BULGARIA, bul-gär'ē-ə, a Balkan state, an independent kingdom of the Balkan Peninsula (q.v.), southeastern Europe. Bulgaria is bounded on the north by the Danube and Rumania; on the east by the Black Sea; on the south by Turkey and the Aegean Sea; and on the west by Serbia and Greece. Before the Balkan Wars (q.v.) in 1912-13 the estimated area of the country was 24,380 square miles, and of South Bulgaria (formerly Eastern Rumelia) 13,700 square miles, total 38,080 square miles. According to the census of 1900 the total population was 3,744,283; in 1906, 4,028,260; in 1910, 4,337,516. By the Treaty of London (30 May 1913) Bulgaria had gained a large amount of territory from Turkey, but being discontented with her share, she turned against her former allies (29 June 1913) and was severely defeated in the second Balkan War and in consequence lost much of what she had won. Rumania intervened and acquired about 2,900 square miles of territory. Bulgaria finally secured only about 10,000 square miles from Turkey, while she lost nearly 3,000 square miles of her own territory to Rumania, with a population of about 273,000. Balkan statistics, however, should be accepted with considerable reserve, as it is rare to find any two authorities in agreement. The most recent figures obtainable give the kingdom of Bulgaria an area of 43,320 square miles, and a total population of 4,607,000, made up of Bulgarians, Turks, Rumanians, Greeks, Serbs, Gypsies, Jews, Russians, Germans and other nationalities. Before 1913 Bulgaria was divided into 12 districts, Saint Zagora, Bourgas, Vidin, Philippopolis, Varna, Rustchuk, Tarnovo, Choumen, Pleven, Sofia, Rustendil and Vratza. The capital is Sofia (q.v.), with a population of 103,000; other chief towns are Philippopolis, Varna, Rustchuk, Slivno, Shumla and Plevna.

Soil, Climate, Industry.—The surface of Old Bulgaria is a gradually sloping plain, broken by occasional mountains, which give rise to rapid tributaries of the Danube. The Balkan Mountains or Stara Planina are described under Balkan Peninsula and Balkan Mountains. There is little mining, although the mountains are rich in minerals, iron, gold, silver, manganese and copper. The soil is excellent and the slopes of the mountains are richly wooded. The climate is healthy, and the country enjoys the reputation of possessing more centenarians than any other in Europe. People stated to be 105 to 125 years of age are not uncommon, though it is not improbable that such remarkable longevity may be due rather to unreliable records and memories than to any virtues of climate. Over 70 per cent of the people are engaged in agriculture and most of them own freehold plots on which they pay a small land tax, while they enjoy free rights over communal grazing and timber lands. A considerable quantity of grain, chiefly wheat, is exported; fruit and vegetables are raised in abundance; roses are largely cultivated for the production of the attar, which is exported at the value of $1,500,000 per annum. Wine is plentiful and cheap; silkworms are bred in some regions and tobacco forms an important crop. Stone quarries and government coal mines are in operation; domestic industries are chiefly carpets, hosiery, woolen and cotton goods and ribbons. The highways are still in a backward condition; most of the traffic is carried on by the rivers, and export trade by the Black Sea ports of Varna and Bourgas; passenger and merchant steamers run between Varna and Constantinople (150 miles). Rustchuk, Vidin and Sistova are the chief Danube ports. There is a railroad system of nearly 1,500 miles in the kingdom; Sofia is connected with the general European system, and several new lines are projected or are in course of construction, one to run from the Danube to the Aegean Sea. The National Bank of Bulgaria (capital, $4,000,000) has over 60 branches; there is also a State Agricultural Bank, and a French, a German and an Austrian bank. On 1 April 1916 Bulgaria abolished the Julian calendar (old style), which is 13 days behind ours, and adopted the Gregorian calendar. Statistics of 1914 showed the Bulgarian revenue as $51,399,000; in 1915, $55,135,975; expenditure, 1914, $51,352,520; in 1915, $53,078,240; national debt, 1915, $231,496,540. Imports, 1914, $44,586,860; exports, 1914, $28,813,372.

Government.—Bulgaria is a constitutional monarchy. Legislative authority is vested in the Sobranje, a national assembly consisting of only one chamber, to which members are elected at the rate of one representative to every 20,000 of the population. The members are paid for their services; elections are held every four years unless the Sobranje is dissolved by the King before the expiration of its term. With certain exceptions every man over 30 is eligible. For decisions concerning highly important matters of state the Sobranje is doubled by special election and resolved into a "Grand Sobranje." The cabinet is composed of
eight ministers appointed by the King; they hold the usual portfolios—premier, finance, war, etc.

Bulgaria

The national religion of Bulgaria is the same as that of the orthodox Greek Church, but it is independent of that body. Over 75% of the population belong to that faith; the remainder are Mohammedans, Jews, Roman Catholics, Protestants and Gregorian Armenians, whose ancestors seceded from the Greek Church in the 5th century. The University of Sofia is open to women as well as men; the state subsidizes education, which is obligatory and free to those who cannot pay for it. There are also Greek, Turkish, American, Jewish, French, Armenian and German schools, and education is further promoted by free libraries, museums and technical schools.

Military Service.—Despite its small population, Bulgaria possesses a large and efficient army. It gave a good account of itself in the Serbian War of 1885, and a still better one in the Balkan Wars. Recruiting is by conscription; Moslems are exempt on payment of a tax of $100 each. Every other Bulgarian subject is liable to 26 years' service, and the army is composed of many different races. Besides the pure-bred Bulgars, there are Turks, who cannot pay the tax, Pomakes (settlers and nomads), Jews ("Spanioles" and Poles), Serbs, Greeks, Kumanians, Armenians, Gypsies, Circassians, and naturalized Russians, Germans and Levantines. The army actually dates from January 1878. From 1389, when the Turks defeated the Slav allies, till 1878, the Bulgarians, as Christian subjects of Turkey, had been exempt from military service. The soldiers are well-trained, though hard-worked, and very particular attention is paid to their spiritual welfare. Should a regiment contain but one Jew and one Mohammedan, a rabbi and a dervish are provided. The barracks are comfortably built and equipped with appliances calculated to promote the health of the troops. Large mirrors and framed pictures adorn the walls; drunkenness is practically unknown, and little smoking is indulged in. The Bulgarian officer takes his profession seriously, working and drinking hard with dogged pertinacity and living within his income. The basis of the army's theoretical teaching and science is German; drill, ranks and names are Russian. The corps of reserve officers—about 3,000—is composed of merchants, lawyers, teachers, etc. There is a military academy at Sofia. The war strength of the army is considerably over 300,000. A few gunboats and about a dozen small steamers make up Bulgaria's floating strength.

History.—The Bulgarians were originally a Tartar nation, which in the 4th century settled on the Volga. The ruins of their former capital may still be seen in the neighborhood of Kazan. Their kingdom, which occupied a part of the Asiatic Sarmatia of the Greeks, was carved out by the Bulgars under Peter of Orenburg. They afterward removed to the countries between the Bug and the Danube and called their territories Second Bulgaria. The first Bulgarian kingdom south of the Danube was founded in the latter half of the 7th century, but the Bulgarians who established it were comparatively few in number, and after their adoption of Christianity in the 9th century they became completely mixed up with the Slavic inhabitants, though the whole became known as Bulgarians. The western ruler of this kingdom was Symeon (888-927), who subjugated the greater part of the peninsula and raised the Archbishop of Bulgaria to a position independent of the Patriarch of Constantinople. Under the son of Symeon his empire fell to pieces. The western half broke off and formed a separate kingdom with Ohrida in Macedonia for its capital; and the eastern portion was subdued by the Byzantine Emperor, John Zimisces, who reorganized it with the empire. The western Bulgarian kingdom existed only till about 1018, when it also was subdued by Basil II, "the slayer of the Bulgarians." Toward the end of the 12th century, however, the Bulgarians revolted and managed to establish a third kingdom between the Balkan range and the Danube, which, sometimes weak and sometimes powerful, continued to exist till the advent of the Turks. The last ruler of this kingdom was conquered by Bajazet I about 1390, and for nearly 500 years the Turks ruled supreme in Bulgaria. An account of the atrocities of the Turkish soldiers, an inscription broke out. Russia took the part of Bulgaria against Turkey, and the war of 1877-78 followed. (See BATAK). By the first article of the Treaty of Berlin, 13 July 1878, the principality of Bulgaria was constituted, made tributary to Turkey and placed under the suzerainty of the Sultan. In 1879, Alexander of Battenberg, a German prince, was chosen sovereign of part of Bulgaria, the rest being made a separate province, called Eastern Rumelia, to prevent Bulgaria from becoming a strong state. In 1885 there was a revolution in Eastern Rumelia, which annexed itself to Bulgaria.

The annexation of Eastern Rumelia led to a quarrel with Russia; Tsar Alexander III withdrew all Russian officers who had been training the Bulgarian army and were still serving in it. King Milan of Serbia considered the moment ripe to realize the territorial aspirations of his country and declared war on Bulgaria, 14 Nov. 1885. (See SERVICES, BULGARIAN WAR). After a short struggle, the Bulgarians were defeated but saved from extinction by the intervention of Austria. Russian and Bulgarian conspirators abducted Prince Alexander and set up a government under Russian tutelage. A counter-revolution, headed by Stambuloff (v.g.), succeeded in restoring the Prince within a few days. Unfortunately Alexander made a false move when he telegraphed to the Tsar and offered to resign his crown into Russian hands. This step turned Bulgarian opinion against him; he was compelled to abdicate and leave the country on 9 Sept. 1886. For 11 months Bulgaria remained without a ruler, its affairs being managed by a regency under the leadership of Stambuloff. This statesman, an innkeeper's son, was a rude, violent man, of uncouth manners and incoherent patriotism. He had been largely responsible for throwing off the Turkish yoke, and now fought strenuously to resist the aggression of Russia. The Russian candidate for the throne was rejected and a Prince of Denmark was proposed to whom it was offered, refused the honor. Stambuloff sent a commission round the Euro-
pean capitals to find a prince for the vacant post. Their choice eventually fell upon Prince Ferdinand of Saxe-Coburg-Gotha, son of Prince Augustus of Saxony, and a great-grandnephew of King Louis Philippe of France. At the time of his election (7 July 1887), Prince Ferdinand was 26 and an officer in the Austrian Hussars. The task that lay before him was difficult and the enterprise most precarious. Though he never achieved the popularly of his predecessor, the new Prince brought his undoubted ability and ambition to the regeneration of Bulgaria. Aided by Stambuloff, who, like Bismarck, was the master of his sovereign, Ferdinand produced order from chaos with an iron hand. None of the Powers would recognize him, and it took nine years before he succeeded in wearing down the antagonism of those within and without his domain. He cultivated the friendship of Turkey and Rumania and combated the Russian influence permeating Bulgaria. It would perhaps be more correct to ascribe the strong anti-Russian policy to Stambuloff rather than to the Prince; the former was the forter in re to the suaviter in modo of the latter. With but one purpose in mind, however—Stambuloff labored ruthlessly and mercilessly for a master whom he despised, whom he would neither flatter nor betray. Stambuloff cared nothing for the man; only for the nationality he represented. With Sery, self-sacrificing energy Stambuloff developed the resources of his country—railways, financial reform, education—creating an efficient army and fostering every type of commerce and industry. During the seven years that Prince Ferdinand and his Minister "worked together" their personal relations grew from bad to worse, developing into sincere hatred. By describing his conduct in an official communication as "infamous," Prince Ferdinand goaded Stambuloff into resignation in 1894. Stambuloff's request that he be permitted to visit a foreign health resort was refused. He made a public declaration that he would be murdered, and on 15 July 1895 his prognostication was fulfilled; he was murdered, and mutineers took the fortifications and deserted the presence of the police. One of his hands, which was cut off in the struggle, is said to be still preserved in his home, to be buried on the day when his murder is avenged.

From the moment of Stambuloff's resignation Prince Ferdinand took the reins into his own hands. For the next 10 years a succession of premiers wrestled with the chaotic finances of the country and the thorny question of Macedonia. Efforts were made to establish friendly relations with Russia and Austria. Prince Ferdinand's eldest son, Boris (b. 30 Jan. 1894) had been baptized a Roman Catholic, the religion of his parents; at the age of two he was rebaptized and received into the Orthodox Greek Church, the Tsar standing as his sponsor. Russia then recognized Prince Ferdinand, and the other Powers followed suit. The Ministry for Public Works in Stambuloff's last cabinet (1892-94) was a Bulgarian journalist, M. Petkoff, who had previously been mayor of Sofia. Wallis was talking with Stambuloff at the time the latter was murdered. In 1903 General Petroff became Premier, and Petkoff joined the cabinet as Minister of the Interior. On the resignation of General Petloff (5 Nov. 1906), M. Petkoff was called to the helm of Bulgarian affairs. He belonged to the party known as the Demokrat, a dissatisfied section of the Liberals, distinguished by its indelible hostility to Russian influence in the Balkans. Less than five months (11 March 1907) later, Petkoff was shot dead on the street by a dismissed employee of the Agricultural Bank. The accession of Count von Aehrenthal (q.v.) as Austrian Foreign Minister in October 1906 was destined profoundly to influence Balkan affairs, and especially those of Bulgaria. For many years Bulgaria had been begging the Powers to relieve her of the burden of the "Capitulations," a relic of Turkish rule. According to these rules, a foreign subject could not be arrested except in the presence of a kavass, dragoman or some other consular official, or tried without similar supervision. Practically all the other Powers had signified their readiness to abolish the Capitulations if consent thereto could be obtained from every one of them. Austria-Hungary, however, had hitherto always objected to any change. Within a month of taking office, Count von Aehrenthal rendered the Tsar of Bulgaria, which cost Austria nothing and yet laid the principality under a great obligation. By this simple stroke the dual monarchy assured to itself the warm sympathy of Bulgaria to an extent long absent from their relations. For 10 years it had been the policy of Count Goluchowski (Aehrenthal's predecessor) to play off the Slav against the non-Slav Balkan States, e.g., Greece and Rumania against Bulgaria and Serbia, inclining toward the former and treating the latter in a magisterial manner that aroused bitter resentment. Austria's "graceful concession" paved the way for two important events profitable to both parties. Having gained the goodwill of Bulgaria, Austro-Hungary, despite the fierce opposition of Serbia, to Prince Ferdinand, the removal of the Capitulations was the first step toward the realization of his larger policy—complete independence from Turkey in the Balkans, and a royal crown. In September 1908, Prince Ferdinand was received with royal honors at Budapest; 12 days later (5 October) Bulgarian independence was proclaimed and the Prince took the title of Tsar of Bulgaria; two days later Emperor Francis Joseph issued a proclamation that Austro-Hungarian sovereignty was extended to Bosnia and Herzegovina. The moment was well chosen; the Young Turk revolution had just achieved its object; the Committee of Union and Progress ruled in Constantinople, and there seemed every prospect of Turkey becoming a united and enlightened nation, strong to reassert her claims on Bosnia-Herzegovina and suzerainty over Bulgaria. Shadowy indeed those claims were, for public opinion in western Europe had long ceased to consider them valid. The fact that Tarnovo (Tnovo) was chosen as the scene of the proclamation of the re-establishment of the Bulgarian kingdom added to the dramatic interest of the situation, for no portion of the Bulgarian soil is so intimately associated with the most stirring events of the national history. The church of the Forty Martyrs, wherein the Prince read the proclamation, was built in 1230.
by John Asen, "Tsar and Autocrat of the Bulgarians," whose inscription on one of the pillars reads: "I smote the Greek army . . . and all lands have I conquered, from Adri- anople to Durazzo, from Rumania to the Servian land." Here the Bulgarian Tsars were crowned and buried, and many inscriptions of those times still adorn the walls. Turkey claimed $24,000,000 as compensation; Bulgaria offered $7,600,000. An agreement was arrived at through the intermediary of Russia, who advanced most of the money; in April 1909, the Powers recognized Bulgaria as an independent, sovereign state.

The next important event in the history of Bulgaria was the formation of the Balkan League (q.v.) and the Balkan Wars in 1912 and 1913. However much Bulgaria was to blame for the second war, the Treaty of Bucharest (10 Aug. 1913), imposed upon her by Serbia, Montenegro, Rumania and Greece, was a colossal blunder on the part of those who dictated it. It left Bulgaria sullen and dissatisfied, and robbed her of the fruits of her early victories. She failed to receive any part of that district of Macedonia inhabited chiefly by Bulgarians. Serbia had obtained her spoils, and Rumania had rectified her frontier at Bulgaria's expense. This legitimate grievance was destined to affect the course of the great European War (q.v.) that broke out a year later. The sympathies of Rumania were with the Allies, but she could not enter the war without an understanding with Bulgaria. On behalf of Greece, M. Venizelos had promised the support of his country to Great Britain and France if the necessity should arise. In a communication to King Constantine (11 Jan. 1915) he pointed out that, if Greece allowed Serbia to be crushed to-day . . . we should have to submit to the disturbance of the Balkan equilibrium in favor of Bulgaria, who, thus strengthened, would either now or some time hence be in a position to attack us, when we should be entirely without either a friend or an ally." He proposed to make "adequate concessions" to Bulgaria; but he confessed, "on account of Bulgaria's greed, it is not at all certain that whatever can be done shall be able to satisfy her . . ." There was every indication that Bulgaria might have been won for the Allies had her price been paid, as her most distinguished generals favored a Russian alliance; but nothing was done to conciliate her. The Bulgarian Premier, M. Radoslavoff, declared in July and again in August that Bulgaria was prepared to enter the war as soon as she received the necessary guarantees. But the Russian disaster in the Carpathians and the failure of the Dardanelles campaign persuaded King Ferdinand that by joining Germany and Austria he would be on the winning side. A secret treaty was signed about 17 July 1915 between Bulgaria, Germany, Austria and Turkey. Bulgaria was promised help from the Triple Alliance in the event of Serbian Macedonia with Salonica and Epirus thrown in. During September began the Austro-German advance that was to deal the final blow to Serbia. On the 21st M. Venizelos asked the Allies for 150,000 men; they were promised on the 24th, and Greece began mobilizing. Bulgaria was also mobilizing; a deputation of ex-ministers waited on the King and warned him against joining the Central Powers. Serbia proposed on the 27th to attack Bulgaria, as the presence of German and Austrian officers in Sofia looked suspicious, but Great Britain opposed the plan, apparently the Albanians, and the Bulgarian declaration of "armed neutrality." Had the Serbians not counted till the last moment on Greece fulfilling her treaty obligations, it is probable that they would have disregarded the British advice. On the 3d of October the Russian government addressed a note to Bulgaria declaring that there was no longer any doubt as to the object of the present military preparations, and the Russian Minister was instructed to leave Sofia if the Bulgarian government did not "openly break with the enemies of the Slav cause and of Russia within 24 hours by sending away the officers belonging to the armies of states who are at war with the Powers of the Entente. An unsatisfactory reply led to a rupture of diplomatic relations, and Bulgaria formally entered the conflict on 5 Oct. 1915. On the 19th an imperial manifesto issued in Petrograd stated that "the Bulgarian troops have attacked our loyal ally Serbia, already bleeding in a struggle against a stronger enemy."

BULGARIAN LANGUAGE AND LITERATURE. Bulgaria and the adjacent districts of Macedonia are considered to have been the cradle of the old Slavic languages. The ancient Bulgarian language was the richest of them all, and was the scriptural language of the Greek-Slavic Church and the great medium of ecclesiastical literature in the ancient Slavic lands. The Russian language is said to have been molded by missionaries of the Greek Church sent from Bulgaria after the tenth century, while the future empire was still in a state of semi-barbarism. The Russian tongue has preserved many inflections which the Bulgarian has lost. After the overthrow of the Bulgarian kingdom at the end of the tenth century, the grammatical structure and purity of the language became impaired by mixture with the Wallachian, Albanian, Rumanian, Turco-Tartar and Greek vernaculars; and the modern Bulgarian language has only the nominative and vocative of the old Slavic case, and the rest being supplied by prepositions. It has an article, which is put after the word it qualifies, like that of the Albanians and Wallachians. Among ancient Bulgarian ecclesiastical literature must be mentioned the translations of the Bible by Cyril and Methodius, and the writings of John of Bulgaria in the 10th century. Grammars of the Bulgarian language have been published by Neofyt in 1835 and by Christiaki in the following year. Venelin, a young Russian scholar, sent to Bulgaria by the Russian archæographical commission, published in 1837 a grammar and two volumes of a history of the Bulgarians, but died while he was engaged in preparing a third volume. A new grammar was given to the public by Bobojev in 1845, and finally, in 1849, by the Rev. E. Riggs, an American missionary stationed at Smyrna, who also sent a Bulgarian translation of Gallaudet's 'Child's Book on the Soul' to New York. Dictionaries of the Bulgarian language have been compiled by Neofyt Rilski, who also published a work on education, and Stojanowicz. A Bulgarian version of the New Testament was printed at Smyrna in 1840 for the British and Foreign Bible Society. The Bulgarian national songs are numerous, and are similar to those of the Serbians. Gorokhovsky's collection of Slavic songs contains a number of Bulgarian songs. Bobojev has published several historical poems. Among more recent writers the poet Christo Boteff (d. 1876), who exercised a powerful influence on the national spirit, is regarded as one of the greatest poets Bulgaria has produced; while the poet-novelist Ivan Vazoff is the most popular author to-day. He is also a dramatist and was at one time a soldier and a revolutionary. His best works were written during the years of his exile in
BULGARIA

— BULKELEY

Russia and Rumania. Many are translated into English and other languages. Ivan Vaiikoff depicts peasant life and writes psychological romances; Mikhailov is a brilliant political journalist, a mystical poet and a satirist of French education; Aleko Constantinov was a lawyer, literary critic and translator of French and Russian masterpieces, and a humorist of a high order. Perhaps the greatest literary artist of all was Pencho Slaveikov, philosopher, poet and revolutionist, who died in 1912 by the hand of an assassin. Competent critics have designated him "the Bulgarian Shakespeare" on account of his beautiful language and deep insight into the mysteries of the soul. His mantle fell on the shoulders of Petko Toddoroff, dramatist, poet and philosopher. Velitchkov translated from Shakespeare, Molière and Dante; he fought against the Turks in his younger days and later held a government position. Tserkovsky is to Bulgaria what Burns was to Scotland, the bard of the peasantry. Among the younger poets there are P. Yavorov, K. Christoff, C. Botef and A. Strashimirov; the last is intensely national in the spirit of their works. Bulgaria can also boast of a number of writers in other spheres. In history, law, philosophy and economics, V. Zlatarsky, M. Danev, the well-known statesman, S. Radev and Stepan Botchev; D. Ivanoff is the Tolstoy of the Bulgarian short story and has all the grim realism of the Russian master. In the scientific field are Ivan Georgoff, D. Michalcitch, F. Neukov, G. Botchev and Stepan Petkov. Literary criticism has its representatives in B. Pennaf, Balabanoff, Kristeff and Ivan Shishmanoff. There are several literary societies and important reviews dealing with all aspects of human culture.

HENRY F. KLEIN,
Editorial Staff of The Americana.

BULGARIAN, bol-gair-in, Raddi Venediktovich, Russian author: b. Minsk 1789; d. 13 Sept. 1839. He served in the Russian army, but, finding himself neglected, in 1810 joined Napoleon. In 1812 he returned to Saint Petersburg where his writings attracted no-
tice by their intense satire and servility. In 1825 he started the Severnyaja Pchela (Northern Bee), a daily paper, which for long was alone permitted to discuss political questions. A zealous supporter of reaction and of absolutism, he enjoyed, through relations with the secret police, an unlimited power. He was a witty and versatile author who lived in travel, histories, novels and statistical works, even signing his own name to the work of N. A. Ivanoff, professor at Dorpat.

BULGARIS, bool-gair-ez, Demetrios, Greek statesman: b. Hydra 1803; d. Athens, 11 Jan. 1878. While a young man he held office in his native city and agor, and his most notable act was the Grecian war for independence. In 1831, after the downfall of Cape d'Istria, he had charge of the administration of the Department of Marine, but on the accession of King Otho he retired from office. After the revolution of 1843 he was a member of the Senate, and from 1848 to 1849 was Minister of Finance in the cabinet of Canaris. During the Crimean War he was at the head of the cabinet and as Minister of the Interior put an end to internal disorder and conciliated the Powers when he resigned and entered the Senate as a leader of the opposition. At the outbreak of the revolution of 1862 he was made regent and chose Canaris and Rufos as his colleagues, but was deposited by the former. In 1865, 1872 and 1874-75 he was again at the head of the cabinet.

BULGARUS, Italian jurist: b. Bologna in the 11th century; d. 1166. He lived to a great age and was one of the trusted advisers of Emperor Frederick I. He was one of the famous group of writers known as the Four Doctors of Bologna, and his work, the Sex. Legum, is a legal commentary, 'De Regulis Juris.' It was edited at Bonn (1856) by F. G. C. Bechhaus.

BULGURU, Mount, on the Asiatic side of the Bosphorus, rises over Skutari to a height of 850 feet. From the summit a magnificent view may be obtained of Constantinople, the Bosphorus, the Sea of Marmora, the valleys of Thrace and the valleys and mountains of central Asia Minor. Most of the ascent can be made in an hour by carriage. An imperial kiosk near the summit was built in 1660 by Muhammad IV.

BULIMIA, a disease characterized by insatiable hunger. Persons suffering from this disorder are never satisfied. When the stomach is surfeited they throw off the food they have taken, half-digested, and with violent pain. It frequently occurs in the insane, in cases of paresis, and usually appears, as a concomitant of other diseases, as certain intermittent fevers and diseases of the stomach and bowels, particularly such as are produced by the tapeworm.

BULIMUS, a genus of land-snails of the family Helicidae, the species of which are mainly restricted to South America, especially Peru, Ecuador and Bolivia. Some of the species are very large, as are also their eggs, those of B. oblongus being about the size of a sparrow's. There is an egg of another species in the British Museum which measures exactly one and three-fourths inches in length.

BULKLEY, Morgan Gardner, American politician: b. East Haddam, Conn., 26 Dec. 1837. At the age of 15 he entered a mercantile
house in Brooklyn, N. Y., and in a few years became a partner in it. When the Civil War broke out he went to the front as a private in the 31st New York regiment, and served during the McClellan-Peninsula campaign under General Mansfield at Suffolk, Va. In 1872 he came to Hartford, organized and became president of the United States Bank in that city, and later (1879) was elected president of the Zeta Life Insurance Company, a position he has held for 30 years. He has been a prominent figure in local and State politics. He was four times elected mayor of Hartford (1880-88), and in 1889 was elected governor. At the State election in November 1890, in the first gubernatorial election under the new secret ballot law, the Democratic ticket received a considerable plurality over the Republican, but a majority being necessary to elect, there was some doubt whether there had been a choice by the people for governor or treasurer. Accordingly the matter went before the general assembly, which met in January 1891, and in which the Republicans had a majority of four on joint ballot, the senate being Democratic. A bill was introduced that the assembly adopted, the senate claiming the election of the recent Democratic candidates and refusing to recognize in any manner Governor Bulkeley and the other hold-over Republican officials. The matter was finally settled on 3 Jan. 1892, when the State Supreme Court, in the quo warranto suit brought against Governor Bulkeley by the Democratic candidate for governor, found "Morgan G. Bulkeley to be governor, both de facto and de jure," and his right to hold over till both houses of the general assembly should unite in declaring the election of his successor was affirmed. As the two houses could not agree, the governor remained in office for another full term. In November 1892 the Democratic ticket swept the State. He was United States Senator from 1905 to 1911. Governor Bulkeley has since, as chairman of the Connecticut highway and bridge commission, interested himself earnestly in trying to procure a fine stone bridge across the Connecticut at Hartford.

BULKELEY, Peter, American colonist and clergyman: b. Bedfordshire, England, 31 Jan. 1583; d. Concord, Mass., 9 March 1659. He was educated at Cambridge, and for 21 years was rector of a Bedfordshire parish. Being removed from this by Archbishop Laud, for non-conformity, he left England and became the first minister at Concord, in the colony of Massachusetts, of which famous town he was the chief founder. He was the author of some Latin poems, which are contained in Cotton Mather's 'History of New England'; also of some English verse and of a theological treatise, 'The Gospel Covenant Opened,' published in London in 1646. He was as remarkable for his benevolence and kind dealings as for the strictness of his virtues. Consult Tytler's 'History of American Literature' (New York 1878); Mather's 'Magnalia' (London 1702), and an article, 'Life and Times of Rev. Peter Bulkeley,' in the 'New England Historical and Genealogical Register' (Vol. XXXI, Boston 1877).

BULKHEAD, the name given to a variety of forms of partition. In its nautical sense a bulkhead is a wall or partition extending across the ship for the purpose of dividing the hold into compartments, for separating classes of merchandise, for strengthening the vessel, or more especially for containing water which may leak in to the compartment in which the breach occurs. In large vessels longitudinal bulkheads are employed, as well as those running athwartships, and communications between the compartments are maintained by means of doors which can be instantly closed in case of accident and for the purpose of maintaining forced draught. One of the most important bulkheads in a ship is the one farthest forward, which is built with great strength, being designed to withstand the shock of ramming and confining the damage to a small portion of the vessel. It is hence known as the collision bulkhead. Another form of bulkhead is a strong framework used in the construction of tunnels, to prevent the irruption of water, quicksand, etc., into the workings. The term is also applied to the facing (generally of timber) that supports the sea-wall of a harbor, and somewhat illogically to the sloping flap doors often used to cover the exit of a dwelling-house cellar. See SHIP-BUILDING.

BULKELEY, Lucius Duncan, American physician and author: b. New York, 12 Jan. 1845. He studied at Yale University and at the College of Physicians and Surgeons, and took courses in dermatology in Europe. He became attending and later consulting physician and dermatologist in various New York City hospitals. Among his works are 'Acne and Its Treatment' (1885); 'Syphilis in the Innocent' (1889); 'Manual of Diseases of the Skin' (1898); 'Eczema and Its Treatment' (1901); 'Compendium of the Diseases of the Skin' (1912); 'Diet and Hygiene and Diseases of the Skin' (1913); 'Cancer, Its Cause and Treatment' (1915).

BULL, Charles Stedman, American physician: b. New York 1846; d. there, 17 April 1911. He was graduated from Columbia College in 1864, and at the College of Physicians and Surgeons in 1868. He was physician and surgeon at Bellevue Hospital, New York, and later studied in Vienna, Heidelberg, Berlin, Utrecht, Paris and London, and was a pupil of Von Arlt, Graefe and Donders. He was surgeon to the New York Eye and Ear Infirmary, consulting ophthalmic surgeon to Saint Luke's and Presbyterian hospitals, and Saint Mary's Hospital for Children. He was professor of ophthalmology in Cornell University and ranked among the greatest oculists of his time. He became president of the American Ophthalmological Society in 1903-07. He wrote 'Eye Defects Which May Cause Apparent Mental Dunness and Deficiency in Children' (1901); 'Tuberculosis of the Eye' (1900); both in the 'Transactions' of the New York Academy of Medicine; 'Vascular Tumors of the Orbit' (1900), and other articles on his specialty in the 'Transactions' of the American Ophthalmological Society, the 'Medical News' and 'Medical Record.'

BULL, George Joseph, Canadian ophthalmic surgeon: b. Hamilton, Ontario, 16 Feb. 1848; d. 1911. He graduated at McGill University in 1869, studied in Paris, and began the
practice of medicine in Montreal, devoting himself especially to diseases of the eye. He made his residence in Paris in 1886, and won celebrity as an expert in ophthalmic subjects. He wrote "Ophthalmia and Optometry," and many similar works.

BULL, John, English musician: b. Somersetshire, about 1563; d. Antwerp, 12 March 1628. He was appointed organist in the Queen's Chapel in 1591; first music lecturer at Gresham College in 1596; and organist to James I in 1607. A Catholic, he fled beyond the seas in 1613, and entered the archduke's service. In 1617 he became organist at Antwerp Cathedral. Little of his music has been printed. The claim advanced for his authorship of "God Save the King," is unfounded.

BULL, John, the popular personification for the English nation. Its origin is obscure. Its first literary use appears to have been in Arbuthnot's famous "History of John Bull," written in ridicule of the Duke of Marlborough. The name is also used for an Englishman.

BULL, Ole Bornemann, Norwegian violinst: b. Bergen, 5 Feb. 1810; d. near there, 17 Aug. 1880. He went to Cassel in 1829, where for a short time he studied under Spohr, returning later to Bergen. He went to Paris in 1831, where at first he met with little success, being robbed of his few belongings, including his violin. His attempt at suicide at this time secured him a patroness, Mme. Villeminot, who provided him with a Guarneri instrument. He secured great triumphs both there and in Europe and in America by his remarkable playing, which won for him a distinct and unique position in the musical world as a virtuoso of extraordinary talent and a master of the violin. He overcame serious discouragements in preparing for his career, throughout which public interest and admiration were no less awakened by his manliness and grace of bearing than by his skill as a musician. At his debut (Paris 1833) he was honored by the presence of Paganini, and that marked his witness to the young aspirants for triumph. Bull afterward studied and turned to good account the method of Pagini. In business life he met with various successes and reverses. He lost all his money in a scheme to found a colony of his countrymen in Pennsylvania, and had to take to his violin to repair his broken fortunes. He afterward married in this country, settled at Cambridge, Mass., and retained a summer residence in Norway. He built a national theatre in Bergen and soon became involved in quarrels with the authorities. Consult "Ole Bull: A Memoir" by Sara C. Bull (Boston 1883), and the Norwegian biography by O. Vik (Bergen 1890).

