was now, chiefly by the labors of Mr. Bell, extended to five volumes. It was well received by the public, and formed the basis of his principal work, 'A System of Popular and Scientific Geography,' published at Glasgow in 1830 in six volumes. His annotated edition of 'Rollins' Ancient History' (1828), was a notable piece of work. His 'Gazetteer of England and Wales' was in the course of publication at the time of his death.

BELL, James, Canadian physician: b. North Gower, Ontario, 10 Oct. 1852; d. 11 April 1911. He was graduated at McGill University in 1877; became house surgeon of the Montreal General Hospital the same year, and medical superintendent of it in 1881. In 1885 he became a member of the hospital staff as assistant surgeon, and in 1886 full surgeon. In 1894 he was making consulting surgeon to the General Hospital and surgeon of the Royal Victoria Hospital of Montreal, and professor of clinical surgery in McGill University.

BELL, James Franklin, American soldier: b. Shelbyville, Ky., 9 Jan. 1856. He was graduated from the United States Military Academy 1878; he was appointed additional second lieutenant of Engineers 12 Jan. 1878; transferred to 7th Cavalry, 9 Aug. 1878; first lieutenant 1890; major of Engineers, United States Volunteers, 1898; captain, United States army, 2 March 1899; major, assistant adjutant-general, United States Volunteers, 17 Apr 1899; colonel of 36th Volunteer Infantry, 5 July 1899; brigadier-general of volunteers, 5 Dec. 1899; brigadier-general, United States army, 19 Feb. 1901; major-general, 3 Jan. 1907. He served on plains in 7th United States Cavalry, 1878-94; captured band of half-breed Cree Indians, near Fort Big Horn, 1879; in Sioux campaign, Pine Ridge, S. D., 1891; adjutant of regiment and secretary to the Cavalry and Light Artillery School 1891-94; aide to Gen. J. W. Forsyth in California, Arizona and Washington; was awarded Congressional Medal of Honor, 27 Nov. 1899, for most distinguished gallantry in action, 9 Sept. 1899, near Porac, Luzon, P. I.; commanded 4th brigade, second division, 8th Army Corps, and third district, department of northern Luzon, to July 1900, provost-marshal-general of Manila, P. I., to Feb. 1901; commanded first district, department of northern Luzon, to November 1901, and third brigade, department of southern Luzon to December 1902; returned to the United States in 1903; commandant of Infantry and Cavalry School, Signal School and Staff College to April 1906; chief of staff, United States army, April 1906 — April 1910; commandant of the Philippines Division, January 1911 - April 1914. Assigned to army of the Philippines Division, United States army, May 1914, which he commanded until demobilized in October 1915, then assigned to command Western department, with headquarters at San Francisco, December 1915. In 1917 Maj. Gen. Bell was placed in charge of the 77th Division of the New National Army, consisting of draft quotas from New York city and State, at Camp Upton, Yaphank, Long Island.

BELL, James Montgomery, American soldier: b. Williamsburg, Pa., 1 Oct. 1837. He entered the 80th Ohio Volunteers 1861, and served with distinction throughout the Civil War, being twice brevetted for gallant and meritorious services in the battles of the Wilderness and Ream's Station, Va. Entering the regular army as second lieutenant in 7th Cavalry, 1866, he took part in the Cheyenne and Arapahoe wars, 1867-69; the Sioux wars, 1876-81, and the Nez Percés war, 1877. He received a brevet-commission of lieutenant-colonel for gallant services in actions against the Indians at Cañon Creek, Mont., 13 Sept. 1877. He was an expeditionary brigade to the Camarines provinces, southern Luzon, 1900-01, and was appointed brigadier-general of volunteers, 20 Jan. 1900; was appointed brigadier-general, United States army, 17 Sept. 1901, and retired, 1 Oct. 1901.

BELL, John, Scottish traveler: b. Antermony, Stirlingshire, 1691; d. there, 1 July 1780. Having gone to Saint Petersburg in 1714, after the completion of his studies, he was sent as medical attendant on an embassy to the Sophy of Persia. On his return from Persia to the Russian capital in 1718 he found another embassy preparing to set out for China and obtained an appointment in it also. The embassy arrived at Pekin after a tedious journey of exactly 16 months; and returned, in January 1722. The Tsar now determined to undertake an expedition into Persia to assist the Sophy against the Afghans, his subjects, who had seized Kandahar and possessed themselves of several provinces on the Sintiers toward India. Bell's former journey to Persia gave him peculiar advantages and he was accordingly engaged to accompany the army to Derbend. In 1737 he was sent to Constantinople by the Russian
chancellor and the British Minister at the Russian court. He afterward settled at Constantinople as a merchant, and about 1746 married a Russian lady and returned to Scotland. The only work written by him is his 'Travels from Saint Petersburg in Russia to Various Parts of Asia' (1763).

**BELL, John**, Scottish surgeon: b. Edinburgh, 12 May 1763; d. Rome, 15 April 1820. He was a brother of Sir Charles and George Joseph Bell, and after completing his professional education traveled for a short time in Russia and the north of Europe, and on his return began to deliver lectures on surgery and midwifery. These lectures, delivered between 1786 and 1796, were very highly esteemed and speedily brought him into practice as a consulting and operating surgeon. The increase of his private practice, indeed, rendered it necessary for him, in 1796, to discontinue his lectures, and from that time forward he devoted himself to his patients and to the preparation of the several publications of which he was the author. Property came to him from all quarters, both of Scotland and England, and even from the Continent; and during that interval he performed some of the most delicate and difficult operations in surgery. The exclusion of visiting surgeons from Edinburgh infirmary led to an acrimonious controversy between Bell and Professor Gregory. Early in 1816 he was thrown by a spirited horse and never entirely recovered from the effects of the accident. He was the author of 'The Anatomy of the Human Body' (1794, 3d ed., with plates by Charles Bell, 1811); 'Engravings of the Bones, Muscles and Joints,' illustrating the first volume of the 'Anatomy of the Human Body,' drawn and engraved by himself (1794, 3d ed.); 'Engravings of the Arteries,' illustrating the second volume of the 'Anatomy of the Human Body' (1801); 'Discourses on the Nature and Cure of Wounds' (1795); 'The Principles of Surgery' (1801-08).

**BELL, John**, American statesman: b. near Nashville, Tenn., 15 Feb. 1797; d. Cumberland Iron Works, Tenn., 10 Sept. 1869. Graduating at Cumberland College (now University of Nashville) in 1814, he practised law until 1827, when he was elected to Congress from 1827-41; he then became Secretary of War in President Harrison's Cabinet, but resigned when President Tyler withdrew from the Whig party. From 1847 to 1859 he was senator from his State. He was chairman of several important committees and vigorously opposed the Kansas-Nebraska bill and the Lecompton Constitution framed for Kansas. In May 1850 he was nominated for President by the Constitutional Union party (q.v.), but was defeated. During the Civil War he took no active part in politics.

**BELL, John**, English sculptor: b. Hopton, Suffolk, 1811; d. 25 March 1895. His best-known works are the 'Eagle Slayer,' 'Una and her Unicorn,' 'The Host of S Consciousness,' 'Amorica,' 'The Wounded Clorinda,' statues of Lord Falkland, Sir Robert Walpole, Newton, Cromwell, etc., and the Wellington Memorial in the Guildhall. He was one of the sculptors of the Guards' Monument in Waterloo Place, London, and the marble group of the United States directing the progress of America for the Albert Memorial in Hyde Park, a replica of which in terra cotta is in Washington. His earlier works were notable in their departure from the frigid classicism that had up to then hampered expression in English sculpture, but his later works were marred by an obtrusive religiosity.

**BELL, John Joy**, Scottish author: b. 7 May 1871. He was educated at Kelvinside Academy, Morrison's Academy, Grieff and Glasgow University. His first novel, 'New Noah's Ark,' was published in 1898; but it was not until 1902 that he made a great popular hit with a series of sketches of humble life, 'Wee Macgregor,' in which the broad Glasgow dialect was effectively employed, the hero taking this place at once among the notable creations of Scottish fiction. The story was dramatized in 1912. 'Wee Macgregor Again' (1904); 'Wee Macgregor Enlists' (1915), are continuations of the series and in the same vein of dialect fiction are 'Mistress M'Lerrie' (1903); 'Our Christian Woman' (1908); 'Our Christian Tina' (1913) and 'Mr. Pennycook's Boy' (1905). He is also author of 'Clyde Songs' (1906-11); 'A Kingdom of Dreams' (1914), etc.

**BELL, John Keble** (KELBE HOWARD): English playwright and novelist: b. 8 June 1823. He was educated at Worcester College, Oxford, was editor of 'The Sketch' (1902-04); and founded the Croydon Repertory Theatre in 1913. He is the author of some 10 plays and his output in fiction has been considerable.

**BELL, Joseph**, Scottish surgeon and diagnostician: b. Edinburgh 1837; d. Milton Bridge, Midlothian, 4 Oct. 1911. His father, grandfather and great-grandfather had been surgeons before him. While his father was president of the Royal College of Surgeons he was elected a fellow of the college. Upon his father's death he succeeded him in that high and important office. While a medical student at the Edinburgh University Sir Arthur Conan Doyle became so impressed by the successful deductive powers of Dr. Bell, from what appeared to be minute evidence of a criminal diagnosis and prognosis, that he became the prototype of the famous romantic detective hero Sherlock Holmes.

**BELL, Lilian**, American novelist: b. Chicago, Ill., 1867. She began to write at the age of eight and afterward became widely known as a contributor to periodicals. In 1900 she was married to Arthur Hoyt Bogue, but continued to write under her own name. Her writings include 'The Love Affairs of an Old Maid' (1893); 'A Little Sister to the Wilderness' (1895); 'The Under Side of Things' (1896); 'From a Girl's Point of View' (1897); 'The Instinct of Stepfatherhood' (1898); 'As Seen by the Me' (1900); 'The Experiment' (1900); 'Yessum' (1901); 'Abroad With the Jimmies' (1902); 'Hope Loring' (1902); 'Sir John and the American Girl' (1901); 'The Interference of Josie' (1901); 'A Band of Girls' (1903); 'At Home with the Jardins' (1904); 'Carolina Lee' (1906); 'Why Men Remain Bachelors, and Other Luxuries' (1906); 'Concentrations of Bee' (1909); 'Angela's Quest' (1910); 'The Runaway Equator' (1912); 'The Story of the Christmas Ship'
BELL

(1915): 'About Miss Mattie Morningglory' (1916); 'The Land of Don't-Want-To' (1916).

BELL, Robert, Irish journalist and miscellaneous writer: b. Cork, 16 Jan. 1800; d. London, 12 April 1867. He settled in London in 1828, edited an important weekly paper, the Atlas, for several years, and afterward the Monthly Chronicle, Mirror and Home News. He compiled several volumes of Lardner's Cabinet Cyclopædia; wrote three plays, 'The Ladder of Gold,' a novel (1856); 'Hearts and Altar,' a collection of tales (1852), and did a great deal of miscellaneous literary work; but is best known by his annotated edition of the 'British Poets' (29 vols., 1854–57).

BELL, Robert, Canadian geologist: b. Toronto, Ontario, 3 June 1841. He was educated at McGill and Queen's universities, and in 1867 joined the Canada Geological Survey, and in 1900 was an assistant director of it. In 1861 he was elected a member of the American Institute of Mining Engineers; in 1881 he was a fellow of the Royal Society of Canada, and in 1888–89 was a member of the Ontario commission which reported on the mineral resources of that province. During his connection with the geological survey he made more extensive explorations throughout the Dominion than any other man. He was the author of about 150 reports and papers, a list of which is found in the Biblio of the Royal Society.

BELL, Thomas, English zoologist: b. Poole, Dorset, 1792; d. Seabourne, Hampshire, 1880. He studied medicine at Guy's and Saint Thomas' hospitals, London, became a member of the Royal College of Surgeons in 1815 and soon secured a large practice as a dentist. In 1832 he was appointed professor of zoology at King's College, London. Latterly he lived for a number of years at Selborne in the residence that had belonged to the celebrated Gilbert White. He was president of the Ray Society 1843–59, and of the Linnean Society 1853–61. His best-known separate works are his histories of 'British Quadrupeds' (1837, revised 1874); 'British Reptiles' (1839); and 'British Stalk-eyed Crustacea' (1853). In 1877 he published an excellent edition of White's 'Natural History of Selborne' with a memoir of its author.

BELL, a hollow vessel, which, by its vibrations when struck, gives forth sounds; whence its name, from the old Saxon word bellan, to bowl or bellow. It is an instrument of great antiquity, being spoken of by Hebrew writers, as in Exodus xxviii, where golden bells are prescribed as appendages to the dress of the high priest, that notice may thus be given of his approach to the sanctuary. And at this day the bell is used for a similar purpose before the priest, in Roman Catholic countries, as he proceeds to administer the Holy Viaticum to the soul that is passing away; and so when the bell is tinkled, in administering the sacrament, by the same priest, it is in pursuance of a custom founded on the ancient Hebrew use of the bell. Only more than the other instruments are bells associated with the serious and imaginative, as also with the most joyous and the saddest feelings of mankind. The metal from which bells are usually made (by founding), is an alloy, called bell-metal, commonly composed of 90 parts of copper and 20 of tin. The proportion of tin varies, however, from one-third to one-fifth of the weight of the copper, according to the sound required, the size of the bell and the impulse to be given. The clearness and richness of the tone depend upon the metal used, the perfection of its casting, and also upon its shape; it having been shown by a number of experiments that the well-known shape with a thick lip is the best adapted to give a perfect sound. The depth of the tone of a bell increases in proportion to its size. A bell is divided into the body or barrel, the ear or cannon, and the clapper or tongue. The lip or sound bow is that part where the bell is struck by the clapper.

The sound of a bell is a compound tone, presenting five and in many instances more notes to the ear. There is a great difference between the harmonics of a bell and of a vibrating string. In the case of the former a minor third is not infrequently one of the loudest tones next to the fundamental tone. When a bell is properly struck the first note which is heard is the fundamental, the second note is known as the strike note, tap note or fundamental, and forms what is called the note of the bell. The low sound heard after the strike note has lost its intensity is called the hum note, and the highest note is known as the strike note the nominal. There are also present a minor third and a perfect fifth in the first octave, and a major third and a perfect fifth in the second octave. Very few bells agree with these conditions. Generally the hum note is a sixth or seventh, and in rare cases a ninth below the strike note. The nominal is somewhere about an octave or a ninth above the strike note, and the other notes diverge accordingly. Bells that are swung are more likely to conform to the conditions than those that are struck.

Bells were used very early in the form of cymbals and hand bells in religious services. In Egypt the feast of Osiris was announced through the ringing of bells. Bronze bells have been found in Assyria. Bells were struck by Aaron and the high priests of the Jews on the borders of their robes, and in Athens the priests of Cybele used them in their offerings. The Romans also used bells which they called tintinabula, to announce the public assemblies, and, according to Suetonius, Augustus had a bell suspended before the temple of Jupiter. In the Christian churches a similar custom early came into use, though it is not known that in the first Christian churches divine service was announced by any such method. They were used, however, in the early monasteries to announce the hours of prayer. Generally they were made of tubes struck with a hammer. They are said to have been first introduced into Christian churches about 400 A.D., by Paulinus, bishop of Nola in Campania (whence campana and nola as old names of bells); although their adoption on a wide scale does not become apparent until after the year 550, when they were introduced into France. They are rung to summon monks and choir nuns to the office, and the people to mass, to announce the Angelus, to toll during funerals and peal on occasions of joy. They are blessed with elaborate ceremonies and consecrated or 'baptized' in honor of some saint.
Until the 13th century they were of comparatively small size, but after the casting of the Jacquemart of Paris (6½ tons) in 1400, their weight rapidly increased. Among the more famous bells are the bell of Cologne, 11 tons, 1448; of Dantzic, 6 tons, 1453; of Halberstadt, 7½; of Rouen, 16, 1501; of Breslau, 1542; of Salamanca, 1550; of Oxford, 1712, 1680; of Paris, 12½, 1680; of Bruges, 10½, 1680; of Vienna, 17¾, 1711; of Moscow (the monarch of all bells), 193, 1736; three other bells at Moscow ranging from 16 to 31 tons, and a fourth of 80 tons, cast in 1819; the bell of Lincoln (Great Tom), 5½, 1834; of York Minster (Great Peter), 10½, 1845; of Montreal, 13½, 1847; of Westminster (Big Ben), 15½, 1859; Saint Stephen, 13½, 1858; the great bell of Saint Paul's, 17½, 1882. Others are the bells of Ghent, 5; of Brussels, 10½; Saint Peter's, Rome, 8; Antwerp, 7½; Olmütz, 18; Brussels, 7; Novgorod, 31; Pekin, 53½. (See Bells; Chimes.) Consult Gatty, 'The Bell: Its Origin and Uses' (1848); Lukis, 'Church Bells and Their Founder's' (1857); Andrews, 'History of Church Bells' (1885); Otte, 'Glockenkunde' (1884); Tyack, 'A Book About Bells' (1899).

**BELL, Liberty,** the bell in Independence Hall, Philadelphia, that was rung to announce the adoption of the Declaration of Independence by the Continental Congress. The bell was cast in London by Robert Charles and cost about $500. The specifications provided that it was to be made by the best workmen, to be examined carefully before being shipped and to contain, in well-shaped letters around it, the inscription: "By order of the Province of Pennsylvania, for the State House in the City of Philadelphia, 1752." An order was given to place underneath this the prophetic words from Leviticus xxv, 10: "Proclaim liberty throughout the land and to all the inhabitants thereof." The reason for the selection of this text has been a subject of much conjecture, but the true reason is apparent when the full text is read. It is as follows: "And ye shall hallow the 50th year and proclaim liberty unto all the inhabitants thereof. In selecting the text, the Quakers had in memory the arrival of William Penn and their forefathers more than half a century before. In August 1752, the bell arrived, but though in apparent good order, it was cracked by a stroke of the clapper while being tested. It could not be sent back as the captain of the vessel who had brought it over could not take it on board. Two skilful men undertook to recast the bell, a bell being provided which pleased very much. But it was found to be defective also. The original bell was considered too high in tone, and in an attempt to correct this fault, too much copper was added. There were a great many Witticisms on account of the sound fault, and ingenious workmen undertook to recast the bell, which they successfully did, and it was placed in condition in June 1753. On Monday, 8 July (not the 4th), at noon, true to its motto, it rang out the memorable message of "Liberty throughout the land and to all the inhabitants thereof." For years the bell continued to be rung on every festival and anniversary, until it eventually cracked 8 July 1835, while being tolled in memory of Chief Justice Marshall. An ineffectual attempt was made to cause it to continue service by enlarging the base of its dissolution and clipping its edges. It was removed from its position in the tower to a lower story, and only used on occasions of public sorrow. Subsequently, it was placed on the original timbers in the vestibule of Independence Hall, and in 1873 was suspended in a prominent position immediately beneath where a larger bell, presented to the city in 1866, now proclaims the passing hours. In 1893 it was taken to Chicago and placed on exhibition at the World's Columbian Exposition. In 1915 it was taken to the Panama-Pacific Exposition at San Francisco and placed on exhibition.

**BELL, Song of the ('Lied von der Glocke'), a poem which is generally considered Schiller's masterpiece. It was first published in the *Mussenalmanach*, in 1800. In this work the various operations attending the casting of the bell are made to symbolize the whole course of human life.

**BELL-BIRD,** the name given to birds in various parts of the world, which utter bell-like notes; especially the *campanero* (Chasmorhynchus nivicae), one of the chattering of the South American family, *Cotingidae*. It resembles, in form and size, the North American wax-wing, but is pure white, and has a remarkable appendage upon its forehead. This consists of a fleshy, tapering caruncle, which is black, thinly covered with star-like tufts of minute feathers. This caruncle ordinarily hangs loosely down at the side of the beak, but in moments of excitement becomes swollen and much extended, reaching a length of even five inches. This seems to be produced by air forced into its elastic tissues from the bird's lungs, and occurs whenever the characteristic notes are uttered. The bird's voice has been described by many travelers as like the sound of a loud, clear bell, which rings out over the forest at mid-day, when most other birds are silent. Waterton said: "You hear his toll and then a pause for a minute, then another toll, and then a pause again, and then another toll, and so on." Others have compared the sound to a blow upon an anvil, and all agree that it can be heard a great distance. Several other species exist in central and southern South America, which have caruncles, and utter extraordinary, ringing notes; but the former belief, that the loud voice was aided by these hollow appendages, is now known to be erroneous. These birds go about in small flocks, which fly through the tree-tops, and feed mainly upon forest fruits. They have been particularly studied by J. J. Quelech, a naturalist of British Guiana, an account of whose interesting investigations will be found in *The Field* of London, for 26 Nov. 1892.

In Australia, the name *bell-bird* is given to one of the honey-suckers (q.v.), whose chattering is welcomed by travelers in the forest as an indication that water is near. The *bell-bird* of New Zealand is another honey-sucker (Anthornis melanura), whose voice, usually heard in chorus, resembles the tinkling of a silver bell.

**BELL, BOOK, and CANDLE,** a mode of excommunication employed in the Roman Catholic Church between the 7th and 10th cen-
turies. After sentence read, the book is closed, a lighted candle thrown to the ground, and a bell tolled as for one dead.

**BELL-FLOWER.** See **Campanula.**

**BELL ROCK, or INCH CAPE,** a dangerous reef of sunken sandstone rocks on the east coast of Scotland, about 12 miles from Arbroath, at the mouth of the Tay. It is about 700 yards long and at certain tides a great part of it is uncovered, and directly in the way of vessels making for the firths of Forth and Tay. The Inch Cape or Bell Rock reef was long the terror of seamen, and on it numerous vessels were wrecked. At a very early period the Inch Cape Rock was unhappily too well known, and tradition has it that one of the abbots of Aberbrothock succeeded in placing a bell upon it (hence the name), in such a way as to be rung by the motion of the waves, to warn sailors of its proximity. The legend tells us that a notorious Dutch sea pirate cut the bell from the rock, and on returning with his ship laden with spoils from one of his piratical expeditions his crew perished, as an old historian has it, "by the righteous judgment of God," for want of the signal which he had so wantonly removed. On this legend Southey has founded his well-known ballad of "The Inch Cape Rock." The lighthouse on the rock was designed by Robert Stevenson in 1800. It was erected in 1810 and is 100 feet high.

**BELL-SMITH, Frederic Marlett,** English artist: b. London, 26 Sept. 1846. He went to Canada in 1866 and was for seven years art director at Alma College, Saint Thomas, and teacher of drawing in the public schools of London, Ontario. About 1888 he became a portrait and figure painter, but he is best known as a painter of landscapes. In 1894 he produced "Lights of a City Street," his greatest achievement up to that year, and later two canvases depicting incidents connected with the death of Sir John Thompson. He is president of the Ontario Society of Artists.

**BELLA GIARDINIERA,** bella-zhär-de-närä, La, a celebrated painting by Raphael, now in the Louvre. It represents the Madonna with the infant Saint John.

**BELLADONNA, or DWALE,** Deadly Nightshade (Atropa belladonna), a perennial disagreeable-smelling herb of the Solanaceae family, is a native of the region from southern Europe to India, but widely naturalized in civilized countries. It is an erect plant which sometimes attains a height of six feet; has entire, ovate leaves, purple, bell-shaped, nodding axillary flowers, single or in pairs, and shining, black, sweetly scented flowers as large as large currants. The plant has long been reputed poisonous but is used in medicine, especially by oculists, because of its property of dilating the pupil of the eye. It is said to derive its name, belladonna ("beautiful lady"), from its use as a cosmetic for distending the pupil and giving the eye a bright glistening appearance and also from the use of the juice for staining the skin. Its names, deadly night shade, and dwale (which latter is believed by some to come from the same source as the French dewil, sorrow, and by others from the Anglo-Saxon dull, because of its stupefying effects), refer to popular belief in the plant's poisonous properties. The generic name came from Atropos, the fate who cut the thread of life.

**BELLADONNA LILY.** See **Amaryllis.**

**BELLAIRE, bel-lärë,** Ohio, city in Belmont County, on the Ohio River, and several railroads, five miles south of Wheeling, W. Va. The river here crossed by a costly iron railroad bridge. Bellaire is the center of a region rich in coal, iron, cement, brick, clay and limestone, and has manufactory of stoves, glass, carriages, boilers and foundry and machine shop products. The United States census of manufactures for 1914 reported 40 industrial establishments, employing 2,865 persons, of whom 2,603 were wage earners who receive annually $1,506,000 in wages. The capital invested aggregated $7,671,000, and the value of the year's output was $9,278,000; of this, $2,892,000 is the value added by manufacture. Bellaire adopted the Federal plan of government in 1910, and owns its waterworks. The city has a national bank, high-grade schools, and public institutions, daily and weekly newspapers, and an assessed property valuation of over $3,-000,000. Pop. (1910) 12,946; (1914) 14,000.

**BELLMONT, or BELLOMONT, Richard Coote** (Earl of), royal governor of New York and Massachusetts: b. 1636; d. New York, 5 March 1701. He was returned to Parliament for Droitwich in 1668, was a strong supporter of William III, was raised to the earldom of Bellamont in the peerage of Ireland 1689, and continued to hold his seat in the Commons. He was appointed governor of New York and Massachusetts in May 1696, and was in New York until May 1698. His administration was uneventful, his time having been occupied in the pursuit of the pirates who infested the coast, one of whom, the notorious Kidd, he had assisted in fitting out for the suppression of illicit trade and piracy, but whom he ultimately secured and sent to England in 1700. He was disliked by the aristocratic party in New York, but was very popular in New Hampshire and Massachusetts and distinguished by an honorable and substantial character. Hutchinson speaks of Bellamont as being a hypocrite in a pretended devotion to religion. It appears, however, that while living at Fort George, in New York, he passed much time in meditation and contrition for his youthful excesses. Consult De Peyster, 'Life and Administration of Richard, Earl of Bellamont' (1869).

**BELLAMY, Edward,** American author: b. Chicopee Falls, Mass., 29 March 1850; d. there, 22 May 1898. He was educated in Germany; admitted to the bar; was on the staff of the Evening Post of New York in 1871-72; and on his return from the Sandwich Islands in 1877, founded the Springfield News. He is best known by his novel 'Looking Backward' (1888), a socialistic work, of which an immense number of copies were sold in two years. This led to the formation of Nationalists in which in which work Mr. Bellamy took active part. His other books are 'Six to One; a Nantucket Idyl' (1878); 'Dr. Heidenhoff's Process' (1880); 'Miss Ludington's Sister' (1884); 'Equality' (1887); 'The Price of Peace' (1901), a sequel to 'Looking Backward.'
BELLAMY — BELLE-ALLIANCE

BELLAMY, Samuel, a notorious pirate, was wrecked in his ship, the Whidah, of 23 guns and 130 men, off Wellfleet, on Cape Cod, in April 1717, after having captured several vessels on the coast and an indecisive engagement with a French ship proceeding to Quebec. Only one Indian and one Englishman escaped of his crew. Six of the pirates, who had been run ashore when drunk a few days previous, by the captain of the captured vessel, were hung in Boston in November 1717.

BELLANGÉ, bě:l-än-zhă, Hippolyte, French painter: b. Paris 1800; d. 1866. Attention was first directed to him by his painting of ‘The Return of Napoleon from Elba,’ exhibited in 1834. He was director of the museum at Rouen, 1837-53. Among his many noted battle pieces are ‘Battle of Wagram’ (1837); ‘Kellerman’s Charge at Marengo’ (1847); ‘Battle of the Alma’ (1855); ‘Assault on Malakoff’ (1859); ‘Cuirassiers at Waterloo’ (1865); ‘The Guard Dies’ (1866).

BELARMINO, bě:l-ār-mě:nō, or BEILARMINE, Roberto Francesco Romolo, Italian cardinal and controversialist: b. Monte Pulciano in Tuscany, 4 Oct. 1542; d. Rome, 17 Sept. 1621. At the age of 18 he entered the College of Jesuits, where he soon distinguished himself; and his reputation caused him to be sent to the Low Countries to oppose the progress of the reformers. He was ordained in 1569 by Jansensius, bishop of Ghent, and placed in the theological chair of the University of Louvain. After a residence of seven years he returned to Italy, and was sent by Sixtus V to France, as companion to the legate. He was made a cardinal on account of his learning, by Clement VIII, and in 1602 created archbishop of Capua. At the elections of Leo XI. and Paul V he was thought of for the pontificate, and might have been chosen had he not been a Jesuit. Paul V recalled him to Rome; Belarmino had the double merit with the court of Rome of supporting her temporal power and spirit of the utmost, and of strenuously opposing the reformers. The talent he displayed in the latter controversy called forth similar ability on the Protestant side; and for a number of years no eminent divine among the reformers failed to make his arguments a particular subject of refutation. The great work which he composed in this warfare is entitled ‘A Body of Controversy,’ written in Latin, the style of which is perspicuous and precise, without any pretension to purity or elegance. He displays a vast amount of Scriptural learning, and is deeply versed in the doctrine and practice of the Church in all ages. His maxims on the right of pontiffs to depose princes caused his work on the temporal power of the Pope to be condemned at Paris. On the other hand, it did not satisfy the court of Rome, because it asserted, not a direct, but an indirect, power in the Popes in temporal matters; which reservation so offended Sixtus V that he placed it among the list of prohibited books. His controversial works were published at Prague in 1721, and again at Mayence in 1842. Of his other works the most important is his ‘Christianae Doctrinae Applicatio’ (1600) — a work originally composed in Italian, but since translated into all European languages. He left an autobiography, which was reissued and annotated by Döllinger and Reusch (1887).

BELLARY, bě:l-lārē, or BALLARI, India, town in the presidency of Madras, capital of a district of the same name, 200 miles northwest of Madras. It is the headquarters of the troops belonging to the districts of Bellary and Kadapa, is connected by good roads with Belgaum, Bangalore, Hyderabad and Madras, and possesses two forts, one built on the summit, and the other on a lower eminence of a huge granite rock about two miles in circumference, giving to the height of about 450 feet from the ground. Bellary is the terminus of a branch line of the Madras Railway, and carries on an active trade in cotton. Pop. (1911) 58,247.

BELLAVITIS, bě:l-lā-větīs, Giusto, COUNT, Italian mathematician: b. Bassano, 22 Nov. 1803; d. 6 Nov. 1880. In 1841 he became professor of mathematics at the Institute of Vicenza. Four years later he was appointed professor of geometry at Padua, later having algebra added to this subject. His writings include important contributions to modern geometry, especially in the field of projective geometry. His chief works are a series of textbooks on geometry (Padua 1851), a work on analytical geometry (Padua 1870) and a work on algebra (Padua 1875).

BELLAY, bě:lā, Joachim du, French poet, known as the French Ovid: b. about 1524; d. 1560. He joined Ronsard, Davoy, Jodelle, Belleau, Balf and De Tisard in forming the ‘Pléiade,’ a society the object of which was to bring the French language on a level with the classical tongues. Bellay’s first contribution was ‘La défense et l’illustration de la langue française.’ His chief publications in verse are ‘Recueil de poésie’; a collection of love-songs called ‘L’Olive’; ‘Les antiquités de Rome.’ a series of sonnets; ‘Les regrets’; and ‘Les jeux rustiques.’ His poems are strongly personal in tone, and they are suffused with militant melancholy. In 1555 he became canon of Notre Dame, and a short time before his death he was nominated archbishop of Bordeaux. A statue of Bellay was unveiled in Ancenis in 1894. Spencer translated some of his Roman sonnets into English; and there are translations of poems by him in Andrew Lang’s ‘Ballads and Lyrics of Old France.’ Consult ‘Life’ by Seche (Paris 1880); Pater, ‘Studies in the History of the Renaissance’ (London 1898). His letters, edited by Nolbâ already appeared in 1883.

BELLE-ALLIANCE, běl-ā-lě-âns, La, a farm 13 miles south of Brussels, famous as position occupied by the centre of the French army in the battle of Waterloo, 18 June 1815.
By the Prussians the battle was called that of Belle-Alliance.

BELLE CHOCOLATIÈRE, bé-lé-šó-kô-là-týár La, a noted portrait by the artist Löfftz painted in 1828. The Princess Dietrichstein, who prior to her marriage, was a waitress in a café in Vienna. The painting is now in the Dresden Gallery.

BELLE ISLE, Va., an island in the James River, opposite Richmond, where nearly 12,000 Federal prisoners were confined in 1863.

BELLE ISLE, bel-é, or BELLE ISLE-EN-MER (anciently Vindelis), an island in the Bay of Biscay, belonging to France, in the department of Morbihan, eight miles south of Quibéron Point, about 11 miles long, and 6 miles across at the widest point. The soil is diverse, consisting of rock, salt marsh and fertile grounds. Palais is the capital. The island is of much interest historically. In 1747 the French fleet was defeated by Admiral Hawke off the island, and it was captured by the English in 1761. Flichard and sardine fishing is the important industry. Pop. 10,000.

BELLE ISLE, North, or BELLE ISLE, an island lying off Newfoundland and northeast of the Gulf of Saint Lawrence, about 21 miles in circuit. On the northwest side it has a small harbor, called Lark Harbor, within a little island close to the shore. At the eastern point it has another small harbor or cove that will admit only fishing shallop. A rescue station has been established for persons who may be shipwrecked. Its area is about 15 square miles. At its southern end is a lighthouse whose light is 490 feet above the sea, and visible for 28 miles. The narrow channel between Newfoundland and the coast of Labrador is called the Straits of Belle Isle. Steamers from Glasgow and Liverpool to the Saint Lawrence commonly go by this channel in summer as the shortest route. In winter and spring it is choked with ice. Jacques Cartier passed through it in 1534.

BELLE PLAINE, Iowa, town in Benton County, on the Iowa River and the Chicago and Northwestern Railroad, 90 miles northeast of Des Moines, and 257 miles west of Chicago. It has flouring mills, furniture factories, creameries, marble shops, broom factories, a brick and tile factory, a brass foundry, a cannie and numerous artesian wells. It was founded in 1862 and was first incorporated in 1879. Pop. 3,121.

BELLE SAVAGE (Fr. Belle Sauvage, beautiful savage), an old inn, on Ludgate Hill, London, celebrated in coaching days, and frequently mentioned by Dickens and other writers dealing with that period. It was built around a court, and was admirably suited for an extemporized stage, being possible to view the performers from the gallery above.

BELLEGARDE, bel-gär dé, Henri (Comte de), Austrian general and statesman: b. Dresden, 28 Aug. 1756; d. Vienna, 22 July 1845. After spending some time in the army of Saxony he entered that of Austria and took part in the campaign of 1788 against the Turks. He became major-general in 1792, served against France under Wurmser and was sent on a mission to the Congress of Rastadt. He became chief of staff in Italy in 1800, member of the aulic council and president of the council after the retreat of Archduke Charles in 1805. He commanded the Austrian right at Caldiero and was afterward successively governor-general of Venice and of Galicia. In 1809 he commanded the 1st Austrian army and took part in the battles of Wagram and Essling. After this campaign he was made field marshal and was again governor of Galicia. He was again president of the Aulic council of war in 1812 and afterward commanded the Austria forces in Italy. Noted for the first treaty of Paris he became governor of Austria's Italian provinces and in 1815 he

BELLEEK CHINA, a porcelain of very high quality distinguished by its iridescence, obtained by means of metallic glazes that are subsequently fired. It was invented by Brianchon, a Frenchman, in 1857. It was at first manufactured in England and France, but it became famous after a manufactory had been established in Belleek, Ireland, whence it derived its name.

BELLEFONTAINE, Ohio, city and county-seat of Logan County, on the Cleveland, C., C. & St. L., the Toledo & O. C. and the Ohio Electric railroads, four miles northwest of Columbus and 57 miles northeast of Dayton. It occupies the highest elevation in the State; and is surrounded by an agricultural region. It has extensive carpentry and other railroad works; manufactures of iron and steel bridges, carriage and automobile bodies, tools, mattresses, harness, shoe blacking, flour and cement; two national banks; daily and weekly newspapers; an assessed prop. val. of $2,250,000. The Lewiston reservoir, with an area of 13,400 acres and a holding capacity of 4,500,000,000 cubic feet, is situated about eight miles from Bellefontaine. The city was settled in 1818. The government is vested in a mayor, elected biennially, two directors, appointed by him, and a city council. An administrative board of education is elected by the people. The waterworks, gas and electric-light works and sewage system are owned and operated by the city. Pop. 8,238.

BELLEFONTE, Pa., borough and county-seat of Centre County, 87 miles northwest of Harrisburg, on the Pennsylvania Railroad. It has important lime quarries, iron furnaces, glass works, manufactories and machine shops, and was incorporated in 1800. There is a soldiers and sailors' monument, and a statue has been erected to Gov. A. G. Curtin. The borough is governed by a chief burgess, elected for three years, and a nine councilmen. The State penitentiary is located at four miles distance from Bellefonte. Bellefounte is a summer resort much visited for its scenery and health, and in spring, whose waters have supplied the borough since 1807. Pop. 4,750.
destroyed the army of Murat. After 1815 he resided several years in Paris. In 1820 for the third time he was president of the council and became also Minister of Stâte. He retired in 1825. Consult Von Smola, 'Das Leben des Feldmarschalls H. von Bellegarde' (Vienna 1847).

BELLEGARDE, Jean-Baptiste Morvan d'Armagnac, French Jesuit and writer: b. Paris, Hauteville, 30 Aug. 1648; d. Paris, 26 April 1734. He entered the Jesuit order and was a pupil of Bonhouts. After 18 years he left the order because of his leanings toward Cartesianism. He became a member of the community of Priests of Saint Francis of Sales. He was a prolific writer, being the author of a great number of works and of translations often inexact. He is best remembered as the translator of the works of eminent ecclesiastics, as Les Lettres du Château Ed. (Paris 1693, 1701); 'Sermon de S. Grégoire de Nazianze' (Paris 1698); 'Discours et homélies de S. Jean-Chrysostome'; 'Sermons de S. Léon le grand' (Paris 1701); 'Imitation de Jésus-Christ' (Paris 1698).

BELLEGARDE, France, a fortress situated on an isolated summit; 1,850 feet above sea level, in the department of Pyrénées-Orientales, and commanding the highway from Figueras to Perpignan. It has been the scene of several armed conflicts. Peter III of Aragon defeated Philip III of France here in 1285. In 1634 it was taken by the Spaniards and again by the French under Schomberg in 1675. Louis XIV erected the height into a regular fortress with bastions in 1679-79. The Spaniards blockaded and captured it in 1793, but it was retaken by the French in the following year.

BELLEISLE, bél-lé, Charles Louis Auguste Fouquet (Comte de), marshal of France: b. Villefranche, 22 Sept. 1664; d. Versailles, 26 Jan. 1761. He distinguished himself during the famous siege of Lille. After the conclusion of the war of the Spanish Succession the cession of Lorraine to France at the Peace of Rastadt was fraudulently his work (1735); Louis XV made him governor of Metz and the three bishoprics of Lorraine. After a diplomatic mission to the courts of Germany in 1741 he was placed at the head of the French forces sent to oppose those of Maria Theresa. He took Prague by assault; but the King of Prussia having made a separate peace, he was compelled to retreat, which he performed with admirable skill. In December 1744, when on a diplomatic journey to Berlin, he was arrested in Germany and sent to England, but he was exchanged in 1746. In the following year he forced General Browne, who had entered the south of France from Italy, to raise the siege of Antibes and to retreat over the Var. In 1748 the King made him a peer of France, and the Department of War was committed to his charge. He reformed the army by abolishing many abuses, enlarged the military academy, and caused an order of merit to be established.

BELLENDEN, William, Scottish author: b. Lasswade, Midlothian, about 1555; d. about 1621. He was a pupil of Bishop Arent, and was professor of belles-lettres in 1602; and though he was made master of requests by James I he still continued to reside in the French metropolis. He was distinguished for the elegance of his Latin style, and in 1608 he published a work entitled 'Ciceronis Princeps,' containing a selection from the works of Cicero, consisting of passages relating to the duties of a prince, etc. He afterward published 'Ciceronis Consul, Senator,' etc. (1612), with two other treatises, from one of which Conyers Middleton's 'Life of Cicero' was largely compiled—a plagiarism first denounced by Wharton and clearly proved by Dr. Parr in a Latin preface prefixed to a reissue of Bellenden's writings (1727). His 'De Tribus Luminibus Romanorum,' published posthumously, was designed to illustrate the history of Rome from the writings of Cicero, Seneca and Pliny; but it is incomplete, and only contains matter drawn from the first named author.

BELLEMMANN, Ferdinand, German painter b. Lüneburg, 13 March 1814; d. Berlin, 11 Aug. 1889. He was educated at the academies at Weimar, and studied later at Berlin under Karl Blechen and Wilhelm Schirmer. He traveled in Norway, the Netherlands, Venezuela and Italy, and in 1866 became professor of landscape painting at the Imperial Academy. He utilized the results of his travels in the production of many magnificent landscapes, among which may be mentioned 'Evening in the Valley of Caracas'; the 'Guacharo Cave, Venezuela'; 'Sierra Nevada,' etc.

BELLOPHON, Bell-rof-o'm, son of Glauclus, king of Erepirne, by Eurymede, at first called Hipponous. The murder of his brother, whom some call Alcimenus and Bellerus, procured him the name of Bellerophon, or murderer of Bellerus. After this murder Bellerophon fled to the court of Prettus, king of Argos, whose wife became enamoured of him; and because he slighted her passion she sought to destroy him. He escaped her machinations, was introduced to the court of Jobates, king of Lycia, and, after a number of adventures, in one of which he conquered the Chimera, he married the daughter of Jobates and succeeded to the throne of Lycia. According to the fabled accounts, on Bellerophon attempting to soar to heaven on the back of Pegasus, Zeus sent a serpent which so stung his horse that he cast his rider to the earth, where lame and blind he wandered lonely in the Aeolian fields, a prey to corroding grief and melancholy, shunning men, and hated by the gods. At Corinth and in Lycia Bellerophon was worshipped as a sun-god. His adventures were a favorite subject in ancient art.

BELLOPHON, a genus of gasteropodous mollusks, typical of the family Bel-lop-hon:ï-de. The species are all fossil shells found in the limestones of the Silurian, Devonian and Carboniferous periods. The best-known American species are found in the coal measures of the Mississippi Valley and the Southwest. The so-called B. cibatus, a fossil characteristic of the Trenton formation, is now assigned to the genus Protovariahia.

BELLES-LETTRES, bél-lé, the French term, for which the English equivalent is polite literature at Paris, where at the courtly explanation of what is or has been called belles-lettres; in fact, the vaguest definition would be the best, as almost every branch of
BELLEVILLES, bél-vil, Pierre Richer de, French botanist: b. Chalons-sur-Marne c. 1564; d. 1623. He was the first person in France who taught botany as a science distinct from medicine. Henry IV established a botanical garden at Montpellier, and created a chair of botany. Bellevil obtained the first appointment in 1593, and immediately began a collection of all the plants in Languedoc, in order to the production of an illustrated flora, for which about 500 quarto plates had been engraved, when he died. Through the carelessness of his representatives, a number of these were lost.

BELLEVILLE, Canada, town, port of entry and county-seat of Hastings County, Ontario, on the Bay of Quinte, at the mouth of the Moira River. It is on the Grand Trunk Railway 60 miles west of Kingston. It has an excellent harbor, and the Moira affords abundant water-power for manufacturing. Belleville is in the heart of the finest dairying region of Canada; is in direct steamboat communication with many Canadian and United States points, and enjoys an extensive trade, especially in lumber. It is the seat of Albert College, and has other excellent educational institutions, a deaf and dumb institute and public library. The chief manufactures are lumber, pottery, cigars, sash and blinds, woolens, shirts, mining tools, machinery, lanterns and tinware. A short distance to the east of Belleville are large cement works for the utilization of a limestone which exists in great abundance in the vicinity. The city has agencies for the principal banks of Canada, daily and weekly newspapers, and is the seat of a United States consul. Pop. 9,876.

BELLEVILLE, Ill., city and county-seat of Saint Clair County, situated on several railroads, 14 miles east of Saint Louis, Mo. It is in the midst of very productive coal mines; has a large trade in flour, and general produce; and is chiefly engaged in the manufacture of glass, stoves, flour, nails and machinery; there are also a distillery, breweries, shoe factories, ice plant, etc.; it has one of the largest rolling mills in the west. The city has trolley lines to Saint Louis, a public library, Saint Peter's Cathedral (Roman Catholic), convent, four national banks and an assessed property valuation of over $2,250,000. Settled in 1814, it was incorporated in 1846. The government is voted in a mayor, elected biennially, who appoints all the important administrative officers. Pop. 25,000.

BELLEVILLE, Kan., town, county-seat of Republic County, 219 miles northwest of Kansas City on the Union Pacific, the Chicago, Rock Island and the Pacific railroads. It is in the centre of a stock raising and grain producing country and has many grain elevators, flour mills and alfalfa mills. Pop. 2,224.

BELLEVUE, Iowa, city of Jackson County, 20 miles east of Maquoketa, the county-seat, on the Chicago, Milwaukwee and Saint Paul Railroad. The city's industries include button-making, piano factories, flower pots and hollow block works and gasoline marine engines. It has three banks with combined resources amounting to $1,012,000, public and parochial schools, three Lutheran schools. The electric-lighting plant and the waterworks are the property of the municipality. In 1917 the city's receipts from all sources totaled $22,464.67 and the expenditures $19,239.17. Clay suitable for many clay products is abundant in the neighborhood. The government is vested in a mayor and an aldermanic board of five members. Pop. 1,776.

BELLEVUE, Ky., city in Campbell County, on the Ohio River, opposite Cincinnati, of which it is practically a suburb. It is almost exclusively a city of residences, but has a few industries of which sand and gravel quarrying are the principal. Bellevue was first settled in 1866 and received its city charter in 1871. The government is vested in a mayor, elected for four years, and a council of eight members chosen every two years. Pop. 6,683.

BELLEVUE, Ohio, city in Sandusky County, on the Lake Shore and Michigan Southern, the New York, Chicago and Saint Louis, the Lake Shore Electric and other railroads, about 16 miles south of Sandusky. It contains a Carnegie library and a hospital and has railroad repair shops, canning factories, lumber yards, manufactories of agricultural and drainage machinery, fixtures and stoves. It is the trade centre for a thriving agricultural region. The most unique feature of the city is its sewerage system. An underground stream flows beneath the city into Lake Erie and on each block a hole is drilled to this stream which thus serves to dispose of all sewage and surface water as well. Pop. 5,209.

BELLEVUE, bél-vé (French, "fine prospect"), a beautiful country palace in the neighborhood of Paris, situated on a ridge of hills stretching from Saint Cloud toward Meudon. It was built by Mme. de Pompadour, between 1748 and 1750. The first French artists of the time had exerted all their talents in embellishing it; so that at the period when it was built, it was considered the most charming in all Europe. After the Revolution it was sold and the purchaser had it demolished. There is a pretty village on its site, which, during the siege of Paris (1870-71), was an important strategic point.

BELLEW (Harold), Kyrie, English actor, the son of the Rev. J. M. Bellew, Calcutta, a well-known elocutionist: b. 1857; d. Salt Lake City, 1 Nov. 1911. After serving for some years in the British navy, he went to Australia, where he was successively engaged as gold prospector, actor, newspaper man and lecturer. Returning to England, his first appearance as an actor in that country at Brighton in 1875, and joined Henry Irving's Company in 1878. He made his début in New York in 1885 as Hubert in the play 'In His
BELLEY—BELLEGERENCY

Power. He was associated with Mrs. James Brown Potter from 1888–98, and accompanied her (some of whom) on a tour in which Australia and India were included. He returned to Australia in 1899, and there engaged in mining ventures. His later years were spent in the United States, where he achieved notable success in the parts of 'Raffles' and 'Brigadier Gerard.'

BELLEY, běl-lā, France (ancient BELLICA), a town in the department Ain, 39 miles southeast of Bourg, and 38 miles southwest of Geneva; situated in a fertile valley watered by the Furan. It is very ancient, having been a place of note in the time of Julius Cæsar, and is the seat of a bishopric founded in 412. It contains a communal college, has an agricultural society and a court of primary resort. The episcopal palace, the belfry of the cathedral, the college and the rich cabinet of medals and antiquities, are worth notice. Silk worms are reared and lithographic stones, reckoned the best in France, are obtained from quarries in the neighborhood, and it has silk and cotton industries. Pop. 6,182.

BELLI, běl-lē, Giuseppe Gioachino, Roman humorist and satirical poet; b. 1791; d. 1863. He wrote in the popular dialect of the Trastevere; and in early life scoured the papacy and the clergy with stinging, irreverent and often vulgar satire. Becoming afterward a zealous convert to the Roman faith, he endeavored to call in and destroy the indiscretions of his youth. In his last years he published a beautiful translation of the Roman Breviary. His published sonnets amount to more than 2,000; his other published Italian verses fill four considerable volumes; while two-thirds of his literary remains have never been gathered and edited. Of this last, much is clothed in language too coarse to bear the light of modern culture.

BELLIARD, běl-yěr, Augustin Daniel, (COMTE DE), French soldier and diplomatist; b. Fontenay-le-Comte, La Vendée, 1769; d. 27 Jan. 1832. Under Napoleon he served in Egypt, Germany, Spain and Russia and rose to great military distinction, and was wounded at the battle of Leipzig. He supported the Emperor on his return from Elba, and on the restoration of the monarchy was made a peer and became, in 1832, ambassador to Belgium. His autobiography was published in 1842.

BELLEGERENCY. In international law, a state of armed hostility which has been legally recognized. This condition may exist between nations, between a nation and a community not within the family of nations, or between an established and recognized nation and one of its sections which may be attempting to throw off the jurisdiction of the parent state with the object of gaining independence or attaining some other political end. It is not necessary that a community be independent in order to have the status of a belligerent, but it is necessary that such community conduct hostilities according to customs pursued by established states or otherwise be under a de facto government. When the fact of belligerency between two nations is established, their legal relations are changed at once, the laws of peace being superseded by the laws of war, while neutrality laws govern the conduct of states not participating in the conflict. See NEUTRALITY.

When a revolted party of great numerical strength forms a regular government and rules over the whole or part of the territory claimed, humanity dictates that the members of such party should not be treated as rebels guilty of treason but, if captured, should be regarded as prisoners of war. Hence those who have risen in arms against the parent government exert every effort to obtain for themselves the status of belligerency, since the recognition of the belligerency of a party, not a state, bestows all the rights of war of an established state. The usual manner of notifying neutrals of the existence of a state of war is by public proclamation and the most common method employed by outside states to recognize belligerency is the issuance of a proclamation of neutrality which states the attitude of the maker thereon toward the belligerents. (See DECLARATION OF WAR). Under the rules of law in war, belligerents must respect the lives and property of non-combatants, must refrain from inflicting any more damage than is absolutely necessary to accomplish victory, and must not employ cruel methods of warfare or use barbarous weapons. Upon occupying conquered territory the dominant belligerent may require the submission of the inhabitants; in the European War Germany imposed numerous fines not only on private citizens but also on established communities for real or alleged disobedience of commands or for hostility displayed by the inhabitants. (See CONQUEST, RIGHT OF). Under international law, neutrals and their goods, ships, commerce, etc., are supposed to be exempt from the dangers and injuries wrought by the war, provided they adhere strictly to a policy of neutrality as regards the belligerents. See NEUTRALITY.

When one community is in rebellion against the parent state (as in the Revolutionary War) or a revolutionary party or section wages war against the general government (as in the Civil War) a more difficult question arises. If a nation or state recognize the belligerency of a community outside the family of nations, that community, so far as the rights of war are concerned, has an international status as regards the nation or state which recognizes it. If foreign nations recognize the belligerency of a community within the territorial area of an established state, then such community has international standing, but, if not, its acts of war are technically acts of piracy, it has no belligerent rights, nor can foreign states be compelled to recognize its blockades or receive its vessels in their ports. (See BLOCKADE).

If the parent government recognize the belligerency of the revolted community, then a state of belligerency exists for all nations, but if the government refuse to recognize the revolutionary section and another nation do so, then for the latter a state of belligerency exists and other nations must take cognizance of the existence of such a state between the recognized and the recognizing parties. It is not necessary that the parent government recognize a revolting community by a formal declaration, but the existence of war may be made known by
an act of less formal character (such as a blockade proclamation or a call for volunteers to support the rebellion) or of a belligerent character. The conferring of belligerent rights on a community by a neutral state does not carry with it the recognition by that state of the independence of the insurgent government and all its consequences would imply that the parent government cannot condone the rebellion and hence, being premature, might be regarded by the parent government as a cause for war against the state making such recognition. No insurgent may claim as a right the recognition of a status of belligerency; it is merely a question of expediency which the neutral state must decide for itself; such recognition may be granted for any reason or reasons deemed sufficient by the grantor, whether they be wholly selfish or humanitarian or dictated by a fixed international policy. But there are two conditions that a neutral must find existent before granting belligerent rights, viz., a civil government in the rebellious community exercising de facto government and the parent government. These military operations need not be of great extent, but if the rebellion should have assumed enormous proportions and be of such a formidable character as to affect outside interests, neutral states may consider that the demand for a recognition of belligerency has become conclusive.

Some have contended that the British proclamation of neutrality of 13 May 1861 was a premature recognition of the Confederate States and that by selling munitions of war and other merchandise to the South and buying her cotton Great Britain was aiding rebellious citizens against the parent government, and, in fact, filibustering. They have compared the protest of the United States against the recognition of Confederate belligerency and the shipment of arms to her by Great Britain with Germany's protest against shipments of munitions to the Allies from the United States in the war of 1914. The fact often overlooked, in the case of the Civil War, is that England, France, The Netherlands and other nations, by their proclamations of neutrality, recognized the belligerency of the Confederacy; this did not mean that these powers recognized the Confederate States as an independent, sovereign government but merely that these foreign states considered the conditions to warrant the conferring of belligerent rights so that both sections were treated alike and impartially.

In his dispatch of 6 May 1861 to Lord Crowle, Lord John Russell states that Her Majesty's Government cannot hesitate to admit that such a Confederacy is entitled to be considered as a belligerent, and, as such, invested with all the rights and privileges attaching to belligerence. (The Case of the United States before the Tribunal of Arbitration at Geneva, 3 Senate Ex. Doc. 31, 12d Congress, 2d session, pp. 24-27). If a civil war affect the relations of the community with others, such countries for a government de facto applying belligerent rights on the seas, if the rules of blockade, contraband and search hamper their commerce, and if they be called upon to decide whether ships carrying a new flag may enter their ports, then such countries are warranted by international law and a due regard for the commercial interests of their subjects in the belligerency of the insurgent and declaring their town neutrality. Hence, England's course in acknowledging the belligerent rights of the Confederacy was justifiable. (Dana, R. H., ed., Wheaton's Elements of International Law, 23 Boston 1866; Woolsey, T. D., International Law, § 180, New York 1875). The British believed their commerce needed protection on the high seas and that by issuing a proclamation of neutrality they would not only bring the management of commerce within the rules of civilized warfare but would prevent inroads on their commerce by pirates, since, in the eyes of the world, the neutrality proclamations placed all vessels that accepted letters of marque from the Confederacy on the level of privateers instead of considering them pirates and their crews amenable for piracy, as Lincoln's proclamation of 19 April had declared them to be. (See Privates; Piracy). On 15 May 1861 the London Times said:

"Being no longer able to deny that a war of a dreadful civil war, we are compelled to take official notice of it.

Our foreign relations are too extensive, the stake we hold in the commerce of the world is too vast, and, we may add, our attitude is a matter of too much importance for us to allow ourselves the gratification of watching 'when there is no peace,' so largely indulged in up to the very latest moment by the statesmen of America herself. Yes, there is war.... Et plus que des ancêtres, les nations contemporaines comparées aux nations des temps passés profitent de la distraction des nations voisines pour se servir d'elles et de l'effort commun de la civilisation pour leurs avantages personnels, mais pourvu qu'il n'y ait pas de contact entre les deux parties en guerre, lorsque l'une est à la fois ennemie de l'autre et a un intérêt aussi grand dans la défaite de l'autre que dans sa victoire, il est permis d'accorder une attention avantageuse à la victoire de l'une ou de l'autre, sans s'inquiéter de la continuation de la guerre et sans que l'effort commun contre l'ennemie de l'ennemie ne soit une preuve d'une détermination irrésolue de la guerre universelle et d'une volonté d'obtenir une victoire par l'inaction, à la fois de l'une et de l'autre.

The same is true of the British government's decision to support the Confederacy in the war. The British government had no more justification than Germany in testing the Confederacy's ability to pay for its war effort. But when these nations conferred belligerent rights upon the Confederacy they could not hold the Northern government liable for injuries inflicted on their subjects by the Confederates in the territory occupied by the latter, whereas Turkey, not having issued a proclamation of neutrality, was able to claim indemnity for losses sustained at the hands of rebellious subjects of the United States. Some states that the European nations were unduly hasty in placing the Confederate States on an equality with the Union as to belligerent rights, as is witnessed by the speeches of John Bright and other prominent men, who sought to press the recognition of their independence at an opportune moment. (Consult Curtis, G. W., ed., 'Correspondence of J. L. Motley,' Vol. 1, p. 380; Rogers' ed. of 'John Bright's

"The proclamation of neutrality was a concession of belligerency to the insurgents and was deemed by the government as unnecessary and in effect as unfriendly.

The United States stand upon what they think imprudent ground when they refuse to be derogated, by an act of the British government, from their position as a sovereign national entity with Great Britain and place upon the principle of equality with domestic insurgents who have risen up in resistance against their authority." (Diplomatic Correspondence, 1863, Pt. I, p. 393).

John Jay also said: "The Proclamation . . . in a moral view lowered the American Government to the level of the rebel Confederacy, and in the next place, it proceeded, in an international view, to place the rebel Confederacy on a par with the American Government." (The Great Conspiracy: Address at Mount Kisco, 4 July 1861). Seward claimed that war did not exist in an international sense and that foreign powers should not take cognizance of the insurgents in territory over which the United States had not recognized as sovereign.

He claimed for the North the rights of a belligerent to blockade and search which implied a legal war but denied the existence of war, in which case there could not be a body of neutrals. But Seward's opinion was not binding on European nations then any more than Germany's wishes in 1914 could be construed into law for the United States to follow. Moreover, at its December term of 1862, the Supreme Court decided that Lincoln's blockade proclamation of 19 April 1861 (Consult Richardson, J. D., Messages and Papers of the Presidents, Vol. VI, p. 14) was in itself "official and conclusive evidence to the court that a state of war existed." (Consult also Snow, Freeman, Cases and Opinions on International Law, pp. xvi, 254, Boston 1892).

Judge Chase also stated from the bench that the rights and obligations of a belligerent were conceded to it [the Confederacy] in its military character very soon after the war began from mutiny and humanity and expediency by the United States. (Wallace, Supreme Court Reports, 1868, p. 10).

Hence, when Adams complained to Lord Russell of the dispatch of numbers of steam vessels laden with arms, and unusual amount of war stores of every description together with other supplies, well adapted to procrastinate the struggle with a purpose of breaking a blockade legitimately established and fully recognized by her majesty (Diplomatic Correspondence, 1863, Pt. I, p. 314), Lord Russell was fully justified in replying as follows:

"With regard to the general duties of a neutral, according to international law, the true doctrine has been laid down repeatedly by presidents and judges of eminence of the United States, and that doctrine is that a neutral may sell to either or both of two belligerent parties, any implements or munitions of war which such belligerent may wish to purchase from the subjects of the neutral.

Admitting also, that which is believed to be a fact, that the Confederates have derived a limited supply of arms and ammunition from the United Kingdom, notwithstanding the Federal blockade of their ports; yet, on the other hand, it is perfectly notorious that the Federal government have purchased munitions from the United Kingdom a greater quantity of arms and warlike stores." (Diplomatic Correspondence, 1863, Pt. I, p. 373).

John Bright wrote to Sumner as follows:

"The present state of public opinion in the United Kingdom shows that great quantities of arms have been sold to the North and argue that it must be equally lawful to sell arms to ships or States. And Mr. Seward and Mr. Adams have lent some support to this view in complaining of the sale of arms to the Confederacy as if it were an offense in magnitude equal to that of furnishing ships of war. Since the South were considered as belligerents, in respect to the sale of arms, you have been treated as two nations equal in the sight of our government and one as much in the same position as the other."

Of course, the equipping in England of privateers for the Confederacy was a breach of neutrality for which England paid a considerable sum of money under the decision of the Geneva Tribunal and Lord Minto in a speech of 26 Sept. 1863 that such acts or similar ones would constitute such breach.

"If you are asked to sell muskets, you may sell muskets to one party or the other, and so with gunpowder, shells or cannon; and you may sell a ship in such a manner. But if you will on the other hand, train and drill a regiment with arms in their hands to take part with one of the two belligerents, you violate your neutrality and commit an offense against the other belligerent. So in the same way in regard to ships, if you will allow a ship to be armed and go at once to make an attack on a foreign belligerent, you are yourself, according to your law, taking part in the war, and it is an offense, which is punished by the law." (Speech in reference to the Foreign Enlistment Act quoted in London Times 28 September).

BELIGERENT, a nation or a large section of a nation engaged in carrying on war. On the outbreak of war between sovereign powers the rights and duties of the warring nations in regard to each other and in regard to neutral powers are clearly defined by international law. The first general stipulation is that neutral powers be formally notified of the existence of a state of war. In regard to the rights and duties of belligerents one to another, international law and custom in modern times demand that non-combatants be protected in their persons and property from military actions of both sides, and that distinctions of war and peace and civil and military laws be observed. The trade of neutrals is to be relieved as far as possible of all inconveni-
An insurgent state cannot claim the recognition of belligerency from a neutral state as a matter of right and for the latter such recognition is merely a matter of expediency. In the contest between the Federals and Confederates in 1861–65 the latter section of the American people, at the very commencement of the struggle, claimed the privileges of belligerents. Their claim was promptly acceded to by the British and French governments, at which the Federal authorities took umbrage, contending that the recognition had been premature, while the British maintained that it could not have been refused to them.

The grant of belligerent rights to insurgents imposes certain obligations on the latter, such as the observance of the rules of international law both in regard to their opponents and to neutrals. Such a grant also shifts the responsibility for damages to neutrals from the sovereign state to the insurgent party. Its advantages to the latter lie in the moral support gained from recognition by neutrals, giving it the right to negotiate loans and placing its companions and their troops under the protection of the laws of war. See Belligerency; Blockade; International law; Neutrality; and consult Snow, Manual of International Law (2d ed., Washington 1898), and Wheaton, Elements of International Law (8th ed., Boston 1865).

BELLINCIONI, bel-lin-chó'ne, Gemma, Italian singer: b. Como, 18 Aug. 1866. Showing herself possessed of a remarkable voice at an early age, her father began cultivating it. Later she became a pupil of Corbi. She made her first appearance in 1881 and was engaged in Marchera at Naples, in 1881, when she was only 15 years of age. Among the audience was the famous tenor, Tamberlik, who was so keenly impressed by her voice that he forthwith engaged her as his prima donna for a prolonged tour of Spain and Portugal. She soon became recognized as one of the best, if not the best, singer of her time. In 1890 Mascagni created for her the part of Santuzza in Cavalleria Rusticana, and it is generally admitted that she secured the immediate success of that famous opera.

BELLING, Wilhelm Sebastian von, German cavalry officer and one of the generals of Frederick the Great: b. Paulsdorf, Prussia, 15 Feb. 1719; d. Stolp, 28 Nov. 1779. He entered the Prussian army in 1737 and rose rapidly in rank, being an officer in the Black Hussars. He especially distinguished himself in the campaign against the Swedes in Pomerania and Mecklenburg during the period from 1759 to 1761. In 1762 he was made a major-general and four years later a lieutenant-general. It was during the operations against the Swedes that he took prisoner the famous Blücher, then a young subaltern, and persuaded him to enter the Prussian service.

BELLINGHAM, Richard, royal governor of Massachusetts: b. about 1592; d. 7 Dec. 1672. He emigrated to the colony, of which he was one of the original patentees, in 1634; in 1635 was made deputy-governor; and in 1641 was elected governor in opposition to Winthrop by a majority of six votes. He was re-elected in 1654 and after the death of Endicott was chosen again in May 1665, and continued in the executive chair of the colony as long as he lived, having been deputy-governor for ten years. He was appointed assistant major-general in 1664, in which year the King sent commissioners to inquire into the state of the colony, when, according to Hutchinson, Bellingham and others obnoxious to James II were required to go to England to account for their conduct. The General Court, however, refused obedience and maintained the authority of the charter. His wife having died, in 1641 he married a second time, of which a contemporary speaks thus: "A young gentleman was about to be contracted to a friend of his, when on a sudden the governor treated with her, and obtained her for himself." The banns were not properly published, and he performed the marriage ceremony himself. He was prosecuted for a violation of the law, but at the trial he refused to leave the bench, sat and tried himself, and thus escaped all punishment. In his last will he provided that after the decease of his wife and of his son by a former wife, and his grandson, the land and estate should be spent for the yearly maintenance of godly ministers and preachers of the true Church, which he considered to be that of the Congregationalists. This will the General Court set aside on the ground that it interfered with the rights of his family. He was a clean and just administrator, but intolerant in his attitude to the Quakers. A sister of his, Anne Hibbens, was executed at Salem in June 1650, during the witchcraft persecution.

BELLINGHAM, Wash., city and county seat of Whatcom County, extreme northwestern corner of Bellingham Bay, and on the Great Northern, Northern Pacific, Canadian Pacific and Bellingham Bay and British Columbia railroads, 97 miles north of Seattle. The first settlement was made in October 1852 by Capt. Henry Roeder, who built a saw-mill on what is now Whatcom Creek. The Lummi tribe of Indians maintained their chief camp on the beach near the mouth and falls of Whatcom Creek, and called the camp or rather the locality "Whrap cop," meaning "the noisy water" or "the troubled water." The white men retained the Indian name for their town, modified as indicated by the spelling to Whatcom. This remained the name of the town until the consolidation of Whatcom and New Whatcom in 1891 under the name of New Whatcom, from which the prefix "New" was dropped by action of the State legislature 19 Feb. 1901. Fairhaven is the English interpretation of an Indian word or phrase, "See-see-leechet," meaning "the sheltered beach." This town was plotted and named in 1883 by Daniel J. Harris, the original donation claimant. In 1890 Fairhaven and the adjoining town of Bellingham were incorporated as one city under the name of Fairhaven. On 27 Oct. 1903, the electors of Fairhaven and Whatcom voted to consolidate the two cities under the name of Bellingham and the consolidation was duly consummated. The new name went into effect 28 Dec. 1903, and the post-office became Bellingham Bay on 1 Apr. 1904. Bellingham Bay was named by Vancouver in 1792, and the consolidated city takes its name from that bay. The city is the commercial centre of a large lumber and agri-
cultural region; salmon fishing is also an industry of great importance. Largest salmon canneries in the world, and mining and quarrying are carried on in the vicinity. The principal manufacturing establishments include lumber and shingle mills, salmon canneries, wood working and iron working plants and brick kilns. Salmon canning and milling, milk condensing and the manufacture of cement and cans are also important industries. The United States census of manufactures for 1914 reported 80 industrial establishments of factory grade, employing 2,182 persons, of whom 1,922 are wage earners who receive $1,318,000 annually in wages. The capital invested totaled $6,912,000, and the value of the year's output was $6,264,000; of this, $2,898,000 was the value added by manufacture. There are four banks with combined capital of $600,000. There are 49 established churches in Bellingham representing practically all denominations. There are 11 city schools, two libraries, the Bellingham Bay Library and the Carnegie Library. The city also contains the State Normal School, and three business colleges, a parochial and two high schools. The government is vested in a mayor, elected biennially, and a council of seven members, elected alternately every two years. Pop. (1910) 24,298; (1916) 36,890.

**BELLINGHAUSEN, Fabian Gottlieb von**, Russian naval officer and Antarctic explorer: b. island of Osel, 9 Sept. 1778; d. Kronstadt, 13 Jan. 1852. Graduating from the Naval Academy at Kronstadt, he became an officer in the Russian navy. In 1809 he distinguished himself in his operations as captain of a corvette against the Swedish fleet. In 1819 he was assigned by the Emperor Alexander to the command of two ships for the purpose of conducting an exploring expedition into the Antarctic regions. In 1819 he succeeded in penetrating the Antarctic Circle to lat. 70° S., discovering and naming Alexander Land, Peter Island and Traversay Island. The expedition returned to Kronstadt, arriving 5 Aug. 1821. Seizing the opportunity, Bellinghausen so distinguished himself in the naval operations against the Black Sea port of the Turks, Varna, that he was made a vice-admiral and was given command of the Russian Baltic fleet. Later he became military governor of Kronstadt. A narrative of his Polar explorations was published in Saint Petersburg in 1831.

**BELLINI, bel-le'ni, Gentile, elder son of Jacopo (q.v.): b. 1429; d. 1507. He became more distinguished than his father, but did not rival his younger brother, Giovanni. In 1469, in reward for his work, he was made a count palatine of the empire and in 1474 official painter to the Venetian state. In conjunction with his brother Giovanni, he painted a series of frescoes for the ducal palace at Venice, depicting the life of St. Mark. Between these frescoes, which were completed in 1483, he painted a series of frescoes in the Ducal Palace in Venice, one of which is the famous 'Adoration of the Magi' in the Layard collection, Venice; and 'Saint Mark Preaching in Alexandria,' is in the Brera at Milan. A small painting in water-color of the Virgin and Child in 1512, which is in Constantinople, is in the possession of Mrs. Gardner, Boston.

**BELLINI, Giovanni, Venetian painter:** b. about 1430; d. 1516. He was the younger son of Jacopo Bellini, an original artist of great vigor and attainments, who went to various cities of northern and central Italy, and came in contact with the Renaissance influences, new in his time, which were to vivify the declining medieval art of Italy. It was particularly in Padua where Squarcione had his famous collection of classical antiquities, that the new attitude toward art and the closeness of relation between the Bellini and Squarcione groups may be judged from the fact that Jacopo Bellini gave his daughter in marriage to Mantegna, the adopted son of Squarcione. Giovanni and his older and only less gifted brother Gentile carried on their father's work, and the two sons lived to see their art triumph over that of the previous school of the Vivarini of Murano. This is the true point of departure of the Venetian school. Beginning with works in which the Squarcionesque ideas joined to his father's teaching forms the dominating influence (this period is well represented at the Correr Museum in Venice by the 'Pieta,' the 'Transfiguration' and the 'Crucifixion'), we find Giovanni Bellini in 1459 painting the 'Agony in the Garden,' the masterpiece of his early manner. From this time on he is more independent and of the character which we associate with Venetian art. The great 'Coronation of the Virgin' at San Francesco, Pesaro, shows Bellini in almost full possession of his personal style as does the 'Madonna' of the National Gallery, London. The change was accentuated in decade 1470-80, when Bellini learned from Antonello da Messina, the process of oil-painting, his work up to this time having been done in tempera. The discovery was one peculiarly suited to the nature of Bellini and his people. For while fresco and tempera with their tendency toward severity were well adapted to the draughtsmen of Florence, the warmth and modulation of oil-color were of the greatest value to the sumptuous art of Venice. It was probably as much Giovanni Bellini's national character as his great mastery that brought to him his great pupils Giorgione and Titian, beside many others who attained fame. The Venetian spirit and sense of beauty are evidenced in the celebrated 'Conversazione' or 'Allegory' in the Uffizi, or the 'Virgin with Four Saints' at San Zaccaria, Venice, where a tradition of the Beecking's brought, in the Uffizi picture, to one of the highest points they had yet attained, and indeed we may almost say, that they were too attain subsequently. Another fine example of the quadrat also ascribed to the 'Transfiguration' in the Naples Museum. To the art middle period belong such important works as the altar-pieces of San Giobbe and of San
BELLINI—BELLO

Francesco della Vigna, Venice, that of Santa Corona at Vicenza (the ‘Baptism of Christ’), the ‘Madonna and Child’ of the Brera, Milan, the famous picture of the ‘Madonna with the Doge Barberino’ at Murano and the ‘Madonna with Saints’ at the Venice Academy. From 1488 to 1505 Bellini was constantly engaged on decorations in the ducal palace, which were later destroyed by fire. Chosen state painter, he executed (about 1500–05) the portrait of the Dogaressa Lorenzo, which is now in the National Gallery, London. Two pictures in American collections may be safely attributed to him, one being in the Metropolitan Museum of New York. The last picture by Bellini to which we can assign a date with certainty is the altarpiece of the church of San Giovanni Chrysostomo, Venice (1513). It shows the venerable painter still in command of his powers, and if he had at this time left innovation to his pupils, he was yet able to intensify the qualities he possessed. Besides his service to landscape art, which we have noted, Bellini gave the first great example of the color for which Venice was to have its unsurpassed renown. His religious feeling is serene and pure, a certain awe, and an almost pathetic sincerity making him one of the best-loved of painters. Consult Fry, Roger E., ‘Giovanni Bellini’ (London 1899); Berenson, ‘Venetian Painters of the Renaissance’ (New York 1897); Venturi, ‘Le origini della pittura veneziana’ (Venice 1907), and Meynell, ‘Giovanni Bellini’ (New York 1906).

BELLINI, Jacopo, Italian painter: b. Venice about 1400; d. 1470. He was a pupil of Gentile da Fabriano, and is said to have been taught oil-painting, which was then a secret, by Andrea dal Castagno, and in turn taught to his sons Gentile and Giovanni (qq.v.) He accomplished much in bringing the art of painting to maturity in his native city. The first works by which he acquired fame were portraits of Catharine Cornaro, the beautiful Queen of Cyprus, and one of her brothers; a picture representing the passion of Christ, in which many figures were introduced, himself among the number; and a historical picture representing a Venetian legend of the miracle of the cross. This cross, containing a piece of the true one on which the Saviour died, was by some accident thrown into the Grand Canal at Venice, and although many persons plunged in after it, it was the will of God that only the guardian of the brotherhood to whom the cross belonged, Andrea Vendramino, could take it out again. This event was represented in the painting. Almost all of Jacopo’s works have perished; only three signed pictures survive—one in the archiepiscopal palace at Verona, one in the Tabini Gallery at Louvre, and one in the academy at Venice, others (unsigned) are in the Uffizi gallery at Florence, the Louvre, and the National Gallery, London. Two sketch books have been preserved, and those of price-less value, the one in the British Museum, London, and another in the Louvre.

BELLINI, Lorenzo, Italian surgeon: b. Florence, 3 Sept. 1643; d. 8 Jan. 1704. In 1663 he became professor of anatomy at Pisa. Later he became physician to the Grand Duke of Tuscany and senior consulting physician to Pope Clement XI. He was the first to observe and comment on the action of the nerves on the muscles. The unirregular ducts, now known as Bellini’s tubes, were named from him. His principal work is ‘De Structura et Uso Renum’ (1662).

BELLINI, Vincenzo, Italian composer: b. Catania, Sicily, 1801; d. near Paris, 1835. He was educated at Naples under Zingarelli, commenced writing operas before he was 20, and composed for the principal musical establishments in Europe. His most celebrated works are ‘Norma,’ ‘I Puritani’ and ‘La Sonnambula.’ He is remarkable chiefly for sweetness of melody, suitability of harmony, and an adaptation of sound to sense, and stood honorably distinguished from many of his profession by the excellence of his moral character.

BELLINZONA, bel-in-zó-nâ, or BELLENZ, bel-lêns, Switzerland, the capital of the canton of Ticino on the left bank of the Ticino, about five miles from its embouchure in the northern end of Lago Maggiore. The town has a very picturesque situation about 700 feet above sea-level and lying in the middle of the Gotthard Pass. It was fortified in the Middle Ages and modern ports have been constructed near the pass to protect the town. Pop. 10,773.

BELLIS. See DAISY.

BELLMAN, Karl Mikael, Swedish poet: b. Stockholm 1740; d. 1795. He grew up in the quietude of domestic life, and the first proofs he gave of his poetical talents were religious and pious effusions. The dissipated life of young men at Stockholm; the death of a friend; was afterward the subject of his poems. By these his name was spread over all Sweden. Even the attention of Gustavus III was attracted to him, and he received from the King an appointment which enabled him to devote himself almost entirely to poetical pursuits, in an easy independence, until his death. His songs are truly national, and love and liquor their most common themes.

BELLO, be’lîó, Andrés á, Spanish-American diplomatist and author: b. Caracas, Venezuela, 29 Nov. 1781; d. Santiago, Chile, 13 Feb. 1851. He became undersecretary of the government of Venezuela in 1802, and in 1807 the King of Spain appointed him Venezuelan Commissioner of War, then an unprecedented honor. In 1810, with Bolivar and López Méndez, he went to London to solicit aid for the South American insurgents. Until 1820 he served as secretary of the Colombian, Chilean and Venezuelan legations in London, where he returned to Caracas. Soon after he removed to Chile, where, in 1834, he became Secretary of State. In 1842 he was appointed the first rector of Santiago University. In 1864 the United States submitted to his arbitration a question pending with Ecuador and in the following year he was an arbiter in a matter in dispute between the U.S and Peru. He was the author of ‘Principles of International Law’ (1832); ‘Gramática de la lengua castellana, dedicada al uso de los Americanos’ (1st ed., 1847; latest edition revised and annotated by R. J. Cuervo, 1914); ‘Silvas Americanas’ (a book of 1827). The Chilean government published his complete works in 1881–93 (‘Obras de Andrés Bello,’ 15 vols., Santiago de Chile; reprinted in ‘Colección de escritores castellanos,’ Madrid). (See
BELLO HORIZONTE — BELLOT STRAIT

SILVAS AMERICANAS. Consult the biography by Miguel Luis Blanquet (Santiago de Chile 1882), also A Balbin de Unquera, 'Andrés Bello, su época y sus obras' (Madrid 1910).

BELLO HORIZONTE, ór-e-zon'ta, the typically modern city of Brazil, capital of the state of Minas Geraes, united by rail with Rio de Janeiro. Its special distinction dates from 1823 when a village called Congonhas, del Rey, afterward its name was Minas, and before it was made the capital of the state it had only 3,500 inhabitants. It possesses the advantages of a climate admirably healthful and pleasant, and the surrounding country is attractive, as its name implies. Pop. (1916) 50,000.

BELLOC, bél-lök', Hilaire, English litterateur: b. La Celle Saint Cloud, France, 27 July 1870. He is the son of M. Louis Belloc, a French barrister; was educated at Balliol College, Oxford, after serving with the French artillery at Toul, and was Liberal member for Salford, 1906-10. In 1911-13 he lectured on English literature at East London College and in 1911 founded The Eye-Witness. He also published, 'The Hawk and the Beasts' (1896); 'More Beasts for Worse Children' (1897); 'The Modern Traveler' (1898); 'The Moral Alphabet' (1899); 'Danton', a much-admired biography (1899); 'Lamblin's Remains' (1900); 'Paris' (1900); 'Robespierre' (1901); 'The Path to Rome' (1902); 'The Old Road' (1905); 'The Historic Thames' (1907); 'The Pyrenees' (1908); 'The Party System' (with C. Chesterton, 1911, in which the British political system is strongly criticized); 'The Four Men' (1912); 'The River of London' (1913); 'The Book of Bayeux Tapestry' (1914); 'The Girondin' (1914); 'General Sketch of the European War' (1914). During the European War he took a distinguished place as a military commentator, his articles being quoted extensively all over the world.

BELLOC, Marie Adelaide. See LOWNDES, MARIE ADELAIDE.

BELLON, Richard, Earl of.

BELLOMONT, Earl of. See BELLAMONT.

BELLONA, the goddess of war among the Romans, daughter of Phorcys and Ceto. She was called by the Greeks Enyo, and is often confounded with Minerva. She was anciently called Duellona, and was the sister of Mars, or, according to some, his daughter or his wife. She prepared his chariot when he was going to war, and drove his steeds through the tumult of the battle with a bloody scourge, her hair dishevelled and a torch in her hand. The Romans paid great adoration to her; but she was held in the highest veneration by the Carthaginians, chiefly at Comana, where she had above 3,000 priests styled Bellenarii. In the Samnite War of 206 B.C., the consul, Appius Claudius, vowed a temple to Bellona, which was erected on the Campus Martius, near the Porta Capena. In it the senators gave audience to foreign ambassadors and to generals returned from war who claimed a triumph, which claims would be void did they enter the city. At the gate was a small column, called the 'column of war,' against which they threw a spear. Beneath was a wall of battle, the pedestals of this goddess consecrated themselves by making great incisions in their bodies, and particularly in the thigh, from which they received the blood in their hands to offer as a sacrifice to the goddess. In their wild enthusiasm they often predicted bloodshed and wars, the defeat of enemies or the besieging of towns. Consult Fowler, 'Roman Festivals' (London 1899).

BELLOT, bé-lô, Joseph René, French naval officer and Arctic explorer: b. Paris 1828; d. 21 March 1853. At the age of 15 he entered the Naval Academy at Brest, and two years afterward received a commission as élève de marine on board the Berceau. He was promoted, for bravery in the French expedition against Tamatave in 1845, to the rank of élève of the first class, and also created a chevalier of the Legion of Honor, though not yet 20 years old. On his return to France in 1847 he was made a sub-lieutenant, and shortly after a two-years' voyage to South America in the Tripomagnante he volunteered his services on the Royal Albert schooner, fitted out by Lady Franklin, in June 1851, to search for her husband, Sir John Franklin. During this expedition he reached with a sledge party the strait now known as Belcher Strait, in which the expedition was destroyed, in its main object, but an interesting journal of it, kept by Belloc, was published after his death. In June 1853, he sailed again on board the Phœnix, under command of Captain Inglefield, on a new Arctic expedition, the principal object of which was to convey dispatches to Sir Edward Belcher, then commanding H.M.S. Assistance in the Polar seas. Arrived in Erebus and Terror Bay, where lay the North Star, whose commander, Captain Pullen, was absent on a journey of discovery, Captain Inglefield set out in search of him; but in his absence it became desirable to get the despatches conveyed to Sir Edward Belcher—a duty which Lieutenant Belloc undertook to perform by crossing the ice. Having set out with four sailors, a canoe and a sledge, the party got separated in a gale of wind on 18 August, and Belloc, with two others, drifted away on a piece of ice. With the view of ascertaining the direction the ice was taking, he crossed over to the opposite side of the hummock and with a sledge. A handsome granite obelisk was erected to his memory in front of Greenwich Hospital, and a provision was made for his sisters. Consult his 'Journal d'un voyage aux mers polaires,' edited with a brief biographical notice (Paris 1854).

BELLOT STRAIT, the passage on the north coast of North America which separates North Somerset from Boothia Felix and connects Prince Regent Inlet with Franklin Channel. Its eastern entrance was discovered in 1852 by Lieutenant Bellot (q.v.), who lost his life there. After four unsuccessful attempts it was explored for the first time by McClintock on his crowning voyage. It is about 20 miles long, and, at its narrowest part, about one mile wide, running nearly on the parallel of 72° N., 95° W., is the most northerly point of the North American continent.
BELLOTTO — BELLOWS FALLS

BELLOTTO, Bernardo, Italian painter and engraver: b. Venice 1724; d. Warsaw 1780. He studied under his uncle, Antonio Canal, and painted perspective and architectural views. He passed much time in Germany and was a member of the Academy of Dresden, where many of his pictures are exhibited. He etched, from his own designs, views of Vienna, Dresden and Warsaw. His pictures are called by the name of Canaletto, which he assumed. Consult M. de Tocqueville, ‘Les peintres de Canaletti,’ and ‘Les deux Canaletti’ (Paris 1906).

BELLOWS, Albert F., American painter: b. Milford, Mass., 20 Nov. 1829; d. Auburndale, Mass., 24 Nov. 1883. In 1845 he obtained a position in the office of a Boston architect and at 19 became a partner of the firm. After a time he adopted painting as a profession and was for some years principal of the New England School of Design. He was one of the first to succeed with water-colors. He studied in Antwerp, Paris and England, becoming a National Artist (1861), and an honorary member of the Royal Belgian Water Color Society (1868). His landscapes are his best work. Of these the best are ‘Study of a Head’ (1876); ‘Autumn Woods’ (1876); ‘New England Homestead’ (1878); ‘Sunday in Devonshire’ and ‘The Village Elm.’

BELLOWS, George Wesley, American painter: b. Columbus, Ohio, 12 Aug. 1882. He was graduated from the Ohio State University in 1905, and studied painting in New York under Robert Henri and others. Though known chiefly as a landscape painter, he also interested himself also in portraiture and the painting of figure subjects. His pictures at various American exhibitions rapidly attracted notice and he was made associate to the Academy of Design at the age of 26, receiving the title of Academician in 1913. Meanwhile one of his works, entitled ‘Up the Hudson’ had been placed in the Metropolitan Museum in New York and another, the ‘North River,’ in the Pennsylvania Academy. The Coast of Maine, 1881; Forty-Two Kids, a swimming scene, are among his most successful paintings. Further examples of his art in public institutions are ‘The Snow-Capped River’ at the Savannah Gallery; ‘Polo at Lake-wood’ in the Columbus, Ohio, Museum; ‘Blackwell’s Bridge’ at Toledo, Ohio, and ‘Skiing’ at the Art Institute of Chicago. He has, besides, painted portraits and figure compositions, the latter—some of which he has executed in lithography as well—being often in a spirit of social satire along the lines laid down by John Sloan and others. The popular nature of his painting with its employment of the dashing technique now in vogue among many artists has won him prizes at the National Academy, 1908 and 1913, at the Pittsburgh, Philadelphia, Panama-Pacific and other exhibitions.

BELLOWS, Henry Whitney, American Unitarian clergyman and writer: b. Walpole, N. H., 11 June 1814; d. 30 Jan. 1882. He was graduated at Harvard in 1832, and at the Divinity School in 1836. He was Pastor of All Souls Church, New York, 1839; became widely known as a pulpit orator, public speaker and writer; was chief founder and long editor of the Christian Inquirer (1846); chief originator of the United States Sanitary Commission and its president during the Civil War (1861–65). His services in this connection were of incalculable value to the country. During the Civil War he supervised the expenditure of more than $5,000,000 for the purchase of supplies valued at over $15,000,000. He assisted Peter Cooper in his plans for Cooper Union. He wrote ‘Public Life of Washington’ (1866); ‘Relation of Public Amusements to Public Morality’; ‘The Old World in its New Face; Impressions of Europe in 1867–68’ (2 vols., 1868–69); ‘The Treatment of Social Diseases’ (1857); ‘Restatements of Christian Doctrine’ (1860).

BELLOWS, machine for blowing fire, so formed as, by being dilated and contracted, to inhale air by an oriifice which is opened and closed by a valve, and to propel it through a tube upon the fire. The invention of bellows is ascribed to Anacharsis the Scythian, though probably it took place in different countries. The forms of bellows at present are very various, as many attempts have been made to improve of this highly important machine, which becomes necessary wherever a powerful flame is required in the arts. As mining was carried on at an early date in Germany, and great heat is required in melting the ores and working the metals, various new kinds of bellows were invented in that country, one of which consists of an empty box, which moves up and down in another, partially filled with water. Between the bottom of the empty box and the surface of the water is a space filled with air, which is driven out by the descent of the enclosed box. Bellows of very great power are generally called blowing-machines (q.v.). The common Chinese bellows consist of a box of wood about two feet long and one foot square, in which a thick, square piece of board, which exactly fits the internal cavity of the box, is pushed backward and forward. In the bottom of the box, at each end, there is a small conical or plug valve to admit the air, and valves above to discharge it. The common bellows do not give a continuous blast but only a series of puffs. To remedy this two bellows were used, one filling while the other was blowing. The double bellows was an even greater improvement. This machine has a third board placed between two main boards; this third board is fixed and both it and the lower board are fitted with valves opening inward. A weight on the lower board keeps the lower chamber filled with air and when raised the air flows into the upper chamber in which the nozzle is placed. A weight on the upper board tends to force the air from the upper chamber through the nozzle in a continuous stream. However, the blast is not uniform and the use of the bellows is limited to domestic fireplaces and ordinary forges. Consult Weisbach, ‘Mechanics of Air Machinery’ (New York 1905).

BELLOWS FALLS, Vt., village in the town of Rockingham in Windham County, on the Connecticut River, so called from several rapids and cataracts occurring there. The whole descent is about 44 feet, and a famous place for spearing salmon. A canal with locks has been cut around the falls, through the solid rock. The scenery is romantic, and various interesting minerals are found.
in the vicinity. Ample power is furnished by the falls and is utilized in the several manufactories which turn out dairy stores, machinery, paper, paper boxes and shirts. The lumber trade is also carried on in all the surrounding land. The village contains a public library, hospital, meeting house and is the seat of the Vermont Academy. It was settled as early as 1753, was organized as a town in 1761 and incorporated in 1833. It is governed by a president and four trustees. The waterworks are the property of the village. Pop. 4,883.

BELLOWS-FISH. See GLOBE-FISH.

BElLoY, bel-law, Pierre Laurent Burettee de, French dramatist; b. Saint Flour, Auvergne, 17 Nov. 1727; d. 5 March 1775. The first French dramatist who successfully introduced revues and scenes upon each other. He was designated by his uncle, a distinguished advocate in the Parliament of Paris, who reared him after his father's death, for his own profession, but while he applied himself to the law with reluctance, he showed much genius for the theatre. His uncle opposed this taste, and the young man secretly left his house. He next made his appearance as an actor under the name of "Dormont de Belloy." Belloy had hoped to reconcile his family to him by the success of his first tragedy, "Titus," but this hope was disappointed by the failure of the piece; and the author went to Saint Petersburg. He returned to France, where he brought out his tragedy "Zelmire," which met with complete success. In 1765 followed his "Siege of Calais," a tragedy which produced a great sensation, and is still esteemed, though it owes the applause bestowed on it rather to its subject than to its poetical merit. He received the medal promised by the King to those poets who should produce three successful pieces, and which was awarded on this occasion only, the "Siege of Calais" being counted as two, it being, in fact, only the second successful piece of Belloy. The city of Calais sent him the freedom of the city in a gold box. Belloy wrote sundry other dramatic pieces, of which "Gaston and Bayard" procured his reception into the Academy.

BELLS, a term used aboard ship to signify the time of day. The hours are struck by the ship's bell, not as on land, one stroke for each hour, but by a system which limits the strokes to eight, each stroke representing half an hour of a four hours' watch. The day is divided into six watches, of four hours each, beginning with noon or midnight. Thus half-past 12 is represented by one bell; one o'clock is denoted by two bells, struck in rapid succession. Half-past one is struck with three bells, the first two strokes in quick succession and the third after a longer interval. Two o'clock is struck by four bells, the first two and the second two strokes, in rapid succession, being separated by an interval. At four o'clock the watch is ended with eight bells, half-past four being struck again by one bell. The watch from 4 p.m. to 8 p.m. is divided into two, each known as the "dog watch," when the "watch on deck" shifts with the "watch below," so that the periods on duty may be varied every other day, but this does not affect the system of time-keeping.

BELLS, The, the title of one of Edgar Allan Poe's most famous poems. It is also the name of the dramatic sketch in which Henry Irving appeared most successfully, adapted from Eckermann's "Jas. Polonius." It is a psychological study of remorse; an innkeeper murders a merchant who stops with him over night, and he is so haunted by his crime that the jingling of the merchant's sleighbells are constantly ringing in his ears, finally driving him insane by a president and four trustees.

BELL'S Palsy, named after Sir Charles Bell (q.v.), a palsy of the muscles of the face supplied by the seventh or facial nerve, and due to some peripheral lesion, in distinction to facial palsy of a central, or of a nuclear origin. It may occur on both sides of the face. The causes are many, but exposure to cold, such as sleeping in the open with the wind blowing over the face, or sitting by an open window in a railway train or steamboat, is one of the most frequent causes. It may also occur in a multiple neuritis that is due to poisoning by alcohol, lead, arsenic or the yop, carbon, etc., and in rare instances from fractures of the skull. It comes on suddenly, the patient often waking in the morning to find one side of his face stiff, and in two or three days the palsy has developed. There is a sense of discomfort on the paralyzed side. The patient cannot close one eye completely and cannot manage his food on the affected side. He cannot whistle, and his speech is peculiar. The wrinkles of the paralyzed side are smoothed out and every motion of the facial muscles seems to be exaggerated one, so that many patients say their face is drawn to one side, the reality being that it is the opposite side that is affected and immovable. The paralysis usually gets well in from three to five months, especially if the treatment is begun early and perseveringly followed out. Some patients never entirely recover, although much improvement takes place in practically all. The treatment is electrical, massage and general tonics, the administration of iron and strychnine, and the removal of the cause. Particular attention should be paid to the care of the paralyzed eyelid. (See also FACIAL PARALYSIS; PARALYSIS.) Consult Starr, 'Text-book of Organic Nerve Diseases' (1903).

BELLUNO, bel-loo'no, Italy, a northern city, capital of a province of the same name, on the Piave, 48 miles north of Venice. It has a cathedral, containing some excellent paintings. The campanile is 217 feet high. There is a handsome theatre. It has manufactures of silk, straw-plait, leather and wax; the principal trade is in silk, lumber, wine and fruit. Pop. (1911) 22,342.

BELLWOOD, Pa., borough in Blair County, 124 miles west of Harrisburg and 120 miles east of Pittsburgh, on the main line of the Pennsylvania Railroad. It was incorporated in 1888. Its assessed value is $650,000 and there is a borough debt of $35,000. It has 10 miles of paved streets, two public schools, two banks, eight churches, hotels and a weekly newspaper. It has also a fine Y. M. C. A. building, costing $50,000. Its industrial establishments include machine shops, iron foundries and railroad repair shops. It has
good electric-light service and a good water supply. The government is vested in a burs- 
gess and elective council. Pop. 3,500.

BELMAR, N. J., borough in Monmouth County, on the Atlantic coast, 55 miles south of New York City, on the Pennsylvania, the New York and Long Branch and the Central of New Jersey railroads. It is famed as a 
summer resort, has a splendid bathing beach, 
clubhouse, public library, borough building, a 
high school and eight graded public schools 
and a national bank, eight churches and nu-
merous hotels and boarding-houses. It has 
manufactories of muslin underwear and shirt 
waists. The value of its taxable property is 
about $3,000,000. The borough expenses 
amount to about $80,000 annually. The 
borough owns and operates the waterworks — 
an artesian system. Pop. 2,500.

BELMONT, August, American banker: b. 
Alley, Germany, 1816; d. 24 Nov. 1890. He 
was educated at Frankfurt, and was apprenticed to 
the Rothschild's banking house in that city 
when 14 years old. In 1837 he went to Havana 
to take charge of firm's interests, and soon 
afterward was sent to New York, where he 
established himself in the banking business and 
as the representative of the Rothschilds. He was 
Consul-General of Austria 1844-50; became chargé d'affaires at The Hague in 1853; and 
was Minister-resident there in 1854-58. He was a 
delegate to the Democratic National Conven-
tion in 1848, and when a part of the dele-
gates withdrew and organized the convention in 
Baltimore he was active in that body, and 
through it became chairman of the Democratic 
National Committee, an office he held till 
1872. He was an active worker in the party 
till 1876, when he closed his political career.

BELMONT, August, American banker: b. 
New York, 18 Feb. 1833; son of the preceding. 
He was graduated at Harvard University in 
1875; at once entered his father's banking house, 
and on the death of his father became head of 
the firm. The Belmont Company, also 
representing the European banking firm of 
the Rothschilds. The house, under the manage-
ment of the son, has continued to exert the 
large influence in the financial and railroad 
affairs of the city and country that it gained 
under its founder. In February 1900 he su-
pered the Rapid Transit Subway Construction 
Company to back John B. McDonald, who had 
been awarded the $35,000,000 contract for the 
construction of a rapid-transit system in New 
York. He was elected president of the National 
Civic Federation in 1905, and was re-elected in 
1906. In 1905 he was appointed treasurer of 
the Democratic National Committee. He has 
also served as chairman of the board of di-
rectors of the Interborough Rapid Transit 
Corporation, the Interborough Rapid Transit 
Company and the Rapid Transit Subway Construc-
tion Company.

BELMONT, Perry, American lawyer: b 
New York, 28 Dec. 1851 (son of August Bel-
mont 1816-90). He was graduated at Harvard 
University in 1877 and at Columbia Law 
School in 1876. He admitted to the bar 
and practised in New York till 1881, when he 
was elected as a Democrat to Congress and 
served till 1887, being a member of the com-
mittee on foreign affairs, and in that capacity, 
in his first term in Congress, came into notice 
by his cross-examination of James G. Blaine, 
then ex-Secretary of State, as to the relations 
with a syndicate of American capitalists inter-
ested in Peruvian guano. In 1885 he was ap-
pointed chairman of the committee on foreign 
affairs, and in 1888 United States Minister to 
Spain. In 1889 he was commissioner to the 
Universal Exposition in Paris, and for his 
services received from the Prince of France 
in 1890, the decoration of commander of the 
Legion of Honor. He was one of the prin-
cipals in the rapid-transit contract in New York, 
in which his brother August (q.v.) was inter-
ested. He is a member of the Navy League and 
of the New York Chamber of Commerce.

BELMONT, Cape Colony, town midway 
between Orange River Junction and Kimberley. 
It was the scene of one of the earliest engage-
ments in the war of 1899-1900, between the 
Boers and the British under Gen. Lord Meth-
uen. The town was attacked by the British 
on 23 Nov. 1899, while on the march to the 
relief of Kimberley, and the battle resulted in 
a victory for them. Two days later Lord Methuen 
took Graas Pan, 10 miles north of 
Belmont, after again defeating the Boers.

BELMONT, N. Y., county-seat of Alle-
gany County, on the Erie and Buffalo & Sus-
quehanna railroads and the Genesee River, 93 
miles west of Elmira. The surrounding coun-
try is a prosperous farming and dairying 
community. In the town are a number of flour 
mills and condensed milk factories, as well as 
a public library, a high school and a State agri-
cultural college. Pop. 1,694.

BELMONTET, bel-moan-ty, Louis, French 
poet and publicist: b. Montauban, 26 March 
1799; d. Paris, 14 Oct. 1879. He studied and 
practised law in Toulouse until involved in 
difficulties with the magistracy on account of 
some satirical poems, when he went to Paris 
and there produced his principal works: 'The 
Sad Ones' (1824), a cycle of elegies; 'The 
Supper of Augustus' (1828); and with Sou-
met, 'A Festival of Nero' (1829), a tragedy 
which exceeded 100 performances. In 1830 he 
edited the Tribune newspaper, opposed the ac-
cession of Louis Philippe and predicted his 
downfall and a second revolution in a bold 
 pamphlet addressed to Chateaubriand, for 
which he was arrested. In 1839 he established, 
together with Messrs. Laffitte and Mauguin, a 
manufactory, in which the men were to share 
the benefits with the employers. In 1852 he 
became a member of the legislative assembly. 
Subsequently he became an ardent partisan of 
Bonapartism, pleading its cause as a journalist 
and poetically extolling the Napoleonic dynasty 
in many enthusiastic odes.

BELDON, an extinct reptile (B. 
Pheningeri) of the Triassic period, partly in-
termediate between dinosaurs and crocodiles, 
but with many archaic characters. The body 
was protected by bony plates, those on the back 
interlocking by a peg-and-socket joint. The 
-snout was long and narrow, the external nares 
behind in contrast to those crocodiles, where they 
are at the tip of the snout. The limbs were longer than those of 
modern crocodiles, but the proportions were
otherwise similar. Its remains have been found in the Triassic coal-beds of North Carolina and Pennsylvania, and the red beds (estuarine sediments) of New Mexico, as well as in European strata of corresponding age. It was early described by Jaeg er under the name phytosaurus, since he considered it herbivorous because of an error due to the fossilization.

BELOIT, Kan., city and county-seat of Mitchell County, on the Missouri Pacific and the Union Pacific railroads and the Solomon River, 184 miles west of Atchison. Besides being the seat of the State Industrial School for Girls, it has an opera house, a large post-office building and a library. Being in a grain-producing country, the city contains a number of grain elevators and flour mills. A rock quarry gives the city a considerable trade in building stones. Pop. 3,082.

BELOIT, Wis., city in Rock County, on the Rock River, and the Chicago & N.W. and Chicago, St. & P. railroads, 80 miles southwest of Milwaukee and 91 miles west of Chicago. The city derives fine power for manufacturing from the river, and has the second largest wood-working machinery plant in the world, besides manufactories of gas-engines, windmills, iron, paper-mill machinery, paper, rye flour (the oldest mill of its kind in the country), gasoline engines, agricultural implements, tools, scales and shoes. The United States census of manufactures for 1914 reported 50 industrial establishments of factory grade, employing 3,826 persons, of whom 3,527 were wage earners receiving a total of $2,346,000 annually in wages. The capital invested aggregated $9,074,000, and the value of the year's output was $6,928,000; of this $3,915,000 was the value added by manufacture. The city is widely known as the seat of Beloit College (q.v.). It was first settled in 1836, and received its city charter in 1856. It is governed by a mayor and council, for two years, and a council. Pop. (1910) 15,125; (1914) 17,100.

BELOIT COLLEGE, a coeducational (non-sectarian) institution in Beloit, Wis., organized in 1846 by the Congregational and Presbyterian Churches. Reported at the end of 1916: 1 Professors and instructors, 37; students, 388; volumes in the library, $6,000; grounds and buildings valued at $600,000; productive funds, $1,500,000; income, $94,000; number of graduates, 1,503.

BELOMANCY, divination by arrows, practised by the ancient Scythians and other nations. One of the numerous modes was as follows: A number of arrows, being marked, were put into a bag or quiver, and drawn out at random, and the marks or words on the arrow drawn determined what was to happen. Consult Ezekiel, xxii. 21. (See SUPERSTITION.)

BELON, be-lon', Pierre, French naturalist and writer: b. Soultèîère, 1517; d. 1564. He was first a medical student, then travelled extensively in divers countries, devoting himself at the same time to a close observation of nature. His works form the distinct beginnings of the sciences of ornithology and comparative anatomy. His books include 'Les observations de plusieurs singularités et choses mémorables trouvées en Grèce' (1551); 'Judee, Egypte, Arabie, et autres pays étrangéres, rédiiées en trois livres' (1553-58); 'Histoire naturelle des êtres poissons marins' (1551); 'Histoire de la nature des oiseaux, avec leurs pourfureurs gravis en bois; plus la vrai peinture et description du Dauphin et de plusieurs autres raias de son espèce' (1555).

BELOCHISTAN. See BALUCHISTAN.

BELOT, bè-lô, Adolphe, French novelist and dramatist: b. Pointe-à-Parle, 6 Nov. 1825; d. Paris, 17 Dec. 1889. He traveled extensively and settled at Nancy as a lawyer. He won reputation with a witty comedy, 'The Testament of César Girodot' (1859, with Villellet) and, being less successful with his following dramatic efforts, devoted himself to fiction. Of his novels may be mentioned 'The Venus of Gordes' (1867, with Ernest Daudet): 'The Drama of the Rue de la Paix' (1868): 'Article 47' (1870): all of which were dramatized.

BELOVED DISCIPLE, The, a name by which Saint John is sometimes known, from the reference to him in John xiii. 23, wherein he is described as 'one of His disciples, whom Jesus loved.'

BELPER, England, market town of Derbyshire, on the left bank of the Derwent, over which there is a handsome stone bridge of three arches, eight miles north of Derby, on the Midland Railway. It has three churches, besides other places of worship, a public hall, with reading-rooms, library, etc. There are large cotton-mills, first established in 1776, hosier works, engineering works, foundries and collieries. It is a thriving town and has recently been much improved. Pop. 11,640.

BELPHEGOR. (1) An arch-demon appointed by Pluto and his council to undertake an earthly marriage, who fled unable to endure female companionship. He has been made the subject of one of La Fontaine's 'Contes' and also of an English play by Wilson, 'Belphegor, or the Marriage of the Devil,' published in 1691.

(2) An English play by Charles Webb, translated and adapted from the French 'Paliasse, in which the chief character is Belphegor, a mountebank. Another play of this name has appeared since.

(3) One of the deities of the Moabites, worshipped with peculiarly disgusting rites.

BELSHAM, Thomas, English Unitarian clergyman: b. Bedford 1750; d. 11 Nov. 1829. He became pastor of the Dissenting congregation and theological tutor of an academy at Daventry in 1781. At this time he was a Calvinist, but a change of views unhitted him for this situation and he became tutor of an academy which had been recently established at Hackney. This institution soon failed for want of funds and Belsham removed first to the Gravel Pit Chapel, which he purchased from Dr. Priestley, and afterward to Essex Street Chapel, where he officiated for some time as the colleague of Lindsey, and latterly as sole pastor till his death in 1829. His works are chiefly of a controversial nature and probably attracted attention more from the cause of the works which they attacked as from their own merits. His first appearance in the polemical
field was as an opponent of Wilberforce, of whose celebrated  "Practical View of the Pre-
vailing Religious Systems" he published a re-
view. His doctrine regarding the person of
Christ represents the humanitarian view. He also published a work on modern
philosophy and "Memoirs of Mr. Lindsay"
(1812, reprinted Boston 1873), which was re-
viewed by the celebrated Robert Hall. Con-
sult his "Memoirs," edited by J. Williams (Lon-
don, 1833). His brother, William Belshazzar
(b. 1752; d. 1827), wrote much on history and
was the author of numerous political pamphlets
espousing the cause of the Whigs. He is the
author of a "History of Great Britain from
1688 to 1820" (14 vols., London 1825-24).

BELSHAZZAR, mentioned in the book
of Daniel as the son of Nebuchadnezzar and
the last of the Chaldean dynasty who reigned
at Babylon, who was slain and his empire sub-
jugated in the Median conquest under Darius.
The last king, however, according to history
and the monumental inscriptions, was Nabon-
dasus, who ascended the throne in 562 B.C.,
who was probably associated with him in the gov-
ernment and is supposed to have been slain at
the battle of Alkad, in the successful campaign
of Cyrus in which Babylon fell (B.C. 539).
The interesting circumstances which immedi-
ately preceded this event, and are recorded at
length in the book of Daniel, have repeatedly
furnished subjects to painters and poets.

BELT, The Great and Little, two straits
of Denmark, connecting the Baltic with the Cat-
tegat. The former runs between the islands of
Zealand and Funen, and is about 15 miles wide,
where it is crossed from Nyborg, in Funen, to
Corsoer, in Zealand. The greatest breadth of
the strait is 20 miles. The navigation is very
dangerous, on account of the many small
islands and sandbanks by which the channel is
impeded. The Little Belt is between the island
of Funen and the coast of Jutland, and the
narrowest part of the strait is not more than a
mile wide. At this place stands the fortress
Fredericia, where tolls were formerly paid. The
route, which completely commands the entrance
from the Cattegat, The Sound, between Zea-
land and the Swedish coast, is preferred for all
large vessels entering or leaving the Baltic.

BELT, in astronomy, a varying number
of dusky, belt-like bands or zones encircling
the planet Jupiter parallel to his equator, as if the
clouds of his atmosphere had been forced into
a series of parallels through the rapidity of his
rotation, and the dark body of the planet was
seen through the comparatively clear spaces
between.

BELTANE. See BAAL.

BELTON, Tex., city and county-seat of
Bell County, situated on the Leon River, 56
miles northeast of Austin City, and on the
Gulf C. & S. F. and the Missouri, Kansas &
Texas, railroad. Baylor Female College (Bap-
tist) is located here, and there is a county cour-
thouse and a Carnegie library. It is in a cotton-
growing district, near some good building-stone
quarries, and has a considerable export trade;
its chief manufactory is cotton-mills, a cottonseed-oil mill, flour-mills, foundries, lumber
yards and marble works. Pop. 5,000.

BELTRAFFIO, bel-traf-yo, or BOL-
TRAFFIO, Giovanni Antonio, Italian
painter: b. Milan 1467; d. 1516. He was a pupil
of Leonardo da Vinci and imitated him in the
reproduction of his works in the treatment of his subject and in the use of color.
Among his works, the best of which are in his
native city of Milan, are several portraits; a
"Virgin and Child," in the National Gallery,
London, and a "Madonna of the Casio Family."

BELTRAMI, bel-tra-meh, Eugenio, Italian
mathematician: b. Cremona, 16 Nov. 1835;
d. 18 Feb. 1900. He studied at Pavia. In 1862
he was professor at Bologna, then professor at
Pisa, Rome and Pavia, and in 1891 again at
Rome. He was president of the Academy of
the Lincei. His work has been chiefly in non-
Euclidian geometry, in which he did valuable
work; also in electricity and magnetism. His
"Mathematical Works" (1902) and "Bibliog-
raphy of Mathematics" (1901) were published
by the University of Rome after his death.

BELTRAMI, Giovanni, Italian lapidary:
b. Cremona 1779; d. 1854. He was self-educ-
ated and at the time of French rule in Italy
found a patron in Eugene Beauharnais for
whom he made a chain of 16 cameos, illustrating
the story of Psyche. Among his other notable
works is a reproduction of the "Last Supper"
of Leonardo da Vinci on a topaz.

BELUGA, or BIBLAGA, bi-lag'ah. See
STURGEON.

BELUS, the Roman name of the Assyrian
and Babylonian divinity called Bel in Isaiah
xlvii. 1.

BELUS, a Phocenician river at the base of
Mount Carmel. Its fine sand, according to
tradition, first led the Phoenicians to the inven-
tion of glass.

BELUS, Temple of, an enormous temple
in ancient Babylon, rebuilt by Nebuchadnezzar
about 604 B.C. Its site is thought by some
authorities to be the modern Bers-Nimrud, and
by others Babil, both situated near Hillah.

BELVEDERE, bel-vay-dehr' (It. "fine
sight"). A name given in Italy to buildings
designed for the enjoyment of prospects.
The name is also given to small cupolas
on houses built for the advantage of fresh
air, or of the view which they afford.
Many of the buildings in Rome are fur-
nished with such cupolas; yet the term
"belvedere" is generally applied only to
those on the palaces of the rich. This is the name
also of a part of the Vatican where the famous
statue of Apollo is placed, which, on this ac-
count, is called Apollo Belvedere. Other build-
ings so named are an open hall in the imperial
gardens at Schönbrunn, the palace of Prince
Eugène in Vienna, and a summer-house in the
royal palace, Prague.

BELVIDERE, bel-vi-dehr', Ill., city and
county-seat of Boone County, on the Kishwau-
kee River, and the Chicago & N. W. Railroad,
78 miles northwest of Chicago. An important
farmers' and dairying trade center and con-
tains railroad shops, one of the largest sewing-
machine and bicycle works in the country,
manufactory of sewing-machine supplies, flour-
mills, creamery and other industries; and has
a public library, opera house, courthouse,
county-record building, two national banks, sev-
eral daily and weekly periodicals and a property valuation of about $2,000,000. Settled in 1836, it was incorporated in 1857. It is governed by a mayor, elected biennially, and a city council. Pop. 7,253.

BELVIDERE, N. J., town and county-seat of Warren County, on the Pennsylvania and Lehigh & Hudson River railroads and the Delaware River, 62 miles northwest of Trenton. It is a market and industrial centre of some importance, having a large silk mill, furniture, felt and hosieries factories and a number of flour mills, all of which are supplied with power from Tequest Creek where it empties into the Delaware. -Pop. 1,764.

BELZONI, bel'zo-nē, Giovanni Battista (John Baptist), Italian traveler: b. Padua 1778; d. 3 Dec. 1823. Destined for a monastic life he was educated at Rome, but left the city when it was occupied by the French and in 1803 went to England, where he acted in Astley's amphitheatre. Here he acquired, besides a knowledge of the English language, a great deal of the English and French languages, and much knowledge of the Chinese and the languages of the Arabians, Persians, Turks, Greeks, and Bulgarians. He was a very thorough artist in his profession, and was one of the most distinguished of his time. He became a great friend of the English poet, Byron, and was one of the principal figures in the literary world of the time. He is remembered chiefly for his travels in Egypt and his contributions to the study of the ancient world.

BEM, Józef, a distinguished military commander, b. Tarnow, in Galicia, 1795; d. Aleppo, Syria, 1850. He was educated at the University of Cracow, and in 1818 was admitted into the corps of cadets founded at Warsaw by Napoleon, afterward entered the horse artillery, and took part as lieutenant in the expedition of the French army in Russia. For his bravery he was rewarded by the king with the decoration of the Order of the Legion of Honor. On hearing of the outbreak of the Polish revolution, he at once hurried to Warsaw; and during the whole of the Polish struggle he displayed great gallantry and military skill. On the night of 7 Sept. 1831, he held the bridge of Praga with his artillery, but the following morning, on hearing of the agreement concluded with the Russians, withdrew to Modlin. After the fall of Warsaw he went to Prussia, and in 1832 to Paris, where he was occupied partly with political schemes, partly with scientific pursuits. Upon the commencement of the Austrian insurrection in 1848, Bem proceeded there and took a prominent part in conducting the defense of Vienna against the imperial troops. Toward the end of the year he received a commission from the new Hungarian government to undertake the conquest of Transylvania, and crossed over into that territory at the head of a large army, raised by his own exertions in an incredibly short space of time. His progress here was marked with great success, with occasional checks; and in March 1849, he succeeded in driving the Austrians, with their Russian auxiliaries, into Wallachia. He subsequently made an incursion into the Banat, which he compelled Puchner to evacuate. Returning to Transylvania, he found himself opposed by overwhelming numbers, and, after several reverses, returned to Hungary, where he took part in the disastrous battle of Temesvar. Shortly after he went to Turkey, became a convert to Mohammedanism, and received an appointment in the Sultan's army under the name of Amurath Pasha. He wrote a work on mnemonics entitled "Exposé général de la méthode mnémonique polonaise." Consult Czet, 'Bems Feldzug in Siebenbürgen' (Hanburg 1850); and Lajos, N.; 'Le général Bem' (Paris 1851).

BEMA, bē'ma (Gr. bēma, a step, raised place), the name applied in the Greek Church to the sanctuary because of its position above the rest of the church. The incommissar or choir screen divides it from the main portion of the church.
BÉMAN — BEMIS

BÉMAN, Wooster Woodruff, American mathematician: b. Southington, Conn., 28 May 1830. Graduating from the University of Michigan in 1849 he was appointed instructor in Greek and mathematics at Kalamazoo College. A year later he was appointed to the same position at the University of Michigan, where he became professor of mathematics in 1867. In collaboration with David Eugène Smith he wrote 'Plane and Solid Geometry' (1895); 'Higher Arithmetic' (1897); 'Famous Problems in Elementary Geometry' (1897); 'New Plane and Solid Geometry' (1899); 'Elements of Algebra' (1900); 'A Brief History of Mathematics' (1900); 'Academic Algebra' (1902).

BEMBATOKA, Bay of, a safe and commodious bay on the northwest coast of Madagascar, lying in lat. 16° S. and long. 46° E. The riverbestos, with the Ikopa, drain into the bay; the former, about 300 miles long, is navigable for small steamers for about 90 miles. Mojanga, on the north side of the bay, is the second town in the island, with about 14,000 inhabitants, Bembatoka being but a village.

BEMBERG, bān-bār, Henri, French composer: b. Paris 1861. He studied at the Paris Conservatory, where he had among his teachers Dubois, Franck, and Massenet. His principal works are 'Le Baiser de Luyon,' a one-act opera (1888); and 'Elaine,' a four-act opera successfully produced in London 1892, and in New York 1894. He is popularly known as the author of many songs and works for piano. In his native land he is regarded principally as a dramatic composer.

BEMBICIDÆ, bēm-bis'-t-de, a family of wasp-like hymenopterous insects with stings, mostly natives of warm countries, and known also as sand-wasps. The female excavates cells in the sand, in which she deposits, together with her eggs, various larvae or perfected insects stung into insensibility, as support for her progeny when hatched. The insects are very active, fond of the nectar of flowers and delight in sunshine. Bembix is the typical genus of the family.

BEMBO, Pietro, Italian scholar and writer: b. Venice, 29 May 1470; d. 18 Jan. 1547. At Ferrara he completed his philosophical studies, and after visiting Rome went, in 1506, to the court of Urbino, at that time one of those Italian courts where the sciences stood highest in esteem. In 1512 he went to Rome, where Pope Leo X made him his secretary. His many labors arising from his office, as well as his literary pursuits, and perhaps too great an indulgence in pleasure, having impaired his health, he was using the baths of Hadua when he was apprised of the death of Leo X. Being by this time possessed of several church benefices, he resolved on withdrawing entirely from business, and on passing his days at Hadua, occupied himself with literature and enjoying the society of his friends. Bembo collected a considerable library; had a cabinet of medals and antiquities, which at that time passed for one of the richest in Italy, and a fine botanical garden. In the year 1529 the office of historiographer of the republic of Venice was offered to him, which he accepted, declining the salary connected with it. At the same time he was nominated librarian of the library of Saint Mark. Pope Paul III, having resolved upon a new promotion of cardinals, from the most distinguished men of his time, conferred on him, in 1539, the hat of a cardinal. From that time Bembo denounced the belles-lettres, and made the Fathers and the Holy Scriptures his chief study. Of his former labors he continued only the 'History of Venice.' Two years later Paul III bestowed the bishopric of Gubbio on him, and soon after the rich bishopric of Bergamo. Bembo's influence on the literature of Italy was deep and lasting. By his works, especially the 'Prose della volgar lingua' (1525) he helped bring about the triumph of classic tradition in Italian. In poetry he aroused an increased interest in Petrarch and the resulting imitation of the latter by the Italian poets for a long period is known as bembism. A collection of all his works appeared in 1729, at Venice, in four folio volumes. Consult Fletcher, J. B., 'The Religion of Beauty in Woman' (New York 1911); Spingarn, 'History of Criticism in the Renaissance' (2d ed., New York 1906); Symonds, 'Renaissance in Italy' (London 1881); Torelli, 'Storia della grammatica italiana' (Padova 1908).

BEMBRIDGE BEDS, in geology, a fossiliferous division of the Oligocene strata, principally developed at Bembridge, in the Isle of Wight, consisting of marls and clays resting on a compact, pale-yellow or cream-colored mestone, called Bembridge limestone. They exhibit a rich molluscan and insect fauna.

BEMENTITE, a mineral occurring at Franklin Furnace, N. J., in radiated-stellate masses. It has a grayish-yellow color and pearly lustre, is soft and has a specific gravity of about 3.0. It is a hydrous silicate of manganese, having the formula H₂Mn₃SiO₆. It was named in honor of C. S. Bement, whose unrivalled private collection of minerals is now in the American Museum of Natural History in New York city.

BEMIDJI, Minn., city and county-seat of Beltrami County, on the Great Northern, the Minneapolis, Red Lake & Manitoba and the Minneapolis, Saint Paul & Sault Sainte Marie railroads, 180 miles west of Duluth. It has a State normal school and several Federal buildings. Lumbering is the principal industry of the neighborhood. Bemidji is also a popular summer resort, being situated on the shore of a picturesque lake. Pop. (1910) 5,099.

BEMIS, Edward Webster, American economist and public utility expert: b. Springfield, Mass., 7 April 1860. He was graduated at Amherst College in 1880; received degree of Ph.D. in 1885 at Johns Hopkins University after over three years' advanced work in economics and history; was a pioneer lecturer in the university extension system, 1887-88; professor of economics and history, Vanderbilt University, 1889-92; and associate professor of economics, University of Chicago, 1892-95. In 1897 he was professor of economics and history in the Kansas State Agricultural College. He was superintendent of the city water department of Cleveland, Ohio, 1901-05; consultant of water supply, gas and electricity of New York, 1910; consulting expert for cities and
BENIS HEIGHTS—BEN-LEDI

States on public utilities since 1910. He is now a member of the advisory board, valuation division, Interstate Commerce Commission, city representative on board of supervising engineers, Chicago Traction, and director of valuations of public utilities for the District of Columbia and other places. He published 'Municipal Monopolies' (1899) and many scientific studies of co-operation, trades unions, immigration, etc., but since 1900 has chiefly confined his writing to technical reports for various public bodies.

BEMIS HEIGHTS, N. Y., village in Saratoga County, on the Hudson River, famous as the scene of the first battle of Stillwater, 19 Sept. 1777. See also SARATOGA, BATTLE OF.

BEMISS, Samuel Merrifield, American surgeon in the Confederate army: b. Nelson County, Ky., 15 Oct. 1821. He received his early training and education from his father, Dr. John Bemiss, and from private tutors, and was graduated at the medical department of New York University in 1846. He practised in Bloomfield, Ky., until 1853, when he removed to Louisville, and in 1858 became connected with the medical department of the University of Louisville, filling various chairs, and at times was secretary and vice-president. From 1862 to 1865 he was a surgeon in the Confederate army. After the war he settled in New Orleans, and in 1866 he became professor of the theory and practice of medicine in the University of Louisiana. He became a member of the State board of health and of the American Medical Association, being its vice-president in 1866, and of other medical societies. He contributed papers to the literature of his profession, among which are 'Essay on Group' and 'Report on Consanguineous Marriages.' He was also editor of the New Orleans Medical and Surgical Journal.

BEMME, Peter von, German painter: b. Nuremberg 1685; d. 1754. He was educated by his father, also an artist, and was employed by the Prince Bamberg, Franz Konrad von Stetten, adorning the walls of his palace. Many of his paintings are preserved at Bamberg and Brunswick. Of the Bemm family 14 were prominent as artists.

BEN (Hebrew, son), a prepositive syllable found in many Jewish names, as Bendavid, Benasser, etc., which, with the Jews in Germany, has been changed into the German sohn (son), for example, Mendelssohn, Jacobssohn, etc. In Arabic the plural form Beni occurs in the names of many tribes, as Beni Omayaiah and in those of places, as Beni Hassan.

BEN, BEIN, or BHEIN, a Gaelic word signifying mountain peak or head, and prefixed to the names of many mountains in Scotland north of the firths of Clyde and Forth, as Ben Nevis and Ben MacDhui. It also occurs in Ireland, as Ben Edar, Edar's mountain (the modern Hill of Howth), and Nephin (Gaelic Neamh-bein, white mountain). Pen, which occurs in Welsh and Cornish nomenclature, is a synonym of the above term, and in the mod. Irish form Pen is also found in the Pennine Alps and in the word 'Apennines,' and some hold that it occurs in somewhat disguised form in the Cevennes of France.

BEN, Oil of, the expressed oil of the buntnut, the seed of Morinda tereba, the ben or horse-radish tree of India, northern Africa and Arabia. The oil is imodorous, does not become rancid for many years, and is used by perfumers and watchmakers. In perfumery it is used in making the fragrant principles of various plants.

BEN BOLT, a noted poem by Thomas Dunn English (1843) set to an old German air. It had been partially forgotten when it was revived by its effective employment in Du Maurier's 'Trilby.'

BEN HUR: A Tale of the Christ, a popular novel, by Lew Wallace, published 1880. The scene of the story is laid in the East, principally in Jerusalem, just after the Christian era. The first part is introductory, and details the coming of the three wise men, Melchior, Kaspar and Balthasar, to worship the babe born in the manger at Bethlehem. In the course of the narrative, which involves many exciting adventures of Ben Hur, hero, John the Baptist and Jesus of Nazareth are introduced, and Ben Hur is converted to the Christian faith through the miracles of our Lord. The author has successfully dramatized, its spectacular features, especially the chariot race, having made it a prime favorite.

BEN HUR, The Tribe of. A fraternal, benevolent society founded upon Gen. Lew Wallace's book, 'Ben Hur,' a tale of the Christ, the life of the young Hebrew, Ben Hur, furnishing the attributes of devotion to family and people and faith in God. The society was organized in Crawfordsville, Ind., in 1894 by David W. Gerard, Frank L. Snyder and others. Through this society Gerard found opportunity to express and put in operation a broad and practical system of mutual philanthropy and, though defective in its financial plan, yet so far was the plan in advance of fraternal operation of the time that for more than 20 years it successfully carried out the purposes of its founders. In 1908 the society adopted the National Fraternal Congress table of mortality as a basis upon which to determine the benefits to be provided and contributions to be collected therefrom, and this table of mortality has since become the legal standard of this (Indiana) and many other States. The beneficent department of the Society provides substantial benefits upon the death or disability of its members. The benevolent purposes of the Society are carried out by means of local courts or lodges chartered by the supreme or governing body. At the close of 1915 the Society had over 100,000 members in 1,356 local organizations, and had paid to the beneficiaries of its members over $14,000,000 in benefits.

BEN-LAWERS, a huge pyramidal mountain of Scotland, Perthshire, on the north bank of Loch Tay, 3,984 feet above the level of the sea, or 4,004 with the cairn at the top. Many rare Alpine mosses and other plants are found on it.

BEN-LEDI, a Scottish mountain, lying northwest of Callander, Perthshire, reaching the height of 2,875 feet above sea-level. It is somewhat difficult of ascent, but gives a splendid view. High up on it there is a small loch. It is mentioned in Scott's 'Lady of the Lake.'
Its name, Ben le Dia, "God’s mountain," was bestowed by the Druids, who were wont to celebrate the Bealtaine, or sun-festival, on its summit.

**BEN-LOMOND**, a Scottish mountain at the western extremity of Stirlingshire, on the east shore of Loch Lomond. The ascent is divided into three great stages, and the top has an elevation of 3,192 feet above sea-level. On the southeastern side it presents a sheer precipice of about 2,000 feet. From the hotel at Rowardennan, on the east shore of the loch, to summit, the distance is four miles. The lower part is well wooded, and the upper affords excellent healthful pasture. It commands a most extensive prospect of the vale of Stirlingshire, the Lothians, the Clyde, Ayrshire, Isle of Man, Hills of Antrim, and all the surrounding hIGHLand territory. Like Ben-Lawers this is one of the botanical gardens of the highlands.

**BEN-MORE** (the great mountain), a conical hill between Loch Dochart and Loch Voil, western part of Perthshire, among the Braes of Ochil; it rises to an elevation of 3,843 feet above the level of the sea. Several other hills also bear this name.

**BEN-MUCH-DHUI, bén-má̃k-doõ’e,** or **BEN-MAC-DHUI** (Gael. Ben-na-muicé-dubh, mount of the black pig), the second highest mountain in Scotland, situated in the southwest corner of Aberdeenshire, on the borders of Banffshire. It is a granite mass, rising to the height of 4,296 feet, and forms one of a cluster of lofty mountains, among which are Brae-riach, Cairn-toul, Cairngorm, Ben-a-bourd and Ben-An. Its upper parts are bare of vegetation. The view from the top includes the Moray Firth, the hills of Caithness and Sutherland, Ben Nevis, Benmore, etc.

**BEN NEVIS** (Gael. ben, mountain, + neamhuis, heavenly), a Scottish mountain now ascertained to be the most lofty height in Great Britain, is situated in the southwestern extremity of Inverness-shire, immediately east of Fort William and the opening of the Caledonian Canal into Loch Eil. It rises from the brink of the latter piece of water to the height of 4,406 feet. In clear weather a view can be obtained from its summit across nearly the whole of the north of Scotland from sea to sea. It consists principally of a fine brown porphyry, and contains red granite of a beautiful grain. Its base has a circumference of 24 miles. It has some very lofty precipices, and in its fissures the snow remains unmelted, even in the warmest weather. An observatory occupied by a resident staff was established on the top of the mountain by the Scottish Meteorological Society in 1883.

**BENADIR, bén-á̃dér,** administrative district in Italian Somalliland, at the mouth of the Juba River, on the east coast of Africa. In 1892 this territory was leased from the Sultan of Zanzibar for a small annual sum, but in 1905 it was purchased for $700,000. The Italian administration is enforced by a police force and a garrison of about 3,000 men. Cantonments are very extensive, in consideration of the quantities. Mogadisho is the largest town, with a population of about 10,000, being also the administrative centre.

**BENAIHK, bê-nâ’ya,** the name of 12 different persons mentioned in the Bible, the most important being a son of Jehoiada, a chief priest. He figures as a mighty and valiant warrior who overcame two Moabite champions, slew an Egyptian giant with the giant’s own spear, went down into a dry cistern and slew a lion that had fallen in while it was covered with snow, and killed the rebels Adrijah and Joab. He was made commander-in-chief in Joab’s place by Solomon.

**BENALCAZAR, bâ-nal-kâ’thar,** Sebastián de, Spanish leader, the first conqueror of Popayan, New Granada: b. about the end of the 15th century, at Benalcáz, in Estremadura, Spain; d. 1550. He set out as a common sailor in the train of Pedrarias, the newly appointed governor of Darien, 1514. The ability and daring of young Sebastian gained for him the confidence of Pizarro, who sent him against the Indian leader, Ruminahui. Sebastian was favored at the moment of engagement by a happy accident; the volcano of Cochabamba suffered an eruption. The frightened Peruvian army fled to Quito and Sebastian then possessed himself of the smoking ruins of this city. From here he passed northward and entered the territory possessed by a chief named Popayan, whose name he preserved to designate the territory over which the former had held sway. Inflamed by the speeches of an Indian captive, who spake strange words about a chief farther north, anointed with gold powder, Benalcazar and his band determined to visit and conquer this El Dorado, or chief of gold. After traversing vast forests, in 1534, he arrived at the country which afterward received the name of New Granada. Arrived there, he found himself forestalled by two other Spanish adventurers or conquistadores. He returned to Popayan, and was made governor of this province by a decree dated 1538. When La Gasca succeeded in supplanting Diego Pizarro, he deprived Sebastian of his governorship.

**BENVARD, bâ-nâr’**, Henri Jean Emile, French architect: b. Goderville 1844. As a student of the Ecole des Beaux Arts in Paris, he competed for and won the Frix de Rome in 1867. In 1899 he was the winner out of a hundred competitors for the plans for the University of California. With some modifications his plans have been followed in the building of the university buildings, at a cost so far of $10,000,000.

**BENARÉS, bê-nâ’rêz,** India, a division in the Northwestern Provinces with an area of 10,414 square miles, largely made up of sá cultivated flats on each side of the Ganges. The heat in summer is excessive, but in winter fires are requisite. About 50 per cent of territory is irrigated by wells and canals. Garden stuffs, grain of different kinds, flax for oil and sugar, are the principal objects of cultivation. Rice, for which many parts of the soil seem well adapted, is seldom grown. Muslins, silks and gauzes, salt, indigo and opium are made very extensively. The principal town is Benares. Pop. about 5,300,000, about 90 per cent Hindu.

**BENARES (in Sanskrit, Varanasi), Hindustan, a town in Northwest Provinces, in the
division of the same name, on the left bank of the Ganges, from which it rises like an amphitheatre, presenting a splendid panorama of temples, mosques, palaces and other buildings, with their domes, minarets, etc. Fine ghats lead down to the river. It is built of freestone and agrees with every idea of a highly decorated houses, but the height of the houses and narrowness of the streets give it all the usual inconveniences of an Asiatic town. Kasi the Splendid, as the Hindus commonly call it, is one of the most sacred places of pilgrimage in all India, being the headquarters of the Hindu religion. To die at Benares is the greatest happiness for a Hindu, because he is then sure of immediate admission into heaven. The number of pious foundations and temples is exceedingly great. There is a continual influx of wealthy pilgrims into the city, and many of the Hindu princes have a town residence here. The principal temple, called Bisheswar, is dedicated to Siva. Aurungzebe built a splendid mosque on the highest ground in the city, and it is the most prominent object from the river side. At the end of the 17th century an observatory was erected in this city by one of the rajas, which still exists. One of the temples has a great number of sacred monkeys attached to it. Altogether there are about 1,500 Hindu temples. Among the municipal structures are the government college, hospitals, town-hall, asylums, swimming baths and waterworks. Benares carries on a large trade in the produce of the district and in English goods, and manufactures silks, shawls, embroidered cloth, jewelry, etc. The merchants and bankers are numerous and wealthy. There are few English inhabitants, except the government officers, and the members of the various missions. Kasi was ceded to the East India Company by the Nabh of Oude in 1775. During the mutiny of 1857 a serious outbreak occurred here. The Benares College was opened in 1791. It is maintained by the government, and includes the Sanskrit College, with over 400 students, and the English College, with about 100. It occupies a fine building, completed in 1852. Pop. about 204,000. Consult Sherring, 'Sacred City of the Hindus' (1869); Havel, 'Benares, the Sacred City' (1911).

BENAVENTE Y ROCAMORA, Enrique, Spanish writer: b. Reus, Tarragona, 8 Sept. 1837. Rather early in life he showed a decided inclination for the study of languages and for many years taught with great success in Madrid. He was professor for several years at the Municipal College of Saint Ildefonso and founded the well-known Benavente Lyceum, of which he was the director from its institution. At an educational exhibition held in Madrid in 1890's Benavente was awarded a medal for his method of teaching. He has contributed to several educational periodicals, and has also written novels both in Spanish and French. His published works include: 'Solução práctica de la política española'; 'El idioma francés y el español en Francia y España', 'La mano de Providencia', a novel.

BENBOW, John, English admiral: b. Shrewsbury, England, 1653; d. Jamaica, 4 Nov. 1702. After serving for some time in the navy he entered the merchant service, and fought so desperately against a pirate from Sallee, on one of his trips to the coast in the year 1686, to beat her off, though greatly his superior in men and metal. He re-entered the navy after the Revolution, and was employed in preparing the English trade in the
channel, which he did with great effect. His valor and activity secured him the confidence of the nation, and he was soon promoted to the rank of rear-admiral, and charged with operations against Dunkirk and the French coasts. In 1668 he was sent to put down the pirates in the West Indies, and not long after returning, he again sailed to the West Indies with a small fleet, having accepted a command previously declined by several of his seniors, from the supposed superiority of the enemy's force in that quarter. On 19 Aug. 1672, he fell in with the French fleet under Du Casse, and for five days maintained a running fight with them, when he at length succeeded in bringing the enemy's sternmost ship to close quarters. In the heat of the action a chain-shot carried away one of his legs. His officers offered their sympathy. "I had rather have lost them both," he replied, "than have seen this dishonor brought upon the English nation. But, harry me—if another shot should take me off, behave like men, and fight it out." He was taken below; but the moment the dressing had been applied to the wound he caused himself to be brought again on deck, and continued the action. At this critical instant, being most disgracefully abandoned by several of his officers under his command, who signed a paper expressing their opinion that "nothing more was to be done," the whole fleet effected its escape. Benbow, on his return to Jamaica, brought the delinquents to a court martial, upon which two of them were convicted of cowardice and disobedience of orders, and condemned to be shot; which sentence, on their arrival in England, was carried into execution at Plymouth. Consult Clowes, 'Royal Navy' (Vol. II, London 1897); Fletcher, 'Admiral Benbow' in Macmillan's Magazine (Vol. LXXXIV, London 1901).

BENCH, in law, the seat which judges or magistrates occupy officially in a court of justice; the court or tribunal itself, also the judges or magistrates sitting together to try cases in contradistinction to the bar. The Court of Common Pleas in England was formerly called Bancus, the Bench, as distinguished from Buncus Regis, the King's Bench. It was also called Communis Bancus, the Common Bench, and this title is still retained by the reporters of the decisions in the Court of Common Pleas. Mention is made in the Magna Charta "de justiciariis nostris de Banco," which all men know to be the justices of the Court of Common Pleas, commonly called the Common Bench, or the Bench. Viner, Abr. Courts (n. 2). The King's Bench (Queen's Bench during the reign of queen) was formerly the highest court of common law in Britain. Since 1875 it is included in the High Court of Justice.

BENCH-MARK, a mark placed upon some permanent object, as a stone or wall, for use in tidal observations and leveling surveys. Its position above the zero of the tide-gauge or other datum level is made a matter of record and any level once established may be readily ascertained at a future period. It is usually made upon some durable material, as the stone foundation of a pier. In tidal observations a bench-mark is determined by measuring the zero of the tide-gauge is recorded immediately so that in case the latter is destroyed, it may be set up again by means of the bench-mark. In leveling engineers and surveyors make extensive use of bench-marks and to them refer all levels measured.

BENCH WARRANT, a warrant issued by the court before which an indictment has been found to arrest the accused, that he may appear and find bail for his appearance at the trial. Where a bench warrant is directed to the sheriff it cannot be executed by any verbal authority from the sheriff, and such arrest does not discharge the recognizance. A bench warrant is defective which does not direct that the party shall be brought before some judge or justice.

BENCHERS, in England, senior members of the Inns of Court, who have the entire management of their respective inns, the power of punishing barristers guilty of misconduct, and the right to admit or reject candidates to the bar. See also INNS OF COURT.

BENCOOLEN, bén-koólən (Dutch, Benkoelen), Sumatra, a seaport on the southwest coast; long. 102° 19' E.; lat. 3° 47' 36" S. The English settled here in 1685, and in 1890 the East India Company built a fort here, calling it Fort York. It rose to some eminence as a centre for trade and coffee growing. In 1825 Bencoolen was yielded up to the Dutch in exchange for the settlements on the Malay Peninsula. A convenient river on its northwest side conveys pepper out of the inland country; but there is great inconvenience in shipping it, by reason of a dangerous bar at the river's mouth. The place, which is almost two miles in compass, is known at sea by a high, slender mountain, which rises in the country 20 miles beyond it, called the Sugar Loaf. It is inhabited by a mixed population. The medium heat throughout the year is from 81° to 82°. Pepper is the chief produce of the adjacent country, which is mountainous and woody. The place is unhealthy and subject to earthquakes; storms are frequent. Pop. about 12,000.

BENCZUR, běn-toor, Gyula, Julius, Hungarian artist. B. Nyiregyhaza 1844. He studied with Hilitensperger, Anschütz and Pilloy. He was made professor at the Academy of Munich in 1880 and was subsequently director of the Academy of Parnaking in Budapest. His distinction was recognized by his nomination as a member of the Hungarian House of Magnates. His paintings, which are of the School of Pilloy, are noted for their splendid coloring. Among the most celebrated are 'Barefoot of Ladislas Hunyady' (1867); 'Arrest of Rakoczy in 1701' (1869); 'Louis XV in the Boudoir of Duharny' (1870); 'Family of Louis XVI during the Assault on Versailles' (1872); owned by D. O. Mills, New York; 'Baptism of Saint Stephen' (1875); 'Bacchanti' (1881); 'The Reconquest of Buda by Charles of Lorraine' (1888).

BEND, in heraldry, one of the nine honorable ordinaries, containing a third part of the field when charged, and a fifth when plain, made by two lines drawn diagonally across the shield from the dexter chief to the sinister base point. The bend sinister differs only by crossing in the opposite direction. Originates from the sinister chief to the dexter base. It indicates illegitimacy.
BENDA, Franz, German violinist: b. Jungbunzlau, Bohemia, 1709; d. Potsdam, 1786. He exhibited, while a boy, a great desire to learn the violin which he could gratify in no other way than by joining a band of strolling musicians. He found means, however, to acquire an extraordinary mastery of the instrument, and in 1732 entered the service of Frederick the Great, then prince-royal, with whom he remained the rest of his long life. He founded a school of violinists, whose method of playing was entirely original and quite effective. He also published some excellent solos for the violin.

BENDA, Georg, German musician, the most distinguished of a notable musical family: b. Jungbunzlau, Bohemia, 1721; d. Köstritz 1795. He was page in the household of the Duke of Gotha (1748-87), and in this period produced several operas and cantatas, such as Ariadne auf Naxos and Medea.

BÉNDALOU, Paul, a soldier of the American Revolutionary army: b. Montauban, France, 15 Aug. 1755; d. Baltimore, Md., Dec. 1826. In October 1776 he embarked at Bordeaux for the United States as a volunteer in the cause of liberty, and, on reaching the headquarters of Washington, received a lieutenant's commission. Transferred to the command of Pulaski he was captain of the first company in his famous legion at the siege of Savannah. There he carried off the field the body of the generous Pole, and preserved, also, the standard of the legion which had been wrought and presented by the wives and daughters of Maryland. He was quartermaster general with the rank of colonel, in the Maryland militia during the War of 1812, and for many years United States marshal for the Circuit and District Courts of Maryland, his official conduct, from first to last, being marked with exactness and integrity.

BENDAVID, bén-dá-'vit, Lazarus, German-Jewish mathematician and philosopher: b. Berlin, 18 Oct. 1762; d. there 1832. After his graduation from the University of Berlin he lectured for some years on the philosophy of Kant in Vienna. His lectures being discouraged by the Emperor, in 1801 he returned to Berlin, where he found employment under the government. He is the author of Über die Parallellinien (Berlin 1786); Versuch einer logischen Auseinandersetzung des mathematisch-unendlichen (Berlin 1796); Versuch über das Verhältniss der Zahlen (2 vols., Vienna 1794); Vorlesungen über die Kritik der reinen Vernunft (Vienna 1795); Vorlesungen über die Kritik der praktischen Vernunft (Vienna 1796); Vorlesungen über die Kritik der Urteilskraft (Vienna 1796); Rede über den Zweck der Kritischen Philosophie (Vienna 1796); Selbstbiographie (Berlin 1804).

BENDEMANN, bén-dé-'man, Eduard, German painter: b. Berlin, 3 Dec. 1811; d. Düsseldorf, 27 Dec. 1889. As early as 1832 his great picture of the Jews Mourning in Exile was exhibited at Berlin, and in 1837 he gained the golden medal at Paris. In 1838 he was appointed professor of the Academy of Art at Dresden. Here he was entrusted with the execution of the larger frescoes in the palace, and on these his fame chiefly depends.

In 1858 he was appointed director of the Düsseldorf Academy, a post which he held until 1867. He afterward produced several large canvases and frescoes, some of which are among his best works. He was a member of the Modern Painters and their Paintings (1899).

BENDER, Russia, a city in the government of Bessarabia. It is situated on the Dniester, 55 miles from its mouth, and 36 miles from Kishinev, the capital of the government, and is a straggling place, chiefly consisting of low houses and mere huts. There are several churches, synagogues a mosque and a gymnasium for women. It formerly possessed a strong fortress but this was dismantled in 1897. Its commerce is important. It has a trade in grain, timber, cattle, animal products and wine. In 1770 the Russians captured the city and put the garrison and inhabitants, about 30,000, to the sword. After being several times taken from the Turks by the Russians, it has belonged to Russia since the Peace of Bucharest, in 1812. Pop. 33,800, mostly Jewish with a blend of Russians, Armenians and Tartars.

BENDER Abbas, Persia, seaport in the Strait ofOrmuz. It was once of considerable commercial importance but its trade has diminished within recent years. The chief exports passing through this port are fruit, tobacco, wool, carpets and opium, amounting to about $2,300,000 a year. The population, about 20,000, is composed of Armenians, Arabs and Kurds, beside the native Persians.

BENDIGO, formerly Sandhurst, Australia, city in Bendigo County, Victoria, on Bendigo Creek, fully 100 miles north-northwest of Melbourne with which it has direct railway communication. It is one of the chief cities in the colony and an important railway centre. Along one side of its main street (Mail Street) there are fine buildings of brick and stone, and facing these, in Rosalind Park, are the elegant government buildings and the law courts, which together cost nearly £80,000. Other buildings worthy of mention are the handsome town-hall; mechanics' institute, with library and school of mines; free library; temperance, masonic and other halls; hospital, benevolent asylum; some fine banks; Anglican, Wesleyan, Presbyterian and other churches; Roman Catholic cathedral, art gallery, jail, state and other schools, etc. The public parks comprise, besides the Rosalind Park, the fine Botanic Gardens and two others largely used for sports. The streets are lighted by gas and electricity, and there is an excellent water supply from large reservoirs near the town. The chief industry of the district is gold mining, which gives employment to 5,000 miners. Other important industries are brewing, iron-founding, stone-cutting, granite-polishing, tanning and the manufacture of pottery, bricks, tiles, cordials, etc. Agriculture and viticulture are carried on in the district and there is a trade in wine and fruits. Bendigo was founded at the time of the gold discovery in 1851, it became a municipality in 1855, a borough in 1863 and a city in 1871. Nearly 700,000,000 worth of gold has been here, much of it from quartz reefs. Pop. (1911) 39,417, including about 300 Chinese. Consult Mackay, 'History of Bendigo' (1901).

BENDIRE, bén-dé're, Charles Emil, German-American military officer and ornithologist:
BENDZIN—BENEDETTO DA MAIANO 503

b. Darmstadt, Germany, 27 April 1836; d. 1897. He came to the United States in 1852, and entering the army in 1854, served through the Civil War, being with the 1st Cavalry. After the war he was transferred to the West, and was retired 24 April 1886. During his stay in the West he applied himself to the study of ornithology, and collected a vast amount of material in various branches of natural history. In 1870 he began to collect the eggs of North American birds, which finally numbered more than 8,000 specimens, and this collection he presented to the United States National Museum. He is the author of 'The Life Histories of North American Birds, with Special Reference to their Breeding Habits and Eggs.'

BENDZIN, bën'jen, Russian Poland, the capital of a district in the government of Piotrkow, situated on the Black Przemysza, 364 miles from Warsaw, on a branch of the Warsaw & Vienna Railroad. Its chief industry is the zinc works, under government control; there are also coal mines in the vicinity, and a considerable manufacture of fireproof bricks. The interior, independent work of Benedicto, in the chapel of Saint Savinus in the cathedral of Faenza, probably dating from 1471-72. The execution of the monument is already so masterly that some authorities have thought it should be assigned to a later date. By 1474 Benedicto was established in Florence, at least for some time, and we have reason to think that the orders he received from other cities, such as Arezzo, Siena and Naples, were executed in the Florentine workshop and sent to their destination ready for setting up in place. Shortly after 1474 Benedicto produced the famous pulpit of the Church of Santa Croce—the finest example of marble pictorial relief in Italian sculpture. It is the most imposing of his works and one which must be referred entirely to his own genius. About the same time he was at work in the Palazzo Vecchio (Municipal Palace) of Florence, which he enriched with architectural and sculptural decorations. That his art was remunerative may be judged from the fact that in 1480 Benedicto and his brother founded a family chapel in Prato. We find the artist working for Loreto in the succeeding years, with another great patron in King Ferdinand of Naples. But the work which has probably done most for his fame is the building of Palazzo Strozzi in Florence. He did not live to see it finished (it was begun in 1489) but there can be little doubt that the conception is his, that he saw the gigantic palace rise to its second story, that he planned its structure and designed its court. His sculptural portrait of Filippo Strozzi (the marble of which is in the Louvre and the clay model in Berlin) shows the kinship between the conceptions of the two parts. It was practised by the genius of Benedicto, and shows his appreciation of the character of the man who was suited by the warrior-palace he had asked for. A striking contrast with this construction is found in Benedicto’s Loggia of Santa Maria delle Grazie at Arezzo, which combines all the fineness and charm that the name suggests. As sculptor and architect Benedicto will stand for all time among pure and noble figures of Florentine art.

We may note further the following important works by him: the altar of Santa Fina at
San Gimignano, the ciborium of San Domenico in Siena, the tabernacle of the Badia at Arezzo, and the Madonna of the Berlin Museum. Consult for reproductions and comments on his sculpture Bode's 'Denkmäler der Renaissance Skulptur Toskanas' (Vol. VII, Munich 1892-1905); for his architecture, Stegmann and Von Geymüller, 'Architektur der Renaissance in Toscan' (Vol. IV, Munich 1885-1908).

**BENEDICTE**, bén-disk'ít-e, the song of the 'Three Children' in the fiery furnace, as given in the Apocrypha and the Septuagint version of Daniel, which is a part of the Roman Breviary in the office of lauds; it is also a part of the Anglican morning prayer, to be used when the Te Deum is not sung, usually, from Septuagesima to Easter and during Advent. It was sung in the Church as early as the time of Saint Chrysostom. The name originated in the opening sentence, "Benedicite omnia opera Dei" ("Praise all the works of God").

**BENEDICT, Saint**, the founder of the first religious order in the west: b. Norcia, Italy, c. 480; d. 543. While yet a youth, he retired to a cavern situated in the desert of Subiaco, 40 miles from Rome, and for three years dwelt in a cavern (afterward called the Holy Grotto). He afterward founded 12 monasteries. In 515 he drew up a rule for his monks, which was first introduced into the monastery on Monte Cassino, in the neighborhood of Naples, founded by him (529) in a grove of Apollo after the temple had been demolished. This gradually became the rule of all the western monks. The abbeys of Monte Cassino afterward acquired episcopal jurisdiction and a certain patriarchal authority over the whole order. Benedict, with the intention of banishing idleness, prescribed, in addition to the work of God (as he called prayer and the reading of religious writings), the instruction of youth in reading, writing and ciphering, in the doctrines of Christianity, in manual labors (including mechanic arts of every kind), and in the management of the monastery. With regard to dress and food, the rule was severe but not extravagant. Benedict caused a library to be founded, for which the aged and infirm brethren (ordo scriptorius) were obliged to copy manuscripts. By this means he preserved the literary remains of antiquity from ruins; for though he had in view only the copying of religious writings, yet the practice was afterward extended to classical works of every kind, and the world is indebted for the preservation of great literary treasures to the order of Saint Benedict.

**Bibliography.**—Doyle, F. C., 'Teachings of Saint Benedict' (London 1887); Henderson, G. F., 'Historical Documents of the Middle Ages' (pp. 274-314, lb. 1892); Lechner, 'Life and Times of Saint Benedict' (ib. 1900); Spitz-zenhofer, S., 'Die historische Voraussetzungen der Regel des heiligen Benedict von Nursia' (Vienna 1895); Wolfin, 'Von Nursia und seine Mönchsgregel' (Leipzig 1897). See **Benedictines**.

**BENEDICT I**, succeeded John III 575; d. 578, and was himself succeeded by Pelagius II.

**BENEDICT II**, succeeded Leo II, 684; d. 685, and was succeeded by John V. He decided the English controversy in favor of Wilfrid of York and was canonized because of his virtues.

**BENEDICT III**, succeeded Leo IV, 855. The Emperor Lothair opposed his election, but he was acknowledged finally. He did much to improve and beautify the ecclesiastical edifices of Rome. During his pontificate, the Saracens were ravaging Apulia and Campania; d. 858, and was succeeded by Nicholas I.

**BENEDICT IV**, succeeded John IX, about 900. He crowned Louis, son of Boson, King of Italy. He was famed for his charity to the poor; d. 903, and was succeeded by Leo V.

**BENEDICT V**, succeeded John XII, 964, and was appointed by the Romans in opposition to Leo VII. The Emperor Otho, supporter of Leo, appeared before Rome with an army, reduced the city to famine, and a new assembly of the clergy declared to be null the election of Benedict, who was exiled; d. in prison at Hamburg. 965.

**BENEDICT VI**, succeeded John XIII, 972. After the death of the Emperor Otho I, the Romans imprisoned Benedict, who was strangled in the castle of Saint Angelo, in 974. Owing to the mistake of later chroniclers in confusing Dominus Papa with a supposed proper name, Donus II appears in many lists of the Popes between Benedict VI and Benedict VII. Geisebrecht, in his 'Year-Book of the German Kingdom under Otho II' has clearly shown that no such Pope as Donus II ever existed.

**BENEDICT VII**, of the family of Conti, elected in 975. He promoted ecclesiastical discipline and did much to suppress simony. During his pontificate, the Emperor Otho II came repeatedly to Rome, where he died in 984. Benedict died about the same time, and was succeeded by John XIV.

**BENEDICT VIII**, of the same family, succeeded Sergius IV, in 1012. In 1016, the Saracens from Sardinia having landed on the coast of Tuscany, Benedict attacked and defeated them. He crowned the Emperor Henry II, and his wife, in the Church of Saint Peter. At the synod of Pavia he insisted on clerical marriage and concubinage; d. 1024, and was succeeded by his brother, John XIX. Consult his 'Life' by P. G. Wappler (Leipzig 1897).

**BENEDICT IX**, a relative of the two preceding Popes, succeeded John XIX in 1034. He was then very young, some say only 18 years old. He was deposed by the Romans soon after election. Conrad II reinstated him in 1038. In 1044 he was again banished by Consul Ptolemaus, but was reinstated within three months. The following year Gregory VI was declared Pope, and in 1046 all three Popes. Gregory, Benedict and Sylvester were deposed by the Emperor Henry III, who set up as Pope. Sutger, bishop of Bamberg, as Clement II. Clement died in 1047 and Benedict resumed the papal throne for eight months, when he was displaced by Leo IX. He died in the convent of Grotta Ferrata in 1056. Consult 'Life' by Gioragnoli (Milan 1900).

**BENEDICT X** was elected by a faction after the death of Stephen IX, in 1058; but the Council of Siena nominated Nicholas II. Bene-
dict did not submit till the following year, when Nicholas came into Rome; d. 1059.

BENEDICT XI, a Dominican, succeeded Boniface VIII, in 1303. Contemporary historians speak highly of his character and virtues. He died 1304, and was succeeded by Clement V.

BENEDICT XII, Jacques Fournier, a native of France, succeeded John XXII, in 1334, the Popes residing then at Avignon. He put a stop to many abuses in the distribution of ecclesiastical patronage, enforced discipline among the monastic orders, and insisted that temporal rulers should observe their compacts with the Holy See; d. 1342, and was succeeded by Clement VI.

BENEDICT XIII, Cardinal Orsini, succeeded Innocent XI, in 1724, but it was with difficulty that he could be made to accept the pontificate. Benedict lived with the greatest frugality, and has been called more a monk than a Pope. He managed, however, to transact an extraordinary number of affairs. A large number of saints were included in the calendar during his pontificate. Benedict was moderate in politics and a great lover of peace, was instrumental in arranging the Treaty of Seville in 1729. His great fault was his implicit obedience to Cardinal Coscia, who much abused it. His works were published in 1728, in three volumes folio. He died in February 1731, and was succeeded by Clement XII.

BENEDICT XIV, Prospero Lambertini: b. Bologna 1675; d. 3 May 1758. He applied himself with success to the canon and civil law, and became advocate to the consistory at Rome. Afterward he was appointed promotor fidei, and wrote a valuable work on the Ceremonies used in Beatifications (1734). He was passionately fond of learning, of historical researches, and of monuments of art, and also associated with the distinguished men of his time; among others with Father Montfaucon, who said of him: "Benedict has two souls; one for science and the other for society." He also made himself familiar with the best poetical works, whereby his mind became elevated and his style animated. Benedict XIII made him, in 1727, bishop of Ancona; in 1728 cardinal, and in 1732 archbishop of Bologna. In every station he displayed great talents, and fulfilled his duties with the most conscientious zeal. He opposed fanaticism even at the risk of his own safety, defended the oppressed and expressed himself with the greatest frankness to Clement XII without losing his favor. When, after the death of Clement XII in 1740, the election of a new Pope in the conclave was retarded by the intrigues of Cardinal Tencin, and the cardinals could not agree, Lambertini, with his usual good nature, said to them, "If you want a saint take Gottf; if a politician, Aldobrandi; if a good old man, myself." These words, thrown out in a humorous manner, operated on the conclave like inspiration, and Lambertini, under the name of Benedict XIV, ascended the papal throne. His choice of the more moderate and constitutional Church, who surrounded him does the greatest honor to his judgment. The condition of the Church and of the Roman court had not escaped his penetration. Since the Reformation princes no longer trembled at the thunders of the Vatican. The power of the Popes in temporal affairs had notably declined, and Lambertini knew that respect for the papal authority could be maintained only by a wise moderation. He constantly regulated his measures by this principle, and thus succeeded, even in difficult circumstances, in satisfying not only the Catholic but even the Protestant princes. The sciences were a special object of his care. He established academies at Rome; promoted the prosperity of the academy at Bologna; caused a degree of the meridian to be measured; the obelisk to be erected in the Campus Martius; the church of Saint Marcellino to be built after a plan projected by himself; the beautiful pictures in Saint Peter's to be executed in mosaic; the best English and French works to be translated into Italian; and commanded a catalogue of the manuscripts contained in the Vatican library (the number of which he had enlarged to 3,500) to be printed. His government of the papal states did equal honor to his wisdom. He enacted severe laws against usury, favored commercial liberty, and diminished the number of holidays. His piety was sincere, yet enlightened and forbearing. He strove to maintain purity of doctrine and of morals, giving in his own character the most striking example. The sole reproach brought against him by the Romans was that he wrote too much and governed too little. His works compose, in the Venice edition, 16 volumes folio (1767). The most important of his works is that on the Synods, in which we recognize the great canonist. Other editions of his works are those issued under the editorship of Azevedo (12 vols., 1747-51); at Prato (17 vols., 1846). His letters were edited by F. X. Kraus (Freiburg 1884; 2d ed. as a biography by F. Scarselli, with bibliography 1888). Other letters edited by B. Manzone (Bra 1890). Consult McHilliam, 'A Chronicle of the Popes' (London 1912) and Pastor, 'The History of the Popes' (London 1906-12).

BENEDICT XV, Giacomo della Chiesa: b. Pegli, near seaport of Genoa, 21 Nov. 1854. Made his early studies in the town gymnasium of Genoa at the university of which he received the doctor's degree in jurisprudence. He studied theology at Rome in the Collegio Capranica and was ordained priest in 1878. He then became secretary of Cardinal Mariano Rampolla who when appointed Secretary of State in 1887 chose him as under secretary. In 1907 Mgr. della Chiesa was created archbishop of Bologna and elevated to the cardinalate 25 May 1915 and on 3 September following, after nine ballots, was elected the successor of Pius X. The tidings from the conclave were proclaimed from the upper portico of the Vatican Basilica by Cardinal della Volpe. He announced in Latin: "Hail, great joy that we have as pope most eminent and most reverend Giacomo della Chiesa who has taken the name of Benedict XV. Points of resemblance are easily traced between Benedict XV and Prospero Lambertini, Pope Benedict the XIV, who was archbishop of Bologna and then elected in 1740 of whom Voltaire wrote: "This is Lambertini the honor of Rome and the father of Christendom who has fought the world by his writings and adorns it by his virtues." The
scholarship of Benedict XV is comprehensive and finished. He is a patron of arts and literature. His is a lofty and penetrating mind. In disposition he is strong and gentle. Noble and aristocratic he counts in his ancestry men distinguished by birth and deeds. From the moment of his succession to the papacy he found himself face to face with world conditions which for the difficulties they still beget and the problems they will surely create have no equal in all history. His predecessor, Pius X, succumbed to the terrible prostration forced upon him by the desolation into which all the European families were plunged by the Great War which at the present writing, that is two years after it began, is still agonizing the universe. Benedict XV stands firm fronting the terrible scenes with which hourly he is presented. He is neutral in the strictest sense of the word. His cry is an eloquent appeal for peace. His sympathy is with every fighting man and with the war widows and orphans. In "Ubi Primum," his declaration to the Universal Church, 8 Sept. 1914, he gives the keynote of his policy when he says: "Since following the example of our Lord, we must be ready even to lay down our life for the salvation of the flock of Christ, it is our avowed intention to leave nothing undone, in as far as in us lies, to bring the present calamity to a speedy termination." He is undismayed, and so far as his children are scattered the world over and his priests are on every battlefield and engaged in all kinds of tasks, his figure is the most conspicuous in these disastrous times. All nations look up to him, approve his efforts and are grateful. His most notable pronouncement is his encyclical "Ad Beatissimi Apostolorum Principis," Nov. 1914. In it he refers to many matters of world-wide importance. He emphasizes the moral disorders that are admitted to be the true source of the present disturbance, the chief of which are: Lack of mutual love among men; disregard for authority; unjust quarrels between the various classes; material prosperity becoming the prominent object of human endeavor, as if there were nothing higher and better to be gained. His attack on this matter is very strong. The bibliography of Benedict XV is very fragmentary. Outside of some magazines and reviews and addresses there is very little information. The best material is to be found in the newspapers of his own and other countries published at the time of his accession. Consult also "The Official Catholic Directory" (New York 1916).

PATRICK S. HALPIN, Professor of Ethics, New Rochelle College.

BENEDICT, St. Julius, German-English pianist and composer: b. Stuttgart 1804; d. London 1885. In 1821 he went to Dresden to study under Weber, and two years later became conductor at a Vienna opera. "Giacinta ed Ernesto," was produced in Naples in 1829 without success. He took up his residence in England in 1835, and was knighted in 1871. He was for many years conductor at the Covent Garden. From the first he was fortunate enough to secure the favor of King Egfrid. From him he received a donation of land at the mouth of the Wear, on which he founded the monastery of Wearmouth. Workmen were brought from France to build the church, and during a number of seasons acted as operatic conductor in London, both for English and Italian opera. His principal works are the operas "The Gipsy's Warning" (1838); "The Bride of Venice" (1843); "The Crusaders" (1846); "The Lily of Kil-
stances of the use of window glass in England. He was now recommended to Egfrid with a further grant of land on the other side of the Wear, where he founded another monastery, that of Jarrow, dependent on the monastery at Wearmouth. During the remainder of his life he continued to live in the latter monastery, except for the last two years which he passed at a monastery he had made in 685, and from which he derived as before valuable additions to his various collections. It is chiefly by these collections that his services to learning are to be estimated, and there can be no doubt that his great pupil, the "Venerable Bede," who was a monk in the monastery of Jarrow, was immensely indebted to them for the learning he acquired. The impulse given by his labors to Anglo-Saxon civilization are difficult to estimate. It is certain, however, that the valuable and extensive library he founded at Wearmouth imparted to the nation a taste for literature and learning, which bore excellent fruit for many centuries. His famer pupil, Bede, wrote his life.

**BENEDICT COLLEGE.—Benedictine.**

A co-educational institution for negroes at Columbia, S. C., conducted by the American Baptist Mission Society. It was founded in 1871 as Benedict Institute and chartered as a college in 1894. It has elementary, high school, collegiate and theological departments. All work on the campus is done by students, also all the work of the kitchen and dining-room. There are 13 buildings and the college has a permanent invested and productive endowment of $140,000. In 1916 it had 35 instructors and 400 enrolled students. The library contains 7,900 volumes.

**BENEDICTINE.** A liqueur originally prepared by the Benedictine monks of the abbey of Fécamp, in Normandy, consisting of spirit (fine brandy) containing an infusion of the juices of plants, and said to possess digestive, anti-spasmodic, and other virtues, and to have prophylactic efficacy in epidemics. It somewhat resembles chartreuse and has been made in the same way since 1510. See LIQUEUR.

**BENEDICTINES.** From the 6th to the 10th century almost all the monasteries in the West might be so called, because they followed the rule of Saint Benedict, and received their names from that monk. From this period the custom prevailed, at that time the monasteries in Spain and France received from their bishops, as well as the rule of the Irish Saint Columba, were essentially the same as those of Saint Benedict; and in the progress of his order the monasteries in Spain and France, as well as those of the order of Columba, united themselves with it. Monte Cassino, the magnificent primitive monastery of the Benedictines, became the model of all others. At that time the monasteries, having no common superiors, were under the immediate control of the bishops in their respective dioceses, and differed from another in many qualifications of the primitive rule. Not even the color of their dress was the same. The Benedictine monks wore white garments like the first Benedictine monks, who originated in France in the 6th century. After the unions which took place at a later period, all the members of this order wore black, as the founder is said to have done. The desire for the unification of the monasteries occasioned the reforms of Benedict of Aniana in France, the renewed inculcation of the old rule, and the adoption of new ordinances suited to the times, by the Council of Aix-la-Chapelle (817), as well as the particular rules and fraternities of the celebrated monasteries in France, Germany and England, which in those barbarous times became seats of civilization, and finally the institution of the Cluniacs, a new branch of the Benedictines, which proceeded from the convent of Cluny in Burgundy, founded in the year 910. The Benedictine monasteries, in the Middle Ages, were often asylums in which science took refuge and found protection. In place of the discordant and uncertain rules which had hitherto existed, the Cluniacs made fixed regulations concerning the hours of worship, the obedience, discipline and common government of all the monasteries belonging to their order, which were soon imitated in all Europe. In the 12th century their order contained 2,000 monasteries, whose luxury frequently called for reforms, and finally became the chief cause of their decline. The remains of the Cluniacs united themselves in the 17th century with the priory of Richelieu, with the Benedictine fraternities of Saint Vannes and Saint Maurus, the latter of which, founded in 1618, had, in the beginning of the 18th century 130 priories and 180 monks and 180 abbots and priors in France, and acquired by means of its learned members, such as Mabillon, Montfaucon and Martène, merited distinction. To this family belong those new orders established on the foundation and observing the rule of Saint Benedict, which have originated since the 11th century, and are distinguished from and proper Benedictines by their dress, names and particular regulations; for example, the Camaldulians, the monks of Vallombrosa, the Sylvestrians, the Grandmontines, the Carthusians, the Celestines, the Cistercians and Bernardines, the Trappists and the monks of Fontevraud. The Benedictine monasteries never constituted one society, constitutionally regulated and governed under an aristocratic or monarchical form; on the contrary, a great many monasteries which descended from the old Benedictines were compelled by the Council of Trent to unite themselves gradually into particular fraternities. Among these the Benedictines of Monte Cassino ruled over that of Monte Oliveto and Monte Olivero (who called themselves Olivetans) in Italy and Sicily; those of Valladolid and Montserrat in Spain; those of Hirsau and Fulda in Germany, and that of Mölk in Austria, deserve particular notice on account of the extent of their possessions, the magnificence of their churches and the mildness of their rules. To the fraternity of Mölk (or Melk), which still exists, but accommodated to the spirit of the times, the rest of the Benedictine convents in Austria are joined. Many of the nunneries of this order are reserved for the nobility, because the places in them are equal to the most lucrative benefices. During the first French revolution the monasteries of the Benedictines along with all other monastic orders were abolished; but the Benedictines later partially re-established themselves in France. In England the Benedictines were an important body at the dissolution of the monasteries, having then 186 abbies, priories and nunneries besides the present there are eight Benedictine abbeys in England, besides an extensive establishment
at Fort Augustus in Scotland, comprising an abbey and college. In the United States there are 13 abbeys, 545 priests, 133 clerics and 345 lay brothers in the order. The Benedictines have charge of 16 colleges in the United States.

**BENEDICTI**n, the act of blessing, of wishing to a person or the grace of God. It has always existed as a custom among Jews and Christians. The Jewish priests bestowed benedictions upon the people when they remained obedient to the law, and maldictions when they neglected it. In the Catholic Church the term is generally applied to the religious public service at which the priest makes the sign of the cross over the congregation with the ostensorium containing the consecrated Host. The Anglo-Saxon term *blessing* is now commonly used to express the benediction invoked with prayer, sign of the cross, and holy water upon religious articles such as prayer-books, holy pictures, rosary-beads, etc. In Protestant churches the benediction is usually given in words similar to those prescribed by Moses to Aaron. It is often accompanied with laying on of hands, especially in the celebration of marriages, the ordination of pastors, the confirmation of converts and the baptism of children.

**Benedictus** (Luke i, 68-79) used in the Roman breviary at lauds and also in the Anglican morning service.

**Bene**fic**è**e (Lat. *beneficium*), an ecclesiastical living, originally including every species of prebent, as well as those to which dignities and offices were attached, namely, bishoprics, deaneries and prebends, as the lesser sort, namely, rectories, vicarages, perpetual curacies and endowments of chaplaincies; but in its popular acception it includes only the latter class, and the distinction is recognized in recent acts of Parliament. A benefice now denotes the beneficial property right or usufruct enjoyed by the holder of the benefice without regard to his dignity. The name is derived from the *beneficium* of the Romans, a grant of any kind to a subject by the sovereign. It was afterward the designation of a grant of land by any large proprietor to a retainer or follower as a reward of services, being the same that later was denominated a fief or fee, the essential incident of which was perpetuity; that is to say, it was a permanent stipendary estate held of a superior and usually subject to some condition indicating vassalage. The principle of the feudal tenure was applied, in the Middle Ages, to ecclesiastical benefices to this extent, that they were held of the Pope, as a superior lord, though these benefices had not the vassalatory character of a fee, so far as respected the office or dignity thereof, and the lands or emoluments conferred by a grant were usually attached to such office or dignity, and on the death of the incumbent, reverted to the ecclesiastical superior who was entitled to appoint a successor. This, at all events, was the claim of the Popes, though it was the subject of contest between them and the principal European sovereigns. Consult Phillimore, 'Ecclesiastical Law of the Church of England' (2d ed., London 1895).