BULL (Lat. bulla, a knob, boss), a seal, usually of lead, appended to state documents to prove their authenticity. Such seals were used by the Roman Emperors, and by various monarchs during the Middle Ages. They finally went out of use in the northern countries but were retained in southern Europe where wax seals did not keep well. In form, the bull resembled a coin, being round with an inscription on each face. The best known seal of this type is the papal bull (q.v.).

BULL, a ludicrous speech in which the ideas combined are totally incongruous or contradictory. A good example is Artemus Ward's saying of Jefferson Davis that "It would have been money in Jefferson Davis's pocket if he had never been born."

BULL, Golden. See GOLDEN BULL.

BULL, Papal, an authoritative letter issued by the Roman pontiff acting in his official capacity as head of the Church. A Papal Brief is also an official letter of the pontiff of a less formal and weighty character, and differs in sundry particulars from the Bull, especially in its seal. The seal of the Bull, from which comes the name of the instrument, is a bulla or globular mass of lead on which is impressed the name of the reigning Pope, also those of Saints Peter and Paul, abbreviated, S. Pe, S. Pa. The material of the Bull is parchment, but of the Brief, white paper; and the seal of the Brief is of red wax, stamped with the Fisherman's Ring, which gives the impress of Saint Peter in a boat, fishing. There are other peculiarities in matter and manner distinguishing the Bull from the Brief, but it suffices to note the foregoing. Of Papal Bulls that have played a signal part in Church, ecclesiastical or civil, especially worthy of mention are the Bull "Clerici laicos" (1296) of Boniface VIII by which the French clergy were forbidden to pay taxes to King Philip the Fair unless these were approved by the Pope; the Bull "Exsurge Domine" of Leo X against Martin Luther (1520); the Bull "In Coena Domini" against heretics and fautors of heresy, dating from the 15th century, but re-enforced by Pius V in 1571 and ordered to be publicly read in all parish churches yearly on Holy Thursday; the Bull "Unigenitus" (1713) against quietism and Jansenism; the Bull "Dominus ac Redemptor," of Clement XIV, abolishing the Jesuit order (1773), and the Bull "Pastor aeternus" (1870), which defined papal infallibility. The most complete collection of papal bulls is that by Cosquinelles, Barberi and Gaude (28 folio vols., 1739-44 et seq.). There are several general or special collections. Consult Giry, "Manuel de diplomatique" (Paris 1894).

BULL AND COW, the names given by English speaking races from time immemorial to the male and female respectively of bovine cattle. The words are probably imitative, the root-idea of *bull* being a suggestion of its bellowing; while *cow*—which in early English, as still in Scotch and some provincial dialects, is pronounced *coo*—is imitative of the lowing call to the calf. Since these animals have become domesticated, and most of the males have been castrated, the term has come to mean more particularly an uncastrated ox. On the other hand, the large size and robust qualities of the bull have led to a transference of the term to the males of various other animals having no zoological resemblance, or very little, to the cattle. Thus we speak of "bull and cow" elephants, moose, swine, pigs, seals, walruses and even alligators; while various animals, as the bullsnake, take the name as expressive of some bull-like quality, as a habit of snorting, or because of horn-like appendages (for example, bullhead catfish).
BULL-BAITING, the sport of setting dogs on a bull, which was tied to a stake and torn to death for the amusement of the spectators. In this case the dogs, which were set upon the bull singly, were trained to seize the bull by the muzzle, technically, *to pin* the bull; but they were very frequently tossed on the horns of the animal, using a bridle so the bull was allowed to run loose in the arena, and then several dogs were set upon him at once. Bull-baiting was a favorite sport in England till about the time of George IV.

**BULL-DOG,** a dog of moderate size, derived previous to the 13th century, from a cross between the old British mastiff and the large pug of extreme southeast Asia. Both its ancestors still exist as separate breeds. An average mature specimen will weigh 40 to 50 pounds. They are squat and muscular in build, with short legs, rather higher behind than in the front, especially if the front legs are very much bowed. Their chests and heads are abnormally broad for their size. The lower jaw overlaps the upper and is of extraordinary strength. The head parts with a large nose, and very strongly fixed in the jawbone, giving the dog a holding power beyond that of any other breed. The coat is close and short. The most variable feature is the color, which ranges from all black to all white among dogs bred for show purposes, but a brindle is more natural. For many centuries this dog was used for *baiting,* or biting at, the bull, as a popular recreation; and up to more recent times men of brutal disposition used it for public dog-fights. It was through these exhibitions that the bull-dog got his bad name for temper, but now he is mainly kept as a watchdog. In that capacity he is invaluable, and so gentle is his disposition that he is the safest canine companion for children. About the year 1800 a small variety of the bull-dog was evolved in the neighborhood of Brussels, but as it was first shown in Paris it has always been known as the *French* bull-dog. It is in the main a miniature of the English bull-dog. The difference, other than that of size, being that the ears are shaped like those of a bat, and are carried erect, or *pricked,* giving the animal a very alert, sharp look.

**BULL-FIGHT,** a contest between men and bulls, conducted as a public spectacle. Once popular in Greece and Rome, this form of entertainment was introduced by the Moors into Spain and universally adopted in the cities of the kingdom, where, as well as in Mexico and some other parts of the world, it is still much in favor. The bull-fight is held in an arena of greater or less magnificence, called in Spanish the *plaza de toros,* a vast open space, open to the sky, and surrounded by seats. The bull is turned out one by one, with many forms of pomp and solemn ceremonial, into the open space, where they are assailed, first by horsemen, called *picadores,* who attack them with the lance; then, with long lances, with short lances, and one or more men have met with injury or perilous mishap—in which case a crowd of active footmen, called *chulos,* provided with crimson banners, take off the attention of the bull—the *banderilleros,* armed with sharp-barbed sticks with barbs on the blade. Should they strike him to them, worry the bull until he is covered with shafts, bleeding and scorched and his glossy hide becomes black and crisp from the explosion of the fire-works. Then comes the last act of the tragedy, when the skilful *matador* enters the arena slowly and alone, clothed in plain black and armed with a long, straight sword and a stick, called a *muleta,* with a piece of red silk fastened to it. With his sword he seldom fails to give the *coup de grâce* to the tortured bull, sheathing the blade, with one sure thrust, up to the hilt in his body just at the juncture of the neck and spine. Mules drag out the slaughtered carcass, amid the sound of trumpets and acclamations of the spectators; the dead or dying horses are removed, the arena is strewed with fresh sawdust, another bull is introduced, and so goes on the combat, until perhaps a dozen bulls and a larger number of horses have been slaughtered to delight the spectators. About 1,300 bulls and 6,000 horses are sacrificed annually in Spain to this sport. The Spanish settlers of Mexico and South America introduced bull-fighting to the New World. Consult Sancho, *Machuquito y el remenimiento del toro* (Madrid 1806).

**BULL-FROG,** a widely distributed amphibious North American frog (*Rana catesbeiana*) found in sluggish waters throughout the eastern half of the United States and Canada, and so called because of its loud, bass voice. It is from five to eight inches long, and of various shades of green, with the legs spotted. It lays its eggs in strings and the tadpole does not reach maturity until two years old. The same name is given by English-speaking people in various parts of the world to other large bellowing frogs, as the *bullfrog* of Siam and Malaya (*Caluwia pulchra*). See *Frog.*

**BULL MOOSE,** a name applied to Theodore Roosevelt in 1912 and arising from his remark, *I feel as fit as a bull moose.* Through constant use of this animal's figure by the cartoonists in connection with Roosevelt's political campaign as the presidential nominee of the Progressive party, he became known as the *Bull Moose candidate* and *Bull Moose party.* See *Progressive Party.*

**BULL RUN,** First Battle of. The first great battle of the Civil War occurred Sunday, 21 July 1861, in the vicinity of Manassas, Va. The Union forces were commanded by Brigadier-General Irvin McDowell, the Confederates by General Joseph E. Johnston, who had arrived from Winchester at noon of the 20th with nine regiments of his army and assumed command. The battlefield was west of Bull Run and near the crossing of that stream by the turnpikes running nearly west from Alexandria to Warrenton. This road, a mile and a half west of the Stone Bridge by which it crossed Bull Run, unexpectedly to the Confederates, became the axis of the battle. Bull Run is a narrow, winding stream with rugged and mainly precipitous banks, but with numerous fords, flowing southeastward, being about 20 miles west of Alexandria and from three to five miles west of Manassas.

McDowell marched from his camps in front of Arlington and Alexandria on the afternoon of the 16th of July, with five divisions, commanded respectively attached to Generals Irvin McDowell, four brigades; Colonel David Hunter, two brigades; Colonel S. P. Heintzelman, four
brigades; Brigadier-General Theodore Runyon, two brigades, and Colonel Dixon S. Miles, three brigades. The Fourth Division was left as a reserve in the region of Fairfax, guarding the lines of communication. The advance division, Tyler's, reached Centreville the morning of the 18th and sent a brigade to Blackburn's Ford in reconnaissance. After a sharp skirmish in which both sides lost about 60 men, it withdrew toward Centreville, to which point McDowell, hearing of the operations at Blackburn's Ford, concentrated four divisions.

Ford, Longstreet's at Blackburn's Ford, Bonham's between Mitchell's and Ball's fords, Cocke's at Lewis' Ford, and Evans' demi-brigade at the Stone Bridge forming the Confederate left. Of Johnston's Army of the Shenandoah, Jackson's brigade supported Bonham, and Bee and Bartow supported Cocke.

From each of these fords fair roads led to Centreville. General Beauregard had planned an attack upon Centreville which involved an advance of his whole force upon that point. This was officially approved by General John-

The Theatre of First Bull Run Battle.

The Confederate “Army of the Potomac” had been concentrated at Manassas under General Beauregard. In expectation of a Union advance it occupied the south bank of Bull Run for eight miles from Union Mills Ford, at the crossing of the railroad to Alexandria, to the Stone Bridge, at the Warrenton turnpike, three brigades being thrown forward of that position, one of them to Fairfax Court House. These brigades fell back before the Union advance, skirmishing slightly. Ewell's brigade, the right of the line, was at Union Mills, with Holmes in support, Jones' brigade at McLean's ston before daylight of the 21st, but at sunrise it was rendered impossible by McDowell's initiative. The plan was then changed to an attack on the Union left from Blackburn's Ford. This also was abandoned from the same cause.

McDowell, who had first intended to attack the enemy's right, after the affair at Blackburn's Ford, finding the ford at Sudley Spring two miles beyond the Confederate left, decided to attack from that direction. While Tyler feinted before the Stone Bridge, Hunter and Heintzelman, by a long detour, crossed at Sudley Spring and moved south toward the Warrenton turn-
pike in the enemy’s rear. Evans, at the bridge, discovering the movement, withdrew 11 companies and formed them on a ridge half a mile north of the road as the head of Hunter’s column entered the open fields which extended a mile north of the Warrenton road. Evans made stubborn resistance and was soon supported by Bull’s brigade and theender battle. While the position was hotly contested, the Confederates were pressed back down the hill, across the valley of Young’s branch, a tributary of Bull Run, to the plateau south of it upon which were the Robinson and Henry houses. Two of Tyler’s brigades expressed about the squares and joined Hunter and Heintzelman in their advance. The fighting continued desperate until noon, and for new troops was, for both sides, most remarkable, but the Confederate line, though stubbornly contesting the ground, began to disintegrate, and the road to Manassas was crowded with retiring soldiers.

General Johnston describes the Confederate situation at two o’clock as “critical”; General Beauregard terms it a “pressing exigency” and speaks of the situation of his forces “in dire straits” and of the fighting line as having “lost its cohesion.” Dr. Jones, Jackson’s distinguished biographer, records that “the retreat became every moment more disorder,” that Bee’s quick eye “now told him that all was lost” and that he could not reform his line.

At that hour a Union victory seemed assured. Johnston and Beauregard reached the position together. The troops on the line of Bull Run that had been held there by the demonstrations of two Union brigades designed to mask McDowell’s attack were ordered in haste to the new line which was at right angles to the first. Jackson soon arrived with five regiments and two batteries. Hampton’s Legion joined him and the Union advance was checked. Other arrivals strengthened the line. Kirby Smith’s brigade of Johnston’s army appeared about three o’clock, having just arrived on the field from Manasses, and pushed its three regiments toward the right of the Union line. Early’s brigade of Beauregard’s force, from the extreme right of his line, hastened beyond Smith’s brigade, now commanded by Colonel Elzey, and, supported by Stuart’s cavalry, appeared directly on the Union right flank. Two regiments from Bonham and two from Cocke also arrived upon the Union right. These also were of Beauregard’s army. This turned the check which that portion of the Union line had received, first into retreat and then into a disorganized withdrawal, except that the rear guards maintained fair order till the columns were well off the field, the right retraction its long detour by Sudley Springs. At Cub Run, half-way to Centreville, the batteries of a pursuing column broke up the wagons and batteries on the bridge, compelling the abandonment of 13 guns. From this point the movement to the rear was still farther disorganized, to which condition the vehemence of many visitors, correspondents and officials largely contributed. The attempt to rally the troops at Centreville failed, though General Johnston reported that the “apparent firmness” of the Union reserves at this point checked the pursuit. The army, in great part disorganized, streamed on to Washington.

After the severe stress under which the Confederate leaders found themselves from 11 o’clock until about 3, the sudden change on the Union side, first from assaulting to cessation of fighting; next, to a general retreat, and later to widespread panic, was as much a surprise to the enemy as to the Union commanders. It was not until after the day that the Confederates ascertained the full extent of the Union stampede. Upon this point President Davis wrote General Beauregard: “You will not fail to remember that, so far from knowing that the enemy was routed, a large part of our forces was moved by you in the night of the 21st to repel a supposed attack upon our right, and the next day’s operations did not fully reveal what has since been reported of the enemy’s panic.”

McDowell’s strength at Centreville appears to have been about 28,000 men and 49 guns. His report says he crossed Bull Run with 18,000 men. A very careful estimate made from official records in 1884, by Gen. James B. Fry, McDowell’s adjutant-general at the battle, gives the number actually engaged at 17,648.

General Beauregard reported his strength on the field when the battle opened as 27,833 and 49 guns; and after Johnston’s delayed troops and Holmes’ brigade had arrived in the afternoon as 31,972 and 57 guns. A very careful estimate by Gen. Thomas Jordan, his adjutant-general, fixed the number actually engaged at 18,053, thus showing the two sides to have been about equal on the firing line.

The Union loss as reported was: killed, 460; wounded, 1,124; missing, 1,312; total, 2,896. Union guns captured or abandoned, 29.

The Confederate loss reported was: killed, 387; wounded, 1,582; missing, 13; total, 1,982.

H. V. BOYNTON.

BULL RUN, Second Battle of, 30 Aug. 1862. When McClellan on the peninsula had reached the vicinity of Richmond, Lee, to prevent McDowell’s corps at Fredericksburg from reinforcing McClellan, ordered Jackson in the Shenandoah to make a demonstration that should detain all available troops for the defense of Washington. Jackson advanced, and in a brilliant campaign drove Banks out of the valley and forced him across the Potomac. By a masterly retreat, he regained the upper valley in spite of McDowell and Fremont, and soon after appeared on McClellan’s flank at Mechanicsville and participated in the seven days’ battles.

On 27 June the Union authorities united the three corps of McDowell, Fremont and Banks into the Army of Virginia under the command of Maj.-Gen. John Pope. He had concentrated his forces between Sperryville and Warrenton, and began to operate with his cavalry against Lee’s railroad lines about Gordonsville. His mission also was to concentrate upon McClellan, when he should withdraw from the peninsula. Lee promptly sent
Jackson's Division, followed by Ewell's and A. P. Hill's, to Gordonsville. On 7 August these moved from Gordonsville toward Pope's position at Culpepper, and 9 August encountered Banks at Cedar or Slaughter Mountain. Banks attacked, instead of holding his position as Pope's plan contemplated, and while at first brilliantly successful, he was at last defeated. Jackson, however, retreated on the 11th across the Rapidan.

On the 13th Lee ordered Longstreet, with his own and Hood's divisions, to Gordonsville. R. H. Anderson's division was ordered to follow. Upon their arrival Pope was largely outnumbered. Lee planned a move for the 18th and Manassas with its immense supplies on the night of 26 August. Pope moved to attack him at Manassas. On the night of the 27th and early on the 28th, Jackson's three divisions withdrew by different roads, and soon after noon of the 28th assembled on the battlefield of the first Bull Run.

On the night of the 25th Pope's headquarters were at Warrenton Junction. Reynolds' Division had joined him on the 23d. On the 25th the advance of Heintzelman's corps arrived from the Army of the Potomac, Hooker's and Kearny's divisions, and Fitz-John Porter, with the divisions of Sykes and Morell of his corps. These two corps with Reynolds' Divi-

against Pope's left, but this officer learned of the plan through the capture of Stuart's adjutant-general, recrossed the Rappahannock, and took position behind it on the 20th. Lee next arranged to cross at Sulphur Springs, turn Pope's right, and move upon his communications. This failed. Pope, at the same time, had planned to cross the river and attack Lee's right and rear, but a sudden flood prevented the movement. Lee then sent Jackson's corps far beyond Pope's right by way of Salem and Thoroughfare Gap to cut Pope's railroad line at Manassas. Jackson succeeded, passing around Pope's right, capturing Bristoe Station

sion were the only reinforcements that Pope received from the Army of the Potomac until after the battle of Manassas.

On the night of the 27th: Pope, supposing Jackson at Manassas, ordered general concentration in that direction. Porter's failure to move promptly under this order constituted one of the charges under which he was subsequently court-martialed and cashiered. Ricketts' Division, the rear of McDowell's corps, upon the information from the cavalry that Longstreet's forces were entering Thoroughfare Gap, moved to the gap and held Longstreet back during the day, and into the evening of the 28th. In the
afternoon of the 28th, Pope, supposing Jackson east of Bull Run, ordered his army to Centre-
ville, Heintzelman and Reno by the fords of Bull Run, McDowell, Sigel and Reynolds by the
Warrenton turnpike. The advance along the
turnpike was begun without the knowledge
that Jackson was just north of it on the first
Bull Run field. The Union approach led Jack-
son to attack, thus revealing his position, which
Pope had been vainly seeking. This was the
battle of Gainesville, being a very bitter fight
between stubborn soldiers with great losses. Not
all of Pope's forces had been put in north of
the turnpike and had been seriously repulsed.
All Union support was now directed to defend
the position against Longstreet's forces south
of the Warrenton pike. The whole of Long-
street's line went forward toward the road with
a rush. There were five divisions—Wilcox
on the left, then Evans (Hood), Anderson,
Kemper and Jones. As soon as Jackson, north
of the road, saw the advance of Longstreet, he
ordered his own line forward. The corps of
Heintzelman and Reno resisted this attack, but
were gradually forced back. The supreme
struggle of the Union forces was to hold two
elevated positions near the Henry and Chinn
houses. The latter, known as Bald Hill, was
carried by the Confederates after two days of
and sanguinary fighting. The Henry house hill
was held against repeated assaults. The Union
army was in retreat across Bull Run, and the
possession of the hill was necessary to main-
tain an orderly retreat.

The Union troops remained in possession
until eight o'clock, when the last of Pope's
army moved unmolested toward the Stone
Bridge, crossing Bull Run about midnight.
The bridge was then destroyed and the Union
army concentrated at Centreville. It was a
Union defeat, but not a rout. While there
was much straggling, the main army had re-
treated in good order, and Lee did not pursue.
In the management of the battle Lee had dis-
played his eminent generalship in a striking
manner. Pope's chief error had been in per-
sisting, before his attack was delivered, that
the enemy was in retreat.
Pope was reinforced at Centreville by the
strong corps of Sumner and Franklin from the
Army of the Potomac. Here also he found sup-
plies. His army was then almost entirely
without food or forage. Lee began
pursuit the afternoon of the day after the
battle, Jackson leading from Sudley Ford and
marching by a circuitous route toward Fairfax
Court House, seven miles in rear of Centreville.
Passing Chantilly, he turned toward the War-
renton turnpike and formed in front of Ox
Hill, his right extending toward the pike. He
was far in advance of Longstreet, and wholly
without support. He was attacked by the two
divisions of Reno under Stevens, and later by
 Kearny. Stevens and Kearny were killed, and
Jackson was repulsed.

Longstreet came up at night, and at noon
the next day (2 September), Pope's army was
ordered by the authorities at Washington to
withdraw within the city. Pope's losses through-
out the campaign from 16
August to 2 September were: Army of Vir-

ginia, killed and wounded 5,318, missing 2,787;
Army of the Potomac, killed and wounded
5,613, missing 1,115; 9th Army corps, killed
and wounded 1,204, missing 319; Kanawha
division, killed and wounded 64, missing 42;
total killed and wounded 10,199; captured or
missing 4,263. The Confederate losses were
not fully reported, but the best estimates
placed them at about 8,500. There are no official returns which enable a presentation of the exact strength of either army during the campaign up to 30 August, but the best estimate places the Union forces at about 63,000 to 70,000 and the Confederates at 54,000.

H. V. BOYNTON.

BULL-SNAKE, See PINE SNAKE.

BULL-TERRIER. See Terrier.

BULL-TRout. 9) A salmon-like trout of North America. See SALMON-TRout. (2) The Dolly Varden trout (q.v.).

BULLA, a genus of mollusks called, from the thinness of their shells, bubble-shells. The shell is oval, ventricose, convoluted externally, or only partially invested by the animal. The animal has a large cephalic disc bi-lobed behind; the lateral lobe is much developed. It occurs in temperate and tropical seas from 25 to 30 fathoms. Over 50 recent species are known and 70 fossil, the latter from the Oolite onward.

BULLACE, a small tree or shrub of the genus Prunus, Prunes. It is a kind of plum, related to the sloe. In England its fruit is used for making jam. The tree is seldom found in America.

BULBÉ, miniature blisters, or blebs. They are larger than vesicles, with a large portion of cuticle detached from the skin and a watery transparent fluid between. The skin beneath is red and inflamed.

BULLANT, bō-lian, Jean, French architect: b. probably in Ecouen about 1515; d. Paris, 10 Oct. 1578. He studied at Rome and after his return to France became supervisor of the royal buildings. He was connected with the erection of the Tuileries and built the pavilion named for him. He was also the architect of the Hotel de Saisons for Catherine de Medici. In 1570 he succeeded Primaticcio at Fontainebleau.

BULLBAT, a name in the Southern States for the night hawk (q.v.), a bird which flies in the dusk like a bat, and makes a booming sound.

BULLE, bül-le, Konstantin, German historian: b. Minden, 30 March 1844. He studied philosophy and history at Jena and Bonn, taught in the gymnasium at Bonn and became director of the gymnasium there in 1879. In 1887-90 he was a member of the Reichstag. After some philosophical studies he devoted himself to historical work and wrote 'History of Recent Times 1815-71'; 'History of the Years 1871-77' and 'History of the Second Empire and the Italian Kingdom.' The first two were combined and published as 'History of Recent Times' in 1886.

BULLEN, Frank Thomas, English author and lecturer; b. Paddington; d. Madeira, 5 April 1857; d. Madeira, 26 Feb. 1915. He received but scanty schooling, and after a few years' experience as errand boy, etc., went to sea as ordinary seaman in 1869, becoming chief mate after several years. He left the sea in 1883 and was usher clerk in the English mercantile office, 1883-99. His contributions to nautical literature have attracted widespread attention, the earliest of these, 'The Cruise of the Cachalot' (1898) being the most noted. His other works include 'Tidbits of the Sea'; 'The Log of a Sea Wait' (1899); 'The Men of the Merchant Service'; 'With Christ at Sea'; 'A Sack of Shakings' (1901); 'The Apostles of the Southeast'; 'Deep Sea Plunderings' (1901); 'A Whalman's Wife' (1902); 'A Sea Wrack'; 'Sea Puritans'; 'Our Heritage, the Sea'; 'The Call of the Deep' (1907). A volume of 'Recollections' was published posthumously.

BULLER, Sir Redvers Henry, English general: b. Devonshire, 1839; d. London, 2 June 1908. He joined the 60th Rifles as ensign in 1858; in 1862 was promoted lieutenant, and eight years later captain. He was major in 1874, lieutenant-colonel in 1878, colonel in 1879 and major-general in 1884. He served with his regiment in the Chinese campaign of 1860, and in the Red River expedition in 1870. During the Ashantee war he acted as quartermaster-general and head of the intelligence department, and gained special mention for his behavior in several engagements. He also served with distinction during the Kaffir War of 1878, and the Victoria Cross was conferred on him in 1879 for his gallant conduct in saving the lives of two officers and a trooper of the Frontier Light Horse, during the retreat at Inhlobane in the Zulu campaign. He was chief of the staff to Sir Evelyn Wood in the war against the Boers in 1881 and in Egypt in 1882, gaining special distinction for his services at Kassassin, Tel-el-Kebir and elsewhere. In the Sudan campaign of 1884-85 he was chief of the staff to Lord Wolseley, and was in command at the battle of Abu-klea after Sir Herbert Stew- art had been wounded. From 1887 till 1890 he held the post of quartermaster-general of the army, and from 1890 to 1897 he acted as adjutant-general to the forces. In 1886-87 he was under-secretary to the lord-lieutenant of Ireland, and in 1891 was promoted to the rank of lieutenant-general. He was created K.C.M.G. in 1882, K.C.B. in 1885 and G.C.B. in 1894. In 1899 he went to Natal as commander in the war with the Boer republics, and succeeded in relieving Ladysmith after it had been besieged 118 days. His various reverses during this event caused him to be superseded by General Roberts, and on his return to England he was placed on the retired list in consequence of an unwise speech. The publication of official documents, still hypothetical, destroyed his reputation as a commander, it being shown by these that he had advised General White, the defender of Ladysmith, to give up the defense and surrender to the Boers.
BULLERS OF BUCHAN—BULLET

BULLERS OF BUCHAN, a large oval cavity in the rocks on the east coast of Aberdeenshire, about six miles to the south of Peterhead, forming a sort of pot or caldron about 150 feet deep, open to the sky above and communicating with the sea below by a natural arch or horizontal passage into which the waves often rush with a tremendous noise.

BULLET. A projectile discharged from a musket, fowling-piece, pistol or similar weapon. When the smooth-bore arms alone were used, the bullets were made by casting. Molten lead was poured into molds and the molds were dipped in cold water, to hasten the solidification of the lead. The molds were cooled after using a few times, and the lead was heated only just to the degree for maintaining fluidity. Bullets are now, however, made more expeditiously, and more truly spherical in form, by compressing the lead. The lead is first fashioned into a rod about a yard long by five- or six-eighths of an inch thick; this rod is passed between rollers to condense it; then between other rollers to press it into a row of nearly globular pieces; then a sphenooid die gives the proper form to each of these pieces; and, lastly, a treadle-worked punch separates them into bullets. With one of these machines and two dies, nine boys can make 40,000 bullets in a day.

Kinds and Sizes.—Spherical bullets for the old muskets, carbines and pistols varied from 14 to 20 to the pound, and from .60 to .68 of an inch in diameter. There is a particular ratio, depending on the specific gravity of lead, by which the number to the pound will give the diameter, or vice-versa. Such bullets are, however, becoming every year less and less used, being superseded by other forms better suited for rifles. Robins' bullet was egg-shaped, with the centre of gravity at the larger end; Beaufroy's was ovoid, with a plug of mixed metal driven into a hole barely large enough for it; Norton's, Delvigne's, Minie's, and others of various related shapes, mostly with some kind of plug, which, driven into the lead by the force of the explosion, causes it to fill up the grooves in the rifling of the barrel.

Since the advent of powder and ball, there have been thousands of varieties of all sizes and imaginative shapes, round and long, with points of every conceivable curve that can be geometrically figured, some with a flat base, others with depressions of all depths and shapes, some to be patched with paper, or covered with steel, copper or nickel, others with grooves, the width, depth and number of them varying according to the theories of many scientific men. The manufacturers of the various arms have by a long series of experimenting decided upon a standard size of bullet to be used in their different calibres, and the manufacturers of ammunition make the bullets to that standard and they will not vary .001 of an inch as they come from the factory. There are, however, some who differ in their opinions as to what diameter of a bullet is used in their rifles, and they will push a bullet through the barrel, and if the impressions of the rifling on it are not deep enough to suit their ideas, they decide that a bullet of the standard size is not large enough and may condemn the mold. Others there are who desire to have their bullets smaller than the standard size and point to their fine records to prove that they are correct. Of course, a bullet should fit so as absolutely to prevent the escape of the gas by the side of the bullet, and pressure generated by the ignition of the powder should be kept at the base of the bullet to expel it. If gas escape through the barrel past the bullet, so much force is lost, and if the escape is greater on one side than on the other, it will deflect the bullet and make the flight irregular, and accuracy under such conditions is out of the question. A bullet when seated in the barrel by hand should fit to the bottom of the rifling so as to shut off all gas before the powder is ignited. As to how a bullet of the standard size will fit a barrel depends wholly upon the bore and the depth of the rifling. Variations in both of these points are found, as well as in everything else; there are no two rifle barrels alike any more than there are two human beings; each has its own individuality and must be handled with regard to its peculiarity. The bore of a rifle is the size of the smooth hole in the barrel before it is rifled, which is commonly called the calibre; this, however, is not the size of the bullet. The diameter of the bullet is determined by the depth of the rifling and should be large enough to shut off the gas. The depth of the grooves in the ordinary rifle barrel is from .001 to .004 of an inch according to the ideas of the various manufacturers. It must be remembered that it is the barrel, not the shells, that the bullet should fit properly to get good results. A reloading tool should have a bullet sizer as well as a bullet mold combined with the loading chamber in a convenient and handy form. The molds thus can be made so as to cast the bullets a trifle above the standard size, allowing the use of any mixture of metal that the shooter desires; and, after the lubrication in the grooves, they can be forced through the sizing die, this will press the lubrication solidly into the grooves, wipe off all surplus grease and at the same time make the bullet perfectly round.

Bullets to be patched with paper are smooth, without grooves. They are from three- to six-thousandths of an inch smaller than the standard size. The diameter is increased to the size desired by having a thin paper patch rolled around them, covering about two-thirds of the bullets from the base up. This paper is of fine, strong texture, similar to bank-note paper. It is specially prepared for this purpose, and is made in different thicknesses, which are known to the manufacturers of ammunition as extra-thin, thin, medium and thick. The extra-thin is about one and one-half thousandths of an inch thick and there is an increase of about one-half thousandth in each successive grade. shooters wishing to increase or decrease the diameter of their bullets can do so by selecting the proper thickness of paper. There is a difference of opinion relative to the superiority of patched bullets over grooved, yet for hunting or military purposes the grooved ball is generally preferred, as such ammunition can be carried and exposed to wet weather without injury, while a part of the patch being exposed is liable to get wet and injured so as to impair
its accuracy. Still, for fine target-shooting, the patched bullet properly handled is, without doubt, preferable.

Explosive Bullets.—Explosive bullets, more appropriately called deforming bullets, alter their shape upon impact with the tissues of the body. All unsheathed lead bullets are of this class, and sheathed bullets are often made deforming by various devices. Among these are the split-nosed, hollow-nosed and soft-bottomed bullets. They are often erroneously called "dum-dum," from the fact that the original deforming bullets were made at Dum-Dum, the fact that principally hard-nosed bullets are made at that place being overlooked.

Explosive Bullets.—Explosive bullets contain a charge of explosive which is detonated on impact, and, exploding, cause great wounds, instantly fatal. They are used only in big-game hunting. Stories of their use in warfare are mistaken due to ignorance of what constitutes such a bullet. The modern Spitz-Geschoss bullet of the Germans produces less dangerous wounds than the Mauser of 1888. It has a remarkably flat trajectory, its height being only 11.75 inches at a range of 400 yards, and only 0.26 inches for the Lee-Metford of the English.

Bullets are now made with extraordinary speed, by machinery of beautiful construction. The machine draws in a coil of leaden rod, unwinds it, cuts it to the required length, stamps out the bullets with a steel dies, drops them into boxes and conveys them away. Each machine, with four dies, makes 7,000 bullets per hour; and four such machines, in an easy day's work, turn out 300,000 bullets. So nearly are the machines automatic that one man can attend them all. Modern rifle bullets have a pressed leaden or steel core, and a thin covering of steel, copper or nickel. A combination of copper and nickel, known as cupro-nickel, is very generally employed, as it is without the poisonous qualities of copper commonly used alone. See Ammunition; Cartridges; Projectiles; Small Arms.

BULLET-TREE, or BULLY-TREE (Minmosops balata), a forest tree of Guiana and neighboring regions, family sapotaceae, yielding an excellent gum known as balata, having properties giving it in some respects an intermediate position between guuta-percha and India-rubber, and making it for certain industrial purposes more useful than either. The timber of the tree also is valuable.

BULLFINCH, a European finch (Pyrrhula Europea), of plump form, and a favorite cage-bird. It is a soft gray above, with shining black cap, wings and tail, and, in the male, has a rich rose breast (gray in the female). Its native call is a clear piping; and birds in captivity are trained to whistle simple tunes and imitate words, and are very popular in the bird market.

BULLHEADS, or "horned-pouts," are small, dark-colored catfish, abundant everywhere east of the plains, and, by introduction, in California and Oregon. They are mud-loving fishes, remaining on the bottom and feeding for food with the barbels, one on each side of the head and two under the chin. The "common bullhead" (Ameliusus Nebulosus) varies in length, at full age, from 18 to 24 inches and occasionally weighs five pounds. It is brownish-black in color, with a fine, scaleless, rubber-like skin, a big head and a long upper jaw. It is a gluttonous biter, gorging the bait, so that the hook must often be cut out of its interior. A smaller species, the black bullhead (A. melas), may be distinguished by the smaller anal fin and its nearly white rays. The southern flat-headed cat (A. platyccephalus) has an eel-like form and a greenish brown hue, and is almost entirely herbivorous. Several of the large "catfish" (q.v.) of the western lakes belong to this genus.