**Benefit of Clergy**, in English criminal law, the *privilegium clericale*, exemption of the clergy from prosecution by law for certain crimes. It was for many centuries an important element in the administration of criminal law and still is a curious and instructive part of the history of England. The origin of this privilege was traced to the ecclesiastics at an early period for the entire exemption of their order from the jurisdiction of the common-law courts. The only exception was the cleric being held in custody by the king himself; but, even in that case, he could only remain in such regal custody with the pleasure and consent of the bishop, who had entire control over his person and over the inquiry into his offense. If a priest or *clerk* happened to be imprisoned by the secular arm, on a criminal charge or capital felony, he was, on the bishop's demand, to be instantly delivered up without any further investigation, to be retained by the ordinary till he had either purged himself from the offense or, having failed to do so, had been degraded. This state of things continued till the Statute of Westminster the First, in 1275, which provided that the prisoner must first be indicted before he could be claimed; and then, in the reign of Henry VI, it was settled that the prisoner must first be convicted before he was allowed to claim his clergy by plea declining the jurisdiction or, as was more usual, after conviction, by way of arresting judgment. The test of admission to this privilege was the clerical dress and tonsure. The statute Pro Cleric (1350), however, extended it to all manner of clerks, and by later practice it was extended to all who could read, whether of the clergy or laity. Women, however, except professed nuns, were until the Reformation excluded. But laymen and chaplains were also so handicapped by so doing were burned upon the hand and discharged, to be again tried by the bishop and, if acquitted by the latter, restored to their liberty, credit and property. By a series of statutes most of the serious crimes and all capital crimes had been excluded from benefit of clergy before the end of the 17th century, but it was extended to all persons convicted of clergiable offenses, whether they could read or not; and instead of burning on the hand, a discretionary power was given to the judge to inflict a pecuniary fine or imprisonment. The privilege was entirely abolished in England in 1827 (7 and 8 George IV, cap. 82). It had never
any legal existence in Scotland. In scattered instances the right was recognized in the colonies of Carolina and Virginia. An act of Congress passed 30 April 1790 provided that benefit of clergy shall not be allowed for any offenses punishable by death. It is now universally obsolete in English and American law. Carrol v. Hedges’ estate (1819) 2 Wall. 113; The Church and the Law (Chicago 1898); Pollock and Maitland, History of English Law (Cambridge 1899); Flanagan, History of the Church in England, 14th ed. 1876 (London 1857); Stephen, History of Criminal Law.

**BENEKE, bë-në-kë, Friedrich Eduard, German philosopher and psychologist:** B. Berlin, 17 Feb. 1798; disappeared 1 March 1854; found drowned in a canal at Charlottenburg, 4 June 1856. After serving as a volunteer in the campaign of 1815, he studied theology and philosophy at Berlin, giving special attention to the English philosophers. In 1820 he lectured in the University of Berlin as a private teacher, but the continuance of his lectures was forbidden by the minister Altenstein, in 1822, on account of his departure from the philosophic principles of Hegel. He then taught for a few years in Göttingen, but, returning to Berlin in 1827, received permission to lecture in the university, in which he was elected extraordinary professor of philosophy after Hegel's death, in 1832. The starting point of his system is that philosophy must be founded upon a strict and careful examination of the phenomena of consciousness. He thus adopts, in mental philosophy, the method observed by Bacon in the natural sciences, and his system is described as an empirical psychology. He was opposed to the speculative system of Hegel and held that a true psychology, the basis of all knowledge, must be formulated along the methods of exact physical science, and he believed the genetic method to be superior to all others. He was a voluminous writer and among his chief works: Erfahrungseelenlehre, als Grundlage alles Wissens, in ihren Hauptsätzen dargelegt (1820); Neue Grundlegungen zur Maurice (1825); Geschichte der Psychologie, oder Seelenlehre in der Anwendung auf das Leben (1850); Psychologische Skizzen (1827); Lehrbuch der Psychologie als Naturwissenschaft (1833; 4th ed., 1877); Erziehungs- und Unterrichtslehre (2 vols., 1835–36; 4th ed., 1876); System der Logik als Kunstlehre des Denkens (2 vols., 1842). Consult Brandt, Beneke, the Man and His Philosophy (New York 1895); Kuhn, C. H. T., Die Sittenlehre F. E. Benekes (1892); Renner, H. H., Halbenke's Physiognomie (Halle 1902); Wanderschneider, A., Die Metalphysik Benekes (Berlin 1903).

**BENEVENTO,** Italy, a province with an area of 680 square miles, and an archiepiscopal city. The surface of the province is hilly but the soil fertile in corn, fruit and pasture. Game is abundant and cattle, grain, wine, oranges and dead game are exported. Benevento was originally called Maleventum, but this was changed to Beneventum by the Romans when they founded a colony here after the defeat of Pyrrhus. It came into the hands of the Romans it belonged to the country of the Samnites. The Lombards in 571 made it a dukedom, which, long after the extinction of the Lombard kingdom, remained independent. At a later period it fell into the hands of the Saracens and Normans. The city, however, was not conquered by the latter because Henry III had given it to the Pope, Leo IX. In 1418 Benevento became part of Naples, but was given back to the Pope by Ferdinand I. In 1798 it was conquered by the French and handed over to Naples, and then in 1806 Napoleon made a present of it to his minister, Talleyrand, who received thence the title of Prince of Benevento. In 1815 it was restored to the Pope, and finally with Naples was annexed to the kingdom of Italy, in 1860. The city of Benevento is situated on a hill between the rivers Sabato and Calore, is 60 miles by rail from Naples but only 32 miles by direct route, is surrounded with a wall, has narrow dirty streets and some interesting buildings. Since 969 it has been the see of an archbishop. Few cities in Italy deserve so much attention on account of the antiquities which they contain as Benevento. Almost every wall consists of fragments of altars, sepulchral monuments and entablatures. Among other things, the well-preserved, magnificent triumphal arch of Trajan, built in 114, deserves particular mention. It is now called Porta Aurea (the golden gate), and is a gate of the city. The cathedral is a beautiful building in the Lombard style. This cathedral has a famous bronze door, with reliefs of New Testament scenes, said to have been executed at Constantinople in the 12th century. There are also several magnificent paintings. The city has also several palaces, a castle and numerous churches, including the circular Santa Sofia. In the public squares are Egyptian obelisks. Gold and silver plating, leather curing and parchment making are the principal industries. Pop. about 25,000.

**BENEVOLENCE,** a forced loan or contribution, by which the kings of England were wont, without any sanction from Parliament, to levy money from their subjects. Such benevolences had been denounced by Magna Charta, and even Richard I., whose Parliament of his reign to enact a statute declaring them illegal, but they still continued under some shape or other till finally abolished by the Bill of Rights in 1689.

**BENEVOLENT ORDERS.** This term is applied in the statutes of many of the states to those societies whose objects are mainly good fellowship, combined with charitable relief or stipulated benefit of limited amounts in case of necessity, sickness or death, as distinguished from the fraternal orders or societies which afford a substantial death benefit, combined in some cases with sick relief and funeral benefit. Both classes of these orders employ the lodge system and have a representative form of government. The benevolent orders include the various bodies of Masons, the Odd Fellows, Knights of Pythias, Red Men, Elks, Foresters of America, Hibernians, Order of Eagles, United American Mechanics, Good Templars, Grand Army of the Republic and many others, the more important of which may be consulted under their individual titles.

family came to Philadelphia from London in 1731. He earnestly opposed the slave trade, advocated the emancipation and education of the colored population of the colonies and himself opened an evening school for negroes. Of his numerous tracts, distributed gratuitously, the most important are 'A Caution to Great Britain and Her Colonies, in a Short Representation of the Calamitous State of the Enslaved Negroes in the British Dominion' (1677); 'Historical Account of Guinea' (1772); 'A Short Account of the Society of Friends' (1780); 'Dissertation on the Christian Religion' (1782); 'Observations on the Indian Natives of this Continent' (1784).

BENFEY, bēn'fi, Theodor, German Orientalist and comparative philologist: b. of Jewish parents, Nörlin, Hanover, 28 Jan. 1809; d. 26 June 1881. He studied in Göttingen, Munich, Frankfort and Heidelberg, devoting himself especially to classical and comparative philology. In 1862 he was appointed to the chair of Sanskrit and comparative philology in the University of Göttingen, which he held till his death. One of his earliest literary efforts was 'Terence' (Stuttgart 1837); after this, however, he turned his attention almost exclusively to comparative philology, Oriental languages, especially Sanskrit, and mythology. In his 50 years devoted, with rare enthusiasm and persistency, to linguistic studies, he did more than any other scholar to enlarge the boundaries of Sanskrit philology.

In comparative philology, though an adherent of Bopp, he deviated from his master in deriving all Indo-European words from monosyllabic primitive verbs. This conception depends on his theory of the origin of stem suffixes. These, he holds, are almost all derived from a fundamental form, ant, which appears in the present participle of verbs. To support this view he assumes the most violent permutation of sounds, which set all phonetic laws at defiance. For his theory consult his 'Lexicon of Greek Roots' (1839); 'Short Sanskrit Grammar' (1868), and numerous essays. In Sanskrit he laid a foundation for the true study of the Veda by editing the 'Sāma Veda' (1848) with glossary and translation; and this work he continued by a scholarly translation of the first mandala of the Rig Veda in his magazine, Orient and Occident (1863-64). His Vedic grammar, for which he had been collecting materials for many years, was left unfinished. He also published a 'Complete Sanskrit Grammar, Crestomathy and Glossary' (1854), and a 'Sanskrit-English Dictionary' (1866). In comparative folk-lore his principal work is a translation of the 'Panchatantra' (1859). It is accompanied with elaborate notes, and the first volume consists entirely of an introduction in which he traces the course of these Indian stories in their wanderings and transformations both in eastern and western literatures.

BENGAL, an African tribe, living on the Spanish island Corisco, off the western coast, having moved westward, having moved westward, and the American Presbyterian board of missions have christened many of the Bengas and translated books into their language, which closely resembles the Kamerun and Dualla.

BENGAL, bēn-gal, India (Hind. Bangāl, Skt. Vangalam, from Vanga), a province of India, administered by a governor and reconstituted in 1905 and in 1912 from the former Bengal presidency and province, which included under its administration the native states of Bihar, Orissa and Chota Nagpur. As reconstituted the province of Bengal has an area of 78,700 square miles and a population (1911) of 45,500,000, mainly Hindus and Mohammedans. The native states were also reconstituted 1 April 1912 as the separate province of Bihar and Orissa, administered by a lieutenant-governor.

Physical Features.—The general physical character of Bengal, which occupies the north-east of India, is that of a practically level country, though it is surrounded with lofty chains of mountains. The northern part rests on the terraces of the Himalaya Mountains, the east is bounded by the Garos or Gharos chain and the west is ribbed with offsets of the Vindhyas Mountains. It is intersected in all directions by rivers, the principal of which are the Ganges and Brahmaputra, whose annual inundations render the soil which they reach extremely fertile. In those tracts where this advantage is not enjoyed, the soil is thin, seldom exceeding a few inches in depth. The most inhospitable part of Bengal is what is called the Sunderbunds (from being covered with the soundu or sundo tree), that portion of the country through which the numerous branches of the Ganges spread in all directions, and in the deltaic space lying between the Hooghly River and Chittagong, about 150 miles from east to west and about 160 from north to south. This district is infested with tigers, is traversed in all directions by watercourses, or nullahs, and interspersed with numerous sheets of stagnant water called jeeles, which abound with fish and waterfowl and are much resorted to by crocodiles.

Geology and Minerals.—In the northern part of Bengal, at the foot of the Himalayas, is a band of Tertiary formations, which, and along the course of the Ganges, more especially east from that river and including the greater part of its delta and that of the Brahmaputra, the country is wholly composed of alluvium or modern detritus. Calcatta stands upon strata of the transition series, which stretch west into Bihar, and are flanked north and south by tracts of crystalline formation. In the Garo Hills coal, iron and limestone are found, and nitre effloresces on the surface around Calcutta and elsewhere. Mineral springs are not numerous.

Rivers.—The principal rivers, besides the Ganges and Brahmaputra, the latter of which enters the province at its northeast extremity and falls into the Bay of Bengal near the principal embouchure of the Ganges, are the Mahanadi, which falls into the Bay of Bengal in lat. 21° 35' north, south-southwest of the Hooghly; the Cossi or Coosee, which rises near Khatamandu in Nepal and falls into the Ganges near Bhagalpur; in lat. 26° 20', and the Dumooda, which, rising in Bihar, falls into the Hooghly about 22 miles below Calcutta. There are numerous other streams of less note, mostly tributaries of the Ganges and Brahmaputra or their larger affluents.
Climate.—There is more regularity in the changes of the seasons in Bengal than perhaps in any other part of India; but it is subject to great extremes, particularly as regards the humidity of its surface and the heavy dews that fall, render it generally unhealthy to Europeans. The prevalence of hot winds, which are sometimes loaded with sandy particles, is another source of disease. The seasons are distinguished by the terms hot, wet, and rainy. The hot season continues from the beginning of March to the end of May, within which period the thermometer frequently rises to 100°, sometimes to 110°. The month of September is also often intensely hot, and when so is the most unhealthy period of the year to natives as well as Europeans, owing to the profuse exhalations from stagnant waters left by the inundations and from a rank decaying vegetation. The rainy season commences in June and lasts till October. During the first two months of this period the rain is frequently so heavy that five inches of water have fallen in one day, the annual average being from 70 to 80 inches. It is in this season that the inundations take place and the waters flow far and wide, covering the land with its waters for more than 100 miles. The cold season, the most grateful and healthy of any to Europeans, continues from November to February, during which period north winds prevail, with a clear sky.

Forests.—In Bengal, as in India generally, great attention has been paid to the management of forests. Great destruction is caused among forests by fires, which are sometimes the result of accident but more frequently made purposely by the natives in pursuance of a system of jungle cultivation that appears to prevail throughout India. This consists in cutting down and burning a patch of forest and raising a crop in the open space, no plowing or digging being necessary. The next year this patch is abandoned and another treated in the same way. Another cause of destruction is the wastefulness of those who use the timber. The sundar trees, for example, which furnish the best wood for the boats which are built in great numbers by the hands of Bengal, have been cut down in so reckless a manner that the western parts of the Sundarbunds have already been to a large extent exhausted. In order to limit the destruction that goes on by such proceedings certain portions of the Indian janes are reserved and placed under the entire control of the government and additions are made to these reserves every year. Of the total 10,612 square miles of forest in Bengal in 1913, 4,671 were reserved, 1,711 protected and 4,030 unclassified.

Animals.—Among the wild animals are tigers, elephants, boars, bears, wolves, foxes, jackals, hyenas, leopards, panthers, lynxes, hares, deer, buffaloes, antelopes and monkeys. The most formidable of all these animals (and more so even than the lion) is the tiger, which here attains its utmost size and perhaps also its greatest ferocity. The domestic animals include native horses, thin, ill-shaped animals, and not well adapted for any kind of labor; cattle, of a very inferior breed, being extremely small and miserable looking; sheep, likewise of diminutive size, with very coarse, hairy wool, but when well fed their flesh is excellent. Hogs and goats are also plentiful, and buffaloes are domesticated for the sake of their milk. Reptiles are numerous and formidable, including gavials, a kind of crocodile, with which the large rivers are infested; and among the serpent tribe, many of which are highly poisonous, the deadly cobra-de-capello. Turtles, frogs and lizards also abound, with swarms of mosquitoes. The turtles are chiefly procured from the island of Che- duba, in the Bay of Bengal. Fish are exceedingly plentiful as to be within the reach of almost every class of inhabitants. Game, poultry and water-fowl of all descriptions abound in Bengal, particularly ducks, of which there is a great variety and most of them of a superior kind. The gigantic crane, commonly called the adjutant, from the stately air with which it struts about, frequents the towns in considerable numbers, performing the office of scavenger by clearing the streets of garbage, in consideration of which it enjoys an immunity from all disturbance; his principal food is offal, toads, lizards, serpents and insects. Crows, kites, sparrows and other small birds are numerous.

Agriculture.—The staple crop of Bengal is rice, which is cultivated so as to produce three harvests in the year—spring rice, autumn rice and winter rice. The last of these harvests is by far the most important. Besides sufficing for the wants of the population, the rice crop leaves a large surplus for exportation. Oil seeds are also largely cultivated, chiefly mustard, sesamum and linseed. The jute plant (pát) has long been cultivated, and in recent times the cultivation of it has greatly extended. It will grow on almost any description of land. Part of this crop is cultivated by those who use or manufacture it, almost all the Hindu farmers weaving cloth from it. It is now manufactured also in large mills under European management, and jute goods are now an export of some importance, though not nearly so much so as jute in the raw state for manufacture in Europe. The sum plant, somewhat resembling the Spanish broom, is now quite extensively cultivated and exported to Great Britain, affording excellent material for both tallow and being made into fishing nets by the natives. Cotton is grown over all India, but the best of the herbaceous kind is raised in Bengal and on the Coromandel coast; the finest grows on light, rocky soil. The cotton of India is generally inferior to that of the United States, but this is believed to be wholly owing to careless cultivation and to the slovenly manner in which it is prepared for the market. The cultivation of the date-palm and the manufacture of date sugar are carried on to a considerable extent, forming a profitable business for the cultivator. This kind of sugar forms an article of export. The sugar-cane is cultivated, but not nearly to such an extent as might be expected. There are two kinds of sugar-cane, a yellow hard cane, about the thickness of a finger; the other much thicker and deeply stained with purple. The latter is the most productive but the most troublesome to cultivate and therefore avoided by the more indolent farmers. Tobacco, which requires a light soil, is grown in three different situations—in rich spots of land contiguous to the farmer's house, in high land suitable for the
growth of sugar-cane and on the banks of rivers. The betel leaf, famous for its intoxicating quality and largely used over all India on that account, is cultivated in what is called a voraj, or fort, and is carefully protected from the sun and wind. Indigo being one of the principal articles of foreign commerce with Bengal, is extensively cultivated in that province. The opium production of Bengal was a government monopoly under Mohammedan rule and has been retained as such by the British. All the juice of the opium poppy must be sold to the government at a fixed price. This cultivation is carried on in the west of Bengal. Orchards of mango trees are to be found in every part of Bengal, the fruit being in general demand during the hot months. The cinchona tree and the tea plant have also been added to the agricultural products of Bengal.

Manufactures.—The principal manufacture of Bengal is that of cotton goods, including cotton piece-goods of various descriptions, calicoes, thread, and sail-cloth. Muslins of the most beautiful and delicate texture were formerly made at Dacca, a city in this province, but the manufacture is almost extinct.

The modern decay of the muslin manufacture of India has been owing in a great measure to the successful competition of Great Britain and to the circumstance of English fabrics being subject to no duty in Bengal, while high duties were levied on the fabrics of Bengal in Great Britain. These duties are now abolished. Large quantities of coarse cloth, manufactured from jute, are made in various districts of Bengal. Sericulture is carried on more largely in Bengal than in any other part of India, and silk-weaving is still a leading industry in many of the districts, but of late years there has been a serious decline. One branch of this industry, however, seems more flourishing than some others, namely, the cultivation of tasar or wild silk, the worm that produces it feeding upon the leaves of the sal and other forest trees. On the other hand, various new manufactures, carried on by machinery, are increasing. The most important of these are the industries connected with jute, cotton and sugar. These are already affording employment to many thousands and the natives show great aptitude for factory work.

Commerce.—The commerce of Bengal, both internal and external, is very large. Multitudes of native boats and other craft navigate the rivers. The imports to Calcutta from the interior have been valued at over $13,000,000, consisting of rice, tea, jute, indigo, linseed, mustard seed, wheat, etc. The foreign trade is large and increasing. Almost the whole of it passes through Calcutta, and the value of it annually is over $275,000,000, over $170,000,000 being exports. The most important exports are opium, jute, indigo, oil seeds, tea, hides and skins and rice; the chief import is cotton piece-goods. The foreign trade is chiefly with Great Britain, China, the Straits Settlements, France, the United States and Ceylon.

History.—The English first got a firm footing in Bengal about 1644 when, through the influence of an English medical man named Bughton, a favorite of the Emperor of Delhi, the East India Company obtained permission to locate themselves at Hugli or Hoogly, some 28 miles above Calcutta. In 1686 the company’s factors, having had a rupture with the Moslem commander at the place where they were located, removed to Calcutta, then the village of Chuttanutty, where they continued to carry on their trade. In 1700 the viceroy of Bengal, being in want of money to dispute the succession to the Mogul throne, obtained a large sum from the company for the township on which their factory stood at Calcutta and some adjacent lands. Seven years afterward, namely, in 1707, Calcutta was erected into a presidency and the foundation of British power in India laid. For nearly half a century the company pursued a peaceful and profitable commerce, but at the expiration of that period, 1756, Calcutta was attacked and taken by the Soulehodar of Bengal, who threw the 147 Englishmen he found there in the notorious “black-hole” of Calcutta, where 123 of them perished in 11 hours. In the ensuing year Calcutta was retaken by Lord Clive—an event which was followed by a series of victories on the part of the British that terminated in the entire conquest of India. In consequence of unprecedented drought great scarcity of food prevailed in 1873 and 1874, but the prompt measures of the government were sufficient to prevent any widespread mortality. A bill conferring on agricultural tenants a transferable interest in their holdings and protecting them against eviction was passed in 1885. For the purpose of more efficient administration, a preliminary partition and reconstitution of the presidency was effected in October 1905, not without considerable agitation and opposition on the part of the population. The present reconstitution into a province took effect in April 1912. For further general history and bibliography see INDIAN.

BENGAL, Bay of, that portion of the Indian Ocean between Hindustan and Farther India, or Burma, Siam and Malacca and extending south to Ceylon and Sumatra. It receives the waters of the Ganges, Brahmaputra, Irrawaddy, Mahanadi, Godavari, Krishna and Kaveri. Calcutta, Rangoon and Madras are the most important towns on or near its coasts. On the west coast there are no good harbors, but the east coast has a considerable number, among them being Akyab, Cheduba, Negrais, Mataban and Syrnam. On account of the extreme heat, the rate of evaporation is very high, sometimes amounting to an inch per day. The tide sometimes rises to the height of 70 feet. In summer the northeast monsoon prevails, and in winter the southwest monsoon. The Andaman and Nicobar islands are situated in the eastern part of the bay.

BENGAL, or BENGALI. Light, a firework, giving a vivid and sustained various light. It is used for signals at sea. It is composed of six parts of nitre, two of sulphur and one of antimony tars sulphide. These are finely pulverized and incorporated together and the composition pressed into earthy similar shallow vessels. It is also used in ordinary pyrotechny to illuminate a district or section of country. Because of a poisonous oxide of antimony given off during combustion the light cannot be used without danger indoors.

BENGALI, ben-gäl’é, the dealer’s name, originating in a mistake as to their origin, for
any of several of the beautiful little African waxbills, bred and sold as cage-birds; especially the "blue-bellied finch" *(Estrilda bengala)*, which is ashy-brown above, with the wing quilts brown, and the sides of the head, the throat and whole lower surface azure blue, spots of green below the wing, and to this charming dress lively manners and an agreeable song. Their requirements in the cage are like those of a canary. They are common also in Australia and Oceania.

**BENGALI ERA**

The one of the chronologically oldest of the Hindus, supposed to have been derived from the Hibrata. The Hindus, however, use the sidereal year and the Mohammedans the lunar, hence the Mohammedan epoch is at present some nine years in advance of the Bengali.

**BENGALI, or GAURA, LANGUAGE,** one of the five modern languages of Hindustan, which are derived from the ancient Sanskrit. Its name is derived from Bonga, the Sanskrit name of the country, with the Arabic article *al* suffixed; the whole being corrupted into *Gaur*. Gaura is derived from Gaur, the name of the ancient metropolis; it is spoken by 44,624,048 British subjects, of whom about one-fourth speak also some other dialect. It extends over the regions on the lower Ganges from Patna down to its delta, being purest in the province of Bengal and in the eastern regions. This language consists of an aboriginal basis, in which a much greater portion of Sanskrit and Pracrit has been admixed than with any one of its cognates with the exception of Aghanik, Persian, Arabic, Portuguese, Malay and English words. Although the Sanskrit element predominates as regards the words, the grammatical forms of the language differ more from the Sanskrit than the forms of the Greek, Latin, Gothic and Persian; most of the flexions of nouns and verbs having been lost, and their places being supplied by auxiliary words and by circumlocution. Notwithstanding this, it shows a superior style of some of those forms, which are intelligible only to more cultivated persons. There are no forms of gender, sex being denoted by the use of qualifying terms or by different words. There are seven cases made here, the suffixes being nominative, accusative, instrumental, dative, ablative, genitive and vocative. The plural of nouns is made by suffixing *di* to the genitive singular. It delights in compound words, formed especially by means of a sort of past participle; elegant Sanskrit compounds being undiomatic. There is but one conjunction, whose radical is the imperative. Compound tenses are made by the auxiliaries, meaning to do, to be, to become. The singular and plural of verbs are often confounded; the plural with a singular noun denoting respect, the singular with the plural noun being used in speaking to inferiors. There are three simple moods, infinitive, indicative, imperative; four others being periphrastic, the potential, optative, imperative and frequentative. Any verb is conjugated by cases only; the system of writing is that of the *devaragari* of the Sanskrit language but the forms of letters are more broken and twisted. B and v, however, are written by one character, and the characters of the sounds, *s*, *z*, *sh*, are interchangeable.

No book written in Bengali appeared before 1500 A.D. After the settlement of Moslems in Gaur, the Voisays and Soodras (agricultural and servile castes) began to study Persian, to gain a livelihood, and were well rewarded by the conquerors. Except the stories of Krishna, the study, the rules of arithmetic in verse and a few other elementary books, the vernacular literature was very poor, until Rajah Krishna-chandra Roy Bahadour restored Hindoo literature in India, by bringing in pundits and endowing schools. Owing to the abundance of Sanskrit books, and the prejudice of most Brahmins against the Bengali, this was neglected until 1800, when the college of Fort William was founded, and the study of Bengali was made imperative and collateral to the Sanskrit. Many Bengali works have since been printed at Calcutta and Serampore. The first native newspaper was published at Serampore in 1818. Considerable change has been made since in the diction and composition of this language, which continues to be degraded and ennobled, by being capable of borrowing indefinitely from the venerable Sanskrit mother. In 1913 the Bengali poet Sir Rabindra Nath Tagore received the Nobel prize in literature.

**Bibliography.**—Beames, 'Comparative Grammar of the Modern Aryan Languages of India'; 'Grammar of the Bengali Language' (Oxford 1894); Cust, 'The Modern Languages of the East Indies'; Dutt, 'The Literature of Bengal' (Calcutta 1895); Ganguli, 'Students Bengali-English Dictionary' (Bhawanipur 1903); Grierson, 'Specimens of the Bengali and Assamese Languages' (Calcutta 1903); Haughton, G. C., 'Bengali, Sanskrit and English Dictionary' (London 1833); Nicoll, 'Manual of the Bengali Language' (London 1894); Sen, D. C., 'History of the Bengali Language and Literature' (Calcutta 1911).

**BENGALI, bën-gā-zē, or BENGHAZI,** north Africa town, capital of the vilayet Barca, on the east coast of the Tripolitania. On the road from Tripoli it is the most important seaport on this coast. The harbor is fast silted up, and admits only small vessels; but there is still a considerable trade, cattle, corn, barley, sponges, ivory, ostrich feathers, wool, being exported, especially to Malta. It is the centre of a fertile region and has a large trade, with the interior by means of caravans. The population, between 25,000 and 35,000, is composed of Maltese, Greeks and Italians. It is sometimes identified as the ancient Hesperides, which was named Berenice by Ptolemy III. It was occupied by the Italians 20 Oct. 1911, and was the scene of several skirmishes during the war with Turkey.

**BENGEL, bëng'ēl, Johana Albrecht, German theologian and philologist:** b. Wurtzburg, 24 June 1687; d. Alpirsbach, 2 Nov. 1752. He studied at Stuttgart and Tubingen, and became curate of Metzingen. In 1708 he was appointed tutor in theology at Tubingen. Among other high offices filled by him.
later in life were those of consistorial councilor and prelate of Alpirsbach. He especially applied himself to the critical study of the Greek Testament, of which he published an edition in 1723. Among his other works are 'Apparatus Criticus Novi Testamenti,' a work of great value for its suggestive condensed comments, which first appeared in 1742, and has been several times reprinted, etc. An attempt has been made to adapt his 'Gnomon' to English readers in the 'Critical English Testament,' by Blackley and Hawes (1866). Bengal was the first Protestant author to treat New Testament exegesis in thoroughly critical style. He also rendered invaluable service in amending the text of the Bible and in pointing the way to the classification of the biblical codices into families. The notes appended to his 'Gnomon N. Testamenti' (Tübingen 1742) have been highly regarded and translated into nearly all modern tongues (English ed., Philadelphia 1862). They were used by John Wesley in his 'Notes on the New Testament.' Other works of Bengal are 'Erläuterte Offenbarung Johannisi' (Stuttgart 1740) and 'Quaestiones de Temporum a Principio per Periodos Ecclesiasticos Depo Turcicius atque Propheticos' (Tübingen 1741). Consult the biography by H. P. Burke (Stuttgart 1831, English trans., London 1837), and Oscar von Wächter, 'Bengel, Lebensabriiss' (Stuttgart 1865).

BENCKENDORFF, Alexander, Count, Russian diplomat: b. 1849; d. London, Jan. 1917. The son of Constantin Count Benckendorff and Louise Princess de Croy-Dülmen; he was reared in the Roman Catholic faith and educated in France and Germany. Entering the diplomatic service in 1869 he acted as attaché to the Russian embassies at Rome and Vienna, and minister to Denmark from 1897 to 1903. In the latter year he became ambassador to Great Britain, and occupied that post till his death. He married Sophie Countess Shuvaloff in 1879; his only daughter was married in 1911 to the Hon. Jasper Ridley, second son of the first Viscount Ridley. Count Benckendorff may be held in a very large measure responsible for the reconciliation between Russia and Great Britain after many years of mutually suspicious animosity. It was he who negotiated the Anglo-Russian Agreement of 1907, which, following on the Anglo-French Agreement of 1904, finally resulted in the Triple Entente.

BENG, Elizabeth Ogilvy, English historical writer: b. Wells, Somersetshire, 1778; d. London, 9 Jan. 1827. She early displayed a turn for literature, but her strained means prevented her from gratifying this taste by the purchase of books, she was in the habit of perusing the open books in a bookshop window, and would return day after day to see if the page had been turned over. In 1802 she removed with her mother to London. Her first literary attempts, including a poem on the abolition of the slave trade and two novels, attracted little attention, but in 1804 she succeeded with her 'Memoirs of Mary Queen of Scots,' and of 'Elizabeth Queen of Boehma.' She also wrote the Lives of Anne Boyleyn, Mrs. Elizabeth Hamilton and John Tobin, the dramatist. Her chief merits are a clear style and industry in the collection and arrangements of facts.

BENGOUGH, bén'gō, John Wilson, Canadian poet: b. Toronto, 5 April 1851. In 1873 he established the Grip, a humorous weekly, in Toronto. His political cartoons in this paper were highly artistic. He is also widely known as a lecturer and a poet. His publications include 'Ontario, Ontario' (a famous election song); 'Grip’s Cartoons' (1875); 'Popular Readings, Original and Selected' (1882); 'Caricature History of Canadian Politics' (1886); 'Motley: Verses Grave and Gay' (1895); 'The Uphold Date Primarily A Book for Little Political Economists' (1896); 'The Gin Mill Primer' (1898); 'In Many Keys' (poems 1902), etc.

BENGUELA, bén'gɛ-la, or BENGUELA, a district belonging to the Portuguese on the western coast of south Africa, forming one of the three provinces of Angola; bounded north by the province of Loanda, south by that of Mossamedes and west by the Atlantic Ocean. The interior of the country is mountainous, the direction of the elevated lands being from northeast to southwest. It is well watered, being intersected by numerous rivers and streams. Its vegetation is luxuriant and it possesses extensive forests. Its products are those of tropical Africa generally. Tobacco, fruit and vegetables are grown. Coffee grows wild. The soil in parts is well adapted for the production of grain, but little is grown. The larger animals of Africa are numerous, such as lions, elephants and hippopotami. The minerals include copper, sulphur, lead, gold and silver. The town worth mention is the seaport, Benguela, founded in 1617 as San Felip de Benguela, which is pleasantly situated and fairly healthy. In slave-trading days Benguela’s population was greater than it is to-day and it was an important centre of the trade. It has rail connection with Lobito, which has a good harbor with improved docking facilities. It exports rubber, coffee, skins, ivory, etc. A short railway starts from the town, the population of which is about 3,600, of whom 1,000 and 1,500 are whites. The population of the province may amount to several millions.

BENHADAD, the name of three kings of Syria, all mentioned in Scripture. The most conspicuous is the second, who was equally remarkable for his arrogance in prosperity and his craven spirit in adversity. He first sent an insolent message to Ahab, claiming him and all his subjects as his slaves; and after Ahab encountered and defeated him, Benhadad sent a message abjectly begging his life. Ahab, impolitic enough to grant it, and Benhadad, dis-regarding all his promises, proved a bitter enemy to his successor. He was murdered about 890 B.C.

BENHAM, Andrew Ellicott Kennedy, American naval officer: b. New York, 10 April 1832; d. at Lake Mohopac, N. Y., 17 April 1905. But he was more successful with her 'Memoirs of Mary Queen of Scots,' and of 'Elizabeth Queen of Bohemia.' She also wrote the Lives of Anne Boyleyn, Mrs. Elizabeth Hamilton and John Tobin, the dramatist. Her chief merits are a clear style and
and rear-admiral in 1890, and retired in 1894. During the Civil War he served in the South Atlantic and West Gulf blockading squadrons, taking part of Port Royal, S. C. In 1868-69 he served at the Brooklyn navy yard; was lighthouse inspector 1870-71 and 1884-88. In April 1893 he commanded one of the divisions in the great naval display at New York; in 1894, as commander of a squadron at Rio de Janeiro, Brazil, he forced the commander of the insurgents' squadron to raise the blockade of the city and to discontinue firing on American merchant vessels; and in 1896 was naval prize commissioner in Savannah, Ga.

**Benham, Henry Washington,** American military engineer: b. Cheshire, Conn., 1816; d. 1 June 1884. He was graduated at the United States Military Academy in 1837 and became brevet major-general, United States army. He commanded the engineer brigade and laid several pontoon bridges under fire during the Chancellorville battles; constructed and commanded the defenses at City Point, devised the picket shovel and made many improvements in the construction of pontoon bridges, in which he was a recognized expert. After the war he was in charge of the Boston harbor sea wall and later of the New York harbor defenses; retired from active service 1882.

**Benham, William,** English clergyman and author: b. West Meon, Hampshire, 15 Jan. 1831; d. 30 July 1910. He was vicar of Adlington, 1867-73; of Margate, 1872-80; of Medmenham, 1880-82; and rector of Saint Edmund's, Lombard street, London, from the year last named. He was canon of Canterbury from 1885. He published among other works 'The Church of the Patriarchs' (1867); 'Catherine and Crauturd Tait; Annals of the Diocese of Winchester' (1884); 'A Short History of the Episcopal Church in the United States' (1884); 'The Dictionary of Religion' (1887); 'Life of Archbishop Tait,' with Davidson (1891), and histories of the cathedrals of Winchester, Rochester and old Saint Paul's, London. He edited the 'Ancient and Modern Biblical and Theological Literature.'

**Beni,** bā'ne, Bolivia, one of the nine departments of Bolivia, South America. It is in the northeastern part and bounded on the north and east by Brazil, by the departments of Cochamba, La Paz and Santa Cruz on the south and La Paz on the west, with an area of 107,744 square miles. It is a level, fertile region, growing coca, coffee, sugar-cane and tobacco, tropical fruits and containing vast forests of rubber-trees and rich deposits of gold. The climate is hot and moist, but is healthful, nevertheless. Pop. 37,300, mostly Indians. 'Trinidad (4,810) is the chief town of the department.

**Beni,** a river of South America, formed by the junction of several streams flowing eastward from the Andes in about 18° south. Its course is north and northeast through Bolivia; and on the border of Brazil it unites with the Mamoré to form the Madeira, by which its waters are carried to the Amazon. It receives several tributaries of importance, the chief being the Madre de Dios from Peru, and it is navigable throughout a great part of its course. Its length is about 850 miles.

**Beni-Hassan,** bā'ne-hās'ân, Egypt, village on the east bank of the Nile below Assiut, remarkable for the rock-hewn tombs in the neighborhood, 39 in number, cut in the calcareous stone of the mountain. They are sepulchres of the ancient monarchs who ruled the district about 2800 b.c. They exhibit interesting paintings and hieroglyphics. The paintings portray incidents in the ancient life of Egypt and the inscriptions are of great value for the light they throw upon the history of the 12th dynasty. In recent years the mural decorations have suffered at the hands of relic-hunters. The tombs were copied at the direction of the Egypt Exploration Fund. Consult 'Publications of the Archaeological Survey of Egypt' (Vols. I, II, V, 1892, 1893-96).

**Beni-Israel,** bā'ne-ir'â-êl, a race in the west of India (the Konkan sea board, Bombay, etc.), who keep a tradition of Jewish origin and whose religion is a modified Judaism. By some persons they are supposed to be a remnant of the 10 tribes. Their number is estimated at 5,000 and in feature they resemble the Jews of Arabia. They abstain from the flesh of unclean animals and observe the Sabbath strictly. Some of their learned doctors are acquainted with Hebrew, but to the vast majority the Scriptures are unknown. They observe several of the religious customs common among their neighbors the Hindus. Little is known as to the time of their settlement in India, but it is certain that they had been there for many centuries when, in 1000 A.D., the reformed David Halebi came among them. Benjamin Tudor has been to the first century and Marco Polo in the 13th. Their communities are governed by the Mukadam, or head man, and their religious chiefs are called cadi. The latter perform circumcision and other rites. Consult Ezekiel, Joseph in 'The Jewish Encyclopedia' (1902) and Samuel, H., 'Sketch of Beni-Israel' (1889).

**Beni-Israel,** a small antelope (Neotragus saltianus) closely allied to the ducker-boks, common in Abyssinia and on the shores of the Red Sea. It is known by the names omidigidg, madoqua, hekgelh and Salt's antelope. It is a related species of the Neotragus Kirkii, or Kirk's antelope of Abyssinia, which is very numerous. They utter shrill cries and travel by long bounds. Their flesh has a heavy, unpleasant flavor.

**Beni-Khabir,** bā-nil-kā'-i'bér (sons of Keber), an Arabic tribe supposed to be a remnant of the ascetic tribe of Rechabites.

**Beni-Mzâb,** a race or tribe of Berbers that dwell in the Sahara, near its northern border, under the supremacy of the French. They number some 30,000. They are peacefully disposed, and numbers of them are employed in Algiers in various occupations. In 1882 their territory was finally annexed to the department of Algiers and a special bureau was established at Ghardia. Consult Coyne, A., 'Le Mzab' (Algeria 1879).

**Beni-Suef,** bā'ne-swâf, Egypt, the capital of a province of the same name; is pleas-
BENICARLY — BENIOWSKY

antly situated on the left bank of the Nile, 65 miles south from Cairo, with which it is con- nected by railway. It is the export for the produce of the fertile valley of Fayoum, and contains cotton mills, controlled by the state, and alabaster quarries. Pop. (1907) 23,357. The province has an area of 400 square miles and a population estimated at 370,000.

BENICARLY, bá-ne-kár-ló, Spain, sea port of Valencia, in the province of Castellán de la Plana, at the mouth of the Benicarló River, on the Mediterranean, 42 miles northeast of Castellón de la Plana. It is surrounded with walls, having an old castle, a fine church, with an octagonal tower, and some manufactories. It is chiefly noted as being the place of export of the red wines called by its name which are produced in the surrounding country. These are chiefly sent to Bordeaux to be mixed with claret, or to England to be manufactured into port. Grain, oil, vegetables and oranges are produced, and spirits are manufactured. Pop. (1910) 7,200.

BENICIA, bén-lish-á, Cal., city in Solano County, at the mouth of the Sacramento and San Joaquin rivers, and on the Southern Pacific Railroad, 24 miles northeast of San Francisco and is good and there is steamship communication with San Francisco. The city has among its principal industries creameries, tanneries, farm implement works, shipyards and fruit packing establishments. It re- ceives its charter as a city in 1861. Its govern- ment is vested in five trustees elected for a term of four years. It contains a United States arsenal and barracks; Saint Augustine College (Roman Catholic); Saint Catherine's Convent (Roman Catholic). Benicia was founded in 1848 and in its early years rivalled San Francisco. In 1853 it was the capital, but the govern- ment seat was transferred to Sacramento in 1854. Pop. 3,100.

BENIGNI, ben-ín'é, Umberto, Italian clergyman and educator: b. Perugia, 30 March 1862. He was educated at the seminary of his native city, the School of Paleography and Diplomacy and State Archives, Rome. In 1880-93 he was successively secretary to the archbishop of Perugia, professor of Church history at the seminary there and founder of the *Rassegna sociale*, the first Italian periodical devoted to Catholic sociology. After 1895 he resided in Rome, where he edited the *Besarione* and *Voce della Verità*. He was also professor of Church history at Saint A polinaris, the Propaganda and the Vatican Seminary. He was assistant at the Vatican Li- brary and member of the Historico-liturgical Commission of the Congregation of Rites. He is at present professor of Church history and diplomatic forms at the Pontifical College for nobles ecclesiastics. He has written *Pro- pedeutica historiae ecclesiasticae* (2 vols.) and *Storia sociale della Chiesa* (2 vols.). He contributed upwards of 400 articles to the *Catholic Encyclopedia.*

BENIN, bè-nil', Africa, a negro country or kingdom, on the Bight of Benin, extending along the coast on both sides of the Benin River, and to some distance inland, but the limits are not accurately known. The capital is Benin, a town which at one time had some 15,000 inhabitants, but is now said to have greatly decreased in population. It is situated on the coast and consists of clay-built houses neatly thatched with reeds, straw or leaves. The coast, which now belongs to the British, is thickly indented with estuaries, some of them of considerable breadth and studded with islands. The country is flat for some distance inland, when it begins gradual- ly to rise till it attains a height of over 2,000 feet. It is very well wooded, and being like- wise well watered, it is rich in all the vegetable productions of the tropics. Cotton is indige- nous and is woven into cloth for the women. Sugar-cane of good quality is grown; and yams, plantains, maize, rice, etc., are cultivated. The religion is Fetishism. The climate, especially at the mouth of the rivers, is very unhealthy. Palm oil is now the principal article of com- merce. The inhabitants are still in law the savage state, human sacrifices being offered in recent times. It is believed that the Portuguese, Diogo Carn, discovered Benin in 1484. It was long the centre of the slave trade, which the British suppressed when they established there their paramount there. A massacre of British officials and other Europeans took place in 1897 and a punitive expedition was sent to take the city, which with the surrounding district now forms part of the southern Nigeria. Government au- thority is vested in a British resident assisted by a council of native chiefs. Consult Roth, *Notes on Benin Customs* (1898) and *Great Benin* (1903).

BENIN, Bight of, Africa, a large bay on the west coast, forming a portion of the Gulf of Guinea, and extending from the Niger delta westward to Cape Saint Paul, a distance along the coast of 500 miles. The Forcadas River, flowing into the bight, forms the principal water route between the ocean and the Niger above the Delta.

BENIOWSKY, bá-né-o-fsk'l, Moritz Au- gust von, Hungarian adventurer: b. Verbova, Hungary, 1741; d. 23 May 1786. The son of an Austrian general, he served as lieutenant in the Seven Years' War and in the Polish war against Russia. In 1769 he fell into the hands of the Russians, who exiled him to Kamchatka. Avail- ing himself of a knowledge of navigation, he succeeded in saving from wreck the vessel which was to convey him to Siberia. This feat won for him the sympathy of the governor of Kamchatka, which was still more strengthened by his proficiency in chess, and he appointed him tutor to his children. One of his pupils fell in love with him, and with her father's consent they were married. In 1771 he effected his escape from Kamchatka with the assistance of his wife, who, although she had since learned that he had another wife in Hungary, followed him to Formosa and Moscow, at which latter place she died. On his return to Paris he un- dertook to found a French colony at Madagas- car, where he arrived in June 1774, founded his colony, and in 1775 was proclaimed king by some of the native tribes, while his wife was proclaimed queen. The French government, however, were disgusted with the result of France refusing to supply him with men to support his state, Beniowsky applied directly to the French government, but without success. Disgusted with the French and their colonies.
he now entered the Austrian service, and was commander in the battle of Habelschwerdt, in 1778 against the Prussians. His subsequent efforts to interest the English government for Madagascar were fruitless, but with the support of a wealthy firm of Baltimore, Md., he effected a landing in Madagascar, but was killed soon after in a conflict with troops from the Isle of France. He wrote his autobiography in French; it was translated into German by George Forster, into English by William Nicholson, and into various other languages. Kotzebue dramatized his character and career in his play entitled ‘The Conspiracy in Kamchatka.’ The Memoirs and Travels, edited by Nicholson and Magelhan, were published in London in 1790. Another edition was prepared by Kubalski (Paris 1863).

BENISH DAYS, days (Mondays, Wednesdays and Saturdays) on which the modern Egyptians don the benish (whence the name), or ordinary garment, relax their religious duties and engage in pleasures.

BENJAMIN, the youngest son of Jacob and Rachel (Gen. xxxv, 16-18). Rachel died immediately after he was born and with her last breath named him Ben-oni, ‘son of my sorrow’; but Jacob called him Benjamin, ‘son of my right hand.’ He was a great comfort to his father, who saw in him the image of the wife he had buried, and of Joseph, whose loss he also mourned. He could hardly be persuaded to let him go with his brethren to Egypt. When Jacob migrated to Egypt Benjamin appears at the head of the family of 10. The territory of the tribe in Palestine was between those of Ephraim and Judah and included the cities of Bethel, Jericho, Gibeon, Ophrah and Ramah. The tribe was one of the most warlike and holds an important place in Hebrew history. The tribe of Benjamin, small at first, was almost exterminated in the days of the Judges, but later it greatly increased. On the revolt of the 10 tribes Benjamin adhered to the camp of Judah; and the two tribes afterward closely united. King Saul and Saul of Tarsus were Benjaminites; also Esther and Boaz. Modern scholars regard the tribe of Benjamin being formerly a constituent part of the tribe of Joseph. See JEW AND JUDAISM.

BENJAMIN, Asher, author of the first American books on architecture, who lived about the close of the 18th century. Little is known of his life except that he followed his profession as architect and builder in Massachusetts. He was the author of ‘The Elements of Architecture, Town and Country Builder’s Assistant,’ (1797) and ‘The Practical House Carpenter.’

BENJAMIN, Charles Henry, engineer and educator: b. Patten, Me., 29 Aug. 1856. He was at the University of Maine in 1878. Degrees, M.E., University of Maine; D.Eng., Case School of Applied Science. From 1880 to 1886, professor of mechanical engineering at the University of Maine; 1889-1907, President of mechanical engineering, Case School of Applied Science. Since 1907, dean of the Schools of Engineering, Purdue University. Principal publications, ‘American Machine Tools’ (1906); ‘Steam Engine’ (1909); ‘Machine Design’ in collaboration with J. H. Hoffman (1906) also papers and monographs on engineering subjects in various technical journals and proceedings of engineering societies; member, Tau Beta Pi and Sigma Xi; honorary member of the Cleveland Engineers’ Society; member of the American Society of Mechanical Engineers, Master Mechanics Association, Master Car Builders’ Association, Western Railway Club, Society for the Promotion of Engineering Education.

BENJAMIN, Judah Philip, American lawyer and statesman: b. Saint Croix, West Indies, 11 Aug. 1811; d. Paris, 7 May 1884; of English parentage and of Jewish faith. He was educated at Yale College and was admitted to the bar in New Orleans in 1832. He had an extensive practice in New Orleans, was engaged as counsel in several cases of national-wide interest and published a valuable Digest of Reported Decisions of the Supreme Court of the Late Territory of Orleans and of the Supreme Court of Louisiana. In 1848 he was admitted to practice before the United States Supreme Court and was elected to the United States Senate in 1852 and 1858. At the beginning of the Civil War he resigned from the Senate and declared his adhesion to the State of Louisiana. In 1861 he accepted the office of Attorney-General in the Cabinet of Jefferson Davis, and afterward became successively Confederate Secretary of War and Secretary of State. He served with great energy and ability in the latter capacity until the close of the war. After Lee’s surrender, Benjamin fled from Richmond and after many hardships succeeded in reaching London, England, where he was admitted to the bar in 1866. He gained a successful practice, and in 1872 was formally presented with a silk gown. He wrote a Treatise on the Law of Sale of Personal Property (1868), which became a legal classic in England. He retired in 1883. Consult Butler, Pierce, ‘Judah P. Benjamin’ (Philadelphia 1907).

BENJAMIN, Lewis S. (Lewis Melville), English writer: b. London, 30 March 1874. He was on the stage from 1896-1901, afterward taking up literature as his profession, and specializing in the Georgian and Early Victorian periods. He has written a Life of Thackeray (1909), and edited the works (1901-07). His other works include ‘Victorian Novelist’ (1906); ‘The First Gentleman in Europe’ (1906); ‘The Beauch of the Regency’ (1908); ‘Life and Letters of Lawrence Sterne’ (1911); ‘William Cobbett’ (1913); ‘Memoirs of Lady Craven’ (1913); ‘The Berry Papers’ (1914).

BENJAMIN, Marcus, American editor: b. San Francisco, Cal., 17 Jan. 1857. He studied at the School of Mines, Columbia University, in 1878; received the A.M. degree from LaFayette College in 1888; Ph.D. University of Nashville, 1889; Sc.D. University of Pittsburgh, 1905; L.L.D. Saint John’s College, Maryland, 1910. He became editor of the American Pharmacist in 1882, and later of its successor, the Weekly Drug News. He has edited more than 100 volumes in connection with his duties as editor of the United States National Museum since 1 April 1896, and as member of the United States Assay Commission 1896, 1900, 1904, 1906 and 1912. He contributed vari-
ous articles to Appleton's 'Annual Cyclopedia,' 1883 to 1902, was on the staff of Appleton's 'Cyclopedia of American Biography'; was editor of various Appleton's guides and handbooks, etc., also of 'Standard Dictionary,' 'Universal Cyclopedia,' 'Encyclopedic Dictionary. 'American Educator,' 'International Year Book,' 'New International Cyclopedia'; was editor-in-chief of Appleton's 'New Practical Cyclopedia' (6 vols., 1910); was translator of Bertholet's 'Explosive Materials' (1883). He was secretary (1904-07) and registrar (1914-15) of the society of the Sons of the Revolution, and president of the Alumni Association of Columbia University in the District of Columbia, 1909-15. He has contributed various articles to the principal magazines.

BENJAMIN, Park, American journalist, poet and lecturer: b. Demerara, British Guiana, 14 Aug. 1809; d. New York, 12 Sept. 1864. Early in life he was sent to New England and was educated at Trinity College, Hartford. He studied law, but later took up literary work, helping to found The New World in New York in 1840. His poems, of a high order of merit, have never been collected. 'The Contemplation of Nature,' read on taking his degree at Hartford, 1829; the satires, 'Poetry' (1843); 'Infatuation' (1849); 'The Nautilus'; 'To One Beloved'; and 'The Old Sexton' are among his best. He was associated editorially with Epes Sargent and Rufus W. Griswold. 'The Old Sexton' has found its way into several anthologies.

BENJAMIN, Park, American lawyer, editor and miscellaneous writer: b. New York, 11 May 1849. A graduate of the United States Naval Academy (1867), he served on Admiral Farragut's flagship, but resigned in 1869, and was graduated at the Albany Law School in the following year. As a lawyer he has been a patent expert. He edited the Scientific American (1872-78), and Appleton's Cyclopedia of Applied Mechanics and Cyclopedia of Modern Mechanism. He has written 'Shakings: Etchings from the Naval Academy' (1867); 'Wrinkles and Recipes' (1875); 'The End of New York' (1881); 'The Voltaic Cell' (1892); 'Modern Mechanism' (1895); 'The Age of Electricity' (1896); 'The Intellectual Rise in Electricity, a History'; 'The United States Naval Academy' (1900).

BENJAMIN, Samuel Green Wheeler, American traveler, artist and miscellaneous writer: b. Argos, Greece, 13 Feb. 1837; d. Burlington, Vt. 19 July 1914. He was educated at Williams College and at the English College in Smyrna; was assistant librarian in the New York State Library, 1861-64; and was United States Minister to Persia, 1883-85. He was also editor of the American Magazine of Art and was a frequent contributor to magazines and periodicals. He was also favorably known as a marine painter and illustrator. Among his numerous works, both in prose and verse, are 'Art in America' (1879); 'Contemporary Art in Europe' (1877); 'Constantinople' (1880); 'Troy and Its Legends' (1881); 'A Group of Etchings' (1883); 'Persia and the Persians' (1886); 'Sea Spray' (1888).

BENJAMIN-CONSTANT, bôn-žha-ماذا-kezn-ștou, Jean Joseph, French painter: b. Paris, 10 June 1845; d. there, 25 May 1902. He studied under Cabanel, and exhibited in the Salon of 1869 a scene from 'Hamlet.' His taste inclined him to Oriental subjects and the nude, and his vivid coloring and dramatic treatment made his work fashionable in Paris, London and the United States. His work displays much finished and minute detail, but he paid chief attention to harmony of effect and decorative value. The most celebrated of his pictures are 'The Last Rebel' (1870); 'Mohammed II's Entry into Constantinople' (1876); and 'Thirst in the Desert' (1878). In his later years he devoted himself to portrait-ure and mural decoration. Two striking examples of the last named are the ceiling of the Opéra Comique, Paris, and 'Justian in Council' in the Metropolitan Museum of New York. In 1893 he carried off the medal of honor of the Salon by his portrait of his son André, now in the Luxembourg Museum, Paris. Among other successful portraits are those of Queen Victoria and Queen Marie de Blowitz, Anthony Drexel of Philadelphia and Frederick Ayer. He visited the United States several times. He was elected a member of the Institute in 1893 and was an officer of the Legion of Honor.

BENJAMIN OF TUDELA, Jewish traveler: b. Tudela, Navarre, Spain, in the 12th century. In 1160-73 he traveled from Saragossa, through France, Italy, Greece, Palestine, Persia to China, returning by Khuzistan, the Indian Ocean, Arabia, Egypt, Sicily and Spain. As the first European traveler who penetrated far into the East, he furnishes a great amount of interesting information, and though not free from error or fable, proves himself worthy of the high estimation in which he has always been held among his Jewish countrymen for soundness of judgment and extent of learning. His 'Itinerary,' first printed in Hebrew at Constantinople in 1543, has been often reprinted, the latest being the edition of Gunther Germain (Jerusalem 1903). It was translated into Latin by Arias Montanus in 1575, and afterward into Dutch, German and French. A part of the text was published by M. N. Adler in 'Quarterly Statement of the Palestine Exploration Fund' (London 1894). A transcript in the British Museum. Consult Carmoly, E., and Lekwel, L., 'Notice historique sur Benjamin de Tudé' (1852). The edition of Asher (London and Berlin 1840-41) contains an English translation.

BENKULEN. See BENCIOLEN.

BENNDORF, Otto, German archaeologist: b. 13 Sept. 1838; d. 2 Jan. 1907. He studied at Erlangen and Bonn, went to Italy and Greece, 1864-68, and was professor of archaeology at the universities of Göttingen, Zürich, Munich, Prague and Vienna. In 1875 he made a second archaeological to Macedonia, and in 1881 and 1883 he made two expeditions, at state cost, to southwestern Asia Minor; in 1898 he was made director of the Austrian Archaeological Institute. He wrote 'The Ancient Sculptures in the Lateran Museum' (in conjunction with Th. Schöne) (Leipzig 1867); 'Ancient Historical Helmets and Sepulchral Masks' (1878); 'Travels in Southwestern Asia Minor' (1884); 'Reisen in Lykien und Karien' (1884), etc.
BENNE OIL, a valuable oil expressed from the seeds of *Scramum orientale* and 3. inand *Sesamum indicum* and *Sesamum indicum*, and used for purposes similar to those of olive oil. Also called sesame oil and gingelly oil. See SESAME.

**BENNET, Elizabeth**, the heroine of Jane Austen's novel, 'Pride and Prejudice.' Con- scut Howells, 'Heroines of Fiction' (1901).

**BENNET, Henry** (Earl of Arlington), Eng. statesman; b. Arlington, Middlesex, 1618; d. 28 July 1685. He was devoted to the cause of Charles I, and was appointed Under-Secretary of State; he fought in several battles, and was wounded at Andover, but after the battle of Worcester he retired to Spain. Upon the restoration he returned to England, and was appointed keeper of the privy seal, and shortly afterward Secretary of State. In 1664 he was created Baron Arlington; in 1670 became noted as one of the famous Cabal, but is not accused of entertaining their extreme sentiments; he was created Earl of Arlington in 1672. He was one of the plenipotentiaries sent to Utrecht to negotiate a peace between Austria and France, but the mission not being successful, an en- deavor was made by his colleagues to cast the odium of the failure upon him. He defended himself, however, before the House of Com- mons, and was acquitted. The war with Hol- land, which is said to have been caused by the machinations of the Cabal, lost to Arlington the favor of the King and people; but in spite of this he received the office of chamberlain. In 1679 he became a member of the new council, and retained his office of chamberlain on the accession of James II.

**BENNETT, Alfred Allen**, American chem- ister; b. Milford, N. H., 30 Nov. 1850. He was graduated at the University of Michigan 1877; became professor of chemistry and physics in Iowa Wesleyan University; and since 1885 has been professor of chemistry in Iowa State College. Publications: 'Text Book of Inor- ganic Chemistry' (2 vols., 1895) and articles in the *American Chemical Society Journal*.

**BENNETT, Alfred William**, English botan- ist; b. Clapham, 24 June 1833; d. 23 Jan. 1902. He engaged in business as a bookseller and publisher in London, which he abandoned in favor of botanical research. He was the author of 'The Flora of the Alps' (1876-77), and of some admirable translations from the German: Sachs' 'Lerhcbuch der Botanik' (1875); Seboth's 'Alpine Plants' (1879-84); and von Dalla Torre's 'Tourists' Guide to the Flora of the Austrian Alps' (1882).

**BENNETT, Charles Edwin**, American educator; b. Providence, R. I., 6 April 1858. He was graduated at Brown University 1878; pur- sued graduate studies at Harvard and in Ger- many 1881-84; was professor of Latin at the University of Missouri 1884-92; was professor of classical philology at Brown 1891-92; and in the latter year was elected professor of Latin at Cornell. He has been a frequent contributor to classical journals and editor of classical texts. Publications: 'A Latin Grammar' (1895); 'The Text-Book of Classical Philology' (6th ed., 1898); 'A Text-Book of Some Recent Subjunctive Theories' (1898); 'The Quantitative Reading of Latin Poetry' (1899); 'The Teaching of Greek and Latin in Secondary Schools' (with George P. Bristol) (1900); 'The Latin Language' (1907); 'Syntax of Early Latin' (Vol. I, 1910; Vol. II, 1914). He has edited 'Xenophon's Hellenica, Books V-VIII' (1892); 'Tactus, Dialogus de Oratoribus' (1894); 'Cicero, De Senectute' (1897); and 'Cicero, De Amicitia' (1897). 'Horace, Odes and Epodes' (1900); 'Cicero, Gallic War, Books I-V' (1903); 'Cicero, Selected Orations' (1904); 'Virgil, Äneid, Books I-VI' (1905). Translating 'The Charac- ters of Theophrastus' (with Wm. A. Ham- mond) (1902); 'Horace, Odes and Epodes' (in Loeb Classical Library) (1903). He is a frequent contributor to philological journals.

**BENNETT, Edmund Hatch**, American lawyer; b. Manchester, Vt., 6 April 1824; d. Boston, 2 Jan. 1898. He was graduated at the University of Vermont in 1843, and admitted to the bar in 1847. He practised for many years in Taunton, Mass., and was mayor of that city 1865-67, and judge of probate and insolvent of Bristol County 1858-83. He was lecturer at Harvard Law School 1865-71, and afterward professor and dean at the Law School of Bos- ton University. In 1896 he was a member of the Massachusetts commission on "Uniformity of Legislation" throughout the United States and chairman of the commission to revise the Massachusetts statutes. His works include 30 volumes of 'English Law and Equity Reports'; 9-12 Cushing's (Mass.) Reports'; 'Massa- chusetts Digest' (3 vols.); 'Bingham on In- fancy'; 'Blackwell on Tax Titles'; 'Leading Criminal Cases' (2 vols.); 'Goddard on Eas- ements'; 'Benjamin on Sales'; 'Polycev's Constitutional Law'; 'Indian's Principles of Common Law'; and 'Fire Insurance Cases' (5 vols.). He made contributions to professional journals, and was co-editor of the *American Law Register*.

**BENNETT (Enoch)** Arnold, English author; b. Hanley, Staffordshire, 27 May 1867. He was educated at Newcastle Middle School, first took up law as his profession, which he abandoned to take up journalism, becoming assistant editor of *Woman* in 1893, and editor in 1896. He gave up journalism in 1900 to devote himself exclusively to literature. He had published two novels — 'A Man from the North' (1898), and 'The Great Babylon Hotel' (1902), before his 'Anna of the Five Towns,' issued in the same year, revealed the fact that a new master had risen in English fiction, and his succeeding books dealing with the Five Towns—the pottery district of North Staffordshire in which the author was reared—have, in the opinion of H. G. Wells, given him the foremost place in English fiction. These are 'The Grim Smile of the Five Towns' (1907); 'The Old Wives' Tale' (1908); 'Clayhanger' (1910); 'The Card' (1911); 'Hilda Lessways' (1912) and 'The Matador of the Five Towns' (1912). A realist of great power, these tales deal with commonplace people in drab and unimpressive surroundings, and reveal in the most arresting fashion how the seemingly outward monotony of their existence pulsates inwardly with moving drama. A writer of amazing powers, Bennett has already published over 30 volumes the majority of which reach a high level as litera- ture. Others of these are 'Leonora' (1903);
Bennett, James Gordon, American journalist: b. New Mill, Keith, Scotland, 1 Sept. 1795; d. New York, 1 June 1872. He was of French extraction. He entered a Catholic seminary at Aberdeen with a view to entering the priesthood and after a three years' course emigrated to America, arriving at Halifax, N. S., in 1819, where he taught bookkeeping. Meeting with little success he removed to Boston and for three years was there employed as proofreader. We next find him in New York writing for various newspapers after which he was engaged on the Charleston, S. C., Courier as translator of articles from Latin-American journals. He was soon back in New York, there established a commercial school and also did some work for the newspapers. In 1827 he became Washington correspondent of the New York Enquirer in which capacity he made a reputation for himself by his reports of the proceedings in Congress. In 1829 the Courier and Enquirer were consolidated and Bennett became associate editor and a recognized leader in politics. He withdrew from his editorial position in 1832, went to Philadelphia, and there acquired an interest in the Pennsylvanian, of which he became editor. Being of an independent nature and refusing to be the tool of the politicians his position made him many enemies and finally led to his withdrawal from Philadelphia. He now embarked on his real life work, investing his savings (about $500) and his experience in establishing a small four-page journal, which he sold for a cent a copy and called it the New York Herald. He was the editor, reporter and contributor. The office was in a cellar in Wall street and two printers shared in the profits of the enterprise. Mr. Bennett brought new views into the journalistic field, his new paper was free of all party control, the acquisition of news from every quarter of the globe became its chief aim; it exposed fraud in every guise, it disseminated facts, not opinions, and lauded everything calculated to benefit and elevate mankind in general. On 13 June 1835 it printed an article on the state of the money market, which gained wide attention and which, despite considerable opposition, became a permanent feature of the Herald and of every other newspaper. Toward the end of the same year Mr. Bennett originated the reporting in detail of public occurrences. He reported sermons and the proceedings of public meetings and introduced the practice of interviewing the chief actors in any great occurrence. He was the first to use the telegraph for reporting and originated the system of distributing his papers. By means of these and other novel features the Herald increased its circulation rapidly and within a few years was the most valuable newspaper property in the country. Mr. Bennett's strong personality was impressed upon the paper by his directing every detail of management and business as well as the general molding of public opinion. In 1867 James Parton wrote that "his paper is generally read and its proprietor universally disapproved." Bennett was often accused of utter lack of conviction, chiefly, perhaps, because of his reiterated remark "We have a large minority, and we never shall be." Consult Hudson, Frederic, 'Journalism in the United States from 1690 to 1872' (New York 1873) and Parton, 'Famous Americans of Recent Times' (Boston 1867).

Bennett, Richard Bedford, Canadian lawyer and legislator: b. Hopewell, New Brunswick, 3 July 1870. He was graduated LL.B. at Dalhousie University, Halifax, Nova Scotia, in 1893, and admitted to the bar of New Brunswick in 1894. After his removal to Calgary, Alberta, in 1897, he became a member of the local legislature (1898-1905, 1909-11), and was in 1911 elected to the House of Commons from Calgary, and soon made his mark in the House as an effective and ready debater. He accompanied Sir Robert Borden to England in 1915, and on his return was appointed director-general of national service.

Bennett, Samuel Crocker, American lawyer: b. Taunton, Mass., 19 April 1858. He was graduated at Harvard in 1879. He is a son of Edmund Hatch Bennett (q.v.), and in 1898 succeeded his father as dean of the law school of Boston University. He is a member of the American Bar Association, and of the Massachusetts Bar Association. He is one of the editors of 'Federal Decisions': 'Smith's Leading Cases': 'Benjamin on Sales': 'Cyclopedia of Law and Procedure.'
BENNETT, Sanford Fillmore, American hymnologist: b. Eden, N. Y., 1836; d. 12 June 1898. He settled in Elkhorn, Wis., in 1860, and became editor of the Independent. Recognizing this place, he entered the 40th Wisconsin Volunteers and served with them throughout the Civil War. In 1867 he aided J. P. Webster, the composer, in preparing 'The Signet Ring,' a Sunday-school hymnbook, to which he contributed about 100 hymns. 'The Swinging Tree,' and other poems, were the result of his service, and the first of these. Many of Mr. Bennett's hymns and songs have been published in sheets.

BENNETT, William Cox, English songwriter: b. Greenwich, 14 Oct. 1820; d. Blackheath, 4 March 1895. He suggested that the bust of Longfellow be placed in Westminster Abbey, and formed a committee of 500, with the Prince of Wales at its head, to effect it. He was the author of 'Poems' (1850); 'The Trial for Salamis' (1850); 'Endowed Parish Schools and High Church Vicars' (1853); 'Queen Eleanor' (1850); 'The Song of the White Cross,' and 'Other Poems' (1856); 'War Songs' (1857); 'Songs by a Song-Writer' (1858); 'Baby May, and Other Poems' (1859); 'Our Glory Roll, and Other National Poems' (1867); 'Contributions to a Ballad History of England and Ireland' (1869); 'Sonnets & Songs of Poets and Sailors' (1870); 'Songs for Sailors' (1872); 'Narrative Poems and Ballads' (1879); 'Songs of a Song-Writer' (1876); and 'Sea Songs' (1878). He died in London in 1895.

BENNETT, Sir William Sterndale, English composer: b. Sheffield, 13 April 1816; d. London, 1 Feb. 1875. He became a pupil of the Royal Academy of Music in 1826, studying under Cipriani Potter, Crotch and Lucas, and afterward Moscheles. By the advice of Mendelssohn, who had already gained, he studied in Leipzig from 1836 to 1838, and his performances and compositions were held in high esteem by the younger German musicians, and especially by Schumann. In 1842 he again visited Germany. He was one of the founders of the Bach Society in 1849; in 1855 he became conductor of the Philharmonic Society, in succession to Richard Wagner. After a period spent in teaching, conducting and composing, he was appointed professor of music at Cambridge in 1856, and was knighted in 1874. In 1868 he became principal of the Royal Academy of Music. He was too entirely dominated by Mendelssohn's influence to do great original work. He was a first-rate pianist, and was highly rated as a composer, and was esteemed the greatest of contemporary English musicians. He is best known by his overtures, 'The Naids' and 'Parisina;' his cantatas, 'The May Queen' and 'Woman of Samaria'; and his little musical sketches, 'Lake,' 'Millstream,' and 'Fountain.' Consult Bennett, V. J., 'The Life of William Sterndale Bennett' (London 1907).

BENNETT SVILLE, S. C., town and county-seat of Marboro County, on the Bennington and Cheraw railroad and the Atlantic coast line, 160 miles northeast of Columbia. Being in the center of an extensive cotton and corn raising district it has a number of textile mills and fertilizer manufactories. There is a large sanatorium in the town. Pop. (1910) 2,646.

BENNINGSEN, Levin Augustus (Baron von), Russian soldier: b. Brunswick 1745; d. 3 Oct. 1826. He entered the Russian service at an early age, and distinguished himself by his bravery in the war against Poland, under Empress Catherine II. In 1806 he was appointed to command the Russian army which went to the assistance of the Prussians. He afterward fought the battles of Eylau and Friedland. After the Peace of Tilsit he retired to his estates. He was one of the commanders at Borodino and voted for a second battle in front of Moscow. Before the French retreat began he defeated Murat at Taratino on 18 October. He retired from the army because of differences with Kutusoff, but after the latter's death he became commander of the Russian army of reserve, which in 1813 he led into Saxony, took part in the battle of Leipzig, and was created a count by Emperor Alexander on the field. He aided in the pursuit of the French army and blockaded Hamburg. Because of ill health he retired from the Russian service in 1818, and settled on his paternal estate in his native country.

BENNINGSEN, Rudolph von, German statesman: b. Luneberg, Hanover, 1824; d. Benningen, 7 Aug. 1902. After part of Prussia he was elected to the North German Diet and the Prussian Assembly, becoming vice-president of both. Entering the German Reichstag in 1871, he became prominent as leader of the National Liberals, warmly supporting Bismarck for years, but later opposing his policy toward the Socialists. After some years spent in retirement, Benningens re-entered politics in 1887 and continued active until 1897, when he resigned his position as president of the province of Hanover, which he had held from 1888.

BENNINGTON, Vt., town and county-seat of Bennington County, on the Rutland railroad, 30 miles east of Troy, N. Y., and 52 miles southwest of Rutland. It contains the villages of Bennington, North Bennington, and Bennington Centre. The Bennington Centre is the seat of the State University of Vermont's College of Art and Science. Bennington also has a large number of national banks, public library, numerous churches and graded public schools. There are valuable deposits of brown hematite ore in the town. The government consists of a town president and a board of trustees elected annually at town meetings under the charter of 1885 but each village manages its own local affairs. The town, which was named after Governor Benning Wentworth of New Hampshire, was settled in 1761, and for many years before Vermont became a State was claimed by both New York and New Hampshire. Bennington was the home of Seth Wawer and Ethan Allen and on 16 Aug. 1777, the battle of Bennington was fought here. Pop. 1910 8,980. Consult Merrill and Merrill, 'Sketches of Historic Bennington' (Cambridge 1898).

BENNINGTON, Battle of, one of the early battles of the Revolution, fought at Bennington, Vt., 16 Aug. 1777. The army of General Burgoyne, marching to the south from Canada, and causing the abandonment of Ticon-
deroga by General St. Clair, created the greatest commotion throughout New England, since Boston was supposed to be its point of destination. General Stark chanced to be at the time at Bennington, having under his command a corps of New Hampshire militia, and he determined to confront a strong detachment of the enemy sent out under Colonel Baum to procure supplies. He hastily collected the Continental forces in the neighborhood, and on 16 August approached the British, whom, after a hot action of two hours, he forced to a disorderly retreat. The engagement was hardly over when a reinforcement arrived, sent by General Burgoyne, and the battle was renewed, and kept up several hours till dark, when the British forces retreated, leaving their baggage and ammunition. The loss of the enemy was 20 killed, 600 taken prisoners, and 1,000 stand of arms. The Americans lost only 14 killed and 42 wounded.

**BENOIT, Saint**, bishop of Meissen (son of the Count of Bultenburg) and Apostle of the Slavs: b. Hildesheim, 1010; d. 1106. At 26 years of age he became a monk in the Benedictine convent of Saint Michael in his native town. His extraordinary virtues and learning caused his brethren to elect him abbot in 1042, but this dignity and office he resigned three months later. During the minority of Henry IV, he was appointed to the see of Meissen, and during his episcopate of 40 years he led the life of an ascetic. In the quarrel between Henry and the Saxon nobles he stood by the latter, and in consequence was led away prisoner when Henry passed through Meissen in 1075 after his victory on the Unstrut. He supported Pope Gregory VII in the long dispute between the Emperor and the Pope. In 1085 he was deposed at the Synod of Mainz, and two years afterward was reinstated. He died at the advanced age of 96 years and his tomb in the Cathedral of Meissen was venerated as a shrine, until the remains were transferred to the cathedral in Munich. The Bavarians chose him as their patron saint after he was canonized by Hadrian VI in 1523. Consult his Life by Ennington, Catholic Biologists for June 34, also his Life by Scyfort.

**BENOIST, bən-wɑːsˈtʁ, René**, French theologian, confessor of King Henri IV, curé of Saint Eustache: b. 1521; d. 7 March 1608. He published a French translation of the Bible in 1566, for which he was censured by the Sorbonne and, later, by Pope Gregory XIII, leading to his expulsion from the Faculty of Theology. He was driven out of Paris in 1591, when he had associated with a political faction supporting the claims of King of Navarre to the throne of France. Henri IV nominated him Bishop of Troyes, but the Pope refused his sanction. He wrote about 150 works and pamphlets, mostly dealing with the history of his time.

**BENOIT', bə-nwɑː, Pierre Leopold Leonard**, Flemish musician and composer: b. Harelbeke, Belgium, 17 Aug. 1834; d. 1901. He studied under Félic. He held the position of director of the Flemish School of Music in Antwerp from 1867 until his death. He was in his time the foremost advocate of a national school of music for Belgium. His compositions include 'Het Dorp in't Gebergte,' a comic opera (1856); the operas 'Isa' (1867); 'Pompejia' (1896); the oratorios 'The Schelde'; 'Lucifer'; 'Children's Oratorio'; 'Drama Christi'; 'The Rhine'; incidental music to Vander Ven's 'Charlotte Corday'; and Goethem's 'Willems de Zeeuwje'; 'De Oorlog'; and 'Vlaanderen's Kunstroom', cantatas; a 'Missa Solemnis'; a 'Te Deum'; and a 'Requiem'; choral symphony, 'De Maaiers'; several choral works with orchestra pieces, and songs. He also wrote much on musical subjects. Consult J. Mortelmans 'Pierre Benoit!' (Antwerp 1911).

**BENOIT DE SAINTE-MAURE, de sà̃-mɔ̃r, French troubadour and chronicler:** b. Touraine; fl. in the 12th century. From 1154 to 1189 he was attached to the court of Henry II of England. He wrote in about 42,000 octosyllabic verses a 'Chronicle of the Dukes of Normandy' to the year 1153. The title of his work was 'The Romance of Troy,' founded on the story of the siege of Troy as written by Diodor Cretensis and Dares; it was translated into the languages of western Europe. Boccaccio, Chaucer, and Shakespeare are said to be indebted to Benoit for the story of the loves of Troilus and Briseis (Cryseide or Cressida being originally called Bristea). Another work from his hand is 'Le Roman d'Enées,' a continuation of the 'Romance of Troy.'

**BENRATH, benrət, Karl**, German Protestant theologian and historian: b. Düren, 10 Aug. 1845. Having studied at and graduated successively from the universities of Bonn, Berlin and Heidelberg, he went to Italy, in 1871, where he spent some years in research. In 1879 he was appointed professor at Bonn and 11 years later accepted a similar appointment at Königsberg. He was also the founder of the *Revista Cristiana*. Much of his writing refers to the history of the Reformation in Italy, on which subject he is leading authority. Among his chief works are 'Geschichte der Reformation in Venedig' (1887); 'Bernardino Ochino von Siena' (1892); 'Geschichte des Hauptver eins der Gustav-Adolf Stiftung für Ostpreussens' (1894); 'Luther im Kloster' (1905).

**BENSERADE, bən-ˈsɛrəd, Isaac de**, French poet: b. Paris 1613; d. Gentilly 1691. He wrote for the stage, composed a great number of ingenious verses for the King and many distinguished persons at court and published a translation of the 'Metamorphoses' of Ovid. In the first half of the reign of Louis XIV the court and its followers patronized songs of gallantry, rondels, triolos, madrigals, and sonnets, containing sallies of wit, conceits and effusions of gallantry in the affected style then prevalent. No one succeeded in taking their place as Benseraud, who was therefore, by way of eminence, called le poète de la cour. His collected works appeared in 1697, and an edition was published in 1875.

**BENSLEY, Thomas**, English printer: d. 1833. He is much known for an edition of 'Lavater's 'Expression of the Passions' ' in quarto, and for an edition of the English Bible between 1800 and 1815, in 7 volumes quarto. He also printed Shakespeare in 1803, in 7 volumes octavo, and in 1806 Hume's 'England' in 10
volumes folio, which is adorned with elaborate portraits and engravings on copper. He was prominent also in the construction of the machine press invented by Köning and applied to printing the Times newspaper in 1847. In 1875 he was appointed chaplain in ordinary to the queen, and in December 1876 was nominated to the newly erected bishopric of Truro. Here he began the building of a cathedral (1880-87), most of the first cost, £110,000, having been gathered by his own energy. In 1882 he was translated to Salisbury to succeed Dr. Tait as primate of all England. A high-churchman, Dr. Benson was frequently select preacher at both universities, and published several volumes of sermons, a small work on 'Cathedrals,' and a valuable article on 'St. Cyprian' (London 1897). A distinguished ecclesiastical lawyer and diplomatist, he gave the important judgment in the Lincoln case on ritual. Consult his 'Life' by his son, Arthur Christopher Benson (London 1899; abridged edition 1901).

BENSON, Egbert, American jurist and politician: b. New York, 21 June 1746; d. Jamaica, N. Y., 24 Aug. 1833. He was graduated at Columbia College 1765; was member of the New York Legislature in 1777, and of Congress 1784-88, 1789-93, and 1813-15; judge of the supreme court of New York 1794-1801, and became a judge of the United States circuit court. He was a regent of the University of New York 1789-92, first president of the New York Historical Society in 1817-20, and wrote a 'Vindication of the Captors of Major André,' (1817) and 'Memoir on Dutch Names of Places' (1835).

BENSON, Frank Weston, American painter: b. Salem, Mass., 24 March 1862. He was educated at the Museum of Fine Arts, Boston, and at Paris; became a member of the Society of American Artists in 1888. He has won many honors from art institutes and academies, including the Hallgarten and the Clarke prizes at the National Academy of Design in 1899 and 1891; has done much in figure work with outdoor effects, but is best known for his portraits.

BENSON, Sir Frederick William, Canadian soldier: b. Saint Catherines, Ont., 2 Aug. 1849. He was educated at Upper Canada College and the Royal Military College, Sandhurst; served as a volunteer during the Fenian raids on Canada in 1866; joined the 21st Hussars in 1869; rose to be colonel of the 21st Lancers; served in the South African War 1900-01; was inspector-general of remounts, 1903-04; director of transport and remounts, 1904-07; and major-general in charge of administration, 1907-09. He was created C.B. in 1901, and K. C. B. in 1910, and on the outbreak of the Great War in 1914 was appointed chief of the Remount Commission.

BENSON, Robert Hugh, English Roman Catholic clergyman and writer: b. Wellington College, 1871; d. Salford, 19 Oct. 1914. He was son of Edward W. Benson, former archbishop of Canterbury and was educated at Eton and at Trinity College, Cambridge. After leaving Cambridge he prepared to enter the ministry, and joined the Community of the Resurrection at Mirfield. In 1903 he was received into the Roman Catholic church and was ordained to

BENSON, William Shepherd, American admiral: b. Macon, Ga., 25 Sept. 1855. He was graduated from the United States Naval Academy in 1877; rose to lieutenant in 1883; lieut.-commander in 1909; captain, 1909, and rear-admiral 11 May 1915. On the last-mentioned date he was named by Secretary Daniels as Chief of Naval Operations; in 1916 he was granted the title of admiral, and in January 1917 was designated as president ex-officio of the Navy General Board. During his long service of over 40 years Admiral Benson has performed numerous duties afloat and ashore, as squadron commander and in the Naval Academy. During the Naval War game held off the North Atlantic coast in August 1916, the admiral announced that beginning in the spring of 1917 all reserve battleships would be sent regularly to participate in target practice in order to maintain the personnel and batteries in fighting trim. A sensational development of that war game was the "defeat" of the defending "Blue" fleet under Admiral Helm by the attacking "Red" fleet under Admiral Mayo, who succeeded—theoretically—in landing "attacking" troops at Far Rockaway Beach, Long Island. Admiral Benson stated that when the battleships were not engaged, submarine bases along both coasts were carried into effect, such a feat as the landing of a hostile force on these shores would be quite impossible. In March 1917 Admiral Benson was selected by the University of Notre Dame, Indiana, as the recipient of the Laetare medal for the year 1917, in recognition of his public services. This honor, which he was the first naval officer to receive, is regarded as one of the highest honors conferred upon laymen of the Roman Catholic Church in the United States. Shortly after the entry of the United States into the European War, Admiral Benson acted as principal representative of the Navy at the important conference held at the Navy Department with Admirals Browning and Grasset, of the British and French navies. In November 1917 Admiral Benson accompanied the American mission headed by Colonel Edward M. House to represent the United States at the inter-Armed war conference in Paris.

BENSON, Neb., city in Douglas County, five miles northwest of Omaha, on the Missouri River. Corn, flax, fruit, oats, wheat and vegetables are cultivated in the district, which is remarkably fertile. The city has a country club and is the seat of Saint James Orphanage. It owns the waterworks. Pop. 3,387.

BENT, Charles, American fur trader and territorial governor: b. Marietta, Ohio, 1799; assassinated, 19 Jan. 1847. After having been engaged in trapping and trading in the region of the Upper Missouri, Charles Bent, with his brothers, Robert, George and William and Ceren St. Vrain, under the firm name of Bent, St. Vrain & Company, established themselves in the Indian trade in the valley of the Upper Arkansas. At first they built a rude stockade between the present towns of Pueblo and Canon City but, two years later, they began the erection of a permanent structure which was known as Bent's Fort, which was completed in 1832. Charles Bent married a lady who was a member of a prominent Spanish-Mexican family at Taos, N. M., where he settled, though still retaining his interest in the trading firm at Bent's Fort. After the occupation of Santa Fe by the American forces under the command of Gen. Stephen W. Kearney, in 1846, and upon the organization of the civil government for New Mexico, Charles Bent was appointed as the provisional governor of the Territory. Governor Bent was assassinated during an insurrection of the native people.

BENT, James Theodore, English traveler: b. near Leeds, 30 March 1822; d. London, 6 May 1897. He was graduated at Oxford University in 1875, and managed excavations in Greece, Asia Minor, Abyssinia, Arabia and South Africa, for the British Museum, the Hellenic Society and the Royal Geographical Society. He went to Mashonaland in 1891 to explore and excavate the ruins of the Great Zimbabwe, discovered in 1871 by Mauch. In his report he assigns to the ruins an Asiatic origin. In 1894 he was engaged on a tour of exploration in southeast Arabia. His publications include: 'A Freak of Freedom, or the Republic of San Marino' (1879); 'Genoa: How the Republic Rose and Fell' (1880); 'Life of Giuseppe Garibaldi' (1883); 'Life Among the Insular Greeks' (1885); 'The Ruined Cities of Mashonaland' (1892); 'The Sacred City of the Ethiopians' (1893). For the Hakluyt Society he edited a volume on 'Early Travels in the Levant.'

BENT, Silas, American naval officer: b. Saint Louis, 10 Oct. 1820; d. 1889. He entered the navy in 1836; served in the Seminole war, and was with Commodore Glynn and Commodore Perry on several cruises to Japan. He was always especially active in survey work; on Perry's Japan expedition he had charge of the hydrographic survey, and his excellent work became the basis of the surveys undertaken later by the Japanese government. His most important work was to delineate and describe scientifically the Kuro Shiw, or Black Tide, the great northward-flowing current of the Pacific, corresponding to the Atlantic Gulf Stream. He was on the brig, Preble, under Glynn, when the latter, in 1849, at Nagasaki, procured the release of 18 American seamen, who had been held as prisoners. He piloted the fleet into Naha, in the Liu-Kiu Islands, and
served as United States commissioner in the negotiations for a treaty with the Regent.

BENT, William W., American fur trader and pioneer: b. Marietta, Ohio, 1809; d. near Las Animas, Colo., 19 May 1869. He became a trader and trapper on the Upper Missouri and, in 1826, with his brothers, Charles, Robert and George, established the business of Bent, St. Vrain & Company in the valley of the Upper Arkansas, near the foothills of the Rocky Mountains. The permanent trading post of this firm, known as Bent's Fort, was built lower down, where the valley of the Arkansas emerges upon the Great Plains, 1828-32, and became one of the most noted places in the history of the surrounding region during the ensuing quarter century. In 1835, William Bent married Owl Woman, a daughter of White Thunder, the venerated keeper of the sacred bundle of "medicine arrows," the national talisman of the Cheyenne tribe. He gained great influence among the Indians, continuing to operate the trading business at Bent's Fort after the death of his brothers. He served a brief term as government agent for the Cheyenne, Arapaho, Comanche and Kiowa tribes, in 1859-60, and, at various times he acted as a mediator in the settlement of troubles with the people of those tribes. In October, 1865, he served as a member of the government peace commission which negotiated new treaties with the chiefs and head men of the tribes of the Southern Plains in the council which was held at the mouth of the Little Arkansas River. Bent County, Colo., was named in his honor. "Contribution of the Men of Kansas, Nebraska, Colorado"; also Kansas Historical Society Collections (Vol. VII, p. 327; Vol. VIII, p. 491; Vol. IX, p. 504; Vol. X, p. 113; Vol. XI, p. 311).

BENT-GRASS (Agrostis), a genus of grasses usually regarded as weeds except in soils which cannot produce better. Common bent-grass or red-top (A. vulgare) is a narrow-leaved species with trailing stems rooting at the joints, and small thin panicles of purplish satiny flowers. It is sometimes sown for lawns or for hay. March bent, white bent, or fiorin grass (A. stolonifera), has broader leaves than common bent, a much closer and larger panicle, and green or pale flowers. It is very common in low, damp places, which it overruns with its compact, trailing, rooting stems, and is a useful grass in newly reclaimed bogs or land liable to inundation. Brown bent-grass (A. canina) is known in the United States as Rhode Island bent-grass, and is highly prized as a lawn grass.

BENTANG. See Eriophorum.

BENTREE, Frederick William, American soldier: b. Petersburg, Va., 24 Aug. 1834; d. 22 June 1898. He was educated in his native state; and at the outbreak of the Civil War went to Missouri and organized a company of Union volunteers. Recruited at the head of the 10th Missouri Cavalry, 1 Sept. 1861; promoted captain, 1 Oct. 1861; major, 18 Dec. 1862; lieutenant-colonel, 27 Feb. 1864; and colonel of the 138th United States Colored Infantry, 15 July 1865; mustered out of volunteer service 6 Jan. 1866. On 28 July 1866 he was commissioned captain in the 7th cavalry; promoted major of the 9th cavalry, 17 Dec. 1882; and retired 7 July 1888. His most brilliant service after the war was in his campaigns against the Indians.

BENTHAL FAUNA, the abyssal or deep-sea fauna; the great assemblage of animals living at all depths below 150 fathoms in the North Atlantic, to 500 fathoms in the tropics. See also DEEP-SEA LIFE.

BENTHAM, George, English botanist; nephew of Jeremy Bentham (q.v.); b. near Plymouth, 22 Sept. 1800; d. 10 Sept. 1884. He was privately educated, early attached himself to botany, and having resided in southern France (where his father had an estate), 1814-26, he published in French (1826) a work on 'The Plants of the Pyrénées and lower Languedoc.' Having returned to England he studied law, and on this subject, as well as logic, he developed original views. Finally, however, he devoted himself almost entirely to botany; was long connected with the Horticultural Society and the Linnean Society; and from 1861 onward was in almost daily attendance at Kew (except for a few weeks occasionally), working at descriptive botany 10 to 4 o'clock as a labor of love. Along with Sir J. D. Hooker he produced the great work of descriptive botany, 'Genera Plantarum'; another great work of his was the 'Flora Australiensis' (in seven volumes). His 'Handbook of the British Flora' is well known.

BENTHAM, Jeremy, English jurist and publicist: b. London, 15 Feb. 1748; d. London, 6 June 1832. After an early education at Westminster School he went to Oxford in his 13th year, taking his bachelor's degree at 15, and his master's degree at 18. He studied English law, but never appeared at the bar, being enabled by easy circumstances to devote himself entirely to literary compositions. He did not, however, publish his chief works himself. They were arranged and translated into French by his friend, Étienne Dumont, and printed partly in Paris and partly in London. Among them were 'Treatises on Civil and Penal Legislation' (Paris 1802, 3 vols.), and 'Theory of Punishments and Rewards' (London 1801, 2 vols.). Bentham advocated a thorough correction of civil and criminal legislation. His 'Fragment on Government,' in opposition to Blackstone, appeared anonymously in 1776, and with his name, London 1823. In France his literary labors found a better reception than in England or Germany. A small pamphlet on the liberty of the press (London 1821) was addressed by him to the Spanish Cortes during their discussion of this subject; and in another ('Three Tracts Relative to the Spanish and Portuguese Affairs,' London 1821) he refuted the idea of the necessity of a house of peers in Spain, as well as Montesquieu's proposition that judicial forms are the defense of innocence. One of his latest works was the 'Art of Packing' (London 1821), that is, of arranging juries so as to obtain any verdict desired. His previous work, 'Essay on Parliamentary Practice,' edited from the author's papers by Dumont (Geneva 1815), and translated into German, contains many useful observations. His 'Introduction to the Principles of Morals and Legislation' (London 1822, 2 vols.) treats of the
principal objects of government in a profound and comprehensive manner. Zanobelli has translated Bentham's 'Theory of Legal Evidence,' into Italian (Bergamo 1824, 2 vols.). Among the earlier works of Bentham was his 'Defense of Usury,' showing the 'Impolicy of the Present Legal Restraints on the Terms of Speculative Borrowings' (1787). At his death, Mr. Bentham bequeathed his body to be dissected for the benefit of science. A complete edition of his works, with a biography by Bowring, was published in London (11 vols., 1843). He was a man of primitive manners, unblemished character and undoubted earnestness in the cause of the people at large. He is considered the father of the Utilitarians, or those moral political economists who view everything as it is affected by the principle of 'the greatest happiness of the greatest number.' Consult Albée, 'History of English Utilitarianism' (London 1902); Atkinson, C. M., "Jeremy Bentham: His Life and Work" (London 1905; 2d ed., 1909); Graham, W., 'English Political Philosophy from Hobbes to Maine' (ib., 1899); Kent, C. B. R. 'The English Radicals' (ib., 1899); Mill, J. S., 'Bentham,' in London and Westminster Review (August 1838); Stephen, L., 'English Utilitarians' (London and New York 1900).

BENTHOS, the fauna of deep water, as distinguished from that of the surface (plankton). The benthal animals live perpetually at depths below a hundred fathoms, a few making nocturnal excursions to the surface, but as a whole constituting a deep-sea fauna. Consult Murray, ' Depths of the Ocean' (London 1912).

BENTINCK, Lord William Charles Cavendish, English soldier and statesman (second son of the 3rd duke of Portland); b 14 Sept. 1774; d. Paris, 17 June 1839. He entered the army at an early age, and served in the Duke of York's campaign in Flanders, and also in Italy with the Russian army under Suwaroff, 1799-1801. In 1803 he proceeded to India as governor of Madras, returned thence in 1805, and subsequently went to Spain, where he commanded a brigade under Sir John Moore at the Corunna. In 1810 he visited Sicily as British plenipotentiary, and commander-in-chief of the English troops. The most noticeable feature of this expedition is his bestowment on the Sicilians of a constitution, which, however, was overthrown on the restoration of the Bourbons. He conducted in 1813 the expedition from Sicily to Catalonia, and in 1814 took possession of Genoa on the revolt of the inhabitants from French rule. The same year he returned to England, and subsequently entered Parliament as member for Nottingham. In 1827, under Mr. Canning's administration, he was sent to India as governor-general, and held that office till 1835, when he returned to England. Among the principal events of his administration are the abolition of the slave trade, the opening up of internal communications, the establishment of the overland route, and the establishment of the press. In 1836 he again entered Parliament as member for the city of Glasgow, but was now unable from ill health to take any active share in political matters. Consult Bougee, 'Lord William Cavendish Bentinck' (Oxford 1892).

BENTINCK, Lord William George Frederick Cavendish, generally known as Lord George Bentinck, English statesman (son of William Henry Cavendish, 4th duke of Portland); b. 27 Feb. 1802; d. 21 Sept. 1848. He entered the army, but quitted it early to become private secretary to Mr. Canning, who had married his mother's sister. In 1827 he entered Parliament as member for King's Lynn, and continued to represent that borough for the rest of his life. He was attached to no party, first voted for Catholic emancipation, and the Reform Bill. Up to 1846 he was a warm adherent of Sir Robert Peel and his measures; but on the latter announcing himself in that year a convert to free-trade principles, Lord George abandoned his old ally and came forward as the zealous and indefatigable leader of the Protectionists in the House of Commons. With the assistance of Disraeli he maintained this position for two years, and though often illogical, and sometimes unscrupulous in his statements, he nevertheless drew attention by the vigor and earnestness of his oratory and deportment. He was an ardent champion of religious liberty, and supported the measure for the removal of the disabilities of the Jews. He was famous for his skill in many arts, and helped to put a stop to many abuses in connection with racing. Consult Disraeli, B., 'Lord George Bentinck: A Political Biography' (London 1851).

BENTIVOGLIO, ben-te-voh-yoh, Cornedio, Italian ecclesiastic and poet: b. Ferrara, 1668; d. Rome, 1732. He early distinguished himself by his progress in the fine arts, literature, philosophy, theology and jurisprudence, and was a patron of the literary institutions at Ferrara. Pope Clement XI made him his domestic prelate and secretary to the apostolic chamber, and sent him, in 1712, as nuncio to Paris, where, during the last years of the reign of Louis XIV, he acted an important part in the affair of the bull Unigenitus. The Duke of Orleans, regent after the death of Louis, was not favorably disposed toward the Pope, and therefore transferred him to Ferrara, and in 1719 bestowed on him the hat of a cardinal, and employed him at first in Rome near his own person, then as legate a latere in Romagna, etc. Poetry had occupied his leisure hours. Sonnets composed by him may be found in Gobbi's Collection, Vol. III, and in other collections of his time. Under the name of Selvaggia Porpora he translated the 'Thesais of Statius' into Italian. He was a great protector and patron of literature.

BENTIVOGLIO, Guy or Guido, Italian historian and ecclesiastic: b. Ferrara, 1579; d. Rome, 1644. He studied at Padua with great reputation, and afterward, fixing his residence at Rome, acquired general esteem by his prudence and industry. He wrote some rhetorical figures at the courts of Clement VIII and Paul V. He was made archbishop and received the appointment of Apostolic nuncio in Flanders 1607, and nuncio in France in 1617. In 1621 he became cardinal. He had confidential relations with Urban VIII and died during the concclave which elected Urban's successor, and just when his own candidacy for the Pontifi-
cated advanced. He was an able politician, and his historical memoirs are valuable, especially his History of the Civil Wars in Flanders, written in Italian, and first published at Cologne (1630), a translation of which, by Henry, Earl of Monmouth, appeared in 1654 (London, folio). His own Memoirs and a collection of letters are reckoned among the most valuable of warmth and veracity in the Italian language (an edition of which was published at Cambridge in 1727). His complete works were published in Venice in 1668.

BENTLEY, John Francis, English architect: b. Doncaster, England, 1839; d. Clapham, London, 2 March 1902. Upon the rebuilding of the great parish church in Doncaster, about 1856, Bentley was placed in the office of the clerk of the works, his architectural education practically beginning at this time. In 1862 he began practice as an architect on his own account, and his patrons from that date onwards were mainly Roman Catholics. Among his lesser works are the Roman Catholic church and convent at Bocking, Essex; and the new Roman Catholic cathedral in Brooklyn, N. Y.; with which his name will inseparably be associated is the Roman Catholic cathedral at Westminster, a structure of vast proportions with a nave wider than that of any church in England. Bentley left nothing in the way of design to subordinates, but designed and directed everything from the foundation to the minutest decorative feature. Bentley's death took place just as the Royal Institute of British Architects had voted to award him the royal gold medal.

BENTLEY, Richard, English divine, classical scholar, and polemicist: b. Oulton, near Wakefield, Yorkshire, 27 Jan. 1662; d. Cambridge, 14 July 1742. His father is said to have been a blacksmith. To his mother, a woman of strong natural abilities, he was indebted for the rudiments of his education, and in 1676 he entered Saint John's College, Cambridge. In 1682 he left the university, and became usher of a school at Spalding; a year later he took the position of tutor to the son of Dr. Stillingfleet, dean of Saint Paul's. He accompanied his pupil to Oxford where he acquired himself of the literary treasures of the Bodleian Library in the prosecution of his studies. In 1684 he took the degree of A.M. at Cambridge, and in 1689 obtained the same honor at the sister university. His first published work was a Latin epistle to Dr. John Mill on an edition of the Chronicle of John Malala, which appeared in 1691. It displayed so much profound learning and critical acumen as to excite the sanguine anticipations of classical scholars from the future labors of the author. Dr. Stillingfleet, having been raised to the bishopric of Worcester, made Bentley his chaplain, and in 1692 collated him to a prebend in his cathedral. He was chosen the first preacher of the lecture instituted by the celebrated Robert Boyle for the defense of Christianity. The discourses against atheism which he delivered on this occasion were published in 1694; they have since been often reprinted, and translated into several foreign languages.

In 1693 he was appointed keeper of the Royal Library at Saint James—a circumstance which incidentally led to his famous controversy with the Hon. Charles Boyle, afterward Earl of Orrery, relative to the genuineness of the Greek Epistles of Phalaris. In this controversy Bentley was victorious, though supported by the greatest wits and critics of the age, including Pope, Swift, Garth, Atterbury, Aldrich, Dodwell and Conyers Middleton, who advocated the opinion of Boyle with an extraordinary degree of warmth and illiberality. In 1699 Bentley, who had three years before been created D.D., published his Dissertation on the Epistles of Phalaris, in which he proved that they were not the compositions of the tyrant of Agrigentum, who lived more than five centuries before the Christian era, but were written by some sophist under the borrowed name of Phalaris, in the declining age of Greek literature.

Soon after this publication Dr. Bentley was presented by the Crown to the mastership of Trinity College, Cambridge, which he held for a year. He now resigned the prebend of Worcester, and in 1701 was collated to the archdeaconry of Ely. His conduct as head of the college gave rise to accusations of various offenses, including embezzlement of money. The contest, lasting more than 20 years, was decided against him, a sentence, depriving him of his mastership, being passed; but Bentley's superior skill and mastery of legal forms constantly baffled all attempts to oust him. In 1711 he published a quarto edition of Horace at Cambridge, which was reprinted at Amsterdam; and in 1713 appeared his remarks on 'Collins' Discourse on Free-Thinking,' under the form of a 'Letter to F. H. (Francis Hare), D.D., by Phileleutherus Lipsiensis.' He was appointed Regius professor of divinity in 1716, and in the same year issued proposals for a new edition of the Greek Testament, an undertaking for which he was admirably qualified, but which he was prevented from executing in consequence of the animadversions of his determined adversary, Middleton. In 1726 he published an edition of Terence and Phaedrus; and his notes on the comedies of the former involved him in a dispute with Bishop Hare on the metres of Terence. The last work of Dr. Bentley was an edition of Milton's Paradise Lost, with conjectural emendations, which appeared in 1732, but this proved a failure. He died at the master's lodge at Trinity, and was interred in the college chapel. His learning was early recognized on the continent, and classical scholarship followed his lead and modern German classical scholars owe much to Bentley. He is justly regarded as the founder in England of the science of textual criticism, and much of his work has served as foundation for the modern science of comparative philology. The German scholar, J. A. Wolf, wrote an excellent biography of Bentley; and an English biography of him was written by Monk (London, 2 vojs, 1833). Consult Professor Jebb's monograph in the English Men of Letters Series (New York 1882); Bartholomew and Clark, 'Bibliography of Bentley' (Cambridge 1908); Sands, 'A History of Classical Scholarship' (Vol. II; Oxford 1908).

BENTLEY, Robert, English botanist: b. 1821; d. 1893. He qualified as a member of the Royal College of Surgeons in 1844. He became professor of botany at the London Institution and King's College, and editor of the
Pharmaceutical Journal. His works include 'Manual of Botany' (1861); 'Character, Properties, and Uses of Eucalyptus' (1874); and 'Medicinal Plants,' with Henry Trimen (1875-80).

BENTON, Angelo Ames, American clergyman: b. Canes, Crete, 1837. He was graduated at Trinity College, Hartford, Conn., 1856, and at the General Theological Seminary, New York. He was ordained in the Episcopal ministry in 1860. He was professor of Latin and Greek in Delaware College, Newark, Del., 1863-87, and professor of dogmatic theology in the University of the South, 1887-94, and rector at Albion, Ill., in 1905. His chief publications are 'The Church Cyclopaedia: A Dictionary of Church Doctrine' (Philadelphia 1884); and 'Tome of Saint Leo' (1890).

BENTON, Guy Potter, American educator: b. Kenton, Ohio, 26 May 1865. After studying at Ohio, Wesleyan and Baker universities he took up a post-graduate course at Berlin. He was then appointed superintendent of schools at Fort Scott, Kan., and later, state assistant, superintendent of public instruction. In 1896 he was appointed professor of history and sociology at Baker University; three years later he became president of Upper Iowa University. In 1902 he became president of Miami University and in 1911 president of Vermont University. He is the author of 'The Real College' (1909).

BENTON, James Gilchrist, American soldier and inventor: b. Lebanon, N. H., 15 Sept. 1820; d. Springfield, Mass., 23 Aug. 1881. He graduated at West Point in 1842, and served in the ordnance department throughout his life. He was in command of the Washington Arsenal and principal assistant to the chief of ordinance during the Civil War, at the close of which he was transferred to the Springfield (Mass.) Arsenal. For single bravery in rescuing exposed ammunition from fire, he was twice brevetted. The various models of the Springfield rifle, known as the models of 1866, 1868, 1873 and 1879, were made under his direction. He devoted himself especially to the improvement of firearms, and acquired distinction for his work in that direction and other lines of his work. He refused to patent any of them, as he held that since the government had educated him it had every right to benefit from his time and talents. He published 'Course of Instruction in Ordnance and Gunnery for the United States Military Academy' (1861; 4th ed. 1875).

BENTON, Thomas Hart, American statesman: b. Orange County, N. C., 14 March 1782; d. 10 April 1858. He was the greatest of that most valuable and scarcely appreciated class, the men of a large family, whose sympathies were with the South, and who had no feeling against slavery, yet at the cost of their influence and much personal peril opposed the political aggressions of slavery and the doctrines of secession. Early orphaned, the eldest of a large family, after part of a course in the University of Pennsylvania he went with his mother to Tennessee as a pioneer, settling at the present Benton town. A few years later he took up the study of law, and was admitted to the bar in 1811 under the patronage of his friend Andrew Jackson, then a judge of the Supreme Court. Elected to the legislature, he pushed through a judiciary reform bill, and one to give slaves the right of jury trial. In the War of 1812 he was aide-de-camp to Jackson, raised a volunteer regiment, was made lieutenant colonel in the regular army, but saw no active service; meanwhile, 4 Sept. 1813, a misunderstanding over a duel of his brother's led to an affair in which the brother was stabbed. Jackson shot and Thomas H. thrown downstairs, and the former finding they had feuded for many years. In 1815 he removed to Saint Louis, practised law and established a newspaper, which involved him in duels (one of which cost his opponent's life), to Benton's lasting regret; but which, he used, so vigorously to advocate Missouri's admission to the Union as a slave State that she elected him one of her senators on her entrance in 1820, and re-elected him every term for 30 years. During this time he stood as one of the foremost public men of his generation. His great ability and mastery of facts, a hard-headed logician and tremendous debater, of astonishing memory, unwearying industry, an iron will and physique, and a power of wit, sarcasm and denunciation that made most men shrink from a contest with him. Being the spokesman of the Western Democrats, his policy and political feelings were coincident with Jackson's, their personal quarrel was at first arranged and Benton became Jackson's first lieutenant and admiring champion. In every regard he supported Western interests: he secured the passage of laws for pre-emption, donation and graded prices of lands, for throwing open the government mineral and saline lands to occupancy and for repeal of the salt tax; advocated transcontinental exploration and post-roads, a Pacific railroad, occupation of the mouth of the Columbia, trade with New Mexico, military stations through the Southwest, amicable relations with Indian tribes and everything conducive to opening up the West and making it prosperous. This made him invincible there till the slavery question drove him into opposition. He supported Jackson in his refusal to recharter the United States Bank, and made his speeches urging the adoption of a metallic currency, which were widely circulated, gained him the nickname of "Old Bullion," and had much to do with the creation of the sub-treasury scheme. When Jackson removed the Secretary of the Treasury, Duane, for refusing to circulate the deposits in the bank, the Senate adopted a resolution censuring him for it; Benton set about having the resolution expunged from the records, and after a protracted struggle succeeded, despite the logical absurdity of his motion, in accomplishing his purpose by a series of fervid panegyrics on Jackson. In the Nullification contest, Benton was Calhoun's chief opponent, not only as Jackson's supporter, but by conviction; and the two men of might — the chiefs of the State Rights and Nationalist wings of the Democracy — remained deadly foes until Calhoun's death. In the Oregon boundary dispute Benton opposed the "fifty-four forty or fight," war-cry: it was dropped, but the Polk administration was glad of an excuse to drop it in order to push the Mexican war, and had no notion of diminu-
ishing the area of slavery to enlarge that of freedom. He favored the vigorous prosecution of the war, and came near being made commander-in-chief. But Calhoun and his supporters in Congress made the war more to their taste; and Calhoun and the other South-rights advocates were defeated. In the summer of 1850, and back again in the fall, the Missouri legislature adopted and ratified the Missouri Compromise, and the Missouri Senate and House were elected without a single Southern vote.

BENTON, N. C., a village in Johnston County, noted as the place where a stubborn battle was fought during the Civil War. Here, during his march from Savannah through the Carolinas, Sherman, at the head of 65,000 National troops, encountered 24,000 Confederates under Johnston. A battle took place 18 March 1865, Johnston having come up in great haste from Smithfield, intending to surprise Sherman. The latter, however, was ready for him, and Johnston was thrown on the defensive near Mill Creek. Johnston was partially defeated and retreated to Smithfield. The Federal loss was about 1,600, the Confederate about 2,700. Consult Johnson and Buel, 'The Battles and Leaders of the Civil War' (1887).

BENTZEL-STERNAU, bentzel-stehr-nou, Count Karl Christian Ernst von, German novelist: b. Mainz, 9 April 1767; d. Mariahalden, Switzerland, 13 Aug. 1849. In 1812 he became Minister of the Interior of the Grand Duchy of Baden, in 1810 president of the Supreme Court of Mannheim and in 1812 Minister of State and Finance of the Grand Duchy of Frankfort. He is esteemed as a humorist after the manner of Jean Paul; and his satirical romances, 'The Golden Calp' (1802-04); 'The Stone Guest' (1808); 'Old Adam' (1819-20); 'The Master of the Chair,' together form a series. His dramatic ventures had less success. He translated Young's 'Night Thoughts.'

BENTZON, Th., the pseudonym of Marie Thérèse Blanc (q.v.).

BENUE, ben've, or BINUE, a river of west Africa, the chief tributary of the Niger. It rises in the Bul'n Jidda hills on the east of Adamawa, flows for a short distance north-west then west to Bassama, after which its course is generally southwest to its junction with the Niger at Lokoja and 300 miles from the coast. Its length is about 850 miles. Its width in its lower reaches is from 1,600 to 3,200 feet, and it is navigable for about 600 miles during the rainy season, but is very shallow in the dry season (January-May). The source of the Benue was long unknown. Dr. Barth, who came upon the river in 1851, while traveling in Adamawa, near the confluence of the Faro, which joins it on its left bank about lat. 12° 30' E., was told that its headwaters were in southeast, a distance of nine days' journey. In consequence of his discovery an expedition was fitted out by the British government for the
purpose of exploring the Niger from its mouth upward. The exploration was made in a small steamer called the Peli, and was under the command of Dr. William Balfour Baikie. After reaching the point of confluence of the Benue with the Niger, about lat. 7° 40' N., Dr. Baikie followed the former eastward for a direct distance of about 50 miles. The point that was reached was about lat. 9° 25' N.; long. 11° 30' E. There was sufficient depth of water, though the river was only rising, to allow a still further exploration. The natives, however, had begun to display their hostility in such a manner as made it necessary to return. The result was to show that a large, fertile and populous tract of a region of Africa previously in a great measure unknown was accessible by means of a navigable river. A second expedition, also under Dr. Baikie, explored the same river in 1857. In 1879 a small steamer belonging to the Church Missionary Society went up the river 140 miles, and its source was discovered by Flegel in 1883. The explorer Robert Hegel journeyed along its navigable length and explored some of its tributaries in 1892. In 1822 the expedition of Mizon practically gave us a complete knowledge of the river. Its principal tributaries are the Majo, Kebbi, Gongola, Kadera and Faro. The freedom of navigation on the river is guaranteed by an agreement between Germany and Great Britain. With the Niger the Benue forms the only navigable route to the far interior of Africa.

BENVOLIO, běn-vōl'ē-o, in Shakespeare's 'Romeo and Juliet,' a friend of Romeo and nephew of Montague.

BENWOOD, W. Va., town in Marshall County; on the Ohio River, adjoining Wheeling, and on the Pittsburgh, Cincinnati, Chicago, and Saint Louis, and the Baltimore & Ohio railroads. It is the centre of a large iron-mining region and has several rolling mills and blast furnaces. About a mile south of the town is a government dam, built to hold the Ohio River in a navigable condition during dry periods. Benwood was settled about 1800. Pop. 4,976.

BENZALDEHYDE, or BENZOIC ALDEHYDE, a colorless, volatile oil, familiarly known as "oil of bitter almonds." Benzaldehyde does not occur in the bitter almonds in nature, but is formed, when the kernels are crushed and allowed to stand in water, by the decomposition of a glucoside known as "amygdalin." It has the chemical formula C₇H₅O₂H, boils at 394° F., and has a specific gravity of about 1.05 and a refractive index of 1.56. Benzaldehyde is prepared, artificially, by boiling benzyl chloride with nitrate of lead, copper or sodium and subsequent treatment with sodium acid sulphite, with which the benzaldehyde forms a crystalline compound that may be easily separated from the mother liquor by filtration or otherwise.

BENZENE, an aromatic hydrocarbon discovered by Faraday in 1825 and called by him "bicarburet of hydrogen." It has the chemical formula C₆H₆, and is the fundamental substance from which the extensive series of "aromatic compounds" is obtained. In 1845, Hofmann proved its existence in coal tar and that substance now constitutes its most important commercial source. In the manufacture of benzene, coal tar is distilled at a temperature not exceeding 300° F., and the distillate is treated with caustic soda solutions and subsequently with sulphuric acid to remove basic substances. It is then redistilled, the temperature (at least in the upper part of the still) being kept as low as 212° F., in order to prevent toluene from passing over. In order to effect a still further purification, the benzene so obtained may be cooled by a freezing mixture of ice and salt. The true benzene solidsifies when thus treated and the fluid impurities that it contains may be expelled by pressure or by the aid of a centrifugal drier. Pure benzene is a colorless liquid, strongly refractive, boiling at about 177° F. and freezing at 40° F. It does not mix with water, but mixes readily with alcohol, acetone, glacial acetic acid, chloroform, and ether. It crystallizes in the triclinic system when solidified by cold and dissolves iodine phosphorus, sulphur, oils, resins, fats and alkaloids. It expands by about 0.00075 of its volume in ten minutes in its own temperature on the Fahrenheit scale. Its specific gravity is about 0.88 at 15° and its specific heat is 0.40. For the chemical constitution of benzene, see AROMATIC COMPOUNDS.

Benzene forms two general classes of compounds, known respectively as "addition" and "substitution" products. In forming an "addition" compound, benzene merely takes up atoms or molecules of some other substance, without parting with any of its own atoms; the new substance being simply "added" to the benzene. Benzene hexabromid, C₆H₆Br₆, is a good example of a benzene addition compound. It is formed by dropping bromine into boiling benzene in direct sunlight; the hexabromide crystallizing out upon cooling. The "substitution" compounds of benzene are far more numerous and important than the "addition" compounds, however. They are formed by replacing one or more of the typical hydrogen atoms in the benzene by an equal number of other atoms or molecular radicals. The general theory of benzene substitutions is given under Aromatic Compounds; but a few of the more important examples of such substitution products may be given here. The radical benzene (which is the original benzene in an independent existence) is called "phenyl," and is often represented by the symbol Ph. The mono-substitution compounds of benzene, in which one atom of the hydrogen in the original benzene has been replaced by a radical (or by an atom of a different type from hydrogen), may then be regarded as addition compounds of the radical phenyl. Thus "monochlorbenzene," C₆H₅Cl, may also be regarded as chloride of phenyl and its formula may be written PhCl. Benzene itself may even be regarded as hybrid of phenyl, its formula being written C₆H₅, or PhH. Carbolic acid (or "phenol") is hydrate of phenyl, its formula being PhOH, the radical OH being here substituted for one atom of the hydrogen in the benzene nucleus of Nitrobenzene, PhNO₂, is formed from benzene (PhH) by the action of nitric acid, in accordance with the equation

\[ \text{PhH} + \text{HNO}_3 = \text{PhNO}_2 + \text{H}_2\text{O} \]

It is used in the arts for the manufacture of
aniline (q.v.). Aniline itself is an amide of phenyl, obtained by replacing an atom of \( \text{H} \) in ammonia \( (\text{NH}_3) \) by phenyl, or by replacing an atom of hydrogen in benzene by the radical \( \text{NH}_2 \). The formula of aniline may be written \( \text{C}_6\text{H}_5\text{NH}_2 \) or \( \text{phenylamine.} \) (See AMIDE; AMINE). Methyl-benzene, \( \text{C}_6\text{H}_5\text{CH}_3 \), in which one of the original hydrogen atoms of the benzene is replaced by the radical \( \text{CH}_3 \). (Though it is most important benzene substitution compound and is known to chemists as toluene. That portion of the original benzene which remains intact, after a substitution, is called the "benzene residue." In a mono-substitution compound of benzene, further substitutions may be made by replacing one or more of the hydrogen atoms in the "benzene residue" by univalent radicals, and secondary, tertiary, and higher substitution compounds may be thus formed. The classification of the secondary substitution compounds is given under Aromatic Compounds. For the classification of higher compounds, special treatises on organic chemistry must be consulted.) It may be mentioned, however, that if \( \text{A}, \text{B}, \text{C}, \text{D} \) is the methyl group, there are no less than 30 distinct substances possible, which shall all have the same general formula \( \text{C}_6\text{H}_5\text{ABCD} \). This fact illustrates the exceeding complexity of the general theory of benzene substitutions compounds. The full theory is even more complex than this example indicates, however, for it often happens that the hydrogen in a substituted radical can be replaced by another radical, as well as the hydrogen of the "benzene residue." Thus in methylbenzene (or toluene), \( \text{C}_6\text{H}_5\text{CH}_3 \), the radical \( \text{OH} \) may be substituted for one of the hydrogen atoms. If the hydrogen so displaced occurs in the "benzene residue," the resulting compound will be "creosol," \( \text{C}_6\text{H}_5\text{(OH)}\text{CH}_3 \), a substance which (since it is a di-substitution compound) can exist in three isomeric forms. If, on the other hand, the \( \text{OH} \) takes the place of one of the hydrogen atoms of the "methyl" radical, the resulting compound will be "benzyl alcohol," \( \text{C}_6\text{H}_5\text{CH}_2\text{OH} \).

When a primary amine of the fatty series is acted upon by nitrous acid \( (\text{HNO}_2) \), the \( \text{NH}_2 \) group of the amine is replaced by \( \text{OH} \), with the formation of an alcohol; but when nitrous acid acts upon aromatic amines, the products are quite different and are known as "diazocompounds." Thus when nitrous acid acts upon aniline nitrate, a compound having the formula \( \text{C}_6\text{H}_5\text{N}+-\text{NO}_2 \), and known as "diazobenzene nitrate," is formed. This is regarded by chemists as a compound of the univalent radical \( \text{C}_6\text{H}_5\text{N}==\text{N}=- \). When the free affinity of this radical is saturated by the addition of phenyl \( (\text{C}_6\text{H}_5) \), the resulting compound, \( \text{C}_6\text{H}_5\text{N}+\text{C}_6\text{H}_5 \), is known as "azo-phenylbenzene," or as "benzene-azo-benzene." Azo-benzene may be prepared by heating nitrobenzene with a solution of \( \text{SnCl}_2 \) in aqueous caustic soda. It is deposited from a solution in alcoholic water in colorless plates and owes its importance largely to the fact that aniline yellow, \( \text{C}_6\text{H}_5\text{N}+\text{C}_6\text{H}(_2)\text{N}+ \), is one of its derivatives.

Benzene is an exceedingly inflammable substance, burning with a luminous flame and the generation of a great amount of heat. It is volatile and its vapor forms a dangerously explosive mixture with air when present in any considerable quantity. Hofmann, mentioned above as having first demonstrated its existence in coal tar, lost his life on 25 Feb. 1855, while experimenting with a considerable quantity of benzene, through the mass accidentally taking fire. Benzene may be formed synthetically by heating acetylene gas \( (\text{C}_2\text{H}_2) \) to dull redness in a glass tube. Polymerisation occurs and among numerous other substances benzene is formed in accordance with the equation \( 3\text{C}_2\text{H}_2=\text{C}_6\text{H}_6 \). In works on chemistry, benzene is often called "benzol." (Compare BENZINE).

This product is so widely employed in the industry of the aniline dyes that chronic poisoning is by no means uncommon. It is usually breathed as vapor in the vat rooms and causes, after some exposure, dizziness in the head, ringing in the ears, nausea and vomiting, coughing and sleepiness which latter may deepen to unconsciousness somewhat resembling the narcosis caused by breathing chloroform. In some instances there are blood changes, with cyanosis, the skin being tinged by fresh air, oxygen, free diuresis, catharsis and diaphoresis, and if the blood changes are marked infusion of physiological salt solution may be necessary.

BENZIDINE, an important substance belonging to the benzene (or aromatic) series and used in the arts for the manufacture of Kongo red, chrysamine and other so-called "coal-tar colors." The coloring matters derived from benzidine have the unusual and valuable property of dyeing cotton without the use of a mordant to fix them upon the fibre. Benzidine has the formula \( \text{HN}+\text{C}_6\text{H}_5\text{CH}_2\text{NH} \), where both the benzene rings contain the \( \text{NH} \), and the \( \text{C}_6\text{H}_5\text{NH} \) radicals in the para position, and is prepared, commercially, by heating nitrobenzene (see BENZENE) with caustic soda and zinc dust in a retort. After treatment with hot dilute hydrochloric acid. Pure benzidine crystallizes in silvery scales which melt at \( 252^\circ \text{ F} \) and boil at a temperature probably above \( 700^\circ \text{ F} \). It is easily soluble in alcohol and ether; it also dissolves readily in hot water, but is almost insoluble in cold water.

BENZINE, the commercial name for a mixture of the lighter and more volatile hydrocarbons that pass off in the earlier stages of the distillation of crude petroleum. It is essentially different from benzene (q.v.), the latter being a definite chemical substance belonging in the group of Aromatic Compounds (q.v.); while "benzine" is a more or less indefinite mixture of hydrocarbons that chiefly belong to the paraffin series. Benzine differs but little from naphtha and petroleum, such slight differences as exist being due to variations in the proportions in which the constituent hydrocarbons are present. Benzine is a colorless, mobile liquid, very volatile and inflammable. It is valuable as a solvent for fats, oils and resins and is much used about the household as a cleansing agent. Its vapor, when mixed with air, is highly explosive and serious accidents are common, as the result of using it in the vicinity of lighted lamps or
tobacco pipes or near stoves in which fires are burning. In printing offices it is used for cleaning type and for removing ink from press rolls. It is also used in large quantities for enriching illuminating gas. Benzine is much lighter than water and will not mix with it. It boils at 157°C or 320°F. Poisond and benzine are rare. The vapor has been used, combined with chloroform and ether, for purposes of narcosis, but it is questionable if it will ever be very popular. Instances of sudden death from the prolonged breathing of benzine vapor have been reported.

**BENZOATE OF SODA, or SODIUM BENZOATE**, most commonly used as a preservative in canned foods. Under the Federal law regulating the purity of foods one-tenth of 1 per cent may be used for this purpose, but the popular feeling against its use in any quantity is causing the higher class of packers to discard it entirely. Its harmfulness as an ingredient in preserved foods has not been entirely established. See Preservatives.

**BENZOIC ACID**, an organic acid, belonging to the aromatic series and having the formula C₆H₅.CO₂H. It occurs in benzoin gum and in certain other resins and balsams. It may be obtained also from the hippuric acid that occurs in the urine of the horse and other herbivorous animals by boiling that acid with concentrated hydrochloric acid. Benzonic acid is used as a mordant in calico printing, and in the manufacture of aniline blue. It is also used in medicine and as a preservative agent for anatomical specimens. The largest use of benzonic acid, however, is as a food preservative. With its salt, soda benzoate, it is used in huge quantities in catseps, sauces, jellies, jams, fruit syrups, sausages and other chopped meats, cider, soft drinks and many other similar food preparations. This use was questioned by the U. S. Chemistry Bureau and led to an elaborate series of experiments upon a so-called "poison squad" of young men. The report, published as Bulletin 84 of the Bureau, was to the effect that benzonic acid and its salts were distinctly deleterious to health and should not be permitted in foods. A referee board of eminent physiological chemists were called to confirm or refute the Chemistry Bureau's findings, and they decided that the largest amount that would be eaten in the ordinary use of such preserved foods would not be injurious to health. Upon this decision the government permits such use of benzonic acid and benzoate of soda on condition that the proportion used is stated plainly on the label covering the goods. Many States, however, prohibit it absolutely; others restrict its use in foods to very narrow limits.

The benzonic acid that is used for medical purposes is obtained by sublimation, through a paper filter of benzoin gum over a sand bath, at a temperature of about 340°C. When so prepared, the acid has a pleasant, vanilla-like odor, which is imparted to it by a trace of an aromatic oil that comes over with it from the gum. For most of the purposes for which it is used in the arts, benzonic acid is formed by chlorinating toluene. The resulting benzonitrilechloride is converted into benzonic acid by oxidation with dilute nitric acid in boilers provided with mechanical stirrers. Hydrochloric acid is liberated and the benzoic acid is recrystallized or distilled under vacuum. Benzonic acid is also made from benzonitrile (C₆H₅CN) obtained from the "middle oils" or carbolic oils in coal-tar distillation. After washing the carbolic fraction with dilute soda lye to remove the phenol and cresol, the remaining oil is placed in a jacketed vessel. Caustic soda lye of a specific gravity of 1,400 is added in quantity about double the benzonitrile content, and the mixture agitated. Steam is passed in as long as ammonia is evolved in quantity. The still then contains an upper oily layer and a lower alkaline layer. The latter is neutralized with carbonic acid or a mineral acid, and after the remaining traces of phenol and resinous matter are removed, the resulting solution of sodium benzoate is decomposed while hot by adding an excess of acid. Upon cooling, pure benzoic acid separates in white crystals.

Benzonic acid dissolves in hot water, but crystallizes out upon cooling, in needles or pearly prisms. It is soluble in ether and benzene. It melts at 250°C, boils at 480°C, and may be sublimed at intermediate temperatures. Its salts are called "benzoates." The methyl, ethyl, isobutyl and amyl esters of benzoic acid are used in making synthetic perfumes and flavors.

In medicine benzonic acid and its salts, the benzoates (sodium, ammonium, lithium) are widely employed for diseases of the bladder and of the mucous membranes of the lungs. They are also used as intestinal germicides. Benzonic acid has marked bactericidal properties, and may be used for sterilizing purposes. Taken into the intestines it prevents excessive bacterial decomposition; absorbed into the blood it is partly broken up, and in the kidneys is eliminated in part as hippuric acid, rendering the urine acid. It is therefore useful in alkaline fermentations of the urine, particularly in cystitis, pyelitis, etc. Benzonic acid is partly eliminated by the lungs, here acting to increase the amount of mucus, it is therefore used to loosen the mucus in tight coughs. As a parasiticide, benzonic acid is very valuable in scabies. Benzoates are practically useless in gout.

**BENZOIC ALDEHYDE. See BENZALDEHYDE.**

**BENZOIN**, an aromatic compound, soluble in hot alcohol and crystallizing in colorless, six-sided prisms having the formula C₆H₅.CH(OH).CO.C₆H₅. Benzoin is best prepared by acting upon pure benzaldehyde with a hot alcoholic solution of cyanide of potassium. Upon cooling, the benzoic acid and may be removed by filtration. The action of the cyanide is not known, because the chemical change involved in the forming process of the manufacture appears to consist merely in the uniting of two molecules of benzaldehyde to form a single molecule of benzoin.

**BENZOIN GUM, or GUM BENJAMIN**, a reddish brown resin that exudes from the tree Styrax benzoin, which grows in Sumatra, Java and other parts of the East. It is a mixture of resin and gum, but the gum is mixed and together with free benzoic acid. Cinnamic acid is also present in the free state in many cases, but it is absent from the Siamese gum. Benzoin gum has a pleasant odor when burned, and for
this reason has been much used for incense and in making pastilles. It has antiseptic properties, and preparations of it are used for dressing for wounds, and in the manufacture of court-plaster. Benzoin is also administered internally, especially in asthma and other pulmonary affections and chronic catarrh. It is readily soluble in alcohol, and when the tincture so formed is dropped into water, it forms a white, milky fluid, which is used in France as a cosmetic, under the name lait virginal. The gum is obtained from the styrax-tree by making incisions in the bark, through which the resin oozes. It is allowed to harden by exposure to the air before removal. The best gum is obtained during the first three years of the tree's life, though a good quality may be had for seven or eight years subsequently. The Siamese gum is esteemed more highly than that from Sumatra.

BENZOL. See BENZENE.

BENZONI, Girolamo, ben-zônë, jë-rô-
là-'mô, Italian traveler: b. Milan, 1519; d. after 1566. He went to Spanish-America in 1542, visited the principal places then known, and frequently joined the Spaniards in raids on Indian settlements; and after returning to Italy (1556) published a narrative of his adventures, History of the New World (Venice 1565).

BENZYL, in chemistry the monovalent radical CH₂CO. Benzyl cannot exist in the free state, but it occurs in the combined state in many organic substances. Benzaldehyde (bitter almonds), CH₂COH, may be regarded as its hybrid, and benzoic acid, CH₃COOH, as its hydrate.

BENZYL, the monovalent organic radical CH₂CH₂, which does not exist in the free state, but which has numerous important compounds. Toluene is its hybrid. Benzylamine, CH₂CH₂NH₂, is derived by substituting benzyl for one of the hydrogen atoms in ammonia, by heating benzyl chloride with alcoholic ammonia. Benzyl chloride, which is used as a source of oil of bitter almonds (benzaldehyde) and of benzoic acid, has the formula CH₂CH₂Cl, and is obtained by passing chlorine into cold toluene, in direct sunlight. Benzyl alcohol, CH₂CH₂(OH), is the hydrate of benzyl, and is obtained by the action of an alcoholic solution of potash upon benzaldehyde.

BEOTHUK, bô-thûk, a linguistic stock of North American Indians, habitants of the region of the Exploits River in northern Newfoundland, and believed to have been limited to a single tribe. The Beothuks painted their bodies and their property with red ochre, and from this circumstance their stock and tribal name was derived. They were also known as the Goodnight Indians, from the incorrect translation of a Micmac word that sounded like Beothuk. It is not known whether the Beothuks became extinct by reason of wars and famine or by absorption among tribes. They built very large tepees which they covered with bark or skins and also designed a crescent-shaped canoe. Because of their hostility to the white man, they were relentlessly pursued and hunted until 1820, when the remnant of survivors crossed the straits and hid themselves in Labrador, where it is possible that some of their descendants may survive. In 1911, F. G. Speck came upon an old woman, who claimed to be of Beothuk descent, and from her obtained a dressing for wounds, and in the manufacture of court-plaster. Believed indicated Algonguin linguistic stock. Data on the subject, however, are far from decisive.

BEÓTHY, Zoltán, Hungarian writer: b. Komorn, 4 Sept. 1848. In 1882 he was appointed professor of aesthetics at the University of Budapest, after he had published several novels and many short stories and some of his critical and dramatic essays. His most important works include a history of Hungarian literature (1877); a history of Hungarian prose fiction (1886); a collection of essays (Budapest 1881). He is considered one of the foremost critics of Hungary.

BEOWULF, bô-'wûlf, Anglo-Saxon epic, of great importance as one of the earliest extant pieces of literature in the English language, as a source of regard to early manners, customs and traditions, and as an heroic poem of great dignity and beauty. The unique manuscript, now in the British Museum, dates from about 1000, but the composition of the poem must be placed some three centuries earlier. The manuscript, originally written by two scribes, is in the West-Saxon dialect, but the original poem must have been composed in the Northumbrian dialect, like most extant Anglo-Saxon poetry, which represents Southern transcription of Northern work. The name of the poet is not known; he was not, in any case, the inventor of the incidents, but rather one who adapted existing material, probably in the form of separate lays, to the ampler frame of the epic.

The plot of the poem is briefly as follows: Hrothgar, King of the Danes, builds a great mead-hall for himself and his warriors. But an evil creature named Grendel, descended from Cain, comes at night and attacks the hall, slaying and devouring Hrothgar's men. Twelve years this continues. Then Beowulf, nephew of Hygelac, King of the Geatas, in the territory which is now southern Sweden, sails to Denmark with 14 warriors to kill the monster. He is entertained at the Danish court and silences Unferth, the King's chief counsellor, who belittles his courage. When night falls Beowulf watches in the hall, with his thanes. The monster appears and kills one of the men before coming to grips with Beowulf. A fearful struggle ensues, in which the hero tears off the demon's arm, but cannot prevent his escape to his lair. On the following day there is great rejoicing, and magnificent presents are bestowed upon Beowulf. But after night comes the mother of Grendel, bent upon revenge, bursts into the hall and carries off Æscher, a Danish warrior. Beowulf then seeks out the she-demon in her lair beneath the waters of an inland mere. His sword, loaned him by Unferth, fails him, and he kills the hag with one of her own weapons. He cuts off the head of the dead Grendel and takes it back with him to the court of Hrothgar. After more feasting and present-giving he returns to the land of the Geatas and recounts his adventures at some length to King Hygelac. After the reign of Heardred, the successor of Hygelac, Beowulf himself ascends the throne and reigns gloriously for 50 years. But a
BEPOPO — BÉRANGER

dragon, angered by the plundering of his hoard, devastates the country with fire, whereupon Beowulf attacks and kills him, with the assistance of Wiglaf, a youngthane. In this encounter Beowulf is himself mortally wounded and dies. His body is burned on a great funeral pyre in solemn ceremonies.

This bare outline gives no hint of the wealth of episodes which enrich the poem. The most important of these are the account of Beowulf’s swimming feat with Breca of the Brondings; the story of Finn, King of the Frisians, and Hildeburg, his Danish wife; the tale of the betrothal of Hrothgar’s daughter Freawaru to Ingeld; and the descriptions of the wars between the Geatas and Swedes. A part of the Finn story is also preserved in the so-called ‘Finnssburg Fragment,’ 50 lines of verse found in the binding of a book of homilies, and now lost.

‘Beowulf,’ as is evident, represents the fusion of history and tradition with themes of popular story. Much of what is told of kings and chieftains must be founded upon fact. One event, the simple Hygiec, established by documentary evidence as between 512 and 520 (Gregory of Tours and the ‘Gesta Francorum’), serves roughly as a basis for dating the action of the poem. But it is impossible to establish exact chronology for events so highly colored by imagination. The story of Grendel and his dam may be traced in the very widespread popular tale of the ‘Bear’s Son;’ the fight with the dragon, originally quite unconnected with this, attached itself independently to the theme of Beowulf. The material probably took shape in the form of lays in Scandinavian territory, was carried to England, retold there in the vernacular, and finally molded by the ‘Beowulf-poet’ into the present epic about the first quarter of the 8th century. It is impossible, however, to distinguish in the present poem the lays on the basis of which it was composed.

The Christian elements, though foreign to the material in its earlier form, are not mere interpolations, but an integral part of the work of the final poet. The tale of Beowulf’s troll-fights, living on in Scandinavia after its transference to England, reappears attached to an historical personage in the ‘Saga of Grettir the Strong,’ with very striking resemblances to the English poem. The other Scandinavian analogues are of less importance.

Many attempts have been made to explain the chief events of the epic as a nature-myth, but these are to be regarded with distrust. If a mythological significance was ever attached to these events, which may be doubted, there is no sufficient evidence upon which to base an interpretation.

The poem is written in alliterative long lines, with four strongly emphasized syllables and a varying number of weaker syllables. The style is simple but vigorous. Metaphor, especially in decorative epithets, is frequently used, but simile is rare. The narrative is constantly retarded by repetition and variation, and an understanding of much in the story, especially in the episodes, is rendered difficult by unexplained allusions. The whole is a primitive, but represents highly developed artistry. As a sustained narrative of heroic events, and as an expression of early ideals of courage and devotion to chief and to kin, ‘Beowulf’ is unrivalled in the vernacular literature of western Europe. Consult the translation by Gummere, F. B., ‘The Oldest English Epic,’ with its comments and illustrative material, particularly to be recommended.

WILLIAM WITHERLE LAWRENCE, Professor of English, Columbia University.

BÉPPO, a satirical poem on Venetian life by Byron, published in 1818, and named for the chief figure. In Aubé’s opera, ‘Fra Diavolo,’ is a character of the same name.

BEPPO, bê-p’po, Japan, a bathing place and seaport on the Island of Kiushiu, famed for its hot alkaline baths. It is seven miles by rail from Oita. There is a sanatorium for consumptive railway employees. Beppu is also a port of call for steamers.

BÉRANE, formerly a Turkish town in the vilayet of Kossa, which came into the possession of Serbia after the Balkan wars. After the invasion of Serbia by the Austro-German and Bulgarian armies in 1915 it reasserted itself. Béranes is the name it now is. It was the scene of some of the heaviest fighting between the Turks and the Serbians during the First Balkan War. In October 1912 it was stormed by the Montenegrins and by them occupied. The population is almost entirely Slavic, only a small percentage being Turkish.

BÉRANGER, Pierre Jean de, bê-rän-zhâ, wooden, national poet of France: b. Paris, 19 Aug. 1780; d. there, 16 July 1857. His father was a restless and scheming man, and young Béranger, left in a great measure to himself, ran a great chance of spending his life as a gamin and vagabond in the streets of Paris. A few days after the destruction of the bastille he was conveyed to Peronne and placed under the charge of an aunt who kept a tavern, and to whom for a time he acted as waiter. At the age of 14 he was apprenticed to M. Laisnez, a printer in Peronne, but after remaining in that employment for some time, was suddenly summoned to Paris by his father, who wished his assistance. The improvidence and gaiety of his father was constantly involving them in difficulties, and Béranger, with as yet no settled vocation in life, was enduring all the hardships and privation which men of genius in a similar position to himself have frequently had to encounter before the recognition of their talents. He had now, besides making an unsuccessful attempt in the drama, produced a number of poems, including his ‘Roger Bontemp,’ ‘Le Grenier,’ ‘Les Gueux’ and ‘Le Vieil Habit.’ Some of these were sent by him in 1804 to Lucien Bonaparte, in the hope thereby of obtaining some patronage or assistance. In this, probably the only application he ever made for aid in the course of a long life, Béranger was not disappointed. Lucien sent for him, encouraged him to proceed in his poetical career and made over to him his own income as member of the French Institute. He was afterward employed in editing the Annales du Musée, and in 1809 received an appointment as clerk in the office of the secretary to the university. Many of his songs had now become extremely popular and in 1815 the first collection of them was published. A second collection was published in 1821, but
BERAR—BERAUD

Béranger had made himself extremely obnoxious to the Bourbon government by his satirical poems on the marshal of France; in addition to being dismissed from his office in the university, he was prosecuted and sentenced to three months' imprisonment and a fine of 500 francs. A third collection appeared in 1825, and a fourth in 1828, which last publication subjected him to a second state prosecution, an imprisonment of nine months, and a fine of 10,000 francs. Nothing, however, could daunt his spirit, and in prison he still continued to busy himself in the composition of his songs and lyrical satires upon government. In 1833 he published his fifth and last collection, which contains some of the most powerful effusions of his genius. He was elected to the Constituent Assembly of the Second Republic, took his seat, and soon after resigned. He refused all honors from the Second Empire. The concluding years of his life were spent in a dignified retirement and he received the honor of a public funeral, which, in the eyes of the world of literature and politics, attended the great attraction of Béranger's songs is the unequalled grace and sprightliness which they display, combined with great descriptive powers, much comic humor, and occasional bursts of indignation and invective when some social or political grievance is denounced. They are sometimes also, it must be admitted, marked by a tendency to levity and looseness of morals, but in this respect they partake eminently of the French character. No one, indeed, was more thoroughly French than Béranger, and the glory of his beloved patrie, as paramount to all other considerations, appears constantly as the inspiring genius of his poetry. The intense nationality of his songs constitutes one of their principal charms, and in this respect he bears some resemblance to Thomas Moore. He has sometimes been called the Burns of France, but though like him essentially a poet of the people, he is far beneath the pathos and depth of feeling displayed by the Ayrshire Bard in depicting the passion of love. In private life Béranger was the most amiable and benevolent of men, beloved by his friends alike for his social qualities and kindliness of heart, while his charities were so numerous and extensive as often to exceed the bounds of prudence. Consult Boiteau, Paul, 'Vie de Béranger' (5 vols. 1800-61); Brunetière, 'Poesie lyrique' (Paris 1894); Janin, 'Béranger et son temps' (1886); Sainte-Beuve, 'Portraits contemporains'; Nivalat, 'Souvenirs historiques et étude analytique sur Béranger et son œuvre' (Paris 1892); Peyrat, 'Béranger et Lammens' (1861).

BERAR, bā-rār', India, former commissionership in the Deccan, south and west of the Central Provinces and north of Hyderabad. The basin of the Godavari River forms part of the province, an area of 17,769 square miles. It consists chiefly of a fertile plain bordered on the north and south by low ranges of hills. It is intersected by the Purna and is partly bounded north and south by the Wardha and Pen-ganga rivers. It has rich fertile soil, which produces much good cotton and millet, the best wheat in India, as well as oil-seeds and other produce. The rainfall is regular and this province is in the position of being able to export food to other parts of India. It is intersected by the railway from Bombay to Nagpur and ultimately to Howrah, opposite Calcutta. After being ruled by independent sovereigns, it was added in the 17th century to the Mogul empire and latterly became part of the British dominions (1857-1947), to which it still in a sense belongs. In 1853 it was assigned or handed over to the British authorities to provide for the payment of the body of troops which the Nizam had been previously bound to furnish in time of war for the Indian government. A new treaty was concluded in 1860 by which certain territorial alterations were brought about and a considerable debt due by the Nizam was canceled. The arrangement continued until 1902, when Berar was leased to the British in perpetuity and it is now attached to the Central Provinces for administrative purposes. The province has greatly prospered under the British rule. It consists of six districts: Ellichpur, Amrath, Ağan, Ahmadnagars, and Wun. The largest towns are Ellichpur and Amrath (Oomrawutte). Pop. (1911) 3,057,162.

BERARD, bā-rār', Frédéric, French physician: b. Montpellier, 8 Nov. 1789; d. there, 16 April 1828. When only 20 years of age he wrote a thesis entitled 'Theory of Natural Medicine, or Nature Considered as the True Physician, and the Physician as an Imitator of Nature.' He afterward went to Paris, where he was engaged to write in the 'Dictionary of Medical Science.' In 1816 he returned to Montpellier as professor of therapeutics in a private course of lectures to the medical students of the college. At this period he published a work explanatory of the 'Doctrines of the Medical School of Montpellier.' With Rouzet, he published Dumas' work on 'Chronic Diseases,' with instructive commentaries. In 1823 he also published in Paris his work on 'The Relations of the Physical and the Moral Organism, as a Key to Metaphysics and the Physiology of Mind.' In this he explains his own views of human nature and the principles of life, in opposition to the views of Canabini. He also took occasion to publish at the same time a manuscript letter of Cahabini on 'Primary or Final Causes,' accompanied by numerous annotations.

BERAT, bā-rāt', Albania, a town on the river Ergent, the ancient Apsus, and about 30 miles northeast of the seaport of Valona. The valley in which it stands is very fertile, producing large quantities of grain, oil and wine. The town is picturesque and contains several quaint churches and mosques. It is the seat of a pashalic and Greek archbishopric and was taken by Ali Pasha from his rival Ibrahim. Amurath II. captured Berat and his troops held it notwithstanding a desperate attempt by Scanderbeg with a strong body of Italian auxiliaries to retake it. Pop. about 15,000, including 5,000 Greeks.

BERAUD, Jean, bā-ro, zhōn, French painter of great power: b. Saint-Petersburg, 1849. His father, a Frenchman, distinguished himself with distinction in the French army during the Franco-Prussian War, he became a pupil of Bonnat. His contributions to the salon began in
BERBER, the chief port and town of British Somaliland, on the African coast of the Gulf of Aden and about 170 miles south of Aden. It has a small but well-sheltered harbor and a long pier; a European quarter with stone houses and warehouses and a native quarter laid out with broad streets but consisting chiefly of huts or sheds. There is a considerable export trade in the products of the country, such as hides and skins, gums, ostrich feathers, ghee, sheep, goats and cattle; rice, millet, dates, cottons, tobacco, etc., being imported. The traffic is chiefly with Aden. The population is perhaps 5,000, increased to 30,000 during the trading season. The Somali Coast Protectorate extends along the coast for about 400 miles and inland for about 200, the area being about 80,000 square miles. Besides Berbera it contains also the ports of Zeilah and Bulhar. It was acquired in 1884 and is administered by a political agent and a consul. A number of Indian troops are stationed in the town. The trade is of some importance and is increasing.

BERBERINE, a non-poisonous alkaloid discovered by Buchner in 1837 in the root of the common barberry and now known to exist in many other plants also. It crystallizes, ordinarly, in yellow, silky needles, having the composition $C_{17}H_{23}NO_5 + 5\frac{1}{2}H_2O$; but when thrown down from solution in alcohol the needles are said to be red—probably from the absence of water. Berberine forms numerous salts and is used to a considerable extent in medicine, occurring in notable quantities in preparations of hydrastis. The alkaloid itself is soluble in from four to five parts of water at ordinary temperatures and is also moderately soluble in alcohol; but it is only slightly soluble in chloroform and insoluble in ether.

BERBERS, the generic name of the barberry (q.v.).

BERBERS, the name of a people spread over nearly the whole of northern Africa. From their name the appellation Barbary is derived. They are regarded as the most ancient inhabitants of the country. Their different tribes are scattered over the whole space intervening between the shores of the Atlantic and the confines of Egypt; but the different branches of Atlas are their principal abode; while to the south they extend to the Soudan. Chief branches of them are: First, the Amazigh, Amazigh, or Mazigh, estimated to number from 2,000,000 to 2,500,000, and who inhabit Morocco. They are for the most part quite independent of the Sultan of Morocco and live partly under chieftains and partly in small republican communities. Second, the Shilhoor or Shella-kah, who number about 1,450,000, and inhabit the south of Morocco. They practise agriculture and carry on some manufactures. They are more highly civilized than the Amazigh. Third, the Kabyles in Algeria and Tunis, who are said to number about 1,000,000. Fourth, the Berbers of the Sahara, who inhabit the oases and consequently live for the most part at wide intervals from each other. Among the Saharan Berbers the most remarkable are the Beni-Mezab and the Tuareg. To these we may also add the Guanches of the Canary Islands, now extinct, but undoubtedly of the same race.

The Berbers generally are short and of the middle height; their complexion brown, and sometimes almost black, with brown and glossy hair. Individuals of fair complexion and light hair and even with blue eyes are said to be not uncommon among them. They are generally thin, but extremely strong and robust, and their bodies are beautifully formed. The head of the Berber is rounder than that of the Arab and the features shorter, but of an equally marked character, although the fine aquiline nose, so common among the latter, is not often seen among the Berbers. The language of the Berbers is said to have affinities with the Semitic tongues. Such of them as mingle with the Arabs speak or understand Arabic; but those who dwell in the interior of the mountains understand no other language than their own. The Berbers are generally straight and honest in their dealings—contrasting favorably with the Arabs—and of high intelligence. They are Mohammedans in religion. They generally dwell in huts or rude houses, the latter rectangular, with two gable ends, covered with thatch and entered by a low and narrow door. These dwellings are often built in little groups, scattered about in the valleys and up the sides of the mountains, and in some parts each group of huts is situated in the midst of a plantation, with a portion of ground laid out as a kitchen-garden. Although the Berbers have always lived in ignorance and have had but little connection with civilized nations, they are remarkably industrious. By working the mines in their own mountains they produced lead, copper and iron. With the iron they manufacture gun-barrels, implements of husbandry and many rudely-formed utensils. They understand the manufacture of instruments of war, from which they make knives, swords and other instruments, not very elegant in form, but of good quality. The tribes inhabiting the borders of the plains and some of the great valleys breed sheep and cattle in considerable numbers. Their sheep are small and yield very little wool, and they have numerous herds of goats. Their cows and oxen are of a small species, but their asses and mules are
BERBICE — BERTHOLD

BERBICE, bér-bés', a district of British Guiana, intersected by the river Berbice.

extends from the river Abari on the west to Corentyne River on the east, about 150 miles along the coast, the boundary inland not being fixed. The chief town is New Amsterdam; pop. about 10,000. Its citadel, Fort York, and numerous intersecting canals, give it the aspect of a mediaval Dutch town. The principal productions are sugar, rum, cotton, coffee, cocoa and tobacco. The coast is marshy and the air damp. Berbice came finally into British possession in 1615, having previously belonged to the Dutch. Till 1831 it formed a separate colony from Demerara and Essequibo. Pop. about 2,000. See GUIANA.

BERBICE, a river of British Guiana: flows generally northeast into the Atlantic. It rises in lat. 3° N. and flows into the Atlantic in lat. 6° 24' N. Crab Island, at its mouth, divides it into two channels of which the western is from 9 to 16 feet in depth. It is navigable for small vessels for 165 miles from its mouth, but beyond that the rapids are numerous and dangerous.

BERCHEM, berchém, or BERCHEM, Nikolaas, Dutch painter: b. Haarlem, 1624; d. there, 18 Feb. 1683. Having studied under his father and Van Goyen, Weenix the elder, and other masters, he spent several years in Italy, where he soon acquired an extraordinary facility of execution. His industry was naturally great and his innumerable landscapes now decorate the best collections of Europe. The leading features of Berchem's works, besides the general happiness of the compositions, are warmth and color, a skilful handling of lights and a mastery of perspective. His etchings are also highly esteemed. Consult Buxton and Poynter, 'German, Flemish and Dutch Painting' (1881).

BERCHET, bér-shèt', Giovanni, Italian poet and prose writer: b. Milan, 23 Dec. 1783; d. there, 1845. He was a friend of Manzoni and Silvio Pellico. About 1819 he became a frequent contributor to a liberal journal at Milan, called the Conciliatore. After this he was suppressed and its contributors cast into prison or exiled by the Austrian government. Berchet sojourned in England, France and Germany. In 1848 he returned to Italy and during the tenure of office of the provisional government of Milan was Minister of Public Instruction. At the time of his death he was a member of the Sardinian Parliament. His writings include 'Poesie'; 'Profughi di Praga'; 'Romanze'; 'Fantasie' (1829). His collected poems appeared in Milan in 1863, with biographical sketch; and more recently were edited by E. Bellorini (Bari, 1911–12).

BERCHTA, bér-tä, a female hobgoblin, in the folklore of southern Germany and Switzerland, of whom naughty children are much afraid. Her name is connected with the word bright and originally she was regarded as a goddess of benign influence. She is the partner of E. Johanns. (Bari, 1911–12).

BERCHTA, etc., are male hobgoblins in the folklore of southern Germany and Switzerland, of whom naughty children are much afraid. Her name is connected with the word bright and originally she was regarded as a goddess of benign influence. She is the partner of E. Johanns. (Bari, 1911–12).

FOODS. Dire penalties are imposed on those who disregard those injunctions. In certain localities Berchta is represented as queen of the crickets, with a long iron nose and a very large foot. Numerous springs in Salzburg and elsewhere are named after her, indicating that she once was worshipped in those localities. In the course of the centuries many of the sagas of Berchta came to be attributed to the Berthas of history. Many legends of a lady who appears at night in great houses, garbed in white, and nurses the children and acts generally as their guardian, are no doubt traceable to the ancient heathen Berchta. Consult article by E. Mögk in Paul's 'Grundris der germanischen Philologie' (Vol. III, p. 278).

BERCHTESGADEN, berch-téz-gä'den, Bavaria, village situated in a most picturesque and much-visited region, about 12 miles south of Salzburg, on the Achen, or Alm, a stream which issues from the beautiful lake called the Königssee. It lies on a mountain slope surrounded by meadows and trees, consists of well-built houses, and has a fine old abbey, now a royal residence; the abbey church, with its Romanesque transepts of the 12th century; a royal villa, etc. Wood-carving is extensively carried on and there is an important salt mine. It is the principal settlement in the district of the same name. It has a reputation as a tourist resort. Pop. about 3,000.

BERCHOLD, Count, Austro-Hungarian Foreign Minister 1912–15: b. 18 April 1863. Anton Johann Sigismund Josef Körnix, Graf Berchold, is one of the largest landed proprietors in the Dual Monarchy; he married, 1893, the Countess Fernandine Károlyi von Nagy-Károly. Whatever may be the verdict of history upon the great European War that broke out in 1914, to Count Berchold belongs the distinction of having applied the actual match that set the war alight, namely, the declaration of war against Serbia. It would be unjust, however, to lay more than a theorethical responsibility for that act upon his own shoulders: he was the instrument rather than the cause. He began his official career in a minor administrative capacity at Brünn and afterward became a secretary in the foreign office in Vienna. In 1895 he was appointed secretary at the embassy in Paris: councillor of embassy in London 1899; at Saint Petersburg (Petrograd) in 1903, and Ambassador to Russia in 1906. On the death of Count Aehrenthal (q.v.) he became Foreign Minister of the Dual Monarchy, 19 Feb. 1912, thus inheriting the aggressive and not over-scrupulous foreign policy of his predecessors. Before accepting the office Count Berchtold gave up his Austrian in favor of his Hungarian nationality. It cannot be truly said of him that he practised the Aehrenthal method of tactless policy: a simple country gentleman—although a diplomat—he brought the instincts of a gentleman into a department organized on a highly efficient but thoroughly unscrupulous basis. He held no pronounced political tendencies, but he was surrounded by a number of subordinates in whom the worst traditions of Austrian diplomacy seemed to have been incorporated. They soon became his masters and obliged him to pursue a policy
BERCK — BEREA

over which he had practically no control. During his earlier tenure of office the best augury of peace, it was thought, lay in his personal friendship for M. Sazonoff, the Russian foreign minister. He also cultivated friendly relations with Italy, and succeeded at Rome in refreshing favourable impressions created by Achrenthal's policy. His own efforts notwithstanding, he became a respectable figurehead for the aggressive and dishonest policy which his government pursued throughout the Balkan War (q.v.) of 1912-13, down to the outbreak of the European War. 'The tool of the military and clerical sections of the state,' he prepared for an attack on Serbia in conformity with their designs. At the instigation of Count Tisza, the Hungarian premier, Count Berchtold prompted the Bulgarian attack on Serbia after the end of the first Balkan War and the signing of the Treaty of London. It was expected that the Bulgarians would vanquish the Serbs and that the latter would thereafter seek to-Austria-Hungary, and open the road to Salonica. But the scheme was defeated by the Serbian victories over the Bulgarians in June 1913. No sooner was the second Balkan War closed by the Treaty of Bucharest than Austria-Hungary demanded a revision of the treaty and Count Berchtold proposed to Italy to undertake an offensive war against Serbia on the pretext that it would be in reality a defensive war against the danger of a Greater Serbia to Austria-Hungary. The Italian government, however, declined to recognize the proposal as entering within the terms of the alliance, the undertaking being aggressive, and not defensive. The action of Italy thus postponed the attack on Serbia for a year, when an excellent opportunity presented itself.

The assassination of the Austrian heir and his wife gave the military and clerical parties the pretext they had long sought. In agreement with Berlin it was decided to use the occasion for an attack on Serbia, an act which precipitated the great conflict. It must be asserted that the charge of duplicity has never been leveled at Count Berchtold. Upright and conscientious, weak and vacillating, he endeavored to do his duty in stormy and critical times. The published correspondence of the British Ambassador and others clearly indicates that in his personal relations with his colleagues Count Berchtold pursued direct and simple courses, and that the blame for the deviant Austrian policy with regard to Serbia and Russia rests rather upon Berlin and the German Ambassador in Vienna, the late Herr von Tschirschky (q.v.), than upon the Count himself. He tendered his resignation more than once, but it was not accepted by the Emperor Francis Joseph till January 1915, when Baron Burian succeeded him as Foreign Minister. In February 1917, Count Berchtold was appointed Chief Chamberlain of the Austro-Hungarian Court. He is the head of an old Moravian family, one that has intermarried in the most exclusive ranks of the nobility. See WAR, EUROPEAN.

BERCK, bärk, France, a fishing village of the department of Pas-de-Calais, on the English Channel, 28 miles south of Boulogne. A mile distant is Berck-Plage, a summer bathing resort. The latter has an excellent beach, a Kur hall and two hospitals for children. Pop. (1911) 11,597.

BERCKHEYDE, bërkhi'-de, Gerrit, Dutch painter: b. Haarlem, 1638; d. 1698. He was a younger brother of Job Berckheyde and with him was employed at the court of the Elector Palatine. Gerrit studied under Jacob Dewet. He traveled the Rhine country, painting at Cologne and Heidelberg. He became a member of the Guild of Haarlem in 1654 and there he remained with his brother until his death. His architectural works are regarded as the best of their kind. Of these the Bourse of Amsterdam was a favorite (Amsterdam Museum, Rotterdam, Frankfort, Brussels), and the church of Saint Bavon in Haarlem. Other important works are 'View of Amsterdam,' (View of Cologne), 'View of Heidelberg Castle.' Among his celebrated genre subjects are 'At Breakfast' (Schwerin), 'Soldiers on Guard' (Dessau) and 'A Courteens Room' (Rotterdam). His elder brother, Jos, b. 1630; d. 1693; was a more prolific artist, but confined himself to street scenes and civic centres of cities. He was more popular than his brother in his day but till this judgment and proclaimed Gerrit the greater artist.

BERDIANSK, bër-dyànsk', a seaport of southern Russia, in the government of Taurida, on the northern shore of the Sea of Azof. It contains many handsome houses, arranged in spacious streets, and has a good anchorage, sheltered on all sides except the south. It is the chief entrepot for the surrounding governments, and exports large quantities of grain, oil-seeds, and wool. It has also a large inland trade in wood, coal, fish and salt, the last obtained from apparently inexhaustible mines in the vicinity. It is also the centre of a district in which the manufacture of agricultural implements and machines is extensively carried on. There are three churches, a gymnasia and a seminary for teachers. Pop. 29,000.

BERDITCHEV, bër-de'-chëf, city of European Russia, in the government and 129 miles southwest of Kiev. It is an ill-built place, mainly the site of several churches and synagogues, and a large Carmelite convent, in the church of which is an image of the Virgin Mary, the object of pilgrimages. It carries on a considerable trade in corn, wine, cattle, honey, wax and leather. It is famous for its four annual fairs. At these, cattle, corn, country produce, carriages and harness are sold in large quantities. The principal manufactures include tobacco, oil products and leather. The population in 1910 was 76,896, including many Jews. The town is the private property of Count Tishkevitch. It has figured prominently in the many conflicts between the Poles, the Cossacks and the Russians.

BEREA, Ky., town in Madison County; on the Louisville & N. Railroad, 35 miles southeast of Lexington. It is the centre of a large agricultural section and is the seat of Berea College (q.v.), founded in 1855. Besides the college buildings and chapel it contains a Carnegie library and a stave factory. The waterworks and electric light works are owned by the college. Pop. 1,510.
BEREA, Ohio, a village in Cuyahoga County, on the Big Four, L. S. & M. S., and the L. & N. R.R., 14 miles southwest from the centre of Cleveland, with which, and Elyria and Oberlin, it is connected by electric lines. It was founded in 1829. The village is lighted by natural gas and electricity; it has extensive quarries of sandstone (Berea grit); a foundry and nail and bolt works, and manufactories of toys, grindstones, pumps and torpedoes. There are two banks. Berea is the seat of Baldwin University, German Wallace College (both Methodist Episcopal), and a German orphan asylum. The assessed property valuation is $1,625,000. Pop. 2,609.

BEREA COLLEGE, a co-educational, nonsectarian institution, in Berea, Ky.; organized in 1855. It has 96 members in its faculty, and some 1,668 students. Its building and grounds are valued at $971,722, and its library contains 29,000 volumes. The distinguishing feature of the college is its work in the southern mountain region, where it carries on, through traveling libraries, social settlements, and lectures, a work of religious and educational nature.

BEREA GRIT, a variety of sandstone, great deposits of which are found at Berea, Ohio. It is of Mississippian age, lying next above the Bedford limestone. It is widely famous for its evenness of texture, and color, and exemption from the impurities that would deteriorate its marketable value.

BEREANS, in modern Church history an almost extinct sect of dissenters from the Church of Scotland, founded by Rev. John Barclay (1734-98) in 1773. From the founder's name they are sometimes called Barcaylans. They take their title from, and profess to follow the example of, the ancient Bereans (Acts xvi, 10-15) in building their system of faith and practice upon the Scriptures alone, without regard to any human authority whatever. They agree with the great majority of Christians, both Protestants and Roman Catholics, respecting the doctrine of the Trinity, which they hold as a fundamental article of the Christian faith; but differ from the majority of all sects of Christians in various other important particulars. For instance, they say that the majority of professed Christians stumble at the very threshold of revelation by admitting the doctrine of natural religion, natural conscience, etc., not founded upon revelation or derived from it by tradition. With regard to faith in Christ, they insist, that as faith is the gift of God alone, so the person to whom it is given is as conscious of possessing it as the being to whom God gives life is of being alive, and therefore he entertains no doubts either of his faith or his consequent salvation through the merits of Christ, who died and rose again for that purpose. Consistently with the above definition of faith, they say that the sin against the Holy Ghost is simply unbelief. Their mode of practice and Church government differs but little from those of many other dissenting sects. See BARCLAY, JOHN.

BERENDT, bà'rent, Karl Hermann, German ethnologist: b. Dantzic, 1817; d. 1878. After studying medicine at Königsberg he began to practise in Breslau, where he lectured in the university. In 1851 his political attitude during the revolution having made his stay in Germany hazardous, he went to Nicaragua and thence to Vera Cruz, where he devoted some years to ethnological study and research. He retired from the practice of medicine and gave his whole attention to the study of the ethnology and linguistics of the Mayas. He came to the United States in 1871 and soon after was sent to Yucatan by the Smithsonian Institution, which published the results of his investigations in its report of 1867. In 1859 he explored the ruins of Ceuta, Tabasco, Mexico, and went to Guatemala in 1874, where he first saw the cultivation of tobacco and studied the paper-making of the Mayans. He published 'Analytical Alphabet of the Mexican and Central American Languages' (1869); 'Los escritos de Don Joaquin Garcia Icazbalceta' (1870); 'Los trabajos linguisticoos de Don Pio Perez' (1871); 'Cartilla en lengua Maya' (1871); 'Los indigenas de la America central y sus idiomas' (1878).

BERENGAR, bà'ren-gàr, two kings of Italy in the 9th and 10th centuries. BERENGAR I, son of the Duke Frederick of Bavaria and heiress of Louis-le-Debonnaire, during the confusion which followed on the dissolution of the empire of Charles the Fat, laid down the crown of Italy, and after a civil war obtained it in 888. At a later period, having been invited by Pope John X to repel the Saracens who were devastations the south of Italy, he was crowned emperor of Rome (915). His warlike expeditions had generally been fortunate, and his internal government was generally acceptable to his subjects; but his nobility of soul and authority, stirred up a new competitor for the throne in the person of Rudolf II, who invaded Italy in 921, and ultimately obliged Berengar to take refuge in Verona, where he was assassinated in 924. BERENGAR II, grandson of Berengar I, was at first Count of Ivrea, while the throne of Italy was occupied by Hugo, count of Provence, a tyrant who had incurred the enmity of almost all the great feudal lords of the kingdom. Berengar taking advantage of this feeling, put himself at the head of a force collected in Germany in 945, and was almost universally welcomed. Hugo abdicated in favor of his son Lothario, who reigned nominally for a few years, and was succeeded in 950 by Berengar, in whom all the powers of the government had previously centred. A quarrel with the Emperor Otho in the following year deprived him of his throne, but he was permitted to resume it on agreeing to acknowledge Otho as his liege lord. In a second quarrel he was not allowed to escape so easily. After losing his territories he shut himself up in the fortress of Saint Leo, and defended himself bravely till famine compelled him to submit. He was imprisoned at Bamberg and died there in 966.

BERENGARIA, bà'ren-gàr'e-a, the queen of Richard I of England: d. Le Mans, about 1230. She was a daughter of Sancho VI of Navarre and was married to Richard at Limasol in Cyprus, 12 May 1191. She remained at Acre while the King was fighting with the Saracens and resided in Poitou during his imprisonment in Germany. She became estranged from him soon after his release and seems
never to have joined him again. She was buried in the Church of Pitois, which she had founded. Tradition says she was of remarkable beauty and was highly accomplished for her age.

BERENGARIO, Jacopo, Italian anatomist: b. Carpi, about 1470; d. Ferrara 1530. He studied at Bologna, taught anatomy and surgery at Pavia, and finally settled at Bologna till a clamor caused by a rumor that he had got possession of two Spaniards affected by a loathsome disease, and was intending to dissect them alive, obliged him to retire to Ferrara. This rumor, caused doubtless by the fact that Berengario looked upon the dissection of the human body as the only means by which the science of anatomy could be advanced, points out the source of the many important discoveries which he made, and the others for which he paved the way, leaving them to be followed out by Vesalius, Eustachius, and Fallopius. He is justly regarded as one of the principal founders of modern anatomy. He was also a dexterous operator, and published a practical work entitled, 'De Cranii Fractura' and another which marked out the path for the anatomical discoveries of the 16th century, 'Isagogae breves perlicuidet uberrimae in anatomiam corporis humani, ad morum scholasticorum unicum secundum facultatem, cum aliquot figuris anatomiae' (Bologna 1514; Strassburg 1530).

BERENGARIUS OF TOURS, French theologian: b. Tours, about 1000; d. 6 Jan. 1089. He is renowned for his philosophical acuteness as one of the scholastic writers. While admitting the real presence of Christ in the Eucharist, he questioned the doctrine of consubstantiation and held that the substance of bread and of wine continued to exist with the body and blood of Christ (consubstantiation). He was condemned by several councils and several times recanted, but died fully reconciled with the Church. He is the first in theological history to call the doctrine of consubstantiation in question. He was treated with forbearance by Gregory VII, but the scholastics belonging to the party of Lanfranc, Archbishop of Canterbury, were irritated against him to such a degree that he retired to the Isle of Saint Cosmas, in the neighborhood of Tours, in the year 1080, where he closed his life in pious exercises. On the history of this controversy, which has long occupied the attention of theologians, new light was shed by Lessing in his 'Berengar' (1770), and also by Städelin, who likewise published the work of Berengarius against Lanfranc. This Berengarius must not be confounded with Peter Berenger of Poitiers, who wrote a defense of his instructor Abelard.

BERENGÈRE, bã-rãⁿ-ʂâ, René, French congressologist: b. Bourgès, Valence (Drôme), 22 April 1830; d. 30 Aug. 1915. He was a soldier during the War of 1870 and was wounded at the battle of Nuits. The following year he was elected deputy to the National Assembly; and in 1873 he became Minister of Public Instruction in the cabinet of M. Thiers and national senator in 1875. He was vice-president of the senate from 1891 to 1897. He was founder and president of a number of societies established for the general improvement of the conditions of society, and the eradication of vice from the streets of Paris. He instituted a campaign against the white slave traffic and headed an association for the protection of young girls and women from the dangers and vices of the great modern city. His studies of the vicious conditions of the great centres of population and his bold attempts to find remedies for them have made him one of the foremost workers in this field. The Legion of Honor and many other honors and decorations have been bestowed on him.

BERENHORST, Georg Heinrich, German military writer: b. 1733; d. 1814. He was one of the first writers by whom military art has been founded on clear and certain principles. He was a natural son of Prince Leopold of Dessau, and in 1760 became the adjutant of Frederick II. He was the author of 'Reflections on the Military Art' (Leipzig 1797).

BERENCIE, bë-rëⁿ-në'së ('a bringer of victory'). (1) This was the name of the wife of Mithridates the Great, king of Pontus. Her husband, when vanquished by Lucullus, caused her to be put to death (about the year 71 B.C.), lest she should fall into the hands of his enemies. (2) The wife of Herod, brother to the great Agrippa, her father, at whose request Herod was made king of Chalcis by the Emperor Claudius, but soon died. In spite of her absolute life, she insured the favor of the Emperor Vespasian and his son Titus. The latter was at one time on the point of marrying her. (3) The wife of Ptolemy Euergetes, who loved her husband with rare tenderness, and when he went to war in Syria made a vow to devote her beautiful hair to the gods if he returned safe. Upon his return Berenice performed her vow in the temple of Venus. Soon after the hair was missed, and the astronomer Conon of Samos declared that the gods had transferred it to the skies as a constellation. From this circumstance the constellation near the tail of the Lion is called Coma Berenices (the hair of Berenice).

BERENICE, Egypt, a city on the Red Sea, whence a road, 258 miles in length, extended across the desert to Coptos, on the Nile. This road was constructed in the reign of the second Ptolemy. Berenice was one of the principal centres by which the trade of Egypt, under the Macedonian dynasty, and that of the Romans subsequently, were carried on with the remote East. During the Roman period, a sum equal to $2,000,000 is said to have been annually remitted to the East by the Roman merchants as payment for its precious products, which sold at Rome for a hundred-fold more than their original price. Nothing now remains of Berenice but a heap of ruins, adjoining the modern port. The modern town is called Sikket Bender-el-Kebir, and now, owing to the formation of a sand bar at the entrance of the harbor and the filling up of the harbor itself, the port is practically accessible only to tegnerine, or Hesperis, a city of Cyrenaica, near which the ancients imagined the gardens of the Hesperides to be situated.

BERENSON, Bernhard, American art critic: b. Vilna, Russia, 26 June 1865. He was brought to America as a child, received his
BERESFORD

education in Boston, and graduated from Harvard in 1887. He went abroad shortly afterward, having already decided on his life work. Since that time he has resided principally at Settignano near Florence, Italy, making journeys to the various parts of Europe where works of art needed for his studies are to be seen, and returning to America from time to time. He has been influential in obtaining many important works for American collections and is generally regarded as the most significant figure in art criticism that this country has produced. Indeed he is to be placed with the very front rank of European connoisseurs, especially in his own specialty of Italian art. An interesting fact about his study of the great figures of the Florentine Renaissance is that it brought to him an early realization of the quality and importance of the modern French painters like Cézanne and Degas. Outside of articles in nearly all the great reviews of Europe and America, his principal writings are: 'Venetian Painters of the Renaissance' (1894); (Lorenzo Lotto, an Essay in Constructive Criticism' (1895-1901); 'Florentine Painters of the Renaissance' (1896); 'Central Italian Painters of the Renaissance' (1897); 'The Study and Criticism of Italian Art' (1901); 2d series (1902); 'The Drawings of the Florentine Painters' (1903); 'North Italian Painters of the Renaissance' (1907); 'A Sienese Painter of the Franciscan Legend' (1899); 'Catalogue of the Italian Paintings in the John G. Johnson Collection now at Philadelphia' (1913); 'Venetian Painting in America: the Fifteenth Century.' Mr. Berenson's method in the study of ancient works is largely a continuation of the one inaugurated by the Italian critic Giovanni Morelli. Mrs. Bernhard Berenson is also deeply interested in art criticism and has written a guide book on the most important Italian pictures for students to see.