BULLIER ADVERTISING AGENCY, the most noted concern for the handling of advertising in France. In 1856 it entered into a working agreement with the Havas agency for the mutual selling of news and advertising together. This agreement strengthened both companies and made of them the strongest institution of the kind in Europe. See Press Associations.

BULLINGER, Heinrich, Swiss reformer: b. Bremgarten, 18 Aug. 1504; d. Zürich, 17 Sept. 1575. He studied first at Emmerich, in the duchy of Cleves, and afterward at Cologne. His intention was to become a Carthusian monk, but after perusing the works of Lachethon and other reformers he changed his views, formed a close connection with Zwingli, became one of the most strenuous supporters of his views, and ultimately succeeded him in his charge of Zürich. He was one of the authors of the first Helvetic Confession, drew up in concert with Calvin the formulary of 1549, by which the differences between the churches of Zürich and Geneva on the subject of the Lord's Supper were happily terminated, and kept up a close correspondence with the principal English reformers. The Zürich Letters lately published by the Parker Society contain part of this correspondence, and, among others, letters addressed to him by Lady Jane Grey. The most important of his many writings is a 'History of the Reformation.' See lives by Hess (1828-29); Pestalozzi (1858); also Heinrich, 'Bullinger und seine Gattin' (1875); Zimmermann, 'Die Züricher Kirche und ihre Antistes' (1877).

BULLION, uncoined gold or silver in bars, plate or other masses, which has been reduced to the standard fineness of the coinage of a country, but is sometimes used to designate the metals generally, whether coined or uncoined. United States standard bullion contains 900 parts of pure gold or pure silver, and 100 parts of copper alloy. The coinage value of an ounce of pure gold is $20.67183, and the coinage value of an ounce of standard gold is $18.60465. The coinage value in standard silver dollars of an ounce of pure silver is $1.2929, and the coinage value of an ounce of standard silver is $1.1630. The word bullion was of frequent use in the proceedings respecting the Bank of England from 1707, when the order of council was issued that the bank should discontinue the redemption of its notes by the payment of specie to 1823, when specie payments were resumed; for, by a previous law, the bank was authorized to pay its notes in uncoined silver or gold, according to its weight and fineness. The investigations of the bullion committee, and the various speculations on the subject of bullion, related to the supply of
BULLIONS — BULLOCK

17

gold and silver, whether coined or not, as the basis of the circulating medium. The discovery of the mines in America did not at first add materially to the stock of bullion in Europe. The total addition for the first 54 years was about $85,000,000; not quite so great an amount of value (in gold at least) as Russia has obtained from the Ural mines in less than half the time. The average annual supply from all the American sources during the 54 years from 1546 to the end of the 16th century was rather more than $10,000,000. During the 17th century the annual average was about $16,250,000; in the next half century it was $27,500,000; and in the years 1750 to 1803 it was $38,000,000. In the decade 1901–10, imports of gold, chiefly bullion, into the United States ranged from a minimum of $43,330,906 in 1910 to a maximum of $148,337,321 in 1908. The extremes of exports were $38,573,891 in 1906 and $118,563,215 in 1910.

BULLIONS, Peter, American philologist: b. Moss Side, Scotland, December 1791; d. Troy, N. Y., 13 Feb. 1864. Educated at Edinburgh University, where he studied theology, he came to America in 1817. He was pastor of the Presbyterian church at Argyle, N. Y., for six years, and from 1824 to 1848 taught languages in the Albany Academy and was, from 1832 to his death, pastor of the United Presbyterian congregation at Troy, N. Y. His published works include ‘Life of Alexander Byllions,’ (1840); ‘Principles of English Grammar’ (1834); ‘Principles of Greek Grammar,’ ‘Analytical and Practical English Grammar’ (1853); ‘Principles of Latin Grammar’ (1853); ‘Latin and English Dictionary’ (1862).

BULLOCK, Charles Jesse, American economist: b. Boston, 21 May 1826. He was graduated at Boston University in 1889, taught in secondary schools for four years and then pursued graduate studies in political economy and political science, receiving the degree of Ph.D. in 1895 from the University of Wisconsin. After holding an instructorship in political economy at Cornell University from 1895 to 1899, he was appointed assistant professor, and later professor, of political economy at Williams College, where he taught from 1899 to 1901. In 1901 he became assistant professor, and in 1908 professor, of political economy at Harvard University. He served as a member of the commission appointed to codify and revise the taxation laws of Massachusetts in 1907, and of the commission appointed in 1913 to draft a forest tax law, which was enacted in 1914. In 1916 he was elected vice-president of the National Tax Association. His best writing is in the field of financial history and theory, especially the finances of the United States between 1775 and 1789 (‘University of Wisconsin Bulletin,’ 1895); ‘Introduction to the Study of Economies’ (1897); ‘Essays on the Monetary History of the United States’ (1900); ‘The Finances and Financial Policy of Massachusetts’ (1907); and has edited ‘Currencies of the British Plantations in North America’ (1897); ‘Selected Readings in Public Finance’ (1906); ‘Selected Readings in Economics’ (1907).

BULLOCK, Rufus Brown, American statesman: b. Bethlehem, Albany County, N. Y., 28 March 1834; d. Atlanta, Ga., 27 April 1907. He was graduated at Albion Academy in 1850, and, after various pursuits, was sent during 1859–60 to organize the business of the Adams Express Company in the South Atlantic States. His headquarters were at Augusta, Ga., where he formed the Southern Express Company and became one of its active managers. During the Civil War he continued this occupation under the direction of the Confederate government establishing railroad and telegraph lines on interior routes. Later he was placed in charge of contributions for the officers and men of the Army of Northern Virginia, and at Appomattox he gave his parole as acting assistant quartermaster-general. After the cessation of hostilities he resumed the general management of express affairs and was elected one of the trustees and secretary of the Southern Express Company. He was also associated in the organization of the First National Bank of Georgia and was elected president of the First and Augusta Railroad. In 1867 he was chosen a delegate to the convention called to frame a constitution under the reconstruction laws then recently passed. His course at that convention met with the approval of its progressive members and he was their unanimous choice as candidate for governor. After a bitter canvass in the spring of 1868 the new constitution was ratified and Bullock was declared elected. But the reactionists obtained a majority in the legislature and expelled the colored men who had been elected and seated. Against this action the governor protested, and after its accomplishment brought the matter to the attention of Congress, by which he was empowered to reassemble the old legislature, including the expelled colored members. This struggle for the rights of negroes to hold office rendered him very unpopular in his State, and he was overwhelmed with abuse. At the next regular election the opposition seated a large majority of the general assembly, and it convening in November 1870 Governor Bullock resigned his office. Charges of corruption were made against him, and, after a hearing in the State courts at Atlanta, he was acquitted and thoroughly vindicated. He resided in Georgia and became president of one of the largest cotton mills in Atlanta. For several years he was prominent in public service; as a trustee of Atlanta University, president of the Atlanta Chamber of Commerce, vice-president of the Cotton States Exposition and government director of the Union Pacific Railroad.

BULLOCK, Shan F., Irish novelist: b. Crom, Fermanagh, Ireland, 17 May 1865. He has written a number of popular works. Among them are ‘The Awkward Squad’s’ (1893); ‘By Them Some’ (1895); ‘The Rushes’ (1896); ‘The Charmer’ (1897); ‘The Barry’s’ (1899); and ‘Irish Pastoral’s’ (1901); ‘The Squireen’ (1903); ‘Dan the Dollar’ (1905); ‘A Laughing Matter’ (1908); ‘Thomas Andrews, Shantyman’ (1911). His fiction is remarkably individual and his studies of life in the north of Ireland are faithful reflections of Irish life and character.

BULLOCK, William A., American inventor: b. Greenville, Greene County, N. Y.,
BÜLOW, Dietrich Adam Heinrich von, German military writer; b. Falkenberg, in Altmark, about 1757; d. Riga, Russia, 1807. He studied in the military academy at Berlin, and afterward entered the Prussian service. But he soon retired and occupied himself with the study of Polybius, Tacitus and J. J. Rousseau, and then served for a short period in the Netherlands. He afterward undertook to establish a theatre, but immediately abandoned his project, and visited the United States, whence he returned poor in purse but rich in experience, and became an author. His first work was on the 'Art of War,' in which he displayed uncommon talents. He wrote a book on 'Money,' translated the 'Travels of Mungo Park,' and published, in 1801, his 'History of the Campaign of 1800.' He lived a time in London, was there imprisoned for debt, and afterward removed to Paris, whence he was banished in 1804. In 1804 he wrote 'Lehrsätze des neunm. Krieges' ('Theory of Modern Warfare') and several other military works, among which is his 'Tactics of the Moderns as They Should Be.' In the former he points out the distinction between strategy and tactics, and makes the triangle the basis of all military operations. This principle he borrowed from Homini and other French writers. His history of the war of 1805 occasioned his imprisonment in Prussia, at the request of the Russian and Austrian courts. He died in the prison of Riga. He was a follower of Swedenborg. Consult Cammerer, 'Development of Strategical Science' (London 1905).

BÜLOW, Friedrich Wilhelm (Count von Dennewitz), Prussian general; b. Falkenberg, 16 Feb. 1755; d. Königsberg, 25 Feb. 1816. In his 14th year he entered the Prussian army. In the war of 1806 he was a lieutenant-colonel at the siege of Thorn, and distinguished himself in various battles. In 1808 he made major-general and general of brigade. When the war against France broke out in 1813 he fought the first successful battle at Möckern, 5 April; 2 May took Halle, and protected the left of the army from the danger which threatened it, by his victory at Luckau 4 June. He saved Berlin a second time by the memorable victory over Oudinot of Grosbeeren, 23 August, and relieved the same city a third time by the great victory over Ney at Dennewitz. For this service the King made him one of the few grand knights of the Iron Cross, and after the end of the campaign bestowed on him the title Count Bülow of Dennewitz, and made the same hereditary in his family. At the storming of Leipzig, 19 October, he took an important part. At the opening of the campaign of 1815 he received the chief command of the fourth division of the army, with which he contributed so essentially to the victory of Waterloo, that the King gave him the command of the 15th regiment of the line, which was to bear in future the name of the Regiment of Bülow von Dennewitz. Consult Bülow, 'Generalfeldmarschall Graf Bülow v. Dennewitz' (Vienna 1910).

BÜLOW, Hans Gusto von, German pianist and composer; b. Dresden, 8 Jan. 1830; d. Cairo, Egypt, 12 Feb. 1894. He studied the piano under Liszt, and made his first public appearance in 1852. In 1855 he became leading professor in the Conservatory at Berlin; in
1838 was appointed court pianist; and in 1867 became musical director to the King of Bavaria, followed by a series of concerts in Germany, Italy, Russia, England and the United States, which he first toured in 1875–76. In 1878 he became musical director at Court Theatre; from 1880–85 was Hofmusikantent to the Duke of Meiningen. From 1886 till his death he was conductor of the Philharmonic Society, Hamburg. His compositions include overture and music to ‘Julius Caesar,’ ‘The Minstrel’s Curse’ and ‘Nirvana;’ songs, choruses and pianoforte pieces. He was considered one of the first of pianists and orchestral conductors remarkable for the range of his repertoire and for his retentive memory, playing and conducting without book. He was the greatest living authority on Beethoven, and edited an edition of his works. His ‘Letters,’ edited by his widow, appeared 1895–97; and ‘Lives’ by Rau- mann (Berlin 1906) and La Mara (Leipzig 1911).

BÜLOW, Karl Eduard von, German author: b. Berg vor Eilenburg, Saxony, 17 Nov. 1803; d. Ottishausen, 16 Sept. 1853. He studied at the University of Leipzig, and became the tutor of Ludwig Tieck. His literary fame rests mainly on his ‘Book of Tales,’ after ancient Italian, Spanish, French, English, Latin and German originals (4 vols., 1834–36), which was followed by a supplementary volume (1841). (Of his own original composition, the ‘Springtide. Wandering Among the Hartz Mountains’ is one of the best. He wrote also the very interesting story of ‘The Youth of a Poor Man of Toggenburg,’ founded on the autobiography of Ulrich Briste, a Swiss weaver. He published the original later.

BÜLOW, Margarete von, German novelist: b. Berlin 1860; d. near there, 2 Jan. 1885. Her early years were spent partly in Thuringia and partly in Smyrna, where her father was Prussian consul. Her published works include ‘Stories’ (1885); ‘Jonas Briccius’ (1886); ‘Herr im Hause’ (1886); ‘Chronicle of the Rißelhausen Folks’ (1887); ‘New Stories’ (1890). She delineated character with great precision, and displayed true insight into the human heart. She lost her life in an attempt to rescue a boy from drowning in the Rummelsburger Lake.

BULOZ, bu-lô, Françoise, French publicist: b. Vulbens, Savoy, 20 Sept. 1803; d. Paris, 12 Jan. 1877. In 1831 he became editor of the Revue des Deux Mondes, the celebrated French fortnightly literary magazine, which, under his direction, increased its subscription list from 330 to 18,000. It published the works of de Vigny, de Musset, George Sand, and rendered remarkable service to the encouragement of contemporary literature. From 1835–45 he also edited the Revue de Paris. For 10 years (1838–48) he was director of the Comédie Française.

BULRAMPUR, bōl-rüm-poor’, a town of India, in the Fyzabad division of Oudh, the residence of the Maharaja of Bulrampur. It has a trade in rice, etc., besides manufactures of cotton and other articles.

BULRUSH, a popular name for tall, reed-like grasses, which are in marshy places, and which for the most part belong to the genus Scirpus. The common bulrush is frequent in clear waters and about the borders of rivers throughout Europe, as well as in North America and New South Wales. The roots are thick and stout, creeping under water in the deep mud; the stems are of a dark-green color, and four or five feet or more in height, and are naked, smooth, round, tough, plant and spongy within. Their base is covered with several sheathing scales, partly ending in leafy points. They are useful for packing and thatching, and especially for plaiting into the bottom of chairs.

BULTHAUP, buhlt-houp, Heinrich Alfred, German poet and dramatist: b. Bremen, 26 Oct. 1849; d. 1905. On quitting the university he was for a while a private tutor; then traveled in the East, Greece and in Italy. He was a lawyer in his native town for some years, and in 1879 became custodian of the city library. Of his dramatic compositions the list is very long, comprising tragedies, ‘Saul’ (1870); ‘A Coriscan Tragedy’ (1871); plays dealing with the questions of the time, ‘The Workmen’ (1876); comedies, comic operas, including ‘Die Kopisten’ (1875); ‘Lebende Bilder’ (1875); ‘Ahasyer’ (1904). He wrote the text for oratorios by Bruch and Vierling, adaptations of Shakespearean dramas (‘Cymbeline’ 1883; ‘Timon von Athen’ 1894); he also wrote ‘Durch Frost und Gluten’ (1892, new ed. 1904), and several works of criticism, especially ‘Shakespeare und der Naturalismus.’ His special distinction, however, is as author of ‘Dramaturgie des Theater’; ‘Dramaturgie der Klassiker’ (1882 et seq.), a work of exceeding value which has been reprinted frequently under the title ‘Dramaturgie des Schauspiels’; also ‘Dramaturgie der Opera’ (2 vols., 1887). Consul Kraeger, H., ‘Litterarische Vorträge aus dem Nachlass ausgewählten und durchge- schen’ (Oldenburg 1912).

BULWER, John, English physician and author. He flourished in the 17th century and appears to be entitled to the honor of having first pointed out a method of instructing the deaf and dumb. His works include ‘Phallos,’ or the Deaf and Dumb Man’s Friend’ (1648); ‘Chironomia, or the Art of Manual Rhetoric;’ ‘Chirologia, or the Natural Language of the Hand’ and ‘Anthropometamorphosis.’

BULWER, William Henry Lytton Earle (BARN DALLING and BULWER), English author and diplomat, brother of Sir Edward Lytton (q.v.) b. London, 13 Feb. 1801; d. Naples, 23 May 1872. He was educated at Sun- burg, Harrow and Cambridge. He became agent for the London Greek Committee in 1824, and made a journey to the Morea, which he later described in ‘A Journey to Greece.’ He entered the army, but resigned to enter the diplomatic service, and after 1827 was successively in Berlin, Brussels and The Hague. In 1830 he was elected to Parliament as an advanced Liberal and in 1837 was made secretary of the embassy at Constantinople. Here he concluded an important commercial treaty with Turkey. He was Minister to Madrid in 1843, and concluded the peace between Spain and Morocco in 1844. Disliked by Narvaez, the soldier-dictator, Bulwer was ordered to leave Spain. Parliament approved of his conduct and
he was awarded the highest decoration of the Order of the Bath; in 1849 had a diplomatic mission to Washington, and was one of the negotiators of the Bulwer-Clayton Treaty (q.v.). In 1852 he was envoy extraordinary to Tuscany and in 1856 was sent to Bucharest to investigate the conditions of the Danubian principalities, and was Ambassador to Turkey in 1858-65. He was created Baron Dalling and Bulwer in 1871. His works include 'An Autumn in Greece' (1826); 'France, Social, Literary and Political' (1834-36); 'Life of Byron' (1836); 'Historical Characters' (1869-70); 'Life of Palmerston' (1870-74).

BULWER-CLAYTON TREATY, a treaty negotiated at Washington, D. C., in April 1850, by John M. Clayton, Secretary of State under President Taylor, and Sir Henry Bulwer, British Minister to the United States. It provided that neither the United States nor Great Britain should attempt to control a proposed canal across Nicaragua. The treaty provided further for the neutrality of the canal and it guaranteed encouragement to all lines of interoceanic communication. The terms of the treaty were a masterpiece afterward much disputed. In 1882 the United States government intimated to Great Britain that the canal having become impracticable because of reasons for which Great Britain alone was responsible, the United States considered the treaty as no longer binding, but Great Britain continued to hold it as in force. On 3 March 1899, Congress passed a bill providing for the construction of a canal on the Nicaragua route, which also authorized the President to open negotiations with Great Britain for the abrogation of the Bulwer-Clayton Treaty, and under the last clause a convention between the two countries, abrogating portions of the treaty deemed to be against the interests of the United States, was signed in Washington, 5 Feb. 1900. For a complete account see CLAYTON-BULWER TREATY.

BULWY-LYTTON, Edward George Earle Lytton, Earl of Lytton, English politician and novelist: b. London, 25 May 1833; d. Torquay, Devonshire, 18 Jan. 1873. The Bulwers, long settled at Heydon Hall, Norfolk, claimed descent from the Normans and Vikings, perhaps as a ready explanation of their bold and turbulent spirit. The novelist's father, William Earle Bulwer, was colonel of the 106th regiment or Norfolk rangers. His mother, Elizabeth Barbara, was the only daughter of Richard Warburton Lytton of Knebworth in Hertfordshire, the family seat since the time of Henry VII. From her and her father, who was a learned scholar, Bulwer claimed to have derived his love for letters. As a boy he lived much among his grandfather's books and read through three circulating libraries. He wrote volumes of Byronic verse, some of which was published at the age of 17. Prepared for the university at various private schools, he entered Trinity College, Cambridge, at Easter in 1822; but soon migrated to Trinity Hall, where it was not necessary to attend lectures. At Cambridge he was a companion of the Union; he won the Chancellor's medal in 1825, and sketched two novels. At this time he also read enormously in history and began the practice of keeping those huge commonplace books which afterward became useful in preparing his historical novels. Before receiving his bachelor's degree in 1820, he published more Byronic verse, fell desperately in love, made a tour of Scotland and the English lakes, and passed a season in Paris, where he was received into the most brilliant salons. Returning to London he finished dandyly; he married on 29 Aug. 1827, Rosina Doyle Wheeler, a beautiful Irish girl of some accomplishments. The marriage led to an estrangement from his mother and the young man was consequently compelled to seek his own resources. He settled with his wife at Woodcot House in Berkshire, where he attempted to live in style from what he could earn with his pen. The marriage proving uncomfortable, a legal separation was obtained in 1836 after years of a life apart. On the death of his mother in 1843 he inherited Knebworth and assumed the surname of Lytton.

To pass by Bulwer's numerous contributions to novels and periodicals, he published in 1827, 'Falkland,' a sentimental novel in imitation of Rousseau's 'Nouvelles Études.' After a quick passage through the sentimental stage, he came out with 'Pelham' in 1828, a brilliant novel founded upon what he had seen of high life in London and Paris. It was likewise Bulwer's first excursion into crime. Late in the same year followed 'The Disowned,' a curious novel which the author called 'metaphysical,' inasmuch as the characters are intended to stand for 'certain dispositions influential upon conduct.' After 'Devereux' (1829), an experiment in romance, Bulwer took up the criminal novel, publishing 'Paul Clifford' (1830) and 'Eugene Aram' (1832), which are among his most characteristic books. By this time a popular novelist, he displayed during the coming years extraordinary versatility. With the Napoleons of the Rhine (1834) he began a series of fantastic tales which he called ideal and poetic, announcing that they should be judged 'by the rules rather of poetry than prose.' The chapter entitled 'The Life of Dreyfus' elegantly shows a clever system of dreaming, evidently made use of in our day by Du Maurier in 'Peter Ibbetson' and by Kipling in 'The Brushwood Boy.' Occult philosophy was cleverly employed in 'Zanoni' (1848) and speculation about the future age of electricity in 'TheComingRace' (1871). A series of ghost stories culminated in 'The Haunted and the Haunters' (1861) hardly surpassed in its kind. Historical romance, resumed in 'The Last Days of Pompeii' (1834), was continued in 'Rimini' (1835), 'The Last of the Barons' (1843), 'Harold' (1848), and the incomplete 'Pausanias' (posthumous, 1876). The best of these novels stand for an attempt to get near to the facts of history. In the midst of this work was planned a comprehensive history of 'Athens, its Rise and Fall,' of which two volumes appeared in 1837. Another idealization of the criminal in 'Lucretia' (1847) provoked considerable criticism, to which he replied with 'A Word to the Public' (1848). The last of his poetic romances was published anonymously in 'Blackwood's Magazine' three experiments in 18th century humor. The series comprises 'The Caxtons' (1849), 'My Novel' (1853), and 'What Will He Do
With It' (1858). Though a little too obviously in the manner of Sterne, the novels are among Bulwer's best work. They were, curiously enough, as well received by the public as if they had borne the author's name. Somewhat like them is 'Kenelm Chillingly' (1873), interesting besides for its infusion of autobiography.

Throughout his career, Bulwer never ceased to cultivate his muse. From the Byronic influence that marked his poems down to 1830, he worked into satire, addressing himself *to the humors rather than to the passions of men.* The 'Siamese Twins' (1831), a poem of four books in the metre of 'Hudibras,' appeared in a volume of miscellaneous poems, of which the longest is one on Milton. 'The New Timon; A Poetical Romance of London' (1846), a satire on men then prominent in politics and literature, is memorable for the reference to Tennyson as 'Schoolmiss Alfred,' and for Tennyson's caustic stanzas in a reply contributed to *Punch,* 28 Feb. 1846. Among Bulwer's other collections of verse as 'Poems and Ballads,' translated from Schiller (1844); an epic in two books: 'King Arthur' (1848-49); 'The Lost Tales of Miletus' (1866); and a translation of the 'Odes and Epodes of Horace' (1869). If Bulwer did not gain much fame as a poet, he exactly hit popular taste in three plays—'The Lady of Lyons' (1839), 'Richelieu' (1838) and 'Money' (1840)—which still keep the stage.

Bulwer's rôle in letters has obscured for later times the part he played in politics. From 1831 to 1841 he sat in Parliament as a Liberal member of Saint Ives, Harvard, and then for Lincoln. After making his maiden speech in support of the Reform Bill, he devoted his energies largely in favor of copyright on original works, cheap postage on newspapers and the laws affecting dramatic literature and the stage. His early speeches on these subjects are still worth reading. In 1834, he issued a spirited pamphlet on the 'Present Crisis,' which went through 20 editions and influenced greatly the election that brought Lord Melbourne into power. The new Premier offered him a lordship in the Admiralty but the post was declined. In 1841, Bulwer lost his seat owing to his willingness to accept a slight tax on corn. Ten years later he advanced to this extent in 'Letters to John Bull, Esq.;' and in 1852 he returned to Parliament as a Conservative member for Hertfordshire. His numerous speeches of this period relate to the excise duties, the Crimean War, China and the East India Company. In the formation of the Derby Ministry in 1846, he became Secretary to the Colonies. While holding this office he organized the new colony of British Columbia. He spoke in support of Disraeli's reform bill of 1859, but against the measures introduced by Lord Russell and Gladstone in 1860 and 1866. As a reward for his services, he was elevated to the peerage in 1866, as Baron Lytton of Knebworth. Before this he received the degree LL.D. from both of the great English universities. In 1854 he was installed honorary fellow of the Royal Society of Edinburgh University, and he was twice elected lord rector of the University of Glasgow. To the last he kept up his literary work: 'The Parisians' was running in *Blackwood's Magazine* when the end came at Torquay on 18 Jan. 1873. He was buried in Westminster Abbey.

As a novelist Bulwer was subject to fierce assaults from the critics throughout his career. Thackeray, for example, in a review of 'Ernest Maltravers' ridiculed and scorned his bad art, affected style, 'his eternal white hair', his 'lame sort of style', the good and the beautiful and the dulness of his moral sense. Still there is the other side. In various prefaces to his novels and especially in two papers contributed to the *Monthly Chronicle* for 1838, Bulwer carefully elaborated his views on the art of fiction, drawing clear distinctions between the novel and the drama as he understood and practised them. He never aimed at the dramatic novel wherein each incident and conversation must contribute to the working out of a logical plot. It is often desirable, he said with reference to the novel, 'to go back instead of forward,—to wind, to vary, to shift the interest from person to person' that the reader may not become fatigued. In that aim he succeeded. However much his novels may fail in technical details, they have never failed to excite the interest of the public.

Bibliography.—Unfortunately there is no adequate life of Bulwer or critical edition of his novels, indicating the many important changes he made in the text from time to time. Uncritical editions of the novels are numerous. To his 'Speeches' (2 vols., Edinburgh 1874), his son, the Earl of Lytton, prefixed a memoir dealing with his political career. The period of his life from 1803 to 1832 is covered by a most interesting autobiography, half fact and half fiction, and several supplementary chapters by his son, published together under the title 'Life, Letters and Literary Remains' (2 vols., London 1883). After the death of Lady Lytton, her executrix, Louisa Devey, published in vindication of her memory 'Letters of the Late Edward Bulwer, Lord Lytton and his Wife' (New York 1889). Consult also Cooper, 'Life of Edward Bulwer, First Lord Lytton' (London 1873); Escott, 'Edward Lytton' (London 1910); Ten Brink, 'Edward Lytton' (Leyden 1882); and Second Earl of Lytton's 'Memoirs of Edward Bulwer, First Lord Lytton' (2 vols., New York and London 1913).

Wilbur L. Cross,
Professor of English, Yale University.

BUM-BOAT (perhaps originally "boom-boat," from the boom rigged out from the side of a man-of-war at anchor, to which boats may make fast), employed by hucksters to visit ships lying at anchor, with supplies of provisions, trunks, clothing, etc., for sale to the sailors.

BUMBLEBEE, a wild bee of some species of the genus *Bombus,* of which upward of 50 species inhabit North America. Few occur in the southern hemisphere or tropical regions, and none in Africa south of the Sahara or in Australia, while they are the only bees inhabiting the Arctic and Alpine regions. The humble or humble, bee is recognized by its large, thick, hairy body and long bass hum. The colonies of bumblebees are not numerous compared with those of wasps, or the stingless or the honey bee. A populous colony in England and
Bumblefoot — Bunce

America may number from 300 to 400 individuals. The proportion of sexes and castes of Bombus muscorum in England were found by Smith to be, in a colony of 120, 25 females, 36 males and 59 workers. The roundish oval cells differ in size and have no exact arrangement. Besides the cells containing the young, the old discarded ones are made to serve as honey tubs or pollen tubs, and there are also the cells of the guest or Pithyrus bees. In good weather and when flowers are plentiful the bees collect and store honey in abundance, and in bad weather, the cells are used to form special cells made entirely of wax and these are filled with honey, and left open for the benefit of the community (Sharp). Hofer states that special tubs for the storing of pollen are sometimes constructed. Putnam says that the larvae make their own cells of silk, which are finally strengthened with wax by the old bees. Bumblebees have been seen working in warm moonlight nights. About two centuries ago Godart stated that a trumpet bee is kept in some hives to cause the colony to work by three or four o’clock in the morning, and this has been recently confirmed by Hofer, who observed the fact in his laboratory. If the trumpet was removed its place was filled the next morning.

There is a great deal of variation in our bumblebees, and, besides the local and climatic varieties, polymorphism is apparently marked, as Packard has (in Bombus fervidus) detected two sets of males and females, the large and the small; but whether there are two sizes of workers has not yet been ascertained. The queen bees lay their eggs in masses of bee-bread attached to the top or sides of the old cells, in little enclosures formed by thin partitions set up by the bee after the eggs have been deposited. Thus placed, says Packard, in a mass of food, the young larvae, on hatching, begin, by eating the food, gradually to construct their cells in the manner described by Putnam, who gives the following account of the economy of the bumble bee: The queen awakes in early spring from her winter’s sleep beneath the leaves or moss, or in deserted nests, and selects a nestling-place, generally in an abandoned nest of a field-mouse, or beneath a stump or sod, and immediately collects a small amount of pollen mixed with nectar, and in this deposit from 7 to 14 eggs, gradually adding to the pollen mass until the first brood is hatched. She does not wait, however, for one brood to be hatched before laying the cell of another; but as soon as food enough has been collected, she lays the eggs for the second. As soon as the larvae are capable of motion, and commence feeding, they eat the pollen by which they are surrounded, and, gradually separating, push their way in various directions. Eating as they move, and increasing in size quite rapidly, they soon make large cavities in the pollen mass. When they have attained their full size, they spin a silken wall about them, which is strengthened by the old bee brushing it with a thin layer of wax, which soon becomes hard and tough, thus forming a cell. The larvae now gradually attain the pupa stage, and remain inactive until their full development. They then cut their way out, and are ready to assume their duties as workers (small females), males or queens.

The cells vary in size and are known as queen, worker and drone cells. Of the first brood only workers are permitted to survive. These now supply the colony with honey and pollen and the queen remains in the nest, laying eggs from which emerge new workers until the colony is strong. About mid-summer males or drones are permitted to develop, and in July or August eggs are laid in the queen cells. The young queens are fertilized by the drones in the fall, the latter dying after the effort. On the approach of cold weather all the workers die, leaving the heavy cells to the queen. The queen who sleeps through the winter to awaken in spring, when the process begins anew. See Bee; Beekeeping.

Bumblefoot, a corn or abscess on the feet of domestic fowls, thought to arise from roosting on narrow perches or walking on sharp pebbles. The disease is sometimes incurable, but in other cases yields to the daily application of lunar caustic.

Bummaloti, a fish (Harpodon nehereus), related to the salmon, but marine, which is caught in large quantities on the western coast of India, dried, salted and exported all over the East. A trade-name is Bombay duck. It is a very long fish, with a long mouth containing slender teeth, an indication of its voracity.

Bumping Posts, constructions at the ends of railroad tracks in shifting yards, intended to prevent cars from running off the track. They are usually strong wooden frames with buffers placed at such a height as to receive the blow of the platform or coupler of the car. Banks of earth or cinders are sometimes utilized for this purpose and portable metal posts known as shipblocks are frequently employed as bumping posts.

Bumpo, Natty. See Leatherstocking Tales.

Bumpus, Hermon Carey, American educator: b. Buckfield, Me., 5 May 1862. He was graduated from Brown University in 1884, was professor of biology at Olivet College, Michigan, 1886-89; professor of zoology in Clark University, Worcester, Mass., 1890-91; and professor of comparative anatomy in Brown University from 1892. In 1898 he was appointed director of the biological laboratory of the United States Fish Commission at Wood’s Hole, Mass., and was assistant to the president and curator of the department of invertebrates in the American Museum of Natural History in New York in 1901-02, when he became director of the Museum. He was chosen business manager of the University of Wisconsin in 1911; chosen president of Tufts College in 1914. He is the author of ‘A Laboratory Course in Invertebrate Zoology’ (1893); also numerous monographs and articles on biology and educational subjects.

Bunce, Francis Marvin, American naval officer: b. Harpers Ferry, 25 Dec. 1836; d. there 19 Oct. 1901. He entered the naval service in 1851 and was graduated from the Naval Academy in 1857. In 1862 as executive officer of the Penobscot he took part in the engagement with the rebel batteries at Yorktown, Va. Assigned to temporary duty with the army, he
had charge of the disembarkation of the heavy artillery and mortars for use in the investment of Yorktown by General McClellan, April 1862. He commanded a successful expedition up Little River, between North and South Carolina, destroying several schooners and large quantities of cotton, turpentine and resin, together with extensive salt works. With the monitor Powhatan he took part in the action in which she was engaged during the siege of Charleston, and was wounded by the premature explosion of a cartridge. Later he was chief of scouts on the staff of Admiral Dahlgren. On 5 Sept. 1865 he was placed in command of the monitor Monitor and took that vessel from Philadelphia to San Francisco, the first extended sea voyage ever made by a monitor. On 1 March 1895 he was selected to command the North Atlantic squadron, with the rank of active rear-admiral. On 1 May 1897 he went to the Brooklyn navy yard and there superintended the conversion of many fast ships and yachts for war service. It is said that the government's policy of furnishing the navy with abundant ammunition for target practice and for special purposes, a policy which produced such admirable results in the Spanish-American War, was due to the efforts of Admiral Buncy. He was commissioned rear-admiral 6 Feb. 1896, and retired from active service 25 Dec. 1898.