BERESFORD, Lord British admiral: b. Ireland, 10 Feb. 1846. Charles William de la Poer Beresford, son of the marquess of Waterford, was for many years known by his courtesy title of "Lord Charles." On his elevation to the peerage in 1916 he adopted the title of Baron Beresford of Metemmeh and of Curraghmore. He entered the navy in 1859 and rose rapidly through all grades by force of a strong personality, a fiery enthusiasm in his work and a relentless courage that made him the idol of his comrades. On three occasions he sprang overboard at sea to the rescue of drowning men. He commanded the gunboat Cowper during the bombardment of Alexandria in 1882. By running her vessel close under the forts he succeeded in silencing the most formidable battery opposed to the British squadron. After the landing of troops he organized an efficient police force for the protection of the city, and later served on Lord Wolseley's staff in the Nile Expedition (1884-85), and subsequently commanded the naval brigade in the battles of Abu Klea, Abu Kru and Metemmeh. For the second time he was specially commended for gallantry. He was in command of the expedition which rescued Sir Charles Wilson's party in the Saffa, when her boilers were repaired under fire. For this action he received the thanks of both Houses of Parliament. He was a lord commissioner of the admiralty from 1886 to 1888, when he resigned, owing to what he regarded as inadequate provision for the needs of the fleet. In 1893-96 he commanded the naval reserve at Chatham; was commander-in-chief of the Mediterranean squadron 1905-07; of the Channel fleet in 1907-09, and retired from the navy in 1911. He was a persistent critic of the administration of Sir John (now Lord) Fisher while the latter was First Sea Lord. Beresford's book, 'The Betrayal,' issued in 1912, was withdrawn on request of the government. It led, however, to the formation of an Imperial naval war staff. At various times Beresford sat in Parliament for different constituencies; his last one, Portsmouth, he represented till 1916. In the House he was nicknamed the "stormy petrel" and "M.P. for the Navy." Like Lord Roberts, he was one of the few British public men who foresaw a gigantic conflict in the not distant future, and openly proclaimed it on every possible occasion. As the time spent 10 years in preparing for a powerful army with which to face the coming storm, so the other at all seasons insisted on the maintenance of the "two-power standard" for the navy, propounding the fundamental truth that battleships are cheaper than battles. Already in 1903 he wrote, "Great Britain must watch the activity of the German Navy League with the greatest attention." Early in the war Lord Beresford was appointed honorable colonel of the Marine Brigade in the Royal naval division organized for land service. He was president of the American Navy League Lord Beresford expressed the opinion that Germany could have won the war had she promptly attacked British commerce without any declarations of war (New York Evening Sun, 30 Oct. 1916). In 1898 he visited China at the request of the Associated Chambers of Commerce of Great Britain to make a study of the complicated commercial conditions existing there; and on his return, in 1899, he passed through the United States and was received with distinguished honors by official and commercial bodies. He has done much to promote the "open door" policy in China. His publications include 'Nelson and His Times'; 'The Break-Up of China' (1899), and a volume of 'Memories' (1914).

BERESFORD, William Carr, Viscount, English general, was a natural son of the 1st marquess of Waterford: b. 2 Oct. 1768; d. Bedegbury Park, Kent, 8 Jan. 1854. He entered the army and served at Toulon and Corsica, in the West Indies under Abercromby, in Egypt under Baird and commanded the first brigade at the capture of Cape of Good Hope in 1805. In 1806 he was raised to the rank of brigadier-general and the same year commanded the land force in the expedition to the Cape of Good Hope. He was also engaged in the capture of Buena Esperanza and soon after was imprisoned for six months before he made his escape. Having been ordered to Portugal in 1808, he was intrusted there with the remodeling of the Portuguese army—an office which he executed with great success, and in acknowledgment of his services was created a Marshal of Portugal, Duke of Elvas and Marquis of Santo Campo. He covered Moore's retreat at Corunna in 1809 and subsequently took part in the siege of Badajoz and the battles of Albuera, where he
had very heavy losses, Vittoria and Bayonne. For his bravery at the battle of Toulouse he was raised to the peerage, with the title of Baron Beresford, afterward superseded by that of Viscount Beresford, conferred on him in 1823. In political principles he was a high Conservative and a thorough supporter of the Duke of Wellington. In 1828, when the Duke became premier, he was made master-general of the ordnance, a post he held till 1830.

Beresford, S. Dak., town in Union County, on the Chicago and Northwestern Railroad, 20 miles northwest of Sioux City. It has a few local industries, three banks and a public high school. It has a good trade in the agricultural products of the region. The value of its taxable property is estimated at $948,000. Pop. 1,400.

Berezin, byer-yezin', Ilya Nikolaevich, Russian Orientalist: b. 1818; d. 1896. He studied oriental philology at the University of Kazan, where in 1846 he was appointed professor, and in 1855 became professor of Turkish at the University of Saint Petersburg. Some of his most important works are: The Library of Oriental Authors (1849-51); Tour Through Daghestan and Trans-Caucasia (1850); A Grammar of the Persian Language (1853); The Mongol Invasion of Russia (1852-53); Popular Turkish Sayings (1853). He also wrote in French, Recherches sur les Mosulans (1848-53), and edited the Russian Encyclopedic Dictionary in 16 volumes.

Berezina, byer-yez-nya', a river in the Russian province of Minsk, a tributary of the Dnieper, with a course of some 335 miles. A canal system connects with the Dvina. It was rendered famous by the passage of the French army under Napoleon, 26-27 Nov. 1812. Admiral Tchetchakoff, with the Moldavian army, forced his way from the south to join the Russian army, which, after Borizoff had been taken, was to assist the army led by Wittgenstein from the Dvina and in this manner cut off Napoleon from the Vistula. Napoleon in face of armies three times as strong as his own and surrounding him on all sides, was obliged to retreat. He was forced to reach Meffis, near at least the Berezina, and to pass it earlier than the Russians. After the advanced guard of the Moldavian army had been repelled to Borizoff by Oudinot and the bridge there been burnt by them, early in the morning of 26 November, two bridges were built near Sembin, about two miles above Borizoff, an undertaking the more difficult because both banks of the river were guarded by extensive morasses, covered, like the river itself, with ice not sufficiently strong to afford passage to the army, while other passes were already threatened by the Russians. Scarcely had a few troops effected their passage, when the greater part of the army, unarmored and in confusion, rushed in crowds upon the bridges. Those who could not hope to escape over the bridges sought their safety on the floating ice of the Berezina, where most of them perished, while many others were crowded into the river by the unexpected masses of Russians who were obliged to remain beyond the Berezina, the division of Bartouaneaux, which formed the rear-guard, was also lost. It was intrusted with the charge of burning the bridges in its rear, but it fell into the hands of the enemy. The French lost half their total strength, which stood at 25,000 men. The genius of Napoleon saved the remnant, a broken and dispirited force.

Berezov, byer-yazof (the town of birch trees), Siberia, a town in the government of, and 400 miles north from, Tobolsk, on a height above the left bank of the Solva, one of the branches of the Obi. Its inhabitants are chiefly Cossacks, who subsist by the chase and by fishing; they barter fur, skins, fish, etc., for flour, flesh-meat, tobacco, ironware and brandy brought by the Tobolsk dealers, whose craft are floated down the Ishch. It lies in a rough country, covered with thick forests, and has a severe climate. Among the noted personages exiled to this place were Prince Menzikoff, the favorite of Peter the Great, who died here in 1729, and Dolgorukii. Pop. about 1,100.

Berg, berg, Friedrich Wilhelm Rembert, generally known as Feodor Fedorovitch Berg, b. Novgorod, 1751; d. Saint Petersburg, 27 May 1794; d. Saint Petersburg, 18 Jan. 1784. He received his education at the University of Dorpat and entered a regiment of infantry at Liban. He took part in the campaigns of 1812, 1813 and 1814 in Russia, Germany and France. After his return to Russia he entered the diplomatic service and was successively attached at the embassies of Munich, Rome and Naples. In 1822 he re-entered active service, directed some expeditions against the Kirghizes and explored the shores of the Sea of Aral. On the accession of Nicholas, Berg was appointed imperial chamberlain and was attached at Constantinople. During the Turkish campaign he was quartermaster of the Second Army, directed the operations between Sibera and crossed the Balkans. He arranged the map of a portion of Rumania and the Balkans. In 1831 he served in Poland under Rudiger and distinguished himself at Ostrolenika and at the capture of Warsaw. He was appointed lieutenant-general and was afterward in charge of geodetic surveys and of various diplomatic and military missions. In 1849, at Vienna, he prepared the plan of campaign against Hungary. In 1853 he was in charge of the troops destined for the defense of Eflonia, and he put the fortress of Reval in a state of defense sufficient to withstand and repulse the attack by the English troops. In 1854 he was made governor-general of Finland and repulsed Admiral Dundas before Sveaborg. Alexander II bestowed on him the title of count and, in 1863, placed him at the head of the kingdom of Poland. He brought this country under submission and retained this post until his death. He was the first to insist on the policy of Russification at all costs. The severity with which he treated the Polish population during the insurrection aroused widespread indignation.

Berg, Joseph Frederick, American clergyman: b. Antigua, W. L. 3 June 1812; d. New Brunswick, N. J., 20 Nov. 1871. He came to the United States in 1823, entered the German Reformed ministry, in which he served 1835-52, and then entered the Dutch Reformed
Church and was professor of theology in the Dutch Reformed Theological Seminary at New Brunswick from 1861 till his death. He was distinguished for the intensity of his opposition to the Roman Catholic Church, on which theme he wrote extensively, his best-known work being 'Synopsis of the Moral Theology of Peter Dens, as Prepared for Romish Seminaries of Theology' (Philadelphia 1842; new ed., 1856). His learning was extensive and he was an eminent controversialist. Consult Corwin, 'Manual of the Reformed Church in America' (New York 1879).

BERG, an ancient duchy of Germany, now included in the governments Arnsberg, Cologne, and Düsseldorf. It extended along the Rhine from the Ruhr to the frontiers of Nassau, and is everywhere hilly. It is more a manufacturing than a agricultural district, and has long been famed for its minerals, which include iron of the finest quality, lead, copper, zinc and the precious metals. In addition to the employment furnished by the working of these minerals, the inhabitants, who are very industrious, have with considerable success superadded textile manufactures. It is now indeed the chief manufacturing district in Germany, and the most densely populated. It contains the important towns of Elberfeld and Barmen. The duchy of Berg, founded in 1399, had been long consolidated with the Prussian dominion when (1806) Napoleon revived the title, and conferred it, with an enlarged territory, on Murat. On Murat's receiving the kingdom of Naples, Napoleon named his nephew Louis Napoleon (brother of Napoleon III) hereditary Grand-duke of Berg, and increased its limits still farther. At the Congress of Vienna, in 1815, the whole was given to the King of Prussia.

BERGAIGNE, Abel, French Orientalist: b. Viny, 31 Aug. 1838; d. 6 Aug. 1888. He was for many years professor of Sanskrit at the Sorbonne in Paris. As a Sanskrit philologist he was considered a foremost authority and he was especially noted for the share he took in the interpretation of the Vedas. Among his works are 'La religion védique' (3 vols., Paris 1883); and a translation of two Sanskrit dramas 'Nāgānātha' (Paris 1879), and 'Sacountalā' (Paris 1884).

BERGAMA, bērg'ga-ma, Asia Minor, town about 20 miles inland from the west coast, on the Selinus, a tributary of the Caicus, 46 miles north by east of Smyrna. It occupies the site of the ancient Pergamus (q.v.), and contains numerous remains attesting its ancient magnificence. In the centre are the remains of a large Roman basilica, a Byzantine church now converted into a mosque, and a curious double tunnel 200 yards long through which the river runs. To the east of the town is a steep hill with the acropolis and the remains of a Roman palace on the top. To the west of the town are the ruins of the ancient amphitheatre with arches of fine workmanship. It was built so that the arena could be flooded with water from a stream, thus affording an opportunity for nautical sport. Bergamo is a town noted for its manufactures of morocco leather, there is trade also in wool, cotton, and opium. The population is about 7,500, including a number of Greeks, who have established excellent schools.

BERGAMI, Bartolommeo. The celebrated trial of Queen Caroline, wife of George IV of England, was principally founded upon a charge of adulterous intercourse with Bergami, who, in 1814, upon recommendation of the Marquis Ghisleri, in whose previous employment he had been, was attached to her household. Bergami, who had in the Italian army from a common soldier to the rank of quartermaster, belonged to a respectable family, and the Marquis Ghisleri described him to the queen as a person of character and attainments superior to his condition, and bespoke for him a kind treatment. This, and the personal advantages of Bergami, who was singularly good-looking, combining athletic strength and stature with almost feminine beauty, naturally disposed the queen in his favor. Moreover, he was full of heartfelt devotion, and on one occasion nearly became the victim of poison intended for her. The queen treated his whole family, especially a little child of his, with the greatest generosity and kindness. All these circumstances were used by her enemies as so many indications of her criminality, and during the trial one of the Italian witnesses, Teodore Majocchi, excited special indignation by his admitting every fact unfavorable to the queen, and by answering every question which might tell in her favor with Non mi ricordo. Bergami, who was at Pesaro during the trial, exclaimed, when he was apprised of her acquittal, but at the same time of her death, that she had been poisoned, and never could be convinced to the contrary. To the last he ever spoke of the queen with the greatest reverence and affection, and his deportment before and after her death led to the conclusion that he looked upon her rather as a benefactress than as a mistress. However, wherever he went he became the observed of all observers. During his occasional excursions to Paris his apartments were crowded with visitors, consisting principally of ladies, who, under the pretext of having been friends of Queen Caroline, gratified their curiosity and obtained an interview with the portly courier. When at home he lived in great splendor; in the capitals of Italy, Rome, Naples, Milan, he was a lion, and the houses of "the best families" were open to him. At the time of the trial many different statements about Bergami's character were circulated in the House of Lords, but however contradictory in many other respects, they all agreed in this one fact, that he was as inoffensive as he was good-looking a person, who probably would never have been heard of beyond the precincts of Italian barracks if it had not been for his relation with Queen Caroline, and for the peculiar construction which was put upon it by her enemies at the trial. His name in England was, by a curious mistake, spelled with a P.

BERGAMO, bērg'ga-mō, Italy, city and capital of the province of Bergamo, situated in the district lying between the rivers Brembo and Serio, and 33 miles northeast of Milan. It consists of two distinct divisions, the upper city, situated on hills, and now attainable by a tramway, and the lower city. Città Alta, with its hilly streets, ancient buildings, and lofty
BERGAMOT—BERGEN

ramparts, now transformed into promenades, has a picturesque mediæval appearance. The much more extensive new quarters in the plain are very modern in every respect. At its far gate, to the value of a million crowns worth, have sometimes been sold. It has an academy of painting and sculpture, a museum, an athænæum, a public library, several secondary schools, and various manufactories. There is a cathedral but some of the other churches are of greater interest. There is a small Protestant congregation. The comic characters in the Italian masked comedy are Bergamese, or affect the dialect of the country people in the neighborhood of this city. In 1706 Bonaparte took Bergamo, and it was subsequently made the capital of the department of the Serio, in the kingdom of Italy. Among many distinguished men born here are Tiraboschi, the historian of Italian literature; the composer Donizetti, and Cardinal Mai. Bergamo has a thriving trade; it was one of the first places to introduce the culture of the silkworm. Its principal manufactures are silk and other textiles, hats, farm implements and organs. Bergamum, the ancient town, was settled by the Gauls and became a municipium in Caesar's time. In 1428 it was added to the Republic of Venice. Pop. 55,857.

BERGAMOT, a shrub or small tree, Citrus bergamia (family Rutaceæ). The plant is largely cultivated in southern Europe, especially Italy, for its green, bitter volatile oil, known as oil or essence of bergamot, which is expressed or distilled from its highly aromatic rind for use in perfumery. The name is also applied, mainly in Europe, to many varieties of pears and in both Europe and America to several species of the family Menthae; for example, Mentha aquatica (Europe), Monarda didyma and M. fistulosa (America). The name seems to be a corruption of the Turkish beg armâdî, a lord's pear.

BERGedorf, bërg'dörf, Germany, town 10 miles southeast of Hamburg, and in the territory belonging to that city, on the Bille, a tributary of the Elbe. It has flourishing glass works and manufactures of enamel ware. Lesser productions are cane chairs, brushes and buttons, and there are tanneries and brick yards. The town is the seat of a District Court and has a realschule and an institution for the blind. It is the birthplace of the composer, Johann Adolf Hasse. It was held jointly by Luiebeck and Hamburg till 1867, when Lubeck assigned its rights to Hamburg on payment of 200,000 thalers. Pop. 14,907.

BERGEN, Joseph Young, American educator: b. Red Beach, Me., 22 Feb. 1851. He was graduated at Antioch College, Ohio, 1872, and for a time was on the Ohio geological survey and professor of natural sciences at Lombard University, Salisbury, Ill. He was teacher of physics in the Boston Latin School, 1887; junior master and master Boston English High School, 1890-1901. He is joint author (with his wife, Fanny D. Bergen) of "The Development Theory: the Study of Evolution Simplified for General Readers" (1884); (with Edwin H. Hall) of "A Text-Book of Physics"; (with Dr. Bradley Moore Davis) of "Principles of Botany" (1906); (with O. W. Caldwell) of "Practical Botany" (1911); and "Introduction to Botany" (1914). Sole author of "Elements of Botany" (1896), and "Essentials of Botany." He spent four years (1901-05) in Italy, mainly in the Naples region, where he made many studies of plants and flowers. He has published papers on the Mediterrenean coast and published papers on the Botanical Gazette and The Plant World. Since his return to America he has made some researches, mostly unpublished, on the light relations of plants and on transpiration.

BERGEN, Norway, a seaport on the west coast, capital of a province or diocese of the same name, formerly the principal town of the kingdom, but now the second. It is 186 miles northwest of Christiania, and about 25 from the open sea, and is situated on and about the head of two inlets, one of which forms the harbor. The tongue of land between the harbor and the other inlet (Puddefjord) is an elevated ridge crowned by an old fort, while the entrance on the other or northeast side is commanded by the old fortress of Bergenhus, now converted into a prison. Rocky hills from 800 to 2,000 feet high encircle the town on the land side and furnish many picturesque spots. The climate is comparatively mild, on account of the sheltered situation, but is remarkable for rain, the annual rainfall being about 73 inches. The town is well built and clean, but the houses are mostly of wood, and many of the streets are crooked and uneven, on account of the irregularity of the site. A portion of the city, burned in 1855, has been rebuilt very regularly. Electric tramsways traverse the principal streets. There are a number of squares or open spaces, including the market-place. There is a cathedral (built in 1537), and several other churches, the oldest being St. Mary's, built after a fire in 1298. The public institutions include schools, a library of 90,000 volumes, a theatre, a museum, etc. The inhabitants of the middle coast of Norway bring timber, tar, train-oil, hides, etc., and particularly dried fish (stock-fish), to Bergen to exchange them for grain, flour and other necessaries. The town carries on a large trade in these commodities. It is the great fish market of Norway. Twice a year the Norland men come to Bergen with their fish. In March and April several hundred vessels are seen in the harbor at once, laden with the produce of the winter fishing and with skins and feathers. Codfish for salting, fish roe, blubber, skins, herrings and cod-liver oil are the chief exports, amounting to two-fifths of the entire country. A fair, attended by fishermen of all nations, is annually held. A fishery museum was established here in 1881. A considerable amount of ship-building is carried on. A United States consul is resident here. Bergen is the native place of the poet Holberg. Bergen was founded in 1070 by King Olaf Kyrre, who made it the second city of his kingdom, and it was soon raised to the first rank. The first treaty entered into by England with any foreign nation was made with Bergen in 1217. But the English and Scottish traders were soon displaced by the merchants of the Hanse towns, who made Bergen one of their four depots, compelled the fisherman to trade here exclusively, and continued to exercise and abuse their monopoly until their suppression was broken by an act issued by Frederick II
BERGEN-OP-ZOOM — BERGERAC

BERGER, Ludwig, German pianist and composer: b. Berlin, 18 Apr. 1777; d. there, 16 Feb. 1839. After studying composition under Gürlich, he went to Dresden, in 1801, there to continue his studies under Naumann. Later he accompanied Clementi on a tour to Saint Petersburg, where he remained for six years. In 1812 he went to Stockholm and later to London, where he again met Clementi and undertook a short tour with him. In 1815 he returned to Berlin, where he remained until his death. During this period he was the teacher of Mendelssohn, Taubert and others who later became famous. Many of his compositions are still popular, especially his 'Die schöne Müllerin.'

BERGER, Philippe, French Orientalist: b. Beaucourt, Alsace, 1848. Having concluded his studies at Strasbourg and Paris, he became assistant librarian at the Institute and professor of Hebrew at the Sorbonne. Later he was appointed to the chair of Hebrew, Syrian and Chaldee at the Collège de France, succeeding Renan. A few of his many works are 'L'Écriture et les inscriptions sémitiques' (1880); 'L'Arabe avant Mahomet' (1885); 'Histoire de l'écriture dans l'antiquité' (1902); 'Etudes sur les renseignements fournis sur le gnosticisme par les Philosopheumena' (1893); 'Le Musée Saint-Louis de Carthage, antiquités phéniciennes' (1900); 'Un nouveau tari des filomphés à Carthage' (1910); 'Le Culte de Mithra à Carthage' (1912).

BERGER, Victor, German-American Socialist leader and United States congressman: b. Nieder Rebbuch, Austria, 28 Feb. 1860. Having graduated from the University of Vienna, he emigrated to Milwaukee, Wis., where he became a teacher of German in the public schools. He became at once interested in the activities of the Socialists and was one of the founders of the American Socialist Party. In 1892 he was made editor of the Milwaukee Daily Forward by the party local leaders. Since then he has edited various papers and periodicals in Milwaukee. In 1911 he was elected to Congress by the Socialist vote of Milwaukee, being the first of that political faith to be sent to Washington.

BERGERAC, Savinien Cyrano de, French author: b. 1619; d. 1655. He was distinguished for his courage in the field, and for the number of his duels, more than a thousand, most of them fought on account of his monstrously large nose. His writings, which are often crude, but full of invention, vigor and wit, include a tragedy, 'Agrippine,' which was regarded at the time as the vehicle of atheistic teaching; and a comedy, 'The Pedant Tricked,' from which Corneille and Molière have freely borrowed ideas; and his 'Comical History of the States and Empires of the Sun and the Moon' probably suggested 'Micromégas' to Voltaire, and 'Gulliver' to Swift. His works have been frequently republished. He was made the hero of a drama bearing his name, written by Edmond Rostand, the French playwright, which had a phenomenal success in the United States in 1899—1900, and was followed by a suit for plagiarism. See Rostand, Edmond.

BERGERAC, France, town in the department of the Dordogne, about 25 miles southwest of Périgueux, and on the river Dor-
BERGERAT — BERGK
dogne. In 1345 the English took the town and fortified it. They were driven off but again took it and it was in their hands until 1450. It contains a splendid Gothic church, dating from 1356. Its industries include brewing, flour milling, paper manufacture, tanning, weaving, leather making and hosiery. There is a considerable trade in bandy, fish and wine. The town, 48 miles east of Bordeaux, gives the name to an agreeable wine cultivated on the banks of the Dordogne, in France sometimes called *petit champagne*.

BERGERAT, bôrzh-râ, Augustë Emile, French journalist, playwright and novelist; b. Paris, 20 April 1845. He received his education in a Jesuit seminary, the Lycée Charlemagne, and at first aspired to be an artist, but soon after turned his attention to journalism. He is son-in-law of Théophile Gautier, and since 1884 particularly known as the amusing chronicler of the *Figaro* under the pseudonym of CALIBAN. His *feuillettes* for that paper were published collectively as *Life and Adventures of Sieur Caliban* (1887); *The Book of Caliban* (1887); *Caliban's Laughter* (1890), etc. He also wrote two novels, *Faubas in Spite of Himself* (1884); *The Rape* (1886). He has published *War Poems* (1871); *Enguerrande, a dramatic poem* (1884); *La lueur comique* (1889); *L'horizon* (in *Petit Journal*); *L'Homme* (1901); *Ballades et Sonnets* (1910). "Souvenirs d'un enfant de Paris* (Vol. I, 1911; Vols. II and III, 1912; Vol. IV, 1913); besides two volumes to the memory of his father-in-law, *Théophile Gautier, Painter* (1877), and *Th. Gautier, Conversations, Souvenirs and Correspondence* (1879).

BERGH, bôrzh, Henry, American philanthropist and author; b. New York, 8 May 1820; d. there, 12 March 1888. He was educated at Columbia College, and from 1861 to 1864 was in diplomatic service, being secretary of the American legation and United States consul at Saint Petersburg. In 1865 he founded the American Society for the Prevention of Cruelty to Animals, was chosen its president, and in 1866 secured the passage of an act giving the Society the power of making arrests and carrying on prosecutions for violations of the statute on which the organization was instituted. He remained president of the Society until his death, being ever its guiding spirit, living entirely in its work, and serving without compensation. At the beginning of his work no State or Territory had any statute relating to the prevention of cruelty to animals. At the time of his death the States had proper laws on the subject, and in 36 of them branch societies of the organization had been formed. The work of the Society was extended to Argentina, Brazil and Canada. He was the author of a volume of tales and sketches, *The Streets of New York*; a successful drama, *Love Alternative*, produced in Baltimore (1881); *The Portentous Telegram*; *The Ocean Paragon*; and *Married Off; a Poem* (1859). Berg also founded the Society for the Prevention of Cruelty to Children, which is now firmly established in every State of the Union.

BERGH, Johann Edvard, Swedish landscape artist; b. Stockholm 1828; d. 1880. He studied at the Stockholm Academy, taking first prize there in 1853. He prosecuted his studies later with Gude at Düsseldorf and at Geneva under Calame. He toured Italy in 1856-57 and on his return to Sweden became professor in the Stockholm Academy. He is looked upon as the founder of a new school of landscape art in Sweden, distinguished by accurate drawing, in which respect a representation of nature, and a very decided nationalism. Among his most noted subjects are 'Wood Interior' (Stockholm Museum); 'View of Stockholm' (owned by the King of England); 'View in Dalecarlia' (Amsterdam), and 'Beech-Wood' (Sothenburg).

BERGH, Pieter Theodor Helvetius van den, Dutch dramatist and poet: b. Zwolle 1779; d. 1873. He took up his residence successively in Paris, Brussels and Vienna, and after becoming blind removed to The Hague. Here, in collaboration with Weiland, he edited the *Maagazine voor Toen en Schilderkunst*. He attracted attention with his comedy 'The Nephew' (1837), considered one of the best in modern Dutch literature, but did not justify expectations by his subsequent dramatic efforts. He also published 'De Nichten*' and a collection, *Prose and Poetry* (3d ed., 1863).

BERGHAN, bôrkhân, a Dutch and colonial name in south Africa for several large hill-haunting eagles, especially the bateleur (q.v.).

BERGHAUS, Heinrich, German geographer: b. Cleve, 3 May 1797; d. Steitten, 8 Feb. 1884. He served in 1815 in the German army in France, and was from 1816 to 1821 employed in trigonometrical survey of Prussia under the War Department. From 1824 to 1855 he was professor of applied mathematics in the Berlin Academy of Architecture. Besides his various maps and his great *Physical Atlas* (republished in a remodeled form in 1886-92), he published *Allgemeine Länder und Völkerkunde* (1837-41); *Die Völker des Erdballs* (1852); *Grundlinien der physikalischen Erdbeschreibung* (1856); *Grundlinien der Ethnographie* (1856); *Deutschland seit hundert Jahren* (1859-62); *Was man von der Erde weiss* (1856-60). His correspondence with Humboldt was published in 1863.

BERGHAUS, bôrkhows, Hermann, German cartographer, nephew of Heinrich Berghaus (q.v.): b. Hereford, Westphalia, 16 Nov. 1828; d. Gotha, 3 Dec. 1890. During most of his life he was cartographer in the Geographical Institute of Justus Perthes at Gotha. His best known work is a chart of the world (1863) which has gone through 11 editions. He also prepared a *Physikalische Karte der Erde* (1874); *Physikalische Wandkarte von Europa* (1875); *Physikalische Wandkarte von Afrika* (1881). Besides this he supervised the revision of his famous uncle's *Physikalischer Atlas* (1842) which work was participated in by many noted specialists.

BERGHEM, Nikolaaas. See BERCHEM, NIKOLAAS.

BERGK, Theodor, German classical philologist: b. Leipzig, 22 May 1812; d. Razaq, Switzerland, 20 July 1891. He became an indubitable authority on Hellenic poetry, producing two works of surpassing importance in that department of scholarship: *Greek Lyric Poets* (4th ed., 1878-82), and *History of Greek Lit-
BERGMAN—BERGSON 547
ceration? (1872); the latter brought to comple-
tion with the aid of his posthumous papers.

BERGMAN, Torbern Olof, Swedish natural-
philosopher and chemist: b. Katharinberg,
West Gothland, 20 March 1735; d. 1784.
Sent to Upsala with a view to preparing either for
the Church or the bar, he, disliking both, gave
his attention to natural history, physics and
mathematics. He soon made important dis-
covemtions in entomology and became noted as
an astronomical observer. In 1758 he became
doctor of philosophy and professor of physics
at Upsala. Upon the resignation of the cele-
brated Wallerius, Bergman was a candidate for
the professorship of chemistry and mineralogy.
His competitors charged him with ignorance of
the subject, because he had never written on it.
To refute them he shut himself up for some
time in a laboratory, and prepared a treatise on
the manufacture of alum, which is still con-
sidered a standard work. In 1767 he became
professor of chemistry, and devoted himself
with ardor to this science. He invented the
preparation of artificial mineral waters, and
discovered the sulphuretted hydrogen gas of
mineral springs, and is indebted to him for a
knowledge of the characters which distinguish
nickel from other metals. On a number of
minerals he made chemical experiments, with an
accuracy before uncommon. He published a
classification of minerals, in which the chief
divisions are based on their chemical char-
acter, and the subdivisions on their external
form. In preparing this work he was much
aided by his former discoverer of the geometri-
cal relations between different crystals of the
same substance, which may be deduced from
one primitive form, and are produced by the
aggregation of similar particles, according to
fixed and obvious laws. His theory of the
chemical relations is still esteemed, and although
it has received new developments from the fur-
ther researches of Berthollet, has not been over-
thrown. The order of Gustavus Vasa was be-
stowed on Bergman. Among his works the first
place is due to 'Opuscula Physica, Chemica, et
Mineralia' (Upsala 1779-94), of which an Eng-
lish translation appeared. His famous essay on
'E Elective Affinities' was translated into English
by Dr. Beddoes.

BERGMANN, Julius, German philosopher:
b. Opherdike, Westphalia, 1840; d. Marburg
1904. At Göttingen and at Berlin he devoted
himself to metaphysics and philosophy, was
appointed to the chair of philosophy at Königs-
berg in 1872, and three years later to a similar
chair at Marburg. Among his more important
writings are 'Grundlinien einer Theorie des
Berechtigten' (1870); 'Zur Herkunft des
Kriticismus' (1875); 'Reine Logik' (1879);
'Sein und Erkennen' (1880); 'Die Grund-
probleme der Logik' (1882); 'Geschichte der
Philosophie' (1892-94); 'Untersuchungen
über Hauptpunkte der Philosophie' (1900);
'System des objektiven Idealismus' (1903).

BERGMANN Karl, American musician:
b. Ebersbach, Saxony, 1821; d. New York, 10
Aug. 1876. He studied at Zittau and Breslau.
Participation in the revolutionary outbreaaks of
1848 induced him to go into exile and he came
to New York. He organized and directed the
first great German music festival, held in the
Winter Garden Theatre (1855); in 1856 intro-
duced German opera at Nible's Garden, and for
several years prior to his death conducted the
concerts of the Philharmonic Society. He com-
posed several orchestral pieces, and excelled as
drill player of the violoncello and the piano. He
contributed greatly to the advancement of good
music in America.

BERGMEHL. See DIATOMACEOUS EARTH.

BERGONZI, Carlo, Italian violin maker:
b. Cremona 1715; d. there 1755. He was an
associate of the famous Stradivari, from whom
he learned the art at which both were such
adepts. Beyond that little is known of his life.
His violins are now rare and bring high prices,
though not so high as those of his master. They
are not only remarkable for their tone, but for
their beautiful shapes as well.

BERG SCRUND, the large crescentic
crevasse partly encircling the head of a glacier,
caused by the forward movement of the ice
which flows away from the stationary snow and
rock walls. See Glacier: Crevices.

BERGSOE, bergse, Jorga Vilhelm, Dan-
ish novelist, poet and naturalist: b. Copenhagen,
8 Feb. 1833; d. 1911. While suffering partial
blindness, caused by excessive use of the micro-
scope in his memorable biological researches at
Messina, he turned to literary composition; and
soon appeared the first of a cycle of novels,'From the Piazza del Popolo' (1866), which
had an extraordinary success. The following
year he published his first volume of poems,
'Now and Then' (1867). Of his many novels,
the one which excels for fineness of touch is,
'Who was He?' (1878). All his stories are
characterized by rich imagination, fine observa-
tion and great originality; his poetry is inferior
in these respects to his prose. He also wrote an
historical work 'Rome under Pius IX' (1877).

BERGSON, Henri, French philosopher:
b. Paris, 18 Oct. 1859. He received his education
in Paris, graduating from the Ecole Normale
with the degree Licencié éé- Lettres. He then
taught at provincial lycees and colleges for a
number of years, removing to Paris and taking
his degree of Docteur-és-Lettres in 1889. In
1896 he received an appointment to the Ecole
Normale in Paris and two years later became
professor in the Collége de France. In 1913
he visited America where he delivered a course
of lectures at Columbia University. The same
year he was also president of the English So-
ciety for Psychical Research, and delivered
addresses at London and Oxford. The volumes
in which his philosophical ideas are contained
have been translated into English and other
languages. The three principal books are
'Essai sur les données immédiates de la con-
sience' (tr. into English under the title, 'Time
and Free-Will', London and New York 1910);
'Matiere et Mémoire' (1896, English tr., 'Mat-
ter and Memory', London 1911); 'L'Evolution
Creatrice' (1907, English tr., 'Creative Evolu-
tion', New York 1911). In addition, the follow-
ing translations into English have appeared
from his writings: 'Introduction to Meta-
physics' (New York 1912); 'Laughter' (New
York 1911); 'The Perception of Change' (Ox-
ford 1911); 'The Meaning of the Word (Lon-
don 1915). For an account of Bergson's phi-
losophy, see BERGSONISM.
BERGSOMISM, the teaching of the French philosopher, Henri Bergson (q.v.). The central idea of this philosophy is Freedom; it is at once an explanation and a refutation of mechanism—a refutation of the claim of mechanical principles and methods to furnish a final explanation of things, and a demonstration of the essential use and function of these ideas in human life. The significance of Bergsonism in France consists in its attempt to meet and refute the determination and pessimism of writers who claimed in the name of *science* to lay down certain general conclusions regarding man's place in nature. In the first place, the most original feature of this system is that it finds its primary datum and its explanatory principle in life. The classical historical philosophies, realistic and idealistic alike, proceeded on the plane of the intellect. The relation of ideas and objects furnishes the material for philosophy—the one school explaining ideas as the effects of the movement of material bodies, the other interpreting material things in terms of ideas. Bergson, however, the relation of the world is stated in terms of ideas; both put science or knowledge in the first place. But for Bergson life is something deeper and more significant than knowledge. To live is something more fundamental than to know. All the distinctions that we make, such as that between ideas and objects, between inner and outer, fall within the original unity of the life process. They are secondary distinctions which the reflective intelligence introduces for the sake of its own practical purposes into the immediate unity of life as it actually goes on. Life itself is just unceasing change, an integral continuous process, not made up of parts, but something that is one and indivisible throughout. Moreover, it is characteristic of life that its changes cannot be predicted; it is in its very essence undetermined spontaneity, a free creative energy, which constantly advances to what is genuinely new. This creative vital process is at once the reality and moving principle of individual life and of the cosmos as a whole. We become aware of it directly in ourselves through intuition; and through sympathy, through the power which life everywhere possesses of recognizing life, we divine its presence in objects and in the world as a whole. In this respect the integral cosmic movement is manifest in each of its parts and parcel of the total cosmic movement; all reality is alike a manifestation of the same vital impulse, the élan vital, as Bergson names it. The ultimate principle for this philosophy is accordingly neither conscious mind nor material substance but the ultimate result does not consist of unchanging elements, whether conceived as material or as *mind stuff*; but it is a moving, creative, living process, in which there is nothing fixed and static, nothing isolated or related only externally to other things and to the whole. It is creative evolution. We become aware of the nature of reality through direct experience of it, by entering into it, forming a part of it, and interpreting it through sympathy. This direct form of knowing is called intuition and relates it sharply with Logic or Intellect, which confines it to the analytic procedure of the reflective understanding.

Intuition, which is just the immediate awareness of life by itself, through direct experience and illumined by sympathy, reveals the true nature of reality as a creative indivisible process of change or development. On the other hand, the reflective understanding breaks up this integral process into a world of permanent objects existing in apparent isolation, and proceeds to organize them into casual systems and to represent the relations between the perceptions which completely exclude freedom. Through this logic of the intellect the standpoint of physical science comes into existence. But this intellectual way of reading reality is only a representation of it in symbolic terms. It does not set before us reality as it really is, but is a translation of the real, made in the interest of practical life, into a series of concepts and symbols. For it is not the function of logic and scientific analysis to reveal to us the nature of the world, but to furnish, through the use of symbols, such a schematized representation of things as will enable us to deal with them in a practical way. Science is an intellectual procedure, depending on analysis. But to all men to the world is something else; all analysis is thus a translation, a development into symbols, a representation, it may be from successive points of view in which we note as many resemblances as possible between the object we are studying and other objects which are taken as already defined. Its results accordingly are always relative, yielding only a formulation of the thing in terms of something other than itself. But, it may be asked, Is it possible to know a thing except in this relative way? Bergson replies that there is at least one object which we are able to seize from within by direct intuition, and that is our own personality as it appears as a conscious stream in time. This life is not, however, composed of discrete states of consciousness, as psychology describes it, and as our ordinary thought is accustomed to represent it; but it is, as actually lived, a continuous flow, a temporal whole without differentiation into distinct states or parts. The tendency to conceive of the mental life as constituted by the addition of states of consciousness rests upon the representation of time in terms of space. It is essential to distinguish between real time or duration (la durée réelle) and the mathematical notion of duration as an homogeneous qualityless medium, which allows us only to distinguish points as external to each other. Bergson uses many figures in order to make clear his view of Duration—the concrete form of the mental life. Perhaps his most illuminating metaphor is that of the way in which a musical phrase is apprehended. The various notes which compose it are successive, yet are not apprehended as a mere succession. They interpenetrate: each has its own place as part of the musical idea, yet each contains within it what has preceded, and prepares for that which is to follow. So inner experience, life, is a whole, not as an aggregation of external parts or states of consciousness, but in the sense of a movement which sums up the past and present, and is complete both in itself. It is a continuous process of change, which, however, must not be regarded as a passing away of states or moments, but as a whole which changes and endures while changing. The intelligence, operating by means
of logical concepts, cannot enter into the real flow of time: it can represent movement only by taking cross-sections of the process, and determining and describing the condition of things at some specified point. When science professes to measure time and motion, what it does is to leave out of account in them what is really characteristic, the duration and mobility, and to measure the correspondence of certain fixed points, or determine the relations of certain elements of the system with which it is dealing, at the end of a longer or shorter period. A favorite figure of Bergson for describing the operation of the intellect is the cinematograph. The intellect fixes things as an order of existing things in space, setting each thing off as something distinct and unchanging. To represent change, it is said, we must introduce time. But it is only the fiction of time that the intelligence is able to represent, just as it is only the appearance of movement that the cinematograph gives us. In both cases alike, we have presented, not real change, and not motion, but only a successive series of fixed points in space which is the real, but a representation of it in terms of what is static and unchanging. The idea of time which the sciences employ is therefore not that of real concrete time at all, but of time which has been assimilated to space. Time from this point of view is represented as a line, or as the successive movements of a body over the parts of a line. But, so regarded, it is robbed of its real continuity, and of all that is characteristic of concrete time, being assimilated to space in two respects. First, it is regarded as something discrete, made up of parts, of minutes or seconds, or fractions of a second. And, secondly, it is reduced to terms of space by being regarded as homogeneous throughout, in short, as having quantity but no quality. But time is in every respect the antithesis of space; it is not quantity, but pure quality. Space is homogeneous and without quality, it is made up of parts that are discrete: it is just pure quantity without quality.

But it is in this spatial view of things that the physical sciences are built up: the logic of their procedure is based upon the arrangement of solid bodies in space. Corresponding to the antithesis of space and time, accordingly, there is a real discontinuity of movement, essentially free and creative, and the world of permanent objects, standing apart from each other, and related by necessary laws. The former is the view of Intuition, the latter that of the logic of the Intellect. But the former is the world of real immediate experience, the latter a transformation or construction of the former affected by the intelligence. It is because we are made for action as well as for speculation that this transformation of the real is necessary. For the intellect is the servant and instrument of action. For the sake of action, it is necessary to break up the inner flow of events, differentiating it into permanent elements with fixed relations. Only thus externalizing and evaluating the unceasing movement of the real can we get a fulcrum for our action; only by symbolizing it by means of unchanging concepts and established definitions are we able to predict the future behavior of things, and without such prediction we should be unable to act. Moreover, it is in a way that these same concepts and descriptive terms which have proved so practically important in dealing with the outer world should be carried over to the mental life, and that psychology should come to describe the mind by means of concepts and methods derived from the physical sciences. Nor is it possible to deny a certain justification to this description; mind has a mechanical side, and to a large extent in terms of external acts and ideas. But in our every-day acts and ordinary associative play of ideas we live outside our true selves; and it is only such an externalized form of life which can be represented or symbolized in terms of separate states of consciousness and their relations.

We have now before us the grounds on which Bergson bases his defense of freedom. Freedom is possible because the intellectual point of view is not absolute and final. The concept of causality and the logical standpoint of the sciences is something which the intelligence has superimposed upon reality as it is immediately given in experience. It has even extended this determinism of the flow of living things and to the inner world of consciousness. But this transformation is for practical purposes only. The true reality as it is lived is quite different from the symbolic representation of it which science gives: reality has no repetition of identical terms, but a free creative process in which what appears is new and original. The importance of Bergson's view of change as a process of creation is seen when this is contrasted with the older ways of conceiving of the process of evolution. The logic of the sciences, unable to deal with genuine change, represents evolution as a procession of unchanging elements. From this standpoint, the process of evolution is described as consisting in the redistribution of matter and energy: in a progressive adjustment of factors and forces which are taken as given, ready-made, perhaps contained in the primitive nebula from which the movement is supposed to set out. And the same thing is true in principle of all theories which find in the idea of intelligent end the explanation of the evolutionary process. In both cases alike, nothing genuinely new ever occurs: all is predetermined, pre-arranged: there is transformation and redistribution, but no real change. It is a transformation of view, real time is eliminated, being taken to be only an external medium like space: it is that in which things are, but it is not essential to them or they to it. But concrete time bites into things, and is essential to their comings and goings. Bergson describes his own point of view by the term "creative evolution." Change must find its way to the very heart of things, time is of their very essence; the concrete movement of life and history cannot be adequately represented in terms of the mechanical redistribution of abstract elements or unchanging counters. It is noteworthy that in this connection he represents teleology as in principle identical with mechanism, being, as he says, nothing but an inverted mechanism, and like it an intellectual and deterministic point of view.

Bergson, however, does not confine his defense of Freedom to these general considerations. In his book entitled "Matter and Memory," he enters into a detailed discussion of the relations of body and mind.
eral position which he defends is that the body, like the intellect, is the tool or instrument of life, not something which causes or determines it. By an examination of psycho-physical experience he attempts to support the current notion that the brain is a kind of manufactory of ideas, or that memories are stored up in brain cells. To understand the function of the brain, we must regard it, not from the point of view of knowledge, but from that of action. The body is organized for action, the impressions which pass into the body are stimuli for action, and the function of the brain (which may be compared to a telephone exchange) is to respond by initiating the appropriate movement. Perceptions then depend upon the body, and their function is not theoretical, but purely practical. On the other hand, pure memory is completely spiritual in character, it does not depend upon the body, but is the affirmation of the life of the spirit. These two, pure perception and pure memory, are fundamentally different in principle and origin and sharply opposed to each other in every way. Nevertheless, in concrete experience they co-operate, always being found in correlation. But in the end, Bergson maintains that the memory, as the inner spiritual principle, is primary and that it subordinates to itself the body and the life of perception. Progress consists in bringing the past to bear upon the present, in prolonging memory through perception, in the embodiment of the spiritual in the material, in making the inner outer.

James E. Creighton, Professor of Philosophy, Cornell University.

BERGSTROM, Hjalmar, Danish playwright: b. 1868. In 1893 he became a teacher in the Brockshes Commercial School, where he remained until 1905. He is a member of the commission for the preservation of the manuscripts of neglected Danish dramatists and one of the directors of the Danish Dramatic Society. Most of his plays were first produced in Copenhagen at the Royal Theatre. Among the most important are 'Ida's Wedding' (1902); 'Mønterågade 39' (1904); 'Lynggaard & Co.' (1905); 'The Golden Fleecer' (1908); 'The Birthday Party' (1910); 'The Way to God' (1912). 'Lynggaard & Co.' has been translated into English by Edwin Bjorkman in 'The Modern Drama Series' (New York 1913).

BERGUES, bär, France, town in the department of Le Nord, in a marshy district, five miles south of Dünkirck; pop. (1911) 4,856. It is situated at the confluence of three canals, one of which admits vessels of 300 tons' burden and connects Bergues with Dünkirck and the sea. This circumstance, united with its central position, makes it the entrepôt of the adjoining country. It has manufactures of beer and oil and also sugar and salt refineries. It ranks as a fortress of the second class, is built of brick and has facilities for laying the valley under water as a defensive measure in war time. Its principal edifices are the townhouse and a beautiful and richly ornamented belfry about 160 feet high. It owes its name to the bergues, which Saint Winnoc retired in 902, was first fortified by Baldwin II, Count of Flanders, afterward adorned with a magnificent monastery of Saint Winnoc by Baldwin IV, and in the 13th century possessed flourishing manufactory. It has suffered all the vicissitudes of a frontier fortress; it was finally taken by Louis XIV in 1667, and Vauban so effectively fortified it that the English found it impregnable in 1793.

BERGUT, or BEARCOOT, the Tartar name in Central Asia for the golden eagle (see EAGLE), there trained by Kirghiz for use in falconry.

BERHAMPUR, bĕr-ham-poor', India, the name of two towns. (1) The capital of the Ganjam district, Madras, 525 miles northeast of Madras, with which it is connected by rail. A good road leads from it to the coast town of Gopalpur, nine miles distant. As the headquar ters town of the district, it contains the usual official buildings. (2) A town of the Moorshedabad district, Bengal, on the left bank of the Bhagirathi, five miles south of Moorshedabad. Berhampur was at one time a large military station of the British. It contains a college, hospitals and churches. The cantonment has been abandoned. The town has manufactures of gold, embroidered turbans and tussah-silk cloths. Improved sanitation methods have made the place the equal of any in Bengal for healthfulness. The first open act of the Sepoy mutiny took place here on 25 Feb. 1857. The town contains a government college. Pop. 22,777.

BERI-BERI, bâ-ri-bâ-ri. This is the strange name for a disease of which but few cases are seen in the United States, but in Oriental countries and in the Philippines it is of common occurrence and is especially prevalent in Japan. It is also very common in Ceylon, Java, Borneo and the Malay countries elsewhere. It is a member of the group of diseases called tropical diseases which at the present time, when all the nations of the world are neighbors and mutually interested in each other, for purposes of trade if for nothing else, are being constantly investigated. The word originated in Ceylon and simply means great weakness, in Japan it is called Kakke, while the English equivalent is tropical endemic multiple neuritis. It is common not alone among the common people in tropical countries, but is also often seen in camps, hospitals and on ships.

Multiple neuritis is a disease which is very well known in this country, very painful, disfiguring, protracted and fatal. If a large number of people were constantly affected with this disease at the same time and in the same region of territory it would be called endemic multiple neuritis, and if they were in a tropical country it would be called beri-beri.
Multiple neuritis, in temperate climates, can come from a great many causes, from the free use of alcohol in any form, from poisoning by arsenic, lead, mercury or phosphorus, from syphilis, from typhus, from the cold and wet, poor food and poor home surroundings, and some of these causes are often at work when the disease is called beri-beri.

So many diseases are the result of germ life and action, it was thought for a long time that it must be such a form of the infectious class. Yet no such germ has been found, though when it is associated with other diseases like syphilis, malaria and the infectious fevers, the specific germs of those diseases will of course be present. It is chiefly observed in those countries in which rice forms the principal article of food for the majority of the people, and about 20 years ago it began to be suspected by those who were studying the disease in the islands of the East India archipelago that there must be a relation between a diet of rice and this disease, especially after it was observed that those who had multiple neuritis as a result of insufficient food and those who were fed on a diet of polished rice, that is, rice from which the husk has been removed, suffered with the same symptoms.

In experiments which were made on fowls the symptoms of multiple neuritis were produced when they were fed on polished rice but not when they were given the unhusked or red rice. Similar results were obtained on human beings in Java, in the Malay Peninsula, and in the Philippines, and hence it was concluded that the husk of rice like the husk of wheat contains important mineral constituents, probably phosphorus in particular, the lack of which resulted in the development of beri-beri. When those who suffered with this disease were fed with rice bran they at once began to improve and steadily got well. In this disease there is injury or destruction of the ends of the nerves which go to the skin, with consequent loss of sensation, and of those which go to the muscles, with loss of motion and gradual withering, the heart muscle becomes flabby and weak and the liver, kidneys, lungs and spleen become congested. There are two forms of the disease, the wet and the dry.

In the wet form there are dropical swellings of the tissues, especially of the legs and ankles, and the cavities of the body, the abdomen, the chest and the pericardium, which surrounds the heart, become more or less filled with fluid. This of course produces great weakness, difficulty in walking, standing and breathing, weak heart action and frequently death within a few days. The disease often begins with a chill and besides the symptoms already mentioned there are fever, nausea, vomiting of blood, albumen in the urine, etc. Should the disease take a favorable turn the bad symptoms will gradually subside leaving more or less paralysis and withering of the muscles which after weeks or months may entirely disappear. In the dry form of beri-beri the disease progresses slowly and is less fatal than the wet form. It begins with neuralgic pain in the extremities and with changes in the nutrition of the skin. There are cramps, tenderness to the touch, deformity of the joints, paralysis of the muscles and unsteady gait. Then follow disturbances of the stomach, blood poisoning and emaciation, and the disease may continue for weeks, months or years or until some other disease develops and the patient dies. The mortality from both forms of the disease is from 10 to 40 per cent. The most important thing in the treatment of the disease is to change the diet from polished rice to unpolished, that is with the husk intact or ground up in bran with the rest of the cereal. Nutritive measures are all important and mean proper diet, freedom from exposure to wet and cold, freedom from excesses and vice, and avoidance of infectious tropical diseases. Tonics like quinine and strychina must be given, and such drugs as will relieve pain and assist in removing the dropical fluids from the body. Massage, electricity and hot baths also play an important part in the treatment.

BERING, bĕr'ŏng, or BEHRING, Vitus, Danish navigator: b. Horsen 1680; d. 19 Dec. 1741. Being known as a skilful seaman, he was employed by Peter the Great in the navy established at Cronstadt. His talents and the undaunted courage displayed by him in the naval wars against the Swedes procured him the honor of being chosen to command a voyage of discovery in the Sea of Kamchatka. He set out from Saint Petersburg, 5 Feb. 1725, for Siberia. In the year 1728 he examined the northeastern coasts of Asia, discovered the strait named after him and proved that Asia is not united to America. It remained, however, to be determined whether the land opposite to Kamchatka was in reality the coast of the American continent or merely islands lying between Asia and America. On 4 June 1741 he sailed, with two ships, from Okhotsk, and reached the northwestern coast of America. Tempests and sickness prevented him from pursuing his discoveries; he was cast on a desolate island covered with snow and ice, where he died. The account of the voyage was written by the survivor, Steller (Saint Petersburg 1729). Consult also the "Life" by Laridsen (Chicago 1890).

BERING SEA, that part of the north Pacific Ocean between the Aleutian Islands, in 55°, and Bering Strait, 66° N., by which latter it communicates with the Arctic Ocean. It has on its west side Kamchatka and the Adakian country, with the Gulf of Anadyr, and on its east the territory of Alaska, with Norton Sound and Bristol Bay; contains several islands, and receives the Yukon River from North America and the Anadyr River from Asia. It is about 1,000 miles from north to south and 1,500 from east to west. Fogs are almost perpetual in this sea. Ice is formed and melted in the sea every year, the northern part becoming closed to navigation about the beginning of November. The chief islands are the Pribilofs, the Unimaks, Saint Lawrence and Saint Matthew. The northern portion is about 100 fathoms deep, while the southern portion has a depth of from 1,000 to 1,700 fathoms. Pack ice gradually extends southward to a little below the latitude of Saint Matthew's Island, and in winter pack ice is found in fies. The southern limit of the ice usually extends from Bristol Bay, Alaska, to about 35 miles south of the Pribilof Islands though in exceptionally severe winters it reaches as far south as Unimak Pass. It usually leaves the Pribilof Islands about 1 May, and vessels
BERING SEA CONTROVERSY

following in its wake may reach Bering Strait between about 15 and 25 June. A strong and comparatively warm current sets northward at about two to three knots an hour, through Bering Strait, and after following the Siberian shore turns north toward Herald Island. A cold current also passes out through the strait.

BERING SEA CONTROVERSY, an international dispute over the territorial status of that sea, chiefly between the United States and Great Britain, and growing out of attempts of the former to protect its fur-sealing industries there from the Canadian subjects of the latter. This industry rests on three great herds in the north Pacific, which resort regularly to certain islands in the breeding season, from May or June till the autumn storms, then move southward to about 35° N., and gradually work northward the next spring. At the islands the elder males remain with the young on the beach while the females go in search of food, sometimes 200 miles. The younger males or bachelor, two to four years old, herd apart, and should furnish all the commercial seal skins, the pelts of the old males being unsalable and the killing of females a blow at the continuance of the species. But this selection can only be made on shore; pelagic or ocean sealing is at best indiscriminate if done during migrations, and is almost exclusively of females during the breeding season, while every mother seal then killed means a young seal starved ashore. The largest of these rookeries is on the Pribilof Islands in Bering Sea, where the Russian-American Company carried on sealing till theircession to the United States in 1867, when it was taking some 40,000 seals a year; the herd being protected by restrictive regulations. In 1821 Alexander I issued a ukase claiming Bering Sea as Russian property, and forbidding trespass on pain of confiscation; but the United States and Great Britain protested so vigorously that the claim was dropped. After the cession the rivalry of competing companies would speedily have made an end to the seals in the Northern Ocean, as it long since had in the Southern, had not the United States leased the islands for 20 years to the Alaska Commercial Company (which then leased the Russian-sealed islands also) for $55,000 a year and $2.62½ a skin, restricting the catch to 100,000 a year. In fact the company kept a little under that mark; but the contract was so profitable that vessels were soon fitting out from British Columbia, Hawaii and Australia, which intercepted the seals as they passed between the Aleutian Islands northward or southward, or entered Bering Sea and caught the females as they ranged the seas for food. The poaching grew in volume, and a stream of protest from the Alaska Company wound in year after year to the government at Washington, which in 1881 was goaded into officially reversing its former contention, and declared Bering Sea east of the treaty meridian of 1867 American waters, but took no further step till 1886, when under President Cleve land it sealed three Canadian sealers, and three Canadian sealers. Great Britain protested, and proceedings were suspended pending discussion; but in 1887 five more were seized, and the question at once became a matter of serious diplomacy. Secretary Bayard attempted to convene delegates from Great Britain, France, Germany, Sweden, Russia and Japan to meet with our own and frame regulations to prevent the extermination of the northern seals; but in June 1888 Great Britain withdrew, under pressure, and in 1889 the German Government sent a practical menace of war if this was not stopped. There being but three alternatives, abandonment of the sealing interest to destruction, which the country would not endure; seizure of all poaching vessels, which meant war; and arbitration—the latter was decided on in 1890. The same year the Alaska Company, its lease expired, was succeeded by the North American Company; the herd, estimated in 1867 at over 3,000,000 on the Pribilof Islands, had shrunk so enormously under the pelagic sealing that the price had risen from $2.50 to $30 per skin, and the new company’s limit of capture was restricted to 20,000, with a royalty of $10 a skin. On 15 June 1891 a modus vivendi was agreed on, by which the pelagic sealing was by British and American vessels; and on 29 Feb. 1892 a treaty of arbitration was signed, under which on 23 March 1893 a tribunal met at Paris, composed of Baron de Courcel (France), Marquis Emilio Visconti-Venosta (Italy), Gregers W. W. Gram (Sweden-Norway), Lord Hannan (England), Sir John S. D. Thompson (Canada), Justice John M. Harlan and Senator John T. Morgan (United States). The United States case was conducted by the Secretary of State (John W. Foster); counsel, Edward J. Phelps, James C. Carter, Frederick R. Coudert and Henry Blodget. The decision on the logical points was entirely against the United States; Bering Sea was held part of the high seas and no one’s preserve, and seals fera nature and no one’s property. But on the point of equity in our case, that the preservation of the seals from extinction was a common interest of the civilized world, it agreed with us and framed regulations binding for five years to prohibit all pelagic sealing within 60 miles of the Pribilofs, or from 1 May to 31 July in the north Pacific east of 180° or north of 35°, with other regulations. The restrictions proved absurdly ineffective, and Great Britain would not antagonize Canada by sealing the Russian-sealed islands, the pelagic catch was the enormous one of 142,000, far beyond any former record, and for several more seasons was very great, till the herds showed signs of rapid exhaustion. Great Britain obstinately refused to make any change in the regulations till the five years were up, sent an expert to the spot who laid all the blame on the North American Company, and refused to send a delegate to meet those of Russia, Japan and the United States, who agreed to prohibit pelagic sealing of Bering Sea subjects if Great Britain would do so. Meantime it was to put pressure on the latter, Congress prohibited the importation of all sealskins except the North American Company’s, in order to destroy the market for Canadian-sealed skins and make their business unprofitable; but England still refused to agree to the provisional treaty, on the ground that it would injure Canada, was not necessary to protect the seals and that the North American Company was solely in fault. But on 18 Nov. 1897 a joint meeting of English, American and Canadian experts was held and unanimously supported the American co-

553
tension at every point, that the herds had diminished by from 60 to 80 per cent, and markedly so even from 1896 to 1897; that the North American Company was handling its business with entire propriety; that pelagic sealing, involving the killing off of the females, was the sole cause of the reduction, which was threaten-
ing the entire extinction of the fur seal. Another year would bring about the time for changing the Paris regulations, and the United States agreed to prohibit all seal killing, even on the Rribidiy, for a year, but Canada would not consent because it would scatter the crews of her sealing fleet. Meantime, Congress on 14 June 1898 appropriated $473,151.26 to pay for the Canadian vessels seized years before. On 30 May 1898 a joint Canadian and American commission was authorized; it met at Quebec in August, adjourned to November at Washington, continued till February 1899, adjourned to the summer and did not reassemble. Most unfortunately, its scope included all the questions at issue between the two governments; the sealing, the fur seal, the crab, and the otter. The Paris regulations had expired, no new ones had been established, and the seals were left wholly without protection; while even so, "as the United States forbade pelagic sealing to its citizens, while England did not, all the profit of the perishng industry was being reaped by foreigners. The Canadian fleet of 1899 numbered 26 vessels, that of 1900 numbered 33, with a catch of over 35,000 each year, considerably more than half females. The same conditions continuing, the North American Company increased its efforts in order to obtain its share while the seals lasted; and in the Congressional session of 1901-02 it was seriously provided to kill off the entire herd at once, and thus end the question by putting an end to the fur seals. In 1911, an international agreement provided for the conservation of the seal industry. See Alaska: Commercial Development—Fur-Seals. BERING STRAIT AND ISLAND. The strait is the channel that separates Asia from America, and connects the north Pacific with the Arctic Ocean. Its breadth varies from six to forty-five miles; its depth is about 36 miles, and its depth in the middle varies from 29 to 39 fathoms. On both sides are several islands, the strait is barren and rocky, with scanty vegetation. The sea here is frozen over every winter, and foggy, hazy weather is almost perpetual. Whales frequent the strait, and the walrus occurs in vast numbers. The inhabitants on either shore support themselves by the seals and the fish. The climate is severe but those on the Asiatic side are greater superior, both physically and intellectually, to those on the American. The strait is called after Vitus Bering, by whom it was first dis-covered. It was more fully explored by Captain Cook in 1778. Bering Island is in the southwest part of the above sea, off the coast of Kamchatka. It is uninhabited, and is without wood. It has, however, several springs of excellent water. Here the navigator Bering died in 1741.

BERINGTON, Joseph, English Roman Catholic theologian: b. Shropshire 1746; d. Berkshire, 1 Dec. 1827. He was a Catholic liberal, who agitated for the repeal of the tests. In 1779 he published a letter to Fordyce on his "Sermon against Popery." His other works include "State and Behavior of English Catholics from the Reformation till 1780" (1780); "An Address to the Protestant Dissenters" (1786); "History of Abelard and Heloise," with their genuine letters (1787); "History of Henry II" (1790); "Memoirs of Gregorio Panzani," papal legate to England in 1634-36, translated from the Italian (1793); "The Faith of Catholics" (1813), and "A Literary History of the Middle Ages" (1814).

BERIOT, bə-ryō, Charles Auguste de, Belgian violinist: b. Louvain, 20 Feb. 1802; d. there, 20 April 1870. He studied with Richter and Ablowitz, and, in Paris, with Baillot; and became a professor in the Conservatory in Paris and in that of Brussels in 1842. In 1836 he married the celebrated singer, Malibran. In 1851 failing eyesight obliged him to resign. He composed a complete manual for the violin (1858) and wrote seven concertos and a great number of popular compositions, all distinguished by refined taste and great brilliancy. He showed a great advance over his predecessors in his treatment of the violin. His splendid technique and eminent qualities of composer made him the head of the Belgian school of violinists, which through him and his pupils became justly famous.

BERISLAV, bər-əsləf, or BORISLAV, Russia, a fortified town on the Dnieper River in the government of Kherson, 46 miles north-north-east of Kherson. The trade in grain is considerable. The Turks are supposed to have founded a town here in 1450 which they named Kizi-Kerman. Peter the Great wrested it from them in 1695, and later it was named Berislav. Pop. about 12,000.

BERKELEY, George, English philosopher and bishop: b. Kilcarn, Ireland, 12 March 1685; d. Oxford, 14 Jan. 1753. He was educated at Trinity College, Dublin, where he took a keen interest in the philosophical problems then under discussion. He received the degree of A.B. with honors in 1704, being afterward successively scholar and fellow. Almost immediately he began his career of authorship. He published in 1709 his first important work, the "New Theory of Vision," which is the logical preliminary to his system and gives expression to certain of its fundamental principles. A year later his philosophy finds complete statement in the "Treatise Concerning the Principles of Human Knowledge." During the next 15 years Berkeley advanced to a position of prominence in the English Church. In 1711, shortly after his ordination to the diaconate, he published his "Discourse on Passive Obedience," a treatise upon ethics, in which he develops a system of theological utilitarianism. The "Dialogues,"
published in 1711, presented his philosophy in literary form, clothing subtle argument in a garb of rhetorical beauty. In the years immediately following, several new works appeared, accompanied by increasing fame and prosperity. He was appointed, successively to the deaneries of Dromore and of Derry, the latter of which yielded a large income. But this he resigned in order to devote himself to a plan for the establishment of a college in the Bermudas, where the Indians of America were to be educated and christianized. For the furtherance of such a plan he obtained a promise from the government for a grant of £20,000. Upon the strength of this he sailed for America in 1728, accompanied by his wife and a few friends. They went first to Rhode Island, where they planned to await the expected grant. Here Berkeley purchased a farm and waited three years in quiet and study. Finally, upon the failure of the government to make good its promise, he was compelled to give up his cherished plan and return to England in 1731. Soon after his return he was made bishop of Cloyne. During the remaining years of his life he published a number of works upon philosophy, economics and other subjects. Notable among these were 'Alciphon, or the Minute Philosopher,' the result of his quiet studies in Rhode Island, and 'Sirius,' a remarkable essay in which the author interweaves his convictions concerning the healing properties of tar-water with the deepest and most profound of his philosophies.

Although the representative English idealist, Berkeley proceeds in his thought from the empirical philosophy of Locke. It was Locke's contention that in knowledge we are concerned with our own ideas only, and that these ideas are derived entirely from experience. He made an important step in eliminating these ideas, however, with reference to their representation of objective or material reality. Ideas of color, sound, taste, etc., called secondary qualities, are subjective processes, and reveal nothing of the material reality behind them. He held that the primary qualities, revealed directly the nature and constitution of that reality which exists without the mind in the material world. Berkeley agreed with Locke that we know only our own ideas, but he attacked vigorously this distinction between primary and secondary qualities. He maintained that ideas of primary qualities are wholly subjective, and tell us no more of the nature of material reality than do our ideas of secondary qualities. He attempts a partial proof of this in his 'New Theory of Vision,' by showing that distance, magnitude and situation are not directly perceived by sight, but are inferred in an indirect manner. These ideas of distance, magnitude and situation are results of judgment based upon visual sensations. He maintained that visual sensations have no essential relation to the ideas in question, however—they are simply associated with them in experience. For example, consider our idea of distance. We find connected with this idea: (1) Sensation of movement in the eye; (2) confusion in vision due to nearness of the object, and (3) strain of fixation. These sensations are associated by custom with degrees of distance. Hence we have in this idea of distance no direct revelation through vision of the nature of material reality. Rather we have the product of our own judgment, based upon sensations which have themselves no objective reference. So it is with other ideas of primary qualities which have been held to bring us into immediate contact with material reality. In ideas of figure and motion we have sensations of light, color and strain, and the remainder is due to association and judgment. Thus Berkeley concludes that we have in visual ideas not a revelation of the nature of matter, but a mental language of symbols whereby we interpret our sensations of touch, and so regulate our actions as to preserve and promote our lives. In his 'Treatise Concerning the Principles of Human Knowledge,' he uses this conclusion to disprove the existence of a material world apart from, and independent of, the perceiving mind. The very notion of matter or corporeal substance involves insoluble contradiction. By matter is meant inertia, senseless substance in which extension, figure and motion reside. But these so-called attributes of matter, it is said, are ideas in the mind, and are shown to be every whit as subjective as ideas of colors and tastes. Now ideas can be similar only to ideas. Hence to suppose that our ideas copy or represent a material substance that is unperceiving and unperceived, is a class absurdity. Ideas are the only objects of our thought. To exist as an object is to be perceived. (Ess est percipi.) Although confined to our own ideas, we may observe their various characteristics and combinations. Sense qualities are simply states of consciousness. Sense-objects are sensation-complexes. There is in our consciousness a continuous succession of these perceptions, in which we perceive perceptions newly excited, perceptions changed and perceptions obliterated. For all these phenomena there must be some cause. This cause cannot be an idea or combination of ideas; for it is the appearance and arrangement of ideas which must be explained. This cause must be a substance, a ground of existence. But idea or corporeal substance, is an impossibility. We are compelled, therefore, to find the cause of our ideas in an incorporeal, active substance or spirit. But we observe an important difference in the production of our ideas. Those ideas actually perceived are independent of the senses of the individual and are not dependent upon his own mind or will. Hence there must be some other will or spirit which produces them. This is God, the Author of Nature. The ideas of sense are imprinted upon our minds by the direct influence of the Divine Mind. Hence they are strong, orderly and coherent. Their source guarantees their trustworthiness, and with good reason they may be called "real things." In this way our knowledge acquires an objective validity much more adequate than if our ideas were solely produced by the influence of a material substance upon our sense-organs. The laws of nature, which we properly regard, represent the regular operation of the Divine Mind upon our minds. There is consequently no difficulty in distinguishing the order of ideas which is real and objective from the train of subjective fancies and imaginations.

Bibliography.—The best edition of Berkeley's works is that by Fraser (2d ed., Oxford 1902), containing a 'Life.' Consult further

BERKELEY, GEORGE CHARLES GRANTLEY FITZHARDINGE, ENGLISH WRITER: B. 10 FEB. 1800; D. POOLE, DORSETSHIRE, 23 FEB. 1881. IN 1832-35 HE WAS A MEMBER OF THE BRITISH PARLIAMENT; AND FOR A TIME HE WAS IN THE ARMY. HE VISITED AMERICA IN 1861. HIS 'MY LIFE AND RECOLLECTIONS' (1864-66), AN EXTENSIVE WORK, ATTRACTION SOME ATTENTION. AMONG HIS OTHER WORKS ARE 'BERKELEY CASTLE' (1836), ADVERSE REVIEWED IN FRAZER'S REVUE; AND 'BERKELEY TO ATTACK THE PUBLISHER AND FIGHT A DUEL WITH THE CRITIC, DR. WILLIAM MAGINN; 'SANDRON HALL, OR THE DAYS OF QUEEN ANNE' (1840); 'THE ENGLISH SPORTSMAN ON THE WESTERN PRAIRIES' (1861); 'ANECDOTES OF THE UPPER TEN THOUSAND AT HOME AND ABROAD' (1867); AND 'TALES OF LIFE AND DEATH' (1870). HE WAS THE LAST PERSON WHO WORE THE FLAT COCKED HAT KNOWN AS THE CAPEAU PECHE. CONSULT HIS 'RECOLLECTIONS' AND ALSO 'MEN OF THE TIME' (7TH ED.).

BERKELEY, SIR GEORGE, ENGLISH ENGINEER: B. LONDON, 26 APRIL 1821; D. THERE, 20 DEC. 1893. IN 1835 HE BEGAN EXPERIMENTING WITH METHODS FOR OPERATING ATMOSPHERIC RAILWAYS. IN 1841 HE ASSOCIATED HIMSELF WITH ROBERT STEPHENSON AND CONTINUED HIS EXPERIMENTS. ON STEPHENSON'S DEATH HE BECAME ENGINEER OF THE GREAT INDIAN PENINSULAR RAILWAY. IN 1892 HE WAS MADE PRESIDENT OF THE INSTITUTE OF CIVIL ENGINEERS. HE WROTE PAPERS ON ATMOSPHERIC RAILWAYS AND ON THE STRENGTH OF IRON AND STEEL; AND HE KNIGHTED IN 1893.

BERKELEY, SIR JOHN, ENGLISH NOBLEMAN, ONE OF THE PROPRIETORS OF NEW JERSEY: B. 1607; D. 28 AUG. 1678. HE WAS A PROMINENT ROYALIST DURING THE CONTROVERSY OF CHARLES I WITH PARLIAMENT. CHARLES II GRANTED HIM, WITH SIR GEORGE CARTERET, A PROPRIETARY INTEREST IN NEW JERSEY AND CAROLINA.

BERKELEY, MILES JOSPEH, ENGLISH BOTANIST: B. BIGGAR, DERBYSHIRE, 1803; D. SIBBERTOFT, LEICESTERSHIRE, JULY 1889. EDUCATED AT CHRIST CHURCH, OXFORD, HE TOOK ORDERS, WAS CURATE AT MARGATE (KENT) AND MARKET HARBOUROUGH (LEICESTERSHIRE), AND SUBSEQUENTLY WAS MADE VICAR OF SIBBERTOFT. HE SOON BECAME THE LEADING BRITISH AUTHORITY ON FUNGI AND PLANT PATHOLOGY AND WAS ESPECIALLY KNOWN FOR HIS RESEARCHES IN MYCOLOGY. ABOUT 6,000 SPECIES OF FUNGI ARE CREDITED TO HIM; HIS MOST IMPORTANT WORK WAS THE TREATISE ON FUNGI CONTRIBUTED TO FRAZER'S 'ENCYCLOPAEDIA' (1823) AND 'OUTLINES OF BRITISH FUNGAL GROWTH' (1850), AND HE ASSEMBLED A VALUABLE HISTORICAL MONOGRAPH ON MORE THAN 9,000 SPECIES, NOW AT THE Kew Gardens, AND REGARDED AS ONE OF THE MOST IMPORTANT IN THE WORLD. A BIBLIOGRAPHY MAY BE FOUND IN THE CATALOGUE OF SCIENTIFIC PAPERS OF THE ROYAL SOCIETY. CONSULT ALSO 'PROCEEDINGS OF THE ROYAL SOCIETY' (VOL XLVII, 1890) FOR A SKETCH BY HOOKER.

BERKELEY, SIR WILLIAM, AMERICAN COLONIAL GOVERNOR: B. NEAR LONDON ABOUT 1610; D. 13 JULY 1677. HIS FATHER AND BROTHER WERE COLONIAL PROPRIETORS. GRADUATING FROM OXFORD 1629, HE TRAVELED ON THE CONTINENT FOR A YEAR; WAS APPOINTED A COMMISSIONER OF CANADA 1632 AND WON A HIGH REPUTATION THERE. IN 1641 HE WAS MADE GOVERNOR OF VIRGINIA, AND DURING 1642, WAS FOR A TIME VERY POPULAR. HE EXPERIMENTED IN THE CULTIVATION OF RICE, COTTON, INDIGO, HEMP, FLAX AND SILK, THE MANUFACTURE OF POTASH AND NAVAL STORES AND THE CUTTING AND EXPORTING OF MASTS; PLEASED THE ROYALIST PARTY BY EXPELLING THE NEW ENGLAND PURITANS IN 1643, AND ALL PARTIES BY CAPTURING THE INDIAN CHIEF OPEECHANACOUGH IN 1644, AFTER A SERIES OF INDIAN MASSACRES. ALWAYS WITH AN EYE TO PROFIT, HOWEVER, HE RECEIVED FROM THE KING A MONOPOLY OF THE FUR TRADE. DURING THE ENGLISH REVOLUTION HE ADHERED TO THE PROTESTANT SIBLEY AND OFFERED AN ASYLUM TO EXILED OR DISSATISFIED ROYALISTS; MANY HUNDREDS AVAILED THEMSELVES OF THIS. WHEN CROMWELL FELT STRONG ENOUGH HE SENT A FLEET (1651) TO BRING HIM BACK FOR PUNISHMENT; BUT BERKELEY SUCCEEDED IN MAKING CERTAIN TERMS BY MINGLED "BLUFF" AND FINESSE, AND WAS ALLOWED TO RETIRE TO HIS PLANTATION, THOUGH DEPRIVED OF HIS OFFICE. WHEN THE RESTORATION BEGAN TO SEEM PROBABLE, THE COLONISTS ELECTED BERKELEY AS GOVERNOR TO OBTAIN FAVOR IN SUCH AN EVENT; BERKELEY ACCEPTED IT PROVISIONALLY AND CHARLES II ON ACCESSION CONFIRMED IT. BUT IN THE SECOND TERM ALL BERKELEY'S EVIL SIDE SHOWED ITSELF, TILL IT ENDED IN THE ATROCITIES OF 1676. DESPITE EXPELLING AND CONFISCATING THE GOODS OF PURITANS AND QUAKERS, A MEASURE POPULAR AT THE TIME, HE FROWNED ON THE ESTABLISHMENT OF SCHOOLS AND ABSOLUTELY REFUSED TO HAVE A PRINTING-PRESS SET UP, AS MAKING PEOPLE TOO CENSORY OF THEIR SUPERIORS. HE FORMED A COUNCIL OF THE FINEST PLANTERS AND HAVING THEM KNIGHTED IN 1675, AND ABOLISHED RESTORATION OF UNIVERSAL SUFFRAGE, SUBSTITUTE A PROPERTY QUALIFICATION, PURELY AS A PRECAUTION FOR THE FUTURE, AS NO ELECTIONS WERE HELD FOR YEARS BEFORE AND AFTER. THESE, HOWEVER, WERE ONLY MEANS TO THE END OF PROFITING HIMSELF AND HIS FRIENDS, AND THE RAPACIOUS CREW OF OFFICERS SENT OVER BY CHARLES TO QUIET THE PEOPLE'S OPPORTUNITIES. HE TAKES TAXES AND FEES ON THE COLONIES, AND THEY WERE CALLED "ROYALISM". IN 1677 THEY WERE RIOT FOR REVOLT. THE BERKELEY'S SHARE IN VARIOUS EXTRORTIONS, HE HAD ON THE MONOPOLY WHICH LED DIRECTLY TO THE CATASTROPHE, THAT OF THE INDIAN TRADE, WHICH HAD BEEN GOVERNED BY UNDERHAND MEANS. THE COLONY ALLOWED NO TRADE WITH THE INDIANS WITHOUT LICENSE; BERKELEY THEREFORE LICENSED A SMALL NUMBER, AND USING THE PROCEEDS, THEY WERE CALLED WITH THEM, WHICH SECURELY SECURED LIQUOR, FIREARMS AND OTHER THINGS AND EXACTED A THIRD OF THE PROFITS. IT WAS BELIEVED TO BE THIS WHICH LED THEM TO REFUSE PERMISSION TO THE
BERKELEY

556

colonists to protect themselves against the In-
dians in 1675-76, while hundreds of them were
being massacred and tortured and scores of
plantations laid waste, and to dissolve force
after force assembled to protect them. How
Nathaniel Bacon chastised the Indians in spite
of him, was proscribed for it, forced into open
rebellion, drove Berkeley into retreat and
burned his capital, and died at the moment of
his victory, is told under Bacon's Rebellion.
Berkeley's soul was as full of senile fury as it
had been of senile avarice; he slaughtered right
and left, hanging a score of victims with such
vindictive haste and ruthlessness that the assem-
ying naval base or station. Berkeley is a motoring
centre. You may use your automobile every
day. Starting from Berkeley you will find well-
kept boulevards that reach to all parts of the
county and to interior points in California. The
Lincoln Highway, the Midland Trail and the
Pike's Peak Ocean-to-Ocean Road all pass
through Berkeley. Owners of machines declare
this city to be an ideal rendezvous for tourists.
As a summer home Berkeley cannot be excelled.
The average temperature in summer is about 59°
F. In winter the average is about 48° F,
giving a range of something like 11° for the
year. This equable climate is beneficial to
health. It is particularly good for children who
live out-of-doors the year round. Berkeley is
just south of lat. 38 N., 375 miles south of the
latitude of Marseilles, 400 miles south of the
latitude of Nice, Cannes, Mentone and the
famous Riviera, all boasting so many attrac-
tions of climate; on the latitudinal line of south-
ern Sicily, southern Greece and Smyrna. To
the topographical position and the favorable
topographical formation of the surrounding
country must be attributed the enjoyable cli-
matic conditions that prevail in Berkeley.
The average rainfall is about 25 inches. During
the summer months gentle mists or fogs prevail
that are charged with health-giving ozone. Electric lines connect
with Oakland the county-seat adjoining Berke-
ley, and with San Francisco, which is also con-
ected by ferry service. Two transcontinental
railroads, the Southern Pacific and the Santa
Fé systems, pass through Berkeley. The city's
fame rests primarily on its established char-
acter as a saloon and disorderly house. Of
many San Franciscans, to which its attractive
location and scenic surroundings have contrib-
uted. That character it still maintains, with
added qualities which enhance its attractiveness
and the prominence which it has attained lat-
terly because of the advantages that it offers
to manufacturers. Climatic conditions conduce
to efficiency. Even when paid higher wages
for fewer hours, workers here return a greater
profit to the factory per unit than operatives in
any other location, because operatives are able
to keep employed every working day of the
year, with no interruptions on account of ex-
cessive heat or cold. Besides this, Berkeley
enjoys a low rate for electric power—as low
as any city in the country, not even excepting
Niagara Falls; fuel oil for motive machinery
is also procured at small cost, because of near-
tness to the terminals of the pipe lines; level
land and reasonable prices provide for factory
sites; water competition on freight rates by rail;
while railroad facilities and the liberal policy of the municipal au-
torities govern spur tracks and like accommoda-
tions. Above all, the civic and social condi-
tions prevailing in the city.—Berkeley has
neither a saloon nor a disorderly house with
its boundaries.—are big physical points in its
favor with companies and corporations which,
along modern lines, devote thought and care
to clean surroundings for their employees and
those dependent on them. Twenty new fac-
tories were established in Berkeley since the
year 1915 and options on many other sites
were obtained by several companies. The leading
manufactures of Berkeley include aeroplane
and other motors, hydraulic machinery, health
foods, soaps, refined petroleum, coconut oil,
carbonic gas, elevators, pumps, etc. The survey
of manufactures for 1917 recorded 107 in-
dustrial establishments of factory grade, em-
ploying 2,350 persons, of whom 1,828 were
wage earners, receiving annually $3,054,-
000 in wages. The capital invested aggregated
$9,814,000 and the value of the year's output
was $7,321,000: of this, $2,532,000 was the value
added by manufacture. It also carries on luc-
rative fishing industries. As a barometer of
business the upward trend of the number of
the city's postal receipts indicates continuous
and growing prosperity. From $112,444 in
1910 they had increased to $190,338 in 1917.
Property returns for taxation also increased
from $35,736,140 in 1910 to $45,000,000 in 1917.
Not a single dollar on current account was due
to any city creditor and the bonded indebted-
ness amounted to only $1,266,075. As Berkeley
has authority under the law to incur bonded
indebtedness aggregating more than $5,000,000,
the city's paper is regard as sound and backed by
the financial experts of the country. A new and
ample sewer system has been installed at a cost
of $700,000. An efficient fire department is
maintained, with nine stations serving the city's
area of 53 square miles. Fire fighters are all
completely motorized, operating 16 cars.
Double platoon system for the department has
brought more expense, but also has insured
better service, as the men are on full pay, with
no call men. Berkeley was the first city in the
West to introduce the golden rule of the po-
BERKELEY — BERKELEY SPRINGS

lice department, impressing on patrolmen the duty to befriend unfortunate wherever possible. The consequence is that there is less disposition to public drunkenness, where the stern hand of authority is never relaxed even in trivial affairs. There were only four arrests for drunkenness in Berkeley during 1915; eleven in 1916, and seven in 1917. The total arrests for 1915 were 201; in 1916, 307; in 1917, 333. The death rate in 1915 was 7.75 per thousand, which was above the figure of several previous years, on account of the number of elderly people who retire here to enjoy their declining years. The city is the home of a great many men and women above the age of 80 years. Death rate in 1916 was 7.34; in 1917, 7.52. Race suicide does not exist in Berkeley. The average birthrate per thousand is 11.36 and childhood in Berkeley is blessed with favorable conditions, the little ones living in the open air almost constantly. The result is a vigorous lot of youngsters. This is shown by the way in which school children win championships in athletics and swimming, bring them in competition with students from other parts of the State. In 1915 Berkeley built and equipped five new school buildings at a cost of over half a million dollars. These are located in different parts of the city, for the greater accommodation and convenience of parents and pupils. The equipment of these schools is modern in every particular. Berkeley is the acknowledged educational capital of the Pacific coast. The city is not surpassed in this by any other community west of the Rocky Mountains. This is true in respect to all departments of instruction, from kindergarten to the University of California, which has its home here. This university ranks with the great seats of learning in the world. Situated in beautiful grounds covering 250 acres, new buildings at a cost of $2,000,000 are being added to the existing structures. (For full description see California, University of.) In Berkeley also are located the California School of Arts and Crafts, the Cora L. Williams Institute for Creative Education, the State School for the Deaf and the Blind, White's School for Boys, Miss Head's School for Girls, Saint Joseph's Academy for Boys, Saint Joseph's Presentation Academy for Girls, the A to Z School, the Berkeley Business College, the South Berkeley Business College, the Pacific School of Religion, the Berkeley Baptist Divinity School, the Pacific Unitarian School, the Berkeley Outdoor School, the Berkeley Kindergarten and several musical and art schools; also public and school libraries. As a genuine musical centre also, Berkeley is attractive to all who are musically inclined. The Berkeley Music Association, which has a membership of 2,000, gives four or five events a year, the artists being of international fame. The Berkeley Oratorio Society presents two concerts a season at which students are accorded libations; its chorus is one of the most attractive by reason of variety. There are three kinds of clubs: clubs for men; clubs for women; and clubs to which both men and women are admitted. All of these devote much time and attention to the serious affairs of life. This is particularly true of the society clubs of Berkeley, which are merely social organi-

zations, although the society of the community is a highly developed organism. Women here devote much attention to civic betterment and public affairs, as befits their character as voters and law makers. While the natural advantages of Berkeley are highly prized by the citizens and although they undoubtedly attract a great many of the thousands who are coming here annually, yet the real lure of Berkeley is its characteristic hospitality. All comers are welcomed with a broad spirit of Western comradeship that is most inviting. The schools, art institutes, civic centres, fraternal organizations, religious societies and social conditions tend to educate and enrich the lives of those who come here. In all the world there is not a more cosmopolitan community — cosmopolitan in the best sense — that of equal opportunity and equal respect. Character and personal worth are what count in fixing the status of the individual or the family in this community. The settlement of Berkeley dates from the selection of the university site in 1868. The town was incorporated in 1878 and adopted the commission form of government in 1909. Pop. (1900) 13,214; (1910) 40,434; (1918) 63,000. In view of Berkeley's fame as an educational centre it is proper to mention that the city was named in honor of Dr. George Berkeley, Bishop of Derry and Lord Bishop of Cloyne, the great scholar and philosopher, author of the oft-quoted line, "Westward the course of empire takes its way."

WELLS DRURY,
Secretary Berkeley Chamber of Commerce.

BERKELEY, England, market town, 17½ miles southwest of Gloucester, pleasantly situated on the right bank of the Avon, in the rich vale of Berkeley, and celebrated for its castle, where Edward II was confined and barbarously murdered in 1327.

BERKELEY DIVINITY SCHOOL, an Episcopal theological school at Middletown, Conn. It was organized in 1851 by Bishop John Williams of Connecticut while he was president of Trinity College, at Hartford, and was at first intended to be the theological department of the college. It was later (1854) placed upon an independent basis and removed to its present location. The chapel was built in 1851, and the library in 1896. The graduates on the roll of the seminary number (1913) 525, of whom 335 survive, including 20 bishops and many of the best-known clergymen of the Episcopal Church. There are about 30,000 volumes in the library. The value of its buildings is about $100,000, and its endowment fund aggregates $485,000.

BERKELEY SOUND, next to Stanley Sound the most frequented inlet of the East Falkland Island, near its northeast extremity. Though it is difficult to enter, it contains some of the best harbors in the south Atlantic.

BERKELEY SPRINGS, W. Va., town and county-seat of Morgan county, located 126 miles south of the Potomac and 103 miles northwest of Washington, on a branch of the Baltimore & Ohio Railroad. It is in an agricultural region, tomatoes and fruit being extensively raised, and has been widely known and popular for more than a century because of its mineral springs. The site of the town was a part of the vast
estate of Lord Fairfax, and Washington owned considerable property here. It is the oldest pleasure resort in the South, and as far back as the colonial days the gentry of Virginia came here in warm weather and lived in log huts in order to enjoy or be benefited by the baths and swimming pools. Mount Wesley Academy is situated in the town, and there are handle and canning factories, a planing mill and a slate quarry. There is a deposit of silica sand being in the vicinity. Berkeley Springs was incorporated in 1872. Pop. 864.

BERKENHOUT, John, Dutch-English physician and general writer: b. Leeds, about 1730; d. 1791. Having entered the Prussian service, he returned to the rank of captain. In 1756 he quitted that service and entered into that of England, where he obtained the same rank. At the peace in 1760 he went to Edinburgh and began the study of physic; while there he published his 'Clavis Angliae Linguae Botanicae,' a book of great merit, and later his 'Pharmacopoeia Medicina,' which passed through three editions. Other works by him are 'Outlines of the Natural History of Great Britain and Ireland' (3 vols., 1771); 'Essay on the Mad Dog' (1773); 'Symptomatology' (1774), etc. In 1778 he attended the British commissioners to America, and at Philadelphia he was committed to prison, but he soon afterward was set at liberty, and returned with the commissioners to England, where he obtained a pension. He was an industrious writer, and his publications possess considerable merit. Consult Rose, 'New Biographical Dictionary.'

BERKHAMSTEAD, bërk'ham-stëd, or BERKHAMSTED, Great, an urban district, parish and market town in Hertfordshire, England, beautifully situated in a hollow surrounded by hills, on the London & N. W. Railway, 28 miles north of London. It consists almost wholly of one main street, and has a fine old church, restored 1821-87; several chapels and a Berkshire School, with a fine chapel (1895). There are works for wooden ware, a large chemical work, a boat-building yard, brush, coach and mantle factories, an iron foundry, etc. The Poor's Farm was born here in 1731. In the small parish of Little Berkhamstead, some miles to the north, the famous Bishop Ken was born. Pop. 7,302.

BERKHEY, bërk'hi, Johannes Lefranze van, Dutch writer and naturalist: b. Leyden, 3 Jan. 1729; d. there, 13 March 1812. He was early interested in natural history and also studied Latin and Greek. Poetry he reserved for his leisure moments. He resided successively at Amsterdam, Leervict and Leyden, where he was professor at the university. His later years were passed at The Hague. Among his principal works are 'Exposition of Characteristica florum qui dicuntur compositi' (Leyden 1761); 'Letter on the Generation of the Testaceae'; 'Notes on the Best Methods of Preparing the Lands of Holland, both Upper and Lower, so as to Cultivate Them to the Best Advantage'; 'Natural History of Holland' (6 vols., Amsterdam 1769). He also distinguished himself as a poet, though he often manifests a tendency to bombast, and indulges in false pathos. One of his best poems is entitled 'Het Verheerlijk't Leyden.'

BERKSHIRE, England, an inland county, lying in the valley of the Thames, with an area of 450,153 acres or 712 square miles. Its shape is very irregular, and has been compared to that of a shoe or slipper, disregarded the hills crosses the country in a westerly direction, and forms a boundary to the fertile vale of Whitehorse, so called from the gigantic form of a horse which has been scooped out on the side of a chalk hill, so as to become conspicuous to all the country round, referred to in 'Thomas Hughes' 'The Scouring of the White Horse.' The cultivated parts of the county, and more especially this vale, are peculiarly fruitful in barley. They also contain much rich pasturage and many excellent down farms, in the Timber bownds, particularly oak and beech, in Windsor Forest and toward the west. Turnips are an important crop. There are but few manufactures carried on in this county, the principal being agricultural implements and artificial manures, flour, paper, sack and sailcloth, and biscuits (at Reading). Malt is made in great quantities, and chiefly sent to London. The principal towns of Berkshire are Reading (the county town), Newbury, Maidenhead, Wokingham, Wallingford, Windsor, Abingdon, Wantage and Farringdon. Including the boroughs of Windsor and Reading the county returns five members to Parliament. Pop. (1911) 280,794. Consult Graves, 'The Way About Berkshire' (1898).

BERKSHIRES, The, or BERKSHIRE HILLS, a range of mountains in the northwest of Massachusetts, in Berkshire County, stretching 16 miles north and south on the east of the valley of the upper Hoosac River. They are a favorite summer and autumn resort. The highest summits are Great Scott in the North, 3,535 feet, and Mount Everett, or the Dome, in the south, 2,635 feet.

BERLAD, bër-lad', Rumania, a town on the Berlad River, and Teteuci-Basului Railroad, in the district of Tutova, about 68 miles northwest of Bucharest. It is the trade centre of a grain-rising district and has many distilleries. It is a well-built town, with good schools, a theatre, a hospital and a number of institutions for secondary education. Pop. 25,381.

BERLEBURG, bër-le-boorg, or BERLEBURGER BIBLE, a translation of the Scriptures published at Berleburg, Germany (8 vols., 1726-42). Its unknown editors have given an original version with accompanying exposition more or less mystical in character. It has all the merits and demerits of pietism.

BERLICHINGEN, bër-lîn-ing-en, Götz, or Gottfried von, German soldier of fortune: b. Jagathausen 1480; d. 23 July 1562. He was a bold, restless, warlike and honorable knight. At first he served Emperor Frederick the Wise of Silesia, but soon joined himself to Albert of Bavaria. He lost his right hand in 1504, at the siege of Landshut, and in its stead wore an iron one, being thereafter known as Götz of the Iron Hand. He was continually engaged in quarrels with his neighbors, disregarded the edict against private warfare and was twice under the ban of the Empire—in 1512 and 1518. He placed himself at the head of a body of the rebellious peasants, in the war which they waged against their oppressors, but was
soo made prisoner. On promising to refrain from further wars he was later released after two years. For many years he was inactive, but in 1542 he took part in the Hungarian campaign against the Turks, and two years later fought for Charles V against the forces of Francis I. His biography, written by himself, was printed in Strasbourg in 1721 and 1775, and, for the third time, at Breslau in 1813. It was edited by Schönhuth (Heilbronn 1859) and by Müller (Leipzig 1882). This book contains an excellent picture of the social life and customs of the time, and has furnished Goethe with the subject of his drama, 'Götz von Berlichingen, translated by Sir Walter Scott. The best biographies of this typical feudal knight are: Götz, Graf von Berlichingen-Rossach, 'Geschichte des Ritters Götz von Berlichingen mit der eisernen Hand' (Leipzig 1861); and Pallman, 'Der historische Götz von Berlichingen' (Berlin 1894).

BERLIN, Canada, city and county-seat of Waterloo County, Ohio, on the Grand R. and the Grand T. railways, 62 miles west of Toronto. It was settled originally by German immigrants and has rapidly developing manufactures of furniture, leather, boots and shoes, pianos and organs, buttons, gloves, etc.; excellent sewerage system, waterworks, street railway and gas and electric-light plants; a Roman Catholic college, and 15 churches. Pop. 15,196.

BERLIN, Conn., town of Hartford County, 11 miles south of the city of Hartford, on the New York, New Haven and Hartford Railroad. There are brick works and manufactories of paper goods. Pop. 3,728.

BERLIN, Germany, capital of the empire and of the kingdom of Prussia, 180 miles southeast of Hamburg. The river Spree, here nearly 200 feet wide, spanned by several fine bridges, flows through the centre of the city, communicating through the Elbe with the North Sea, and also having canal communication with the River Oder and the Baltic Sea.

History: No authentic record of the earliest settlement of Berlin has come down to us, but it is supposed that the city was founded during the decade from 1230 to 1240. Indeed, the Margraves John I and Otto III are said to have established the city as a stronghold against the Slavs. The name Berlin is probably of Slavic origin, although some scholars trace the word to *Bärlein,* from the fact that a bear appears on the coat of arms of the city. The new city, or town, was situated on the old commercial highway which led from Leipzig to Stettin and was known especially as a market for herring, grain and wood. Cologne (Colonia), the near-by sister city on the river Spree, seems to have been established as an independent municipality simultaneously with Berlin and was united with Berlin temporarily, in the year 1307.

Though the margrave had his castle in the city, the municipal government was left to the mayor and aldermen, who enjoyed full sway.

In 1134 the mark of Brandenburg had come into the hands of Albrecht the Bear, of the house of Ascan, to which family also belonged the founders of Berlin, who ruled in common. After the extinction of this family (1323) the German emperor, Ludwig of Bavaria, gave Brandenburg to his son Ludwig as a fief, who in 1351 passed it to his son, Ludwig the Roman. His successor, Otto the Lazy, sold the mark to the Emperor Karl IV (1373). Karl's son, the Emperor Sigismund, appointed Friedrich von Hohenzollern, Burggrave of Nuremberg, viceroy of the mark in 1411 and made him an elector in 1415. This increased dignity, which indeed had already been worn by Ludwig the Roman, gave the ruler of the mark an importance that redounded to the good of the country and of the city. The first Hohenzollern had a difficult position to fill, in that he had to put down a rebellious and, in part, thievish nobility. This nobility, especially the family of Quitzows, did great damage to the trade of Berlin (1400-10). Just as his father had had to contend with the nobility, Frederick II, the second Hohenzollern, had to fight against the populace of Berlin-Cologne. Soon after he undertook the government he began a strong citadel in Cologne, on the bank of the Spree.

This same citadel, enlarged and extended during the centuries, now serves the present emperor both as a residence and an armory where he receives his princely guests. With the building of the citadel the margrave removed to Berlin; and the result was that Berlin and Cologne had to surrender much of their authority to him. At first the cities had become involved in a dispute over constitutional and administrative matters and had called in Frederick II as arbiter; but soon they were quarreling with the prince himself, and he defeated both of them.

Since Berlin-Cologne has been the residence of the Hohenzollerns the history of the city has been intimately connected with that of the reigning family. The rulers have always been particularly interested in building up the city. In this respect the work of the Great Elector, Frederick William (1640-88), was noteworthy. He added two new wards to the city, Friedrichswerder and Dorotheenstadt, built magnificent fortifications (though later these were removed), and summoned architects and engineers from Holland to finish the palace and public grounds, as the Lustgarten and the Linden-promenade. His successor, Frederick III, the first king of Prussia, added to the city Friedrichstadt and other suburbs. Supported by artists like Schlüter and Esander he enlarged and beautified the palace and gave the city a number of fine statues and public buildings, particularly the Zephyr House, which is one of Berlin's conspicuous monuments of architecture. The fine equestrian statue of the Great Elector, on the bridge near the palace is by Schlüter. Frederick William I was especially interested in building private residences. He made presents of building-lots and even furnished lumber gratis and made other concessions.

His son, Frederick the Great, turned his attention to the erection of new buildings in Potsdam, his favorite residence. After the Seven Years' War, in which Berlin had been burned twice, the King began, at great personal expense, the construction of houses for those who enjoyed his favor. External architecture and beauty was aimed at, rather than convenience. Among the public structures erected by Frederick the Great may be mentioned the two domes of the German and the French church, the King's
Colonade and the Royal Library. In 1763 he established the Royal Porcelain Manufactory.

The famous Brandenburg Gate, a triumphal arch in classic style, was erected in 1793, during the reign of Frederick William II. It was ornamented by the sculptor Schadow with a bronze statue of Victory driving a four-horse chariot. When Berlin was taken by the French in 1807, this was taken to Paris, but was recovered in 1814 after Paris had been taken by the Allies. Under Frederick William III the present Royal Theatre and the Old Museum were built, and under Frederick William IV the statue of Frederick the Great. The wonderful progress made by Berlin during the reign of William I gave the city a quite different appearance in a short time. Buildings of a monumental character, both public and private, sprang up everywhere.

This development has continued; and the present Fragmentary condition of the city entails many practical difficulties. For instance, the city has bought in the suburbs not less than 14,200 hectares of land for the construction of streets and public utilities. The laying of pipes through these neighboring municipalities often gives occasion for long and tedious negotiations. Similar difficulties have formerly attended the construction of streetcar lines. In every case the company in question has had to secure a concession from every suburb concerned. This always involved long negotiations as to details.

Municipal Government.—The administration of the city of Berlin is in the hands of a municipal council of 34 members, including the mayor. Half of these fill honorary positions, half receive pay. Among the salaried members may be mentioned the chief mayor (Oberbürgermeister), the mayor, two syndics, a minister of finance, two school commissioners and two commissioners on buildings. The members of the council are elected, for a limited period, by the board of aldermen. The aldermen themselves are elected by vote of the citizens. The sessions of the council are secret; those of the board of aldermen are usually public. All important innovations require the consent of both bodies. Besides, there are a number of committees, composed of members of the council and of the board of aldermen. In certain branches of the administration the authority of these committees is competent, but in important matters transcending their special departments their authority is conditioned by the consent of the municipal council.

The aldermen, 144 in number, receive no salary, their position being honorary. They are represented by a chairman and his deputy. A further category of honorary and unsalaried officials is formed by the citizen-deputies, who are elected by the board of aldermen; also the poor law guardian and the members of the poor law board. The number of several thousand persons working for the city without any salary is 2,378. The city police force is employed and controlled by the state, under the Ministry of the Interior, but the city has to make appropriation for this object.

Finance.—The city budget for the year 1910-11 amounted to $75,000,000 and the indebtedness in 1904 was $351,000,000.

The receipts come mainly from taxes, in-

2 Palace of Emperor William I
including income tax—levied on incomes just as the corresponding state tax—the special tax on incomes derived from trade, taxes on real estate and on the undivided real estate, and for sewerage purposes. The citizen of Berlin pays on an average not less than $25 a year in taxes.

Public Utilities.—The gas plant is municipally owned. The street lighting system covers an area of 320 miles. The water supply is entirely in the hands of the civil engineer. There are several waterworks, the water being obtained in part from deep wells. Other wells are to be bored soon. Sewerage is also provided for by the city, the waste being brought through pressure pipes to the city's farms in the country, where it is prepared for agricultural purposes. The sewage and drainage system, begun in 1873, was completed in 1911 at a cost of upwards of $42,000,000.

Berlin also has a stock-yard, which serves as a general market for live stock, also a slaughter-house, where all slaughterings must take place. Here the fresh meat is at once officially inspected. All meats shipped into Berlin are inspected, unless an official inspection has taken place. There are retail meat markets, in houses for the retail trade and one special market-house for the wholesale trade.

There are five regular city hospitals and a smaller sick-house, which are open to the public; also three state hospitals and at least 10 other public hospitals, including the large Virchow city hospital. Besides there are three city asylums for the insane. The city also maintains a dissecting establishment for furnishings, flats, etc. There are seven public bathing places for hot baths, and 10 with cold running water.

The city also runs a savings bank ("Sparkasse*). There is also a royal pawn-office, and a number of private benevolent institutions which are, in part, supported by the city.

The Central Employment office is of particular significance, and its management is unusual. In many German cities such an institution is managed directly by the city administration. A special office is fitted up for the purpose, men and women of one kind and another are received and those seeking employment are informed of such opportunities for work. Now, in Berlin, this general employment agency is not directly in the hands of the city, but receives support from the city. This support on the part of the city, which has been extended to $10,000, was given after a number of high city officials had identified themselves with the management of the agency in question, which was called the Central-Verein. This employment agency has a special building for its purposes, containing separate offices for different kinds of work; also youthful applicants are separated from the mature. A number of smaller employment agencies and unions of one kind and another have joined this general union. This condition for thus joining is that an executive committee be formed for each trade, consisting equally of workmen and employers, with a chairman belonging to neither party.

Charities, etc.—The city council spends annually about $80,000, aiding various private charitable associations; for instance, nine organizations for nursing the sick, 15 for the care of children, five for the care of women lying-in, and 43 other aid associations; also 23 educational institutions, besides a large number of foundations partly under the administration, partly under the inspection of the city.

The city has two asylums for the homeless, one for families, the other for such persons as only require a shelter for the night. A similar institution, as "Asyl,* is maintained by a private association. In fact, it is characteristic of Berlin that public and private charity supplement each other. The care of the poor, as such, is in the hands of the city administration, and about 4,000 persons are employed in this work, though in honorary positions and without salary.

In addition to these means of providing for the poor must be mentioned the system of insurance for the working classes. The statute regulating insurance against sickness as passed in 1883, though previous to that time such insurance had already been made compulsory. The obligation is placed upon the employer, who pays the assessments and deducts the amount from the wages of the workman. At present there are 26,000 insurance offices. This kind of insurance under the control of the city council, besides a few branches that are controlled by the state, and a number of private associations. The number of workingmen and women insured already exceeds 700,000, and in 1910 about $7,000,000 was paid out in sick insurance. According to the law, the weekly allowance during sickness is paid for as long as 26 consecutive weeks, but, under special circumstances, it may be paid for as long a period as 52 weeks. The city has built upon its own land homes for the convalescents, which are for the complete recovery of the sick. For the rest the city hospitals are open to the insured, but their expenses must be paid out of the insurance money.

There is in Berlin a state institution for the care of invalid workmen. In connection with the same there are several sanatoria which care for those who are about to become invalids. The sanatorium at Beilitz may be mentioned. It is fitted up in magnificent style and is probably the best sanatorium on the continent of Europe.

Educational Institutions.—In the field of education the University of Berlin takes the first place. It was founded by Frederick William III in 1810. During the winter term of 1910 there were enrolled over 7,500 regular students, besides almost as many more so-called Zuhörer, i.e., mostly persons who have secured permission to attend lectures, but whose previous education is not sufficient to enable them to take up systematic studies leading to a degree. In connection with the university is the Seminary for Oriental Languages.

Further, of special significance is the "Technische Hochschule," which has nearly 3,000 students; also the "Bergakademie," and the Hochschulen for agriculture, for fine art, and for music.

All these are state institutions. To them has now been added a Hochschule for Commerce, which is being erected by the "Aeltesten der Berliner Kaufmannschaft," i.e., is a society of merchants which was licensed by Frederick William III in 1820. Formerly they exercised the function of a board of trade. Since the
Chamber of Commerce was formed some years ago they have had to give up this function and have extended their activity into the field of commercial education.

As to Gymnasium and Realschulen, Berlin has five royal and 20 city institutions. There are besides, 13 city Realschulen, two royal and six city high schools for girls, four city finishing schools, a normal school, a royal seminary for male teachers, a similar one for female teachers and teachers of gymnastics, a royal theatre-school and school for deaf-mutes, a city school for deaf-mutes, and a city school for the blind. Instruction in these schools is free. It may be added that each of the suburbs has its own schools of various kinds.

Museums and Collections.—The more important picture galleries and collections are, the Old and the New Museums, the National Gallery, the Pergamon Museum and the Emperor Frederick Museum—all maintained by the state. Further, the new Museum. Among historical collections may be mentioned the Royal Hohenzollern Museum, the Zeughaus, the Provincial Museum—a city institution, the Post Museum, and the royal museums for anatomy and technology. The library arts are represented by the Royal Museum for Liberal Arts and by the exhibit of the Royal Porcelain Manufactory. Further, there are the royal museums for science, for agriculture, for mining and smelting, and for pathology. The Zoological Garden belongs to a private company, but it is in the nature of a public utility. The Aquarium is also owned by private parties, but is subventioned by the authorities. The state maintains a botanical garden. There are also the Hygienic Museum, the Colonial Museum and the Institute for Hydrography, which serve further the interests of science and the technic of shipbuilding. A curious recent creation is a permanent exhibit of contrivances for the betterment of the conditions of labor. There are three astronomical observatories, a state observatory and two private ones. The latter are always open to the public.

Many libraries, including the Royal Library of about a million volumes, provide opportunities for study in every group.

Monuments and Public Buildings.—There are a large number of monuments on the streets and public squares of the city. A considerable number of them have been erected during the reign of the present Emperor, and, in fact, under his immediate influence.

The number of the palaces and public buildings is likewise very large, though, as compared with other German cities, Berlin is poor in specimens of old architecture.

There are numerous theatres, including the Royal Play House, the Royal Opera House, the New Royal Opera-Theatre, 13 other large theatres, and about a dozen smaller ones, a number of so-called "cabarets," and two permanent circuses.

Churches.—The oldest churches in Berlin are the Nikolai Church and Saint Mary's. Both were built in the 13th century but have been restored. Further, Saint Peter's may be mentioned. There are more than 40 evangelical churches, the most important being the Emperor Frederick Memorial Church, built in 1891, and 95 in beautiful Romanic style (two large neighboring houses are in the same style of architecture); the Emperor Frederick Memorial Church, beautifully situated in the Tiergarten; and the New Cathedral (dedicated in 1905), built in Italian Renaissance style and ornamented with numerous sculptures. Another church was built in 1701-05; and there are also an English and an American church. Saint Hedwig's Church (Catholic) dates from the middle of the 18th century. Of the two larger synagogues, the oldest and finest dates from the year 1866.

Monumental Buildings.—To be mentioned here especially are the Royal Palace, the palaces of Emperor William I, Emperor Frederick and Prince Albrecht, and the palace at Charlottenburg; further numerous state buildings, e.g., those occupied by the Departments of War and Education, the Foreign Office, the Imperial Health Office, the Imperial Insurance Office, the Patent Office, the Algeordnetenhaus, the Wilhembrückerstrasse, Friedrichbrücke, Schloßbrücke, Moltkebrücke and Oberbaumbrücke. Aside from the National Monument, the most note-worthy statues in the central part of the city are those of William I, Frederick the Great, the Great Elector, Frederick William III, Emperor Frederick, Empress Augusta, the two Humboldts, Helmholtz, Luther, Schiller, Waldeck and Schulze-Delitzsch. In front of the Reichstag building is an immense bronze statue of Bismarck. Near by are the statues of Moltke and Kuno and the Column of Victory, which overlooks the 3.8-mile-long German and Prussian statesmen and rulers in the Avenue of Victory. Other notable statues in the Tiergarten are those of Goethe, Lessing, Richard Wagner, Frederick William III and Queen Louise. Some of the numerous fountains worthy of note are the large fountain before the palace, which was designed by Bekas and presented by the city on the accession of Emperor William II; the Hercules Fountain at Lützowplatz, which was designed by Lessing; and the large Reichtag building in the Tiergarten. The magnificent structures of the large banks, stores, breweries, insurance companies, etc., add much to the beauty of the city. The arcade between Frederick street and Unter-den-Linden may also be mentioned.

Bridge, Statuary, Fountains.—The following are the more notable of the monumental bridges in Berlin: Heydtbrücke, Potsdamerbrücke, Belle Alliancebrücke, Kurfürstenbrücke, Wilhelmbrücke, Friedrichbrücke, Schloßbrücke, Moltkebrücke and Oberbaumbrücke. Aside from the National Monument, the most notable statues in the central part of the city are those of William I, Frederick the Great, the Great Elector, Frederick William III, Emperor Frederick, Empress Augusta, the two Humboldts, Helmholtz, Luther, Schiller, Waldeck and Schulze-Delitzsch. In front of the Reichstag building is an immense bronze statue of Bismarck. Near by are the statues of Moltke and Roon and the Column of Victory, which overlooks the 3.8-mile-long German and Prussian statesmen and rulers in the Avenue of Victory. Other notable statues in the Tiergarten are those of Goethe, Lessing, Richard Wagner, Frederick William III and Queen Louise. Some of the numerous fountains worthy of note are the large fountain before the palace, which was designed by Bekas and presented by the city on the accession of Emperor William II; the Hercules Fountain at Lützowplatz, which was designed by Lessing; and the large Reichtag building in the Tiergarten. The magnificent structures of the large banks, stores, breweries, insurance companies, etc., add much to the beauty of the city. The arcade between Frederick street and Unter-den-Linden may also be mentioned.

Trade, Transportation and Population.—The land traffic of Greater Berlin in 1910 amounted to 12,697,965 tons (exclusive of transit trade), and the water-borne traffic to 8,848,900 tons. In that year the value of the exports to the United States and its possessions amounted to $17,172,413. Twelve main lines of railway enter the city, and these are splendidly equipped. An important waterway for large ships from Berlin to Stettin on the Baltic, a distance of 62 miles, was opened on 2 May 1914. It is an extension and deepening of canals previously existing, and is
expected to develop enormously the several trades of the metropolis. The character of the population of Berlin is subject to an internal change, which is caused partly by the building up of new industries, partly by the removal of well-to-do taxpayers to the suburbs. This migration of the wealthier classes is attended by an influx of the laboring classes, especially in the newly built parts of the city, so that the laboring population is constantly increasing. Again, the inner residential part of the city is coming to be used more and more for business purposes, so that here the population is decreasing continuously.

The development of facilities for transportation has contributed much to these changes. The "Stadt bahnh," a railway which crosses the city from east to west, then encircles it both on the north and on the south, was and has been the cause of the wonderful growth of the western suburbs. Migration was encouraged by the exceedingly low fare of 10 pfennings to the fifth station, or 20 pfennings for the entire distance, not to mention the great reduction allowed on monthly tickets. This has led to the building of new stations and of small houses. The highest of the suburbs is due to the "Stadtbahn" and to the institution of suburban trains, on which one may have a monthly ticket at a price varying with the distance.

In this connection must be mentioned also the "Grosse Berliner Strassenbahn." This is a private traction company which owns nearly all the street cars in the city. Since on most of the lines the fare is only 10 pfennings this company has had great influence in the development of the suburbs. The fare is 5 and 10 pfennings. The electric elevated and underground road passes along the southern periphery of the city from east to west. Important extensions of the subway system are now (1916) almost completed. During construction a section under the Spree was flooded on 27 March 1912, happily without loss of life.

Since 1911, when the lease of the operating company expired, the tramway lines within the city have been municipally owned. In 1912 the decision was taken to electrify the entire system of Berlin. By 1918 the large electric engines are to be used in traction, the current for which is to be supplied by two 150,000 horse-power electric plants, one near Bitterfeld coal mines, 80 miles from Berlin, and the other in Berlin. The cost, including stations, cables, feeders and rolling stock, is estimated at $32,000,000. The system has been leased to a company for a period of 30 years. The whole enterprise was completed in 1917.

The bridging of the Havel Valley, completed in 1914, marks an important epoch in the development of Greater Berlin. This engine ring triumph, carried through in despite of bad soil conditions, has involved the building of a dam and two bridges — the Stateserge and the Havel — the latter, 29 feet wide and 537 feet long, with five spans. Under the influence of improved facilities for transportation the composition of the population in the various parts of the greater city has become quite varied. The well-to-do live in the west and in the western suburbs, while the working classes have settled in the east and the north, and partly in the southeast. The large factories are situated in the east and in the northwest. While in Berlin 80 persons out of every thousand pay tax on an income of $750 and upward, the proportion of people in Rixdorf, a southeastern suburb, who have such an income is only 27 out of a thousand. On the other hand, in the wealthy western suburbs, Grunewald and Wilmersdorf, the proportion is 441 and 228, respectively, out of every thousand. Similar differences can also be noted in the interior of the city.

The city maintains a statistical bureau that keeps a careful record of all these conditions. Undoubtedly, such differences in the composition of the population will be found to account for the varying rate of mortality in the different parts of the city, as well as for the varying rate of taxation.

Death Rate.—To be sure, the mortality in Berlin is not only low, but is still decreasing. In 1873 the death rate was 28 per 1,000; in 1885 it had risen to 29.98; in 1898 to 29.16; in 1904 to 18.16; in 1911, 15.59. Still, the rate is not uniform, varying from 8 in the wealthier parts of the city to 22 per thousand in the poorer quarters. The decrease in the rate of mortality is due to the "Stadtbahn" and to the institution of suburban trains, on which one may have a monthly ticket at a price varying with the distance.

In connection must be mentioned also the "Grosse Berliner Strassenbahn." This is a private traction company which owns nearly all the street cars in the city. Since on most of the lines the fare is only 10 pfennings this company has had great influence in the development of the suburbs. The fare is 5 and 10 pfennings. The electric elevated and underground road passes along the southern periphery of the city from east to west. Important extensions of the subway system are now (1916) almost completed. During construction a section under the Spree was flooded on 27 March 1912, happily without loss of life.

Similar differences can also be noted in the interior of the city.

The city maintains a statistical bureau that keeps a careful record of all these conditions. Undoubtedly, such differences in the composition of the population will be found to account for the varying rate of mortality in the different parts of the city, as well as for the varying rate of taxation.

Death Rate.—To be sure, the mortality in Berlin is not only low, but is still decreasing. In 1873 the death rate was 28 per 1,000; in 1885 it had risen to 29.98; in 1898 to 29.16; in 1904 to 18.16; in 1911, 15.59. Still, the rate is not uniform, varying from 8 in the wealthier parts of the city to 22 per thousand in the poorer quarters. The decrease in the rate of mortality is due to the "Stadtbahn" and to the institution of suburban trains, on which one may have a monthly ticket at a price varying with the distance. Though the death rate among children is still high the city authorities are doing everything possible to combat the evil. Building ordinances have been made stricter, and the hygienic conditions of flat-houses have been thereby greatly improved, especially in the newly built portions of the city. Within recent years there has been a decline in the birth rate which was 25.98 in 1906, and 21.64 in 1911.

Tenements.—Still the principal evil persists, i.e., the crowded condition of apartment-houses. On an average such a house in Berlin shelters 77 persons, and the flat of a workman, which usually consists of only two rooms, closet, etc., must not only shelter the family, but provide sleeping quarters for one or two outsiders. The explanation of this is to be found in the relatively high rents for such flats, the minimum being $3 per month, or about one-fourth of a laborer's income. The desire to cut down the rent by letting sleeping quarters to outsiders is the large number of workmen moving into Berlin.

The building of model tenements for the betterment of living conditions among the poor has not taken place to any considerable extent. Aside from a co-operative company that built 269 small homes for workmen in the suburbs, which were sold to the members of the company, there are seven building companies of philanthropic nature, but their houses offer accommodations for less than 10,000 persons. Besides, the administrations of some of the state industries have placed homes at the disposal of their workmen, and both the city and the state aid such benevolent enterprises by furnishing capital at a low rate of interest.

Aside from the evils of high rents, and, consequently, overcrowded flats, the conditions are not bad. The plumbing in the newer flat-houses leaves nothing to be desired. In fact, both in Berlin and the suburbs, the better class of such houses have all modern conveniences, and are comparatively well equipped. The streets.—The streets of Berlin are well cared for and are in excellent condition. Al-
ready 40 per cent of the streets are paved with wood or asphalt, the rest being paved with tar or cement. But the work of improvement continues. The yearly pay-roll for street cleaning amounts to $531,000. Much more is spent now on parks than formerly. Within the city limits there are seven state and five city parks. For the most part the city is illuminated by gas, but, since recently, in part by electricity. The city maintains an efficient fire department, which also acts as a good Samaritan in all cases of distress, whether from fire or otherwise. In accordance with an ordinance of more than a hundred years standing, all buildings must be insured in the city "Feuerkasse." The average insurance valuation per house is $41.500.

Naturally, the great demand for real estate and the more luxurious style of architecture have increased valuations considerably. On an average property is worth about $65 per square metre.

Climate.—The mean temperature is 9° Centigrade, the thermometer varying from about 0.7° below zero in the middle of January to 19° above zero in the middle of July. During the months of December, January and February the mean temperature varies from 0.7° below zero to 0.8° above zero. The mean temperature for other months is as follows: March, 3.5°; April, 8.5°; May, 13.3°; June, 17.4°; July, 18.9°; August, 18.1°; September, 14.6°; October, 9.5°; November, 3.8°. The mean barometer is 76.2, the lowest, 56.9 centimetres. West winds prevail.

While, in general, healthful, the climate has been found to be unfavorable to young children in the summer. Stomach troubles are aggravated by the heat, and the death rate among infants is thereby considerably increased. The city has been free of epidemics for years.

Recent Development.—Since about 1865 the capital city of the empire has had, in many respects, a brilliant development. In this short period the population has trebled, hygienic conditions have been wonderfully improved, and the city has become one of the most beautiful and one of the most visited, cities in the world. More than a million strangers register in the hotels annually, not including the large number of visitors who find their temporary quarters in the numerous hotels and boarding houses of the greater city which are under separate municipal control. Indeed, for the stranger, who cannot see the imaginary boundary lines, it is all Berlin. Socially and industrially it is really only one city, and the entire complex of separate municipal corporations might be fittingly called Greater Berlin.

E. HIRSCHBERG, Ph.D.,
Director of Statistical Bureau of Berlin.

BERLIN, N. H., city in Coos County on the Androscoggin River and on the Grand Trunk and the Boston and Maine railroads, 98 miles northwest of Portland, Me. The surrounding mountains, including Mount Washington, add much to the scenery, and the river supplies a water power equivalent to nearly 20,000 horse power. The chief manufactures are sulphite pulp and paper, in connection with the large lumbering industry. The United States Census of manufactures of 1914 recorded 19 industrial establishments of factory grade employing 2,886 persons, of whom 2,680 were wage earners, receiving annually $1,974,000 in wages. The capital invested aggregated $20,860,000, and the year's output was valued at $13,090,000: of this, $4,245,000 was the value added by manufacture. The city has a public library, a hospital, two theatres, parochial and public schools and a fine municipal building. Pop. (1910) 11,780; (1914) 13,013.

BERLIN, Wis., city in Green Lake County, 97 miles northwest of Milwaukee, on the Chicago, Milwaukee and Saint Paul Railroad, and on the Fox River. There are granite quarries in the vicinity, and the dairying and cranberry growing industries are of considerable importance. It manufactures apiary supplies, bricks, dairy supplies, brooms, gloves, fur coats, mittens, shoes and washboards. It was settled in 1847 and was incorporated in 1856. The government is vested in a mayor, chosen for two years, and a council. Pop. 4,636.

BERLIN, Treaty of. See BERLIN CONGRESS.

BERLIN, University of, a celebrated institution of learning in Berlin, Germany. It is, with the exception of Bonn, the youngest of the German universities, but is probably the most famous of them all. It was founded in 1810, when the Napoleonic victories had left Prussia apparently crushed, and had even transferred her great University of Halle to the newly-formed kingdom of Westphalia. Wilhelm von Humboldt was Minister of Education at the time, and Prussia's debt to him for organizing her national school system, with the University of Berlin at its head, during that period of national defeat and disaster, is certainly very great. It should be borne in mind, too, that Humboldt was ably seconded by Fichte and Schleiermacher. The first rector of the university was Schmalz; the first deans of its faculties were Schleiermacher, Biener, Hufeland and Fichte; and before it was 10 years old it had for professors such men as Niebuhr, Wolf, Böckh, Bekker and Hegel. In more recent years, Ranke, Mommsen, Helmholtz, Grimm brothers, Lepsius, Ritter, Gneist, Savigny, Virchow, and other famous scholars have upheld the reputation which the university won for itself at the very start. There are four faculties, theology, medicine, philosophy, with a total of 377 professors and teachers. It had in 1912 more than 14,000 students, of whom over 8,000 were matriculated. The university also includes several *institutions,* comprising the seminars, the institutes of physics, clinics, museums and observatories. The university is supported by the state and is under control of the Minister of Education. The administration is in the hands of the rector and senate, the so-called "plenum," or full body of professors, and the faculties and judicial powers over its members, exercised by the administration and a university court. Men and women of all nationalities are admitted. The choice of professors for distinguished excellence is still maintained. The library consists of over 200,000 volumes and more than that number of university and school "theses," etc. The chief library facilities for students are to be found, however, in the Royal Library (1,200,000 volumes), in the Reichs Library (13,000 volumes), the Royal War Academy library (94,000 volumes), and the Royal Prussian and Royal Secret Archives; other collections are also accessible.
From 1906-14 the University of Berlin was exchanging professors with Columbia and Harvard, a system by which it maintained permanent chairs at these universities in return for an American professorship at home. The arrangement was in the hands of the Russian government. The ‘Akademische Auskunftstelle’ was recently established as a bureau of information, particularly for foreign students.

BERLIN CONGRESS, a gathering at Berlin, Germany, where the European powers undertook the settlement of the questions growing out of the Russo-Turkish War of 1877-78. The Congress met 13 June 1878; and completed its labors with the signing of a treaty on 13 July following. The Treaty of San Stefano (3 March 1878) between Russia and Turkey did not suit the other powers; and the Congress, convened at the suggestion of Germany, so modified the agreement between Russia and Turkey that the former lost nearly all the fruits of victory. By the new arrangement Bulgaria was divided into two parts, Bulgaria proper and eastern Rumelia. Parts of Armenia and Kars, to Russia and Persia; the independence of Roumania, Serbia and Montenegro was guaranteed; Bosnia and Herzegovina was transferred as protectorates of Austria; and Bessarabia restored to Russia. Greece was also to have an accession of territory. By a sentence previously made between Great Britain and Turkey, the former got Cyprus to administer. Bismarck was the president of the Congress. The more important members were Prince Gortschakoff, Count Andrassy, Lord Beaconsfield, Lord Salisbury, Lord Russell, M. Waddington, Count Corti, Karadódi Pasha, Prince Hohenlohe and General von Bülow. On 9 April 1909 Great Britain and Germany recognized the annexation of Bosnia and Herzegovina by Austria and signed their consent to the abrogation of Article 25 of the Treaty of Berlin. France and Russia took the same action on the following day. Consult Hertsl, ‘The Map of Europe by Treaty’ (Vols. III. and IV., London 1891); Holland, ‘The European Concert in the Eastern Question’ (Oxford 1885); id., ‘Studies in International Law’ (Oxford 1885).

BERLIN DECREES, a decree issued by Napoleon, 21 Nov. 1806, which declared the British Islands in a state of blockade. It forbade commerce with them and trade in their merchandise, and declared all merchandise belonging to Englishmen, or transported from England, lawful prize. Its effect was to inflict great injury on the American carrying trade. See CONTINENTAL SYSTEM.

BERLIN MEMORANDUM, a remonstrance addressed to the Turkish government in May 1876 by the principal European Powers, insisting on a two months' armistice between the Sultan and his European subjects who were in rebellion, in order that terms of peace might be negotiated. See ANDRASSY NOTE.

BERLINER, Emilie, bär-lëñò, ämél, American inventor: b. Hanover, Germany, 20 May 1851. After graduating at Woffenbüttel in 1865, he came to America five years later, and in 1878 was appointed chief inspector of instruments by the Bell Telephone Company. He invented the loose contact telephone transmitter or microphone, known by his name, and the device called the gramophone. He has devoted his energies to perfecting the telephone, and has secured many patents for his inventions. He planned and was a member of the Washington milk conference of 1907. He has been engaged since 1901 in an educational campaign against the dangers of raw milk and other dairy products. He was the first to have made and used in aeronautical experiments the light weight revolving cylinder internal combustion motor, now extensively used on aeroplanes. (1908). He is the author of a number of pamphlets dealing with the prevention of sickness and has published ‘Conclusions,’ a work dealing with philosophical and religious questions.

BERLIOZ, Louis Hector, French composer: b. Côte Saint André, 11 Dec. 1803; d. Paris, 8 March 1869. His father, a physician, desired his son to follow the same career but the latter early in life was greatly attracted to music, and soon found his way to the Paris Conservatory library, where he studied the masters. He studied harmony and composition and composed a mass which was performed at Saint Roch. In 1823 he was admitted to the Conservatory and at once his great talent became evident, and at the same time his disregard for the traditional canons of music, giving expression to his own ideas, Berlioz proceeded by violating all precedents and established rules. As a consequence he was never complete master of the various forms of composition. With his ‘Fantastic Symphony,’ and the cantata, ‘Sardanapalus’ he established a new school of composition which came to be known as the school of program music. Composers of the school seek to express by means of music definite ideas and moods and even to relate definite events. Berlioz had won the Prix de Rome with ‘Sardanapalus’ in 1830 and his residence in Italy furnished him with inspiration for his gifts. He wrote the overture to ‘King Lear,’ and ‘Lélio,’ a symphonic poem. He took up journalistic work successfully for the Correspondant, the Courrier de l’Europe, the Revue Européene and the Gazette Musicale de Paris. His style was marked by its brilliancy and power and by unsurpassing honesty and candor. In 1839 he was made conservator; and in 1852 librarian at the Conservatory. The symphony, ‘Harold en Italie’ (1834), the ‘Messe des morts’ (1837) and ‘Roméo et Juliette’ (1839) won him high praise from the critics, but his opera, ‘Bénuvolo Celi‘ (1838), was a dismal failure. In 1843 Berlioz made a tour of Germany and for the next 10 years he toured Austria, England, Russia and other countries of Europe, and met with success everywhere. In 1856 he was elected to the Academy. ‘Les Troyens’ (1863) proved a failure, which greatly disheartened the composer. His writings on music and musical topics are among the best of their kind. His ‘Traité d’instrumentation’ expressed his views on instrumentation and long remained the first work in its field. In his lifetime Berlioz did not receive his due measure of appreciation. It is true he lacked melodic invention but he was master in all else. His place in the history of music is most important. He exerted a wide influence on the advance in orchestral techniques and was an acknowledged father of modern orchestration.
BERM — BERMUDEZ

BERM, or BERME. In fortification, a narrow, level space at the foot of the exterior slope of a parapet, to keep the crumbling materials of the parapet from falling into the ditch. It is from four to eight feet in width and is about level with the natural ground surface.

In engineering, a ledge or bench on the side or at the foot of a bank, parapet or cutting, to cast away all down the slope, or to strengthen the bank.

BERMEJO, bér-má’hô, a South American river rising in Tarija, Bolivia, and flowing across Argentina to the Paraguay River, which it enters about 140 miles south of Ascension. It is navigable for about half of its length of 1,300 miles. It is of great importance as a waterway from Paraguay to the Andine region. There is a steamer service in operation on the river. It was first thoroughly explored by Cornejo in 1790.

BERMONDSLEY, a metropolitan borough in the southeast of London, England, bounded on the west by Southwark. Area, 1,500 acres. It is a congested district of mean streets, and is the centre of the leather trade. The riverside wharves give employment to numbers of the laboring population. Pop. (1911) 125,903. Consult local histories by Bell (1880), Clarke (1901), Phillips (1841), and Besant’s ‘South London’ (1899).

BERMUDA, bér-mú’da, or SOMERS, ISLANDS, a cluster of small islands in the Atlantic Ocean, belonging to Great Britain, and situated 580 miles southeast of Cape Hatteras and 677 miles from New York. They number 360, but 20 are for the most part so small and so barren that they have neither inhabitants nor name. They were first discovered by Juan Bermudez, a Spaniard, in 1522; in 1609 Sir George Somers, an Englishman, was wrecked here, and after his shipwreck, formed the first settlement. The most considerable of these islands are Saint George, Bermuda or Long Island (with the chief town, Hamilton, population 2,630, forming the seat of the governor), Somerset, Saint David's and Ireland. They are chiefwise as a naval and military station, the strategic importance of which has increased since the construction of the Panama Canal and has led to improvements in the spacious harbor of Saint George. The island of Ireland is occupied by government dockyard and other naval establishments, while Boa and Watford islands have the military depots. The military headquarters are at Prospect. The climate is generally healthful and delightful, the air being mild and moist at all seasons. It is not adapted, however, for consumptive patients. The thermometer seldom falls below 40° F., and rarely rises above 85°. These islands with their scenic attractions have become a popular holiday resort for Americans, and plentiful hotel accommodation is provided at Hamilton. The surface is rather irregular; the soil, though light and stony, is in general rich and fertile. The islands form a nearly continuous chain and are connected almost uninterruptedly by roads, bridges and causeways. The water is in general salt; there is but little fresh except rain-water, preserved in cisterns. The inhabitants export early potatoes, onions, lily bulbs, et., nearly all of these products being shipped to New York. The value of the exports ranges from $585,000 to $635,000 annually; that of the imports from about $2,851,000 to $3,185,000. The revenue is about $405,000. Pop. about 20,000. Consult Bell, E. Y., ‘Beautiful Bermuda’ (New York 1902).

BERMUDA GRASS (Cârpìola dactylon), a perennial grass cultivated in the West Indies and the United States, which has a great value on the sandy soils of the Southern States. It is a valuable fodder grass for warm climates. It will grow in any soil not too damp, but in America it matures only in the extreme south. It is probably a native of India, but has no spread throughout the warmer portions of the globe. It is a low, creeping plant, rooting at the joints and has short flower stalks. It makes a dense sod. It turns brown under frost. Because of its rooting qualities it is dislodged with difficulty once it is well established. It is propagated from root stocks as well as from its seed.

BERMUDA HUNDRED, Va., a peninsula in Chesterfield County, formed by the junction of the Appomattox and James rivers, occupied by Gen. B. F. Butler, who, in 1864, commanded the Army of the James, numbering about 25,000 Federals, where he might intrench himself and await Grant's arrival. In the vicinity of this position there was constant fighting between Butler's troops and those of the Confederates under General Beauregard whose forces were 20,000 strong. In the fighting which continued from 16 May to 30 May. On the 16th Heckman's brigade was destroyed by the Confederates, who were then pushing on to Bermuda Hundred, when Ames and Gilmore came up and Beauregard's plans miscarried. On the 19th the Confederates assaulted the Federal rifle pits under Ames and Terry, but without success. Skirmishing continued until the 30th, when the Confederates desisted. Bermuda Hundred was a valuable position, since it was very near both Richmond and Petersburg; but Butler was charged with military incapacity in having "corked himself up in a bottle." The population of the district was 2,554 in 1910. Consult Johnson and Buel, 'Battles and Leaders of the Civil War' (Vol. IV, New York 1887).

BERMUEZ, Renigio Morales, bár-moo’ðá-th, rá-mé’ð-e-mó-rá’ð, Peruvian statesman: b. Tarapaca province, 30 Sept. 1836; d. Lima, 31 March 1894. He began business in the nitrates trade in his native province. In 1854, as a lieutenant, he joined the revolutionary army which finally overthrew General
BERN—BERNADOTTE 567

Echinique's government. In 1864 he joined the revolution against President Castilla. In the war with Chile he led the force that marched to Arica. When Caceres was elected President in 1886, Bermudez was chosen Vice-President and was elected President in 1890.

BERN, bärn, or bern, Switzerland, the chief canton of the confederacy, situated in the western half and surrounded by the cantons of Neuchâtel, Freiburg, Vaud, Valais, Uri, Unterwalden, Lucerne and Solothurn, being partly bounded also by France and Alsace; area 2,657 square miles. The more northern portion of the canton has beautiful plains and valleys and a fertile and highly cultivated soil, producing corn, wine and fruits; the Emmental, one of the richest and most fertile valleys in Switzerland, raises the finest cattle and produces a celebrated cheese. The southern portion of the canton, the Bernese Oberland, begins at the foot of the high mountain chain between this canton and that of the Valais and extends to its summit. The lower valleys produce good fruit and wine, and in the more northern districts are excellent Alpine pastures; then succeed bare rocks, extensive glaciers (the source of magnificent streams and waterfalls) and some of the highest mountains of Switzerland, as the Finsteraarhorn, the Schreckhorn and Wetterhorn, the Eiger, the Jungfrau. The chief trade of the canton is in linen and woolen manufactures and cattle-raising. Pop. about 550,000.

BERN, Switzerland, the capital of the canton of the same name (see above) and of the whole confederation since 1848, situated on an elevated rocky peninsula, washed on three sides by the Aar, which is crossed by several bridges, including the handsome Nydegg Bridge, the huge iron Kirchenfeld Bridge and the Kornhaus Bridge (opened in 1898), with a roadway 100 feet above the Aar and a principal arch of 380 feet span. The streets are, for the greater part, straight, wide and well paved; and the houses, partly provided with piazzas, are substantially built of stone. The streets are purified by rills of water and fountains. The fountains. The city gets water for its drinking supply and for the motive power of its electric plants by means of a dam 1,000 feet long across the Aar. Among the public buildings are the great Gothic edifice of the Church of the Holy Spirit; the University; the hall of the Swiss Federal Council; the art museum, containing the municipal picture gallery; a hospital; the town-house, a Gothic edifice of the 15th century, restored 1888; the mint, corn hall, historical and archaeological museum; the natural history museum; observatory; deaf-and-dumb institution; infirmary; orphan and lunatic asylums. The public library possesses great treasures of printed books and manuscripts. Trade and commerce are lively; the manufactures consist of woolens, cottons, silks, machinery, chocolate, scientific instruments, etc. It has two great annual fairs and a large cattle and horse market. There are street railroads with compressed air and electricity as motive power. The roads are excellent. At Bern is located the central office of the International Postal Union. The city was founded in 1191 and in 1218 the German Emperor Frederick II declared it a free city of the empire and confirmed its privileges by a charter, which is still preserved. In 1353 it entered into the Helvetic Confederacy. The government of the town from early times was democratic but in the 16th century a tendency toward aristocratic domination set in. The invasion by the French in 1798 overthrew the aristocratic régime. The struggle between Liberals and Conservatives during the 19th century resulted in victory for the Liberals. The Constitution was repeatedly revised in a democratic sense and after 1870 the referendum was developed with great completeness. In 1405 the city was destroyed by fire, but it was afterward regularly rebuilt. The bear, as the heraldic emblem of Bern, figures frequently in a sculptured form; and a number of these animals in the flesh are kept at the cost of the municipality. There is a curious clock-tower containing a mechanism by which the striking of the hours is heralded by the crowing of a cock and a procession of bears. Pop. (1910) 85,264.

BERN, University of, a state educational institution having its origin in a minor school which in the early 18th century was much enlarged by the demand for accommodations for theological students. About 200 years later it expanded by the institution of departments of law, science and medicine. The Napoleonic period seriously affected the university, as it did others near to the French frontier, but in 1834 it was formally reorganized as a state university. It has an income of about 900,000 francs and an endowment of 1,000,000 francs. Its 1,800 students include over 300 women and are divided among the faculties of evangelical theology, Catholic theology, philosophy, law, medicine and veterinary medicine. The library was incorporated in 1905 with the city library at Bern and numbers over 200,000 volumes.

BERNADOTTE, Jean Baptiste Jules, bär-nä-döt', zhön bâptést zhool, king of Sweden and Norway. b. Pau, 26 Jan. 1763; d. 8 March 1844. He was the son of an advocate of Fan and enlisted in a French regiment of marines at the age of 17. He was made a general in 1790 and thereafter his promotion was rapid. In 1794 he was appointed general of division and distinguished himself greatly in the campaign in Germany and on the Rhine. After the battle of Neuwied he was introduced for the first time to Bonaparte, who conceived the highest opinion of his abilities, though a constant suspicion of Napoleon seems always to have been present in the mind of Bernadotte. In 1798 he married Mademoiselle Clary, sister-in-law of Joseph Bonaparte. The following year he became Minister of War, but was shortly obliged to resign. On the establishment of the empire Bernadotte was created Marshal of France and (after Austerlitz) Prince of Ponte-Corvo. At the height of the campaign of 1809, a large army of observation stationed in the north of Germany, he fixed his headquarters at Hamburg. At the battle of Wagram (1809) he led the Saxon contingent. At this time Gustavus IV had been driven from the throne of Sweden. The Duke of Soderbom, who had been placed under the name of Charles XIII; and as he was far advanced in years the Diet had nominated, as his successor, the Prince of Holstein-Augustenburg, when the latter died in a mysterious manner. The heir-apparency to the
Swedish crown was then offered to the Prince of Ponte-Corvo. This offer was accepted by Bernadotte with the consent of the Emperor; and in October 1810 he arrived in Sweden, where, having previously abjured the Roman Catholic religion, he was proclaimed heir-apparent to the throne under the title of Prince Charles John. He had not long been established in this dignity before serious disagreements took place between him and Bonaparte, whose blockade of the Continental ports was very detrimental to the commercial interests of Sweden. The result was a complete rupture and the accession of Sweden in 1812 to the coalition of sovereigns formed against Napoleon. At the battle of Leipzig Prince Charles John contributed effectively to the victory of the Allies. The acquisition of Norway was one of his chief aims; it was provisionally ceded from Denmark under the Treaty of Kiel (1814), but a military campaign was required to make it effective. On the general re-establishment of the European dynasties at the termination of Napoleonic war, Bernadotte retained his position as crown prince and became king of Sweden in 1818, under the title of Charles X. During his reign agriculture and commerce made great advances, many important public works were completed, and the King, though he could not speak their language, was popular with his subjects. Consult Meredith, 'Memoirs of Charles John, King of Sweden and Norway' (London 1829).

Bernard, bër-när', bär-när', or (Fr.) bā-nār', Saint, of Clairvaux, French ecclesiastic: b. Fontaines, Burgundy, 1091; d. 1153. In 1113 he became a monk at Citeaux; in 1115 1st abbot of Clairvaux, near Langres. An austere manner of living, solitary studies, an inspiring eloquence, boldness of language and the reputation of a prophet, rendered him an oracle to all Christian Europe. In 1128 he drew up the rules for the new order of Knights Templars and was instrumental in securing its recognition. He was the founder of 70 monasteries. Such was the spell of his oratory that it is said mothers hid their sons, wives their husbands, companions their friends, that they might escape the contagion of his spiritual enthusiasm. He promoted the Crusade of 1146, with almost fatal success, as of the many thousands who gave up home and kindred to join that adventure, few returned. Its failure, in the face of his glowing prophecies, was a cruel disappointment to him. He succeeded, however, in quieting the fermentation caused about that time by a party of monks against the Jews in Germany. He declined all promotion and in the rank of abbot of his "beloved Jerusalem" (as he used to call Clairvaux), he continued with all humility, but with great boldness, his censures of the laxity of the clergy and his counsels to the Popes. Innocent II owed to him the possession of the right of investiture in Germany and Eugenius III his education. He was, at the same time, the umpire of princes and bishops and his voice in the synods was regarded as divine. By his rigid orthodoxy and his remarkable eloquence, which was always directed to the promotion of practical Christianity, he did much to confirm the faith and influence of the Church in the Middle Ages. His sermons were preached in Latin, he was honored with the title of the "Mellifluous Doctor," and he is esteemed by the Catholic Church as the last of the Fathers. He was a strong opponent of Abelard and Gilbert of Porée in their philosophical teachings. He is the author of two well-known hymns, "Jesus, the Very Thought of Thee," and "O Sacred Head, Now Wounded." He was canonized by Alexander III in 1174. The monks of the reformed order of Cistercians, which he founded, are named in his honor. The 3rd edition of his works is that of Mabillon (Paris 1690, 2 vols.; reprinted Paris 1839-40). Consult the works bearing his name by Eales, S. J. (1890); Morrison, J. C. (1863); Ratisbonne (1841); English trans., (1878); Sparrow-Simpson (1895); Storr's (1893); and Vacandard (1895).

Bernard, Saint, of Montene (Men-thon): b. Montene, Savoy, 923; d. Novara, May 1007. Very little is known of his life except that he was at one time archdeacon of the city of Aosta and that he later entered upon a monastic life and founded the abbeys on the Great and Little Mount Saint Bernard, about 962 A.D. For his biography consult L. Bur-gener (2d ed., Lucerne 1870).

Bernard, Alexis Xyste, Canadian clergyman: b. at Beloeil, 29 Dec. 1847. He was educated at Montreal College, and at the University of Montreal and the College of Sorel, ordained to the priesthood in 1871 and consecrated bishop of Saint Hyacinthe 15 Feb. 1906.

Bernard, bā-nār', Charles de, properly Bernard du Grail de la Villette, French novelist: b. Besançon, 25 Feb. 1804; d. Neufly, 6 March 1850. He entered upon the study of the law, but soon gave it up to engage in journalism. He was a disciple of Balzac, whom he resembles in his power of realistic description and psychological analysis; but he possesses a purer and more nervous style and above all is content with a less minute elaboration of story and characters. His first piece, 'The Gerfal-con', made a hit with its clever description of the literary cliques. Everywhere he evinces clear insight into the foibles of society. Of his novels, the following may be named as only second in rank to his masterpiece, 'The Gerfalcon', 'A Magistrate's Adventure'; 'The Gordian Knot'; 'Wings of Icarus'; 'The Lion's Skin'; 'The Country Gentleman'. He collaborated with C. H. L. Laurençot in producing two comedies. His 'Oeuvres complètes' were published in 12 volumes after his death. For appreciative criticisms consult James, Henry, 'French Poets and Novelists' (1878) and Thackeray, W. M., 'Paris Sketch-Book'.

Bernard, Claude, French physiologist: b. Saint Julien, Rhône, 12 July 1813; d. Paris, 10 Feb. 1878. His parents were small rural proprietors. The parish curé taught Bernard at first, and he continued his studies at the college of Villefranche and at Lyons. He was destined at first for the priesthood, which he soon abandoned for literature. St. Marc Girardin, to whom he submitted one of his works, dissuaded him from following a literary career and Bernard turned to medicine. He paid particular attention to anatomy, dissection and operation. In 1839 he became interne and in this capacity became associated
with Magendie at the Hôtel Dieu. Under the direction of the latter he was soon attracted to the study of physiology and took Magendie’s course at the Collège de France in 1841. In 1843 Bernard published his first work on anatomy and physiology, the same year his thesis on gastric juice secured to him his doctorate. Within a few years his discoveries placed him in the first rank among the physiologists of France and of Europe. In 1847 he assisted Magendie at the Collège de France and succeeded to the latter’s chair of medicine in 1855. In 1854 he entered the Academy of Sciences and entered on his duties in the newly-founded chair of experimental physiology at the Sorbonne. In 1868 he was succeeded at the Sorbonne by Paul Bert and became professor of general physiology at the Museum of Natural History. He was elected to Flourens’ place in the French Academy in 1868, and became senator of the empire in 1869. Bernard exercised a great influence on the science of physiology through his works and his important discoveries, also by his lectures at the museum, and by his activity as president of the Société de Physiologie. In later years he was a world-wide figure and his prestige, gained through his discoveries, was sustained by his personal character. His death caused universal regret. The Chamber of Deputies, on the motion of Gambetta, voted him a public funeral, the first scientist so honored. A monument by Guillemot was erected to his memory on the grounds of the Collège de France. It is difficult to point out in detail all his original discoveries; they cover the entire field of physiology and time has left them almost intact. His works include ‘Leçons de physiologie expérimentale appliquée à la médecine’ (2 vols. 1854-55); ‘Leçons sur les effets des substances toxiques et médicamenteuses’ (1857); ‘Leçons sur la physiologie et la pathologie du système nerveux’ (1858); ‘Leçons sur les propriétés physiologiques et les altérations pathologiques des liquides de l’organisme’ (1859); ‘Leçons sur la chaleur animale’ (1876); ‘Leçons sur la diabète et la glycosurie animale’ (1877); ‘Leçons sur le diabète’ (1886); ‘Physiologie générale’ (1872); ‘Physiologie de l’opéra et de la musique’ (1879); ‘La science expérimentale’ (1878), and ‘Introduction à la médecine expérimentale’ (1876). Consult Mallozzi, G. ‘Bibliographie de travaux scientifiques’ (1881) and the notices by Chauveau, Dartre and Paul Bert in the ‘Proceedings’ of the Société de Biologie for 1886.

BÉNARD, bérnárd, Sir Francis, Eng. administrator; b. Nettleham, England, 1714; d. Aylesbury, England, 16 June 1779. Graduated at Oxford in 1736, he became a distinguished member of the bar, and was made governor of New Jersey 1758-60, and of Massachusetts Bay 1760-69. At first he enjoyed the good will of the people; but when the division into two parties came he favored the Crows and did a great deal toward precipitating the Revolution by his aggressive attempts to strengthen the royal authority. He was finally recalled on account of the unpopularity resultant on his bringing troops into Boston. His departure was the occasion of general rejoicing. He manifested a special interest in Harvard College, and when its library was destroyed in 1764 he obtained funds for its reconstruction. He published ‘Letters to the Ministry’ (1769); ‘Select Letters on the Trade and Government of America’ (1774). In 1846 his ‘Letter-Books’ were purchased by Dr. Jared Sparks, who bequeathed them to the library of Harvard University.

BÉNARD, Jacques, French Protestant clergyman and author; b. Nions, in Dauphiné, 1 Sept. 1658; d. The Hague, 27 April 1718. When the Edict of Nantes was revoked, Bénard went to Holland, and while there founded a school of philosophy and belles-lettres at The Hague. He was for a time assistant professor at Leyden. He became editor of the ‘Bibliothèque Universelle,’ and later editor of the ‘République des Lettres.’ He wrote and published ‘Recueil de traités de paix, de trèves, de neutralité...et d’autres actes publics faits en Europe’ (1700); ‘Actes et mémoires des négociations de la paix de Ryswick’ (1725), etc.

BÉNARD, Montague, English lawyer; b. Gloucestershire, 28 Jan. 1620; d. Overross, 2 Sept. 1882. He was educated at Trinity College, and was professor of international law at Oxford 1859-74. In 1871 he was one of the high commissioners who signed the Treaty of Washington, and on his return home was made a privy councilor. In 1872 he assisted Sir Roundell Palmer in preparing the British case for the Geneva Arbitration Tribunal. He resigned his professorship at Oxford in 1874 because of the multiplicity of his public employments, but he also took an active part in the university. He published ‘Four Lectures on Subjects Connected with Diplomacy’ (1868), and ‘Historical Account of the Neutrality of Great Britain during the American Civil War’ (1870).

BÉNARD, Pierre Joseph, bár-nár, pé-ar zhó-séf, or GENTIL (zhó-niél) BÉNARD, French poet; b. Grenoble, 26 Aug. 1708; d. Choisy-le-Roi, 1 Nov. 1775. At an early age he showed a great taste for poetry, and was at first an attorney’s clerk, but afterward became secretary to Marshal Oudinot, who commanded the army of Italy in 1733-34. After the marshal’s death he obtained a lucrative appointment, through the protection of Madame Pompadour, and was then able to indulge his poetic faculties. Few writers were more popular in their own day than Bernard. He wrote an opera, ‘Castor and Pollux,’ which met with great success; the ‘Art of Loving,’ and a number of odes, songs, etc. His works were collected and reprinted by F. Drujon (1833). Consult ‘Correspondance littéraire, philosophique et critique’ (16 vols., Paris 1877-82), and Voltaire, ‘Correspondance générale.’

BÉNARD, Simon, bár-nár, sé-môń, French engineer; b. Dole, 28 April 1779; d. 5 Nov. 1839. He served as aide-de-camp to Napoleon; was wounded in the retreat after the battle of Leipzig; superintended the defense of Torgau, and was present at Waterloo. In 1816 he came to the United States; was commissioned brigadier-general of engineers, and planned an elaborate system of seacoast defenses, the most important of the works built by him being Fort Mifflin. He was also associated with the building of the Chesapeake and
Ohio canals and the Delaware breakwater. In 1831 he returned to France, where he designed the fortifications of Paris. In 1834 he was appointed inspector-general of engineers, and from 1836-39 was Minister of War.

BERNARD, bérnár'd, William Bayle, Anglo-American dramatist; b. Boston, Mass., 27 Nov. 1807; d. 5 Aug. 1875. His first work was a nautical drama called 'The Pilot.' This proved successful and encouraged him to pursue a literary career. He wrote in all 114 plays, of which the best known are 'Rip Van Winkle'; 'The Messiah'; 'Marie Dundace'; and 'The Boarding School.'

BERNARD, bér'nár'd, Great Saint, a celebrated pass of the Pennine Alps, Switzerland, in the canton Valais, on the mountain-road leading from Montigny to Aosta in Piedmont. On the east side of the pass is Mount Velan, and on the west is the Point de Dromon. On the east side there is no mountain known by the name of Saint Bernard. Almost on the very crest of the pass is the famous hospice, among the highest permanently inhabited spots of Europe, 7,760 feet above the level of the sea. This is a massive stone building capable of accommodating 70 or 80 travelers with beds and of sheltering 300. As many as 500 or 600 have received assistance in one day. It is situated on the highest point of the pass, exposed to tremendous storms from the northeast and southwest, and is tenanted by a prior and 15 brethren of the order of Saint Augustine, who have devoted themselves by vow to the aid of travelers crossing the mountains. The climate of this high mountain town is extremely rigorous. There is a lake on the summit, at a short distance from the hospice, on which ice has frequently remained throughout the whole year. From the difficulty of respiration in so elevated a locality, and the severity of the climate, few of the monks survive the time of their vow, 15 years from the age of 18, when they are devoted to this service. The famous breed of dogs kept at Saint Bernard to assist the brethren in their humane labors have died out, and the breed is now taken by Newfoundland dogs. In the midst of tempests and snowstorms the monks, accompanied by some of the dogs, set out for the purpose of tracking those who have lost their way. If they find the body of a traveler who has perished they carry it into the vault of the dead, where it is wrapped in linen and remains lying on a table till another victim occupies the place. It is then set up against the wall among other dead bodies, which, on account of the cold, decay so slowly that they are often recognized by their friends after the lapse of years. Adjoining this vault is a kind of burying-ground, where the bones are deposited when they accumulate too much in the vault. It is impossible to bury them, because there is nothing around the hospice but naked rocks. The institution is supported partly by its own revenues, partly by subscriptions and donations. The pass appears to have been known at a very early period; and a Roman road led down the Piedmontese side of the mountains. The remains of a massive pavement are still visible; and the cabinet of the hospice contains votive tablets, bronze figures and other antiques found in the vicinity. The hospice was founded in 962 by Saint Bernard of Menon, an Italian ecclesiastic, for the benefit of those who performed pilgrimages to Rome. In May 1800 Napoleon led an army of 30,000 men, with its artillery and cavalry, into Italy by this pass. A carriage road has been built to its summit; but the importance of the pass has diminished with railroads.

BERNARD, Little Saint, a mountain of Italy, belonging to what are called the Grain Alps, about 10 miles south of Mount Blanc. It stands between Savoy and Piedmont, having the valley of the Isère, in the former, on the west, and that of the Dore, in the latter, on the east. The pass across it is one of the easiest in the Alps, and is supposed by many to be that which Hannibal used. The hospice, at the summit of the pass, has an elevation of 7,192 feet.

BERNARD DE CHARTRES, bár'nár de shártr; a writer of the 12th century, who has been lauded as the ablest Platonist of his time, and wrote two works, now lost, in one of which he endeavored to reconcile Plato and Aristotle, and in the other maintained the doctrine of the soul of the sea. There is a massive stone building capable of accommodating 70 or 80 travelers with beds and of sheltering 300. As many as 500 or 600 have received assistance in one day. It is situated on the highest point of the pass, exposed to tremendous storms from the northeast and southwest, and is tenanted by a prior and 15 brethren of the order of Saint Augustine, who have devoted themselves by vow to the aid of travelers crossing the mountains. The climate of this high mountain town is extremely rigorous. There is a lake on the summit, at a short distance from the hospice, on which ice has frequently remained throughout the whole year. From the difficulty of respiration in so elevated a locality, and the severity of the climate, few of the monks survive the time of their vow, 15 years from the age of 18, when they are devoted to this service. The famous breed of dogs kept at Saint Bernard to assist the brethren in their humane labors have died out, and the breed is now taken by Newfoundland dogs. In the midst of tempests and snowstorms the monks, accompanied by some of the dogs, set out for the purpose of tracking those who have lost their way. If they find the body of a traveler who has perished they carry it into the vault of the dead, where it is wrapped in linen and remains lying on a table till another victim occupies the place. It is then set up against the wall among other dead bodies, which, on account of the cold, decay so slowly that they are often recognized by their friends after the lapse of years. Adjoining this vault is a kind of burying-ground, where the bones are deposited when they accumulate too much in the vault. It is impossible to bury them, because there is nothing around the hospice but naked rocks. The institution is supported partly by its own revenues, partly by subscriptions and donations. The pass appears to have been known at a very early period; and a Roman road led down the Piedmontese side of the mountains. The remains of a massive pavement are still visible; and the cabinet of the hospice contains votive tablets, bronze figures and other antiques found in the vicinity. The hospice was founded in 962 by Saint Bernard of Menon, an Italian ecclesiastic, for the benefit of those who performed pilgrimages to Rome. In May 1800 Napoleon led an army of 30,000 men, with its artillery and cavalry, into Italy by this pass. A carriage road has been built to its summit; but the importance of the pass has diminished with railroads.

BERNARD OF CLUNY, Benedictine monk; b. at Morlais, about 1100; d. 1156. He was a member of the Benedictine monastery at Cluny under Peter the Venerable, and is best known as the author of three hymns included in almost every English collection: 'Jerusalem the Golden'; 'For Thee, O Dear, Dear Country,' and 'The World is Very Evil.' These are a part of his 3,000-line poem 'De Contemptu Mundi,' in dactylic hexameters, translated by J. M. Neale.

BERNARD DE VENDATOUR, bár'nár de vón-tá-dór, French troubadour: b. about 1125; d. Daon, about 1197. Love songs 'To Eleonore,' and various amatory lays to courtly dames, form the riches of his delicate verse.

BERNARDAKIS, Demetrios, bér-nár'dá-kís, dám'é-tré-os, Greek poet and dramatist; b. Santa Marina, Lesbos, 2 Dec. 1834. After a course of study at Athens and in German universities he was (with one considerable intermission) professor of history and philosophy in the University of Athens, 1861-82, when he went back to Lesbos. He is author of a spirited Pindaric ode for a jubilee occasion, of several dramas and of a satire, 'The Battle of Cranes and Mice'; he has also written a 'Universal History'; a 'Church History', and a spirited tractate, 'Confutation of a Book,' directed against the would-be Attic purists.

BERNARDES, Diego, bér-nár'dés, dé'gô, Portuguese poet; b. Ponte de Lima about 1530; d. 1605. He was called the 'Sweet Singer of the Lima,' a streamlet immortalized in
his verse. He left his native valley in 1550 and attached himself to the master-singer, Sà de Miranda, who lived retired on his estate, Quinta da Tapada, a devotee of the Muses. Here Bernardes wrote 'The Lima'; 'Various Regensburg verses from Lima's Banks'; 'Various Rimes to the Good Jesu,' and other poems.

BERNARDIN OF SIENA, Italian ecclesiastic: b. Massa, Italy, 8 Sept. 1380; d. Aquila, Abruzzi, 20 May 1444. He became a Franciscan friar in a monastery near Siena in 1404, but desiring to make a pilgrimage to the Holy Land, was appointed a commissary of that country, and was thus enabled to gratify his wish. After his return he acquired a great reputation as a preacher, and three cities were rival suitors for the honor of having him as bishop. Bernardin, however, was unwilling to accept the distinction, and was made vicar-general of the friars of the Observantine order in Italy. He is said to have founded more than 300 monasteries. In 1450 he was canonized by Pope Nicholas V. His works appeared at Venice in 1501 in 4 volumes quarto, and at Paris in 1636 in 2 volumes folio. They consist of essays on religious subjects, sermons and a commentary on the book of Revelation. A biography by J. P. Toussaint was published (1855); and one by L. Bianchi (Siena 1888).

BERNARDINES, bêr-när-dênz. See Cistercians.

BERNARDO DEL CARPIO, bêr-när-do dèl kár-pě-ô, Spanish knight-errant (the fruit of a secret marriage between Ximenia, the sister of Alphonso the Chaste, and of Don Sancho, lord of Saldauga): b. in the 9th century. Alphonso, irritated at the marriage, put out the eyes of Don Sancho and imprisoned him in a castle, but spared Bernardo and brought him up carefully at his court. In course of time Don Bernardo grew up to be a warrior, and distinguished himself in the Moorish wars, in the hope that the King would be bent to pity and set his father at liberty. Alphonsus was inflexible, and Bernardo withdrew to his paternal domains; and leaguing with other lords in the north, he undertook to the conquest of the country in defiance. On the accession of Alphonsus the Great, Bernardo returned to court, and again performed many exploits against the Moors, hoping to be rewarded with his father's freedom. He was once more denied the boon, and withdrew as before, not only leaguing with his friends, but making alliance with the Moors. Alphonsus agreed at length to give up his father on receiving the surrender of the castle of Carpio. Bernardo, true to his word, performed his part of the stipulation, and then learned with indignation that Alphonsus had practised an infamous deception upon him, as his father had been for some time dead. He disclaimed any longer to tread the Spanish soil, and removed to France, where he spent the remainder of his life as a knight-errant.

BERNAUER, bêr-nôv-yard, Agnes, Bavarian lady celebrated for her beauty and her unfortunate fate; d. 2 Oct. 1435. She was the daughter of a poor citizen, said to be a barber of Augsburg. Duke Albert of Bavaria, only son of the reigning prince, met Agnes at a tournament given in his honor by the grandees of Augsburg, became enamored of her, and, as he could not prevail on her to be his mistress, secretly married her. He conducted her to his own castle of Vohburg, and for a time succeeded in concealing the alliance he had contracted; but his father, wishing to marry him to Anne, daughter of the Duke of Brunswick, was compelled to acknowledge his marriage with Agnes. His father refused to credit it, and having caused the Duke to be denied admission to a tournament on the plea that he was living unlawfully with a woman, Albert openly proclaimed his marriage and caused Agnes to be recognized as Duchess of Bavaria, giving her for residence the castle of Straubing on the Danube. The Duke of Bavaria, incensed at this open avowal of his alliance, caused Agnes to be seized in her castle during the absence of his son, brought her before a tribunal specially constituted, where she was accused of magic, and being condemned, had her hands tied together and was thrown into the river. Albert in revenge took arms against his father, but the Emperor Sigismund finally reconciled them. The story is a favorite theme with the Bavarian poets.

BERNAY, bêr-nâ, France, town in the department of Eure, 25 miles west-northwest of Evreux and 17 miles southeast of Lisieux, on the right bank of the Charentonne. It has two fine old churches, a communal college, a hospital, a court of first resort, a board of manufacture, an agricultural society and a savings bank. It has important manufactures of cloth and flannel, tape, linen and cotton goods; and spins a good deal of cotton, thread and worsted. It has also bleachfields, dye works, tanneries, etc. Its trade is principally in grain, cider, cloth, iron, paper, leather, linen, horses and cattle. The horse-fair, held in Lent, is one of the greatest in France, and is attended by purchasers from all parts of the country. Pop. 7,883.

BERNBURG, bêrn-bûrarg, Germany, town in the duchy of Anhalt, capital of the former duchy of Anhalt-Bernburg; on both sides of the Saale, northwest from Leipzig, with which, as well as with Berlin and Magdeburg, it is connected by railway. It is divided into the old, the new and the high town, the first two surrounded by walls and communicating by a bridge 173 feet long. Bernburg is well built and contains several well paved and well lighted streets. The principal building is the palace, situated, with a garden, on the highest part of the high town. It is very ancient, but has received numerous modern additions and contains a picture gallery, theatre and church. Besides an oil-mill and several breweries, distilleries, there are manufactories of paper and earthenware, copper and tin wares, lead, zinc, cement and starch, etc. Old Bernburg was a fortified town as early as the 10th century. Pop. about 35,000.

BERNE-BELLECOEUR, Étienne Prosper, bârn-bel-koor, â-té-ân prós-pér, French painter: b. Boulogne, 29 July 1838; d. 1910. After some years of study under Barras and Picot, he made a reputation by his spirited representations of episodes in the Franco-Prussian War of 1870. He received a first-class medal in the Paris Salon of 1872, the Legion of Honor in
BERNERS — BERNHARDI

1878 and a second-class medal at the Paris Exposition of 1889. His best-known works are 'Cannon Shot'; 'The Intended'; and 'In the Trenches,' the last two in the Metropolitan Museum, New York; 'Attack on the Château'; 'To Arms!'

BERNERS, John Bourchier, boor'ché-a, Lord, English lord, a descendant of the Duke of Gloucester, youngest son of Edward III: b. 1474; d. 1533. He was a member of Parliament, 1495-1529; aided in suppressing the Cornish insurrection, 1497; Chancellor of the Exchequer, 1515; Ambassador to Spain, 1518, and later 7 years governor of Calais. He translated 'Froissart's Chronicles' (1523-25) and other works, his translation of the former being a sort of English classic.

BERNERS, or BARNES, Dame Juliana, lady, English prioress and author: fl. 15th century; daughter of Sir James Berners, who was ushered in the reign of Richard II. Little more is known that she was prioress of the nunnery of Sopewell, near Saint Albans, and has her name prefixed as writer or compiler to one of the earliest and most curious production of the English press. The first edition entitled 'The Treatises Pertnyynge to Hawkyng, Huntyng and Fysshnyng with an Angle' (of which only three perfect copies are known), printed in the abbey of Saint Albans in 1486, treats of hawk-yang, hunting and healdry. A second edition was printed by Wynkyn de Worde in 1496. This work, under the title of the 'Book of Saint Albans,' became a popular manual of sporting science and was many times reprinted in the 16th century. It had latterly been issued in facsimile of the original print.

BERNHARDI, bern'här't, duke of weimar, german soldier (fourth son of Duke John of Saxe-Weimar): b. 6 Aug. 1604; d. 8 July 1639. He entered first the service of Holstein and afterward the Danish army employed in Holstein against the troops of the Emperor. When Gustavus Adolphus entered Germany, Bernhard joined him (1630) and was present at the attack upon Wallenstein's camp in the neighborhood of Nuremberg, 24 Aug. 1632. In the battle of 6 Oct. 1632, he commanded the left wing of the Swedish army and took over the command of the army on the death of Gustavus Adolphus, and, although himself severely wounded, put the right wing of the imperial troops to flight. In 1633 he captured Ratisbon and Straubing and frustrated Wallenstein. His impetuosity caused the defeat at Nördlingen (q.v.), 24 Aug. 1634, where he narrowly escaped being made prisoner. France, now forming an alliance with Sweden (1634), Bernhard carried on the war in the country adjacent to the Rhine, took the fortress of Zabern and vanquished the forces of the Emperor in several battles. A brilliant campaign in 1638 culminated in the capture of Breisach. Friction over the occupation of Breisach is said, on unsubstantial foundations, to have been the cause of his death by poison at the instigation of Richelieu. He died suddenly at Neuburg on the Rhine.

BERNARDI, August Ferdinand, bern'här'd, German scholar: b. Berlin 1769; d. there 1820. In his youth his attention was directed to universal language (that is, to language as far as it is common to all rational beings), to the mystery of its construction—the mathematics, as it were, of language. Bernhardi, considering all different languages as a whole, endeavored to discover a universal grammar common to all. The result of his researches appears in his works, 'Abstract Grammar' (2 vols., 1801); 'Grammar in Its Application' (1803); and 'Elements of the Science of Language,' in which many philosophical principles of language are laid down. He was a professor and director of a classical school in Berlin.

BERNARDI, Friedrich von, Prussian general and military writer: b. 22 Nov. 1849, the son of an able diplomat and historian and grandson of a philologist and his poet wife, the sister of Ludwig Tieck. He was hardly known until the English translation of his 'Deutschland und der nächste Krieg' (1911) was seized upon in England as revealing the cause of the European War. In it he makes some interesting statements, declaring that the conflict between England and Russia was an eventuality determined upon in 1902. He predicted in 1911 the defection of Italy from the Triple Alliance. Recalling the British capture of the Danish fleet in 1807 and the bombardment of Alexandria in 1888, he warned Germany that she would have to fight Russia, France and England (the Entente) with only the assistance of Austria. The Prussian disaster of Jena in 1806 led to a fatal pacifism, which was being repeated in Germany. He had vouched for the opposite. He was devoted to commercialism and enjoyment. He calls war a biological necessity, an indispensable regulative element in the life of man, due to the universal struggle for existence, possessions, power, sovereignty. Only the weary, spiritless ages have toyed with the dream of perpetual peace, and if strong nations establish peace congresses and Hague tribunals he thinks pacific ideals are seldom the real motive of their action but only a cloak under which to further selfish political ambitions. No power exists which can judge between states and make its judgment final. Increase of population and trade rivalry make expansion imperative or nations' decay inevitable. War does more to arouse national life and to expand national power than any other known means. National needs may demand an aggressive war. Most unfavourably situated in the midst of mighty colonial powers, who are determined not to allow German expansion, Germany must be prepared to "gain a start" on her probable enemies. She must strike quick and with all force in order to win. The most efficient and most dangerous foe must be struck first. It is the moral duty of the state to begin the struggle before the rival nations gain a lead which cannot be won back. As Germany was vulnerable only in the northwest, Bernhardi was convinced that in case of war England and France would attempt to turn Germany's strategic right flank between Breisach and Wesel (a fortress near the Dutch border), at the same time seizing a naval base on the northwest coast of Germany. Hence he regarded the neutrality of Belgium as impossible. Germany must maintain a defensive war by seas, controlling the Baltic at all hazards, but must
defeat France decisively on land and destroy her Channel naval ports. The occupation by the Allies of Gembloux must be prevented at all hazards. For Bernhardi the danger is in the west, while Russia's defeat is presupposed, providing Germany is successful in the west. He expects the effective blockade of the German coast and urges the development and vigorous use of the submarine and the aerial service. He is opposed to a sea battle with superior hostile forces, but torpedo-boat attacks by night are recommended. "The blockading fleet must be given no breathing-time, and must be "whittled down." Germany's "whole history may turn upon the impregnability of the fortifications which, in combination with the fleet, are intended to guard our coasts and naval bases, and should inflict such heavy losses on the enemy that the difference of strength between the two fleets would be gradually equalized." He accepts the principle of the submarine blockade and the sinking of all enemy or neutral ships to or from hostile ports. As a popular explanation of Germany's defense, Bernhardi's book is keen and ingenious. Less so is the program of offense in "Unsere Zukunft, ein Mahnwort an das deutsche Volk," to which the translator gives the title "Britain as Germany's Vassal." This translates Turkey's making common cause with the Central Powers from the beginning. Other books by Bernhardi are "How Germany Makes War;" "Cavalry;" "On War of To-day" (trans. by Karl von Donat).

Assistant Professor of German, University of Michigan.

BERNHARDI, Theodor von, German historian and diplomat: b. Berlin, 6 Nov. 1802; d. Kunesdorf, Silesia, 12 Feb. 1887. His diplomatic career was important and afforded him special facilities for compiling a "History of Russia and of European Politics during the Years 1814-31" (1863-77); "Frederick the Great as a Military Commander" (1881); and similar works, all of value.

BERNHARDT, Rosine (b. 5-Sep., 1837, better known as Sarah Bernhardt, French actress: b. Paris, 23 Oct. 1845. Of Jewish descent, her father French, her mother Dutch, her early life was spent largely in Amsterdam. In 1858 she entered the Paris Conservatoire and gained prizes for tragedy and comedy in 1861 and 1862, but her début at the Théâtre Français in "Iphigénie" and Scribe's "Valérie" was not a success. After a brief retirement she reappeared at the Gymnase and the Porte Saint-Martin in burlesque, and in 1867, at the Odéon in higher drama. Her success in Hugo's "Ruy Blas" in 1872 led to her being recalled to the Théâtre Français, since which she has abundantly proved her dramatic genius. In 1879 she visited London and again in 1880, about which time she headed M. Mosa's production of "La Tosca" and "Cléopâtre" in the plays bearing those titles. In 1882 she married M. Demail, a Greek, whom she divorced not long afterward. She visited America again in 1911, appearing in a repertoire of her best-known roles, and in the spring of 1913 returned and played a short engagement, her repertoire consisting of single acts selected from "Phèdre," "Lucrèce Borgia," "La Dame aux Camélias," "La Tosca" and a new one-act play, "Une Nuit de Noël, sous la terreur," written by her son Maurice Bernhardt in collaboration with Henri Cain. Owing to a slight accident, she was unable to walk without assistance during this engagement, but her matchless voice was unimpaired and she received an ovation at every performance. Her position as the first actress of her day is undisputed. She is mistress of every item of stagecraft. With the exception of Coquelin, no actor or actress of her time has approached her in the perfection of her art. In addition to her extraordinary gifts as an actress, she has shown considerable talent in sculpture, painting and stage decoration. Her book of memoirs, "Adrienne Lecouvreur" (1907), is based on the play of the same name by Scribe and Legendre. She was made a member of the Legion of Honor in 1913, and in the same year, in Paris, won one of her greatest triumphs in "Bois d'Or," consult Jules Huret, "Sarah Bernhardt," with a preface by Edmond Rostand (Eng. trans., Philadelphia 1909), and her own "Mémoires" (Paris 1907).

BERNARDY, Gottfried, bern-har-de got-fréd, German classical philologist: b. Landsberg-on-the-Warthe, 20 March 1800; d. Halle, 14 May 1875. He was professor at the philosophical seminary in Halle and librarian of the university. His principal works are "Greek Syntax Scientifically Considered" (1850), a historical study of the subject: "Outlines of Roman Literature" (5th ed., 1872); "Outlines of Greek Literature"; a supplement to the first-named treatise, entitled "Paralipomena Omission" in [the Work on] Greek Syntax (1854-62); and a monumental edition of Suidas' "Lexicon" (1834-53).

BERNI, BERNA, or BERNIA, Francesco, bé-rné, bé-rná or bé-rné-a, Italian poet: b. Lamporecchio, Tuscany, about 1497; d. 26 July 1536. His family was noble but poor, and young Berni went to Florence and, at the age of 19, to Rome, where he lived under the care of his relation, Cardinal Bibbena. At length he entered the service of Ghiberti, bishop of Verona, datary of the papal chancery, as secretary. In the hope of promotion, he took orders; but sought reconciliation in amusements which displeased the prelate. A society had been established in Rome, consisting of young ecclesiastics of a jovial temper like Berni, and of a poetical vein, who, in order to denote their love for wine and their careless gayety, called themselves i vignaiuoli (vine-dressers). They laughed at everything and made sport in verse of the most serious, nay, the most tragic matters. Berni's verses were the most success-
FUL and were written in so peculiar a style that his name has been given to it (maniera bernesca or bernesco). When Rome was sacked by the troops of the Constable Bourbon, 1527, Bernini lost all that he possessed. He afterward made several journeys, with his patron Giberti, to Verona, Venice and Padua. At length, wearied with serving and satisfied with a canonical at the cathedral at Florence, he retired to that place. The favor of the great, however, which he was weak enough to court, brought him into difficulties. He was required to commit a crime, and his refusal is said to have cost him his life. Alessandro de' Medici, at that time Duke of Florence, lived in open enmity with the young Cardinal Ippolito de' Medici. Bernini was so intimate with both that it is doubtful which first made him the proposal to poison the other. Certain it is that the cardinal died by poison in 1535, and it is probable that Alessandro caused Bernini's death. In the burlesque style of poetry, Bernini is still considered the best model. His satire is often very bitter and frequently unites the good humor of Horace with the causticity of Juvenal. The extreme licentiousness of his writings is his greatest fault. Bernini also wrote Latin verses very correctly and was well acquainted with Greek. His 'Burlesque Verses' have great merit; so also has his rifacimento of Boiardo's 'Orlando innamorato.'

BERNICE, in biblical history, was the daughter of Herod Agrippa I and married to King Herod of Chalcis, who was her uncle. After his death she lived with her brother Agrippa, and subsequently became the wife of Ptolemaus, the King of Acaia, but soon left him and returned to her brother. Josephus, Tacitus and Suetonius state that she was mistress of Titus and Vespasian.

BERNICLE or BARNACLE GOOSE, a large goose of northern Europe and Greenland, allied to the brant and named Branta leucopsis, a name identified with strange fables. It differs from the brant mainly in its white cheeks and the lavender-gray of the mantle. This goose is a common winter visitor to western Europe, retiring in summer to Arctic regions to breed, but the region and character of its nesting remain undiscovered. Up to comparatively recent times it was the belief of the European peasants that this goose was born from the stalked barnacles which adhere to driftwood and sometimes to the branches of trees that reach down into the sea at high tide. Circumstantial accounts were given of the birth of the young, whose tiny wings (the waving filaments of the feeding cirripeds) could be seen sticking out of the shells from which they were supposed to escape. So firmly was this fixed in the minds of the people that it is given and illustrated with much detail as truth in many books of the time, and the Roman Church permitted these geese to be eaten on holy days because they were sea-born and therefore 'fish'! What is less generally known is that the cirripeds were named after the bird, as their supposed parent, and not the bird after the crustacean. Bernicle, like 'brant,' refers to the 'burnt' black color of the birds, as explained in the 'English Dictionaries.' Others derive bernicle from hibernaculum, as the bird was supposed to come from Ireland. The name has been adopted as generic for a large group of the geese usually distinguished by sportsmen as 'brants' (q.v.).

BERNIER, bér-ný, Camille, French painter: b. 1823; d. 1902 or 1903. His best known works are 'The Abandoned Lane' (La Rochelle); 'Road near Bannalec' (Nantes); and 'Morning' (Lille).

BERNIER, François, French physician and traveler: b. Angers, about 1625; d. Paris 1688. He set out on his travels in 1654, and after visiting Egypt and Palestine, went into India, where his skill in medicine brought him into notice, and he remained for 12 years, residing chiefly at Delhi, as physician to the great Mogul Emperor Aurungzebe. On one occasion he accompanied the Prime Minister on his march, at the head of an immense army, to the conquest of Cashmere, and in his travels, recording all that he saw, has given accounts full of interest and recognized by subsequent travelers as remarkable for their fidelity. After his return to France he not only compiled his 'Travels' and several volumes of history relating to the empire of the Great Mogul, but turned his attention to philosophical subjects and published an abridgment of the philosophy of Gassendi. He also wrote a treatise entitled 'Traité du Libre et du Volontaire.'

BERNINA, bér-né-ne, a mountain of the Rhaetian Alps, 13,290 feet high, in the Swiss canton of Grisons, with remarkable and extensive glaciers. Its summit was first attained in 1850. The Bernina Pass, which attains an elevation of 7,642 feet and over which a carriage road was completed in 1884, leads from Pontresina to Poschiavo.

BERNINI, Giovanni Lorenzo, bér-né-ne, jò-ván'ne ló-rén'zo, called IL CAVALIERE BER- NINI, Italian sculptor and architect: b. Naples, 7 Dec. 1598; d. Rome, 28 Nov. 1680. His father was a sculptor, and even in childhood he showed remarkable aptitude in this art. Thus richly endowed by nature and favored by circumstances, he rose superior to the rules of art, creating for himself an easy manner, the faults of which he knew how to disguise by its brilliancy. One of his first works was the famous bust of the prelate Montajo; and in this type of art he excelled from first to last. He was not yet 18 when he produced the 'Apollo and Daphne,' in marble, a masterpiece of grace and execution. Looking at this group near the close of his life, he declared that he had made very little progress since the time when that was produced. Without forsaking sculpture, Bernini's genius embraced architecture, and he furnished the design for the canopy and the pulpit of Saint Peter's, as well as for the circular place before the church. Among his numerous works were the palace Barberini, the belfry of Saint Peter's, the model of the monument of the Countess Matilda and the monument of Ugo Capeto and Vittorio. About he had scarcely closed his eyes and Innocent X ascended the papal throne, when the envy engendered by the merits of the artist and the favor bestowed on him broke forth. His enemies triumphed, but he regained the favor of the Pope Pio X, and at the same time he erected the palace of Monte Citorio, Alexander VII, the successor of Inno-
cent X, required of him a plan for the embellishment of the Piazza di San Pietro. The admirable colonnade, so beautifully proportioned to the Basilica, was built under the direction of Bernini. We may also mention the palace Odescalchi, the Rotunda della Riccia and the house for novices belonging to the Jesuits, on Monte Cavallo. Having invited him to Paris, he set out from Rome in 1665, accompanied by one of his sons and a numerous retinue. Never did an artist travel with so great pomp and under such flattering circumstances. The reception which he met with in Paris was highly favorable. He was first occupied in preparing plans for the restoration of the Louvre, which, however, were never executed. Cardinal Rospigliosi having become Pope, Bernini was admitted to an intimate intercourse with him and charged with several works, among others with the decoration of the bridge of Saint Angelo. In his 70th year this indefatigable artist executed one of his most beautiful works, the tomb of Alexander VII. He was buried with great magnificence in the church of Santa Maria in Maggiore. To his children he left a fortune amounting to about 3,300,000 francs. Bernini's favorite maxim was "Chi non ese talvolta della regola, non passa mai." Thus he was of opinion that, in order to excel in the arts, one must rise above all rules and create a manner peculiar to oneself.

BERNINUS, François Joachim de Pierre de, bár-nèš, fróni-svá jō-a-kém dê pé-ár dé, French cardinal and minister of Louis XV: b. Saint Marcel, de l'Ardeche, 1715; d. Rome, 2 Nov. 1794. Madame de Pompadour presented him to Louis XV, who, being pleased with him, assigned to him an apartment in the Tuileries, with a pension of 1,500 livres. He went as Ambassador to Venice, and after his return enjoyed the highest favor at court and soon became Minister of Foreign Affairs. The political system of Europe was changed at that time. France and Austria, hitherto enemies, united in an offensive and defensive alliance, which was succeeded by the Seven Years' War, so unfortunate for France. Bernini has been designated as one of the chief authors of this alliance. Duclos, however, asserts that it was the intention of Bernini to maintain the old system which, since the time of Henry IV and especially since the time of Richelieu, had made France the protectress of the less powerful states of Germany and the rival of Austria. Oppressed by the misfortunes of his country, which, in part at least, were ascribed to Bernini, Bernini surrendered his post and was soon after banished from court. His disgrace lasted till the year 1764, when the King appointed him archbishop of Albi and, five years later, Ambassador to Rome. Here he remained till his death. In the name of his court, and against his own opinion, he labored to effect the abolition of the order of the Jesuits. When the armies of Louis XVI left France in 1791 they fled to him for refuge and lived in his house. The Revolution deprived him of his fortune and the means of indulging his generous disposition. The easy poetry of youth had procured him a place in the French Academy, but he himself is its severest critic. Voltaire had a great esteem for his talents, his judgment, his criticism and his character, as is evident from their correspondence, which, in every other respect, is very honorable to Bernini. A collection of Bernin's works was published in 1797 by Didot, and another in 1825.

BERNOULLI, bär-noo-ge, or BERNOULLI, a family which has produced nine distinguished men, who have cultivated mathematical and physical science with success. The family, emigrated from Antwerp on account of religious persecutions under the administration of the Duke of Alva, fled first to Frankfort and afterward to Basel. Important members of the family were Nicolas (1623-1708), Jakob (1654-1705), Johann (1667-1748), Nicolas (1687-1759), Nicolas (1695-1726), Daniel (1700-82), Johann (1710-90), Johann (1744-1807) and Jakob (1758-89).

BERNOULLI, Daniel, Swiss philosopher: b. Groningen, 9 Feb. 1700; d. 1782. He studied medicine, he took the doctor's degree, and at the age of 24 was offered the presidency of an academy about to be established at Genoa, but in the following year accepted an invitation to Saint Petersburg. Accompanied by his younger brother John, he returned to Basel in 1733; became there professor of anatomy and botany; in 1750 professor of natural philosophy; resigned this place, because of his advanced age, to his brother's son, the younger Daniel Bernoulli, in 1777 and died in 1782. He was one of the greatest natural philosophers as well as mathematicians of his time. At 10 different times he received a prize from the Academy of Paris. In 1734 he shared with his father a double prize, given this academy for their joint essay on the causes of the different inclinations of the planetary orbits. Most of his writings are contained in the Transactions of the Saint Petersburg, Paris and Berlin academies, of which he was a member. His principal work is the 'Hydrodynamics,' in which he first developed the kinetic theory of gases.

BERNOULLI, Jakob, Jacques or James, Swiss mathematician: b. Basel 1654; d. 1705. The differential calculus discovered by Leibnitz and Newton was applied by him to the most difficult questions of mechanics; he calculated the loxodromic and catenary curve, the logarithmic spirals, the evolutes of several curved lines and discovered the "numbers of Bernoulli," as they are called. Unquestionably the most original and able representative of the second generation of eminent mathematicians in this family (see Bernoulli or Bernoulli), he probably outranks also all the other Bernoullis of the 17th and 18th centuries in that quality of intellectual venturing that appears in the posthumous work entitled 'Ars Conjectandi' (1713). Noteworthy are also his 'Conamen Novi Systematis Comtaturum' (Amsterdam 1682); 'Dissertatio de Gravitate & Etheris' (Amsterdam 1683); and the two-volume edition of his works, 'Jaci Bernoulli Basileensis Opera' (Geneva 1744).

BERNOULLI, Johann, Swiss mathematician: b. Basel 1667; d. 1 Jan. 1748. He was one of the greatest mathematicians of his time and the worthy rival of Newton and Leibnitz. He was destined for commerce, but his inclination led him to the study of mathematics. In the year 1683 he principally devoted himself to medicine and mathematics. To him and his brother James we are indebted for an excel-
lent treatise on the differential calculus. He also developed the method of proceeding from infinitely small numbers to the finite, of which the former are the elements or differences, and called this method the integral calculus. In 1690-92 he made a journey to France, where he instructed the Marquis de l'Hopital in mathematics. At this time he discovered the exponential calculus, before Leibnitz had made any communications respecting it, and made it known in 1697. In 1694 he became doctor of medicine at Basel, and in 1695 went, as professor of mathematics, to Groningen, where he discovered the mercurial phosphorus or luminous barometer, for which he received from King Frederick I of Prussia a gold medal and was made a member of the Academy in Berlin, afterward of that of Paris. After the death of his brother in 1705, he received the professorship of mathematics at Basel, which he held until his death. His collected works were published at Geneva in 1742.

BERNOULLI, Nicolaus, nephew of Johann Bernoulli, Swiss mathematician: b. Basel 1687; d. 1759. He studied law but more particularly devoted himself to mathematics; in 1705 went to Groningen to Johann Bernoulli; returned, however, with him to Basel toward the end of the year and became there professor of mathematics. He traveled through Switzerland, France, Holland and England, and in 1713 became a member of the Academies of Science in London and Berlin. On the recommendation of Leibnitz, he went as professor of mathematics to Padua in 1716, but returned to his native city in 1722 as professor of logic. In 1731 he became professor of the Roman and feudal law in that place.

BERNSTEIN, Eduard, leader of the German social democracy: b. Berlin, 6 Jan. 1850. As a young man he edited socialist newspapers in Berlin until the vehemence of his opposition to the government of Bismarck made it desirable for him to leave Germany. After the publication of his criticism of Marxist doctrines he was permitted to return to Germany, where he died in 1910, he became professor of law. In 1902 he became editor of Dokumente des Sozialismus. He contends that every movement for the advancement of the people should be encouraged and taken advantage of by the common people, whom he urges to take an active part in politics. He regrets the materialistic conception of history as inadequate to explain modern social evolution. He was elected to the Reichstag in 1902, failed at the elections of 1907, but was returned in 1912. His published works, besides an edition (1891–93) of the speeches and writings of Lasalle (translated into English, 1893, by E. Aveling), include 'Die Voraussetzungen des Sozialismus und die Aufgaben der Sozialdoktrin' (1899, 1909); 'Zur Geschichte und Theorie des Sozialismus' (1904); 'Die heutige Sozialdemokratie in Theorie und Praxis' (1905); 'Die Geschichte der Berliner Arbeiterbewegung' (1907–10).

BERNSTORFF, Andreas Peter, bernstöf, Count von, Danish statesman: b. 1735; d. 1797. He was the foreign minister 1771–97, and 1797–49. He introduced a "catheter for finance, prepared the abolition of villanage in Schleswig and Holstein. He was instrumental in making an exchange of territory, by which the Gottorp part of Holstein was ceded to Russia for Oldenburg and Delmenhorst. He was a pronounced Liberal, and contended for the freedom of the press.

BERNSTORFF, John Hartwig Ernst, Count von, Danish statesman in service of the King of Denmark: b. Hanover 1712; d. 1772. He was employed in diplomacy and afterward filled with consummate ability the office of Foreign Minister to Frederick V for about 20 years, resigning in 1770. He was called by Frederick the Great the oracle of Denmark.

BERNSTORFF, Johann Heinrich August Count von, German diplomat: b. London, 14 Nov. 1862. He received his early education in England, where his father was the German ambassador—before 1871, Prussian minister. During the Franco-Prussian war he acted as a press agent in London for his government, transmitting to Berlin all the news that might prove useful to his country. Knowing French, he read the indirect revelation by a Paris newspaper of MacMahon's sudden change of march just before Sedan, which news he wired to Berlin. He entered the General Staff (artillery) in 1881, was made attaché at Constantinople in 1889, served in the Foreign Office in 1890, secretary of Legation at Belgrade 1892, Dresden 1894, Saint Petersburg 1896, and Munich 1898. In 1902 he was appointed advisor to the embassy in London, and in 1906 was transferred to Egypt as German Consul-General. On 14 Nov. 1908 he was appointed Ambassador and Plenipotentiary Extraordinary to the United States. From the outbreak of the European War he carried on a strenuous press campaign throughout America with the object of enlisting sympathy for the German cause. During 1915 the United States Department of Justice unearthed a conspiracy carried on in New York by Hans von Wedell and Carl Ruroede to forge passports to enable German reserve officers to return home. Ruroede was arrested and sentenced to three years' imprisonment; von Wedell escaped on a Norwegian vessel, but was of Bernstorff, which was shortly afterward sunk by a submarine. Correspondence seized by the secret service implicated Count Bernstorff's naval and military attachés, Captains Boy-Ed and von Papen, who were dismissed from the United States. Later various checks for large sums to spread pro-German propaganda were traced to Count Bernstorff, who had telegraphed home for authority to spend $50,000 in order to influence Congress. See Consult World's Work (March 1918). See WAR, EUROPEAN.

BERNWARD, Saint, bishop of Hildesheim: b. about 950; d. 20 Nov. 1022. He was equally distinguished in theology and art, devoting himself to painting, gold and mosaic work. About 988 he was charged by the Empress Theophania, widow of Otto III, to undertake the education of her seven-year-old son Otho III, in conjunction with Gerbert (afterward Pope Sylvester II). Bernward taught the young king mathematics; the actual manual which he composed for these lessons is still preserved in the cathedral at Hildesheim. Before the Empress Regent had some years before brought a colony of Byzantine artists and craftsmen from Constantinople. These were settled in Germany,
some building churches and others engaging in painting and enameling. Bernward industriously studied their methods and, from the time he was consecrated bishop (7 Dec. 992) he divided his labors between the administration of his diocese and of converting his episcopal town into a flourishing artistic and literary centre. One of his predecessors had begun the construction of the cathedral, and a large stock of golden ingots and precious stones had been accumulated. Thus the bishop proceeded to utilize for the ornamentation of his church; he melted the gold and fashioned it into decorations, set the stones himself, painted and enameled, and drew architectural designs. He equally cultivated literature; he founded a school for copyists and himself prepared the original manuscripts for them to work from. He also traveled in France and Italy, often taking parties of his pupils with him for their enlightenment. This versatile prelate, whose life has aptly been described as one of the most remarkable biographical monuments of the Middle Ages, combined the functions of priest, teacher, artist and diplomat. He even built the fortifications of Hildesheim, and on at least one occasion accompanied a military expedition in war. He was canonized in 1194, or 172 years after his death.

BERALDO, bér-ral’do, Filippo, Italian scholar; b. Bologna 1453; d. 1505. He gave instruction, chiefly by lectures, at Parma, Milan and Paris; finally, in response to the wish of his fellow-townmen, returning to Bologna, where he spent the remainder of his life as professor of belles-lettres. He is now chiefly known as the editor of some good editions of the classics, and the author of a curious tract entitled 'Declaratio Ephrosi, Sociatoris et Aleatoris,' in which the drunkard, rake and gambler, represented as three brothers, debate which of them, as being the most vicious, should be excluded from sharing in his father's inheritance.

BEROE, daughter of Oceanus; also the name of several women connected with Thrace, Illyria etc.; also a genus of animals, the typical one of the family Beroda. The beroes are oval or globular-rubbed animals, transparent and gelatinous, with two cirri from pole to pole, and two long tentacles fringed with cirri, which aid them in breathing and in locomotion. They have a mouth, a stomach and an anal aperture. They are free swimming organisms inhabiting the sea, sometimes rotating, and at night phosphorescent.

BEROSUS, according to some a Chaldean by birth, and a priest of the temple of Belus at Babylon, and according to others a contemporary of Alexander the Great, is celebrated both as an historian and an astronomer, though it has been supposed that he had been used for the purpose of giving a reputation to what others had written. His history, giving an account of the Babylonian Chaldeans and their kings, consisted of three books written in Greek, and professed to be founded on the ancient archives of the temple of Belus. It has been preserved only in fragments, contained in the writings of Josephus, Syncellus, Eusebius and others. He was also the author of a treatise on Chaldean astrology. According to Pline the astronomical observations contained in the works of Berossus extended over a period of 480 years.

BERQUIN, ARNAUD, bër-kàn, är-nô, French writer; b. 1749; d. 1791. He first attracted notice by poems and translations from the English but is best known for his Prince de Neuvilly, 'L'Ami des Enfants' (1782–83), crowned by the Academy and repeatedly translated. His complete works (20 volumes) were published in Paris in 1803.

BERQUIN, ber-kàn', Louis de, the first Protestant martyr in France; b. 1490; d. Paris, 17 April 1529. He was a gentleman of Artois, a friend of Badius, the savant. When, in 1523, the police began to seize Luther's works with a view to suppressing Protestantism, they found among Berquin's books some manuscripts of his own writing that were pronounced heretical. As he refused to retract, he was thrown into prison. Francis I, whose counsellor he was, obtained for him his freedom; and Erasmus, always his friend, tried in vain to prevent him from exposing his life in a fruitless struggle. His fixed opinions and intrepid nature, however, having thrown him into prison three times, caused him to be condemned to death, and he was burned alive.

BERREDO E CASTRO, bér-re’dô é kash’trô, Portuguese soldier and historian; b. Serpa, about 1560; d. Lisbon, 13 March 1748. Having entered the army, he fought at the battle of Saragossa (1710), so distinguishing himself on that occasion that he was made governor-general of the province of Maranhão, Brazil, and in 1718 he became captain-general of Maragao. The rest of his life was spent upon his history, which is of great value as an original source of information for the period of which it treats. It is entitled 'Annais Historicos, do estudo do Maranhão' (1749).

BERRETTA. See Biretta.

BERRIEN, John Macpherson, American lawyer and politician; b. New Jersey, 23 Aug. 1781; d. Savannah, Ga., 1 Jan. 1856. He was the son of an officer in the war of the American Revolution, graduated at Princeton in 1795, was admitted to the bar of Georgia at the age of 18, and gradually rose in reputation till he was elected, in 1809, solicitor of the eastern district of Georgia. He became judge of the same district the next year, retaining the latter office till 1822, when he entered the Georgia senate, from which he was transferred, in 1824, to the Senate of the United States. He established in that body a high reputation as an orator and statesman, was appointed Attorney-General of the United States in 1829, resigned this office in 1831 when General Jackson's Cabinet became inharmonious, resumed the practice of his profession in Savannah till 1840, when he was elected again to the national Senate, and was re-elected in 1846. BERRUGUETE, bér-roo-gàte, Alonso, Spanish sculptor, painter and architect; b. Paredez de Nava, Spain, about 1486; d. Toledo 1561. He went in or soon after 1504 to Florence, studied in the school of Michelangelo, and became intimate with Bandinelli, and other celebrated artists. In 1523, three years after his return to Spain, he was appointed painter to Charles V. His skill as a sculptor is seen to great advantage in the choir of the cathedral of Toledo. Berruguete's work there was
begun in 1539 and finished in 1548. Authentic paintings by him (and it is to be said that those are few the authenticity of which is about him has been preserved in the surroundings for which they were painted, at Salamanca, and in the old capital, Valladolid, where Berruguete built a house for himself in 1528. See Spain—Spanish Painting, Architecture and Sculpture.

BERRUYER, Joseph Isaac, French Jesuit: b. Rouen 1681; d. Paris 1758. He was the author of a 'History of God's People,' 1728-58, written in a strong, secular vein. It created a scandal when the first part appeared, and the Jesuit General ordered the writer to prepare an expurgated edition, which he did, though the second version was little better than the first, which was devoted to the Old Testament. His work was censured at Rome in 1734; the second part, 'The Gospel,' printed in Paris 1753, was prohibited by the French clergy. When the third part 'Epistles' appeared in Lyons in 1758, Pope Clement XIII declared that the measure of scandal had overflowed, and ordered special prayers to the Holy Trinity for the outrage inflicted by the works of Berruyer.

BERRUYER, Charles Ferdinand, Duc de, second son of the Count d'Artois (afterward Charles X) and Maria Theresa of Savoy: b. Versailles, 24 Jan. 1775; d. 14 Feb. 1820. He was educated along with his elder brother, the Duke of Angoulême. In 1792 he fled with his father to Turin, served under him and Condé on the Rhine, and early learned the art of winning the love of the soldiers. Subsequently he lived alternately in London and Scotland, continually occupied with plans for the restoration of the Bourbons. Landing at Cherbourg, 13 April 1814, he passed through the cities of Bayeux, Caen, Rouen, etc., gaining over the soldiers to the cause of the Bourbons, distributing alms, and delivering prisoners. When Napoleon landed from Elba, the King committed to Berry the chief command of all the troops in and around Paris. All his efforts to secure their fidelity proving ineffectual, he was obliged to retreat on the night of 19 March, with the troops of the household, to Ghent and Alost, where the King then was. The battle of Waterloo enabled him to return to Paris, where he arrived 8 July, and surrendered his command over the troops of the household into the hands of the King. At the opening of the chambers in Paris he took the oath to maintain the Constitution, and was appointed president of the fourth bureau; but soon retired from public life. He died of a blow inflicted by a political fanatic named Louvel. The Duke left a daughter Louise Marie Thérèse, afterward Duchess of Parma; and a posthumous son, subsequently known as Comte de Chambord.

BERRY, Hiram George. American soldier. b. Thomaston, Me., 27 Aug. 1824; d. Chancellorsville, 2 May 1863. He was promi-

nent in local politics, holding office as representative in the State legislature and as mayor of Rockland. He entered the Union army as colonel of the 4th Maine Infantry, and as regimental com-

mander at the battle of Bull Run, the siege of Yorktown, took a conspicuous part in the battles of Williamsburg, Fair Oaks, Chantilly and the second Bull Run campaign. President Lincoln nominated him a major-general of volunteers, January 1863, and he succeeded in command of the 2d division of the 3d army corps. At a critical point in the battle of Chan-

cellorville, 1 May 1863, Hooker ordered General Berry to charge with the bayonet the advancing enemy. He did so, and for three hours his division, almost alone, withstood the enemy's assault and regained for the Federal forces a portion of their lost ground. He was killed at the head of a successful bayonet charge upon the renewal of the battle the following day.

BERRY, Mary, English author: b. Kirkbridge, Yorks., 16 March 1763; d. London, 20 Nov. 1849. She and her intimate friends of Horace Walpole, who in his letters spoke of them in terms of the strongest affection. For their amusement he wrote 'Reminiscences of the Courts of Georges I and II' (1789). He established the sisters at Teddington in 1789. In his will he bequeathed £4,000 to each and to both the house and property at Little Strawberry Hill, where they had made their home after 1791. In 1798 Mary edited the 'Works of Horace Walpole.' Her most ambitious work was, and is, 'Social Life in England and France' (1844).

BERRY, Richard James Arthur, Anglo-Australian author and educationalist: b. Lancaster, England, 30 May 1867. He was educated at the University of Edinburgh, where he was Grieg's assistant in piano teaching, and graduated in medicine and became lecturer on anatomy in the School of Medicine of the Royal College of Edinburgh (1894-1906); examiner in anatomy in the University of Saint Andrews (1898-1901), in the University of Aberdeen (1899-1900); and in the Royal College of Surgeons (1896-1905). In the latter year he became professor of anatomy in the University of Melbourne. He was once thoroughly identified himself with the life and interests of Australia. Among his published works, which are all of a scientific nature, are 'The Cerebral Folds and Fossae' (1897); 'Regional Anatomy' (1900); 'Surface Anatomy' (1906); and 'A Clinical Atlas of Sectional and Topographical Anatomy.'

BERRY, or BERRI, a former province and dukedom of France, of which Bourges was the capital. With the exception of the arrondisse-
ment Saint Amand, which belonged to the Bourbonnais, it now forms the departments Indre and Cher. In ancient times it formed part of the territory of the tribe of the Attingates, and passed under the dominion of the Franks in the 6th century. Later it enjoyed its independence under a line of hereditary counts. In 1360 it was made a duchy and in 1601 annexed by the French Crown. It gave title at various times to French princes, the younger son of
BERRY — BERTHELOT

Charles X being the last to hold them. George Sand, in her 'Légendes Rustiques' and others of her later novels, gives very good pictures of the country and life of Berry.

BERRY, Canal de, one of the important canals in France. It begins at Monthelon on the Cher, the chief trading centre of the coal fields of the Allier; descends the Cher valley to Tours, and ultimately enters the Loire near Saint Aignan, below which point the canalized Cher continues the line of navigation to Tours. Length of navigation 200 miles, of which 36½ miles belong to the canalized Cher. Constructed 1807-41.

BERZIER, bar-zye, Antoine Pierre, French advocate and orator: b. Paris, 4 Jan. 1790; d. 29 Nov. 1868. In 1814 he proclaimed at Rennes the deposition of Napoleon and remained till his death an avowed Legitimist of liberal principles. He assisted his father in the defense of Ney, secured the acquittal of General Cambronne and defended Lamennais from a charge of atheism. His eloquence was compared with that of Mirabeau, and after the dethronement of Charles X (1830) he remained in the Chamber as the sole Legitimist orator. In 1840 he was one of the counsel for the defense of Louis Napoleon after the Boulogne fiasco. In 1843 he did homage to the Comte de Chambord in London, adhering to him through the revolution of 1848 and voting for the deposition of the prince-president the morning after the coup d'état of 1851. He gained additional reputation in 1858 by his defense of Montalembert, and was counsel for the Patterson-Bonapartes in the suit for the recognition of the Baltimore marriage. In 1863 he was re-elected to the Chamber with Thiers. He was elected to the Academy in 1854.

BERSAGLIERI, bér-sä-glyär-le, a corps of riflemen or sharpshooters, introduced into the Sardinian army by General Della Marmora about 1849. They took part in the Crimean War and assisted at the battle of the Chernaya, 16 Aug. 1855. They were likewise employed in the Italian wars of 1859 and 1866. They wear cocks' feathers in their hats. They are not big men but are noted for their marching powers and endurance. They regularly march at four miles an hour, with a step of 34 inches. The 11th Bersaglieri in the Tripolitan campaign made two wonderful desert marches—one of 50 miles in 26 hours and one of 33 miles in 17 hours. At the entry of Italy into the Great War in 1914 there were 12 regiments of Bersaglieri in the regular army, with about 3,000 men in each, and 20 battalions in the mobile militia, with 1,000 men to the battalion.

BERSERKER, a descendant of the eight-handed starkader and the beautiful Alfhilde and, according to the Scandinavian mythology, a fierce warrior. He was supposed to have the protection of armor, whence he received his name, which signifies, according to Vigfusson and Fritzner and 'The Oxford English Dictionary' (Oxford 1888), probably 'bear-sack,' that is, 'bear-clad.' He fought like a man in battle. He killed King Swynfrid and married his daughter, by whom he had 12 sons as untamable as himself. They were also called Berserkers, and after their time the name was given to wild and fierce Scandinavian warriors.

BERZIEZ, ber-zeyz, Vittorio, Italian novelist and playwright: b. Peveragno, Piedmont, 1830; d. 1900. He was long active as an editor and was a voluminous writer of fiction, drama and works of history. Both as a writer of tales and of comedies he is conspicuous for vivid and faithful delineation of Piedmontese life, especially in his dialect comedies, among which 'The Misfortunes of Monsù Travett' is considered to be his masterpiece. He also wrote an excellent historical work, 'The Reign of Victor Emmanuel II' (1878-93). Consult Orsi, D., 'Piedmontese Dialect and the Theatre' (1890).

BERSIER, bar-syer, Eugène Arthur François, a French Protestant pulpit orator of note: b. Morges, near Geneva, 1831; d. Paris, 19 Nov. 1889. He became in 1855 a preacher in Paris, where he was much admired and his sermons were translated into several languages. Among his writings are 'Coligny avant les guerres de religion' (1884); 'Histoire d'une petite fille heureuse' (1890); in English, 'Sermons' (London 1881-1901). Consult Tinling, J. F. B., 'Bersier's Pulpit: An Analysis of the Published Sermons of Pastor Eugene Bersier' (1901).

BERTHEAU, bër-työ, Ernst, German theologian and orientalist: b. Hamburg 1812; d. Göttingen 1888. Most of his active life as professor of Oriental languages and Scripture exegesis was spent at Göttingen. His fame rests mainly upon his theological works, of which the more important are: 'The Seven groups of Mosaic Laws' (1840); 'History of the Israelites' (1842); 'Exegetical Handbook to the Old Testament' (1845); 'Commentaries on the Books of Judges and Ruth'; 'Proverbs of Solomon'; 'Books of the Chronicles,' and a 'Syriac Grammar.'

BERTHELOT, bër-thlo, Pierre Eugène Marcellin, French chemist and politician: b. Paris, 25 Oct. 1827; d. there, 18 March 1907. He early studied chemistry, and was brought into notice in 1854 by his thesis for a doctor's degree, in which he gave an account of artificial reproduction of natural fats. In 1859 he was appointed professor of organic chemistry in the Superior School of Pharmacy; and in 1865 a new chair of organic chemistry was organized for him in the College of France. In 1870 he was elected president of the scientific committee of defense, and during the siege of Paris was entrusted with the manufacture of ammunition and guns, and especially dynamite and nitro-glycerine. In 1873 he became a member of the Institute, and in 1878 he became president of the committee on explosives, which introduced smokeless powder. His labors also led to the discovery of dyes extracted from coal tar. He received the decoration of the Legion of Honor in 1861; was made commander in 1879, and grand officer in 1886. In 1889 he was elected permanent secretary of the Academy of Sciences. He contributed to the knowledge of synthetical processes and to the relations between the phenomena of heat and of chemistry, and is regarded as the founder of synthetic chemistry and thermochemistry. In public life he held a prominent place, became in 1876 inspector-general of education, in 1881 a life member of the Senate,
in 1886–87 was minister of public instruction and in 1895–96 foreign secretary. His works include ‘Chimie organique fondée sur la synthèse’ (1860); ‘Leçons sur les principes sucrés’ (1862); ‘Leçons sur l’isomérie’ (1865); ‘Traité élémentaire de chimie organique’ and ‘Sur la force de la poudre et des matières explosives’ (1872 and 1889); Essai de mécanique chimique (1879); ‘Les origines de l’alchimie’ (1885); ‘Collection des ancien alchimistes grecs’ (1888); ‘Chimie des anciens’ (1890); ‘Traité pratique de calorimétrie chimique’ (1893); ‘Recherches experimentales’ (1901).

BERTHIER, bär-tē, Louis Alexandre, marshal of France, Prince and Duke of Neu-châtel and Valence, Prince of Wagram; b. Versailles, 20 Nov. 1753; d. Bamberg, 1 June 1815. In the American war of independence he served under Lafayette. In the early days of the Revolution, he aided in the escape of some members of the royal family. He served with distinction in Vendée War, 1793-95. In 1795 was appointed chief of the staff to Kellermann, and by causing the French army to take up the lines of Borghetto contributed to arrest the advance of the enemy. In October 1797 Bonaparte sent him to Paris to deliver to the directory the treaty of Campo-Formio. In 1798 he received the chief command of the army of Italy, and in the beginning of February made his entrance into Rome, abolished the papal government, and established a consular one. In 1799 he was appointed Minister of War. He afterward became General-in-Chief of the army of reserve, accompanied Bonaparte to Italy in 1800, and contributed to the passage of Saint Bernard and the victory of Marengo. He signed the armistice of Alessandria, formed the provisional government of Piedmont, and went on an extraordinary mission to Spain. He accompanied Napoleon to Milan, June 1805, to be present at his coronation, and in October was appointed chief of the general staff of the grand army in Germany. He distinguished himself at Austerlitz and Jena, and for his services after the battle of Wagram (1809) he was given the title of Prince of Wagram. In 1810, as proxy of Napoleon, he received the hand of Maria Louisa, daughter of the Emperor Francis I, and accompanied her to France. Somewhat later Napoleon made him colonel-general of the Swiss troops. In 1812 he was with the army in Russia as chief of the general staff, which post he also held in 1813. After Napoleon’s abdication he lost his principality of Neu-châtel, but retained his other honors, and possessed the favor and confidence of Louis XVIII. Subsequently he retired to Bavaria, where, in a fit of insanity, he committed suicide. His memoirs were published in 1826.

BERTHOLD VON REGensburg, bêr-tolk fon rē-gē̄ns-boor, German Franciscan preacher: b. about 1210; d. 13 Dec. 1272, and buried in the Franciscan convent at Ratisbon, of which he was a member. From 1250 to the close of his life, he preached to immense congregations in Switzerland, Hungary, Austria, Moravia, Bohemia, Saxony, Swabia, etc., generally in the open air, as the churches were not large enough to hold the audiences. In the Heidelberg University library some MSS. of his sermons are preserved. Near Glatz, in Silesia, a tent under which he had preached was exhibited long after his death, and revived the feelings of affection and reverence in which his name is held by the people. It seems models of homely and affecting pulpit eloquence. Consult ‘Biography by Unkel’ (Cologne 1882).

BERTHOLET, Alfred, Swiss theologian; b. Basel 1868. He was educated at Basel, Strassburg and Berlin. In 1904 he was chosen secretary of the Second International History of Religious Congress at Basel. He has published ‘Die Stellung der Israeliten und der Juden zu den Fremden’ (1896); ‘Kommentare zu Leviticus, Deuteronomium, Hesekiel, Ruth, Esra, und Nehemia’ (1897-1902); ‘Die Gefilde der Seligen’ (1903); ‘Seelenwanderung’ (1904); ‘Daniel und die Griechische Gefahr’ (1907); ‘Aesthetische und Christliche Lebensaufassung’ (1910); ‘Die judaïsche Religion von dem Zeit Esras bis zu Zeitalter Christi’ (1911).

BERTHOLET, bär-tō-lā, Claude Louis, Count, French chemist of distinction; b. Talloire, Savoy, 9 Dec. 1748; d. Paris, 7 Nov. 1822. He studied medicine at Turin; went to Paris, where he became connected with Lavoisier, was admitted in 1780 a member of the Academy of Sciences in that city; was made in 1794 professor in the normal school there, and was sent to Italy in 1796, in order to select the plunder that was to be carried to Paris. He followed Bonaparte to Egypt, and returned with him in 1799. After the 18th Brumaire he was made a member of the senat-conservateur; afterward count and grand-officer of the Legion of Honor. In 1804 Napoleon appointed him Senator for the district of Montpellier. In 1813 he received the grand cross of the Order of the Réunion. He voted, however, for establishing in 1814 a provisional government and the dethronement of Napoleon. Louis XVIII made him a peer; but Napoleon passed him by in 1815. After the restoration of Louis, he took his seat again in the chamber of peers. Among the inventions and new processes on which the sciences and the arts were enriched by him, the most important are those for the charring of vessels to preserve water in ships, for the stiffening and glazing of linen, for the artificial production of nitre, etc., but principally that for the bleaching of vegetable substances by means of chlorine, which, since 1786, has been in general use in France. Besides different essays in the collections of the Academy and the Institute, he wrote several larger works, among which his ‘Essai de Statistique Chimique’ (1803; translated into English, German and Italian) must be considered as the most important. The complicated phenomena of chemistry were here treated as under the strict and simple laws of mechanics. He had also a large share in the nomenclature of chemical nomenclature, as well as in the publication of the work that appeared on this subject in Paris, 1787 — ‘Méthode de Nomenclature Chimique.’ Consult Cuvier, ‘Éloge de Claude Louis Berthollet’ (Paris 1826).

BERTHOLLETTIA, bér-thōl-le'șhē-ą, the generic name of Brazil nut (q.v.).
BERTHOUX, bär-toö, Ferdinand, Swiss mechanician, celebrated for his marine chronometers: b. Plancemont, Neuchâtel, 19 March 1777; d. 20 June 1807. His father caused him to be instructed in the art of watchmaking, and, to afford him an opportunity of perfecting his knowledge, sent him to Paris. He resided in this city for 12 years, during which time he invented marine chronometers, which have been used by French navigators on so many occasions for extending and correcting geographical knowledge. He left several works relating to his art. His nephew, Louis Berthoud, his pupil and the heir of his talents, extended his improvements still further. His chronometers came to be very widely used by French navigators, and were even more convenient than those of his uncle.

BERTIE, Willoughby, fourth Earl of Abingdon, English politician: b. 16 Jan. 1740; d. 26 Sept. 1799. He was a vigorous opponent in the House of Lords of the policy of England toward the American colonies that culminated in the Revolution; wrote a famous and very popular tract called "Thoughts on Mr. Burke's Letter on the Affairs of America," was active in promoting favorable legislation for Ireland, and sympathized with the French Revolution.

BERTIER, bär-tyä, Francisque Edouard, French painter: b. Paris, 1841. He was a pupil of Cabanel, and among his many portraits of notables are those of De Lesseps, Grand Duchess Eugenie of Warwick, Prince of Wales and Max O'Rell. He has several times visited the United States in order to paint the portraits of prominent Americans.

BERTILFON, bär-te-yōn, Alphonse, French anthropologist: b. Paris 1853; d. there, 13 Feb. 1914. He is widely noted as the founder of a system of identification of criminals. In 1880, while chief of the bureau of identification in the prefecture of police, he established his system of measurements which has given results marvelous for their precision. The system has since been adopted by the police authorities of the large cities of Europe and the United States. The French method of "reconstructing" a crime by photography and "rehearsing" it in the way it was probably perpetrated, is also his invention, though the idea was no doubt borrowed from Cabanis. He was one of the expert witnesses in handwriting in the trial of Captain Dreyfus in 1899, and soon after his close was removed from office. He is author of numerous works bearing upon his system, including: "Identification anthropométrique" (1893); "La comparaison des écritures et l'identification graphique" (1897); "Anthropologie métrique et photographique" (1909). See BERTILLON SYSTEM.

BERTILLON SYSTEM, a scientific method of identifying suspected male criminals, invented by Alphonse Bertillon of Paris, 1885 by Dr. Alphonse Bertillon of Paris. As now in use it is not a single system, but a combination of the one invented by himself with two others approved by use. It rests on three principles: (1) Simple and exact measurement of certain parts of the body (using a measuring head, the vertebral and clavicular). (2) Extreme diversity of the relative dimensions of different subjects, no two correlations ever closely approximating each other; (3) almost absolute fixity of the male skeleton after 20.

The measurements are taken with calipers, and include: Height, standing and sitting; length of stretched arms; length and width of head; length and width of right ear; and length of left foot, forearm, middle and little fingers. The descriptive elements are color of eyes (the most important detail of all, as it never changes and is impossible to disguise), hair, beard and complexion; deformities and peculiarities of shape; marks on body, as moles, scars, the tattooings frequent among criminals, etc., carefully located as "mole six centimetres to left of fifth vertebra" or "horizontal scar on back of second phalanx of right forefinger, three millimetres below middle." A photograph of full face and one of profile are taken when thought desirable, from a fixed chair and a fixed camera. The entire process, by a measurer and a secretary who writes from dictation, takes five to seven minutes, and the measurements are planned to be accurate within one thirty-second of an inch. Descriptions and photographs are put together on cards of uniform size, and the cards are divided into three equal sections according to length of head: short heads, of 187 millimetres and less; medium 187 to 194; long, 194 and above. Experience proves that these divide very closely into nearly equal numbers; and their cards are placed in three tiers of drawers, the shortest heads uppermost. Each of these is subdivided into three sections according to width of head, without further reference to length; each of these into three sections, according to length of middle finger; each of these into three sections, by length of foot; these are subdivided successively by length of forearm, full height, length of little finger, and color of eyes. These last groups contain from 12 to 14 individual cards, and are classed by length of ear. Thus any new measurement can be compared with its duplicate in this enormous mass, or the absence of such record shown, with marvelous celerity and almost infallible accuracy. Its index value alone is of the first order. Under the old systems no entire mass of descriptions and photographs had to be searched and compared with any given arrested person, and with the immense number accumulating in great cities it became physically impossible to proceed with any certainty. The system was for some years also of great value in distinguishing new criminals from old offenders: it not merely registered identity, but the fact of a first offense.

In European cities the Bertillon system has been almost entirely superseded by the fingerprint system. The great weakness of the former was that the element of personality affected the measurements upon which the identifications depended, hardly any two measurers getting exactly the same dimensions from the same subject. The delicate instruments used were often injured so that they gave incorrect readings. Moreover, the system absolutely failed as to women and children, whose physical dimensions are subject to constant change. On the other hand, the three-print records are made without any intervening agency, are as readily classified and indexed as the Bertillon cards, and retain their distinctive characteristics from childhood to old age, re-

BERTIN, bár-tán, Antoine, French poet: b. Isle of Bourbon, 1752; d. San Domingo, 1790. He was much admired by his contemporaries, who, somewhat extravagantly, styled him the French Propertius. He was a friend of Parny, and like him excelled in elegiac and epistolary verse. His principal works are 'Voyage in Burgundy' (1777); and 'The Loves' (1780).

BERTIN, Louis François (called BEcTIN L'AINÉ), French journalist: b. Paris 14 Dec. 1766; d. 13 Sept. 1841. The Revolution made him a journalist, and in 1790 he started the famous 'Journal des Débats.' His royalist principles offended Napoleon, and cost him imprisonment and banishment to Elba; hence, however, he escaped to Rome, where he formed a friendship with Châteaubriand. In 1805 he returned to Paris and resumed the editorship of the Débats, but was much hampered by Napoleon placing it under police supervision and causing it to be styled 'Journal de l'Empire.' The second restoration of the Bourbons restored once more to Bertin the free control of his journal, and henceforward he gave almost constant support to the ministerial party. He supported the July monarchy, and edited the Débats till his death.

BERTIN, Louise Angelique, French musician and composer: b. Les Roches, Bievres, 15 Feb. 1805; d. Paris, 26 April 1877. She was a daughter of L. F. Bertin (q.v.), and composed 'Guy Mannering' (1827), 'Faust' (1831), 'Esmeralda' (1830), and other operas. She published volumes of verse, 'Les Glaneurs' (1842) and 'Nouvelles Glaneurs' (1876).

BERTIN, Nicolas, French artist: b. Paris, 1668; d. 1736. His picture, 'The Building of the Ark,' obtained the grand prize, in 1685, and 'Prometheus Liberated by Hercules' brought him, in 1703, membership in the Academy, where he became professor in 1715. His paintings are found in the galleries of Dresden, Stockholm, Saint Petersburg, Antwerp, Amsterdam, Orleans and Toulouse.

BERTINI, Giuseppe, bér-te-neh, Italian historical painter: b. Milan, 1823; d. 1898. The Milan Academy awarded him the prize for the best historical picture in 1845, and his painting on glass of 'Dante and the Divine Comedy,' exhibited in London in 1853, has been greatly admired. He became professor of painting at the Academy in 1860. Among notable pictures by him are: 'The Vision of Saint Francis of Assisi;' 'Death of Saint Joseph;' 'Tasso Introduced to the Duke of Ferrara.'

BERTRAND, Henri Gratien, bár-trán, ön-të gra-të-yàn, COUNT, French military officer: b. Châteauroux, 1773; d. there, 31 Jan. 1844. He was distinguished by his energy and expedition, and was, after the battle of Aspern, in 1809 for his share in saving the French army by bridges, was created count and governor of Illyria. After serving with credit

in the subsequent campaigns, and saving the French army after the battle of Leipzig, he retired with the Emperor to Elba, was his confident in carrying out his return to France, and finally shared his banishment to Saint Helena. On Napoleon's death, Bertrand returned to France, where, though sentence of death had been pronounced upon him, a sentence which Louis XVIII had wisely recalled, he was restored to all his dignities, and, in 1830, appointed commandant of the Polytechnic School. In 1840, he formed part of the expedition which brought back the remains of Napoleon to France.

BERTRAND, James, French historical painter: b. Lyons, 1825; d. 1857. He studied in Rome, and his 'Saint Benedict taking Communion,' exhibited at the Salon in 1859, was highly approved. He worked in the classical style, and his paintings are as notable for their careful finish as for their religious tone. They have been frequently engraved. Among them are 'Death of Virginia' (1869); 'Charlotte Corday's Last Day' (1883); 'Calvary' (1884).

BERTRAND, Joseph Louis François, bár-trán, jô-séf lô-z frûn-swâ, French mathematician: b. Paris, 1822; d. 1900. He taught at the Polytechnic and Normal schools, and the Collège de France, and in 1884 became a member of the French Academy. He wrote treatises on arithmetic, algebra, calculus, thermodynamics, and probabilities, and in 1881 was appointed commander of the Legion of Honor.

BERTUCH, Friedrich Justin, German translator, publisher and author: b. Weimar, 30 Sept. 1747; d. there, 3 April 1822. He studied at Jena, first theology, then law, graduating in 1769, then became private tutor in Altenburg, during which period he made a thorough study of Spanish literature. In 1775 he became cabinet-secretary at Weimar and Councillor of Legation in 1785. He, Wieland and Schütz founded the Jenaische allgemeine Litteraturzeitung, to which he was a very frequent contributor. He was also an editor of the 'Journal des Lusus und der Moder. One of his most popular studies was that for children, 'Bilderbuch für Kinder' (12 vols., 1790-1822). But it was as a publisher of maps and geographical works that he attained a world-wide reputation. Consult Feldmann, 'F. J. Bertuch' (Saarbrücken 1902).

BERULLE, bär-ulu, Pierre de, French cardinal: b. near Troyes, 4 Feb. 1575; d. Paris, 2 Oct. 1629. He early showed remarkable mental acuteness and knowledge, and became distinguished for skill in controversy. He instituted, and was the first superior of, the order of Carmelites in France, and also founded the congregation of the Oratorians, notwithstanding the opposition of the Jesuits. He was statesman as well as priest, as Ambassador to Spain negotiated the treaty of Monção (1620), and was for a time secretary of state. He was often opposed to Richelieu, whose jealousy he excited, and could not conceal his satisfaction at the news of his death. He accompanied the Princess Henrietta to England, on her marriage with the Prince of Wales. He shunned elevated positions, and was very unwillingly obliged to accept the hat of a cardinal.
This elevation made no difference, however, in his humble way of life, and did not prevent him from taking part, as he had always done, in the service work of the religious community to which he belonged. He was also a man of letters, and was the first to appreciate and encourage the genius of Descartes, urging him, by his sense of obligation to his Creator, to merit the great recognition that was bestowed on him. The most noted of his writings is 'Les grandeurs de Jésus.'

BERVIC, bär-vek, Charles Clément, French engraver: b. Paris, 1756; d. 1822. The works of Bervic are among the best of the French school, but are not numerous. The most celebrated of them is the full length figure of Louis XVI, after a picture of Callet. The copies are very rare and dear, because the plate was broken to pieces in the revolutionary tumults of 1793. The exactness of his drawing, the firmness and brilliancy of his touch, the purity and correctness of his design, and the happiness with which he transferred to his plate the beauties of the original, gave a high character to his productions.

BERWICK, James Fitz-James, Duke of French marshal: b. Moutins, 1670; d. 1734. He was the natural son of the Duke of York, afterward King James II, and Arabella Churchill, sister of the Duke of Marlborough; and first went by the name of Fitz-James. He received his education in France, and served his first campaigns in Hungary under Charles, Duke of Lorraine, general of Leopold I. He returned to England at the age of 17, and received from his father the title of duke. On the landing of the Prince of Orange in 1688 he went to France with his father, whom he afterwards accompanied on the Irish expedition. He took part in the siege of Derry and was wounded at the battle of the Boyne, 1 July 1690. He afterward served in the low countries. In 1705 he suppressed the rising of the Camisards of Languedoc, and was naturalized in France. In 1706 he took Nice, was made marshal of France, and sent to Spain, where he gained the battle of Almanza, which rendered King Philip V again master of Valencia. In 1709 he went to take the district of Dauphiné, and the measure by which he took to cover this and the neighboring provinces against the superior forces of the Duke of Savoy gained him a great reputation. In 1718 and 1719 he was obliged to serve against Philip V, who from gratitude to the marshal had taken a son of his into his service. On his entrance into the Spanish dominions he wrote to his son, the Duke of Liria, admonishing him to do his duty to his sovereign. At the siege of Philippsburg, on the Rhine, his life was terminated by a cannon-ball. He had served in 29 campaigns. His memoirs were published in French in 1778 and have gone through English editions. Consult Wilson, 'Duke of Berwick, Marshal of France' (1833).

BERWICK-ON-TWEED, England, seaport town, once forming a county of itself, but now united in Northumberland, on the north or Scottish side of the Tweed, within half a mile of its mouth. It is surrounded by a complete series of ramparts, which are well preserved, and along which is an agreeable promenade. The ramparts are in the main of Elizabethan construction, with parts dating from Edward I. The streets are for the most part narrow, steep, straggling and irregular, though some of the principal ones are wide and open. The Tweed is crossed at the town by an old bridge of 15 arches, 1,164 feet long and only 17 wide, and by a magnificent railway viaduct of stone, 667 yards long and 184 feet in extreme height with 28 semicircular arches built by Robert Stephenson in 1835. The chief industries are iron foundling, the manufacture of engines and boilers, agricultural implements, feeding-cake, manures of various kinds, ropes, twine, etc. The chief exports are grain, artificial manures, and herring. A dock affording accommodation for large vessels was opened in 1876, but its shipping remains unimportant. In the beginning of the 12th century, during the reign of Alexander I, Berwick was part of his realm of Scotland, and the capital of the district called Lothian. Soon after this date it became populous and wealthy, was the chief seaport of Scotland, contained a strong castle, churches, hospitals and monastic buildings, and was created one of the four royal burghs of Scotland. In 1216 the town was captured, stormed and taken by King John. During the competition between Balliol and the elder Bruce for the Scottish throne the English Parliament sat in Berwick; and in the hall of the castle Edward I pronounced judgment in favor of Balliol. King Robert Bruce retook the town and castle in 1318; but, after undergoing various sieges and vicissitudes, both were surrendered to Edward IV in 1482, and have ever since remained part of the soil of England. From 1482 to 1835 the burghers to the English Parliament, when it was merged in the Berwick division of Northumberland. The borough includes the watering places of Tweedmouth and Spiittal, situated on the south bank of the Tweed. Pop. (1911) 13,075.

BERWICKSHIRE, Scotland, maritime and border county, nominally divided into the three districts of Lauderdale, Lammermoor, and the Merse or March. The principal rivers of the county are the Tweed, the Leader, the Eye, the Whiteadder and the Blackadder; and all except the last contain water in which great quantities are shipped for London. Vast quantities of agricultural produce are shipped from the ports of Berwick and Eyemouth, and much is also sent to Edinburgh, Dalkin, Haddington and Dunbar. Very few manufactures are established in this county, the principal one which it supplies beyond domestic consumption being that of paper. The North Sea fisheries are of great importance. Berwick formerly abounded in strong castles and fortified places mainly on the high and rocky coast. The ruins of East Castle, the 'Wolf's Crag' of Scott's 'Bride of Lammermoor,' stand on a precipitous headland four miles northwest of Coldingham. In the Tweed Valley the land is highly cultivated; otherwise the country is mainly pastoral. The county town is Dunbar. Other small towns are Duns and Eyemouth. The county has an area of 292,535 acres; its population (1911) was 29,643; and it returns one member to Parliament.

BERYL, a native silicate of aluminum and the rare metallic element glucinium (or 'beryllium'), having the formula 3Al₂O₃·6SiO₃, and crystallizing in the hexagonal system. It
BERYLLIUM — BESANÇON

commonly has a specific gravity of 2.70, and a hardness of from 7.5 to 8. A portion of the glaucum is sometimes replaced by lithium, silicium, or caesium, and a chemically combined water is also occasionally present. In the latter case the formula of the mineral appears to be \( \text{H}_2\text{GeAl}_{2}\text{Si}_{6}\text{O}_{18} \). Beryl is usually transparent or translucent, and in color may be green, blue, yellow, white, or light red. A variety which is transparent, and bright green from the presence of oxide of chromium, is known as "emerald," and is highly esteemed as a gem (see GEMS); the "oriental emerald" (see SAPPHIRE), however, is not a variety of beryl, but a green variety of sapphire. A bluish-green variety of the common beryl, known as "aquamarine," is also used as a gem. Beryl occurs in all parts of the world, being commonly associated with granite. Its crystals are sometimes enormous in size, and two specimens from Grafon, N. H., are known, which weigh 2,900 pounds and 2/5 tons, respectively. The finest emeralds (q.v.) are from Bogota; aquamarines (q.v.), from Siberia, Brazil, Maine, North Carolina and Colorado; golden beryls, from Connecticut and New York.

BERYLLIUM, a rare metallic element, called "beryllium" from the fact that it was first found in the beryl. Its salts have a sweetish taste, and from this circumstance the element itself has received the name glaucium (q.v.).

BERYTUS, School of, a famous Greek Law school which existed in the 3d century B.C. and probably for some time previous. When Justinian closed the schools of philosophy and law at Athens, in 529, he confined the study of jurisprudence in the East to Constantinople and Berytus. He reorganized the course of study, making his new codification the basis of the curriculum, to be pursued in its logical sequence for five years. Berytus was destroyed by earthquake in 554.

BERYX, bēr'īks, the designation of a genus of deep-sea fishes in tropical waters belonging to the division Perciformes of the Acanthopterygii and the family Berycidae. B. splendens, deep blue with bright streaks, is one of the most beautiful of the Cuban fishes.

BERZELIUS, ber-tzēl'ē-us, Jöns Jakob BÅRÖN, Swedish chemist of distinction: b. Westerlåsa, East Gothland, Sweden, 29 Aug. 1779; d. Stockholm, 7 Aug. 1848. The first fruit of his studies and of a year's residence as assistant to a physician at the famous watering-place of Medewi, was the 'Nova Analysis Aquarum Medievienium' (1800). After taking his doctor's degree, he was appointed by the board of health in 1802 adjunct of medicine and pharmacy in Stockholm. In 1807 he became professor of medicine and pharmacy in Stockholm. In 1808 he was admitted a member of the Academy of Sciences at Stockholm, in 1810 one of its directors, and in 1818 its perpetual secretary. In 1818 the King, while allowing him to retain his own name, made him a noble; and in 1835, on account of his marriage with a daughter of Poppius, a councillor of state, he was named a baron.

The existing state of chemistry is founded in a great measure on the discoveries and views of Berzelius, though, by the rapid development of the science, the edifice which he erected has undergone many alterations, notable defects have been discovered in it. Hence his views in regard to atomic weight, his electrochemical theory, and his mode of procedure in organic chemistry, have met with many opponents. He discovered selenium and thoriium, first exhibited calcium, barium, strontium, tantalum, silicium and zirconium in the elemental state, and investigated whole classes of compounds, as those of fluoric acid, the metals in the ores of platinum, tantalum, molybdenum, vanadium, sulphur salts, etc. He introduced a new, or at least a wholly altered nomenclature and classification of chemical compounds. In short, there is no branch of chemistry to which he did not render essential service; and his labors were so numerous that, when the accuracy with which they have been executed is kept in view, it becomes almost incomprehensible how one man should have been able to perform them. It ought to be especially mentioned that he never rested satisfied with the bare investigation of isolated facts, but always extended his investigations over a wide field, so as to contribute to the advancement of chemistry as a whole. In addition to his numerous communications to the journals and periodicals of the period, may be mentioned, among his separate works, his 'View of the Composition of Animal Fluids,' 'New System of Mineralogy,' 'Essay on the Theory of Chemical Proportions,' and above all his "Text-book of Chemistry," which has been translated into most European languages. As secretary of the Academy of Sciences, he published an annual account of the progress of chemistry and mineralogy, which, having been continued during 27 years, extends to as many volumes. Consult Söderbaum, 'Berzelius, Werden und Wachsen' (Leipzig 1899).

BERZŠENY, bēr'zhē-ny, Daniel, Hungarian poet: b. Heyte, 1776; d. 1836. An authorized version of his 'Versei' appeared in 1813 and in 1816 was reprinted with his consent and speedily became classic in Hungarian literature. The poems received a hearty acclaim from the younger patriots. The best edition is that by Toldy (2 vols., Pesth 1864).

BES, an Egyptian god, represented clad in a lion's skin, with the head and skull of the animal concealing his features, and with a dwarfish and altogether grotesque appearance. He was supposed to preside over art, music, the dance and childbirth. He was formerly identified with Typhon. He was of foreign origin and appears chiefly after 1500 B.C.

BESANÇON, bē-zahn-sohn, France, fortified town, capital of the department of Doubs, 206 miles southeast of Paris. The town is surrounded by hills, covered with vineyards. The isthmus or peninsula on which it is built is composed of a mass of rocks crowned by the citadel, which commands the country toward the north, but the citadel itself is commanded by several eminences, on which forts have been erected to control its approaches. Besançon is one of the strongest towns in France, and also one of the best built. The streets are spacious and well laid out, and the squares are adorned with fountains. The citadel is one of Vauban's finest works. There are here a theatre, a large and valuable public
library, containing over 130,000 volumes, a museum, a botanic garden, school of artillery, lyceum, etc. The trade and manufactures are extensive. The latter comprise linen, cotton, woolen and silk goods, ironmongery with steel, but the principal industry is watch- and clock-making. It employs about 12,000 work people. There are also extensive foundries, breweries, sawmills and tanneries. Besançon is the ancient Roman city of Divorces, which is mentioned by Julius Caesar, who drove the Sequani from it in 58 B.C., as a place of great natural strength. Several of the streets and places still bear their old Roman names, and there are numerous Roman remains, especially a triumphal arch of the Emperor Marcus Aurelius, an aqueduct, an amphitheatre and a large theatre. Pop. (1911) 57,978.

**Besant, bĕ-zánt,' Annie, English theosophist and author:** b. London, 1 Oct. 1847. She was married in 1867 to the Rev. Frank Besant, brother of Sir Walter Besant, but was legally separated from him in 1873. She early manifested an earnest interest in social and political topics, and in 1874 became connected with the National Secular Society. Owing to the publication of 'Fruits of Philosophy,' Mrs. Besant was prosecuted, in conjunction with Charles Bradlaugh (June 1877), but the prosecution failed. Mrs. Besant has since stated her disagreement with the sentiments expressed in this book. In 1883 she announced her adhesion to Socialism. For three years she was a member of the school board of London. She was prominently connected with various socialistic movements and a frequent speaker at meetings for workingmen. In 1889 she underwent a complete change of mind when she joined the Theosophical Society, and in 1907 she was elected president. She visited the United States in 1891 and 1892-93 and lectured on Madam Blavatsky and reincarnation and on theosophy and occultism. Among her numerous publications are 'Reincarnation'; 'Seven Principles of Man'; 'Autobiography'; 'Death and After'; 'Building of the Kosmos'; 'In the Outer Court'; 'Karma'; 'The Self and Its Sheaths'; 'Path of Discipleship'; 'Man and His Bodies'; 'Roots of the Grapes of Wrath'; 'The Ancient Wisdom'; 'Three Paths to Union with God'; 'Evolution of Life and Form'; 'Dharma'; 'Avatara'; 'Ancient Ideals in Modern Life'; 'Esoteric Christianity'; 'Thought-Power'; 'The Religious Problem in India'; 'Theosophy and the New Psychology'; 'The Wisdom of the Upanishads.' In July 1916 she was refused admission into India by the British authorities.

**Besant, bĕ-zánt', Sir Walter, English novelist:** b. Portsmouth, England, 14 Aug. 1836; d. 17 Oct. 1901. He was educated in London and at Christ's College, Cambridge, where he graduated with mathematical honors. He was for a time professor in the Royal College, Mauritius. His first work, 'Studies in Early English Poetry,' appeared in 1858, and to it he brought the field of Irish literature also. His 'French Humorists' (1873), and his 'Rabelais' (1877 for the Foreign Classics series). He was for years secretary to the Palestine Exploration Fund, and published a 'History of Jerusalem' (1871) in conjunction with Professor Palmer, the life of whom he also wrote. The 'Survey of Western Palestine' was edited by him. He is best known by his novels, a number of which were written in partnership with James Rice, including 'Ready-Money Mortiboys' (1872); 'This Son of Vulcan'; 'The Case of Mr. Lucraft'; 'The Golden Butterfly' (1876); 'The Monks of Thelema,' etc. After Mr. Rice's death (1882) Sir Walter wrote: 'All Sorts and Conditions of Men' (1882), which led to the establishment of the People's Palace in London; 'All in a Garden Fair' (1883); 'Dorothy Foster' (1884), which in his own estimation was his best work; 'The World Went Very Well Then' (1887); 'The Ivory Gate' (1892); 'The Rebel Queen' (1893); 'Beyond the Dreams of Avarice' (1895); 'The Orange Girl' (1899); 'The Alabaster Box' (1900); 'The Story of King Alfred' (1901), etc. Among his other works are 'The Eulogy of Richard Jefferies' (1888). He labored for many years to promote the interests of all members of the literary profession, and was editor of the monthly 'The Author.' In 1894 he projected a great survey of London, which was intended to bring the history of the city from the earliest times down to the end of the 20th century, and wrote four volumes of preliminary studies with that end in view, but he did not live to complete the undertaking. He was knighted in 1895.

**Beselow, the Alaskan pollack. See Pollack.**

**Beside the Bonnie Brier Bush,** a novel by Ian Maclaren (the Rev. Dr. John Watson), delineating Scotch character and life among the lowly and published in 1894. It consists of short sketches with no attempt at plot, but interest attaches to the well-drawn characters. It is one of the best examples of what has been styled the "kail-yard" school of fiction, whose principal exponents are Crockett, Barrie and Watson. It was successfully dramatized.

**Besikta Bay,** an inlet of the Ægean Sea on the northwest coast of Asia Minor, opposite Tenedos, to the south of the entrance of the Dardanelles. The English fleet here during the centuries in the eastern question in 1853-54 and 1877-78. See War, European, Dardanelles Campaign.

**Beskow, bĕskōv,' Bernhard von,' Swedish dramatist:** b. Stockholm, 19 April 1796; d. 17 Oct. 1868. He was ennobled in 1836 and appointed marshal of the royal household in 1833. He officiated for some time as director of the royal theatre, and is the author of several excellent tragedies, which were translated into Danish and German by Oehlenschläger, and of which 'Torkel Knutsson' is considered the best acting play of the Swedish stage. He wrote an opera, 'Trubaduren,' for which King Oscar composed the music. His literary reputation was increased by his books of travel, by his poetical works, and by his contributions to the press. The great Swedish literary award was in 1824 to his poem 'Sveriges anor.' Other tragedies, which were very popular, are 'Erikden Fjortonde,' and 'Birger och Lars Att.' His poem 'Karl XII' has also been very widely known.

parents were both artists, his father having studied under Ingres. The young Bessard, with such influences, who from an early age had a taste for art-study and went into Cabanel's private studio at the age of seventeen. He studied under Brémond as well. His first salon picture was received in 1868. In 1874 he received the Prix de Rome bringing him to the sojourn in Italy at the Villa Medici. From 1879 to 1881 he practised portrait painting in London. In 1884 he exhibited at the salon his decorations for the École de Pharmacie in Paris which, followed (in 1889) by his 'Femme qui se suffe' now in the Luxembourg, raised considerable outcry against him in orthodox circles. It was asserted that he, designated by his training to carry on the traditions of the École des Beaux-Arts, was surrendering to the allurements of impressionism. In reality there was little need for the academicians to take alarm, for despite his extreme virtuosity and his learning certain principles from the advanced painters, he remains a school man, though a brilliant one. The idea is corroborated as his work advanced by later productions being 'Life Re-born from Death,' at the Sorbonne; 'Truth Attended by the Sciences Enlightening Man,' a ceiling decoration in the Hotel de Ville; 'The Happy Isle,' at the Musée des Arts Decoratifs and the Petit Palais, portraits like the 'Portrait de Femme,' at the Düsseldorf Museum, and genre, like his pictures of India. He has received many honors and is represented in the Brussels Gallery by 'Les Cariatides' and the Luxembourg by 'The View of Algiers,' the 'Portrait of an Engraver' and the 'Femme qui se suffe,' before mentioned. Bessard is a great traveler and brought from Spain and Algiers admirable specimens of his art; but his greatest undertaking was his journey to India in 1911. He brought back incomparable pictures of the exotic color and the interesting life of that country. They are masterpieces of intense color, often in a single tone; such as his 'Weeping Woman,' painted entirely in red. Other excellent examples are the 'Steps at Benares'; 'Indian Dancing Girl'; 'The Bracelet Merchant.' The exhibition of his Indian works in Paris in 1912 attracted international attention. A large and representative exhibition of his works was held in 1913 in the Boston Museum of Fine Arts and afterward in other American museums. He was engaged in 1914 to execute mural paintings for the Peace Palace at The Hague. He is also a pastellist and engraver of note. Bessard has successfully united the achievements of the impressionists in light and color with whatever is really sublime and permanent in classic tradition; he has resumed the historic mission of French painting to express in form and color the intellectual and spiritual achievements of the nation. A good example of his unconventionality is his portrait of Madame Réjane. Consult Marx 'The Painter Albert Bessard' (Paris 1893), and Mourey, 'Albert Bessard' (ib, 1906), with 100 illustrations and literary contributions by the artist.

BESSARABIA, a government in the south-west of Russia, on the borders of Rumania. It extends in a north-eastern direction from the Black Sea, between the Pruth and the Dniest; area, 16,181 square miles. Possession of the territory was stubbornly contested between the Turks and Russians at different times, from early in the fourteenth century. In 1812 it was definitely annexed to Russia. A portion of the southeast extremity was given to the principality of Moldavia (now incorporated in the kingdom of Rumania) in 1856, but the greater part of Bessarabia (now Southern Bukovina) was restored in 1878. Agriculture is chiefly developed in the north, pasturage is most largely carried on in the south, in the middle portion are extensive forests. It is watered by the Dniest, the Pruth and the Danube. The inhabitants include Russians, Poles, Rumanians, Germans, Armenians, Jews, etc. The capital is Kishinef. The products are salt, wool, tallow, leather, soap, etc. Pop. 2,490,200.

BESSARION, Johannes, or Basilius, Greek monk: b. Trebizond, 1389; d. Ravenna, 19 Nov. 1472. He was titular patriarch of Constantinople, archbishop of Nicæa, afterward cardinal and legate to France, in the time of Louis XI. After having spent 21 years in a monastery of Greece, devoted to theology and literature, he left it to follow the Emperor John Palæologus to Italy, where he continued being present at the Council of Ferrara, in the hope of uniting the Greek and Latin churches. They were accompanied by many Greeks, distinguished by their talents and dignity. Bessarion seconded with so much zeal the projects of Palæologus that he became odious to the Greek Church, while Pope Eugenius IV rewarded him for his devotion to that of Rome, by the dignity of cardinal-priest. He was sent to France by Sixtus IV to reconcile Louis XI with the Duke of Burgundy and obtain aid against the Turks. He did not succeed, and it is pretended that he received a personal insult from the king, which humiliation some suppose to have been the cause of his death.

BESSER, Friedrich Wilhelm, German astronomer: b. Minden, Prussia, 22 July 1784; d. 17 March 1846. An astronomical work on which he had drawn up brought him into communication with Olbers, who encouraged him in his labors and procured for him the appointment of inspector of astronomical instruments to the University of Göttingen. He was sent from Göttingen to Königsberg, and in 1812-13 superintended the construction of the observatory of this town. From 1824 to 1833 he completed a series of 75,011 observations on the celestial zone contained between 15° N. and 15° S. declination. These observations included all the stars in the zone as far as the ninth magnitude. A dissertation which he published in 1844 contains important investigations on the variability of the movements of the fixed stars. An important share in the discovery of the new planet Neptune belongs to him, as in a paper read in 1840 he called attention to the existence of a planetary mass beyond Uranus, founding on considerations which were afterward happily proved to be correct. Few contributed as much to the advancement of astronomy in the first half of the 19th century. He was the inventor of 'Bessel's Functions.' His principal works are an 'Essay on the Path Traversed by the Comet of 1807;' 'Astronomical Observations' during various directions of the pendulum, the 'Determination of the Pendulum Which Beats Seconds at Berlin;' 'Investigations and Measurements made
with a View to Establish a Metrical Unit for Prussia; "Measure of the Distance of the Sixth and Hafnion in the Constellations of the Swan," and "Popular Lectures on Scientific Questions." Consult Herschel's "Brief Notice of F. W. Bessel" (London 1847), and Durège, "Bessel's Leben und Wirken" (Zürich 1861).

BESSELS, Emil, German naturalist: b. Heidelberg, 2 June 1847; d. Stuttgart, 30 March 1889. He studied in the University of Heidelberg, and while an assistant at the Royal Museum in Stuttgart became interested in the subject of Arctic research. In 1869 he was a member of Petermann's expedition that sailed into the sea between Spitzbergen and Nova Zembla. In 1871 he came to the United States and was appointed both naturalist and surgeon to the expedition under Capt. Charles F. Hall, United States navy, most of his collection being lost in the wreck of the Polaris. Most of the scientific results of this expedition were gathered by his personal efforts, and published under the title of "Report on the Scientific Results of the Polaris Expedition" (1876). In 1879 he published a German narrative of the expedition illustrated with his own sketches. Later he returned to Germany.

BESSEMER, Sir Henry, English inventor: b. Charlton, Hertfordshire, 19 Jan. 1813; d. London, 15 March 1898. He received mechanical training at an early age in the type foundry of his father, a French artist, and going to London in 1831 began his career as a modeller and designer. His earliest invention was an improved method of stamping deeds which the revenue office straightway adopted without giving him any compensation therefor. Late in 1859 he brought to the attention of the government and was then knighted (1879) in acknowledgment of his services in this particular. His inventive ability was next turned to the production of a new method of making bronze-powder or "gold" paint, as it was termed, which proved a commercial success, and subsequent inventions of his were machines for making Utrecht velvet and improvements in type-casting machinery. At the time of the war in the Crimea he designed a projectile intended to revolutionise its flight, but as the cannon of that day were not strong enough to permit of its use, he went on experimenting in Paris under the patronage of Louis Napoleon till he had secured a much improved kind of cast iron. This, however, did not fully satisfy him and he continued at work refining the iron until steel was produced. He took out patents for this invention in 1855, but persevered in experiments till at his London bronze factory steel ingots had been manufactured which could be rolled into rails without hammering. When this process had become fully developed the Bessemer Steel Works were built in Sheffield, where, besides employing a large number of workmen in steel manufacture, many others were trained for similar work in factories all over the world. On 13 Aug. 1856, he read before the British Association at Cheltenham a paper dealing with the invention which has made his name famous, "The Manufacture of Malleable Iron and Steel without Fuel. This was a new and cheap process of converting hoop and scrap iron by blowing a blast of air through it when in a state of fusion, so as to clear it of all carbon, and then adding just the requisite quantity of carbon to produce steel— a process which has introduced a revolution in the steel-making trade, cheap steel being now made in vast quantities and used for many purposes in which its price formerly prohibited its application. At the Birmingham meeting in 1855 he read a second paper "On the Manufacture of Cast Steel, Its Progress and Employment as a Substitute for Wrought Iron." The Bessemer process not only stimulated the growth of the steel industry but greatly reduced the cost of manufacture and rendered steel available for rails and general engineering work. Bessemer was also the originator of a method still in use for compressing into a solid block the graphite employed in the manufacture of lead pencils; of a system of rollers for embossing and printing paper, and of improvements in telephones. In 1859 he received the Telford Medal of the Institute of Civil Engineers, and in 1872 the Albert Medal of the Society of Arts. He was president of the Iron and Steel Institute of Great Britain, 1871-73, and in 1879 became a Fellow of the Royal Society. In 1882 States eight localities and one railway bear his name. Bessemer was an honorary member of many foreign scientific and engineering societies, among which was the American Society of Mechanical Engineers. Before the end of December 1896, he presented a paper entitled "The Origin of the Bessemer Process," printed in its "Transactions."

BESSEMER, Ala., a city in Jefferson County, on several trunk railroads; 12 miles southwest of Birmingham, the county-seat. It was founded in 1887 as a manufacturing center because of the valuable iron and coal mines in its immediate vicinity. It contains iron foundries, coke ovens, a number of blast furnaces, machine shops, planing mills, iron pipe works, fire brick works, and other works connected with the iron and steel industry. The United States census of manufactures for 1914 recorded 47 industrial establishments of factory grade, employing 1,999 persons, of whom 1,772 were wage earners receiving annually $1,069,000 in wages. The capital invested in this manufacturing was $659,000 and the year's output was valued at $6,023,000: of this, $2,185,000 was the value added by manufacture. It has four banks, several weekly newspapers, electric lights, waterworks, a Carnegie library, the Elizabeth Duncan hospital, and a property valuation of $3,000,000. It is governed by a mayor elected biennially and a board of aldermen elected on a general ticket. Pop. (1910) 10,864; (1914) 15,000.

BESSEMER STEEL PROCESS. See BESSEMER, SIR HENRY; STEEL MANUFACTURE.

BESSENYEI, György, Hungarian dramatist: b. Berezel 1747; d. 1811. Being of a noble family he spent his earlier years in idleness, until, in his 18th year, he became a member of the court bodyguard. It was the year in which he began his serious studies, applying himself especially to foreign languages and literature, which led on to his first attempts at writing. His first work was a tragedy, "Agis," portraying a period of Spartan history (Vienna 1782), considered by Hungarian critics as the first step in modern Hungarian literature. His comedies are also the first works of a humorous nature in
Hungarian. Chief of these is 'The Philosopher' (1777). Among his other works are 'Life of John Hunyadi' and a 'Philosophical History of Hungary.' He has been considered the father of modern Hungarian literature.

BESSEY, Charles Edwin, American botanist: b. Milton, Ohio, 21 May 1845; d. Lincoln, Neb. 25 Feb. 1915. He was graduated at the Michigan Agricultural College 1869, studied at Harvard under Asa Gray 1872 and 1875-76, and was professor of botany at the Iowa Agricultural College 1870-84; professor of botany at the University of Nebraska in 1884, and head of the university 1909. He published 'The Geography of Iowa' (1876); 'Botany for High Schools and Colleges' (1880); 'The Essentials of Botany' (1884); 'Elementary Botany' (1904); 'Plant Migration Studies' (1905); 'Synopsis of Plant Phyta' (1907); 'Outlines of Plant Phyta' (1909); and with others, 'New Elementary Agriculture' (1911).

BESSIÈRES, bés-yär', Jean Baptiste, Duke of Istria, French marshal: b. Preissac, 5 Aug. 1768; d. Lützen, 1 May 1813. Entering the army in 1792 as a private soldier, in less than two years he had attained the rank of captain. After taking part in the Spanish campaign, he passed into the army of Italy and soon attracted the notice of Napoleon who took him to Egypt in 1798, where his conduct at St. Jean d'Acres and Aboukir covered him with glory. At the coronation of Napoleon to the throne, he became marshal of France. He showed his usual conspicuous courage at Austerlitz Jena, Eylau and Friedland, and, raised to the rank of Duke of Istria, commanded in Spain in 1808-09. In the same year he led the cavalry of the Guard, and did much by his sleepless courage and presence of mind to save the wreck of the army in the disastrous retreat from Moscow. On the morning of the battle of Lützen he fell mortally wounded by a cannon ball. He was a great cavalry leader, cool and dauntless, and beloved by his troops.

BEST, William Thomas, English musician: b. Carlisle, 13 Aug. 1826; d. Liverpool, 10 May 1897. In 1849 he was appointed organist of the Philharmonic Society in Liverpool; in 1853 he went to London and became organist of the Panopticon of Science and Art and also of the Church of Saint Martin-in-the-Fields; in 1854 he was organist of Lincoln's Inn Chapel and in 1855 organist of Saint George's Hall, Liverpool. He was the author of 'The Modern School for the Organ' (1853); 'The Art of Organ Playing' (1869); 'Arrangements from the Scores of the Great Masters' (1873), and was well known as an editor.

BESTIARIES, the name given to certain extremely popular books of the Middle Ages. In the written volumes, sometimes with copious illustrations, were given descriptions of animals, real and imaginary, which was which being left to the discretion or knowledge of the readers. They were composed in verse or prose or a mixture of both, and were designed not only as hand-books of zoology, but as teachers of morals as well. They were written in a fashion to assign each spiritual meaning to the animals or their actions, until every quality of good or evil in the soul of man had its type in the beast world. It is to the bestiaries that we must look for explanation of the strange, grotesque creatures which are found sculptured on the churches and other buildings of the Middle Ages. The oldest Latin bestiaries had an early Greek original, the well-known 'Physiologus,' under which name about 50 such allegories were grouped. The Greek text of this famous work is found only in manuscript. There are old Syriac, Armenian, Ethiopic, Arabic, Icelandic and numerous Latin versions. Editions of the Latin have been issued by Mai, Heieer and Cahier. An Old High German version was made earlier than the 11th century; in the 12th century versions in French were made by Philippe de Thaun and Guillaume, a priest of Normandy. The 'Bestiary of Love' of Richard de Fournival was rather a parody upon the earlier form of such books. Following is a characteristic extract from the 'Divine Bestiary': 'The unicorn has but one horn in the middle of its forehead. It is the only animal that ventures to attack the elephant; and so sharp is the nail of its foot, that with one blow it rips up the belly of that most terrible of all beasts. The hunters can catch the unicorn only by placing a young virgin in the forest which it haunts. No sooner does this marvelous animal descry the damsel than it runs toward her, lies down at her feet, and so suffers itself to be taken by the hunters. The unicorn represents our Lord Jesus Christ, who, taking our humanity upon him in the Virgin's womb, was betrayed by the wicked Jews and delivered into the hands of Pilate. Its one horn signifies the gospel truth, that Christ is one with the Father, etc.'

BESTUZHEV, bě-stoo'zhěf', Alexander Alexandrovitch, Russian novelist and soldier: b. Saint Petersburg, 3 Nov. 1797; d. 19 July 1837. Of his numerous novels, the most celebrated are 'Ammalat-Beg'; 'The Kadosha Frigate'; 'The Terrible Prophecy'. His 'Private Correspondence' is highly prized. He was killed in battle in the Caucasus.

BESTUZHEV-RYUMIN, bě-stoo'zhěf ryo'omen, Alexei Petrovitich, Count, Russian statesman: b. Moscow 1693, of a family of English origin, and of the second class of nobles in Russia; d. St. Petersburg, 21 April 1768. He entered the civil service under Peter the Great, and became a diplomatist. Under the Empress Anne he was made a member of the Cabinet, and the Empress Elizabeth, whose fullest confidence he possessed, created him count, great chancellor of the empire, and his influence in the government became almost boundless. He was strongly opposed to the Prussian and French diplomatic influence, and was disliked on this account by Peter III, nephew and presumptive heir of Elizabeth. He concluded several treaties with England, Sweden and Denmark, favorable to English policy. By a treaty concluded in 1747, he paved the way for the union of Schleswig and Holstein with the kingdom of Denmark. By his influence, the Russian troops supported Austria against Frederick the Great in the Seven Years' War. But they were opposed to the fashion of Russia, and this occasioned the fall of Bestuzhev. He was banished to his country seat, but Catherine II, in 1762, restored him to liberty and made him a field marshal. He is regarded as the inventor
of a chemical preparation known in medicine
under the name of *tinctura tonica Bestuchefii.*

BESTUZHEV-RYUMIN, Konstantin
Nikolayevitch, Russian historian: b. Kudresh,
governor of Nizhni Novgorod, 1829; d. 1897.
After graduating from the University of
Moscow, where he had studied law, he
taught school 1856-1858, and then he became
associate editor of the *Moscow Gazette.* Later he
removed to Saint Petersburg, where, in 1865,
he was appointed professor of Russian history
at the university. In 1890 he was elected to
membership of the Imperial Academy of
Science. He and Tibilin collaborated in trans-
lating Buckle’s ‘History of Civilization’ into
Russian. Among the more important of his
works are: ‘The Christianization of Russia’
(1864); ‘The Black Days of Tatarism’ (1864);
‘Biographies and Characteristics’ (1882). Of
greatest importance was the ‘History of Rus-
sia,’ which he did not complete, of which only
two volumes were published, the first in 1872
and the second in 1885. The last volume con-
cerned the reign of Ivan the Terrible.

BETAIN, or BETAINE, an organic base,
having the chemical composition C,H$_6$N$_2$O$_4$, ob-
tained from the juice of the common beet, or
from beet-root molasses. It is not present
in the beet-root in nature, but is obtained from
it by the action of baryta or hydrochloric acid.
The hydrochloride is one of its most important
salts, and numerous others are also known.

BETANZOZ, bā-tám’thōs, Juan José de,
Spanish historian of the 16th century. His
biographers tell little of him, other than that
he was among the first to accompany the nine
expeditionaries to the Indies, that he remained
a long time in the New World and there studied
the customs, usages and language of the abor-
gines and at his death left the manuscript of
the well-known and very interesting work enti-
tled ‘Historia de Indorum Moribus.’

BETEL, BETLE, PAWN or PINANG
popular Oriental names for various species of
Chavica (see PIPER, under special C. betle, and
C. siniboa), climbing shrubs cultivated in the
East for their leathery leaves which are used
to a prodigious extent with bits of areca-nut
and shell lime for chewing, particularly by the
Milay race. The plants are trained upon trebil-
ses, poles, etc., in shady but hot and moist
places, which in northern India are secured by
means of sheds. Europeans do not take readily
to the habit because the mixture is hot, acrid,
and stagnant, abrasives the mouth, temporarily de-
stores the sense of taste, reddens the lips as if
they were covered with blood and blackens the
teeth, which are sooner or later destroyed.
25 years of age, habits are often toothless.
Among East Indian races the habit dates back
more than 2,400 years and at the present time
is as general as was the habit of using snuff
among Europeans; the betel box is carried by
old and young, men and women, and presented
upon all occasions. Opinions differ as to the
utility of this habit, some writers claiming advantages which in the face
of the above-mentioned facts seem as far-
fetched as like arguments in defense of the sim-
ilar use of tobacco. Sir James Emerson Ten-
nent is of opinion that the habit is beneficial to
a people of whose food flesh forms no part, as
it is the antacid, the tonic and carminative
they require. Chavica is the genus into which
the old genus Piper has been divided.

BETELGREUSE, bē-tēl-grez’, the star
Alpha Orionis, the bright, reddish star in one of
the shoulders of Orion. It varies some-
what in brightness, but in no regular period.

BETH-AVEN, ‘house of idolatry,’
mentioned in Joshua and Samuel, lay northwest
of Michmash near Ai and disputed by what was
called the City of Ha-
lon. The place was still inhabited during the
8th century B.C. The calves of Beth-aven
were probably those at Bethel nearby.

BETH-DAGON, or HOUSE OF DA-
GON, the name of two Biblical cities whose
location has not been determined. About four
miles southeast of Jaffa stands a village named
Beit Dejan, which has arisen in comparatively
recent times. Khurbet Dajan, a Roman site, is
close by. The other Beth-Dagon was a city of the
tribe of Asher.

BETH-HORON, in Bible history, two
important towns of Palestine, supposed to have
been built by Sheerah, a daughter of Ephraim.
In the neighborhood, Joshua destroyed the
Canaanites; under Solomon both towns were
strongly fortified; the Egyptian King Shishak
passed along the high road to invade Judah,
and here, also, the Syrian commander Seron
was defeated by Judas Maccabeus. At a later
period a Roman army under Cestius Gallus
was driven back by the Jews. The site is occupied
to-day by two villages barely two miles apart.

BETH PEOR, bēth pē’ōr (Hebrew, house of
Peor, i.e., the god of Baal-Peor), a city where
the Israelites are said to have received the laws
of Deuteronomy, and the supposed locality of
Moses’ burial. The precise locality of Beth
Peor is undetermined, however, and various
points have been suggested as probable sites,
but the only theory which seems reasonably
sure is that it stood somewhere among the
Nebo-Pisgah Mountains. It belonged to the
tribe of Reuben. Some geographers have sug-
gested Ain el-Minyeh, on the northern side of
the ridge, as the location of the city.

BETH-SHAN, or BETH-SHEAN, in
ancient times a fortified town of Palestine, on
the site of which stands the modern village of
Beisân, inhabited by Circassians, and lies about
20 miles south of Tiberias, on the route of the
Acre-Damascus railroad. It is believed that the
stronghold was included in King Solomon’s
domains, but it belonged to the Philistines at
the time of Saul, for it was there that they dis-
honored the bodies of Saul and his sons. The
place was known as Scythopolis during the
Greek period, and after the Maccabean strug-
gle it rose to prosperity as a member of the
Decapolis, or league of 10 Greek cities. It re-
tained its Canaanite population for a while
during the Israeliite occupation after submission
to Manasseh.

BETH-ZUR or BETHSURA, ‘house of
rock,’ a town of Judah in the Hebron Moun-
tains. Rehoboam built the fortifications. The
Greeks under Lysias were here defeated by
Judas Maccabeus (165 B.C.). The ruins still
exist on a cliff near the Hebron road; the site
is called Beit Sur.
BETHABARA — BETHESDA

BETHABARA, the scene of Saint John's baptism. This name occurs only once (John i, 28), whereas the revised version, following the principal codices, reads Bethany (q.v.).

BETHAM-EDWARDS, Matilda, English author: b. Suffolk 1836. She was privately educated and has published numerous works in poetry, fiction and on French rural life. Among her works are 'The Dream Charlotte'; 'France of To-day'; 'A Romance of Dijon'; 'The Lords of the Angle-French Reminiscences'; 'A Suffolk Courtship'; 'Literary Rambles in France'; 'French Men, Women and Books'; 'In French Africa'; three volumes of poems, and an edition of Arthur Young's 'Travels in France.'

BETHANY, a village of Palestine, at the foot of Mount Olivet, on the eastern side, about two miles east of Jerusalem, where Lazarus dwelt and was raised from the dead and where the ascension of Christ is related to have taken place. The house and grave of Lazarus and the house of Mary Magdalene are still shown to travelers.

BETHANY, Mo., city and county-seat of Harrison County, 64 miles northwest of Saint Joseph, on the Chicago, Burlington and Quincy Railroad. It has flour mills, brickyards and canning factories. The district is rich in agricultural and stock raising products. Building stone is quarried nearby. The city is the seat of Heilbron Sanatorium. The electric light and power plant is municipal property. Pop. 1,931.

BETHANY COLLEGE, American coeducational institution at Lindsborg, Kan., under the auspices of the Swedish Lutheran Church, founded in 1881. In 1884 arrangements were made for the training of teachers for the parochial and public schools; the name was accordingly changed to Bethany Normal Institute. In 1886 the school was invested with the power to confer academic degrees. It now has preparatory, normal, commercial, collegiate, model school, art and music departments, with 47 instructors and a student-body of 792, and a library of over 10,000 volumes.

BETHANY COLLEGE a coeducational institution at Bethany, Va. The college was chartered by the Legislature of Virginia, 2 March 1840. The total number of graduates is 1,448. Prominent alumni, Champ Clark, United States senator George T. Oliver, associate justice of the Supreme Court Joseph R. Lamar, John C. New and governor E. B. Odell. The endowment is $420,000; property assets $500,000; students enrolled 447; professors and instructors 30; courses offered classical, scientific, philosophical, ministerial, agricultural, domestic science, normal, music.

BETHEL, a village of Palestine, about 10 miles from Jerusalem, now called Beitin or Beittein. It is situated at a point of strategic importance on which three roads converged and is mentioned frequently in the Old Testament. Here Abraham reared an altar and called on the name of the Lord. And here Jacob weary with travel, fell asleep and had a vision of angels, in commemoration of which he built an altar and called the place Bethel ("the house of God"). It is memorable also in the story of the apostasy of Rehoboam and the miracle of the withered hand, when, instead of the house of God, it became Bethoven, the place of idols, until every memorial of the idolatry was destroyed by Josiah. Consult 1 Kings xii, xiii; 2 Kings xxiii, 15-20.

In this neighborhood the two she-bears came out of the wood and tore forty and two of the children that had mocked at Elijah (2 Kings iii, 23, 24). It became a royal residence after the secession of the northern kingdom, and was one of the border fortresses. It was captured by Vespasian on his march to Jerusalem. It is not mentioned in the New Testament. Pop. about 500.

BETHEL, Maine, town in Oxford County situated on the Androscoggin River and the Grand Trunk Railroad, 70 miles northwest of Portland. It is a popular summer resort and is noted for its beautiful scenery. Being at the centre of a lumbering region, it has a number of wood-working establishments, which produce chairs, spoons, bobbins, etc. A large fish cannery is also located in the town. It contains Gould's Academy. Pop. 1,530.

BETHELL, Sir Richard, first Lord Westbury, English jurist: b. the first baronet-on-Avon 1800; d. 20 July 1873. The son of a Bristol physician, he matriculated at Wadham College, Oxford, at 14, gained a scholarship the succeeding year and took his degree in his 18th year. He was called to the bar in 1823 and rapidly rose in his profession; was returned to the House of Commons, as member for Aylesbury, in 1851; became solicitor-general in 1852 and attorney-general 1856-57, rendering conspicuous service to Mr. Gladstone in carrying through the complicated Succession Duty Bill; and became Lord Chancellor in 1861, taking the title of Baron Westbury. As Lord Chancellor he carried through important reforms. Owing to scandals associated with the administration of a protege of his in Leeds Insolvency Court, he was forced to resign. After his fall he did excellent work as one of the law lords.

BETHENCOURT, Jean de, bâ-tôn-koor, zhoân dé, king of the Canary Islands: d. 1425. He was chamberlain to Charles VI of France, but being reputed to be rich he sought to repair his fortunes in foreign countries and made a descent from Spain on the Canary Islands in 1402. Not having sufficient force, however, he returned and obtained reinforcements from Henry III of Castile, with which he was successful and was crowned king in 1404, under the title of Louis. He converted the greater portion of the Canaries to Christianity and in 1405 received from the Pope the appointment of bishop to the islands. The following year he went to Normandy, where he passed the remainder of his days.

BETHESDA, bê-thêz'da, a pool in Jerusalem, the name of which signifies *house of the stream.* In the five halls or porticos near it many patients lay waiting, according to the account of John (ch. v), for the moving of the waters to bathe in. According to Gen. iii, 7-10, one of the Jews, an angel descended, at a certain time, into the pool and troubled the water, and whoever first entered the water after this agitation was cured. It was near the Sheep Gate, north of the temple. The traditions as to Bethesda have varied. It was variously placed at differ-
Bethlehem is a probable site for Bethesda is the Virgin's Pool, the only natural spring of Jerusalem, which still presents the phenomenon of intermittent "troubling of the water," which overflows from a natural siphon under the city wall and a public library, while on Church and neighboring streets are notable dwellings built in the 17th century style of domestic architecture of eastern Germany. On the opposite side of the river, here spanned by three bridges, is the South Bethlehem (q.v.), the seat of Lehigh University, of the Lehigh Valley Railroad Company, of the famous Bethlehem steel works and other important manufacturing establishments. Monocacy Creek separates Bethlehem from East Bethlehem, formerly a separate borough and since 1904 consolidated with Bethlehem borough. Bethlehem was founded in 1741 by Moravians or United Brethren under Count Nikolaus Ludwig Zinzendorf, shortly before Christmas, which suggested its name, and it has remained ever since the chief centre of the Moravian sect in the United States. The old colonial hall in the seminary, built in 1748, was used as a general hospital for the Continental army during the Revolutionary War, and over 500 soldiers are buried in Bethlehem. On festival and funeral occasions, the old European custom of trumpet playing from the tower was early established and Bethlehem soon became recognized as a musical centre, Benjamin Franklin recording his impressions of the fine orchestral music rendered in the church. In modern days, under the directorship of J. Frederick Wolle, a pupil of Rheinberger and organist of the Moravian Church, Bethlehem attained a conspicuous position in the musical world from the institution of an annual festival largely devoted to the compositions of Johann Sebastian Bach. The first organized festival was held in 1901 and attracted considerable attention, lasting for three days. During Mr. Wolle's absence in California, from 1906 to 1911, when he gave annual Bach festivals at Berkeley, the Bethlehem festivals were discontinued, but were resumed on his return in 1912. Pop. (1900) 7,295; (1910) 12,837. See also Moravian Church and Moravian Seminary.

Bethlehemites. (1) An order of monks somewhat like the Dominicans, who settled in England in 1257. They were so named because they wore on the breast a five-pointed star in commemoration of the star that appeared at the birth of Jesus. The order was comparatively insignificant and had only one convent in England (at Cambridge). (2) An order of American Bethlehemites, sanctioned by Innocent XI in 1687, was established in the city of Guatemala by a Franciscan monk named Pedro de Bethencourt (1619-67), a native of the island of Teneriffe, about 1655, and was specially devoted to the nursing of the sick and the education of children. It became extinct about 1850. A female order of Bethlehemites also was founded by Maria Anna del Galdo, who belonged to the Tertiaries of Saint Francis. Twenty years later they obtained the privilege that the order were enlarged to an equality with those of the Augustinians, Dominicans and Franciscans. (3) The followers of Huss are sometimes called Bethlehemites, from the name of the church in Prague to which Huss preached.
BETHLEN-GABOR, bët-lém gä’bör, or GABRIEL BETHLEN, Prince of Transylvania, 1580-1638. He was a member of a prominent Protestant family of upper Hungary, which also held large estates in Transylvania. At the age of 17 he entered the service of Gabriel Bathori, prince of Transylvania, fought under his orders and then repaired to Court. He was elected in 1610 in the esteem of the Turks. Prompted by ambition, he became ungrateful to his first benefactor, and after bringing Bathori into bad odor with both the Transylvanians and the Turks, managed to make the latter declare war and actually headed a Turkish army against him. His treachery was successful and in 1613 he was proclaimed prince of Transylvania in defiance of the Emperor. Shortly after, having succeeded in stirring up the Hungarians against the Emperor Frederick II, he took several towns and in 1620 was chosen king of Hungary. Thereafter, supported by Turks and Tartars, he entered Austrian territory, laid waste Moravia, hemmed in the imperial army and was on the eve of an overwhelming victory when the refusal of the Turks to undergo a winter campaign defeated all his hopes. The approach of Tilley compelled him to withdraw. The Protestants of Germany were his allies, and thus, they were worsted at the battle of Prague. Bethlen-Gabor concluded peace with Ferdinand II, receiving Kaschau, seven Hungarian counties adjoining Transylvania, the principalities of Oppeln and Ratibor in Silesia and therank of Prince of the Empire. In 1623 he married Catharine of Brandenburg and became again involved in the Thirty Years' War. He at length retired from the strife and gave his attention to the internal affairs of Transylvania. He was one of the three great Magyars of his time, an able administrator and a promoter of sciences and literature. While preparing for a new war against the imperialists he died of dropsy. He is said to have participated in 42 battles.

BETHMANN-HOLLWEG, Moritz August, German jurist and statesman: 1 b. Frankfort-on-Main, 10 April 1811; d. 14 July 1877. Having graduated from his law studies at Göttingen and Berlin, he was appointed professor of civil law at the latter institution. In 1829 he was appointed to a similar position at Bonn, which he held until 1842. Three years later he was made a councillor of state and in 1852 he became a member of the First Chamber of the Prussian Parliament. In 1858 he was appointed Minister of Public Instruction, which office he held for four years. He was a strong supporter of the Moderate Constitutionalist Party. As a writer on jurisprudence he had a deep influence in the reforms of the German laws following the enactment of the German Civil Code in 1896. Among his principal works are "Vorlesungen über den gemeinen und preussischen Civilprozeß" (1821); "Ursprunge der lombardischen Stadtreife" (1846); "Der Civilprozeß des gemeinen Rechts in geschichtlicher Entwicklung" (6 vols., 1804-74); "Ueber Gestesgebrauch und Rechtswissenschatz als Aufgabe unserer Zeit" (1876).

BETHMANN-HOLLWEG, Theobald Theodore Friedrich Alfred von, German statesman: 1 b. Hohenfinow, Brandenburg, 29 Nov., 1836. Descended from one of the oldest patrician families in Germany, he entered the service of the Electors at Frankfort-on-Main, where in 1857 he was educated at the Universities of Strassburg, Leipzig, Berlin and Bonn. At the last named he was a fellow-student of the future Kaiser Wilhelm II; a close friendship was formed between them. In 1879, Bethmann-Hollweg was appointed Landrat of Ober-Barnim in Brandenburg in 1885 and thence rose in rapid succession to provincial president of Potsdam, president of the government of Bromberg and president of the province of Brandenburg. He became Prussian Minister of the Interior in 1905, introduced numerous important social reforms and in 1907 was appointed Imperial Home Secretary and vice-president of the Prussian Council. On 14 July 1909 the Kaiser conferred the greatest office of the state upon Doctor Bethmann-Hollweg by making him Imperial German Chancellor in succession to Prince Buelow. Two notable incidents of his chancellorship were the Zabern affair of 1914 and the famous Zabern affair, which resulted in the censure of the imperial and military executives by a large majority in the Reichstag. But it was the European War and its diplomatic connections that made the Chancellor a prominent actor in the history of the world. He was also the author of the now famous phrase describing the Treaty of 1839, which guaranteed the neutrality of Belgium, as "a scrap of paper." Much has been written concerning his personal share in the events of July and August 1914; that part of history remains for the future. In his speech in the Reichstag on 4 Aug. 1914, when the violation of Belgian neutrality was already in progress, he said: "We are now in a state of necessity, and necessity knows no law. Our troops have occupied Luxemburg and perhaps have already entered Belgian territory. Gentlemen, this is a breach of international law. It is true that the French government declared at Brussels that France would respect Belgian neutrality as long as her adversary respected it. We, in 1870, when France was arrayed against us for an invasion, France could wait, we could not. . . . Thus we were forced to ignore the rightful protests of the governments of Luxembourg and Belgium. The wrong—I speak openly—the wrong we thereby commit we will try to make good as soon as our military aims have been attained. He who is menaced as we are and is fighting for his highest possession can only consider how he is to hack his way through (wie ers sich durchzudrin gen kann)." Later in the evening the British Ambassador called upon him for a final interview. Sir W. E. Goschen reported: "I found the Chancellor very agitated. . . . He at once began a harangue, which lasted for about 20 minutes. . . . Just for a word—neutrality—a word which in war time is all too disregarded—just for a scrap of paper Great Britain was going to make war on a kindred nation who desired nothing better than to be friends with her. . . . He held Great Britain responsible for all the terrible events that might happen." (See WAG; BRITAIN—DIPLOMATIC HISTORY). On the eighth anniversary of Doctor Bethmann-Hollweg's assuming the office
of Chancellor, the following was sent out through the wireless stations of the German government: "The Kaiser has accepted the resignation tendered by the Imperial Chancellor, Herr von Bethmann-Hollweg, and has appointed as his successor the Prussian Under-Secretary of Finance, Herr Michaelis." (14 July 1917). The Chancellor fell as a result of the powerful opposition he encountered from the military party. He has the reputation of being a man of peace, a scholar and a philosoper; yet he has been identified throughout his official career with the agrarian and military caste known as Junkers (q.v.). He had never served in the army, but since the war he was appointed to an honorary rank which carried with it the wearing of a general's uniform. The Kaiser has more than once offered him a title, which he has steadily refused. His activities as Chancellor are spread over a wide field, not the least important being the various peace maneuvers conducted under his official patronage. See Germany—History; Morocco; Peace Proposals; William II.

BETHNAL GREEN, England, a metropolitan and parliamentary borough in the east end of London, Middlesex County. Area 759 acres. It was formerly a great centre of the weaving industry. The chief industries are now bootmaking, cabinet-making and matches. The borough returns two members to Parliament. Pop. (1911) 128,183. Consult Allgood, 'History of Bethnal Green' (1894); Gavin, 'Sanitary Ramblings — Sketches and Illustrations of Bethnal Green' (1848).

BETHPHAGE, beth'faj (Hebrew, 'house of figs'), a place of Scriptural interest, of which no trace is left. Its name was significant of its general location but not of the particular site. "The place of figs," it must have been situated somewhere on the eastern slope of that range of hills extending north and south between Jerusalem and Bethany, at the foot of which in the western valley flowed the Kedron. The principal points of this range are the Mount of Olives and the Mount of Olives. The fig-tree still abounds both on the eastern and western slopes of the range and on Mount Jericho today. Some travelers have been disposed to place Bethphage on the site of the modern village of Abu Dis, lying south and a little to the east of Bethany. Robinson thought this could not have been its position and gave little credit to the tradition of the monks of the country, who place it between Bethany and the summit of the Mount of Olives, since there is no trace that a village of any description ever existed there. Lightfoot thought it was a district extending from the Mount of Olives to Jerusalem and embracing a village of the same name.

BETHSAIDA, beth-sâ'-dâ', Palestine, village on the west shore of the Lake of Galilee, a little east of where the Jordan enters and near the newer Greek city, which was some distance inland. It was the birthplace of Peter and Andrew and Philip. Its site has been identified with a heap of grass-grown ruins. At the northeast extremity of the lake was another Bethsaida, a village near which the 5,000 were fed. Philip the Tetrarch raised it to the dignity of a town and renamed it Julia, in honor of the Emperor Augustus’ daughter.

BETHSHEMESH, beth-shemesh (Hebrew, 'house of the sun'), a city of ancient Palestine, which probably occupied the site of the modern village, Ain Shems, about 15 miles west-southwest of Jerusalem, whose extensive ruins are still remaining. The exploits of Samson were mainly in the neighborhood of Bethshemesh.

BETHUNE, Alexander Neil, Canadian clergyman: b. Glengarry, Ont., 28 Aug. 1800; d. 3 Feb. 1879. He was consulted to the priesthood in 1824, became archdeacon of York in 1846, coadjutor to Bishop Strachan of Toronto in 1867 and succeeded to the bishopric in the same year. He wrote the biography of Bishop Strachan.

BETHUNE, George Washington, American Dutch Reformed clergyman and poet: b. New York, 18 March 1805; d. Florence, Italy, 27 April 1862. He was educated at Dickinson College and at Princeton Theological Seminary. He had charges at Rhinebeck and Utica, N. Y., Philadelphia, Brooklyn and New York city. In 1859 he visited Italy to improve his health and in 1861 again went to Italy, where he died of apoplexy. He was noted as an orator, wit, poet, scholar and angler. Besides religious works, he wrote 'British Female Poets'; 'Lays of Love and Faith' (1847); several of the hymns which are widely used; 'Orations and Discourses' (1850); 'Memoirs of Joanna Bethune' (1864). He also published an edition of Izaak Walton's 'Complete Angler' (1846). He wrote the life by A. R. Van Nest (New York 1867).

BETHUNE, bâ-tûn, France, town in the department of Pas de Calais, 19 miles north-northwest of Arras. It stands on a rock washed by the Brette and is a place of considerable strength. The appearance of the town is not prepossessing. There is, however, one fine square, the centre of which is occupied by an ancient belfry of remarkable construction, while the hotel-de-ville, among the best edifices in the town, forms one of its sides. The chief manufactures at Boulogne are wool, soap and cloth. There are also distilleries, tanneries and salt and sugar refineries. The trade is greatly favored by the canals of Lawe and Bassée, which meet here. The family of the lords of Bethune is very celebrated and a branch of it was established in Scotland about the end of the 12th century. To this branch the celebrated Cardinal Beaton belonged. During the great European War Bethune formed part of the "debatable land" in which German and British forces faced each other in severe trench warfare of 1915 and 1916. Pop. 15,309.

BETTIS, or Bitlis, Turkish Armenia, a town about 20 miles west from Lake Van. It is one of the most ancient cities of Kurdistan, situated in a wide ravine traversed by a stream on whose steep banks the town is built. The houses are of red and white bricks; some stories in height, with grated windows to the streets. In the centre, on a high rock, is an ancient castle, formerly the residence of the Khans of Bitlis. The country around is fertile, well cultivated and produces excellent
crops of grain, cotton, hemp, rice, olives, tobacco of the best description and excellent fruits and vegetables. The principal manufactures of the town are coarse cotton cloth and tobacco. In February 1916, during the great Russian drive in Armenia, Betlis was occupied by the Russians following on the capture of Erzerum. Pop. about 30,000.

BEYOAN, a primitive but widely-extended branch of the South American Indians, between 67° and 73° west longitude, covering parts of eastern and southern Columbia and the neighboring regions of Venezuela and Brazil. Consult Koch-Grunberg's 'Zwei Jahre unter den Indianern,' and Reisen in Nordwest Brasilien 1903-05 (Berlin 1910).

BETROTHED, The. (1) A famous romance by Alessandro Manzoni—'I Promessi Sposi.' (See below). (2) A novel by Sir Walter Scott (1825), the scene of which is laid in the reign of Henry II. (3) An opera by Petrella, first sung in 1869 at Lecco.

BETROTHED, The ('I Promessi Sposi'). There are three redactions of this masterpiece of Alessandro Manzoni. The first (1821–23) bore the title 'Fermo e Lucia' and constituted a vast historical canvas, rich in digressive episodes of Milanese life around 1630, the year of the great pestilence. In the second, entitled in manuscript 'Gli sposi promessi' and published in 1827 as 'I promessi sposi,' we have a thorough critical revision. The historical materials extraneous to the story proper are made more proportionate to the imaginative content, while the ethical purpose of the novel more rigidly controls. In preparation for the third and final edition (1840–42) Manzoni had 'washed his duds in the Arno,' as he modestly avers. It expresses the Manzonian theory, now triumphant, of the national Italian language. 'I promessi sposi' in this form is the leading classic model of modern Italian speech. This romance is the best Italian effort in prose of the Romantic period. It substituted solid historical scholarship and studied psychological portraiture for the sentimentality of the mal du siècle and the purposeless adventures of the old romanesque novels. It gave a typical and evolved interpretation of Italian individualism, democratic (eziol) in outlook, Roman Catholic in inspiration, conservative and evolutionary in tactic. In artistic mood, it shows a kindly, ironical scepticism toward human nature, expressed subtly in the conception of the plot and more openly in frequent epigrammatic flashes. The conviction that man's efforts are powerless to win happiness leads Manzoni to a pessimism essentially passive and inactive; save that this feeling is but the groundwork for something more positive. Through faith in God and in the triumph of righteousness we may take refuge in a peaceful and secure optimism. "When troubles come, deserved or undeserved, trust in God softens them and makes them useful to better life." In lifting the veil delicately from the hidden vanities of his characters to reveal their helplessness in their pride, Manzoni finds a source of a rich humor, discerning but free from bitterness. The plot, hastily summarized, is amusingly melodramatic. Renzi himself is a type of man corrupted by the wickedness of a bold, bad baron, and the deliciously human weakness of a priest, Don Abbondio—the most popular figure of the novel—are prevented from marrying; and compelled to become nuns, they are caught up in the turmoil of great events occurring in their province. This review of 17th century society is accurate and sound. Its various traits and tendencies are incarnated in characters elaborated in detail. Hardly one of them but has become in some measure a phrase proverbial; for belonging exactly to their own ancient period, they reflect Manzoni's characteristic view of life, and are universally typical of humanity. The sagaciously worldly saint, Padre Cristoforo; the unthinking nun (monaca forzata) Gertrude; the converted reproube called l'innominato; the officious and wisely blundering mother, Agnese, are all famous and engaging personages. Perhaps the best-known section of the book is the jurid description of the pestilence at Milan, with its weird superstitious terrors. In the portrayal of feudal Italy, crushed by foreign oppression, modern Italian patriotism has always found much stimulus. Nevertheless, the complexity and delicacy of Manzoni's humorously portrayed full richness of 'I promessi sposi' accessible only to maturer minds. It seemed disappointingly oppressive and quiescent to the more turbulent spirits even of its own age. Forced, by its linguistic prestige, upon Italian children, it presents to them the conventional requisites of the textbook: dullness and sublimity. 'I promessi sposi' is not only the 'Ivanhoe,' but the 'Vicar of Wakefield' of Italians. A distinguished American, Andrew D. White, has called it the best novel ever written; which means simply that it can be read over and over again with increasing pleasure, due to ever new discoveries, though it will never have for Americans the glamour of sanctity with which the Italian scholastic tradition surrounds it as the principal model of the mother tongue.

ARTHUR LIVINGSTON, Western University, London, Ont.

BETROMTH, or BETROTHAL, a mutual promise or compact between two parties, by which they bind themselves to marry. The word imports giving one's troth, that is, true faith and allegiance; and the consent of both parties, of course, is required. This may be expressed either verbally, or by writing, or by action. In Germany the consent of the parents is always necessary, if the parties are under age, not yet sui juris. But if the parents withhold their consent unreasonably, the permission of a judge is allowed to sanction the contract. If the opinions of the parents are diverse, the law gives effect to that of the father. Betrothals contracted thus, according to law, are called sponsalia publica; others reckoned sponsalia clandestina. The latter are, in some
places, utterly invalid; in others, only punishable. By the common German law, however, they are valid in every case in which consummation or consecration by the priest has taken place. The parents, in these cases, are not allowed to apply for a dissolution of the contract, nor can they refuse their consent, except for highly important reasons. Public betrothment induces the obligation to marry. In case of refusal to complete the contract by marriage, the injured party is allowed an action at law to compel its performance; but, since unhappy marriages are among the greatest misfortunes, the means of compulsion applied by the law are never great, amounting only to a small fine or a short imprisonment. If circumstances take place which, if happening before the betrothment, would have necessarily prevented it, the party affected by them is allowed to rescind the engagement, and modern laws allow only an action for damages. In Germany, betrothment generally takes place in a small company of relations and friends. In Russia it was once binding and indissoluble, like marriage, but is now a mere form accompanying the marriage ceremony. The contract is called by the Jews jenain risoninim. In the case ofBettelheim, Anton, Austrian author: b. Vienna, 18 Nov. 1851. Having graduated from the universities at Vienna and Munich, he immediately devoted himself to a literary career. Most of his writings have been biographical. He edited the collection of biographies (Führende Geister, to which he contributed a biography of Anzengruber (1891, 2d ed., 1897). He was editor of the Allgemeine Deutsche Biographie. Of his notable biographies are 1 Deutsche Geisteshelden (1895); 2 Louise von François und Conrad F. Meyer (1905); 3 Auerbach (1907); 4 Prince Hohenlohe (1910).

BETTERTON, Thomas, English actor: b. August 1635; d. London, 26 April 1710. He was the son of an under-cook in the service of Charles I, and was apprenticed to a bookseller in London. His master, Mr. Rhodes, obtained a license for a company of players in 1659, and with him Betterton commenced his career. He was engaged by Davenant in 1661 for Lincoln's Inn Fields theatre. He was sent by royal command to visit Paris with a view to the adoption of French methods of staging, etc., in England. For his performance of Alvars in 'Love for Love,' Charles II lent him his coronation suit. His position was pre-eminent. There was no personal grace to him; he had no personal graces from nature to second his rare talents, if the following account be true: 'Mr. Betterton, though a superlatively good actor, labored under an ill figure, being abundantly made, having a thick neck, stooped in the shoulders, and had fat, short arms, which he rarely lifted higher than his stomach. His left hand frequently lodged in his breast between his coat and waistcoat; while with his right he prepared his speech; his actions were few but just; he had little eyes and a broad face, a little pock-fretten; a corpulent body, and thick legs, with large feet; he was better to meet than to follow, for his aspect was serious, venerable, and majestic. In his latter time, a little paralytic; his voice was low and grumbling, yet he could tune it by an artful climax which enforced universal attention even from the fops and orange girls. He was incapable of dancing even in a country dance, as was Mr. Barry, but their good qualities were more than equal to their deficiencies.' Betterton had the rare faculty of identifying himself with his part. He married Mrs. Sanderson, an actress of almost equal merit with himself, whose Lady Macbeth was reckoned a perfect piece of acting. He was prudent and saving, but he lost his small means in a commercial speculation, and a theatre which he afterward opened was not successful. After occult influence upon anything she touched or anybody with whom she came into contact. During these 40 days the lady was kept on starvation fare, so that when the day of the wedding came she looked more like a skeleton than a bride. Consul Pollock and Maitland, 'History of English Law' (2d ed., 1899); Hutchinson, H. N., 'Marriage Customs in Many Lands' (1897); and Miln, L. J., 'Wooings and Weddings in Many Lands' (1900).

BETSY AND I ARE OUT, the title of a popular American poem by Will Carleton (q.v.), first printed in the Toledo Blade in 1872. It was followed by 'Betsy and I Made Up.'

Under the common German law, however, they are valid in every case in which consummation or consecration by the priest has taken place. The parents, in these cases, are not allowed to apply for a dissolution of the contract, nor can they refuse their consent, except for highly important reasons. Public betrothment induces the obligation to marry. In case of refusal to complete the contract by marriage, the injured party is allowed an action at law to compel its performance; but, since unhappy marriages are among the greatest misfortunes, the means of compulsion applied by the law are never great, amounting only to a small fine or a short imprisonment. If circumstances take place which, if happening before the betrothment, would have necessarily prevented it, the party affected by them is allowed to rescind the engagement, and modern laws allow only an action for damages. In Germany, betrothment generally takes place in a small company of relations and friends. In Russia it was once binding and indissoluble, like marriage, but is now a mere form accompanying the marriage ceremony. The contract is called by the Jews jenain risoninim. In the case of Bettelheim, Anton, Austrian author: b. Vienna, 18 Nov. 1851. Having graduated from the universities at Vienna and Munich, he immediately devoted himself to a literary career. Most of his writings have been biographical. He edited the collection of biographies (Führende Geister, to which he contributed a biography of Anzengruber (1891, 2d ed., 1897). He was editor of the Allgemeine Deutsche Biographie. Of his notable biographies are 1 Deutsche Geisteshelden (1895); 2 Louise von François und Conrad F. Meyer (1905); 3 Auerbach (1907); 4 Prince Hohenlohe (1910).

BETTERTON, Thomas, English actor: b. August 1635; d. London, 26 April 1710. He was the son of an under-cook in the service of Charles I, and was apprenticed to a bookseller in London. His master, Mr. Rhodes, obtained a license for a company of players in 1659, and with him Betterton commenced his career. He was engaged by Davenant in 1661 for Lincoln's Inn Fields theatre. He was sent by royal command to visit Paris with a view to the adoption of French methods of staging, etc., in England. For his performance of Alvars in 'Love for Love,' Charles II lent him his coronation suit. His position was pre-eminent. There was no personal grace to him; he had no personal graces from nature to second his rare talents, if the following account be true: 'Mr. Betterton, though a superlatively good actor, labored under an ill figure, being abundantly made, having a thick neck, stooped in the shoulders, and had fat, short arms, which he rarely lifted higher than his stomach. His left hand frequently lodged in his breast between his coat and waistcoat; while with his right he prepared his speech; his actions were few but just; he had little eyes and a broad face, a little pock-fretten; a corpulent body, and thick legs, with large feet; he was better to meet than to follow, for his aspect was serious, venerable, and majestic. In his latter time, a little paralytic; his voice was low and grumbling, yet he could tune it by an artful climax which enforced universal attention even from the fops and orange girls. He was incapable of dancing even in a country dance, as was Mr. Barry, but their good qualities were more than equal to their deficiencies.' Betterton had the rare faculty of identifying himself with his part. He married Mrs. Sanderson, an actress of almost equal merit with himself, whose Lady Macbeth was reckoned a perfect piece of acting. He was prudent and saving, but he lost his small means in a commercial speculation, and a theatre which he afterward opened was not successful. After
his retirement from the stage, he reappeared in his old age a few times to take a benefit, his last appearance being 13 April 1870. He was the author of three plays. He was buried in Westminster Abbey. Consult Howe, 'Thomas Betterton' (1801); 'Life and Times of Thomas Betterton' (1888).

**BETTINI, bêt-tee-nil’e, Saverio, Italian author: b. Mantua, 1718; d. 1808. He studied theology, entered the Jesuits, and, in 1736, received the novitiate of this order, and taught from 1739 to 1744, belles-lettres at Brescia, where he made himself known by some poems composed for the use of schools. In Bologna, where he studied theology, he continued to cultivate his poetical talents, and wrote for the theatre of the college his tragedy of Jonathan. In 1751 he was entrusted with the direction of the college of nobles at Parma. After the suppression of the Jesuits in 1773 he returned to his native city, where he resumed his literary labors. His chief work is his 'Risorgimento negli studi, nelle Arti e ne’ Costumi dopo il MilLE' (1775). The 'Lettere dieci di Virgilio agli Arcadi' attracted great attention, and its criticism of the older poets, particularly Dante, involved him in much dispute. The best of his poems are his 'Vers scioliti,' which though they do not show any great poetical power, are always elegant and ingenious. His collected works appeared in 24 vols., 1799-1801.

**BETTING, the staking or pledging of money or property upon a contingency or issue. The processes of betting may be best illustrated in connection with horse-racing, which furnishes the members of the betting fraternity with their best markets. Bettors are divided into two classes—the backers of horses, and the bookmakers, or professional booktors, who form the betting ring, and make a living by betting against horses according to a methodical plan. By the method adopted by the professional booktor the element of chance is as far as possible removed from his transactions, so that he can calculate, with a reasonable prospect of having his calculations verified, on making more or less profit as the result of a season's engagements. Instead of backing any particular horse, the professional booktor lays the same sum against every horse that takes the field, or a certain number of them, and in doing so has usually to give odds, which are greater or less according to the estimate formed of the chance of success which each of the horses has on which the odds are given. In this way, while in the event of the race being won (as is usually the case) by any of the horses entered in the betting-book of a professional booktor, the latter has always a certain fixed sum (say $1,000) to pay, he receives from the backers of the losers sums which vary in proportion to the odds given. Thus if a bookmaker is making a $1,000 book, and the odds against some horse is four to one, he will, if that horse wins, have to pay $1,000, while, if it loses, he will receive $250. It usually depends upon which horse it is whether the bookmaker gains or loses. If the first favorable wins it is evidently the worst thing that could happen for the bookmaker, for as he is bound to receive the sum of the amounts to which all the horses, except one, have been backed, the largest deduction must be made from his total receipts on account of the first favorite. Very frequently the receipts of the bookmaker are augmented by sums paid on account of horses which have been backed and never run at all. Sometimes, although not often, the odds are given upon and not against a particular horse. Books may also be made up on the principle of betting against any particular horse, giving a place among the first three. The odds in this case are usually one-fourth of the odds given against the same horse winning. Another mode of betting is that called a sweepstake, in which a number of persons join in contributing a certain stake, after which each of those taking part in the sweepstake has a horse assigned to him (usually by lot), which he backs, and the backer of the winning horse gains the whole stakes. If there are more persons taking part in the sweepstake than there are horses running some of them must draw blanks, in which case of course their stakes are at once lost.

At common law, wages are not per se, void, but statutes prohibiting betting have been passed by many of the States. When one who loses a wager gets another to 'take' the bet for him, an action lies for the recovery of the money. Wagers on the event of an election laid before the poll is open, or after it is closed, are illegal. In horse-racing, simple bets upon a race are unlawful both in England and the United States. In the case even of a legal wager, the authority of a stakeholder, like that of an arbitrator, may be rescinded by either party before the event happens. See WAGER.

**BETTS, Samuel Rossiter, American jurist: b. Richmond, Mass., 8 June 1787; d. New Haven, Conn., 2 Nov. 1868. He practised law in Sullivan County, N. Y.; served in the War of 1812 and first became prominent when appointed judge advocate. He was a member of Congress 1815-17; Circuit Court judge, 1823-26; and United States district judge, 1827-67. As codifier of the maritime laws of the United States he exercised a clarifying influence upon such questions as salvage, wages, charters, insurance, seamen's wages, etc., and the formulation of the neutrality and patent laws. Despite the enormous volume of business brought to him over a long period his decisions were always consistent with the law as held. Hoffmann, Van Buren, Webster, Hall, Emmet and Choate were among the eminent lawyers who conducted cases before him. He published 'Admiralty Practice' (1838).

**BETULA, the generic name of birch (q.v.).

**BETWA, Hindustan, a river which takes its rise in the Vindhya Mountains, near Bhopal and flowing nearly 340 miles in a northeasterly direction through the provinces of Malwa and Allahabad, finally joins the Jumna below Kalpee. Near Erch a slight fall occurs. The country through which it flows is highly cultivated. The river at times is said to rise to a great height and in a portion of its course flows through beds of iron ore. The towns Bhilsa and Jhansi are located on its banks.

**BETZ, Franz, German opera singer: b. Mainz, 19 March 1835; d. Berlin, 11 Aug. 1900. He made his first appearance in 1855 and four years later became a member of the Royal Opera House Company at Berlin, where he first appeared in Verdi's 'Ernani.' Wagner chose him to create the part of Hans Sachs in
Munich in 1868 and of Wotan at Bayreuth in 1876, after which he devoted himself entirely to Wagnerian opera.

**BEULAH**, bûl'ə, a region described in Bunyan’s *Pilgrim’s Progress*, where there is nothing to annoy and all sounds are agreeable.

**BEULE, Charles Ernest**, French archaeologist and politician: b. Saumur, 29 June 1826; d. 4 April 1910. Having graduated from the École des Beaux-Arts, he was a professor of rhetoric. In 1849 he accompanied an expedition of French archaeologists to Greece, where he discovered the propylaia of the Acropolis. On his return to Paris he was appointed professor of archaeology at the Bibliothèque Nationale. In 1858 he undertook on his own account a trip to the site of Carthage. The latter part of his life was devoted to politics. In 1871 he was elected to the National Assembly, where he showed himself an ardent royalist. In 1873 he was for a brief period Minister of the Interior under MacMahon. Among his works are *L’Acropole d’Athènes* (2 vols., 1854); *Etudes sur le Peloponnesse* (1855); *Les monnaies d’Athènes* (1858); *Histoire de l’art gréco-romain* (1862); *Le procès des Césars* (4 vols., 1870).

**BEURMANN, Karl Moritz von**, German African explorer; b. Potsdam, 28 July 1835; d. Mao, Africa, February 1863. In 1853 he began his studies at the Military Engineering School at Berlin, from which he graduated and became an engineer in the engineering corps of the German Army. In 1860 he left the military service and accompanied an exploring expedition to the Nile and the Nubian Desert. Two years later he set forth on an exploring expedition on his own account to seek traces of Edward Vogel (q.v.), who had gone into the interior of Africa and had not since been heard from. Beurmann had as his objective Wadai. He proceeded to Kuka, the capital of Bornu, thence southward to Yakaka, capital of Batschi. Thence he set out for Wadai, but was compelled to return on account of the desertion of his carriers, who also robbed him of his outfit. A month later he made another start, reaching the frontier of Wadai, where, like Vogel, he was murdered at the order of the Sultan. His one work is *Glossar der Tigrésprache* (Leipzig 1868) which was also published in English (Halle 1868). A biographical sketch, by A. Merx, appears in *Jahresbericht des Leipziger Vereins für Erdkunde* (1860).

**BEURNONVILLE, bûr-nôf’văl, Marquis de** (Pierre de Rousset, pêr’är de rôz’f), marshal of France: b. Champignolle, Burgundy, 10 May 1752; d. 23 April 1821. He served in the east until 1789. Arriving in Paris at the commence ment of the Revolution, he identified himself at once with the Jacobins, and in 1792 commanded on the Moselle. In 1793 he became minister of war. Sent in 1793 to arrest Dumouriez, he was himself arrested by Dumouriez, and confined until 1795, when he was exchanged, and became successively general-in-chief of the army of the north, inspector-general of the army, Ambassador to Berlin in 1800, to Madrid in 1802, and count of the empire. In 1814 he was commissioned by Napoleon to organize defense means upon the frontier, and on the Emperor’s abdication was named Minister of State and Peer of France by Louis XVIII. On the return of Napoleon to Elba, he was proscribed by a special decree but was reinstated in all his dignities after the battle of Waterloo. He became marshal of France in 1816, and marquis in 1817.

**BÉUST, Friedrich Ferdinand**, boist, fréd’rē fér’ðə-nânts (Count von), Saxon and Austrian statesman: b. Dresden, 13 Jan. 1809; d. Altenberg, 24 Oct. 1886. He adopted the career of diplomacy, and as member of embassies or ambassador for Saxony resided at Berlin, Paris, Munich and London. He was successively Minister of Foreign Affairs (1849) and of the interior for Saxony (1853). At the London conference regarding the Schleswig-Holstein difficulty he represented the German Bund. He lent his influence on the side of Austria against Prussia before the war of 1866, was on its conclusion forced out of office by Bismarck. He entered the service of Austria as Minister of Foreign Affairs, became president of the ministry, Imperial Chancellor, and in 1868 was created count. He rendered excellent service in the reorganization of the dual monarchy. In 1871-78 he was Ambassador in London, and in 1878-82 in Paris. An English translation of his memoirs appeared.

**BEUTENMÜLLER, boit’ən-mül’-ür, William**, American entomologist; b. Hoboken, N. J., 31 March 1864. Educated in the public schools. From 1889-1910 he was curator of the department of entomology in the American Museum of Natural History. He has written admirable works on butterflies and moths, especially on those in the vicinity of New York, and contributed voluminously to scientific and popular magazines. He was president of the New York Entomological Society (1900-01) and editor of its *Journal*.

**BEUTH, Peter Christian Wilhelm, Prussian statesman**: b. Kleve, 28 Dec. 1781; d. Berlin, 27 Sept. 1853. Graduating from the University of Halle, where he had studied law, he entered the service of the government. In 1810 he was appointed director of the Board of Inland Revenue at Berlin; three years later he became a member of the Ministry of Finance, to which he was promoted on account of the reforms he had effected in the financial management of the revenue department. In 1821 he became a member of the Council of State. In 1844 he was raised to the position of acting privy councillor. He was the founder of the Industrial Institute in Berlin and of similar institutions in the provincial cities. A statue was erected in honor to his memory before the Architectural Academy.

**BEUTHEHN, boit’ən, Prussian, town, province of Silesia, government of Oppeln, about two and a half miles from the frontier of Russian Poland. It has steam and electric tramways, and among buildings of note are the Roman Catholic church of St. Mary (13th century), Protestant parish church (15th century), synagogue, royal Catholic gymnasium, higher girls’ school, etc. It is an important centre of mining and metallurgy, having iron-works, zinc-works, lead-works, coal mines and various industrial establishments. The town passed from the Kingdom of Bohemia into that of Prussia in 1742. Pop. 67,718.
BEVERAGES. Beverages are those drinks to which mankind resorts in order that he may relieve the pangs of thirst or supply some other demand of the system. In the beginning man's life was marked by its simplicity. Our first parents were content to eat the fruits that they found so convenient for their needs and it is doubtful if they knew any other beverage than the pure water coursing through the streams that irrigated the ground. It was not until they began to eat the flesh of beasts and searched the soil for delicacies to gratify their newly awakened appetite for a variety in foods that they felt the craving of unnatural thirst. But the long journeys of strong meats required the drinking of stronger drinks than water and in this fact we find the origin of the history of beverages.

It would be intensely interesting if we could know in just what way prehistoric man first satisfied his unnatural thirst for drink. It is, of course, more than probable that the second beverage discovered by man was the milk of the animals he slaughtered to gratify his taste for meat. From a temperate and hygienic point of view it was not a long stride from the waters of the brooks to the milk of cows and asses and yet it stands out as a landmark in the development of the demand for variety, the demand which may be regarded as the first tendency toward civilization. It is also quite probable that, in the beginning, man drank his milk soon after it was drawn or while it was still fresh, but finally there came a day when some prehistoric investigator was bold enough to take a drink of the milk of mares that had been set aside, and from this fermented liquid learned the sensations of intoxication, for kumys, still the favorite tipple of the Tartar, is unquestionably the most ancient of all intoxicating beverages.

To mankind, next to water, milk is still a favored beverage, for it possesses the double advantage of being both food and drink. To the civilized taste the milk of cows is the most desirable but more barbaric taste calls for a stronger beverage and is best gratified by the milk of mares, asses, camels or even reindeers.

It is undoubtedly true that if we ate only wholesome foods in such quantities only as our system requires; performed our work with regularity; enjoyed, at proper intervals, requisite rest and recreation, and avoided all such deleterious actions as intoxication and worry, water would be the only beverage that nature would demand.

While it is the primary object of all beverages to relieve thirst nearly all of them also possess this universal property, but have a more or less effect upon the body. For example, those drinks which contain the largest quantities of water pass most rapidly into the circulation, increasing the volume of blood. Diluting the food, they not only assist digestion but also aid in eliminating waste matter from the body through the ordinary channels. There are beverages that soothe and beverages that irritate, but all have their purpose. The former find their place in the times of fever and cold, while the latter are stimulating irritants of great medicinal value.

Among the most useful beverages are those that best relieve the cravings of thirst, the sour liquids prepared from the lemon, or other fruit juices, which, while perhaps not acid in themselves, have been rendered acidulous by charges of carbon dioxide. While the carbonated and mineral waters have the greatest effect in eliminating waste matter from the system they are not so useful in this regard as the hot drinks, like tea, coffee or even hot water, for they not only play their part in the elimination of waste but also cool the body by increasing the perspiration. Particularly soothing are such mucilaginous or gelatinous liquids as barley water, flaxseed tea and Irish moss. The mineral waters, malt liquors and light wines act with a tonic effect; the more common beverages, like tea and coffee and the milder alcoholic liquors are stimulating to the nerves, while tea and coffee, if milk and sugar are added, as well as chocolate, cocoa and the malt liquors may be classified as the nutritive drinks.

Next in popularity to milk are those unfermented beverages which are made from products of the vegetable world such as tea, coffee, cocoa and chocolate. Although cocoa is by far the most ancient of these drinks, having been in use long before the stimulating qualities of either tea or coffee were discovered, coffee has long been in greatest demand. In fact, it has been estimated that about 500,000,000 people drink coffee daily, as against the 100,000,000 who drink tea, and the 60,000,000 who partake of chocolate and cocoa. In the United States alone some 500,000,000 pounds of coffee are consumed annually, as against 90,000,000 pounds of tea, and some 20,000,000 pounds of the various preparations of cocoa and chocolate.

There are several points of resemblance between all these table drinks of the world, though they are in appearance and flavor. In each case they exercise a stimulating effect, the caffeine of coffee and theine of tea being almost identical, while the theolhrone of chocolate and cocoa is but a slightly different principle. Each also contains the same bitter principle, tannin, and each owes its characteristic odor and flavor to an essential oil.

Coffee, which must be considered first, because of its great popularity, is the berry from the several species of the genus Coffeo of which C. arabica is the most important. First used in Abyssinia during the 9th century, it was later introduced into Arabia, and from there to Constantinople, where it had become popularized by the middle of the 16th century. It is supposed that it was Leonhard Rauwolf, a German physician, who introduced coffee into Europe in 1573. A few years later Prosper Alpinus brought some of the beans to Venice to use them as an exercise medicine but was many years before it was drunk to any extent outside of Constantinople. In 1652, however, a coffee house was opened in London by the Greek serv-
ant of a merchant named Edwards, whose ships sailed to the Levant, and since that time the popularity of the beverage has never waned.

In its preparation as a drink coffee should not be boiled in water, but instead, should be covered with water that has previously been boiled. Here it should be allowed to infuse for fully 10 minutes, at a temperature little below the boiling point. As coffee does not contain as great a quantity of tannin as tea and does not yield it so readily, it may infuse longer without becoming bitter and indigestible, the effect which tannin exerts if it is boiled or left for too long a time over the fire.

Like many other beverages coffee exercises both good and evil effects upon the system. Stimulating the muscles, heart and nerves, its tendency is to overcome the ills of fatigue, while its strengthening effect upon the heart’s action makes it a most valuable stimulant. At the same time its action upon the nervous system is so marked that over-indulgence in the drink is certain to be attended by such ill effects as insomnia, and nervous headaches, ill not palpitation and general nervous disability.

Tea, which stands next to coffee as a table beverage, is a native of China where these shrubs of the Camellia family have been cultivated for more than a thousand years. It was once a general belief that there were many kinds of tea plants, but Robert Fortune, the botanist, exposed the myth by his thorough investigation of the various methods of cultivation and manufacture in use in the tea districts of China and India. It is now known, therefore, that while there are many variations in the tea plant the varieties are all the same plant cultivated under different conditions, while the two distinctive varieties, the green and the black tea, are the results of different methods of manufacture. Green tea, for example, is prepared by steaming the leaves before they have been rolled and dried, a method of procedure which produces a greater quantity of tannin.

As the flavor of tea as a beverage depends as much upon the quality of the water in which it is infused as upon the method of infusion, care should be taken to see that the water is neither too soft nor too hard, and that it has been heated before it is poured over the tea. The period of infusion, which is then continued at a lower temperature, should not last more than a few minutes, for the longer the infusion the greater the quantity of tannin that will be extracted.

Like coffee, tea has its good and evil effects. If infused too long it becomes bitter unwholesome and indigestible. If drunk too freely it not only induces insomnia and kindred nervous disorders but irritates the stomach, producing a serious kind of diarrhoea. At the same time it is a mild stimulant which refreshes the body and prepares the brain for intellectual energy. It is also beneficial in aiding one to withstand the ill effects of cold, fatigue and hunger. By producing perspiration it cools the body when overheated and, by means of its action upon the heart, it warms the body when cold.

While tea has been consumed in China and other parts of Asia since the latter part of the 6th century it was not introduced in European countries until the 16th century. The first mentions having tasted it for the first time in 1660, but the novel beverage must have met with almost instant recognition for, less than 18 years later, it was in general use in every part of England.

As both cocoa and chocolate contain starch and fat in considerable quantities they are among the most nutritious of the stimulating table beverages. Both are obtained from a small evergreen tree, native to tropical countries, for while the cocoa of commerce is prepared by grinding the seeds themselves, the commercial chocolate cakes contain the better parts of the berry, usually mixed with sugar and some distinctive flavoring. The preparation of the drink is a simple process, the cocoa or chocolate merely being dissolved in milk and boiling water.

Although by no means so popular as tea or coffee the drinking of mineral waters has become so general during the past century that they must now be regarded as among the most important temperance beverages. Early in the 16th century an attempt was made to produce artificial mineral waters, but it was not until the 18th century that chemistry had made sufficient progress to enable the experimenters to produce the elementary compounds of the waters both as to quality and quantity. In fact, the first unqualified success in this line of investigation was made by Dr. Frederick Adolphus Augustus Struve, a Dresden druggist, who celebrated his achievement by opening an artificial mineral water pavilion in that city, in 1820.

The alkaline and mineral waters which so much in use to-day owe their distinctive characteristics to the preparation of carbonic acid and bicarbonate of sodium as well as to the carbonate of potassium, lithium, calcium and magnesium which they contain, all of which tend to make them useful aids to the physician in the treatment of disease. The Vichy of France, for example, or the Emser of Germany, are extensively used in the dietetic treatment, correcting disorders of the stomach and acting as alkalinizers of the blood, bile and urine. In cases of gout, gall stones, rheumatism, dyspepsia, constipation, etc., they have proved of invaluable service and have also been used successfully in the treatment of obesity. In many instances their value as medicinal agents is enhanced by the addition of carbon dioxide, while, in other cases, they are made more palatable and easy of digestion by being served with milk. Among the natural mineral waters produced in this country are those of Saratoga, N. Y., Saint Louis, Mich., and Waukesha, Wis., all of which are well and favorably known to those who make use of such beverages.

Another class of drinks, the popularity of which is beyond question, are those beverages which contain alcohol as an active principle: beer, ale, wine, cider and the many kinds of spirituous liquors that are now manufactured in almost every part of the world. In addition to the alcohol these beverages also contain such properties as tannin, sugar, carbonic acid, or various acidulous substances, any or all of which exert an influence over the flavor of the liquid. As to alcohol itself it has so long been a bane of contention that it would be folly to attempt to review the century-long contest in a single article. Originally used exclusively as a medicine, and admittedly a valuable agent in
the treatment of certain diseases it is to be doubted if even the moderate use of such liquors as beverages is not productive of far more evil than good, while the effect of immoderate indulgence in such liquid stimulants is well known to require further discussion. In spite of all the warnings of science, however, man continues to gratify his craving for alcoholic preparations. Even in countries where the ordinary beverages of commerce are unknown, the taste has learned to delight in the flavor of fermented liquors, and this desire even the most barbaric people have had ingenuity enough to gratify.

Beer, or lager, as it is more generally known in this country, is by no means a modern invention and no drink has continued to maintain a more steadfast hold upon the taste of man since the earliest days of civilization. The Egyptians manufactured beer from barley many hundred years before the Christian Era. Archilochus, 700 B.C., shows that the Greeks had learned the art of brewing, while we have such eminent authorities as Sophocles and Eschylus, Diocles and Pliny to prove that the Greeks and Romans both made and loved it. Like the Gauls, the Romans called it Cervisia, from Ceres, the goddess of field fruits, and there is ample history to show that the art of making this beverage was known to man fully as early as the art of making wine from the grape. Prior to the triumph of the Romans the Britons were drinkers of milk and water although they occasionally drank mead, an intoxicating beverage made from honey. As Tacitus tells us that beer was the ordinary drink of the Romans, and beer and vinegar the favorite beverage of the soldiers of Julius Caesar, it is not difficult to imagine why, so soon after his triumph, the Britons became a nation of beer-drinkers. Unlike the Romans, however, they employed wheat instead of barley in their malting. In Germany, too, beer was introduced at a very early date. Charlemagne loved it dearly and not only compelled the best brewers in the land to become attachés of his court, but gave his personal attention to the subject so conscientiously that he was able to tell them how to improve their brew. As early as 1432 the monasteries of that country began to make beer and, by the 16th century, that beverage had become one of the chief exports of the country. In fact, the German brewer has always been recognized as one of the best beer makers of the world and it has only been within the past century that the success of their Austrian rivals has had a tendency to somewhat eclipse their glory. Centuries ago beverages known as beer were made in England by tapping such trees as the birch, maple, spruce and ash for their juices, or by resorting to the properties contained in ginger and other roots, a practice which not only still prevails in some parts of the country but is being practiced by the first colonists, who loved these humble, harmless drinks too well to leave their recipes in the motherland.

Ale and porter, the heavier malted liquors which are so much used in England and the United States, cannot boast such ancient lineage as beer, but still there is reason to believe that it was a beverage like ale on which the Anglo-Saxons and the Danes loved to become drunken, and, fully as early as the reign of Henry II, the monks of England had become famous for their wondrous brews. In fact, it was due to the investigations of some of these fathers of the monasteries that the superior quality of the waters of Burton-on-Trent for brewing purposes was discovered, a discovery that has made the ales and porters of England world celebrated.

Wine, whose history is as old as that of civilization, is the most aristocratic of drinks. Ascribed to the gods by the ancients—to Dionysus by the Greeks, Bacchus by the Romans and Osiris by the Egyptians—there can be no question but that the use of the juice of the grape as a beverage was one of the first discoveries of civilized man. It is true that the very ancient Romans did not know it at the time when even the Israelites had learned the secret of its production, but, later, wine-making in Rome became such a general enterprise that Emperor Domitian ordered half of the vineyards destroyed so that the more necessary wheat might be raised in the plain of the Tiber. According to the best authorities Asia was the country in which the vine first grew without the aid of man, while Armenia and eastern Pontus were the lands in which the cultivation of the grape was first undertaken. From there the love of wine spread to Assyria and Egypt through all the lands of ancient civilization. Among the best known Asiatic wines was that of Chalybon, near Damascus, the beverages with which the tables of the Persian kings were constantly supplied, while the most famous Greek wines came from such places as Chios and Lesbos.

In ancient India and in Egypt priests were forbidden to drink, while the Jewish priests were only forbidden on days of religious services. In fact, the Hebrews were by no means as strict about the use of wine as were some other nations and the fact that wine-culture was one of their favorite occupations is proved by history, both biblical and profane. Traditions state that it was the Phoenicians, the earliest of vine-growers, who carried the secret of wine-making to Spain, Italy and France. They also established large vineyards on the islands of Chios, Mytilene and Tenedos.

As early as 550 B.C. the process of blending selected wines was known to the Carthaginians, while the ancient practice of adding turpentine to the wine for the purpose of preserving it was probably an invention of Italy. France, Spain, and Portugal are now the chief centres of vine-culture although the grape-growers in many parts of the United States, and particularly in the far Western States, have recently raised the making of wine to the dignity of a greater American industry. Champagne, however, one of the most popular of wines, is a beverage of extremely modern invention when compared to other makes. Invented by Dom Perignon of Hautvill, about the beginning of the 18th century its use has become more general until it is now consumed by wine-lovers in all parts of the world. If wine is the most aristocratic, whisky may be designated as the most democratic of drinks. Thoroughly cosmopolitan in character, in various countries it is distilled from various substances, but always, whether it is made from barley, corn, wheat, rye, or even from potatoes, it bears the same name and usually enjoys the same proportion of
popularity. The word “whisky” is a name that was bestowed upon this beverage by the Celts of Ireland and Scotland who began to make it about the middle of the 17th century. The word itself is a corruption of the Gaelic “usquebaugh” (water), and closely interpreted means “strong water.” In the beginning this drink was used almost exclusively as medicine but as soon as it had become introduced as a beverage it became a favorite drink throughout Great Britain, and itself is a corruption of the Gaelic “uisge-beatha” which once referred only to the Scotch and Irish drinks of that name, the rye and Bourbon whiskies of American manufacture are now consumed almost as generally as those made from recipes that have been handed down from the days of the ancient Celts.

Almost as strong as whisky, brandy, the “brande-vin” or burnt wine, is a drink which is often used, both for medicinal purposes and as a beverage. Its name, as is indicated, was derived from the method of its manufacture, a form of alcohol made by the distillation of wine. Since the days of the ancients this form of distillation has been followed for many generations and in many parts of the world. In Morocco the Jews use the refuse of the grape as well as such fruits as raisins, figs, dates and pears in its distillation, and from these strange drinks because that they believe that their freedom from that terrible disease, elephantiasis, always so common among theMohamedans in that country, is due to the fact that they partake so freely of this unique spirit. In Mogadore, in his travels, discovered a tribe on the Barbary coast which made excellent brandy from honey; in Persia it is the tears of the weaker sorts of wines that are distilled, and almost every country has its particular method of making this beverage. None of them, however, can compare in quality to the cognac of France, that rich distillation from wines which alone properly bears the name of “brandy.”

Gin is another distilled liquor. It is made from rye, grain and malted barley, flavored with juniper-berries and sometimes with turpentine. It is also known as Hollands, and as Holland gin, these names being a relic of the days when the beverage was called Holland-Geneva, the word “gin” being a corruption of the word “Geneva.” Although originally made in Holland it was soon introduced into other countries where it immediately became one of the most popular of drinks. Easily manufactured and always strong it could be sold so cheaply that it was finally found necessary to adopt strict legislative measures restricting its sale and consumption. Hogarth’s excellent picture, “Gin Lane,” which was one of the influences in bringing about the much needed reform, is said to have been but slightly an exaggeration of the actual conditions which existed in all the large English cities.

Rum, formerly spelled as the French still spell it, “rum,” is a spirit which is distilled from the sugar-cane juice, the skimmings of the juice from the boiling house, or from the molasses mixed with the lees of former distillations. Although not so commonly used as some of the other strong liquors rum has been known both for its medicinal value and as a beverage ever since its introduction from the West Indies, more than a century ago.

The following are among the drinks which are not so generally known but which are in common use among the people of other countries:

Armack, a drink manufactured widely in the East and West Indies, is much used by the natives. In making it it is sometimes distilled from the fermented juice of the palm tree, and sometimes from a combination of rice and molasses used in connection with the palm-tree juices.

Vodka, which is the chief source of intoxication in Russia, is a liquor which may be distilled either from rye or from potatoes.

In several parts of the world the sap of trees is called into requisition to satisfy the thirst for intoxicants. Pulque, for example, the beverage most commonly used in all Spanish-American countries, is made from the fermented sap of the aloew, while a somewhat different drink, called Tepache, is made by mixing sugar and water with this sap of the aloew, which after- ward is allowed to ferment for a few hours only. In Tasmania the so-called “cider-tree” furnishes the bushmen with a means of intoxication. In this case the sap is of such a character that it may be drunk as soon as it is drawn from the tree, in which state it is both refreshing and harmless, but if left to stand for some time it becomes an intoxicant of great potency.

The Soma of the Hindus is supposed to be the original intoxicant of the human race. The Persians, who accept this tradition, revere the beverage that is made from this plant and it is looked upon as the beverage of the mighty god, ever-giving new strength and new vigor. It is a milky fluid which is found in the climbing bindweed, and, when properly fermented, is extremely heady.

Sake, the commonly used distilled liquor of Japan, is made entirely from rice, as also is Samshue, a drink used by the lower classes in China.

Kvaass is the name of a sour beer much favored by the Russian peasantry. It is made from barley and rye, by a similar malting process as that applied to the manufacture of beer.

The natives of South America have a drink which they call Guarapo, which is made from the fermented juice of the sugar-cane.

Chi-chi is the name given to another kind of cider which is made by the natives of Patagonia. In brewing it, in the autumn when the apples are ripe, they dig large pits which they line and interline most carefully with hides in order that none of the juice may soak into the earth. Into these hides they throw the ripe apples which are left to decay and ferment until they are ready for use. It is then extremely intoxicating.

A drink called Kephir is drunk by the natives of the Caucasus. It is an effervescing milk-like liquid, the effervescence being caused by the introduction of horny, yellowish-brown masses called “Kephir-grains.” Kern, who made a scientific examination of these grains, discovered that they were made of a rod-like bacterium and a yeast-like substance that was entirely unknown to him. Not unlike Kumys in appearance and in taste, Kephir is far more intoxicating.

Kava, or ava, is a Polynesian drink which is made by macerating in water a portion of the root and stem of one of the pepperaceae.
BEVERIDGE — BEVERLEY

There are several substitutes for tea in use in various parts of the world. In some of the Pacific Islands there are "tea-trees," while the natives of Tibet are very fond of their "brick tea," which is made from the offscourings and dust of the leaves and stems of the tea plants. It derives its name from the fact that the dust is pressed into hard, solid, brick-shaped lumps, from which pieces are chipped off as they are to be used.

BEVERIDGE, Albert Jeremiah, American lawyer: b. Highland County, Ohio, 6 Oct. 1802. He was brought up on a farm in Ohio; was graduated at De Pauw University in 1833; and engaged in law practice in Indianapolis. He entered political life in 1883, and soon won a reputation as an effective orator. On 17 Jan. 1889, he was elected United States senator for Indiana, as a Republican. Soon after his election he went to the Philippine Islands; made a thorough study of political and material conditions there; and, on the assembly of Congress in December following, delivered a three-hour speech in the Senate in support of the administration's policy concerning the new possessions in the East. In 1906 he introduced an amendment to the Agricultural bill providing for closer inspection of the meat-packing industry. He became one of the leaders of the new Progressive party in 1912. He wrote: 'The Russian Advance' (1903); 'The Young Man and the World' (1905); 'The Meaning of the Times' (1907); 'Americans of Today and Tomorrow' (1908); 'Pass Prosperity Around' (1912); 'What is Back of the War' (1915).

BEVERIDGE, William, English divine: b. Barrow, Leicestershire, 1637; d. Westminster 1708. He studied at Saint John's College, Cambridge, devoting his attention particularly to Oriental literature. In 1658 he published a work on Eastern tongues, especially Hebrew, Chaldee, Syriac, Arabic and Samaritan, accompanied with a Syriac grammar. In 1660 he took orders, and obtained the vicarage of Ealing in Middlesex, where he wrote a useful 'Introduction to Chronology.' In 1672 he was appointed to the rectory of Saint Peter, Cornhill, London, and the same year published his 'Syndicon' in two folio volumes, containing the Apostolic canons, decrees of the councils received by the Greek Church, and the canonical epistles of the early Fathers. This work called forth an opponent, to whom Beveridge replied in a 'Vindication.' In 1674 he obtained a prebend in Saint Paul's, and in 1681 was appointed archdeacon of Exeter. In 1684 he became prebendary of Canterbury, and in 1688 was appointed chaplain to William and Mary. Shortly after, the see of Bath and Wells was offered him; but as it had become vacant by the conscientious refusal of Bishop Ken to take the new oaths, Beveridge, to his honor, declined to accept it. The episcopal dignity, however, was only delayed; in 1704 he became bishop of Saint Asaph. Among his best-known works are 'The Church Catechism Explained'; 'Private Thoughts upon a Christian Life'; and 'The Great Necessity and Advantage of Public Prayer and Frequent Communion.' Collective editions of his works were published in 1824 and in 1842-46. Consult Burnet's 'Own Times'; and the 'Life' by Horne.

BEVERLEY, Constance de, in Scott's poem 'Marmion,' a nun who for love of Marmion follows him in the disguise of a groom, and on being thrown over by Marmion is immured at Holy Isle for breach of her vow of chastity.

BEVERLEY, Robert, American historian: b. Virginia 1675; d. 1716. He was educated in England and about 1697 became clerk of the Council of Virginia and had charge of the records of the colony. He was the author of a 'History of the Present State of Virginia,' published in 1705, a most interesting account of the details of the daily life in colonial Virginia. A reprint was published in Richmond in 1855.

BEVERLEY, Saint John of, English divine: b. about the middle of the 7th century at Harpham, Yorkshire; d. Beverley 721. He was educated at Canterbury under Archbishop Theodore, and became a monk under Hilda in the monastery founded by her at Whitby. In 687 he was appointed to the see of Hexham, and in 705 was transferred to York. He founded a convent of nuns at Beverley, and built the choir of the church there. He resigned his bishopric and retired to Beverley in 718. Bede, who is said to have been his pupil, speaks of him with great veneration. He was canonized in 1057, and his remains were placed in a costly shrine, in Beverley Minster. His fame was so widespread that when William the Conqueror led his army to the north and ravaged the country he saved the town of Beverley out of respect to the memory of the bishop. In 1416 Archbishop Chicheley ordered the anniversary of his death to be celebrated as one of the festivals of the Church, and special privileges were conferred on his church at Beverley by several English sovereigns. He is said to have written an 'Exposition of Luke' and 'Homilies on the Gospels.'

BEVERLEY, England, municipal borough and the principal town in the East Riding of Yorkshire, eight miles north-northwest of the city of Hull and a mile from the river Hull. It stands on the eastern edge of the Wolds, and on a branch of the Northeastern Railway, and consists of a principal street and a mile in length, and several minor streets, all churches and tolerably well built. Its most remarkable edifice is the minster of Saint John the Evangelist, in the early English, Decorated and Perpendicular styles, and one of the finest specimens of ecclesiastical architecture in the kingdom, its west front in the opinion of excellent authorities surpassing in magnificence that of York Minster. The choir contains the celebrated Percy shrine, of chaste and exquisite workmanship. Other churches are Saint Mary's and Saint Nicholas. The grammar school is so old a foundation that its date is unknown. Among the other chief buildings are the guildhall and corn exchange. The chief manufactures are leather, iron castings, agricultural implements, whiting, linseed oil and cake, manures, tallow and ale. Its environs abound with beautiful walks. It sent two members to Parliament until merged in one of the divisions of Yorkshire in 1885. Pop. 13,654. Consult Hiatt, 'Beverley Minster' (1900).
BEVERLY, Mass., city in Essex County, on the Boston & M. Railroad, two miles north of Salem. It was founded 14 Oct. 1668; was incorporated as a city 23 March 1849; contains several villages; and is connected by trolley lines with Salem, Peabody, Gloucester, and Wenham. It is a popular summer resort.

It is the distributing station for the products of the Texas oil fields, a regular line of steamers plying between Beverly and Fort Atkinson. The government is vested in a mayor and council. It is the seat of the New England Institute for the Deaf and Dumb; is principally engaged in the manufacture of women's boots and shoes, and leather; has considerable shipping and fishery interests; contains high and graded schools, a public library, a national bank, a number of handsome residences belonging to Boston business men; and has a property valuation exceeding $16,000,000. Pop. 20,000.

BEVERLY’S FORD, Va., scene of a sharp cavalry fight during the Civil War, between Buford, Pleasanton and Gregg, commanding 9,000 Federals, and Stuart leading 12,000 Confederates. Hooker had sent Pleasanton to find Stuart, who was said to be near Beverly Ford. Pleasanton surprised the Confederates, but his plan miscarried. Stuart was fully prepared for him. Pleasanton was badly beaten. This action is also known as the battle of Brandy Station.

BEVIS OF HAMPTON, Sir, a legendary English knight who has been made the hero of many romances by both English and Continental writers. He was the son of Sir Guy, Earl of Hampton, who was treacherously murdered by Divoun, Emperor of Almayne, and was given by his false mother to some heathen merchants to be sold for a slave among the Paginim. By them he was carried to Ermony, where he soon became dear to King Ermyn, and dearer still to his only daughter, the lovely Josian. His chief exploits were the overthrow of Brademond of Damascus, of a monstrous beast, the giant Ascard, whom he spared to become his squire, and of a dreadful dragon near Cologne. His famous sword “Morglay” he won in battle; his horse “Arundell” was the gift of Josian. Still more romantic episodes in his story are his carrying his own death-warrant in a sealed letter to the vassal Brademond; his escape from his noisome dungeon after seven years’ imprisonment; and recovery of his wife.

BEWICK, bëwik, Thomas, English wood-engraver: b. Cherryburn, Northumberland, 12 Aug. 1753; d. Gateshead, 8 Nov. 1828. He early showed a great talent for drawing, and was apprenticed to an engraver in Newcastle. The celebrated Dr. Hutton, of Woolwich, then a schoolmaster in Newcastle, was preparing his great work on mensuration, and having employed Bewick’s master in getting up the woodcuts for illustrating it, the execution of these was entrusted to the young apprentice. Bewick performed the work so admirably that his master advised him to turn his attention to wood-engraving, and in 1775, according to this view he proceeded to London. He returned, however, to Newcastle after a short time, and established himself there in partnership with his former master. His turn of mind led him to the study of natural objects, more especially animals. In 1779 appeared his edition of ‘Gay’s Fables’; in 1784 ‘Select Fables’; in 1789 his large wood cut the ‘Chillingham Ball,’ one of his most ambitious works; and in 1790 he appeared his ‘History of Quadrupeds,’ the beauty of the illustrations of which attracted universal attention, so superior were they to anything hitherto produced by the art of wood-engraving. In 1797 appeared the first, and in 1804 the second volume of his ‘British Birds’; generally regarded as the finest of his works.

Bewick has never been surpassed in his spirited delineations of animals and the admirable naturalness with which the accessories and backgrounds of the drawings, such as foliage, grass, and other rural objects, are represented. The tail-pieces to chapters throughout his works are of the highest excellence, and often display a rich vein of humor. His illustrated edition of ‘Esop’s Fables’ appeared in 1818.

He was the reviver of the art of wood-engraving; he was one of the earliest to cut upon the end of the wood instead of along it; and he invented what is technically called the “white line” in wood-engraving. Consult his ‘Memoir’ (London 1846); Clement, ‘Painters, Sculptors, Architects, and Engravers’ (Boston 1899); Dobson, ‘Thomas Bewick and His Pupils’; Linton, ‘Masters of Wood Engraving’ (London 1899); and Thomson, D. C., ‘Life and Times of Thomas Bewick’ (ib. 1882).

BEWLEY, Anthony, American abolitionist: b. Tennessee, 22 May 1804; d. Fort Worth, Tex., 13 Sept. 1860. A Methodist clergyman opposed to slavery in 1843 he entered the Missouri Conference. When the slavery question rent the Church, he adhered at first to neither side, but earned his livelihood at manual labor. He re-entered the Church in 1848 and at once launched forth against slavery. In 1858 he was driven from Texas for preaching according to his convictions. Against the advice of friends he returned in 1860, but remained only a few weeks, being again obliged to flee for his life. A reward of $1,000 was offered for his apprehension; he was seized in Missouri, carried to Fort Worth, and there hung by the mob, the only reason for whose act was that he had maintained human slavery to be unjust.

BEY, bê’ among the Turks, signifies a governor of a town, seaport or small district. The Turks write the word beg (q.v.). It is often applied to superior military officers, sea captains, and to distinguished foreigners.

BEYER, bi-er, Samuel Walker, American geologist: b. Clearfield, Pa., 15 May 1865. He graduated at Iowa State College, 1889, and at Johns Hopkins University 1893. He is professor of geology and mining engineering in Iowa State College since 1887, and is vice-dean of the engineering division since 1908. As special assistant on the Iowa Geological Survey he has prepared reports on the geology of Boone, Marshall, Story and Hardin counties, and annual reports on the mineral productions of the State. In 1897 he was a delegate to the first United Geologic Congress at Saint Petersburg. He is assistant geologist of the United States Geological Survey since 1901, specializing in economic geology. He is the author of ‘Clays and
BEYERLEIN — BEY SCHLAG

Clay Products of Iowa (1903); Quarries and Quarry Products of Iowa (1906); Road and Concrete Materials in Iowa (1907); Peat Deposits in Iowa (1908), all published in Iowa Geological Survey reports.

BEYERLEIN, Franz Adam, German novelist and playwright; b. Meissen, 22 March 1871. He is a graduate of Freiburg and Leipzig. He became suddenly famous in 1903 on the production of his play Zapfenstrech, which dealt with conditions in the German army and caused a strong sensation. It was translated into English and produced in the United States under the title Taps. Other his works are Jena Oder Sedan (1903, Eng. trans. 1913); Démon Othello (play, 1895); Similde Hegevalt (1904); Der Grossknacht (1905); Stirb und werde (1910); Das Wunder des heiligen Terenz (1911).

BEYERS, Christian Frederick, South African general; b. 1869; d. 8 Dec. 1914. A lawyer by profession, he enlisted as a private soldier in the Boer army during the South African War (1899-1902) and rose to the rank of assistant adjutant-general for the northern district. His principal achievement was the capture of the British camp at Nooitgedacht; he was also chairman of the congress that met at Vereeniging to draft the peace terms. He afterward became speaker of the legislative assembly of the Transvaal and appeared to have become reconciled to the incorporation of the republics by Great Britain and the establishment in 1906 of the Union of South Africa. He had also visited Germany and been received by the Emperor with honor he had never recovered. At the outbreak of the European War Beyers was commandant-general of the Defense Forces of the Union, a post he resigned early in September 1914. Together with General Kemp, a former lieutenant of Delarey's and a good soldier, he proceeded to stir up disaffection in the western Transvaal. He was joined by Gen. Christian De Wet, Col. S. G. Maritz and General Delarey. A certain local preacher, Van Rensburg, had prophesied that General Beyers would be the leader to purify the world; he beheld visions and saw an angel perched on the Paardekrans monument and announced that Delarey, De Wet and Beyers were the leaders destined to restore the old republic. A number of irreconcilables flocked around the plotters, all determined to throw in their lot with Germany. On the night of 15 Sept. 1914 Delarey and Beyers were speeding in an automobile from Johannesburg when they were challenged by a police patrol. As they failed to stop, a shot was fired which glanced off the car and killed Delarey, whose intentions with regard to the proposed rebellion have never become known. Beyers formed a command and threatened Pretoria, while De Wet operated in the Orange Free State. General Botha of the British, quickly raised 30,000 burghers and fell upon Beyers and Kemp so fiercely that their forces were scattered in all directions. Beyers fled across the Vaal into the Orange Free State, lost 400 men in a fight and just escaped himself, making for German territory via Bechuanaland. De Wet was defeated and taken prisoner; Kemp and the prophet preacher crossed into German Southwest Africa, and Beyers was defeated at Bulfontein.

On the morning of 8 December he encountered a body of Union troops and was driven toward the Vaal River. Beyers and some companions attempted to cross; midway in the stream his horse failed and he slipped from its back to swim. He tried in vain to save his coat, which hampered his movements. One of those with him heard him cry, I can do no more as he disappeared beneath the swollen flood. Two days after his body was recovered.

BEYLE, Marie-Henri, bäl, mär-rö-ö-rë (pseudonym De Sendenhal), French author; b. Grenoble, 23 Jan. 1783; d. 23 March 1842. He was educated at Grenoble and at Paris, and for a time gave much attention to painting, studying under Regnault. He held civil and military appointments under the empire; took part in the Russian campaign of 1812; thence until 1821 lived at Milan, chiefly occupied with works on music and painting. After nine years' residence in Paris he became in 1830 consul at Trieste, and in 1833 at Civita Vecchia. In 1841 he returned to Paris, and during the following years made several excursions in France, England and Italy. He wrote under various pseu- donyms articles which appeared in French and English periodicals. The distinguishing feature of his works was the application of his analytic faculties to sentiment in all its varieties, his best books being the treatise 'On Love' (1822); 'The Red and the Black' (1830); 'History of Painting in Italy' (1817); 'Racine and Shakespeare' (1827), and Life of Napoléon, etc. A collective edition of his works appeared in 18 volumes in 1855-56, and his Correspondance Inédite in two volumes in 1855. Consult Colomb, 'Notice sur la vie de M. Beyle' and the article by Méribée in Revue des deux Mondes (15 June 1843).

BEYRICH, Heinrich Ernst, German geologist and paleontologist; b. Berlin, 31 Aug. 1815; d. there, 9 July 1896. He was appointed professor of geology and paleontology at the University of Berlin, also serving as assistant director of the Prussian Geological Survey. While in the latter capacity he supervised the preparation of the Geological Chart of Prussia and the Thuringian States. Aside from that he did much original research work. Among his important works are Beiträge zur Kenntnis der Versteinerungen des acutely Uebergangengebirges (Berlin 1837); Untersuchungen über die Trilobiten (2 vols., Berlin 1846); Konchylion des norddeutschen Terrägergebirges (Berlin 1853-57); Über einige Cephalopoden aus dem Muschelkalk der Alpen (Berlin 1867). His wife was also a well-known writer of children's stories under the pen name Klementine Helm.

BEYROOT. See BEIRUT.

BEY SCHLAG, William, German theologian; b. Frankfort 1823; d. 1900. He studied theology at Bonn and Berlin, became minister in Coblenz 1850; vicar at Treves in 1856 and
court chaplain at Karlsruhe. In the last-named place he took an active part as a defender of ecclesiastical régime against the liberal agitation. He was one of the founders of the Deutsch-evangelische Blätter and a prominent organizer of the Evangelical Alliance for the protection of German Protestant interests. In 1860 he was appointed professor of practical theology at Halle. During a long career of political-religious controversy he wrote a number of Protestant theological works, among them the "New Testament," "Melanchthon and the German Reformation," and published a collection of sermons.