BRIDGES, John Bell. American author. b. New York, 8 Feb. 1828; d. there, 15 May 1890. After spending several years as clerk in a stationery store, and bookseller and publisher on his own account, he became manager of the publishing house of James G. Gregory, which he conducted successfully for many years. It was at his instigation that the fine edition of Cooper's works, with steel and wood engravings by F. O. C. Darley, was planned and published. For a short time he was a reader for Harper & Bros., but in 1869 he formed a connection with D. Appleton & Company, that ended only with his death. He edited 'Appleton's Journal,' and largely planned and carried through for the firm some of their most famous illustrated publications, such as 'Picturesque America,' 'Picturesque Europe,' 'Picturesque Palestine,' etc. In addition to office business his literary aptitudes and ambitions kept him at work in spite of chronic invalidism. He wrote, among other works, 'Romance of the Revolution' (1852); 'A Bachelor's Story' (1859); 'Life Before Him' (1860); 'Bachelor Bluff. His Opinions, etc.' (1881); 'Don't: A Manual of Mistakes and Impropricities' (1883), of which over 100,000 copies have been sold; 'My House: An Ideal' (1884), a graphic study of a country home; and 'The Adventures of Timias Terrystone: a Novel' (1885). As a very young man he wrote three plays which were accepted and produced on the stage with success: 'Fate, or the Prophecy,' a tragedy; 'Love in '76,' a comedy; 'Marco Bozzaris,' an heroic tragedy. The second of these was played by Laura Keene, the other two by James W. Wallack.

BUNCO, a familiar term applied to the practices of a certain class of swindlers. The trickster trades upon the credulity of the apparently well-to-do stranger in the city, under pretense of some connection with the latter's friends or native place, or by similar expedi-

ents. After confidence is secured, counterfeit money is imposed upon him, he is induced to cash 'bogus' checks, etc., or even becomes the victim of more direct robbery.

BUNCOMBE, or BUNKUM, swollen political oratory not directed to the point in hand or the audience present, but to the achievement of a charlatanic reputation outside. "Twisting the tail of the British lion," and other like feats of windy chauvinism, are specimens of bunkum; the object of the speaker being, not so much to impress the hearers, but to make the general populace admire his swaggering patriotism. The reputed origin of the story is an anecdote of a member of the North Carolina legislature, from Buncombe County in that State, who told the thin remnants of a house he had nearly emptied by his dull and pointless remarks, that they might go, too, as he was only "speaking for Buncombe." Consult Wheeler, 'History of North Carolina.'

BUNDELKUND, bún-del-kúnd', or BANDELKHAND, bún-del-kúnd', India, a tract, consisting partly of certain British districts connected with this province, and partly of a number of small native states subordinate to the central Indian agency. Politically, there are nine states, 13 estates and the pargana of Alampur belonging to the Indore state, making an area of 9,851 square miles. Diamonds are found, especially near Panna. Its surface is considerably diversified, and there are several ranges of hills, some of which reach the height of 2,000 feet. It has soil of every variety, which yields almost every grain and plant of India. The Jumna and the Ken are the only two navigable rivers. The lesser waters are carried by different streams to the Jumna and so on to the Ganges. A branch of the Great Indian Peninsular Railway traverses the north of the country. A garrison of all arms is stationed at Nowgong. Pop. about 1,400,000. The people represent various races, the Bendas still remaining chieftains. The prevailing religion is Hinduism. In 1817 the British government, by the Treaty of Poona, acquired all territorial rights over Bundelkund. There was a mutiny in 1857.

BUNDESRATH, boon'der-srät, the German Federal council which represents the individual states of the empire, as the Reichstag represents the German nation. It consists (1916) of 61 members, who are appointed by the governments of the individual states for each session, while the members of the Reichstag are elected by universal suffrage and ballot for the term of five years, and its functions are mainly those of a confirming body, although it has the privilege of rejecting measures passed by the Reichstag.

BUNDESTAAT, a German term denoting a political form created by the union of several independent states into a single sovereign state with a Federal government. Examples are the United States, Switzerland and Germany.

Bundi, boon'dé', or BOONDI, India, a native state of Hindustan, in the southeast of Rajputana, under British protection; area 2,220 square miles. A double line of hills running from southwest to northeast, penetrated by few
passes and rising to the height of 1,793 feet, divides the state into two almost equal portions, that of the south bearing the name of Bunion, and that of the north bearing the name of Koiash. Much of the state is under wood. The chief river is the Mej, which penetrates the central range and joins the Chambal near the northeast extremity of the state. It was much more extensive before Koish and its territory were separated from it. The inhabitants are of the Hara tribe, which has given birth to many famous men, and, among others, to Ram Singh Hara, one of Aurungzebe's most renowned generals. The ruler is practically absolute in its own territory. Pop. 218,731. Buniu, the capital, is picturesque situated on a steep slope in a gorge in the centre of the hills above mentioned, 190 miles southwest of Agra, and its antiquity, numerous temples and magnificent fountains give it a very interesting appearance. It is crowned by a fort and surrounded by fortified walls. For picturesque effect its main street is almost unequaled. At its upper extremity stands the palace, built of stone, with turreted windows and battlements, supported partly by the great rock, and partly by solid piers of masonry 400 feet high. At its lower extremity is the great temple dedicated to Krishna. Pop. 31,000.

BUNGALOW, an East Indian term for a kind of country house with a thatched or tiled roof. Bungalows are generally of one story, though sometimes of two, and have verandas running round them to afford shelter from the sun. Public bungalows for travelers (daks) are maintained by government on the main highways. In the United States the term means any small cottage of one story usually, or else with a second story in the roof, with dormer windows. It usually has large porches. Consult Saylor, 'Bungalows: their Design, Construction and Furnishing' (New York 1913).

BUNGAy, England, a market town in Suffolk, on the right bank of the Waveney, 30 miles northeast of Ipswich. It is well built; the streets, spacious and well paved, diverge from a moderate-sized area in the centre of the town, and a large market-place, in which is a handsome cross. It has two fine churches. The principal trade is in corn, flour, lime and malt, in which a considerable amount of business is done. There is also an extensive printing office. Adjoining the town is a very spacious common. Pop. 3,359.

BUNG, boon'gë, Alexander, Russian botanist: b. Kiev, 24 Sept. 1803; d. 1890. He was educated at Dorpat, and after taking the degree of M.D. in 1825 he traveled in Siberia and the eastern part of the Altai Mountains, and then joined the mission of the Academy of Saint Petersburg to Persia, where he remained eight months and procured an extensive herbarium. In 1883, by invitation of the Academy of Saint Petersburg, he made a second Asiatic journey, and in 1836 settled as professor of botany at Dorpat. His principal publications are catalogues of the plants which he collected in China and near the Altai Mountains.

BUNG, Friedrich Georg von, Russian legal historian (brother of the preceding): b. Kiev, 13 March 1802; d. 1897. He was educated at Dorpat, and for many years was professor of law there. His writings, principally upon the history of law and rights in the countries around the Baltic Sea, are numerous and valuable.

BUNGENEB, boon-ge-nà, Louis-Félix, French writer and critic: b. Marseilles, 29 Sept. 1814; d. Geneva, June 1874. He was educated from the theological school in Geneva and afterward continued in the same institution as professor until 1846, when he began to devote his time to literature. His works, most of which were published at Geneva, are quite numerous. Among the most notable of them are 'Deux Soirées à l'hôtel de Rambouillet' (1839); 'Essai sur la Poésie moderne' (1840); 'Histoire du concile de Trente' (1846); 'Voltaire et son temps' (1850); 'Julien, ou la fin d'un siècle' (1853, 4 vols.); 'Rome et la Bible' (1859); 'Rome et le cœur humain' (1861); 'Saint Paul, su vie, son œuvre et ses épîtres' (1867); 'Lincoln' (1867). At his death he left a great deal of work still unpublished.

BUNGERT, boon-gär't, August, German composer: b. Müllheim, and partly by solid piers of masonry 400 feet high. At its lower extremity is the great temple dedicated to Krishna. Pop. 31,000.

BUNGAY, England, a market town in Suffolk, on the right bank of the Waveney, 30 miles northeast of Ipswich. It is well built; the streets, spacious and well paved, diverge from a moderate-sized area in the centre of the town, and a large market-place, in which is a handsome cross. It has two fine churches. The principal trade is in corn, flour, lime and malt, in which a considerable amount of business is done. There is also an extensive printing office. Adjoining the town is a very spacious common. Pop. 3,359.

become popular. In Russia it is used as a vegetable.

**BUNION**, a small, hard, painful tumor formed in any part of the foot, but especially in the metatarsal joints. It consists in a swelling of the bones themselves, which fact distinguishes bunions from corns. It appears to be caused by the pressure of a boot or shoe which is too tight, especially when the feet are a little deformed. The best means to relieve the pain is to remove the causes of the tumor as soon as possible, to give rest to the foot and to apply lotions and emollient poultices.

**BUNKER HILL**, Mass., an eminence, 110 feet high, in the Charlestown district of Boston, connected by a ridge with another elevation, 75 feet high, named Breed's Hill. These heights are memorable as being the scene of a battle, 17 June 1775, commonly known as the battle of Bunker Hill. The city of Boston was occupied by the British under General Gage, who had resolved to begin offensive operations against the rebels. This design becoming known in the American camp, it was determined to seize and fortify the heights of Charlestown on the night of 16 June. The execution of this perilous mission was confided to Colonels Prescott and Pepperell at the head of a brigade of 1,000 men; and at dawn of day a strong redoubt was already completed on Breed's Hill. About 1,500 Americans advanced successively to the relief of Prescott, and General Warren entered the redoubt as a volunteer, refusing the command which was tendered to him. At about 2:30 o'clock, two columns of the British advanced to a simultaneous assault; they were received with a terrific fire, and were twice repulsed in disorder. When the Americans had exhausted all their ammunition, Prescott gave the order for retreat. They received a destructive volley as they left the redoubt, and Warren fell, shot through the head with a bullet. The retreat was harassed by a raking fire from the British ships and batteries, but there was no pursuit beyond Charlestown Neck. The British loss was 226 officers and men killed and 828 wounded; that of the Americans 145 killed or missing and 304 wounded. Although defeated, the moral result of this action was important. The Americans had seen superior numbers of the disciplined soldiers of England retreat before their fire, and had given the proof they were able to defend their liberties. On Breed's Hill, and near the spot where Warren fell, stands the Bunker Hill Monument, the corner-stone of which was laid by the Marquis de Lafayette, 17 June 1825. This monument was inaugurated 17 June 1843. It consists of a plain granite shaft, 220 feet high, 31 feet square at the base and 15 at the top. The monument affords a magnificent panoramic view of the surrounding country. Consult Ellis, G. E., 'History of the Battle of Bunker's (Breed's) Hill' (1875); Adams, C. F., Jr., in *American Historical Review* (Vol. 1); Frothingham, P., 'Siege of Boston' (Boston 1902).

**BUNKER HILL ORATIONS.** The first of the so-called 'Bunker Hill Orations' of Daniel Webster was pronounced 17 June 1825, the 50th anniversary of the Battle of Bunker Hill, when the cornerstone of the Bunker Hill Monument was laid. The second was delivered 18 years later at the exercises to commemorate the completion of the monument. The earlier address is, justly, the better known, and ranks as one of the most notable examples of American oratory, if indeed it is not the greatest occasional oration delivered in America during the first half of the last century. Though Webster substituted a weighty dignity of utterance and sheer personal force for the more exuberant figures, the classical allusions and quotations which were in vogue in the public speaking of his day, he belonged after all to the old school, which regarded oratory as something apart from the simple expression of natural thought and feeling. A comparison of the 'First Bunker Hill Oration' with Lincoln's 'Gettysburg Address' will make this plain; and it may help in explaining why, notwithstanding the clearer recognition of Webster's honesty and ability, his orations are less read and admired now than they were in his day. The most valuable part of the 'First Bunker Hill Oration' is the discussion of the American government and the ideals for which the fathers fought—a feeling exposition which have renewed pertinency in each new national crisis; but the most popular passage is perhaps the moving address to the veteran survivors of the battle, who were seated on the platform. The second oration is filled with felicitations and compliments, and contains no very notable passage, though the tribute to Washington has often been quoted.

**WILLIAM B. CAIRNS.**

**BUNODONT,** a term applied to animals in which the crowns of the molar teeth are composed of a number of low rounded cones or cusps. The pig is one of the best examples among living animals; the teeth of monkeys and other omnivorous or frugivorous animals, including man, are also of this type. It is probable that the molars of many if not all modern mammals have been evolved from bunodont teeth, for the ancestors of many races of the modern hoofed animals, carnivora, and some other groups, show a series of stages in the evolution of the teeth leading from the omnivorous bunodont type into the specialized grinding or cutting teeth (selodont) of the modern animals. See **Teeth.**

**BUNSEN, Christian Karl Josias (Chevyler),** German statesman and philosopher: b. Korbach, Waldeck, 25 Aug. 1791; d. Bonn, 28 Nov. 1860. He studied philology under Heyne at Gottingen, and subsequently went to Holland and Denmark, to acquire a critical knowledge of the Danish and Dutch languages. In 1815 he made the acquaintance at Berlin of the celebrated Niebuhr, and in 1816 proceeded to Paris, where he studied Persian and Arabic under Sylvestre de Sacy. The same year he visited Rome, where he married, and renewed his intimacy with Niebuhr, then Prussian Ambassador to the Papal court. Niebuhr procured him the appointment of secretary to the Prussian legation, and in 1823 Bunsen assumed Niebuhr's duties, being later, and in 1827, formally accredited as resident Prussian Minister. In this capacity he continued till 1838, when conducted several important negotiations with the Papal see, the result of one of which was the brief of Leo XIII relative to mixed marriages. His next mission was to Berne, as Ambassador to
the Swiss Federation. During his residence at Rome Bunsen had industriously pursued his philological and historical studies, including more especially that of the Platonic philosophy, and investigations into the religious and ecclesiastical history of mankind. The liturgies of the Church received his especial attention, and a service of his own framing, introduced by him into the chapel of the Prussian embassy at Rome, was printed by order of the King of Prussia, who wrote a preface to it. This work was published without the author's name at Hamburg in 1846, under the title of Allgemeines Evangel, Gesang-und Gebetbuch (Generall Hymn and Prayer Book of the Evangelical Lutheran Church), and may be regarded as a new edition of the Versuch eines Allgemeinen Evang. Gesang-und Gebetbuchs, published at Hamburg in 1833.

In 1841 Bunsen was summoned to Berlin from Switzerland to proceed to England in charge of a mission for the establishment, in conjunction with that country, of a bishopric at Jerusalem. Shortly afterward he was nominated Prussian Ambassador to England. In 1844 he was consulted on the subject of granting a constitution to Prussia, and is said to have drawn up and submitted to government the form of one which bore a very close resemblance to that of Great Britain. In the Schleswig-Holstein affair he strenuously opposed the claims of Prussia and the German Confederation in opposition to those of Denmark. From the opposite views taken by him to those of his government in relation to the Russian War he was recalled from London in 1854, and, abandoning politics, retired to Heidelberg to devote himself exclusively to literary pursuits. The results of these have established his reputation as one of the most profound and original critics in the department of Biblical and ecclesiastical history. Among these are Die Verfassung der Kirche der Zukunft (The Constitution of the Church of the Future) (1845); Agyptens Stelle in der Weltgeschichte (Egypt's Place in the World's History) (1845); Hippolytus und Seine Zeit (Hippolytus and His Time) (1851), and lastly, his greatest work, Bibelwerk für die Gemeinde (Bible Commentary for the Community), the first part of which was published in 1852 and was intended to be completed in 1862. It had occupied his attention for nearly 30 years, and, as he informs us, was regarded as the grand centre-point to which all his literary and intellectual energies were to be devoted. Death interposed to prevent him completing his undertaking. Ill health caused him to spend the winters of 1858-59 and 1859-60 at Cannes, in the south of France, returning thence in the spring of 1860 to Bonn (whither he had recently transferred his abode from Heidelberg), where he died. Three volumes of his Bibelwerk had been published at his death (the first, second and fifth), and this great work was completed in his spirit and by the aid of his manuscripts under the editorship of Holtzmann and Kamphaussen, in nine volumes (1868-70).

**BUNSEN, Robert Wilhelm Eberhard, German chemist:** b. Göttingen, 31 March 1811; d. 16 Aug. 1899. He studied at Göttingen University and at Paris, Berlin and Vienna; was appointed professor at the Polytechnic Institute of Cassel 1830; extraordinary professor at the University of Marburg 1838, and ordinary professor there 1841; professor at Breslau 1851; and finally, for some years, at Heidelberg 1852. Among his many discoveries and inventions are the production of magnesium in quantities, magnesium light, spectrum analysis, and the electric pile and the burner which bears his name (see below). Among his works are 'Chemische Analyse durch Spektrobelobachtung' (with Kirchhoff, 1861; new ed., 1895); 'Gasometrische Methoden' (1857; English by Roscoe); and 'Anleitung zur Analyse der Aschen und Mineralwasser' (1874). He retired from active teaching in 1889.

**BUNSEN BATTERY**, a modification of the Grove battery, plates or bars of gas coke being used instead of platinum. The electromotive force is slightly less than that of the Grove battery.

**BUNSEN BURNER**, a form of gas-burner especially adapted for heating, consisting of a tube in which, by means of holes in the side, the gas becomes mixed with air before consumption, so that it gives a non-illuminating, smokeless flame. Burners of this nature are part of the indispensable outfit of a chemical laboratory.

**BUNT**, sometimes called SMUT BALL, PEPPER BRAND and BRAND BLADERS, the most formidable disease, perhaps, to which wheat is subject, but which one may in most instances be greatly modified, and which seldom in the present day does material injury except where there is careless cultivation. Like many other of the diseases to which the cereal plants are subject, it arises from the attack of a parasitic fungus (Uredo aries). It is generated in the ovary of wheat and a few other Gramineae, and very rarely on the stem. It is formed at an early stage of growth, before the ear is free from the sheath; and indeed the plants which are affected by the parasite may be readily recognized by their unusual luxuriance, being generally several inches higher than plants not affected, larger in bulk, and often producing a greater number of stems from the same root. The bunted grains are shorter and blunter than the sound, of a dark-green when young, but with old, a yellowish or sometimes nearly black. The contents of the ovary are reduced to a uniform black powder or paste, which has an offensive smell like that of decayed fish. Various substances have been used by cultivators to prevent the growth of bunt, such as salt, quicklime, arsenic, corrosive sublimate, etc. Careful washing and a selection of good seed will alone prevent much mischief, but it is advisable to take some more stringent measures with a view to destroy the vitality of the bunt spores. For this purpose Dombasle's method is the most successful. It consists in thoroughly wetting the grain with a solution of sulphate of soda (Glauber's salts), then drying the wheat with quicklime, which combines with the water to make sulphate of lime (gypsum), which acts as a manure, while the organic acid destroys the vegetative powers of the bunt spores.

**BUNTER SANDSTONE**, one of the three divisions of the Triassic. It is the lowest, that is, the oldest of the series. It corresponds to the grès bigarré (variegated free-
BUNTINGS, CANARIES, ETC.

1 Lapland Longspur Bunting
2 Chaffinch
3 Wild Canary
4 Meadow Bunting
5 Cardinal
6 Rose-breasted Grosbeak (Male)
7 Reed Bunting (Male and Female)
stone or grit) of the French. In the Hartz it is more than 1,000 feet thick; in Cheshire and Lancashire, England, it consists chiefly of red sandstones, and fossils are very rare. The rocks are highly porous and afford an important source of water supply. The footprints formerly known as those of chirotherium, now known to be labyrinthodont, are found there. These plants are chiefly ferns, cycads and conifers. 

BUNTING, Jabez, English clergyman: b. Monyash, Derbyshire, 1778; d. London, 16 June 1838. His parents were members of the Wesleyan Church and removed to Manchester when he was a child. While at school he attracted the attention of Dr. Percival, who employed him as his amanuensis, and at his death made him one of his executors. He early joined the Church; became a traveling preacher in 1799; joined the Conference after the death of Mr. Wesley, and was appointed to the Oldham circuit. After traveling four years he was sent to London, where he gained great popularity as a pulpit and platform orator. After remaining two years in London he was removed to Manchester, where he distinguished himself as an advocate of ecclesiastical order and discipline in a controversy with some dissatisfied Methodists. In this controversy he gave such evidence of a knowledge of the polity of Wesleyan Methodism as secured for him the favor of the entire body to which he belonged. He was four times president of the Methodist Conference; 17 years missionary secretary, and three years as editor. In 1835 he was chosen president of the theological school, and was looked upon as the acknowledged leader of the Methodists, superintending the interests of the body at home and abroad, while, at the same time, his influence was felt in other evangelical denominations, and also in the political world, statesmen frequently resorting to him for advice. Yet he derived only the ordinary emoluments of a Methodist minister—a yearly salary of £150, with house-rent and taxes. During all the distractions connected with the secessions that have taken place in the Wesleyan body, Dr. Bunting remained a firm, unwavering adherent and advocate of the doctrines and discipline of the Church as they came from the hands of John Wesley, and to his influence and indefatigable zeal are largely to be ascribed the permanency and prosperity of the Wesleyan connection. 

BUNTING, Sir Percy (William), English journalist: b. Manchester 1836; d. 22 July 1911. He was educated at Owens College, Manchester, and Pembroke College, Cambridge, and was called to the bar. He was editor of the Contemporary Review from 1882 until his death and was concurrently editor of the Methodist Times from 1902. He was knighted in 1908. 

BUNTING, William Maclardie, Wesleyan minister: b. Manchester, 23 Nov. 1805; d. Highgate Rise, 13 Nov. 1866. He began to preach at the age of 15. In 1826 he was a spiritual writer and very active in the Evangelical Alliance and also in the British Society for the Propagation of the Gospel among the Jews. After his death his selected sermons and other writings were published under the editorship of G. Stringer Rowe (1870). 

BUNTING, one of a group of cone-billed birds, forming the genus Emberiza, represented in Europe by the corn-bunting, reed-bunting, and meadow bunting. It is marked by its cone-shaped bill and a hard knob on the inner surface of the upper mandible. The corn-bunting has a black head and throat and the nape and sides of the neck are white. The head of the corn-bunting is olive-green, with bright yellow patches on the cheek and over the eyes. The term is used in the United States for two or three similar birds, such as the dick-cisella and snow-bunting (qq.v.). All the buntings are good singers, and the term is applied by dealers in cage birds not only to the true European buntings, but to many other seed-eaters, such as the ortolan and our indigo-bird. 

BUNTING, a thin woolen stuff, of which flags are usually made; hence, flags, collectively. 

BUNYA-BUNYA, the native Australian name of Araucaria cunninghamii, a podocarp tree with cones larger than a man's head, containing seeds that are eagerly eaten by the natives. 

BUNYAN, John, English preacher and author: b. Elstow, near Bedford, Bedfordshire, England, 1628; d. Swan Hill, 31 Aug. 1688. The Bunyans were an old family in Bedfordshire but Bunyan's immediate ancestors for several generations had been obscure, and Bunyan's own father, Thomas Bunyan, was a tinker. Of his mother, Margaret Bentley, little is known. In spite of their lowliness, however, these parents trained Bunyan with some care and sent him to the Bedford schools. Then he took up the trade of tinker, at which, until he became an established preacher, he worked industriously. In the latter part of 1645 and the early months of the following year he fought in the Civil War, but on which side is uncertain. Froude maintains that he was in the Royalist army, whereas Macaulay and Brown, to whom the weight of authority must be given, state that the evidence goes to show that Bunyan was with the Parliamentarians. In 1646, he returned to his trade in Elstow, and at about the age of 20 married a wife, whose goodness of character is the accepted proof that Bunyan was better than he represented himself. Of far more importance in giving character to Bunyan's career was his spiritual life. Besides being brought up religiously and at a time of peculiarly strong belief in the literal truth of hell and heaven, of damnation and atonement, of devils and evil spirits, Bunyan's boyhood and early manhood were not only a continual struggle between the inclinations of an active, pleasure-loving youth and the terror lest he be doomed to eternal perdition, but also a spiritual anguish, a man of the most imaginative of minds of which there is record. "He was," says William James ('The Varieties of Religious Experience'), "a typical case of the psychopathic temperament, sensitive of conscience to a diseased degree, beset by doubts, fears and insistent ideas, and a victim
of verbal automatisms, both motor and sensory. These were usually texts of Scripture which, sometimes damnable and sometimes favorable, would come in a half-hallucinatory form as if they were voices, and fasten on his mind and buffet it between them like a shuttlecock. Though in most ways a wholly respectable character, he speaks of himself, in his autobiography, ‘Grace Abounding,’ as a most blasphemous youth, in return for which he was warned and tormented by visions to which he gave little heed. When the visions left him, he tells us that he became worse, nor were some narrow escapes from death sufficient to make him repent. His marriage had a good effect on him; he went to church regularly and was repentant, though, he says, in a formal way. He still liked his sports and was in the habit of playing cat on the village green Sunday afternoons. The effect of a peculiarly vivid vision of a warning voice from heaven while he was in the act of striking the cat was to make him determined to alter his wicked ways and be redeemed from his wicked courses. Yet he began to mend his ways, first giving up his profanity, then his love of bellingring, and lastly his dancing, though it took him nearly a full year before he could quite leave that behind him. He became esteemed as a good man, but he feared that he had no depth of repentance. Overhearing some poor old women talking of the new birth and of the ways of resisting the devil, he became convinced that he wanted the true tokens of a truly godly man. Though he meditated much on their saying, though he gave up all his evil companions and once or twice had visions of the way to salvation, two questions troubled themselves, ‘Whether he was elected?’ and ‘How if the day of grace should now be past and gone?’ After much questioning, distress of mind and manifold temptations that Satan put in his way, he gained some comfort from the Scriptures. The preaching and talk of Gifford, the Bedford minister, made him feel worse and worse; he seemed to himself to be utterly base and corrupt. Temporary comfort came in the Song of Solomon, but about a month after, a very great storm came down upon me, which handled me twenty times worse than all I had been before. Slightly was continually with him; he feared that he had blasphemed against the Holy Ghost. This temptation lasted about a year, but partly from texts in the Bible, and partly from the ministrations of Gifford and Luther’s ‘Comment on the Galatians,’ he received some comfort. Even so, he was subject to another temptation, which endured a year, “to sell and part with the most blessed Christ.” He feared that he had committed the unpardonable sin, and he was so torn between despair and hope that, after another conflict of three-quarters of a year, he fell into sickness. Even then he was tempted, but his mind and body grew whole together, and from this time on, about 1655, he seems to have felt himself redeemed.

In 1653 Bunyan joined the Bedford churh, and two years later, “after I had been about five or six years awakened,” he began preaching at the suggestion of some of the most able of the town. He was first appalled by the gravity of his mission, but finding that he gave comfort to many he grew more confident. The secret of his success lay in the fact that he preached what I felt, what I smartingly did feel; even that under which my poor soul did groan and tremble to astonishment. So great was the sincerity and success of his mission that he raised for himself much opposition among the Anglican divines, and was much slandered. Almost simultaneously with the launching of his literary career as author with a book of controversy directed against the Quakers, ‘Some Gospel Truths Opened’ (1666).

On 12 Nov. 1660, shortly after the return of Charles II, Bunyan was arrested for preaching. Refusing to flee or to agree not to preach, he was lodged in the Bedford county jail. Failing to get his case heard, he remained there for 12 years, except for a few weeks of liberty in 1665. During his unjust imprisonment, Bunyan had some access to the outside world, frequently visiting his church and once going as far as London. In the sense that he had much leisure to write, his confinement was of advantage to him. He composed and had published many books of which the most famous was ‘Grace Abounding to the Chief of Sinners’ (1666). On his release, in 1672, from jail, in accordance with the Declaration of Indulgence of Charles II, he became minister of the Bedford church. In 1675-76, Bunyan was again imprisoned, this time for six months in the small jail on Bedford bridge. The fact is important because it is probable that there he wrote, among other books, at least two-thirds of the first part of ‘Pilgrim’s Progress.’ This part was first published in 1678, and a second edition with some additions, as the case of Mr. Worldly Wiseman, appeared the same year. The third came out early in 1679 and since then editions have been numerous. The second part appeared in January 1685. In the interval between the two were published the other books for which Bunyan is best known next to ‘Pilgrim’s Progress’ and ‘Grace Abounding’—‘The Life and Death of Mr. Badman’ (1680) and ‘The Holy War’ (1682). Aside from the imprisonment of 1665 and some persecution Bunyan’s last years were quiet. His influence from his preaching and his writing was very widely diffused, and he was, in these respects, second to scarcely any man in England. He met his death in doing a characteristic act of charity: having successfully reconciled a father and son at Reading, he was, while continuing his journey to London, overtaken by a rain storm and died from the effects of the exposure, in his 60th year.

Bunyan ranks among the most popular of English authors: his ‘Pilgrim’s Progress’ is said to be read more widely than any other book in the language, except the Bible. It has been translated into over 70 foreign tongues. The reasons for its extraordinary vogue lie in the simplicity of the style, the fervor of the imagination, the universality of its spiritual appeal; no book is more widely intelligible or freer from sectarian dogmas. In all his books he appears as an unsurpassed master of a simple, direct, vernacular style. See ‘Holy War; The; Pilgrim’s Progress.’

Bibliography.—Editions. Bunyan’s four more important works are numerous, and there are several of his collected works. Altogether he wrote about 60 books. Among the many lives that of the Rev. John Brown, ‘John Bun-
van. His Life, Times and Work (1885), is the most complete and authoritative. Froude's life in the 'English Men of Letters' (1880); and that by Canon Venables in the 'Great Writers Series' are also good; to the latter a full bibliography is added. Consult also Dowden, 'Puritan and Anglican Studies' (1901) and Jones op. cit. BUNZLAU, boons'low, Germany, the name of several European towns, chief of which are:

1. A town of Prussia, in the province of Silesia, near the Bober, 25 miles west of Liegnitz. It is a flourishing town, rich in manufactures, and has a trade in coal, iron, and other products.

2. Jung Bunzlau, a town of Bohemia, 31 miles northeast of Prague, the capital of the circle of Bunzlau. It stands on the left bank of the Vltava, and has an old castle, an ancient town house, and other interesting buildings. Its inhabitants are chiefly engaged in manufacturing cottons, woollens, starch, sugar, spirits, beer, etc. Pop. 11,500.

3. Alt Bunzlau, a small town of Bohemia, situated on the Elbe.

BUOL-SCHAUENSTEIN, bwol-shawn-en-stin, Karl Ferdinand (COUNT), Austrian statesman: b. 17 May 1797; d. Vienna, 28 Oct. 1855. He was Minister in succession at Carlsruhe, Stuttgart, Turin and Saint Petersburg. He was second Austrian plenipotentiary at the Dresden Conference (1850), after which he was appointed to London until the death of Schwarzenberg recalled him to Vienna to hold the portfolio of foreign affairs. He presided at the Vienna Conference in 1855, and represented Austria at the Congress of Paris.

BUONAPARTE. See BONAPARTE.

BUONARROTI, bwon-rah-rot-te, Filippo: b. Pisa, 11 Nov. 1761; d. Paris, 15 Sept. 1828. He received an excellent education under the auspices of the Grand Duke Leopold, but forfeiting the friendship of that prince on account of his sympathies with the French revolutionists, he resorted to Corsica, where he commenced his career as a character actor and returned to Paris in 1814. The cask buoy is in the form of a cask; the larger are employed for mooring, and are called mooring buoys. Spar buoys are wooden poles weighted at the thick end, by which they are moored. They are used in inland waters and in situations where, by reason of ice, a norbuoy's anchor would be damaged in winter. Whistling buoys are provided with apparatus, operated by a bell, which sounds a signal in foggy weather. The life or safety buoy is intended to keep a person afloat till he can be taken from the water. Its most usual form is a ring of cork covered with a signal device such as a light or bell.
buoys serve as a guide at night. Some buoys are fitted for generating and burning acetylene gas, and are often made to carry a charge to last six months or more. Electric buoys are illuminated by connection with power on shore by means of a cable.

**Bupalus**, Greek sculptor fl. at Chios about 500 B.C. He and his brother Athenis are best known for their satirical conflict with the poet Hipponax. Augustus adorned many of the Roman temples with works of the two brothers, who used the pure white marble of Paros. Pausanias represents Bupalus as being an elegant architect as well as a sculptor.

**Buphaga**, bū'fa-ga, a genus of birds of the starling family (*Sturnidae*), whose species are found in various parts of Africa, where they are of great use from their habit of feeding on the parasites infesting cattle. They are popularly known as beef-eaters or ox-peckers, and are distinguished from the true ox-peckers by their shorter beak, bare nostrils, more curved claws and some other characters. The South African ox-pecker (*B. africana*) inhabits Natal, while farther north the genus is represented by a red-billed species (*B. erythrophthalmus*). The third species is found still farther north and also in the Transvaal.

**Buphagus**, in ancient mythology, a son of Japetus and Thornax, who was killed by Diana for an attempt upon her chastity. A river of Arcadia was named after him. Buphagus was also one of the surnames of Hercules, which was given to him on account of his gluttony.

**Buphonia**, bū-fō'nē-a (Gr. ἐβοσφόνα ox-killer), an ancient Athenian festival in honor of Zeus, celebrated every year on the 14th of Scirophorion, on the Acropolis. Barley and wheat were placed on the altar, and the ox destined for the sacrifice was permitted to go and eat the grain, when a priest armed with an axe and slewed the ox, and then secreted himself. The other priests, as if not knowing the author of the deed, made inquiry, and, failing to ascertain anything, for lack of a better victim arraigned the axe, found it guilty and condemned it. The Buphonia were also called Diopilia.

**Buprasium**, a town of ancient Greece, in Elis, often mentioned by Homer as one of the chief cities of the Epians. It had ceased to exist in the time of Strabo, but the name was still attached to a district situated on the left bank of the Larissus, and on the road leading from Dyme to Elis. The region is now identified with the plain of Bakouma.

**Buprestideae**, bu-prē'stī-dē, a family of coleopterous insects (bettle), many of which are remarkable for the splendor of their appearance. This family is included in the pentameric section of Coleoptera, which was formed by Latreille, and so named because the members of both five-jointed in the tarsi. The characters of the Buprestide are: body ovate, elongated, somewhat broad and obtuse in front, but pointed behind; eyes oval, with the antennae finely serrate inserted between them; jaws powerful. The larvae are mostly wood-borers although some of the smaller species live in leaves or galls. They walk slowly, but fly with great rapidity, especially in warm weather. They are very fond of sunning themselves on bushes or the branches of trees. When one attempts to seize them, sometimes even when one approaches them, they allow themselves to fall suddenly to the earth, or fly rapidly away. There are several hundred species known to this family, over 200 species occurring in North America, and the tropical species are those which are chiefly distinguished by the brilliancy of their colors. The prevailing color appears to be green, but species are often found of a blue, red, golden or other color. The most injurious is the *Chrysobothris fermonata*, an apple borer. The largest are the *B. Chalcephora*, which bore into pines. The *B. gigas* of Linneus, which is about two inches in length, and one of the largest of the family, has bright golden elytra, or wing-cases, which are often used as ornaments by the inhabitants of South America, of which continent it is a native.

**Bur-marigold**, a large genus of annual and perennial herbs (Bidens) of the family Asteraceae, mostly natives of North America, but widely distributed in other countries, chiefly as weeds, but some as garden plants. The best-known ornamental species is *B. grandis* or *B. floridana*, a native of Mexico. Several species are common in eastern North America, where they are variously known as devil's bootjack, stick-tight, beggar-tick, Spanish-needle, etc. They are especially troublesome in wool and on clothing, to which the seeds stick like burs. Some species are valuable as honey plants.

**Bura**, in ancient mythology, a daughter of Jupiter, or, according to some authorities, the offspring of Ion and Helice, from whom Bura, or Buris, once a flourishing city of ancient Greece, on the Bay of Corinth, received its name.

**Bura**, in ancient Greece, one of the 12 original Achaean cities, which stood formerly close to the sea, on the Bay of Corinth, but, having been destroyed, with the neighboring town of Helice, by a terrible inundation, the surviving inhabitants rebuilt it afterward about 40 stadia from the coast, and near the small river Buraicus. Bura was situated on a hill, and contained temples of Ceres, Venus, Bacchus and Lucina, the statues of which were sculptured by Euclidas of Athens. On the banks of the river Buraicus was a cave consecrated to Hercules, and an oracle usually consulted by the throwing of dice. The ruins of Bura are close to the road from Megastenia to Vostitza, and the cave of Hercules Buraicus is visited by tourists.

**Burbank, Luther**, American naturalist, author and plant originator: b. Lancaster, Worcester County, Mass., 7 March 1849; of English-Scotch ancestry; educated in the common schools and local academy; worked as a boy for the Ames Plow Company, agricultural implement manufacturers, Worcester, Mass., where he exhibited marked inventive abilities, but soon began market-gardening and seed-raising in a small way, developing the well-known Burbank potato in 1873; removed to Santa Rosa, Cal., 1 Oct. 1875, where he has since resided and carried on his work. His many and important new creations of fruits, flowers, vegetables, timber trees, grains and
grasses have made him the best known plant-
orticulturist in the world. The characteristics
which are the special factors in the success of
his work are, the large extent of his experi-
ments, his keenness of perception of slight
variations in plant qualities and the rapidity
with which he develops new qualities, the
rapidity being due to a combination of multiple
hybridizing, selection and grafting of seedling
plants on mature stocks, so that immediate re-
results as to flowers and fruits are obtained from
seedling stems. But the final and most import-
ant factor in Burbank's success is the inherent
personal genius of the man, whose innate
sympathy with nature, aided by the practical
education in plant biology derived from 50
years of constant study and experiment, enable
him to perceive correlations and outcomes of
plant growth which seem to have been visible to
no other man. As the history of Burbank's
life is the history of his work, the remainder of
his biographical sketch may advantageously be
devoted to a brief consideration of the character
and career of this remarkable man, with some
of the new plant varieties. Burbank has originated
and introduced a remarkable series of plums and
prunes. No less than 60 varieties are in-
cluded in his list of offerings, and some of
them, notably the Gold, Wicken, Apple, Oc-
tober, Chako, America, Climax, Formosa, Bart-
lett, Santa Rosa and Beauty plums and the
Splendor, Sugar, Giant and Standard prunes are
among the best known and most successful
kinds now grown. He has also perfected a
stoneless prune, the Abundance, and has created
an absolutely new species, the plumcot, by a
combination of the common plum and the apri-
cot. The Sugar and Standard prunes promise
to supplant the French prune in California.
The Bartlett plum, cross of the bitter Chinese
simoni and the Delaware, a Burbank hybrid,
has the exact fragrance and flavor of the Bart-
lett pear. The Climax is a cross of the simoni
and the Japanese triflora. The Chinese simoni
produces almost no pollen, but few grains of
it ever having been obtained; but these few
grains have enabled Burbank to revolutionize
the whole plum shipping industry. Most of
Burbank's plums and prunes are the result of
multiple crossings, in which the Japanese var-
eties have played an important part. Hundreds
of thousands of seedlings have been grown and
carefully worked over in his 40 years' exper-
iments with plums and single trees have been
made to carry as many as 600 varying seedling
grafs.
Burbank has originated and introduced the
Van Deman, Santa Rosa, Alpha, Pineapple,
*No. 80,* Dazzle and other quinces; the Leader,
Opulent and National peaches, cross-bred from
the Muir, Wager and White nectarine; the
Winterstein and Goldridge apples; and has
made interesting, although not profitable,
crosses of the peach and almond, and plum and
almond.
Next in extent, probably, to his work with
plums is his long and successful experimentation
with berries. This work has extended through
33 years of continuous labor, and has in-
volved the use of over 50 different species of
Rubus, and has resulted in the origination and
introduction of 10 new commercial varieties,
mostly obtained through various hybridizations
of dewberries, blackberries and raspberries.
Among these may especially be mentioned the
Phenomenal, a hybrid of the Western dewberry
(R. urginsus) and the Red raspberry (R. ideous),
fixed in the first generation, which ripens its
main crop far ahead of most raspberries and
blackberries and that this pro-
portions and exquisite quality; the Iceberg, a
cross-bred white blackberry derived from a
hybridization of the Crystal White (pistillate
parent) with the Lawton (staminate parent)
and with beautiful snow-white berries so nearly
transparent that the small seeds may be seen
in them; the Balloon berry, selected from a
complicated cross of many species; the Him-
laya, the most rapid growing and by far the
most productive blackberry in existence, of
unequalled quality and of great value in Cali-
ifornia and other mild climates; also a wonder-
ful series of absolutely thornless blackberries
of great productiveness and superior quality.
The thornless berry has not yet been generally
introduced, but will no doubt supplant the
thorny varieties nevertheless, as one of the
most interesting feature of Mr. Burbank's brief account,
in his "New Creations" catalogue of 1894, of
the berry experimentation, is a reproduction
of a photograph showing *a* sample pile of
brush 12 feet wide, 14 feet high and 20 feet
long, containing 63,000 two- and three-year-old
seedling bushes (40,000 Blackberry X
Raspberry hybrids and 25,000 Shaffer X Gregg
hybrids) all dug up with their crop of ripening
berries. The photograph is introduced to
indicate the reader some idea of the work neces-
sary to produce a satisfactory new race of
berries. Of the 40,000 Blackberry-Raspberry
hybrids of this kind 'Paradox' is the only one
now in existence. From the other 25,000
hybrids two dozen bushes were reserved for
further trial.
Leaving Burbank's other fruit and berry
creations unmentioned, we may refer to his
curious cross-bred walnut results, the most
astonishing of which is a hybrid between
Juglans californica (staminate parent) and
J. regia (pistillate parent), which grows with
an amazing vigor and rapidity, the trees in-
creasing in size at least twice as fast as the
combined growth of both parents, and the
clean-cut, glossy, bright-green leaves, from two
to three feet long, having a sweet odor like
that of apples. This hybrid produces no nuts,
but curiously enough the result of a nearly
similar hybridization (i.e., pollen from nigra
on pistils of californica) produces in abundance
large nuts of a quality superior to that pos-
sessed by either parent. These new species of
walnut are now known as "Paradox" and
"Royal" respectively.
Of new vegetables Burbank has introduced,
besides the Burbank and several other new
potatoes, new tomatoes, sweet and field corn,
squashes, asparagus, etc. Perhaps the most in-
teresting of his experiments in this field is the
successful production of a whole series of
giant spineless and spiculeless cactus, both for
forage and fruit (the spicules are the minute
spines, much more difficult to get rid of than the
conspicuous long, thorn-like
spines), edible for stock, and indeed for man.
This work is chiefly one of pure selection, for
the cross-bred forms often seem to tend

BURBANK
strongly to revert to the ancestral spiny condition.

Among the many new flower varieties originated by Burbank may be mentioned the Peach-blow, Burbank, Coquito and Santa Rosa roses, the Splendor, Fragrance (a fragrant form) and Dwarf Snowflake callas, the enormous Shasta and Alaska daisies, the Ostrich plume, Waverly, Snowdrift and Double clematis, the Hybrid Wax myrtle, the extraordinary Nicotunia, a hybrid between a large, flowering Nicotiana and a petunia, numerous hybrid Nicotianas, a hundred or more new gladliots, an amelopsia, numerous amaryllis, various dahlias, the Fire poppy (a brilliant flame-colored variety), striped and carnation poppies, a blue Shirley (obtained by selection from the Crimson field poppy of Europe), the Silver lining poppy (obtained by selection from an individual of *Papaver umbrosium* showing a streak of silver inside) and a silver interior and crimson exterior, and a crimson California poppy (*Escholtzia*) obtained by selection from the familiar golden form. Perhaps his most extensive experimenting with flowers has been done in the hybridizing of lilies, a field in which many botanists and plant breeders have found great difficulties. Using over a hundred varieties as a basis of his work, Burbank has produced a great variety of new forms. "Can my thoughts be imagined," he says, in his *New Creations* of 1893, "after so many years of patient care and labor (he had been working over 16 years) as, walking among them (his new lilies) on a dewy morning, I look upon these new forms of beauty, on which other eyes have never gazed? Here a plant six feet high with yellow flowers, beside it one only six inches high with dark red flowers, and further on one of pale straw, or snowy white, or with curious dots and shadings; some delicately fragrant, others faintly so; some with upright, others with nodding flowers, some with dark green, woolly leaves in whorls, or with polished, light green, lance-like, scattered leaves."

So far no special reference has been made to the more strictly scientific aspects of Burbank's work. Burbank has been primarily intent on the production of new and improved fruits, flowers, vegetables, trees, grains and grasses for the immediate benefit of mankind. But where biological experimentation is being carried on so extensively it is obvious that there must be a large accumulation of data of much scientific value in its relation to the great problems of heredity, variation and species-forming. Burbank's experimental gardens may be looked on from the point of view of the biologist and evolutionist as a great laboratory in which, at present, masses of valuable data are, for lack of time and means, being obtained. In a *Burbank's Own* particular scientific beliefs touching the "grand problems" of heredity we have space to record but two; first, he is a thorough believer in the inheritance of acquired characters, a condition disbelieved in by the Weismann school of evolutionists; second, he believes in the constant mutability of species, and the strong individuality of each plant organism, holding that the apparent fixity of characteristics is a phenomenon wholly dependent, for its degree of reality, on the length of time this characteristic has been ontogenetically repeated in the phylogeny of the race. See *PLANT-BREEDING*.

For other accounts of Burbank and his work, consult articles in the illustrated magazines: *New Creations in Plant Life* by W. S. Harwood. Burbank has written 12 large volumes, *Luther Burbank, His Methods and Discoveries and Their Practical Application*; *The Training of the Human Plant*; and his series of catalogues, 1893-1901, called *New Creations*; and has several shorter volumes under preparation covering an enormous amount of experimental data on plant life in all its aspects.

VERNON L. KELLOGG, Professor of Entomology, Leland Stanford Junior University.

BUBOT, a fresh-water fish (*Lota lota*) of the cod family, inhabiting northern Europe and America. It is numerous in the inland waters of the Northern States and Canada, where it displays the nocturnal voracity of its race. It ordinarily weighs about five pounds, but has small market value. It is more often called cusk, ling or loche among us, than burbot, which is the British designation.

BURBRIDGE, Stephen Gano, American soldier: b. Scott County, Ky., 19 Aug. 1831; d. 1894. He organized the famous 26th Kentucky Regiment, which he led for the Union at Shiloh, where he was promoted to the rank of brigadier-general of volunteers. He was engaged in the Vicksburg campaign, and led the charge at Arkansas Post and at Port Gibson, being the first to enter each of these places; was retired with the brevet of major-general in 1865.

BURCH, Charles Sumner, American Protestant Episcopal bishop: b. Pincnery, Mich., 30 June 1855. A graduate of the University of Michigan in 1875; after engaging in publishing business in Chicago; he was editor of the Grand Rapids Evening Press from 1897 to 1905. He had taken deacon's orders in 1895 and was ordained to the priesthood in 1905. He was rector of Saint Andrew's, Staten Island, N. Y., until 1911, when he was consecrated suffragan bishop of New York.

BURCHARD, Samuel Dickinson, American clergyman: b. Steuben, N. Y., 6 Sept. 1812; d. Saratoga, N. Y., 25 Sept. 1891. He was graduated at Centre College in 1836 and became a prominent lecturer in Kentucky on the anti-slavery and temperance questions. He was for many years a Presbyterian pastor in New York. In 1885 he became pastor emeritus. During the presidential campaign of 1884 a company of clergymen, about 600 in number, called on James G. Blaine, the Republican candidate, at the Fifth Avenue Hotel, New York. Dr. Burchard made an address, in which he affirmed that the antecedents of the Democracy were "Dum, Romanism and rebellion," and this denunciatory speech on the very eve of the election created intense excitement throughout the United States and alienated from Blaine many Democratic votes upon which he had reckoned. It is generally conceded that Burchard was thus largely instrumental in electing Grover Cleveland.
BURCHIELLO, doo-ché'ël'ló, Domenico, Italian poet: fl. 15th century at Florence, where he was probably born. He died at Rome, about 1449. He was the son of a barber named Giovanni, and was called originally only Domenico. He assumed the name of Burchiello afterward for reasons that cannot be assigned. His fame began about 1425. He was first registered as a barber in 1432. Some writers have reproached him for shameless vices, and represented him as a low buffoon who did everything for money. Others have defended him. His shop was so famous that learned and unlearned, high and low, assembled there every day, and Cosimo the Great caused a picture of it to be painted on one of the arches of his gallery. It appears here divided into two portions; in one Burchiello is acting the part of a barber; in the other that of a musician and poet. The portrait of Burchiello himself is painted over his shop. It is extremely difficult to decide upon the absolute value of his satires, as the local and personal allusions in them are obscure. They were composed of his contemporaries, with a studied aim at security and extravagance of expression. His style is, nevertheless, pure and elegant. His burlesque sonnets are enigmas, of which we have no intelligible explanation, notwithstanding what Doni has done. The descriptive arts are very easily understood; but the wit they contain is, for the most part, so coarse, that the satire fails of producing its effect. They are, on the whole, lively, but licentious. The best editions of his sonnets are those of Florence (1568) and of London (1767).

BURCKHARDT, Max Eugen, Austrian writer on jurisprudence, poet, novelist and dramatist: b. Korneuburg 1854; d. 1912. He studied at the University of Vienna, rendered efficient service for several years as a member of the ministry of education, and received in 1890 his appointment as director of the Hoftheater (court theatre) in Vienna, an office so well suited to his talents that it called forth a series of appropriate works. Thus, in 1896 he published 'Das Recht der Seelen' (Berlin 1905); 'Gottfried Wunderlich' (1906); 'Das Theater' (Frankfurt am Main 1907); 'Im Paradies' (Wien 1907); 'Die verflixten Frauenzimmer' (1909); 'Jene Asra' (Salzburg 1910); a novel of distinction entitled 'Trucarla' in 1910; and in 1912 his 'Cillis — Sina — Gabrielle: Briefe von und an Carl Rahl.' It should be noted that, before his appointment as director of the court theatre, he had published his 'Gesetze und Verordnungen in Kultussachen' (1887) and the poem entitled 'Das Lied vom Tannhäuser' (1888).

BURCKHARDT, boork'hart, Jakob, Swiss author, eminent as a student and critic of Italian art and as an historian: b. Basel 1818 d. 1897. At the university of his native town, and later at the University of Berne, he became interested in history and theology. His first appointment was as professor of the history of art and civilization at the University of Basel, and this connection he maintained to the end of his life, with the exception of a few years spent at Zürich as an instructor in the University College. His most important works are 'Die Zeit Constantins des Grossen' (Leipzig 1880); 'Der Cicerone; Eine Anleitung zum Genuss der Kunstwerke Italiens, 4 Auflage, unter Mitwirkung des Verfassers und anderer Fachgenossen bearbeitet von Dr. Wilhelm Bode' (parts 1 and 2, Leipzig 1879) with its English versions, 'The Cicerone, or Art Guide to Painting in Italy' (ed. by A. von Zahn and trans. by Mrs. A. H. Clough, London 1873; 2d ed. 1875); 'Geschichte der Renaissance in Italien' (1st ed., 1860, 8th ed., 1902, and English translation, 'The Civilization of the Renaissance in Italy,' London 1890); 'Geschichte der Renaissance in Italien und ihres Nachfolgers und der Aufklärung' (1890—91); 'Griechische Kulturgeschichte' (3 vols., 1898—1900). Material additions to and enhancement of the value of 'Der Cicerone' must be credited to Dr. Bode and the other editors.

BURCKHARDT, Johann Karl, German astronomer: b. Leipzig, 30 April 1773; d. 22 June 1825. He acquired a fondness for astronomy from the study of the works of Lalande, and made himself master, at the same time, of nearly all the European languages. He wrote a Latin treatise 'On the Combinatory Analytic Method' (Leipzig 1794) and studied practical astronomy with Baron von Zach at the latter's observatory on the Seeberg, near Gotha, and assisted his patron, from 1795—97, in observing the right ascension of the stars. Von Zach recommended him to Lalande, who invited him to Paris, where he received him at his house 15 Dec. 1797. Here he distinguished himself by the calculation of the orbits of comets; participated in all the labors of Lalande and those of his nephew, Lefrançois Lalande; took an active part in the observatory in the Île de France; and translated the first two volumes of Laplace's 'Mécanique Céleste' into German (Berlin 1800—02). Being appointed adjunctastronomer by the board of longitude, he received letters of naturalization as a French citizen 20 Dec. 1799. His important treatise on the comet of 1770, which had not been visible for nearly 30 years, although, according to the calculations of its orbit, it should have returned every five or six, was rewarded with a gold medal by the Institute in 1800. This treatise, which contained some improvements in Dr. Ober's mode of calculation, is contained in the 'Memoires de l'Institut' for 1800. During this year he was made a member of the department of physical and mathematical sciences in the Academy; in 1818 made a member of the board of longitude; and, after Lalande's death, astronomer in the observatory of the Ecole Militaire. In 1814 and 1816 he published in French, at Paris, 'Tables to Assist in Astronomical Calculations.' He also wrote some treatises in Von Zach's 'Geographical Ephemerides.'

BURCKHARDT, John Lewis, English African explorer: b. Lausanne, Switzerland, 24 Nov. 1794; d. Cairo, 17 Oct. 1817. He was educated at Neuchatel, Leipzig and Göttingen. In 1806 he went to London and was introduced to Sir Joseph Banks, who accepted his proffered services on behalf of the African Association, founded to explore the interior of Africa. After studying at Cambridge, and inuring himself to hardship and exposure, he sailed for Malta in 1809; and from Malta he proceeded to Tripoli as an Oriental, and studied there for two years Arabic and Mohammedan law. In 1810 he
BURDEKIN — BURDETT

made a tour of Palmyra, Damascus and Baalbek; in 1812 he journeyed through Palestine and Arabia to Egypt; in 1813 he traversed the Nile above Assouan; in 1814 he visited Mecca, successfully personating a Moslem pilgrim; 1815 saw him at the Prophet's tomb at Medina, and he journeyed to Suez and also made the ascent of Mount Sinai in 1816. He died with the main purpose of his life unfulfilled, the exploration of the sources of the Niger, and was buried in his assumed character of a devout Moslem pilgrim. His collection of 150 volumes of manuscript he bequeathed to Cambridge University. His works were all published posthumously: travels in Nubia (1819), in Syria (1822), in Arabia (1829); Notes on the Bedouins and Wahabys (1830); 'Arabic Proverbs' (1830).

BURDEKIN, a river of the northeast of Queensland, with a course of about 350 miles. With its affluent it waters a large extent of country, but it is useless for navigation.

BURDEN, Henry, American inventor: b. Dumblanc, Scotland, 20 April 1791; d. Troy, N. Y., 19 Jan. 1871. He was brought up on a farm, and at an early age showed his inventive genius by making a variety of labor-saving machines, including a threshing-machine. He came to the United States in 1819 and engaged in the manufacture of agricultural implements. He invented an improved plow; the first cultivator made in this country; machines for making horse-shoes and hook-headed spikes used on railroads; a self-acting machine for rolling iron into bars, and a new machine for making horse-shoes, which received a rod of iron and turned out completed shoes at the rate of 60 a minute.

BURDEN OF PROOF, in legal procedure, the obligation to establish by evidence certain disputed facts. As a general rule this burden lies on the party asserting the affirmative of the issue to be tried or question in dispute, or on the party who would fail if no evidence were adduced on either side. Burden of proof is to be distinguished from prima facie evidence or presumptive evidence. Generally, when the latter is shown, the duty imposed upon the party having the burden will be satisfied; but it is not necessarily so. In criminal cases, on the two-fold ground that a prosecutor must prove every fact necessary to substantiate his charge against a prisoner, and that the law will presume innocence in the absence of convincing evidence to the contrary, the burden of proof, unless shifted by legislative interference, will, in criminal proceedings, be on the prosecuting party, though in order to convict he must necessarily have recourse to negative evidence. The burden of proof throughout is on the government. This subject is treated by all writers on Evidence, as Taylor, Roscoe and Powell in England; Dickson in Scotland and Greenleaf in the United States. Consult also Bentham's 'Rationale of Judicial Evidence.'

BURDER, George, Congregational minister: b. London, 5 June 1752; d. 5 June 1832. He started life as an engraver and artist and drifted partially into journalism. He began preaching in 1777 but not publicly recognized until 1784. In the meantime he had been doing the work of a traveling preacher throughout England and Wales. He initiated Sunday schools at Coventry (1785) and he was chief founder of the 'Association of Ministers for the Spread of the Gospel at Home and Abroad' (1793), now called the 'Warwickshire County Association,' which has done much to encourage foreign work among British Congregationalists. In 1803 he became secretary of the London Missionary Society, a post he held until 1827. He also edited the Evangelical Magazine for several years, and in 1804 he was in the foundation of the British and Foreign Bible Society. Among his works are 'The Welsh Indians, a Collection of Papers Respecting a People whose Ancestors Emigrated from Wales to America in the year 1710 with Prince Madoc' (1797); 'Missionary Anecdotes'; 'The Pilgrim's Progress, an Epic Poem,' and several volumes of poems. Consult Bennett's 'History of Dissenters' (1839).

BURDETT, Sir Francis, English politician: b. 25 Jan. 1770; d. 23 Jan. 1844. He was educated at Westminster and after two years at Oxford made a continental tour. In 1796 he obtained a seat in Parliament by the patronage of the Duke of Newcastle; but he soon abandoned the Tory party and made himself conspicuous by his advocacy of liberal measures. In 1802 he stood for Middlesex but though at first elected he finally lost his seat in 1806 after much costly litigation. He was more successful in 1807 at Westminster where his election at the head of the poll was hailed as a great popular triumph. In 1810 he published a letter in Cobbett's Political Register, denying the right of the House of Commons to discuss for libel, as they had recently done in the case of John Gale Jones. This letter, having been brought under the notice of the House, was declared a gross breach of its privileges, and a warrant was issued by the speaker for the committal of Sir Francis to the Tower. He denied the legality of the warrant and declared his determination to surrender only to force. The public mind was strongly agitated, but prorogation of Parliament relieved him from his imprisonment in the Tower, and he perhaps the most popular man in the kingdom. In attaining this popularity he was greatly aided by the graces of his appearance and the talents which he undoubtedly possessed. Ultimately, however, his fervor cooled, and he owed his last seat in Parliament to the Conservatives of Wiltshire.

BURDETT, Sir Henry, K.C.B. (1897), K.C.V.O. (1908), English author, publicist and statistician: b. 1845. Was superintendent of the Queen's Hospital, Birmingham, and the Seaman's Hospital, Greenwich, and secretary of the share and loan department of the London Stock Exchange. He was founder and editor of The Hospital. His works are numerous and cover a wide range. Among them are 'The Sinking Fund of the National Debt'; 'The Patriotic Fund'; 'How to Become a Nurse'; 'Dwellings of the Middle Classes'; 'Helps in Sickness'; 'Health'; 'The Future of Hospitals'; 'Official Intelligences of British, American and Foreign Securities' (17 vols.); 'The National Debts of the Worlds Beyond our Tires'; 'The National Debts of England and Wales'; 'Seventeen years of Securities'; 'Colonial Loans and Development'; 'The Admiralty and the Country'; 'Hospitals and Asy-
lums of the World' (4 vols.); 'Hospitals and Charities'; 'Hospitals and the State'; 'Architec-
tons, Hospitals and Asylums'; 'The Practical Scheme for Old Age Pensions'; 'The Nursing
Profession'; 'Housing of the Poor'; 'Official Nursing Directory'; 'London Water Com-
pany'; 'Light Railways'; and 'Municipal, County and Indian Finance.'

BURDETT-COUTTS, Right Hon. An-
gela Georgina (Baroness) English philanthro-
pert. b. 21 April 1814; d. London, 30 Dec.
1906. In 1837 she inherited much of the prop-
erty of her grandfather, Thomas Coutts, the
banker, on the death of his widow, the Duchess
of Saint Albans (formerly the actress, Miss
Mellon). Besides expanding large sums of
money in building and endowing churches and
churches, she endowed the three colonial bish-
oprics of Cape Town, Adelaide and British Co-
olumbia. She founded an establishment in Saf-
ter Australia for the improvement of the abori-
gines, and established a fishery school at the
Irish village of Baltimore (1887). To the city
of London she presented, besides several hand-
some fountains, the Columbia Market, Bethal
Green (1870), for the supply of fish in a poor
district. She also built Columbia Square, con-
sisting of Model dwellings at low rents, for
about 300 families. The home established by
her at Shepherd's Bush has rendered great as-
sistance to many unfortunate women, and the
People's Palace owes much to her generosity.
In 1871 she was created a peeress in her own
right as Baroness Burdett-Coutts. In 1877 she
organized the Turkish Compassionate Fund, to
relieve the sufferers of the peasants in Turkey,
and in recognition of her services the Sultan
conferred upon her the Order of the Medjidie.
In 1881 she was married to William Ashmead-
Barlett, who in 1882 obtained the royal license
to assume her name.

BURDETT-COUTTS, William Lehman
Ashmead-Barlett, English philanthropist; b.
in the United States in 1851, the son of the
late Ellis Barlett of Plymouth, New England.
He was graduated at Keble College, Oxford,
in 1874, and married in 1881 Angela, Baroness
Burdett-Coutts, whose name he assumed. As
commissioner for the Baroness' Turkish Com-
passionate Fund he proceeded to the theatre
of the Russo-Turkish War in 1877; and sub-
sequently largely developed her schemes for
relieving Irish distress and aiding Irish fisher-
men. The food supply for the poor of London
is a subject that has deeply interested him, and
he has been instrumental in carrying through
some useful acts of Parliament, notably the
Hempstead Heath Act of 1885. He has repre-
sented Westminster in the House of Commons
since 1885.

BURDETTE, Robert Jones, American
humorist, lecturer, writer, preacher: b. Greens-
boro, Pa., 30 July 1844; d. Pasadena, Cal., 19
Nov. 1914. Removed in boyhood to Peoria, Ill.
He was educated in public schools; D.D.,
Reformed University, Michigan City, Ind., M.
Ls. D., Occidental College, California, 1913. Served
as private in the 47th Illinois Volunteers,
1862-65. In 1869 he became night editor of
the Peoria Transcript, and afterward was
associated with other Peoria papers. He be-
came associate editor of the Burlington, Iowa,
Hawkeye in 1872, where he made a reputation
as a humorist. Later he was on staff of the
Brooklyn Eagle, and was editorial contributor
to the Los Angeles Times, and many periodi-
cals. Began to lecture in 1876. He became a
licensed minister of the Baptist Church in 1887,
was ordained in 1903, and became pastor of the
Temple Baptist Church, Los Angeles; pastor
emeritus, July 1909; and was city commissioner
of Pasadena, Cal. He published 'Hawkeye-
tems' (1877); 'Rise and Fall of the Moustache'
(1879); 'Life of William Penn' (1882); 'Innach
Garden' (1897); 'Sons of Asaph' (1876); 'Chimes from a Jester's Bells'; 'Temple and
Temples'; 'Smiles Yoked with Sighs' (poems,
1900); 'Silver Trumpets' (poems); 'Old Time
and Young Tom' (1912); 'Drums of the Forty-
Seventh' (1914).

BURDICK, Francis Marion, American
jurist and author: b. De Ruyter, N. Y., 1 Aug.
1843. He was graduated at Hamilton College
in 1869, and at its law school in 1872. He prac-
tised law in Utica, N. Y., from 1872 to 1883,
and was later professor of law at Hamilton
College and at Cornell. From 1891 he was
professor of law at Columbia University, and
in 1907 was appointed commissioner on uniform
State laws for New York. Besides numerous
articles in law journals his published works
include 'The Law of Sales' (3d ed, 1913); 'The
Law of Torts' (1905; 2d ed., 1908); 'Law of
Partnership' (2d ed., 1906); 'Essentials of
Business Law' (1908).

BURDOCK, a small genus (Arctium) of
course perennial or biennial herbs of the family
Asteraceae, natives of temperate Asia and Eu-
rope, but widely distributed as weeds through-
out the world. Common burdock (A. lappa),
which often attains a height of four feet, is
sometimes planted in Japan, where it has been
improved by cultivation, for its enlarged pars-
nip-like roots, which are eaten as a boiled
vegetable. Formerly the roots were used in
medicine, but they seem to have been supplanted
with many other domestic remedies of doubtful
value. The plant is best known as a weed in
waste land, but usually on good soil. Its globu-
lar burs become attached to the wool of sheep
and to clothing. Their presence injures the
price of wool.

BURDON-SANDERSON, Sir John
Scott, English physician: b. Jesmond, New-
castle-on-Tyne, 21 Dec. 1828; d. 23 Nov.
1905. He was graduated at Edinburgh University
in 1851 and afterward studied at Paris, settling
in London as a practising physician in 1853.
In 1856, while medical officer for Paddington,
his first gave proofs of the eminence to which
he was to attain. In 1870 he gave up his hos-
pital appointments and a valuable private prac-
tice to devote himself exclusively to scientific
research. He held the appointment of profes-
sor of practical physiology and histology at
University College, London, 1871-77; was Jordrell
professor of physiology, 1874-82; Waynfee
professor of physiology at Oxford, 1882-95; and
regius professor of medicine at Oxford univer-
sity, 1895-1903. He is regarded as the
virtual founder of the medical school at Ox-
ford. His methods of research into the diseases
of animals occasioned the violent opposition of
the anti-vivisectionists. He accomplished much
in the way of elucidating the true character
of cholera and tuberculosis. He was created a baronet in 1899, and died without issue. He contributed many papers to scientific publications, and a 'Memoir,' which contains some of his addresses, edited in part by his widow, was published in 1911.

BURDWAN, or BARDWAN, India, town and capital of a division of the same name in the lower provinces of Bengal, on the left bank of the Damoda, 68 miles northwest of Calcutta, with which it is connected by railway. There is a titular rajah of Burdwan, who resides here in a spacious palace, with gardens, etc.; and there are also a large collection of temples and a shrine of Pirba-haram. Pop. 34,477. The division has an area of 13,956 square miles, and a population of about 8,250,000, and is divided into the districts of Burdwan, Bankura, Birbhum, Hugli, Midnapur and Howrah. The chief crops are sugar, indigo, tobacco, cotton and the usual cereals. Mulberry-trees are cultivated and coal is raised.

BUREAU, the chamber or official apartments of an officer of government, and the body of subordinate officials who labor under the direction of a chief. The term "bureau system," or "bureaucracy," is applied to the systems of government in which the business of administration is carried on in departments, each under the control of a chief; and is opposed to those in which the officers of government have a co-ordinate authority. Sometimes a mixture of the two systems is found. Thus the business of the executive branch of government may be carried on by bureaus, while the administration of justice is in the hands of co-ordinate judges. In the United States, bureau is the universal word for a chest of drawers.