Beza, Bézaz or de Beze, de Bâz, Theodore, Calvinistic divine: b. of a noble family at Vezelay, in Burgundy, 24 June 1519; d. 13 Oct. 1605. He was educated in Orleans under Melchor Volmar, a German philologer devoted to the Reformation; and, early familiar with the ancient classical literature, he became known at the age of 20 years as a Latin poet by his petulant and witty "Juvenilia" (a collected edition of which he was afterward ashamed). In 1539 he was made a licentiate of law, and went to Paris. He received from his uncle the reverse of his valuable abbey Froidmand, and lived on the income of two benefices and on property which he inherited from a brother. Wit, scholar and poet, his habits were dissipated, but a clandestine marriage in 1543 recalled him from his excesses, and a dangerous illness confirming the intention which he had formed at Orleans of devoting himself to the Reformed Church, he went to Geneva with his wife in 1547. He accepted a Greek professorship at Lausanne in 1549. During his 10 years in this office he wrote a tragico-comic drama in French, "The Sacrifice of Abraham" (1550) - which was received with much approbation; delivered lectures (which were numerously attended) on the Epistle to the Romans and the Epistle of Peter (which served as the basis of his Latin translation of the New Testament, of which he afterward published several editions); finished Marot's translation of the Psalms in French verse, and obtained to such a degree the confidence of the Swiss Calvinists that he was sent in 1558 on an embassy to the Protestant princes of Germany to obtain their intercession at the French court for the release of the Huguenots imprisoned in Paris. In the following year he went to Geneva as a preacher, and soon after became a professor of theology and the most active assistant of Calvin, to whom he had already recommended himself by several works, in which many of the views of that eminent theologian were advocated with great zeal and no small measure of ability, so that he was generally regarded as Calvin's ablest coadjutor and the person destined to be his successor. His talents for negotiation, which were distinguished, were now often put in requisition by the Calvinists. He was sent to the court of Anthony, King of Navarre, at Nerac, to obtain toleration for the Huguenots; and when he appeared, 1561, at the religious conference at Poissy, where he spoke in behalf of his party with a boldness, presence of mind and energy which gained him the esteem of the French court. He often preached in Paris before the Queen of Navarre and the Prince of Condé; also in the suburbs. At the conference of Saint Germain, in 1562, he spoke strongly against the worship of images, and after the commencement of the civil war accompanied the Prince of Condé as chaplain, and on the capture of the Prince joined Emile Coligny. After the restoration of peace he returned to Geneva in 1563, where, besides discharging the duties of his offices, he continued to engage in theological controversies in support of the Calvinists; and after Calvin's death in 1564 became his successor, and was considered the first theologian of this Church. He presided in the synods of the French Calvinists at La Rochelle (1571) and at Nîmes (1572), where he opposed Morel's proposal for the alteration of clerical discipline; was sent by Condé (1574) to the court of the Elector Palatine; and at the religious conference at Montpellier (1586) opposed the theologians at Württemberg, particularly James Andreas. At the age of 69 years he married his second wife in 1588. He continued to repel, with the power of truth and wit, the attacks and calumnies which his enemies, apostatized Calvinists (such as Bossec), Lutherans and Jesuits, heaped upon him. They reported in 1597 that he had died before his death in the Roman Catholic faith. Beza, now 78 years old, met his assailants in a racy poem full of youthful enthusiasm, and resisted in the same year the attempts of Saint Francis de Sales to convert him and the alluring offers of the Pope. In 1600 he visited Henry IV in the territory of Geneva, who presented him with 500 ducats. Among his many works, his exegetic writings are now very little read, but the able and correct "History of Calvinism in France from 1521 to 1653," which is ascribed to him, is still much esteemed. Beza's name is associated with the Codex which he presented to the University of Cambridge, for an account of which see Bible. Consult the "Life" of H. M. Baird (New York 1899).

Bezalel, in biblical history, a son of the Jewish clan Pahath-Moab (Ex. x, 30). Another bearer of that name was the chief architect of the Tabernacle, expressly called by Jehovah to superintend the work of erection, decoration and furnishing of the "tent of meeting." He taught the arts of his craft to his assistants, the chief of whom was Aholiab.

Bezant, a round, flat piece of pure gold, without any impression, supposed to have been at one time the current coin of Byzantium. Bezants are frequently employed as one of the charges in heraldry, a custom supposed to have been introduced by the Crusaders. Its value was about $2. For a long time after the Crusades it was current in England and on the Continent. Bezants are common in the arms of banks and of individuals who have been connected with money. Figures, similar to bezants, when not colored, are in heraldry known as roundels.

Bezborodko, Alexander Andreyevitch, Prince, Russia schools: b. Little Russia, 25 March 1747; d. St. Petersburg, 17 April 1799. Having graduated from the theological seminary at Kiev, he decided to devote himself to a military career and entered the army, where he rose rapidly in rank.
In the Russo-Turkish War he was second in command to the field marshal. In 1774 he entered the civil service. Six years later he was appointed secretary of the council on foreign affairs. His abilities attracted the attention of the Empress Catherine II, whose private adviser he became. In this unofficial position he acquired a strong influence in matters of state policy. After the coronation of Paul in 1796 he was appointed to the highest office in the empire, Imperial Chancellor. Two years later he was instrumental in effecting an Anglo-Russian alliance against France. He was also largely responsible for the third partition of Poland. He was one of the very few men who were able to retain the favor of Tsar Paul throughout that capricious monarch’s entire reign.

_BEZIERS_, bē-zē′-ə, France, town in the department of Hérault, 38 miles southwest of Montpellier; situated on a height above the Orb, and on the Canal du Midi, a few miles from the Mediterranean, to which there runs a tramway line. It is surrounded by old walls, and though its streets are narrow, it is tolerably well built. Its most conspicuous edifice is the cathedral, a Gothic structure, crowning the height on which the town stands, and possessing a fine semi-circular choir surrounded by columns of red marble. The city has a collegiate college, a museum, a library, and a society of economics and archaeology. Its manufactures consist chiefly of woollens, silks, hosiery, chemicals, spirits, parchment, gloves, glass, soap, leather and confectioneries, etc. It has also extensive brandy distilleries and is the centre of most of the trade of the district. Béziers was from immemorial times a fortress town, first Gallic, then Roman. It was during the Roman occupation named first Béterra, then Betarra Septimianorum, and was the station of the 7th Legion, and still contains Roman remains. It is historically interesting in connection with the massacre of the Albigenses, when its inhabitants were indiscriminately put to the sword to the number of over 20,000 by Simon de Montfort, and the papal legate, for having afforded protection to the fugitives in 1209. It suffered also in the religious wars of the 16th century. Pop. 51,042.

_BEZIQUE_, a card game which crystallized into official form in 1887. Two packs of cards are used, two players participate and the cards rank, ace high, then ten, king, queen, knave, nine, eight and seven. All cards below that are discarded from both packs. Eight cards are dealt to each player. Trumps may be determined either by turning up the first card of the stack or by the suit of the first marriage. The non-dealer leads for the first trick, and the winner of each trick has the succeeding lead. After each trick, each player draws one card from the top of the stack, the winner of the trick taking the top card. The playing is as in whist, the leader taking the trick unless he has a higher card of the same suit or a trump. It is not necessary to follow suit until the stack is exhausted, when one must do so and take each trick, if possible. Counting is done by means of the values of the cards; each ace or ten-spot taken in a trick counts 10, the winner of the last trick of each hand scores 10, and if the trump is turned, both sevens count 10 for the turner, and if one exchanges from his hand a seven of trumps for another turned trump or if one declares the other seven of trumps 10 more is scored. The game is won by the player who first makes 1,000 points, and if his opponent has not made 500 the game counts double. There are certain combinations of cards other than the above, which, when declared, count as follows: Double bezique (both queens of spades and both knaves of diamonds), 500; sequence of five highest trumps, 250; any 4 aces, 100; any 4 kings, 80; any 4 queens, 60; any 4 knaves, 40; bezique (queen of spades and knave of diamonds), 40; royal marriage (king and queen of trumps), 40; marriage (king and queen of same suit), 20. A declaration is made by placing the declared cards face up on the table where they remain till played or the stack is exhausted, except in the case of the seven of trumps. To score, a declaration can only be made after winning a trick and before drawing, and but one declaration can be made at a time. After a card has been used in one combination it may be used to form another, excepting when used in equal or inferior combination in the same class as before. A player need not declare a combination which he holds and only before the stack has been exhausted can a declaration be made. Consult A. Howard Cady’s treatise for details and rules.

_BEZOAR_, concretions found in the fourth stomach of many of the herbivora, notably goats, at one time held in high repute because of fancied miraculous healing properties.

_BEZOBRADOV_, Vladimir Pavlovich, bē-zō-brā′-zoif, Russian political economist and publicist; b. 3 Jan., 1820; d. 29 Aug., 1889. He received his education in the Imperial Aleksander College. In the governmental service he spent a few years in almost every department and finally became a senator. In recognition of his activities in the field of political economy the Academy of Sciences awarded him the honor of regular membership. He became a lecturer in political economy at the Imperial Aleksander College and gave also private instruction, in that subject, to Grand Dukes Alexeyi and Serge Aleksandrovich, Nikolay and Konstantin Konstantinovich. In recognition of these services he was awarded the order of Alexander Nevsky. In the course of many years the imperial government availed itself of Bezobrazov’s practical knowledge of finance and political economy. In these fields he had an opportunity of applying effectively his own theories which bear largely the stamp of Adam Smith. In his pamphlets on ‘Inspections of Factories’ he severely criticized the established order of things in the industrial institutions of the empire. As a statesman and a politician he was a moderate Liberal. Disregarding constitutional problems he severely attacked the formalism and bureaucratic methods then common in Russian home affairs. In his noteworthy treatise on ‘Government and Society’ (1882) he laid stress on the indispensability of an organic link between the local governments and the central power. It was upon his initiative and under his supervision that the Sbornik Gubernatsev Znamia (Magazine of Political
BEZOLD — BHAGAVADGITA

Sciences) was established and published for six years (1874–80).

BEZOLD, Karl, German philologist: b. Donauworth, 18 May 1859. He pursued his studies in the universities of Leipzig, Munich and Strassburg, after which he became, in 1883, lecturer at Munich. In 1888 he received an appointment in London to lecture at the British Museum. This position he held until 1893, when he was appointed professor and director of the Oriental seminars at the University of Heidelberg. In 1908 he became privy councillor. Among his original works are ‘Catalogus Tabellarum et planimetricarum Thebaei aegypticae’ (Cairo 1893); ‘The Tell el-Amarna Tablets in the British Museum’ (London 1889–99); ‘The Tell el-Amarna Tablets in the British Museum’ (1892); ‘Oriental Diplomacy’ (1893); ‘Nineve und Babylon’ (3d ed., 1909); ‘Die Babylonischen und assyrischen Keilschriften und ihre Bedeutung für das Alte Testament’ (1904); ‘Festschrift für Ignaz Goldziher’ (in ‘Zeitschrift für Assyriologie und verwandte Gebiete,’ 1912).

BEZOLD, Wilhelm von, German meteorologist: b. Munich, 21 June 1837; d. 1907. After graduating from the University of Göttingen, he was appointed professor at the University of Munich, later shifting over to the Technical Institute in the same city. In 1885 he was appointed professor of meteorology at the University of Berlin, where he at the same time became director of the Meteorological Institute, lately established. He has conducted some valuable and original researches in the field of thermodynamics. Among his writings are ‘Die Farbenlehre im Hinblick auf Kunst und Künstler’ (Berlin 1874); ‘Die Klimahellungen im Mai’ (1883); ‘Zündende Blitze im Königreich Bayern’ (1884); ‘Zur Theorie des Erdmagnetismus’ (1897); ‘Erfahrungen der Meteorologischen Beobachtungen’ (48 vols., 1885–1902). Casseb–Helmholtz ‘Wilhelm von Bezold, Gedächtnisrede’ (1907).

BEZOUT, Etienne, French mathematician: b. Nemours 1730; d. Paris 1781. His writings, which attracted much attention in his time, contained important contributions to the theory of elimination. He was also one of the first mathematicians to recognize the value of determinants. His best known works are ‘Théorie générale des équations’ (Paris 1779); ‘Cours complet de mathématique’ (Paris 1780).

BEZSONOV, Peter Alexeyevitch, Russian writer on Slavic folklore: b. Moscow 1828; d. 1898. He studied at the University of Moscow, where he devoted five years to ancient and modern languages. In 1864 he was appointed supervisor of the Viina Museum and Public Library, becoming at the same time director of public education in the same city. This position he held three years, after which he became librarian at the University of Moscow. In 1879 he was appointed professor of the Slavic languages at the University of Kharkov, where he remained for the rest of his life. His works include ‘Bulgarian Songs’ (1855); ‘Serbian Folk Songs’ (1857); ‘Russian Folk Songs’ (1861).

BEZZENBERGER, Adalbert, German philologist: b. Cassel, 14 April 1851. Graduating from the University of Munich, where he had made a special study of Indo-Germanic languages, he became lecturer at the University of Göttingen. In 1879 he was appointed professor of Sanskrit at the University of Königsberg, becoming rector in 1900. His works include ‘Beiträge zur Geschichte der Litauischen Sprache’ (1877); ‘Litauische Forschungen’ (1882); ‘Lettiische Dialektstudien’ (1885); ‘Über die Sprache der Preussien Letten’ (1888); ‘Die Kurische Nehrung und ihre Bewohner’ (1889); ‘Sitzungsbericht der Altertums geschichte Prussia’ (1892); ‘Analysen Vorgeschichte Bronzen Ostprussia’ (1904); ‘Beiträge zur Kunde der Indogermanischen Sprachen’ (1877–1906).

BHAGALPUR, bʰaːɡaɻ-pʊɻ, city of Hindustan, in Bengal, capital of a district and division of the same name, situated on the Ganges, 113 miles northwest of Moorshee and 265 miles northwest of Calcutta by rail. The city is the headquarters of the troops for keeping in check the Sonthal tribes. In the town and neighborhood are some interesting Moham edan shrines; there are also here two monuments, one erected (in 1780) by natives and the other erected by government in memory of Augustus Cleveland, the consolidator of the formerly turbulent and marauding hill tribes of Sonthals. There are several indigo works in the neighborhood. Pop. about 75,275. The division of Bhagalpur lies between that of Rajshahi on the east and that of Patna on the west. It has an area of 19,776 square miles. Pop. (1911) 8,144,821. The district of Bhagalpur is fertile, well watered and highly cultivated. Cereals, pulses, tobacco, cotton, indigo, opium, flax, hemp and sugar cane are the principal products and there is a large trade by river and rail with lower Bengal. It is divided into two unequal portions by the Ganges. Area, 4,226 square miles; pop. 2,139,318.

BHAGAVADGITA, bʰaːɡaɻ-ɡěː tʂʰa (Sanskrit, ‘the Divine Song’), the title of a religious-philosophical didactic poem interwoven as an episode in the great Indian epic of the Mahabharata (q.v.). The leading theme of the poem which is divided into three sections, is the exaltation of the god Vishnu in his human form or avatar of Krishna, and throughout the god speaks in his own person. In the incarnation Vishnu became the character of Arjuna, a chief of the Pandus, who were then at war with their kinsmen the Kurus. On the eve of battle, when Arjuna is appalled at the thought of slaughtering his own kindred, Krishna sets before him the duties demanded of him as a member of the warrior caste, and at the same time propounds an ecletic system of philosophy of an ethical pantheistic type, laying especial emphasis on the doctrine of bhakti, or faith in the Supreme Being, whom he declares himself to be. There are translations in English by Davies (1882); Telang in ‘Sacred Books of the East,’ Vol. VIII (Oxford 1898); Thompson (1855), and Wilkins (1875).
BHAIRAVA, bhāravā, a Sanskrit word signifying "fear" and "terrible," one of the many names applied to Siva. Though the name as applied in this sense is of ancient origin, the worship of Siva under the separate form of Bhairava is a later development. In Hindu mythology, some 10 or 12 forms are regarded as objects of worship chiefly by the Maharrattas. There are various designations of Bhairava, the most popular apparently being "Bhairava the Dog," "Bhairava the Black," and Svalava, the latter having a female consort named Bhairavi. This modern character is not connected with Siva, but is derived from Bhairon, the village god, originally a "peasant godling," who rose through successive stages and became the only form of Siva recognized by some communities in northern India. The confusion over the two distinct gods arose from the accidental resemblance of their names and the attributes of the greater were transferred to the smaller deity by his worshippers, with the result that it is now impossible to distinguish the attributes or characteristics of one from the other. See Siva.

BHAMO, bha-mō, India, town of Burma, on the upper Irrawaddy, about 40 miles from the Chinese frontier and 180 north-northwest of Mandalay, with which it has railway communication. About 20 miles above Bhamo the river suddenly narrows from 1,000 to 150 yards and flows through a rocky gorge subject to eddies and backwaters. Navigation is at that point very difficult and at times impossible. It was formerly the capital of a Shan principality and was a large and flourishing city, but fell into decay. It is, however, important as the chief mart of the trade with China, through western Yunnan. A British consulate at Manwyne, Yunnan, since 1893, has greatly facilitated commercial intercourse. The imports are woolens, cottons and silks, which are brought chiefly by caravans. There is a considerable trade with the tribes of the neighborhood, who exchange their native produce for salt, rice and a sandalwood oil. A steamer makes for Bhamo on the Irrawaddy, and steamers connect it with Rangoon. Pop. 9,762.

BHANG, bāng, (1) an Eastern name for common hemp (Cannabis Indica). (2) A narcotic made from Indian hemp. The large leaves are smoked with or without tobacco, or are chewed or made into a drink by the addition of cold water.

BHARTPUR, bhārt-pōrə, or BHURTPORE. (1) A native state of India with an area of 1,961 square miles. The surface is generally low and the state is scantily supplied with water; soil generally light and sandy; chief productions, corn, cotton, sugar and salt. It has been under British protection since 1826. Pop. (1911) 558,785. (2) A town, the capital of the above state, on an extensive and fertile plain, 11 miles north of the city of Delhi. It covers an area about four miles in circuit, and was so strongly fortified that in 1805 it stood a siege by Lord Lake of 14 weeks and cost the besiegers 3,100 men. In a second siege, in 1826, its resistance to Lord Combermere was less successful. The fortifications have been demolished, but the fort still exists, and is enclosed by a wet ditch and a wall of hewn stone, which taken together are 60 feet high. Within the fort is the Raja's palace, built of red and yellow freestone in the Mogul style, and picturesquely crowning an eminence surrounded by flower-gardens and fountains. The population (1911) was 33,918, about one-half that for 1881, the decrease in that period having been 48.7 per cent. due to many causes, such as poverty, famine and emigration.

BHARTRIHI, bhārṭrā-hēṛ, Indian poet, author of a book of apothegms. According to the legend he was the brother of King Vikramāditya, who lived in the 1st century B.C. The collection of 300 apothegms (short poems) bearing his name is divided into three parts, and present us with graceful descriptions of nature, charming pictures of love, shrewd remarks on everyday life and profound thoughts on the Deity and the immortality of the soul. Bhartrihari was the first Indian writer who became known in Europe, 200 of the apothegms having been translated by the missionary Abraham Roger and published at Leyden (1653). His actual personality has been much discussed without any very satisfactory conclusion having been reached. The weight of opinion inclines to belief in his existence, and that he was a poet of a philosophical cast, possibly a grammarian also, and very likely of royal descent. Consult Von Bohlen, "Bhartrihari's Sententious" (1833); Tawney, "Two Centuries of Bhartrihari" (1877); Wightman, "Translations of the Apotheogms of Bhartrihari" (1886); More, "A Century of Indian Epigrams, Chiefly from the Sanskrit of Bhartrihari" (1898); Bale and Gurjar, "Nitisatka and Vairagyastaka, with Notes and an English Translation" (1898).

BHASKARA, surnamed ACHARYA, the Learned, Hindu astronomer and mathematician: b. 1114; date of death unknown. He was the sixth successor of Brahmagupta, at the head of the college of astronomy of Ujjain. His chief work was the "Siddhantasiromani" ("Crowning of the Star System"), which, like all his works and those of his contemporaries, was written in verse. It is at the head of navigation on the Irrawaddy, and steamers connect it with Rangoon. Pop. 9,762.

BHATTI, bhāt-tē, Indian epic poet of the 5th or the 7th century. His poem, named after him, "Bhattakavyam," is in 22 cantos. Its theme is the deeds of Rama; but the author designed the work to be also an exemplification of the rules of grammatical and rhetorical composition. It was published with a two-fold commentary at Calcutta (1828).

BHAVABHUTI, bhā-va-bhō-te, surnamed SAJ-ΚANTHI, Indian dramatist, of the latter part of the 7th and first part of the 8th century. He wrote at least three plays, the "Māhāvīracharita" ("life of the great hero") and the "Uttarā-mācharita" ("later life of Rama"), forming together, in seven acts each, a dramatized version of the story of the Ramayana, and the "Malati-madhava" (the Hindu Romeo and Juliet), a domestic drama in 10 acts. Bhavabhūti is often compared with Kālidāsa, whom he equallled in vigor and variety, but hardly in genius. He differed from them in adding prose comments and explanations.

BHAVABHUTI, bhāvabhuṭi, a poet of the 12th century, born in Benares, known by the name of "Bhava-bhūti." He was the author of several dramas, of which the "Kathakālī," a romance, is the best known. He also wrote a romance, the "Ramāvadana," in verse, which is considered by some to be the best of its kind. He is also known for his "Vishvakāramāyana," a work on the life of Vishnu.

BHILLS—BHUTAN 609

BHILLS, bêls, or BHEELS, a Dravidic race inhabiting the Vindhyas, Satpura, and Satmala Hills, a relic of the Indian aborigines driven from the plains by the Aryan Rajputs. They appear to have been orderly and industrious under the Delhi emperors, but on the transfer of the power in the 18th century from the Moguls to the Mahattas they asserted their independence, and being treated as outlaws took to the hills. Various attempts to subdue them were made by the Gaekwar and the British in 1818 without success. A body of them was, however, subsequently reclaimed, and a Bhel corps formed, which stained the retreats of the rest of the race and reduced them to a comparative order. The hill Bhelis wear little clothing and live precariously on grain, wild roots and fruit, vermin, etc., but the lowland Bhelis are in many respects Hinduized. Their total numbers are about 1,250,000. Their religion contains much superstition, including the worship of Mother Amila Bhavani. Their language belongs to the Kolarian stock of Indian tongues, but many of them speak a dialectic Aryan. Consult Rowney, "Wild Tribes of India" (1882); Reclus, "Primitive Folk" (1891); Crooke, "Natives of Northern India.

BHIMA, be'ma, BEEMAH, or BIMAH, (1) a god in Hindu mythology, the son of Pritha (or Kunti) by Vayu, the god of the wind, remarkable for his great size and strength; (2) the name of a river of India, rising in the Poona district of Bombay and flowing southeast to the Kistna River, about 400 miles in length.

BHIWANA, bhâwa'na, India, a town in the Punjab, district of Hissar, 55 miles west of Delhi. It is the trading centre of its district, exporting metals, sugar, salt and spices. Pop. 31,100.

BHOPAL, bho'pal, India. 1. A native state of central India, with an area of 6,874 square miles. The country is full of jungles and is traversed by a hilly tract, forming part of the Vindhyas Mountains. The soil is fertile, yielding millet, rice, peas and other vegetable productions peculiar to central India. Sugar, tobacco, ginger and cotton are the chief exports. The district is well watered by the Nerbudda, Betwa and other minor streams. The state of Bhopal was founded by an Afghan adventurer named Dost Mohammed Khan, who in 1723 succeeded in establishing himself here by the countenance of Aurungzebe, on whose death he assumed the title of nabob, which was retained by his successors. Bhopal has all along been friendly in its relations with the British. In 1818 the state was placed under British protection. Pop. 1,375,317; (2) a town, capital of the above state, on the boundary between Malwah and Gourdwana, 108 miles east of Oojina. It was defended successfully in 1813 against the forces of Scindia and the Rajah of Naporre. It is surrounded by a wall two miles in circuit and contains a fort. Outside is another fort on a large rock, the residence of the ruler of Bhopal. The chief buildings are two mosques, arsenal, mint and the palace of the Begum. Large artificial lakes supply good water. The town is clean, has fine promenade gardens and is well lighted. Pop. 56,000.

BHRIGU, a Sanskrit word signifying "radiant," "sparkling." A mythical race of men or demigods mentioned in the "Rig Veda." (q.v.). They are connected with fire, which is brought to them and kindled by the Brahmans; they are tarsi-svan and afterward given by the Bhrigu-men. They are also said to fabricate chariots. Bhrigu is likewise the name of one of the chief Brahmans families and also of Varuni, author of one of the Rig Veda, being enumerated among the 10 Maharshis created by the first Manu. The name of Bhrigu is furthermore borne by one of the Prajapatis produced from Brahma's skin; by one of the seven sages; by the father of Cjavana; by the author of a Dharma shatra; by an ancient astronomer, a physician of the planet Venus and a number of other persons and things. The Bhrigu myths of the Rig Veda and the Mahabharata are believed to be merely a more developed form of the tradition regarding the descent of fire and some authorities identify Bhrigu with Agni. Consult Monier-Williams, Sir M., "Sanskrit-English Dictionary" (Oxford 1899). See Sanskrit Literature.

BHUI, or BHOOJ, India, chief town of Cutch in India, Bombay presidency, at the base of a fortified hill, with military cantonments, high school and school of art, mausoleums of the Raos or chiefs of Cutch, pagodas, etc., including a temple dedicated to the cobra di capello. Bhuj is famous for its manufactures of gold and silver. Pop. 21,579.

BHUTA WORSHIP, in Indian (Hindu) mythology: bhuta (the word is plural) are evil spirits or goblins who kill the living and breathe life into the dead. The myth has existed from the earliest ages and in later periods the god Siva (q.v.) was recognized as the chief of the bhutas. Hence, Siva is also called Bhutapati—Lord of the Bhutas. These spirits are worshiped and propitiated by many non-Aryan tribes, and in temples and houses, under the forms of animals, such as cows, tigers, pigs; of human beings in gaudy dress, or of stones and pyramidal mounds of earth. Blood sacrifices are offered to the bhuta, especially goats or fowls; also rice soaked in blood. The ceremony is performed with wild dances accompanied by tom-toms. In the south of India the people recognize the amiable Bhuta Kannimar, or virgin spirits. The offerings to malignant spirits; Bhuta-Dvata is an evil being worshipped as a divinity; Bhut-khet is a piece of land granted for the cost of sacrifices. A Hindu purificatory rite is called Bhuta Shuddhi; in this connection, however, Bhuta signifies the four elements.

BHUTAN, bhoo-tan, an independent state in the eastern Himalayas, with an area of about 16,800 square miles, lying between Tibet on the north and Assam and the Jalpaiguri district on the south and consisting of rugged and lorry mountains, abounding in sublime and picturesque scenery. Pop. (estimated) 250,000. The climate varies with the elevation and extremes of heat and cold may be experienced in a day's journey. Some portions of the territory are fertile and produce corn, rice, wheat, buckwheat, mustard and cardamoms. Cattle and considerable numbers of a
peculiar breed of ponies are raised. The manufactures, which are primitive and intended for home consumption, include coarse blankets, cotton cloth, swords, daggers and other weapons and agricultural implements. The Bhutanese are a hardy and vigorous race, of Tibetan stock, and their language is a dialect of Tibetan. They profess to be Buddhist, but their religion, like that of Tibet, partakes largely of shamanistic or old Bon-ppo, which preceded Buddhism and consists chiefly of devil worship and propitiatory sacrifice. The administration of the state is divided between the secular Deb rajah, who is elected for a term of three years by the penlops, or magnates, from their midst, and the Dharma rajah, the presumed reincarnation of Buddha, who is supposed to interest himself solely with the spiritual control of the state. The winter capital is Punaka, or Dosen, a strong natural fortress 96 miles east-northeast of Darjeeling; Trashichodzong is the summer capital. Bhutan formerly included considerable tracts of territory now included in Bengal and Assam, which were annexed in 1864 and 1866 by the British, and are now in retaliation for outrages committed by the natives. In 1865 they drove the English out of Dewangiri and a punitive expedition was sent against them. A treaty concluded with the Bhutan government provided for the payment by the Indian government of an annual subsidy in return for formal cession of the annexed territory. This subsidy began at £2,500 and was gradually increased to £3,332; it is conditional upon the maintenance of peaceful relations.

**BIAFRA, Bight of, a large bay on the west coast of Africa, at the head of the Gulf of Guinea, between Capes Formosa and Lopez. Its breadth is about 190 miles. The principal rivers flowing into it are the Niger, the New and Old Calabar rivers, the Rio del Rey, the Kamerun and the Gaboon; its islands are Anomabo (Danish) and Saint Thomas' and Prince's (Portuguese). Opposite Fernando Po are the Kameruns.**

**BIALYSTOK, byalë-stôk', Russian Poland, or BIELOSTOK, town in the province of Grodno, on the Bialy; 45 miles south-southwest by road and Warsaw it is connected by rail. It is a well-built, handsome town, with a spacious market, gymnasium and several churches and has among its edifices a palace which belonged to the counts of Braniski and was once known as the Polish Versailles. Its manufactures are woolen goods, leather, hats, soap, etc. The town was founded in 1320 and became part of Russia after the third partition of Poland. Pop. about 80,000.**

**BIANCACUNNA, byan-ka-vell'ka (Italian bianca, white, and stella, town), a city of Sicily, situated on the slope of Mount Etna, 20 miles northeast of Catania, founded in 1480 as an Albanian colony. Lava is employed for paving its streets and in its neighborhood are the noted grottos of Scilla and Archi, the former having the latter in the lava of 1607 with a tunnel half a mile in extent. Wine and grain are produced in the district and all the cotton in this portion of Sicily is called Biancavilla.**

**BICHELLI, byan'kë, Francesco (called IL FRANTI), Italian painter: b. Modena 1447; d. 1510. He was the instructor of Correggio, according to Vidriani, and his works were esteemed for graceful design and agreeable coloring. His works, however, have all the traditional dryness of the period and the eyes are painted in a manner somewhat grotesque. Among his few works extant are a 'Madonna with Saints' now in the Louvre. He must not be confounded with Federigo Bianchi, a Milanese artist, born about the end of the 16th century. The paintings of the latter are numerous in northern Italy and are held in high esteem. He wrote a volume of biographies of painters. Consult Lanciotti, 'Cronaca Modenesi'; Vedriani, 'Scultori ed Architetti Modenesi'; Winckelmann, 'Neues Malerlexikon.'**

**BIALENCCHI-GIOVINI, Aurelio, Italian journalist and historian: b. Como, 25 Nov. 1799; d. Naples, 16 May 1862. His early studies were adapted to the purpose of following a commercial career, but he took up the profession of journalism in Switzerland, where he had gone to escape the persecutions of the Austrian police. For some years he was editor of various Swiss-Italian newspapers. In 1841 he began his more serious work, writing a number of historical works in Milan and Turin. During this time he became a member of the Chamber of Deputies. His principal works are 'Biografia di fra Paolo Sarpi' (1834); an incomplete history of the Popes (12 vols., 1850-64); 'L'Austria in Italia' (2 vols., 1854). His biography has been written by Montazio (Turin 1862).**

**BIALENCCHI AND NERI, Italian, White and Black; Parties or factions in the Florentine Republic in the 14th century. Dante belonged to the Bianchi, and, being banished, wrote his great 'Divina Commedia' in exile.**

**BIALENCCHI, be-an-kë-ke, Francesco, Italian antiquarian and astronomer: b. Verona, 13 Dec. 1662; d. Rome, 2 March 1729. He was intended for the clerical profession and to this end studied theology, jurisprudence, languages, mathematics and botany in Padua. Afterward he repaired to Rome and applied himself to jurisprudence and continued the study of experimental physics, astronomy, etc., as well as of Greek, Hebrew and other languages. Pope Alexander VIII bestowed on Bialenchii a benefice, with the appointment of tutor and librarian to his nephew, the Cardinal Pietro Ottoboni. Pope Clement XI also patronized him and appointed him secretary to the commission employed in the correction of the calendar. Being on a tour through France, Holland and England, he formed the idea of drawing a meridian in Italy, from one sea to the other, in imitation of that which Cassini had drawn through France. He was occupied eight years at his own expense in that work; but other employments withdrew his attention from it, and it remained unfinished. He concluded his career with two important works (1727) on the planet Venus, and on the sepulchre of Augustus. He is the author of several memoirs and dissertations on antiquarian and astronomical subjects, including 'Istoria universale pro-vata co' momenti, e figurata co' simboli degli antichi' (Rome 1697), and 'Astronomico et Geographico Observationes Selecte' (edited by
BIANO — BIAS

611

his nephew, Verona 1737). An edition of Anastasius, 'De Vitis Romanorum Pontificum' was begun by him and completed by his nephew, Giuseppe Bianchini (4 vols., Rome 1718-34). There is a monument to the memory of Francesco Bianchini in the cathedral of Verona.

BIANO, Andrea, Italian cartographer who lived in Venice in the beginning of the 15th century. It has been asserted that he had a knowledge of America previous to Columbus, for among his charts is one dated 1436, in which are indicated two islands, one "Antilia," the other "De lama Satanaxio," located in the Atlantic Ocean west of the Azores. His maps are now rare and are valued as illustrating the knowledge, or ignorance, of geography then prevalent.

BIANCONI, Charles, Italo-Irish promoter of transportation: b. Tregolo, Italy, 24 Sept. 1786; d. Tipperary, September 1876. At 15 or 16 he was bound for 18 months to a countryman, who took him to Dublin, where the young student was sent to tend cheap print shops. Soon he removed to Waterford and started on his own account as itinerant vendor. In his long pedes-trian journeys he was led to envy those of his own calling who could afford to drive. He engaged in other enterprises, all of which were successful, and in July 1815 he started a one-horse, two-wheeled car to carry passengers, goods and mail-bags from and to Clonmel and Cahir, a distance of about 10 miles. The experiment succeeded and grew apace, so that in 1845 Bianconи was conveying passengers and freight over 1,633 miles and working daily 3,266 miles of road. His cars were patronized by all classes and were of great benefit in opening up communications with remote districts. Between 1846 and 1865 the growth of railways forced the discontinuance of the Bianconи service on 4,534 miles, but during the same period it was extended over 3,594 miles in routes crossing the railways and reaching districts remote, whose custom was made of conveyance by rail. Bianconi was the friend and supporter of O'Connell, and on the occasion of a visit to Rome he erected at his sole cost the monument over O'Connell's heart in the church of the Irish College. In 1863-65 he disposed of his vast interests on liberal terms to his agents and others employed by him and then retired to his estate at Longfield, near Cashel, Tipperary. Consult O'Connell, Mrs. Morgan John, 'Charles Bianconi: A Biography' (Dublin 1878).

BIARD, François Auguste, byār, ā-güst frōⁿ-swā, French genre painter: b. Lyons, 30 June 1799; d. near Fontainebleau, 20 June 1882. He traveled extensively, visiting Spain, Greece, Syria, Egypt, Mexico, Greenland and Spitz-bergen, Brazil, etc. Among his best known pictures are the 'Babes in the Wood' (1828); the 'Beggars' Family' (1836); the 'Combat with Polar Bears' (1839), and 'The Strolling Players,' now in the Luxembourg. A strong ele ment of caricature runs through most of his works.

BIARD, Pierre, French missionary in America: b. Grenoble 1565; d. 17 Nov. 1622. He was one of the first two missionary priests sent to New France. With his companion, Masse, he arrived at Port Royal 22 May 1611, and on 11 June wrote the earliest letters sent by the Jesuit order from Canada. He at once began a study of the Indian languages with a view to their conversion,—a task of extraordin ary difficulty, as the Indians had no symbols which could express either moral or religious ideas. He established friendly relations with the Indians on the Kennebec in 1612, and in the same year composed a Micmac catechism. Owing to the hostility of the colonists to the Jesuits, the missionaries left Port Royal and founded a settlement on Mount Desert, near the mouth of the Penobscot. The colony was soon destroyed by the forces of Argall, deputy governor of Virginia, and Biard, being captured, was sent to England. This enterprise of Argall's marks the actual beginning of hos tilities between the French and English in North America. Biard was liberated after a short time, and returning to Lyons, became a professor of theology and afterward chaplain of the King's forces. He published, in 1616, 'Relation de la Nouvelle France, et du voyage des pères Jésuites dans cette contrée.' This is the earliest of the 40 volumes of 'Jesuit Relations' (1632-72), which are such valuable stores houses of material for early American history. Consult Hughes, 'History of the Society of Jesus in North America' (Cleveland 1910).

BIARRITZ, byār-rēt, France, a fashionable watering place, department of Basses-Pyrénées, five miles south of Bayonne. It is a favorite of bathers and other persons who come from all parts of Europe, and especially of the Basque mountaineers, who deem it an obligation to drink of the mineral waters once a year, as well as to bathe in the sea of Biarritz. In 1856, the place acquired additional importance from being made the summer residence of Napoleon III and his court. Since then its popularity, both in winter and summer, has steadily increased. It has no industries and is composed almost entirely of hotels and lodging-houses. Pop. 18,260. Consult Laborde, 'Encore le vieux Biarritz' (1909).

BIART, byār, Lucien, French novelist, poet and writer of travels: b. Versailles, 21 June 1829. He published a number of novels, containing mostly descriptions of French landscape, nature and customs. Among his works are 'Les Mexicanes,' 'La Terre Chaudé,' 'A travers l'Amérique,' and (in 1885) 'Les Ariégeois,' an interesting historical study. He died in Paris 18 March 1897.

BIAS, bēⁿs, one of the seven wise men of Greece: b. Priene, one of the principal cities of Ionia, about 570 B.C. He was the son of Teutames, was a practical philosopher, studied the laws of his country, and employed his knowledge in the service of his friends, defending them in the courts of justice or settling their disputes. He is said to have been an advanced age immediately after successfully defending in court one of his friends. The inhabitants of Priene having resolved to abandon the city with their property, Bias replied to one of his fellow-citizens, who expressed his astonishment that he made no preparations for his departure — "I carry all that is mine with me." Many of the stories attributed to him are of doubtful authenticity. A number of his short, pithy sayings have come down to us.
Consult Mullach, F. W. A., ‘Fragmenta Philosophorum Graecorum.’

BIBAUD, Michel, French-Canadian poet and historian: b. near Montreal 1782; d. 1857. He published in 1830 a volume of poems, ‘Epîtres, Satires, Chansons, Epigrammes,’ the first miscellany of poems in the history of French-Canadian literature. He afterward published in three volumes the ‘Histoire du Canada.’ This work, however, was not well received by his compatriots, being written from the British rather than the French-Canadian standpoint.

BIBB, George M., American jurist: b. Virginia 1772; d. Georgetown, D. C., 19 April 1859. He was graduated at Princeton in 1792 and took up the practice of law in Kentucky. He was twice chief justice of the State Court of Appeals, served two years in the State senate and was chancellor of the Court of Chancery. He was a senator in Congress, 1814-19 and 1829-35 and Secretary of the Treasury under President Tyler. During later life he practised his profession in Washington, D. C. He compiled ‘Reports of Cases at Common Law and in Chancery in the Kentucky Court of Appeals’ (1808-11).

BIBBIENA, be-byâ’na, Bernardo Dovizio da (styled BIBBIENA), Italian poet: b. Bibbiena, 4 Aug. 1470; d. 9 Nov. 1520. For many years secretary to Cardinal Giovanni de Medici, in whose election as Pope Leo X he is said to have had a considerable share, he was appointed treasurer and soon after raised to the dignity of cardinal (1513). He conducted a successful campaign against Urbino and in 1518 was legate to France for the purpose of securing concerted action of the Christian nations against the Turks. He translated several plays of Plautus, which were performed before the Pontifical court. He was an ardent promoter of art and science. His comedy, ‘Calandria,’ is probably the earliest in Italian literature. Consult, the biography by Bondini (Leghorn 1578); Camerini, ‘Nuovi profili letterari’ (Milan 1875); Flaminii, ‘History of Italian Literature’ (New York 1906); Graf, ‘La Calandria’ (1878); Wendriner, ‘Die Quellen von Bernardo Dovizios Calandria’ (1895).

BIBBIENA, Giuseppe, Italian painter: b. 1696; d. 1757. The most distinguished of the Bibbiena family, he was famed as architect as well as an artist. Not only did he design gorgeous decorations for a court wedding at Munich in 1722 and a dazzling court festival in Prague in 1723, but he built the noted theatre at Bayreuth in 1757 and remodeled the opera house at Dresden. The ‘Architettura e Prospettiva’ (1740) contains several illustrations of his works. Consult Nagler, ‘Neues Allgemeines Künstler-Lexicon.’

BIBERACH, bêbê’râch, Württemberg, a town on the river Riss, an affluent of the Danube, 22 miles south-southwest from Ulm. It is 1,750 feet above sea-level, is irregularly built and with its old walls, still in part remaining, and its old towers and gateways, has a mediæval aspect. Among its buildings is a fine church, dating from 1100 and recently restored. The town has important educational institutions and a richly endowed hospital. The French, under Moreau, defeated the Austrians near Biberach on 2 Oct. 1796; and again 9 May 1800 the Austrians suffered defeat at the hands of Saint-Cyr. There is a monument to the poet Wieland, who was born in the vicinity. The town is noted for its bell foundries and manufactures of artificial flowers, toys and machinery. Its grain and fruit markets are famous. The gas works and waterworks are the property of the town. Pop. 9,096.

BIBESCO, Barbo Demetrius, also known as Patrick Sin vac, Wallachian stagnam and b. 1801; d. Pisa, Italy, 13 April 1869. In 1817 he went to study in Paris where he remained until 1821 when he returned to his native land. He participated in the uprising of the Greek officialdom established in Rumania under the Turkish government. Under the provisional government established under Russian protection he accepted the portfolio of Minister of the Interior. He is considered one of the founders of the modern Rumania.

BIBIKOV, bê-bê’t’of, Vasili Ilich, Russian actor, dramatic critic and playwright; d. 1787. He was the secret councillor of the Imperial court. From his earliest boyhood he manifested a passionate love for the theatre as also a remarkable dramatic verve which did not escape the eye of his future teacher, A. Sumarokov. It was with the aid of that great master that Bibikov originated the theatrical art in Russia by establishing, upon the invitation of Empress Catharine II, the Imperial Theatre in Saint Petersburg. He was the first director of that company and as such has deserved an immortal name. But he was even more celebrated as founder of the first Academy of Drama in Saint Petersburg (1779) which became the nursery-garden of Russian actors. No smaller fame did he deserve as author of a comedy in five acts ‘Likhoimetz’ (The Usurer) which was performed with immense success in all the theatres in Saint Petersburg. It is obvious, however, that he had been familiar with Voltaire’s master-piece, ‘L’Avarc,’ and that the elaboration and the dialogue are essentially Russian in character. The subject matter of the comedy has been taken from the contemporary customs of the metropolis, which he had satirized in a powerful manner, and the characters of the play are drawn with vigor so that, in its time, ‘The Usurer’ was considered, and is now to a great extent, one of the best comédies de mœurs ever written in Russian.

BIBLE, The. Introduction. The Name. —The Phcenician port of Gebal, the modern Jebel, famed as seat of the Adonis cult and still earlier as a mart for papyrus, was called Byblos by the Greeks, whence the Greek word byblos or biblos came to denote the papyrus plant (as we say barege or nankin) and its inner pith, then the paper made therewith. While the first writing (Matt. i. 1, first used to denote a body of sacred writ in the Letter of Aristeas, 316) Thence the diminutive biblion with its plural biblia (often byblia, -a), meaning papers, little books, books, documents, scriptures, orders. In the preface to its Ecclesiasticus (written in Hebrew about 172 B.C. by Joshua Sirach, turned into Greek and prefaced by his grandson Joshua about 117 B.C.) this biblia is used twice . . .
BIBLE

613

"of the Law and the Prophets and the other Bible"... also the Law and the Prophecies and the rest of the Bible... to denote the literature of Israel as an equivalent and in fact a translation of the Hebrew S'farim (scriptures) used in the same era in the same sense in Dan. ix, 2, "I Daniel understood from the S'farim." From the Jews this term passed, along with so much other freighting of thought and visions (first in 2 Clem, and in Cor. xiv, 2), by whom it was at last extended to include all authoritative scriptures, Jewish and also Christian. In the Middle Ages this Greek neuter plural was mistaken for a Latin feminine singular and so declined: biblia, biblia, etc. As such it has passed over into various languages of modern Europe (the Bible, die Bibel, la Bible, la biblia, etc.).

Other Names.—S'farim or biblia was by no means the only term applied by Jew or Christian to the scrolls in question. At first all Israel's literature was regarded as holy, if not quite equally so, merely as being written—such was its preoccupation with religion—and not till the Middle Ages do the Jewish exponents (never the Talmud or Midrash) speak of the "Scriptures" (scrip ha-qodesh). When other books appeared, they received the special suffix "the outsiders" (ha-chitzonim), the Greek "Apokrypha" ("hidden away")—perhaps as not included in Temple or Synagogue libraries. As read publicly on Sabbaths and holidays, the books were named: (a) Miqra, the "read"; also (b) "writing the holy" (kith'be ha-qodesh), a title reappearing in Rom. ii, 2 (graphas hagiastis) and in 2 Tim. iii, 15 (hiera grammata). Again, the superfluous "sacred" omitted, they were called (c) "books" (kutub (katub), and the modern phrase the Scripture says merely translates the Hebrew ha-katub 'omer, as the "every scripture" of 2 Tim. iii, 16 translates kol ha-katub. Once more (d) since "Law" (Torah) was the first and chief division of these Books, the term is applied to the whole, as also in John x, 34, 1 Cor. xiv, 21. (e) The name "Testaments" (Old and New), translating the Greek diaithke (covenant), first used in this sense in 2 Cor. iii, 14, though formerly known to the Jews and among the Jews, is admitted to be entirely appropriate if ever used by a Jew to mean "Scripture"; the "Book of Covenant" or Testament (sefer ha-brith) denotes the whole "Law" in Ben Sirach xxiv, 23, but properly only Ex. xx, 20-xxiii, 35. (f) Still other less important designations are found: as Cycle (macheer), "Twenty and Four Books," "Verse"; often an acrostic was formed with the Hebrew initials (i-n-k) of Law, Prophets, Writings, and of other designations. (g) Lastly, in the Mishnah the mark of the Holy Books is that they "defile the hands," which sounds like a tabu, but in any case the phrase "defiling the hands" came to define the Holy Books as canonical.

Division of the Subject.—In discussing this authoritative literature the question is first: what is the content of these scriptures? then: what is their actual literal content? and lastly, what is its meaning (or interpretation)? The first question, in all its ramifications, concerns the Canon; the second, the Text and textual criticism; the third, the History of Interpretation and so-called "Higher Criticism." These topics, then, will be discussed in this order. As is well known and was already stated, about half the whole literature falls into two grand divisions: the Old Testament and the New, or Jewish and Christian Scriptures, and these, being wide apart, will require separate and distinct treatment.

Canon of the Old Testament.

Terms.—Both the word and the idea of Canon appear to be Semitic. The Assyrian kanu, Hebrew qanah, the English cane and many others, all mean reed, whence the Greek kanon meant a rod or bar used to keep a thing straight or right; thus Homer calls the arm-rods of Nestor's shield kanonas (Il. viii, 192). Hence kanon came to mean a straight-edge, thence rule, norm, standard, model; thence canons or canonical biblia came to denote Scriptures accepted as authoritative, as the rules of faith and practice, whether prescribing or prescribed. All this, however, is Christian; the Jews employed such term, but instead of it the names already mentioned, to designate their regulative literature. This latter, of course, came into being gradually, indeed very gradually, and for many generations no question was raised as to the authoritative or unauthoritative character of any particular "Writing." For no such distinction arose into consciousness. Nor was there, for many years, perhaps hundreds, any collection of writings into a single body; but in the 2d century B.C. there may be discovered traces more or less distinct of so-called "written books." In 2 Maccabees ii, 13ff we read: and there were related in the records and the memoirs of Nehemiah the same things, and how he, founding a library, collected the bible concerning the kings and the prophets and those of David and the letters of kings concerning offerings (anathemas). But especially this part (i, 2-ii, 18) of this book (dated by Niese 124 B.C.), namely, the letters recommending the temple-consecration, ostensibly from Palestinian Jews to their brethren in Egypt, is admitted by me to be untrustworthy, and its statements may be only enlarged inference from the actual mention in Nehemiah of the book of the Law (viii, 8), the book of the Chronicles (xii, 23), the commandment of David (xii, 24), and letters of King Artaxerxes to governors and others, touching (among other matters) the gift of timber for the gates, etc. (ii, 7-9), as well as earlier alleged proclamations of Cyrus, Darius, Artaxerxes, prescribing the offering of gifts for restoration of the temple, letters ostensibly copied in Ezra (i, 2-4, vi, 6-12, vii, 12-26). (Consult Wellhausen's 'Bleek,' ed. iv, p. 559f, and König's 'Einleitung,' 442f, for opposite judgments.) But we may detect here some faint hint of a triple or quadruple segmentation of a body of literature generally accepted but not yet peculiarly sacred.

Ben Sirach.—Much clearer are the lines of cleavage in the passage already quoted from the grandsons of Sirach, as well as in this, from the same context: Whereas many things and great

*The Chinese are said to regard as holy all writing (Calquhon in 'China in Transformation,' p. 240), perhaps as possibly containing the name Confucius.

*Even the buckler of Nestor: the name wherein unto heaven Reacher, as being of gold, wrought solid, itself and the arm-rods.
have been transmitted unto us through the Law and the Prophets and the others that followed after them, wherefore one must needs praise Israel for culture and wisdom,—and since there is need not only for such as (can) read (the original) to get understanding but also for those without to profit both by the word and the writ of the lovers of learning (the scribes), therefore my grandfather, etc." Here we discover not only the triple classification, Law, Prophets and the Others, but also what impulse was urging to recognition of literary values and consolidation of a body of authoritative scriptures: It was the contact with Greek culture, in which literature played such a dominant part, that forced Israel to recoil and say in self-defense, "But we too have a literature, greater even than the Greek," and to make it accessible, Israel proceeded to translate it into Greek, the vernacular of culture, as Ben Sirach relates. This contact with the Hellenic world started Israel on the path of self-vindication, which spread out into the great missionary propaganda of the New Christianity.

Men of Grace.—The authors that Ben Sirach names in his 'Hymn of the Fathers of Old' (xiv, 1; 1, 24) are these: Moses, Joshua, Samuel, David, Solomon, Isaiah, Jeremiah, Ezekiel, Job, Twelve Prophets, Nehemiah, but there is no clear indication of what or how much he attributes to each. Ecclesiastes, Daniel and Esther are not mentioned. Ruth may be included in the works of David (the Psalms), and Ezra in Nehemiah. The substance of Ezra iii, 2 is quoted in xlix, 12; the Law and the Prophets in xxxix, 1. Some have thought to find reference to Psalms, Proverbs and Job in xlv, 4-5, but these verses (xxxii, 3-9, 7?) all refer, as Levi has perceived, not to Israel, but to pagan worthies, the contrast with whose perishable fame begins in v. 10. "But these men, the sages, etc." Neither is there any hint in Ben Sirach of a closed canon, though there may be some faint allusion thereto at close of the book of Malachi (iv, 4-5). "Remember the Law of Moses," and "Bless God, you Elijah the Prophet, etc." words doubtless appended by a later hand. Again, Qoheloth (Ecclesiastes) closes with a warning against making many books and wearying the flesh (xii, 12). These verses, also doubtless inserted later, were understood by Rabbis to forbid not only the addition of any other work to the "Twenty-four," but also the study to weariness of any such, and even in later times to read at all any "outside" books, was held to forfeit all "lot in the future life."

First Canon.—In Nehemiah viii-x is found an elaborate account of the formal introduction, proclamation and acceptance of the Law on the part of the Jews returned from Babylon. It was read and expounded from morn till noon for seven days; one may say then it was enacted from the 17th to the 24th of the seventh month of the year 444 B.C. (the year when Thucydides was ostracized and Pericles' sway established in Athens). About 200 years later the list of the prophets appears complete, and over 100 later, in the latter half of the 2d century B.C., the roll of the Law was finished and closed forever, and therewith the canonization of Jewish Scriptures was ended. Such at least is the face-value of the facts in evidence; but it must not be disguised that the trend of deepening research is to lower all the dates in question, to what extent it is not yet possible to determine. Thus it is not even certain whether Artaxerxes I (Longimanus, 465-425) or II (Mnemon, 465-359), is meant in Ezra vii, viii, and Neh. ii, i, v, 14, xiii, &; the whole Ezra-Nehemiah matter is unsettled, and there is a wide range between the radicalism of Torrey and the conservatism of Meyer.

Text Open.—More important, however, than any single variation in date, is the fact that establishment of a Canon by no means implied cessation of literary process within the Scriptures canonized. The sacred lists of Prophets and Writings were never formally closed with any such ceremony as honored the Law, which to the last retained its position of easy eminence, but even its majesty was attinged by various hands for hundreds of years after its canonization. Of this there are many clear indications; one may be noted. In Ex. xxv-xxxi is a body of regulations concerning details of worship and ceremonial utensils and furniture; in Ex. xxxv-xl the same is repeated, often nearly verbatim, but in greater detail, by another hand; in this latter the Septuagint (Seventy) translation differs extensively from the Masoretic in arrangement, in diction and in the smaller amount of material, an index pointing to the fact that so late as 250 B.C. the text had not attained a final form.

Jeremiah.—Still more heavily must the Prophets and the Writings, protected by far less sacred sanctity, have felt the finger of redaction. This is most clearly seen in the book of Jeremiah, where the later Masoretic or Palestinian (Hebrew) text exceeds in length (by about one-eighth of the whole) the older Egyptian text represented in the Septuagint. By so much the prophecies of Jeremiah were enriched after 250 B.C. Yet they were rated especially high by the post-exilic Jews (as appears from Daniel ix); indeed, it was just because they were so dear to the people's heart that they were edited and re-edited, and enlarged and enlarged again. The interpolator was removed as far as possible from irreverence. His interpolations were in truth the answer of his soul to the strong appeal of the prophet. This holds quite as true of the Scriptures of both Testaments. Extensive and repeated revision and interpolation is the sure sign of esteem and affection. The notion of an author's rights, as we count them, was quite unknown. The worshipper whose heart was enkindled by the saintly chant did not hesitate to add his own voice to that of the invisible choir. With respect, then, to every important book of the Bible, there is a highly antecedent probability, indeed almost a certainty, that it

* At this point it may be instructive to note the results of the latest analysis of the Jeremiad in Mowinckel's 'Zur Composition des Buches Jeremia' (Kristiania 1914) whose fundamental principle is: "The prophetic books are compilations of the Gospels"; "Jeremiah" proper, cc. i-xiv (cc. xli-lix forming a later appendix), is compiled from four writings: A, B, C, D. Of these, A was a collection of Jeremian oracles; B, a rather personal narrative, perhaps composed in Egypt; C, a group of rather long speeches; D, certain anonymous prophecies of salvation, never professing to be Jeremian. A has itself been redacted, so that as it is four A, B, C, D into the present "Jeremiah" sometimes before 165 B.C. Even this analysis can hardly claim to be ultimate. Perhaps a dozen, or even a score of authors has contributed features to the composite photograph, "Jeremiah."
Psalm CXVIII, 33–45

5th Century MS.

Washington MS. in Freer Collection
has had a prolonged birth, that it is the joint issue of multiplied labors.

The "idea, long prevalent, that the total canonization was effected by Ezra, who as president of the "Men of the Great Synagogue" (merely the shadow of a mighty name), both unified all the Jewish Scriptures in one volume, restored the correct text, and made the three-fold division into Law, Prophets and Writings,—this idea budded in the 13th century and developed amply 400 years later in the imagination of Elijah Levita (1538), and to still greater proportions in that of Buxtorf (1665),—a merely fictive outgrowth from the records that Ezra "the priest, the scribe, "ready in the law of Moses," officiated as chief reader during the work of canonization of the Law (Neh. vii. 1, 2, 6, 9).

Meaning.—The occasion of this latter is very significant. Since the first return from Babylon (536 B.C.)† three generations had passed away, but affairs in Jerusalem and Judea, so far from showing improvement, had grown worse and worse, the country and city the prey of neighboring free-booters, but far worse, a process of miscategorization with the heathen nomads and of consequent religious degeneration and decay had set in, and threatened to extinguish Israel in the South as totally as (already) in the North. Ezra had indeed not neglected the most drastic measures against this amalgamation (Ezra x), and in the midst of a drenching rain had pleaded the people to put away all "strange wives," even those that were mothers. Nevertheless the strong hand of the governor Nehemiah was needed to lift up the people from their degradation, to restore the walls that were broken down and the gates that were burned with fire. It is the revival of a national consciousness, the reanimation of a perishing people, that is celebrated in that great Feast of the Tabernacles (Chag Ha-sukkoth).

It is the group-soul that comes back to life and the canonization of the Law is the seal and symbol of the new career just opening. No such formal solemnity marked the canonization of the Prophets and the Rest, yet we may be sure that the significance was similar. They were conservative measures, protective reactions of the racial consciousness against an environment hostile or still more dangerous in its friendship. Some such instinct of self-defense seems to have dictated the formation of every canon.

What then were the books thus sanctified and hallowed as the guardians of the national life? As already indicated, they were the "Four-and-Twenty": Genesis, Exodus, Leviticus, Numbers, Deuteronomy (forming Torah, the Law); Joshua, Judges, Samuel, Kings, Jeremiah, Ezekiel, Isaiah, the Twelve Minor Prophets (forming the Ne'eb'im, Prophets); Ruth, Psalms, Job and Proverbs, Ecclesiastes, Song of Songs and Lamentations, Daniel and the Roll of Esther, Ezra (including Nehe-}

miyah) and Chronicles (forming the Kethubim, "Writings" or Hagiography). These familiar names agree in the main with the Greek, whence the Latin, and denote the books according to Content or Author; but the Hebrew uses instead the first words of the Content; thus, "Bre'shith" (In-the-Beginning), "Ve-leh, Shemoth" (Now-these-are-the-Names, Ex. 1), "Vay-yiqra" (And-called, Lev. i.1), "B'mid-bar" (In wilderness, Nu. i, 1), "Ellech Ha-d'varim" (These-the-words, Deut. i, 1) (but "Thilim", Psalms), "Mishle" (Proverbs-of), "Qo-heleth" (Words of Qoheleth, Ecc. i, 1), "Shir Ha-shirim" (Song of-the-Songs, i, 1), "Ekhah" (How, Lam. i, 1) (but "Dibre Ha-yamim" Words-of-the-days Chronicles). Still other titles, as Book of Creation; of Patriarchs; of Penalties; of Priests; of Offerings; of Precepts; of Numbers; of Reiteration, of Reproofs; Prayers; Book of Wisdom; Lamentations—which seem to show later influence—are found in the Mishnah.

Number.—Note that our present two Books of Samuel, two of Kings, two of Chronicles are each reckoned with the Twelve Minor Prophets as one, and Nehemiah is included in Ezra, which reduces our present 39 by 3 + 11 + 1, i.e., by 15, to 24. It is perhaps not quite accidental that this number is the double of the sacred number, 12, the number of the Tribes of Israel. By its peculiar spiritual properties, as the most divisible of all small numbers, Twelve justly reigns among symbolic and significant numbers, though Ten, as the number of fingers on the hand, has very unfortunately displaced it as the basis of notation.

Apocrypha.—In IV Ezra xiv, 37-48 (written shortly before Dositheus' death, 96 A.D.) we find a purely imaginative account, with mythologic elements, of the writing or copying of 94 books, by Ezra, with five assistants in 40 days, at command of God. Of these, the "Four-and-Twenty, which thou didst first write, thou shalt publish, for the worthy and the unworthy to read; but the last 70 thou shalt hold back and give only unto the wise of the people. For in them is the vein of insight and the well of wisdom and the river of knowledge." The 70 books, regarded here and also in wide circles of the Jews as superior even to the 24, are the Apocrypha, of which this IV Ezra is itself a great part. The number 70 is also sacred and symbolic as in the 70 (strictly 72) translators (the Septuagint), the 70 disciples (the universal mission, Luke x. 1-18), and elsewhere.

Twenty-two—The number 72, as six times 12, was also emblematic, and 22 was the number of letters in the Hebrew alphabet; hence Ephesians divides the foregoing 94 into 22+72, and Josephus actually gives 22 as the number of the Books (con. Ap. i, 39, Nieze), and Origen also, as quoted in Eusebius 'Historia Ecclesiastic', vi, 6.4

As given by A. Kuenen in 'Over de manen des Groote Synagogen' (Deod. 1896), into German by K. Harnack (1894).

5 The actuality of which is now doubted or denied in the higher quarters, since Koster's "Herzel van Israel in het Periodiek" (1893), in spite of Weissenstein's conclusive rebuttal (1895).

4 So given as what "our Rabbis teach" in the classic Talmudic passage, the Baraitha ("outside" gloss on Gemara (comment), in Baba Bathra ("last"), of the first section of the Fourth Order of the Mishnah, dealing with Neninim ("damages"). The whole passage (14b, 15a) is full of queer traditions concerning biblical authorship, as that, "the Men of the Great Synagogue wrote Bneiel, and the Twelve, Daniel, and the Roll of Esther," that "Hesekiah and his company wrote Isaiah, Proverbs, Song of Songs, and Qoheleth," and was formerly, though without reason, supposed to contain real data concerning the Canon.
25, who omits the Twelve (Minor) Prophets, and reckons Judges and Ruth together, as well as Jeremiah, Lamentations, and his Epistle in one; these he reckons with the Twelve, 21, but Origen adds, "And besides these are the Maccaebes, which are entitled Sarcheth Sabaniel." Whence it might seem he regarded this work as canonical, though it is not now so reckoned by Jews or Romans. From a Mishnah (B. B. 13b, 14b), it appears that each of the books (after the Law) had to be written on a distinct roll, except that Judges might be written with Ruth, and Jeremiah with Lamentations, each pair on one roll; which would then reduce the number of rolls, and hence in the reckoning of some, 28, the number of Books, to 22. But the examples of Josephus and of Origen (who, taught by Jews, had uncommon knowledge of things Hebrew) show that the number and names of the Books of the Old Testament was not absolutely settled till late in the 3rd century of our era.

Order.—The order of the Prophets, Jeremiah, Ezekiel, Isaiah, is at first surprising. Facetious explanations have been devised but sober criticism regards it as merely that of size, like the orders of Psalms, Job, Proverbs, and Ecclesiastes, Song of Solomon, the largest leading. This explanation seems sufficient, but is not therefore necessarily correct; deeper analysis may yet show that the order of time has been roughly observed. Ben Sirach gives the same scheme, Isaiah, Jeremiah, Ezekiel, but then inserts Job before the Twelve Prophets (xlvi, 22; xlix, 7-10). The order of the historical works, Joshua, Judges, Samuel, Kings, is chronological and fixed, but in the Writings (Hagiographa) the greatest uncertainty prevails: Ginsburg tabulates at least eighteen different sequences, forming three grand classes: the Liturgic (of the Five Rolls), the Masoretic according to size, and the Talmudic according to time. This diversity testifies clearly to the comparatively late formation of the third part of the canon. It is interesting to note how Nehemiah, a man of affairs, glorified by Ben Sirach (xlix, 13) and evidently much more important than Ezra, priest and scribe, gradually retires before the latter, who rises steadily to the highest pinnacle in Jewish tradition, following the waxing ascendency of the priestly idea in the course of Israel's history (though the Rabbis think it a rebuke to Nehemiah's vainglory; cp. Levy's 'Wörterbuch,' II, p. 184b).

Josephus.—A closer determination of the canonization of 'Prophets' and 'Scriptures' has been repeatedly attempted but with no great success. Josephus (100 A.D.) departs from the ordinary, both in the number 22 and in the division of the Books into three classes: Mosaic (5), historical (13), poetic and didactic (4), apparently the same, he adds Judges and Lamentations with Jeremiah. His witness is so important as to deserve quotation; after mentioning the measures taken to preserve the purity of the Jewish blood, and that writing is confined to the prophets inspired of God, and every other work, he concludes, "For there are not with us any books of Discordant and embattled, but only two besides the 20 containing the record of all past time, which are justly believed (divine*). And of these, five are of Moses, which contain both the Laws and the tradition of the origin of man, kind, till his death, that is of 3000 years. But from Moses' death till the reign of Artaxerxes the King of the Persians after Xerxes, the prophets write down the doing in their days in 13 books; and the other four contain his unity, God, and the men, precepts of life. And from Artaxerxes our time details have been written, but have not been esteemed as of like credence with those before them, because of there not having been the exact succession of the prophets. And it is evident indeed how we have believed in these Scriptures of ours, for during so many ages as have already passed, none has dared to add or subtract or to change anything in them; yea, it is inborn in all the Jews immediately from their very birth to esteem them as doctrines of God, and to abide in them, and for them, if need be, gladly die."

Others.—In a passage of disputed genuineness ('De Vita Contemplativa,' 3), Philo names four divisions, 'laws' claimed through prophets, and hymns, and the rest whereby knowledge and piety wax together and are perfected—the rest referring apparently to Proverbs and the Wisdom-literature. The New Testament (Luke xxiv, 44) agrees with Philo in the three divisions, Law, Prophets and Psalms, but elsewhere the constantly recurring division is twofold, into the Law (or Moses) and the Prophets. The Psalms are cited three times (Luke xx, 2; Acts i, 23, xiii, 33), and David nine times (Matt. xxii, 42; Mark xii, 35ff; Luke xx, 41ff; Acts i, 16, ii, 25, iv, 25; Rom. iv, 6, xi, 9; Heb. iv, 7), but the New Testament consciousness of the other Hagiographa seems exceeding faint. Even Melito, bishop of Sardis, writing to the unknown Onesimus, speaks of the Law and the Prophets only, in giving the first detailed list of the ancient books, of only 21 however, for he omits Esther, separates Judges and Ruth, but unites Samuel and Kings into one, Jerome (340-420 A.D.), in his preface to Daniel declares that "all scripture is divided by them (the Hebrews) into three parts: Law, Prophets, Hagiographa, i.e., into five and eight and eleven books"; but in the preface to Samuel and Kings, the famous 'helmeted beginning' of the books which we turn from Hebrew into Latin, he is convinced there should be and are properly only 22 books of the ancient Law: of Moses five, of Prophets eight, of Hagiographa nine. For there are only 22 letters of the Hebrew alphabet, of which five are double, Caph, Mem, Nun, Phe, Sade, written one way as the beginning or middle and another as the end of words. Whence also, by the most, five books are accounted double: Samuel, Joshua, Judges, Ruth, and Lamentations.

* This word (theos), generally given in the texts, is an interpolation, asNice has shown, and very instructive. From their being 'believed' the interpreter deduced that they must be divine; later, from their being divine it was argued that they must be believed.
† Evidently Josephus was not an opponent with modern criticism.
‡ The mystery of the origin of this alphabet of 22 letters (in a certain order), the mother of all Western and certain Eastern alphabets, and hence in a measure of the cognate civilizations, has long fascinated and defied inquiry. How came man to impress spirit in speech? Ideograms and phonograms conducted to syllable, to language, to Persian, but no further. Whence, then, the supreme
Kings, Chronicles, Ezra, Jeremias with Cinoth, i.e., his Lamentations. Therefore, just as the elements are 22 by which we write in Hebrew and yet ten and two are reckoned according to the human voice is embraced; so 22 volumes are reckoned by which, as if by letters and preambles, the infancy of the righteous man, while yet tender and fed on milk, is instructed in the doctrine of God. This passage deserves quotation as perhaps pointing to a diversity of judgment among the Rabbis at whose feet Jerome had sat, and as throwing a vivid light on the Fathers' habits of thought and of adjusting facts to a keen sense of the eternal fitness of things, in presage of the great conception that truth is harmony.

Prophets.— We may then sum up by saying that the Law or Pentateuch was first in Israel, by unanimous consent, by universal preference, and by hundreds of years. At a long remove came the Prophets in two books, the former (historic) being Joshua, Judges, Samuel, Kings, and the latter Jeremiah, Ezekiel, Isaiah and the Twelve, but all attained (in some form, not by any means exactly their present form) an undisputed place as authoritative perhaps as early as 400 B.C., and perhaps as early as 576, though there is some divergence of opinion. Jerome held that the prophetic canon was still open to the days of Hillel the Old (75 B.C.—10 A.D.). That Daniel failed to find place among the prophets has been thought to show that the list was closed before 165 B.C., the supposed date of his visions; but this date is uncertain; there are perhaps much later elements in Daniel, which descend far down into the Roman period, according to the trenchant analysis of Eduard Hettler. In fact, there is no exact date for the canonization of the prophets, such as is apparently found in the case of the Law; the feeling that the list was closed arose gradually and most probably not for a whole generation or more did it become general and accepted; and it was doubtless felt long after to be perfectly legitimate to add to a prophetic Book in a prophet's spirit and to modify it otherwise more or less profoundly. Hence the Prophets are found to have been interpolated more or less extensively long before the last of the names was enrolled in the canon. But insensibly the sacred awe spread itself deeper over the whole prophetic text, and all such tamperings, gradually grown slighter and rarer, now ceased altogether; and this reverence extended itself finally to the very letters and pointings of Holy Writ.

Hagiographa.— With respect to the third division, the "Writings," all the features of the foregoing hesitancy appear strongly marked. The question of 22 or 24 may have been largely a matter of convenience in codes (Meggilloth), as already stated, but not the admission or rejection of Esther, the Song and Qoheloth.

Agamemnon four of the hands* many eloquent voices were raised. Nay more, among the later Prophets even Ezekiel had got little escaped censure, though he was the legal guardian of the Law, some would have put his Book away, but Hananiah ben Hezekiah ben Garon was its successful champion, "spending three hundred jars of oil." So, too, some opposed 'Proverbs' as self-contradictory, but in vain. However, regarding Esther the discussion continued for centuries. The Tannaim (10—210 A.D.) would defend it by quoting Ex. xvi. 14: "Write this as a memorial in a book," not convulsively to a western mind. Aqiba urged that "Haman said in his heart" (Es. vi. 6) refers to dictation by the Holy Spirit, which seems inconclusive, in view of Haman's character. Rabbi Samuel (200 A.D.), one of the last of the Tannaim, rejected all such proofs and declared that "Esther does not make hands unclean." Similarly the defiling value of the Song of Songs was questioned and again it was Aqiba that rose up in defense, declaring "all Writings holy but the Song the holiest;" the whole world is not worth the day when the Song was given, or the world that sings from the Song in the wine-houses and makes it profane will not have share in the world to come. His great authority seems to have rescued the Song from the Chizurim (Apocrypha) to which some would have consigned it.

Preacher.— Most earnest of all was the strife about Qoheloth (Ecclesiastes), which Shammai's school defended against Hillel's. Said R. Judah, "the Song defiles, Qoheloth is debated;" and Aqiba, "if there was any debate, it was about Qoheloth only;" and Rabbi Simon ben Menasya, "the Song defiles, being inspired by the Holy Spirit, but not Qoheloth, being produced only by the wisdom of Solomon." Grätz holds that the decision as to the canon dates from 90 A.D., but as late as 150 A.D. Simon declared Qoheloth doubtful.

Many Scribes.— However, all such objections were finally overruled, though the so-called additions of Daniel and Esther, as well as the Baruch Epistle added to Jeremiah, were thrust aside. The critical movement made itself felt mainly in the exclusion of the numerous Chinnuzim that had begun to spring up thick and to throng the entrance to the Canon. Qoheloth himself explains (xii. 12), "of making many books there is no end." Formerly, every 'writing was considered prophetic,' the phrase Esther wrote (Es. ix. 29) was held to prove that she was a prophetess; if this seems strange, let us remember that, in comment on Ps. xiii. 5, the Rabbis reckoned the number of prophets at six (or twelve) hundred thousand, only prophecies significant for the future being published. Such views are, of course, centuries later, but they magnify and distort the real facts, that the literary production of Israel proceeded almost wholly directly from the prophets and was hence religious in aim though often historic in content, and that there arose thence a strong presumption that every writing, as the word of a prophet, was holy. Nor must we fancy that the list of s-
credited writers was no longer than the list of sacred writings, since, as we have seen and shall see again, all such are highly composite, the results of revision and reversion, so that each may very well embody on the average the labors of a dozen or even a score of scribes. The whole body of Hebrew literature may be the issue of hundreds or even thousands of pens, but this connection is not to be lost sight of in mind that the scribe of that elder day was a person of rare dignity and accomplishment; even in the very advanced civilization of Egypt he figures very importantly in mural decorations, and it is not strange that he should have been esteemed still more, particularly among the Hebrews, where his culture was less generally known and hence more mysterious.

We may also recall that undoubtedly the main, if not the exclusive, interest of other scribes was religious. Even under the far more secular civilization of Assyria, the great library of Assur-banipal was composed in much the larger measure of tablets that dealt with religion in some or other of its phases. The content is extremely varied: astrological comets; the most important being "As the God Bel," fragments of the annals of the ancient kings, each event connected with the proper constellation; fragments of the Gilgamesh epics (Flood, Creation, Conquest of Tiamat); Assyro-Babylonian, Assyrian, Babylonian, and Persian laws; Hymns, Prayers, Psalms, Rituals for Exorcism, the State Prayer-book, historical texts, Letters, Contracts, Commentaries on older difficult texts, catalogs of words, and Ideograms with interpolation. Of these only the last five are secular, and the greatest predominance of the religious is apparent. Neither should we forget that in the Middle Ages, not very long over past, the ability to write was confined almost wholly to the clergy. It is then by no means strange that in the very primitive Hebrew world the functions of scribe and of prophet should almost coincide, that the writings should deal almost wholly with some aspect of religion and should all be regarded as authoritative and sacred.

Hellenism.—But when the conquests of Alexander began to spread Greek civilization over the Orient, including Judah, and still more, when the Jews of the Dispersion began to lead a larger life, to take an a half-pagan culture with some knowledge of the Greek language and even of Greek literature, we may believe that the power of the pen became far more widely diffused and its products not only greatly multiplied but frequently secularized. It was no longer possible to identify even partially the prophet with the scribe, there arose a profane literature by the side of the religious, and it was found necessary to discriminate between them. Then dawned the day of strife over the Canon, over the question, "Does this book make the hands unclean?"

Wisdom and Song.—After the close of the prophetic list indicated later by saying, "When Haggai, Zachariah and Malachi died, the Holy Spirit left Israel" and even earlier, a new form of literature, the literature of Wisdom (Chokmah), began to flourish; two illustrious specimens are universally known and received as canonical, Job and Proverbs; a third, Qoheleth ('Preacher' or 'Ecclesiastes'), came later and met with less favor, but still, being ascribed to Solomon, made good its place among the listed. Also the Psalter, the National Anthem, the lyric cry of suffering Israel, established itself as the book of Songs for the service of the second Temple, and there was no occasion to question Lamentations. Very different indeed was the "Song of Songs," a center of love-lays, and we may justly wonder why such an erotic ever came to rank with the Writings, among them but not of them. The answer appears to be that it was not unjustly popular, parts of it being sung from an early day at yearly festivals (Taanith, 48), that it bore the illustrious name of Solomon and finally that Aquila (at the Synod of Jamnia, 90 a.d.) had recommended it as an allegory of God's Love for his People Israel. Nevertheless, as already observed, it was long doubted or rejected by many. The historic or quasi-historic books of Ruth, Ezra, Nehemiah and Chronicles offered no ground of offense and seemed necessary to complete the Hebrew History, while Esther, as a glorification of the Jew in exile, appealed to the national consciousness and thereby established its claims, against long and strong opposition. Lastly, Daniel, as both intensely national and intensely religious, was admitted to the company of Writings, though not of Prophets, where would have been its natural place but for its later origin (not before 165 B.C.), and was peculiar in introducing a new form of literature, the Apocalyptic (revelative or visionary), which afterward attained to great dimensions as well as popularity.

Cloture.—These works, then, at the time of the close contact of Jew and Greek, in the dawn of the critical consciousness of Israel, succeeded, not without dissent widespread and sometimes vehement, in securing a permanent foothold among expressions of race-consciousness before the doors were shut in the street and no further admissions allowed. It was indeed high time for the clouture; for "of making many books there was no end," and already a great throng were knocking at the planks long since shut for admittance. Such were Baruch, Judith, Maccabees, Sirach, Tobit, as well as Jubilees, the Wisdom and the Psalms of Solomon, the Assumption of Moses, with the Apocalypses of Baruch, Enoch, Ezra, Noah and others. Had these been received, it would have been hard indeed to close the gates at all, and to have canonized all would have amounted at last to canonizing none; neither was there any clear principle of discrimination, and the common consciousness rejected them in a lump. Henceforth no more books sacred and authoritative could proceed from the Hebrew mind, all of whose literary energies were to be directed toward the exploitation, explanation and elaboration of the exhaustless treasures already securely gathered in the Prophets and the Writings. Hence, under the un-

*At least half the Psalms are distinctly national, expressions of the communal experience; of the rest, in a large number the much-afflicted "I" is in all likelihood a personification of the cruelly buffeted People; in some, perhaps, personal experience may lie at the base, but the individual features have been most closely excised in the course of successive compilations of compilations.
weary hands of so many generations of Rabbis arose that stupendous mass of interpretation and commentary known as the Talmud (Learning). For the most part, it consists of extensions and ramifications, which is thus seen to be a direct and inevitable result of the sealing of the Canon, of the authorization and sanctification of a definite body of national literature, so much and no more, even as this itself was the unavoidable reaction from the wide and intimate contact of Jew and Greek brought about by the conquests of Alexander and the domination of his successors.

Outsiders.—Neither is it strange that in Alexandria, a firm seat of Hebrew learning and influence, more liberal views with respect to the Chittuzum prevailed than in Palestine and that the so-called Alexandrian Canon, had it not yielded to Palestinian authority, would have sensibly enlarged the volume of Writings. As it was, these Outsiders were sent forth upon very uncertain seas, to be buffeted hither and thither for nearly 2,000 years, and only within the last decade to come into their crucial rights.

Style.—It is impossible to tell their story here even in bare outline; only some salient points may be noted. From the first they seem to have enjoyed a popularity not wholly unmerited for though never quite to the highest summit of the canonized Scriptures, in many parts they attain very respectable elevation, distinctly above a very large portion of the canonic selves. They are written in general with considerable literary skill and have often a share of human interest. Their content is various, as is also their literary form. In Baruch the elder prophecy of Israel reappears like an Indian summer; in the Book of Wisdom we find the Faith of the Fathers tempered with Alexandrine philosophy; in Bar Sinach the philosophical temper with religion; in the Odes of Solomon the hopes and enthusiasm of the early Gnostics glow with poetic ardor; in IV Macabees the Jew has learned the ways of the world, the logic of philosophic Athenianism, the tone of philosophical Athenianism, Enoch, IV Ezra and others, the apocalyptic imagination burns at white heat; in I Macabees, Judith and Tobit the narrative faculty of the Jew is displayed to high advantage; in I Esdras pure literature comes to its own in the story of the three youths, while in Albal other the walls of nationalism seem to fall away and disclose the wider horizon of universal interest,—all these and many more in the 30 Books Outside, the Chittuzum or Apocrypha. Some of them won the honor of occasional citation by the Rabbis, Ben Sinach oftener than all the others put together, and Baruch is said even to have been read in the synagogue on the Day of Atonement.

In the New Testament.—But their chief recognition came not from Jews but from Christians. Since the proto-Christian movement found its start not in Judea but in the Dispersion, it is not strange to find Apocrypha frequently quoted in the New Testament, as Matt. xxvii, 9 (Jeremiah the Prophet, the passage is not in the canon of Jeremiah), Luke xvi, 31 (Wisdom of God), Judg. xiii (Assumption of Moses) 14 (Ezra), 1 Cor. ii, 9 and Eph. v, 14 (Apocalypse of Elijah), Heb. xi, 37 (Martyrdom of Isaiah). How many are the points of lighter contact may be seen from Dittmar’s 13 pages of references (Vet. Test. in Nov., 149-162).

Adoption.—When the triumphant Christian Propaganda had organized itself into a church, and, indeed, during the process of organization, the question of standards, of authoritative scriptures, arose, and the first most obvious answer, since the propaganda issued from Jewry in contact with Hellenism, was that the standard books of the Jews should be also the standard books of the Christians; and, accordingly, we find them quoted from the start as authoritative. Since the Greeks had no such standard (except the Pentateuch), there was, of course, none to be taken over into their new faith by the Gentile converts. Naturally, diversities of view with respect to the canon that were current in Jewry passed over into the ranks of the Christians, with the difference already noted, that the new religionist tended toward a more liberal view than that of the stricter orthodox Jews, represented so forcefully by Rabbi Aqiba. Accordingly, not only were the Apocrypha from the first used freely by the Christians, but many were finally received into the Catholic Canon.

Early Use.—The history of these Deutero-canonicals (sometimes so called to indicate their secondary position) is both interesting and instructive. The free use of them in the New Testament has already been noted. Except, perhaps, Baruch, I Maccabees, and the additions to Daniel, they seem all to enter into the religious consciousness of the Apostolic Fathers, though the allusions are, as a rule, loose and implicit, as is generally the case with the Fathers. Next we find nearly all attested by this or that apologist, as Baruch by Athenagoras and Irenaeus, the latter also noting that the stories of Bel and the Dragon were ascribed to Daniel. Justin Martyr is the first to hint at the ability of the Church to form its own Canon, regardless of Jews, though the Church itself came only, slowly to this conviction. Melito, bishop of Sardis, gave (170 a.d.) the first list of Jewish canonics, omitting Esther. Origen mentions Maccabees at his next list (Eus. H. E. iii, 11), but writing to Julius Africanus he defends Judith and Tobit and the Daniell additions, agreeing with the Martyr that the Church is empowered to decide, and introducing all the Deuterons in his Hexapla. The Codex Claromontanus, itself of the 6th century, contains, immediately before the Epistle to Hebrews (with which it ends), a table, "Versus Scripturaram Sacram," referred by such opposing critics as Harnack and Zahn to Alexandria and the time of Origen, in which are found the two "Wisdoms" (of
Solomon and Ben Sirach), 1, 2, 4 Maccabees, Judith and Tobias (along with the Epistle of Barnabas, the Shepherd of Hermas, the Acts of Paul and the Acts of Peter). Bishop Hippolytus cites 'Wisdom' as Solomon's, uses Maccabees and Baruch as Scripture and treats of the incident of Susanna. In Africa, Cyprian, as well as Tertullian, is said to employ all the Deutero-canonicals but Judith and Tobit. Tertullian, does declare (c. 2), "The Face of God is awaited of whose seeketh Him in simplicity, as teacheth 'Wisdom' itself, not of Valentinus, but of Solomon," with manifest allusion to Wisdom 1, 1. He also refers to the Maccabees as fighting on the Sabbath, but does not cite the books.

Later.—On entering the 4th century we find the authority of these Chiturium on the wane. At Alexandria the far-famed watchdog of dogma, Athanasius, in his 39th Festal Epistle (367 a.d.) accepts only the Hebrew Old Testament excluding Esther, but allowing it to be read to catechumens for edification and instruction, along with the two 'Wisdoms' and 'Judith' and 'Tobias' (also the Shepherd and the Teaching). Similarly Saint Cyril at Jerusalem,—as always a centre of Jewish influence,—will allow any book not read in the Church to be read privately. Eusebius classes them all as Antilegomena (Contradicted), as intermediate between the Accepted and the Rejected. Still they maintained their popularity, as shown by their persistent presence in Greek manuscripts and in Oriental versions.

Jerome.—Passing over this we now come to Jerome who, in his "Helmeted Prologue" rejected all but the Hebrew Canon as apocryphal, naming the 'Wisdoms', Tobias and Judith, which indeed the Church may read for edification of the people, but not to confirm the authority of Church dogmas.°° The Solitary of Bethlehem was the most learned Christian and especially the most erudite Hebraist of his day; he was also the companion of Rabbis, and his words bore down the scale against the Deuterost on the Vulgate translation of the Old Testament into Latin

found its way.

Rome.—But Rome had not yet spoken nor did speak till in the so-called Decretal of Gelasius "Concerning books to be received and not to be received," dating in substance (it is held) from the synod convoked by Pope Damascus in 382. In this, as well as in the Canon of Innocent I., "sent in 405 to a Gallican bishop in answer to an inquiry" the list is the same as that adopted by the Tridentine Council in 1546, and all the Deuterost are included.

Augustine.—The leading spirit of the African Church, Augustine, would distinguish grees of inspiration but used the Deuterost freely and the four synods that he guided (Hippo 393, Carthage 393, 395, 419) on traditional and liturgical grounds included all the Deuterost in their sacred lists. Of these the Carthaginian passed over to the East and there by its mere authority determined the attitude of the Greek Church, which, however, in excess of generosity, added 3 Maccabees, a Jewish-Greek patriotic extravaganza and maintained the canon down to the beginning of the 18th century (Rev. Bibl., April 1901).

The End.—Meanwhile for over 1,000 years in the Latin Church the beam was held trembling between acceptance by Rome and rejection by Jerome, reminding us of the famous line of Lucan:

"Victrix causa dea placuit, et victa Catoni."

The scholars sided with the man, the unturmed mind and all underlings of authority were led by the other; the chief of the schoolmen, St. Thomas Aquinas was hesitant and bewildered. But the final decision came at last. In 1442 the Council of Florence adopted the "Decree of Jacobites" of Pope Eugenius IV, which declared the Deuterost received by the Church to be inspired, but did not yet say "canonical"; not until 1546 did "the holy ecumenical and general Council of Trent" by its decree of April 8 establishing the Canon, "the entire books [of the two Testaments] as sacred and canonical with all their parts as wanted to be read in the Catholic Church, and as found in the ancient Latin Vulgate edition," stamp authority upon all the Deuterost, including Tobias, Judith, Wisdom, Ecclesiasticus, Baruch, I and II Maccabees, with "Let him be anathema" on "whoever does not receive." Herewith all doubts were excluded; and it is again notable that the grounds of canonization did not involve authorship or character of the books, but only tradition and liturgy; they had been accepted and used as canonical, and therefore were established as canonical, precisely as at Carthage nearly 1,200 years before. Thus had Trent filled up the gap left by Florence, but in so doing it had opened against the very gate that had closed, for it did not perform the inspiration explicitly. This defect, which had begun to give annoyance, the Vatican Council of 1870 duly amended by stamping all the canonicals as inspired in all their parts—thus closing the discussion forever.

Basis.—The Church has thus based both canonicity and inspiration on authority, and in truth with wisdom, for they could be based on nothing else. The difficulty is not theological but psychological, as Hobbies long ago perceived. Though a man might honestly say "the spirit of Jehovah is upon me," he could never communicate his own consciousness to another, he could never make another know his own self-knowledge.

Rejection.—Authority, however, might be either acknowledged or rejected, and in the stress of controversy with Eck in Leipzig (June 1519), Martin Luther found it necessary* to reject II Maccabees as outside the Canon, in order to invalidate the argument for Purgatory.

* But hardly sufficient, since the doctrine of the purgatorial fire was certainly a part, however inessential, of the Jewish faith, as indeed also of the Zendavesta.
drawn from the example of Judas (xii. 43-46). Moreover, in the first edition of his translation of the Bible, he gathered together the Deuteros with the other Apocrypha between the Testaments, as the unholy between two holies, a position of dishonor to which Protestants universally consigned them, but which they have not always been able to maintain. Calvinism has shown them all its native sternness, especially since the Westminster Confession (1647), whichshore them of all authority and reduced them precisely to the low level of "other human writings." The Anglican Confession of 1552 had been milder, reasserting the patronizing position of "Hieronymus." However, they were still printed in Protestant Bibles till in 1825, after 12 years of preliminary wrangling, the Edinburgh branch of the British and Foreign Bible Society announced to London that the Scottish societies would withdraw their support unless the British and Foreign Bible Society should finally and entirely desist from distributing Apocrypha. After two more years of waiting, London yielded to most of the continental branches withdrew, and the Scottish branch, on the refusal of the Society to retire all its officers that had championed the Apocrypha, itself withdrew and founded a new Bible Society in Edinburgh.

Cut off.—Since then the Deutero-canonical Appendix (along with all Apocrypha) has been omitted from nearly all Protestant Bibles in English-speaking countries, though still retaining its ambiguous position among other Protestants, and still furnishing lessons, though in diminishing numbers, for the Anglican liturgy, and even appearing in a separate volume of the Revised Version (1894), in a translation inferior to that of the canonicals.

True Worth.—Meantime, however, with the general deepening and broadening of research, due to the critical spirit of modern scholarship, interest in all the "outsiders" has been revived and greatly intensified and has assumed a thoroughly rational character. It is now seen that these works are natural and intelligible expressions of the Hellenistic soul, of the Jewish mind active under the profoundly altered conditions of its intimate contact with the spirit of Greece. It is also perceived that the Deuteros in Edinburgh are not the greatest event of all history, the proclamation of the Gospel, the propaganda of primitive Christianity, to which they form a prelude and accompaniment, and to the correct understanding of which they are well-nigh indispensable.

Kautzsch.—Accordingly, as attention has been centred more and more on the origins of Christianity, the Apocrypha have been studied more and more intently. An unequivocal sign of the Society's interest may be seen in the splendid editions that have recently appeared, not only of separate books, but also of the whole body of such literature discovered thus far. The great work of Kautzsch, collaborating with 16 German scholars, on 'Die Apokryphen und Pseudepigraphen des Alten Testaments' appeared in 1900 in two volumes of 542 and 540 large pages, treating 24 of these books, and the reader must remember that the whole Hebrew Canon has also been similarly treated by Kautzsch (assisted by ten German scholars) in two volumes of 960 and 637 slightly larger pages, on 'Die Heilige Schrift des Alten Testaments' (1909-10); whence it appears that though they are no longer entitled "Holy Writ," they at length receive critical attention of the first order—which is indeed far better.

Charles.—The scholarly work of Kautzsch has been quickly followed and surpassed by a still more ambitious work, bearing the like title, 'The Apocrypha and Pseudepigrapha of the Old Testament,' under the editorship of the illustrious scholar, 'R. H. Charles,...in conjunction with many others'(Oxford 1913), professing to include "all the extant non-canonical Jewish books written between 200 a.c. and 100 a.d., with possibly one or two exceptions," though the reader will not find Josephus nor Philo; what is meant, is the non-canonical literature of unknown authorship, but even then the profession remains too wide for the "books" and too narrow for the "writings." Playfule, then, these 30 "outsiders" have at length been established immovably in their rights, not indeed as inspired or in any way superhuman, but as shedding much welcome light on a very obscure but extremely important transition period in history.

New Base.—It remains to add that the position of Protestants with respect to the Canon, after they had abandoned the solid rock of authority and rejected the witness of tradition, seemed somewhat insecure and difficult to defend. It became necessary to find some still firmer foundation than either Jerusalem or Rome could offer, and this was sought, with the most extraordinary diligence and with the utmost prodigality of learning and ingenuity, in the Scriptures themselves which were to be their own witness, self-luminous, self-evident, self-proving. "Canonical authority of Scripture does not depend on the Church or on its councils," but "lies in the Scripture itself; it is inherent in the books so far as they contain a revelation or declaration of the divine will. Hence...the authority of Scripture is from God alone." These words of the eminent scholar and critic, Dr. Samuel Davidson, are found in the 'Encyclopaedia Britannica' (9th edition 1875), but neither they nor any equivalent in the 11th edition (1910),—where the whole matter is left undefined and floating in the air,—such is the change a generation has wrought. The deliverance of Davidson is clear and direct, except for the elastic clause "so far...divine will," which saps it of force and value: for this clause simply means, "so far as they are inspired of God," but leaves the question "How far are they inspired?" entirely untouched. The proposition that the Scriptures are authoritative so far as they are divinely inspired, it is indeed impious to deny, but it is also vacuous to affirm.

Canon of the New Testament.

In dealing with the Canon of the New Testament we find the area of inquiry much narrower and more sharply bounded and the sources of evidence more abundant as well as closer at hand; nevertheless, the debate has not been less but even more stubborn and acrimonious.
Earliest Stage.—Proto-Christian preaching, as it appears in the earliest Christian literature, was essentially missionary (a Missions-predigt, says Norden, 1913), the propaganda of a new universalistic, in contrast to the Jewish particularistic, Monotheism ("the monothetic Jesus-cult," Deissmann, 1912), the "Ethical Gospel," "Fear God and give Him glory" (Rev. xiv, 7). Though directed to the whole Roman pagan world, "a light to lighten the Gentiles" (Luke ii, 32, Matt. iv, 16, Acts xiii, 47; xxvi, 23), its prime object was the overthrow of idolatry, as it proceeded from the Jewish Dispersion, its inspiration was the thousand-year-long struggle that Israel had waged for the One God against the surrounding hosts of Polytheism, its apostles (missionaries) were in general liberal-minded Jews or Jewish proselytes full of zeal for their pearl of great price, their new-found faith in God, and their common armory and arsenal of arguments was the Law, the Prophets, the Writings, the three-fold Canon of Hebrew Scripture, and the permanent shape in the teaching of Rabbis and in the service of the Synagogue. An evangelist like Paul or Barnabas might indeed deliver a philosophic discourse against idolatry, after the type of that on Mars' Hill (Acts xvii, 22-31), without allusion to Scripture, but on grappling in closer combat he would nearly always have recourse for proofs to the literature of Monotheism, the well of religion undefiled, the authoritative Books of the People of the Living God. Tatian tells us ("Address to the Greeks," c. 29) that, having found one demon (heathen god) here and another there instigating to evil, he chanced to light on certain "barbaric writings" (of the Jews), too old to be matched with opinions of Greeks and too divine to be matched with their errors, which declared the government of the universe to be centred in One Being. It is obvious, indeed, that the new religion would naturally and almost unavoidably adopt these sacred volumes as their own standards in their high debate; and accordingly, we find early Christian literature richly laden with quotations from Scriptures (graphai); though by no means always either accurate or relevant, such citations and reminiscences show how completely Christian consciousness was dominated by the Hebrew Bible.

But comparatively few could extort its meaning from the Hebrew text, and, accordingly, recourse was had to the Septuagint or some other translation. Of the 350 citations in the New Testament from the Old, about 300 lean toward the Septuagint, away from the Hebrew. Hence it was natural, if not inevitable, for the proto-Christian to look more kindly upon "outsiders" than did the Palestinian Jew, since he found them not only enlisted but actually inscribed among the translated Scriptures "that defiled the hands." As already noted, we find works like Enoch and the Assumption of Moses, though lying far back on the border of the Apocrypha, still cited in Jude (3:9), and some of these "extraneous works" established themselves fixedly in the Tridentine Canon,—about which sufficient has been said.

Christian Scriptures.—We may conclude, then, that the natural Canon of the early Christian was that of the Jews, not in its narrow Palestinian-Hebrew, but in a wider Alexandrian-Greek form, which not only made room already for numerous "outsiders," but also opened the door for admission of other works to be born hereafter of the world-wide religious fermentation and deemed worthy of place among the worthies of old. Yet it was centuries before any product of the new Faith could make good its claim to such recognition. Everywhere in our present New Testament the term Scripture(s) refers to the Hebrew Canon, as we see it today. The only marks, who attest and represent usage in the first half of the 2d century,—with one apparent exception: In 2 Peter iii, 16, we read: "even as our beloved brother Paul . . . wrote unto you; as also in all his epistles . . . as also the other scriptures . . ." Here it seems plain that Epistles of Paul are spoken of as "Scriptures," such being the force of "other" ("remaining," loipas). However, the exception is only apparent, for this 2 Peter is recognized with platitudes and truism (as it says) as a pseudepigraph dating from (say) 170, though there is no sure proof of its existence before the beginning of the 3d century (Harnack, 'Chronologische,' 469), and moreover as proceeding from some source in Alexandria, where, from the looseness of prevalent conceptions concerning the Canon, the term "Scriptures" would find easier and earlier extension to Pauline Epistles than it would elsewhere. The famous verse does not, then, represent apostolic or even sub-apostolic, but at the latest, patristic apologetic usage after the middle of the 2d century. Nor is the weight of its witness increased by the fact that the author impersonates "Symeon Peter, servant and apostle of Jesus Christ," who had died a century before.

A nearly contemporaneous, perhaps slightly earlier, use of "Scripture" is found in the Homily, formerly called the second Epistle of Clement to Corinthians (ii, 4): "And another Scripture says that 'I came not to call just men, but sinners.'" — exactly as in Mark ii, 17, Matt. ix, 13. However, we cannot conclude with confidence that there is any reference to these Gospels; for the sentence quoted is epigrammatic in form and was probably a slogan of the Gentile mission ("Jews, sinners=Gentiles), and as such it may have appeared in various writings before our era. Nevertheless, it is in any case cited as Scripture.

Irenæus.—On entering now the last quarter of the 2d century, we are met near the gate by the monumental work of Irenæus. This chosen champion of Catholic faith seems to have been sent about the year of the persecution (177), as presbyter of Lyons, on a mission to Rome, whence returning he succeeded to the bishopric made vacant meanwhile by the martyrdom of Polteinos. It was the crisis of church-fortunes in the battle with the "heretics," especially the followers of Valentinus and Marcion, the former the first great biblical theologian since the days that had understood Paul, though he misunderstood him (Harnack), and by the testimony of vehement opponents, both of them men of exceeding ability, religious devotion and spiritual insight, who had carried their campaign into
John IV, 53–V, II

Washington M.S. of the Gospels, Freer Collection
Rome itself and there established themselves (138-140) in a determined effort to "reform" the Church. Their "heresies" must have interested Irenæus intensely and on returning to Lyons he began writing, apparently at the request of some "very dear friends," who may have been the highest official, a series of five Books Against Heresies. This Detection and Refutation of the Gnosis falsely so-called is ordinarily dated between 181 and 189, and it is in Book III, c. 23, that the Ephesian "Testament of Jesus Christ," which appeared (Eusebius says) in the second year of Commodus (181); and in Book III, c. 3, we read that "Eleutherius, (d. 189) now holds the bishopric (of Rome) in the twelfth place from the Apostles." While these statements may fix the date for so much of this book, it is clear that they fix less for the earlier and later ones. For the composition evidently extended over a considerable period, the separate books being sent from time to time to Irenæus as they were written. The interval noticeable between the second and the third; indeed, the work seems logically well-nigh completed in Book II with the minute description and confusion of heretical schools, while in Book IV the connecting them and setting forth and vindicating the whole body of Church-doctrine. Accordingly, this elaborate apology has special interest as accompanying, characterizing, and exhibiting in its gradual growth the idea of a New Testament Canon. In the earlier books we find scarcely any allusion to the sources of the Scripture citations, while in the later the references by name to nearly all the New Testament books become too numerous to catalogue. Approaching the close of the century we behold in both the consciousness of a New Testament Canon.

His Usage.—What, then, is the Bishop's use of the term Scripture? It is not easy to give a thoroughly satisfactory answer. About 100 times the word refers clearly to Hebrew Scriptures; about 17 times it might include the Christian as well; about 16 times it would seem to be aimed more directly at the latter. A difficulty in determining the reference lies in the fact that Irenæus conceives of ancient Scripture as already containing in minutest detail the Gospel story and the history of the primitive Church (as did Justin and other leading lights), so that when he speaks of "Scriptures dominican," which we should use exclusively of the New Testament, his reference may very well be to the Old. Again, he seems rarely if ever to employ the phrase "the Scripture says," of any but Jewish Scriptures. He also distinguishes often between the Old Canon and the New that is just in birth, by such locutions as "neither any Scripture has told nor the Apostle has said nor the Lord has taught" (II, 43), and "all Scriptures cry aloud and the Lord teaches" (II, 3, 7), and "all Scriptures cry aloud and Paul moreover (et Paulus autem) bears witness" (II, 47)—all these examples being in the second book, after which he seems to have acquired new knowledge or felt a change of heart. Yet how largely the new literature bulked in his mind appears in the fact that of 1,467 citations 532 are Old Testament and 935 New Testament. This latter term itself is frequent enough in the later books of Irenæus, being used over a score of times, but never in the modern sense of a body of writings, always in the proper use of covenant, dispensation; it is "the Old order changeth, yielding place to the New": the Old is the lawgiving that was at a time, the New conversation (manner of life) according to the Gospel; "the New Testament (covenant) having been known and preached by the prophets." For him the Christian Scriptures are not yet the New Testament.

Four Gospels.—What, then, are they? He gives no catalogue but proves (III, 11) that there are and must be in the nature of the case neither more nor less than four Gospels, since there are "four climes of the world" and "four catholic winds" and four faces of the Cherubim (lion, calf, man, eagle, Rev. iv, 7) "images of the activity of the Son of God." He is perhaps not far wrong, in voicing a vague but dominant sense of the eternal fitness of things and of the omnipresence of the Trinity, in saying this reverence for the Quaternion "a font with roots of eternal being," the Johannine, though originally intended as unique, the sole and sufficient Gospel (Wendland, 'Literaturformen,' p. 236) was to be "the rain of the Four." These he ascribes to Matthew "who edited a writing of Gospel among Hebrews in their own tongue;" to "Mark the disciple and interpreter of Peter;" to "Luke the follower of Paul," "who set down in a book the Gospel preached by him;" and "John the disciple of the Lord, who also leaned on His breast, himself also edited the Gospel, while raving in Ephesus of Asia" (III, 1).

The Rest.—The other Scriptures, though not yet classified, are cited often by name, Acts, Romans, 1 and 2 Corinthians, Ephesians, Philippians, Galatians, Colossians, 1 and 2 Thessalonians, Peter, John, Apocalypse,—the others are not named. Verses 7, 8 of 2 John are cited as from 1 John iii, 17, 7, also v. 11 as from John. Two expressions are used that are also found in Jude ("an example of just judgment of God," 7, and "faith delivered unto us," 3), but neither as quoted, nor is there reason to suppose that either was taken from Jude. Likewise the aphorism in 2 Peter iii, 8 is twice used (v. 23, 2; 28, 3) in the form "the day of the Lord is a thousand years," but with no indication of derivation from 2 Peter. Three phrases are somewhat like phrases in James, but only one need be mentioned, "the friend of God," a characterization of a devout man, frequent in the classics and appearing in 2 Chron. xxvii, 7 ("Abraham, thy friend"). Harvey thinks he finds references to 10 passages in Hebrews, all of which is mere imagination; there seems to be no use made of this Epistle, the correspondences are merely in stock phrases. The whole verse Titus iii, 3-10, about avoiding heretics is quoted with the formula, "As Paul also said" (iii, 2, 4; also in 1, 9, 3, in what seems to be an interpolation). Other supposed references are illusory; of about eight phrases, only one, "most... words of false knowledge," is referred to Paul (ii, 18, 51, 1 Tim. vi, 20) in a sentence much discussed and perhaps inserted. About half a dozen phrasal resemblances to 2 Timothy may be hunted down in Irenæus, and of 4, 10f, it is expressly said (iii, 1), "Paul has manifested
in his Epistles. There is no allusion to Philemon.

Apocrypha.—It seems, then, that seven Epistles, the Pastoralis, Philemon, Hebrews, James, John, lack an express recognition by Irenaeus, though passages in the Timothies are ascribed to Paul. But the Bishop knows and uses still other "Scriptures." He cites (III. xxxii, 1, xxxi, 1) from Isaiah: *And the Holy Lord remembered his dead of Israel that had shed in the land of sequestration, and descended to preach them salvation that is from Him, to save them.* Again (IV, xxxvi, 1) he cites it in almost the same words from Jeremiah, as does also Justin ( Dial. 72) characteristically accusing the Jews of suppressing it, though it is unknown to the Hebrew, Septuagint, Vulgate, Targums, Hexapla, and all other versions,—clearly a Christian addition useful in argument and the basis of the famous passage "the gospel was preached even to the dead" (1 Peter iv, 6). Again, (IV, ix) we find the apocryphal Daniel xiv, 3f, 24, quoted and ascribed to the prophet. Once more (IV, xxxii, 2) we find Enoch described as "God's legate to the angels," in apparent reference to the long story in the apocryphal Enoch, xxiv, 5. Still further, at IV, xxxiii, 3, "If it be sacrifice..." says the passage cited here (also by Clemens Al., pzd. III, xlii) as Scripture is not in our present Scriptures. Last, we find (IV, xxxvi, 2) the first commandment of the Shepherd of Hermas cited with praise as "Scripture," and the First Epistle of Clement described and approved as "Scripture itself" or "very Scripture" (ipsa Scriptura). At II, lvi, I "the Lord said: Ilf, etc.," which words are also cited in 2 Clement viii, 5 as "in the Gospel," and Grabe thinks the reference is to "the Gospel according to Egyptians," whereas fragments are still adrift. Finally, the letter of Polycarp is declared (III, 3, 4) "written most sufficient" to teach both the character of his faith and the preaching of the truth, and at V, xxxv, 1 the long citation from "Jeremiah" is found only in apocryphal Baruch (iv, 36-v, 9).

Canon.—Ten such examples are enough to show that the scriptural horizon of the ancient Bishop was notably wider than the modern, as was clearly defined at many points. Manifestly the Canon is coming to birth, but for him it is not yet born. It remains only to recall that the allusions (real or apparent) to the later New Testament writings are nearly all to be found in the later books (1,1-V) of Irenaeus, written it appears after the demand of his friend had been fulfilled, as an overplus beyond what was expected ("praeter quam opinabaris"). Also, in the barbarous though generally faithful Latin translation of the Greek, it is almost impossible that some emendations should not be found,—the marginal comments of readers or copyists, which have crept into the text, as at V, xii, 3, where the words "in second to Corinthians" are not in the Greek. These definite references to the New Testament Scriptures represent in large measure a somewhat later consciousness, even as Harvey notes. The rapid growth of this recognition of an authoritative literature, and of its precise determination, is the all-important fact that shines through the pages of Irenaeus.

In Tertullian the development of nearly 20 years reveals itself distinctly. His earliest polemics, "Ad Nationes" and "Apologeticus," are assigned to the year 197, and his literary span reaches to 220. Far more brilliant and profound than Irenaeus, indeed a forensic genius, but far less catholic in his representations,—he was either canonized, nay, he fell ultimately into Montanism, a heresy much less rational and more extravagant than any he had so vehemently opposed,—his witness withal to the growth of the Canon conscious and sure, and the Canon itself is an invaluable supplement to that of Irenaeus.

Tertullian's Terma.—The fierce African pours forth such a deep and rapid torrent of speech that one is often bewildered in its uproar. Some things, however, are heard distinctly, and it soon becomes clear that he has gone much beyond the Gallican Bishop. Of terms to denote the Scriptures, Old and New, together and apart, as a whole or in division or even opposition, he has about 30. He uses the word "Scriptura" in a very wide sense (De Res. Car. xxvii, 1 and often elsewhere less certainly), but his favorite word is Instrumentum, for which he tells us (in Marc. IV, 1) Testamentium is more in use; he distinguishes two such "Instruments," i.e., Old and New; he speaks of the "old Scripture" and the "New Testament" (adv. Prax. 15), of the "old instrumentum" and "our rather new apparatus" (Apol. 47); also of the "old instrumenta of legal Scriptures," and "all our apparatus" (Monog. 7). With him instrumentum signifies (means of) documentary proof, a sense adopted from the Roman forum or books of law and still approved at the bar; over against the "instrument of Jewish literature" (Cult. I, 3), he sets the "Christian letters" (Prescr. Her. 37) and the "instrument of preaching" (Mod. 1). He has then clearly in mind a body of Christian evidential literature, and it seems remarkable that he still hesitates and rarely applies to it the term "Scripture."

His List.—This New Apparatus, Instrument, or Testament consists in his mind of two grand divisions: the Evangelic (Marc. IV, 2) and the Apostolic (Resurr. 39), called also "evangelic letters," "evangelic (Gospels) and apostolic letters," or simply "apparatus," or "apostolical apparatus." Of these two, the first consists of the Four Gospels, which, possibly for controversial reasons, he gives in the order John, Matthew, Luke, Mark (Comp. Codex Bezae: Matthew, John, Luke, Mark), the first two being apostles, the others only apostolic. The second contains the "Instrument of Acts" (Marc. V, 2)—used relatively little, called also "Acts of Apostles," "Scriptures of Apostolics," "commentary of Luke," and the "Apostolic Instrument" proper, or "his own Instrument," i.e., the apostle's, i.e., Paul's, called also simply "Paul"; as well as, thirdly, the "Instrument of John" (Resurr. 38), embracing the Apocalypse and the First Epistle of John. The main division, "Instrument of Paul," consists primarily of the Ten Epistles, first collected by Marcion (near 144) under the name of "Apostle or Apostolicorum" and in this order: Galatians, 1 and 2 Corinthians, Romans, 1 and 2, Thessalonians, Laodiceans (Ephesians), Colossians, Philémon, Philippians; but the "aukistic battle-front" (acae).
as Tertullian calls it (Mod. 17), was strengthened
by the three Pastoral of Timothy and Titus.

The Dubious.—So much, then, seems to have been noted in the
list of apostles, but also placed and named in the body of Christian
writings recognized as authoritative by Ter-
tullian and doubtless in the main by the African
Church. But there was also a considerable
group of writings not yet securely folded within
the sacred pala. Of these the Epistles to Hebrews was chief.
In his pamphlet on
"Modesty," having gone through the whole
discipline of the Apostles properly (so-called),
at the beginning of c. 20 he "superduces"
another "redundant testimony of a companion
of Apostles": "For there exists also a title
'To Hebrews,' of Barnabas, a man well
authenticated by God," . . . "and surely
the Epistle of Barnabas is more received among
churches than that apocryphal Shepherd of adult-
bers;" he then goes on, "let us much as we now read them. His other allusions to
this Epistle, though numerous, are illusive:
Again ("Prayer," 20), with apparent reference
to 1 Peter iii, 1-6, he mentions the "prescrip-
tions" of the churches, and the word of the mouth,
because with the same spirit, as Paul,
the glory of garments, etc., yet without any
assertion of recognized authority. But this
chapter is apparently interpolated, being out
of connection with the context and absent from
some MSS., one of which places here the
words, "End of Tertullian's book on Prayer."
Other allusions are quite unconvincing; per-
haps Tertullian knew 1 Peter, but only as an
appendix to his "Scriptures." Similarly he
concludes his defense of the book of Enoch as
"Scripture" with "the fact that Enoch pos-
sesses testimony in Jude, an apostle" (Fem.
Dress, 3), but he does not stress this fact,
merely "adding" it as of seemingly little
weight, nor does he certainly use the Epistle,
not even v. 25. The second Epistle of John
(or the Presbyter) Tertullian may have known
but does in no way recognize. The second
Epistle of Peter, the third of John, and that
of James doubtless existed in Tertullian's time
but was not yet known. Tertullian, in the
sense of certain or canonical, being apparently unknown both
to him and to the African Church. We have
also seen that he rejected the Shepherd, for
dogmatic reasons, as "overlehen" in matters of
sexual relation, but accepted Enoch. The
dates of Tertullian's numerous writings are too
uncertain to permit discussion of the develop-
ment and determination in his own mind of the
Canon-idea,—only one positive and absolute
datum is to be found: he was writing (Marcion
1, 15), or "150," the Emperor Severus" (207-08). However, the growth from
the time of Irenæus is obvious and doubtless
went on continuously during the 25 years of
Tertullian's literary career (197-222).

First Catalogue.—The third important wit-
ness to the Canon at the junction of the
centuries is the so-called "Muratorian Fragment,"
discovered (1740) by the "father of
Italian history," Ludovico Antonio Muratori (1672-1750),
in an 8th century compound of
tologic tracts and five early creeds. It con-
tains lines of barbarous Latin, possibly a
translation from Greek, cataloguing the Chris-
tian Scriptures. The date of the original seems
to lie somewhere between 195 and 205 (pos-
sibly 210). The first line is "at which (or
some) he was nevertheless present and so put
down" (quibus tamen intravit et ipsa posuit).
The reference is seemingly to Mark, the first
part of the list being lost, which doubtless
noted both Matthew and Mark, as the second
line reads, "third book of Gospel according to
Luke," and the origin of the various books is
described: four Gospels, Acts (assigned to
Luke), thirteen Epistles of Paul (to seven
Churches,—for there were just seven in
Revelation,—two repeated and four personal),
two of John, one of Jude, two Apocalypses
(John's and Peter's), and "Wisdom written
by friends of Solomon in his honor" (like a
jubilee-volume presented to a university
professor.). "Epistles to Laodiceans and to Alex-
andrians, feigned in the name of Paul, for
the heresy of Marcion" are rejected, "for gall fits
not to be mixed with honey" ("del cume melis,"
as we might say, sand with candy); the
Epistles "To Hebrews," of Peter, and of James
are not mentioned, and "the Shepherd..."
: it is indeed meet to read but not publicly in
the church to the people's mouth, because with the same spirit, as Paul,
the glory of garments, etc., yet without any
assertion of recognized authority. But this
chapter is apparently interpolated, being out
of connection with the context and absent from
some MSS., one of which places here the
words, "End of Tertullian's book on Prayer."
Other allusions are quite unconvincing; per-
haps Tertullian knew 1 Peter, but only as an
appendix to his "Scriptures." Similarly he
concludes his defense of the book of Enoch as
"Scripture" with "the fact that Enoch pos-
sesses testimony in Jude, an apostle" (Fem.
Dress, 3), but he does not stress this fact,
merely "adding" it as of seemingly little
weight, nor does he certainly use the Epistle,
not even v. 25. The second Epistle of John
(or the Presbyter) Tertullian may have known
but does in no way recognize. The second
Epistle of Peter, the third of John, and that
of James doubtless existed in Tertullian's time
but was not yet known. Tertullian, in the
sense of certain or canonical, being apparently unknown both
to him and to the African Church. We have
also seen that he rejected the Shepherd, for
dogmatic reasons, as "overlehen" in matters of
sexual relation, but accepted Enoch. The
dates of Tertullian's numerous writings are too
uncertain to permit discussion of the develop-
ment and determination in his own mind of the
Canon-idea,—only one positive and absolute
datum is to be found: he was writing (Marcion
1, 15), or "150," the Emperor Severus" (207-08). However, the growth from
the time of Irenæus is obvious and doubtless
went on continuously during the 25 years of
Tertullian's literary career (197-222).

First Catalogue.—The third important wit-
ness to the Canon at the junction of the
centuries is the so-called "Muratorian Fragment,"
discovered (1740) by the "father of
Italian history," Ludovico Antonio Muratori (1672-1750),
in an 8th century compound of
tologic tracts and five early creeds. It con-
tains lines of barbarous Latin, possibly a
translation from Greek, cataloguing the Chris-
the Acts and Gospel and Preaching and Apocalypse of Peter "we know have not been universally accepted" (in 3), but in 25 his Apocalypse is "among the spurious," while still worse, his Gospel and Acts are "all of them to be cast aside as absurd and impious," "the fictions of heretics," unworthy of place "even among the spurious." This is progress, surely. In his later discussion the historian uses a puzzling cross-division: First, the four Gospels; then Acts; "after this must be reckoned the Epistles of Paul;" next 1 John and "likewise the Epistle of Peter must be maintained"; "after them is to be placed the Apocalypse, if it really seem proper;" these are among the Confessed (Homologoumena). Among the Contradicted (Antilegomena), but "nevertheless recognized by many" are the so-called Epistle of James, and that of Jude, also 2 Peter, and the so-called 1 and 3 John. Among the Spurious (Nothoi) are the Acts of Paul, the Shepherd, Apocalypse of Peter, Epistle of Barnabas, the so-called Teachings of the Apostles, and besides "the Apocalypses of John if it seems proper," and "the Gospel according to the Hebrews," "and all these may be reckoned the Contradicted." Lastly, "those cited by heretics under the name of Apostles," "Gospels," and "Acts" which are "fictions of heretics . . . absurd and impious."

It seems worth while to note the standard applied by Eusebius: it is "church tradition" alone that decides what are "true and genuine and commonly received." Some were universally received, some by most but not by all, some by only a minority, some "by no one of the succession of Church writers deemed worthy of mention." Clearly there was still much ground for debate.

As general result, we find the notion of a body of authoritative Christian documents rapidly forming in the usage of Irenaeus, distinctly formed in that of Tertullian, and actually formulated in the Muratorian Fragment. But this notion of the Canon is not yet complete. There is agreement as to central and even medial portions but the widest disagreement as to the peripheral, a difference of judgment that it will require long centuries to adjust.

Still Earlier.—If now we ask, Had Irenaeus no forerunners in his idea of a Canon? the answer must be: Assuredly he had; the law of continuity was not broken. Beyond doubt the composition of the "proof-documents" was gradual and their collection into smaller and then into larger groups was also by degrees. Backward from Irenaeus, through two or even three generations, lies indeed a dark abyss of time, yet not wholly unlit of stars. To be sure, we find no certain conception of authoritative Christian writing. Scripture is the Old Testament only, in wide or narrower sense. True, the famous church letter of "the servants of Christ residing at Vienne and Lyons" to their Asiatic-Phrygian brethren, respecting the persecution in the year 177, does in fact say "that the Scripture might be fulfilled. He that is lawless, let him be lawless still, and he that is righteous, let him be righteous still" (Eus. Hist. Eccl. I V, i, 58). But in spite of the just praise accorded this letter we really know nothing of its authorship, authenticity, or date; moreover, the citation sits loose and even jars with its context. The same is true of each of its forerunners, the collection and judgment either side; nothing suffers from its removal; it makes the impression of a pious observation of a copyist, which has crept from the margin into the text. Besides, it is quoted as a stock phrase; for in Rev. xxii, 11, it is also most probably not original but a quotation.

In the uncertain letters of "Theophilus to Autolycus" (173-90) there are two mentions of the Gospels, in Book III, 13 and 14; the first is manifestly and the second very probably interpolated, as is also the phrase, "and in the Gospels," c. 12. But in any case, the text need not modify the foregoing.

Nearest to Irenaeus stands Tatian (160-80), who seems to have known of four Gospel forms and sought to blend them into one in his 'Diatessaron' (1737), in which scarcely any traces of the humanity of Jesus appear to have been found. His 'Address to the Greeks' and "Apomnemona" that are also found in the Gospels and Epistles, apparently the watchwords of certain religious or dogmatic tendencies, but none given as citations.

The Martyr.—Tatian's master, Justin Martyr, had considerable acquaintance with literature now found in the New Testament, but all of it seems to be floating as an unorganized mass (or rather as a meteoric swarm) in his mind. He never cites any such passage by the author's name, but ascribes them in the main to "the Lord" or to Jesus or Christ or the Saviour, most frequently omitting the subject "He." In Apology I, 66, and especially toward the close of the Dialog (cc. 100-07), he speaks of the "Memoirs of (or composed by) His Apostles." The phrase "which are called Gospels," in Apology I, 66, has long been felt to be interpolated, and so indeed is the whole chapter, which breaks visibly the connection between cc. 65 and 67. Again, that these Memoirs or Commentaries (Apomenoma) should be mentioned 12 times in cc. 100-07, only in treating of Psalm 22, and not at all elsewhere in the Dialog, is surely extremely suspicious, suggesting easy interpolation, or a later date for these late chapters. That Justin Martyr did not really refer to our Four Gospels seems clear for many reasons. Had he known of them under the names of Matthew, Mark, Luke, John, it seems practically certain that in the course of 120 allusions (50 in App. 70 in Di.), he would have named some one, for he is a stickler for names and exactness, as he conceives it. In citing the Old Testament he names the author 197 times, omitting the name only 117 times for various, mainly literary, reasons. He names John the Baptist repeatedly. He ascribes to "a certain man among us, by name John, one of the Apostles of the Christ, the Revelation that they who believed in our Christ should spend a thousand years in Jerusalem" (Di. 81): had he ascribed the Gospels, as his authors, as Irenaeus (Books III-V) and Tertullian...

CODEX VATICANUS (B): MARK XVI, 3-8
The Close of the Gospel. From Burgon's photograph of the page
A. Hebrews XIII, 18-19
B. II Timothy I, 10-12
6th Century
Washington MS. of the Fragmentary Epistles of Paul
liam did, it seems inconceivable that he would not have adorned his pages with their names. Moreover, it is certain that he drew from apocryphal sources, as from the Gospel of Peter; for both he and this Gospel (in the Achrom fragment discovered 1885) use the strange word *lachmon* for *for* in the casting of lots over the garments of Jesus, a word known there only to these two and to Cyril. Again, he says, "And fire was kindled in the Jordan* at the baptism of Jesus, as *wrote the apostles of him, this Christ of ours*" (Di., 88), an incident noted in the "Preaching of Paul," the Ebionite Gospel, the Sibylline Oracles, and the Syrian Liturgy, but not in the New Testament.

Without going into further details, it appears manifest that Justin Martyr had before him, in writing or in memory, a considerable body of miscellaneous Christian literature, much of it perhaps under the name of Oracles (*Logia*) of the Lord or Jesus of the Saviour, some of it maybe professing apostolic origin or "gospel" character. Most of this has been taken up and organized in the New Testament, though some of it has failed of that honor; none of it did Justin certainly regard as inspired, canonic, authoritative; all of it he used or disused, and often misused, according to his own fancied needs in argumentation and his own sense of eternal fitness. The notion of a New Testament canon was unformed in the Martyr's mind.

Others.—If such was the case with this learned and zealous student between the years 140 and 166, perhaps about 147, it would seem almost needless to look unto lesser lights whether earlier or slightly later. However, a momentary glance at Athenagoras (170), the letter ascribed to Diognetus (200), Hegesippus (185?), and Dionysius of Corinth (170) discovers the same usage and state of mind as with the Martyr. The latter says, "there are many false teachers among us* forging in His name* (185), the Epistle of Philip makes similar complaint (Eus. Hist. Eccles., xxiii, 12): "My epistles have the devil's apostles filled with tares, cutting out some things and adding others... It is not strange then that some have espied in the Lord's writings also* a practice that pervaded all literary ranks.

Apostolic Fathers.—Ascending the stream we find Polycarp's Epistle (150-160) crowded with sentences and phrases now incorporated in the New Testament, but without any indication of their source, with no name of an author, with no hint of inspired or canonic character.

Of the other Apostolic Fathers, Clemens Romanus, Ignatius, Hermas, Barnabas and the Teaching, none have any idea of canon or authoritative scriptures besides the Old Testament, though they use many New Testament phrases and sentences apparently drawn from the common stock of religious feeling and expression. In Barnabas' Epistle (iv, 14) we read, "lest, as it is written, 'Many called but few chosen,' we be found.* The five words agree exactly with Matt. xx. 16, but they are there also a proverb, whence quoted we cannot say. It seems certain that Barnabas (119?) is not citing Matthew as Scripture. It is common enough for him to quote from Scripture or prophets what we do not find therein.

Collections.—But while the notion of Canon first takes form in Irenaeus and Tertullian, we may be sure there had been much earlier *collections* of Christian writings. Of one such we hear definitely, that of Marcion, who came to Rome a little before 140, having 10 Pauline Epistles and one Pauline Gospel, the relation of which to our present *According to Luke* has been a theme of elaborate discussion. Tertullian and the Catholics held it was a mutilation of their Lucan Gospel; unfortunately the Marcionite reply has not reached us. With respect to the Epistles the case is similar, but in any event the example of Marcion seems to have been widely followed and to have precipitated a battle of the books, whose echoes resound through the pages of Irenaeus, Tertullian and others. The Gnostics were indeed the first scientific theologians of the new faith, copious writers, religious philosophers, keen-witted expositors, if too often lawless in allegory. The New Testament teachers of the most illustrious Church Fathers such as Clemens Alexandrinus and Origen; with the former,—in whom *the modern theologian is disappointed to find very little of what he deems characteristically Christian,*—"Perfect Gnosticism" means *"perfect Christianity,"* and Origen was a close student of the Gnostic Heracleon's Commentary on a John's Gospel (170)? Basilides was perhaps the deepest thinker, Valentinus the most constructive, as well as conservative, of the whole school. As these vigorous exponents of the Gnosis entered the fray armed with numerous collections of writings, among them certain forms of our present Synoptics as well as the Fourth Gospel, it became necessary for Catholic champions to meet them on even terms, with counter-arrays of authoritative writings, of proof-documents, the *instrumenta* of Tertullian. From this desperate and long-fought battle the Canon of the New Testament has emerged, in proof that "Strife is Father of All*.

Contents.—To discuss the questions, What were the earliest contents of these documents? and, How were the Gnostic and the Catholic forms related to each other? would carry us much too far afield, into the field of Origen; but we may be sure that the extant forms are all developments of similar though simpler primitive forms that grew up under endless revision and re-revision through successive generations, each new growth displacing the preceding like leaves of the forest, so that from the short and pithy oracles that Polycarp and Justin love to cite, we pass over by a devious path into the continuous discourse of the Gospel of John:—though one must not think all the earlier forms were right; some long ones have doubtless been shortened and fitted with finer point and brighter polish.*

Authorship and Date.—It is not strange then that the query as to the date and authorship of many New Testament Scriptures should not be answerable in simple or positive terms,
for they have not dates and author's in the ordinary sense of these words, having been molded gradually under many hands into their present forms. If date and author of a certain verse were proved ever so clearly, it would decide nothing as to the verses before or after. Did we suppose the Spirit, whether Catholic or Gnostick, was weaving and unweaving ceaselessly at the loom of speech, and the New Testament is the perfected garment, the fruit of its toil.*

The Non-Canonics.—But it must not be for a moment supposed that the finally rejected writings (however inferior to the Canonics) in any of their forms or stages are worthless or to be despised. On the contrary, their virtue is often exceeding great, the light they shed on the whole genetic process most welcome and even invaluable. They are like intercalary and collateral forms in fossils, without which the familiar types could not be understood. Again, it is absurd to suppose that the Gnostic variants were in general mere corruptions of an elder uncorrupted text. They are the best expressions of another and often of an earlier consciousness. A single example of extreme importance may make this clear. In Matt. xi, 27 (Luke x, 22) are the weighty words: "no one knoweth the Son; save the Father; neither knoweth any the Father, save the Son, and he to whomsoever the Son will reveal." So it stands in Matthew, Luke and Mark, says Irenæus (IV, II), but he charges that they who wish to be expert than Apostles write it thus: "No one knew the Father save the Son; nor the Son save the Father, and he to whomsoever the Son wills to reveal; and at first the charge sounds plausible, since the former seems more natural. But Irenæus himself in Book I, 13, gives the Gnostic form without protest and argues therefrom; and again in Book II, 4 he quotes the same as his own in the Gnostic form (with only knoweth (or known) and again (Book II, 18) he quotes twice the Gnostic "No one knew the Father," uncomplaining. Thus it appears that in Books I and II he makes no objection to the Gnostic form but sanctions it by the example of other; which is confirmed by the fact that when he requotes the passage in Book IV, xi, 5

be not only gives but repeats and emphasizes the Gnostic form shall have revealed (reveleatur), instead of the orthodox shall have willed to reveal (voluerit... reveleatur). Hence the vehement churchman and heresy-hunter Harvey admits in a Note (II, 162): "It is remarkable that this note has been quoted correctly at page 158, the translator now not only uses the single verb reveleatur, but says pointedly that it was so written by the venerable author. It is probable therefore that the previous passage has been altered to harmonize with the received text by a later hand."

The Gnostic Form Order.—When now we recall that in a Syriac Fragment (XVI) Irenæus himself again quotes the verse and again in the Gnostic order of words with the single verb, declaring "Our Lord said: None knows the Father save the Son nor the Son save the Father and to whomsoever the Son shall have revealed;" moreover that Justin quotes the passage first (Ap. I, 63) exactly in the Gnostic form, and afterward (Di. 100) again in the same form, and who with the expression "he to whomsoever the Son will;" knows, and that Eusebius ('Hist. Eccles.' I, 2) again confirms the Gnostic order of words, as well as still other Fathers, it seems that Harvey's "probable" must be changed to certain, that the Gnostic was the older form, which Irenæus along with others accepted first, but which afterward it was found wise to "harmonize" with Church doctrine by changing it into the "received text." That this elder form agreed with the Gnostic in giving knew and not know is now clearly shown independently by both Harnack ('Sprüche u. Reden Jesu,' pp. 189ff., 1907) and E. Norden ('Agnostos Theos,' pp. 279ff. 1913). An 'elder form' not a better, and by no means the eldest, which was doubtless much simpler. Wellhausen has perceived that the clause "none knows the Father save only the Father" is a very old interpolation. It is a corollary, it must therefore not stand in the first place and can nevertheless not be put in the second (D. Ev. Mt., p. 58). The whole passage (Matt. xi, 25-30, Luke x, 21f.), among the most famous and important ever written reaches far back of our Gospels or even our era; in 'Ecce Deus' (p. 118) it is called "the great Gnostic Hymn," and again (p. 166), "these rhetorical and almost metrical verses" are "the voice of Wisdom," and two years later, in 1913, Norden proved as much by a profound analysis ('Agnostos Theos,' 277-308), and this conception is now adopted by Bacon in 'Christianity Old and New' (1914): there is placed in the mouth of Jesus a typical Hymn of Wisdom (p. 164).

Later Growth.—When now we glance once more from this scarcely present mound of history, the junction of the 2d and 3d centuries, down the stream of years, we behold the notion of the Canon indeed firmly fixed, but the borders still vaguely defined, uncertain, unstable. Of the Fathers, Cyprian followed Tertullian as his "master": Origen (as we have seen) indeed attempted scientific criticism but without ade-

---

* How much was or could be known of Gospel authorship in shown by the following: Eusebius (II, E, iii, 39) says that Papias, bishop of Hierapolis, said (in his five books of 'Exposition of Oracles') "This also the Elder said: Mark, having become Peter's interpreter, wrote carefully whatever he remembered, tho not indeed in order, the things Spache said or did by the Christ." Again, "Matthew accordingly compiled the oracles in the Hebrew dialect, but each interpreted them as he was able." Now Eusebius, a thorough master of tradition, in his great History has amassed the best he could learn, especially on such a critical subject, moreover Papias was a restless tradition-hunter, and what the Elder said was surely the best that Papias could find; these traditions, then, must count as the best that Eusebius could use. Yet critics assign them little worth, as applicable to neither Gospel as it now is (see Schmiedel's 'Gospels,' Enc. Bib., 145 p. 11). But even if they fitted exactly, the case would hardly be altered; for the fact that Eusebius could give only the word of the unknown Elder, shows that there was no real knowledge on the subject, but only the best conjecture the Elder could make. With regard to other Gospels, the indication is, if possible, even less. But it is no reproach to these wonderful works, no less than, that their authors are unknown. Rather, as in case of nearly the whole Bible, it is the fact that they mirror not any individual consciousness but a collective consciousness of a Church, that makes them both Catholic and Canonic.

* With v. 27 compare the words of the first great moose-theist Ithnaton (1370-30 B.C.), in his Hymn to the "Sole God: beside whom there is none other:"

"Thou art in my heart."

"There is none else that knoweth Thee, only the Son Ithnaton."
quate principles to guide him; Church tradition was empirical and often inconsistent, inspiration was not determinable. Slowly during the 3d century the mantle of the Canon was widened. At length, in 363, the Council of Laodicea by its 59th canon enacted that "only the Canonicity of the New and Old Testament be read in the Church, but "not private psalms nor uncanonized books"; the 60th canon, which follows was a list, has been set, our author to be not genuine but of much later date (G. d. n. K., 217ff). The Apostolic Constitutions (viii, 47, 85) gives the Old Testament list of "books to be esteemed venerable and holy" by "all you both clergy and laity" (adding, "see that your young men learn the Wisdom of the most learned Sirach"), and names as "our sacred books" of the New Covenant the four Gospels, fourteen Epistles of Paul, two of Peter, three of John, one of James, one of Jude, two of Clement, and the Constitutions dedicated to you, the Bishops, by me, Clement, in eight Books, which it is not fit to publish before all, because of the mysteries contained in them,—and the Acts of us, the Apostles, omitting Revelation. Cyril of Jerusalem (348) in his list of Scriptures includes "Baruch and the Epistle with Jeremiah and also omits Revelation. At last the archbishop of Alexandria, Athanasius, in his 39th Festal Epistle (367), determines as "canonized and handed down and believed to divine" 22 Old Testament books (without Esdras) and our present New Testament exactly; but he still quotes Apocrypha as "Scripture" and allows them to be "read." The great authority of Athanasius finally prevailed, though various fluctuations lingered long in the judgment of the Fathers.

East and West. In the West the councils swayed by Augustine, though somewhat more liberal toward the Old Testament, yet fixed the New Testament as at present. Meanwhile the Syrian Church inclined to a narrower canon. The Cappadocian (Pe-shitta) version, omitting the Apocrypha at first, admitted them later, but in the New Testament it lacked four Catholic Epistles and the Apocalypse, all of which, however, were used by Origen, the Syrians (about 500) divided the Scriptures into authoritative, semi-authoritative and unauthoritative. In the 4th-century, beside Job, Chronicles, Ezra, Nehe- riah, Esther, Judith, 1 and 2 Maccabees, were found James, 2 Peter, Jude, 2 and 3 John, and Revelation was much debated. Armenian and Abyssinian canon show many minor eccentricities of no great interest or importance.

Still Later. During the Middle Ages the Eastern canon alternately expanded and contracted from time to time under various hands, but these variations at most changed the canon. In the West the pendulum trembled between the stricter view of Jerome and the laxer of Augustine, till the day of Luther, when the Catholic sided definitely with the latter at the Council of Trent. With the Canon and the New Testament, the Lutherans included a similar spirit, reviving the Eusebian distinction between Accepted and Contradicted, and ranging among the latter the Apocalypse, Hebrews, and the Epistles of Jude and James, which last he called a "straw-epistle," an uncritical judgment determined by his dogma of "Justification by Faith alone," against which James had protested, and which, as it existed in the early Christian consciousness, the Re- former had wholly misunderstood. But his work was invaluable in partially freeing the Christian mind in the presence of the Canon. His notion of degrees of inspiration, authority, dignity among the Scriptures has been followed up by many theologians and has even found its way into modern criticism; but it makes a vain distinction leading nowhere and logically worthless. Better reason were the decrees of the Florentine, Tridentine and Vatican Councils (1441, 1546, 1870) and of the Jerusalem Synod under Dami- theus (1672), which threw the robe of the Canon over all the Deutero-canonicals. Of absolute authority there are no degrees.

Text Criticism. Modern thought accepts the millennial debate over the Canon as an interesting phase of the history of spirit, but turns its own attention to a far deeper question, as to what the remarkable literature thus canonized really is, or, What is the text of the canonical scriptures?

It was the learned Jerome, a critic born out of due time, who first consciously confronted this query, when he came to translate the Hebrew into Latin. His notion, that only the original script itself is inspired and authoritative, has maintained itself to this day, when it is still widely prevalent, though criticism long since perceived it to be wholly illogical. More sanely the Council of Trent (1546) declared that canonicity and authority reside in the Vulgate translation used in Church Service. It would indeed be vain and nugatory for authority to reside wholly in the Hebrew text, which extremely few could read if ascertained, and which could not really be ascertained at all. Of what use was a Church Court inaccessible to appeals? Nevertheless, though the Council has wisely closed the question for the faithful, it still remains open for unfettered critics: What is the Text of the Scriptures? What in their own tongue do they really say?

The Old Testament. The Original.—The Old Testament was composed and is extant in the Hebrew, ex-

* Luther's view as given at close of the Preface to his Translation (1st ed., omitted from later eds.) appears very extreme: "From all this you can rightly judge between all the books, and distinguish which are the best. For St. John's Gospel, and St. Paul's Epistles, especially that to the Romans, and St. Peter's first Epistle, are the true narrow and kernel of all the books; which properly also might be the first, and each Christian should be counselled to read them first and most, and make them as common by daily reading as daily bread. For St. John's, his Gospel; his first Epistle, St. Paul's Epistles, especially those to the Romans, Galatians, Ephesians, and St. Peter's first Epistle: these are the books that show you Christ and teach all that it is needful and blessed for thee to know, even if thou never see or hearken any other book, or any other doctrine. Therefore the Epistle of St. James really a straw-epistle compared with them, for it has no character of the Gospel in it." The ground of this unjust judgment of James is really what makes one of the most valuable and enlightening of the early Christian documents. For the same effect, the Complutensian Polyglot of Cardinal Ximenes (which, leaving the press 10 Jan. 1514, was published in 600 copies, was bordered by Greek and Hebrew, symbolizing it was said) the Roman Church between the Orthodox Greek and the Syriac, like the Crucified between the two thieves.
cept certain small portions (Jer. x, 11, Ezra iv, 8—vi, 18; vii, 12—25, Dan. ii, 46—vii, 22) written in Aramaic or Chaldean as sometimes called since Jerome (because used by the Chaldeans in the speech reported in Dan. ii, 44). Hebrew was the language of Canaanites, called "lip of Canaan" (Is. x, 18) but also "Jewish" (in Judea, 2 K. xvii, 25, Neh. xiii, 24), from the 5th century B.C. gradually displaced as the vernacular by the kindred Aramaic (called "profane" in contrast with the holy but obsolete Hebrew, and displaced in turn by the conquering Arabic, 7th century). The term "hebraic" (in Hebrew) occurs first in Scripture in Ben Sirach's Prolog (117 B.C.), long after the eclipse of Hebrew, and is used often for the profane, sometimes for the holy tongue. Both belong to the grand group of languages (called Semitic by Eichhorn), between whose two chief representatives, Assyrian north and Arabic south, the Hebrew lies in the middle, somewhat as Dutch between German and Old English. The main mark of these tongues is that the consonants consist nearly always of three consonants, whose vocalizations vary from shade to shade of the radical idea. Vowels being unwritten, the text was purely consonantal, as if one should write r g d and pronounce it rag, raged, rag, rugged, rig, rigid, according to sense, or f r m and pronounce it farm, firm, form, from, forum, or even affirm—a fact of fundamental importance.

The Masoretic.—The earliest text of at least the Old Testament Scriptures was in the Canaanite Script (called Ra'ata, or Libona'ah by the Rabbin), of which six lines dating apparently from Hezekiah's reign (ca. 700 B.C.), discovered (1880) in a tunnel of the Siloam pool, resemble that of the Moabite Stone, though slightly more cursive. The oldest known specimen of what developed into the present Aramaic script (kethob, called by the Rabbis merubb, square, or Asshuri, Assyrian) is a single word of five letters, discovered at Arad-al-amir (former castle of Hycranus, east of Jordan), dating from 176 B.C. Somewhere about this time the portions of the Old Testament then existing were copied from the Canaanite-Moabite form into the older, square form of script. It was impossible that minor mistakes of copying should not creep in, and as many copies were doubtless made, a somewhat uncertain form of text must have resulted. Whence, then, came the standard consonantal Hebrew text?

From a critical comparison of various copies? By no means! Some one copy was adopted, what one we know not, for reasons also unknown. This text thus chosen was long afterward regarded as sacrosanct, not to be altered in a single Jod ("for title." kera'ad, "horn," is apparently interpolated, Mt. v. 18). As the ancient holy tongue sank lower in the consciousness of the people, the guardians of tradition (Massorah) devoted themselves to preserving the text inviolate not only in letters, also in its exact vocalization, and accordingly from the 5th century on they intercalized the text with a system of vocal signs (derived from the Syrian?),—as if we should write pr'mn'mnt or pr'mn't or pr'mn't—
at the same time interputating with an elaborate system of signs as guides to proper cantillation. Thus they superposed the text upon the adopted consonants and therewith established for millenniums an interpretation thereof. Moreover, they not only vocalized, but also verbalized, for the earliest manuscripts were doubtless written continuously without any evident division of words, as thus: Yvhnhstscrdmdknnt (Yahveh, thou hast searched me and know me).—Three systems of such signs are now known, Babylonian, Palestinian, Tiberian, developed between 500 and 900 A.D. But much earlier a number of so-called vowel letters (consomants tending to quiesce into vowels, as in English draw, dray, from drag; plow, though, etc.) had been introduced as guides to vocalization, though forming no part of the earlier text, so that whether such a letter is present the inspiration may be raised, Is it original or a Masoretic insertion? The oldest dated manuscript of this so-called Masoretic Text (denoted by MT) is the Codex Babylonicus Petropolitani of 916 a.D., but a very few others are of a century older. In any case it would seem that the Masorites have hanged down with remarkable accuracy and fidelity the text that had established itself with the sturdy Rabbi Aquiba (d. 132 a.D.). Where they felt called on to suggest a new reading, they did so by keeping the old consonants (the k'hot, written) and writing with them the vowels of the suggested consonants written in the margin and called Q'rtr (legend, to be read). They also made many other minor emendations of little interest except as evidence of painstaking study and unspeakable devotion.

Variants.—But before Hadrian's time or the death of Aquiba, there was no small diversity in the numerous copies of the sacred consonantal undivided text, a fact attested in many ways. What copy Aquiba chose and why he chose it, no one knows, perhaps it was merely the best written that was accessible. We may be sure there was no critical adjustment of the contesting claims into the text thereto were wanting. Accordingly, to rely on the printed pointed text is to rely on a Masoretic interpretation of an unknown square Hebrew copy of an unknown cursive Canaanite text. It is not strange that Protestant scholarship, represented especially by the Swiss lexicographers, the Buxtorfs,* long held to the inspiration and divine authority of the Masoretic points as well as of the consonantal text; for it seemed to be the sheet anchor of the whole doctrine of verbal inspiration—a position long since abandoned. It now seems to be no radicalism but merely common sense when Kittel in the Preface to his 'Biblia Hebraica' raises at the start the question whether to attempt a continuous emended text (such as may have existed 300 or 100 B.C.) or to take the Masoretic as the base, subjoining emendations in footnotes. Though he decides for the latter, the former remains the goal of further study.

* I. e., "broken, splintered." a name well-fragging but probably corrupted from d'gts (pricked, cleft), whence the term deserron used by Epiphanius (Migne, 'Patr. Gr.' 43, 389).
Seuzeugmat.- The means that help mightily forward are the existing versions in other tongues. Made at various periods over a long stretch of time, these are now considered invaluable in establishing the pre-Christian Hebrew text. Oldest and most authoritative is the so-called Septuagint (LXX), so named from the story related at much length in the romantic ‘Letter of Aristeas,’ of how Ptolemy Philadelphus (280-247 B.C.), at the suggestion of his librarian, Demetrius Phalereus, wishing to gather all literature into his library at Alexandria, called by embassy on the Jews for their sacred books in a Greek translation, and how the High Priest Eleazar at Jerusalem replied by sending him 72 experts, six from each tribe (as requested), who were then, after preliminary seven days’ symposium, dismissed each to his own hut on the Island of Pharos, where each made independently his translation, and finally on comparison it was found they all agreed exactly, whereupon, by unanimous approval of Alexandrian Jews, the translation was proclaimed canonic, henceforth to be received as authoritative, with a curse against any modification (as in Rev. xxii, 18, 19).

Its Origin and Character.- Back of this extravagance (describing everything as indescribable), which indeed refers to the Law only and is marked at every step by ample archaeological knowledge and a plentiful display of local color, there may lie some semblance of the fact that there was a felt need for a Greek translation of the Scriptures, felt however among the Jews themselves, though their instruction in Holy Writ was oral, and the translation may have begun as early as 200 a.c. and extended slowly from book to book through two or three hundred years. The presence of many hands is indeed not doubted, the character of the version varies within wide limits in different sections: Sometimes it is almost word for word, as in the Song of Songs, in Christ’s parables; in others, it is theATA, with considerable apparent additions, as in Daniel and Job. The more narrative portions, especially the Pentateuch, seem to be rendered best, while the chief Prophet, Isaiah, has such a style that the change in style becomes most notable on comparing younger with older portions. In general there is fair agreement with the MT, which, however, does not exclude disagreement at countless points to indefinite extent. In the Pentateuch the conformity is in general good, but toward the close of Exodus (cc. 35-40) the departures grow wide and frequent, both in words and arrangement, an indication of late composition, the text having not then attained a fixed form (p. 614.). Still more marked the divergences in Samuel, Ruth, and Judges. The broad order, the Prophets, as Ezekiel, and most of all in Jeremiah, where many chapters are differently numbered, with a total of some 2,000 words wanting. Such variations show clearly that another Hebrew text, in general shorter than the Masoretes and underlying the Sebastian, which indicates that in the border centuries (150 B.C. to 150 A.D.) the Holy Writ was still alive and undergoing development. Occasionally the translators ventured to go beyond the present Hebrew text; thus they added considerable to Daniel, from what Hebrew original, if any, cannot be said.

Its Text.- The Septuagint is probably the first translation of large scope that was ever undertaken, and its importance, even to the present remained scarcely diminished. It gave a distinct stamp to all Biblical Greek, supplies even now the clue not only to the New Testament but to all Greek literature kindred and derived, and is the most trustworthy collateral witness for the Hebrew Scriptures in the two centuries immediately before our era. Accordingly, it becomes a matter of signal interest to determine just what this translation was in its original form,—but at the same time a matter of perplexing difficulty. The manuscript and testimonies do indeed vastly abound,—as seen in the fact that the critical apparatus (of 20 uncial and 277 cursives) amassed by Holmes and Parsons fills five huge volumes (1796-1827),—but their witness is inordinate contradictory and uncertain. Indeed the problem proper of the Septuagint, so brilliantly attacked by Lagarde in his ‘Remarks on the Greek Translation of Proverbs’ (1863), remains yet one of the most embarrassing in textual criticism. The reason for this should be briefly stated.

Other Versions.— Under the Roman irritation and especially after the destruction of Jerusalem by Titus (70 a.d.), as the national Jewish feeling became extremely intense, the rift opened between the Jewish consciousness and the Christian widened, through two generations, into a chasm in the time of Hadrian. The Jewish race, receding from its pagan environment, fenced itself more and more firmly within its own institutions, especially its religious and sacred books, becoming a stricter and stricter constructionist. The highest impersonation of this tendency was the illustrious Rabbi Akiba. Inasmuch as the Christians depended almost wholly on the Septuagint, the latter became unisonomous with the Jewish text and was not merely because of its inaccuracies and divergencies from the synagogue text. Hence arose a demand for a new and faithful rendering of the latter, since the dispersed Jews could not now dispense with a Greek translation. This demand was met (about 132?) in the spirit of Akiba by the version of Akyla (Aquila), slavishly faithful, turning the Hebrew word for word. Meantime it was widely perceived that the official Palestinian text could not be that used by the Seventy, and accordingly still other translations of the former were now undertaken, as by Symmachus and Theodotion into Greek, and also into Syriac (Peshitta). The version of Symmachus is highly praised by the Fathers for its elegance and clarity. In contrast with Akyla’s, often obscure than the original; Theodotion’s is thought to display a rather inferior scholarship.

The Hexapla.— Here, then, were four versions, and more than one edition of some, often widely divergent. Such apologists as Justin, assuming that the Septuagint was perfectly made from a perfect text, charged the Jews with corrupting their own Scriptures; others assumed (with many generations of moderns) that the Palestinian was the true aboriginal and hence discredited the Septuagint and other ver-
sions, and Origen even proposed to himself the superhuman task of making a collation, at first in four, then in six (or even in nine) parallel columns, of the Hebrew (in Hebrew and also in Greek characters), of Aquila's, of Symmachus, of the LXX, and also of Theodotion's translation, in a formidable array of deadly parallels, called the Sermatia (Hexapla). The Septuagint he then corrected as seemed best, prefixing an asterisk (*) to each insertion and an obelos (†) to each deletion, and suffixing a metobolos (+) to each of both,—a scheme that could be carried out only very imperfectly.

Chaos.—The example and authority of Origen stimulated endless attempts at improving the Septuagint, all of which ended in making confusion worse confounded. Half a century after his death (254) three main types of text appeared and established themselves on the eastern coast of the Mediterranean: as named in order by Jerome (Preface to Chron.), that of Hesychius in Egypt, of Lucian in Asia Minor from Constantinople to Antioch, of Ephorus and Pamphilus in Palestine, this latter being really Origen's fifth column; and the most, but not all, of the manuscripts still fall under these three types.

Targums.—Still another, though far inferior, index to the old Hebrew text, is found in the Targums, or Aramaic paraphrases of the Old Testament Scriptures. The two most important are those of Onkelos* and (Pseudo-) Jonathan, the latter called Palestinian. But the former is by far the more valuable, because its fidelity to the Hebrew, where a pseudo-Jonathan† has adorned his scroll with all manner of more or less vivid pictorial additions and elucidations. Thus he assures us, "the Lord made the firmament, poising it with his three fingers," and to the serpent is said, "thy skin shalt cast off once every seven years"; in this way the text is expanded by nearly one-half, a fact that is interesting as showing a manner of literary growth. The Targums attest the Hebrew text as it was expanded to the people of the 1st century B.C. in our era, and in parts perhaps two centuries earlier.‡

Samaritan.—Still further, the Samaritan Pentateuch, i.e., the Hebrew text in Samaritan characters, as current among Samaritans, is an important witness to the text of the Law. First brought from Damascus to Europe in 1616 by Pietro della Valle, it has long been a bone of bitter but indecisive contention. At many points diverging from the MT, it agrees with the Septuagint in many, but critics still debate whether it represents a truly different tradition or only a faulty retranslation from the Greek. Its witness is by no means yet proved negligible, but rather gains steadily in consideration.

* This name is most probably only a disguise or corruption of Aquila, the result of a confusion of two very different works of translation.
† A mistaken form for Yerushalmi. The Targum of the tribe (Shethar) was used (a sequel of Hillel) of the pious only and departs widely from the MT and the interpretation of the scribes.
‡ It is surmised (by Terpje) that of 278 quotations of the Old Testament in the New Testament, 19 agree with MT only, 37 with LXX only, 53 both, 175 with neither, 3 out of 30 Testament: whence Brown, Neumayer, Toy, and others infer that the New Testament never quotes from the Hebrew text but always from some Targum.

Progress.—Armed with all these and many other helps, and embarrassed by so many mentioned and unmentioned difficulties, the textual critic strives with the question, What was the earliest written form of the Hebrew Bible? He is very far yet from being able to give an entirely satisfactory answer; at the same time it cannot be doubted that he has made memorable advances along a path where he will hardly have need to retrace his steps. Knot after knot has been untangled, obscurity after obscurity cleared up, and a broad light diffused over the sacred page. True, the solution of one problem is often found to open up a still more profound problem, and doubtless many surprises are yet in store for the student; but enough has been securely fixed to make the need for a new version of the Old Testament as imperative now as it was before the revision of 1885. To convince oneself, it should be enough to compare the successive editions of the noble work of Kautzsch and his co-workers, Die Heilige Schrift des Alten Testaments, first issued in 1890, then in 1894, of which—so rapid was the encroachment of new knowledge in this ancient demesne—it was found necessary in 1909-10 to issue a third völlig neugearbeitete* edition.

Conjecture.—At the very best, however, when all the documentary aids have been explored to the utmost, there will still be a considerable residuum of dissatisfaction. Often enough the critic must feel that the text before him, in none of its attested forms, can be the original, that some primitive error lies still farther back, disturbing or hiding the sense first intended. His plight is that of the physician who divines some deep organic malformation or perversion, which nothing but the knife can relieve. In such a case the textual critic is driven in last resort to conjectural emendation, "not only a right but a duty of the exegete" (Dillmann, "Bibeltext," in P. R. E.). His own spirit thoroughly saturated with his author's modes of thought and expression, he must divine what the latter would have said in the context, under the assumed conditions of language and feeling. Of course, conjectures will almost surely go astray—there is only one way to be right, many ways to be wrong. However, there will be a thousand of the critic's peers, all eager to detect and expose any error he may commit. Hence, his mistakes, though many, will be harmless, while his guesses, though few, that command acceptance, will be so many points of vantage gained in the slow campaign of science. Conjectural emendation must then be reconciled to frequent failure and rare success, but the latter may be like the lucky number in a lottery, of priceless value.

Text-emenders.—Such textual reconstructions have been tried by Bickell and Duhm and others under guidance of metrical considerations, and by the pioneer Cheyne in the interest of his North-Arabian theory (adopted from Winckler), as the majority believe, to an excessive extent. To what lengths a sober editor may find himself led to go may be seen in Karl Budde's booklet, "Die schönsten Psalmen.

* Even the book of Jubilees (or Little Genesis) of the 1st century B.C. enables R. H. Charles to correct the MT of Genesis in 25 places.
the, and the nature and extent of this revision of 51 short Psalms Budde has set forth in the Zeitschrift für die alttestamentliche Wissenschaft (pp. 175-95, November 1915). Plainly we are far from having attained a satisfactory (original) text of the Hebrew Scriptures, but this fact weighs comparatively little against the literary worth, the historic value and the religious significance of these writings.

Illustrations.—A striking example of the false vocalization of the consonantal text is the following: In Jer. xvii, 9, occurs the familiar pronouncement, "The heart is deceitful above all things and desperately wicked; who can know it?" The word rendered "desperately wicked" is in consonants - n - s h, vocalized by the Masorites, a-n-u-s-h; but the Septuagint evidently vocalized it e-n-o-s-h (man) and accordingly translated thus: Deep is the heart beyond all things, and is man, and who shall know him? Strange as it may sound, it was challenged by the Gnostics to prove the humanity of Jesus, he appealed (IV, 55) to this passage. Here are those (prophets) who say, He is a man, and who shall know him? [Homo est, et quis cognoscat eum?] Again in Hos. vii, 6, we read: "Their baker sleepteth all the night; in the morning it burneth as a flaming fire." Here the letters 'p-h-m have been pointed to read 'ophelhem, but on reading 'apphem (with Targum and Syriac) we obtain the couplet:

All the night smoulders their anger,
Morning's burneth like flame of fire.

The change of "anger" into "baker" (in Hebrew) is like turning "ripple" into "riffle" in English. Once more, the consonant-group m-z-r-y-m, as vocalized in the MT, is pronounced Mizraim and translated Egypt, the apparent dual ending being referred incorrectly to Upper and Lower Egypt. In Assyria on the monuments it appears often, in various forms, as M. Mr., Muzri, Mizur, Muzir, Muzur, with many cognates, and means apparently frontier, frontier. As early as 1834, Dr. C. T. Beke deduced from Exodus that Mizraim was not always Egypt, but like so many Anglo-Saxon seeds of thought, this fell among thorns and was choked, though noted by Ewald. In 1874, Schrader renewed the observation, but not till about 1890, in a series of memoirs, did Winckler make clear from the inscriptions the existence of both a North-Syrian and a North-Arabian Mizri, which required the frequent change of the Mesoretic vocalization from Mizraim to Mizriim, and draws along with it a series of revisions both of the Hebrew text and of our whole conception of Israel's history. In particular, Winckler, followed by Cheyne, would in this confusion of the two Mizris the single and simple origin of the legend of Israel's sojourn on the banks of the Nile. Still further, to understand what Cheyne's general text-revision ("Critica Biblica") may accomplish, consider, not indeed the sense of a few words in the Authorized Version, but the much improved American Standard Version of Is. vi, 3. "And if there be yet a tenth in it, it also shall in turn be eaten up; as a terebinth, and as an oak, whose stock remaineth when they are felled; so the holy seed is the stock thereof." But the amended text yields this quatrain:

And should there yet be a remnant therein,
It shall again be destroyed.
For consumption shall be on its plants,
And failure of fruit on its sprouts.

A few among countless such examples may show at once the importance, the difficulty and the necessity of a reconstruction of the Hebrew text.

How stands the case with the New Testament? One might suppose its problem would be less complex, less difficult to grapple and master, on account of the abundant material of evidence; but it yields no whet to the other. The so-called critical apparatus is indeed so enormous in extent as to be hard even to name for ready reference. It consists wholly of three kinds of manuscripts: (1) The Greek text itself; (2) translations into various other languages; (3) quotations in a multitude of authors. Of these the first might appear to be prepotent, but such is by no means always the case. The manuscripts, very numerous, are rarely of the whole New Testament (only about 167), more often of only some sections thereof, most frequently of the Gospels (1,277), then of Acts and Pauline Epistles (32), then of Acts and Catholic Epistles (25). Many are only small fragments, scattered through the centuries (as well as the libraries) from the 4th to the 17th, and a few pieces of papyrus, each containing but a few verses (over 40 in all), may date from the 3rd century. In form they are of two grand types: uncials, up to the 9th century, and minuscules from the 10th century on. In general the material is parchment or vellum up to the 13th century and after the 14th paper. Of course the authority of the eldest is in general by far the weightiest, but not necessarily decisive.

Notation.—The system of naming the manuscripts, introduced by John Jacob Wetstein (1693-1754), designates the uncials by capital letters (Latin, Greek, Hebrew), the minuscules by Arabic numbers; it has been most fully developed by F. H. A. Scrivener (1813-91) and by Tischendorf's successor, C. R. Gregory (1846-1917), whose notation supplants Scrivener's. But as new discoveries multiply the manuscripts, the letters become insufficient, in number and at best such designations are purely formal and tell nothing at all about the manuscripts themselves. Hence Hermann von Soden has proposed (1902) a wholly new system of co-ordinates sharply defining the manuscript itself. He makes the two divisions, according to the contents of the manuscript, denoted by δ (for 'diatheca, Testament), ε (for evanghelion, Gospel) and ά (for apostolos, Acts—Epistles), the presence or absence of the Apocalypse not affecting the notation. The second co-ordinate is a number naming the century, the numbers 1 to 49 being assigned to the first nine centuries, those from 50 to 99 to the 10th, the higher numbers to the later centuries. It is that the centuries after the 10th (as 4 the 14th) and so on. Owing to further distinctions in centuries where the number of manuscripts is very large, especially in the 12th and 13th, the denotation becomes elaborate and somewhat
cumbrous, but it tells the utmost possible by a few signs and is extensible to any number of manuscripts likely to be found. However, for the most important and familiar codices, the current Wetstein-Gregory notation remains preferable. B and D are more manageable than δ 1 and δ 5, and ε than ε 1001.

Text.—Criticism of the New Testament text, the attempt to restore the supposed original, after valuable preliminaries by Mill (1707), in Bengel’s Proposal (1734), in Bengel’s introduction (1734), in Wetstein’s huge edition (1751-52), a priceless repertory of classical and other citations, and by J. S. Semler (1725-91), began in grave earnest with the labors of Griesbach (1745-1812), which came to light in a three-volume critical edition of the New Testament (1774-75). It was he that first divided the manuscripts into Constantinopolitan (Bengel’s ‘Asiatic’), Western, and Alexandrian, and that introduced the principle of dating the texts by their evidence. Naturally Wescott and Hort regard him with peculiar reverence, as the chief of their forerunners, though his New Testament text was inferior. It was not till 1831 that a truly critical text was published by the brilliant Lachmann (1793-1851), who reverted to Bentley’s principle of the agreement of Greek and Latin texts as a test of antiquity (in a reading). Since then such attempts to restore the presumed primitive have multiplied. Samuel Fridericus Tregelles (1813-75), the distinguished historian of the New Testament, in his 13-volume edition, method, but with added material, issued his stately edition (1857-72), and the unwearied zeal of Constantin von Tischendorf (1815-74) gave forth as 8th edition (1869-72) two volumes of text with the most extensive critical commentary up to that time known. Both Tregelles and Tischendorf, smitten by paralyses, were unable to publish their Prolegomena, but the pious task was accomplished for the latter in 1894 by his successor, C. R. Gregory, and by E. M. Abbot.

Neutral.—However, as early as 1853, B. F. Wescott (1825-1901) and F. J. A. Hort (1828-92), discontented with the state of the New Testament text, began the life-labor that culminated (1881) in their two-volume work, The New Testament in the original Greek, a signal achievement of British scholarship, making a distinct advance beyond all predecessors. They exalt the genealogical principle of Griesbach, to whose three grand classes of manuscripts, called by them Syrian, Western, Alexandrian, they add an important fourth, the “Neutral,” especially by the Vatican and Sinaitic Uncials, B* and ε*.

Of 4th century, numbered 1200 Gr. in Vat., each page of three columns and 42 lines each, the whole Bible except Par- torals, Philemon, Revelation, Heb. 9th—13th (lost), written by the monks of St. Cyril (Cies., consecrated 22 Dec. 1481) and catalogued in Vat. in 1481 (not in 1475), phototyped in 1889-90, 1905. — Its page is thin, of four columns 48 lines each, of antelope (or ass) skin, each of two leaves four pages, in all 346 leaves, 13 by 13 inches, Old Testament and New Testament (134 leaves) with Ep. of Barnabas and part of Shepherd of Hermas, c. 0996 (Oxford, 1906), Tischendorf borrowed the treasure from the monks of Sinai, as the Israelites borrowed from the Egyptians: “I received them from them, under the form of a loan, the Sinaitic Bible to carry to Saint Petersburg, and thereto have it copied as accurately as possible!” In 1869 the Tsar presented the monks with decorations and $3,000 in cash.

(he latter, discovered in Saint Catherine’s Monastery, Mount Sinai, by Tischendorf—43 leaves in 1843, now in Leipzig, and the rest in 1859, now in Petrowgrad,—was published in 1862 at the cost of the Tsar). The manuscripts if re-evaluated and regarded as having undergone manifold corruption, from various sources according to various tendencies, from all of which the “Neutral” (they think) have remained relatively free. In 1720, with much confidence they made a brave attempt to present exactly the original words of the New Testament, holding that its books in extant documents assuredly speak to us in every important respect in language identical with that in which they spoke to those for whom they were originally written.

Errors.—That this confidence was ill-grounded may appear from three among many facts: They rejected the Pauline Codex F as an independent witness, declaring it was at least, in its Greek text 1000 years of G (to also did Zimmer, in 1887, for much better reasons); but this judgment (in which they were followed by English and even by Continental critics generally) was entirely wrong, as Gregory explicitly declares: “Smith aus Ne- orleans weist nach, dass F nicht aus G sein kann. sondern dass F und G a ein gemeinsames, bekanntes Handschrift abgeschrieben wurden” (Am. Jour, Theology, Bd. 7, 1903, S. 452-85, 656-88, Text Kritik d. Neuen Testaments, iii, 1941). Again, they raise no doubt about the text of Boe on, regarding the agreement of all the chief manuscripts, versions and citations as decisive; but both Harnack and Zahn now admit the writer’s earlier proof (1901) that the word “Rome” is interpolated in the elder text: “To all those that are in love of God.” Neither had they any doubt about the text of Matt. xi, 27, yet both Harnack and Norden now recognize that the elder text was επιγύμα (knew), and not επιγνωσκει (knows), as all the manuscripts and editors give. It seems, then, that the text problem is much more difficult than ever Wescott and Hort conceived.

Recensions.—More recently (1902-13) a much more ambitious attempt at text-restoration has been carried out by H. von Soden, with collaborators, in the four-volume Die Schriften des Neuen Testaments in ihrer ältesten erreichbaren Textgestalt, with the supplementation of 165 manuscripts of the New Testament as a whole, 1,240 of the Gospels only, 244 of the Apostolos only, besides 250 Commentaries with texts, 170 on the Gospels, 20 on the Apostolos, 40 on the Apocalypse. The standpoint of von Soden in this colossal work is worth notice; in large measure it is that of Hug (1765-1846), the acute, if eccentric, Swiss Catholic, developed in his Introduction (1888), which Westcott and Hort, shrinking from the word “Recension,” have termed a “discrepancy,” and Hug regarded as “fanciful.” Footing on two statements of Jerome, one already noted, the other in his Preface to the Gospels: “I disregard those Codices fathered by Lucian and Hesychius, which the perverse contentiousness of a few Bishops, as Hesychius, has injected into the original Western text (köine ekdosis, vulgate edition), prevailing till the last half of the 3rd century, when it underwent three independent revisions; by Hesychius (otherwise unknown, the x of
text criticism) in Alexandria, by Lucian, the martyr of Antioch (312), and by Origen in Cæsarea. Similarly von Soden assumes that about the year 300 the increasing confusion of text-tradition urged to the revision and authoritative edition of the text as one of its three great Episcopal Sees.\(^9\) Alexandria, Cæsarea, Antioch, and accordingly he classifies his witnesses under the three text-forms, Η, Ι, Κ (for koine). Of these H (Hesychian), prevalent only in Egypt, is represented by the August "Neutrals" Η of δ 1 and μ or δ 2; also by the Codex Ephraemi (C or 3), in Paris, a palimpsest deciphered by Tischendorf (1842), by δ 48, and (for Luke and John) by the recent find δ 014 (in Detroit); it is likewise attested by about 40 papyrus fragments of the 4th, 5th and 6th centuries, by Egyptian translations and by quotations of Egyptian Fathers, as Athanasius, Cyril of Alexandria, Didymus. Such are the decisive authorities for a critic like Hort, such "The weight dark Egypt on his spirit laid."

I and K.—Next to H stands I, the text of Pamphilus (presbyter at Cæsarea, pupil of Pierius,—Origen's pupil,—teacher of Eusebius, scribe of Origen's works, a martyr in 331?),—a text not nearly so distinctly attested as H, but largely present in the quotations of Origen. Much further off, by itself, stands the K-text,—of Lucian, whose "authority in wide circles," says Harnack, "about the year 300 displaced even that of Origen."—issued from Antioch, a primitive focus of Christianity, and departing both widely and oft from H as well as I. The main well-spring of these deviations (in the Gospels) von Soden would find in the Diatessaron of Tatian, for Acts he refers them directly to Latin and Syriac translations, indirectly to a second edition of that work, which won great acceptance. For the Apostolos, Marcion's edition is suggested as the culprit. In general the attitude of Lucian seems to von Soden to have been freer than that of Origen, to which, indeed, it was consciously opposed.

The Three.—No manuscript has reached us antedating these recensions, some one of which is attested by every Codex, but throughout Christianity the three comprise Η at least of all, but I and K sharply for centuries, with mutual concessions that fell mainly to the good of K. Not one of the 36 I-witnesses to the Gospels, nor of the 14 to the Apostolos, approaches in singleness and purity of its text the first attestation of the H-uncials, but at best only those of those two ranks, but C (43) and δ 48. A chief Ms. for the Gospels is the famous Codex of Beza (D or δ 5) in Cambridge, for Acts E (or a 1001), and for Mark δ 014. These manuscripts of the I-type begin, perhaps in the 4th, multiplied in the 5th and following centuries, but more and more the K-readings intruded till they finally triumphed. In the Apostolos the two main types may be distinguished. Both show close contact with Syriac versions, involving material text-variants that Origen would explain (as in case of Acts) by supposing, analogously, very early Eastern editions of the Epistles in which "the text was treated very freely" (mit sehr freier Textbelandlung). After the 5th century these texts (of I and K) vanish, and K is left sole-reigning in the manuscripts.

For the Gospels the oldest K-text is that of Matthew in δ 014 of the 5th or 6th century, next is δ 051 (in Tiflis) of the 7th or 8th. But the oldest indirect witness to this text is the Common (Pistula) Syriac translation made by Rabbula (71), bishop of Edessa 411-443, and representing the Greek text at Antioch.

Not final.—This scheme of von Soden's is noteworthy in dismissing the "neutral text" and recognizing that the venerable twain, B and W, are revisions like all the rest, as indeed is clearly shown by Adelbert's dissection of the two sons (Matt. xxi, 28-31). But it is far from true that the text-problem has been solved; von Soden's own conception of the earlier history of the text seems naive, romantic and apologetic to a degree, and he is indeed contradicted by himself in immediately sequent sentences, thus: "As against the Gnostic redactions as well as Marcion's version of Paul's Epistles, the situation demanded that they lay emphasis now on the authentic verbal form of those Scriptures. Nevertheless, they were still so free in attitude toward verbal form that Tatian between 160 and 170 could offer in his Diatessaron a compound of the four Gospels in one and obtain success for it in the widest circles." Plainly, then, the "demand," however just it may seem to von Soden, did not seem so to the Christians, neither was it by any means met. Moreover, it is to be noted that von Soden's explanation of the creeping-in of Tatian-variants and others is at most only probable, in no case certain. Even when it seems quite satisfactory it is not therefore necessary or proved: such (does not must) have been the case. Now, when there are so many distinct and often independent cases, even though the probability in any one be very high, this does not make the probability high for the whole body of cases; it may still be very low, even though one may be unable to suggest any other solution nearly so likely in any individual case. We must beware, then, of ascribing great likelihood to such collective explanations as von Soden's. Often the results may have come about in totally different ways.

Originals.—In title if not in fact, it is surely modest enough: 'The Scriptures of the New Testament in their oldest attainable text-form,' which is by no means necessarily the original form. Indeed, not only does any such original form seem almost if not quite as unattainable as in case of the Old Testament, but we may seriously question whether indeed there was ever any such, in the ordinary sense of the phrase. By original form of a modern work, as it first leaves the press, of an ancient one, as it was first written or dictated by the author himself, we indicate a more or less complete and rounded unit, subject only to minor modifications. In case of far-reaching changes, by addition, subtraction or otherwise, we should say, "This is practically a new work," and we should discriminate, as between the A and B editions of Kant's "Critica," whether a new or original. Moreover, we associate such an original with a certain author,—or if with collaborators, ascribing, generally with fair exactness, responsibility to each. However, on coming to the New Testament, in particular the central mass, the Gospels, we find all such conclusions reversed. Not to speak of leaving the press,
there is no notion of first writing or dictation of the Gospels as a rounded whole complete but for minor corrections. To be sure, some person or persons must have presided at each transformation of transformations, but they who shaped it, as it now is, most likely supplied but little material. It is indeed an accepted principle of Gospel study that the Synoptics, at least in their present form, are the result of century-long processes of continual growth, directed by continual pruning, of weaving, unweaving and weaving again. At the very opening, we recognize that the first two chapters of Matthew and Luke, the so-called pre-histories, form no part of the originals, but are the prefix of a later hand. As we penetrate deeper and deeper into the intimate structure of the Gospel, the seeming unity resolves into multiplicity, the same chapter, paragraph, verse even showing layers of different ages and authors, of varying and even inconsistent tendencies. Inevitably the critic becomes anatomist and is forced to distinguish the components by finer and finer division. It is not any single output of any single mind or group of minds that lies before him, but the gradual unfolding of a common consciousness, the stratified deposit of more than 100 (or even 200) years of the intensest religious life. The history of a Gospel is not unlike that of a saying or a "winged word." On tracing it down we may find it now has many forms, perhaps in many tongues, that it goes back for generations perchance, and may be lost in the mists of antiquity.

Illustration.—As a special case, take the most famous of Logia, the one already mentioned (Matt. xi, 25-30), and hear the latest enlightened and enlightening judgment, that of Ed. Norden (elaborating earlier suggestions) in Agnostos Theos (1913, pp. 307-08). The author of the source Q [the Oracles, commonly regarded as an oldest layer of Gospel tradition] was acquainted with a mystic-theosophic tract, which already had a long past behind it and which in any case had taken a fixed literary form in oriental languages (Greek included, which, however, is secondary). Not a few religious communities had made the Q-tradition not only through literature but also by oral propaganda it had been spread abroad; meantime the ground-form had in each case been adapted to the special interests involved. Hence it followed of itself that it drew Christianity into its circles, as the latter was just entering into the rivalry of religions. The author of Q had accordingly taken out of it, over into his own book of doctrine and edification for the Christian community, motifs, preserving the exact connection of thought and words, a path along which the author of the Fourth Gospel has advanced consistently further. But to the old wine they have given an especial spice. The Gnosis, to propagating which according to the conception of the next following generations — the Christian Soter [Saviour] was devoted not only of a kind but a kind in whose service both before and after him, the Soters of the other cult-communities had been engaged. In their theosophic systems the wisdom of this world was by no means banned; without knowledge no one could follow their complicated trains of thought. On the contrary, the struggle of the former against the learning of the scribes was still fresh in memory when the first sketches were begun. By combining individual traits drawn from the life-struggle of Jesus against the conceit of wisdom, with the traditional motifs of the Jewish-Gnostic propaganda, the author of the Logion, like the author of the Fourth Gospel gave the Logion a polemical point directed against such Gnostic treatises. The Christian Soter, from whom the "babes" ought to learn that he is meek and lowly of heart, directs his appeal to the world: "Be out of love and compassion he will give peace for the soul. Here a new sun flashes through the cold darkness of the pretentious Magi, theologists and prophets. In the strict sense of the word, not even this new element was an autophonia [actual utterance of Jesus]: it is far too deeply interwoven with motifs, borrowed from literary tradition, for that. But that the Ideal is true in the higher sense, and as such is also imperishable, we know from Plato."

A Gnostic Hymn.—This literal translation makes no pretense to lighten the laboring speech of the illustrous linguist, nor does his view seem correct at one vital point; he throws out sops to Cerberus, not hints that the "babes," as elsewhere in the New Testament, are Gentile converts to monotheism; but his general conception of the oracle as primarily a theosophic meditation of pre-Christian Gnostics, transformed in passing from community to community and laid at last in noble music on the lips of Jesus, is certainly correct and in full accord with the two years earlier statements of Ecc Deo already cited. Now we may indeed inquire with von Soden after the "oldest attainable text-form" of these verses, but that will certainly not be "the original text," a notion that vanishes along with that of the oral author. Even the New Testament were all properly printed in verse, it would contribute more to the popular understanding of these writings than many commentaries. A good beginning has been made by Professor Briggs in his Wisdom of Jesus and some striking examples are given in his 'Study of Holy Scripture'; as also by Dr. Moffatt in his 'New Translation' (1913).

Latest Phase.—Furthermore, with the disappearance of the mirage of neutrality in certain manuscripts, the centre of gravity of text-authority seems to have suffered displacement; it lies no longer in the testimony of the codices, but rather in the earliest translations and in the quotations by the Fathers. Of these there seem to be three types: Old Syrian. Old Latin, Clementine Tatian's Diatessaron. Justin's is a little different from this. In his Greek text in Rome in the first half of the 2d century. For Buchanan's views see Biblical Archology — New Testament.

Bibliography.—The literature of the Bible is immeasurable; 2,000 quarto volumes issued in Paris, in the second third of the last cen-
tury, from the press of Migene alone; fortunately, it is also in great part dispensable; it perishes by supercession; what is valuable in the work or possession of one century being constantly absorbed, assimilated and reproduced in the next. A few of the most noted books have already been named or even appear in the foregoing text; a few others may now be added.

The writings of the Fathers are preserved in 476 quarto volumes in Migene's Patrologiae and in the later more critical collections not yet complete. From time to time copious selections have been made under such names as 'Catena' (e.g., Cramer's, 1841), 'Spicilegium' (J. A. Grabius, 1700) and the like. Such a huge anthology is found in the 32-volume Bible-work of Lemastre, hereafter mentioned under various. Like the works of Augustine, those of his great continuator, in the Reformation, Jehan Calvin, especially the masterly 'Institutes of the Christian Religion' (Latin, 1536; greatly enlarged in French, 1540), stand conspicuous among such compilations and especially the 'Locs communes' (1521) of Melanchthon, scribe of the Reformation. On the Catholic side, surpassing even Bellarmine's, the works of Bossuet (1627-1704), as the 'Discours sur l'histoire universelle', and especially the 'Histoire des variations, etc.' (1698), outshine all others. The 'Great Commentary' of the Flemish Jesuit, Cornelius à Lapide (van den Steen, 1567-1637), excels in extent (omitting only Psalms and Job) and thoroughness (reveling in the 'fourfold sense'), and has been repeatedly edited and translated. Nathaniel Lardner's 'The Credibility of the Gospel History, etc.' (1727, 1733-55), a pioneer work of exhaustive patience and painstaking, was the chef d'œuvre of its day. J. J. Wetstein's 'Novum Testamentum Graecum' (1751-52) deserves renewed mention as a storehouse of classical parallels. Joseph Butler's famous 'Analogy' (1728) displayed extraordinary power of sustained thought, but the arch of argument from premises to conclusion was long and fine spun. William Paley's more common-sense 'Natural Theology, or Evidence, etc.' (1802), as well as his earlier 'Horae Pauline', appealed powerfully to the Anglican mind, but proved insusceptible to the increasing demands of thought and knowledge.

About the same time (1818) T. H. Horne occupied the field with his long popular, but now superseded, 'Introduction to the Critical Study, etc.' Later works are generally less ambitious and comprehensive, content to occupy some limited sector in the long line of discussion, and in the main escape brief characterization.

ments' (1894), 'Early History of the Hebrews' (1897), 'The Archeology of Cuneiform Inscriptions' (1907); Gressmann, H., 'Altorientalische Texte und Bilder zum Alten Testament' (1909); Jastrow, M., Jr., 'Die Religion Babylonien und Assyriens' (1910); Kittel, B., 'Die Ausgrabungen und das Alte Testament' (1910); Petrie, W. M. F., 'Egypt and Israel' (1910), and many others; Breasted, J. H., 'Ancient Records of Egypt' (1905), and other works of R. W. P. Cuneiform Parallels to the Old Testament' (1912); Barton, G. A., 'Archaeology and the Bible' (1916); Cobern, C. M., 'Recent Explorations in Palestine' (1915), 'The New Archæological Discoveries' (1917); Deissmann, G. A., 'Bibelausgaben' (1895; 1897); 'Licht vom Osten' (1898; Eng. trans.); 'Paulus' (1910); Montgomery, J. A., 'The Samaritans' (1907); Goodspeed, E. J., 'History of the Babylonians and Assyrians' (1917).

Among more general works should be named Lightfoot, J., 'Hermes Hetaireic et Talmudice' (1684); Rawlinson, H. C., 'The Cuneiform Inscriptions of Western Asia' (1861–84); Schürer, E., 'Geschichte des jüdischen Volkes, etc.' (1890; Eng. trans.); Singer, B., 'Geschichte des Volkes Israel' (1881–88); Maspero, G., 'Histoire ancienne des peuples de l'Orient' (1895–); Meyer, E., 'Die Entstehung des Judentums' (1896); Weizäcker, K., 'Das apostolische Zeitalter, etc.' (1897); A., 'Die Entstehung der altkatholischen Kirche' (1890); 'Die Christliche Lehre von der Rechtfertigung und Versöhnung' (1870–74); Lipsius, R. A., 'Acta Apostolorum Apocrypha' (1891), and 'Die apokryphen Apostelgeschichten und Apostellegenden' (1883–90). On the Mythical Theory of Christian Origins, connected but not to be confounded with the views set forth in 'Ecce Deus' (1911) and 'Der vorschristliche Jesus' (1906), consult Robertson, J. M., 'The Historical Jesus' (1916), and earlier works; Drews, A., 'Die Christusmythe' (1909), 'Die Zeugnisse, etc.' (1911), both also in English; contra, Case, S. J., 'The Historicity of Jesus' (1912); Conybeare, F. C., 'The Historical Christ' (1914); Thorndike, T. J., 'The Mythical Interpretation of the Gospels'; also elaborate reviews by Smith in the 'Monist'; also Saldiger, G. T., 'The Origin and Meaning of Christianity' (1916); Lohfink, S., 'Der urchristliche Erdkreis' (1917). Among the works of learned societies, may be named: 'The American Journal of Theology' (1887–); Bibliotheca Sacra (1844–); Hebraica (1884–95), continued as American Journal of Semitic Languages and Literatures (1895–); Harvard Theological Review (1908–); Princeton Theological Review (1909–); Journal of Theological Studies; Journal of Jewish Quarterly Review; Journal of Hebrew Studies; Modern Language Review; Review of Theology and Philosophy (1903–); Revue biblique; Revue des Etudes juives; Revue archéologique; Revue Sémittique; Studien und Kritiken; Hittig's Zeitschrift für wissenschaftliche Theologie (1858–); Zeitschrift für die duserneibische Wissenschaft (1881–); Zeitschrift für die neuestamentliche Wissenschaft, etc. (1900–); Archiv für Religionswissenschaft (1897–); Theologische Literaturzeitung; Theologischer Tijdschrift (1867–); Didaskaleion (1912–); invalidable the Theologischer Jahresbericht (1881–). Among works of Reference: William Smith's 'Dictionary of the Bible' (1800–65), superseded by Hasting's 'Dictionary of the Bible' (1898 et seq.); Vigouroux, F., 'Dictionnaire de la Bible' (1895 et seq.); Migne, J. J., 'Encyclopédie Théologique' (1847). The highest critical level is attained by Cheyne and Black's 'Encyclopedia Biblica' (1899–1903); invaluable the 'Jewish Encyclopedia' (1901–06), a treasure-house of knowledge elsewhere almost inaccessible. Valuable also the 'Catholic Encyclopedia' (1907–12). The great French and German encyclopaedias have enlisted the highest abilities of the masters of criticism, as the Saack-Herzog 'Real-Encyclopädie' (Eng. New York 1908–11). If from the foregoing it should appear that Biblical criticism, especially the 'Introduction,' has been in large measure a German discipline, the reason is to be sought in the Reformation and the more tolerant conditions it engendered, as compared with the firm and often harsh repression that has uniformly met the struggling religious spirit both in the East and in the West.

WILLIAM BENJAMIN SMITH, Emeritus Professor of Philosophy, Tulane University.

BIBLE. History of Old Testament Interpretation. Jewish.—Of all peoples the Jewish is the People of Exegesis. For over 1,000 years it poured out all its literary energy in the interpretation of its Bible. When Hebrew philology was born, the one scientific birth of Medieval Judaism, it was at once diverted to swell the stream of biblical exposition; when the philosophy of religion was born, the tale was repeated, and even the mysticism of the Qabbala met a similar fate. All the rivers of the Hebrew mind have run into the sea of hermeneutics.

The key-word of this devotion is darâsh, "to seek," as in Ezra vii, 10, "to seek the Law of Yahveh"—whence midrash (inquiry), which for generations was only oral. As the national science, it was developed by the Pharisees in two main directions, Miqra' (Holy Writ as read) and Mishnah (repetition, tradition, instruction). This latter branched into Midrashoth proper, expositions of Scriptures, and (as first shoot therefrom) the legal Halakah (customs), statutes derived by exegesis from the Law. Jewish thought branches back traced back to the Law, and the moral Hagadoth (reports), expositions and illustrations connected not with the Law but with materials
derived from other scriptures. This deduction of the Halakha from the Law was also called Talmudic Learning. The Tosefta (strictly Tosefata, increments) supplements the Mishnah. The earliest known commentary on any text is the Midrashim to four books of the Pentateuch: Mekita (rule) on Exodus, Sifra on Leviticus, Sifre (Writings) on Numbers and Deuteronomy. The sages of the Mishnah and the Baraita ("outside" tradition), called *Tannaim* ("teachers"), flourished from 10 to 220 A.D.

With the advent of the *Amoraim* ("speakers," 219-500) came a change: The Mishnah itself was interpreted, and the whole body of this interpretation (in the second degree) was consolidated later and edited in the two Talmuds, Babylonian (Babli) and Palestinian (Yerushalmi) and alongside of them the Targum literature was extended to the whole Hebrew Bible. From Hillel (30 B.C.) on, the names of the expositors begin to appear. Hillel himself formulated seven Rules for halakic exegesis; his pupil Johanan ben Zakkai followed with a school, and between the two destructions of Jerusalem (70 and 135 A.D. by Titus and Hadrian), a period of symbolism dominant in Christian ranks. Two opposing leaders were the liberal Ishmael ben Eliezar, who expanded the seven rules to 13, a number afterward raised by Eliezer to 32 (for Haggadah), and laid down the doctrine of the human form of expression in the Bible, and the rigorist Aqiba ben Joseph, who held every minuita of the sacred text to be significant, and successfully built up tradition as a hedge about the Law. This first period of Jewish exegesis ends with the final redaction of the Talmud (ca. 500).

Meantime among the *Minim* (sectaries) and even occasionally among the orthodox there had been considerable infiltration of foreign influence, which showed itself in curious speculations and esoteric doctrine (Ma'aseh, "work") about Creation (Bre'shit) in Gen. i, and the chariot (Merhabah) in Ezek. i. Outside rabbinic ranks, Josippon wrote practically a commentary on the Bible in his *Archaeology,* and Philo tried to show by thorough allegorizing that Greek philosophy had been anticipated by Moses. This exegesis of the Tannaim and Amoraim contained much acute and even just exposition—the depths of the Talmud are indeed thick-strewn with pearls, and would that well-equipped divers might bring more of them up!—but still more downright imposition of meaning on the text; as Ishmael b. Eliezar finely said in rejecting an exegesis of Eliezer b. Hycranus: "In fact, you say to Scripture, Be silent while I expound." (Sifra on Lev. xiii, 49).

The Babylonian Amoraim distinguished between *Peshat* (out-stretched, manifest, primary sense) and *Derash* (Midrash-exposition), declaring but not obeying the maxim that the latter could not annul the former; in the practice of the centuries following the final redaction of the Talmud, the Peshat vanished, only Derash was left through the Masorah ("letter") still hedged the Law after a fashion.

In the 8th century the Qara'ites (Lecturists, "Sons of Scripture," Bene Miqra'), founded by Anan, disclaiming tradition, reacted from the Midrash back to the Bible itself (reminding one of Luther). The illustrious Saadia* (892-942 A.D.), prince of all his order, in turn reacted with more powerful stress and stimulated them to worthier efforts, some of which made real advances. Benjamin Naha-wendi revived Philonism; Chivi of Balkh (885 A.D.) avowed rationalism and gave 200 reasons, historical and legal, against the authenticity of the Pentateuch. For his perversity he is nick-named Al-Kalbi (the Cynic) instead of Al-Balki (used only once). Aaron b. Elijah's "Crown of the Law" (*Keter Torah*) in the 14th century was the swan-song of Qara'ism in exegesis, though Isaac ben Abraham Troki (1533-94) produced in his "Fortress of Faith" (*Chazzag Emunah*)—translated and published repeatedly in several languages, as late as 1873 in both German and Hebrew—a master-piece of po- lemical, which, according to the word of Voltaire, left the anti-Christian critic nothing new to discover.

Under Saadia, Gaon* of Sura, the Peshat came once more to its own. Writing in Arabic, he not only founded Hebrew philology but strove to harmonize it with rabbinical law by which one of his disciples explained 200 passages. Moses ibn Giqatilla even dared to explain miracles rationalistically, inviting thereby the attacks of Ibn Baham, and was the first to essay a continuous historic interpretation of the Psalms and Isaiah, dating the former from the Exile and the latter part of the latter from the Second Temple—so winning the honor of frequent citation by Ibn Ezra. Such under Arabic contact was the golden age of Jewish thought in Spain, which held fast Saadia's principle that Scripture did not transcend Reason even in the loftiest flights of religious experience. To make the twain agree called for high-handed freedom with the former, the latter was inexorable, and philosophic Michael ibn Serac began to threaten Peshat. Meantime in Christendom, particularly in northern France, the exegetes (*Darsakim*) were active, and R. Solomon ben Isaac (called Rashi, 1040-1105) wrote his great common-sense exposition of the Scripture, in particular, the Law, never yet surpassed in circulation and acceptance. But the ablest work of this French School was the Pentateuch Commentary of Samuel b. Meir, who held firmly that interpretation must be unfettered by tradition. Lady, Joseph Beker Shor gave a foretaste of modern criticism in assuming a double narrative in the Pentateuch. So considerable was the accomplishment of common sense unguided by scientific philology or philosophical culture. Somewhat later (1140) the rover of learning, Abraham ibn Ezra (1092-1167), in the noon of his days "departed from his native place, in Spain, and went to Rome," spent 27 years of travel in France, Italy, England, and brought the highest scholarship then known to his Hebrew Commentary, notable for courage as well as caution, for compass even

---

*Variously spelled even by Saadya himself. The form Saadia seems most common.
† Highness, Excellency, title (first conferred by Ali on Mar Isaac) of presidents of the Jewish academies at Sura and Pumbedita in Babylonia (609-1038).
more than for depth, in general conservative yet admitting minor accretions to the Pentateuch, to which a nebulous note on Deut. i would seem to ascribe post-Mosaic authorship, and hinting a later origin for Is. xi-1xvi. In traditional exposition he sees no exposition proper, but only "suggestion," "reminder," mnemonic device. The Kimchis, Joseph and his two sons, Moses and David, the latter the chief of all, agreed with Ezra but insisted more on grammar and rationalism, besides inveighing against Christian interpretation of the Psalms. Following but far surpassing all these, Moses Maimonides (Rabbanu Moshe bar Maimon Haddayyan, of Cordova, 1135-1204), court-physician to Saladin of Egypt, mathematician, astronomer, Talmudist, the Aristotle of Jewry, and leader of all the expositor-choir, in his 'Mishneh Torah' digested and almost superseded the Talmud itself, and in his Arabic 'Guide of the Erring!' (Dalălatu 'l-Hārin, or, in Hebrew, Moreh Nebukhim) essayed the reconciliation of Moses and the Stagirite. Of course, such an attempt laid all the resources of metaphor, figures, esoterism, symbolism and the like under heavy contribution, but it abjured all mysticism, remaining rationalistic throughout. And in its modes and premises it might seem to bulk, but a theory of visions contrived to transfer much from the physical and objective without to the psychological and subjective within. Translated into Hebrew, it naturalized Aristotle in the Jewish mind and was propagated in a long succession of philosophic interpretations, some of which launched out boldly upon shoreless allegory.

Two beliefs now dominating, that there must be a deeper meaning in the Bible than the literal, and that all truth is hidden therein, gave rise (about 1268) to mystic exposition called Secret Wisdom (Chokmah Nishtarah) or Qabbala, and at the same time to the Gematria* of Eleazer ben Judah at Worms, on which the Qabbala itself is based. Bachr ben Asher commenting on the Law (1298) recognizes four Ways to Truth: Peshat, Midrash, Reason, Qabbala (*path of light*). More portentous was the simultaneous introduction into Spain by Moses de Leon of his commentary on the Pentateuch, with many digressions and additions, professing a hoary antiquity for its mysticism as having been taught by the sages of old, even by Aqiba's pupil, the wonder-working Simeon ben Yochai. It also taught four Senses of Scripture: Peshat, Remez (al- lusion), Darash and Sod (secret, mystical), —which indeed it had borrowed from such Christians as the Venerable Bede (673-735), who thought the inner sense surpassed the letter as apples do leaves (cp. Jerome, Ep. ad Gal. i, 2), and Hrabanus Maurus (776-856), Preceptor Germanicus. Hence the consonantal acrostic PaRDeS (Paradise), known since Aqiba, came into vogue as the teten of the fourfold sense,† which had already marked hermeneutic with long and broad eclipse. Herewith the night of one and a half centuries settled down on Jewish Biblical Exegesis, till the morning star of Mendelssohn arose. One lamp indeed was still lit in the dark, the learned and unwaried grammarian and lexicographer, Eliahu Levita (1468-1549) whose 'Masoret Ha-Masoret' (Venice 1538) demonstrated the human and post-talmudic birth of vowel-points, to the indignant dismay of the orthodoxy, both Jew and Gentile, who had accounted them primitive and divine. Meanwhile the hunt for many meanings went bravely on, and in Poland with especial vigor and success: in 1630 Nathan Spira discovered 250 senses for Deut. iii, 24ff, only alias! to be outvied by Eliahu b. Abraham Oettingen, who brought 365 to light.

Moses Mendelssohn (1729-86), the "Nathan" of Lessing, victor in competition with Kant (1763), by his Commentary on Ecclesiastes (1775) and still more by his translation of the Pentateuch (1783) recalled the Rabbin to reason. His co-workers, called by Wetz, (from Bitur, exposition), translated and commented (in German, at first in Hebrew letters, later in German). Similarly each nation now received its own translation, Luzzatto's Italian and Cahlen's French being especially valuable. Nevertheless, in the marvelous advance of the last century toward the comprehension of their Scriptures, the Jews have rarely been conspicuous in front. Though abounding in ability and learning, they have suffered from lack of organization in universities and academies; their attention has been in large measure absorbed in the study of post-biblical Judaism, a terrain immense and dear as fatherland to their hearts, wherein only they are at home; and the rapidly increasing complexity of modern life has burdened the Rabbinate with social activities and countless extra-scholastic cares. But when all is said it remains true perhaps that the Jewish scholar has put off his sandals, as treading on holy ground,—"he feared the gods and heroes and spake low,"—he has not quite found as yet a modus vivendi with the dissonant criticism of the last 60 years, he awaits another turn of the wheel. Witness the recent severe strictures of David Hoffmann in 'Die wichtigsten Instanzen gegen die Graf-Wellhauischen Hypothesen' (1904) and his uncompromising statement of the (orthodox) Jewish position on the whole Bible-question, in his 'Leviticus' (1905-06): "As we are firmly convinced of the divinity of the Halakoth, the words of the Tradition count for us exactly as much as the words of the Scripture* (p. 2): "Our first principle is: we believe that the whole Bible is true, holy, and of divine origin,—every word of the Torah was written down at the command of God* (p. 6); "The second principle, which must guide every Jewish exponent of the Bible, is the assumption of the integrity of the Masoretic or traditional text* (p. 7)."

Hoffmann's contradiction, dealing mainly with matters of the Law, would evade the critics by supposing frequent changes and adaptations of the Torah during the wanderings of the 40 years (it were better 40
squared).* while on the other hand Siegmund Zampel has treated the historic features in detail, and has developed while retaining its edge at various points and the Breslau editor, Rabbi A. Geiger (1810-74), has clearly shown in his 'Urschrift und Uber- setzungen der Bibel' (1857), that the growing, expanding, self-transforming religious conscience of Israel is mirrored in the like-changing text of the Bible, and that the Masoretic as well as the elder forms have shared in this steady evolution. The effect of prolonged study is also strikingly shown in the extremely erudite and broadly-viewed commentaries of Marcus M. Kalisch (1829-83) and the refugee of 1848, of which 'Exodus' (1855) is conservative, 'Genesis' (1858) liberal, 'Leviticus' (1867, 1872) radical, forestalling Wettstein in this (German) 'History of Jewish Philosophy' has brought this discipline to the aid of Judaism, seeking to supplement and correct the Higher Criticism into accord with deeper and broader view of the genesis of the idea of God under the influence of Propheticism. Plainly, then, the counter currents are as strong in Judaism as elsewhere, and there is no reason to fear that Jewish exegesis will not yet catch up and keep pace with Gentile, remembering that the vehicle of revelation is not any lifeless form of human speech but the everliving spirit of the People itself.

Gentile. — Since the Christian movement took its rise among the Jews of the Dispersion, in Galilee and Judaea, the attitude of the early disciples toward the Hebrew Scriptures can hardly have differed sensibly from that of the Jews, among whom Hellenistic died with Rabbinical methods. Very soon, if not indeed at the start, allegoric interpretation was in vogue and prevailed. Which things are an allegory, Gal. iv. 24. The Scriptures were regarded as so many sign-posts all pointing toward the consummation of ages, and all previous history was viewed as reflected in the present. These things were our examples, * that Rock was Christ* (1 Cor. x, 6, 4); *whatever was fore-written was written for our learning* (Rom. xv, 4), etc. From such premises the Scriptures were speedily interpreted throughout as prophesies in types, and out of them elaborate lives of Jesus were constructed, as in the epistles of Barnabas and Ignatius, in the writings of Justin and of still earlier and later Christians generally. From such interpretation the step was easy and natural to invention: if the event was not known to have occurred, our knowledge was defective. Clemens Alexanderinus in his 'Stratoma' (VI, 673, Syr.) defines the fourfold engraving of the sacred word, the last or gnostic form being able (like Sodh) to look through things to themselves. Origene, systematizing the 23 rules and distinguishing three senses of Scripture, corresponding to Body, Soul and Spirit, carried allegoric interpretation to most inaccessible heights. Under this or that form the typical or allegorical method (representing as an after-image in Hesychian philosophy) prevailed for centuries, though here and there discountenanced by sober judgment represented mainly by the Antiochian School founded by Lucian (300) and for centuries the vigorous mother or grandmother of the most approved patristic exposition, which still however insisted on two senses corresponding to the Covenants, Old and New. Jerome appears to have been saner, but inconsistent, unwilling to tie himself even to the allegoric method, which reigned throughout the Middle Ages, the fold sense being formulated in the couplet: *Literal sense (littera) teaches facts; allegorical, what to believe; moral, what to do; analogic (mystic), whither we tend.* No steps were taken by the Christian Church toward ever proposing the problem of biblical criticism, of whose existence indeed men were quite unconscious. The faith of Augustine was in truth wounded by the phrase "unto this day" in Josh. iv, 9, but was healed by the same phrase in Josh. vi. 25. We have noted many such qualms in reviewing Jewish interpretation, but the first scientific criticism we owe to the Neo-platonic Porphyry, who showed, against tradition, that "Daniel originated not in the Jewish Captivity but 400 years later under Antiochus Epiphanes. For the untroubled conscience of the Middle Ages, the Hebrew Scriptures served only the purposes of edification and controversy, — the thought of making them the subject of scientific study does not seem to have arisen. At length came stirrings of the dawn. From authority and allegory Wyclif and Hus reacted toward the letter, but it was the Jewish convert Nicolaus de Lyra (1270-1340) who by sober methods and knowledge of Hebrew displayed in his 'Postilla Perpetua' (litteralis in 1322-31, mystica in 1339) made smoother the way for Luther. *If Lyra had not piped, Luther had not danced* (si Lyra non lyrasset, Lutherus non saltasset). By the Council of Trent, however, Exegesis was formally immured within four walls: Rule of Faith, Mind of Church, Consent of Fathers, Decrees of Councils.

With the Reformation, the Holy Writ sprang up into a seat of supreme authority. Said Chillingworth, "The Bible, and nothing else, is the religion of Protestants*; it became the Court of Cassation, of final appeal. Under Luther, Melanchthon, Zwingli, Calvin, the mind of the Reformers maintained in some measure its attitude of new-won freedom; but with the 17th century the Dark Age was closed down upon Europe, for 150 years, during which practically no advance was made toward understanding the Scriptures. However great the talents of the learned, they all lay enwrapped up in the napkin of implicit faith (Hobbes). A rude shock fell on the plan of the all-sufficiency and verbal infallibility of the

* Aqiba held that the whole ritual was given thrice, first on Sinai, then in the tent of meeting, finally on Mt. Moab; so Hoffmann assumes four sets of Laws: Pre-Sinaitic, Sinaitic, tent-of-meeting, and Arboth-Moab; of these the content is "eternally invariable," but the form is subject to change with time and circumstances. (*Leviticus,* i. p. 22.)
Sciences, as known to clergy and people, was given by the demonstration (already noted) of Elijah Levi, which was indeed violently resisted by the Buxtorfian school (1684-1686), and afterwards, but was confirmed (1650) by Louis Cappel (1585-1658)*, and at length sullenly submitted. Nevertheless, no awakening followed. The mind of the Reformed Church turned over again to a sleep continually troubled by dreams of consummating dogmas. It was one of the wisest and widest-armed, if least attractive, of English thinkers, Thomas Hobbes (1588-1679), who in his well-named "Levithan" (1651), with the unclouded eye of common-sense, armed with no lens of exact philology, first saw and proclaimed the general conception of Hebrew Scriptures that has now long since become the common property of culture. From obvious considerations he shows (c. 33, pp. 200-203) that the five books of Moses were written after his time, though how long after it he be not so manifest, while allowing his authorship of the "volume of the Law" found again by Hillick, and sent to King Josias (2 Kings xviii, 10). The ill-famed "unto this day," and similar phrases refer to Moses, Samuel to times long after those persons, even to the day of the captivity of the land (Ju. xviii, 30). Similarly Kings and Chronicles, as also Ezra and Nehemiah, are shown to have been written after the captivity* and Esther during the captivity or after it. As to the rest, he departs in general much less from tradition, though regarding Jesus not as history but as philosophy and poetry "in hexameter verses," with Prologue and Epilogue in prose. The Psalms seemed to him mainly Davidic, though edited after the Captivity, for the Psalms of a "godly man, that lived after them all" (the authors); Ecclesiastes and Canticles are "Solomon's." Strangely, Sophoniah is "among the Prophets the most obscure..." if the Apocrypha be credited, the Scripture was set forth in the form we have it in, by Esdras.* In the preceding chapter Hobbes speaks from the summits of intelligence and freedom (pp. 196-197), only to sink into the depths of prejudice (198-199), but his example is extremely instructive as showing what triumphs are possible to the open mind. The Englishman did not excel in keenness many others, both Jew and Gentile, who surmounted him in technical mastery of the subject in hand; and yet he saw clearly what had been hidden from rabbinical pipilp and clerical scrutiny for nearly 2,000 years.

Hobbes was soon followed by a far greater thinker far better equipped. In 1670, while the "Levithan," formerly sold for eight shillings, having been condemned in 1666 by Parliament, was selling at 30 shillings, it being a book the bishops will not let be printed again (Pepsy's "Diary," 3 Sept. 1668), Baruch de Spinosa (1632-77) published anonymously his noble plea for "freedom of thought and speech" (libertatem philosophandi), "Tractatus theologico-politicus," the groundwork of modern criticism, wherein having set forth in chapter VI a purely rationalistic doctrine of miracles, and in chapter VII the common method of interpreting Scripture from Scripture alone, he proceeds in chapter VIII to lay the foundations of historical criticism of the Old Testament by discussing in detail the authorship of the Pentateuch and the other historical books of the Old Testament beginning with the mystic note of "Aben Ezra" on Deuteronomy, which he expounds, and concluding that "it is clearer than the sun at noon that the Pentateuch was written not by Moses but by some one living long after Moses," to whom indeed he attributes its other writing, but not the Pentateuch. From various considerations, as of the phrase "unto this day," he deduces that the book of Joshua was "written many generations after his death," and Judges "after the establishment of the monarchy," and Samuel "many generations after Samuel's death," and Kings compiled, he does not say when — but "all the books we have hitherto considered are compilations," — he might have still said mosaic, no other term is so fitting. But the compendious single historian, most probably Ezra, if we had the originals, "we should find a great difference in the words of the precepts," their "order," and the "reasons" assigned. He thinks "that all this, Judges, Numbers, Samuel to times long after these persons, even to the day of the captivity of the land" (Ju. xviii, 30). Similarly Kings and Chronicles, as also Ezra and Nehemiah, are shown to have been written after the captivity and Esther during the captivity or after it. As to the rest, he departs in general much less from tradition, though regarding Jesus not as history but as philosophy and poetry "in hexameter verses," with Prologue and Epilogue in prose. The Psalms seemed to him mainly Davidic, though edited after the Captivity, for the Psalms of a "godly man, that lived after them all" (the authors); Ecclesiastes and Canticles are "Solomon's." Strangely, Sophoniah is "among the Prophets the most obscure..." if the Apocrypha be credited, the Scripture was set forth in the form we have it in, by Esdras.* In the preceding chapter Hobbes speaks from the summits of intelligence and freedom (pp. 196-197), only to sink into the depths of prejudice (198-199), but his example is extremely instructive as showing what triumphs are possible to the open mind. The Englishman did not excel in keenness many others, both Jew and Gentile, who surmounted him in technical mastery of the subject in hand; and yet he saw clearly what had been hidden from rabbinical pipilp and clerical scrutiny for nearly 2,000 years.

Hobbes was soon followed by a far greater thinker far better equipped. In 1670, while the "Levithan," formerly sold for eight shillings, having been condemned in 1666 by Parliament, was selling at 30 shillings, it being a book the bishops will not let be printed again (Pepsy's "Diary," 3 Sept. 1668), Baruch de Spinosa (1632-77) published anonymously his noble plea for "freedom of thought and speech" (libertatem philosophandi), "Tractatus theologico-politicus," the groundwork of modern criticism, wherein having set forth in chapter VI a purely rationalistic doctrine of miracles, and in chapter VII the common method of interpreting Scripture from Scripture alone, he proceeds in

* For 10 years his manuscript sought a publisher; Buxtorf vainly at first to dissease and then to refuse.
perfectly to Schocettgen and even to Rabbi Azarias. In the same year (1753) a much more important advance was made—again on purely literary lines and again by a layman, the Catholic Jean Astruc, in his celebrated 'Conjugatures sur les mémoires oriaux dont il paraît que Moïse s'est servi pour composer le livre de la Genèse,' wherein he announced that Moses in Genesis and Exodus, i., ii made use of two large documents, A and B (besides 10 small ones), distinguished by use of the divine name: Elohim in A and Yahveh in B. The path thus opened was diligently followed for 155 years; not until 1908 did Eerdmans diverge from it boldly. But though Astruc (1684-1766) rendered a notable service in supplying criticism with its first purely literary criterion of authorship, he himself lingered far behind the standpoint of Spinoza (whose 'Amen triumph he would annihilate') or even of Hobbes, his object being to pave the way in the way of accepting Mosaic authorship, and his book a strange mixture of naïveté and acuteness. He builded better than he knew: and it may be well to remark that as the first ancient Old Testament critic, Porphyry, was a metaphysician and not a first moderns, Herder and Spinoza, while Astruc was physician to Louis XIV, and all were dilettantes. It is also interesting to note, and significant, that many of the boldest discoveries were not the intuitions of youth nor even the conquests of middle life, but the ripe fruitage of time, the hard-won trophies of declining years. But even Astruc's cry was long unheard in the wilderness. At length under the stimulation of Herder (1744-1803), the philosophic litterateur, in 1780-83 Eichhorn (1752-1827) brought forth his 'Einleitung,' the first comprehensive treatment of the Old Testament as literature. He adopts and extends Astruc's analysis of Genesis into Elohist and Yahvistic portions, and distinguishes between the people's Code (Deut.) and the preceding priestly legislation; moreover, while still clinging to Moses authorship he recognizes many fragmentary documents embedded in the Five Books, whence the name 'Documentary Hypothesis;' he detects in Isaiah II, as had Koppe in his translation of Lowth, much that is non-Israelic, in Daniel no little that is post-exilic; and he displaces the Song from the age of Solomon and the Preacher into the Persian period (538-332 B.C.)—results that have won him the title 'Founder of Modern Old Testament Criticism.' Twenty years later they were restated in a modified form as the Fragment-Hypothesis by the unrocked Catholic Scot Alexander Geddes (1737-1802), by whom Eichhorn was willing to be judged, in his 'Critical Remarks on the Hebrew Bible' (1800). But on the island the season of figs was not yet. The next move forward was made in 1798 by another layman, K. D. Ilgen (1763-1834), in his splendid 'Documentary Archives of the Jerusalem Temple in their original Form' (1798), by discerning two Elohist sources where Astruc and Eichhorn had seen only one. But thus far criticism had remained merely literary, starting no question of the evidential worth of the documents or sources, a question first brought to the front (1806-14) in the 'Contributions to Old Testament Introduction,' the first and best work of the many-sided de Wette (1780-1849), the pioneer of historical criticism, also inspired by Herder in the golden days of Weimar. Turning first to Chronicles, its fictive and tendential character, thus clearing away a thick cloud from the history and religion of Israel; next he brought Deuteronomy down to the 7th century, where Parvish in his 'Inquiry into Jewish and Christian Revelations' had first placed it (1739), and proved that the history from Judges to Kings contradicted the dogma of Mosaic origin of Pentateuchal legislation,—all permanent achievements of criticism.

Though a poet, de Wette gave no rein to historic imagination, and indeed all work thus far had been almost entirely negative. In striking contrast was the personality and with it the work of Heinrich Georg Augustus von Ewald (1803-75), protegé of Eichhorn, founder of a new science of the Hebrew language and literature, its history, controversy, patriotism, excelled, exalted, tried, acquitted, condemned, imprisoned,—but above all the constructive historian with the gift of tongues, the Niebuhr of Israel as it was in the mind of the first half of the 19th century. His central work, 'History of the People Israel' (1843-59; Eng. tr. 1857-74), the product of boundless learning and 30 years of untiring investigation, is a glorification of Israel as the inspired people of God, whose history is the history of the Revelation of Religion to the Race, in a Trinity of Stages, as of Hebrews, Israelites, Jews, through three half-millenniums, from the Exodus to the final complete and perfect self-manifestation of God in Christ. On such a huge canvas this passionate artist-scholar, this backward-gazing prophet, has painted the life of the chosen people. Although still deeper study and exacter thought have cast aside the picture as false in color and faulty in drawing, its place is secured among the creations of genius by the immensity of knowledge displayed and the technical skill and the freshness and minuteness of delineation, the richness and vividness of tone, the dramatic skill and boldness of the composition, and by the unwavering faith, the devoted and unflagging enthusiasm that the author has brought to his task. Ewald did not in truth lift or roll away the clouds that hung dark over the history and literature of the People Israel, but he lit them up with the splendor of his learning and imagination into a luminous haze, where we behold vast forms that move fantastically to the charm of his dogmatic conceptions.

So great was the authority of this Göttingen oracle that for a full generation a conception widely different from his called vainly for recognition. Ewald had made classic the notion, held by Dillmann with some modifications since the death (1894), that the priestly legislation ('caused by him 'Book of Origins' and now denoted by P') was the oldest stratum of the Pentateuch, was Grundschrift (Tuch) or basis of the whole, on which the prophetic parts (JE) and Deuteronomy were later deposits. But as early as 1832
Eduard G. E. Reuss (1804–91), as privat-docent in the Strassburg Theological School, had perceived and maintained in lectures, though he died in 1860, that the order was the reverse, that P came last in time. It was Vatke (1806–82), however, who first gave such views to print (1835) in his ‘Religion of the Old Testament,’ but without effect on critical opinion, having relied, as Hegel’s pupil, on a priori logic, rather than on historical fact and the discovery that God would be the natural order in the development of Israel’s religion and ritual, rather than on any actual determination and interpretation of literary or historical facts. Eduard’s towering construction received its first concussion (1866) from the ‘Historical Books of the Old Testament,’ by Reuss pupil, K. H. Graf (1815–99), but the decisive blow was delivered by the Dutch master, a prince of critics, Abraham Kuenen (1825–91), who, starting but quickly diverging from Eduard’s standpoint, developed and demonstrated the Reuss-Graf theory in his celebrated ‘Godsdienst van Israel’ (1869–70), a lasting model of clear, judicial, convincing examination, followed by a series of supplementary proofs in the leading Dutch journal, Tijdschrift voor Theologie, as well as by his comprehensive and exhaustive ‘Onderzoek’ (Inquiry), etc. Hereby to the unbiased mind the matter seemed decided, but it was Julius Wellhausen (1844–1918) who with astonishing mastery of detail and with a martial power in historical combination overcame the most determined opposition and compelled the assent of the most reluctant converts, though of the two props of the earlier construction, Delitzsch and Dillmann, the latter remained unconvincing till death. Wellhausen’s incisive memoirs were followed (1878) by his ‘Prolegomena zur Geschichte Israels,’ reprinted (1883) as first volume of ‘History of Israel’ (tr. 1885), and (1894) by ‘Israelitische und jüdische Geschichte.’ Hereby was established the school that in spite of Harold M. Wiener still dominates Old Testament criticism.*

Meanwhile there had been crying in England the voice of Kuenen’s valued friend, Jn. Wm. Colenso (1814–83), bishop of Natal, through his ‘Pentateuch’ (1861, the Book of Joshua critically examined) (1862, 1871, 1879), wherein he showed forth the fictive nature of the story in P and the many contradictions of the Hexateuch, having been impelled to critical inquiries, while translating Genesis, by the puzzling question of his Zulu converts: ‘Is all that true?’ His fellow-bishops answered by deposition in Africa and excommunication in England, allowing him however the unique distinction of learning and ability employed otherwise than as a humble

---

* Smend’s ‘masterpiece.’ comparatively conservative, ‘Die Erschliessung des Hexateuch’ (1912), distinguishes three parallel Judaic sources: J (850–480 B.C.), J (great poet, greatest Old Testament historian, 800–700), E (prophetistic, Israelitic, after 700) combined in two redactions: R (J. + J), R (J. + E), with later interpolations, as of the ‘Book of the Covenants’: all the work of Yahvists, of Miins opposed to ‘Aaronists’ of J. Next is Deuteronomy, two editions: D1, with the Introduction (I–49) by an author before downfall of Judah; D2, with the Introduction (I–84) post-exilic. Lastly, the Priestly Code and History, in which are many extensive secondary elements. Redactors are always at hand. Apart, by itself, stands the Law of Holiness (Lev. xxi.–xxvii.).

**The words of the noble Bishop deserve commemoration:**

‘May your great God impower the words of the Prophet. Shall a man speak lies in the name of the Lord? I dared not do so.’

The converts had converted their converter.

---

* To measure this movement in the Church of England compare Driver’s chapter on Daniel (485–515) with Pusey’s The Prophet Daniel (1864, 1885) written to refute ‘Essays and Reviews’ (1860), the work of seven authors, the very year of its date, but long since overridden. Driver repudiates of Pusey’s contentions, as does even the Catholic now. See ‘History of Pious’ (1858). For on Earth as in Heaven, the ‘R. and R.’ best quietly without it (1750), as harmless but in bad company, on elevation the bishopric of Easter.
Psalmen' (1914) that they are mainly post-
estitic (consult the brilliant book of Cheyne on
the 'Origin and Contents of the Psalter,' 1890). Without insisting on other examples, it may be said (as even Sayce has repeatedly
avoided) that compilation is surely the open
sesame to the correct understanding of the Old
Testament. Questions of authorship have long
since lost much of their pertinence and mean-
ning. The authors' names have become signs for
certain highly complex phases of the one great
Spirit of Israel, which wrote and rewrote, which
revised and re-revised, the word, the
scrolls of Scripture. In last analysis, this in-
deed is the only true conception of any liter-
ature; it is the visible sign of some shining
phase in the life of Spirit; but in the literature of
Israel we are brought to face most fully and
unmistakably this momentous fact.

The sifting process, under which the centre of
Israel's Bible settles down ever deeper into
the Perso-Hellenic period, is it now complete?
By no means. Of course, it cannot go on in
definitely; sooner or later it must be
practically attained; but there is still
room for notable depression, which has
even been attempted of recent years with
remarkable energy. It was Erne Havet
(1813-89) who suggested in his compre-
ensive work 'Le Culte et le Cultume' et ses
origines1 that "the supposed antiquity of
the prophets placed in the 8th, 7th and 6th centuries
is a pure illusion, even as that of the Psalms" (III, 180-213, 1884). The inspiration of these
prophets he finds not in the fall of Samaria and
Jerusalem under Assyria and Chaldeans, but
in the glorious struggles of Jews against Syrian
kings in the 2d century. The reproach was
made by Scherer (1879) that Havet, though cer-
tainly acute as a critic, had no right to speak in
the matter, being disqualified by his ignorance of
Hebrew and German, and his arguments, ad-
mittedly ingenious, had little effect. More
recently his theses have been revived by dis-
tinguished scholars of France, such as Joseph
Halévy ('Récurrences bibliques, 3 vols., 1895,
1901-2; Notice sur M. l'Exégèse biblique,' 1890,3 Essais bibliques,' and
'Du prétendu polythéisme des Hébreux'
1891), and especially by Edouard Dujardin ('La Source du Fleuve Chrétien,' 1906; revised
and translated 1911), who restores the order of the
Hebrew books, not in the spirit of 'anticritics
(as Sayce and Orr), by placing the Law before
the Prophets, but by placing the Prophets after
the Law; this with Joshua, Judges, Samuel,
Kings he refers to the 4th and the beginning of
the 3d century (adding Chronicles and Ezra-
Nehemiah somewhat later), but Jeremiah,
Ezekiel, Isaiah and the Twelve to the second
half of the 4th and all of the 3d century, and
lastly Psalms, Daniel and the other Hagiographies
to the 2d century and the 1st (a.c.)—in all,
three grand divisions as old, in the old time
together. Law, Prophets, Apocalypse. Undoub-
tedly this scheme, set forth by Dujardin with
such impressive eloquence and such vivid his-
toric imagination, has somewhat to say for itself,
and it yields a cleaner-cut answer to
some questions than any other yet proposed.2

For instance, it is not easy to think of Amos,
the shepherd of Tekoa, as really author of the
prophecies that bear his name but attest con-
siderable culture and literary art. Guthe is con-
strained to invoke the aid of various redactors
whose work was completed in Jerusalem,
where in the 3d century a.c. the writings of the
erd prophets were collected by the religious
community.3 These various redac-
tors not only 'arranged' prophecies but made
various 'smaller additions,' such as the denunci-
ations against Tyre, Edom, Judah, the second
half of Chap. 9, and so on. For how much
these various redactors are responsible, it is
difficult to say. Guthe's claim for Amos is modest
enough: "Without doubt the book is based on
notes (Aufzeichnungen) of the utterances of
Amos, which he made himself or had others
make for him" (Kautzsch, I, D. H. S., 8, p. 27).
"Without doubt" this 'oldest of the prophets'
(760 a.c.) seems hereby virtually surrendered
to the 3d century in Jerusalem.4 Similarly
Haupt refers Zachariah i-iiii to the beginning
of or later the reign of Darius Hystaspis (521-486),
the others (x-xiv) to the Maccabees, but
Driver finds the style of cc. xii-xiv
'singularly pure,' the diction resembles that
of Amos (473, 505). But there appears no
reason why these various redactors may not
in any case have taken very considerable tra-
ditional material, whether oral or written, of
very ancient origin, whether lyric, historic or
gnomic, and worked it up into forms better
suited to the needs of the community, their own
ideas and the historical conditions under which they
lived.5 In so doing they may either have
preserved the ancient names and reference, or
have taken over the ancient names, as Edom,
Egypt, Babylon, etc., and applied them to the
new political factors, as Rome, Greece, Syria,
etc. That this latter was a habit is proved by
'the Parables' (3, 52, 82). In the original
French, the strife between French and German criticism is
far from ended, but in one aspect at least it
is largely a question of degree, of the extent
of admitted 3d-century redaction.

In still another direction the prevailing Well-
hausen-criticism is brilliantly disarming in
Gunkel's Genesis (1902, 2d ed.), has of late
met strong opposition. After 155 years of recog-
nition the Astruc criterion was formally re-
bected by B. D. Eerdmans in his 'Altestament-
lische Studien' (1908-12). The basis of rejec-
tion is largely laid in a deeper study of the
Septuagint, which certainly shows considerable
irregularity where order had been held
to reign. Thus even in the famous first chapters of
Genesis, where the separation into Elohist and
Yahvistic documents appeared almost to
lie on the hand, the whole matter seems thrown
into doubt by the Septuagint and other wit-
tesses. The distinguished Semitist of Cornell,
Nathan Schmidt, in a remarkable paper in the
Journal of Biblical Literature (March
1914) has shown that the name YHWH probably
did not appear at all in the original so-called

3The claim is also made that it finds confirmation in the
Passover celebration in 419-418 (at which date the law
in Deut. xvi, 6 was therefore not known) but appears
not to have been observed in Jerusalem in 409, whereby
they turn to Samaria in 406—a statement that Deut.
xvi, 6 went into effect between 419 and 409 a.c.

4To feel the force of such "working-over" or "over-
working", compare Chronicles with the canones from Genesis to Kings.
BIBLE

Yahvistic account, and Dahse's immense accumulation of evidence in 'Textkritische Materialien zur Hexateuchfrage' (1912) is aimed to show that the variations in the divine name arise from divisions of Genesis into reading lessons, while the priestly portions are the insertions of a compiler. Most of all, however, Eerdmans' studies piece deep into the matter and would draw in their train a complete reconstituting of Old Testament interpretation. Especially he is moved to reject the hitherto accepted notion that the legends of Genesis were originally monotheistic -- for Eerdmans, in fact, Elohim retains its proper meaning, gods -- that the Elohistic narrative is pre-exilic, that (priestly) portions are now to be found in Genesis. Of course, the dominant school, thus boldly assaulted in its strongholds, has not been slow to reply, and the battle rages on the Continent. A most recent and comprehensive statement of the case is to be found in Eichrodt's 'Die Quellen der Genesis: Eine Untersuchung' ('New Inquiry into the Sources of Genesis,' 1916).*

Yet another aspect of this great historical theme calls for signalization. The lamented E. A. Wallis Budge, who opened his brilliant career with very conservative contentions, was irresistibly borne on to liberal positions, and thence, in his devotion to truth, still forward to others ever more and more radical, until he was finally landed in almost painful isolation. In particular, by his so-called North-Arabian Theory of Israel's origin and history, elaborated after adoption from Winckler, in connection with his further theory touching the name and worship of Jerachmeel, the rival and arch-enemy of Israel, he was led to far-reaching reconstructions not only of the Hebrew text, but therewith of all Hebrew history. These matters are too technical for full statement in this connection, but they may serve even here to hint the exceeding profusion of Old Testament problems.

Thus far, we have spoken of Israel's literature and history almost as if it were self-centred and self-contained, without determining connections with the world around. Such however was certainly not the case. The linguistic relations of Hebrew to its sister tongues are not more clear than the historical, cultural, spiritual ties that bound Jacob to his brother peoples of the East. Hence it becomes imperative to conceive of Israel's history not as a detached episode or en'acte, but as an interwoven and inextricable part of the whole grand drama of Semitic history as it unrolled itself between the Mediterranean and the Persian Gulf. Such a conception called for extraordinary intellectual effort, not only for linguistic attainment of the first order, but for wide extended collateral knowledge and for historic imagination fitted for the boldest flights. These requisitions appeared fulfilled in remarkable fashion and measure in Hugo Winckler, too early to succeed, who in his 'Israelitische Geschichte' (1895-1900) has sketched Israel in history with a breadth and sweep, a boldness and grandeur unattempted heretofore in such composition. Footing in large measure on the deep researches of Eduard Stucken ('Astralmythen der Hebräer, Babylonier und Ägypter,' 1896-1907), Winckler has not only reconstructed the career of Jacob in its Asiatic setting, but has sought to trace it out in its mythic or cosmic relations, as illustrating his fundamental doctrine of the 'old-oriental world-conception' of history as the reflection on earth of a process accomplishing itself in heaven among the stars, a conception that has determined (he contends) the form assumed in the Scriptures by the legends of all the patriarchs. Here, also, he thrusts his facts into explanatory details, but almost certain that the contest between the followers of Winckler and their opponents, led on by the astute and learned Jesuit Kugler, cannot fail to spread a wonderful if weird illumination over the remotest patriarchal story.

Meantime it must not be inferred that far more conservative criticism has been either idle or ineffective. Not only the brilliant but sometimes erratic free lance, A. H. Sayce, has been indefatigable in his assaults, but the cautious Orr and the trenchant Wiener with many others have piled incessantly at the structure of 'higher-critical fancies,* and not a few of its stones they have loosed or dislodged. Indeed, of all these matters we may say,

Verily, though, on the knees of the gods these issues are lying.

There is no finality in criticism, any more than there is in physics or chemistry or the 'logics' of the other sciences. In the mass there may well be some elements of correctness, reconcilable only when caught up into some far higher synthesis. Criticism will never indeed regress to its elders positions, it will never return upon itself, as the youth will never become a child again, but neither has it attained maturity, much less the rigidity of age. The front of criticism reforms itself continually in its continual advance, and the honest and enlightened striving neither of radical nor of conservative can ever be lost. The true spirit of research declares to each of its results, even the most plausible, "I cast thee silently into everlasting time."

WILLIAM BENJAMIN SMITH.

BIBLE, History of New Testament Interpretation. On passing now to the interpretation of the New Testament, we enter a region strewn thick with the embers of controversy, fresh and hot, where the conflicting interests are much stronger and livelier than those which beset the path of Old Testament study. At first blush, indeed, it might seem that our feet would rest on surer and safer ground, since
the literature is so much more recent and grew up under conditions so much more modern and more readily describable. But a little reflection will show these distinctions in a large measure illusory. In the first place, the difference in age is not what many imagine. It is not a chasm of one or two thousand, but only two or three hundred, years that opens between the Testament and the New. Then again, the conditions under which the New Scriptures were written, like those under which the new religion was preached, it must be avowed, were more varied and complicated than we have hitherto supposed (Loisy, reviewing 'Der vorchristliche Jesus', 1906). The naive views so gratuitously assumed for 1,600 years, which even now appear often under thin disguise in authoritative critical connections, do not call for much notice and need not long detain us.

The earliest Christian theologians were the Gnostics (as Harnack admits), and of some of them brought a very high order of ability to the task of constructing a well-ordered system out of the chaos of hopes, loves, creeds, together heaped and hurled that tossed in the soul of the first two centuries of our era. Such names as Basilides, Valentinus, Marcion, and others should not be mentioned but with profound respect. It is true, these pioneers failed completely, but in such a great matter, to have attempted even, was great. Their abundant writings have all perished, and their thoughts have been grossly misrepresented, but even under the grotesque mask of travesty it is still possible to recognize features of grandeur. Origen thought it well worth while to study and to cite that primitive Commentary of Heracleon upon the Fourth Gospel. The earliest orthodox conception of the New Testament was that of a repertory of proofs, as expressed in Tertullian's favorite juristic term 'Instrumentum' (documentary proof) and again in the elegant distich of Samuel Weneriel's (1637-1740), the triumvir of Basel, promoter of hermeneutic and the most distinguished divine among Reformers of that age:

This is the volume in which, for his dogmas each one inquiring, Findeth his dogmas in truth equally each one his own.

This conception prevailed for over 1600 years and is by no means yet finally displaced. Orthodox and heterodox alike proved their theses by appeal to the authoritative Word, and seemed to regard this judicial function as its main reason for being. Its main fulcrum was the postulate of the manifold (generally fourfold) sense, of which sufficient has been said. To feel the magic of this number four, one need only read Briggs' 'The Study of Holy Scripture, much of which moves on the plane of Irenaeus (III, 11). The procedure of Erasmus in editing nearly discarded and translating it into Latin with notes (Novum Testamentum, 1516) was more rational and independent, was in fact a movement toward understanding the sacred volume, a movement urged on by Luther, who in his translation with his notes, and with the additional help of Melanchthon, was well on the way to the 'nearer and purer' text.

When the authority of the Church fell away from the Protestant mind, the latter, dazzled and bewildered, felt that no guide and no other was at hand but the Bible itself; so that Protestantism quickly passed over in doctrinal and controversial phases into the worship of the Bible, and as such it still endures in wide and respectable circles. This character of last resort required as necessary corollary the verbal inerrancy of the Bible, since it were vain to appeal to a supreme court that could err; and alongside therewith flourished, alike among Catholics and Protestants, the amanuensis-theory of Scripture-authorship, which regarded the writers as mere pens of the Holy Spirit (according to a saying ascribed to Gregory), so that their names and personalities were quite indifferent; who would care for the pen, knowing that God himself was the penman—an attitude unfavorable to higher criticism. But over against this cherished dogma there grew up year after year a denser and denser array of facts in variants continually disclosed by the multiplying manuscripts and by textual criticism. At the same time the rationalistic trend of the 17th and 18th centuries, propagated from all the adjacent domains of human inquiry, spread irresistibly over the fields of theology and Scripture. The 19th century added the regulative notion of evolution, of gradual growth from seemingly simple forms to forms of endless complication. Under the urge of these forces New Testament interpretation has pressed forward year after year with quicker and longer strides toward its goal, the sympathetic comprehension of New Testament Scriptures.

The Biblical interpretation of the Middle Ages and of the Reformation embodies an immense amount of intellectual effort put forth in many cases by minds of the first order. However, its significance to to-day is by no means proportioned to its intrinsic excellence. From the principles from which it started and the methods by which it was guided, the modern spirit has departed definitely and finally: any return there is to Ptolemaic astronomy or to pre-electric mechanics. The student of to-day is not concerned with the 'fourfold sense,' nor even the 'double sense,' of the Scriptures, nor yet again with proof-texts wrested in controversy to the support of this or that system of dogmatic theology. On the contrary, his sole or at least his main concern is to understand the mind of the author; what he actually thought and felt and meant at the moment of writing. To such a student the easier commentaries learned and deep-thought as they often are, seem more like Meditations than Interpretations. No attempt can be made here to set forth the nature and extent of these musings, nor their value, which indeed depends largely on the mood of the reader. A similar state of case presents itself also in the study of the profane masters. When we read 'Ueber allen Gipfelt ist Ruth,' a vast perspective seems to be open before us; we think of solitary heights of achievement in art, in science, in action, in sacrifice, of the holy calm of the victorious soul. This may all be very legitimate and
even ennobling, but it is not interpretation, it does not reveal the mind of Goethe, who was writing of the deep hush of evening as it falls with awe and solemnity upon the mountain-tops.

So much premised, we may call the 2d century the "Apologetic" age of Scripture interpretation, marked by such names as Clemens Romanus, "Barnabas," Justin Martyr, Irenaeus, Tertullian, whose main interest was to refute Gnosticism and especially, by allegoric interpretation of the Old Testament, to establish the Gospels as history. The "Philosophic" stage, best represented by Clemens Alex. and Origen in the 3d century, greatly stresses and develops the allegoric method but in a much wider interest, striving to elaborate a theology in some measure acceptable to the Greek intellect. As a reaction, arose and flourished in the 4th and 5th centuries the "half-critical and historical" school of Syria, of Ephraim of Syria at Edessa and Theodore of Mopsuestia, "exegete of the Church," at Antioch. These in some measure recalled exegesis to the literal sense of the Scriptures and to a much soberer handling of the sacred text, and especially the former stressed its influence far and wide, over Athanasius, Chrysostom and Cyril in the East, and Ambrose, Augustine and Jerome in the West. But the exigencies of dogma did not allow any of half-way measures, a thorough-going historical criticism seemed out of the question, and the Antiochan method fell before the allegoric of Origen, which thenceforth reigned till the Reformation.

There followed the great millennium of "Authority," marked indeed by some very notable names, but contributing little or nothing to the comprehension of Scripture. The general contact of the Greek with the Latin mind was now interrupted, and the conduits by which the treasures of the former were transmitted to the latter is inadequately form of Anthologies, so-called "sentences" culled from the Fathers. Isidore of Seville (560-636) led the way, exploiting chiefly, however, Augustine and Gregory the Great. In fact, the following centuries fed upon the latter as the earlier upon Origen. For nearly 600 years such ox-blood capsules sustained the spiritual life of the generations, but with the dawn of the 12th century a new spirit of daring breathed upon the dry bones and they started up clothed with flesh and vigor. It was Peter Abelard (1079-1142) who inaugurated that splendid century and set Reason and Aristotle side by side with the Bible and the Fathers. His audacious Sic et Non, which ranged authority against authority in every direction, was followed by flocks of "Sentences" compiled with pious purpose, as by Peter Lombard (d. 1164). Aristotle was now enthroned, and special pleading ruled in the schools, with endless disputation. The stately structure of dogma was read by Saint Thomas Aquinas in his "Summae," and Thomism still sways Catholic thought, as at Louvain. But in boldness, keenness and originality he had already been surpassed by the Gnostic Johannes Scotus Erigena (d. 877), who made caprice supreme in God (whose essence was nothingness), surpassing even Origen who had pushed free will and individualism to the utmost, even to the practical annulment of the "historic Jesus" (Harnack). The exceedingly acute William of Occam glorified doubt as the handmaid of God; by removing all the natural bases of mental security he sought to set faith the more firmly on the rock of church authority. Anselm with his "Cur Deus Homo?" also played in this game of the Valhallans, of giants beating the air. No important step was taken toward understanding the Bible, the common armory of this endless warfare, until the "Postilla Litteralis" of Nicolaus de Lyra, who with great learning, keen asceticism and with sound historic judgment strove hard to recall his readers from the "mystic" to the literal sense of the Scriptures, whom the following centuries admired but could not emulate. In Luther, he was partially revived, but the German was a moral and spiritual force rather than a sequacious thinker. System he left to Melanchthon (1497-1560), who was unequal to the task and fell back more and more into the abandoned paths of traditionalism. Not so Jean Calvin (1509-64), who was a thinking, vigorous and consequential and surveyed the whole field of religious controversy with scrupulous care in his calculations. Augustine came again to his own in the Genevan, the master-builder of the Reformation, whose method and authority have dominated the severer forms of Digmat theology from that day to this. But neither he nor his successors raised seriously the previous question as to what the Scripture really is; nor even while proclaiming "The Bible, the Bible alone, is the religion with keen assent and explanation" (Chillingworth 1637), did they open up any safe paths of study in order to understand it as an historic product. On the contrary, they fell into a dogmatism as hopeless as the scholasticism from which they had emerged. The Scripture was treated as a proof-texts, a homogenous whole, self-contained and unrelated, its own commentary, a verse in John to be explained by a verse in Isaiah, a passage in Daniel by one in Revelation. Meaning, authority, light, but illuminated by "inner light," was raised to the seat of authority, and a disintegrative process set in, which has continued up to the present. From this the Catholics, even during the reaction sometimes called the Counter Reformation, headed by Cajetan (1469-1534), Bellarmine (1542-1621), Francis (1567-1622), Janseni (1585-1638), were sheltered by the still unshaken pillars of Church authority, but their new-quickened zeal while purifying the life, perfecting the organization and inspiring the activities of the Church, did not expand its intellectual horizon nor sharpen its critical insight. The seals of the Bible remained unbroken.

The first really modern phase of this protracted struggle was the elder Rationalism as represented by H. S. Reimarus (1694-1768), seven fragments of whose huge work (still in the main unpublished) appeared (1774-78) at the hands of the Wolfenbüttel librarian, Les-
singing (1729-81), under the title of Wolfenbüttler 'Fragmente eines Unglückten' (Reimar's 'Apology for the Rational Worshippers of God'). The author's standpoint is that of English Deism, and his unsympathetic treatment of the Gospels consists mainly in purely naturalistic interpretation of the miracles and a depreciation of the purposes and personalities of the early Christians. The title of the 7th Fragment, so highly praised by Schweitzer, is 'The Aims of Jesus and His Disciples.' Its literary merits are certainly great, and it inaugurates brilliantly the long reign of the purely natural and historical in the conception of Jesus, anticipating indeed in large measure the recent eschatological view. Hence the remarkably appreciative judgment of Schweitzer. The reaction against Lessing was violent, even to persecution. Semler assailed him in a famous apologue, and especially the Hamburg Pastor Goethe was vehement and unscrupulous in denouncing him for hostile attacks upon our all-holiest religion. Lessing replied with courage and brilliance, extraordinarily strong, and silenced by state authority; turning then to the stage, he produced 'Nathan der Weise.' In simple truth, the comments of Lessing had contrasted very unfavorably in their reticence, hesitation and apologetic tone with the bold, resolute and uncompromising text itself of Reimarus; but this does not mean that the editor was of less heroic mold than the author, who enjoyed the incalculable advantage of being dead. Such rationalism, even in tolerable representative, H. E. G. Paulus (1761-1851), however acute in negation and however vibrant with hate and scorn, with all its 'natural explanations' does not advance us very far toward a comprehension of the New Testament. Feeling how weak it was in construction, David F. Strauss (1808-74) renounced it utterly in his 'Leben Jesu' (1834-1835), and developed a mythical theory, which saw in the Gospel accounts only reflections, in the excited minds of Messianic enthusiasts, of ideas that were already current in the Old Testament, or else Messianic ideas modified by the personality of Jesus, whose human and historic character it did not occur to Strauss to deny. Whenever in the Gospel he read 'that which might have been', he held an incident devised by the Messianic imagination of the evangelist, as the flight into Egypt to fulfill the words of Hosea (xi, 1), "Out of Egypt I have called my son," the riding into Jerusalem to fulfill the mistranslated word of Zachariah (ix, 9), 'Thy king cometh—riding upon an ass and upon a colt the foal of an ass.' This work, marked by a pitiless acumen, and pushing German criticism suddenly over a precipice on which it had long been hovering, was passionately rejected on all sides by German theologians, but its most important reaction was in the mind of F. C. Baur (1792-1860), pre-eminent in the annals of theology as the founder of its Tübingen School, who rightly objected that Strauss had prematurely criticized the Gospels as history, before he had criticized them as literature, and hence without any proper understanding of their origin and meaning. By a most comprehensive study of the New Testament and early Christian literature in general, he was led to develop in a long series of publications his own idea of the genesis of the New Testament as an example of Hegelian Thesis-Antithesis-Synthesis, the unfolding in successive stages of a primary contrast and conflict between two opposing views of primitive Christianity, the Conservative or Petrine and the Liberal or Pauline. In terms of this Petrine-Pauline antagonism and of successive efforts at reconciliation, culminating in the Fourth Gospel, he interpreted practically the whole body of early Christian writings. His construction, often exceedingly ingenious, was also noted for the late dates assigned to the great majority of the New Scriptures,—wherein he was partly anticipated by the premature Edward Evanison, who, in his 'Dissonance, etc.' (1792), adds (pp. 255-289), "my reasons for expunging the Epistles of the Evangelists, Colossians, Hebrews, James, Jude," and "the Epistles to the Seven Churches of Asia" in Revelation, a seed of thought, which, like so many in England, fell among stones. Baur's influence has declined but has grown through the preceding even into the present century, though it is now generally recognized that the New Testament problem is far too complex and profound for the application of his two-term formula; but in unity and comprehensiveness no other single formula has taken its place.

The learned labors of Baur commanded wide approval and almost universal admiration. Far different the fate of his deeply thought-out contemporary, Bruno Bauer (1809-1882), whose ten cumbersome and lumbering volumes of 'Kritik' of the New Testament (1840-1852, followed by more popular statements in 1874 and 1877) not only cost him his career and his position (his 'venia docendi' was withdrawn in 1842), but involves almost unanimous rejection and even abhorrence. He who anticipates is lost. Of all his generation he saw furthest into the real problem of the genesis of the Gospel and the character of Christianity; he alone conceived them as environmentally determined, as arising from the total complex of historical conditions, social and cultural, of that imperial age. His critical constructions were indeed almost wholly of sand, but his grasp of the problem itself was broad and firm. Ostracized in his own country, his thought found welcome among foreigners, especially in Holland, with A. D. Loman, the Teiresias of the North, with Pierson and Naber (Verisimilia, 1886) and later Van Manen (Paulus, 1890), and Bolland, with R. Steck (1848: 'Galaterkritik', 1888) and Edwin Johnson ('Antiquus Man,' 1887). At last he has been restored to Germany, as by Wrede ('Das Messiasgeheimnis', 1901) and the authorititative Schweitzer's 'Leben-Jesu-Forschung' (1905, 1911),—in which he figures second only to Strauss, and where we read: "Bauer's 'Criticism of History' is worth a good dozen 'Lives of Jesus'... For his contemporaries he was..."
merely a fantast, but in his fantasies after all a deep insight lay hidden. It had been revealed to no man in such comprehensive manner that primitive and early Christianity cannot properly be understood as the simple result of the preaching of Jesus, but that it reflects the experience of the World-Soul in the first generations of our era. Since Paul, no one had seized with such power on the mystic in the subs-personal being of Christ and Bauer, translating this into history, made the Roman empire, as it lay in throes of death, into a ‘Body of Christ.’

If Bauer’s ‘Kritik’ was despised and rejected of men, the like could not be said of ‘La Vie de Jésus’ (1853), by the supreme literary genius, Ernest Renan (1823-92). Begun in Syria at the bidding of his noble sister Henriette, before their fatal exploration of the upper Lebanon, with intent to evoke from the past the Origins of Christianity, in an Hebraist of the first order, it is steeped in the romance and mystery of the East; through the far-off haze of legendary marvel looms up in its pages the spectral figure of the “noble founder,” the incomparable man. It is not likely that such exact antiquarian knowledge and high imaginative power and rare charm of style will ever again unite in the effort to produce a convincing portrait of the Jesus of the Gospels as an extraordinary carpenter. But its failure could scarcely be more complete. Though 60,000 copies were sold in four months, and though it shook all Christendom with its echoes, it is now seldom named, its permanent value lay almost solely in the proof by example that the task it attempted could never be performed. Close on the heels of Renan’s ‘Life of Jesus’ came Theodore Keim’s ‘History of Jesus of Nazareth’ (3 vols., 1867; 1871; 1872), written with far greater critical knowledge and conscientiousness, but with far less literary skill; it strives hard to find a history proper, a development in the Gospel story; it tells about ‘the Holy Youth,’ ‘the Galilean Spring,’ ‘the Galilean Storms,’ ‘the Signs of Downfall,’ and many such, in the effort at historic plausibility, but all skill do not blight the fact that it builds a house of cards on a base of mirage.

Since New Testament criticism passed out of the sign of Baur and Tübingen, and by that of Renan, its course has been steadily onward through at times erratic. For a while there seemed to be an era of disintegration: not only did the Scriptures, in particular the Gospels and Revelation, crumble under incessant probing and analysis, but the problems themselves became more sharply separate and distinguished; instead of multiplying, profused, 1838, by the continuator of Strauss, the philosopher, C. A. Weisse, in ‘Die evangelische Geschichte,’ confirmed by C. G. Wilke in ‘Der Urevanglist’ (1838), since when it has gained increasing recognition approaching general acceptance in some form, though opposed by Tübingen, in particular by A. Hilgenfeld (1823-1907); (2) the Two-Source Theory—‘Mark’ and the ‘Oriæcles’ or ‘Logia’ were the prime elements out of which our present Gospels were derived and compounded; (3) the Son-of-Man Question—as to meaning and use of the term ‘Son-of-Man,’ and whether as a self-designation of the Jesus it can be historic, concerning which see Dalman’s ‘Die Worte Jesu’ (1898) and N. Schmidt’s exhaustive treatment in the ‘Encyclopaedia Biblica’ (4705-40); (4) the Johannine question—concerning date, authorship, composition and aim of the Fourth Gospel, elaborated by Bacon (1909) and much illumined by recent publications of Schwarz, Wellhausen, Soltau, Wendland and others; (5) the Problem of Acts,—authorship, date, composition, nearest form or later editions—advanced by F. Blass; (6) the Pauline question,—authorship, date, structure of the Pauline epistles, especially ‘Unto Romans’—the latest phase of this high argument was opened by the Dutch seer, A. D. Loman in 1852, and followed by Pierson and Naber in ‘Verisimilia’ (1886), then by Michelsen, Steck, Völter, Van Manen (who, at first an opponent, passed over to Loman’s side in his ‘Paulus II. De Brief aan de Romeinse’ (1890), the most complete statement for the 20th century date), by W. B. Smith and others named in Van Manen’s article on ‘Romans’ in ‘Encyclopaedia Biblica’ (4127-4145, 1903), also in Schweizer’s ‘Paulinische Forschung’ (1913); (7) the Apocalyptic question—dealing with the elements blended in Revelation, their dates, origins and meanings, matters largely cleared up by Völter, Visccher and their successors; (8) the Eschatological view—that Christianity originated in a semi-political Messianic movement started by the Baptist, continued by Jesus, in a Palestinian striving for a kingdom of God as the end, the last things (eschatos),—a view championed by J. Weiss and A. Schweizer and much in vogue, especially in Great Britain; (9) finally, opposed thereto, all skill do not blight the fact that early Christian doctrine and ritual, especially Pauline portions, were deeply dyed with elements derived from the cults and mysteries then flourishing in the Roman empire,—a view favored by Cumont, Gunkel, Pfleiderer, and particularly recommended by the philologist R. Reitzenstein. To these must now be added (10) the Indian question: Does the New Testament contain Buddhist elements? Passing by the extravagant claims of R. Seydel and others, criticism now settles down; the conviction that in at least four items—Aramaism (Luke ii, 23-35), Temptation, Peter’s Walking on Water, Miracle of Loaves—the Gospel has drawn from the well of Buddha. R. Garbe admits as much in his ‘Indien und das Christentum’ (pp. 12-61, 1914), and is now prepared to concede still further the dependence he had earlier denied in toto. Indeed, it seems highly probable that John ix, 1-3 must swell the list, since only the doctrine of Karma can explain the question, ‘Did this man sin (or his parents), that he was born blind?’ was this long battle the American scholar A. J. Edmunds has won
especial distinction (‘Buddhist and Christian Gospels,’ 1902, 1905, 1908–09), as well as the Hollander, van Eysinga.

However, it is now seen more and more clearly that all these riders are at last only one, they are different facets of the same polyhedron, the varying aspects of one fundamental question: "What think ye of the Christ?" What was the origin and content of proto-Christianity? Since this latter is far away the most imposing as well as the most mysterious single feature of the history, it seems clear that this question yields in interest to none that has ever engaged his attention. It may be well, then, to note the different attitudes that may be and actually are assumed in its presence.

The Traditional view, too familiar in all the creeds of Christendom to call for more than the briefest mention, is very imposing. It regards Scripture as the inspired and authoritative depositary of God's self-revelation to man, having in Moses and the prophets, authors of the Old Testament; but the latter was the Son of God Himself, in the form of the son of Mary, "very man and very God," along with His immediate disciples and apostles including all the authors of the New Testament. Both these forms of the one continuous revelation, but especially the latter, were extra- natural, neither included nor paralleled in the forces and processes of the universe as everywhere else in operation.

The second attitude, that of Liberal criticism, rejects this last thesis of Tradition and insists on understanding the whole body of Scriptures, with all their attendant history, as normal historic products of human activity under extraordinary but strictly natural and intelligible conditions. Christianity, as the most richly gifted of the family of four (Islam, Zoroastrianism, Buddhism being the others—cp. Söderblom and Troeltsch,—like the family of Napoleon, Lucien, Joseph and Jerome), and its Founder, the Carpenter-Prophecy of Nazareth, as an enthusiastic or revivalist of whom scarcely anything can be said with confidence (cp. Schweitzer's 'Leben-Jesu-Forschung,' 2d ed.).

At this point the new Radicalism joins issue and enters protest. Liberal critics, after a century of incessant endeavor, can find not one point of common consent in their figure of Jesus (JesuBild), and the attempt to account for the immediate and world-wide progress and success of the Christian propaganda in terms of a bundle of contradictory guesses seems to the Radical to be not only grotesque but even censurable trifling; in particular, it leaves the central fact, the worship of the Jesus as God, entirely unexplained and unexplainable, besides degrading Christianity down to the most irrational and absurd of all superstitions, to a mere man-worship, a ridiculous compost of delusion and fraud. Such degradation could be allowed only under compulsion of logic and of the surest and exactest facts, but the Liberals present no such facts, not one on which they themselves can even nearly agree. Despite the immense learning, devotion and ability by which it is recommended, liberal criticism appears to the Radical to be utterly impotent in presence of the larger facts of early Christianity.

On the contrary, Radicalism (as in 'Ecce Deus' and 'Der vorchristliche Jesus') regards all cosmic history as the struggle of the individual spirit to realize its own universality, its own oneness with the Whole, and the history of Israel (set forth in the Hebrew Scripture) as one signal phase of the general monistic striving, as the continuous national effort to form, appropriate, assimilate and finally propagate the conception of God as One, and in second line as dwelling (coming to consciousness) in His chosen people, that had come to know Him. Consistently, Radicalism regards the proto-Christian propaganda as the final phase of this national effort, at length become international in the Dispersion, as the prolongation and extension of that same Monism cited to enthusiastic evangelism by contact with Hellenic philosophy, especially in the doctrine of the Oneness of God, a doctrine reaching in a long line of thinkers as far back as Amenhophis IV (Ikh-Naton, 1370–1350 n.c.), and ramifying through all the higher enlightenment of Greece and her pupil Rome. This monistic propaganda, zealously preached from shore to shore of the Mediterranean, by missionaries (apostles) of the Dispersion, at first secretly under many devices and slogans, finally concretized around the figure and in the worship of the Saviour-God Jesus, i.e., of God as Jesus, Soter, Saviour, under the aspect (or person) of Saviour from sin (i.e., idolatry, the supreme sin of unfaith to God). It was also combined with the purer Jewish doctrine of the Messiah (Christ), and at the same time deeply tinged with elements derived from venerable faiths sanctified in the mysteries of contemporaneous cults. The Eternal Gospel* of this early, even prechristian, propaganda is clearly proclaimed in Rev. xiv, 7: "Fear God and give him glory," which is pure monothemism, recalling the last words of the Preacher, xii, 13: "Fear God and keep his commandments, for that is the duty of every man."

In looking back over the way we have come, it seems exceeding long and often exceeding steep, and one might wonder whether it was all really worth while, whether either in the process or in the result there was any justification for the prodigious expenditure of energy, for the concentrated endeavor of so many minds for so many hundreds of years. For him that measures life in terms of bread and butter and fine linen and yachts and motor cars and opera boxes, the answer may be a decisive No. Not however for him that regards the soul as worth more than food and raiment, and the revelation of Spirit as the increasing purpose of unending time. To him it may well seem worth while, and all the lingering stages in the monothematization of the world will appear but to prepare the necessary as the geologic ages that have fitted the earth for the kingdom of Man, and Man for the kingdom of God.

William Benjamin Smith.
BIBLE, Versions of the. No other book has received the honor of such frequent translation as the Bible. The history of this immemorially ancient body of human effort, easy to expand into volumes, but here to be compressed into a few columns, naturally falls into two divisions concerning, respectively, the Old Testament and the New, and the former again into two sections treating, respectively, of Jewish and of Christian translations.

Jewish Translations of the Old Testament.—Already, under Text Criticism, it has been stated that the older portions of the Old Testament existed first in the Canaanite script, of which the scantiest traces survive. Says the Babylonian Talmud (Sanh. 21b): "At first the law was given to Israel in Hebrew script and in the holy tongue. Again, in the days of Ezra it was given to them in the Assyrian [i.e., Syrian] script and in the Aramaic tongue. Israel chose for themselves the Assyrian script and the holy tongue, and they left to the idiots [Kuthim, Samaritans] the Hebrew script [libbonaḥ] and the Aramaic tongue." This change of script from "libonean" or da'as (chiseled) to our present square [merubba'] Hebrew was almost in effect a translation, at present quite beyond us to control or appraise. We cannot get behind the existing square form, not even by help of Samaritan manuscripts or monumental Samaritan derived from the earlier script. Deep-thoughted Rabbis have feigned that the Law was originally given to all nations (but rejected) and engraved in all tongues on the altar stones (Jos. viii, 32). But the first real call for translation was heard when Israel put away Hebrew and adopted the sister Aramaic, first in the north, then in the south, a change speedily effected among Jewish military colonists at Elephantine (6th century B.C.), but passing over Palestine gradually through 300 years. The Targum (translation, especially into Aramaic) was made at first orally by the appointed interpreter, Targumim (whence "dragoman"), as the Law was read verse by verse, or the Prophets section by section. Written Targums, at first disfavored if not forbidden for public use, were allowed in private, whence they forced their way into the Synagogue. Gradually Yerushalmi, the Palestinian Targum of the Pentateuch, took definite form, to be displaced gradually by the Babylonian (Babli), now known through the version called of Onkelos (Aqhalas, Aquila). Of this second revision, in the main faithful, of looser predecessors, the older strata go back to Aqha (ca. 135 A.D.). The surviving Yerushalmi, miscalled "of Jonathan," is later than the Pentateuch Babil, but contains very old elements, along with much sermonic enrichment. There is also a Babli of the Prophets, ascribed to a Jonathan ben Uzziel, disciple of Hillel,—a mixture of old and new, faithful in the Earlier prophets, paraphrasing the Later; also a Palestinian Targum, never official, of the Writings (Kethubim, Psalms to Chronicles), and another, in scant

fragments, of the Prophets. Very characteristic of all is the tendency to tone down; to smooth out the asperities of the original, especially by removing supposed names of persons to guard the glory of God] and many compromising phrases (to shield the honor of Israel), as well as the bold beauties of personification in general. Thus they approach the commonplaces, but, remaining external and external witnesses to the growth of the Jewish soul.

The world-wide Dispersion of the Jews gave them all tongues of the Gentiles (Acts ii, 8-11), and accordingly the translations of their Scriptures were numerous, but all have vanished,—unless some fragments of the Egyptian be preserved in the Christian Coptic version,—with the illustrious exception of the Septuagint, already treated in Text Criticism (q.v.). As rendering possible the Christianization of the ancient world, the day of its birth was a fast day in Palestine and compared to the natal day of the golden calf. Some at least of the Seventy showed acquaintance with Greek literature (as in Job), whence the extremely interesting one to the Greek world and where the Old Testament reflects (say) the Iliad, on the average five centuries older. A reaction from the Septuagint, taken over by the Christians, was the translation of the Pontic proselyte Aquila (guided by Rabbis Joshua and Eleazar), almost by syllables; a supposed reaction from this was the Christian paraphrase of Symmachus, while the Jewish proselyte Theodotion aimed to avoid both extremes. Here opens a chasm of nearly 12 centuries in Jewish-Greek translation. Not till the 14th century did Jewish learning again essay to turn the Hebrew into (Attic) Greek, the Aramaic of Daniel into Doric. A New Greek version (in Hebrew characters) appeared in Constantinople, 1547. The next great attempt to vocalize 'Hebrew Truth' in the world was made by the famous Gaon Saadya (892-942) in his Arabic translation still owned and read by exiled Jews of Yemen, adapted by Abu Said in the 11th century to the needs of Samaritans, and highly valued by the competent. Saadya's foes, the Qaraite, also had their Arabic version but their Tataric was much later (1640). Jewish learning in north France produced no translation of the Hebrew Bible save in detached passages scattered through Rashi's Commentary, and others, as well as in various glossaries. Through the Postilla Perpetua (Rome, 1471-72) of the Christian convert Nicholaus de Lyra (1270-1340), Rashi made a deep impress on Luther's German translation.—Spanish-Jewish learning also guarded zealously without translating the Hebrew text, though Hayyuj of Cordova (1500-1057), by laying bare in a natural nature of Hebrew roots, grounded Hebrew linguistics, and the physician, Ibn Janach (1085-1045?) "Greatest of Medieval Hebraists," by his grammatical studies, paved the path toward a comprehension of the Bible. The great eye-opener, in the way for modern criticism, but did not translate; neither did the Kimchis; Jewry had not forgotten the lesson of the Septuagint. But at the close of the 14th century a Jew turned Isaiah, Jeremiah and part of Ezekiel into Persian and the Pentateuch in Persian by Rabbi
American. But very recently the great design, conceived 1892, of the Jewish Publication Society (organized 1888) has at last been accomplished (1917). Chiefly the worn-out seal of M. Margolis, sustained by the munificence of the Jewish Mæcenas, Jacob H. Schiff — being nothing less than a thorough revision, suited for the synagoge, of the Revised Version of 1885, wherewith has been spoken the latest and best word of their relationship in the translation of the Old Testament.

Christian Translations.—Inasmuch as the two Testaments have held equal rank in the Christian consciousness for 17 centuries, it would seem no useless purpose to separate them in this discussion; accordingly we shall treat them together, except where distinction is expressly made. As we have seen, the sole object of Jewish translations, the all-important Septuagint only partially excepted, was to bring the Holy Writ to the understanding, not of the Gentile but of the Jew himself, to whom the Gentile tongue was vernacular. Likewise, the aim of early Christian translations was to bring the pure "Hebrew truth" home to the mind and heart of the Christian. As the new religion, the "Eternal Gospel," required that its prophecies should have no "thorns" (Rev. xiv, 7), was from the start a crusade against idolatry, a zealous propaganda of monotheism, from the first the audience was mainly pagan, composed mostly of "God-fearing Gentiles" and proselytes to Judaism. Of these, in great part, the faith was built on some Greek version of the Scripture, particularly the Septuagint, and it was in Greek that the first public preaching was spoken and the first records thereof committed to writing, though some very early Christian compositions may well have been Aramaic. For nearly two centuries the Christian seems to have rested content with the Septuagint, subject to slight alterations, but when the Jew disclaimed it as incorrect or inadequate, substituting the literalism of Aquila, the logical loss was keenly felt, and a reply seems made in the loose rendering of Symmachus. This also was soon found insufficient, and in the first great critical essay, the Hexapla, Origen sought to mass all the evidence in point and to show the way clear to the sacred goal of aboriginal "Hebrew" text. As this came more and more to be regarded as altogether unique and indispensable, the one and only record of primitive history, the single depository of divine will, purpose and power, to the more enlightened the need seemed imperative of ascertaining it, if possible, with absolute exactness and completeness. Origen, the most competent explorer, failed, however, to find it, and the search seemed little hopeful. Nevertheless, sufficient appeared to be known.

But the Greek was not the sole Christian consciousness. The noble Syriac language, a variety of the Aramaic, was widely spoken, and various attempts were made at a Christian Targum in this tongue, even now not numbered among the silent. Of these the most successful was the so-called Persiatta ("Simply," "common"), at once faithful and elegant, tinged with traditions of the Jews (whose help made it possible), but often under the spell of the Seventy. Far away, in north Africa and other western provinces of the empire, at an early date Latin had begun to displace Greek,
and the pressing need of a version in that tongue was met in various ways: there is no Old Latin version, but many Old Latin versions, varying indefinitely with the knowledge and skill of the translator and the text of the Greek copy at his hand. It was Lachmann that first restored these modest versions to their place in the text. The Latin Vulgate (for the New Testament text) is now only coming to full recognition. All were strictly popular, rustic in their Latinity already departing from the classic norm at Rome toward the varied Romanic speech of to-day. Gradually even the speech of the Capitol fell away from the Greek, and the need was felt of an authoritative Latin Version. By far the prince of Christian scholars was Jerome; to him Pope Damasus (346–420) committed the task of revision. He began at Rome by setting a gentle hand to the Psalms (383), and Saint Peter's still resounds with his Roman Psalter, introduced at once by Damasus. In 392, as Hermit of Bethlehem, he re-revised the Hexapla, and this Psalter, first introduced in Gaul and hence called Graeca (still held in its place against his third version, the Hebraica) in the Vulgate. On this latter he toiled at intervals for 15 years, learning Hebrew in Palestine under Jewish teachers and guides. Slowly at first, but steadily, his translation (complete but for certain Apocrypha, which he too lightly esteemed) won its way to universal recognition over all others, the greatest single work of Catholic scholarship, and in the fourth Trinitarian session (8 April 1546) it was stamped with the signet of exclusive authority of Scripture in English, and called the Douai Bible (1609). Intended as a corrective of the multiplying Protestant versions, it conforms too closely to the "authentical Latin" to be idiomatic English, and as a tertiary product has no critical worth; nevertheless, it is happy in some turns of expression and seems to have molded the Authorized Version at certain points. There are many such translations of languages, in Arabic, Armenian, Coptic, English, Ethiopic, Georgian, Gothic, Persian and other tongues, ranging over a thousand years. Conspicuous is the Gothic preserved in fragments on the silver-lettered purple Codex Argenteus (ca. 50?) in the Upsala University; Philostorgius (b. 364), as quoted by Photius (c. 620–91), ascribes the Gothic translation of the whole Bible (except Kings, omitted as a weakness) to Wulfovald, Apostle of the Goths, which is stultly gainsaid by L. Wiener in his revolutionary 'Commentary to the Germanic Laws and Mediaeval Documents,' which with his 'Contributions toward a History of Arabo-Gothic Culture' (1, 1917) would overturn the structure of Germanic philology.

Through all the watches of the mediæval night Jerome reigned in the West, the Seventy in the East. As new tongues budded forth on the Latin stem, rude paraphrases appeared, often as interlinear glosses, especially in the Psalms, the book of devotion, and these were gradually improved but remained quite devoid of authority, jealously reserved by the Church for the Vulgate. During the uneasy slumber of the 14th century, premonitions of awakening were faintly heard in widely scattered and far more earnest attempts to get nearer the divine truth in vernacular versions, as the partial Waldensian in Provencal and the first complete French translation of importance. It was felt in Italy in the 14th century, but the first complete English Bible goes back only to John Wyclif and his friends (1382), in which his own share is problematic. A "curialist" till 1374, in the last 10 years of his life he won the fame of a reformer (politico-religious) and the father of English prose, the latter rather by his 'Sermons,' for his English version is poor and slavish to the "Latyn." Germany meanwhile was prolific of translations, and John Hus, following Wyclif along so many lines, among the many improprieties for which he suffered at the stake (Constance, 6 July 1415), produced a vernacular version for his Bohemians. Movable type (1448), by lessening cost, gave wings to the Word. To the Vulgate was the first to leave the press (1452–56), then落到 a dozen German editions, then the Complutenius (1517–20), then the Aldine (Venice 1519). Morning was now on the mountains, and editions after edition appeared in Hebrew, 21 before Luther's rupture with Rome (10 Dec. 1520), among these the first great Rabinic Bible (Venice 1516), dedicated to Leo X by the Christian Jew, Felix Pratensis. Catholics now felt the need of a new version, and many not without merit were made. These, being Latin, were still foreign to the people, who cried for the Word in their own tongue. Luther in his German translation (from the Hebrew, in the Brescia edition of 1494) gave the first great national answer. Himself hardly equal to the task, he leaned heavily on Nicholas de Lyra; but he labored long and conscientiously and well, translating not for scholars but for the man-in-the-street, occasionally in a controversial spirit, and finally (1530–34) erecting an enduring monument of German literature and determining in large measure the German speech, as well as the form of various following translations into other Tenont tongues.*

According to Conybeare, unsurpassed in beauty and because of its fidelity almost as valuable as an original text is the Armenian version of the Old Testament by Mesrop, Sahak, Elmik, and others, with various manuscript help, from the Greek (though Moses of Chorene says Sahak used the Syriac), between 397 and 430, and revised later. Perhaps a century older and hence valuable according to Tertullian's "id verius quod prius," is the Armenian version of the New Testament made from the Peshitta (as was also the related Georgian), but revised from the Greek about 400. The Georgian Bible (from the Greek) is ascribed to Mesrop, inventor of the Georgian alphabet. The Armenian Bible, first printed from one manuscript with text adopted to the Vulgate (Amsterdam 1666, Venice 1733), was first critically edited by Zohrab (Venice 1805). Of minor importance are many versions derived from the Armenian (noted in Scrivener's 'Introduction' and Gregory's 'Prolegomena'), and such as the Philoxenian (lost except 2 Peter, 2 and 3 John, Jude and Revelation) and a paraphrase revised (1616) into slavish fidelity by Thomas of Heraldis (hence in this form called the "Palestinian," a lectionary of the 6th century, formerly referred to Jerusalem. But now, after Burkeitt, to Antioch. France owes her earliest vernacular version to the missionary chief, Pierre de Vaud, the next to Guayard des Moulins (1394, published Paris 1480). At last the first Testament in French print, followed in 1487 by the stately Bible dedicated to Charles VIII and by others similar.

* The Swiss "Zürich Bible" (1529–30), revised frequently and as late as 1595, was only in later parts independent of Luther's version.
BIBLE

655

Immediately upon the appearance of Luther's work the centre of interest in translations was shifted to the English, though not to England, for William Tyndale finding "no place in all Englonde" to ply his task, such was the conservation of the island, retired to Germany, where under Luther's shadow he printed the New Testament in English (3,000 copies, one at Worms 1525), though stopped at Cologne by Johann Cochleaus. In 1530 appeared his Pentateuch, in 1531 his Jonah. In his Belgian prison he begged for a Hebrew Bible, grammar and lexicon, along with warmer clothing, and held out true to the end (6 Oct. 1536), when he was strangled and burned, the pre-eminent hero of English translation. His noble work, though often faulty, remains the unshaken basis of all subsequent English versions, 60 per cent of his Old Testament having gone into the Authorized Version, and the New Testament being retained in the Authorized Version. France, Spain, Italy, Holland, Bohemia all had their vernacular Bibles before, and Germany hers printed in 1466, reprinted 7 times before Luther. But Tyndale's New Testament was the first part of an English Bible in print (1525), and the first English Bible printing was done in England in 1538. In 1535-36 appeared the first complete printed English Bible, based not on originals but on Furst's, and "with the help of six interpreters" (doubtless Luther, Zürich Bible, Vulgate, Pagninus, Tyndale), by the Augustinian friar Michael Coverdale, undertaken at the bidding of Thomas Cromwell and dedicated to Henry VIII. Coverdale was not made of such stuff as Tyndale, but his work contributed to the fineness and felicity of the English. Under the pen-name of "Thomas Matthews" in 1557 John Rogers, who was to Tyndale what William was to Wyclif, published the "Matthew's Bible," being Tyndale's work published and unpublished, supplemented by Coverdale's, annotated by Rogers, for all of which he "broke the ice valiantly" at the Smithfield stake, 4 Feb. 1555. The book appeared and was sold on Cranmer's petition, with the encouragement, and influence, by Henry's authority. Revision followed revision; one by Coverdale, exploiting Münster's Latin version (1534-35), was called the Great Bible, or the Chained Bible, was introduced into every church, and often chained. Public interest was intense and the clergy complained bitterly that even at divine service the people would read English Scriptures rather than hear English sermons. This Great Folio, begun in Paris, "furnished in April 11, anno MCCCCC CXIX," shows Henry on the title page, giving the 'Word of God' to Cranmer and Cromwell, to give to the rest. The second of seven editions (1539-41) in 1540, called Cranmer's Bible, from Cranmer's long preface, contains the addition "This is the Bible appointed to the use of the Church of England...in the first usage of nearly four centuries familiar. After 1546 this was the only Bible allowed. Tyndale's was forbidden in 1543, no notes were allowed, and "no woman (unless she be a noble or gentlewoman), no artificers, journeymen, serving-men, under
the degree of yeomen . . . Husbandmen or labourers should read or use any part of the Bible, no matter what it相干于 crimes and imprisonment."

Fleeing from the flatly that broketh under Mary, the Puritans Reformers gathered with John Knox at Geneva, home of Calvin and Beza, and there headed by Whittingham, revised the Great Bible into the more literal Geneva or Breeches Bible (so-called from its adopting Wyclif's rendering of chagoroth in Gen. iii, instead of aprons or girdles). Annotated, divided into verses (for the first time in English), and convenient in size, this Bible from the start (1557-60) won the hearts of the people, reaching 100 editions in 50 years. But as Geneva it could never please the bishops, who under the lead of the learned Archbishop Parker tried to displace it with their (eight) "Bishops' Bible" (1562-66), but failed for lack of unison, too many cooks spoiling the broth.

After such manifold preparation the time was ripe for the Revision of 1611, first suggested to King James by the Puritan Dr. John Reynolds in conference (Hampton Court, January 1604). An "holy work to be amassed in the church." Working under instructions from James to follow the Bishops' Bible wherever possible, to retain old ecclesiastical terms, to reject marginal notes except in explanation of the Greek or Hebrew, to translate severely and afterward compare — and translating in six groups, two at Westminster, Oxford and Cambridge each, 47 in all, with three or four of the most ancient and grave divines in consultation, they completed the whole work in 33 months, revised it in nine additional, and in 1611 gave it to the world fulsomely dedicated to the King, and with a remarkable preface by Miles Smith.

As may be inferred, its critical authority is feeble, but its literary charm and its emotional appeal are irresistible; its hallowed rhythm still enters the heart that no longer understands. In general faithful to the sense, to the form, and even to the color of the original, in its idiomatic flavor it sets up a standard of excellence that both the modern reader regards with delight tempered with despair.

To perfect a work of such unrivaled mastery by the "great helps" of incomparably superior knowledge, and enlarged and corrected historical perspective is difficult though not an impossible task. But for many years the restless progress of thought and study along the whole circuit of biblical inquiry had made it evident that this Authorized Version (so-called though never publicly sanctioned by King or Convocation or Privy Council or Parliament) could no longer in reason be held authoritative. Not a few private attempts were made to provide translations at first of particular books, afterward of the whole Bible, more fitted to meet at once the more exacting critical demands underlain in the altered time of age; but of course all such were doomed to failure, though some were not lacking in merit. At length, at instance of the Convocation of Canterbury, February 1870, a thorough revision of the Authorized Version was undertaken and carried to completion in 1885 (though the Apocrypha did not appear till 10 years later). The revisers worked in four groups, two in England, and the other two in America, appointed; invited 18; on the New Testament, appointed six, invited 22, two (advisory) in America (the second in each dealing with the Apocrypha), including such masters as Cheyne, Davidson, Driver, Field, and others. The committee was the two Smiths (R. P. and W. R.). On the New Testa- ment their meetings were 407 up to May 1881; on the Old Testament 792 up to 20 June 1884; every verse was minutely discussed and the whole submitted to three revisions. A deli- cate and dangerous undertaking! No wonder that four of the invited declined, and that 10 died before its completion. The result, not seldom disappointing, has not passed unchallenged but has been subjected to a severe cross- fire of criticism, in large measure intemperate and unjust. A complete reconstruction or aesthetic with newer critical claims has not indeed been effected, but undoubted progress was made, and the enormous labor was far from thrown away. The Revised Version is steadily forcing its way to be admired, though it has by no means displaced its predecessor. The American advisers were much more plant to critical pressure than their English brethren, and the Standard American edition (1901) embodies many changes unaccepted by the latter.

Nevertheless, even this latest revision is far from final. While the conservatism of accept- ing the received Hebrew text should not be condemned, it seems certain that a thorough revision of that text is demanded no less im- periously than of the English translation. To be sure, the task is one of extreme difficulty, for which the time is not full, and generations or even centuries may wait on its fulfillment; a wholly satisfactory result may be attainable only by altering profoundly the statement of the problem; but a very notable advance is even now practicable at many points. Similar but less serious and significant was the Lutheran re- vision projected at the Eisenach Church Con- ference (1861-63). The result ("Probelat") tentative, the modern reader regards with delight tempered with despair.

To perfect a work of such unrivaled mastery by the "great helps" of incomparably superior knowledge, and enlarged and corrected historical perspective is difficult though not an impossible task. But for many years the restless progress of thought and study along the whole circuit of biblical inquiry had made it evident that this Authorized Version (so-called though never publicly sanctioned by King or Convocation or Privy Council or Parliament) could no longer in reason be held authoritative. Not a few private attempts were made to provide translations at first of particular books, afterward of the whole Bible, more fitted to meet at once the more exacting critical demands underlain in the altered time of age; but of course all such were doomed to failure, though some were not lacking in merit. At length, at instance of the Convocation of Canterbury, February 1870, a thorough revision of the Authorized Version was undertaken and

The number of such exceptions, 7,000 in 1611, has since the conv, much enlarged, and the marginal references have swollen from 9,000 to 60,000.
large portions of nearly all the documents; the
form of the Scripture is hardly less
important than the substance.
A labor of Hercules is the Polychrome or
Rainbow Bible ("Regenbogenbibel") of Paul
Haupt and his company, which would visualize
the composite character of the Old Testament
by printing older incorporated documents or later
sections on back grounds of different
colors, both text and translation. This
spectral effect is very striking, and some way of
distinguishing the sources in type seems desirable,
and various devices have been employed.
However, though the composite structure is be-
yond serious dispute, the complete disintegra-
tion and just distribution of components are
still very far from perfect, the most plausible
color-scheme is at best provisional. But
Haupt's S. B. O. T. (Sacred Books of the Old
Testament) is a monument of erudition, invalu-
able for the polychrome attempt to modernize the
Bible into journal, to make the ancient—whether his-
torian, legendist or mythopoet, whether moral-
ist or parabolist, whether prophet or apostle—
speak the language of the gutter—all the attempts are so ill-advised and proceed from conceptions gone so far astray that they may be passed by in silence.

Examples of translations named from certain peculiarities have already met us; such too is the Doway reading at Jer. viii. 22 "Is there no rosin in Galaad?" and thence called the "Rosin Bible." The tale of such may be found in the great dictionaries. Often the translator stands before the alternative of being understood amis not at all. "The Father of lights, with whom there is no variableness, neither shadow of turning" (Jas. i. 17). The reader is content to think of "the least bit of turning." The American revision gives "variation" and "shadow that is cast by turning," which bewilders the reader, who still finds no hint of astro-
nomical "parallax" and "eclipse." Again, he
seems to understand the Authorized "course of nature," but hardly the Revised "wheel of nature" or "birth," for he is not prepared for Old Testament coming.

The false notion that the Bible, at least the New Testament, is crude and artless, the naive record of simple and unlearned men, gives rise to endless misunderstand-
ing.

In modern times the original motive of
Christianity, the "conversion" of the world of polytheists and idolaters to Monotheism, the
worship of the One God, has reasserted itself in
a consuming missionary zeal, which has ex-
pressed itself in a determined effort to bring the
power of salvation, to the mind and heart of all men, by translations into every tongue under heaven, so that modern
conversion reminds one of the angel
hearing the "Eternal Gospel," "Fear God and
Give Him Glory" (Rev. xiv. 7). Far in the van
is the British and Foreign Bible Society
(founded 1804) credited with translations into
over 450 tongues, followed by the American
Bible Society (1808, 1816) with a credit of over
150 tongues. Of course, there is here no ques-
tion of a "true" religious translation, of inten-
sion, but rather of difficult adaptation, as when
"Lamb" becomes "Little Seal" in Eskimo, but
these devoted labors have at least borne notable
philologic fruit.

In glancing back over this immense range of
translations we behold three towering apart,
above and beyond all others: the Greek (Sep-
tuagint), the Latin (Vulgate), and the English
(Authorized). Of these, the chief in impor-
tance is the Greek, since it conditioned the ap-
pearance and triumph of Christianity; next is
the Vulgate, the authoritative voice of the
Roman Church to so many millions for so many years; last in importance though first in
literary excellence is the English, which now
perhaps speaks to a larger audience than any
other, than even the Vulgate itself. Next in
eminence is the German (Lutheran), and far
below it next the Syriac Peshitta. Of all five
the German bears most distinctly the stamp of
the individual spirit, and in much less measure
the Latin, whereas the Greek is a growth of
centuries, and the English the issue of a collec-
tive effort consummating the long-drawn labors of
nearly nine generations. The common con-
sciouness has passed into the Three Chief
Translations and therein found expression; and
in spite of errors which the following years will
constant detect and expose in number, these versions will scarcely be surpassed by any
future rivals. The corroboration of time has
down these mountain summits, but it is very
unlikely that the energies of the national spirit
will ever upheave any others to such solemn
and commanding heights.

WILLIAM BENJAMIN SMITH.

BIBLICAL ARCHEOLOGY. Old
Testament.—Archeology is literally an
account of the old, but it has become limited in
application, first, to the old in relation to man,
thereby distinguished from geology and pale-
ontology, and secondly, to man as a creator of
Civilization, thereby distinguished from paleo-
logy and palaeontology. As an account of
ancient civilization, archeology itself divides
into antiquarianism, dealing with antiquities,
the mere physical products and agents of ancient
civilized life, such as houses, temples, tombs,
tools, arms, household articles and the like, and
other artifacts, and epigraphy, which deals with
the written legacies of ancient peoples, such as
inscriptions on stone, brick, papyrus, pottery,
vellum, parchment. The former makes appeal
to our artistic nature, but the documents are
laden with far rich and more definite
information and historic content. Biblical arche-
ology draws upon both for the illumination of
the Scriptures, but in far larger measure upon the
second.

The history of the Holy Land, and therewith
the peculiar significance of the people Israel
with its literature and religion, were decidedly
conditioned, though not determined, by the
geographic singularity of its lying on the high-
road of nations, midway between the two
cradles of civilization, Egypt and Mesopotamia,
the ever-growing deposits of the Nile and of the
Twin Rivers. The independent civilizations
of these valleys reach back in high develop-
ment to remote epochs, being definitely cer-
tified in Egypt 4240 B.C. (beginning of the first
Sothic Cycle, of 1460, i.e., 4245 years, circuit
of New Year's day through the year), and the
Nippur tablets carry back the Mesopotamian
perhaps still further. Between these two lay
Canaan, for millenniums apparently little in-
fluenced by either, but gradually drawn into the widening vortex of their ambition and empire. The earliest Hebrew tradition recognized this double dependence, reaching out one hand to the Nile, and the other to the Euphrates. According to Gen. xi. 27, xii. 4, Abram hailed from Chaldean Us, or Harran, whence he went into Canaan at the host of Yahveh. Again it is to Paddan-Aram (Gen xxviii, 2) that Isaac sends Jacob to get him a wife among his own clansmen. Such early contact of East and West is not unlikely, since the inscriptions attest that Lugalzaggisi, King at Ereh of all Babylonia about 2800 B.C., extended his sway from the Persian Gulf to the Western Sea, and his successor, the great Sargon, is even said to have crossed it. But again, even Abram is brought into close relations with Egypt; he goes thither in time of famine (Gen. xii, 10), dwells there, departs thence, and his concubine, Sarah's maid Hagar, is an Egyptian. Much more, however, the most outstanding facts in the racial consciousness would seem to be the descent of Jacob and his family into Egypt, the sojourn and persecution there, above all their deliverance through the high hand and outstretched arm of Yahveh, followed by the legislation at Sinai and the wandering in the desert. It would appear then, that Egypt bulked far larger than Mesopotamia in the national imagination, but this does not quite prove that the ties of blood and history were really stronger. Indeed, as already observed, it is not certain that Egypt is always mentioned by the Hebrew text, and critics of the highest eminence suspect a confusion of geographic names at the base of the whole Egyptian story.

When now we ask about the witness of archaeology to these Biblical statements, which undoubtedly represent the popular Hebrew consciousness, the answer is somewhat disappointing. Palestine is geologically a huge fault in the earth-crust, the western strata having slipped down nearly a mile and become extremely crumpled in the dislocation. This has resulted its extraordinary variety of surface, face, climate and production, well matched by a long and highly varied racial history gradually coming to light from the mounds that dot it and the caves that afford glimpses of man 10,000 years ago. Since as early as A.D. 333, the Holy Land has been a goal of pious pilgrimage and loving inquiry and exploration. A little later the learned Eusebius composed (and the still more learned Jerome turned into Latin) the "Onomasticon," a careful list of the places in Palestine that are named in the Bible, identifying as many as possible and adding data concerning distances and events. His general method, though not his alphabetic order, has been followed by many travelers and culminated (1841, 1856) in the capital 'Biblical Researches' of the well-known Rev. A. B. Robinson, which he carried on for 21 years as Professor of Biblical Seminary, who explored the Holy Land in 1838 and 1852, armed with no instruments, except an ordinary surveyor's and two pocket compasses, a thermometer, telescopes, and measuring tapes—not with spade; it was Renan (1860) who suggested but only feebly exemplified the supreme value of this latter. About the same time (1848) the depression of the Dead Sea, first recognized in 1837, was determined by another observer. This was of the navy, as nearly a quarter-mile below the Mediterranean. Religious zeal soon began to organize itself for minute study of Palestinian topography, in the Palestine Exploration Fund (London 1865) followed by the American Exploration Society (1870), and American Palestine Exploration Society (October 1870)—one main object of whose efforts was attained in the publication (1880) of a consummate map of Palestine. The Germans followed with their "Palestine Society" by R. A. S. Macalister, (1877) and its important journal (Zeitschrift). Renan's suggestion was followed after nine years by Warren in excavating on the Temple Hill, Jerusalem, and laying bare the famous Robinson's arch*, but not till 1890 did the scientific use of a Jacob de T Directors of Tell el-Hesy (the ancient Lachish), under direction and often under the hands of the renowned William M. Flinders Petrie, in service of the Palestine Exploration Fund. His practiced eye recognized the potsherds exposed by the corrosion of an intermittent stream on the side of the 120 feet high mound as indicating the ruins of by-gone ages, and his excavations published in 1891, continued in 1892 by Dr. F. J. Bliss, revealed city upon city, eight in number, the oldest of the Hebrew text, and the critics of the highest eminence suspect a confusion of geographic names at the base of the whole Egyptian story.

*That the Biblical praise of Palestine is not exaggerated appears from the account of Simhe, a high-placed Egyptian, who writes about the Levant, "It is a goodly land nay, the Vaul (Ahab? Gen. xxvi, 24, 1 Chr. i, 40); Pigs were in it and vines. More abundant than water its wine, Copies its harvestious oil. All fruits were upon its trees; Barley was there and spelt. All cattle without end."
THE BLACK ARCHAIC BABYLONIAN TABLET

One of the earliest known inscriptions, thought to be at least 7000 years old. As tentatively deciphered by Prof. G. A. Barton, it defines the boundaries of a "field of clay" belonging to the priest of Sallitir."
1st, 2d, 3d COLUMNS OF SENNACHERIB'S HEXAGONAL PRISM
The middle column tells of his cooping up Hezekiah as in a cage. In the British Museum.
From Bezold
have uncovered at Tell Hum (Capernaum) a synagogue of the 4th century A.D., and below it the floor of an older structure which some fancy may be mentioned in Luke vii, 5. H. Clay Trumbull, followed by C. M. Cober and many others, has thought to identify the Kadesh-Barnaa of Numbers xxxii, 8, with the present Ain Kades, which Woolley and Lawrence hotly contest in the interest of Kossima (‘The Wilderness of Zin,’ 1912). Also the Assumptionist Fathers of Notre Dame de France have uncovered streets on the western hill sloping east, south of the present city wall of Jerusalem, and think they have found the house of Caiaphas (John xviii, 24; Matt. xxxvi, 3). It is seen that the spade has made wonderful revelations, widening immensely the horizon of Palestinian history, but has dug up little of direct bearing on the Bible, beyond a long array of objets d’art too numerous to mention or even classify. Civilization after civilization, often of no mean order, is revealed surging over the Hebrew Monthly (1000-900 B.C.S.), appearing only as a comparatively brief interlude in the grand drama of history. The Hebrews themselves seem to be of dubious antecedents and connections, and we are startled at recalling the repeated charge of Ezekiel (against Jerusalem): "Thy birth and thy nativity is of the land of the Canaanite; the Amorite was thy father, and thy mother was a Hitite" (xxvi, 3, 45). The Amorite has long been known as the elder inhabitant of the land, and the Hitite emerges slowly from the mists of antiquity as a composite race wide-scattered from the Aegean to the Tigris, from the Euxine to the Jordan. The conquest of Canaan looks like the work of centuries and of widely separated but related tribes invading at various times from different and distinct quarters and with varying and uncertain success. Coming to closer quarters, we ask what does archaeology tell us of Bible history and worthies, and first of Abraham? On a tablet dating from 1965 B.C., it is written that "Abraham, son of Aviel-Ischar, for one month has hired one ox broken to the yoke." Again "Concerning the 400 shares of land, the field of Sin-idinam, which to Abaramma To lease, thou hast sent ... A shekel of silver out of the rest of his field brought Abaramma...". These tablets and two others in which Abaramma is mentioned as owning a field come from Dilbat opposite Babylon on the Euphrates midway between Ur and Haran. What the name is genuinely Babylonian, and the region agrees with the Bible text, but there is no suggestion of identity between this humble tenant-peasant and the patriarch in Genesis. Over a thousand years later (Suseh), ‘Shashak’ speaks of a place, ‘The field of Abram’ (near Hebron?), but this does not enlighten us. Still another tablet, of the Hammurapi era, records the lease of a wagon for a year, declaring ‘unto the land of Kittim He shall not give it;’ which bears crested witness to the intercourse between Mesopotamia and the western coast. A far more important historical relation has appeared to some in Gen. xiv, the account of the triumphant foray of Abram, dwelling by the terebinths of Mamre, within reach of his household, against the four eastern kings already victorious over the five kings of Pentapolis. Schrader, followed by many, identified Amraphel King of Shinar with Hammurapi King of Sunset (Mar-tu), through a supposed corruption, Amrahi. But later scholarship questions or denies outright any such connection. Similarly, the Chedrolaomer of Gen. xiv. 14 has been identified with the ‘King of Elam, Kukumal’ (read ‘Kudurlakhamal’), by Savce and others, in the cuneiform inscription. But the reading is unwarranted and fails to identify. Again, the same Chedrolaomer has been sought but not found in Kudur-Mahug, Father of Sunset (Mar-tu) in another wedge-writing, where ‘Sunset’ or ‘Westland’ means not Palestine but Babylonia. Other imaginative identifications are ‘Arioch, King of Ellasar, with Arad-Malkua (read as Sumerian, ‘El-esheku), and ‘Tidal, king of nations,’ with ‘Tudhulia, son of Gazza.’ But the tablets of the 4th century celebrate Babylon’s overthrow by Elam, Kukumal’s conquest of Hammurapi’s capital! They doubtless deal with centuries after Abraham. But even if the identifications were complete, it would only discredit Genesis: for that Abraham with 318 household servants should attack and disarm the victorious armies of the four kings and ‘return from the slaughter of Chedrolaomer’ is too heavy a tax upon our faith. If the whole thing is in some way symbolic, but semi-historic, the facts in the case are too deeply disguised for recognition.

When we turn to the West and ask concerning the early Egyptian connections of Israel, the gleaming is scanty. ‘Sargon, mighty king, king of Agade’ tells of his exposure in a basket of reeds and of his rescue by ‘Akkil, waterman.’ There need be no copying of this in the account of Moses, but rather independent elaboration of a favorite motif; the Egyptians, of course, understand it all as a part of the dream-myth of the hero-birth, the basket as the womb, and etc. Hitherto, King Merenptah (1225-15) has enjoyed the ill-fame of being the Pharaoh of the Exodus; but in 1896 Petrie discovered a stele inscribed with his pæan of triumph in which, proclaiming his victory over Lybiots, Hittites, Canaan, Phenicia, he adds: ‘Israel is wasted, his seed (fruit, crops!) is not.’ Yet it is uncertain, from the absence of the ‘determinative,’ whether a settled people be meant. In any case, the implication that Israel had been overthrow in Palestine is puzzling and seems to call for revision of previous ideas. Hardly less bewildering is the frequent reference in the Tell el-Amarna letters (to Am monoepithet II and IV, from the vassal King of Jerusalem, Abdi-Hipa) to the inroads of Habiri, who seem to be Hebrews, nearly 150 years before the supposed Exodus. The implication seems to be that the Hebrew invasion was a century-long process with no apparent outset from Egypt; a view not antecedently improbable. Of nearly the same date is a letter exhumed by Sellin at Tell el-Taanneh (1903) and containing the proper name Ahi-ya-mi, apparently the Babylonian for the Hebrew Abijah or Abiain (as Barton thinks) the knowledge of the Holy

**O**r Kadur-lagigummar.

**F**our hundred clay tablets in Babylonian, discovered (1887-88) on the site of the new capital of Ammonophia IV, is said, by an Egyptian woman, accidentally, and sold for two shillings!
Name Yahveh at the early period in Canaan.

Of somewhat similar purport is the discovery of the name "Yakub-ilu" (in Hebrew, Jacob-el) of three men in Babylonia as early as 2161-44. Under Hammurapi, a fourth gave his father's name as Yakub, the first ancestor of "Abarama" by 190, the last by 75 years. Seven hundred years later (1478-46) Thothmes III records the conquest in Palestine of a city Jacob-el (in Egyptian Ja'-k'b'-ra), which combined with the biblical history of Jacob suggests the partial derivation of the Chosen People in Palestine from immigrants from the North East. Similar conjecture is suggested by the similar presence in a Babylonian document (c. 2200) of the name Yashub-ilu (Joseph-el), along with the city name Ya-sha-pana (Joseph(?)-el) in Thothmes' list. The Bible account seems to point toward a powerful more or less independent Josephine element in the Chosen Race. The touching story of Joseph and his temptation is remarkably paralleled in the Egyptian Tale of the Two Brothers (written for the crown-prince, afterward Setii II. 1209-05), as well as in the case of Bellerophon and Anteia (II. vi. 160ff) and elsewhere; but again it does not seem to be borrowing, but rather independent exploiting of an obvious and favorite motif. Among the El-Amarna Letters are two of the Amorite vassal, Aziru, to Dûdu (Hebrew, David), a Semite, apparently all-powerful favorite of the King Amenophis. Again, an inscription published by Brugsch (in the Egyptian Prose X. 117-89), tells how Amarna of (2800) prayed to Khnum, god of the Nile, to prepare his city of El-Kab against such a famine as he had seen in Egypt, much as we read of Joseph. Whence it appears that the historical background upon which the pleasing picture in Genesis is painted is sufficiently justified and exact.

If the illumination shed by archaeology on the times of the patriarchs and the Exodus is faint, scattered and uncertain, the light cast on the period of the Judges is almost "darkness visible." Only a remarkable report of one of the "Wen-Amon, sent from Egypt to procure logs from Lebanon by the great and august barge of Amon-Rc," might have been of a modern consul or special envoy and sets forth in lively language the difficulties and dangers of primitive commerce; but beyond confirming the report of Lebanon, attesting the disorganization of the maritime Palestinian dependencies of Egypt, and presenting a parallel to "Saul also among the prophets" in a noble youth whom "the gods rejoiced and cast into frenzy," this admirable state paper offers no points of contact with the contemporary Israel of Gideon and Deborah. The temple of the Lebanon cedars far anterior to these Judges. Nearly 2500 years B.C. Gudea, the noted ruler of the Babylonian Lagash, in restoring the temple of Ningirsu, "brought from Amanus, mountain of cedar, cedar wood where the length was 60 cubits, as well as great cut stones from Ummanu, mountain of Amorites." Such was the enterprise of the ancients! Not till after the establishment of the monarchy does the Hebrew step forth clearly into the light of profane history. Sheshonk I (954-924), the Shishak of 1 Kings xiv, 25, having plundered Jerusalem in the fifth year of Reoboam, pictures his victory on the walls of his pylon at the Karnak temple, affixing a list of conquered towns, 120 still legible, indicating conquest not only in Southern and Northern kingdoms, even beyond Jordan. Ashurnasirpal (884-860) boasts, "In the great sea I washed my weapons," but seems to have passed by Canaan. But his son, Shalmaneser III (860-825) claims, perhaps with exaggeration, to have vanquished (854) an extensive alliance including 2,000 chariots, 10,000 men of Ashur, the Israelites and 1,200 chariots, 1,200 horsemen, 20,000 men of Hadad-Idri (Benhadad, in 1 Kings the determined foe of Ahab). This king has chronicled many campaigns and set up a black obelisk depicting "Ichu son of Omri," of whom be "received tribute," bowed and kneeling before him. Scripture is silent concerning those exploits. Again, Adad-shirifi (810-782), unnamed in the monuments of Babylon, enumerated in conquering "advanced... the land of Omri... to the coasts of the great sea." The warlike Tiglath-pileser IV, whose inscriptions were badly marred by Esarhaddon, vaunts a victory over "Azariah the Yauedan," "of Yaudi" (738), but this was perhaps Seth in Syria, named again in Sargon's inscription of 717; The Assyrian conqueror is the Pul to whom Menahem of Israel gave a thousand talents of silver as tribute, the price of his throne. Six years later, Pul swept again in full triumph over the West, Juda being saved only by the tribute of (Jeho) Ahaz (2 Kings xvi. 7-10), presented in person at Damascus. The mutilated inscription declares "The country of the house of Omri... all its people... I carried away unto Assyria. Pekah their king they had overthrown. Hoshea... over them I placed. 10 talents of gold... talents of silver I received as tribute from them." This greatly overlaps the statement of 2 Kings xxv. 29. Hoshea rebelled, and Shalmaneser V (727-22) besieged him in Samaria but did not live till his capture, recorded by Sargon (721-706) for "my first year," - 27,290 people from its midst I carried captive," which accords reasonably well with 2 Kings xxv. 1-4.

The deportation was small, even when augmented by that of Pul, far less than has occurred in recent cultured times. It was rather by absorption at home that the "ten tribes were lost." For ages this Sargon was known from 18. xx. 1 as conqueror of Ashdod (711). His name was next discovered when Botta exhume his palace in 1845. It is Sennacherib (706-681) that bulks largest in Judah's history. His inscription relating to his campaign of 701 tells of his delivering Ekron's king Yadi m of "Hezekiah, the Judaeans... to whom his people had delivered him" in "fetters of iron," - out of the midst of Jerusalem; that he captured 46 of his (Hezekiah's) strongholds, 200-150 people... I brought out of their midst with countless booty." Hence it is thought these tablets an "engaged in the transfer of human chattels."
A Sumerian-Babylonian Dictionary, Two Sections of Four Columns Each (Ca. 3000 B.C.). The second and third columns contain respectively the character and its name; the first and fourth respectively the Sumerian and Babylonian equivalents. — From the Yale Collection, by courtesy of Professor Albert T. Clay
Babylonian Tablet Inscribed with the Oldest Known Laws (Ca. 1750 B.C.), the supposed basis of the Hammurabi Code.—From the Yale Collection, by courtesy of Professor Albert T. Clay
up like a caged bird in Jerusalem." Deserted by "Urbi and his favorite soldiers," Hezekiah "saw calamities and infestations" and "endless treasures," also his daughters, the women of his palace, male and female musicians he sent after me to Nineveh, my capital, and sent his messenger to present the gift and to do homage. From this much-debated inscription it would appear, quite in accord with Is. xxxvi, xxxvii, and 2 Kings xviii, xix, that Jerusalem did not actually fall to the Assyrian, but that he departed to Nineveh, leaving his army behind. However, the extent of Hezekiah's disaster is only vaguely hinted in the Scripture, and no intimation of the angelic slaughter of 185,000 Assyrians is found in the wedge-writing. Some, as Meinhof, would accept this latter, whose minuteness inspires credence, at its face value and regard the Biblical account as confused or garbled; others, as Winckler, refer 2 Kings xix, 9-36, to a second expedition, about 691 (when Tirhakah first ascended the Ethiopian throne), and the inscription to the first expedition only—though this seems impossible to Sennacherib. At Nineveh (2 Kings xix, 36) is clearly implied in the close of his inscription. This latter however strongly suggests that something happened to the Assyrian to call him away, and G. A. Smith, followed by others, in view of a passage in Herodotus (II, 141) telling how Egypt was delivered from Sennacherib's host by field-mice that ate up their quivers, bowstrings and shield-straps "in the night," conjectures that it was the bubonic plague that paralyzed the "might of the Gentile," and became in the Egyptian tradition a "multitude of field-mice," vehicles of the pestilence, but in Hebrew imagination the Angel of Yahveh. In these accounts, then, we see men as trees walking. An inscription of Esarhaddon (689-669) names *Manassah King of Judah* as second among "22 kings of Hitite lands," whom "I overthrew," confirming 2 Chr. xxxiii, 11, and Ezra iv, 2. Asurbanipal (669-626) also appears in Ezra iv, 10, characterized as the "greatest and noble Osmappal. In Is. xxx, 1, 2 Kings xx, 12, 2 Chr. xxxii, 31, we find Merodach-Baladan sending an embassy to congratulate Hezekiah on recovery from illness; Sennacherib's inscription of 703 tells of the overthrow of the former at Kish; the embassy was doubtless to induce the latter to rebel. The many inscriptions of the highly religious Nebukadrezar (Nabukdurni-nuzur, "Nabu, border-mine defend") relate chiefly to his buildings (Dan. iv, 30) and pass by his Judaean conquests. Inscriptions that merely contain Bible names are too abundant for any specification. The Siloam inscription, which may illustrate 2 Kings xx, 20, has already been mentioned. The celebrated "Stone of Meshah" the King of Moab mentioned in 2 Kings iii, 4, discovered by Klein 1868, and later finally lodged in the Louvre, contains a long inscription containing the subjection of Moab to the house of Omri for forty years and its deliverance under Mesha, whose nature is best known to us in 2 Kings; the two scarcely at all overlap, their viewpoints being wide apart. It remains to add that the inscriptions show clearly enough that Babylon fell to Cyrus under the usurper Nabunaid (not to Darius, as in Dan. v, 31, not under Belshazzar, as in Dan. v, 30), who (and not Nebukadrezar as in Dan. v, 11-18) was father of Belshazzar. They also make clear how the later Isaiah could speak so knowingly of Cyrus (xlv, 28-xxxiv, 5). On the other hand, Pinches and Clay have published two tablets which may indicate that Belshazzar was in some way associated with his father Nabunaid in sovereignty. On the whole, it seems likely that the author of 'Daniel' was too far removed from the situation to write of it with correctness. The famous inscription of Cyrus celebrates how he triumphed as the chosen instrument of Marduk (not of Yahveh, as in Ezra i, 1-4), how he took "Babylon without war or battle," how he showed mercy and justice, how he reversed the stern policy of Tiglath-pileser IV, for two centuries prevalent, and restored the deported to dwell, the people in their homes, the gods in their eternal shrines. Such was his general policy, not his special favor toward the Jews. A special decree in favor of the latter (as in Ezra i, 1-4) seems possible but unlikely. Such are the main points of historical contact between the Bible and the inscriptions. Another important matter is that of literary resemblance or contrast. The vast Egyptian and Assyrian literatures continually emerging to light raise this question afresh at each new decipherment. With the first chapters in Genesis one must compare the Seven Tablets of the Babylonian Epic of Creation. Minute treatment is not possible in this connection; suffice it that critics feel sure that there is intimate relation at a number of points, though the discrepancies are far greater and more numerous. To try to trace in the two accounts agree in assuming a primeval chaos of waters,—in Hebrew Tehôm, in Babylonian (Mummu) Tiamat, cognate terms, like English moorow and German Moor. But Genesis is monothetic, while the epic is polytheistic, and though vivid in its manner of the god Marduk's struggle and triumph, it by no means approaches the serene sublimity of the fiat of Elohim. Yet the notion of cosmic Creation as a victorious struggle against Chaos had a charm of its own and seems to appear here and there in the Scriptures, as in Job ix, 13-14, where "Rahab's helpers" seem to be the helpers of Tiamat in Tablet IV, 105-18. Also in Ps. lxxxiii, 10, and Is. ii, 9, Rahab is like Tiamat. Similarly Job xxxi, 13, seems to recall Marduk's cleaving of Tiamat (IV, 93-104, 135-140). Once more, the "Leviathan" of Ps. lxiv, 13, 14, Job iii, 8; xli, 19-21, Is. xxvii, 1, remind us of Kingu in the Tablets, the spouse of Tiamat. Lastly, to the present writer the noble Old Psalm, especially in verse 4, "the echo and glory the triumph of the cosmicogonic God over the turbulent chaos (of Tehôm)." In another tablet is found a distant resemblance to the second account of creation in Gen. ii, 4ff, as well as in the greater part of Gen. vi, where "Arru oaved her hands, Clay she pinched off and spat thereof, Eabani, a hero she created,"
Exalted offspring, with Ninib’s might. Once more in the myth of Adapa, who “broke the Southwind’s wing,” critics detect sundry suggestions of the fall of man in Gen. iii. In spite of countless disparities, the atmospheres are alike. Moreover, the antediluvian patriarchs are matched in the long-lived Babylonian kings of the tablets and of Berossos, and even their names have been equated by Barton, extremely interesting results, which cannot be detailed in these column. Very striking resem cheous to the account of the Flood in Genesis are found in the 205 lines of the immense Gilgamesh-epic dating from Babylon, 7th century, but doubtless elaborating far older material. Ut-Napotim (day-life), or in the Nippurian version, Zis- giddu (life-day prolonged) figures in place of Noah. The essential features of the Bible story all appear in the Babylonian, along with plentiful polytheistic additions: the warning from heaven to the hero alone, the building and pitching of the vessel of safety, the embarkation, the “mighty rainstorm,” the ruin it wrought, the cessation when “the sea calmed, the destruction abated, the flood ceased,” the settling on the mount (Nair), the sending forth and sparing of the fowls and of the raven, the disembarking and sacrifice, not however the rainbow (but compare the ‘Iliad, XI, 271: Three on a side, and they likened to rainbows set of E. K. Ker.”

High on a cloud, as a marvel to mortals articulate-speaking.

Another more fragmentary version of the Flood-story from earlier than 2000 B.C. has been found at Nippur and recently published (1914), and there are still others. The Babylonian poem is well worth reading as literature, far surpassing the Biblical in vividness and vigor, but as far surpassed in the inaccessable monothetic sublimity of the latter. The certainty of community of origin in this case is reflected upon other parallels less exact. The Flood seems to have been a favorite theme for Oriental imagining, but its primitive meaning has not yet been made clear.

Recently (1915) Stephen Langdon has published ‘The Sumerian Epic of Paradise, the Flood, and the Fall of Mankind’ from a Nippurian tablet antedating 2000 B.C. It differs very widely from the accounts already mentioned, but Langdon’s interpretation is very vigorously rejected by other scholars, such as Barton, Jastrow, Prince, who find nothing about Paradise, Flood or Fall, but rather an imagination concerning the origin of a city and of social life and the beginning of Agriculture, a view certainly favored by their translations. The likeness of Tugtu (or Takku) to Adam and Noah is faint. One of the most important discoveries ever made amid the monuments was that of the Code of Hammurapi (2104-2061), on a block of black stone in three sections a-burned (December 1901, January 1902) by the French under de Morgan at Susa, whether it had been taken from Marduk’s temple in Babylon, where the Semitic version of elder Sumerian laws was set up for the Semite to read them. These codes made a number, the oldest known, present very many points of agreement with the Mosaic law, and naturally very many more of difference. They contemplate a far more complex and highly organized state of society than the Hebrew, though more than a millennium older. The consciousness that dominates them is moral and jural, whereas that of the Pentateuch is ritual and religious. It cannot be made out that the latter has borrowed directly from the former, but a certain consciousness is distinctly shown in many notable parallels. A similar remark, perhaps more emphatic, may be made touching the Carthaginian law of Sacrifices (of 5th or 4th century B.C.) is it related to the Biblical? It is a far cry from the Pentateuch to the Psalms, and we are prone to think of the Psalter as the most peculiar book of a peculiar literature; yet it is exactly at this point that the Hebrew-Babylonian approach is nearest. The wedge-writing abounds in Psalms, especially the pentitical, which often reveals the soul and a sense of sin with great distinctness. In general they are frankly polytheistic—yet intensely earnest, god after god being asked to intercede with some other,—though sometimes bernalistic, as when Bel or the Moon-god Sin is passionately and exclusively invoked in high wrought imagery and exalted conceptions, or in the Akkadian Hymn to Marduk (1300): Whose lot the throne of heaven, whose will is eternal mystery. Thou makest it plain in heaven and on earth. Bid the sea, and the sea obeys thee. Command the tempest, and the tempest is calmed. Command the curves of the Euphrates, and Marduk’s will shall slay the floods. Lord, thou art holy! Who is like unto thee? Marduk, thou hast honor among gods that are named. The reader will note the familiar chords. Finest are the hymns to the sun-god Shamash, extolling his justice and righteousness: Thou guidest the law of the hosts of men. Forever righteous in heaven art thou. The righteous wisdom of the lands art thou. Especially splendid, even in its ruins the great hymn to Shamash, of four columns, 424 lines, lauding his goodness and glory and might. The repose, with which we are familiar in certain Hebrew Psalms, as “For his mercy endureth forever,” characterizes also the Babylonian (and especially the magic-formulate thus: “My god, who is lord of prayer, may be present my prayer to thee.” (Ishar)

“The god of pity, the lord of fields, may be present my prayer to thee; God of heaven and earth, the lord of Bidd, may be present my prayer to thee.”

In many of the Psalms the note of anguish is loud, but it is the anguish of the individual sufferer; the grander note of national distress, where the voice of the whole people swells to heaven, remains silent in Babylonia, the privilege of Israel. However beautiful many of Babylon’s Psalms, they scarcely equal the Egyptian, some of which approach monotheism, which was even fully attained under Amenophis IV (Ikh-n-Aton. “Man of Aton,” as he called himself), who reached almost the topmost peak of religious consciousness in his long and wonderful hymn to Aton (the sun’s disc, symbol of the One God): “Thou art in my heart; There is none other knows thee, Save thy son Ikh-n-Aton.” (Matt. xi, 27)

From the Psalms one passes naturally to the Proverbs, though by a steep religious descent, the noblest religious projection of Mesopotamian musings, in his humanity and tenderness recalling at times the God of the New Testament.

THE SHECHEM INSCRIPTION OF THE TEN WORDS OF CREATION
From L disgusti
and we find both Egypt and Babylonia rich in the Literature of Wisdom. The 'Precepts of Ptah-Hotep' reach far back into the 3d millennium B.C., a record of experience already hoary, and the great library of Ashurbanipal teemed with prophetic philosophy. The Assyrian seems rather closer both in form and in spirit to the Hebrew than is the Egyptian. *Before thy God mayst thou have a pure heart, For that is befitting a godhead.* *The fear (of God) begetts favor, Offering enlivens and calms; And prayer brings forgiveness of sin.* *Ptah-Hotep:* *If thou pourest and there is growth in the field, the god gives it as increase in thy land. Satisfy not thine own mouth beside thy kin.* *Love thy wife without alloy.* *Justice is mighty, immutable, fixed.* *To please the master greatly, let us do for him more than he has bid,* which recalls the Gospel saying. Since in the proverb it is mainly a matter of practical prudence rather than religious sentiment, it is not strange that the Assyrian and Egyptian rank well with the Hebrew, though overtaken by the voice of Wisdom in Proverbs. The climax of ancient, at least, Egyptian morality is found in the *Book of the Dead,* dating in form from the New Kingdom, but traditional in origin, and the Judgment Scene with its three sessions of Introduction, Disavowal and Address to the underworld gods, reminds us at points of the picture (Mt. xxv. 31ff) that inspired the *Dies Irae.* The soul says: *I live, I feed upon right and truth; I have given bread to the hungry, and water to the thirsty, and raiment to the naked* ... therefore, let it be said *Come in peace, Come in peace.* *Compare also* *I have not caught fish with bait made of fish of their kind,* with *Thou shalt not seethe a kid in its mother's milk.*

It was especially in prophecy that Israel surpassed all other peoples, yet was not quite alone. As Samuel (1 Sam. iii. 3-4) and Zechariah (1, 8) had visions of Yahweh in the night, and Isaiah (xl. 1) in the temple, so in the stress of Ashurbanipal's victorious struggle with Tumman, King of Elam, *a seer lay down, he saw a prophetic dream* of Ishtar, armed like Artemis and Athena, promising her invincible help to the artificers. As the prophets, in particular Amos and Isaiah, denounce the avarice, luxury and oppression of the upper classes, so does the sense of common right and social justice find powerful and passionate utterance in the nine *Pleas of the Peasant* in Egyptian story. In the prophets, the basis is always religious, such is the will of Yahweh; but the peasant Hunaup's appeal more than a thousand years older is to the level scales, to the abstract and eternal principles of truth and equity: *Speak the truth; for it is great, it is mighty, it is everlasting.* Most characteristic of prophecy is the messianic expectation, the vision of a king of justice and holiness, who shall restore to its pristine beauty the marred visage of creation and establish a universal reign of righteousness and peace. Characteristic, but not peculiar, nay, almost as universal as the yearning of the soul of man. The classic peoples longed for the return of the *Golden Age,* the *eternal spring.* As a Saviour-Pacificator. But 2,000 years before, such aspirations had found expression in the musings of the Egyptian Ipweru. However, the distinctly religious and monothestic setting, along with the national consciousness of world-mission and destiny, remains unique in the Hebrew prophecies.

On the other hand, world-weariness, if pessimistic, may easily pass over into hedonism or even sensualism, the *carpe diem* of the Roman poet; such was not only the case with Qoheleth (the Preacher), as in 1x, 7-9, but also of the Babylonian stibes of 2000 B.C., who ex- horts Gilgamesh, *Day and night be joyful. Daily ordain gladness, Day and Night make merry and riot, Let thy garments be bright. Thy head purify . . . a wife enjoy in thy bosom*—quite in the manner of the Hebrew moralist. Close akin to this world-weariness, whether pessimistic in the Preacher or optimistic in the Prophets, is bewildement at the moral government of the earth, at the sufferings of the righteous and the prosperity of the wicked. This problem of Good and Evil in graspsion, the book of Job—apparently with an eye on the misfortunes of the people Israel,—perhaps the finest product of the Hebrew mind, but 1,500 years Earlier, the Nippurian Tahun-tubel, a righteous and religious ("prophet") who was my wisdom, my sacrifice, my prosperity* "advanced in life," appears to have fallen on evil days and slanderous tongues: *All day long the pursuer pursues me, In the watches of the night lets me breathe not a moment; Through torture my joints are torn asunder, . . . On my couch I welter like an ox . . . My enemy heard, his face did gladden*—which reminds us not only of Job, but of the sufferer in the Psalms. The wonderful central mass of the Hebrew drama is without parallel in Babylonian, and its close, perhaps an addition, surpasses the account of how the Nippurian was cured by the messenger from Marduk. Thus the tale of the polytheistic magic-practising official sinks far below the empyrean flight of the Hebrew, but the parallel is none the less important.

Altogether by itself in Scripture is the Song of Songs, a cento of love-lyses, lively and beautiful, if often intimate in their suggestions. Similar ditties have been heard taken down in modern times, but the like were also heard in Egypt nearly 4,000 years ago, and remind us vividly of many passages in the Song, thus: *I am thy darling sister, To thee like a bit of land, Each shrub of grateful fragrance. . . . A beautiful place to wander, Thy hand in my hand, My soul inspired, My heart in bliss, Because we go together.* Compared with Cant. v, 1; vi, 2, 3, these lines show that the elder bard has not only rivaled the Hebrew but also the moderns in celebrating the tendril. It is noteworthy that the use of the term "sister," intelligible enough in Egyptian, clears up in a measure the use in the Hebrew.

Lastly the great finds of papyri (dated 494-409 B.C.) at Yeb or Coptos in Hamath (in the Nile, near the first Cataract) (published London 1906; Leipzig 1911), that the Jewish military colony established perhaps by Psammetich II of Egypt (593-588) has built a *temple of Yahu-god* there been Coptos restored (525). A letter to Bagohi (407) tells how this temple had lain three years in ruins, destroyed by *wicked Waidrang.* Having appealed in vain to the High Priest, Jehohanan, at Jerusa-
lem, they turned successfully to the Persian governor Bagas (Bagohi) and to the two sons of Sanballat, Governor of Samaria, in order to check the bearing of these facts on the date of Deuteronomy is disputed. It is possible that Isaiah xix, 19-22, may refer to this temple and not, as hitherto supposed, to that of Onias (170 B.C.). Another letter (419) from a certain Hananiah instructs the Jews of Yeb concerning the Passover, which seems to imply their ignorance of the Pentateuch, as critics maintain.

Such are the more important connections of Hebrew with profane literature, as they are recognized in the works of even conservative scholars, such as Rogers (1912) and Barton (1916). Pan-Babylonism, however, goes very much further in the learned works of Gunkel ('Schöpfung und Chaos in Urzeit und Endzeit'), in its third edition, with Zimmern of Schrader's 'Keilschriften und das Alte Testament,' his 'Israelitische Geschichte,' and numerous monographs, Zimmern in the same edition of Schrader, and elsewhere, A. Jeremias, the spokesman and continuator of Gunkel, in his 'Das Alte Testament im Licht des Orients,' and especially Jensen, who in his colossal work on the Gilgamesh-Epos would seem to regard nearly all 'world-literature' as an outgrowth from the Babylonian legend, even the gospel with its Christ. Less enthusiastic scholarship reduces such claims to far more modest dimensions. With more reason Zimmern, in his contribution to the "Jesu-Question," finds remote suggestions of New Testament teaching in primitive Babylonian ideas, and Gunkel finds the aboriginal cosmogonic struggle reflected in the Apocalyptic visions of the final consummation. The Winckler-Jeremias theories contain perhaps many golden grains of truth, but it will require years to sift them out, "Under the whistle of wind and the swing of the winnower's shovel." The eagerly expected publication of Ed. Glaser's North Arabian inscriptions may shed light on many dark places.

In conclusion, the revelations of the spade have undoubtedly wrought a profound transformation in our conceptions, both of the history and of the literature of Israel. The former is seen to have unveiled itself upon a world-stage of extraordinary range both in time and in space. Though dominated outwardly by the colossal empires that towered on both sides far above it, though it caught and reflected their light at various angles, and was but lost in their shadows, it still maintained its individuality a fantastic and not only conserved but magnified, purified, and even glorified its unique ideals. Though Ikh-n-Aton may appear as the first great monotheistic reformer, yet his reformation was lost in the sand; though Delitzsch may be right in holding that Babylonia attained or approached the idea of the One God, of whom the many gods were only partial and inadequate phases, yet the idea never became effective in Mesopotamian thought or life. Israel still shines as the hearse vehicle in history of the monotheistic conception. Similarly with respect to the Hebrew literature, we can no longer regard it as wholly unique and peculiar, the pure efflux of an isolated fountain, a well in the wilderness. It flows through a well-watered land and is fed from many sources. It is a tree on which indeed few grafts are set, but it spreads its roots far and wide and draws its sap from distances far distant. Even the outstretched finger of time, this literature shines not indeed as a solitaire but still distinct and conspicuous in a brilliant cluster. The imperial libraries of Ashur and Egypt are immense in extent and by no means always inferior in literary quality; but the solitary sublimity of monotheistic religion and the inextinguishable national consciousness of world-mission and world-destiny still invest the Hebrew Scriptures with a beauty and a majesty all their own. We must indeed recognize fully the utter ineptness of such "Thoughts" as Pascal's (Art. XIV, ed. Lahure, VII, Bossut), unwarranted even when first they were penned, but the present relation of the Bible and archaeology need in no way disturb the reverence and enlightened spirit, whether Jewish or Christian, that rightly regards it.

For bibliography see article BIBLE.

WILLIAM BENJAMIN SMITH.

BIBLICAL ARCHAEOLOGY.

New Testament.—The contribution of archaeology to the understanding of the New Testament has not been less important than to that of the Old, since, while it has indeed come from various quarters, yet the largest element has proceeded from a source far less prolific in case of the one than of the other. It is the recent finds of Egyptian papyri that have cast the broadest light upon the life of the first Christian centuries, at least on the banks of the Nile, but the discovery and decipherment of numerous inscriptions in other regions, especially in Asia Minor, have also cleared up many questions, while indeed starting many others.

The use of papyrus in writing is thought to date back nearly or quite 5,000 years, and the oldest preserved specimen, about 4,500 years old, to be the copy of an original a millennium older. Such writing, though a government monopoly till Alexander's conquest, was the constant occupation of numerous scribes. Papyrus rolls were of course very perishable, and it was Herculaneum that first yielded some charred ones written in Greek, which however were little valued. Twenty-six years later a roll discovered (along with 40 or 50 others) in an earthen pot, by Arabs in Egypt, was brought to Europe, where it excited small interest. Forty-two years then passed before the Serapeum at Memphis yielded the mass of manuscripts of the 2d century a.C., which supplied local color for Ebers' novels. The next year (1821) the so-called Bankes Homer (Book XXIV of the Iliad), purchased near Elephantine, was brought to England; thenceforth the finds enriched more and more the treasury of the classics, and in 1839 the British Museum published 44 papyri. The recent period, marked by four great discoveries (circa 187, 1892, 1895, 1905-06) was one of enormous finds at Arsinooe, at first but little

* Spoken rather, in a three-hour discourse to friends (1658). The 'Pensées' must be judged tenderly, as the product of four years' progressive invalidism; though written on scraps of paper, they sketch the grand outlines of philosophy by the greatest mind ever enlisted in the service of tradition. But not every ten years of health, as also vainGlory, could be the author's justification for concerning oneself; the pensées of Pascal, Concerning Perier, 'Préfaces,' and for specimens of criticism "Appendice aux Pensées."
esteemed as non-literary fragments from Byzantine times; many others of the first three Christian centuries, better preserved and with interesting contents, were found in 1892 on the site of the neighboring village of Socnopæai Nesus. But already in 1890 the first great papyrus sensation had been felt in the discovery of Aristotle's "Constitution of Athens," supposed to be irrecoverably lost, written on the backs of four rolls (ledger of a small Egyptian farm, 78-79, a.d.), about 19 by 12 inches, a book, when translated, of 110 pages, startling by the strange light cast on the political-legislative history of Athens. In 1891 Kenyon of the British Museum published a volume of "Classical Texts from the Papyri," including seven mimes of Herodas (found in 1889), and the next decade witnessed a rivalry among museums in the purchase and publication of the long neglected papyri, adding to the Greek classics masterpieces of Hypereides, Bacchylides and Timotheus, the "Persai" of the latter found at Abusir near Memphis (Weidemann, 1890) in a manuscript written in the 4th century B.C., being the oldest Greek manuscript book yet known. In 1892 Ed. Naville disclosed a whole library in a government registry office at Thmusis in the Delta, but the charred rolls defied decipherment until 1915, when the editors of the Greek papyri in the John Rylands library, Manchester, succeeded in making 80 of them legible in publication, thereby disclosing an ancient book-keeping comparable with the best of to-day. Still earlier (1888-90) the illustrious W. M. Flinders Petrie had unwound extremely instructive papyri-manuscripts (of the 3rd century B.C.) from the faces of mummies in the Hawara cemetery. Trained by him (1894-95), B. F. Grenfell, with A. S. Hunt, began digging (1895) in the Fayum (sunken oasis, 30 miles across, 40 miles south-southwest of Cairo), and in 1897 at Oxyrhynchos (south, on the canal supplying the Fayum with water) in the heaps of rubbish that gird this town, like others of the East, they began the series of discoveries that have restored so vividly the life of the Fayum from Philadelphia (270 B.C.) to the 3rd century A.D. (when irrigation ceased and the desert reclaimed its sway), and have contributed no little to our comprehension of New Testament Greek. These remarkable finds have been published, text and translation, in a stately series of 14 volumes entitled "Oxyrhynchus Papyri" (1898-1918). While the great mass of these and similar publications by the same and other scholars concerns only the private life of that time and clime (letters, accounts, receipts, deeds, tax-lists and the like), not a few contain verses of the Scriptures, particularly the New Testament. Of these, five date apparently from the 3rd century (90 verses), two others from the 3rd or 4th century (33 verses), and very many from the 4th, 5th and 6th centuries, while from the 7th comes a treasure in some ways still more remarkable, 20 fragments of a Gospel lectionary, possibly a continuous text, written by three poor Christians not on papyrus but on much cheaper pottery. Such ostraka, long disregarded, are now carefully collected and studied, since the great work of U. C. BUDGE ("Coptic Ostraca, in Egypt and Nubia," 1899) and W. E. CRUM ("Coptic Ostraca," 1902) Altogether, the New Testament finds of recent years reach the imposing total of 28 New Testaments (17 on skin, 11 on papyrus), 14 parchment manuscripts (listed by C. R. Gregory, 1909), 20 papyrus manuscripts (Kenyon and Milligan, 1912-13), with countless fragments in hopeless dismemberment, an array constantly swelling through additions. Chief among all, however, is the "Washington Codex," bought (19 Dec. 1906) with three others by Charles L. Freer of Detroit from the Arab dealer Ali, in Gizeh, near Cairo, who got (Sanders), or possibly from near Akhmim, it from some ruined monastery in the Delta prolific of manuscripts (Schmidt). Critically edited, with facsimile, by H. A. Sanders (1912), it takes its place beside the other three great manuscripts, Alexandrine (A), Vatican (B), Sinaitic (#), dating probably from the 4th century and bringing strong and unsuspected support to the "Western" text of the New Testament, hitherto chiefly represented by the almost outlawed Codex Bezae (D). Almost as important is the palimpsest recently found in Syria, discovered February 1892 by the twins, Mmes. Agnes Smith Lewis and Margaret Gibson, in Saint Catherine's Convent, Mount Sinai, overwritten (778) with lives of women saints. Mrs. Lewis, having detected the words "Evangelion, Mathi, Lukas," in the underwriting, guessed that it was the Syriac Gospels, a guess that Professor Bensly was the first to confirm on examining the photographs made from it by the two sisters on Mount Sinai. The interesting question of the relative authenticity of this ancient Syriac version compared with oldest known Greek text remains yet debated and debatable. Five more recent visits of Mrs. Lewis to the Convent have resulted in various interesting finds, none comparable in importance with the first.

Less weighty are the rapidly multiplying Coptic New Testaments in the various dialects: (Sahidic) of southern, (Bohairic) of northern, (Fayum-Akhimitic) of middle Egypt. Nearly the whole New Testament may now be pieced together out of fragments in Bohairic; lately has also been found a manuscript (not complete) of the Gospels in Bohairic with Paul's, Peter's and John's Epistles in Sahidic possibly representing a text older than B's or #'; and Dr. Budge has published (1912) the oldest known copy (350?) of any translation of any large part of the Greek New Testament (the Acts and the Apocalypse) in Sahidic (found 1901). Besides Proverbs and the Minor Prophets (the latter not yet published), not much of importance is offered in Fayum-Akhimitic.

More, if not most, important textually are the Old Latin versions, especially current in North Africa. These, displaced (384-400) by Jerome's Vulgate,7 reach back into the 2d century, but only of late are coming into their rights as witnesses. Of the 18 fragmentary manuscripts 5 date from the 5th or even the 4th century. Thus far their voice has been faint, but very recent criticism, as represented by E. S. Buchanan and others, gives them full...
ear and would revise thereby the New Testament in the most radical manner, claiming a Latin original for Mark's Gospel and regarding the present accepted New Testament text as the result of a systematic corruption by the hierarchy in a semi-rationalistic sense. Whatever may be the final verdict of criticism, it seems certain that the deeper study of the Old Latin texts is both imperative and hopeful. Hardly less, may, even more important than Grenfell and Hunt's unearthing of New Testament texts was their discovery (1896) of seven 'Logia' or Sayings of the Jesus, copied in the 3d century and referred directly to the Jesus by the recurring formula: "The Jesus says" (τὰ ἴδια λέγει), seeming to indicate high antiquity. Several such were already known from extra-canonical sources; but the newest seemed to form part of a handsome volume and breathed a more mystical speculative spirit than prevails in the Canonic Gospels. In 1903, Grenfell and Hunt, on returning to Oxyrhynchus, exhumed five more such ancient Oracles (42 lines), written on the back of a list of land-surveyors not later than 300 A.D., oracles of highly Christian but not quite canonic tone, veering still more from the Synoptics toward the traditional Fourth Gospel. In collected form these 'Logia' seemed to be later and most probably much earlier than 140, in fact, quite as primitive as any Gospel, if not indeed presenting the very earliest known form in which 'The (Doctrine) concerning the Jesus' (τὰ πρὸς τὸν Ἰησοῦν) was reduced to writing.

This momentous find has been supplemented in various directions. It had long been known that Tatian, the Syriac rhetorician and friend of Justin Martyr, had produced about the year 170 A.D., a 'Diatessaron,' a kind of Gospel Harmony, which in spite of criticism and in spite of the virtual absence of the human in its Jesus, almost displaced the Canonic Gospels in the Syrian Church (especially at Edessa) and was laid by Ephraem Syrus at the base of his Gospel Commentary (4th century), though itself displaced in the 5th century by the Peshitta version of the Edessan Bishop Rabula (411-35). But Tatian's 'Diatessaron' was known only from one incomplete manuscript of the 4th-Arabic version (14th century), a Latin version (Fuldensis, 6th century), and the Commentary of Ephraem till 1888, when Ciasca published, with Latin translation, a far better Arabic text (11th century) translated from Syriac in the 9th century, which omitted the last 12 verses of Mark as well as the Lucan incidents of the bloody sweat and prayer on the cross (xxii, 43-44, xxiii, 34). The 'Diatessaron,' by its early testimony to a Fourfold Tradition, has brought the orthodox much satisfaction not untempered with keen regret that the Synoptists lost this last phase of humanity of the Saviour. Far more important the discovery, announced 1875 by Bishop Philotheus Bryennios, in the library of the Jerusalem Monastery of the Most Holy Sepulchre in the Phanar of Constantinople, of a parchment volume (copied and dated 11 June 1056, by the "notary and sinner," Leon) of 120 leaves, containing besides the so-called Epistles of Clement to the Corinthians and other less interesting matter, 10 priceless pages written with the 'Teaching' (Didache), a long-lost document of two parts, often mentioned in early Christian literature, composed probably before 100 and containing matter far more primitive. Published in 1883, after a strangely accurate forecast by Adam Krawotzky, 1852, it startled all with its voice, silent for 16 centuries. The earliest manual of Christian theory and practice, it is full of parallels to the teaching of the New Testament, agreeing strikingly in phraseology with the Gospels, but with hardly the slightest allusion to the familiar narrative element. Of course, it has been a storm-centre of discussion, but its witness remains unimpeached and unequivocal.

Scarcely less significant are the 64 leaves of Syriac discovered and published (1909) as 'Odes and Psalms of Solomon,' by J. Rendel Harris. Of these the Psalms are a Pharisaic collection (? 50 B.C.), long known in another form, but the 'Odes,' unknown for 1,700 years, are Christian, at least in their recension, and recall the Palestinian soul of the 1st century in its deeper mystical musings, its higher poetic flights, and its wider spiritual visions, with frequent suggestion of the Fourth Gospel, as the 'Teaching' suggests the Synoptics. As a parallel to the New Testament these Odes are invaluable, though like the Didache, they know little or nothing at all of the evangelic story. A dense cloud of books, pamphlets and articles, nearly 200 in number, has gathered and still gathers around this "Hymn-Book." Somewhat similar in spirit, though far more artificial and less profound, is the 'Shepherd of Hermas,' a vade mecum of 2d and 3d century Christians, a product of the Roman soul, known only as cited or translated till 1856, when Tischendorf discovered one-fourth of it in a manuscript of the 4th century, on Sinai, and 1888, when S. Lambros found the other 12 leaves, of the 3d century. But, in 1900, seven more leaves were published, and in 1907 Kilspop Lake published 'Athos Leaves, etc.' A facsimile of the Hermas, the Psalms, the Psalter of Mount Athos, as well as the 'Codex Sinaiticus' in 1911. Taylor has translated all and striven hard to show that this Pastor (dating from near 100) is saturated with covert allusions to the New Testament and with its phraseology disguised,—all of which the natural eye fails wholly to discern and essentially any reference to the Synoptic story.

Other early Christian documents have been unearthed, too numerous to mention, such as the 'Gospel of Peter,' a 'Revelation of Peter,' also vary it greatly its "divine" Paul (secured at Akhmim by Reinhardt, 1896), the 'Book of Revelation,' ascribed to Bartholomew, and various others,—all evidently products of religious fancy. Some were exceedingly popular in their day, like a modern 'Book of Hours,' also a noted book of devotion, 'The Ring of Pope Xystus,' written not later than 150, but first translated into English and edited, in 1910, by F. C. Conybeare.

Also certain long-lost works of the Fathers have come lately to light, as in 1904 the

* The Syrian Theodoret of Antioch, bishop of Cyrrhus, wrote in 423, referring to the 'Diatessaron': "I have found more than 200 such books highly esteemed by the churches in the West, and I have collected and destroyed, every one, and substituted the Gospels of the Four Evangelists."
OLDEST ORIGINAL OF A CHRISTIAN LETTER
Written in Rome between 264 and 283 by an Egyptian Christian to his brethren near Aresinoe. The papyrus is now the property of Lord Amherst of Hackney. From the reproduction by Deissmann
EDICT OF G. VIKINS MAXIMUS PREFECT OF EGYPT

The Papyrus (of the year 104 A.D.) is now in the British Museum. From the reproduction by Deissmann
‘Apostolic Preaching’ of Irenæus, notable for establishing New Testament incidents from Old Testament prophecies; also 37 passages from an unsuspected treatise of Origen on Revelation were found 1911 in the Meteoron Monastery in north Greece. Far richer, however, the wealth exhumed of Christian Sermons (250+). How men of the Soul, quite extraordinary imagination directed with rhetorical skill, to a highly mechanical and extravagant orthodoxy, and much more to an all-pervading tendency to symbolic interpretation of Scripture stories, — a very clear indication of the atmosphere in which these were born. Deficient as they were in knowledge, the preachers of old do not yield in mental power to their successors of to-day. Numberless Amulets (bearing Gospel versions like beads, with prayers for healing) show that paganism and magic, especially in the use of the Name had departed not wholly from the first Christian centuries and returned powerfully in the later. Much of the phraseology of petition is dignified and impressive, eloquent with invocations still heard in Church service.

The use of song in the life of Christ is well known. Alexandria, long accounted the oldest of Christian songs, consisting almost wholly of a succession of poetic epitheia of the Jesus, is now at last rived in antiquity by one similarly discovered at Oxyrhynchus. Almost as old is the famous Syriac Hymn of the Soul, quite extraordinary in its sustained symbolism and imagery. Complete Coptic Psalters (6th or 7th century) have been recently uncovered. These ancient hymns disclose a strong movement toward Mariolatry, as the devotee mused on the mystery of the Virgin birth. Many Christian letters recently deciphered give welcome and intimate glimpses of the early disciplines; along with which are others pagan, but so nearly like the Christian in language and spirit as to be scarcely distinguishable. One gets the impression that these souls were Christian because they were noble, rather than noble because they were Christian. In the descent toward the 7th century the early simplicity degenerates into mock movement. Nomes to be epitomized found in great numbers, are strangely enough often hard to discriminate from the pagan, though in general sounding a clearer note of hope. Some have established model forms in use even to this day. Least attractive of all such religious relics are the ‘Libelli,’ certificates of Christianity, disproved, of which Krebs detected the first (1893) in the British Museum, Gre Dell and Hunt the fourth in 1904, dating from the Decian persecution (ca. 250), and Meyer published 19 others (1911); still later, the number has risen to about 30, mostly from Theadelphia. It remains possible that such declarations may have proceeded from sincere pagans falsely reported as Christians. It is remarkable that the persecuting emperors, Trajan (112), Aurelius (176), Septimus Severus (202), Decius (250), were among the noblest that adorned the Roman throne; they regarded the new religion as anti-patriotic.

While Egypt has yielded papyri, it is Asia Minor, and particularly Phrygia, that has most enriched the fund of inscriptions. Palestine might indeed have been expected to speak most eloquently of earthy Christianity; but even though 11 cities have been excavated and called to witness, they are dumb; the decipherments of Dalman, Schmidt, and others do not hark back beyond the 4th century. The greatest single interpreter of Greco-Roman life is Pompeii, but its testimony is too early to illumine Protochristianity. It is the stupendous excavations at Rome that shed light upon the 1st century, whence dates the earliest Christian inscription (72) of the oldest Catacombs (of Domitilla, Priscilla, Commodilla, (crypt Lucina) while the majority are of the 4th century and the latest from the time of Alaric (410). The output of Catacomb-inscriptions has been enormous in number (15,000 of De Rossi alone) rather than significant or instructive. The temper of the people is revealed as peaceful, trustful, hopeful, their religion as centred in the worship of Christ as God (under form of a beautiful shepherd youth) and as abounding in symbols, their morality as pure, their ritual as simple, their art as classic and excellent. Connections with New Testament or Palestine, if at any all, seem very remote.

As yet the papyri bear no clear witness to Quirinus as governor of Syria before 6 A.D., but they have yielded a Christian household touching the Roman census (Luke ii, 3), from which U. Wilcken has shown (Hermes, 1893) that the regular registration fell on each 14th year from 20 A.D., and possibly from 6 A.D., or even 8 B.C. The enrolment was by households, and naturally all members of a family were expected to be at home at the taking. An order to this effect, in No. 408 of the Greek Papyri in the British Museum, reads thus (translations of the supplied portions of the mutilated text being inclosed in brackets, and the initials of the lines capitalized). (Quirius Vibia Maximus, prefect of Egypt says) Because of the (im)minent census by house (holds) Necessary (it is for all) at any time for a(ny) rea(son) have departed from their (own) homes(s) to be enrolled (enrollment) with the own (hearth) stones (of) Also the accustomed (dis)position of the (enrollment) may they fulfill and to the farmland be(coming) to them may firmly ad(h)er(e). — This edict recalls to their own present homes the peasants that have gone out (kordai). In spite of learned attempts to wrest its meaning into the exact opposite, it gives not the slightest hint of going to ancestors. (Luke ii, 4), — as if a Kansas farmer should return to Vermont to register!

In Egypt also the symbolism of the Good Shepherd appears, the ancient burial rites were christianized and preserved, the figure and functions of Osiris are supplanted by similar ones of the Saviour, the two being sometimes indistinguishable, and Isis nursing Horus is transformed into the Madonna with the Child. The venerable swastika, welfare symbol of the Age of Bronze, is everywhere sanctified, and even Anubis and Aput adorn the ‘skirts of a Christian burial-robe. So tenacious of life were the mythologic motifs, and so they have remained. If one may trust in the evidence it was in Asia Minor, and mainly in Phrygia, that Christianity took its firmest and widest

* Often far-fetched, as when Athanasius identifies the label xx. 1-10 with the long series of Scripture worthies from Moses to the Apostles.
hold. A region largely inhabited by Jews, many of them wealthy and prominent, descendants (says the Talmud) of the Ten Lost Tribes, 2,000 having been imported from Babylon by Antiochus Magnus (ca. 200 B.C.), who had become in large measure paganized and so open to the universalism of the Gospel. Here, too, flourished the mystery-cults of Aty, Adonis and others, whose deep imprints on New Testament phraseology as well as ecclesiastical dogma and rites are daily becoming more visible. This region has been the favorite haunt of excavators, conspicuous among whom, at least for zeal and production, is Sir William M. Ramsay, whose intense pursuits led him to the famous South Galatian Theory in answer to the puzzling query, Who were Paul's "foolish Galatians"? —a theory zealously advocated by archaeologists and as earnestly rejected by linguists in favor of the North Galatian Theory. In northern Syria, also, numerous cities have been excavated, as well as the extensive Christian cemeteries of Salona, the ancient Adriatic port of Dalmatia, but their revelations are more important in artistic and sociologic than in biblical bearings. Great interest has attached to explorations, notably the Austrian (1897-1913), at Ephesus, especially because of the uproar narrated in Acts. The title there (xix, 35) given to the city, "temple-warden of ... Artemis" (Αρτεμίδων), is confirmed by a dedication exhume, and Dr. Hicks (half-supported by Ramsay) fancies he finds the Demeter of Acts xix, 24, at the head of Ephesian magistrates; an official inscription speaks of Julius Caesar as "God made manifest... saviour of human life"; a Christian tablet tells of a deceiving image of the demon Artemis and of a "God that banishes idols," where the identification of demon with heathen god sheds light on the Gospel "demons"; neither is it strange, in a city given to the worship of the "Great Mother" and the chaste Artemis, that many inscriptions attest an early reverence for the Virgin Mary.

Touching the moot question, Was any altar at Athens inscribed "To an Unknown God"? ansed by E. Norden in "Agnostos Theos" (1913). Deissmann has published (1911) a picture of an altar uncovered (1909) in Pergamon, "To Gods Unk[noun]," where the added θεός makes a difference; but endless explorations at Athens have discovered nothing Christian of importance. At Delphi, however, a fragment (found 1908), inscribed with a letter of the Emperor Claudius, dates the Achaian proconsulship of Gallio from the summer of 51. Paul then seemed to have left Corinth the autumn of 51 and to have reached it early in 50 (Acts xviii, 11, 12): an important synchronism, throwing back the beginning of his mission almost to the received date of the pentecostal wonder. Remembering that Paul did not inaugurate the Gentile mission in full flood and was upborne by its current (Bousset, 'Kyrios Christos,' p. 93), one sees that this mission dates practically from the first dawn of Christianity.

At Antioch (in Syria) some well-diggers exhumed (1910) a silver chalice or communion bowl of rude workmanship but covered with a silver sheet on which amid exquisite grapevine decorations are wrought "portrait-figures" in Christ, with 10 Apostles, said to be of exceeding excellence. For this opportunity has dated this sheet between 57 and 87 and has even thought to recognize in the central figure a genuine portrait of the head of Christ. From numberless other excavated cities various gluts are cast upon the New Testament Protochristianity, as when "life" and "light" are found on the door-post of Artemis' temple at Sardis, or at Assos an inscription of the soldiers' sacrament to Caligula (37): "We swear by the Saviour and God, Caesar Augustus, and by the Pure Virgin, i.e., Athena Polias (Cityguard), to whom the temple was built. Very interesting and important are the revelations of the life and soul of the empire, which make plain that former notions of its depravity were gross exaggerations. Many centuries of war and conquest had indeed hardened the Roman in his native cruelty and bloody-mindedness,—much less time has suffered in other cases,—and licentious self-indulgence flourished then perhaps even more than now in the ruling and free classes. But the heart of the people was still sound, the homely virtues were still prized and honored and cultivated, and public benefactors were not less numerous or generous than to-day. Civic spirit and social charity were indeed at their height, and almost a remnant of the old democracy seemed to possess the empire under the Antonines, when philosophy sat upon the throne. Under a slight scarcity of provisions, in time of great national danger and endeavor, profiteering has run amuck among us, prices have doubled or even tripled, and eggs earlier for sale at $65,000 and $60,000 have been patriotically sold to the government for $650,000 and $500,000. Compare herewith the Ephesian public inscription in honor of three wealthy men who had sold their storehouses of wheat at cost during a famine. Undoubtedly the Greco-Roman consciousness furnished a soil not unfit for the sowing of the Gospel.

Linguistically, it has come clearly to light that the language of the New Testament was not, as so long imagined, a more or less coarsened tongue or dialect, but was the all-prevailing Koiné, the every-day speech of the people, not untinctured with the mystic phraseology of the mystery-cults, and soaring at times into solemn sublimity on the wings of a missionary spirit of religious zeal. The net result of these exhumations, which future researches are sure to enlarge and confirm, putting a quietus on all rationalistic attempts to derive Christianity from "The Carpenter of Nazareth," has been to delocalize and depersonalize our conception of the origin and early proselytizing movement. In the words of Professor Gurlitt, "The rapid spread of Christianity, hitherto an insoluble riddle, receives a startlingly simple explanation, and indeed the whole speech of the New Testament becomes

*The Greek is ἀγνωστός. This has been completed by Heding into ἄγνωστος, uncertainly, as he admits (1910).

BIBLICAL CRITICISM

now, for the first time, understandable. The
setting now supposed for the New Testament revolution is something less than the Judeo-Greco-Roman world. The religion of the Jew, the art, science and philosophy of the Greek, the law and administration of the Roman,—the ethical monotheism of the cultured, the mysticism of the early Church fathers, and the union with God in the Mysteries, the sense of Brotherhood fostered in the guilds and the seething cauldron of hopes and fears, of superstitions and sufferings in the multitude—all these and far more mingled their elements in the mighty Birth of 19 centuries ago. In this new Light from the East the Palestinian portrait bursts its miniature frame and spreads away into the measureless canvas of the circum-Mediterranean world.

For bibliography see article Bible.

WILLIAM BENJAMIN SMITH.

BIBLICAL CRITICISM. Textual Criticism of the Bible.—The object of Textual Criticism is to ascertain the original text of a literary work, as written by the author or authors. Since its objects and principles do not vary essentially in different fields of operation, its application to the Bible gives it no special characteristics. Literary works vary, of course, in the nature and amount of the materials available for textual criticism, this being true of the Old and New Testaments in comparison with each other, and also of the individual books or even parts of books. Textual Criticism is sometimes called Lower Criticism, in distinction from Higher Criticism. The term Textual Criticism, however, is more exactly descriptive, and hence to be preferred.

The materials available for the textual criticism of the Bible may be classified under three heads, (1) Manuscripts. These are the principal source in the New Testament, more than 3,000 existing which contain the whole or a part of the New Testament, of which the earliest are assigned with much confidence to the 4th century A.D. In the Old Testament the manuscript material is of comparatively much importance, the oldest manuscript of a part of the Old Testament being dated in 916 A.D., and the manuscripts show but few variations of importance. An exceptional position, however, is occupied by the Samaritan manuscript of the Pentateuch. This is of uncertain date, but probably comparatively old, and its evidence is of much value. (2) Versions, that is, translations into other languages than the original. Several of these have a real, though subordinate, value for New Testament work. The Syriac and Old Latin being most important. In the Old Testament, however, they are the principal documentary source. The chief of these, in the order both of age and importance, are the Septuagint, a Greek translation, made, at least for the most part, in the 3d and 4th centuries B.C.; the Peshitta, a Syriac translation belonging probably to the 4th century A.D., but based on versions as early as the 2d century; the Vulgate, a Latin translation made by Jerome, completed about 405 A.D.; and various targums, which are Aramaic translations of the Old Testament written in the 1st and 2d centuries A.D. (3) Quotations. Those from the Old Testament which are sufficiently ancient to be of value are in the Targums and Jewish writings, but the textual variations they exhibit are of minor importance, although they would doubtless repay more careful study in reference to this matter. Those of value in relation to the New Testament are found in the early Church fathers, and these have been studied with considerable thoroughness but have not furnished much material of importance.