BUREAU OF ANIMAL INDUSTRY, The. See Agriculture, Department of.

BUREAU OF BIOLOGICAL SURVEY, The. See Agriculture, Department of.

BUREAU OF CHEMISTRY, The. See Agriculture, Department of.

BUREAU OF CROP ESTIMATES, The. See Agriculture, Department of.

BUREAU OF ENTOMOLOGY, The. See Agriculture, Department of.

BUREAU OF PLANT INDUSTRY, The. See Agriculture, Department of.

BUREAUCRACY, bu-ru-kra-sē, a form of political organization through which the government is carried on by means of bureaus, each of which manages a particular branch of state business. This form of organization is admirably adapted to securing responsibility, since each bureau is hierarchically organized with a chief at its head on whom rests the final responsibility, whereas in the collegial or board system a number of persons of coequal authority divide the responsibility. While the officials of bureaucracies are usually trained and experienced administrators, little affected by public opinion, their tendency is to develop a caste spirit, to overemphasize administrative routine and to become more and more formal and exquisitely formal. They fail to stimulate interest in public affairs or to cultivate patriotism among the masses, thus becoming "pedantocracies." Consult Garner, J. W., 'Introduction to Political Science' (New York 1910); Goodnow, F. J., 'Comparative Administrative Law' (New York 1903).

BURETTE, a graduated glass tube occasionally used for dividing a given portion of any liquid into small quantities of a definite amount.

BURG, boorg, Adrian van der, Dutch painter; b. Dordrecht 1693; d. 1733. He studied under Arnold Houbraken, distinguished himself by his portraits, and acquired a reputation which would have procured him an independence. But intemperate habits rendered his talents of no avail, and hurried him to a premature grave. His freedom of touch and fine coloring are his distinguished excellences. His best-known pieces are two large pictures at Dordrecht, one of which gives a single canvas portraits of the managers of the orphan hospital, and the other portraits of the officers of the Mint.

BURG, Johann Tobias, Austrian astronomer; b. Vienna 1766; d. 1834. He attracted the notice of Van Swieten, who was then at the head of the commission appointed to reform the scholastic establishments of Austria, and through his patronage obtained the means of prosecuting the study of mathematics, and more especially of astronomy, for which he showed a decided inclination. In 1791 he became professor of physics at Klagenfurt, and in 1792 was appointed colleague of Trinecker at the Observatory of Vienna. In 1798, the French Institute having proposed a prize for the determination, by at least 500 observations, of the mean place of the apogee and ascending node of the moon, Burg sent in a memoir in which the determination was made by a most accurate and ingenious method, not from 500 but 3,322 observations. The tables contained in it were afterward published by the Institute, and constitute the chief foundation of his fame. In 1813 he became almost entirely deaf and retired from public life to Wiesenau, Carinthia.

BURG, Prussia, a town in the province of Saxony, 12 miles northeast of Magdeburg, on the Ihle, where it joins a canal uniting the Havel with the Elbe. It has four churches, a hospital, a gymnasium and a well-endowed institution for the bringing up of orphan children, and is the seat of civil and judicial administration for the circle. Its manufactures are extensive, especially of woollens, for which it was a centre as early as the 12th century. Cloths for army purposes are largely made. There are also spinning mills, dye works, machine works, tanneries, oil works, brick kilns, foundries and a large trade in farm produce. The prosperity of Burg dates from the end of the 17th century, when a large number of French, Palatinate and Walloon refugees took shelter there. Pop. 24,074.

BURGAGE TENURE, in England, a tenure in socage, whereby burgesses, citizens or townsmen hold their lands or tenements of the King or other lord for a certain yearly rent. In Scotland this tenure has been known as "red heart," but in royal burghs is held under the Crown, proprietors being liable to the (nominal) service
of watching and warding, or, as it is commonly termed, "service of burgh, used and wont."

Burgas, boor-gas, or Bourgas, Turkey, a seaport of the province of eastern Rumania, situated on the Black Sea. The bay on which it stands is of sufficient depth for large vessels, and the exports are grain, iron, butter, wine and also wooden goods. For a considerable distance from the terminal of the Sofia-Burgas Railway, and contains several mosques and Christian churches. The principal source of the prosperity of the town is the manufacture of pottery, pipe-bowls, cups, etc., for which a superior clay is found in the neighborhood. Pop. about 12,000.

Burgdorf, boor-deeorf, Switzerland, a town in the canton of Bern, situated on the Aar. It is the market for the linen goods and cheeses of the Emmental, and manufactures linen, wool, tobacco and chocolate. The castle which stands here was formerly a place of great strength. Pestalozzi resided from 1798 to 1804 in the château of Burgdorf, and converted it into an educational institution. In the vicinity are the baths of Sommerhaus. Pop. 9,381.

Burgeo Islands, Newfoundland, a group of islands on the southern coast, much visited by summer tourists and artists from the Eastern States and Canada, lat 47° 33' N. and long. 57° 44' W. The population is chiefly engaged in fishing. Burgeo, the principal town, has a population of less than 1,000. In 1765 Captain Cook made an observation of the sun's eclipse here.

Burger, Gottfried August, German poet: b. 1 Jan. 1748, at Wolmerswende, near Halberstadt; d. Göttingen, 8 June 1794. He showed an early predilection for solitary and gloomy places and the making of verses, for which he had no other model than hymnbooks. He learned Latin with difficulty. In 1764 he studied theology at the University of Halle, and in 1768 he went to Göttingen, in order to exchange theology for law, but soon found that his connections here were equally disadvantageous to his studies and his morals, so that his grandfather, who had hitherto maintained him, withdrew his support. The friendship of several distinguished young men at the university was now of great service to him. He studied the ancient classics and the best works in French, Italian, Spanish and English, particularly Shakespeare, and the old English and Scottish ballads. Percy's 'Reliques' was his constant companion. His poems soon attracted attention. In 1772 he obtained the office of bailee in Alten-Gleichen, but throughout his life he was involved in pecuniary difficulties. In 1774 he married the daughter of a neighboring bailiff, named Leonhart, but his marriage was unfortunate. He conceived a violent passion for the sister of his wife and married her in 1784, soon after his first wife's death. She also, his celebrated "Molly," died the first year of their marriage. At the same time he was obliged, by intrigues, to resign his place. He was made professor extraordinary in Göttingen, but received no salary, and this favorite poet of the nation was obliged to gain his living by poorly rewarded translations for booksellers. A third marriage in 1790, with a young lady of Swabia, who had publicly offered him her hand in a poem, completed his misfortunes; he procured a divorce from her two years afterward. The government of Hanover afforded him some assistance shortly before his death. His songs, odes, elegies, ballads, narrative poems and epigrams hold a very high place in German literature, especially commending his work, though Schiller criticised him very severely. The first collection of his poems appeared in Göütingen in 1778. His complete works were first published by Reinhard at Göütingen in four volumes between 1796-98, and this edition has been repeatedly published since. Other editions of his works and letters have also been published, and his life has been written by Döring; Pröhle, 'G. A. Bürger: Sein Leben und Seine Dichtungen' (Leipzig 1865), and others.

Burger, Ludwig, German historical painter and illustrator: b. Cracow, 19 Sept. 1825; d. Berlin, 22 Oct. 1884. He studied at the Berlin Art Academy, at the same time working at book-illustrating; he was also a pupil of Couture in Paris. Among his best drawings are the illustrations for the works of La Fontaine and a collection of 20 plates known as 'Die Kanone.' After 1869 he devoted himself to decorative painting, his most important work in this line being the walls and ceilings in the Berlin City Hall (1870) and the colossal figures symbolizing the warlike virtues at the School of Cadets at Lichterfelde (1878).

Burgers, Thomas Francis, Transvaal statesman: b. Cape Colony 1834; d. 1881. He was educated for the ministry at Utrecht and was pastor of the Dutch Reformed Church at Hanover, Cape Colony. Some of the rationalistic views he expressed led to his trial for heresy, but he was acquitted. He was elected President of the Transvaal republic in 1872 and held the office until 1877, when the republic was annexed by Great Britain.

Burgers, Tristan, American statesman and orator: b. Rochester, Mass., 26 Feb. 1770; d. Providence, R. I., 13 Oct. 1853. While 15 years old he attended a school in the vicinity for six weeks, and again the next year for six weeks more. This was all the instruction he received from others until he reached the age of 21. In September 1793, he entered Rhode Island College, now Brown University, graduated three years later with the first honors of his class and was admitted to the bar in 1799. He became a leader of the Federal party, and in 1811 was elected to a seat in the State legislature. In 1815 he was made chief justice of Rhode Island, and afterward became professor of oratory and belles-lettres in Brown University. In 1825 he was elected to Congress, and almost immediately achieved a national reputation by his speech on the judicial branch. He continued in Congress until 1835. Many of his most brilliant efforts were in defense of the American tariff system, and his logic and sarcasm won for him an unrivaled reputation as a debater. Consult Bowen, 'Memoirs of Tris- tan Burgers.'

Burgess, Alexander, American Protestant Episcopal bishop: b. Providence, R. I., 31 Oct. 1819; d. Saint Albans, Vt., 8 Oct. 1901. He was a younger brother of George Burgess, first bishop of Maine. He was graduated from
Brown University in 1838, and from the General Theological Seminary in 1841. He was successively rector at East Haddam, Conn., 1842–43; at Saint Mark's, Augusta, Me., 1843–54; at Saint Luke's, Portland, Me., 1854–62; and at Saint John's, Brooklyn, N. Y., 1867–69; and Christ Church, Springfield, Mass., 1869–78. In 1878 he was consecrated first bishop of the diocease of Quincy, Ill. He wrote a popular religious textbook, Questions for Bible-Classes and Sunday-Schools (1855), and a Memoir of the Life of George Burgess, First Bishop of Maine (1869).

BURGESS, Charles Frederick, American electrochemical engineer: b. Oshkosh, Wis., 5 June 1873. A graduate of the University of Wisconsin, he became instructor and assistant professor of electrical engineering there 1895 to 1900, organized the department of applied electrochemistry and chemical engineering. He developed several electrolytic processes and was appointed, in 1904, investigator of electrolytic iron alloys for the Carnegie Institute and president of the North American Electroplating Laboratories. He is author of ‘The Strength of the Alloys of Nickel and Copper with Electrolytic Iron’ (1910).

BURGESS, Daniel, English ecclesiastical writer: b. Staines, England, 1645; d. London, 26 Jan. 1713. He studied at Oxford but was not graduated because he would not conform to the established church. In 1667 he went to Ireland with Roger Boyle, Earl of Orrery, where he became head of a school established by the latter at Charleville. In 1685 he went to London where he soon attracted attention on account of his humor, vivacity and oratorical power. His publications include ‘Directions for Daily Holy Living’ (London 1690); ‘The Golden Snuffers’ (1697); ‘Proof of God’s Being and of the Scriptures’ Divine Origin’ (1697).

BURGESS, Edward, American naval architect: b. West Sandwich, Mass., 30 June 1848; d. Boston, 12 July 1891. He was educated at Harvard, whence he was graduated in 1871, and became secretary of the Boston Society of Natural History, being editor of the publications of that society. He was instructor of entomology at Harvard from 1879 to 1883. He then became a designer of sailing-yachts. In 1884 he designed the Puritan, the winner of the America’s cup in 1885; and a year later the Mayflower, the winner in 1886. He was also the designer of the Volunteer, which won the cup in 1887.

BURGESS, [Frank] Gelett, American humorist and satirical writer, novelist and illustrator: b. Boston, 30 Jan. 1866. He was graduated from the Massachusetts Institute of Technology in 1887; was a draughtsman with the Southern Pacific Railroad 1887–90, and instructor in topographical drawing in the University of California. He was a designer 1893–94, and in 1895–97 he came prominently before the reading public as a publisher and writer of eccentric and humorous literature, such as his journals and The Lark, and poem, ‘The Purple Cow’ (1897). In 1898 he removed to London, but returned to America in 1900; in 1914–16 he was in Paris as correspondent of Collier’s Weekly. He edited ‘Petit Journal des Refusés’ (1897), and has written ‘The Lark Almanac’ (1898); ‘Vivette’ (1898); ‘The Nonsense Almanac’ (1898); ‘The Lively City o’ Ligg’ (1898); ‘Goops and How to be Them’ (1900); ‘A, B, C, D, E, F, G’ (1901); ‘Romance of the Commonplace’ (1902); ‘A Gage of Youth’ (1901); ‘Burgess Nonsense Book’ (1901); ‘More Goops’ (1903); ‘The Reign of Queen Isy’l’ (with Will Irwin, 1903); ‘The Picaroons’ (with Will Irwin, 1904); ‘A Little Sister of Destiny’ (1905); ‘Are You a Bromide?’ (1906); ‘The White Cat’ (1907); ‘The Heart Line’ (1907); ‘The Maxims of Methuselah’ (1907); ‘Blue Goops and Red’ (1909); ‘Lady Méchante’ (1909); ‘Find the Woman’ (1911); ‘The Master of Mysteries’ (1912); ‘The Goop Directory’ (1912); ‘Love in a Hurry’ (1912); ‘The Master of Mysteries’ (1912); ‘Burgess Unabridged’ (1914); ‘The Romance of the Commonplace’ (new version, 1915).

BURGESS, George, American Protestant Episcopal bishop: b. Providence, R. I, 31 Oct. 1809; d. Hamlet, 23 April 1864. After graduating at Brown University, and holding a tutorship in that college, he traveled in Europe, and studied for two years in the universities of Göttingen, Bonn and Berlin. He was rector of Christ Church in Hartford from 1826 to 1847, when he was consecrated first bishop of the diocease of Maine and became, at the same time, rector of Christ Church in Gardiner. Both offices he filled with great ability. He published two academic poems, a metrical version of a portion of the Psalms; Pages from the Ecclesiastical History of New England (1847); ‘The Last Enemy Conquering and Conquered’ (1850), and various sermons.

BURGESS, George Kimball, American physicist and author: b. Newton, Mass., 4 June 1874. He studied at the Massachusetts Institute of Technology and at the University of Paris, later, in the former institution, and at the universities of Michigan and California, becoming instructor in physics. He was appointed associate physicist in the National Bureau of Standards in 1903, and editor of the Journal of the Washington Academy of Sciences. He translated Le Chatelier’s ‘High Temperature Measurements’ (1901), and Duhem’s ‘Thermodynamics and Chemistry’ (1901). His original work includes ‘Recherches sur la constante de gravitation’ (1901); ‘Experimental Physics, Freshman Course’ (1902); ‘The Measurement of High Temperatures,’ collaboration with H. Le Chatelier (1911; 3d ed. rev., 1912); ‘A Micropymometer’ (1913).

BURGESS, James, Scottish archaeologist: b. Kirkmaho, Dumfriesshire, 14 Aug. 1832. He went to India in 1855, and there entered upon educational work in Calcutta and Bombay. From 1886–89 he was director-general of the archaeological surveys of India. From 1872 to 1884 he published the ‘Indian Antiquary.’ His works include ‘The Temples of Shatriunjaya’ (1869); ‘The Rock Temples of Elephanta’ (1871); ‘Scenery and Architecture in Gujarat and Rajputana’ (1873); and other books; also many writings in the ‘Epigraphia Indica,’ and ‘Archaeological Reports (1874–87).

BURGESS—BURGKM A IR

was educated at Cumberland University, Lebanon, Tenn., and at Amherst College, Mass., where he was graduated in 1867; studied law, and began to practise in 1869. During this year he was appointed professor of English literature and political economy at College, Galesburg, Ill. Two years later he studied in Göttingen, Leipzig and Berlin. On his return in 1874, he became professor of history and political science at Amherst, in 1876 professor of history, political science and international law at Columbia College, and in 1880 professor of constitutional and international history and law. In 1890 he became dean of the faculty of political science; also dean of the faculties of philosophy, pure science and fine arts, holding all of these offices until 1912, when he retired from the active service of the university. In 1906 he became Roosevelt professor of American history and institutions at Berlin University. He received the degrees of A.B., M.A. and L.L.D. from Amherst College, the degree of LL.D. on the burgess roll of Phi th. from Princeton, and from the University of Leipzig, Germany, and the degree of J.U.D. from the University of Berlin. In 1907 he received the order of the Prussian Crown from the Emperor of Germany, and the Albrecht’s Order from the King of Saxony. He has published ‘Political Science and Comparative Constitutional Law’ (1890); ‘The Middle Period of United States History’ (1897); ‘The Civil War and the Constitution’ (1901); ‘Reconstruction and the Constitution’ (1902); ‘The European War of 1914’ (1915); ‘The Reconciliation of Government and Liberty’ (1915); ‘The Administration of Rutherford B. Hayes’ (1915); ‘America’s Relations to the Great War’ (1917), and contributions to reviews on historical, political and legal topics.

BURGESS, Neil, American comedian: b. Boston 1846; d. 19 Feb. 1910. Not long after entering the theatrical profession, he undertook in a stage emergency to fill the place of an actress, and his success in the humorous female role assumed led to his entering that line permanently. He acted in ‘Josiah Allen’s Widow’ and in ‘Widow Bedrot.’ The latter was very popular, as was also ‘Vim,’ produced in 1883. ‘The Country Fair,’ a play which he brought out in 1889, ran for more than two years. Mr. Burgess finally undertook vaudeville acting, Consult Clapp and Edgett, ‘Players of the Present’ (Dunlap Society Publications, New York 1899).

BURGESS, a word used in somewhat varying senses, but generally meaning a freeholder, or a person invested with all the privileges of a citizen in a borough or corporate town. Those entered on the burgess roll of English boroughs are householders who have resided and paid rates for 12 months prior to July in any year. In the United States the uses of the word have undergone some specific changes, and in States having boroughs as political divisions, as Jersey and Pennsylvania, it carries an implication of magisterial authority. See Borough; Burg.

BURGH, berg, a corporate town or borough, more especially the Scottish term corresponding to the English borough, applied to several different kinds of corporations and to towns and cities in Scotland. There are three classes of burghs: (1) A burgh of barony is a certain tract of land created in a barony by the feudal superior and placed under the authority of magistrates. The right of electing these magistrates is vested by the charter of erection sometimes in the baron or superior of the barony and sometimes in the inhabitants themselves. (2) A royal burgh is a corporate body created by a charter from the Crown, the corporation consisting of the magistrates and burgesses of the territory embraced within the burgh. The magistrates are generally a provost and bailies, dean of the guild, treasurer and common council. (3) A burgh of regality is a kind of burgh of barony which had legal jurisdiction (i.e., exclusive over its own territory. The right of free trade in return for bearing certain public burdens was sometimes given to a burgh of barony, in which case it was known as a free burgh. In the United States, the termination "borough" was for generations added to the names of places, as in England. But under a decision of the United States Board on Geographic Names, the form "boro" was adopted, as in "Bristleboro."

BURGHER, the name applied to a former subdivision of the Scottish Seccession Church. The Secession, which originated through the withdrawal of Ebenezer Erskine and some other ministers from the Scottish establishment in 1732, split in two in 1747, part having felt free to take, while others refused, what they deemed an ensnaring burgess oath. They reunited in 1820 under the name of the Associate Synod, and, joining with the "Rele" in 1847, formed the United Presbyterian Church. The name "burgher" is also applied to any citizen of a borough or town.

BURGKMAIR, boork’mär, Hans, German painter and engraver: b. Augsburg 1473; d. about 1531. He is supposed to have been a pupil of Albert Dürer, but studied principally under Schongauer in Colmar, Alsace. Several of his frescoes and paintings in oil and wood are still preserved in his native town; but though possessed of considerable merit, they have contributed far less to his fame than his woodcuts, in which he at least equaled Dürer, and has scarcely been surpassed by Holbein. In 1501 he executed three pictures of Roman basilicas, with scenes from the lives of patron saints, etc. He was one of the first exponents of the Renaissance in Germany. Among his most famous works are the Triumph of the
Emperor Maximilian I, embracing 135 cuts, with a text written by that Emperor; and a series, 'The Wise King,' including 237 cuts, in which the deeds of the same ruler are represented; Consult Wolfsheim in Döhmen's 'Künstler' (Vol. I); Dornhöfer, Uber Burgkmair und Dürer' (1903).

BURGLARY, at common law, the breaking and entering the house of another in the nighttime, with intent to commit a felony therein, whether the felony be actually committed or not. Burglary at common law, and in its first degree, in the statutes of the various States, must, in general, be committed in a dwelling-house actually occupied as a dwelling, but if it be left by the owner animo revertendi, though no person resides in it in his absence, it is still his mansion. But at common law burglary may be committed in a church. In New York (Penal Code § 496), and in some other States in which the New York statute has been adopted, burglary at common law, or in the first degree, must be committed in the nighttime, but in New York and in some other States burglary in the second and third degrees may be committed in the daytime, and it is burglary in the third degree in New York feloniously to enter a building, whether inhabited or not, either in the daytime or night. Before the offense is complete there must be both a breaking and an entry or an exit. An actual breaking takes place when the burglar breaks or removes any part of the house, or the fastenings provided for it, with violence. Constructive breakings occur when the burglar gains an entrance by fraud, conspiracy or threats. The least entry, with the whole or any part of the body, hand or foot, or with any instrument or weapon, introduced for the purpose of committing a felony, will be sufficient to constitute the offense. Burglary is a felony in all of the States, and in North Carolina it may be punished with death or imprisonment. In New York it is punishable as follows: Burglary in the first degree, imprisonment for not less than 10 years; second degree, not exceeding 10 years; third degree, not exceeding five years.

BURGLARY INSURANCE. A contract of indemnity: (1) against direct loss by burglary, or by burglary, theft or larceny of any of the assured's property, occasioned by its felonious abstraction from the interior of the house, building or apartment occupied by the assured as a residence by any domestic servant or other employee of the assured, or by any person or persons, excepting a person whose property is insured; also against direct loss by damage to property insured, and to the premises, caused by burglars or thieves; known as residence burglary insurance; (2) against direct loss by burglary of merchandise owned by the assured, or held in trust or on commission, or sold but not delivered, occasioned by its felonious abstraction from the premises, occupied by the assured for business purposes, by persons, after entry into the premises by the use of force and violence, of which there are visible marks upon the premises; also for direct loss by damage to the merchandise, furniture, fixtures or premises caused thereby; known as mercantile burglary insurance; (3) against direct loss by burglary of money, post office and revenue stamps, bullion, negotiable securities, drafts, promissory notes and merchandise, in consequence of the felonious abstraction of the same from a safe or safes in Döhme's 'Künstler' (Vol. I); Dornhöfer, Uber Burgkmair und Dürer' (1903).

BURGLARY—BÜRGLEN

BÜRGLEN, Switzerland, village in the canton of Uri, about a mile from Altorf, is the traditional birthplace of William Tell. The supposed site of the patriot's house is now

EDWIN W. DeLEON.
BURGOMASTER — BURGOYNE

occupied by a chapel, erected in 1522, upon the walls of which are represented certain well-known scenes from his history. Pop. 1,852.

BURGOMASTER, the title of the chief magistrate of a city or a large town in Germany and the Netherlands, practically equivalent to mayor. It is held by the people, but in most German towns he must have the confirmation of the government.

BURGOMASTER, a sailor's name for certain large domineering gulls of the genus Larus.

BURGON, John William, English Biblical scholar and critic: b. Smyrna, 21 Aug. 1813; d. Chichester, 4 Aug. 1888. He was the son of a Turkish merchant, was sent to study at London University, and later was graduated at Oxford in arts and finally in theology (1848). He became vicar of Saint Mary's, Oxford (1863), Gresham professor of divinity (1867) and dean of Chichester (1876). He was the bitterest and at the same time ablest and most learned of the critics and opponents of the revised New Testament including the revised Greek text. His publications, which are very numerous, include, in addition to controversial tracts and periodical literature, 'The Life and Times of Sir Thomas Gresham' (2 vols., London 1839); 'A Plain Commentary on the Four Holy Gospels' (8 vols., 1855); 'Ninety Short Sermons for Family Reading' (2 series, 2 vols. each, 1855-57); 'Portrait of a Christian Gentleman' (1859); 'The Revision Revised' (London 1883); 'The Lives of Twelve Good Men' (2 vols., 1888); 'The Traditional Text of the Holy Gospels Vindicated and Established and Causes of the Corruption of the Traditional Text' (1890).

BURGOS, boor-góz, Francisco Javier de, Spanish statesman and poet: b. Motril, Granada, 1778; d. 1845. In his dramatic compositions he sought to restore the classical Spanish comedy. Among them are 'The Three Equals'; 'The Masked Ball'; and 'The Optimist and the Pessimist.' He wrote a celebrated 'Ode to Reason.'

BURGOS, Spain, city, the capital of the province of Burgos, and formerly of Old Castle, and once the residence of its kings. It stands on the declivity of a hill, on the right bank of the Arlanzon. The streets are narrow and dark, the finest in every respect being that called the Huerto del Rey. Places of promenade are numerous; the one most frequented, and justly forming the boast of the town, being the Espolon. The most remarkable structure is the cathedral, one of the finest buildings of the kind in Europe. It was begun in 1221, but was not finished for several centuries. It is built of white marble in the form of a Latin cross, and is about 300 feet long by 200 broad, and its size is such that it can be performed in eight chapels at once without confusion. Its interior, as well as its exterior, is of great magnificence, is adorned with fine carvings and paintings, and contains numerous monuments, particularly the tombs of Don Fernando and the Cid, both natives of Burgos, and celebrated throughout Spain for their heroic achievements in the wars with the Moors. There are several other fine churches, but the rest of the public buildings are not deserving of notice. The wool of Old Castle passes principally through Burgos, and it has some woolen manufactures and hat making. Burgos is the see of an archbishop, and at one time contained a university. It was founded about the close of the 9th century as the capital city of the county of Leon and soon became a flourishing city, reaching the height of its prosperity in the 15th century, when it shared with Toledo the prestige of being occupied as a royal residence. It declined rapidly after the removal of the court to Madrid in 1560. To-day, despite its decay, the city is dominated by the grand old cathedral and the personality of the national hero, the Cid Campeador. Pop. about 31,400. The province of Burgos is bounded on the north by Santander, east by Alava, Logroño and Soria, south by Segovia and west by Palencia and Valladolid. The area is 5,650 square miles. Pop. about 340,000.

BURGOYNE, ber-goin', John, English general and dramatist: b. 24 Feb. 1723; d. London, 4 Aug. 1792. He was the son of Capt. John Burgoyne, and grandson of Sir John Burgoyne of Bedfordshire, although he never was a natural son of Lord Bingley. Educated at Westminster, he entered the army at an early age, and while a subaltern eloped with Lady Charlotte Stanley, daughter of the Earl of Derby. Soon after his marriage he sold his commission to pay his debts. He then lived abroad for seven years, but entered the army again in 1758 as captain of the Foot Guards. In 1759, as lieutenant-colonel of the Coldstream Guards, he served at Belle Isle. After an election to Parliament in 1761, he served with distinction in Portugal, and was sent to America in 1775. He joined General Gage at Boston, with large reinforcements, and witnessed the battle of Bunker Hill, of which he has left an animated description. After proceeding to Canada as governor, he returned to England, but in 1777 was despatched to take command of that expedition from Canada against the United States, the failure of which so largely contributed to the establishment of American freedom. Indeed, few battles have led in their ultimate influence to results so great as did the surrender of Burgoyne with 5,791 fighting men, well provided with artillery, at Saratoga, to the army of General Gates. On his return home, he was received by the King with marked disfavor. His wife died in 1776. He had several natural children by Susan Caulfield, an opera singer, one of whom was Field Marshal Sir J. F. Burgoyne. Burgoyne did not possess the genius of a great general, and was in many respects utterly inadequate to the tasks imposed upon him, yet no one can read his work written in his own defense, 'State of the Expedition from Canada' (London 1780), without acknowledging his courage, and detecting qualities which in a less successful career have been of much service to his country. Disgusted with his treatment by the government, he retired to private life, and devoted his leisure to the production of dramas, some of which, as 'The Maid of the Oaks,' 'The Lord of the Manor,' etc., were highly popular in their day. His best play, 'The Heiress,' has been successful not only in its original tongue, but also in several foreign versions. He was made commander-in-chief in Ireland in 1782, and in 1787 was one of the managers of the impeachment of
BURGOYNE — BURGUNDY

Warren Hastings, whose trial lasted through several years after Burgoyne's death. He was born at Saratoga. (See BATTLE OF BURGONY.) Consult De Fomblander, 'Episodes from the Life and Correspondence of Burgoyne' (London 1876); O'Callaghan (editor), 'Orderly Book of Lieutenant General John Burgoyne' (Albany 1860); and Stone, 'Campaign of Death of his father, he became heir apparent to the throne. He was called the Grand Dauphin. Throwing himself into the party of St. Simon and his old teacher, Fénélon, he boldly advocated liberal measures that would have removed many of the worst evils of the old régime. But before his party had more than barely outlined their scheme, he was stricken with smallpox. With him perished the hopes of the party. His wife died two days previous to his death. His second son became Louis XV of France. Consult St. Simon, 'Memoirs' (Paris 1829-30), and Farmer, 'Versailles and the Court under Louis XV' (New York 1896).

BURGOYNE, Sir John Fox, English officer of engineers: b. 24 July 1782; d. 7 Oct. 1871. He was the son of Gen. John Burgoyne; was educated at Eton and at the Royal Military Academy at Woolwich; entered the Royal Engineers in 1796; served at Malta in 1800, in Sicily with General Stewart in 1806, in Egypt in 1807 and in the Peninsula with Sir John Moore and Wellington from 1809 to 1814. He shared in the celebrated retreat on Corunna and was present at all the sieges, generally as first or second in command of the engineers, and at most of the battles of the Peninsula War, in which he was twice wounded. During the War of 1812 he assisted as lieutenant-colonel and chief engineer in the attack on New Orleans. In 1823 he accompanied the army of General Clinton to Portugal in the same capacity. He was appointed chairman of the board of public works in Ireland in 1830 and in 1845 became inspector-general of fortifications in England. He was made a lieutenant-general in 1851, and on the outbreak of the Crimean War was sent to Turkey to provide for the defense of Constantinople. After returning to England he was again sent out to Sebastopol, where he was chief of the engineering department till recalled in 1855. He received the order of the Medjidie from the Sultan of Turkey, was made a general in 1855, the following year was created a baronet, in 1808 a field-marshall and for some years, up to his death, held the appointment of constable of the Tower of London. In 1859 a work was published in London under the title of 'Military Opinions of Gen. Sir J. F. Burgoyne,' in which many of his official writings were collected.

BURGRASS. See SANDBUR.

BURGRAVE (cf. Ger. Burg, town, + Graf, count, governor), a count who in the Middle Ages had command of a castle or burg. Burgraves were appointed to their office by the Emperor or by the bishops, and belonged to the nobility by virtue of their office, which became hereditary. Their powers differed in different places, but as a rule they were entrusted with keeping the public peace, the oversight of trade and the market, and the command of the troops and the police in their districts. As the free cities grew in power they were separated from the jurisdiction of the burgrave. The office lost its significance in the course of the 13th century, but the title is retained by some princely families to the present day, as, for instance, by the Kings of Prussia, who have the title of Burgrave of Nuremberg.

BURGUNDY, Louis (Duke of), Dauphin of France: b. Versailles, 6 Aug. 1682; d. 18 Feb. 1712. He was grandson of Louis XIV and of his famous unobtrusive passions and temper, great haughtiness of bearing and sensuality of life, he is said to have been much corrected in character and conduct by the influence of his preceptor, the saintly Fénélon. At the age of about 15 he married Princess Adelaide of Savoy, was made colonel-in-issimo of the army in 1701, but he failed to show any ability and the result of the unfortunate campaign of 1708 was laid at his door, after which he returned, disgraced, to Paris. On the death of his father he became heir apparent to the throne. He was called the Grand Dauphin. Throwing himself into the party of St. Simon and his old teacher, Fénélon, he boldly advocated liberal measures that would have removed many of the worst evils of the old régime. But before his party had more than barely outlined their scheme, he was stricken with smallpox. With him perished the hopes of the party. His wife died two days previous to his death. His second son became Louis XV of France. Consult St. Simon, 'Memoirs' (Paris 1829-30), and Farmer, 'Versailles and the Court under Louis XV' (New York 1896).

BURGUNDY, a region of western Europe, so called from the Burgundians, a Teutonic people originally from the country between the Oder and the Vistula rivers. In consequence of the wars against the Alamanni, in which they were defeated, they migrated to the region of the upper Rhine and in the beginning of the 5th century they passed over into Gaul, and, as allies of the Romans, after a long struggle obtained possession of the southeastern part of this country. Here they founded a kingdom, which had as its seat of government sometimes Lyons and sometimes Geneva; but having become engaged in a war with the Franks, they were at last wholly subdued in 530. More than one kingdom of Burgundy, so called, subsequently arose, as well as the important county of Burgundy (Upper Burgundy, Franche-Comté); but the most important state of this name was the duchy of Burgundy (Lower Burgundy), consisting principally of the French province Bourgogne (Burgundy, properly so called). The long line of ancient dukes of Burgundy became extinct in 1361 with the death of Duke Philip, and Burgundy was immediately united by King John of France to the French crown. The dignity of Duke of Burgundy was restored in 1363 by his grant of the dukedom to his youngest and favorite son, Philip the Bold (q.v.). In 1368 he married Margaret, the widow of the last Duke Philip of the old line, only daughter and heiress of Louis III, Count of Flanders, and thereby greatly augmented his possessions, which now included Flanders, Mechlin, Antwerp and Franche-Comté. In 1402 he was made regent of France, an appointment which gained him the hatred of the King's brother Louis, Duke of Orleans, and led to the struggle between the Orleanists and the Burgundian factions. In 1404 Philip died and was succeeded by his son, John the Fearless, who was stabbed by the companions of the Dauphin in 1419. His son and successor, Philip the Good (q.v.), gained great acquisitions of territory, including Hainault, Holland, Zeeland, Namur and. in 1431, Brabant and Limburg, which reverted to him from a younger branch of his family. In 1441 he also obtained the duchy of Luxemburg. On his marriage with his third wife, Isabella, daughter of King John of Portugal,
he founded the order of the Golden Fleece (1429). His son, Charles the Bold (q.v.), who succeeded him in 1467, became the inveterate enemy of Louis XI of France, and one of the most powerful princes in Europe. He acquired Guelders in 1475, but perished in the fatal battle of Nancy in 1477, leaving behind him a daughter, Maria, the sole heiress of his states. She married Maximilian of Austria, who thus obtained the Netherlands and Upper Burgundy. The King of France received the dukedom of Burgundy, which he assumed as a male fief. Henceforth the territories that had belonged to Charles shared the fortunes either of France or of the empire. In the empire what was called the circle of Burgundy for a time embraced Franche-Comté and the Netherlands. In the Peace of Madrid, in 1526, Francis I was obliged to agree to the cession of the duchy of Burgundy to Charles V of Germany, but the cession was never carried out, and in the Peace of Cambray, in 1529, Charles renounced his claim to it. Franche-Comté was conquered by Louis XIV and retained by him at the Peace of Nimeguen in 1678. After this time the name Burgundy is best known as designating one of the few provinces of France. The name is now applied to one of the four departments of Yonne, one of the most productive regions in France. Consult Plancher, U., 'Histoire générale et particulière de Bourgogne' (Dijon, 1739-41); 'Geschichte der Burgundionen' (Halle 1874); Barante, B. de, 'Histoire des ducs de Bourgogne de la maison de Valois' (Paris 1833-36).

BURGUNDY (called also Burgundy Proper or Lower Burgundy), formerly a province in the east of France, lying on the west of Franche-Comté and on the south of Champagne. It now forms the four departments of Yonne, Côte-d'Or, Saône-et-Loire and Ain. It is one of the most productive regions in France. The principal product is wine. See BURGUNDY Wines.

BURGUNDY PITCH, the resinous exudation of the stem of the spruce fir (Abies excelsa on old and sun-exposed parts. It is obtained from Switzerland, but is seldom genuine. It is hard and brittle, opaque, of a dull reddish-brown color, empyreumatic odor and aromatic taste. It gives off no water when heated, is not bitter and is free from vesicles. It consists chiefly of resin and a little volatile oil, whence its odor. The resin resembles that of turpentine. The resin is melted in hot water to remove some of the oil and is then strained through a coarse material. Pitch plaster acts as a sweat stimulant to the skin. Burgundy pitch enters also into the composition of the iron plaster. It takes its name from Burgundy in France, where it was first prepared. A pitch resembling it can be prepared from common resin and palm oil, which, unlike Burgundy, is non-soluble in glacial acetic acid.

BURGUNDY Wines, famous French wines, deriving their name from the ancient province of Burgundy. They have a reputation superior to their present popularity. They are nevertheless wines of delicious flavor and bouquet. It has been supposed that they would not well bear a sea-voyage, but it is now set-tled that when transported to America and back, their quality is greatly improved. Burgundy has a medium content of alcohol, acids and solids, is very low in tannin and resembles red in color. The vineyards, consisting of Pinot, Gamay Noir and Meunier grapes, are located half-way up the hillsides (800-1,000 feet high) in the Côte d'Or, between Dijon and Châlons. Three classes of red Burgundy and two of white are recognized, a red wine and a white wine and a red wine and a white wine. The most renowned red wines of Burgundy are Romanée-Conti, Clos-Vougeot, Chambertin and Richebourg. Chambertin was the favorite wine of Louis XVI and Napoleon. Chablis, a white wine, has many admirers but is inferior to the best growths of the Garonne and the Rhone.

BURHÁNPUR, boor-han-poor', a town of the Nimar district, Central Provinces, British India, formerly the capital of Khandesh, is situated on the Tapti River about 300 miles northeast of Bombay, 210 miles east of Surat. It is situated on high ground and is well planned and built, with a rampart of brick and a palace of brick, known as the Red Fort, built by Akbar, who adorned the town with marble halls. It has a mosque and other buildings worthy of note, and was once famous for its manufactures of gold and silver brocade, muslin and silks, which still exist to some extent, though the town has long been declining. Pop. 22,777.

BURHEL. See BAHRI.

BURI, the grandfather of Odin, in Norwegian mythology. According to the legends, 12 streams flowed from the spring Hvergelmir (the roaring cauldron) in Niflheim (the region of shadows), and later in their course were frozen, thus surrounding the region of elemental fire (Muspelheim) with blocks of ice. In the conflict of the ice with the fire, the rime, or frosty snow, was melted and the drops formed the giant Ymir and the cow Audhumla (darkness); from the cow's udder came four streams of milk with which the giant was fed. Audhumla was nourished by licking the salt ice-blocks, and as she licked them a man's hair appeared on the first day, a man's head on the second day and the whole man on the third day; this was Buri. He was the most renowned in strength; he had a son Bor through whom he was the grandfather of Odin, Vili and Ve. Consult Anderson, 'Norse Mythology' (Chicago 1901).

BURIAl, the ordinary method of disposing of the dead, a practice which varies among different people. Among savage races, and even among some civilized peoples of the East, exposure to wild animals or birds of prey is not uncommon. The careful embalming of the dead by the ancient Egyptians may be regarded as a special form of burial. But by far the most common forms of disposing of the dead have been burning and interring. Among the Greeks and Romans both forms were practised, though among the latter burning became common only in the later times after the Phrygian. In this form of burial the corpse, after being borne in procession through the streets, was placed upon a pyre built of wood, and profusely sprinkled with oils and perfumes. Fire was set to the wood, and after the process of cremation was complete, the bones and ashes were carefully gathered together by the relatives and
BURIAN VON RAJEČZ—BURIN

placed in an urn. With the introduction of the Christian religion, consecrated places were appropriated for the general burial, and the Roman custom of providing the sepulchre with a stone and inscription was continued by the Christians. The practice of cremation now declined and finally disappeared, but has recently to some extent been revived. See BURYING-PLACES; CREMATION; FUNERAL RITES; MOUND BUILDERS; MUMMIES.

BURIAN VON RAJEČZ, Baron Stefan, Austro-Hungarian diplomat and statesman: b. near Pressburg, Hungary, 15 Jan. 1851, a Hungarian of Slovak extraction. Educated in his native town and Vienna, he served in various consular capacities at Alexandria, Bucharest, Belgrade, Sofia and Stuttgart. As Austro-Hungarian Consul-General at Moscow, he acquired a thorough knowledge of the Russian language and country; later, as Ambassador to Greece, he became intimately acquainted with the complexities of Balkan politics. He was also for a time Finance Minister of the Dual Monarchy, and in 1903 succeeded von Kallay as chief administrator of Bosnia-Hercegovina, in which office he came into close touch with the vexed southern Slav question. On the resignation of Count Berchtold, the Austro-Hungarian Foreign Minister, in January 1915, Baron von Burian, known as a man of conciliatory temperament and firm character, in addition to his wide experience, was called to succeed him. His appointment at that juncture was regarded as evidence of a desire to make some political changes at a moment when affairs had become extremely critical. The policy of Count Berchtold (q.v.) had precipitated the great war; and Berchtold was now involved in a diplomatic duel with Baron Somnino (q.v.), the Italian Foreign Minister, over the interpretation of Article VII of the Triple Alliance (q.v.), on the strength of which Italy demanded certain territorial concessions. It was believed that Baron Burian would be more disposed than Count Berchtold to make the sacrifices necessary to assure a continuance of Italian neutrality. Almost from the beginning, however, he declared the cession of territory to be impossible, though he afterward agreed, on the advice of Germany, to cede almost the whole of the Italian-speaking territory of Austria. The only important Italian demand he rejected was the cession of certain islands along the Dalmatian coast. The negotiations, at which Prince Buellow assisted in Rome, broke down owing to the inflexible demand of Baron Somnino that the transfer be effected immediately and not, as was proposed, after the end of the war. Italy declared war on Austria-Hungary, 23 May 1915. The undiplomatic activity of the Austrian Ambassador to the United States, Dr. Dumba (q.v.), revealed by the British seizure of a private letter addressed by him to Baron Burian, and resulted in the Ambassador's dismissal. In the Ancona and Arabic (q.v.) controversies with the American government, Baron Burian experienced further diplomatic misfortunes. Reports of his resignation were current on several occasions, the first appearing a few days after his acceptance of office.

BURIATS, boò-re-ats, a Mongolian people, numbering some 300,000 who were conquered by the Russians in 1664 and have since developed the peaceful arts. They resemble the Chinese in certain general habits of life and in retaining the queue. They inhabit the southern part of Irkutsk and the trans-Baikal territory. Their principal occupation is the breeding and rearing of cattle and horses, the latter being especially famous for their endurance and for the masters' attachment to them. They are good agriculturists, being adept at manuring and irrigation, and are also clever fishers and trappers. They are active in the mechanical arts. Their religion is partly Buddhist, with a Khambo Lama at their head who resides at the Goose Lake; partly Shamanistic with headquarters at the river Angar; and some thousands near Lake Baikal have been converted to Christianity. They have three dialects of their own, and some literature. Many are educated. Consult Melinkoff, Dr. N. 'Internationales Archiv für Ethnographie' (1899); Gmelin, 'Siberia'; Howorth, Sir H. H., 'History of the Mongols' (1876-88).

BURIDAN, bù-rè-dân, Jean, French scholastic philosopher: b. Bèthune, Artois, about 1300; d. after 1358. He studied at Paris, where he attached himself as a disciple of Occam to the party of the Nominalists, and at a later time became himself a teacher. In the end he was forced by his opponents to flee from Paris, when he betook himself to Vienna, where he is said to have been influential in bringing about the establishment of the university. Here also he wrote some logical and ethical treatises, in which he appears as a zealous adherent of the Aristotelian philosophy. Buridan was a supporter of the doctrine of Determinism (q.v.), and is now chiefly known through having his name attached to an illustration that he is said to have used in support of his views, and known as 'Buridan's Ass.' He is said to have supposed the case of a hungry ass placed at an equal distance from two equally attractive bundles of hay, and to have asserted that in the supposed case the ass must inevitably perish from hunger, there being nothing to determine him to prefer the one bundle to the other. This illustration, however, is not found in any of his works, and from its nature it would appear more likely to have been used by the assailants of the doctrine of Determinism. He wrote 'Compendium Logicae' (1489); 'In Aristotelis Metaphysicae' (1518); 'Questiones in Decem Libros Ethicorum Aristotelis' (1489). Consult Prantl, 'Geschichte der Logik' (Vol. IV, Leipzig 1855-70); Townsend, 'Great Schoolmen of the Middle Ages' (New York 1905), and Rickaby, 'Scholasticism' (London 1908).

BURIN, or BRAVER, the principal instrument used in copper engraving, is made of tempered steel, and is of prismatic form, the graving end being ground off obliquely to a sharp point. The distinctive style of a master is frequently described by such expressions as a soft burin, a graphic burin, an alert burin, etc. It is fixed in a handle, the end of which is rounded to fit the hand. Pushed forward by the hand it cuts a shallow or deep furrow, according to the pressure exerted. When in sticking, bitten lines or lines of the point are imperfect or weak, the burin is used to repair or strengthen them.
BURITI, or tucu, PALM, a lofty, fan-shaped palm,  *Caryota umbratica*, common in swamps in northern Brazil. It bears abundant crops of scaly nuts about two inches long, from the reddish oily pulp of which a confection is made by boiling with sugar. The nuts also yield an oil which is emulsified to make a paste that is used in the preparation of numerous cuplike holes are made in the prostrate trunk. These become filled with a reddish fluid, which is used as a beverage. Its taste resembles some sweet wines.

BURRE, Edmund, political philosopher and orator: b. Dublin, 12 Jan. (possibly) 1729; d. Beaconsfield, England, 9 July 1797. He was the son of a solicitor in good practice. His mother was a Roman Catholic, but he and his two brothers adopted the religion of their Protestant father. Always, however, he was tolerant of Catholicism. At the age of 14 he entered Trinity College, Dublin, where he took his bachelor's degree in 1748. In this period, as his letters show, he had fits of enthusiasm over various studies — a *fureor mathematicus*, succeeded by a *fureor logicus*, a *fureor heroicus*, and a *fureor poeticius*. The 17 years between 1748 and 1765, when his career was finally determined by his election to Parliament, he spent in different employments. Going to London with the intention of taking up law, he succumbed to the attractions of literature, science, and philosophy. He traveled in England and on the Continent, frequented debating clubs and theatres and did more or less hack work for publishers. He printed nothing, however, with which his name is connected till the two books of 1756: *A Vindication of Natural Society* and *A Philosophical Inquirie into the Origin of Our Ideas on the Sublime and Beautiful*. In the first he attempted to refute Bolingbroke's arguments against revealed religion by showing that they might be urged with equal force against the organization of society. In the second he took up a subject much discussed at the time; and though his speculations have been superseded, he has the credit of stimulating Lessing to the production of *Laokoon*.

Burke also wrote an *Account of the European Settlements in America* (1757), and an *Abridgment of the History of England* (1758). In 1759 he began to edit the *Annual Register*, with which he was connected for 30 years. In 1761 he went to Ireland, attached in some indefinite way to William Gerard Hamilton — *Single-speech* Hamilton — who was secretary to the lord-lieutenant. After two years in Dublin he returned to England; there he joined the famous Literary Club, with which are associated the names of Johnson, Goldsmith, Sir Joshua Reynolds and Garrick.

In recognition of his abilities and of the knowledge of politics which he had shown in the *Annual Register*, he was offered the post of private secretary to Lord Rockingham when the latter became Prime Minister in 1765. In the same year he was elected member of Parliament from Wendover. Within a week or two he made a strong impression with two speeches for and against the South America Bill. The fall of the Rockingham ministry, Burke, who might have had a place with the new administration, remained with his friends. Turning to their account his literary powers, he began his series of great political tracts. In 1769 he put forth 'Observations on the Present State of the Nation,' a reply to a pamphlet by George Grenville. In this controversy Burke showed himself a master of the details of revenue and finance. At this time he took part in some transactions which afforded his enemies a handle against him. Though he had been living almost from hand to mouth till he entered Parliament, he bought in 1768 an estate worth upwards of $100,000. The underlying facts have never been determined with complete satisfaction. This much, however, is clear: Burke lived on terms of intimacy with his brother Richard and a distant kinsman, William Burke. Richard and William, together with Lord Verney, a political patron of Edmund, speculated in stock of the East India Company; and later Richard was engaged in questionable dealings in West Indian lands. That these ventures were shared by Burke has been charged but never proved. On the other hand it can be shown that most of the money for the purchase of his estate he borrowed from Lord Rockingham. After getting the place, he had to borrow right and left to maintain it. Probably his faults were neither dishonesty in speculation nor venality in Parliament, but undue ambition to live as he thought became his position, carelessness and improvidence, and adherence to 18th century standards of propriety, which in such matters were lower than ours.

Whatever his shortcomings in managing his private affairs his services to the public were very great. He was on the side of the people in the long contest over John Wilkes. Since his sentiments on this subject were in general those of the 'Letters' of Junius, he was suspected of being Junius. This accusation he denied; and his 'Thoughts on the Cause of the Present Discontents' (1770) showed so many differences on minor points that — were no other evidence available — it must be concluded that Burke was not Junius. In the 'Thoughts' Burke argued that the King and a small knot of advisers were building up power for themselves, which, if not checked, would have changes more gradual. During the years immediately following 1770 Burke devoted his energies to keeping the Rockingham Whigs united against the efforts of the King to win them over. Without Burke, says John Morley, *the Rockingham connection would undoubtedly have fallen to ruin, and with it the most upright, consistent and disinterested body of men then in public life*.

From his political activity Burke withdrew for a time in 1773, for a trip to France. There he observed two things which he strongly dreaded: atheism and an eager questioning of the 'allowed opinions which contribute so much to the public tranquillity.' This atheism and speculation, he perceived — and he was one of the few who were so clear-sighted — were working toward revolution. His fear of these tendencies he expressed in Parliament not long after his return.
By this time Burke had won a substantial reputation throughout the United Kingdom. Indeed, as early as 1766 at least one Irish municipality had voted him the freedom of the city; and in succeeding years English mercantile organizations passed resolutions commending his labors in behalf of commerce. Finally in 1774, when troubles with America were thickening, Bristol, the trading centre of the west of England, a city which had everything to lose and nothing to gain from a war with the colonies, elected him to Parliament. At the conclusion of the poll his colleagues had promised obedience to the instructions of his constituents. Burke, however, declared his independence: 'Your representative owes you, not his industry only but his judgment; and he betrays you instead of serving you if he sacrifices it to your opinion.' To this declaration he adhered when in 1778 a bill was proposed relaxing restrictions upon Irish commerce. The English merchants, including those of Bristol, protested; but Burke replied: 'England and Ireland may flourish together. The world is large enough for us both. Let it be our care not to make ourselves too little for it.' ('Two letters to Gentlemen in Bristol'). For this liberality Burke was never forgiven, and in the election of 1780 he was forced to seek a new constituency.

It was during his six years as member for Bristol that, in the contest over America, he rose to his full height as a statesman. He was almost alone among the speech-makers of that time in always going below the superficial considerations of the moment to the fundamental fact that in the long run restraint and violence defeat themselves. In addition to many minor speeches scattered through the 'Parliamentary History,' he made three great contributions to the subject—'Speech on American Taxation,' 19 April 1774; 'Speech on Conciliation,' 22 March 1775, and 'Letter to the Sheriffs of Bristol,' 3 April 1777. In the first he argued that the tea duty was of no use to England for revenue; that it served only to irritate the Americans, and that by winning the loyalty of the colonists England would get more than she could ever take by force. In the second speech Burke maintained that England must conciliate, and that the only way was by yielding. In the 'Letter' he reviewed the struggle and in the light of events justified his own position. Of the three pieces that on 'Conciliation' is the best. Not even when dealing with India does Burke excel in grasp of details, in lucid presentation of a large mass of facts, and in ripened political wisdom. Then, too, he saw what so many failed to observe, that the real cause of the contest lay deeper than the casual orders of a governor or the retaliation of a mob, and that America, in resisting the encroachments of royal prerogative, was fighting a battle for the liberties of Englishmen at home.

Though Burke could not win over Parliament to his views on America, he had better success with his 'Speech on the Plan for Economical Reform' (1780). People were staggering under the debt from the American war and agitating for a general reform of Parliament. Burke opposed such radical changes; he proposed to abolish some offices, consolidate others, reduce so that he reformed, that of paymaster of the forces, he himself occupied in 1782. At that time the North ministry yielded to the Whigs, who were temporarily united under Lord Rockingham, Charles James Fox and Lord Shelburne. Burke, owing in part to infirmities of his temper and the suspicions against him, got only this third-rate position, instead of a place in the cabinet, in their seats when Lord Rockingham died and Lord Shelburne became head of the administration. At once Fox and Burke refused to work with him, and by joining their old enemy, Lord North, in what is known as the Coalition, they broke up the Whig party at Bute as accused of deserting his principles for purely personal motives. His conduct is hard to defend, for he attacked Shelburne with asperity, and under the Coalition resumed for a few months the office of paymaster.

Against this dubious course we may set his strenuous advocacy of reform in India. That country was victim of the corrupt and cruel system of the East India Company. Burke was familiar with the subject, for he had been a member of select committees which had drawn the two important reports. He is also supposed to have framed the East India bill commonly known as Fox's. At any rate he defended it, 1 Dec. 1783, in one of his best speeches. The bill, however, was defeated and the Coalition, which supported it, was out of office. Early in 1785 Burke renewed the attack in his 'Speech on the Nabob of Arcot's Debts'—a preliminary to the proceedings against Warren Hastings. In 1786 Burke drew the articles against Hastings. The trial dragged on till 1795, and though the Crown had drawn away from the men with whom he had been allied against the encroachments of the Crown in England and America. In 1790 he widened the breach still further by aggressive proclamation of his opinions in 'Reflections on the Revolution in France.' The book had for that day an enormous sale and divided Great Britain into two parties—one composed of Burke and an uncongenial company of Tories; the other of Liberals, many of whom had been Burke's lifelong associates. Burke himself violently quarreled with his old friend Fox. The seeming contradiction between his early position and his later is accounted for in part by the fact that he grew more conservative with age, in part by his desire to preserve the balance between monarch and subject. In England and the Crown had been the aggressor; in France, he thought, the people. Moreover, he had always insisted that liberty is inseparable from order; and in France he saw nothing but disorder. As the Revolution progressed, Burke became more and more wrong on the whole of his succeeding utterances—'Letter to a Member of the National Assembly' (1791), 'Appeal from
Among his important writings or speeches not already mentioned are 'Address to the King' (1777); 'Letter to Sir Hercules Langrishe' (1792); 'Thoughts and Details on Scarcity' (1795). See Reflections on the French Revolution; On Conciliation with the Colonies; On the Sublime and Beautiful.

Bibliography.—There are in the market three or four editions of Burke's writings and speeches, substantially complete. The best short life is in the 'Dictionary of National Biography.' John Morley's 'Life of Burke' (in the 'English Men of Letters,' 1879) is excellent; also his 'Burke, a Historical Study' (1867).

Of the earlier lives, James Prior's (2d ed., 1826) is the best. Of course Burke bulked large in the standard histories and memoirs of England in the 18th century.

Hammond Lamont,
Editor New York Nation; Editor of Burke's Speech on Conciliation with America.

Burke, Jane, better known as Calamity Jane, American army scout and mail carrier: b. Princeton, Mo., 1852; d. Deadwood, S. D., 1 Aug. 1903. She was reared on the plains and early became an Indian scout and was an aide to General Custer and General Miles in numerous campaigns. For several years she was the government mail carrier between Deadwood, S. D., and Custer, Mont.

Burke, John, Irish genealogist: b. near Parsonstown, Ireland, 1786; d. Aix-la-Chapelle, 27 March 1848. His life was devoted to genealogical research. In 1826 he began to publish a 'Genealogical and Heraldic Dictionary of the Peerage and Baronetage of the British Empire,' and subsequent works by him were 'A Genealogical and Heraldic History of the Commons of Great Britain and Ireland' (1833–38), which in subsequent editions appeared as 'A Dictionary of the Landed Gentry.'

Burke, John, State governor and national treasurer: b. Keokuk County, Iowa, 25 Feb. 1859. He studied at the University of Iowa, receiving the LL.B. degree in 1886, when he removed to North Dakota and was county judge during several years of Rolette County. After being elected member of the North Dakota House of Representatives (1893–95), and State Senator (1893–95), in 1906, 1908 and 1910, on three occasions, he was elected Democratic Governor of North Dakota. President Wilson in 1913 appointed him Treasurer of the United States.

Burke, Sir, John Bernard, English herald and genealogist, son of John Burke (q.v.): b. London 1815; d. Dublin, 13 Dec. 1892. He was educated at Caen in Normandy, was trained as a lawyer and called to the bar in 1839. Besides editing the successive issues of the 'Peerage' founded by his father (4th ed., 1887), he published other works on the 'Landed Gentry' (1846); 'Extinct Peerages' (1846); 'Anecdotes of the Aristocracy' (1849); 'Family Romance' (1853); 'The Vicissitudes of Great Families' (1859); 'The Rise of Great Families' (1873); 'The Book of Peerage' (1881); and 'Reminiscences' (1882).

Burke, Maurice Francis, American clergyman: b. Ireland, 5 May 1845. He came to the United States in childhood and was educated in
BURKE—BURLEIGH

Chicago and Notre Dame, Ind., and in the American College, Rome, where he was ordained to the Roman Catholic priesthood in 1875. Returning to the United States, he took charge of St. James, Philadelphia, a parish. In 1887 he was consecrated bishop of Cheyenne, Wyo., and in 1893 was transferred to the see of Saint Joseph, Mo. Bishop Burke is known as a fine linguist.

BURKE, Robert O'Hara, Australian explorer: b. County Galway, Ireland, 1820; d. Australia, 28 June 1861. After serving in the Austrian army he went to Australia, and after seven years' service as inspector of police was appointed commander of an expedition to cross the continent of Australia from south to north. He and his associate, Wills, reached the tidal waters of the Flinders River, but both perished of starvation on the return journey. They were among the very first white men to cross the Australian continent from south to north.

BURKE, Thomas, American statesman: b. Ireland, about 1747; d. Hillsborough, N. C., 2 Dec. 1783. He left Ireland about 1764 and lived for a time in Virginia. He entered the study and practice of medicine. He received a degree in medicine in 1774 and removed to Hillsborough, N. C. Of a bold and impetuous temper, a ready writer and speaker, he became one of the leading spirits in the Revolutionary struggle. While he was in Virginia, his writings in opposition to the Stamp Act had brought him into notice, and he had a large share in the formation of the constitution of North Carolina. He was a member of the provincial congress at Halifax in 1776 and a volunteer at the battle of Brandywine. He was a member of Congress from December 1776 to 1781, when he was chosen first governor of North Carolina under the new constitution. In September of that year he was surprised and seized by the Tories and retained at James Island, S. C., as a prisoner on parole. Obnoxious to the Tories from his previous course, he was in daily apprehension of assassination, to escape which he ventured unavailing to obtain an exchange or a parole to some other State, he effected his escape in the night of 16 Jan. 1782, after an imprisonment of four months. In a letter to General Leslie, Burke gave his reasons for withdrawing and said that he still considered himself subject to the disposal of the British authorities. He was regularly exchanged soon afterward and resumed his duties as governor, but was defeated the following year, when a candidate for re-election, it being urged that he had violated his parole.

BURKE, Thomas Martin Aloysius, American clergyman: b. Ireland, 10 Jan. 1840; d. 20 Jan. 1915. He came in childhood to Utica, N. Y., and was educated at the College of Saint Michael, Toronto, and at Saint Mary's Seminary, Baltimore, and was ordained to the Roman Catholic priesthood in 1864. He was appointed to labor in Albany and became successively vicar-general and administrator. In 1894 he was consecrated bishop of Albany.

BURKE, Thomas Nicholas, Irish clergyman and orator: b. Galway 1830; d. 1883. He was educated in Italy, where he entered the Order of Saint Dominic. Going to England, he preached in that country and later in Ireland, gaining a high reputation as an orator and becoming familiarly known as "Father Tom." In 1872 he made a visit to the United States and lectured in reply to Froude, his addresses appearing in print under the title of 'English Misrule in Ireland.'

BURKE AND HARE, two miscarreens, of whom William Burke, a native of Ireland, was detected, tried and executed at Edinburgh, in 1829, for the murder of numerous individuals, his accomplice, Hare, escaping the hangman by turning king's evidence. At this time the resurrectionists were busy at their nefarious trade, but the vigilance with which the burying-grounds throughout the country were watched rendered a supply of subjects for anatomical schools almost impracticable, and the demand for dead bodies consequently became great. This led Burke and Hare to murder, by suffocation, many poor waifs who were decoyed into Hare's lodging-house, and when they ceased to be useful they were sent to Dr. Robert Knox, proprietor of an anatomical theatre in Edinburgh. The case of Burke and Hare brought home to the public mind more clearly than ever before how necessary it is that schools of anatomy should receive a regular supply of subjects for dissection, and in 1832 an act was passed for supplying the anatomical schools throughout the kingdom from the unclaimed dead in the hospitals.

BURKEL, bür'kël, Heinrich, German painter: b. Pirmasens, 30 March 1813; d. Munich, 10 June 1869. He was educated at Munich and in Italy; he is chiefly known for his religious scenes from the Bavarian and Tyrolean Alps were among the first of their kind, and his village and tavern scenes rank among the best in modern art. Among his paintings are 'Scenes in an Inn' and 'Winter Scenes in the Tyrol.'

BURKITT, Francis Crawford, English Biblical scholar: b. London, 3 Sept. 1804. He was graduated at Trinity College, Cambridge, was lecturer in palaeography at Cambridge University 1804—5, and since 1805 has been Norriston professor of divinity and head of the same institution. He has published 'Early Christianity Outside the Roman Empire' (1899); 'Fragments of Aquila' (1897); 'The Rules of Theomitos' (1894); 'Two Lectures on the Gospels' (1900); 'Early Eastern Christianity' (1904); 'The Gospel History and Its Transmission' (1906); 'Earliest Sources for the Life of Jesus' (1910); 'The Failure of Liberal Christianity' (1910); 'Jewish and Christian Apocalypses' (1914).

BURLEIGH, bér'lë, Bennet, war correspondent: b. Glasgow, Scotland, 1841; d. 17 June 1914. He fought in the American Civil War, during which he was twice condemned to be shot. As war correspondent he served in the Egyptian campaign of 1882, in the Sudan, Madagascar, Ashanti, South Africa, the Russo-Japanese War, Tripolitan War and the Bulgarian War of 1912-13. He was the author of 'Two Campaigns' and 'The Empire of the East' (1905).

BURLEIGH, Edwin Chick, United States Senator: b. Linneus, Me., 27 Nov. 1843. A student of Houlton Academy, he became State
land agent and assistant clerk in the Maine House of Representatives 1876–78, clerk in the office of the State treasurer in 1880 and treasurer in 1884. He was elected Governor of Maine 1888–92; member of Congress 1897–1911; and United States senator 1913–19.

BURLEIGH, George Shepard, American writer, brother of William H. Burleigh: b. Plainfield, Conn., 25 March 1821; d. Providence, R. I., 21 July 1903. He has published 'The Maniac and Other Poems'; 'Signal Fires on the Trail of the Pathfinder', a metrical romance in six cantos, several dramas and a very considerable volume of fugitive poetry which appeared in newspapers and magazines for half a century. His work is characterized by simplicity, naturalness and forcefulness; but it is very uneven in quality, though generally euphonic. Burleigh early developed a facility in verse which gained for him distinction in his native State where he was known as the farmer poet. He received only such education as the district school afforded in the winter months, and he continued to work on the farm until middle life. All his spare time was given to literary pursuits from his boyhood days.

BURLEIGH, William Cecil (Lord) English statesman: b. Bourn, Lincolnshire, 13 Sept. 1520; d. London, 4 Aug. 1598. He was Secretary of State under Edward VI and Elizabeth, and Prime Minister of England for 40 years. In 1588 Parliament was assembled, and, by his advice, a plan of religious reform was laid before it. In this he had a considerable share; and he also took the leading part in the establishment in the Thirty-nine Articles of faith which form the basis of the reformed religion of the State. To him is due also the regulations of the coinage, which had been altered since Henry VIII's time. He was created Baron Burleigh, in 1571, and in 1588 concluded an advantageous treaty with the Netherlands. His policy was both cautious and comprehensive and he was unaffected by personal prejudices in his management of public affairs. Consult NG, 'Notices of Lord Burleigh' (1829–31); Charlton, 'Life' (1847); Hume, 'Great Lord Burleigh' (1898).

BURLESON, Albert Sidney, United States Postmaster-General: b. San Marcos, Tex., 7 June 1863. A graduate in 1884 of the University of Texas, he became a lawyer, and was assistant city attorney of Austin, and attorney of the 24th judicial district of Texas during several years. From 1899 he was several times elected member of Congress, and in 1913 was appointed Postmaster-General by President Wilson.

BURLESQUE, the comic effect arising from a ludicrous mixture of things high and low. High thoughts, for instance, are clothed in low expressions, or noble subjects described in a familiar manner, or vice-versa.

BURLINGTON, Edward Livermore, an American editor, son of Anson Burlingame (q.v.): b. Boston, 30 May 1845. He studied at Harvard and was later elected as private secretary to his father, who was United States Minister to China. Since 1879 he has been associated with the publishing house of Charles Scribner's Sons, and from 1880 to 1914 was editor of Scribner's Magazine. He has received the degrees Hon. A.M., Harvard, 1901; Litt.D., Columbia, 1914.

BURLINGAME, Cal., city in San Mateo County, situated on a peninsula, 20 miles south of San Francisco, on the Southern Pacific and the United of San Francisco railroads. It is
BURLINGTON, England. See BRIDINGTON.

BURLINGTON, Iowa, city and county-seat of Des Moines County, 206 miles west-southwest of Chicago on the west bank of the Mississippi River at the intersection of the Chicago, Burlington and Quincy, the Chicago, Rock Island, and Pacific, the Muscatine North and South and the Toledo, Peoria, and Western railroads. Burlington, sometimes called the Orchard City, occupies a natural amphitheatre, formed by the limestone bluffs that slope down from the river, and on which many of the residences are built. The river here is broad and deep and is spanned by a railroad bridge. The city is connected by steamboat lines with important points on the Mississippi, and its river commerce is of considerable importance. The industries include the manufacture of agricultural tools, pearl buttons, wheels, desks, furniture, screens, boilers, mattresses, soap, flour, candy, burial caskets, Corliss engines, sleigh bells, novelties and the manufacture of lime and salt. The city has a large iron works. The extensive machine and repair shops of the Chicago, Burlington and Quincy Railroad are located here. The city contains among its important buildings an opera house, courthouse, public library, hospitals, schools of various kinds and the Burlington College of Commerce. Crapo Park, of 100 acres, is in the southern part of the city and is noted for its beauty. The city is governed by a mayor, elected for two years, and a city council, which has the power of appointment to all city offices (the commission form of government). It was named for Burlington, Vt., by its first settlers. A fur trading post was established there in 1829; its earliest buildings were erected in 1833, and its river commerce was founded in 1834. The city was incorporated in 1837 and received its city charter in 1838. Pop. 24,800.