The textual criticism of the New Testament has been the subject of much careful work which has produced results of great value. Among those specially prominent and successful in this study may be mentioned Michaelis, Tregelles, Tischendorf, Westcott and Hort, and von Soden.

Textual criticism is necessary because of textual corruption, changes from the original form of the text. This textual corruption has arisen in large measure from the scribal copying by hand, but partly also as a result of corrections, so-called, in the manuscripts already copied. The corruption is either deliberate or accidental. Deliberate corruption includes principally grammatical corrections, assimilation to parallel passages, explanatory additions, usually first written in the margin and later put in the text, and dogmatic changes, the last being undoubtedly found but not numerous. Accidental corruption is quite certainly more frequent and more important than deliberate. This results from the carelessness that is in some measure inevitable in copying by hand.

The following are the principal forms of corruption that are due to accident: (1) Ditography and Elision. Ditography is the repetition of letters or words, and elision is the omission. Both are usually due to the occurrence of the same or a similar combination of letters or words at two points near together, the scribe unconsciously passing from one to the other. (2) Additions, not of the nature of ditography. These are usually scribal explanations on the text, and, as a rule, at first deliberate; but the reception into the text is usually accidental. (3) Conflation. This results when a scribe or corrector is acquainted with two readings and is uncertain which is correct so that he includes both. Here the inclusion itself is deliberate, but the corrupted text on which it is based is ordinarily accidental. (4) Changes. This is frequently by mistake for a word that is similar either to the sight or the hearing, as manuscripts were copied in both ways, and sometimes also by mistake for a word of similar meaning. It sometimes arises, also, from the illegibility of the manuscript that is being copied.

The methods of textual criticism are two, comparison of documentary evidence, and conjecture. Where manuscripts for the former is abundant, as in the New Testament, the latter has little place. Where such material is scanty, as in the Old Testament, conjecture must be used, although it should always be with caution. The chief principles generally recognized in the employment of documentary evidence are the following: (1) The weight of manuscript evidence is to be considered, although this alone cannot be decisive. The weight of
evidence does not come from a mere enumeration of manuscripts, but must take into consideration their division into classes and relation to each other, with special reference to their genealogical relation, that is, the derivation of one from another, or of two or more from a common earlier manuscript. The result of such study is that some manuscripts are to be regarded as of much greater value than others. But any estimate of the value of a manuscript is itself based in large measure upon the question of the correctness of its readings. Hence such judgments can be only tentative or there is danger of reasoning in a circle. (2) The most comprehensive and generally accepted principle in this, that reading is to be preferred which best explains the others. A special application of this is often stated thus, the more difficult reading is to be preferred. But that is by no means universally the case, it applies particularly to deliberate changes, and is of comparatively little importance in relation to the Old Testament. (3) The reading should be suitable to the context. On this point, however, there is obviously an especially wide opportunity for difference of opinion.

Higher Criticism of the Bible, Historically Considered.—For a discussion concerning the nature of Higher Criticism see the article, HIGHER CRITICISM. The employment of Higher Criticism must have characterized Biblical study from the earliest times, no thorough study could be made without its use in some measure. A few of the early Church fathers, notably Origen, particularly illustrate this. But such early use was unsystematic and comparatively unimportant. It is only in modern times that Higher Criticism has become one of the most important elements in Biblical study.

Higher Criticism, being a study of internal evidence, proceeds by an inductive method. The use of inductive methods is one of the prominent characteristics of modern science. Without doubt the large use of Higher Criticism in modern times is simply one phase of the general scientific progress of this period, it is the application of scientific method of literary study.

The evidence used in Higher Criticism may be conveniently classified as of three kinds, literary, historical, and that arising from the thought. In the historical development of Higher Criticism these three varieties of evidence have become successively prominent in the order named.

Especially at first the use of Higher Criticism was much greater in connection with the Old Testament than with the New Testament, although the general historical development was similar in the two cases. Hence in this brief historical account it is the application to the Old Testament that will be more largely considered.

Some use of Higher Criticism was made at the time of the Reformation and after. But the beginning of any systematic use, and so of the really modern period, should be put in 1753. S. F. de S. S. was a French physician, published "Conjectures sur les memoires originaux dont il paroit que Moyse s'est servi pour composer le livre de la Genese." This presents the view that Moses in writing Genesis made use of two earlier documents, in one of which God was known as Jehovah and in the other as Elohim. The evidence he presents is thus purely literary. J. G. Eichhorn, in his "Einleitung ins Alte Testament" (1780-85), called attention to the fact that the Jahwistic and Elohim sections were also characterized by differences of style, and that the same documents are to be discerned in the remainder of the Pentateuch. He first called this method by the name "Higher Criticism," and treated the whole Old Testament from this standpoint. The general type of view which he presented has been called the "document-theory." The "fragment-theory" of Alexander Geddes, which appears in "The Holy Bible, or the Books accounted Sacred by Jews and Christians," (1792-97), does not differ from it in principle, but contemplates smaller documents, or fragments. Others followed along the line of each of these views.

The second stage was introduced by W. M. L. De Wette in "Kritik der israelitischen Geschichte" (1807), and in other books. He made use of historical evidence in addition to literary. His specific view is called the "supplement-theory," because he held that the writer of Genesis made use of one principal Elohist document which he supplemented by the use of various Jehovistic documents. De Wette gave particular attention to the origin of the documents, in connection with his special study of historical evidence.

The third stage was marked by the prominent use of the evidence from thought, in addition to that of a literary and historical nature. This means that a large amount of attention was given to the development of religious thought, particularly in the Old Testament. The philosophical theory of evolution has strongly influenced the way in which this evidence has been used. The beginning of this stage appears in two works published in 1835, that of Wilhelm Vatke, "Die Biblische Theologie wissenschaftlich dargestellt," and of Leopold George, "Die Alten Jüdische Feste." Eduard W. E. Reuss, of Strassburg, became one of the most eminent writers of this phase of the study. A pupil of his, K. H. Graf, thoroughly combined the three lines of evidence. He taught the priority of Deuteronomy to the Priest Code, the latter being dated, in his ultimate view, after the exile. Abraham Kuenen, in "Historisch-critisch Onderzoek naar het ontstaan en de verzameling van de boeken des Ouden Verbonds" (1861-65), gave special attention to the details of the religious development. The theory of Graf was elaborated by Julius Wellhausen, in "Die Composition des Hexateuchs" (1889), which had been published earlier, in 1885, as a part of the series "Skeizzen und Vorarbeiten. His view of the documents of the Hexateuch, including Joshua, Judges, and the Pentateuch, is that they consist of J, Yahwist or Jehovist, the work of a Judean prophet or prophets, written about 800 B.C.; E, Elohist, a prophetic work of Israel, written about 750; D, embracing the most of Deuteronomy, written shortly before or during the Priest Code, composed at various times mostly during and after the exile and completed by Ezra about 444. This view in substance is the prevailing one to the present day.
While the Pentateuch, or Hexateuch, has been the chief subject matter for the development of Higher Criticism, more and more the whole Old Testament has been included within its scope. The discussion of the authorship of the several books of the book of Isaiah began soon after that concerning the Pentateuch, and has had many phases. The more recent study has been devoted, in the case of the Hexateuch, to a more minute study of the form-critical questions, and in the case of the Pentateuch, a careful study of the relation of the documents to the history and the development of thought. The whole Old Testament has been studied, from the standpoint of Higher Criticism, with increasing attention to detail. The result is that, in the view of many critics, nearly all books of the Old Testament are considered to contain elements of diverse dates, the original writing having been supplemented by various additions. And several of the documents are believed to have been combined. Many English and American writers have been prominent in the later discussions.

The pioneer work in the development of Higher Criticism has been done for the most part in Germany. The form-critical criticism is, therefore, in large measure an application of methods and lines of evidence in use in the Old Testament, although in recent years the Higher Criticism of the New Testament has acquired great prominence. Eichhorn, who has been mentioned earlier as conspicuous in reference to the Old Testament, is one of the early leaders in New Testament criticism. In his 'Historisch-kritische Einleitung ins Neue Testament' (1804), he, for the first time, clearly grasped the synoptic problem and proposed the hypothesis of an original gospel before the present gospels. The work of De Wette was notable on the New Testament as well as on the Old, the results being seen in his 'Lehrbuch der historisch-kritischen Einleitung in die kanonischen Bücher des neuen Testamentes' (1826).

Almost simultaneously with the beginning of the third stage of Old Testament criticism, and to a certain extent connected to it, came a strongly-marked movement in New Testament study. This was the work of F. C. Baur, 'Die Christuspartei in der Corinthischen Gemeinde,' in the Zeitschrift für Theologie (1831), and later books; this is sometimes called the Tübingen criticism. In particular, he was dominated by the His work was strongly influenced by prepossess-philosophy of Hegel, especially in its theory of development that history moves through the three processes, thesis, antithesis and synthesis. The principal position of Baur was that the New Testament shows the conflict between two parties, original Christianity which was a Jewish sect, and Paulinism which had the broader spirit. His position aroused violent discussion, the theory being generally held to be extreme; it has now been entirely abandoned. Baur rendered great service, however, in putting emphasis upon the necessity of seeing the New Testament in its relation to the whole thought of Christ.

The principal problems of the Higher Criticism of the New Testament which have been considered in recent times, in addition to those relating to epistles called Pauline which have always been prominent, are those of the authorship, editing and sources of the synoptic gospels, the gospel of John, the book of Acts and the book of Revelation. See Apocalyptic Literature; Bible; Higher Criticism; Pentateuch, and the various articles on the books of the Bible.

BIBLE IN SPAIN. The 'The Bible in Spain' (1843) is an account of the experiences of the author, George Borrow, in the Spanish Peninsula in the years 1835 to 1840, as agent for the English Bible Society. In his rather quixotic but highly congenial task of distributing copies of the New Testament in the vernacular Borrow encountered a series of surprising adventures among rude peasants, smugglers, bandits and Spanish gypsies which are duly recorded and lose nothing in the telling. Many portions of the narrative, as, for instance, the account of the journey from Badajos to Madrid in the company of the mysterious gypsy, Antonio, read more like the adventures of a Sir John Mandeville than like the real experiences of a modern traveler in a civilized land, yet we are assured by Borrow's recent biographer that this book, like 'Lavengro' and 'The Romany Rye,' is a faithful record. Whatever may be the relation of fact and fiction in Borrow's work (and the matter can hardly be said to have been settled) it reveals as no other book has done the mystery of the soil and the mystery of romantic Spain. Borrow's linguistic facility and his truly remarkable power of placing himself on a footing of equality with the strange persons whom he encountered enabled him to see their lives from
the most intimate standpoint. By the gypsies he was regarded as one of their own brotherhood. 'The Bible in Spain' is one of the strangest books that was ever written and one of the most fascinating. Good editions of 'The Bible in Spain' were published in English. Consult Walker, Hugh, 'The Literature of the Victorian Era' (1042ff.).

JAMES H. HANFORD.

BIBLE SOCIETY, a religious society organized and maintained, for the translation, publication and distribution of the Bible or parts thereof at home and abroad, in English and in many other languages. Naturally the Bible Society is a Protestant effort. It grew out of the attempts of the various Protestant denominations to make known the general principles of Protestantism and the particular views of the numerous Protestant sects. The invention and perfection of the printing press made these efforts effective. All denominations of Protestants were anxious to spread abroad a knowledge of the Scriptures. Numerous Protestant societies made a business of distributing free copies of the Scriptures at a very early date on the history of the Reformation and the growth of Protestantism; but none of these efforts were controlled and directed by the one motive, that of the handling of the Scriptures. As early as the time of Spencer, Baron Hildebrand von Constein, a close friend of the latter, along with other Protestants, founded a society for providing copies of the Bible for those not able to purchase them. This society had given away or sold, at a price often below cost, nearly 3,000,000 Bibles and more than 2,000,000 New Testaments, before the modern Bible societies came into the field. In England in 1790 there was formed an association for the distribution of the Bible among soldiers and sailors under the name of 'The Bible Society'. Later the title was changed to its present designation, 'Naval and Military Bible Society.' Twelve years later the French Bible Society was formed in London for the purpose of having Bibles printed in French. No attempt was made to print the French Bibles in England but the funds collected by the Society were sent to France. During the French Revolution the premises and plant of the Society, together with its funds, were taken possession of by the revolutionary party and, for the most part, destroyed. After two years of effort the British and Foreign Bible Society was formed. Its establishment was due, in great part, to the enthusiasm of Thomas Charles, a Welshman, who urged the Religious Tract Society to supply the lack of Bibles which he found everywhere among the poor people in Wales. The hint was followed up and a society for the supply of Bibles in all parts of the world was the direct result. All Protestant denominations were invited to help in the enterprise. The Society grew rapidly and extended its sphere of action and influence. In 1912-13 its expenditures amounted to almost $27,000,000. But this was but a small part of its work; for auxiliary societies sprang up everywhere throughout the British domains; and these now number in the neighborhood of 6,000. The Society publishes both the authorized and the revised version of the Bible. Naturally, owing to the influence under which the Society started, it gave great prominence to the distribution of Bibles in Great Britain in both English and the Gaelic languages. But gradually it extended its sphere until now it translates (published in English, New Testament, 197 copies and New Testament, 4,584 copies). The total of 50 different alphabets or modifications of alphabets is employed in the printing of the Bible, or parts thereof, issued by the Society. In a recent year the work of the Society stood as follows:

<table>
<thead>
<tr>
<th>No. of languages</th>
<th>Copies printed in</th>

</tr>
</thead>
<tbody>
<tr>
<td>Bibles</td>
<td>108</td>
<td>4,584</td>
</tr>
<tr>
<td>New Testaments</td>
<td>231</td>
<td>4,841</td>
</tr>
</tbody>
</table>

The total issue of the British Society during its existence up to the close of 1916 was, in round numbers, 250,000,000 copies. So broad has become the work of the Bible Society that there is scarcely a country or part of the world where its agents are not at work whether they are missionaries or lay distributors.

In Scotland the various Bible societies have been united into the National Bible Society of Scotland since 1861; while in the United States the principal work of the Association is carried on by the American Bible Society. In Germany, though there are a number of Bible societies, that of chief importance is the Prussian Central Bible Society of Berlin founded in 1814. It has branches in many parts of Prussia and distributes over 100,000 Bibles a year. All the other divisions of the German empire have also Bible societies. Some of the German Bible societies do not print their own Bibles but get them from London, from the British and Foreign Bible or from Berlin Society. However the German societies have of late been extending their sphere of influence and broadening their efforts until now the Lutheran version of the Bible is to be met with everywhere.

The one great country where the Bible Society has had but little effect upon the masses of the people is Russia. There the work of its 300 or more agencies is confined almost exclusively to the foreign population. This condition is due to the attitude of the government and that of the Greek Church, both of which took the position in 1829 that the task of supplying the Scriptures to the people could properly be performed only by the Holy Synod. This resolution automatically stopped all secular work in the distribution of Bibles to the members of the Greek Church throughout the land from Bible Societies. To the Bible Society to looking after the great mass of non-Greek-Church foreigners within the bounds of the empire. So the Bible still remains to be translated into most of the languages and dialects spoken by the vast un-homogeneous population of the Russians. In Austria the influence of the Bible Society has been even less than in Russia; for, since 1817 its operation throughout the Austrian empire
BIBLE STATISTICS

has been rendered illegal by restrictions on the part of the government. The work of the American Bible Society shows a steady and rapid increase, as the following table demonstrates:

In 1661 John Elliot translated the New Testament into the Algonquian Indian language and had it printed at Cambridge. This was the beginning of activity in this work which was destined to assume vast proportions. Two years later he finished the translation of the complete Bible into Algonquian and published it. It was not until 80 years later that a German edition of the Bible was published at Germantown, Pa. The first English Bible published in America appeared in Philadelphia in 1782. Thus it will be seen that the progress of the work of printing Biblical literature in America was very slow in the years of colonial life. The establishment of the first American Bible society in Philadelphia in 1808 was followed by considerable activity in the same work in other places. In 1809 New York, Boston, Princeton and Hartford all established Bible societies. The next seven years saw 54 new Bible societies started in the United States, making in all a total of 59. In this latter year (1816) 35 of these societies meeting in New York, organized the American Bible Society with the subscribing Bible societies as local organizations. This Society was incorporated in 1841; and 11 years later the Bible House was opened at Astor Place, 3d and 4th avenues, where the work of printing, publishing and carrying on the distribution of Bibles, Testaments and parts thereof was proceeded with much as in England. The Society now has one of the most complete printing plants in the United States. The Association is managed by a board of 36 laymen, one-fourth of whom are elected every year. All the publications of the Bible Society, excepting the New Testament, are sold at cost, under cost, or, given away and vast quantities of these have been scattered broadcast over the United States in 84 languages. The energy of the American Bible Society also aims to reach out to all peoples, races and countries of the world. See American Bible Society, The.

With the growth of American foreign missions the work of the Society in foreign lands has increased enormously until in 1916 it issued almost 5,053,400 copies for foreign distribution. Since its establishment it has issued 71,536,305 copies at home and 46,151,286 abroad. This is an average well over 1,000,000 a year, for every year of its existence. The publications of the Society are issued in over 150 distinct languages, and the number is being yearly added to. Not all the printing and publishing of the Bible Society is done in New York, considerable of it being issued from branch establishments in various foreign countries. The fact that accurate work is greater than in America.

The American and Foreign Bible Society and the American Bible Union are two Baptist Bible societies which are very active in the printing and distribution of Bibles and the carrying on of Biblical propaganda and missionary work. The publication and other work of these two societies is now united and carried on by the American Baptist Publication Society.

BIBLE STATISTICS, an interesting compilation, said to be the fruits of three years' labor by the indefatigable Dr. Horne, and given by him in his introduction to the study of the Scriptures. The basis is an old English Bible of the King James version.

Old Testament.—Number of books, 39; chapters, 929; verses, 23,214; words, 593,493; letters, 2,728,100.

New Testament.—Number of books, 27; chapters, 200; verses, 7,959; words, 181,253; letters, 838,380.

The Bible.—Total number of books, 66; chapters, 1,189; verses, 31,773; words, 773,746; letters, 3,566,480.

Apocrypha.—Number of books, 14; chapters, 184; verses, 6,031; words, 125,185.

Old Testament.—The middle book of the Old Testament is Proverbs. The middle chapter is Job xxix. The middle verse is 2 Chronicles xx., between verses 17 and 18. The shortest book is Obadiah. The shortest verse is 1 Chronicles i. 25. The word “and” occurs 35,543 times. Every letter of our alphabet occurs 73 times and only in the poetical books. 2 Kings xi. and Isaiah xxxvii. are alike. The book of Esther does not contain the words God or Lord. The last two verses of 2 Chronicles and the opening verses of the book of Ezra are alike. Ezra ii. and Nehemiah vii. are alike. There are nearly 30 books mentioned, but not found in the Bible, consisting of civil records and other ancient writings now nearly all lost. About 20 of these are alluded to in the Old Testament.

New Testament.—The middle book is 2 Thessalonians. The middle chapter is between Romans xiii. and xiv. The middle verse is Acts xvii. 17. The smallest book is 2 John. The smallest verse is John xii. 18. The word “and” occurs 10,684 times. The name Jesus occurs nearly 700 times in the Gospels and Acts, and in the Epistles less than 70 times. The name Christ alone occurs about 60 times in the Gospels and Acts, and about 240 times in the Epistles and Revelation. The term Jesus Christ occurs 5 times in the Gospels.

The Bible.—The middle book is Micah. The middle (and smallest) chapter is Psalm cxvii. The middle verse is Psalm cxviii. 8. The middle line is 2 Chronicles iv. 16; the largest book is that of the Psalms; the largest chapter is Psalm cxiv. The word Jehovah (or Lord) occurs 6,855 times. The word “and” occurs 46,227 times. The number of authors of the Bible is 50. The Bible was not until modern times divided into chapters and verses. The division of chapters has been attributed to Lanfranc, archbishop of Canterbury, in the reign of William I; but the real author of this division was Cardinal Hugo de Sancto-Caro, about 1230. The number of languages on earth is estimated at 3,000; the Bible or parts of it have been rendered into
over 450 languages and dialects together. The first English translation complete of the Bible was by Wyclif in 1382. The first American edition was printed in Boston in 1752. 

**BIBLIA PAUPERUM** (Bible of the poor), the name for block books common in the Middle Ages, and consisting of a number of rude pictures of Biblical subjects with short explanatory Latin text accompanying each picture. A similar work, but more extended, and with rhymed text, was the *Speculum Humane Salvationis* or *Mirror of Human Salvation*. Prior to the Reformation these two books were much used by the preaching monks, and as such orders as the Franciscans, Carthusians, etc., were styled *Pauperes Christi*, the first named book, so popular with them, came to be known, therefore, as the *Biblia Pauperum*. Many manuscripts of these works have been preserved in different languages. The *Bible* was one of the first books printed in Germany and the Netherlands both from blocks and from types. The chief proof of the discovery of printing in Haarlem is derived from early impressions of the *Bible*, and *The Biblia Pauperum* has been reprinted in facsimile several times. There is an edition by Unwin, with a preface by Dean Stanley issued in London in 1884.

**BIBLIOGRAPHY.** A leading contribution in *The Papers of the Bibliographical Society of America* (Vol. X, No. 4, October 1916), supplies the observation that may very well stand at the beginning of a study of this subject. Mr. Feipel writes that "bibliography, or the compilation of bibliographies, is one of the most important branches of bibliography, or the science of books. It is the chief source of information for seekers after book knowledge, and is as varied in its resources as the questions [brought] to it are multifarious." That elastic statement makes room, as we shall show, for the most complete, and the most broad characterization — which he gives afterward — of the art or science of bibliography as it is understood in our own times.

But, desiring for our present purpose a more exact introduction, we turn to a definition that seems to us admirable — the one put forward by James Duff Brown in *A Manual of Practical Bibliography* (London and New York 1906, pp. 3, 4). "For the purpose of this book," Mr. Brown writes, "the definition of bibliography as the science which treats of the description, cataloguing and preservation of books is ample. Within these limits are included practically everything which relates to the externals and registration of books, without trespassing on the province of criticism, historical typography, librarianship, paleography, or any other special department which deals more particularly with the archaeology, qualities, and circulation of books." A sharp distinction must be drawn between bibliography and librarianship, which are too often confounded. The former is the science which relates to the history, materials, and description of books in general. The latter is concerned chiefly with the collection, preservation, classification, and making publicly available the books in a particular collection. The one is universal, and considers the personal history of all books; the other is restricted to the elucidation and distribution of the comparatively small collection which forms a library or mere selection of books. The same writer holds that "for bibliographical purposes it does not matter whether a book has commanded a fabulous price in an auction saleroom or whether it is a pamphlet of yesterday dealing with some unimportant local controversy. The business of bibliography," he asserts, "is to take heed of all publications, old or new, great or small, cheap or dear, and to describe, and catalogue, and index them in such a clear and sufficient manner that the whole literature of the world on any given subject, or by any given author, shall be placed at the service of the humblest inquirer. This," he adds, "may seem an unattainable ideal, but it has the practical advantage of being something definite at which to aim."

Ripe scholarship, however, does not invariably or unhesitatingly go quite to that extreme. Mr. E. W. Wilberforce gives, for example, the distinguished bibliographer of The New York Public Library, who is devoting a part of his time to the completion of Sabin's *Dictionary of Books Relating to America* — is not averse to a more promptly utilitarian practice in the conduct of the wide bibliographic field; and a discriminating signification may, we also think, quite properly be added to the definition of the word bibliography. To him it seems right that, in some instances at least, lists of books for common use should be lists of carefully selected books. The service that such lists render is to guide the reader to works of positive value, instead of sending him perhaps on a fool's errand in quest of a volume that may be difficult to procure simply because it never was thoroughly well worth the reading. And this eminent collector and scholar thinks that it is sometimes helpful to add, after the more strictly bibliographic data, brief literary notes giving a synoptical statement of the contents together with a general impression of the character of the listed works.

The interest in this science has never been so widespread and so systematically active as it is in recent years. The history of the world we now find bibliographical societies; and their publications, as well as the periodicals devoted to book and library questions, or giving to these matters special prominence, bear testimony to a general and genuine public interest in the subject. "As to the practical value of a knowledge of bibliography," Mr. Feipel says, "there can indeed be little room for doubt;" and he quotes from the J. D. Brown 'Manual' as follows: "In every possible avenue of research or inquiry, bibliography plays an important part. An acquaintance with bibliographical writings, conjoined with access to the best examples, is a kind of master-key which will unlock the stores of knowledge of all ages, and, when used with intelligence, has the power of opening up sources of information which might otherwise be unsuspected or neglected." When we realize that bibliography assists the student to such an extent, we must also realize that to the librarian, who is concerned with the welfare of students in regard to the actual or possible provision of books, it is wholly indispensable.
The etymology of the word may afford some explanation of a tendency, observed in certain classes of books, to subvert the older meaning of Bibliographia which, in post-classical Greek, was used, says Mr. Feipel, "to mean the writing of books; and, as late as 1761, in Fenning's 'English Dictionary,' a bibliographer is defined as 'one who writes about books.' The transition from the meaning 'a writing of books' to that of 'a writing about books' was accomplished in France in the 18th century. An ideal of bibliography—an ideal which, it is needless to say, will never be achieved, but which may be closely approximated—is the description, in minute detail, of all the books of the world. Bibliography may, according to the views of this writer, be regarded as, first, the art of discovering and imparting to others information concerning the books; second, the mass of literature containing such information; third, a compilation of book information concerning a particular thing, person, place, period, etc. The relation existing between these various considerations is that of means and ends—the first constituting the means by which the last two are produced. It follows, therefore, that the perfection of the art of bibliography consists in adapting the means to the end in the most satisfactory manner possible and, in order to do this a thorough study of the principles underlying the art is essential.

Again, if we have in mind especially the utilitarian aspects of the several kinds of bibliographic work (as it is eminently proper to do), we may distinguish and discriminate the four classes: historical, eclectic, commercial and inventorile. Of these, the first two are essentially cultural and altruistic in their appeal, while the latter two are practised primarily for the benefit of the practitioner—as the following differentiation clearly shows: Works of the class first mentioned serve primarily the needs of book-collectors and of the students of the art of printing; those of the class termed eclectic are mainly directed toward the appraisal of the subject matter contained in books, with a view to determining their relative values for purposes of study or recreation. On the other hand, commercial bibliography serves as an indispensable medium of exchange of books between bookseller and book buyer, and works of the class last mentioned, the inventorile, are prepared by or for the owners of books, manuscripts, etc., for the sake of registering such possessions as may be called literary, in the widest sense of that word. The second of these may be more active in the field of historical bibliography may be summarized as follows: (1) tracing the origin of books, (2) describing their form and contents, (3) recording the events connected with their "careers," so to speak. The special realm of historical bibliography deals with books in a manner resembling that in which history deals with nations or biography and genealogy deals with persons. When properly executed, historical bibliography not only supplies information about various books but also reflects the state of civilization of the era to which the books belong—its material comprising both primary and secondary sources. Primary sources constitute the bulk of contemporary historical bibliography, while the secondary sources constitute the great body of antiquarian book knowledge—a subdivision that will be the theme of the next paragraph. The primary sources are to be found in the private and public documents of the persons and institutions concerned in the production of books. They comprise journals and correspondence of authors and their friends, and subsequently the correspondence and documents exchanged between authors and publishers. Then follow, if the book is published, advertisements and announcements, including those carried by the book itself and such as appear elsewhere. These are finally supplemented by reviews and news items in the journals of the day. If the book continues to live in the minds of the people for any length of time, contemporary records of the book are apt to multiply indefinitely, and bibliographical lore is correspondingly increased. The aggregate of the foregoing constitutes the storehouse from which succeeding ages must derive their bibliographical information, and without which antiquarian bibliography would be an impossibility.

Now, the aim of those literary workers who devote themselves to antiquarian bibliography is to construct authoritative descriptions and accounts of the books of former times; and here the varieties are found to range from extensive histories of the literature of a nation to a brief paragraph throwing additional light on a single book or on a single phase of its history. The essential features of this kind of bibliography are (1) the comparative antiquity of the book or books concerning which information is being imparted, and (2) the fact that this information is derived from acknowledged authoritative sources. A few words may be added in regard to the eclectic, the commercial and the inventorile divisions or classes. Of these three, the first is regarded as peculiarly the province of the educator, since it strives to suppress the bad and to advance the good; and the documents for the proper practice thereof are, of course, impartiality and sound judgment. The second is referred to as a phase of salesmanship, or as advertising ability applied to the sale of books. The third—inventorial bibliography—is requisitioned wherever a valuable collection of books is deposited, and exemplifies the application of accounting methods to books considered as personal property.

We shall now consider in turn the leading characteristics of Subject and Class Bibliographies, of National Bibliographies, of Bibliographical Encyclopedias, of Handbooks of Literary Curiosities, and of Bibliographies of Bibliographies; and for the reader's convenience a number of titles of representative works will be included.

A large place in bibliographical literature is held by the bibliographies of special subjects, of literary forms and of classes of books; and it has been well said that such bibliographies are, to the literatures of their special fields, what an index is to a book—if the index chosen for comparison be decidedly ample. They show the extent and character of their respective literatures; they assemble and make

National bibliographies are very numerous, but commonly either incomplete or out of date. Among those mentioned by Mr. Feipel are Lowndes' 'Bibliographer's Manual of English Literature' (originally published in 1834, but now best known in the revised edition, London 1857-64); the 'Bibliotheca Britannica,' compiled by Robert Watt and published at Edinburgh in 1824; Sabin's 'Dictionary of Books Relating to America' (in 20 vols., New York 1867-92), to which we have already referred; and Roebach's 'Bibliotheca Americana' (New York 1849-61). Continental nations of Europe have produced, among many other works of this order, the following: Brunn, C. V., 'Bibliotheca Danica' (3 vols., Copenhagen 1887-90); 'Bibliotheca Belgica' (Ghent 1879-98); Heinsius, W., 'Allgemeines Bücher-Lexicon' (19 vols., Leipzig 1812-94); Hidalgo, D., 'Diccionario general de bibliografía española' (7 vols., Madrid 1862-81); Linström, H., 'Svenskt Bibliografiskt Lexicon' (Stockholm 1862-84); Petersen, H., 'Norsk Boglexikon' (Christiania 1899, in progress); Quérard, J. M., 'La France littéraire' (12 vols., Paris 1827-64); Silva, J. F., 'Dictionario bibliographico portuguez' (16 vols., 1859-93); Thieme, H. P., 'Guide Bibliographique de la Littérature Française de 1800 à 1906' (Paris 1907).

Bibliographical encyclopaeas, or universal reference-works of book information, should, if the promise of the title were fulfilled, contain standard descriptions of all kinds of literary, historical or typographical interest, not only as they first issued from the press but also as they subsequently appeared in all the variant editions; but in very few instances has any approach been made to the realization of that ideal in the past, and at the present time the number of such standard works is very small, owing partly to the greater and more accurate detail now demanded, and partly to the absence of any sufficiently extensive or quite adequate system of co-operation among libraries. The nearest approach to such a work is the 'Catalogue of Printed Books in the British Museum,' which was begun in 1881, and, although completed as far as the original alphabet is concerned, receives additions continuously. In Germany, in general, a system resembling the British Museum catalogue, that of the 'Bibliothèque Nationale' of Paris is still in course of preparation. Georgii's 'Allgemeines Europäisches Bücher-Lexikon,' in 11 volumes, was published at Leipzig in 1742-58. Especially noteworthy as a bibliography of the best and rarest editions of books is J. C. Brunet's 'Manuel du Libraire,' the original edition of which was published in 1810. Its 5th edition (Paris 1865-65) was issued in six volumes, and two supplementary volumes appeared in 1878-80. We mention also the 'Trésor de Livres Rares' by J. G. T. Graesse (7 vols., Dresden 1859-69) and Santander's 'Dictionnaire Bibliographique' (Brussels 1895-97).

The dictionaries of anonymous and pseudonymous works, the lists of prohibited works, etc., following the many unexplored or partly explored by-paths of literature, form a not unimportant branch of bibliography, and are usually classified as handbooks of literary curiosities.

In 'Bibliographies of Bibliographies,' by A. G. S. Josephson (2d ed., originally published in the Bulletin and concluded in the 'Papers' of the Biographical Society of America), may be found a list of works devoted to the cataloguing of bibliographies on all kinds of subjects. Among these are Peignot's 'Répertoire de bibliographies spéciales, curieuses et instructives' (Paris 1810); Petzettd's 'Bibliotheca Bibliographica' (Leipzig 1866); Stein's 'Manuel de bibliographie générale' (Paris 1880), and Vallée's 'Bibliographie des Bibliographies' (Paris 1883-87).

The Chief Bibliographer of the Library of Congress, Mr. H. H. B. Meyer, calls special attention to the value of such publications as the 'Readers' Guide to Periodical Literature' and its supplement, the 'Cumulative Book Index,' the 'Index of Legal Periodicals,' the 'Magazine Index' and the 'Engineering Index.' Every student of bibliography is glad to acknowledge his obligations also to the bibliographies of historical literature in magazine form, constituting a great storehouse of book information, and the notices
and criticisms of new books in the publications of a general and popular character; and to those inventories of particular collections of books, the printed catalogues of libraries large and small, public and private.

In regard to the compilation of bibliographies, Mr. Feipel writes that the various bibliographic details fall into the more or less well-defined groups or categories: authorship, title, subject, literary form, place and date of publication, size, binding, price, typography, number of copies printed, edition, etc.; and upon the scope and aim of the particular piece of bibliographic work depends the decision to omit or to include any of these details. Naturally the perfection of the work when completed will be found to depend in great measure upon the good judgment manifested in such careful selection of the items. Moreover, this judgment must be shown in deciding whether to cast the bibliography in the narrative form or the catalogue form, the choice depending — in this matter also — upon the object to be attained and the scope of the work. The narrative form is especially adapted to treaties intended to be read as a whole, while the catalogue form is better suited for occasional or particular reference. In either case, a logical arrangement of the subject-matter is essential for proper presentation and consultation. In short, the ideal of bibliographical exposition is that which supplies the greatest number of wants with the least expense of time and effort on the part of the user. Scholarly bibliography usually involves a great deal of research on the part of the compiler; and a thorough knowledge of bibliographical sources and authorities, as well as of general reference books, is of prime importance.

In conclusion we refer once more to the all-important consideration of the utility of this art; and shall treat briefly of the requirements of librarians, of private book collectors and of students — the three chief groups of persons who profit by bibliography most directly.

The librarian considers both the contents and the character of the book he collects; his aim is naturally to supply the wants of all comers. Theoretically, it is his privilege to strive to have his library contain books on all topics and representative works — or even all the work — of all good writers; but since this is an unattainable end as well as an ideal of questionable worth, he works up to it as reasonably as he sees fit and as nearly as his resources allow. And for his work of buying, making sure that the books are complete and of the best editions, cataloguing them, and filling up gaps in the collection, bibliography without doubt his most essential tool.

Now, the private book collector, not being obliged to take account of the tastes and requirements of other people, but on the contrary devoting his leisure to the quest of such books as he himself cares for, very often appraises his acquisitions not according to their use as reading-matter, but according to their origin, their history and their scarcity. They are prized not so much for what they contain as for what they are, namely, specimens of an art that can never be placed.

For him, then, bibliography's utility is measured by the correctness of its replies to these or similar questions: What books exist? What constitutes a complete copy of each? Which are rare and which abundant? But the student's wants are unquestionably those that have received most solicitous attention; and the fact has been clearly recognized that bibliography serves him far less as a technical description of books, far more as a guide to literature: "It is a guide to the books in the range of books, less to their contents than to their external peculiarities, that he requires." See Bibliomania.

MARRION WILCOX.

BIBLIOMANCY, divination performed by means of the Bible, also called sortes biblicae, or sortes sancturum. It consisted in taking passages at hazard, and drawing indications thence concerning things future. It was much used at the consecration of bishops. It was a practice adopted from the heathens, who drew the same kind of prognostications from the works of Homer and Virgil. In the Council of Vannes condemned all who practised this art to be cast out of the communion of the Church; as did the councils of Agde in 506 and Aixerre. But in the 12th century we find it employed as a mode of detecting heretics. In the Gallican provinces it was long practised in the election of bishops; children being employed, on behalf of each candidate, to draw slips of paper with texts on them and that which was thought most favorable decided the choice. A similar mode was pursued at the installation of abbots and the reception of canons; and this custom is said to have continued in the cathedrals of Ypres, Saint Omer and Boulogne, as late as the year 1744. In the Greek Church we read of the prevalence of this custom as early as the consecration of Athanasius, on whose behalf the presiding prelate, Caracalla, archbishop of Nicomedia, opened the Gospels at the words, "For the devil and his angels" (Matt. xxv, 41). The bishop of Nice first saw them and adroitly turned over the leaf to another verse, which was instantly read aloud: "The birds of the air came and lodged in the branches thereof" (Matt. xiii, 32). But this passage appearing irrelevant to the matter in hand, the bishop first became gradually known, and the Church of Constantinople was violently agitated by the most fatal divisions during the patriarchate. It has persisted in a measure in modern times and devout persons have used this means of seeking guidance. Tenney makes use of the custom in 'Enoch Arden.'

BIBLIOMANIA ("book-madness"), a word formed from the Greek and signifying a passion for possessing rare or curious books. The true bibliomaniac is determined in the purchase of books less by the value of their contents than by certain accidental circumstances attending them. To be valuable in his eyes they must belong to particular classes, be made of singular materials or have something remarkable in their history. Some books acquire the character of literary prizes by being issued to classes from treating of a particular subject; others from something peculiar in their mechanical execution (as the omission of the word "not" in the seventh commandment, which gives the Wicked Bible its name), or from the circumstance of having issued from a press of uncommon eminence, or because they once belonged to the library of an
eminent man. But there are certain fashions in bibliomaniac and books much sought at one time may at another be comparatively neglected. Some collections of books may possess or have possessed much intrinsic value; such as collections of the various early editions of the Bible; collections of editions of single classics (for example, those of Horace and Cicero); the editions of the Greek and Latin classics in usum Delphinii and cum notis variorum; the editions of the Italian classics printed by Aldus and by Elzevirs; and by Aldus; the classics published by Maittaire ou Foullis; and the celebrated Bishops editions, with others. It perhaps was more customary in former times than at present to make collections of books which have something remarkable in their history (for example, books which have become very scarce and such as have been prohibited), yet various scarce books are highly prized on account of nothing but their rarity, the original (1572) King James Bible edition for instance. First editions may be ranked in the same class. Books distinguished for remarkable mutilations have also been eagerly sought for. Those which appeared in the infancy of typograhy were called excudabula, from the Latin came, a cradle, and among them the first editions (editiones principes) of the ancient classics, are still in general request. An enormous price is frequently given also for the proof impressions of copperplate engravings and for colored impressions, for works adorned with miniatures and illuminated initial letters; likewise for such as are printed upon vellum. Works printed upon paper of uncommon materials or various substitutes for paper (asbestos, for instance), have been much sought after; likewise those printed upon colored paper. Other books in high esteem among bibliomaniacs are those which are printed on large paper, with very wide margins. In English advertisements of rare books some one is often mentioned as particularly valuable on account of its being "a tall copy." If the leaves happen to be cut the value of the copy is much enhanced. Other works highly valued by bibliomaniacs are those which are printed with letters of gold or silver or ink of singular color; for example: (1) "Fasti Napolonicum" (Paris 1804, 4to), a copy on blue vellum paper with golden letters; (2) "Magna Charta" (London 1816, fol.), three copies upon purple-colored vellum, with golden letters.

Bibliomania often extends to the binding. In France the bindings of Deurope, Padoupe and Bozerian are highly valued; in England those of Charles Lewis and Roger Payne, among 18th century binders; while Haydav, Riviere, Bedford and Zaehndorff may be mentioned as among the notable craftsmen of the 19th. Even the edges of books are often adorned with fine paintings. Many devices have been used to give artistic value to bindings. Jeffery, a London bookseller, had Fox's "History of King James II" bound in fox-skin, in allusion to the name of the author; and the famous English bibliomaniac, Askew, even had a book bound in human skin. In the library of the edifice of the 18th century the 20 books bound in silver (commonly called the silver library). These are richly adorned with large and beautifully engraved gold plates in the middle and on the corners. To the exterior decoration of books belongs the bordering of the pages with single or double lines, drawn with the pen (exemplaire réglé), commonly of red color—a custom which we find adopted in the early age of printing in the works printed by Stephens. The custom of coloring engravings has generally been dropped, except in cases where the subject particularly requires it (for instance, in works on natural history or the costumes of different nations), because the colors conceal the delicacy of the engraving.

Other means of idle competition being almost all exhausted, a new method of gratifying the bibliomaniac taste was adopted, that of enriching works by the addition of engravings,—illustrative indeed of the text of the book, but not particularly called for,—and of preparing only single copies. Books are often mutilated in this way to enrich some other book. Such "grangerized" copies have long been valued! Burns' Poems for instance.

Among recent books valued as specimens of typography are some of those that issued from the Kelmscott Press of the late William Morris. Bibliomania, which flourished first in Holland (the seat likewise of the tulipomania) toward the end of the 17th century, has prevailed in England to a much greater extent than in France, Italy or Germany. The modern bibliomaniac is very different from the spirit which led to the purchase of books in the Middle Ages at prices which appear to us enormous. External decorations, it is true, were then held in high esteem; but the main reason of the great sums then paid for books was their scarcity and the difficulty of procuring perfect copies before the invention of the art of printing. Consult Dibdin, 'Bibliomaniac' (London 1811); Fitzgerald, 'The Book Fancier' (ib. 1886); Lary, 'The Library' (1886); Burton, 'The Book Hunter' (New York 1882); Field, 'The Love Affairs of a Bibliomaniac' (ib. 1896); Ferguson, 'Some Aspects of Bibliography' (Edinburgh 1900); Lang, A., 'The Library' (London 1881); Merryweather, 'Bibliomaniac of the Middle Ages' (London 1849, reprint, 1900); Pollard, 'The Fine Book' (New York 1912); Fletcher, 'An Index to General Literature' (Boston 1901); Gusteier, 'Guide to Periodical Literature' (2 vols., Minneapolis 1910); Poole, 'Index to Periodical Literature,' covering the period after 1802.
BICARONATE. See CARBON.

BICCI, Béraldo, Italian poet: b. 1485. He studied in Florence, and became professor of Italian literature in the University of Siena. His best composition is in the collection styled 'New Verses.'

BICCHERI. See BICCIRI.

BICCHU, province, island, Japan.

BICHLER, Johann, sculptor: d. 1689. He was a native of Schulen, near Bobera, and studied in Italy. His works are now valuable and interesting, as his name has become almost obsolete. His best compositions are in stone, and in a manner that is more elegant and refined than the works of any other sculptor of the time. He was a member of the Royal Academy of St. Luke, and was one of the most celebrated sculptors of the 17th century. He was also a distinguished collector of art, and his collection is now in the possession of the British Museum.

BIDRÉ, Charles Henry, French physicist: d. 1817. He was a pupil of the École Polytechnique, and was a member of the Academy of Sciences. He was also a distinguished collector of art, and his collection is now in the possession of the British Museum.

BIELE, b. 1385. He studied in Florence, and became professor of Italian literature in the University of Siena. His best composition is in the collection styled 'New Verses.'

BICE, bice, or BISE, the name of two colors used in painting, one blue, the other green, and both native carbonate of copper, though inferior kinds are also prepared artificially. As other artificial pigments are often called, the word is now of doubtful value and has become almost obsolete. Blue bice is known as mountain blue or ongario, and green bice as Hungarian-green, verde de Spagna, etc.

BICEPS (biceps flexor cubiti), the principal flexor muscle of the arm, the muscle popularly shown as evidence of muscular development. It has two heads, one being attached to the coracoid process of the scapula, and the other to the margin of the glenoid fossa, about the joint. The long head, passes over the head of the humerus as a tendon and unites with the short head to form the belly of the muscle. The lower end of the biceps is inserted for the greater part to the radius, and a smaller tendinous expansion is inserted in the fascia of the forearm. The action of the biceps is to bring the forearm to the arm and to turn the interhumeral joint.

BICETRE, bē-sātē, France, village a little to the southwest of Paris, with a famous hospital for old men in indigent circumstances, and an asylum for lunatics, together forming one vast establishment, containing over 2,700 beds. This establishment was originally founded by Louis IX as a Carthusian monastery, but became afterwards a castle, which was demolished in 1632, after being long in a ruinous state, and was restored by Louis XIII, and destined as a retreat for infirm officers and soldiers. When Louis XIV afterward erected the great Hôtel des Invalides, Bicêtre became a general hospital, and it continued as such down to the Revolution, and contained also a house of correction. The establishment was then entirely altered and converted into a workhouse. The poor persons admitted must be at least 70 years of age or incapacitated by some incurable disease from earning a livelihood. The lunatics are such as belong to the department of the Seine. They are attended to by the greatest care and fabricate neat little articles of wood and bone, known in France by the name of "Bicêtre work."

BICHAT, bē-shā, Marie François Xavier, French physician: b. Thoiroult, department of Jura, 14 Nov. 1771; d. 22 July 1802. His father, a physician, early initiated him into the study of medicine, which the young Bichat prosecuted at Lyons and Paris, where he studied under the direction of Desault (q.v.), who treated him as a son. On the latter's death, Bichat superintended the publication of his surgical works, and in 1791 began to lecture upon anatomy in connection with experimental physiology and surgery. From this period, amidst the pressing calls of an extensive practice, he employed himself in preparing those works which spread his reputation through Europe and America, and which had the most beneficial influence upon medical science generally. In 1800 appeared his 'Treatise on the Membranes,' which passed through numerous editions, and immediately after publication was translated into almost all the languages of Europe.
European languages, and 'Researches Concerning Life and Death,' followed, the next year, by his 'General Anatomy' (4 vols., 8vo) — a complete code of anatomy, physiology and medicine, which was translated into English by Dr. G. Hayward, and published in 3 vols. 8vo. In 1800 he was appointed physician of the Hôtel-Dieu, in Paris, and with the energy characteristic of true genius began his labors in pathological anatomy. In a single winter he opened no less than 600 bodies. He had likewise conceived the plan of a great work upon pathology and therapeutics; and immediately upon commencing his duties as physician to the Hôtel-Dieu he began his researches in therapeutics by experiments upon the effects of simple medicines. In the midst of his activity and usefulness he was brought down by a malignant fever, probably the consequence of his numerous dissections. His friend and physician, Corvisart, wrote to Napoleon in these words: 'Bichat has just fallen upon a field of battle which counts more than one victim; no one has done so many things in so short a time.' He was the creator of general anatomy, or of the doctrine of the identity of the tissues of the different organs, which is the fundamental principle of modern medicine.

BICHIR, bé-shér, one of the African mudfishes (of the genus Bichir), a fish that inhabits the upper Nile and its tributaries, and is regarded as the best food-fish of those waters. It may attain the length of four feet, and is one of the few remaining species of the great nearly extinct group Gonoideidae, and is related to the American gar-pike. It is not truly a mudfish in its habits, though it haunts the deeper holes of the Nile. Its swim-bladder opens ventrally and is double, simulating a pair of lungs in many respects, though the fish cannot live long out of water. See Mud-Fish; Reed-Fish; Ichthyology.

BICHLORIDE OF GOLD, a substance formed by the action of chlorine gas upon dry metallic gold that has been previously thrown down in the form of an impalpable powder, by chemical means. Some authorities formerly asserted that the substance so formed is a true compound, but recent researches, however, it is a mere mixture of metallic gold and the well-known trichloride, AuCl3.

BICKELL, Gustav Wilhelm Hugo, German theologian and Orientalist, son of J. W. Bickell (q.v.): b. Cassel, 7 July 1838; d. Vienna, 15 Jan. 1906. At the age of 24 he became tutor of Semitic and Indo-Germanic philology at Marburg. He became a convert to Roman Catholicism in 1865, was ordained priest in 1867 and appointed professor of Oriental languages at Münster. In 1874 he accepted a similar post at Innsbruck, and finally settled in Vienna in 1891. Bickell wrote a great number of theological treatises, a Hebrew grammar and made several translations; also 'De indole ac ratione versionis Alexandrinae in interpretando libro Job' (1862); 'Grounds of the Infalibility of the Head of the Church' (1870); 'Mass and Pasha' (1872); 'Metrices biblicae regule exempli illustratae' (1879); 'Synodi Brixinenses sacculi XV' (1880); 'Hebrew Poetry' (1883); 'A Papyrus Fragment of a non-Canonical Gospel' (1885); 'Selected Writings and Poems of the Syrian Church Fathers.'

BICKELL, Johann Wilhelm, German ecclesiastical jurist: b. Marburg 1799; d. Cassel 1848. He became professor of jurisprudence at the age of 25; at 33 he was appointed councillor of the High Court of Appeal in Cassel and vice-president in 1845. Bickell gave the impetus to the modern development of ecclesiastical law, leading to extensive research among the writings of early authorities. Of his great work, 'History of Ecclesiastical Law' (Giessen 1844), only one volume was completed. Among his other works are 'Corpus juris canonici' (1825); 'De usuque in Gratianii decreto inveniuntur' (1827); 'Reform of the Protestant Church Constitution' (1831).

BICKERSTAFFE, Isaac, Irish dramatic writer: b. Ireland, about 1735; d. about 1812. At the age of 11 he became page to Lord Chesterfield, lord lieutenant of Ireland. Later he was officer of marines, but was dismissed because of his love of cards. In 1772 he was suspected of a capital crime and fled for his life. Little is known of his later life, save that he lived for a time at Saint Malo under an assumed name. He wrote many successful pieces for the stage, some of which, such as the operas of 'Love in a Village' and 'The Padlock,' are still presented. His celebrated comedy of 'The Hypocrite,' adapted from Colley Cibber's 'Nonjuror,' which was again borrowed in its leading incidents from Molière, long retained its place on the stage, with its well-known characters of Mawworm and Dr. Cantwell. The music of many of Bickerstaffe's pieces was composed by Charles Dibdin. Most of his comedies and light musical pieces were produced under the management of Garrick.

BICKERSTETH, Edward, English clergyman: b. Kirby Lonsdale, Westmoreland, 19 March 1786; d. 28 Feb. 1850. He was educated in the grammar school of his native town, and became successively a postal official, clerk to a London attorney and flourishing solicitor in Norwich. Influenced by a new and powerful impulse, he began in 1805 to exert himself in promoting the formation of Methodist and religious parties among his fellow-townsmen. After publishing successfully in 1814 'A Help to the Study of the Scriptures,' he resolved to enter the ministry of the Church of England. The Church Missionary Society wished to send him abroad on a special mission to Africa, and in this view his bishop, dispensing with the usual course of a university education, admitted him to orders in 1815, and a fortnight afterwards he was admitted to full orders. Mr. Bickersteth thereupon, with his wife, proceeded to Africa, from which, after finishing the objects of his mission, he returned in the following autumn. He filled afterwards the office of secretary to the Church Missionary Society with zeal and distinction until 1830, when he became rector of Watton, in Hertfordshire. He was a strong Protestant, warmly evangelical, and an ardent millenarian. One of the founders of the Evangelical Alliance, he was the author of a series of publications which had an immense circulation, including his famous compilation, 'The Christian Psalmody,' which went through 59
editions in seven years. A collected edition of his works appeared in 1853.

BICKERSTETH, Edward Henry, English divine and hymn-writer: b. 25 Jan. 1825; d. London, 16 May 1906. His father was a Church of England clergyman and at the age of 14 he decided to take holy orders. Though not eminently successful in other subjects during his university career, he won the chancellor's medal for English three years in succession—a unique feat. Ordained priest in 1849, Bickersteth held several church livings before he became vicar of Christ Church, Hampstead, in London, where he remained 30 years. Here he established daily services and engaged actively in missionary work. He made journeys through India, Palestine and Japan. Of extremely broad-minded views, he aided and encouraged many church and diocesan societies which lacked the prescribed evangelical sanction. His writings in prose and verse were very numerous. He published in 1866 ("Yesterday, To-day, and For Ever: A poem in 12 books"), which quickly achieved a world-wide popularity. Nearly 30,000 copies were sold in Great Britain, and twice that number in America. In 1838 he published "Psalms and Hymns, harmonized on his father's "Christian Psalmody." Some 30 hymns of Bickersteth's own composition are in popular use, the best known being "Peace, Perfect Peace" (1883) and "O Brothers, Lift Your Voices." In 1885 he was appointed dean of Gloucester, and shortly afterward was nominated bishop of Exeter. Besides sermons, charges and poems, he wrote a "Practical and Expository Commentary on the New Testament" (1864), of which over 40,000 copies were sold; "The Rock of Ages; or Scripture Testimony to the one Eternal Godhead of the Father and of the Son and of the Holy Ghost" (1859-60); "The Lord's Table" (1884); "The Second Death; or the Certainty of Everlasting Punishment" (1889). Consult Agnew, F. K., "Life of E. H. Bickersteth" (1907).

BICKNELL, Ernest Percy, American public official and social worker: b. near Vincennes, Ind., 23 Feb. 1862. After graduating from Indiana University he became a newspaper reporter in Indianapolis. In 1893 he was appointed secretary of the State board of charities of Indiana, and five years later he became general superintendent of the Chicago bureau of charities. In 1908 he became national director of the American Red Cross Society, whose principal agent he was in San Francisco after the great fire in 1906. He was also active in behalf of this organization in Sicily and Calabria after the earthquake of 1909. In 1914 he was appointed a member of the United States Commission sent to Europe to assist Americans stranded in the war zone. He is a member of the executive board of the Boy Scouts of America.

BICKNELL, George Augustus, retired rear-admiral of the United States navy: b. Batsto, N. J., 15 May 1846. As a midshipman he crossed the line in 1859. At the conclusion of hostilities he entered the Naval Academy, from which he graduated in 1866. During the opening of the Japanese ports of Kobe and Osaka two years later he commanded the marines which maintained order at Yokohama. During the Spanish-American War he commanded the Niagara, and during the Boxer uprisings in China in 1899 he was in command of the Monocacy. From 1902 until 1904 he was commander of the Naval Station at Key West, Fla., after which he commanded the battleship Texas for two years, flagship of the United States coast squadron. In 1906 he was appointed commandant of the Philadelphia and Portsmouth navy yards, which position he retained until 1908, when he was retired, having been promoted to the rank of rear-admiral the year before.

BICKNELL, Thomas Williams, American author, educator, historian: b. Barrington, R. L., 1 Sept. 1834. He was educated at Thetford Academy, 1850-53; Amherst, 1853-54; Brown University, 1858-60. He was school teacher and principal, 1860-69; commissioner of education for Rhode Island, 1869-75. He founded the New England Journal of Education, Education and Primary Teacher. He founded the New England Bureau of Education, 1876; was a member of the Rhode Island house of representatives, 1880, and of the Massachusetts house of representatives, 1888-90; co-founder of the town, New England, N. D.; founder (1889) and president (1880-84) of the National Council of Education; president of the American Institute of Instruction, 1877-78; president of the International Sunday School Association, 1884; president of the Rhode Island Citizens' Historical Association since 1904; founder, secretary and registrar of the National Society of Sons and Daughters of the Pilgrims, 1908; founder and secretary Providence Founders Society, 1911. He has published "Biography of William L. Noyes" (1867); "Reports as School Commissioner" (1869-75); "Annals of Barrington, R. I." (1870); "The Bicknells" (4 vols., 1860-67); "John Myles and Toleration" (1868); "The History of Barrington, R. I." (1898); "Barrington in the Revolution" (1898); "Sowams" (1908); "Bicknell Family Genealogy" (1913); "History of the Rhode Island Normal School" (1912); "The Story of the Monroe School, Founder of Civil and Religious Liberty in Rhode Island, 1638" (1915), and many historical addresses and poems.

BICYCLE, a light steel vehicle consisting of two wheels arranged tandem, united by a frame with the rider's seat upon it; propelled by his feet acting on the pedals connected with one of the axles, at present that of the rear wheel; and steered by a handle-bar guiding the direction of the front wheel. As at present constructed the wheels are of equal size; the driving mechanism is usually a chain with the links fitting over a sprocket-wheel, but one in 25 are chainless, mainly with a shaft and bevel driver; the weight is 23 to 27½ pounds, complete; the frame is of hollow cold-drawn tubing, with brazed joints; the wheels are suspension, with cross-steel spokes, wheel rims, pneumatic tires and ball bearings. The names dates from about 1865, though first so spelled in a patent of 8 April 1869, and elsewhere called "bycycle," "bicicyle," "bicicyclic velocipede," etc.; but prior to 1870 the form
of the machine was usually called a velocipede, a French name dating from 1779.

The pedomotor itself goes back perhaps to Egyptian and probably at least to classic times, winged figures astride of a stick connecting two wheels being found in the frescoes at Pompeii. In the 17th century it suddenly appears with surprising frequency; there is a picture of a bicycle in a stained-glass window at Stoke Pogis, England; in August 1665, John Evelyn writes in his diary of "a wheel to run races in"; in 1690 a Frenchman named De Sivrac invented a two-wheeled vehicle having a horse-shaped wooden body with a saddle, and steered by the rider's feet; in 1693 Ozanam described before the Royal Society a vehicle pedaled by a foot traveler. In 1761 the _Universal Magazine_ describes a similar one invented by an Englishman named Ovenden; in August 1769 the _London Magazine_ describes "a chaise to go without horses." On 27 July 1779, _Le Journal de Paris_ describes a velocipede invented by MM. Blanchard and Magurier, which is merely the bicycle with an upright with four support the hands; this gained considerable vogue from France and England the idea spread to Germany, which added to the one idea needed to vivify it. In March 1784 one Ignaz Trelzer, of Gratz, Austria, invented a pedomotor credited with the speed of a galloping horse — unquestionably meaning down hill. But the direct progenitor of the modern bicycle was one built in 1816 by Baron Karl von Drais, Freiherr von Sauerbronn (1784-1851), chief forester to the Grand Duke of Baden (to whose memory in 1830 the bicycle was dedicated as the "Draisine"), often called "the father of the bicycle." It was designed to aid him in his daily journeys. The whole was of wood; the wheels of equal size, connected by a perch, astride which the rider sat in a saddle, and to the fore end of which was swiveled a fork into which the front wheel was axled; the rider propelled it on level ground or up hill by striking the ground with his feet, and coasted down hill. But the significant feature, the germ of the bicycle was the pivot of the front wheel and its steering by a handle-bar; for which there was a stuffed arm-rest on an elevated cross-piece. Drais patented this in Paris, 1816, and claimed that it would go up hill as fast as a man could walk, on a level, after a rain, at six or seven miles an hour, or courier's pace, the same when dry at eight or nine and down hill at a horse's gallop. It excited much attention and was called the "draisine"; and in 1818 one Dennis Johnson patented in England an improved form called the "pedestrian curricule," with adjustable saddle and elbow-rest. Meanwhile, in June 1819, the curricule had been introduced into the United States and became a craze in Boston, New York, Philadelphia, etc.; and many riding-schools were opened. On 26 June 1819, William S. Clark obtained a patent for an "improved velocipede"; but the excitement soon subsided here also.

The real ancestor of our bicycle, the crank-driven velocipede that led straight to better things, arose in France: the honor of the invention is doubtfully attributed. According to one account it belongs to Ernest Michaux, the son of a Parisian carriage repairer (to whom a monument was erected in 1894); but if so, he did not make it public and it led to nothing, and it is generally accredited as theory, where it belongs as practical result, to Pierre Lallement, a Parisian blacksmith, said to have been, in Michaux's employ. It sprang, in fact, not from Michaux's, if that existed, but from a multicyclic invention of 1865 by one Marechal; a five-wheeler, each wheel having an independent axle with cranks, loose pedals and a separate seat; the front was the guide-wheel, but it could be ridden by one or many. In September MM. Woirin and Leconde patented a tricycle, with two smaller rear wheels on the same axle, and a large front one with cranks and loose pedals, the whole connected with a wooden horse-shaped body like De Sivrac's, on whose back the rider sat well over the front wheel; this was the progenitor of the modern tricycle. Lallement, against the judgment of his friends, who thought that keeping one's balance would be impracticable on two wheels, applied the principle thus the same year, learned the art of balancing, and exhibited his machine and his skill at the Paris Exposition of 1867; but thought too little of it to patent it. The next year (1868) he came to the United States to look for work, made a velocipede and rode it about New Haven, Conn., and was induced by one James Carroll to patent it with him, which was done 20 November. It had two wooden wheels, the front one slightly the larger, with iron tires; was a front-driver, and the saddle was on a steel spring midway between the wheels. But it was too crude and unpleasing to attract much notice. In France, however, great interest was made on it, and in the winter of 1867 it became the sensation of Paris; riding schools sprang up all about, and straps to fasten the machines were part of the equipment of the great places of amusement. This continued till the Franco-German War temporarily destroyed the business, which had developed a large manufacturing interest. Meantime, in England, Edward Gilman in 1866 had patented a rear-driver with a single treadle, and the chain gear had been added to the front wheel and its steering by a handle-bar. In 1869 the American Improved velocipede and the reflex of the French enthusiasm brought it into sudden vogue in the United States, and American inventiveness was turned toward perfecting it: at the time the "boom" burst in 1870 the Patent Office was receiving half a dozen applications for new patents every week. The sport, however, collapsed, with the suddenness of a financial crash, within a single week; thousands of machines, worth $100 to $150 each, could not be sold at any price the next, and were ultimately disposed of to boys or the poorest classes at nominal prices, or allowed to become old iron; and manufactories crowded with orders had them countermanded in a mass. It was nearly a decade before America took it up again in any large way and then with a different wheel, the bicycle proper.

Meantime a great development had gone on in England, where the hard, smooth macadam roads and beautiful by-paths for cyclists without disturbing horses made all conditions more favorable. The bicycle under that name was patented 8 April 1869; it had steel rims and solid rubber tires, round or half round. To gain speed the front wheel was
BICYCLE

gradually enlarged and the rear reduced to a mere steerer, till the Ordinary was attained in 1871 with a 40- to 48-inch front wheel and 16-inch rear. The front wheel was gradually raised in proportion to the rider's height and skill, and in the early eighties attained 60 and even 64 inches. It still remains the perfection of grace and simplicity in bicycle construction: the motive power being applied direct, and the wheel, with cranks and pedals, forming a solid body. The most exhilarating to ride, given strength and skill.

The Ordinary, however, could not be the bicycle of the future. It was hard to mount, except in favorable spots, and if the rider was dismounted had often to be walked long distances on streets or hillsides; both from this and the great air resistance due to the rider's elevation, it was merely the sport of a few athletic men, mostly young; headers were frequent from the rider's mass centre being directly over that of the large wheel, and from his seat, through a high seat, though the danger was exaggerated. A safer build was therefore mooted. The first idea was to bring the rider's centre below that of the driving wheel; this could only be accomplished by operating the pedal with some kind of leverage, and a rear-driven safety wheel and lowered front wheel was patented in 1879 by H. T. Lawson of England. A similar type, called the "Bicyclette," followed in 1880. In the same year the "Star," a reversed Ordinary with the small wheel in front, was introduced. A more popular form, which had high racing speed and made new records, was Starley's "Kangaroo" (1883), with diamond frame, independent cranks and two chains gearing them to the front wheel, followed in 1884 by Starley's famous and still speedier "Rover," for a long time the popular term for "safety" of any pattern. Here the cranks and pedals were on a separate axle, connected with the driving-wheel by a single chain which was therefore permanently tight; the seat was far back over the rear wheel, so that headers over the handle-bar were absolutely impossible. The front wheel was about one-fourth larger than the rear; later they were made of practically the same size as now, completing the evolution back to the velocipede, and making its general utility possible. This advent of the "safety" has carried the bicycle into everyday business and the life of every household; carriers, policemen, messengers, etc., find it of great service. The enormous brain-power devoted to its perfection is shown by the fact that in the United States alone 7,573 patents had been granted up to 1900 for cycles and their parts, and probably double that in the world altogether. Of these, only 16 had been issued before 1865, and the great majority were after 1880. By 1892 the applications had grown so numerous that a special department of the Patent Office was created for them.

The greatest of all single inventions, and one which has revolutionized the business and method of travel, is the pneumatic tire. It was originally invented, not for bicycles, but road wagons, by an English civil engineer named R. W. Thompson, in 1843, and was patented in the United States in 1847; but was allowed to lapse. The first bicycle tires were iron or steel; then a strip of rubber was fastened over the tire; later, a round or half-round piece of solid rubber was cemented or fastened into the hollow of the rim. But in 1889 an Irish veterinary surgeon, Dr. John B. Dunlop, fitted a piece of rubber hose on his son's bicycle; it worked so well that he patented it, not broadly, but for specific details now disused. About the same time P. W. Tillinghast, of Providence, R. I., patented a hollow air chamber. But even this would have been ineffectual safe for the enormous reduction in weight by the use of steel weldless tubing and wire, so that a machine of the incredibly small weight of nine pounds has been used for racing, with a wheel on whose spokes four men can stand without injuring it: these machines are too frail for road use, but even the average roadster does not reach 28 pounds, while in 1873 65 pounds, and even in 1885, 48 was thought fair, and 27 a racing winner.

The ball-bearing, invented by an Englishman named Bonn, is another epoch-making invention. The earliest bicycle bearing was a plain one with a sleeve, known as the parallel bearing. The friction was so heavy that the roller bearing was substituted, but did not last long; the next was the adjustable cone, which for a time was universal use. But in all solid-surface bearings the grinding of the sand which worked in made them irregular and rattling after a while, and the layers of gudgeon grease required a steady tax on time for cleaning. In the ball-bearing, the conical axle bears against a row of steel balls in a circle, tangent to the bearing surface and to two other surfaces at right angles, so that the friction is only against three points, and the bearing parts roll over instead of sliding upon each other. The wear of the balls is astonishingly slight, and from the constant change of surface there is little irregularity, and from the small contact points scarcely any making of axle great.

A fundamental invention was the suspension wheel, of which, in the words of an English patentee of 1820, "the weight they have to carry is suspended from that part of the wheel which happens to be uppermost, instead of being supported, as is usual, by the spokes that happen to be under the axle-tree"—a principle invented by Leonardo da Vinci before 1490, reinvented as above stated, and in France in 1804. Spring seats have abolished the saddle-galling which was one of the worst tortures of the "bone-shaker," and even of the earlier bicycles. The wooden rim takes two and a half pounds off the weight of the machine, but is not used in England, the roads being too wet. The drop-frame for ladies' use is perhaps the most important single advance made on the velocipede, so far as the increase of speed and safety is concerned. The coaster-brake is another important advance. The chain gearings which made the "safety" possible has been noted; later, much ingenuity has been employed to get rid of it, but not with complete satisfaction, the cost being prohibitive to the mass, and the complaint of extra exertion being heard. The two chief devices for chainless machines are the pin-wheel gearing, which works smoothly but lacks durability; and the bevel gear, which is very difficult to cut so that the teeth shall fit
exactly, but is said to increase in both accuracy and ease of driving with ease, as the surfaces of the tooth grow to fit each other. In the chain gear the case is the reverse, as the links and rivets wear and dust grinds them off.

In the United States the bicycle did not appear after the collapse of 1870 till the Centennial Exposition of 1876, when some English models were imported and exhibited. Col. Albert A. Pope of Boston saw them, and thought of reviving the business here; went to England to study the industry, brought back some English wheels, and had W. S. Atwell of Boston build him one, weighing 70 pounds and costing $313. Again visiting England, he decided that conditions there warranted their manufacture for the market, and in 1878 he had the Weed Sewing Machine Company, of Hartford, Conn., make some "Columbias" for him in a corner of their shop, the first bicycles made in America. From the first, these have been the American model of durability and excellence of make, as well as of advanced invention in construction and fittings, and unsurpassed in the world; and they still maintain that their business soon grew into one of the great manufacturers of the country, and the Pope Company was the chief among those merged in the American Bicycle Company a few years ago. The "safety" brought the same expansion here as elsewhere; but since about 1895 there has been a severe decline. The slackening of demand produced a severe crisis in the business, but it eventually settled upon a firm though more limited basis of practical service and every-day pleasure. The census returns show the remarkable changes that have taken place. In 1890 there were 27 establishments engaged in making bicycles in the United States; the capital invested being $2,058,072; the number of employees, 1,797, and the value of the product, $2,568,326. By 1900, the business had so extended that the number of establishments had increased to 312; the amount of capital invested to $20,783,659, while the 17,525 workmen employed received an annual wage of $8,189,817. The cost of material in that year was $9,702,083, and the value of the product $31,915,908. Five years later, when the special census of American manufacturing interests was taken, the number of establishments had been reduced to 101. In that year the capital employed was but $5,913,458; the number of employees, 3,319; the wages paid, $1,971,403; the cost of materials, $2,628,146, and the value of the product, $5,153,240. The number of finished machines turned out was 250,487, of which 2,328 were motorcycles. Between 1904 and 1914 the number of establishments in operation decreased from 122 to 94, but the number of workers increased 33.7 per cent— to 4,487, and the value of the output 111.2 per cent—to $17,667,676. A considerable part of this increase was due to the motorcycle industry: there were 62,793 of these machines made, a value of $12,306,447. The number of bicycles manufactured was 398,000, a value of $5,301,229. The remainder of the output was in parts, valued at $7,819,266. The capital employed in 1909 was $9,780,102. In France the vogue of the bicycle has steadily progressed. The official records show that in 1912 there were 2,969,585 bicycles in use in that country: about one to each 13 persons. Ten years before the production was one to each 30 persons.

T., 'Digest of Cycles or Velocipedes,' Patented in the United States from 1789 to 1892' (Washington 1892); Bouguer, H., 'Cycles et Motocycles' (Paris 1911); Clyde, H., 'Pleasure-Cycling' (Boston 1895); Garrett, H. A., 'The Modern Safety Bicycle' (New York 1890); Schoepflin, Andrew, 'Bicycles and Tricycles' (London 1896); and the valuable historical summary in the United States census reports of 1910, 'Manufactures' (Part X, p. 825).

BIDA, bëd'a, Alexandre, French painter: b. 1813; d. 2 Jan. 1895. He studied in Paris under Delacroix; traveled in the East for two years, and most of his paintings have Oriental or Scriptural subjects. He was at his best in water-color work. Among his paintings are 'The Slave Market,' 'The Massacre of the Mamelukes' (Metropolitan Museum, New York), 'Jews Praying at the Well of Solomon' and 'The Field of Boaz.' He is more generally known as the illustrator of Alfred de Musset's complete works (10 vols., Paris 1865-66), and of the Bible, comprising the 'Four Evangelists' (1870), and the 'Book of Ruth.'

BIDAR, bë'där, India, an ancient town in the Nizam's dominions, 75 miles northwest of Haidarâbâd; noted for the metal ware to which it has given the name of Bidri or Bider. It occupies a commanding site above the surrounding country, and its mosque and madrissa or college testify to its former splendor and importance. Pop. 14,000.

BIDASSOA, bë-da-sô' a, a river in Spain, about 46 miles long, the last 12 of which form the boundary between France and Spain. It rises in the mountains of Spanish Navarre, and, after various changes of direction, falls into the Bay of Biscay near Puenteria. In former times Spain claimed not only the entire river, but so much of its banks, on the French side, as its waters covered at full tide. This difference was finally settled by each country contenting itself with its own shore. Near Irun there is a small island in the middle of the stream, called the Island of Phædra, on which, between a neutral ground, Louis XI and Henry IV met in 1463. Here also peace was concluded between France and Spain in 1659. It was the scene of two engagements of the Napoleonic wars. On 1 Aug. 1813 the Allies defeated the French under Soult at San Marcial, on the Bidassoa, and in the following October Wellington ousted the French from their entrenched positions on the northern bank of the stream.

BIDDEFORD, Me., city in York County, on the right bank of the Saco River, six miles from the sea, and on the Boston & Maine Railroad, 15 miles southwest of Portland. The river separates it from Saco (q.v.) and, like that city, Biddeford grew up as a manufacturing centre, its development being favored by the abundant water-power furnished by the falls, the stream descending here about 40 feet. The city also has a large local trade. The leading industries include the extensive manufacture of cotton goods, lumber, match blocks, boots and shoes, machinery, etc. Here are some of the most important cotton mills in New England, the products of which are found
in the markets of many States. Near the city are granite quarries which annually produce large quantities of superior stone, used in many parts of the world. Several thousand people are employed in the city’s industries and the flourishing of these has led to its gradual growth. It has two national banks. There is a fine beach here with good boating and bathing facilities and Biddeford is becoming a favorite resort. The public school system is well organized and conducted and the various religious denominations are represented by 14 churches. The intellectual life of the people is also stimulated through useful publications and an excellent public library. The city was named from Biddeford, England, the home of some of its early settlers. In 1616 a small settlement was made at Biddeford Pool, near the mouth of the Saco, and Biddeford was settled under a patent in 1630, embraced Saco until 1718 and was then incorporated under its present name. This was long the chief settlement of the Maine province. In 1835 Biddeford received a city charter. The present government includes a mayor and a city council, elected annually. The population in 1910 was 17,079. Consult Folsom, ‘History of Saco and Biddeford’ (Saco 1893); Clayton, ‘History of York County’ (Philadelphia 1880); Ridlon, ‘Saco Valley Settlements and Families’ (1895).

BIDDING PRAYER, a prayer which directs that which is to be prayed for. The form is very ancient, dating back to Apostolic times. In the ancient Church it was used in the service after the departure of the catechumens, the church communicants remaining. It was offered by the deacon, each petition beginning, ‘Let us pray for——,’ and the faithful making responses at its conclusion. A form of bidding prayer was enjoined by the 5th canon of the Anglican Church in 1608 and be used before all ordinations and sermons. It is a prayer for the Church, the sovereigns and others in high station, and a thanksgiving for the faithful departed, always concluding with the Lord’s Prayer. Consult Dearmer, ‘Everyman’s Prayer Book’ (Milwaukee 1913); Harford, ‘Prayer Book Dictionary’ (New York 1912) and Wheatley, ‘Bidding of Prayers Before Sermon No Mark of Disaffection to the Present Government: Or an Historical Indication of the LVth Canon’ (London 1718; new ed. 1845).

BIDDLE, Anthony Joseph Drexel, American publisher, journalist and miscellaneous writer. b. West Philadelphia, 1 Oct. 1874. He was educated at a private school in Philadelphia and at Heidelberg, Germany. He lived in the Madeira Islands, studying conditions there, returning to the United States in 1891. He joined the staff of the Philadelphia Public Ledger, and contributed to magazines and humorous journals. In 1895 he revived the Philadelphia Sunday Graphic and became its editor and owner, and is now the owner of the Drexel Biddle publishing house in 1897-1904. He is the founder of the movement known as Athletic Christianity and in 1907 founded the Drexel Biddle Bible Classes, now numbering 30,000 in English-speaking countries. He is a fellow of the Royal Geographical Society and corresponding member of the Société Archéologique de France. He has written ‘A Dual Role and Other Stories,’ ‘An Allegory and Three Essays,’ ‘The Madeira Islands’ (1894); ‘Froggy Fairy Book’ (1894); ‘All Around Athletics’ (1894); ‘The Flowers of Life’ (1898); ‘Shantytown Sketches’ (1898); ‘The Madeira Islands’ (1900); ‘The Land of Wine’ (2 vols., 1901).

BIDDLE, Arthur, American lawyer: b. Philadelphia, Pa., 23 Sept. 1852; d. 8 March 1897. He studied law and was admitted to the bar in 1878. Later he became a member of his father’s firm and devoted much time to the study of certain branches, the results of which were published in his works, ‘Treatise on the Law of Stock Brokers’ (1881); ‘Treatise on the Law of Warranties in the Sale of Chattels’ (1884); and ‘The Law of Insurance’ (1893).

BIDDLE, Clement, American Revolutionary soldier: b. Philadelphia, 10 May 1740; d. there, 14 July 1814. He was educated in the schools of the Society of Friends (Quakers) and in early life engaged in a mercantile business in his native city; but notwithstanding his Quaker training, he joined a number of Quaker friends, in 1764, in forming a military corps for the protection of a party of friendly Indians who had sought refuge in Philadelphia from the fury of a band of lawless zealots known as the Paxton Boys, who had recently massacred some unoffending Conestoga Indians at the interior town of Lancaster. These banditti, powerful in numbers, had advanced within five or six miles of the city, threatening destruction to all who should oppose them, when the vigor of the military preparations checked their further progress. Scarcely had this local disturbance been quieted when news was received of the resolution of the British House of Commons to charge certain stamp duties in the colonies. The feeling engendered throughout the whole country by this step and by the subsequent passage of the Stamp Act induced, in Philadelphia, the celebrated “non-importation resolutions” of 25 Oct. 1765, signed by the principal merchants of the city, including Colonel Biddle and his brother Owen. When all hope of a reasonable adjustment of the differences was lost, Colonel Biddle was greatly instrumental in forming the Quaker company of volunteers raised in Philadelphia in 1775, of which he was elected an officer before the corps joined the army. Congress, on 8 July following, elected Colonel Biddle deputy quartermaster-general of the militia of Pennsylvania, New Jersey, Maryland and Delaware, ordered to rendezvous at Trenton. Colonel Biddle took part in the battle of Trenton at the close of the same year and, with another officer, was ordered by Washington to receive the swords of the Hessian officers. He was also engaged in the victory of Princeton, the surprise and retreat of Brandywine and the unsuccessful enterprise of Germantown and during 1777-78 shared the sufferings of the American army at Valley Forge. As commissary-general of forage under General Greene he rendered important service to the army in several critical junctures, especially during the famine at Valley Forge. At Monmouth he shared the same sufferings of his countrymen. In September 1780,
owing to the pressure of his private affairs, he was compelled to return to private life. His military career, however, was briefly renewed in the capacity of quartermaster-general of Pennsylvania in the expedition under Washington, in 1794, against the whisky insurgents of that State. Colonel Biddle labored earnestly also in the early political movements of the patriot party of his State, advocating effectually the revolution in the Constitution of 1776 (which his brother Owen had had, as a member of the convention, a share in framing). He was also active in support of a declaration or bill of rights as a constituent part of the Federal Constitution to prevent abuse or misconception of its powers. After the organization of the Federal government under the Constitution of 1787, Colonel Biddle was appointed marshal of Pennsylvania, as an evidence of the regard in which he was held by Washington.

BIDDLE, James, American naval officer: b. Philadelphia, 28 Feb. 1783; d. 1 Oct. 1848. He was educated at the University of Pennsylvania and entered the navy in 1800. In the war against Tripoli he served as a midshipman, was taken prisoner and kept in confinement seven months. In the War of 1812 he was a lieutenant on the Wasp when she captured the Frolic and was later captured by the Poictiers. Though a prisoner for a short time at Bermuda, Biddle was exchanged and in 1813 took command of the Hornet and captured the British brig Penguin on 23 March 1815, being wounded in action. He was made captain in 1815 and received a gold medal from Congress in reward for his services. In 1817 he was sent to take possession of Oregon for the United States and was afterward commissioner to Turkey and China and in 1845 negotiated the first treaty between the United States and China. He also served on the Pacific coast in the Mexican War.

BIDDLE, John, English Socinian writer and founder of English Unitarianism: b. Woffin-under-Edge, Gloucestershire, 14 Jan. 1615; d. London, 22 Sept. 1662. He entered Magdalen College, Oxford, in his 19th year and graduated A.M. in 1641. Being led to doubt the doctrine of the Trinity, he drew up 'Twelve Arguments' on the subject, for which he was committed to jail, but was released on bail. About six months afterward, on examination before a committee of Parliament, he acknowledged his opinion against the divinity of the Holy Ghost and his 'Twelve Arguments' were ordered to be burned. He persisted in his opinion and in 1648 published two tracts, containing his 'Confession of Faith Concerning the Holy Trinity' and 'Testimonies' of Irenaus, Justin Martyr and several other early writers on the same subject. On this the Assembly of Divines asked Parliament to decree the punishment of death against those who should impugn the established opinions respecting the Trinity and to enact severe penalties for minor deviations. Such a decree was passed but disappeared, and was not included in the Parliament itself and the penalties to which this sweeping measure rendered many in the army liable prevented its execution. Biddle was again remanded to prison, however, and remained for some years in rigorous confinement. A general act of oblivion in 1651 restored him to liberty, when he immediately disseminated his opinions both by preaching and by the publication of his 'Two-fold Scenery under Washington. Cromwell banished him to Saint Mary's Castle, Scilly Islands, assigning him an annual subsistence of 100 crowns. Here he remained three years, until liberated in 1658. He then became pastor of an Independent congregation and continued to support his opinions until fear of the Presbyterian Parliament of Richard Cromwell induced him to retire into the country. On the dissolution of that Parliament he preached as before until the Restoration, after which he was obliged to confine himself to private preaching. In June 1662 he was apprehended at one of the private assemblies and upon process of law fined £100 and ordered to lie in prison until it was paid. He fell a victim to jail fever and died in the 47th year of his age, a martyr to religious intolerance. His private character was moral, benevolent and exemplary and Toilmin styles him the 'father of the modern Unitarians.' Consult Toilmin, Joshua, Unitarian, and Biddle (London 1789; new ed., 1805) and Spears, 'Memorable Unitarians' (London 1800).

BIDDLE, Nicholas, American naval officer: b. Philadelphia, 10 Sept. 1750; d. 7 March 1778. In 1765, while on a voyage to the West Indies, he, with two others, chosen by lot, were left for two months on an uninhabited island. In 1770 he entered the British navy. When Phipps, afterward Lord Mulgrave, was about to start on his exploring expedition, young Biddle, though a midshipman, deserted his own vessel and shipped as a seaman on the Carcass, serving through the cruise with Lord Nelson, who was a mate of Phipps's vessel. On the commencement of the American Revolution he came to America and was made captain of the Amethyst, a brig of 14 guns and 130 men, taking part in Commodore Hopkins's attack on New Providence. After refitting in New London he was ordered on a cruise to the banks of Newfoundland and in 1776 took, among other prizes, two transport ships with a battalion of Highland troops. He was appointed to the command of the Randolph, a 32-gun frigate, in February 1777. In March 1778 he was wounded in an action with the Yarmouth, an English 64-gun ship, near Charleston, S. C. While under the hands of a surgeon the magazine blew up and the whole crew of the Randolph were lost, except four men, who were tossed about on a piece of wreck for four days before being rescued. The other vessels of the squadron escaped in consequence of the disabled state of the Yarmouth.

BIDDLE, Nicholas, American financier: b. Philadelphia, Pa., 8 Jan. 1780; d. there, 27 Feb. 1844. He became secretary to John Armstrong, United States Minister to France, in 1804 and subsequently went as secretary to James Monroe, then United States Minister to England. He returned home in 1807 and took up the practice of law, was elected to the Pennsylvania legislature in 1810 and appointed a director of the United States Bank in 1819.
He became president of the bank in 1823 and managed it ably down to the expiration of its charter. The financial trouble precipitated upon the country by Jackson's withdrawal of the government deposits in 1833 gave an unfortunate ending to Biddle's career as a banker, but while both his ability and his integrity were recognized in his time, he has been amply vindicated since. In 1836 he became president of the new United States Bank, but resigned in 1839. Besides miscellaneous writings, he published a 'Commercial Digest' and 'History of the Expedition Under Lewis and Clarke to the Pacific Ocean.' He was president of the board of trustees for the funds of Girard College and was instrumental in establishing that institution.

BIDDLE, Richard, American lawyer: b. Philadelphia, Pa., 25 March 1796; d. Pittsburgh, 7 July 1847. He studied law and was admitted to the bar in Pittsburgh. He was a member of Congress (1837-41) and was author of a 'Memoir of Sebastian Cabot, with a Review of the History of Maritime Discovery' (1831).

BIDGEL, William Phillips, American mariner: b. Philadelphia, Pa., 17 Dec, 1853. Graduating from the University of Pennsylvania he entered the United States Marine Corps, in which service he attained the rank of captain in 1894. He was present on board the Olympia with Admiral Dewey during the battle of Manila Bay 1898. In 1900, during the Boxer uprisings in China, he was in command of the American forces operating with the international expedition to Peking. From 1912 to 1910 he was commandant of the marine barracks at New York, after which he filled a similar position at Panama. In 1911 he was promoted to the rank of major-general and in 1914 he was retired.

BIDULPH, Sir Michael Anthony Shrapnel, English military officer: b. Cleeve Court, Somerset; d. Biddulph, 23 July 1904. He entered the Royal artillery in 1843 and served in the Crimean War at Alma, Inkerman, Balaklava and the siege of Sebastopol. In India he commanded the field force accompanying Lord Heber, and returned by the Tali Chotiali and Boree to the Indus, in 1878-79. He was created K.C.B. in 1879 and G.C.B. in 1895 and in 1896 became gentleman usher of the Black Rod.

BIDFORD, England, a market town and municipal borough of Devonshire, 44 miles north of Plymouth; situated on both sides of the Torridge, four miles from the sea, the principal portion being on the west side, on a bold activity. A handsome stone bridge of 24 arches and 677 feet in length connects the two divisions of the town. It has a spacious market place, an Elizabethan town-hall, public assembly rooms and music hall. The Bridge Hall, in French Renaissance style, contains a free library, a reading-room and a science and art gallery. Important churches are that of Saint Mary, in Perpendicular style, rebuilt, except the tower, in 1865. The chief industries comprise the manufacture of coarse earthenware, ropes, sails and collars and cuffs, tanning, malt, iron-smelting, etc. Timber and coal are exported chiefly to Ireland and Wales. In former times Bidford had an extensive shipping trade and is said to have imported more tobacco in some years than the metropolis. From the beginning of the 18th century this trade gradually declined and gave place to a small coasting trade. Vessels of 500 tons approach the quay. Bidford dates from before the Norman conquest. It was the birthplace of Sir R. Greene, a founder of Virginia, whose exploit in attacking a Spanish fleet is celebrated by Tennyson. Pop. 9,078. Consult Watkins, 'History of Bidford' (Exeter 1792).

BIDPAI, bid'pāi, or PILPAI. When we consider the wonderful history of Bidpai's Fables, their fame and their charm, we naturally invest their supposed author with a personality and a name. In fact, however, *Bidpai* is probably a changed form of an Indian word for "court-scholar," misunderstood as a proper name, and implying therefore neither personality nor specific date. In India from early times the parable or *aquap" (example) has been the recognized method of conveying moral instruction. In the didactic literature, some general truth or some rule of life is stated in the form of a maxim, and a beast fable or other story then added as a concrete instance or *example" (a). The folklore of which these tales are a reflex is not the exclusive property of any of the great religions of ancient India, but is common to Buddhism, Jainism and Brahmanism alike. The sculptured representations of the stories upon the great Buddhist monuments of 250 B.C. make it certain that the stories themselves were familiar to the common people at that early date; and it is hardly less certain that they were so known long before that time. The oldest and most important collection of Indian *Bidpai" is the Buddhist one called *Jataka*—that is, 'Birth-stories,' or stories of Gautama Buddha in his previous births: it consists of 550 tales, each containing a moral; each is placed in the mouth of the Buddha, and in each the Buddha plays the best and most important part. It is this device of a framework or setting for the folk-tales that constitutes the principal essentially literary element of the collection. Next in importance to the *Bidpai* are the Brahmanical *Panchatantra." Here the material is not essentially different in kind from that of the *Jataka*; but again it is the setting of the material which gives the work its distinctive literary character. It is a kind of *Mirror for Magistrates." Both the *Jataka," written in Pali, and the *Panchatantra," in Sanskrit, are still extant, and contain many of the stories which in translations of translations attained great currency and celebrity in medieval literature.

The precise Indian original of these translations is lost; but we know that it was translated into the literary language of Persia (the *Pehlevi, or Pahlieer," by command of the Sassanian King, Khosru the Just, about 550 A.D. From the Pehlevi came two notable versions; one the Old Syriac, called 'Kalilah and Dam-nag,' after the two jackals, Karataka and Damanaka, who figured prominently in the framework of the Sanskrit original; and the other the Arabic version, called 'Kalilah and Dinmah,' or 'Fables of Bidpai,' made about 750 A.D. by Abdallah ibn al-Moqaffa, a Persian convert to Islam under the Caliph
al-Mansor. According to the Arabic introduction, Dabshelim was the first king of the Indian Restoration, after the fall of the governor appointed by Alexander at the close of his campaign in the Punjab, 320 B.C. When firmly established, Dabshelim gave himself over to every wickedness. To reclaim the King, a Brahman philosopher takes up his parable, as did Nathan before David, and at last wins him back to virtue. The wise man is called in Arabic bid-bah, and in Syriac bid-egg. These words are traced through the Pehlevi to the Sanskrit vidya-pati, "master of sciences." Accordingly bid-bah, which has become Bidpai or Pilpai in our modern books, is not really a proper name, but an appellative, applied to a "chief pandit" or "court-scholar" of an Indian prince.

From the Arabic are descended, in the fourth generation from the original, a dozen or more versions, of which three may be mentioned as noteworthy links in the chain of tradition: the Greek one, made about 1080 by Symeon Seth, a Jewish physician; the Persian, made some 50 years later, by Nasr Allah of Ghazni; and the Hebrew, ascribed to Rabbi Joel, and probably made before 1250. Of the descents from the Hebrew, the first mentioned, the 'Directorium Humane Vitae,' made about 1270 by John of Capua from the Hebrew, is distinctly the most celebrated, because it gave rise in turn to Danish, Dutch, Spanish, Italian and French, and above all to the famous German and English versions mentioned below. But besides the 'Directorium,' we must notice the 'Specimen of the Wisdom of the Ancient Hindus,' a version into Latin from the Greek Symeon, made by the Jesuit father, Petrus Passionis (1666); and the 'Anvār-i Suhaili' or 'Lights of Canopus,' a simplified recast of Nasr Allah's. In the second edition of his fables, La Fontaine tells us that he owes the largest part of his new material to "Pilpay, the Indian sage," Pierre Pousin's 'Specimen' was the one embodiment of his shadowy Oriental fabulist, and a French version of the 'Lights' was the other. Two offshoots of the 'Directorium' are of unrivalled interest; the first student of the one is the 'Book of Examples of the Ancient Sages,' and the other is Doni's 'La Moral Philosophia' (1552). The 'Book of Examples' was made at the instance of Duke Eberhard in Burt, whose name and motto, 'Eberhart Graf zu Wirttenberg Attempt,' appear as an acrostic in the initials of the first sections. It was first printed about 1481 and has since been admirably edited by W. L. Holland (Stuttgart 1860). Holland used, besides three manuscripts, two print books, out place and year, and enumerates 17 dated editions that appeared between 1483 and 1592. Four dated editions appeared at Ulm between 1483 and 1485. The great number of editions of the work and their rapid succession are the best proof of its importance as a means of instruction and amusement at the beginning of the age of printing. The examples themselves had doubtless pointed the moral of many an ancient homily long before the days of Gutenberg; but the language of the German version of them is so remarkable for its simplicity, dignity, strength and beauty that we cannot wonder at its immense popularity; and to this version, more than to any other, is Europe indebted for the widespread knowledge of this cycle of literature from the last part of the 15th to the middle of the 17th century. The other offshoot of the 'Directorium'—namely, 'The moral philosophy of Doni'—drawn out of the Latin by English-speaking people because it is the first literary link between India and England, written in racy Elizabethan, a piece of Tudor prose at its best, a veritable English classic. Consult Browne, E. G., 'Persian Literature,' (1806); Deslouchamps, 'Essai sur les fables indiennes' (Paris 1838); id., 'Lights of Canopus' (new ed, London 1904); Hervieux, 'Les fabulistes latins' (1889); Keith-Falconer, 'Kalilah and Dimnah' (1885); id., 'Translation of Wright's Edition of the Latin Syriac Version of Bidpai's Fables' (Cambridge 1885); Lanman, 'Sanskrit Reader' (1888); Rhys Davids, 'Buddhist Birth Stories' (London 1880); Müller, Max, "On the Migration of Fables" (in Chips from a German Workshop, Vol. 3, London 1880); ‘La Moral Philosophie de Doni’ (ed. Jacob 1888).

CHARLES ROCKWELL LANMAN, Professor of Sanskrit, Harvard University.

BIDWELL, John, American politician: b. Chautauqua County, N. Y., 5 Aug. 1819; d. 5 April 1900. He went to California in 1841; served in the Mexican War reaching the rank of major; was a member of the Constitutional Convention of 1849, and of the National Democratic Convention in Charleston in 1860. In the Civil War he was brigadier-general of California militia. In 1864 he was elected to Congress as a Republican; in 1866 was a member of the Philadelphia convention; in 1890 was the unsuccessful Prohibition candidate for governor of California, and, in 1892, unsuccessful candidate of his party for the Presidency.

BIDWELL, Marshall Spring, Canadian statesman: b. in New England 1799; d. 1872. Migrated to the United States in 1812. Upper Canada assembly in 1824, becoming speaker in 1829 and securing re-election to that office in 1835. His strong sympathy with the popular movement which culminated in the Rebellion of 1837, and his covert part in the rising, led to his voluntary banishment from the country in 1838.

BIEBEMANN, Gustav Woldemann von, Baron, German historian: b. 5 March 1817; d. 1903. After graduating from the University of Heidelberg, where he had studied law, he practised privately for a while, then entered the government civil service. He rose rapidly in rank in the management of the state railroads, finally becoming chief director of railroads. He made many contributions to the literature on Goethe, among which may be mentioned Goethe and Leipzig (2 vols., Leipzig 1878); Zu Goethes Gedichten (Leipzig 1880); 'Goethe's Gespräche' (10 vols., 1889-97).

BIEBERSTEIN, Adolf Marschall von, Baron, German statesman: b. Karlsruhe, Germany, 1831; d. Badenweiler, 24 Sept. 1912. Son of a court chamberlain of Baden, he studied
law at Heidelberg and Freiburg, and entered the civil service of his native state. In 1878 he was sent to the Reichstag as a Conservative and became a representative for his home in the Federal Council (1883). In 1880 he succeeded Count Herbert Bismarck as Foreign Secretary, in which capacity he negotiated the commercial treaties under Chancellor Caprivi. He incurred the bitter hostility of the Agrarians and certain court circles, and was the subject of a police intrigue which he defeated. The Kaiser's historic telegram to President Kruger over the Jameson raid (5 Jan. 1896) is generally ascribed to him; he also declared that the independence of the South African Republic was a matter of vital interest to Germany. Political opposition compelled him to resign the Foreign Secretaryship in June 1897; four months later he was sent as Ambassador to Constantinople, where he revealed most remarkable ability as a diplomatist. He consolidated German influence in Turkey, obtained the Bagdad Railway concession which caused so much strife between interested European powers, especially with England, and brought about the downfall of the notorious Fejim Pasha, a favorite of Abdul Hamid and certainly the most disreputable villain in the Sultan's entourage. He had overreached himself by literally stealing a German vessel laden with lumber, which brought the energetic German Ambassador on his trail. When Fejim had to be dropped, all Constantinople rejoiced; the mob shortly after expressed their gratification by hanging him on a lamp-post in the street. After the Young Turk revolution (1908-09) Baron Marschall ingratiated himself with the new rulers, but his position was severely shaken by the Turco-Italian War—the seizure of Tripoli being an equally bitter disappointment to both Germany and Turkey. Germany could not well interfere as she was at war with both belligerents. On the retirement of Count Wolff-Metternich (8 May 1912) Baron Marschall was appointed Ambassador in London. It was hoped in England that the strongest man in German diplomacy would help to place the relations between the two countries on a more satisfactory basis, but unfortunately he died four months later, before he had entered upon his new duties. His death was deeply regretted alike in London and Berlin.

BIEDA, be'da, the modern name of the ancient Blora, a town in Italy. It is noted for its extensive Etruscan necropolis of rock-hewn tombs, built in several terraces. These tombs are interesting for their imitation of dwellings. They have molded doorways, and, within, the ridge beams and rafters of the roof are cut in relief. There are rock benches on three sides made to receive the dead and, besides the doors, numerous windows.

BIEDERMANN, Friedrich Karl, German author: b. Leipzig, 25 Sept. 1812; d. 1901. He was educated at Heidelberg and Berlin. He became professor of philosophy in Leipzig University in 1838 and held this chair till 1845, when he was deposed on account of his political opinions. In 1849 he played an important role in the Parliament of Frankfurt; was expelled and in 1850 he became a member of the ministry, was vice-president for a short term, and was reinstated as professor at Leipzig, but was again removed in 1853 for political reasons. In 1854 he edited the Deutsche Annaien and was sentenced to a term of imprisonment and removed from his professorship. He was editor of the Deutsche Allgemeine Zeitung (1863-65), and founded and edited a number of other liberal papers. His works include 'Wissenschaft und Universität' (1838); 'Die deutsche Philosophie von Kant bis auf unsere Tage' (1842-43); 'Vorlesungen über Sozialismus und soziale Fragen' (1847); 'Erinnerungen aus der Pauls Kirche' (1849); 'Fünfzig Jahre im Dienste des nationalen Gedankens' (1892); 'Friedrich der Grosse und sein Verhältniss zur Entwicklung des deutschen Geisteslebens' (1859); 'Vorlesungen über Sozialismus und Sozialpolitik' (1900); 'Deutsches Volks und Kulturgeschichte' (4th ed., 1901). Consult his 'Mein Leben und ein Stückzeitgeschichte 1812-1889' (2 vols., 1889).

BIEFVE, bi'fə, Eduard de, Belgian painter: b. Brussels, 4 Dec. 1809; d. there, 7 Feb. 1882. He painted many portraits and was also noted for his scenes from history. His best-known work probably is his 'Compromise of the Netherlands Nobles at Brussels, 1566.' Among others are 'Last Moments of Mary, Countess of Northumberland,' 'The Introduction of Rubens to Charles I of England,' 'Masaniello,' 'Raphael and La Fornarina.'

BIEL, bē'la, Gabriel, German philosopher: b. Spires about 1425; d. Tübingen, 1495. He was educated at Heidelberg and Erfurt, and became a cathedral preacher in Mannheim. In 1477 he was made provost of Urach and an adviser in the founding of the University of Tübingen, where he became professor of theology in 1484. He has been erroneously called 'the last of the Schoolmen.' His principal works are 'Collectorium ex Occasum super Iv Libros Sententiarum' (1495); 'Expositio Canonis Missae' (1510); 'Sermones Dominicales de Tempore et de Sancis per Totum Annum' (1519); 'De Monetarium Potestate simul et Utilitate' (1541).

BIELA, be'la, Wilhelm von, Austrian officer and astronomer: b. Rosia, 19 March 1722; d. Venice, 18 Feb. 1856. He entered the army, reached the grade of major and finally resigned the profession of arms to study the fine arts and astronomy. On 27 Feb. 1826 he discovered at Josefsbad, Bohemia, a new comet which, a few days later, was sighted by Gambart from Marseilles. Both noticed its similarity to comets appearing in 1772 and 1805 and fixed its period at between six and seven years, but it was named after Biela, who had first discovered it. Shortly after its reappearance at the end of 1845 it was seen to divide into two portions, each of which afterward developed a tail and a brilliant nucleus, features wanting in the original body. In August 1852 the double comet reappeared, but this time the two portions were much farther apart; and not long after the comet vanished and has never been sighted since.

BIELA'S COMET, a comet of short period, named after its discoverer, Wilhelm von Biela (q.v.), who discovered it in 1826 and furnished such data regarding its movements as to convince the other astronomers that he had a proprietary right to it. The same comet had been noticed 8 March 1772, and
again in 1805. It was reckoned that the comet had passed its perihelion six times between the two periods without being detected by the astronomers. On another visit it passed out of sight on 3 Jan. 1833. Its next appearance was in January 1845. It was found again late in November 1845, and in the following month an observation was made of one of the most remarkable phenomena in astronomical records, the division of the comet. It put forth no tail while this alteration was going on. Professor Challis, using the Northumberland telescope at Cambridge, on 15 Jan. 1846, was inclined to distrust his eyes or his glass when he beheld two comets where but one had been before. He would call it, he said, a binary comet if such a thing had ever been heard of before. His observations were soon verified, however. Late in August 1852, the larger came into view and three weeks later the smaller one, now much fainter than its former companion, was seen singly in the lead. Schiaparelli’s investigations showed it to be probable that the comet is the illuminated central mass of a stream of meteorites. The Bield stream of meteors (or Andromedas, as they are also known from the position among the stars from which they seem to radiate) revolves around the sun in a period of 13 years, and the earth passes their orbit every year but meets the main swarm only when passing the point of intersection of the two paths. The meeting usually takes place on the 27th or 28th of November.

BIEGLA, a Russian name for the great European sturgeon (Acipenser huso), also called *hausen* and *huso.* See STURGEON.

BIELEWA, byel-a-yga, the name of 10 Russian rivers, the most important of which is about 500 miles in length, rises in the Ural Ridge and flows northwest to the Kama River. From April to November it is navigable from its mouth to the city of Ufa, about 200 miles, regular trade in minerals, lumber and salt being carried on. Of the other rivers of this name may be mentioned the one in the government of Irkutsk, Siberia, which is a branch of the Angara, and another in the government of Yekaterinoslav which flows through a coal region.

BIELEFELD, be-lfelt, Prussia, a town in the province of Westphalia at the northern foot of the Teutoburg-Wald, 38 miles east from Münster. The river Lutter divides it into an old and a new town. The best German linens are manufactured here, flax-spinning and bleaching are largely carried on and there are various other industries, among which some of the chief are shirt-making, silk-weaving, horse-furniture, cycles, sewing machines and motor cars and of cigars, glass, cement, leather, etc. It contains a gymnasiurn, two hospitals and other public buildings. The Bethel colony for epileptics was founded here in 1876 and has now 1,600 patients. The castle of Speenberg, built in 1012, is in the immediate vicinity and, since its recent restoration, has been occupied as a museum. Pop. 78,334.

BIELGORD, biel-gord. See BIELGORD.

Bielitz, b’ellez, Austria, town in the crownland of Silesia, 40 miles southwest of Cracow, on the left bank of the Biala. It is separated from Biala in Galicia by the river, over which is built a bridge. It is an important centre of the Austrian textile industries, manufacturing large quantities of woolen goods for the trade in the Orient. Wire, nails, machinery, furniture and coal-tar coal are also manufactured in important quantities. Pop. 18,568, of which the largest proportion is German.

BIELO-OZERO, byel-0-ozar-o, ("white lake"), a lake of European Russia, in the government of Novgorod, whose outflow is carried by the Chekina River to the Volga. It is of a somewhat circular form, 27 miles long and 20 miles broad, and has an area of about 430 square miles. Its bottom consists of a white clay which in stormy weather gives the water a milky-white appearance, hence the name. A system of canals connects it with Lake Onega, the Dwina and other rivers. It also forms part of the canal system which connects the Baltic and Caspian seas.

BIELOWSKI, byel-ov’sk’, Augustus, Polish poet: b. Krechowice, Galicia, 1806; d. 1876. He received university training and became director of the Ossolinski Institute at Lemberg in 1869. Among his poetical compositions is to be mentioned the historical rhapsody, *Lay of Henry the Pious.* He wrote a ‘Critical Introduction to the History of Poland’ (1830), but his principal work was the publication of ‘Monumenta Poloniae Vetustissima’ (1864-72); a collection of Polish chronicles up to the time of Duigou, since his death continued by the Cracow Academy of Sciences. He also made further work on the works of Schiller. He edited ‘Pompeii Trogo Fragmenta’ (1853), fragments of Pompeius found at the Ossolinski Library.

BIELHOLE, bialhel-e, a stalactite cavern in the Bieslent Mountain Harz, on the right bank of the Bode. It was discovered about 1672, but first made accessible in 1798. Its entrance is 108 feet above the bed of the stream; and its total length is 230 yards.

BIELSK, byel-sk, Marcin, Polish historian: b. Biala, near Sieradz, 1495; d. there 1575. His *Kronika swiata* and *Kronika Polska* (1550 and 1564) contain the first comprehensive attempt at a national history of Poland. He wrote two satirical poems, ‘Sen majowy’ (1590) and ‘Seym niewiesci’ (1595), picturing, in the one, the degradation of Hungary and calling upon his countrymen to exhibit a nobler spirit than the Hungarians, while the other gives a keen analysis of the condition of Poland in his days. A satirical work, ‘Sprawa rycerska’ (1569), gives valuable information upon the condition of the Polish army and the character of Polish tactics. After serving in the army and taking part, in 1531, in the battle of Obertyn, he devoted himself for the rest of his days to literary pursuits. In 1617 the bishop of Cracow interdicted his *Chronicles* as they were suspected to contain heterodoxy. His satirical poems made him many enemies. He idealized the distant past and regarded his own period as one of general decadence.

BIEINAIME, bi-in’a-me, Luigi, Italian sculptor: b. Càrrara 1795; d. Florence, 17 April 1878. He studied his art in Rome under the
tuition of the famous Danish sculptor, Thorvaldsen, with whom he collaborated later extensively. He has been considered one of the leading sculptors of his period in Italy. Among his chief works are 'John the Baptist' (1820), now in the Metropolitan Museum of Art in New York city; 'Cupid and the Dove,' now in Milan; 'Venus,' in the Turin Museum; and several statues in the Winter Palace at Petrograd. The influence of Thorvaldsen is obvious in all his works.

BIENCOURT, by-án-coor, DE POU-TRINCOURT, Charles: b. 1583; d. 1624. Son of Jean de Pourtourcourt (q.v.). He accompanied his father to Port Royal in 1605. He visited France in 1611, created a stir at court by the announcement of Indian conversions and brought back with him Jesuit missionaries. He administered Acadia from 1611-23 and partially rebuilt Port Royal after its destruction by Argall.

BIENCOURT DE POURTRINCOURT, Jean, French soldier: b. France 1557; d. Mery-sur-Seine 1615. In 1603 he came to Canada, where De Monts made him a lieutenant, and in 1604 received a grant of Port Royal and established there a colony of which he took little care. The grant was confirmed in 1607, and at the same time the King urged Pourtourcourt to labor for the conversion of the savages. Desirous of keeping the Jesuits from Port Royal, he delayed their departure from France, sent back glowing accounts of his own missionary success, and welcomed the Jesuits very ungraciously. He went to France in 1612, and after the English left Acadia sailed thither in 1616 to rebuild Port Royal which he returned to France later in the same year. Consult Sulte, B., 'Pourtour-court en Acadie' (in 'Royal Society of Canada Proceedings and Transactions,' Vol. XI, p. 31, 1892)

BIENER, Christian Gottlob, German jurist: b. Zörbig, 10 Jan. 1748; d. 13 Oct. 1828. He studied law at Wittenberg and Leipzig, and became instructor in law at the latter university in 1776, becoming professor in 1790. His chief works are 'Commentarii de origine et pro origine' (Leipzig 1786-95); 'Systema processus judiciarii et communis et saxonici' (Leipzig 1801); 'Opuscula academica' (2 vols., Leipzig 1830).

BIENNE, bi-én, Switzerland, town in the canton of Bern, 17 miles northwest of the city of Bern, on the north shore of the lake of the same name, in the valley of the Suze; on the railroad between Berne and Basel. It nestles among the lower foothills of the Jura Mountains, 1,400 feet above sea-level, and cable roads ascend the mountains nearby. Among its architectural attractions are an old castle, the town-hall and the Schwab Museum, which contains an extensive collection of old Roman and Celtic weapons and relics of the ancient lake-dwellers. Here, too, is located the West Swiss Technical Institute, which includes a watchmakers' school and a school for railroad employees. Textiles, tanning, watchmaking, machine building and the manufacture of paper and cigars are the chief industries. Attached first to the bishopric of Basel, it allied itself with Bern canton in 1352, then became a free city, was annexed by the French in 1797, but awarded to Switzerland in 1815. Pop. 23,583.

BIENNE, lake of, called in German, Bielersee, a Swiss lake, 1,419 feet above sea-level, about 10 miles long by three broad, with a depth of 280 feet. Its scenery is more beautiful than bold. Being eight feet below the level of Lake Neuchâtel, it receives its waters by the Thièl and discharges them into the Rhone. On the islet of Saint Pierre, in this lake, J. J. Rousseau resided for two months in 1765. That the lake was a centre of population from remote times, the remains of numerous pile-dwellings prove. At the northern extremity is the town of Bienne (q.v.).

BIENNIALS, in botany, plants which do not produce flowers and fruit during the first year of growth, but store up a stock of nourishment in a thickened stem or root, whence they draw the material for the growth of the second year, during which flowers and fruits are developed and the plant becomes one of our commonest foodplants, such as turnip, cabbage and carrot, are biennials. Under special circumstances favorable to rapid growth a plant ordinarily biennial may become an annual.

BIENTEVEO, by-an-té-vo'6, a flycatcher of southern South America, related to our kingbird and familiar about the villages and gardens of Argentina. Its note comes from its loud and cheerful cry, which resembles the Spanish phrase Bien te veo, I see you well. Unlike its relatives elsewhere, it builds a domed nest, the design of which is so elaborate that several weeks may be required for its completion.

BIENVILLE, by-an-vil, Jean Baptiste le Moyne (Sinus me), French colonist: b. 23 Feb. 1680; d. France 1768. In 1698, with his brother Iberville he left France to found a colony at the mouth of the Mississippi. In 1700 he constructed a fort 54 miles above the mouth of the river, and in 1701, at the death of Sauvole, a second brother, he succeeded to the direction of the colony, the seat of which became Mobile. In 1704 a third brother, Champeaugay, joined him with 17 settlers from Canada, and from France came 20 women to be married to the colonists. In 1718 he received a commission as governor of Mississippi, and about this time founded the city of New Orleans. In 1724 he was summoned to France and on 9 Aug. 1726 was removed from office. In 1733 he was sent back to the colony as governor, with the rank of lieutenant-general. In 1743 he was again removed and returned to France, where he lived in retirement for 25 years.

BIER, August, German surgeon: b. Helsens, Waldeck, 24 Nov. 1861. He studied at the universities of Berlin, Leipzig and Kiel, after which, in 1889, he became a lecturer at the latter institution. In 1894 he was appointed professor and director of the surgical clinic at Greifswald. In 1903 he continued the same work at Bonn University and four years later at Berlin. He is noted for his original researches, for his many innovations in the practice of surgery and for his text-books. Among his publications are 'Hyperämie als Heilmittel' (1903; English translation under the title 'Bier's Text-book of Hyperemia as Applied in Medicine and Surgery,' 1909);
BIERBAUM, bê´r-bôm, Otto Julius, German poet: b. Grünberg, Silesia, 28 June 1865. He is a rising man of letters; his ‘Songs of Experience’ (or ‘Poems That Were Lived’) (1892), is as yet his most noteworthy volume. Other works of his are ‘Studentenbeichte’ (1897), ‘Der Junge Vogel von 1897 und 1899’, ‘Ein Kalenderbuch’ (1896 and 1898).

BIERCE, Ambrose, American author and journalist: b. Meigs County, Ohio, 24 June 1842; d. Mexico 1914. He served in the Civil War as a lieutenant of volunteers and was brevetted major for garrison duty. In 1866 he went to California, and he went to London in 1872, where he contributed to Fun for 30 years. He was closely identified with Californian journalism. He edited the Argonaut and the Wasp and was a constant contributor to the Overland Monthly and San Francisco Examiner. His publications are ‘Cobwebs From an Empty Skull’ (1874); ‘Black Beetles in Amber’ (1892); ‘Can Such Things Be?’ (1893); ‘In the Midst of Life’ (1898). His most popular work was originally published at San Francisco (1890), under the title of ‘Tales of Soldiers and Civilians’; ‘Fantastic Fables’ (1899); in collaboration with G. A. Danizer, ‘The Monk and the Hangman’s Daughter’ (1892); ‘Shapes of Clay’ (1905); ‘The Cynic’s Word Book’ (1906); ‘The Shadow on the Dial’ and ‘The Right’ (1909). His collected works appeared (13 vols.) in 1912.

BIERNATZKI, bör´náts´ke, Johann Christoph, German pietist, poet and story writer: b. Elmshorn, Holstein, 17 Oct. 1795; d. Friedrichstadt, 11 May 1840. A country pastor, he devoted himself to the versification of his own precepts and beliefs, the volume ‘Faith’ being the result. In ‘The Brown Boy’ and ‘Hallig, or the Adventures of Castaways on an Island in the North Sea’, he displays a not unpleasing capacity for prose narrative.

BIERSTADT, bör´stát, Albert, American painter: b. near Düsseldorf, Germany, 7 Jan. 1830; d. New York, 1 Feb. 1902. He removed with his parents to New Bedford, Mass., in 1831; began to paint in oils in 1851, and in 1853 returned to Düsseldorf to study art, spending a winter in Rome, traveling in Italy and Switzerland and returning to the United States in 1857. In 1859 he accompanied General Lander’s expedition to the Rocky Mountains and spent several months in studies of mountain scenery. He was elected a member of the National Academy in 1860. In 1861 he finished his painting, ‘Laramie Peak,’ and in 1863 ‘View of the Rocky Mountains—Lander’s Peak.’ These at once gave him a national reputation. Among his many other paintings of American subjects are ‘Valley of the Yosemite’ (1866); ‘El Capitan’; ‘Looking Down the Yosemite’ (1865); ‘Great Trees of California’ (1874); ‘Geyser’ (1883); ‘On the Saco, New Hampshire’ (1886); ‘California Oak’ (1886). ‘A Storm over the Mountains’ is the best known of his Alpine subjects. Bierstadt received many foreign medals and decorations and was a member of the National Academy of Design from 1860.

BIBSCH, bë´bôsh, a marshy sheet of water interspersed with islands, between the Dutch provinces of North Brabant and South Holland, formed in November 1421 by an inundation which destroyed 72 villages and 100,000 people and spread over an area of 80 square miles.

BIESTER, bê´stér, João Ernesto, Portuguese dramatist: b. Lisbon 1829; d. 12 Dec. 1880. At the age of 19 he produced his first play, not without some success. His whole life was spent for and on the stage, producing altogether some 90 plays, many of which were for years the most popular plays before the Portuguese public. Among his best known dramas are ‘Moedade de D. João V’ (1858); ‘Primavera eterna’ (1860); ‘Abnegação’ (1861); ‘Uma Viagem pela literatura contemporânea’ (1856), the latter being a critical review of dramatic literature.

BIET, byä, Antoine, French missionary, who in 1652 accompanied 600 colonists to Cayenne, where he remained 18 months. He was the author of ‘Voyage de M. Antoine Bié, Chambellan de la Roy de France, en l’isle de Cayenne’ (1654), with a Gallici dictionary at the end.

BIERVRE, bë´avr, Maréchal, (Marcús me), French writer: b. 1747; d. Spa, Germany, 1789. He served in the corps of the French musketeers, was a life-guard of the King of France and acquired much reputation by his puns and repartees. After publishing several entertaining works he composed (1783) ‘Le Séduteur,’ a comedy in verse, for the theatre, which has maintained its place on the stage, although it is bad both in plan and execution. Mes amis, he said, dying, je m’en vais de ce pas (de Spa).

BIFROST, bëfròst (‘the trembling way’), in northern mythology the name of the bridge represented as stretching between heaven and earth (Asgard and Midgard); really the rainbow. It was used by the gods and was guarded by Heimdall.

BIG BEN, the great bell in Westminster Abbey, London. See Bell.

BIG BEThEL, Va., village on the peninsula between the York and James rivers, where an unsuccessful attempt, directed by General Butler, was made by General Pierce, with four regiments, to dislodge outposts of Magnolia and Confederate encampment at Yorktown, 10 June 1861. The Federal regiments, under Townsend and Bendix, en route for the Big Bethel camp, mistook each other for the enemy and fired. This created great confusion. Pierce arrived and pushed on to the Confederate earthwork on Back River, destroying the camp at Little Bethel. The Federal troops crossed Back River and charged the earthwork, but were repulsed with considerable loss, Maj. Theodore Wither, the well-known novelist, losing his life on this occasion. Consult ‘Official Records’ (Vol. II, Washington 1881-1901) and (Battles and Leaders of the Civil War’ (Vol. II, New York 1887).

BIG BLACK RIVER, an affluent of the Mississippi, which it enters at Grand Gulf, Miss., on the 200 miles, 50 of which are navigable. On 16 May 1863 a battle took place on this stream during Grant’s pursuit of Pemberton toward Vicksburg. The Confederates were defeated and lost heavily,
both in killed and captured. Mc Clermand, swiftly following the retreating Confederates, came upon them drawn up on both sides of the Big Black River. Mc Clermand led 10,000 Federals, Pemberton 8,000 Confederates, his main command, from across the river to the rear of Pemberton. Mc Clermand began the fight. He was for a time unsuccessful, but Lawler, discovering a weak spot in the Confederate line, immediately took advantage of it and charged impetuously.

BIG BONE LICK, a salt spring, in Boone County, Ky., 11 miles south of Burlington, where fossil remains of mastodons and other extinct fauna have been found. These animals are supposed to have resorted here to lick the salty earth in the vicinity of the spring.

BIG BROTHER MOVEMENT, The. This movement was founded in 1904 by Ernest K. Coulter, Esq., in New York city. Since that time the work has been taken up in over 100 cities. There is a small staff of paid workers, supplemented by volunteers—lawyers, physicians, merchants, executives, teachers—all busy men, selected because of their good will and natural ability to do effective work. The little brothers are boys referred by parents, hospitals, police, courts, by boys who have been helped. They are the sons of widows, inebriates, prisoners, of careless or ignorant parents—boys who are largely the victims of their environment. The task is to ascertain the cause of the trouble—whether it be truancy, stealing, lying, running away from home, etc.; then, with the co-operation of parents, through the mediation of the Big Brothers, to build up within the boy a sense of honor and good citizenship. Every possible agency is employed to secure results—hospitals for examination or operation, the Y. M. C. A., church and settlement gymnasia, industrial classes and boys' clubs, Boy Scouts, trade schools, camps and farm schools. Where the proper agency does not exist it is established.

BIG-HORN, the wild sheep of the mountains of western North America, so called on account of the massive, spiral horns of the ram, which resemble those of the Asiatic argali. They originally ranged throughout the whole mountain system from New Mexico to northern Alaska, and as far down the valley of the Missouri River as the rough country extended. They are still to be found in the lofitter and wilder parts of this territory, but remain numerous only about the head-waters of the Yellowstone and thence northward. Their home is upon the loftiest parts of the ranges, where they find plentiful pastureage between the highest growth of timber and the snow or ice of the summits, and upon the elevated and rocky plateaus of the Bad Lands of Dakota. In summer they wander about a good deal in small flocks, climbing to the highest points, where a wide outlook enables them to see quickly the approach of an enemy and where they are least troubled by flies. In winter they are forced to descend somewhat, but rarely enter the forest, finding shelter against the storm in the mountain caves and other retreats. From the mass upland and the wind-swept ridges. Its principal enemy, in the old days, were the pumas and Indian hunters, whose constant pursuit taught it an alertness and wariness which now makes it one of the most difficult animals for the sportsman to approach. The speed, agility and endurance of this mountaineer are equal to that shown by any wild sheep or goat of the Alps or the Himalayas, and equally tax the skill and patience of the buckaroo. As a summer coat, its horns are highly valued as trophies, and its flesh is universally regarded as the best of all Western game.

The common Rocky Mountain big-horn (Ovis canadensis) is a strongly built sheep, standing up to 40 inches high. In color in its summer coat, it is tawny yellow, and in winter grayish brown, with the face ash and a dark line along the spine. The under parts and a conspicuous roundish patch on the buttocks are whitish. The horns of the ram are of large circumference at the base and thick and rugged, with a distinct keel at the outer edge, and sweep around backward into a spiral, which is complete in the largest specimens and will measure 40 to 42 inches along the outer curve. A smaller and paler variety of Utah and Idaho is called Nelson's big-horn. In the mountains of British Columbia is found Stone's big-horn, which is larger in size and much darker in color (almost black, indeed), with comparatively slender horns. A third species, Pa l's sheep, belonging to the mountains of central Alaska, is perfectly white, with horns of moderate size and of a clear amber color. A fourth species, also Alaskan, may prove to be a variety of Dall's, which it resembles, except that a mantle of brownish-gray covers the body as if a blanket were laid across its back. This last species has been named Fannin's sheep. All these sheep breed once a year, at the beginning of warm weather, usually producing two kids at a birth. They are hardly separable from the argalis of northeastern Asia, and doubtless all are descendants from the same primitive stock. Consult Baille-Grohman, 'Fifteen Years' Sport and Life in the Hunting Grounds of Western America' (1900); Mayer, 'How to Hunt and Gun ' (1892); Roosevelt, 'Hunting Trips of a Ranchman' (1883). See also SHEEP.

BIG HORN MOUNTAINS. This sub-mountain of the Rocky Mountains extends north through the north-central part of Wyoming and terminates in southern Montana. Its length is about 120 miles and width varies from 30 to 50 miles. It is a rugged barrier between the Great Plains on the east and Big-horn Basin on the west, above both of which its higher portions rise 7,000 to 9,000 feet. Its highest summit, Cloud Peak, is 13,165 feet above sea-level. Several small glaciers lie in the shadow of the higher peaks and formerly these ice masses were of considerably greater extent. The mountains are due to a great uplift in the earth's crust, an arch whose crest has been truncated by erosion, leaving an elevated central area of quartzite with flanking ridges of Cambrian, Ordovician and Carboniferous sandstone and limestone. The central area of granite presents remarkably fine Alpine scenery, and all through the mountains there are large running streams teeming with trout. Most of the higher region is heavily forested and is embraced in the Bighorn Forest Reservation. No important mineral resources have been developed. For description consult United States Geological Survey, folios
BIG HORN RIVER — BIGAMY

141 and 142, and Professional Paper 51, all by N. H. Darton.

BIG HORN RIVER, a river of Montana and Wyoming. It rises in the Rocky Mountains near Fremont's Peak, and flows northeast into the Yellowstone. Along its course is some of the greatest mountain scenery in the world. It is navigable in its lower course, has a total length of about 450 miles and drains an area of approximately 20,000 square miles. At its junction with the Little Big Horn is Fort Custer.

BIG JAW, or LUMPY JAW. See ACTINOMYXOSIS.

BIG RAPIDS, Mich., city and county-seat of Mecosta County, on the Muskegon River, the Pere Marquette and other important railroads, 56 miles north of Grand Rapids. The river is here dammed in two places, providing a very valuable water-power. The city has the Holly system of waterworks and an extensive trade in lumber and manufactures of furniture, sash, doors and blinds, coiled elm hoops, shingles, veneer, etc. Among the noteworthy institutions is the Ferris Industrial School. There are four daily and weekly newspapers, a private bank, several hotels, a public library, hospital, theatre and courthouse. Big Rapids was settled in 1859 and incorporated as a city in 1869. It is now governed under the commission-manager plan. Pop. 5,000.

BIG SANDY RIVER, a stream forming the boundary between West Virginia and Kentucky and flowing into the Ohio, having two confluent forks, Tug Fork that rises in West Virginia, and West Fork that rises in Kentucky. For small or flat-bottomed boats 100 miles of its lower course are navigable. Portions of the area which it drains (over 4,000 square miles) have long been regarded as of special interest on account of their mineral products.

BIG SIOUX, soo, a stream of South Dakota, uniting with the Missouri about two miles above Sioux City, after a course of 300 miles.

BIG SISTERS, The. This movement was incorporated on 12 June 1912. It was organized about three years prior to this date by Mrs. Wm. K. Vanderbilt. It is a movement to enlist the personal interest in behalf of unfortunate girls (particularly those coming before the Children's Court) and also small children brought before the court because of improper guardianship. There is a staff of three paid workers, supplemented by the volunteer Big Sisters who, through their personal interest, try to give to the Little Sisters friendship and opportunities which are their due, thereby laying the foundation for better citizenship. When a girl is brought before the court an endeavor is made to find the cause of the difficulty and then, with the co-operation of the parents or of any possible social or religious agency, the Big Sister endeavors so to change conditions as to make them constructive and not destrucive. The organization is supported entirely by voluntary contributions.

BIG SPRING, Texas, town and county-seat of Howard County, 270 miles west of Fort Worth, on the Texas & Pacific Railroad. It is of importance as a railroad town, the division shops and offices of the Texas & Pacific Rail-

road being situated here. It carries on an active trade in live-stock, hides, fruit, lumber, cotton and agricultural products. Extensive deposits of salt are found underlying the region and in the neighborhood is the great spring for which the town is named. The city contains cotton gins, an ice plant, fine school buildings, a hospital and public library. The waterworks are the property of the city. Pop. 4,102.

BIG STONE GAP, Va., town in Wise County, 175 miles southwest of Charleston, on the Louisville and Nashville and the Virginia and Southern railroads. The town contains a large government building, a public park, a museum and Bee Rock Tunnel. It has lumber and mining interests but is chiefly a place of residence. Pop. 2,500.

BIG STONE LAKE, a body of water on the boundary between South Dakota and Minnesota, drained by the Minnesota River. It is about 25 miles long.

BIG TREES. See SEQUOIA.

BIG WOODS, a wooded tract in the southeast part of Minnesota, extending south from Saint Cloud to Le Sueur, where it crosses the Minnesota and sends branches toward Faribault and Mankato. It is 100 miles long and from 10 to 40 miles wide, covering 5,000 square miles, four-fifths of which lie north of the Minnesota. This great belt of hardwood timber is one of the most valuable forests in the West.

BIGAMY, in the canon law, means being twice married; in the common acceptance of the word, as a term of ordinary law, it means the being married to two wives or husbands at the same time. The laws relating to plurality of wives or husbands might be supposed to come strictly under the head of polygamy; but, as it constitutes an offense, against these laws to have more than one husband or wife, they are usually brought under that of bigamy. The laws of every civilized society make some provision respecting this subject. By the statute of 4 Edward 1, stat. 3, cap. 5, the marrying of a second husband or wife, the first being alive, was made felony; and by that of 2 James I, cap. 11, this crime was made punishable by death. But the same statute provided that, where either party was absent beyond seas for seven years, whether known or not known to the other party to be alive, or was absent, though not beyond seas, for the same period and not known by the other party to be alive, the other party was at liberty to marry again. Now, however, one of the parties is not held guiltless unless the other was absent continuously for seven years and was not known to be alive. The penalty has been lessened by subsequent enactments, and the guilty party is now liable to penal servitude for seven years or not less than five, or to imprisonment, with or without hard labor, for not more than two. Every person aiding or abetting the bigamist is held to be equally guilty and may receive the same punishment. By a Scottish statute of 1551 bigamy was made punishable in person — that is, with confiscation of goods, imprisonment and infamy; now imprisonment is the usual sentence, but in some cases penal servitude is inflicted. If the accused had reasonable ground for believing the first spouse dead, be
is not guilty of the crime; and if the first marriage was void, for any reason or dissolved by divorce, the second is not bigamous. In Scottish law, too, it is not necessary that either marriage should be regular for bigamy to be committed. The statute of James I has been adopted in most of the United States as to the description of the crime, but the State laws generally differ from it as to the penalty, having therefore, instead of death, as provided by the English statute, the punishment of imprisonment and hard labor for a number of years, according to the discretion of the court; others leaving it to the verdict of the jury to fix the period of imprisonment.

The New York statutes against bigamy are substantially similar to those in nearly all the States of the Union. These statutes provide that any person who, having a husband or wife living, marries another person, is guilty of bigamy and is punishable in State's prison or penitentiary for not more than five years. The statute does not extend to a person whose former husband or wife has been absent for five years successively, without being known to have been living. The husband or wife has not been believed by him or her to be dead, or to a person whose former marriage has been pronounced void or annulled or dissolved by the judgment of a court of competent jurisdiction for a cause other than his or her adultery, or to a person who, being divorced for his or her adultery, has received from the court which pronounced the divorce permission to marry again, or to a person whose former husband or wife has been sentenced to imprisonment for life. A person who knowingly enters into a marriage with another which is prohibited to the latter by the statute is punishable by imprisonment for not more than five years, or by a fine of not more than $1,000, or both. Consult Stephen, 'Digest of the Criminal Law' (5th ed., London 1894); Philimore, 'Ecclesiastical Law of the Church of England' (London 1895); Eversley, 'Law of the Domestic Relations' (London 1896).

BIGELOW, Edith Evelyn (JAFFRAY), American novelist: b. New York, 23 Dec. 1861; m. 1894. She was born in New York City. She received an education under the care of her mother and her aunt, Mr. John G. Bigelow (q.v.), in 1864. She has published 'Diplomatic Enchantments' and several novelettes.

BIGELOW, Edward Fuller, American editor and naturalist: b. Colchester, Conn., 14 Jan. 1860. He received his preparatory education at Bacon Academy, Colchester; was a special student at the Biological Laboratory, Yale University, 1896—97; student at the Biological Laboratory, Cold Spring Harbor, L. I., 1899; also studied at Nature Study School, Cornell University; A.M., Ph.D., Taylor University, 1899. He was editor of nature and science departments of Saint Nicholas Magazine 1900—14; is now editor of The Guide to Nature; was editor of Popular Science for three years, of the Observer eight years and of weekly and daily newspapers in Connecticut for eight years. For 10 years he was a nature study at university summer schools in Ohio, Michigan, North Carolina, Alabama, Indiana, Iowa, etc.; is the inventor of chemical tablets for the artificial nutriment of plants (1901) and of an educational bee-hive (1905); was elected president of the Agassiz Association (1907). Publications: 'Bigelow's Descriptive Plant Analysis'; 'How Nature Study Should Be Taught'; 'Walking, A Fine Art'; 'The Spirit of Nature Study' (1907).

BIGELOW, Erastus Brigham, American inventor: b. West Boylston, Mass., 2 April 1814; d. Boston, 6 Dec. 1879. His name is prominent in the early day of the American textile industries, his inventions including looms for suspender webbing, piping cord, knotted counterpanes, carpets, coach laces, etc. He was also one of the original incorporators of the Massachusetts Institute of Technology. He wrote 'The Tariff Questions Considered in Regard to the Policy of England and the Interest of the United States' (1863).

BIGELOW, Frank Hagar, American clergyman and meteorologist: b. Concord, Mass., 28 Aug. 1851. He was graduated at Harvard in 1873 and at the Episcopal Theological School at Cambridge, Mass. He was ordained in 1880. He was assistant astronomer at the observatory in Córdoba, Argentina (1873—76 and 1881—83), and afterward was successively professor of mathematics in Racine College (Wisconsin) (1884—86) and assistant in the Nautical Almanac office, Washington, D. C. In 1891 he was appointed a professor of meteorology in the United States Weather Bureau, and in 1894 professor of solar physics at the Columbia University. He also became, in 1891, assistant rector of St. John's Church, Washington, and in 1898 was president of the Washington Philosophical Society. In 1904 he was made a member of the International Commission on Solar Physics and Meteorology. He became professor of meteorology at the Argentine Meteorological Office in 1910, and in 1915 director of the Pilar Solar and Magnetic Observatory. He invented an instrument for obtaining photographic records of stellar transits and endeavored to prove a connection between terrestrial magnetic phenomena and the solar corona. He published an important monograph on the 'Solar Corona' (1899); 'Studies on the Thermodynamics of the Atmosphere' (1907); and bulletins on evaporation, the radiation of the atmosphere and synchronism between solar phenomena and terrestrial meteorology (1911—13); 'The Daily Normal Temperature and the Daily Normal Precipitation of the United States' (1908); 'Treatise on Atmospheric Circulation and Radiation' (1915).

BIGELOW, Jacob, American physician: b. Sudbury, Mass., 27 Feb. 1787; d. Boston, 10 Jan. 1879. He was graduated at Harvard College 1806 and began medical practice in Boston in 1810. He early became known as a botanist, and a number of plants were named for him by Sir E. J. Smith in the supplement to 'Rees' Cyclopaedia,' by l'Heritier de Dendere in France. He founded Mount Auburn Cemetery in Cambridge, the first garden cemetery established in the United States. He was professor of materia medica in Harvard College in 1815—35 and Rushford professor there in 1836—7. His works include 'Useful Arts
BIGELOW. John, American author: b. Malden, N. Y., 25 Nov. 1817; d. 1911. He was graduated at Union College in 1835, and became first a lawyer and afterward a journalist. In 1845-46 he was inspector of Sing Sing prison; in 1849-61 one of the editors of the New York Evening Post; in 1861-64 United States consul-general at Paris, and in 1864-67 Minister to France. He was secretary of State of New York 1875-77. From August 1886 he was one of the three trustees and on 27 May 1895 was elected president of the consolidated board of trustees, and appointed chairman of the executive committee. The New York Public Library, Astor, Lenox and Tilden Foundations. His works include 'Molinos the Quietist'; 'France and the Confederate Navy'; 'Life of William Cullen Bryant'; 'Life of Samuel J. Tilden'; 'Some Recollections of Edouard Loubet'; 'The Mystery of Kapek'; 'A Life of Franklin.' In 1885 he published 'The Writings and Speeches of Samuel J. Tilden,' and in 1888, 'The Complete Works of Benjamin Franklin.' Consult Bigelow, J., 'Retrospection of an Active Life' (2 vols., New York 1909).

BIGELOW, John, American military officer and author, son of the preceding: b. New York, 12 May 1854. He was educated in Paris, Bonn, Berlin, Freiberg, and Providence, R. I.; was graduated at the United States Military Academy in 1877; and was assigned to the 16th United States Cavalry. In 1877-89 was adjutant-general of militia in the District of Columbia; and in 1894-98, professor of military science at the Massachusetts Institute of Technology. During the war with Spain he was wounded in the attack on San Juan, Cuba, 1 July 1898. He retired from active service at his own request in 1904. From 1904 to 1910 he was professor of French at the Massachusetts Institute of Technology, and from 1910 to 1919, in active military service on the staff of the governor of Massachusetts. He published 'Mars-la-Tour and Gravelotte' (1884); 'Principles of Strategy, Illustrated Mainly from American Campaigns' (rev. ed., 1894); 'Reminiscences of the Santiago Campaign' (1899); 'The Campaign of Chancellorsville' (1910); 'American Policy, the Western Hemisphere in Its Relation to the Eastern' (1914); 'World Peace, How War Cannot Be Abolished, How It Possibly May Be Abolished' (1915).

BIGELOW, Marshall Train, American printer and proofreader: b. South Natick, Mass. 5 Oct. 1822; d. Cambridge, Mass., 28 Dec. 1902. In 1843 he became associated with the University Press in Cambridge, the firm name of which from 1859 to 1879 was Welch, Bigelow & Company. He was long classed as one of the most competent of American proofreaders. He published 'Punctuation and Other Typographic Matters' (1881); 'Mistakes in Writing English and How to Avoid Them' (1886).

BIGELOW, Maurice Alpheus, American biologist: b. Milford Centre, Ohio, 8 Dec. 1872. Graduating from Harvard University, he became instructor in biology at Ohio Wesleyan continuing in this position at Northwestern University the following year. In 1899 he was appointed instructor in biology at Columbia University, becoming professor in 1907. Besides being editor of the Nature Study Review, from 1905 until 1911, he wrote 'The Early Development of Lepas' (1902); 'The Teaching of Zoology in the Secondary School' (1904); 'Applied Biology' (1911); 'Teacher's Manual of Biology' (1911); 'Introduction to Biology' (1913).

BIGELOW, Melville Madison, American lawyer: b. Eaton Rapids, Mich., 2 Aug. 1846. He was graduated at the University of Michigan 1866 and in 1870 removed to Boston. He received the degree of Ph.D. at Harvard 1879, and LL.D. Northwestern University 1896. He was lecturer in the law department of the University of Michigan, and in Northwestern University Law School; was professor in and sometime dean of Boston University Law School, is a member of the Massachusetts Historical Society, and of Harvard Chapter Phi Beta Kappa; member of American Academy of Arts and Sciences. His works include 'The Law of Estoppel' (1872); 'Leading Cases in the Law of Torts' (1875); 'The Law of Torts' (8th ed., 1907); 'Placita Anglo-Normannica' (1879); 'History of English Procedure' (1880); 'The Law of Fraudulent Conveyances' (2d ed., 1911); 'The Law of Bills, Notes and Cheques' (2d ed., 1900); 'The Law of Wills' (1898); joint author 'Centralization and the Law' (1906); 'A False Equation—The Problem of the Great Trust' (1911). His works are in use in law schools throughout America, in England, China, Japan, India and South America.

BIGELOW, Poultney, American author: b. New York (son of John Bigelow) 10 Sept. 1855. After a cosmopolitan training in the United States, France and the East, where Emperor William II was his pupil in 1871-72, their friendship persisting until 1895, when the Jameson raid ranged Mr. Bigelow in political opposition to the anti-English policy of Germany, he was graduated at the Norwich Academy 1873, at Yale University 1879, and from the Columbia Law School 1882. In 1875-76 he made a voyage around the world in a sailing-ship which was wrecked on the coast of Japan. Admitted to the bar in 1882, he abandoned the law, after a few years, for journalism and travel in China, Africa, the West Indies, Borneo, Australia, New Guinea, Russia and India, the while collecting material for studies on colonization. He was the first to take a steamer through the Strait of the Danube and was the founder and first editor of Outing, the first American magazine of amateur outdoor sport 1885-87; was lecturer at principal universities on modern history and colonial administration; was correspondent of the London Times during the Spanish-American War 1898. In 1906 he returned from his 4th voyage round the world and retired to Malden-on-Hudson, the birthplace of his father, where he devotes his time to rural and literary pursuits. He has published 'The German Em-
pero'); (1889); ‘The German Emperor and His Eastern Neighbors’ (1892); ‘Paddles and Politics down the Danube’ (1892); ‘The Borderland of the United Kaiser’ (1894); in gathering the materials for which he was expelled from the Russian Empire; ‘History of the German Struggle for Liberty’ (4 vols., 1896; new ed., 1912); ‘White Man’s Africa’ (1898), and ‘Russian Memories’ (1915).

BIGELOW, Robert Payne, American zoologist, was born in Ithaca, N. Y., 10 July 1863. He was graduated at Harvard in 1887 and studied at Johns Hopkins 1889-93. In 1893 he became instructor in biology at the Massachusetts Institute of Technology; was made librarian in 1895, assistant professor in 1912, and associate professor in 1915. He has written a number of papers on zoological subjects and contributed articles to the Reference Handbook of the Medical Sciences 1900-04, and 1913.

BIGELOW, Samuel Lawrence, American chemist: b. Boston, 23 Feb. 1870. Graduating from Harvard and the Massachusetts Institute of Technology, he took a post graduate course at Leipzig. After serving as instructor at the University of Michigan from 1898 until 1901, he became acting director of the laboratory of general chemistry. In 1907 he was made professor of chemistry in the same institution. Among his works are ‘Denatured Alcohol’ (1907); ‘Theoretical and Physical Chemistry’ (1912).

BIGELOW, Timothy, American military officer: b. Worcester, Mass., 12 Aug. 1739; d. there, 31 March 1790. He was a blacksmith by trade, was a member of the Provincial Congress of 1774-75 and on 23 May 1775 he led a company of minute-men to Cambridge, and became major in Ward’s regiment. He was under Arnold in the expedition to Quebec in 1775, and was there captured, remaining a prisoner till 1776. He became colonel in 1777, and assisted in the capture of Burgoyne. He also saw service at Valley Forge, Monmouth, West Point and Yorktown.

BIGELOW, Timothy, American lawyer (son of the preceding): b. Worcester, Mass., 30 Apr. 1816; d. there, 18 May 1821. He was graduated at Harvard College in 1786, was admitted to the bar, and settled in practice at Groton, Mass., in 1789. He took an active part in politics as a Federalist, was for 20 years a member of the State legislature, and 11 years speaker of the House of Representatives, and a member of the Hartford Convention. In 1807 he removed to Medford, and kept an office in Boston. His legal standing and practice were at the head of his profession in his time; and in the course of 32 years, he was supposed to have argued 10,000 causes.

BIGELOW, Willard Dell, American chemist: b. Gardner, Kan., 31 May 1866. Graduating from Amherst College, he was appointed assistant professor of chemistry at the Oregon State College. In 1891 he became chief chemist at the Bureau of Plant Industry, United States Department of Agriculture; 10 years later he was chief of the Division of Foods and in 1903 he was assistant chief of the Bureau. On account of the resignation of his chief he was appointed chief chemist in 1905, and in 1911 was the head of the Bureau. In 1913 he was made chief of a board of experts formed to investigate health conditions in the State of New York and the following year he was appointed State Commissioner in the Bureau of Public Health. He has written ‘The Administrative Control of Tuberculosis’ (1904); ‘An Ideal heath De-
BIGLOW — BIGNON

BIGLOW, William, American educator and poet: b. Natick, Mass., 22 Sept. 1773; d. Boston, 12 Jan. 1844. He was first established as a teacher in Salem, and in 1790 delivered a poem on education before the Phi Beta Kappa Society at Cambridge. He then took charge of the Latin school, Boston, preaching occasionally, writing for different periodicals, and publishing occasional textbooks. Here he fell a victim to intemperate habits and was compelled to retire to his home in Natick. In this state of his fortunes it was his habit to lounge about the newspaper offices at Boston, write poetry for his friends, the editors, while the humor lasted, and then return to his rural retreat. He taught, also, a village school in Maine, and in the latter part of his life was employed as a proofreader in the university printing office at Cambridge. He had a genial and pleasant humor, and was a ready versifier, as well as an agreeable prose-writer. His 'Cheerful Parson' and others of his songs were much admired by his contemporaries and are well worthy of remembrance. He also published, in 1830, a 'Poems' of the 'Town of Natick,' and one of Sherburne, Mass. But his best and most numerous writings were in periodicals, the Village Messenger, of Amherst, N. H., which he edited in 1796, the Federal Orrery, and Massachusetts Magazine.

BIGLOW PAPERS, The. Lowell's masterpiece, 'The Biglow Papers,' one of the most delightful books ever written by an American, embodies the best humorous and satirical verse since Byron. The papers, first and second series, are made up of one prose paper and of 19 poems in a variety of metres, aggregating about 3,800 lines, and treat topics suggested by the Mexican and the Civil Wars. They are written in Yankee dialect, and purport to be the spontaneous effusions of a certain Hosea Biglow, a rustic political philosopher and an old man very ready versifier, and are edited for publication by his friend and pastor, the Rev. Homer Wilbur. Though the papers vary greatly in length, subject matter and tone, they produce a remarkably uniform impression. The first series was inspired by Lowell's indignation over the Mexican War, while he was in the midst of his labors on the National Anti-Slavery Standard. Five numbers were printed in the BostonCourier, beginning June 1846, and the four remaining numbers were printed in the Anti-Slavery Standard, ending September 1847. All were anonymous. Lowell himself was astonished at the success of his verses, which he had regarded as mere "jeur d'esprit." Hosea Biglow became a household name, and it was evident that the despised anti-slavery cause had found a powerful champion. When the first series was published in book form in 1848, with the name of the author, Lowell became famous. Fourteen years later, urged by his friends and in response to a wide spread public demand, he began the second series, the 11 numbers of which were published in the Atlantic Monthly between January 1862 and May 1866. These dealt with slavery, States' rights, the Civil War and national politics in general. Though the second series exhibits the same moral earnestness, and though it contains the best single number of all the 'Papers' ("Sunthin in the Pastoral Line," VI), it is perhaps on the whole not quite so spontaneous and convincing as the first.

Apart from their humor, wisdom and metrical facility, 'The Biglow Papers' are remarkable among satires for their creation of real characters. Hosea Biglow, the shrewd, humorous, frank critic of political conditions, who together with moral earnestness possesses a vein of sentiment and poetry, is a genuine Yankee type. Birdofreedom Sawin, the clown of the piece, an amusing and likable rascal, represents the same Yankee shrewdness, but uncontrolled by moral sense. The Rev. Homer Wilbur embodies the cautious element of the New England character, with something of the 'harmless vanity and amiable pedantry of a certain type of New England Clergymen.' His elaborate introductions and notes, for all their pedantry and verbosity, are no less delightful in their way, and often no less trenchant, than the winged words of the versifier. Though inconsistently portrayed, he is not unworthy the companionship of the immortal Adams and Primrose.

Lowell's justification for his use of dialect in 'The Biglow Papers' by the plea that he needed a speech more racy than "literary" language, was unnecessary; for the dialect adds meaning and point to his satire; it is redolent of the soil; it helps to express both Hosea and his race. Though Lowell follows "Sam Slick" and other satirists in his use of the New England rustic who discusses politics in dialect, he so far surpasses his predecessors that he actually now seems the first to have given to literature the Yankee dialect and the Yankee rustic. Again, 'The Biglow Papers' reveal Lowell himself, a great personality, fun-loving and fun-making, witty, wise, fearless and patriotic; and also his race, for he is here the spokesman for New England. With such qualities, the 'Papers' have as a whole lost little with the years. Their relation to their times is plain enough to the reader with any knowledge of American history; while their satire on perennial political follies and human foibles and their essential poetry and humanity, are as fresh as ever. From the first series, however, the reader is apt to prefer Hosea's views on "recruckin" (I), "B. Sawin's first letter" (II), "What Mr. Robinson Thinks," with its fragrant refrain, worthy of Gilbert at his best (III), and "The Pious Editor's Creed" (VI); and from the second series, "The Courtin," prefixed to the series and independent of it; "Jonathan to John" (contained in II); that most delightful of New England pastorals, "Sunthin in the Pastoral Line" (VI), in which sentiment and imagination have free play, with little regard to satire or the general purpose of the series; and the poignant verses on the price that we pay for liberty and peace (X). The best edition of 'The Biglow Papers' is that contained in the Cambridge edition of Lowell's complete poetical works, edited by H. E. Scudder.

M. S. TUCKER,
Polytechnic Institute of Brooklyn.

BIGNON, bë'-nöⁿ, Louis Pierre Edouard, French historian and statesman: b. La Meilleraye, 3 Jan. 1771; d. Paris, 5 Jan. 1841. He entered the National Assembly in 1817; became
BIGONIA — BIJAPUR

a peer of France in 1837, and wrote a ‘History of France’ (7 vols., 1827–38). He received from Napoleon I. a bequest of $20,000.

BIGNONIA, the type genus of the family Bignoniaceae, consisting of more than 100 species of mostly South American tropical climbing shrubs, many of which are grown in greenhouses for their ornamental foliage and handsome tubular flowers of various colors. Some species are used as cordage in South America and are said to be employed in making mats, baskets, etc. The cultivated species are generally of easy management if given gritty soil, plenty of light, and space for both roots and tops. B. capreolata, which has numerous orange-red flowers, is a common climber throughout the South and as far north as Maryland. In favorable soils and situations it often attains heights exceeding 50 feet. It is known as “trumpet-flower” from the shape of its blossoms, and “cross-vine” and “quarter-vine” from the appearance of the cross-section of its stem. It is sometimes confused with its near relation Cestrum parqui and Cumaru.

BIGORDI, bë-gör-dë, Domenico, Italian painter: b. Florence 1146; d. 11 Jan. 1494. He was nicknamed Ghirlandajo, a name already borne by his father, Tommaso. He studied painting and mosaics under Alessio Baldovinetti. At the same time he studied Mosaccio’s frescoes. After 1440 he painted a ‘Last Supper’ for the church of Ognissanti, and soon after he undertook a series of frescoes in the Sasseti chapel in La Trinita. Here he depicted the principal scenes of the legend of Saint Francis, intermixed with the Florentine public recognized as some of their well-known contemporaries. He also painted at this time ‘The Adoration of the Shepherds,’ now in the Academy of Fine Arts. His fame soon reached Rome, and he was summoned thither in 1483, to work on the Sixtine chapel. Here he painted ‘The Vocation of SS. Peter and Andrew’ and another work now lost. At Rome he met Francisco Tornabuoni who became his patron. From 1445 to 1490 he was employed in repairing the chapels of Saint Maria Novella at Florence. Here Michelangelo was the apprentice of Bigordi and aided his master in the work on the choir chapel, which remains one of the most venerable monuments of Florence. The life of this great artist, one of the most notable precursors of the development which was to follow, was short. He died in 1494 leaving several works unfinished. His two brothers and his pupils undertook to finish them. In fact several of his paintings show traces of a strange hand. Independent of the works mentioned above there are others deserving of mention, such as the (Visitation) in the Louvre and the (Old Man and Child) in the Paris Museum. Florence has several works: the convent of Saint Marco, now a museum, contains a ‘Last Supper’; and in the church of Ognissanti there is a Saint Jerome. Ghirlandajo’s art represents the highest technical development in his century. As a technician he was one of the greatest of the Florentines. He excelled in composition and draftsmanship and was a good colonist but was deficient in originality. Consult Vasari, ‘Lives of the Painters’ (10 vols., New York 1913); Crowe and Cavalcaselle, ‘History of Painting in Italy’ (London 1903); and the monograph by Davies (London 1908).

BIGNOT, bë-gô, Charles Jules, French critic: b. Paris, 14 Sept. 1840; d. 1893. After finishing his studies at the Ecole Normale and the Art School at Athens, he entered journalism and spent years in Greece. He became a French critic. His articles appeared in XIXe Siècle and the Revue Bleu. Among his larger works are ‘Les classes dirigeantes’ (1875); ‘Le clergé français devant la loi française’ (1877); ‘Le petit Français’ (1882); ‘Raphaël et la Farnesina’ (1884); ‘Grèce, Turquie, le Danube’ (1886); ‘De Paris au Magara’ (1887). His wife, Mary Healey Bigot, an American, is also well known as a writer under the pen name of ‘Jeanne Mairet.’

BIGNOT, François, French colonial administrator: b. Bordeaux, 30 Jan. 1703. He became commissary of marine at Rochefort, 1731; ordonnateur at Louisbourg in 1739, where he began that career of peculation which only ended with the ruin of French Canada. After the capture of Louisbourg by the English, he returned to France, and was appointed intendant of Canada in 1748. His administration of the finances was marked by the grossest corruption, the colony being exploited in the most shameless way for the benefit of himself and his associates. On his return to France after the conquest, he was brought to trial, sentenced to make restitution and to suffer banishment; but the sentence of banishment was not carried out, and he was permitted to end his days in Bordeaux. The date of his death is unknown.

BIHAC, or BIHATCH, bë-hâch, Bosnia, fortress and town on an island of the Una, about 50 miles east of the Adriatic. It has a low and unhealthful site, but is remarkable for its strength. In 1592 the Turks converted its Gothic church into the Pethija Mosque. The possession of it has often been keenly contested during the Turkish wars. In the autumn of 1878 the Bosnian insurgents successfully defended the town against the Austrians. Pop. 4,700.

BIHAR AND ORISSA, India, a northeastern province constituted in 1912 from the native states of Bihar, Orissa and Chota Nagpur, formerly feudatory to the presidency of Bengal (q.v.). Total area 83,181 square miles; population 34,490,184, comprising Bihar, 42,361 square miles, 23,752,969 population; Orissa, 13,743 square miles, 5,131,753 population; Chota Nagpur, 27,077 square miles, 5,605,962 population.

BIKUH, bë-hû, Portuguese West Africa, a fruitful district lying east of Benguela, in the colony of Angola. It is an important caravan centre, as the only route across the continent passes through it. Area, 3,900 square miles. Pop. 95,000.

BIJAPUR, bë-jâ-pôr’, India, a decayed city in the Bombay presidency, 160 miles southeast of Poona. It was for centuries the flourishing capital of a powerful kingdom, but fell there to the combined forces of the Hindu and Mussulman, till in 1686 it was captured by Aurungzebe. It passed, during the early part of the 18th century, into the hands of the Maharrattas, and became British in 1848. Now that a gradual decay has done its worst,
Bijapur presents a contrast perhaps unequalled in the world. Lofty walls of hewn stone, still entire, enclose the silent and desolate fragments of a once vast and populous city. With the exception of an ancient temple, the sole relic of aboriginal domination, the ruins are Mohammedan, and consist of beautiful mosques, colossal tombs, a fort, with an inner citadel, a mile in circuit. The British government has done everything to prevent further decay.

BIJNS, bínz, Anna, Flemish poet: b. Antwerp 1494; d. there, 10 April 1575. She was the first Flemish writer of the 16th century. Much admired for her melodious verses, full of metaphors and showing great technical skill, she was styled the "Brabantine Sappho" by her contemporaries. Many of her poems were directed against Luther and his followers. The first of her volumes of collected verse bore the title 'This Is a Beautiful and Truthful (or Sincere, Little) Book' while a second, known as 'Spiritual Refrains.' Consult her 'Schoone Refereneyen Schriftueeren ende Leeringen teghen Tall Ketteryen' (1528); with commentaries by Van Helten and Jonckbloet 1830. Van Helten published a collection of 94 of her other poems.

BIKANIR, bê-kâ-nê'r, India, a native state of Rajputana, under the superintendence of a political agent and the governor-general's agent for Rajasthan, lying between lat. 27° 12' and 30° 12' N. and long. 72° 12' and 75° 41' E.; area, 23,311 square miles; est. (1911) 700,893. The surface is for the most part undulating sandhills; there are no forests, and for want of water trees are scarce. Two canals form the only irrigation works. The climate is generally dry and healthful, but is characterized by great extremes of temperature. Coal is the principal mineral; woolen fabrics, pottery and lacquer work form the chief native industries. Famine took nearly half of the population in 1968-69, and there were visitations in 1891-92 and 1899-1900.

BIKANIR, India, capital of the above state. 250 miles west-southwest of Delhi, an irregularly built city surrounded by a fine battlemented wall four and a half miles in circuit, six feet thick and from 20 to 30 feet high. It has a fort, containing the Rajah's palace, and manufactures blankets, sugar candy, pottery, etc. It contains 10 Jain monasteries, 160 temples and nearly 30 mosques. Pop. 55,826.

BIKELAS, bê-kâ'las, Dimitrios, modern Greek poet and historian: b. Hemopoli, island of Syra, 1835; d. Athens, 21 July 1908. After completing his studies he went to London, where his poems were published, and after 1874 lived in Paris. After publishing a collection of his poems in 1862, he devoted himself to the task of making Shakespeare's dramas known in Greece through excellent metrical translations. As a prose-writer he has won wide reputation with his tales 'Lukis Larga' (1879), which was translated into 13 languages. His historical writings include 'The Greeks of the Middle Ages' (1878); 'The Role and the Aspirations of Greece in the Eastern Question' (1885); 'Greece, Byzantine and Modern' (1893).

BIKUKULLA (Greek for "double-hooded"), a genus of plants of the fumitory family (Fumariaceae). The genus numbers about 15 species, natives of North America and western Asia. The best-known American species are the Dutchman's breeches (B. cucullaria), and wild bleeding-heart (B. carneus). The common squirrel-corn (B. canadensis) is also a member of the genus. The Dutchman's breeches grows in woods from Nova Scotia to Lake Huron and Washington, south to North Carolina and Missouri. Wild bleeding-heart is found in rocky places from the 2nd part of New York, south to Georgia and Tennessee, along the mountain ranges. The best-known Asiatic species is B. spectabilis, bleeding-heart, a native of northern China and the neighboring parts of Siberia, which was discovered in 1810, and is now everywhere common as a garden plant. It blossoms in April and May, and its long drooping racemes of purplish-red blossoms present a very graceful appearance.

BILASPUR, British India, town of the Central Provinces and capital of the administrative district of Bilaspur. It is situated on the Bengal and Nagpur Railway and the Arpa River. It is in the centre of one of those poorer districts in which the irrigation canal system has been as yet least developed and famines are frequent. The chief crop is rice. Pop. including the entire administrative district, 1,146,223.

BILBAO, bêl-bâ'o, Spain, capital of the province of Viscaya (q.v.) or Bilbao, situated on the navigable Nervion, in a plain surrounded with high mountains, a few miles from the sea. The river is crossed by five bridges. The town is picturesque and well built and contains several good churches, two fine promenades, a theatre, a marine school, etc. Bilbao carries on important trade and manufactures (the latter consisting chiefly of sailcloth, ropes and leather, hats, tobacco and earthenware) and possesses large shipyards and iron-foundries, iron and steel works, etc. It is one of the most flourishing seaports of Spain, though its accommodation for shipping is defective, and it is the seat of a United States consul. Various harbor improvements, however, have recently been carried out, including a breakwater and mole. Bilbao exports much iron ore (especially to the United Kingdom), also pig-iron, wool, wine, fruits, oil, flour, grains, madder, licorice, etc.; the imports are manufactured goods, dried fish, timber, coal, hardware, etc. Its supply of water and sanitary arrangements are not good. Its prosperity is due to the valuable iron mines nearby. The city was founded in 1300 by Diego Lopez de Haro as "Belvao," or "fine ford." It was an important commercial centre in the 14th and 15th centuries but suffered in the wars with France in 1795 and 1808. It was besieged by the Carlists in 1833-35 and 1872-74. Pop. 92,514. Consult Guiraud Larrauri, 'Historia de Bilbao' (Bilbao 1905).

BILBERRY. See HUCKLEBERRY.

BILBILIS, Spain, an old Celtiberian city, two miles east of the modern town of Calatayud, in the province of Saragossa, chiefly celebrated as the birthplace of the poet Martial, but also famed for its highly-tempered steel blades. In the Roman period it was a municipium with the surname of Augusta and had the right to coin money.
BILDAD, "the traditionalist": one of the leading characters in the book of Job. See Jos. BILDERDRIJK, bilˈdər-dɛk, Willem, Dutch poet, born in Amsterdam, 7 Sept. 1756; d. Haarlem, 18 Dec. 1831. Graduating from the University at Leyden where he had studied law, he began a private practice, devoting himself also to the writing of verse. While still very young he became famous as a poet. On account of political activities objectionable to the government he was exiled from Holland in 1795, after he lived for a while in England and later in Brunswick. In the latter place he gained some notoriety on account of a scandal in which the wife of Karel van Schalkwijck was involved, herself an author of some repute. They were later married. Bilderdriek returned to Holland in 1806 and became state librarian, under the patronage of King Louis Napoleon. In 1817 he went to Leyden, where he lectured for 10 years on history. In 1827 he settled in Haarlem, where he remained for the rest of his life. His poetic masterpiece is 'The Destruction of the First World' (1820), but he has written a voluminous mass of other matter. Among his symbolical works are 'De Doode van Edipus' (1789); 'Mijn verlusting' (1781); 'De geesten wereld' (Amsterdam 1843). On account of his politics, which were ultra conservative, he was for a time very unpopular among his countrymen. Consult Gorter's 'Bildaarskrant' (Amsterdam 1871).

BILE, the most important secretion of the liver. It is formed directly by the liver cells, largely from the blood, is collected by the bile ducts, and discharged through the hepatic ducts. Most of the bile is stored in the gall-bladder, from which it is discharged in mom by the cystic duct and the common duct into the upper portion of the duodenum, four inches below the lower end of the stomach. As first secreted in man it is a clear limpid fluid, but in the gall-bladder it is mixed with mucus and becomes darker, varying from dark brown to greenish, according to the amount of oxidation of the bile pigments. The bile of the carnivora is usually yellowish in tint, that of the grass-eaters greenish, but the colors vary widely, dependent on the oxidation.

Bile is an alkaline fluid with a bitter taste, and contains water, bile acids, bile pigments, traces of lecithin, cholesterin, soaps and fats, and mineral salts. The proportions of these are very variable. The acids are known as glycocholic acid, yielding glycochol and cholic acid, and taurocholic acid, yielding taurine and cholalic acid. The pigments are two, bilirubin and biliverdin, and the color is a compound of the colors of these two and varies with the proportion of each from reddish-brown to grass-green. They are thought to be derived from the hemoglobin of the blood. The functions of bile are not clearly understood, but it seems to aid in the digestion of fats; it is an important organ of excretion, getting rid of many broken down products of metabolism, notably the cholesterin and lecithin. It is an efficient antiseptic, reducing the amount of excessive fermentation in the intestines, it aids in peristalsis and thus overcomes constipation, and perhaps has other functions connected with proteid digestion. The amount of bile secreted daily varies from 25 to 35 ounces, its secretion is more or less uniform, but at the digestive periods the stored bile of the gall-bladder is added to the intestinal content. Gall-stones result from concentration of the bile in the gall-bladder. They are also formed as a process of infection of the gall-bladder that creeps up from the duodenum. Gall-stones following typhoid fever are very common, and are probably formed in this manner. As a result of inflammation of the stomach and duodenum the common duct sometimes is inflamed and its walls swollen. This prevents the escape of bile into the intestines, and the bile pigments are taken up by the blood and cause the jaundice symptom of jaundice (q.v.). The specific gravity of bile is 1.026. The bile of salt-water fish contains potash; that of land and fresh-water animals contains soda. Bilioussness, so called, is rarely an affection of the liver, but much more often a mild inflammation of the stomach and intestines, with catarrhal obstruction of the common duct that is not severe enough to dam back the bile entirely. Clayey stools are usually indicative of deficient bile-elimination. The best-known stimulants of bile-formation and bile-elimination are heat and the biliary acids themselves. The vast majority of the numberless patent liver-pills on the market have no influence on the liver whatever; they are simply cathartics and empty the bowels. Consult Schäfer, 'Physiology' (1898). See Digestion; Glycojen; Jaundice; Liver.

BILFINGER, Georg, (ga-ohr'), Bernhard, German philosopher and mathematician: b. Kandelstadt, Württemberg, 23 Jan. 1693; d. Stuttgart, 18 Feb. 1750. He was born with 12 fingers and 12 toes, and submitted to an operation which removed the deformity. He studied with Wolff at Halle and became a disciple of the school of Wolff and Leibnitz. He was made professor of philosophy in 1721 and of mathematics also in 1724. In 1725 he received an invitation from Peter the Great to the chair of logic and metaphysics in the college at St. Petersburg. He now solved the problem of the cause of gravity proposed by the Academy of Sciences at Paris, and gained the prize. Being recalled in 1731 by Duke Charles Edward of Saxe-Weimar he returned to Tübingen and proceeded to lecture on theology; here his originality in style and ideas soon made him popular, and in 1735 he was appointed a privy councillor. Here he displayed great administrative ability, and by severe study soon became as celebrated for his political and statistical knowledge as for his scientific attainments. He afterward paid particular attention to agriculture and promoted the culture of the vine. He was the author of numerous theological and philosophical works, including 'Dilucidationes philosophiae de deo, anima humana, mundo' (1725; 3d ed., 1746), an able defense of Wolff's division of metaphysics.

BILGE, a term in naval construction, the very bottom of a ship. Bilge blocks, those blocks on which a ship rests in dry dock and which maintain its upright position. Bilge keel, strips which are fastened to the side of a ship below the water line to check her rolling. Bilge keel, a stiffening plate or timber fastened inside the bilge of a ship. Bilge water, water which seeps in through the cracks and seams of a
ship's bottom, especially wooden ships, and collects under the floor. Unless constantly pumped away, the water here collected becomes stagnant and acquires a bad odor. Bilgers ways, those timbers on the launching ways on which rests the structure which supports the ship being built.

BILGUER, bil'gwär, Paul Rudolf von, German chess-player; b. Schwerin 1808; d. Berlin, 6 Oct. 1840. He entered the Prussian army in 1833, and shortly afterward was promoted lieutenant. On 18 March 1840, he performed at Berlin the curious feat of playing three games at once with as many different opponents, conducting two of the contests without seeing the boards and men. This intense mental effort is supposed to have been the primary cause of the illness which resulted in his death. His 'Chess Handbook' (Berlin 1841 and 1852), completed after his death by his friend T. Heydebrandt von der Lasa, made an epoch in the history of chess, and is still the best practical work on that game. Another work from his hand is 'Das Zweispringerspiel im Nachzuge'.

BILHAH, in Biblical history (1) A Simeonite city the position of which is unknown; also referred to as Balah, Baalah and Baalath. (2) According to Gen. xxix, 29, a slave girl given to Rachel by Laban and by her to Jacob as a concubine. She was the mother of Dan and Naphtali.

BILHARZIA, a disease caused by a parasitic worm of which two species are known, the African blood fluke, Schistosoma hemato-lobium and S. japonicum, very common in Egypt and south Africa, but rare in the United States and usually those with cystitis, or inflammation of the bladder, with bloody urine. The diagnosis is usually made by finding the ova of the worm in the blood, by the microscope. (See PARASITES). Consult Blanchard, R., 'Traité de Zoologie medicale' (Paris 1888).

BILIMBI, Cucumber-tree (Averrhoa bilimbi), a tropical tree of the family Oxalidaceae, native of southern Asia, where it is largely cultivated and whence it has been introduced in other tropical countries. It is extensively grown in South America. The tree attains a height of 60 feet, bears racemes of red flowers followed by smooth cucumber-shaped green fruits as large as hen's eggs, which are highly esteemed for their acid pulp. The camambola is a close relative.

BILIN, bé-lén', Bohemia, town and health resort seven miles south-southwest of Teplitz. It contains a fine old castle built in 1680, and one of more modern date; several churches, chapels, mills, etc. Within one mile of the town are much-frequented mineral springs, from which much water is exported. The salts and magnesia obtained from the water form important articles of commerce. It is an alkaline water, and is used with advantage in certain concretionary disorders. Here is also the singular basaltic rock called Bliner Steen. Pop. about 7,760.

BILIOUS FEVER, an old name given to a variety of conditions, but in all of which there was characteristic low-grade fever associated with a certain amount of jaundice, clayey stools, headache, foul tongue, etc. It probably represents no one disease, but a complication of many diseases. See BILIOUSNESS; FEVER; GAS- TRITIS; INFLUENZA; MALARIA.

BILIOUSNESS, a popular term to express some affection of the liver, but in all probability it is frequently a condition of disturbed gastric and duodenal digestion, and having nothing whatever to do with the liver. In the article on bile (q.v.) the mention of this liver secretion into the hepatic duct and storage in the gall-bladder and subsequent emptying into the duodenum is described. When the stomach is inflamed, the inflammation usually extends a certain distance into the intestines and as a consequence the mucous membrane of the common ducts also becomes inflamed and swollen. This prevents the free passage of bile into the intestines and therefore its important function in digestion is stopped or diminished. This results in further indigestion, and causes constipation, and increased putrefaction of the intestinal contents results. Thus there is a chain of many links formed that results in headache, heaviness, bloating, constipation, foul tongue, sour breath, dark urine, and a generally mild jaundice. The entire series may have been set in motion by over-eating, or drinking alcoholic liquors, or deficient exercise, eating excessively of fatty (so-called rich) food, or other hygienic misbehavior. Any or all have started the mild inflammation of the stomach or intestines, and the biliary flow has been diminished. But, diminished functional activity of the biliary and pancreatic secretion due to congestion of the liver and pancreas produces similar symptoms as well as sometimes nervous prostration or, if prolonged, interference with action of the heart and arteries. The treatment should take into consideration the cause, and if the condition is obstinate a physician should be consulted. Rest, careful dieting, plenty of water, some mild laxatives, heat over the pit of the stomach, and hot water enemas, will usually right the condition. The free washing of the bowels and the laxative will usually cure the symptoms of poisoning and heaviness. Dosing with patent pills and teas and even so-called "home remedies" are to be condemned. Violent cathartics irritate the stomach, intestines and even the liver. While they empty the bowels and thus get rid of the poisoning symptoms, they leave behind them increase the conditions which permit of further trouble. See AUTO-INTOXICATION; BILE; CON- StpATION; DIGESTION; LIVER.

BILL, BROWNBILL, GLAIVE, VOUlGE, or Gisarme, all names for nearly the same instrument, which, with some slight modification, was the standing weapon of the English infantry at close quarters, as was the long-bow their weapon at distant range, from the days of the battle of Hastings, at which the Saxons used the bill and the Normans the bow, until those of the Crusaders. The original brownbill was a ponderous cutting weapon with two edges, that forward of the shaft having a concave or sickle blade, that to the back, a sort of angular cutting face, the upper part projecting before the head of the shaft, for giving a drawing blow. This terrible instrument was nearly three feet long, and 10 or 12 pounds in weight, set erect on a shaft of three or four
feet. It was wielded with both hands, and could sever a horse's head or a man's thigh or shoulder, through the strongest mail or plate armor, as a modern woodman's bill-hook slices off a hazel stick. The weapon was afterward lengthened and lightened, and provided with a spear head, so that the holder could charge it like a lance, and sometimes with a cutting hook, for severing bridles or pulling men out of their saddles. A bill is a cutting instrument, hook-shaped toward the point, or with a concave cutting edge; used by plumbers, basket-makers, gardeners, etc., made in various forms and fitted with a handle. Such instruments, when used by gardeners for pruning hedges, trees, etc., are called hedge-bills or bill-hooks.

BILL, a paper, written or printed, giving a statement of the particulars of an account or action. A printed proclamation, an advertisement, an act of Congress or Parliament, or a tradesman's account is a bill. A legislative act used to signify a special act passed by the legislature in the exercise of a quasi-judicial power. Thus, bills of attainder, bills of pains and penalties are spoken of. The draft of a law submitted to the consideration of a legislative body for its adoption or rejection. The Constitution of the United States provides that all bills for raising revenue must originate in the House of Representatives, but the Senate may propose or concur with amendments as on other bills. Every bill before it becomes a law must be approved by the President of the United States, or within 10 days returned, with his objections, to the House in which it originated. Two-thirds of each House may then enact it into a law. These provisions are copied in the Constitutions of a majority of the States.

BILL of Adventure.—A writing signed by a merchant, in which he states that certain goods shipped in his name really belong to another person, at whose risk the adventure is made.

BILL of Attainder.—A bill declaring that the person named in it is attainted and his property confiscated. The Constitution of the United States declares that no State shall pass any bill of attainder. During the Revolutionary War, bills of attainder and ex post facto acts of confiscation were passed to a wide extent. The evils resulting from them, in times of cooler reflection, were discovered to have far outweighed any imaginary good.

Bill of Costs.—A statement of the items which form the total amount of the costs of a suit or action. This is demandable as a matter of right before the payment of the costs.

Bill of Credit.—A letter sent by an agent or other person to a merchant, desiring him to give the bearer credit for goods or money. It is frequently given to one about to travel and empowers him to take up money from the foreign correspondents of the person from whom the bill or letter of credit was received.

Bill of Entry.—A written account of goods entered at the custom-house, whether imported or designed for exportation.

Bill of Exceptions.—A bill of the nature of an appeal from a judge who is held to have misstated the law, whether by ignorance, inadveriture or by design. The judge is bound to seal if he be requested by the counsel on either side so to do. The exceptions noted are reviewed by the court to which appeal is taken, and if the objections made to the rulings of the trial judge are well founded, the finding in the case is reversed and usually the cause is remanded for a new trial.

Bill of Exchange.—A bill or security originally introduced for enabling a merchant in one country to remit money to a correspondent in the other. It is an open letter of request from one man to another, desiring him to pay to a third party a specified sum and put it to the account of the first.

Bill of Health.—A certificate given to the master of a ship clearing out of a port in which contagious disease is epidemic, or is suspected to be so, certifying to the state of health of the crew and passengers on board.

Bill of Indictment.—A written accusation made against one or more persons having committed a specified crime or misdemeanor. It is preferred to and presented on oath by a grand jury. If the grand jury finds the allegations unproved, they ignore the bill, giving as their verdict, "Not a true bill"; if, on the contrary, they consider the indictment proved, their verdict is a "True bill."

Bill of Lading.—A document by which the master of a ship acknowledges to have received on board his vessel, in good order and condition (or the reverse), certain specified goods consigned to him by some particular shipper, and binds himself to deliver them in similar condition,—unless the dangers of the sea, fire or enemies prevent him,—to the assignees of the shipper at the point of destination, on their paying him the stipulated freight.

The bill of lading should contain the name of the shipper or consignor; the name of the consignee; the name of the vessel and her master; the places of shipment and destination; the price of the freight, and in the margin, the marks and numbers of the things shipped. It is usually made in three or more original parts, one of which is sent to the consignee with the goods, one or more others are sent to him by different conveyances, one is retained by the merchant or shipper, and one should be retained by the master. It is assignable by endorsement, and the assignee is entitled to the goods, subject to the shipper's right of stoppage in transitu in some cases, and to various liens. It is considered to partake of the character of a written contract, and also that of a receipt. In so far as it admits the character, quality or condition of the goods at the time they were received by the carrier, it is a mere receipt, and the carrier may explain or contradict it by parol; but as respects the contract to carry and deliver, it is a contract and must be construed according to its terms. 3 N. Y. 322; 6 Mass. 422. Under the Admiralty Law of the United States, contracts of affrayment entered into with the master in good faith and within the apparent scope of his authority as master bind the vessel to the merchandise for the performance of such contracts in respect to the property shipped on board, irrespective of the ownership of the vessel, and whether the master be the agent of the general or special owner; but bills of lading for property not shipped, and designed to be instruments of fraud, create no lien on the interest of the gen-
eral owner, although the special owner was the perpetrator of the fraud. Under a bill of lading in the ordinary form, having no stipulation that the goods shipped are to be carried on deck, there is a contract implied that the goods shall be carried under the deck, and parol evidence to the contrary will not be received. 14 Wend. 26. But evidence of a well-known and long-established usage is admissible, and will justify the carriage of goods in that manner.

Bill of Rights.—A bill which gave legal validity to the claim of rights, that is, the declaration presented by the Lords and Commons to the Prince and Princess of Orange on 13 Feb. 1688, and afterward enacted in Parliament when they became king and queen. It declared it illegal, without the sanction of Parliament, to suspend or dispense with laws, to erect commission courts, to levy money for the use of the Crown on pretense of prerogative, and to raise and maintain a standing army in the time of peace. It also declared that subjects have a right to petition the king, and, if Protestants, to carry arms for defense; also that members of Parliament ought to be freely elected, and their proceedings ought not to be impeached or questioned in any place out of Parliament. It further enacted that excessive bail ought not to be required, or excessive fines imposed, or unusual punishment inflicted; that juries should be chosen without partiality; that all grants and promises of fines or forfeitures before conviction are illegal; and, that, for redress of grievances and preserving of the laws, Parliament ought to be held frequently. Finally it provided for the settlement of the Crown. In the United States, a bill of rights, or, as it is more commonly termed in this country, a declaration of rights, is prefixed to the Constitutions of most of the States. See United States—State Constitutions of the.

Bill of Sale.—A deed of writing, under seal, designed to furnish evidence of the sale of personal property. It is necessary to have such an instrument when the sale of property is not to be immediately followed by its transference to the purchaser. It is used in the transfer of property in ships, in that of stock in trade, or the goodwill of a business. It is employed also in the sale of furniture, the removal of which from the house would call attention to the embarrassed circumstances of its owner; hence the statistics of the Bills of Sale Act as an index to measure the amount of secret distress existing in times of commercial depression. In not a few cases bills of sale are used to defeat just claims against the nominal or real vendor of the goods transferred.

Bill of Sight.—A form of entry at the custom-house by which one can land for inspection, in the presence of the officers, such goods as he has not had the opportunity of previously examining, and which, consequently, he cannot accurately describe.

BILLAUD-VARENNE, bê-vô-vâ-ren, Jacques-Nicolas, French revolutionist; b. Rochelle, 23 April 1756; d. Port-au-Prince, Haiti, 3 June 1819. He was bred to the legal profession, and having come in 1785 to Paris, political events soon began to occupy his attention. In 1789 three treaties appeared from his pen, entitled respectively 'Despotisme des ministres de France'; 'Dernier coup porté aux préjugés et à la superstition'; and 'Le Peintre politique.' Another publication, 'Acéphalocratie,' which appeared in 1791, subjected him to a judgment that he was obliged to conceal himself for a time. He emerged from his retreat on the triumph of his party in September 1791, and in 1792 was elected a member of the National Convention. On the trial of the King he voted for execution within 24 hours. He contributed to the overthrow of the Girondists, and was subsequently chosen president of the convention, and member of the Committee of Public Safety, and in that capacity framed the Bulletin des Lois and assisted in organizing the revolutionary government. In 1795, on a reaction having taken place against the ultra party, he was arrested, and along with Collot d'Herbois, banished to Cayenne. On the overthrow of the Directorate he refused the amnesty offered, and when he visited New York but was coldly received and in the same year, on the restoration of Cayenne to France, he was obliged to take refuge at Port-au-Prince, in the island of San Domingo. Here he died in poverty.

BILLAULT, bê-yô, Adam, or Maître Adam, French poet; b. Nevers, 31 Jan. 1602; d. there, 19 May 1662. A carpenter by trade, he wrote rude but original poems, the gaiety of which, together with the contrast they afforded with his occupation, made them very popular at the time. He was a protege of the Duke of Nevers and visited Paris in 1637, where he was feted by the grand monde. He received a pension from Richelieu. Displeased with Parisian life he returned to Nevers, where he followed his trade and continued to write verses. A voltaire called him "Virgil with the Plane." The first collections of his poems were entitled 'The Pegs'; 'The Centre-Bit'; and 'The Plane.' His 'Œuvres choisies' were published at Paris (1806) and his 'Poésies' (Nevers 1842). Consult Laporte, 'Histoire littéraire' (Paris, 1844).

BILLERGIA, a genus of about 40 species of evergreen epiphytes of the family Bromeliaceae, natives of tropical America and often cultivated in greenhouses for their showy flowers.

BILLE, bêle, Steen Andersen, Danish naval officer; b. Copenhagen, 5 Dec. 1797; d. Copenhagen 17 May 1883. He served in the French navy from 1820 to 1825 and took part in the expedition to Spain. For five years he was professor of French at the naval school, Copenhagen. He was a member of the expedition that went to South America in 1840, and had command of a schooner which rounded the world in the corvette Galatea, 1845-47. In his 'Beretning om Corvetten Galathias' (1845-46 og 47) (1849-51) he has given an account of this expedition. In 1852-54 he was Minister of Marine and again in 1860-63. In 1864 he was made vice-admiral and retired in 1868. He was sent to conclude a treaty with China and has left a description of the voyage in 'Min Reise til China' (Copenhagen 1865). Consult Bille, Martha, 'Steen Andersen Bille' (Copenhagen 1885).

BILLET, bê-lé, Félix, French physicist; b. Fismes, Marne, 1808; d. 26 Jan. 1882. From 1845 he was professor of physics at the Univer-
BILLET — BILLIARDS

sity of Dijon; in 1873 he became dean of the faculty. The apparatus known as the "Bilin
tilles de Billet" was named from him. He has writ
ten numerous important works, among
which are "Sur les changements de volume des
 corps par le passage de l'état solide à l'état
liquide" (1845); "Condensation électriques de
deuxième et de troisième espèce" (1851); "Traité
d'optique physique" (2 vols., 1859); "Mémoire
sur les demi-lentilles d'interférences" (1862).

BILLET, the term given to a molding
frequently introduced in mediæval architec
ture, consisting of a torus ornamented by alternate
checkers, like a staff cut into short lengths and
disposed horizontally or around a molding, and
of another molding, composed of a series of
small projections, arranged around a curve in
alternate directions, but in a consecutive
manner.

BILLETING OF SOLDIERS, the com
pulsory lodging of soldiers with the inhabitants
of a town, formerly a frequent practice when
ever there was a deficiency of accommodation in
barracks or regular quarters. The billeting of
soldiers on private householders is now
scarcely known generally, and billeting is reduced
as much as possible by camping out and other
arrangements. In the United States the practice
is regulated by the third constitutional amend
ment. In England it is confined to troops on
the march and individual soldiers on special
duty. Innkeepers or others, on whom troops are
billeted, are paid according to a scale fixed by
the government.

BILLFISH, any of several fishes having
notably long, beak-like snouts, as a gar, needle
fish, or spear-fish (q.v.).

BILLIARDS, the generic name of a group
of games; is played in the United States usually
on a 5x10 table, fitted on each side and at the
ends with rubber acting as cushions. Ivory
balls driven by a wooden cue and varying in
size from 2 5-16 inches to 2 7-16 inches are
generally used. The bed of the table is slate,
from 15 3/4 to 21 3/2 feet long, an inch and a
quarter thick, and covered, as is also the rubber, with green cloth.
The body of the table and legs, and the rails,
are made from various designs of wood.

The origin of the game of billiards is shrouded
in mystery, and is known to have been played in
a crude way since before the birth of Christ. It
is mentioned in Shakespeare's 'Antony and
Cleopatra' (1607), and it is now generally agreed
that the immortal bard, in his researches for facts,
had read of billiards before the birth of
our Saviour. Cathire More, a sub-king of Ire
land, as early as 148 A.D., speaks of billiards and
billiard balls of brass. In the 'Confessions'
of Saint Augustine (b. 340 A.D.) mention is
made of the game of billiards. From this time
until the end of the 14th century very little is
known of the game. It is mentioned in
Spencer's 'Mother Hubbard Tales' (1591).
About this time the French made it an indoor
table game by playing it on a square table
with pockets at each corner, and one in the centre
of each side, a little in the middle of the table
called the "king," and an arch of ivory, known as
the "port." Certain scores depended on pass
ing the "port" and touching the "king." As
early as 1734, as stated in Seymour's 'Court
Gamester' these features of the game had dis
appeared, and cues had begun to replace the
"mast" or "mace" first used. Billiards came
into fashion in the time of Louis XIV, whose
physicians recommended him this kind of exer
cise after eating. Some profess to believe the
game of English origin as the earliest and full
first description of billiards is found in Cotton's
'Complete Gamester' (1674). The bed of the
table was then made of oak, sometimes marble.
Slate beds were first used about 1827. The
pockets of the tables at that time, called "haz
ards," were at first made of wooden boxes, nets
being employed soon afterward.

The billiard table is said to have found its
way into America through the Spaniards about
1570. At this time it was played in England,
France, Germany and other countries, but the
size of the table and style of the game differed.
The English style of table and game was first
adopted by the Americans. Six by twelve, six
pocket tables and four balls (two reds and two
whites) were used. Soon the tables were re
duced in size from 6x12 to 5 1/2x11, then to about
4 feet wide by 10 feet long. Table and pocket
measurements. All match and tournament games
are now played on 5x10 tables, and are very
popular in all leading public rooms and clubs
throughout the United States, while the so
called 4x10 tables are almost exclusively used
in private residences and in small cities and
towns.

It is only in the last 50 years that billiard
tables and their paraphernalia, and billiard play
ning itself, have made giant strides. Until the
year 1855, when Michael Phelan, the father of
billiards, first introduced the celebrated com
bination cushions, made of rubber chiefly, the
tools were necessarily crude and imperfect, and
greatly retarded the progress of the players up
to that period. Then was played the four-ball
game on a 6x12, six-pocket table. Two red balls
and two white balls were used. In the 'sixties
the tables were reduced in size to 5x10x11, but
so fast did the professionals and amateurs im
prove their games under the improved condi
tion of the table and cushions, that the se
eming monotony of long runs, it was found
necessary to again reduce the size of the table,
from pockets to carom, to about 5 feet wide
and 10 feet long, and change the style of game
from four-ball to three-ball game. This was
done early in the 'seventies. Experts soon be
came so proficient at this style of game as to
render it necessary to place restrictions on the
bed of the table by drawing lines first 8 inches,
them 10, 12, 14, and finally 18 inches from the
edge of the cushions the entire length and width
of the table — called balk-line game. This
method of restricting the professionals and lead
ing amateurs in no wise does away with the
beauties of the game, at the Massé, draw, fol
low, and combination cushion shots are left in
tact. The superb play of the professionals in this
country and in France, where the same style
of game is played, is due in a great measure to
the improved construction of the beveled table,
slabs, match rubber cushions, and to the ivory
balls, cue, cue tips and chalk.

Various are the styles of billiards played
now, such as "three-cushion carroms," "cushion
carroms," "champions' game," "balk-line game,"
and the regular three-ball game.

Pool may be said to be, broadly speaking,
a branch of billiards, and is very popular with the masses. It lacks the skill and variety of billiards. Pool is played on a 5x10 or a 4x8x9, six-pocket table, and generally with gully attachments—a new device that rather adds to the popularity of the game. The gully is so placed under the table that all the balls, when pocketed, will drop into a basket at the foot of the table. The most popular of the various pool games is "continuous pool," played with 15 numbered balls and one plain white one—the cue ball. These 15 balls are arranged in a triangle form at the foot of the table. The player's object is to drive as many of the numbered balls successively into one or other of the pockets as he can, subject to certain rules and regulations. There are various other kinds of pool games—"American," "pyramid," "Chicago," "forty-one," and others. For a complete list of these various styles of games, also all styles of billiards, with the rules governing them, the reader is referred to the "Handbook of Standard Rules of Billiards and Pool." This handbook also gives valuable hints on the care of tables, balls, cues, etc.

One of the most important parts that go to make billiard playing complete is the cue and cue-tip. The size and weight of the cue is a matter of individual judgment, but nearly all professionals and the best amateurs prefer one that weighs from 19 to 22 ounces, with the tip of the cue about a half inch full in diameter. The cue-tip is one of the leading, if not the leading, factor in billiard playing. Many public and private games are lost because of the imperfect quality of the cue-tip, and many players are wont to ascribe their defeat or bad play to the tip itself. Much depends on the manner of tipping the cue. Cue-tips are made in France and are of comparatively recent origin. They consist of two qualities of leather united, the under leather being very hard and flat, while the upper or top leather is somewhat porous, spongy, and springy. Selecting a good leather and the tipping of billiard cues is an art in itself, and has become so important an adjunct to the success of the business that the leading billiard halls in this country find it necessary to employ a man to exclusively attend to that branch of the business. For instance, it is necessary to hammer a tip down to the requisite firmness before it is ready to be glued to the top of the cue, over which the tip generally projects. If the tip is not of a good quality, the glue is good, the tip may be finished off ready for use. Turn the cue bottom side up, firmly press the leather onto a table, then using a sharp knife, cut the leather even with the top of the tip itself, and pare the upper leather as one would an apple, finish with sandpaper, size about 1 ½, and smooth off with single O sandpaper. A cue-tip, when ready for playing, should be about half-moon shape, but many and various are the shapes of tips. Never use sandpaper on a cue-tip after it has been played with for a while, as sandpaper leaves a scuff in the tip, which makes it hard to VR from frequent use of chalk, roll it lightly with a French file.

Billiards is without doubt far superior in point of skill and science to any game played, either indoors or outdoors. Chess and checkers are purely mental and yield no exercise to the body. Golf and other out-door games are dependent chiefly on execution, whereas billiard playing requires and combines both knowledge and execution. As a health-giving exercise and recreation, restful to the mind, physicians are now agreed that billiards leads all other games, while divines, politicians, artists, men of letters and women recommend it and play it at home, in the clubs and public rooms. It is steadily gaining in popularity among merchants, bankers, and other business men to the turmoil of a busy life. No residence is thought complete without a billiard table.

Bibliography.—Thatcher, 'Championship Billiards, Old and New' (1898); Daly and Harris, 'Daly's Billiard Book' (1913), and for the English game, Ritchie, 'Useful Strokes for Billiard Players' (1910).

GEORGE F. SLOSSON,
American Billiard Expert.

BILLINGS, Frank, American physician: b. Highland, Wis., April 1854. He was graduated M.D. at Northwestern University Medical School 1881; honorary M.S. ibid. 1891; was interne at Cook County Hospital 1881-82; and studied in Vienna 1885-86; was appointed professor of medicine at Northwestern University 1888; professor of medicine and dean of faculty of Rush Medical College 1898; professor of medicine University of Chicago 1905; president American Medical Association 1902-04; president American Association of Physicians 1907; president National Association for the Study and Prevention of Tuberculosis 1908; Shattuck lecturer, Boston 1902; Doctor of Science, Harvard University 1915; Lane Medical Lecturer, San Francisco 1915. He became editor of the 'Year Book of General Medicine' in 1901.

BILLINGS, John Shaw, American surgeon and librarian: b. Switzerland County, Ind., 12 April 1839; d. 1913. He was graduated at Miami University in 1857, and at the Ohio Medical College, 1860; was a demonstrator of anatomy in the last institution, 1860-61; entered the Union army as an assistant surgeon, 1861; was promoted to lieutenant-colonel and deputy surgeon-general, 6 June 1864; and was retired Oct 26, 1866. Billings became curator of the Army Medical Museum and Library and made the latter the third and one of the most valuable medical libraries in the world. The 'Index Catalogue' of the library in 16 quarto volumes, which he prepared, is among the foremost of its kind. He was professor of hygiene in the University of Pennsylvania, 1893-96; and in the last year was appointed director of the New York Public Library (Astor, Lenox and Tilden Foundations). After the close of the war Dr. Billings reorganized the United States Marine Hospital Service; was vice-president of the National Board of Health, 1879-82; and had charge of the compilation of vital and social statistics in the 11th Census. He was a member of a large number of medical, scientific, and society societies, and his numerous publications include 'Principles of Ventilation and Heating' (1884); 'Index Catalogue of the Library of the Surgeon-General's Office, United States Army'; 'National Medical Dictionary' (2 vols., 1889); 'Description of the Johns Hop-
BILLINGS — BILLOT

kms Hospital’ (1890); ‘Social Statistics of Cities’ (1891, for the 11th Census); ‘Social Library Problems of Tomorrow’ (1902); ‘Physiological Aspects of the Liquor Problem’ (1903).

BILLINGS, Josh. See Shaw, Henry W.

BILLINGS, Robert William, English architect and author: b. 1813; d. 1874. He was a pupil of John Britton, and illustrated such important works as ‘The History and Description of St. Paul’s Cathedral’ (1837); and ‘The Churches of London’ (1839); and made notable additions to the literature of architecture in ‘Illustrations of Architecture and Antiquities of the County of Durham’ (1846); and ‘Baronial and Ecclesiastical Antiquities of Scotland’ (4 vols., 1845–52). He was employed in the restoration of many important old buildings in Scotland and England, including the chapel of Edinburgh Castle, Douglas Room, Stirling Castle, Gosford House, and Crosby-upon-Eden Church, Cumberland.

BILLINGS, William, American composer: b. Boston, 7 Oct. 1746; d. there, 26 Sept. 1800. He published no less than six collections of tunes, which, with a few exceptions, were of his own composition. They were founded upon the new style of church music, then first introduced by English composers, and their contrast to the dismal old tunes previously in use naturally gave them immense popularity. Yet they were far from being perfect in the requisites of good melody and harmony, and their author, in a quaintly worded preface to his second work, entitled ‘The Singing Master’s Assistant’ and commonly known as ‘Billings’ Best,’ apologizes for the errors which his first collection contains. Billings was a civic patriot, and an intimate friend of Samuel Adams, who frequently sat with him at church in the singing-choir. Many of his tunes, composed during the war of independence, breathe the true spirit of patriotism, and were sung and played wherever New England troops were stationed. Billings may fairly claim the title of the first American composer, for before his time there is no record of any musical composition by a native of this country. He is also known as ‘the father of New England psalmody.’

BILLINGS, Mont., city and county-seat of Yellowstone County, on the Yellowstone River and the Northern Pacific, the Great Northern and the Burlington and Missouri River railroads, 238 miles east of Helena. The city is a very important wool exporting market, being in the centre of an extensive sheep-raising region. Its industrial establishments include machine shops, a beet sugar factory, flour and lumber mills and extensive brick yards. Coal, marble and limestone are found in the neighborhood. Pop. (1910) 10,031.

BILLINGSGATE, the proper name (presumably, though not quite certainly, from a personal name Billing) of one of the gates of London, 

BILTON, or BLITONG, East Indies, an island belonging to Holland, lying between Banca and the southwest of Borneo, of an irregular sub-quadrangular form, about 40 miles across; area, 1,863 square miles. There are large deposits of tin and other minerals. It is divided administratively into five districts, under the governor-general of the east coast of Sumatra. There are many Chinese among the population but few Europeans. Coral is the island. Padang is the capital. Pop. (1912) 58,480.

BILLON, an alloy of copper and silver, in which the former predominates, formerly used in Austria and Germany for coins of low value, the object being to avoid the bulkiness of pure copper coin.

BILLOT, bē′lō, Jean Baptiste, French soldier: b. Chaumel, Corrèze, 15 Aug. 1825; d. 31 May 1907. Graduating from Saint-Cyr Military Academy, he entered the army, becoming a colonel in 1870. He was with the French army of invasion in Mexico and later served in Algeria. On the outbreak of the Franco-Prussian War he was commanding general of the 2d Army Corps, on the Rhine, and was one of the defenders of Metz. Later, while commanding the 18th Army Corps, he participated in the fighting at Bazeau la Rolandé and Villers-sexel, where the French gained one of their few victories during the war. During all of 1882 and part of 1883 he was Minister of War in the Cabinet of Freycinet, and again under Meline from 1896 to 1898.
BILLROTH, bill'rot, Theodor, German surgeon: b. Bergen, on the island of Rügen, 26 April 1829; d. 6 Feb. 1894. He was educated at Greifswald, Göttingen, Berlin and Vienna; was assistant to Langenbeck at Berlin and became professor of surgery at the University of Zürich in 1860, and at Vienna in 1867; in the war of 1870-71, he worked in German hospitals on the Rhine. He was one of the foremost surgeons of the day, not only as an operator, but as an authority on microscopic work, pathology and military surgery. He made many valuable contributions to medical literature, including 'Die allgemeine chirurgische Pathologie und Therapie,' translated into all European languages and into Japanese (1863; 16th ed., 1906); 'Chirurgische Briefe aus den Kriegslazaretten in Weissenburg und Mannheim' (1872); 'Über den Transport der im Felde Verwundeten und Kranken' (1874); 'Die Krankenpflege im Haus und im Hospital' (6th ed., 1899). Billroth was a good amateur musician and after his death appeared his 'Wer ist Moses Bach?' (3rd ed., 1898).

BILLS, Course of. Public bills are those which affect the interests of the people at large and private bills are those which affect the interests of a person or persons whether they be private individuals or corporations (see Bills, Private). The term "bill" is applied to a passed law until it has passed through all its legislative stages and has been signed by the proper official, when it becomes an act or statute (see Acts of Congress). In the United States, even after they have become law, some bills are so known by the name of the member or members of the legislative body introducing them, as the McKinley Bill, or the Gorman-Wilson Bill, though the words bill, act and law are used interchangeably in designating them. The British government provides that the preparation of all public bills must be supervised by an expert, the clerk of the House of Commons, and even private bills must pass his scrutiny before introduction. In the United States House of Representatives, however, there is no check on the right of an individual member to introduce a bill on any conceivable subject upon any legislative day, and since the form and scope of the bill are determined by its introducer, there is much laxity and variation in the methods pursued in the preparation of bills.

In the House, private bills are left in the clerk's box while public bills are left on the speaker's table; in the Senate, after a member is recognized he asks permission to introduce a bill, but unless the other members give unanimous consent (which, however, is seldom refused) he must wait the customary period of one day. After bills have been introduced they are referred to the committees having jurisdiction, and are then printed; when the committee reports they are placed upon the calendar in the order in which they are reported. The Senate has a single calendar and consideration is given to bills in order, but the House has three calendars, the private calendar, the Union calendar for money bills, and the House calendar for other public bills. Hence consideration is not given to bills in the order in which they are reported but they are brought up either at the instance of the committee reporting them, or by unanimous consent, or by suspending the rules, or by adopting a special rule reported by the committee on rules. While three readings of a bill are required and the rule is followed technically, the committee system has divested the rule of much of its significance. At the first and second readings in the Senate take place before a bill is referred to the proper committee, but in the House a bill is first read by title and then in full when taken up from the calendar for consideration. After finishing discussion of a bill on its second reading and disposing of suggested amendments, the final stage (if no objection be made) is entered upon, consisting of three operations, though only one vote is taken: the order for engrossment, the third reading and final passage. When reading for the third time it is customary to read by title only, though if a question be raised it must be of the entire engrossed bill; upon final passage the bill is engrossed, now by printing. After this has been done it is signed by the clerk or secretary and forwarded in which it pursues the course of a bill originating therein. If it be passed by the second house without amendment, it is returned to the first house for enrolment on parchment, is next signed by the speaker of the House and the president of the Senate (upon report by the committee on enrolled bills that it has actually been enrolled) and then presented by this committee to the President for his signature or rejection by veto. But if the bill be amended by the second house it must again be considered by the first house, either to accept the amendments (in which case the bill is enrolled) or to reject them and request the other house to appoint a conference committee. In this case the other house either eliminates its amendments or insists and appoints such committee. After conferring, the committees report simultaneously to their respective houses and if the report be adopted by both the bill is enrolled as above. When bills have been signed by the President (but see Veto) they are filed in the State Department, and the house in which the bill originated is notified of the signature which fact is recorded in its journal.

In the main the State legislatures follow the proceedings of Congress but there are many minor variations. Some State Constitutions provide that no bill shall receive consideration for passage unless previously referred to and reported by a committee. Several States prohibit the introduction of bills after a certain period of time has elapsed or within a certain number of days prior to the termination of the session; and two States forbid the passage of bills on the last day or two. The majority of the States require that a bill be read three times, usually in full on separate days, though this requirement may be overruled by unanimous consent or a special message from the governor. If the legislature fail to conform to the rules strictly, there is no outside power that can compel such observance. Consult Cushing, L. A., and L. H. (Private Practice of Legislative Assemblies) (1907); Hinds, A. C., 'Rules of the House of Representatives' (1909); Reinsch, P. S., 'American Legislatures and Legislative Methods' (1907).
BILLS, Private. A private bill is distinguished from a public bill in that it affects only a particular person or place, whereas the latter affects all persons in the State or all persons in a class. Private bills are usually designed to benefit some particular person, corporation or place, and the proceedings with reference to them are not only legislative but to a certain extent, judicial. Among private bills are those to incorporate gas, water, railway and other companies; to incorporate cities or towns or to increase their powers; to naturalize particular individuals or to change their names; to grant pensions to particular persons; to settle private claims; divorce bills; etc. A private bill must not be confused with a private member's bill in the British Parliament, the latter being a bill which is introduced by a private member of Parliament as distinguished from a member of the government. In England private bills are initiated by "petition" and may be introduced only if they have been advertised publicly for three months prior to the assembling of Parliament. Being regarded as a privilege, fees are required to be paid by the promoters of such bills at the various stages of their passage. They are required to be deposited before 31 December in the "private bill office" where they may be subjected to public inspection and the inspection of two examiners appointed to ascertain if they have followed the prescribed preliminaries. A committee is then appointed to hear the arguments on their merits and reports to the House, where they are either passed or rejected. See Great Britain—Parliament.

In the United States House of Representatives there is a separate private bill calendar but the legislative stages through which private and public bills must pass do not differ in any essential particular. However, the House of Representatives does sit aside Friday of each week for the consideration of private bills, such as pension bills, relief measures, claims against the government, etc., though by a majority vote this day may be devoted to other business. Some States observe the English distinction between public and private bills, using a different procedure in their passage. Pennsylvania and some other States require at least 30 days notice of the intention to introduce such a bill, which notice must be published in the locality in which the thing to be affected is situated. Massachusetts requires a petition and notice by advertisement or otherwise to all parties affected or interested before a private local bill can be introduced and considered. Consult Bryce, James, 'The American Commonwealth' (4th ed., 1910); Clifford, W. K., 'History of Private Bill Legislation' (1885); Cushing, L. S., 'Law and Practice of Legislative Assemblies' (1907); Forrest, J., 'House of Representatives' (1907-08), and 'Rules of the House of Representatives' (1909); Ilbert, Sir C., 'The Mechanics of Law Making' (1914); Reinsch, P. S., 'American Legislatures and Legislative Methods' (1907).

BILLY-BOY, a flat-bottomed, bluff-bowed vessel rigged as a sloop, with a mast that can be lowered so as to admit of passing under bridges. They generally belong to the Humber ports.

BILNEY, Thomas, "Little Bilney," English martyr: b. probably at Norwich, about 1495; d. Norwich, 19 Aug. 1531. He studied at Trinity Hall, Cambridge, and was ordained in 1519. He was opposed to the formal "good works" of the Schoolmen and denounced saint- and relic-worship; and to these plain Protestant views he converted Hugh Latimer and other young Cambridge men. In 1527 he was arraigned before Wolsey and, on recanting, absolved, but was confined in the Tower for over a year. Stung by remorse, after two years of suffering, he began to preach in the fields of Norfolk, but was soon apprehended and condemned; and although reconciled once more to the Church, he had to suffer the penalty of a relapsed heretic and was burned to death.

BILOXI, bil-o克斯, Miss., a city in Harrison County, on Biloxi Bay, opening into the Gulf of Mexico, and the Louisville & Nashville Railroad, 80 miles northeast of New Orleans. It is principally engaged in the canning of oysters, fish, fruit and vegetables and has also considerable manufacturing and shipping interests. The waterworks are the property of the municipality. Biloxi is near the site of the first settlement made upon the Mississippi by white men, under the direction of Pierre Le Moyne d'Iberville, in 1699. In 1701 this settlement (now Old Biloxi) was abandoned after a destructive fire and in 1712 a permanent settlement was made on the present site across the river. It was long the capital of the French territory in that part of America, was incorporated in 1872 and chartered as a city in 1896. It is governed by a mayor and council. The modern town is a popular resort, has a fine beach, paved streets and beautiful surroundings. Consult French, 'Historical Collections of Louisiana' (New York 1846-50). Pop. 8,049.

BILOXI INDIANS, one of the groups of tribes into which the Siouan stock of North American Indians is divided. In 1669 they had one village on Biloxi Bay near the Gulf of Mexico. Thirty years later another village, Biloxi, Paskagula and Mootobi. Probably early in the 18th century they removed to the present site. It was long the capital of the French territory. It was long assumed that they were related to the Choctaws but Gatsche's researches have shown that their language is a dialect of the Siouan stock. He discovered a few survivors of the group near Lecompte, Rapides Parish, La., who still spoke their language. Consult Darsey and Swanton, 'Dictionary of the Biloxi Language' (Washington 1912), and Swanton, J. R., 'Bulletin 43, Bureau of American Ethnology.'

BILSON, Thomas, English divine: b. Winchester 1547; d. 18 June 1616. He was educated at Winchester School, and after completing his studies at New College, Oxford, became successively warden of the school and prebendary of the cathedral of Winchester. In 1569 he published a work, entitled 'The True Difference Between Christian Submission and Anti-Christian Rebellion,' intended mainly to defend the government and policy of Elizabeth; it was swiftly perceived by Nonconformists that Bilson "gave strange liberty in many cases, for subjects to cast off their obedience." Histori-
cally, this work, while accomplishing its object in Elizabeth's day, contributed to the ruin and death of Charles I. In 1593 another work, entitled 'The Perpetual Government of Christ's Church,' is still considered one of the ablest defenses of episcopacy. In 1596 he was made bishop of Worcester, and was transferred in the following year to Winchester. In 1603 Bils
don preached the coronation sermon before James I, and in 1604 he took a prominent part in the celebrated conference at Hampton Court. The translation of the Bible, executed during the reign of James, was partly submitted to his revision. He was buried in Westminster Abbey.

BILSTED. See LONDON.

BILSTON, England, town in Staffordshire, three miles southeast from Wolverhampton. It is a part of the parliamentary borough of Wolverhampton. It has extensive coal and iron mines; the other chief industries consist of iron and steel foundries, manufactories of tin-plate goods, enamelled wares, nails, wire and pottery. The waterworks are municipal property. Nearby is found a fine grade of sand much used for metal casting. Pop. 25,681.

BIMETALLISM. A monetary system wherein gold and silver are both used as standard money and coined without limit at a fixed ratio imposed by legislation. Bimetallism proper implies, first, that the money unit shall be represented in two metals; second, that these metals shall enjoy equal and unlimited coinage privileges; third, that they shall be equalized by law in a fixed and definite ratio; and fourth, that the coins made from either of them shall be a full legal tender.

The term "limping bimetallism" has been applied to systems wherein gold and silver were both recognized as standard money, but in which one of the metals was not coined at all, or not coined on equal terms with the other. The term "free coinage" has sometimes been used to mean unlimited coinage and sometimes to mean gratuitous coinage. Unlimited coinage is necessary to a complete bimetallic system. When coinage is limited the volume of standard money is to that extent regulated by law; when unlimited the volume depends, first, upon the total accumulation of coin, and, second, upon the annual production of the money metals. This sum is further augmented by the coinage of gold and silver plate when money becomes scarce, or lessened by an increased demand for gold and silver in the arts when money becomes plentiful.

Bimetallism does not rest upon any natural particular ratio; the coinage ratio is arbitrarily fixed by law, and varies, changed by law. The ratio states the proportion existing between the silver dollar and the gold dollar when measured by weight—that is, at the ratio of 16 to 1, the silver dollar weighs 16 times as much as the gold dollar. While the legal and commercial ratios between the metals have fluctuated from time to time the commercial ratio has, as a rule, followed the legal ratio, and from the begin
ing of history down to 1873 the fluctuations in the commercial ratio were never as sudden or as great as they have been since 1873. During the 400 years which elapsed between 1473 and 1873 the extreme variation in the commercial ratio was from 14 to 1 to 16 to 1, although during that period there were greater changes in the relative production of the metals than have occurred since. For instance, between 1800 and 1840 the world's production of silver was about 4 to 1 in value, compared with the production of gold; after the new discoveries of gold in 1849 the production of that metal so increased that soon more than 3 to 1 in value, compared with the output of silver, and yet during this tremendous change in relative production the commercial ratio was comparatively stable, owing to the fact that all the gold and all the silver could go through the mints into the world's currency.

The ratio of 16 to 1 was advocated by American bimetallists, first, because it was the ratio existing between the silver and gold coins in circulation in the United States; and, second, because an increase in the ratio, made by in
creasing the size of the silver dollar, would to the extent that it was joined in by other nations require the recoinage of silver coins into larger coins, and thus reduce the world's volume of standard money. If, for instance, it were changed to 32 to 1 by international agreement, and the silver money of the world, approximating $4,000,000,000, were recoined into $2,000,000,000, it would cause a shrinkage of about 25 per cent in the total volume of metallic money and, as contracts would still call for the same number of dollars, such a change in the ratio would transfer billions of dollars in value from the wealth producers to the holders of fixed investments.

Bimetallism, therefore, relates to the legal status of the metals rather than to their com
mercial value, and does not necessarily imply the simultaneous or concurrent circulation of both metals.

The Gresham law has often been quoted against bimetallism. That law is a statement, made by a master of the English mint of that name, who announced as his observation that the worn, light-weight coins ran the full-weight coins out of the country—the explanation being that while, to a majority of the people, one coin was as good as another so long as it would pass current, the jewelers would melt and the dealers in money would collect and export the heaviest coins (coins passing by weight rather than by legal tender value outside of their own country). It can readily be seen that the Gresham law can apply not only to the use of two metals when there is difference between government ratios, but also when the commodity values of the two metals differ. When, for instance, we had a ratio of 15 to 1 in this country and the French ratio was 15½ to 1, there was a tendency to send American gold to France and bring French silver to the United States, and yet this tendency did not cause the exportation of all American gold to France or of all French silver to the United States. France, being at that time the stronger nation commercially, fixed the ratio and our gold rose to a premium. In the payment of debts silver was the money employed, and gold, when it was used, was used at its commodity price, which was long below the legal tender value. After 1834 the situation was reversed and silver went to a premium. Gold was then used for the payment of debts and for general transac-
tions, and silver, when it was used, brought a premium. When the ratio was 15 to 1 in this country gold went to a premium of about 3 per cent, because the French ratio was 15½ to 1: when our ratio was changed to 16 to 1 silver rose to a premium of about 3 per cent.

In bimetallism the debtor always has the option. This is true, not because of a desire on the part of the government to favor the debtor, but because the parity can be maintained in no other way. The fact is, the demand for silver is so steady that metal which is the cheaper will, in itself, by increasing the demand for the cheaper metal, tend to equalize the commercial value of the metals with the legal value.

Bimetallism has been declared to be theoretically better than monometallism (either of gold or silver), because under the double or bimetallic standard the volume of money changes less rapidly and less suddenly than under the single standard. As a rule the increase in the production of one metal has spread itself over the entire volume of money and has, therefore, caused a less proportionate increase than it would have caused had the world been using but one metal, either gold or silver, as standard money.

The practical argument advanced in favor of bimetallism is that neither metal alone furnishes a sufficient quantity of money to support the world’s commerce. This phase of the question was not much considered until after 1873 because, prior to that date, there were sufficient mints open to the coinage of both metals to furnish a monetary use for every ounce produced. When all of the gold and silver available for coinage could go through the mints into the currency, each nation could consider the question from a purely theoretical standpoint, because so long as the commercial world had the benefit of the entire volume of gold and silver, it did not make so much difference how many nations used one metal, or the other, or both. When, however, the world standard for money systems came into favor and enough nations joined in it to reduce the demand for silver below the supply available for coinage, then each nation was compelled to consider not only the replacement of silver but something else — and it was a vital question — it was always sure of having a sufficient quantity of the chosen metal.

The advocates of bimetallism contended not only that the law of supply and demand regulates the value of the dollar — an increase in the demand, the supply remaining the same, raising the purchasing power of the dollar, and an increase in the supply, the demand remaining the same, decreasing the purchasing power of the dollar, but they also asserted that supply and demand regulate the market price of the metals.

The contention of monometallists that it is impossible to fix a relation between two metals was met with the reply that the relation between two things of limited production, such as gold and silver, can be fixed by any nation or group of nations which can furnish an use for so much of both metals as is available for coinage.

The demand created by the government must be considered as added to the demand created by the arts. If the demand created by the government is sufficient to utilize the surplus over and above what the arts require, the commercial value can be kept up to the coinage value for the reason that each owner will seek the highest possible price, and so long as the government stands ready to convert a given amount of metal into a given amount of money, he will not have to dispose of the metal to any one else for less than the government price. If the government, instead of standing ready to convert one metal into money, stands ready to convert two metals into money, it can make the commercial ratio and the coinage ratio identical, if there is a use for the money. The changes in relative production would not affect this condition so long as the government was able to utilize all of the surplus of both metals.

Independent bimetallists and international bimetallists, though agreeing as to the theoretical and practical benefits of the double standard, differed as to the ability of the United States alone to maintain the parity, the former contending, and the latter denying, that under conditions as they then existed the nation was able to utilize all the silver that could come to our mint.

The fear that, under bimetallism, our country would be flooded with the coined silver of the world was declared to be without foundation, for the reason that our ratio, 16 to 1, was more favorable to gold than the ratio existing between gold and silver in the nations that have a large quantity of silver coin. France, for instance, was the largest European holder of silver, but as her silver circulates on a parity with gold at a ratio of 15½ to 1, it could only come here at a loss equivalent to about three cents on the dollar.

Whether the mines would furnish an excessive amount of silver was a question about which no one could speak positively, because no one can foresee new discoveries or estimate the possible exhaustion of mines.

Raising the government price of a precious metal does not necessarily increase the production of it, neither does the lowering of the price necessarily reduce the production. The use of gold and silver as money is the dominating factor in its value. It has been said that, among all the nations, the legal tender function was withdrawn from both gold and silver, and other money substituted for them, both would fall in value, as expressed in the new money, just how much no one knows, because a fall in the price of either of the metals would develop new uses and thus increase the demand, which, in its turn, would react with the supply in determining the ultimate price. The arguments pro and contra as to the desirability of bimetallism as a monetary system belong properly in the article Money.

The United States established the double standard in 1792. France followed in 1803. England adopted the gold standard in 1816 and since then has exerted a controlling influence on other European nations whose coinage, however, remained silver for many years. About 1850, France went over to the gold basis and in 1865 the Latin Union adopted the French standard. In 1867 the international money conference at Paris unanimously accepted the single standard for co-ordinating the currencis of the countries taking part in
that conference. In 1871, after the Franco-German War, Germany established the gold standard and demonetized silver. In 1873 the United States formally adopted the gold standard, but in 1878 initiated a monetary convention at Paris to discuss the question of a return to bimetallism. The proposition was rejected. Again, in 1881, with the cooperation of France, the United States invited the nations to another conference on bimetallism. England and Germany opposed the change and the movement failed. In 1892 the United States made another attempt at Brussels to discuss bimetallism, but without result. In 1893 India closed its mints to the free coinage of silver. The elections in 1900 in the United States finally disposed of the question of a double standard and bimetallism disappeared from political controversy.

Bimetallism in the United States.—The bimetallic standard was recommended by Jefferson and Hamilton and adopted by our government by a statute approved by Washington in 1792. This law provided for the free and unlimited coinage of silver and gold at the ratio of 15 to 1, the coins being equally a legal tender for all debts public and private. The Spanish milled dollar then in use in this country contained the same amount of pure silver as our present silver dollar and, the ratio of 15 to 1 having been adopted, the gold dollar was made to weigh one-fifteenth as much. The silver dollars then coined are sometimes called the “unit dollars,” because they had on the edge the inscription: “Hundred Cents, One Dollar, or Unit.”

In 1834 the ratio was changed from 15 to 1 to 15.998 + 1, which for convenience has been called 16 to 1. The change was made for the purpose of checking the exportation of gold, but as the new ratio undervalued silver it made gold the money in general use. This law provided for the free and unlimited coinage of gold and silver into full legal tender money at the new ratio. In 1837 the alloy in the dollar, both gold and silver, was changed from one-twelfth to one-twentieth, making the weight of the standard silver dollar 412/24 grains, nine-tenths fine, and the weight of the standard gold dollar 25 8-10 grains, nine-tenths fine.

As the law of 1834 undervalued silver and led to the exportation of considerable quantities of it, it became difficult to keep fractional currency in circulation, and to remedy this the law of 1853 was enacted. By the terms of this law subsidiary silver (that is, coins of less denomination than $1), were reduced from full weight to light weight and made token money, with limited legal tender, instead of standard money. This law, however, did not change the provision in regard to the standard silver dollar, the free and unlimited coinage of that dollar still continuing. The subsidiary silver coins were redeemable in the standard money, either gold or silver. Sometimes the Act of 1834 has been referred to as establishing the gold standard, but this is erroneous. It merely changed the ratio and that, too, by reducing the weight of the dearer dollar, not by increasing that of the cheaper dollar. Equally erroneous is the assertion that the Act of 1853 established the gold standard. That did not in the least change the law relating to the standard money, either gold or silver.

On 12 July 1873 the demonetization of silver was effected by an act entitled “An Act Revising and Amending the Laws Relative to the Mints, Assay Offices and Coinage of the United States.” When this law was passed the business of the country was transacted with paper money, both gold and silver being at a premium — silver at a greater premium than gold. In making provision for silver coinage it omitted the coinage of the standard silver dollar and substituted for it a trade dollar of 400 grains which was intended for use in the Orient, it being thought that the trade dollar would compete with the Mexican dollar in China and other Eastern countries. In 1874 the Federal statutes were revised and in this revision a clause was inserted that the legal tender of silver coins to amounts not exceeding $5.

The suspension of silver coinage by the United States alone would not have caused a fall in the price of silver. In 1876 the price of gold reached $42.50 an ounce, but other nations joining in the demonetization of silver it soon became apparent that the mints of the world still open could not utilize all the silver available for coinage, and the gold price of silver began to decline. An effort made to reopen the United States mints to silver resulted in the passage of what was known as the Bland-Allison Act. The bill, as it passed the House, under the leadership of Richard P. Bland, of Missouri, restored the free and unlimited coinage of gold and silver at the ratio of 16 to 1. The opposition in the Senate was sufficient, however, to defeat the bill in its original form, and to compel the acceptance of a substitute framed by Senator Allison, whose name was thus connected with the law. This compromise measure provided that there should be coined at the several mints of the United States silver dollars of the weight of 412½ grains troy of standard silver as provided by the Act of January 1837, and also provided for the issue of silver dollars together with all silver dollars heretofore coined by the United States of like weight and fineness should be a legal tender at their face value for all debts public and private, except where otherwise stipulated in the contract.

In order to secure the bullion out of which to coin the dollars mentioned in the Act of 1878, the law provided that the Secretary of the Treasury is authorized and directed to purchase from time to time, silver bullion, at the market price thereof, not less than $2,000,000 worth per month nor more than $4,000,000 worth, and cause the same to be coined monthly, as fast as so purchased, into such dollars.

The purchase of silver for coinage under this act retarded the fall in the price of silver, but as it did not consume the entire surplus it was not sufficient to restore the price of bullion to the coinage value of $1.29 an ounce. The Bland-Allison Act remained on the statute books until 1890 when it was repealed by what was known as the Sherman Purchase Act, which provided for the purchase of 4,500,000 ounces of silver per month, or so much thereof as might be offered at a price not exceeding the coinage value, the bullion to be
paid for by the issue of treasury notes, redeemable in coin; and after 1 July 1891 only so much of the silver was to be coined as was necessary to redeem the treasury notes presented.

This act immediately increased the demand for silver and the price of silver bullion, not only in the United States, but all over the world, rose to about $1.21 an ounce. But when it was found that even this demand was not sufficient to utilize all the surplus silver, the price again began to fall.

The treasury notes issued in the purchase of silver were made a legal tender for the payment of all debts public and private, except where excluded by contract, and were redeemable by the Secretary of the Treasury "in gold or silver coin at his discretion." It will be seen that the option as to the coin of payment was reserved to the government, but another clause in the measure which declared it to be "the established policy of the United States to maintain the two metals on a parity with each other upon the present legal ratio or such ratio as may be provided by the law," was afterward construed by the Treasury Department to deprive the Secretary of the option.

This ruling of the Treasury Department was followed by the presentation of treasury notes and a demand for gold, and the drain upon gold which followed was used as an argument in favor of the repeal of the purchase clause of the law.

What has sometimes been called "the silver movement" began with the discovery of the effect of the law of 1873, and has continued with varying force ever since.

It might better be designated as the bimetallic movement, because it was an effort to restore bimetallism, and the supporters of the movement asked for silver nothing more than was already granted to gold.

During the period following 1873 three international conferences have been held with a view to the restoration of silver (at Paris in 1878 and in 1881, and at Brussels in 1892), but they have been unsuccessful, largely because other European countries have hesitated to act without England, and England, being largely a creditor nation, has been unwilling to surrender the advantage which a rising dollar has given her in the increased purchasing power of her credits.

In the summer of 1893, the President, giving as his reason the suspension of the coinage of silver in India, called Congress together in extraordinary session and recommended the unconditional repeal of the purchase clause of the Sherman Law. Congressman Wilson, chairman of the Committee of Ways and Means, and leader of the administration forces in the House, introduced a bill identical in purpose and almost repealing the purchase clause of the Sherman Law without substituting any provision for the further coinage of silver. After a prolonged contest this bill became a law in November 1893.

The campaign of 1896 resulted in the election of the Republican ticket by a large majority, and as that party had committed itself to international bimetallism, the verdict at the polls was considered a victory for the double standard rather than for the single gold standard.

In the pursuance of the promise contained in the Republican platform, President McKinley, immediately upon taking his seat, sent a commission to Europe to solicit co-operation in the restoration of silver to its former place by the side of gold, but this commission failed to secure any concessions from England and no formal conference was arranged. See Democratic Party; Republican Party.

BIN, bî′n, Emile Jean Baptiste Philippe, French painter; b. Paris, 10 Feb. 1825; d. 1897. He was a pupil of Gosses and M. Duret, and in 1878 he was made a member of the Legion of Honor, and in 1881 was conspicuous as one of the founders of the Society of French Artists. His "Prometheus Chained" is in the Musée at Marseilles. Among his portraits are those of MM. Clemenceau and others.

BINALONAN, bî'nâ-lo'nân, Philippines, a town of the province of Pangasinán, Luzon, situated in the western part of the island of Luzon, about 20 miles from the coast, at the junction of several highroads. Pop. 10,295.

BINANG, bî'nâng, Philippines, a town of the province of Laguna, Luzon, situated on the Bay Luzon, about 15 miles south of Manila, on highroads connecting it with Cavite, Manila and other important towns. Pop. 16,796.

BINARY LOGARITHMS, a system of logarithms devised by Euler for facilitating musical calculations. Instead of having, like the common system of logarithms, 1 as the logarithm of 10, it had 1 as the logarithm of 2.

BINARY NOTATION, a method of notation invented by Leibnitz, but which appears to have been in use in China about 4,000 years ago. As the term binary implies, there are only two characters in this notation; these are 1 and 0. By it, our 1 is denoted by 1, 2 by 10, 3 by 11, 4 by 100, 5 by 101, 6 by 110, 7 by 111, 8 by 1000, 9 by 1001, 10 by 1010, etc. The principle is that the postposition of 0 multiplies by 2 in place of by 10, as in the common system. Some properties of numbers may be more simply presented on this plan than in the common one; but the number of places of figures required to express a sum of any magnitude is a fatal objection to its use. Indeed, Leibnitz himself did not recommend it for practical adoption.

BINARY STAR. See Double Stars.

BINARY THEORY, in chemistry, a hypothesis proposed by Davy to reduce the haloid salts (as NaCl) and the oxides (as Na2O) to the same type, the monad Cl− being replaced by the monad radical containing oxygen (NO2)−. Acids are hydrogen salts, as HCl, or H(NO2). A radical is only part of a molecule, which can unite with or replace an ele-
ment or another radical, valence for valence. Thus the dyad radical \( \text{SO}_4 \) can replace two monad radicals, \( (\text{NO}_3) \), as in the equation \( \text{Pb}^2\text{SO}_4 + \text{Mg}^2\text{SO}_4 \rightarrow \text{Pb}^2\text{Mg} \cdot 2\text{SO}_4 \). A radical cannot exist in a separate state.

BINBIR-KILISSEH, bë'n-bër-ke-le-sa', some ruins of ancient tombs in the pashalic of Karamania, Asia Minor, 20 miles north-north-west of Karaman, supposed to occupy the site of Lystra, where the cripple was healed by Paul.

BINCBOIS, be' shwa', Gilles, composer of Gallo-Belgic music: b. Bins, Hainaut, 1400; d. Lille 1460. He is supposed to have been a soldier during his earlier years, after which he became a choir singer in the chapel of Philip the Good of Burgundy. Recently some of the manuscripts of his masses have been found, containing some 50 songs in rondelay form with instrumental accompaniment, which have added considerably to a knowledge of the music of that period.

BINDING, Karl, German jurist, criminologist and historian: b. Frankfort-on-the-Main, 4 June 1841. He studied law at Göttingen and Heidelberg and in 1873 was appointed professor of criminal law at the University of Leipzig. During 1898-99 he was rector of that institution. Among his leading works are 'Der Entwurf eines Strafgesetzbuch für den Norddeutschen Bund' (Leipzig 1870); 'Die Normen und ihre Uebertretung' (2 vols., Leipzig 1872-77); 'Die rechtliche stellung des Kaisers im heutigen deutschen Reich' (1898); 'Grundriss des deutschen Strafprozessrechts' (1899, 5th ed., 1905); 'Lehrbuch des gemeinen deutschen Strafrechts' (3 vols., 1902-05).

BINDWEED. See Convolvulus.

BINET, be'-na', Alfred, director of the laboratory of research at the Sorbonne, Paris: b. Nice, 4 July 1857; d. 1911. He went to Paris in 1871, where he made a study of medicine and law. For a time he was uncertain which career he should follow; but his deep interest in research work won the day for medicine. He became a frequent and noted contributor to the medical journals of Paris interested in the special line of work to which he had decided to devote himself. He attracted attention by a book on the psychology of thought as applied to hypnotism (1886). This was followed by 'Sub-conscious Thought' (1887); 'Studies in Psychology' (1888); 'Changes in Personality' (1892); 'Introduction to Experimental Psychology' (1894); 'Double Consciousness' (1896); 'Intellectual Weariness' (1898); 'Suggestibility' (1900); 'Thoughts upon Children' (1900); 'An Experimental Study of the Intelligence' (1903); 'Soul and Body' (1905); 'Revelations made by writing under Scientific Control' (1906); 'Abnormal Children' (1907). In several of these works Binet was aided by V. Henri, Coutade, H. Beaunis, and Th. Ribot. Simon, and in some of them one or other of these writers is acknowledged as joint author, in some others as helper or adviser. Beaunis and Ribot were joint editors with Th. Ribot of L'Année psychologique, a yearly publication devoted to the scientific study of psychology. In 1906 this journal confined its efforts to the study of practical and social questions along the lines of Binet's favorite studies. Previsous to this, Binet had been making deep and active researches into the working of the human intelligence. In 1905 the joint authors published the first series of the Binet-Simon tests, an attempt to find some exact standard by which to measure degrees of intelligence. This was followed by a second series along the same line in 1908. Binet and his co-workers taught, contrary to the German thinkers along the same lines, that the higher functions of mankind, such as intelligence, comprehension, imagination, sentiment and suggestion, varied more in the individual than other functions which had, until then, been depended upon for the judgment of mental capacity. So he and his fellow-workers set to work to invent and develop new tests such as would make it possible to make use of these higher functions in the tests for mentality. He and Simon constructed a series of graded tests based upon continuous experiments under different conditions and surroundings. By these tests it is possible to determine the degree of intelligence of a child and to measure normality or abnormality with considerable exactness. These tests, as issued in 1908, are 56 in number and cover the ages from three to 12. They are simple tasks such as the child might be expected to perform and they are graded and grouped to suit the age of the child. A subject who performs the tests assigned to his age in a satisfactory manner is classed as normal; if he can perform only tasks of a child several years younger than his age, he is looked upon as sub-normal; but if he can perform those of a child several years older than his age he is classified as supernormal. Under the title 'A Method of Measuring the Development of Young Children,' the Binet-Simon work of most importance was published in Chicago in 1913, and the 'Psychological Method of Testing Intelligence' appeared in Boston the following year.

BINGEN, Germany, town of the grand-duchy of Hesse, 17 miles west of Mainz, on the left bank of the Rhine and the right of the Nahe, near the Nahe. It is the site of a Gothic church dating from the 15th century. The castle of Klopp and the sanctuary of Saint Roch are situated nearby on the Rochusberg. A dangerous passage on the Rhine, called the Bingerloch, has been opened up by the blasting of sunken rocks, leaving a channel of 210 feet wide. On the opposite side of the river rises the Niederwald Denkmal, raised to commemorate the victories of 1870-71. In a neighboring castle the Emperor Henry IV was detained a prisoner in 1105, and on a rock in the middle of the river stands the Müßeturm or Mouse-tower, the scene of the ancient legend of Archbishop Hatto, who was devoured by rats in 969. Drusus Bridge over the Nahe near its mouth was first built by Drusus in 13 a.c. Bingen was a town of the Teutons when a battle took place in 70 A.D. in which the Romans inflicted a defeat on the Gauls. Bingen came under the rule of the see of Mainz in 1281, was taken and retaken several times during the Thirty Years' War and in 1668 was burned by the French, who blew up the castle. From 1797 to 1814 it belonged to France and
after 1815 was incorporated with Hesse. Bingen is the market for the sale of wines produced in the neighborhood. The principal industries are the manufacture of leather, liquors, tobacco, starch, and there is also considerable trade in cattle, grain, coal and iron. The Rheinish Technical College is situated here. Pop. 9,950.

BINGER, bän-zhā, Louis Gustave, French soldier and African explorer: b. 14 Oct. 1856. He came from the upper Niger to Grand Bassam in 1887-89, thus connecting the French possessions with the Ivory Coast. In 1892 he was commissioner of the French government to settle the Ashanti boundaries with England.

BINGHAM, Amelia (family name Smiley), American actress: b. Hicksville, Ohio, 1869. After studying at the Ohio Wesleyan University, she married Lloyd M. Bingham, who died 22 Dec. 1915. Her first appearance was in the People's Theatre, New York city, in 'The Gold.' After six years she became leading lady at the New York Empire Theatre in 'His Excellency the Governor,' playing leading roles continually thereafter. In 1901 she appeared with her own company in 'The Climbers,' 'A Modern Magdalen' and 'The Frisky Mrs. Johnson.' During the season of 1914 she played Mrs. Odyke in Bronson Howard's 'The New Henrietta,' a revision of 'The Henrietta.'

BINGHAM, Hiram, American Congregational clergyman: b. Bennington, Vt., 30 Oct. 1789; d. 11 Nov. 1869. He was graduated from Andover Theological Seminary in 1819, and was one of the first missionaries of the Congregational Church to be sent to the Sandwich Islands, where he acquired much influence with the natives.

BINGHAM, Joel Rote, American clergyman: b. Andover, Conn., 11 Oct. 1827; d. Hartford, Conn., 18 Oct. 1914. He entered the Congregational ministry, but in 1871 exchanged it for that of the Episcopal Church. He has written 'The Christian Marriage Ceremony'; 'Francesca da Rimini' (1897-1904), and 'Selected Hymns and Napoleonic Ode of Alexander Manzoni' (1904), translations.

BINGHAM, John Arende, American politician: b. Mercer, Pa., 1815; d. Cadiz, Ohio, 20 March 1900. He studied at Franklin College, Ohio, and became a lawyer in 1840. He was elected to Congress as a Republican in 1854 and retained his seat 1855-63. He was chairman of the managers of the House in the impeachment of Judge Hughes for high treason, in 1862. President Lincoln appointed him military judge-advocate in 1864 and, later in the same year, solicitor of the United States Court of Claims. He was special judge-advocate in the trial of the assassins of President Lincoln. He sat in Congress again 1866-73. He was one of the managers of the impeachment trial of President Johnson. From 1873 to 1875 he was United States Minister to Japan. Consult Foraker, J. B., 'John A. Bingham' in 'Publications' of the Ohio Historical Society (Vol. X, 1902).

BINGHAM, Joseph, English clergyman and antiquarian: b. Wakefield, Yorkshire, 1668; d. Havant, 17 Aug. 1723. He distinguished himself as a student at University College, Oxford, and devoted his attention particularly to ecclesiastical antiquities. He was graduated in 1688 and became a fellow the following year, but had to withdraw from the university on the charge of preaching unsound doctrines. He now became curate of Headbourn-Worthy, near Winchester, and there, while possessed of a scanty living on which his numerous family could barely subsist, had the merit of composing one of the most learned works of which his Church can boast. This work, 'Origines Ecclesiasticae, or The Antiquities of the Christian Church,' was published in 10 volumes octavo (1706-22) and is still a standard on the subjects of which it treats. The best modern edition is that published at the Clarendon Press (1855, 10 vols.). It was soon translated into Latin and published in Germany, and has since appeared in various languages. In 1712 he was collated to the living of Havant, near Portsmouth. He lost his savings in the South Sea Bubble of 1720.

BINGHAM, Theodore Alfred, American public official: b. Andover, Mass., 14 May 1858. Graduating from the United States Military Academy at West Point in 1879, he served in the engineer corps of the army until 1900, after which he became United States military attaché at Berlin and Rome. In 1897, when he had attained the rank of colonel, he was put in charge of the public buildings and grounds at Washington, in which capacity he served until 1903. He then undertook the supervision of the engineering district of Lake Ontario and Lake Erie for a whole year, after which he was retired with the rank of brigadier-general. In 1906 he was appointed police commissioner of New York city, where he served until 1911 when he was removed by Mayor Gaynor on the charge of insubordination. Later in the same year he was appointed chief engineer of highways of New York city but retired after two months' service. He was then appointed consulting engineer in the department of bridges but resigned again in 1915.

BINGHAM, William, American educator: b. North Carolina 1835. He was graduated at the University of North Carolina in 1856 and succeeded to the management of a classical school at Mebanesville, Alamance Co., N. C., which had been conducted with success by his father and grandfather. He published 'A Grammar of the Latin Language,' 'A Grammar of the English Language' and 'Cæsar's Commentaries,' with notes and a vocabulary.

BINGHAM, Utah, town of Salt Lake County, 20 miles southwest of Salt Lake City, on the Bingham and Garfield, and the Denver and Rio Grande red-sand gravel. It contains a hospital and has large copper-mining interests. Pop. 2,881.

BINGHAMTON, N. Y., city and county-seat of Broome County, at the junction of the Chenango and Susquehanna rivers and on several railroads, 50 miles east of Elmira. It stands more than 667 feet above both rivers are here spanned by several bridges. The city is supplied with water by the Holly system, which cost over $1,500,000; has nearly 100 miles of streets lighted by electricity, and contains over 30 churches and chapels, public
school property valued at over $1,175,000, a public library, two national banks and assessed property valued (1910) exceeding $1,486,554. Among the attractions of Binghamton, which has been named the "Parlor City," are Ross Park, Ely Park and O'Neil Park, and the driving parks and fair grounds. The noteworthy buildings include the State asylum for the insane, United States government building, State armory, courthouse, city hall, two orphan asylums, an opera house and the Casino and the home office building of the Security Mutual Life Insurance Company. Binghamton ranks as the third cigar-manufacturing city in the United States, and according to the census of manufactures for 1914, it then had 245 industrial establishments of factory grade, employing 8,413 persons, of whom 7,428 were wage-earners, receiving annually $3,653,000 in wages. The capital invested aggregated $18,237,000, and the value of the year's output was $18,360,000; of this, $7,970,000 was the value added by manufacture. Other important manufactures are tobacco, cigars, silks, scales, chemicals, furniture, sheet metal work, glass, gloves and rubber goods. An interesting feature of the city is the large number of cottages owned by the working people. Binghamton received a city charter in 1867. Pop. (1900) 39,647; (1915) 53,668.

BINGLEY, England, town of the West Riding of Yorkshire, on the Aire, five and one-half miles northwest of Bradford, 15 miles northwest of Leeds and on the Leeds-Liverpool Canal. The town contains the interesting church of All Saints (restored 1871) in the Perpendicular style, several other places of worship, an endowed grammar school and a mechanics' institute. The chief industries are worsted-spinning, cotton and paper manufactures. The town has a public library, free public baths and owns its water and gas works. Pop. 18,759.

BINNALEY, Bin-ma-li'e, Philippines, a town of the province of Pangasinen, Luzon, situated on the Gulf of Lingayen, in the western part of the island of Luzon, only a few miles east of the town of Lingayen. Pop. 13,787.

BINNACLE, a brass or wooden stand supporting a helmet-shaped hood in which is placed a ship's compass. In the front of the hood is a glass-covered aperture through which the helmsman may observe the compass, and on each side is an opening into which are fitted the lights illuminating the compass at night.

BINNEY, Amos, American merchant and naturalist: b. Boston, Mass., 18 Oct. 1803; d. Rome, Italy, 18 Feb. 1847. He was graduated at Brown University in 1821, engaged in business, interested in natural history and devoted his leisure time to natural science. He was one of the founders and, at the time of his death, president of the Boston Society of Natural History. His writings on the land shells of America are in the 'Journal' and 'Proceedings' of that Society. His book 'The Vital-Eschalting Mollusks of the United States and Adjacent Territories of North America' (3 vols., 1847-51), was issued under the direction of Dr. A. A. Gould. Binney was a patron of artists and scientists and did much to advance the study of natural history in America. The Museum of Comparative Zoology, Harvard University, contains the collection of land and fresh-water shells of North America and preparations of their anatomy made by Amos Binney and his son.

BINNEY, Hibbert, Canadian clergyman: b. Cape Breton Island, 12 Aug. 1819; d. 1887. He was graduated at Oxford University in 1842. He became bishop (Anglican) of Nova Scotia in 1851.

BINNEY, Horace, American lawyer: b. Philadelphia, 4 Jan. 1780; d. 12 Aug. 1875. He was graduated at Harvard in 1797, and for many years was at the head of the Pennsylvania bar. He had a number of distinguished cases in his career, the most noted one being the defense of the city of Philadelphia against the executors of Stephen Girard. He was a member of the 23d Congress, in which he opposed the Administration in the question of removing public funds from the United States Bank, and a director in the United States Bank. He withdrew from active practice and confined himself to the preparation of writings and literary publications. In 1850 he retired altogether. He was frequently called upon to address great public gatherings. He wrote many valuable papers and was the author of 'The Leaders of the Old Bar of Philadelphia' (1858); 'The Privilege of the Writ of Habeas Corpus Under the Constitution,' in which he supported Lincoln's policy of suspending the right of habeas corpus during the Civil War; and 'Reports of Cases in the Supreme Court of Pennsylvania.' (6 vols., 1814); 'Life and Character of Chief Justice Tilghman' (1827); 'Life and Character of Chief Justice Marshall' (1835); 'Sketch of the Life and Character of Justice Bushrod Washington' (1858). Consult Binney, C. C., 'Life of Horace Binney' (Philadelphia 1893).

BINNEY, Thomas, English theologian: b. Newcastle-on-Tyne 1798; d. 24 Feb. 1874. A bookseller's apprentice in his youth, he worked from 7 in the morning till 9 at night. He was trained for the Congregationalist ministry at Wymondley Seminary, Hertfordshire; served after ordination (1824) at Bedford and Newport, Isle of Wight, and in 1859 was called to the Weigh House Chapel, London, where he ministered for 40 years. He was a voluminous writer on polemical subjects, vehemently antiritualistic; raised a storm of controversy over a statement he made that "the Church of England damned more souls than she saved," but regarded with regret the baldness of Nonconformist Church services and was the first to cause the prose Psalms to be chanted in public worship. He was the author of 'Is It Possible to Make the Best of Both Worlds?' and the hymn 'Eternal Light! Eternal Light!' Consult H. Alton's 'Memoir' prefixed to his sermons, and 'Lives' by Paxton Hood and I. Stoughton (1874).

BINNIE, Sir Alexander R., English civil engineer: b. London, 26 March 1839. He was educated at the Royal Engineers College at Woolwich, and became a member of the Institution of Civil Engineers 1862-66 and for the Indian Public Works Department 1868-74; was engineer of the city of Bradford 1875-90; constructed the Sabour waterworks, the Blackwall tunnel, the Bradford waterworks, the Farning Road Bridge, etc. In 1897 he was made chief
engineer of the London county council and in the same year he was knighted. His publications include articles and reports on professional subjects, lectures on waterworks, papers on rainfall, etc.

BINNS, Charles Ferguson, ceramic expert: b. Worcester, England, 4 Oct. 1857. A son of the director of the Royal Porcelain Works in his native city, he was superintendent of various departments there 1872-97. Leaving England in the last-named year, he became principal of the Technical School of Science and Art, Trenton, N. J., 1897-1900, and since June 1900 has been director of the New York State School of Clay Working and Ceramics, Alfred, N. Y. He has written 'Ceramic Technology' (1896); 'The Story of the Potter' (1897); 'The Potter's Craft' (1910), and has contributed extensively to the 'Transactions' of the American Ceramic Society.

BINOCULAR MICROSCOPE. See Microscope; Opera Glass; Telescope, etc.

BINOMIAL, in algebra, a quantity consisting of two terms or members, connected by the sign + or -. The binomial theorem is the celebrated formula which shows how to obtain any power of a given binomial, as \(a + b\), from the two terms, \(a\) and \(b\), and the exponent of the power. It gives as the value for \((a + b)^n\):

\[
\sum_{k=0}^{n} \binom{n}{k} a^{n-k} b^k
\]

for all integral values of \(k\) for which the expression has a meaning. This theorem, frequently called the Newtonian theorem, was known, as far as relates to integral positive exponents, to several mathematicians before Newton. But Newton was the first who taught its application to fractional and negative exponents; and this discovery, one of the most important of those made by that great man, is engraved upon his tombstone. The discovery of the correct understanding of the limitations under which this theorem is valid, however, belongs to the last century.

BINONDO, Philippines, a native town near Manila, on the right bank of the Pasig, now a suburb of the walled European city, having been annexed to it by a magnificent stone bridge 411 feet in length. The bridge of Binondo is regarded as the most remarkable structure ever erected by Europeans in the Indian archipelago.

BINTURONG, a large civet of the Malay Peninsula and islands ('Arctictis binturong'), which spends its life in the trees, where it is assisted in climbing about by its long, bushy, prehensile tail. It passes the day asleep in the top of a tree and travels about at night in search of small mammals, birds, eggs, but also eats leaves and fruit. It is dirty yellow when young, but black when fully grown, and reaches a length of two and a half feet, exclusive of its long tail, which may measure six feet 10 inches in length.

BINUE, bin'wê, or BINUE, Africa, the largest and most important tributary of the river Niger. See BINUE.

BINYON, Laurence, English poet: b. Lancaster, 10 Aug. 1869. He has been an assist-

ant in the British Museum from 1893 and assistant keeper from 1909. Besides editing the 'Shilling Garland' (1895-98) he has published 'Lyric Poems' (1894); 'Poems' (1895); 'London Visions' (1895-98); 'The Praise of Life' (1896); 'Porphyryon and Other Poems' (1898); 'Western Flanlers' (1899). The Poets (1900); 'Catalogue of English Drawings in the British Museum' (1898-1907); 'Atilla' (1907); 'England and Other Poems' (1909); 'The Flight of the Dragon' (1911); 'Botticelli' (1913); 'Auguries' (poems, 1913); 'The Winning Fan' (1915); 'Bombastes in the Shades' (1915). Consult Streetfield, 'Two Poets of the New Century.'

BINZ, Karl, German physician and pharmacologist: b. Bernkastel, 1 July 1832; d. 1913. After studying at Würzburg, Bonn and Berlin he became, in 1868, professor at Bonn. In the following year he founded the Pharmacological Institute of Bonn. He was the first to demonstrate the action of quinine and he has done much important research in pharmacology and pathology. He has written many works, among which are 'Ueber den Traum' (1879); 'Vorlesungen über Pharmakologie' (1891); 'Aether gegen den Schmerz' (1896); 'Rezeptsünden und ihre Folgen' (1899).

BINZER, August Daniel von, German author: b. Kiel, 30 May 1873; d. Reisze, 20 March 1888. He studied law at the universities of Kiel and Jena, after which he was both teacher and newspaper editor for some years. Among his works are 'Die Dämmerungsstunden der Familie Abert' (Altona 1833); 'Venedig im Jahr 1844' (Pest 1845); a German translation of Benjamin Franklin's 'Autobiography and Writings' (Kiel 1829); 'Erzählungen und Novellen' (in collaboration with his wife, under the pseudonym "A. T. Beer," 3 vols., Leipzig 1841). He is also the author of several songs still popular in Germany, among them one beginning with the line "Wir hatten gebaut ein stattliches Haus."

BIO-BIO, bé'o-bé'o, Chile, an eastern province with Concepción on the north, the Argentine territory of Neuquen on the east, Mallego and Caunin on the south, and Arauco on the west. Its area is 4,138 square miles. The rainfall is rather excessive and the variations in temperature are somewhat extreme. There are three departments, La Taja, Mulchen and Nacimiento. The capital of the province is Los Angeles, situated in the Central or Longitudinal Valley (see Chile) on the banks of a tributary of the Bio-Bio River. It is a mountainous province, with moderately high peaks and good valleys. Viticulture is carried on in the north; there are herds of cattle on the pastures; the valleys are cultivated, and the forests exploited. Pop. over 100,000.

BIO-BIO, the largest river of Chile. It has a west-northwesterly course of about 200 miles, from near the volcano of Antuco in the Andes to Concepción on the Pacific Ocean. It is two miles wide at its mouth, and is navigable for 100 miles.

BIOGENESIS, (1) the theory of the genesis or origin of all living beings from living beings. It is opposed to abiogenesis, which im-
plies that at the present time the simplest, lowest forms of life may arise by spontaneous generation (q.v.). The principle of biogenesis was first placed on a scientific basis by Harvey, who demonstrated that living beings arise from eggs, as stated in his famous aphorism, omne vivum ex ovo. As now modified all organisms are known to arise from living matter, that is, either from germs, spores, seeds or eggs. (2) The history of a living organism biogenesis, or biogeny, is divided into ontogeny, or individual organism, and phylogeny, or the development of the class or other group of organisms, to which the individual belongs. (3) Biogenesis also may be interpreted as meaning the different modes of reproduction (q.v.): whether sexual, or asexual or by fission or budding. See BOTANY; EVOLUTION; EMBRYOLOGY; ZOOLOGY, etc.

**BILOGENETIC LAW.** See Recapitulation Theory.

**BIOGRAPH,** an apparatus that displays in rapid sequence a long series of photographs. It belongs to a class of apparatus which followed the invention of the kinetoscope, and includes the vitascope, cinematograph, phantoscope, etc. It differs from the kinetoscope in that instead of showing small pictures through an enlarging lens by reflected light, it projects them on a screen. The biograph may be described as a stereopticon combined with such mechanism as is requisite for the precise manipulation of the celluloid picture film. When the apparatus is set in motion the long band of celluloid passes quickly, though not continuously, behind the projecting lens, between spools or bobbins which revolve at a uniform rate. While thus passing from its original spool to the winding reel the film encounters certain pulleys and toothed rollers that serve to direct its movements accurately. Along its edges are numerous small perforations into which the teeth of the rollers fit with precision, and by this means the small transparencies are made to occupy exactly similar positions when their images are projected upon the canvas. As each picture in its turn attains this critical position it is momentarily brought to a standstill. At the same time a shutter is opened and an image of the picture flashes for an instant upon the screen. The shutter is then quickly closed, the picture resuming its motion, while its successor in the series is brought into a similar fixed situation. This temporary stoppage of the film (or rather of a portion thereof), as each picture attains its proper place behind the projecting lens, is a very essential feature of the process.

At the instant of its arrival a portion of the film on the preceding side of the picture will be in an unstrained or slack condition. The "slack" is then taken up by a continuously moving sprocket pulley, whereupon a rod or roller is quickly brought to bear against the now tightened film, pressing it to one side and as quickly moving it. By this movement the next picture is pulled into its fixed position, while the film is made taut (or nearly so) on the following side of this picture. These operations are repeated continuously until the entire film has passed through the holding device in rear of the lens.

The camera used in taking the negative from which motion pictures are made is provided with a similar mechanism to that employed in showing the finished photographs. The picture roll is replaced by a roll of sensitized film, and the exposures are made at the rate of from 25 to 50 per second. The films range in length from 50 to 200 feet, and contain, when finished, from 800 to 3,000 negatives. After the film has been subjected to the usual photographic operations it is made to travel on the sensitized film, beneath an incandescent lamp, and by this means the photographs are printed upon the sensitized surface. This second film is then in turn passed through the various photographic processes, and when complete it is wound on a spool which may then be placed in the machine used for exhibiting the pictures.

**BIOGRAPHIA LITERARIA.** Samuel Taylor Coleridge's "Biographia Literaria" was originally intended as a mere preface to a collected volume of his poems, explaining and justifying his own style and practice. The work grew under Coleridge's hands to a literary autobiography, including, together with many facts concerning his education and studies and his early literary adventures, an extended criticism of Wordsworth's theory of poetry as given in the preface to the "Lyrical Ballads" and a statement of Coleridge's philosophical views. The work was published in two volumes in 1817. In spite of its miscellaneous character, the "Biographia" remains one of the few prose works of Coleridge which continues to be read, and it is valuable as being the chief vehicle of his very important contributions to critical theory. In the first part of the work Coleridge is mainly concerned with showing the evolution of his philosophic creed. At first an adherent of the associational psychology of Hartley, he came to discard this mechanical system for the belief that the mind is not a passive but an active agency in the apprehension of reality. The discussion involves his definition of the "esthetic" or "emplastic power," the faculty by which the soul perceives the spiritual unity of the universe, as distinguished from the fancy or merely associative function. The later chapters deal with the nature of poetry and with the question of diction raised by Wordsworth. While maintaining a general agreement with Wordsworth's point of view, Coleridge elaborately refutes his principle that the language of poetry should be one taken with due exceptions from the mouths of men in real life, and that there can be no essential difference between the language of prose and of metrical composition. A keen and appreciative critique on the qualities of Wordsworth's poetry concludes the volume. Consult "Biographia Literaria," edited by J. Shawcross (London 1909), and Etienne Charletet, "A Survey of English Literature," containing the best discussion of the issue between Coleridge and Wordsworth.

**JAMES H. HANFORD.**

**BIOGRAPHY,** in its general sense, literature treating of the lives of individuals; in its restricted meaning the history of a person's life. When composed by the subject of the
narrative it is called an autobiography. Biography has existed in one form or another from the most ancient times. In the book of Genesis there are biographies, or at least memoirs, of Adam, Noah, Abraham, Isaac, Jacob, Joseph and others. Homer's 'Odyssey' may be considered as an extended biography of Ulysses, limited, however, to the most interesting period of his life, that of his wanderings. Though the 'Iliad' may be loosely called a history of the Trojan War, yet, accurately, it is a chapter from the life of Achilles. Among the calamities he brought upon the Greeks by the revenge which he took on Agamemnon for carrying off his female captive Briseis. The most elaborate Greek biography was Plutarch's 'Parallel Lives' ('Biōi Paralelōi'), consisting of 46 memoirs of Greek, Roman and other celebrities; it was published about 80 A.D. In 44 B.C. Cornelius Nepos had sent forth a biographical work, his 'Vita Imperatorum' ('Lives of Commanders'). Under the Greek and Roman civilizations, however, the individual was absorbed in the state. When Cincinnatus or Coriolanus is mentioned, we recall rather an act than a person. The elder Cato wrote a history of the Roman republic, in which there was not found a single proper name. He said simply: 'The people, having made such a law, the general gained such a battle.' Biography differs from history, properly so called, in considering public and national events, if at all, only in their relations to a single personage. It assumes various forms, being sometimes most interested in the circumstances and external career, the curriculum vitae, of its subject; sometimes regarding chiefly intellectual and moral qualities and development; sometimes being hardly more than a catalogue of a man's positions and changes of position; and sometimes, like the autobiography of Goethe, fit to be entitled truth and poetry; sometimes being formally narrative throughout, but often presenting the hero also by his letters and notes of his conversation. A biography may be a mere chronicle or a diatribe, or the life of a man may be used as only a frame on which to attach moral reflections. Its true aim, however, is to reveal the personal significance of those men who have played a distinguished part in the world, either by action or by thought. History has reference to the development of principles, biography to that of character. To observe the growth of a nation or of any institution from the idea on which it was grounded, through its vicissitudes and conflicts, is the part of history. To trace a human life, to remark the manifold efforts, defeats, triumphs, perplexities, attainments, sorrows and joys which fill the space between the cradle and the grave, is the province of biography. In history, Scipio at the head of the Roman legions subdues the geography against the misfortunes of his country; in biography, the former is seen not only gaining victories, but also gathering cockle-shells on the shore, and the latter not only fighting after defeat, but also hunting on a hobby-horse among his children. Plutarch says it is not fate but cause an action is great that it therefore manifests the greatness and virtue of him who did it, but, on the contrary, sometimes a word or a casual jest betrays a man more to our knowl-
edge of him than a battle fought wherein 10,000 men were slain, or sacking of cities, or a course of victories. Xenophon remarks that the sayings of great men in their familiar discourses and amid their wine have somewhat in them which is worthy to be transmitted to posterity.

Modern biographical literature may be considered to date from the 17th century since which time individual biographies have multiplied enormously. Dictionaries of biography have proved extremely useful, Moreri's 'Historical and Critical Dictionary' (1671) being, perhaps, the first of this class. During the 19th century there were published the 'Universal Biography' (85 vols., 1811–62); 'New General Biography' (46 vols., 1852–60); Chalmers' 'General Biographical Dictionary' (32 vols., 1812–17); Rose's 'Biographical Dictionary' (12 vols., 1848–50); Leslie Stephen's 'Dictionary of National Biography' (completed in 63 volumes, the first of which appeared in January 1885 and the individual was absorbed in the state. When Cincinnatus or Coriolanus is mentioned, we recall rather an act than a person. The elder Cato wrote a history of the Roman republic, in which there was not found a single proper name. He said simply: 'The people, having made such a law, the general gained such a battle.' Biography differs from history, properly so called, in considering public and national events, if at all, only in their relations to a single personage. It assumes various forms, being sometimes most interested in the circumstances and external career, the curriculum vitae, of its subject; sometimes regarding chiefly intellectual and moral qualities and development; sometimes being hardly more than a catalogue of a man's positions and changes of position; and sometimes, like the autobiography of Goethe, fit to be entitled truth and poetry; sometimes being formally narrative throughout, but often presenting the hero also by his letters and notes of his conversation. A biography may be a mere chronicle or a diatribe, or the life of a man may be used as only a frame on which to attach moral reflections. Its true aim, however, is to reveal the personal significance of those men who have played a distinguished part in the world, either by action or by thought. History has reference to the development of principles, biography to that of character. To observe the growth of a nation or of any institution from the idea on which it was grounded, through its vicissitudes and conflicts, is the part of history. To trace a human life, to remark the manifold efforts, defeats, triumphs, perplexities, attainments, sorrows and joys which fill the space between the cradle and the grave is the province of biography. In history, Scipio at the head of the Roman legions subdues the geography against the misfortunes of his country; in biography, the former is seen not only gaining victories, but also gathering cockle-shells on the shore, and the latter not only fighting after defeat, but also hunting on a hobby-horse among his children. Plutarch says it is not fate but cause an action is great that it therefore manifests the greatness and virtue of him who did it, but, on the contrary, sometimes a word or a casual jest betrays a man more to our knowl-
BIOLOGY. The study or science of living organisms, and the phenomena of life. Its field is the whole breadth of the organic world, and it seeks to mark the boundaries which separate living from inorganic nature,—to discover the principles that unify it, the processes by which living things have developed, the nature of life itself and the future in store for it. Biology, then, is the sum of all the special departments of study which deal with plants, animals and man in his animal relations, such as botany, zoology, anthropology, and their subordinate or associated sciences; that is, bacteriology, microscopy, physiology and many more. In his outreach toward the causes and principles underlying its phenomena, the philosophical biologist must therefore understand organic chemistry, and the laws of electricity, light, heat, and mechanics, as they relate to animal needs; and at the other extreme he must consider psychology as an integral part of his domain.

This array of responsibilities and of objects for investigation seems too formidable for any one man to undertake or a lifetime to encompass, and it would be were not the realm of living nature capable of resolution into simple elements; unified in its fundamental structure; and controlled in its developmental growth by definite laws of growth which have come more and more clearly into view as knowledge of details has increased. The classification and co-ordination of the enormous mass of facts incessantly poured into his laboratory and library by experimenters and observers, to illuminate the truth by some generalization, or to exhibit a plan, law, type of structure or growth, is the high purpose of the thoughtful biologist; and the greatest names in the science,—Aristotle, Leibnitz, Harvey, Malpighi, Linné, Buffon, Lamarck, Treviranus (who in 1802 first used the term Biology), Cuvier, Galvani, Goethe, Lyell, Von Baer, Owen, De Blainville, Leueckart, Agassiz, Darwin, Wallace, Kowalewsky, Müller, Haeckel, Marsh, Cope, Hyatt, Weismann and many others,—have been those of men who had those large aims in view, and have contributed toward a solution of the great problem of life.

The living world may be pictured as an enormous bundle of tangled and interlaced cords of phenomena, which, moreover, are never quite stationary and fixed, but are always slowly, invisibly, altering and forming new entanglements. Every naturalist is at work upon some part of this bundle, endeavoring to extiricate his particular part. In more cases he pays so little attention to anything else, and is so fascinated with the beauty of his single strand, that he draws but little out. In other cases men of larger view or more serious purpose, or societies of them co-operating, disentangle more. The great biologist is he who can perceive those who have found a clue, and is able to teach them and the others how still more surely to unravel the intricate threads of phenomena that entwine and conceal the great fact of life at the centre of the puzzle.

To drop the figure, the science of biology in its more restricted and ordinary meaning is the co-ordination of the observed facts and manifestations of the organic world into laws, and the discovery of the principle from which all proceed; that is, its object is to find an answer to the ever-present question of existence—What is Life? To this end goes on the incessant collection of facts in natural history, and it goes on joyously because any moment the biologist may come upon some fact or suggestion which shall contribute to the grand result.

Progress has been made. The study at first was nothing but a miscellaneous gathering of specimens and records of observations. Then a crude sorting out began. Men at first failed to distinguish between what was animate and what was inanimate. The wind, the wave, volcanoes, springs were things of life. Later the broad distinction of organic from inorganic was perceived, but even now it is not known whether some of the manifestations of movement and response in certain "slimes" are purely chemical, or due to the presence of actual life.

The next step was the separation of the two great branches of the organic world—plants and animals. The broad features of these groups must have been apparent to primitive man, but it is only within comparatively recent years that such groups as the sponges, the branching forms of the corals, the spreading growths of the polyzoans, have been definitely placed among the animals; the "sea-anemone," "moss-animal," "zoophyte," and the like, show the popular error or doubt as to these forms. The relationship of the minute or even microscopic hydroids and protozoans were still longer in doubt; and to this day there is a borderland in this great group (the Protozoa) of minute, unicellular objects where no one is able to draw a certain line between what should be called a plant and what an animal, or even whether some of the objects are organic at all.

As men perceived certain likenesses and unlikenesses the sorting of plants and animals went on crudely at first, on purely superficial or even fanciful grounds. This sufficed fairly well for some large and well-marked groups, as beasts, birds, fishes, insects, hardwood trees and the like, yet led to many mistakes, such as placing whales with the fish and the bats with birds. Meanwhile students here and there had become interested in special branches, and called his pursuit a science. Thus arose Ornithology—the study of birds; Conchology, the study of shells (in which for a long time little attention was paid to the animal that made them!); Anatomy and Physiology, the study of structure, at first confined wholly to the human form, and only lately to animals in general, when it was distinguished as Comparative Anatomy; Botany, the study of plants; and so on. In each, men gathered and recorded specimens and facts, as a rule from a single neighborhood. Nevertheless, curiosity began to inquire beneath the surface. Plants were pulled apart, animals dissected and resemblances and contrasts of structure were noted. Naturalists traveled, and found that the creatures of the world were more numerous than had been suspected, and varied with climate, soil, height above the sea and diverse conditions, and when records and specimens from many localities were gradually collected the facts of organic likeness and contrasts appeared that had not been visible in the small local cabinet. Materials were thus obtained for more intelligent arrangement, and classification became one of
the most important sciences in the scope of biology. The great service an accurate arrangement of living things would render to an inquirer as to their nature was perceived, and scientific men perceived this by facts which should fill the gaps in their knowledge. The criteria were made more and more exact, and as classification was perfected it became increasingly evident that the criteria for all branches were substantially similar, and there came to be seen plans of structure. One of the latest and most powerful aids to investigation, the result of the perfecting of the microscope, was the science of Embryology, or the study of the development of a plant from the seed or of an animal from the egg. It went hand in hand with Histology, the study of tissues, and both disclosed the new truth that the structure of both animals and plants was at its basis the same—a cell filled with life substance (protoplasm); and that the multiplication of these cells constituted the growth, and their arrangement and limit the form and bulk, of every animal and plant. It was furthermore ascertained that an egg or a seed (in which it is believed that every animal plant begins, in spite of extreme apparent exceptions) was simply a cell differing, so far as we can yet see, from other cells in the body only by its possession of the potentiality of independent life under the fostering of suitable conditions. Classification had already shown that its groups might be arranged in something like a series from those very simply organized (the one-celled protozoa at the foot of the list) up to the highly complex. Now embryology showed that the changes each individual passed through from egg to birth were a series of changes from simplicity to complexity and furthermore that they suggested a parallel to the features of the successive groups in classification, especially to those of the subordinate ranks of the subject’s own class. Palaeontology pointed to a similar parallel, finding that the most ancient animals fossil in the rocks were of simple and generalized structure as compared with those of more modern geological formations: in other words, that structural development has also been historic development.

All these facts changed the point of view of the biologist. Instead of looking at separate animals and seeking to find differences upon which to make new species and subdivide groups, he is now seeking for likenesses—points of unity. It was long ago suggested to thoughtful minds that the world was not always as we found it, but that for a vast period there had been a slow, persistent growth and unfolding. The phenomena of the inorganic world pointed in the same way, and hence arose the “nebular hypothesis”—the explanatory theory that the universe developed from a gaseous state, and the earth, as one of its parts, was slowly perfected in pursuance of the forces inherent in its origin. Biologists are only carrying this theory out in a detail when they argue that the facts in their hands can be accounted for only by the supposition that the living beings on the earth have been slowly developed from a primitive source, comparable to the germ-cell along unequal and ramifying lines of progress under the influence of their changeable environment. This is only a detail,—a flower,—of the general unfolding of the universe which is well called its evolution; it is an organic evolution.

In the light of this grand generalization biology is now progressing with an organized force for investigation of the great question as to the origin and nature of life. This has not been answered by any of the fruitful hypotheses, like those of Darwin or Lamarck, which have placed such effective tools in the biologist’s hands. Toward the solution of this problem all scientific men are working, consciously or unconsciously. In aid of this purpose are pushed forward the incessant and world-wide collection and preservation of preserved animals and plants—museum specimens; and the systematic and accurate observation and record of local species and their habits and instincts. Much of this seems trivial and dry as dust in the eyes of the ignorant or of those whose minds, being occupied with other thoughts, forget the reason and tendency for these ever-multiplied details of natural history. Patient students toil to the same end in laboratories of anatomy and microscopy, laboriously gather statistics, laboriously work out the geographical distribution, chisel out of the rocks remains of extinct races, and sort and re-sort in experimental classifications—all this in order to provide the generalizers of the science with more and better factors for the solution of the great focal problem, What is Life, and how came it to be? What has been the net result so far? In one direction the conviction of the universal eminence and force of the principle of evolution; in another the realization of the independent life and action of each separate cell. To the study of the constitution, qualities and behavior of the cell, whether standing alone in the unfertilized egg, or as a naked monad, or one in an interdependent association of millions building up a complex organism, has biology come at last; and not until it has vanished the difficulties presented by this atom of living and potential protoplasm, the cell, will it accomplish its full purpose.

Ernest Ingersoll, Author of ‘The Life of Animals.’

BION OF ABDERA, Greek mathematician: lived about 400 B.C. He was a pupil of Democritus and is said by Diogenes Laërtius to have been the first who taught that there were countries in the world where the year consists only of a single day and a single night, each lasting for six months (Diog. Laërtius, iv, 58). He must therefore have been acquainted both with the spherical form of the globe and the obliquity of the ecliptic. Unfortunately nothing more is known of his history. He is probably the same one whom Strabo (i, p. 29) calls an astrologer.

BION OF BORYSTHENES, Greek philosopher contemporary with Eratosthenes (born about 275 B.C.) and with Zeno the Stoic. Laërtius has preserved an account which Bion gives of his ancestry (iv, 46). His family was sold as slaves and he fell into the hands of a rhetorician who made him his heir. He studied philosophy at Athens, first under Crates of the Cynic school, then took lessons of Theodorus,
surnamed the Atheist; and at last, considering his studies completed, set up for himself. It is not easy to ascertain what his opinions were, as only a few fragments of his numerous writings have been preserved, but he was accused of Atheism, and apparently on good grounds, as he is said to have regarded all questions relative to the nature of the gods and divine Providence as indifferent. He died at Chalcis in Euboea about 241 B.C. His habits of life were reputedly infamous. Many of his wit and wit wascisms have been preserved by Laertius. Horace ranks him as a brilliant satirist (Epist. ii, 2, 60), and Cicero preserves one of his sayings (Tusc. iii, 26). He is also referred to by Athenaeus (xiii, p. 591, f. 592).

BION OF SMYRNA, Greek pastoral poet, who flourished in the latter part of the 3d century B.C. He was a contemporary of Theocritus whose manner he imitated. On attaining manhood, Bion emigrated to Sicily, where a conspiracy was formed against him and he was briefly imprisoned. The poems of Bion were chiefly pastoral, occasionally erotic. The fragments of them that are extant fully justify the eulogies of his admirer, Moschus. Their sentiments are tender and delicate; their style is copious, graceful and polished. Seventeen short poems and the famous 'Lament for Adonis' are preserved to us, the last-named furnishing the model for Shelley's 'Adonais,' edited by Ahrens (1855); Meinecke (1856); Ziegler (1868); Williamowitz-Moellendorf, 'Adonis und die Kunst' (Leipzig, 1901); Susemihl, 'Geschichte der griechischen Litteratur in der Alexandrinerzeit' (Leipzig 1891); Edmonds, 'The Greek Bucolic Poets' (London 1912).

BIANCO, Flavio, byōndō flā'vrō, Italian archeologist; b. 1840; d. 1863. He was secretary to the Popes Eugene IV, Nicholas V, Calixtus III and Pius II. His encyclopedias have served as the foundation for all subsequent collections of archeological knowledge. They were called 'Roma instaurata,' 'Roma triumphans' and 'Italia illustrata.' His works and manuscripts are preserved in the Vatican, at Dresden and at Oxford.

BIONOMICS, in biology, the study of the habits and modes of life of animals or plants and their relations to each other, to all living beings and to the world around them. It corresponds to "ecology" and to "biology" as used by German naturalists. Wasmann defines biology in the restricted sense of bionomics as —

"The science of the external conditions of existence, which pertain to organisms as individuals and at the same time regulate their relations to other organisms and to the inorganic environment."

It therefore, he says, embraces in its restricted sense —

"First, a knowledge of the mode of life of animals and plants, their nourishment, mode of propagation, the care of offspring and their development, in so far as these present external manifestations; hence also, second, a knowledge of the life-relations that obtain between individuals of the same and different species (including all the phenomena of parasitism, symbiosis, etc.), and hence also, third, a knowledge of the conditions of existence which are essential to the life and maintenance of animals and plants."

By conditions of existence are meant the action on plants and animals of climate, soil, light, gravity, heat, the dryness or moisture in the air and soil; the nature of the water, whether salt, fresh or brackish; currents of air and of water; elevation above the sea, also any other physical and biological agents in causing variation in or modification of organisms. As Wheeler states:

"Whenever we undertake the detailed or exhaustive study of an ethological problem, we are led imperceptibly into the details of physiology, morphology, embryology, taxonomy, or chorology, according to the particular aspect of the subject under consideration."

Many of these subjects, falling under the head of bionomics, are treated under the head of evolution (q.v.), as the struggle for existence, mimicry, etc. Another department of bionomics is geographical distribution and distribution in time, together with migration, heredity, hibernation and seasonal dimorphism. The word "bionomics" seems preferable to "ethology," which has been used as the name of the science of ethics; it is also the more comprehensive term. Consult also Baer, 'Einleitung in die Geologie,' parts i, ii; 'Bionomie der Meeresthiere' and 'Lebensweise der Meeresthiere.' See Ecoloe.

BIOPLASM, that portion of the protoplasm in living bodies that possesses the physiological qualities of life. This term was first used by Prof. L. S. Beale, an English scientist; the word protoplasm had formerly been used in an analogous sense, but Professor Beale considered that a much wider meaning had been given to this latter term by Huxley and others and therefore introduced the use of the word bioplasm with its narrower signification.

BIOT, bōt, Edouard Constant, French authority on China, son of Jean Baptiste Biot (q.v.): b. Paris, 2 July 1803; d. 12 March 1850. After accompanying his father on a scientific tour to Italy in 1825-26, he undertook the construction of a railway from Lyons to Saint Etienne, the first in France. In 1833 he retired from active life and devoted his leisure to the study of the Chinese. He was the author of numerous articles in the Journal des Savants and Journal Asiatique, as well as of the 'Dictionnaire des Anciens et Modernes, des Villes et Arrondissements compris dans l'Empire Chinois' (1842) and 'Essai sur l'Histoire de l'Instruction Publique en Chine' (1847). Besides translations of Chinese works — for example, the chronological 'Tcheou-chou-ni-kien' (Paris 1842) and the 'Astronomical Tcheou-pe,' — he wrote a 'Notice sur quelques procedes industriels connus en Chine, au 17me Siecle'; an Examen de diverses sieves des faits relatifs au climat de la Chine,' and 'Chine et Indo-Chine.' The printing of his translation of the Chinese Imperial Geography, 'Tcheou-li,' was interrupted for some time by his death.

BIOT, Jean Baptiste, French mathematician and physicist of distinction: b. Paris, 21 April 1774; d. there, 3 Feb. 1862. He was educated at the College Louis-le-Grand and in 1793 entered the artillery service. Shortly after
ward he entered the École Polytechnique and thenceforth devoted himself to the study of mathematics and the natural sciences. After teaching physics for some years at Beauvais, he became professor of the same subject in the Collège de France in 1800, and in 1803 was elected a member of the Institute. He stood nearer than any one question of the founding of an empire. In 1804 he made a balloon ascent with Gay-Lussac, and in 1806 was made a member of the Bureau des Longitudes. In 1809 he became also professor of physical astronomy in the University of Paris. With the exception of three journeys, undertaken in connection with the measurement of a degree of the meridian, — namely, to Spain in 1806–08, to Scotland, Orkneys and Shetland in 1817, and to Spain and Italy in 1824–25,—his whole life was quietly passed in study and teaching. He published some excellent text-books, which became widely known beyond France. Important works by him are the "Traité élémentaire d'Astronomie Physique" (3 vols., Paris 1805, and 3d ed., 6 vols. 1820), "Mélanges scientifiques et littéraires" (1858); also, a history of the ancient Egyptians, Indians and Chinese. His most valuable contributions to science, however, are chiefly contained in communications to learned societies and periodicals. There are few branches of physics which were not advanced by his labors; and in optics especially he made some valuable investigations, particularly in connection with refraction and polarization. See CURIE.

BIOTITE, a mineral of the mica group, having its characteristic monoclinic crystallization and very perfect cleavage. Its chemical composition varies widely, but in general it may be said to be a silicate of aluminium, magnesium, iron, potassium; with hydrogen. On account of the presence of magnesium, it is sometimes called 'magnesia mica.' In color, biotite varies from green to black. It has a hardness of from 2.5 to 3, and a specific gravity of about 2.9. It is a common constituent of granite and gneiss, and of many eruptive rocks, such as andesite and trachyte. Biotite was named for the French physicist, J. B. Biot (q.v.).

BIPERTATA, a name given by Cuvier to a family of Crustacea, so called because the carapace is divided into two parts or shields; the anterior shield is large, oval in shape, and corresponds to the head; the posterior is angulated in outline, corresponds to the thorax, and bears the foot-jaws and ordinary feet. This family is one of those making up the order of Stomopoda, and is now very generally known under the name of Phyllosomidae.

BIPENNIS, a double-headed battle-axe, mentioned in Homer. The Greek literature attributes its use to the barbarians, most especially to the Amazons. Such axes have been found in stone.

BIRES, bīpēks, (1) a genus of reptiles belonging to the order Sauoria, in which the posterior feet only are visible, though the rudiments of the anterior extremities appear under the skin. This genus is the connecting link between lizards and the snakes. (2) The name given to a lizard from the Cape of Good Hope, which is called Anguis biptes by Linnaeus and Scelotes biptes by Gray.

BIPONT EDITIONS, famous editions of the Latin classics, published in Bavaria in the city of Deux Ponts, whose name in German is Zwei-brücken, and in Latin Bipontium. The publication was begun in 1779, but after the French conquest was finished in Strassburg. The collection forms 50 volumes octavo.

BIQUADRADIC EQUATIONS, in algebra, equations containing but one unknown quantity, of which, in the equation, the highest power is the fourth. An equation of this kind, when complete, is of the form $x^4 + Ax^3 + Bx^2 + Cx + D = 0$, where $A$, $B$, $C$ and $D$ denote any known quantities whatever. See Equation.

BIR, bēr, or BIREJIK, town in Asiatic Turkey, 80 miles northeast of Aleppo, on the side of a steep hill on the left bank of the Euphrates, which is here about 600 yards wide, and 10 to 12 feet deep. The town is surrounded on the land side by a wall, with towers at the angles, and pierced with loopholes. The streets are narrow but clean. In the centre, on a steep rock, is an old mosque. Bir has long been the point where caravans and travelers from Aleppo to Orfa, Dinarbekir, Bagdad and Persia, cross the Euphrates. Pop. 8,000.

BIRAGO, bē-rāgō, Karl, Baron von, Austrian military engineer: b. Cacina, d'Olmo, 24 April 1792; d. Vienna, 20 Dec. 1845. He studied mathematics at Pavia; was a teacher in a military school in Milan, and in 1825 invented the military bridge which is named for him. He assisted at the building of the fortifications of Linz, the fortifications of the Po near Brescia, and in 1839 built a military bridge across the Po which was especially successful. Nearly all the Continental armies have since adopted his system of bridge construction. In 1844 he was in command of the newly organized Pioneer and Pontonier Corps, and became commander of a brigade. He wrote 'Researches in European Bridge Construction.'

BIRAGUE, bē-rāgū, René de, Italian political: b. Milan 1507 (or 1506); d. 1588. He incurred the hostility of Louis Sorza, the duke, but was received favorably by the French King, Francis I, who made him councillor of the Parliament of Paris, governor of Lyon, and sent him to the Council of Trent. Under Charles IX his advancement was still more rapid, and in 1570 he was made keeper of the seals. In this capacity he was a party in the secret council at which the massacre of Saint Bartholomew was organized. He zealously defended the Catholic cause against the inroads of French Calvinism, both in its religious and its political aspects. He was bitterly hated by the Huguenots, who in consequence made many derogatory accusations against him. He was made a cardinal in 1578, and held the bishopric of Lavaur and several rich abbey. He died chancellor of France.

BIRBHUM, bēr'boom, a district of the Division Bardwan in Bengal. It is crossed by a few unimportant rivers; has hot springs, iron mines and limestone deposits. The chief agricultural product is rice; there is also a large silk-worm industry. For over 2,000 years Bir-
BIRCH, Harvey, the principal figure in Cooper's novel, 'The Spy' a romance of the American Revolution.

BIRCH, John, English soldier: b. 7 April 1616; d. 10 May 1691. A Presbyterian in religion, he took the side of the Parliament, acting as a captain of volunteers at the siege of Bristol by the Royalists. On the institution of the "New Model" he was ordered to join the army of Fairfax and Cromwell in the west of England, and had Bath entrusted to his care. He commanded a body of horse and foot at the storming of Bristol, an affair in which he so highly distinguished himself as to receive special commendation from Cromwell in his report to the Parliament. In 1645 he was sent against Hereford, and by a stratagem succeeded in bringing about the surrender of the city and with this the special thanks of Parliament. He objected to many of the proceedings of the party of Cromwell, and was repeatedly thrown into prison. He took an active part in bringing about the restoration of Charles II, and the latter part of his life was a prominent member of Parliament. He was a man of great personal strength and stature, a rough but most effective public speaker, and had remarkable talent for business and practical affairs. Consult Roe, 'Military Memoir of Colonel John Birch' (in Camden Society Publications 1873).

BIRCH, Samuel, English Egyptologist: b. London, 3 Nov. 1813; d. there, 27 Dec. 1883. At the age of 23 he was appointed an assistant in the department of antiquities in the British Museum and latterly became keeper of the department devoted to Egyptian and Oriental antiquities, a post which he retained till his death. His labors did much to advance the study of Oriental archaeology, and his eminence in his own province was duly recognized by learned bodies and institutions. In 1870 he assisted in founding the Society of Biblical Archaeology, of which he was president till his death. In 1874 he successfully presided over the International Congress of Orientalists that met in London in that year. His studies ranged over a wide field, but it is on his eminence as an Egyptologist that his reputation chiefly rests. His work was invaluable alike to the expert and the beginner: the first dictionary of hieroglyphics, the first elementary grammar of Egyptian, the first set of popular translations into English, and the first treatise on Egyptian archaeology, came from his hand. Among his writings are: 'Introduction to the Study of the Egyptian Hieroglyphs' (to accompany Gardiner Wilkinson's work on Egypt: 1857); 'History of Ancient Pottery, Egyptian, Assyrian, Greek, Etruscan and Roman' (1858); 'Hieroglyphic Inscriptions of Southern Arabia' (1863); 'Dictionary of Hieroglyphics and Grammar' of the same in the fifth volume of the English edition of Bunsen's 'Egypt's Place in the Universal History' (1867); 'Guide to the Egyptian Galleries of the British Museum' (1871); 'Views, Action and Customs of the Ancient Egyptians' (1878). For full account of his life and work, consult 'Transactions of the Society of Biblical Archaeology' (Vol. IX, 1893).

BIRCH, Thomas, English historian: b. London, 23 Nov. 1705; d. there, 9 Jan. 1766. His early taste for reading induced him to prefer a literary life, which he was permitted to choose on condition of supporting himself by his own exertions. He took orders in the Church in 1730, and obtained in 1732 a living in Essex. In 1734 he engaged with some coadjutors in writing the 'General Historical and Critical Dictionary,' founded on that of Bayle, and completed, in 10 volumes folio, in 1741. He subsequently obtained various preferments in the Church, and for about 20 years before his death held the rectories of Saint Margaret Pattens, London, and Depden, in Suffolk. Birch had formed very extensive manuscript collections, which, together with his library of printed books, he bequeathed to the British Museum. He produced a large number of historical and biographical works in the course of his laborious life and served as one of the pioneers of literature. He collected fully and faithfully, but without much discrimination, materials relating to the various subjects of his research, which are calculated to afford important assistance to writers possessed of more taste and judgment. Among his works are: 'Life of the Right Hon. Sir Robert Boyle'; 'Historical View of the Negotiations between the Courts of England, France and Brussels, 1592-1617'; 'Life of Archbishop Tillotson'; 'Memoirs of the Reign of Queen Elizabeth, from 1571 till Her Death'; 'History of the Royal Society of London' (of which he was secretary); and he edited the works of Raleigh and Bacon.

BIRCH, Thomas, American painter: b. London, England, 1779; d. Philadelphia, Pa., 14 Jan. 1851. Coming to the United States in 1793, he settled in Philadelphia, and painted chiefly portraits until 1807, when he took up marine painting, in which he achieved a high reputation. A number of his works represent naval battles of the War of 1812, and of these paintings representing the engagements between the United States and the Macedonian, and between the Constitution and the Guerriere, are the best known. Both are in the Harrison collection at Philadelphia.

BIRCH (Betula), a genus of trees belonging to the family Betulaceae. The principal habitats of the trees of this genus are North America, Europe, northern Asia and the Himalayas. The common European birch is indigenous throughout the north, and on high situations in the south of Europe. It is extremely hardy, and only one or two other species of trees approach so near to the North Pole. There are two species natives of Great Britain, Betula pubescens, and B. pendula, or weeping-birch; the latter by far the more valuable and ornamental. When young it may readily be distinguished by the touch, its bark being covered over with rough exudations, while that of the common tree is soft and velvety. Each species is found exclusively in some districts, but frequently they are interpersed. Throughout the most remote parts of the Highlands of Scotland, birch is found covering extensive tracts or rocky elevations, where no other ligeous plant is to be met with. It also grows in glens and ravines, adorning the margins of lakes and rivers,
where the silvery whiteness of its trunk and the light and airy habit of its spray form beautiful and interesting pictures, even in the absence of every other tree. Though often found associated with the alder on swampy ground, yet few trees more successfully resist drought. Adapting itself to various soils and situations, it possesses a wider range than any other tree. It is well suited to form a cover on ground from which Scotch pine timber has been re- covered, and in the sylvan which always overspread such places, though hostile to plants in general, are favorable to the birch, which commonly springs up and becomes the successor of the pine. The common tree, where it grows wild, attains a height of about 30 feet, and the weeping variety about 40 feet; but both sorts rise to a much greater height when formed into plantations, particularly when interspersed with other trees. Although the birch is considered by no means a valuable tree, yet its wood, which is light in color and firm and tough in texture, is used for a variety of purposes. Not long ago, in many parts of the Highlands, the birch may be said to have been the universal wood, and was used by the Fuegians for every purpose. They made their beds, chairs, tables, dishes and spoons of it, and even manufactured ropes and harness by heating and twisting its spray. The brushwood is used in forming wicker fences to prevent the inroads of cattle and sheep, in thatching cottages and in forming brooms or besoms. The wood is largely used for fish-casks and hoops, and for smoking hams and herrings. Turners use it for trenchers, bowls, ladles and other wooden ware. Ox-yokes, small screws, women's shoe-heels, pattens and in France wooden shoes are made of it. Birch-trees are not infrequently planted along with hazels, for the purpose of procuring wood to be converted into charcoal for forges. This charcoal is much esteemed, and the soot which is formed on burning the wood constitutes a good black substance for printers' ink. Nearly all the other parts are applicable to useful purposes. The bark is employed in the tanning of leather; and by fishermen for preserving their nets. In America, in northern Europe and Asia the birch is utilized for a great variety of purposes. The North American Indians use it for canoes, boxes, buckets, baskets, kettles and dishes, curiously joining it together with threads made of roots of the cedar-tree. It is serviceable in dyeing a yellow color. In Norway it is dried, ground, mixed with meal, and boiled with other food for swine. The houses or huts in many parts of the north of Europe are covered with the outward and thicker part of the bark, instead of slates or tiles. It is spun into a coarse kind of cordage, woven into shoes and hats, and in some places even made into drinking cups. The Laplanders fasten together large pieces of it to keep off the rain. Abounding in resins, matter, slices of the bark are sometimes tied together to make torches. During a scarcity of corn it has, in several instances, been ground with bread corn, and successfully used as food for men. At one time, at least, the sap, from the amount of sugar it contains, affords a kind of agreeable wine. Birch-wine is produced by the tree being tapped by boring a hole in the trunk, during warm weather, in the end of spring, or beginning of summer, when the sap runs most copiously. It is recorded that during the siege of Hamburg, in 1814, many birch-trees in that vicinity were destroyed in this manner by the Russian solders. The dwarf birch, Betula nana, is a low shrub, a native of parts of the Highlands of Scotland and of Arctic regions generally. It is never more than two or three feet high, and is generally much less; a full-grown plant being thus a very small clump. It is used as fuel, and as stuffing for beds, and its seeds furnish food for ptarmigan and other birds. A similar species is a native of the Antarctic regions. Among others the red or river birch of North America (B. nigra) grows to the height of 90 feet, and produces hard and valuable timber. It is known as the red birch from the redness of the bark in the young trees. Another American species, the cherry birch or sweet birch (B. lenta), is also called the black birch. It grows to a similar height with the preceding, and yields even more valuable timber, used in making furniture, etc., being tough, fine-grained and taking on a good polish. The paper birch (B. papyrifera) is another American species which also attains a large size. Its habitat extends within the Arctic Circle, but it becomes rare and stunted in the extreme north. It receives its name from the fact that thin strips of the brilliant white bark are sometimes used as a substitute for paper. The bark of this species is put to perhaps a greater variety of uses than that of any other, its wood and sap being also utilized. Another American birch is the yellow birch (B. lutea), so named from the golden color of the outer bark. It is a large-leaved species, yielding timber used for shipbuilding, etc., and is a native of the eastern parts of Canada and the northeast of the United States. Of Himalayan species may be mentioned B. utilis, the Indian paper birch. Its thin papery bark has been used as paper from a remote period, and is still commonly used for packing purposes, for lining the flexible tubes of hookahs, and in other ways, while the wood is tough, and is employed in making articles of various kinds. In its native mountains it may be found at an altitude of 10,000 to 13,000 feet. Several of the pigmy species deserve mention. B. pumila, which is generally less than eight feet tall, but sometimes reaches a height of 15 feet, is found from Newfoundland to Minnesota, and south to Ohio. B. glandulosa, which extends from Labrador to Alaska and south to Michigan and in the mountains to Colorado, seldom exceeds four feet. Other species, natives of Europe and Asia, resemble the preceding more or less in appearance and uses. Consult Bailey, 'Standard Cyclopedia of Horticulture' (1914); Regel, 'Monographische Bearbeitung der Betulaceae' (1861); DeCandolle, 'Prodrorum 16' (1869).

BIRCH-PFEIFFER, bërn'pïf'-ër, Charlotte, German actress and playwright: b. Stuttgart, 23 June 1800; d. 24 Aug. 1868, her maiden name being Pfeiffer. She first appeared on the stage in her 13th year and acquired a great reputation, her special rôle being that of the heroines of tragedy. In 1825 she married Christian Birch, a writer of some note. After playing with success at places as
far apart as Saint Petersburg, Amsterdam and
Budapest, in 1837 she took the management of
the theatre at Zürich, and remained in this
capacity till 1843. Next year she was engaged
for the Theatre Royal, Berlin, and here she re-
mained till her death. Her plays, mostly
founded on novels, became well known on
almost every stage in Germany, and give evi-
dence of real dramatic talent, as well as of a
knowledge of stage effects and what would suit
the taste of the theatre-going public. Victor
Hugo's 'Notre Dame' and Charlotte Brontë's
'Jane Eyre' furnished her with materials for
two of her dramas. She also wrote novels and
tales. Her collected dramatic works appeared
at Leipzig in 23 volumes (1863-80); her nar-
native writings in three (1863-65). Her
daughter has become well known as a novelist
under the name Wilhelmine von Hillern.

BIRD, Arthur, American musician: b.
Cambridge, Mass., 23 July 1856. After study-
ing music in Berlin under Rohde, Loeschhorn,
Haupt and Urban, he went to Canada. In 1886
he conducted at the Milwaukee Music
Festival and soon after returned to Berlin.
He studied two summers with Liszt in Weimar.
His compositions comprise a symphony,
carnival, three suites for orchestra and various
other compositions for the piano and organ;
the comic opera 'Daphne' (1897); the ballet
'Rübezah1'; and a decemt for wind in-
struments, which won the Paderewski prize in
1902. He is a member of the National Institute
of Arts and Letters.

BIRD, Charles, American military officer:
b. Delaware, 17 June 1838. He entered the
volunteer service in 1861, as first lieutenant, 1st
Delaware Infantry; was promoted lieutenant-
colonel, 9th Delaware Infantry, in 1864; and
was commissioned colonel of the 1st United
States Veteran Infantry, 24 Dec. 1865. On
2 March 1867 he was brevetted first lieutenant
and captain in the United States army for gal-
lantry in the battle of Fredericksburg, major
for Spottsylvania, and lieutenant-colonel for
Petersburg, Va. He was appointed a second
lieutenant, 14th United States Infantry, in
1886; promoted to major and quartermaster in
1890; was commissioned a colonel and quarter-
master of United States Volunteers for the
war with Spain in 1898. He became brigadier-
general in the regular army 16 April 1902 and
was retired 17 June 1902.

BIRD, Edward, English painter of note: b.
Wolverhampton, 12 April 1772; d. Bristol 1819.
He took up art as a profession, without any
regular training, and carried on a school of
drawing at Bristol. In 1807 he exhibited some
pictures at Bath, and had the good fortune to
find purchasers for them. In 1809 he had a
picture, 'Good News,' in the exhibition of the
Royal Academy, and so successful was this work
that his name at once became known. He
was elected an associate of the Academy in
1812, and his reputation was increased by such
paintings as the 'Surrender of Calais,' the
'Death of Eli,' and the 'Field of Chevy Chase' —the last considered his greatest work. The
'Death of Eli' was sold for 500 guineas, and
was awarded a premium of 300 by the British
Institution. In 1815 he became a full member
of the Royal Academy, and he was also
appointed court painter to Queen Charlotte.
Among his last pictures were the 'Crucifixion';
'Christ led to be Crucified'; the 'Death of
Ananias and Sapphira'; and the 'Burning of
Kilday and Latumer.' His talents, however,
were considered to be rather for genre than for
historie or sacred subjects. Consult Cuming
ham, 'Lives of British Painters.' There is a
catalogue of Bird's works in the British
Museum.

BIRD, Frederic Mayer, American Episco-
pal clergyman: b. Philadelphia, 28 June 1838;
d. South Bethlehem, Pa., 3 April 1908. He was
rector at Spotswood, N. J., 1870-74; and
professor of psychology, Christian evi-
dences and rhetoric, at Lehigh University,
1881-86; and acting chaplain there, 1893-98.
He was noted as a hymnologist, and collected
one of the most complete and valuable musical
libraries in the United States. He edited
several collections of hymns; was associate
editor of 'Chandler's Encyclopedia'; editor of
'Lippincott's Magazine' (1893-98); and
published 'The Story of Our Christianity' (1891).

BIRD, Golding, English medical and scien-
tific writer: b. Downham, d. 27 Oct. 1854. In 1838 he took the degree of
M.D. at Saint Andrew's, and in 1840 that of
M.A. In the latter year he became a licensee
of the Royal College of Physicians, London,
and in 1845 was elected a fellow. In 1843 he
was appointed assistant physician at Guy's Hos-
pital, where he also lectured on materia medica;
and in 1847 he entered on a three
years' course of lectures on the same subject at
the College of Physicians. He took an active
interest in natural history, chemistry and other
subjects more or less connected with medicine;
and his multifarious occupations overtaxed his
strength and undermined his health, so that he
died at a comparatively early age. He had by
this time acquired a very large practice, and
had made his name well known in his profes-
sion, more especially by his researches in scien-
tific medicine. A work by which he was more
generally known was his 'Elements of Natural
Philosophy,' for many years a textbook. A
well-known work on 'Urinary Deposits' was
also published by him, as also 'Lectures on
Electricity and Galvanism in their Physiologi-
cal and Therapeutical Relations'; 'Lectures
on Ozaelia'; etc. A biographical notice by
his brother, Dr. Frederic Bird, was published
in 1855

BIRD, Isabella. See BISHOP, ISABELLA
BIRD.

BIRD, John, English mathematical instru-
ment maker: b. in the county of Durham 1709;
d. 31 March 1776. He set up in London about
1743 as a maker of scientific instruments, hav-
ing previously received instructions from Gra-
ham, the greatest mechanician of the time. In
1749 he received an order to construct a new
brass mural quadrant of eight feet radius for
the Royal Observatory. This was used by
Bradley and by Maskelyne, and continued serv-
ing as the 'Id of Chevy Chase' —the last
ordered for Saint Petersburg, Cadiz and the
École Militaire, Paris—the last employed
by D'Agelet and Lalanne in determining the
decimations of 50,000 stars. He also furnished
Bradley with a new transit instrument and a
40-inch movable quadrant. Bird's marked superiority to all other makers of the day is strikingly exemplified by the fact that in 1767 the Board of Longitude paid him £500 on his agreeing to take an apprentice, one to instruct other persons as desired, and furnish upon oath descriptions and plates of his methods. A result of this arrangement was the publication of two treatises, named respectively 'The Making of Natural Instruments' (1767), and 'The Method of Constructing Mural Quadrants' (1768), each with a preface by Maskelyne, the astronomer-royal.

BIRD, Robert Montgomery, American novelist; b. Newcastle, Del., 1803; d. Philadelphia, 22 Jan. 1854. He qualified as a physician, but soon gave up the practice of medicine for literature. He first became known as a dramatist, having written three tragedies,—'The Gladiato'; 'Oraloosa'; and 'The Broker of Bogota'—the first of these often acted by Edwin Forrest. His first novel was 'Calavar' (1834), his second 'The Infidel' (1835) — both of them having their scene in Mexico, at the time of the Spanish conquest. Then followed the 'Hawks of Hawk Hollow'; 'Sheppard Lee'; and 'Nick of the Woods, or the Jibber-Goose' (1837)—the last probably the most popular of all his fictions. Its scene is laid in Kentucky soon after the close of the Revolutionary War, and in it we have a lively picture of pioneer life at this date, and the relentless hostilities between the Indians and the early settlers. He also wrote 'Peter Pilgrim,' a collection of tales and sketches; and 'Adventures of Robin Day,' a novel.

BIRD, BIRDE, or BYRD, William, Eng-lish composer; b. 1538; d. London, 4 July 1625. He was trained in music under Thomas Tallis, and was appointed organist of Lincoln about 1563. In 1575 the two composers obtained the monopoly for 21 years of printing and selling music and music paper; and on the death of Tallis in 1585 Bird became sole patentee. His first work of importance was 'Psalms, Sonnets and Songs of Praise and Piety Made into Music of Five Parts' (1588). In 1589 he published a collection of songs, and also a collection of sacred pieces for five voices; a second collection of similar pieces appeared also in 1589. In 1591 he published two books of 'Graduallia,' being a collection of motets for the ecclesiastical year of the Roman Catholic Church; and in 1611 'Psalms, Songs and Son-nets.' He continued all his life a Roman Catholic, but notwithstanding this he held a lease from the Crown of lands confiscated from a Roman Catholic recusant, and never lost the appointment which he held in the Protestant Chapel Royal. Bird was the composer of the first English madrigal. He wrote a large num-ber of pieces for the virginals, and also three masses. He was the author of a celebrated canon, 'Non nobis, Domine,' often sung in England by way of grace after meat at public banquets, and which has never ceased to be popular.

BIRD-CATCHING. See TRAP-SHOOTING.

BIRD-CATCHING SPIDER, a name ap-plied to gigantic spiders of the genera Mygale and Epeira, which catch birds and suck their blood. The species to which the name was originally given was Mygale avicularia, a native of Surinam and other parts of tropical South America. The body of this insect is about two inches long, very hairy and almost black; when the legs are stretched out, one can see the bird foot across. It lives in holes or crevices and does not spin a net proper, but makes a tubular nest for itself in which it lurks during the day, seeking its prey by night. Other species of Mygale belong to the Malay Archipelago, as M. javanica and M. sumatrensis. In experiments made with these spiders small birds have been known to die in a few seconds after being bitten. Some of the web-spinning spiders make webs strong enough to entangle small birds, which thus become their prey.

BIRD-CHERRY, in America, the wild, red, pin or pigeon cherry (Prunus pennsylvanica) of the natural order Rosaceae, a tree 20 to 40 feet high of little use except occasionally for ornamental purposes, as fuel and as a stock for grafting garden cherries upon. Its red, thin-fleshed fruit is sour and somewhat astringent. The name is also given in Europe, to the hagberry of Scotland (Prunus padus), whose many varieties are often cultivated for ornament. It sometimes attains a height of 20 feet, bears racemes of flowers larger and a week earlier than the choke-cherry (Prunus virginianna), which it somewhat resembles. The fruit, which is black, is smaller than the common cherry and has a disagreeable taste, but is greedily eaten by birds. The wood, which resembles mahogany, and takes a good polish, is used in cabinet-making.

BIRD DAY, a special school holiday on 5 May to commemorate the birthday of Audubon. The purpose of the holiday is to stimulate interest in natural history and nature study.

BIRD LICE, minute wingless insects parasitic under the feathers of birds and hair of certain mammals, to which they are very annoying. They belong to the sub-order Mallophaga, a group of wingless degraded insects allied to the death-tick (Psocodea), stone-flies (Perlidae), and the white ants, altogether the order Platytera. They differ from true lice in having free jaws adapted for biting, and not a sucking beak. The flattened body is conical, hard above, and the head is horizontal, with three- to five-jointed antennae; the eyes are small and simple, the mandibles are small, like a hook, and the maxillary palpi, when present, for they are sometimes wanting, are four-jointed, while the labial palpi are two-jointed. The thorax is small and but two-jointed ap-parently, as the meso- and meta-thorax are united. The abdomen is from nine- to ten-jointed, while the short, thick limbs have two-jointed tarsi and one or two claws.

BIRD-LIME, a viscous substance used for entangling small birds so as to make them easily caught, twigs being for this purpose smeared with it at places where the birds resort or to which they are attracted by a call-bird. It is often prepared from the middle bark of the holly, which is stripped off in June or July, boiled in water for six or eight hours, and the water being strained off, is then left to ferment. This process may take two or three weeks, during which it is watered if necessary. At the end
of this time it assumes a mucilaginous form, and after being pounded in a mortar and worked with the hands in water is fit for use. This substance, when prepared, is of a greenish color and very tenacious. Mice are sometimes caught with it as well as birds.

**BIRD OF PARADISE FLOWER.** See Strelitzia.

**BIRD SPIDER,** also called Bird-catching Spider, gigantic representative of the family Theraphosidae, infesting the tropical jungles of South America. Its body is two inches in diameter, black and hairy, but with outspread legs it has a diameter of nearly 12 inches. Like the tarantula, which it resembles, it builds its nest in the ground in the form of a hole about 18 inches deep, which it lines with a silky-white substance. In spite of its ferocious appearance, it is not dangerous and will not even bite when handled. Its reputation as a bird catcher seems to be founded on a traveler's myth, for the natural food of this strange insect is as yet unknown to science.

**BIRD-TICK,** one of the horse-tick or forest-fly family (Hippoboscidæ) of the order Diptera. Like the horse-tick the body is much flattened, but unlike the Hippobosca, or horse-tick, it has ocelli, but in the short proscissoc it resembles the latter fly. In the wings there are six costal veins. There are numerous species, all of which are bird-parasites. *Oifferia americana* lives on the owl and other birds. Certain species of *Lipoptera* live on birds, but afterward migrate to mammals, finally losing their wings through disuse.

**BIRDS.** The birds form that class (Aves) of warm-blooded vertebrate animals most distinct, most easily defined and most popularly known and interesting. They are at once distinguished by their covering of feathers, which is possessed by no other sort of animal; and by the modification of their fore-limbs into instruments for flight (wings). Their aerial existence, from which few have wholly departed, requiring great activity and exertion, has called forth a high perfection of organization, especially in the respiratory and circulatory systems of the body, and has led to the characteristic spindle-shaped form, narrowing from the full chest and shoulders toward a pointed head, which will cleave the air easily, and diminishing toward the rudder-like tail. The graceful form, to which the beauty of birds is largely due, has been brought about by the enlargement of the shoulder-girdle, and its great pectoral muscles, and by the necessity of an increased capacity of chest to contain the comparatively great heart and lungs. In birds such as ostriches, cassowaries, moas and the like, which have ceased to fly, and have developed short legs; or in those like the penguins, which have become swimmers and divers, the changes of structure are degenerations from the type, which is a bird with powers of flight.

**Character of the Feather Coat.**—Flight, as well as clothing, is due to the presence of the complicated horny appendages growing from the skin, called feathers, which are peculiar to the class. Their structure is described under Feathers. Those of the body are usually small, grow in certain definite tracts (see Pterylography), varying in the different groups, and form a close jacket, not easily pervious to moisture and a poor conductor of heat, thus conserving the vital warmth and protecting the body against sudden changes of temperature. It is shed (molted) and renewed semi-annually. This body-coat is ordinarily nearly uniform in length and character, but often is varied by ornamental plumes, erectile crests, ruffs, and other modifications, such as are seen in birds of paradise, herons and many others. The feathers are also variously colored in patterns varying with the groups and more minutely with the species, whereby they may recognize each other and be distinguished by us. These colors are usually those of pigments incorporated in the web of the feather itself, but may be due to minute scales on the surface, which break up the light, giving it an iridescent or metallic sheen, conspicuous in hummingbirds and in certain pheasants. The plumage often varies, according to age, sex, season, or all three conditions; these colors play an important part in bird-life. See Coloration, Protective; Natural Selection.

**Powers of Flight.**—The bones of the wing and tail support very large, strong "quill" feathers, which, when outspread, support the bird in the air, and when moved in the proper manner carry it forward—enable it to fly. The mechanism and phenomena of which method of locomotion are explained under Flight. The wing-power of most birds is very great, but the speed of their flight is often exaggerated. Few exact facts are at hand, but it is apparent that the highest speed is nearer 50 than 100 miles an hour, although the latter speed is undoubtedly reached by ducks and other swift flyers under pressure of attack or escape. Endurance on the wing is more remarkable. Many sea-birds seem tireless, and swallows, among land-birds, are almost incessantly in the air. During migrations a large variety of birds, including some of the smallest and feeblest, undertake rapid and extensive journeys, reaching in some cases almost half around the world; and some regularly pass over spaces of ocean as much as 2,000 miles in width, while a flight of 500 miles from land to land is accomplished by many species. This is the more notable as a feat because in many long flights birds during nine-tenths of the year only fly from bush to bush. In these migratory journeys (see Migration) birds often fly very high; but this is the regular custom of certain ones, especially vultures, which soar beyond human sight, yet will swoop to the earth in a swift dash, betraying great adaptability to sudden changes in atmospheric density. Other notable qualities are the power (largely residing in the tail) to suddenly change speed and direction, helping them to dodge and elude winged pursuers, and to catch the agile aerial insects, upon which many of the smaller species depend for subsistence. The sharpness and quick adjustability of eyesight also involved in this is noteworthy.

These abilities in flight have led to the very wide distribution of birds, which occur in every part of the world yet seen by man; and are the most numerous representatives of all terrestrial branches of animal life in the oceanic islands. Nevertheless very few are cosmopolitan, and
1 Motmot
2 Mother Carey's Chicken
3 Mouse-bird
4 American Mockingbird
not many range beyond the confines of a single continent, while many are more narrowly restricted, so far at least as their habitat in the breeding season is concerned. Thus the geographical distribution of birds has been found perhaps the best criterion for the mapping out of zoogeographical regions (see ZOOGRAPHY). The greater number of families of birds is tropical, and both variety of kinds and numbers of individuals decrease toward the poles. A striking fact is the great difference between the birds of the northern and the southern hemispheres—a difference much more decided than exists between those of Europe and North America, or of South America and Australasia.

Reproduction.—Birds in every case reproduce their kind by means of eggs protected by a calcareous, often highly-colored shell, laid by the mother a considerable time before they are ready to hatch, which consumption is brought about by the application of warmth. This may be arranged for in two ways. A few birds bury their eggs in rotting vegetation, or in hot sand, and the incubation is a ferment in the former case, or the sun’s rays in the latter, accomplish the desired result. The great majority, however, place their eggs in some sort of a receptacle (sometimes a mere hollow on the ground, or hole or niche in a cliff or tree, sometimes in a burrow or nest of more or less elaborate construction (see BIRDS, NESTS OF)), and there brood upon, or “incubate” them until the chick matures and emerges. In one class of birds (Phasianidae) incubation is so long continued, and the embryonic chick becomes so far advanced before leaving the shell, that it is well coated with feathers, and can at once begin to take care of itself. These birds are the sea-birds, water-birds, game-birds and their allies of comparatively low organization. In another class (Alcedinidae) of higher organization as a group, the chicks are permitted to break from the shell before they have acquired feathers or are able to move about or obtain food. They must therefore be shielded, defended, fed and cared for by the parents for several days or weeks. Out of this condition have grown some of the most interesting, complicated and delightful features, habits and instincts of bird-life.

Birds' Feeding Methods.—Birds as a class are omnivorous, but each of the various groups might be characterized by its food, which, more than anything else in the process of evolution, has determined the various types of structure that distinguish their tribes, and which are indexed, as it were, by the form of the bill and feet. Those of lowest organization,—nearest the ancestral type,—are the seabirds, which live upon fish varied to some extent by mussels and other small marine creatures. Many of the ducks and shore-birds share this marine diet, and numerous wading birds eat fresh-water fish, frogs, crayfish and the like. The great body of rattle and gallinaceous birds,—ostriches, emus, partridges, pheasants, etc., that run and nest on the ground,—are vegetable-eaters, seeking green leaves, fruits, seeds, lichens, etc., and picking up such insects as come in their way. All the foregoing are precocial birds, and the young feed on the same things as their parents. These classes have little relation to mankind so far as their food is concerned except that they sometimes devour too much grain or spoil certain plants. Among the higher class, or altricial birds, the fare is more varied, and while there is a very numerous group (the cone-billed or fringilline birds; see FINCH; SPARROW, etc.), which live altogether upon seeds, and a few others, like the kingfishers, which catch fish, the great majority indulge themselves in a miscellaneous diet of both vegetable and animal materials. Some called "soft-billed," and including most of our song-birds, except the finches, are mainly insect eaters, some catching them upon the wing, others digging them out of rotten wood, and the greater number picking them off the leaves of trees or searching for them among the herbage. Another large class, embracing the birds of prey, and a few others, like the shrikes, depend for food upon capturing and devouring other smaller birds, together with such small mammals, reptiles, amphibians, fish and insects as they are able to seize and kill. These are the falcons, owls and their relatives; but a related group, the vultures, varies this fare by feeding upon carrion.

Usefulness to Man.—In the case of all of these altricial birds, however, except the birds of prey, the young are fed upon soft insect food, mainly worms, caterpillars and maggots; and the period of their nesting coincides with the time when these larval insects abound. In the feeding habits of these higher birds man has a great interest, for nearly all of the innumerous insects which they capture for themselves, or for the nourishment of their young, are such as are annoying or injurious to him; and experience in many localities has shown that the destruction of bird-life is accompanied by a distressing increase of noxious insects. In the same way the hawks and owls, by their incessant pursuit of mice, and other small animals injurious to agriculture, so reduce the numbers of these pests, as greatly to benefit the farmer; while the useful work done by the vultures, as scavengers, by removing offal and dead animals, is recognized by everyone. In tropical regions where these birds most abound. Nor does the relative usefulness of birds to man stop here. They not only afford him great pleasure, by their pleasing colors and animated behavior, and delight his eye, but large numbers of them furnish him with excellent and even dainty food. Lastly, this group has furnished men with several varieties of domestic poultry, such as the turkey, peacock, guinea-fowl, duck, goose and various pigeons and partridges, that are among the most valuable of his animal possessions.

Distinctive Character of North American Bird-Life.—In considering the bird-life of North America, the natural southern boundary is the arid region between the United States and Mexico, which acts as an effective barrier. Our bird-fauna is by this means substantially separated from that of Central and South America. On the contrary it strongly resembles that of northern Europe and Asia. While a large number of extensive tropical families are not known north of central Mexico, or are represented by only one or two species, many of the families, the genera and even a fair number of species—not counting the seabirds common to both oceanic coasts—of the United
States and Canada are the same as those of Europe, and, to a less degree, of Siberia. This is especially true of the ducks, geese, shorebirds, and birds of prey. When we examine the list of birds of the interior fields and woodlands the general resemblance to those of Europe remains close, while their divergence from those of South America is very striking. In fact, Europe has only two families of small birds that are not represented also in North America — the starlings and the wrynecks.

The explanation of this condition, like that of so many other facts in our natural history, is to be looked for in the past. Geologists find evidence that in the early part of the Tertiary period, and at intervals during its progress, the northern borders of this continent were connected with both Europe and Asia; and that at times in the past the subarctic climate was comparatively warm — perhaps like that of the Middle States now.

This state of things enabled birds and many other animals of the Old World (which there is reason to believe was provided with animal life before this continent) to pass hither to the New by land abundant time has elapsed since they spread all over the continent, and to undergo the changes promoted by the differences in climate and food, which have resulted in the promotion of new American species, all derived from a remote, Old-World ancestry.

This history gives a reasonable explanation of both the likeness and the diversity between the two faunas.

Distribution of Birds in North America. — One of the most important features in ornithology is the study of geographical distribution (q.v.). Few species of birds extend their range over a whole continent, even in their seasonal migrations; almost all are restricted to a comparatively small area, the limits of which are set principally by their requirements in each case in the matter of food suitable not only for themselves but for their young in the nest.

The birds of widest range are those whose food is widely distributed, such as swallows, seed-eating sparrows, river-haunting sandpipers and the like; and those that feed on small animals. Even these are more or less affected by local food-conditions.

But the food available to and suitable for birds depends very largely on climate; and climates vary according to geographical conditions. Hence, climate is the greatest factor in determining the range of any species of birds. But by climate in this connection we mean the climate of summer, that is the average degree of warmth and moisture — the average kind of weather during the season when a bird is hatching and rearing its young.

On this continent the isotherms, or lines of equal warmth, do not run straight across from east to west according to the latitude, because of the interference made by our two great north-and-south mountain systems, whose crests are colder than are the low countries between them. Therefore in the middle west they bend northward and run up toward Alaska. Thus a species that is comfortable in Connecticut, but finds Maine too cold, will reside in Michigan, Minnesota and halfway to Alaska — perhaps 20 degrees north of the latitude of Maine — because it finds there an average mid-summer warmth like that of southern New England. Thus are constituted approximately east-and-west districts, or "zones," of life inhabited by various groups of birds requiring similar conditions.

Thus characteristic Arctic birds do not come much south of the treeless region extending in the west from Great Bear Lake to a point half way down the coast of Hudson Bay and into northern Labrador. They dwell in the "Arctic" Zone. South of it lies the narrow "Hudsonian" Zone, which swings from the mouth of the Saint Lawrence along the southern shore of Hudson Bay and north-westward to Alaska, including all of that peninsula. South of this the "Canadian" Zone embraces all the wooded parts of Canada except the Saint Lawrence Valley, and sends a long tongue down the Mackenzie River almost to the Arctic Circle. South of this lies the "Transition" Zone — a narrow strip running from New England and New York through southern Quebec and Ontario west and northwest to the prairies of the Dakotas and western Canada; it also extends far south along the east side of the Alleghanies and the Rockies. The remainder of the United States east of the Rockies is included in the "Austral" Zone, which is divided into an "Upper" and a "Lower" half, the latter embracing the South Atlantic and Gulf States. The Rocky Mountains form a composite zoological district where altitude has much the same effect on local climate, and consequently on animal life, as has latitude elsewhere. West of them the Pacific Coast is a "region" itself, with many exclusive birds.

Each of these zones has a bird-population which is not to be found outside of it in the breeding season; and that is true also of the vegetation and of other kinds of animals, showing the interdependence of all forms of life, and the reason for the facts noted in the distribution of North American birds.

Migration of American Birds. — The general subject of migration (q.v.) is treated elsewhere; but a few words may be pertinently added in this connection. All birds are migratory. Here, as elsewhere, migratory habits are adapted to local conditions, especially as to routes followed: and here as elsewhere most of these are far from keeping to the precise north-and-south direction that many persons suppose birds always take.

In the first place many of our birds make no regular migration at all. These are known as "residents." They are such as are able to find food all the year round in the region where they live; but in the case of some of these there is a partial migration, the individuals of a species moving a short distance southward from the northern border of its range into a more favorable climate, chiefly to escape deep snow. Then a considerable number of species of birds of northern Canada are forced southward in the fall, and visit the region of the Great Lakes, northern New York and New England during the cold weather, but rarely go farther south. These are the true "winter birds."

Running over the list one will find that of about 1,000 species of North American birds only about 225 depart in winter as far south...
Migration of American Birds

The birds of North America are of the same family of species as those of every part of the globe; but there is a great difference in the habits of the birds of this country as compared with those of other parts of the world. The birds of North America are not so numerous as those of the Old World, and are not so well adapted to our climate. They are not so well adapted to our climate. They are not as well adapted to our climate. They are not as well adapted to our climate. They are not as well adapted to our climate. They are not as well adapted to our climate. They are not as well adapted to our climate.
as the Gulf States, and of these only two-thirds entirely leave the United States. The fact that these far-travelers include almost all of the song-birds, or those most noticeable in summer, makes it seem to the uninformed northern as if the whole bird-tribe had left the country.

**Federal Protection of American Birds.**

The Federal migratory bird regulations of the United States prohibit the killing at any time of the following birds: Band-tailed pigeon; little brown sandhill and whooping crane; wood duck, swans; curlews, willet, upland plover and all shore birds (except the black belted and golden plovers, Wilson snipe, or jacksnipe, woodcock, and the greater and lesser yellowlegs); bobolinks, catbirds, chickadees, cuckoos, flickers, fly-catchers, grosbeaks, hummingbirds, kinglets, martins, meadowlarks, nightinghaws (or bull bats), nuthatches, orioles, robins, shrikes, swallows, swifts, tanagers, titmice, thrushes, vireos, warblers, waxwings, whippoorwills, woodpeckers and wrens, and all other perching birds that feed entirely or chiefly on insects.

**Books about North American Birds.**

**BIRDS, Fossil.** Birds are rare as fossils, compared with other vertebrates, and little is known about their early evolution. For five hundred extinct species have been described, as against 12,000 living, and most of them are from very fragmentary remains, found in widely scattered places. The explanation of this is found in their small size, their liability to be eaten, dead as well as alive, and the slight construction of their skeletons, which makes their bones less likely to be buried in sediments and preserved as fossils. At a few favorable places, however, as in the Oligocene strata of the east coast of South America and the Pleistocene deposits of Fossil Lake in Oregon, they occur abundantly. Birds have been found as far back in geological time as the Jurassic Period of the Age of Reptiles. The supposed bird-track of the more ancient Triassic sandstones of the Connecticut Valley are now believed to be mostly, if not all, tracks of dinosaurs (q.v.), a group of reptiles having many bird-like characters. From some ancient offshoot of this group the birds are probably descended, but the early stages of their evolution are not known.

The oldest fossil bird known is the *Archaeopteryx*, of which three specimens, one in marvelously complete condition, have been recovered from the upper Jurassic lithographic slates at Solenhofen, Bavaria; and it is a true bird although its skeleten presents many reptilian features. It was about the size of a crow, and had a rather elongated, narrow body, with a small, somewhat flattened head, and very large eye-sockets. The jaws protruded in a beak-like form; but there was no horny beak, and the upper jaw, and probably the lower also, was armed with many slender lizard-like teeth, set in a groove. The legs were of normal length, and had four toes, of which the bones of the shank (tibia and fibula) were separate, as in most reptiles. The wings were short and rounded, but unlike all known birds there were three long, slender fingers on each wing, which was armed with a hooked, sharp-edged claw. The wing-feathers were large and strong. These feet and the claw-armed wings indicate arboreal habits; but great powers of flight are doubtful, mainly because the breast-bone is poorly preserved, so that its adaptation to large flight-muscles cannot be determined. The bird probably took short flights, and scrambled about in tree-tops by aid of its wing-fingers. Its food can only be guessed at. The most remarkable feature of *Archaeopteryx*, however, was its tail, which was as long as its body and head together and consisted of 23 free bones, as in lizards. Beside it, in the fossil, are many pairs of broad quill-feathers: and it is probable that each caudal bone supported a pair of these, arranged horizontally along the tail as if the covering of the body was not known; but
there are indications of feathering on the legs, and around the neck, and it is certain that the body was not coated with scales. Dr. Frederick A. Lucas said of it: "It was, on the whole, much nearer to the birds than to the reptiles. It is clearly a connecting link between the two classes, and yet we are undoubtedly still very far from the original point where the branch was made from the reptilian stem. . . . It must have taken a very long period of time for the development of such distinctly bird-like feet and feathers."9

In point of time the next bird known appears in the rocks of the Upper Cretaceous Age, when the dinosaurs had about disappeared, and the earliest known mammals are faintly discerned as precursors of their class. These are the toothed birds of the subclass Neornithes, in two typical forms named Hesperornis and Ichthyornis, both of which are found fossil in the Cretaceous rocks of western Kansas. The true affinities of both are still in discussion. They were first put together in a "toothed-bird" group called Odontornithes; then rearranged into two groups, on account of a difference in dentition: (1) A group of Odontornithes (Hesperornis, etc.), in which the teeth are set in a continuous groove; and (2) Neornithes Odontotorma (Ichthyornis, etc.) having teeth set in separate sockets. Hesperornis was a flightless, swimming and diving sea-bird, nearly four feet long, with a long neck and strong legs ending in four lobed toes, and set far back at right angles to the spine. It no doubt caught fish as food, and rarely came ashore except to nest, resembling in this respect the habits of a modern penguin. Its structure, however, was very primitive, and its race soon became extinct, without leaving any line of developing descent, although several related forms were contemporary with it. Ichthyornis was also an aquatic, fish-eating bird, but was only about as large as a pigeon. Its wings were long and fitted for powerful flight, and its habits were apparently like those of the modern terns; but its relationship is still in doubt. The tail in both these Neornithes had become greatly shortened as compared with that of Tachypteryx, and exhibited the condensation of bones completed in the pygostyle of modern birds.

In the succeeding epoch, the Lower Eocene, at the beginning of the Tertiary Period, or "Age of Mammals," birds had begun to foreshadow modern types with little or no reference to the preceding "toothed" type. That seems to have come to an end; and there is no evidence of any ancestral connection between them and the modern types, whose ancestors, earlier than the Eocene, remain undiscovered. These earliest Tertiary birds are also aquatic, however, and are to be classed with the cormorants, cranes, etc.; but there were also gigantic, ostrich-like forms, such as Doryornis, Gastornis and Diatryma — not real ostriches, but with affinities to the wading birds. Especially notable among these were Diatryma gigantea, of the Wahsatch formations of Utah, — a flightless bird standing 12 feet in height and the largest known fossil bird, hardly exceeded by the great moa (q.v.) of New Zealand. By the end of the Eocene period, a wide variety of kinds of birds occur, usually referable to existing families but not to existing genera. "They are all types," says Osborn, "fitted to inhabit great warm plains, scattered with groves, and the assemblage [representing birds] now for the most part inhabitants of the equatorial regions of Africa and South America." In the succeeding epoch, the Oligocene, some existing genera may be recognized, and the fauna of that time has "an unmistakable African aspect," but in the next, or Miocene, period many forms belonging to the North Temperate Zone appear. It is in this Miocene epoch that the plains of Patagonia, then warm and bearing abundant vegetation and a crowded population of strange animals, were the home of certain great ostrich-like birds of which the most remarkable, perhaps, was Phororhachis, several species of which are known from bones recovered from the Santa Cruz formation, so rich in fossils. It stood eight or nine feet high, was supported on long legs, very thick and strong, had a rather long tail, fully formed wings, useless, however, for flight, and carried an immense head with a huge, hooked beak shaped like an outstretched-footed dagger of these gigantic birds, whose habits were probably raptorial, is named Brontornis.

From this time on the birds became well fixed in modern types; and they appear to have exchanged but little, in marked contrast to the great evolution of the Mammals, since the Middle Tertiary.

Consult books listed under GEOLOGY; ORNITHOLOGY; PALAEONTOLOGY.

ERNST INGERSOLL.

BIRDS, Nests of. The receptacles prepared by birds for the holding and security of their eggs and young. The eggs of birds are few in number, larger in proportion and more advanced in development as compared with those of fishes, amphibians and reptiles, and are encased in fragile shells, the rupture of which would be fatal to the enclosed embryo; they are never (with a single exception) covered with down, or any other protective covering, and the shell must be broken or punctured to get at the young bird within. From this it follows that the shell must be very strong, and it is also covered with color which allows of concealment of the egg. The nest is therefore a necessity, and the birds vary greatly in their methods of covering it. Some species do not use a nest at all, but lay their eggs on the ground, or, as is the case with some water birds, in the sand. The eggs are sometimes covered with a covering of coarse grasses, or, as among the moles, they are covered with a coating of mud. Others (as among the plovers, rails, and sandpipers) use grasses in covering the nest, while many of the birds (as among the strong-billed species) use grasses, moss, leaves, and even the feathers and down of the young bird. The Nest is a common place for the birds to roost, and many of them use it as a place of concealment from their enemies. Some species use it as a place of incubation, while others use it as a place of security for the young bird. Some species use it as a place of incubation and security for the young bird, and others use it as a place of incubation and security for the young bird. Some species use it as a place of incubation and security for the young bird, and others use it as a place of incubation and security for the young bird.
1. The Carrion Crow (Catharista atrata)
2. The King Vulture (Sarcorhamphus papa)
3. The Turkey Buzzard (Catharista aura)
4. The Plumbeous Vulture (Neophron plieatus)
5. The Condor (Sarcorhamphus gryphus)
the young for a period after they have hatched, greater or less according to their helplessness, which varies with the degree of organization. It is among birds of the highest organization, therefore, that complete and elaborate nests are alone to be found, because there only are they required as cradles and homes for the young.

The seafowl, such as penguins and auks, make no nest whatever, depositing only a single egg on some cliff-ledge or sea-islet, almost inaccessible to enemies, and covering it with their webbed wings, which serve the same purpose as cradles, when it is immediately ready to go into the water and fish for itself. The great company of shore-breeding birds, gulls, sandpipers, etc., need do nothing more than scrape a smooth hollow among the pebbles or sea-wrack where their eggs may lie close together and not roll or be blown away. The waterfowl — rails, ducks, pelicans and other, — seeking the greater seclusion of marshes and swamps, must do a little better, making a firm raised bed of earth with a covering of grass or down and a lining of reeds, etc., to keep their eggs out of the mud or water. Some of these, as the herons, cor-morants and the like, have learned to make their homes in bushes and trees, and these are likely to be rather more substantial than those on the ground, to prevent their falling to pieces in the swaying of the branches, or dropping the eggs over the side or through the bottom. Similarly the great tribe of ratite, limicoline and game-birds, which breed inland on the ground, do not make nests in such sense as are those of the song-birds, but mere beds for the eggs, since these are all Precoces, or Nidifuga, that is, of those whose chicks run about as soon as they hatch.

The higher families of birds, however, called Altrices or Nidicola (but more convenient terms for these classes are found in the words "independent" and "dependent," respectively), must safeguard and nourish their young for a period after birth from the egg, and these must make a home for them, which shall be durable and of such a form and finish as shall protect the helpless young from bad weather, observation and attack, and prevent their falling out. These objects are attained in various ways, but in many cases seem to be almost perfectly accomplished, and the nests resulting have added to them the finish of great beauty. Some birds' nests are marvels of skill, ingenuity and adornment; while others, perhaps made by nearly related species, are rude or slovenly.

Classifying Nests.—Several of the earlier writers on ornithology have attempted to classify birds according to their modes of nest-building. Such attempts are not without value, but they are purely artificial and of no use to the systematic ornithologist. The classification of nests may take account of their situation, means of support, shape, materials or other characters, or of two or more of these. Taking the first-mentioned consideration as a basis we may group birds into many such as the kingfisher and the sand-martin; mound-builders, like the brush-turkey and scrub-pleasants of Australia; masons, which use a sort of mortar of earth or clay, including several swallows and allied birds, etc. One of the most distinctive categories is that of the borers, such as the woodpeckers and their relatives, which carve out tunnels and chambers in the trunks of trees as breeding-places. Many of the terms employed in nest classification are useful for descriptive purposes. Such are platform-nests, basket-nests, pencil nests, etc., or, in the names of birds, weavers, tailors, felt-makers, etc. As a general rule birds of the same family or lesser group will agree pretty well in their style of nidification; but there are many exceptions, as, for example, the North American tyrant-flycatchers, among which a remarkable diversity of style in architecture exists.

Methods of Construction.—Birds choose for their nests the material of that kind to which they are habituated which lies nearest; and if it cannot be found will seek a good substitute, so that the nests of birds whose specific range covers a wide region will be found varied greatly and often much improved in some localities. Similarly the builders are likely to change the form of nesting places, laying in trees in wooded regions and on the ground or rocks where trees are absent. In this way certain birds have greatly modified their nesting habits since the civilization of their habitats — that is, the ground on the ground, others in bushes or trees; and it is hard to say which is to be considered the normal method.

A bird's nest sometimes forms an immense mass, as is the case with the birds of prey, crows, or herons, one of which, the umbrelle of central Africa, makes a home large enough to fill a dumping-cart. Such great structures are likely to be used many years in succession; but few small nests last the winter. The nests of closely related birds may vary considerably. In many families, as, notably, in the Fringillidae, some species nest on the ground, others in bushes or trees; and it is hard to say which is to be considered the normal method.
mitted to do little but bring materials which are often rejected by the industrious builder. While nest, especially of the smaller kinds of birds, separate into pairs and seek secluded places for their homes, others breed gregariously, as is the custom of many seawolf and most herons, pelicans, etc. Some of the land's storks, the yellow-billed, betray a tendency toward this; but the most remarkable case is that of the African social weaver-birds (q.v.), which actually build a roof in common, beneath which each pair of the flock establishes its individual dwelling. Thus strictly community life does not occur elsewhere among birds, although cases of commensalism are occasional.

**Edible Nests.**—Few birds' nests serve any human utility, though many are utilized by other members of the animal kingdom. One, however, is valuable as food. This is the nest of the selangane (Collocaia fusiphaga) or of related species of swift or swiftlet of the Malay Archipelago, used as a delicacy by the Chinese. It has the same shape and size of a half teaspoon, is attached to the rock in the interior of a cave and has the appearance of fibrous gelatine or isinglass. It is composed of a mucilaginous substance secreted by special glands, and is not as was formerly thought made from a glutinous seaweed. The caves in which these swifts dwell in crowds are numerous in northern Sumatra and in Borneo, especially near the north end of the island, and are in most cases the property of wealthy owners, who get a large annual income from the hazardous occupation of securing the nests, which can be done only by climbing about the interior of the great sea-caves, holding torches and raking off the nests into little bags hung upon the end of the pike-poles. The best, which are whitish in color, and almost free from any mixture with the pure glutine from the glands in the mouth of the bird, are worth $10 to $15 a pound.

Among works dealing with the subject of birds' nests are Rennie, 'Architecture of Birds' (London 1831); Wood, 'Homes Without Hands' (New York 1865); Pycraft, 'Infancy of Animals' (New York 1913). Special books for the United States and Canada are Beudin, 'Life Histories of North American Birds' (with colored plates of eggs, Washington 1892–95); Davie, 'Nests and Eggs of North American Birds' (Columbus, Ohio 1898); Reed, 'North American Birds' Eggs' (New York 1904); Ingensoll, 'Primer of Bird Study' (New York 1915).

**ERNST INGERSOLL.**

**BIRDS, Plants Attractive to.** Certain trees, shrubs and herbaceous plants bear fruits which afford food for birds. These have been discovered by observation, and by the scientific examination of the contents of birds' stomachs. By planting those species, therefore, which have been proved most desirable and that are suited to the climate and soil of the chosen location, birds can be attracted to the vicinity of dwelling-houses or to any other desired spot as a copse or shrubbbery; or, on the other hand, some valuable orchards, since they fortunately appear to like best arid, bitter, sour or aromatic fruits, distasteful to human beings, even better than the cultivated kinds.

Moreover, these bird-attracting plants are apt to be ornamental as well, since many have pretty fruits, red in color and often clinging to their branches far into the winter, furnishing grateful additions to the meagre fare of the hard-weather birds. Among the most frequented trees are the various wild cherries (Prunus); trash tree (Schinus); pepperidge (Nyssa); China-tree (Melia); pines (Pinus); oak (Quercus); magnolias (Magnolia); apples (Acer); manzanita (Arctostaphylos); cedars and junipers (Juniperus); hollies (Ilex); mountain ashes (Pyrus); hackberrys (Celtis); sassafras (Sassafras) and thorns (Crataegus). The mulberry (Morus) is the prime favorite, and the tree most used for tolling the birds away from cultivated fruits.

For shrubbry, one can plant with success all of the ordinary edible small fruits and berries besides the elders (Sambucus); service (—) or juneberries (Amelanchier); wild roses (Rosa); snowberries (Symphoricarpos); sumach (Rhus); spicebush (Benzoin); pokewerry (Phytolacca); coralberry (Arctostaphylos); silverberry (Elaegnus); buffal berry (Shepherdia); buckthorn (Rhamnus); bayberries (Myrica); black-alder (Ilex); viburnums (Viburnum); bluewood (Cordial); lotebush (Ziziphus); firethorn (Cotoneaster); ndeckway (Eleptia); barberry (Berberis); and a number of others.

Climbing plants can also be utilized, among them the wild grapes (Vitis); Virginia creeper (Psedera); bittersweet (Celastrus); hog-peanut (Falcula) and milk-vetch (Astragalus).

The many sparrows feed chiefly on weed seeds, but more acceptable plants from the gardener's point of view can be offered to them, such as the various so-called millets (Panicum, Setaria, Elesin); princes' feather (Amaranthus Polygounum); chamomiles, white and yellow (Anthemis); California poppy (Escholtzia); tarweed (Madia); bachelor's buttons (Centaurea) and the like. Wild ducks are attracted by several aquatic and semi-aquatic plants, among the most important being the wild rice (Zizania); the wild celery, or tagegrass (Vahlnera); various pondweeds (Potomageon) and arrowheads, also called wapato and the Delta duck potato (Sagittaria). The wild mullet (Echnochloa) and chufa tubers (Cyperus) also afford them food. Consult Kennard, H., 'List of Trees, Shrubs, Vines and Herbaceous Plants, native to New England, bearing fruit or seeds attractive to Birds' (Reprint from Bird-Lore, Vol. XIV, No. 4, 1912); McAtee, W. L., 'Plants useful to attract Birds and protect Fruit' (Reprint from 'Yearbook of Agriculture' 1896); also many pamphlets, farmers' bulletins, circulars and reports published by the United States Department of Agriculture, and Bureau of Biological Survey.

**HELEN INGERSOLL.**

**BIRDS, Protection of.** During all the early history of this country little or no attention was paid to the destruction of birds or other wild animals. Probably the earliest law on the subject was one passed in Massachusetts in 1817, establishing closed seasons for certain animals and birds shot as game. It was not
BIRDS

until many years later that any protection was
thrown over small birds, even in New England.
About 1880 it began to be fashionable for
women to adorn their hats and other decorat-
ive garments with the feathers of birds, and
the whole world was ransacked for fine feath-
ers. The enormous destruction of birds-
life large and small that ensued pained bird-
lovers and humane persons, and alarmed econo-
mists, who understood the immensely beneficial
service birds did in aiding to keep down the
hordes of injurious insects that preyed on our
grain fields, orchards and gardens. Societies for
bird-protection were organized in Great Britain
and on the continent of Europe, and in the
United States Audubon societies came into
existence, and exerted a powerful and perman-
ent influence, as described elsewhere (see
AUDUBON SOCIETIES). The result of this was
to discourage the wearing of feather-ornaments,
and the restriction of the local supply, by laws
passed in most of the States prohibiting the
killing of game-birds and wild fowl except dur-
ing the seasons of the year; and the pro-
hibition of the killing, or destruction of their
eggs, of all other birds, with a few exceptions,
such as some hawks, the crow, etc., regarded
as injurious. With these laws behind them the
Audubon societies and other friends of the
birds were able to punish wanton shooting and
trapping, guard breeding-colonies of herons
(especially the egrets), gulls, terns and wild-
fowl; and to carry out plans, now widely use-
ful, for education of the young in the interest
and value of birds, and regard for them and
for other native animals. In this way the de-
struction of birds for millinery use was largely
stopped; but in order to complete the reform
greater co-operation with foreign efforts in the
same direction was needed. This was seen to
be a matter of Federal action, and first resulted
in the United States Statute of 4 March 1909,
known as the Lacey Act. This prohibited the
importation into the United States of any bird
or other animal declared by the Secretary of
Agriculture to be injurious; and forbade com-
mon carriers handling or transporting any such
animals, or their dead bodies, or parts thereof,
or any animals killed in, or shipped from, any
State in violation of the laws. This prevented
would-be evaders taking ad-
vantage of inequalities between the States as to
"open seasons" for game.

This inequality among State laws as to the
periods when shooting was permitted was the
cause of continual dissatisfaction and evil, espe-
cially as to ducks, geese and shore-birds,
during their annual migrations between the
tropics and their northern breeding-places; the
open season for them began early in the South
and extended late in the North, so that the
intent of various local laws was practically
nullified, and this class of birds was threatened
with extinction. After a long campaign of
effort Congress came to adopt the theory that
the migratory birds, being in most cases mere
travelers across States, were not local residents
nor State property, but belonged to the people
at large; and if they were to be saved to the
people the national authority must intervene.
Congress, therefore, passed (4 March 1913) the
Migratory Bird Law, popularly known as the
McLean Law in compliment to its foremost
promoter, Senator McLean of Connecticut, the
gist of which is as follows:

"All wild geese, wild swans, brant, wild ducks, snipe,
plover, woodcock, rail, wild pigeons, and all other migratory
and insectivorous birds which in their northern and
southern migrations pass through or do not reside by
natura lly the entire year within the borders of any State or
Territory, shall be had or taken to be with the customary
and protection of the Government of the United States, and
shall not be destroyed or taken contrary to regulations
hereinafter providing therefor. The said regulation
is hereby authorised and directed to adopt suitable
regulations to give effect to the previous paragraph."

These regulations have been issued in suc-
cessive bulletins by the Biological Bureau of
the Department of Agriculture, with slight
changes from year to year. The most impor-
tant effect of this law — and a very far-reaching
benefit — is stoppage of the shooting of wild
fowl in the spring, an evil especially prevalent
in the Mississippi Valley.

The well-disposed people of Canada had
been equally active in bird-protection with
those of the United States, but met with the
similar difficulty of inequality of laws between
their provinces; furthermore both countries
were hampered by gunners and dealers shoot-
ing and trafficking more or less illegally across
the border. It was perceived after the passage
of the Migratory Bird Law in 1913 that its full
purpose could not be realized in the United
States, or availed of by the Canadians, except
by co-operation. This resulted, after much effort,
in formulating a "convention" or treaty be-
tween this country and Great Britain (for Can-
da), which unified the protective laws of both
countries. This treaty was perfected in the
autumn of 1916 and proclaimed by the Presi-
dent on 8 December; and several months later
Congress passed an "enabling act," giving power
and money to the designated officials to
enforce its observance, as Canada had pre-
viously done for its side of the border. This
treaty incorporates the substance of the Migrat-
ory Bird Law; declares that the close season
on migratory game birds shall be between 10
March and 1 September (except for shore-birds
along the northeastern coast, for which the close
season shall be 1 February to 15 August); pro-
bids the killing, capture, or destruction of
eggs of all migratory song-birds at any time
(with certain special local provisions and ex-
ceptions); and establishes prohibitory regula-
tions in regard to international commerce in
game or other birds. Consult Forbush, Use-
ful Birds and Their Protection (Boston 1908),
and publications of the United States Depart-
ment of Agriculture (Biological Survey), Re-
ports of Game Commissions of the various
States and provinces and reports and publica-
tions of the National Association of Audubon
Societies (New York).

ERNST INGERSOLL.

BIRDS. The, a play by Aristophanes, first
performed in 414 B.C. The happy thought of
the Birds is the establishment of Cloud Cuckoo
town or Nephelococcygia, a city in mid-air,
in order to starve out the gods by cutting their
communication with the earth and restore to
the birds their rightful sovereignty. It was
produced at the time of the Sicilian expedi-
tion. But the traces which some modern
critics have detected of admonitory satire of
that overambitious project are very faint and
nebulous. The fleet had sailed, and even an Athenian audience would hardly have tolerated unpatriotic and ill-omened ridicule of an enterprise to which the entire power and the future of the state were pledged. The comedy is then in the main a pure pantasia into which Aristophanes has distilled the quintessence of all the bird vocabulary, the bird lore, the bird mythology, the bird poetry of the Greeks.

Plausible and Hopeful, with a raven and a jackdaw as guides are wandering in quest of some quieter city than litigious and party-ridden Athens. They knock at the doors of birdland and a long beaked runner bird “opens the wood” and admits them to the presence of King Hoopoe, the hero of Sophocles’ recent tragedy. They have so to speak gone “through the looking glass.”

After some preliminary badinage, the great thought of the foundation of Bird City strikes Plausible. Hoopoe, in a lovely lyric summons his mate, the nightingale, whose answering song is represented by a flute solo, and calls all the birds to council. The chorus of birds come fluttering, twittering and hopping in, amid the scurrilous comments of Plausible and Hopeful. They are at first very angry with Hoopoe for entertaining their enemy, man. The threatened conflict is resolved by the usual compromise and there follows a set debate on the magnificent new project submitted to them by the two strangers from wise Hellas. The birds are won over by Plausible’s denunciations of the usurpations of the Olympians that have robbed them of their ancient prerogatives. The birds themselves expand and develop this theme in the magnificent anapaests amusingly paraphrased by Court hope in his charming “Paradise of Birds.”

“We wish to declare how the birds of the air
All high institutions designed.
And holding in awe art, science and law.
Delivered the same to mankind.”

Matthew Arnold’s Poor Mathias draws its inspiration from the same source.

“Was it as the Grecian sings
Birds were born the first of things?”

Andrew Lang transposes it into the key of savage ethnology in his ‘Barbarous Bird Gods.’

“...we would have you to wit that on eggs though we sit and are spiked on the spot, and are baked in the pan.
Birds are older by far than your ancestors are, and made love and made war ere the making of man.”

Swinburne translates it to show, how nearly English anapaests match the resonant harmonies of the Greek.

“Come on then ye dwellers by nature in darkness and like the leaves generations.
That are little of might, that are moulded of mire, unenduring and shadow-like nations.”

The plan once accepted, execution follows with magic celerity. The birds discover in themselves all needful capacities and resources.

“There came a body of thirty thousand cranes
With stones from Africa in their claws and gizzards,
Which the stone curlews and stone chattersers
Were by the shape and finished.
The sand martens
And mud larks too were busy in their department.
Mixing the mortar while the water birds
As fast as it was needed brought the water.”

After the realization of the happy thought the last half of the comedy as usual illustrates its consequences in a series of farcical scenes.

The new colony is visited by every type of ambitious, designing projector and faker in Greece. And Plausible’s dealings with the petitions and the pretensions of the poet, the priest, the political syren, the sophist, and designer of the city beautiful, afford material for so many scenes of parody, buffoonery and farce. Prometheus comes in camouflaged by an umbrella from the thunder bolts of Zeus. Winged Iris, messenger of the Homeric gods, in the role of a saucy soubrette is arrested and brought in by the guard for “flying about in other peoples’ chaos.” And her threats to tell “Pa Zeus” on them are answered by Plausible in terrific strains of more than Eschylean sublimity. Finally a deception from the gods headed by Neptune and Heracles appears to treat for terms of peace. Heracles, the glutton, and shirt-sleeve diplomatist, cannot resist the savor of a dish of rebel squabs which Plausible is ostentatiously preparing and he concedes a peace that yields to the birds the beautiful maiden Sovereignty herself. A riotous celebration of the marriage of Plausible and Sovereignty furnishes the motive of the song and dance and revelry of the concluding scenes.

There is an interesting account of a modern performance of the play at Cambridge, England, by Jebb in the Fortnightly Review 41, 88.

Paul Scorey,
Head of Greek Department, University of Chicago.

BIRDS, Vision of. See EYESIGHT IN THE LOWER ANIMALS.

BIRDS OF AMERICA, The, the monumental work of John James Audubon, the great American naturalist, first published in England between the years 1827 and 1838. It contained colored illustrations of 1,065 species of birds. The text is descriptive of the habits and manners of the birds observed by Audubon himself in his long wanderings over the North American continent.

BIRD’S-EYE LIMESTONE, one of the subgroups into which the Lower Silurian has been divided by New York State geologists, now called Lowville Limestone, in which the crystallized corals of the genus Tetradium appear as whitish points. The maximum thickness is 30 feet but is generally not over 20 feet. The rock is a fine-grained limestone, generally of a dove color and when free from the whitish points, or “eyes,” is used as a secondary grade of lithographic stone. A tribolite (Ba-thyurus extans) is a characteristic fossi of the Lowville limestone.

BIRD’S-FOOT, (Ornithopus), a genus of about seven species of small slender pinnate-leaved, white, pink or yellow flowered annual herbs of the natural order Leguminosae. The common and generic names were suggested by the shape of the articulated, cylindrical pods which resemble the bent claws of a bird. The principal species, O. sainius, is used as a forage plant. It is a member of the sub-family Papilioneae of the Leguminosae. A small plant of this genus (O. perianthus), having yellow flowers streaked with red, is common in Great Britain and on the continent.