BURLINGTON, Kan., city and county-seat of Coffey County, 60 miles south of Topeka, on the Atchison, Topeka and Santa Fe, and Missouri, Kansas and Texas railroads, on the Neosho River. It has extensive agricultural and stock-raising interests; is in a district rich in natural gas, and contains grain elevators, flouring mills, cigar factories and manufactories of electric appliances, tiles and carbohydrates, and a Carnegie library. Pop. 2,180.

BURLINGTON, N. J., city and port of entry in Burlington County, on the Delaware River and the Pennsylvania Railroad, 18 miles northeast of Philadelphia. It is a manufacturing trade centre for surrounding towns, and contains Saint Mary's Church, endowed by Queen Victoria, the oldest Church school for girls in the country; the State Masonic Home; Burlington College, and many fine old residences; and has manufactories of shoes, stoves, iron pipe, canned goods, silk, hollowware, braid, typewriter ribbons and carbon paper, carriages and structural iron. There is a national bank and a trust company, with combined resources amounting to $2,356,959. The corporation is divided into five wards. The city is a favorite residential suburb of San Francisco. It is progressive in the matter of improvements, with miles of permanently paved streets and walks, well-lighted, and with a municipal water plant. Pop. 3,500.

BURLINGTON, N. C., city in Alamance County, 20 miles east of Greensboro, on the Southern Railroad. It contains casket factories, hosiery and overalls establishments, manufactories steal bridges and has extensive cotton interests. Settled in 1850 Burlington was incorporated in 1876. The government is vested in a mayor and council, the former being chosen for a term of two years. The city owns the waterworks. Pop. 4,808.

BURLINGTON, Vt., city, port of entry and county-seat of Chittenden County, on Lake Champlain and the Central Vermont and Rutland railroads, 40 miles northwest of Montpelier. It has a very large lake commerce and manufactories of lumber, cotton and woolen goods, furniture, boxes, refrigerators, brushes, paper, toys, medicines and iron. In the neighborhood are large quarries of marble and limestone. The environment is picturesque. The city is the seat of the State University of Vermont and of the State Agricultural and Medical colleges; Bishop Hopkins Hall; the Roman Catholic Cathedral; the Fletcher, Billings and Burlington Law Libraries, a courthouse, United States government building and a Young Men's Christian Association hall. Burlington is noted for its benevolent and educational institutions, which include the Mary Fletcher Hospital, Home for Aged Women, Home for Friendless Women, Home for Destitute Children, Adams Mission House, Louis Howard Mission, Providence Orphan Asylum, Cancer Relief Association, Lake View Retreat, several sanitariums, the Vermont Episcopal Institute, Saint Joseph's and Saint Mary's academies (Roman Catholic) and high and graded schools. The city was settled in 1763, was a garrison post during the War of 1812 and was incorporated in 1865. It is governed by a mayor, elected for two years, a council and a board of aldermen. The waterworks, incandescent lighting plants, the property of the city. Its material development has been largely due to its great lumbering industries. The famous Col. Ethan Allen is buried beneath a handsome monument in
Greenmount Cemetery. Pop. (1910) 20,468. Consult Allen, 'About Burlington, Vermont' (Burlington, Vt., 1905); Possoms, 'Burlington, Vt., as a Manufacturing, Business and Commercial Centre' (Glens Falls, N. Y., 1890); 'Vermont Historical Gazetteer' (Vol. 1, 4 vols., Burlington and Rutland, 1865-72), and New England Magazine (Vol. XI, 20 vols.).

BURLINGTON, Wis., city in Racine County, 35 miles southwest of Milwaukee, on the Chicago, Milwaukee and St. Paul and the Minneapolis, St. Paul and Sault Sainte Marie railroads. It is a prosperous dairying centre and has brickyards, tileyards, brassworks, condensed milk factory and manufactories of baskets, horse blankets and veneer. The waterworks are the property of the municipality. Consult Wood, 'Burlington: Its Early Growth, History and Progress' (Burlington 1908). Pop. 3,212.

BURLINGTON LIMESTONE, a limestone of sub-Carboniferous (Mississippian) Age, named for its occurrence near Burlington, Iowa. It is also found in other parts of the Mississippi Valley. This limestone is of light color, commonly tessellated and fine-crystalline, resembling lithographic stone. It has important industrial value.

BURMA, India, the largest province of British India, on the east side of the Bay of Bengal, at one time formed the greater portion of a native kingdom or empire, which is said to have extended from lat. 9° to 28° N., and from long. 92° to 104° E. Its greatest length was about 1,000 miles and its breadth 600, its area being then about 270,000 English square miles. In 1826 the provinces or divisions of Arracan and Tenasserim were occupied by the British, and in 1852 Pegu and the province of Martaban shared the same fate. This portion was then known as British Burma and continued to be so till in 1886 the rest of the kingdom was annexed by Great Britain, when the two portions came to be designated Upper and Lower Burma, respectively. They now form together one province under a lieutenant-governor and legislative council. Total area, about 231,000 square miles; population, over 12,000,000, mainly Buddhists.

Ler Loi Burmese is a large extent mountainous in character, the only extensive level being in Pegu, where the valleys of the Irrawaddy and Sattaung form an alluvial tract of about 10,000 square miles. The rainfall varies from less than 60 inches in some places to 190 or more in others. About half the soil is believed to be cultivable, but a comparatively small portion is as yet under cultivation, though agriculture is extending year by year. Since the occupation of the country by the British it has rapidly increased in prosperity, and the revenue is generally greater than the expenditure. The imports and exports together exceed £84,500,000, the bulk of the trade being with Great Britain. The capital and principal port is Rangoon. Other towns are Moulmein, Akyab and Bassein. Upper Burma is on the whole similar in character to Lower Burma, but less productive, and has generally a smaller rainfall. It is rich in minerals, including gold, silver, precious stones, marble, iron, lead, tin, antimony, arsenic, sulphur and petroleum. Only a few of these are worked. The chief precious stones are the ruby and the sapphire; amber and jade are also found. All precious stones used to be sent to the royal treasury and strangers were prohibited from approaching the places where they were found. These districts are still the subject of special regulation under the British rule. The whole country is intersected by numerous streams, which, following the direction of the chief mountain chains, flow generally eastward into the Indian Ocean. The chief of these are the Irrawaddy, the Salween and the Chindwin, which joins the Irrawaddy, the combined stream being of great volume. The Irrawaddy is of great value as a highway of communication and traffic, being navigable beyond Bhamo, near the Chinese frontier. In their upper courses the rivers flow through narrow valleys; in their lower courses they traverse low-lying districts, and in the rainy season often overflow their banks. Among the wild animals of the country are the elephant, rhinoceros, tiger, leopard, deer of various kinds and the wild hog. The rivers abound with fish. Of domestic animals we may mention the ox, buffalo, horse, elephant and cat. In the southern districts, owing to the numerous rivers, the soil is most productive of rice, sugar cane, tobacco, cotton, indigo and all the tropical fruits. Tea is cultivated in many of the more elevated parts. The forests produce timber of many sorts, including teak. A great part of the trade of the country is carried on by means of the Irrawaddy River. From Bhamo goods are conveyed to China. Rice is the great crop (occupying about 80 per cent of the cultivated area), and this grain forms the chief export, others being teak, cotton and silk stuffs, petroleum, saltpetre, lacquered ware. About 12,446 miles of roads are maintained, and the number of railway miles open is now about 1,000. From Rangoon two lines proceed north, one along the left bank of the Irrawaddy to Prome and Meaday, the other through the Sittang Valley to Mandalay, and from that on the other side of the Irrawaddy to Bhamo and Mogau.

The Burmese have many skilful weavers, smiths, sculptors, workers in gold and silver, joiners, etc. Among industrial establishments are rice-mills, saw-mills, a few works for iron goods, ship-building yards, cutch works, etc. Other industries include boat-building, weaving, pottery, lacquerwork and brasswork. The weaving of cotton and silk goods is carried on by the women everywhere. The pottery of the country is strong and durable, if not especially artistic; and the gold and silver work finds numerous purchasers outside the country. Wood-carving is extensively practised for the adornment of houses, boats, etc. The native vessels plying on the Irrawaddy and other rivers are often of 100 to 150 tons burden, while thousands of small craft are engaged in trade or fishing. Large numbers of good cigars are made by women, and are partly used in the country, partly exported. The buildings among the Burmese are very slight, the Burmese women to require them to be chiefly of wood or bamboo, and prohibited the use of stone or brick except for pagodas, and other important structures.

People.—The Burmese are divided into several tribes, and belong to the common Indo-Chinese stock. Among the tribes other than the Burmese proper are the Karen, Kakhys,

BURLINGTON—BURMA 51
Shans, etc. The Burmese proper are of a brown color, with lank, black hair, and vigorous, well-proportioned frames. No Burmese can have more than one wife; but he may have as many mistresses as he will. The latter live in the same house with the wife, and are her servants. The Burmese between Ayer it and the Irrawaddy enjoy a good deal of freedom; are not shut up as in some parts of the East, and can even engage in a lawsuit in their own name. The chief amusement of the Burmese is their theatre, where declamation, dancing and music are given by turns. The new year (which begins in April) is celebrated with what is known as the "water feast," when young men and women throw water on each other and the passers-by. The Burmese usually write on palm leaves with an iron style or on black tablets, with a pencil; the rich have libraries, with books, the leaves of some of which are thin pieces of ivory, with gilt edges. Their materia medica is chiefly confined to herbs, spices and mercury; with vaccination they have long been acquainted. The language is monosyllabic, like Chinese; and the alphabet (derived from India), the characters of which are more or less circular. Among the common people the principal part of the male dress consists of a double piece of cloth about five yards long, loosely wrapped about the body. Over this is worn a long robe, with sleeves open in front, and reaching below the knees. The lower classes of women wear only a single garment, resembling a sheet, wrapped round the body and fastened under the arms. Men of rank wear a long robe of flowered velvet or satin, with open sleeves. In winter they wear a sheepskin, being thrown over this. On the head is worn a high velvet or silk cap, plain or embroidered, according to rank. The men wear earrings, often of large size. Women of the higher classes generally wear a shift which reaches only to the pit of the stomach, where it is drawn tight and fastened by strings. This is covered by a loose jacket, with tight sleeves. A piece of silk or cloth encircles the waist and descends to the feet. When a woman wishes to be particularly gorgeous she strews her hair with palm leaves of a red color, and tinges her teeth and the edges of her eyelids with black. Both sexes wear the hair long; the men tying it in a knot on the crown of the head, the women on the back. Sandals are often worn, but neither boots, shoes nor stockings; every man, woman and child, however, carries an umbrella. The chewing of betel and smoking of tobacco are universal. The Kachyens or Singfo are a courageous people inhabiting the upper basin of the Irrawaddy above Bhamo. They practise a sort of nature worship, and are active as traders, though at present rather lawless. Their villages are ruled by hereditary chiefs. Chinese from Yunnan have settled in considerable numbers as traders and agriculturists in the Kachyens country, and in Lower Burma. The most highly important element in the population as traders and otherwise. In the hilly districts of Tenasserim and Pegu we find the Karens, a somewhat secluded people, less intelligent and more ignorant than the Burmese, and not so purely Mongol in physical character. The Talaings or Mons of the Irrawaddy delta resemble the Burmese, but speak a distinct language. The Shans are a numerous people closely allied to the Siamese, and inhabiting eastern and northeastern Burma, together with portions of the neighboring countries.

The native government was an absolute monarchy, the King having unlimited power over life and property. The seat of government, after osculation, was first at Prome, but it was transferred to Rangoon in 1530, and is now at Mandalay. The country was divided into provinces, the chief of which was the King himself, who was assisted by a council of state known as the Htaik-daw, to which belonged at once the functions of a legislature, a cabinet and a supreme court of justice. It was composed of officials of 14 grades, the president being the King himself, some other member of the royal family or the Prime Minister. The King had power to punish at his pleasure anyone, including even the great officers of state. The public revenue was derived from taxes levied in a very irregular and capricious manner, and as the officials received no fixed salary, the tax-gatherers were extremely prevalent. The criminal laws were barbarously severe. Capital punishment was commonly inflicted by decapitation, but crucifixion and disemboweling were also practised. Torture might be applied to principals or witnesses; and in the case of their relations, the penalty of death was inflicted. The standing army was small. Levies were made, in case of war, by way of conscription; and a specified number of houses was required to furnish a soldier or pay a fine. The religion of the country is that of Buddha, which is said to have existed in the greatest purity. The tutelary divinities worshipped in various Buddhist countries are unknown, and the vows of poverty and chastity taken by the monks are said to be less frequently broken here than elsewhere. The Burmese possess a complete system of education so far as male children are concerned. All boys are required to reside in a religious house for three years and there they act as servants to the priests who instruct them in reading, writing and arithmetic, as well as in the doctrine and practice of Buddhism. Up to the present time only 962 in 1,000 against 1,006 and 1,022 in Bengal and Madras. But the explanation probably lies in the preponderance of the male element among the numerous immigrants into the province. Marriage in Burma is a purely secular ceremony, and elementary education is far more widely dispersed than in India, one individual in five being able to read and write.

History.—The Burmese empire is of little note in ancient or general history. Buddhism and Hinduism may have been introduced into the country from Assam and Tenasserim as early as the 1st century B.C. But the real history of the country begins with the establishment of the Burmese dynasty a little later in the 5th century A.D. The Burmese are the most ancient and most powerful nation in the Peninsula, and their language and literature are the most ancient and the most civilized of the Peninsula. The Burmese are a people of ancient origin, and their language and literature are the most ancient and the most civilized of the Peninsula. The Burmese are a people of ancient origin, and their language and literature are the most ancient and the most civilized of the Peninsula.

2 The 300 Lion steps leading to the Sagaing prayer temple
introduced various reforms and useful measures. Shembaun (Tshen-bo-yen), the Emperor's brother, became regent as guardian for his nephew, Mon, and he passed through himself and conquered Siam. In 1771, however, Siam recovered its independence, while the principal part of the Burmese forces were engaged in a war with China. In this war they were victorious, and compelled the Chinese, whom they took prisoners to intermarry with Burmese females, and to remain in their territory. In 1776 Shembaun left his empire, much enlarged, to his son, Chengua. This prince lived in the unrestrained indulgence of every appetite till in 1782 he was dethroned and put to death. In consequence of the revolution, Mentaraygi, the fourth son of Alompra, ascended the throne. He ordered his nephew, Momien, who was a state prisoner, to be drowned, and in 1783 subdued the kingdom of Arracan. He then engaged in a war with Siam, which continued till 1793, when peace was made on certain conditions. About this period, it happened that some robbers fled from the Burmese empire, and took refuge in the territory of the East Company. The Burmese demanded that they should be delivered up, and on their demands not being immediately complied with, marched with a strong force into the offending country. At the same time they carried on a friendly negotiation with the government in Calcutta, which resulted in the surrender of the criminals, and the conclusion of a treaty of amity and commerce between the two governments, negotiated by Captain Symes. The last victory of the Burmese was in 1825 over the province of Assam. The party driven from Assam, together with the Burmese rebels, fled to the British territories, whence they intended to invade Burma. The British government directed the insurgents, but refused to deliver them up or to drive them from the island of Shapuri, which they had occupied. At length the Burmese sovereign demanded of the government at Calcutta the cession of northern Bengal as being a part of Ava, and in January 1824 his forces marched into Cachar, which was under British protection. Lord Amherst, as governor-general of the British East Indies, now declared war against Burma, and Gen. Archibald Campbell prosecuted it so successfully that after the victory at Prome (1-3 Dec. 1823), he obliged the monarch to conclude a peace at Pansawar in 1825. As the treaty was not ratified on the part of the Burmese Emperor by the time specified (18 Jan. 1826), Campbell renewed the war and stormed the fortress of Munnum. On 24 February the peace was ratified, and the war concluded with the cession of Arracan, Mergui, Tavoy, etc. In 1852 a second war broke out at the conclusion of which Rangoon and the whole of Pegu fell into the hands of the British. About 1860 the new city Mandalay supplanted Amarapura as the capital. In 1867 British steamers were permitted by treaty to navigate Burmese rivers, and not long after traffic was carried on up the Irrawaddy as far as Bhamo. In 1885 the outrageous proceedings of King Theebhaw provoked another war, and the British force proceeded to Rangoon up the Irrawaddi River, took Mandalay and sent King Theebhaw a prisoner to Rangoon. On 1 Jan. 1886, Theebhaw's dominions were annexed to the British empire by proclamation of the viceroy of India (the Earl of Dufferin). After the annexation there was a considerable amount of scattered fighting with dacoits and others, but this has ceased since 1890 and the country is now opened up to commerce, and is rapidly advancing in prosperity. In 1897 Burma was constituted a province, and placed under a lieutenant-governor instead of a chief commissioner.

**BURMEISTER, boor'mis-tér, Hermann**, German scientific writer: b. Stralsund, 15 Jan. 1807; d. Buenos Aires, Argentina, 2 May 1892. In 1842, he became professor of zoology at Halle. He distinguished himself as a geologist and zoologist in his native country and permanently in Argentina, where he continued his investigations. He traveled in South America, and was for a time director of the Museum of Natural History at Buenos Aires. Among his works are "Handbuch der Paläontologie" (5 vols., Berlin 1831-53); "Geschichte der Schöpfung" (Leipzig 1843); "Systematische Übersicht der Tiere Brasilien's" (3 vols., 1854-56); and many contributions to scientific periodicals.

**BURMEISTER, Richard**, German-American musical composer: b. Hamburg, Germany, 7 Dec. 1860. He received an academic education in Hamburg; studied with Franz Liszt, and in Rome, Budapest and Weimar; made concert tours in Europe in 1883-85 and in the winter of 1893; was at the head of the piano department of Peabody Institute, Baltimore, Md., 1885-97; and settled in New York in the latter year. He made concert tours all over the United States and was director of the Scharwenka Conservatory, New York, in 1897-99. In 1903 he became the first head of the piano department of the Royal Conservatory of Dresden. Since 1907 he has been living in Berlin. He has composed "The Sisters" (a dramatic tone poem), numerous songs, and piano, violin and orchestra pieces; and arranged Liszt's "Concerto Pathétique," originally for two pianos, for the piano and orchestra.

**BURN, Sir George**, Canadian banker: b. Thurso, Scotland, 10 April 1847. He was educated in Scotland and was trained in the Royal Bank of Scotland. He joined the staff of the Royal Canadian Bank in 1866; in 1880 was appointed general manager of the Bank of Ottawa. He was elected president of the Canadian Bankers' Association in 1915; has been prominently identified with philanthropic and patriotic work, and was knighted in 1917.

**BURNABY, Frederick Gustavus**, English soldier and traveler: b. Bedford, England, 3 March 1842; d. 17 Jan. 1885. He was educated at Bedford and Harrow, and entered the Royal Horse Guards in his 18th year as cornet. In 1861 he became lieutenant, in 1866 captain, major in 1879, lieutenant-colonel in 1880, and finally, in 1881, was appointed colonel, a rank which he held till his death. He was military
correspondent for the London Times with Don Carlos in Spain, and joined Gordon in the Sudan. In 1875 he made his famous ride to Khiva—a journey that presented great difficulties. During the ride, which he undertook partly because he had learned that the Russian government kept Europeans out of central Asia, he suffered severely from the intense cold and thirst at the time when he crossed the steppes. In 1876 he rode through Asiatic Turkey and Persia. Of these two journeys he published narratives, namely, 'Ride to Khiva' (1876, 11th ed., 1877, new ed., 1884), and 'On Horseback Through Asia Minor' (1877). In 1880 he was the unsuccessful candidate for the Birmingham seat in Parliament. While serving as lieutenant-colonel of the Royal Horse Guards in the Egyptian campaign, he was killed at the battle of Abu-Klea. Consult Mann, 'Life of Burnaby' (London 1882) and Wright, 'The Life of Colonel Fred Burnaby' (London 1908).

BURNAND, Sir Francis Cowley, English author: b. 29 Nov. 1837; d. 21 April 1917. He was educated at Eton and Trinity College, Cambridge, and at first studied with a view to entering the Church of England, but when in 1858 he became a Roman Catholic he devoted himself to legal studies, and was called to the bar in 1862. By that year he had already achieved some success as a writer, and in consequence he seldom practised. After about a year's connection with Fun he joined the staff of Punch in 1863, and was editor from 1880 to 1900. His book 'Happy Thoughts,' republished from Punch went through several editions, and was followed by 'More Happy Thoughts' (1871); 'Happy Thought Hall' (1872); 'Quito at Home' (1890). Other successful productions of his are the extravaganzas, 'New Light on Darkest Africa,' and 'Ride to Khiva' (making fun out of Stanley and Colonel Burnaby respectively), the parody on Ouida's novel, 'Strathmore,' which he published under the title of 'Strapmore,' and 'The Modern Pilgrim.' Numerous plays have come from his pen, mostly of the nature of burlesques and light comedies, such as the plays 'Black-eyed Susan' (a burlesque of Douglas Jerrold's drama), and 'The Colonel.' He issued a history of the dramatic art in America, and had founded at Cambridge University. He collaborated with Sir A. Sullivan in the light operas 'The Chieftain,' produced in 1894, and 'Contrabandista.' He was knighted in 1902, and published an interesting volume of 'Records and Reminiscences.'

BURNE-JONES, Sir Edward, English painter: b. Birmingham, 28 Aug. 1833; d. London, 17 June 1898. In 1852 he went to Exeter College, Oxford, where he was a fellow student of William Morris, and afterward became acquainted with A. C. Swinburne (who dedicated his 'Poems and Ballads' to him). His first intention was to enter the Church of England, and it was not till he had reached his 22nd year that he seriously devoted himself to art studies; but, going to London in 1855, he came under the influence of D. G. Rossetti and the Pre-Raphaelites; most of this time he was occupied with the most absorbing work, and soon attained considerable success in various departments of artistic work. In 1859 he set out on a journey through Italy in order to see the productions of the early Italian painters and sculptors, and on his return to England he gave in his stained-glass designs and his pictures splendid promise of his subsequent triumphs. In 1866 he began a series of illustrations to Morris's 'Earthly Paradise,' and he also executed some 70 designs for the 'Story of Cupid and Psyche,' besides pictures dealing with the same subject. He was elected a member of the Old Society of Painters in Water Colour in 1864, and associate of the Royal Academy, a position which he resigned in 1893 (having only exhibited one picture at the Academy, 'The Depths of the Sea'), and he was created a baronet in 1894. His most important pictures are 'Day Night'; 'Spring, Summer, Autumn, Winter' (1867-68); 'The Wine of Circe' (1869); 'Chant d'Amour' (1873); 'Be guiling of Merlin' (1877), an illustration of Tennyson's 'Merlin and Vivien'; 'Six Days of Creation' (1877); 'The Golden Sun' (1878); 'The Wheel of Fortune' (1883); 'Wood nymph'; 'King Cophetua' (1884); 'Ia Luia Venitra'; 'The Depths of the Sea' (1886); and 'The Briar Rose' series (1890). He holds a specially high place as a designer for stained-glass windows, and in many other departments of decorative art. His leading characteristics as a painter are his fertile imagination and fine poetic feeling, qualities which no painter of the century has possessed in anything like the same degree. The Old-World quality of his work is strongly aided by his wonderful power as a colorist. In common with his friends, Morris and Rossetti, he exercised a most potent influence on Victorian art. Consult Bell, 'Edward Burne-Jones' (1902).

BURNELL, Arthur Coke, English Orientalist: b. Gloucestershire 1840; d. 1882. He was educated at Eton, Sandford, and Merton. Numerous plays have come from his pen, mostly of the nature of burlesques and light comedies, such as the plays 'Black-eyed Susan' (a burlesque of Douglas Jerrold's drama), and 'The Colonel.' He issued a history of the dramatic art in America, and had founded at Cambridge University. He collaborated with Sir A. Sullivan in the light operas 'The Chieftain,' produced in 1894, and 'Contrabandista.' He was knighted in 1902, and published an interesting volume of 'Records and Reminiscences.'

BURNES, Sir Alexander, Scottish soldier and traveler: b. Montrose 1805; d. Cabul, 2 Nov. 1841. Having obtained a cadetship, he joined the Bombay native infantry in 1821.
Here his proficiency in Hindustani and Persian procured him two regimental appointments as interpreter, and contributed greatly to his future promotion. In 1830 he was appointed to proceed to Lahore, ostensibly for the purpose of delivering a present of horses from the King of England to Ranjit Singh, but really for the purpose of acquainting himself with the lower Indus, with the view of opening it up to commercial enterprise. On returning from this mission, which he successfully accomplished, he proposed the establishment of cotton factories, having obtained the sanction of the government, set out in January 1832, descended the Sudjel to Lahore, and proceeded thereafter to Peshawur, Cabul and Bokhara. He afterward traveled with a caravan across the desert of Merv, visited the Shah of Persia in his capital of Teheran, traveled southward to the Persian Gulf and reached Bombay after a year's absence. He published an account of this journey in 1834, under the title of 'Travels into Bokhara.' He was afterward sent to England as the bearer of his despatches, received the special thanks of the court of directors and was presented with the gold medal of the Royal and the silver medal of the French Geographical Society. He returned to India in 1835, and in the following year was sent on a commercial mission to Cabul. While there he discovered that Russia was intriguing to detach the Emir, Dost Mohammed, from the British alliance, and on finding the Emir disposed to be friendly to Great Britain, he urged Lord Auckland to come to terms with him. His advice was heeded, and was rejected, and a force was dispatched in 1839 to reinstate Shah Sujah on the throne. Burnes accompanied the force as second political officer, and received the honor of knighthood. On the breaking out of an insurrection in Cabul, he was mured in with his brother and several other Europeans.

BURNET, Gilbert, British prelate and historian; b. Edinburgh, 18 Sept., 1643; d. London, 15 March 1715. Having graduated at Marischal College, Aberdeen, he zealously devoted himself to the study of law and divinity. In 1661 he qualified as a probationer in the Church, and took his orders into Holy Orders in 1664. On his return he was made fellow of the Royal Society in London, and ordained to the living of Saltoun, Haddingtonshire, in 1665. In 1669 he was made a professor of divinity at Glasgow, where he published his 'Modest and Free Conference between a Conformist and a Nonconformist,' and wrote his 'Memoirs of the Dukes of Hamilton' (1676); and was offered a Scottish bishopric, which he refused. His 'Vindication of the Authority, Constitution, and Laws of the Church and State of Scotland,' in which he maintains the cause of episcopacy, was much approved of at court, and several bishoprics were successively offered him and refused. In 1673 he was made chaplain in ordinary to the King, and was in high credit both with Charles and the Reformation in England. He gave a first volume to the public in 1679, when the affair of the popish plot was in agitation. It procured for the author the unprecedented honor of thanks from both houses of Parliament. The second appeared in 1681; the third, which was supplementary, in 1714. The high character of Burnet as a divine caused him to be sent for by the witty and prudish Sir Richard Steele. When, exhausted by a course of libertinism, he was sinking into the grave. The result of his conferences with the dying nobleman he gave to the world in his celebrated 'Account of the Life and Death of Sir Richard Steele.' About this time he wrote a letter to the King censoring his public misgovernment and private vices. His connection with the opposition party was now very intimate, and he attended Lord William Russell to the scaffold, when executed for his share in the Rye House plot. He published during this period several works in favor of liberty and Protestantism, and wrote the lives of Bishop Bedell and Sir Matthew Hale (1682); and in 1683 made his translation of More's 'Utopia.' On the accession of James he made a tour in France, and in 1684 he published an account of his travels in a series of letters to Robert Boyle. When at Utrecht he was invited to The Hague by the Prince and Princess of Orange, and had a great share in the councils relative to Britain. James caused a prosecution for high treason to be commenced against him in Scotland, and demanded his person from the States, who refused to deliver him up. In the revolution he took an active part, accompanying the Prince of Orange to England as chaplain, and was rewarded for his services by the bishopric of Salisbury. On taking his seat in the House of Lords, he displayed his usual moderation in regard to the non-juring clergy and dissenters. As a prelate, Bishop Burnet distinguished himself by fervor, assiduity, tolerance and charity. In 1697 he published his 'Exposition of the Thirty-nine Articles.' The scheme for the augmentation of poor livings out of the first-fruits and tenths due to the Crown, known as Queen Anne's Bounty, originated with Burnet. He left behind him manuscript his well-known 'History of His Own Times' (1723-34), upon which the best judgment to-day is that nothing could be more admirable than his general candor, his accuracy as to facts, the fullness of his information and the justice of his judgments, both of those whom he vehemently opposed and of those whom he greatly admired. The value of the work, says a recent authority, 'as a candid narrative and an invaluable work of reference, has continually risen as investigations into original materials have proceeded.'

BURNET, Jacob, American jurist; b. New-ark, N. J., 22 Feb. 1770; d. Cincinnati, Ohio, 10 May 1853. He was graduated at Princeton 1791, was admitted to the bar in 1796, removed to Cincinnati, then a village with about 500 inhabitants, and was a member of the territorial government from 1799 till the establishment of a State government in 1803. In 1806 he was appointed judge of the Supreme Court of Ohio, and was elected United States senator in 1828, and was prominent in the legislation to remove the national debt of the Middle West for public lands; and for the completion of the Miami Canal. Burnet was elected a member of the French Academy of Sciences upon the recom-
BURNET, John, Scottish engraver, painter and art-critic: b. Musselburgh, near Edinburgh, 20 March 1874; d. 1868. He learned etching and engraving, and, with Sir William Allan and Sir David Wilkie, was a student in drawing and painting at the Trustees' Academy, Edinburgh. In 1806 he went to London, where he engraved Wilkie's 'Jew's Harps'; 'Blind Fiddler'; 'Two Days'; 'Rabbit on the Wall'; 'Chelsea Pensioners Reading the Gazette of the Battle of Waterloo' (his largest and most elaborate work); 'Letter of Introduction'; 'Death of Tippoo Sahib'; and 'Village School.' He also engraved plates from several recent paintings, among them Rembrandts in the National Gallery and from several of his own paintings. Among his written works, for which he still maintains a reputation, are 'Practical Treatise on Painting' (1839) and 'His Works' (1849). 'Life and Works of J. W. M. Turner,' with Cunningham (1852). He was a sound and careful painter, but possessed little originality. He was made a fellow of the Royal Society, and in 1860, receiving a civil pension, he retired. Captured Fye, 'Patronage of British Art' (in Art Journal 1850, 1868).

BURNET, John, Scottish classical scholar: b. Edinburgh, 9 Dec. 1863. He was educated at the Royal High School and University, Edinburgh, and Balliol College, Oxford, and has been professor of Greek in Saint Andrews University since 1892. His works include 'Early Greek Philosophy' (1892); 'Greek Rudiments' (1897); 'Platonic Opera' (5 vols., 1899-1907); 'Plato's Phaedo' (1911); 'Greek Philosophy, Part I' (1914).

BURNET, Thomas, English divine and philosopher: b. Croft, Yorkshire, about 1635; d. London 27 Sept. 1715. He was educated under Dr. Ralph Cudworth at Cambridge, and afterward traveled as tutor to several young noblemen. In 1681 he made himself known by his 'Telluris Theoria Sacra,' which he subsequently translated into English. In 1683 he became master of the Charterhouse and after the revolution of 1688 was appointed chaplain in ordinary and clerk of the closet to King William. In 1692 he published 'Archaeologia Philosophica, sive Doctrina Antiqua de Kerum Origenibus,' but the freedom of opinion displayed in this work led to the removal of the author from the clerkship of the royal closet. Two posthumous works of this author appeared in 1727—the treatise 'De Fide et Officiis Christianis'; and 'De Statu Mortuorum et Resurgentium.' All the works of Burnet exhibit him as an ingenious speculator, rather than as a patient and sober inquirer concerning the moral and natural phenomena of which he treats. His great work, the 'Theory of the Earth,' started the systems of cosmogony in which Christian philosophers have attempted to reconcile the Mosaic account of the creation, paradise and the deluge, with the traditions of the ancient and the principles of modern science. His speculations are recommended by sublimity of description and eloquence of style. In his 'Archaeologia Philosophica' he has combated the literal interpretation of the history of the fall of man, and to expose its improbability he has introduced an imaginary dialogue between Eve and the serpent, which, as coming from the pen of a divine, is singular enough. It is only to be found in the first edition of

BURNET, William, American colonial governor: b. The Hague, Holland, 1688; d. Boston, 7 Sept. 1729. He was a son of Gilbert Burnet (q.v.) and was appointed governor of New York and New Jersey in 1720. Two years later he founded at Oswego the earliest English trading post on the Great Lakes as the first step in his able Indian policy in New York which accomplished very much for the interests of the mother country and the colonies. In 1728 he was transferred to the governorship of Massachusetts and New Hampshire, and was involved in disputes with the assembly of the former colony over the question of salary. He was fond of astronomical studies and published observations in the 'Transactions' of the Royal Society.

BURNET, the popular name of two genera of plants of the family Rosaceae. (1) Garden Burnet ('Sanguisorba'), a perennial plant which grows to the height of about two feet; leaves smooth, alternate, imparipinnate, composed of serrate leaflets; flowers arranged in rounded heads of a purplish color, with the female flowers above and the male flowers below. It is a native of Europe but has become naturalized in sunny places among rocks and in open fields, from New York to Maryland. It is cultivated in kitchen gardens for its aromatic leaves, which are used to season salads. (2) Canadian Burnet ('S. canadensis') is also a perennial plant; calyx of four divisions; stamens four; its stem is straight, from three to six feet in height; leaflets are oval, small. This plant grows chiefly in bogs and wet places from Labrador to Georgia, and west to Michigan.

BURNET MOTH, the name for the genus of hawkmoths, called Anthrocera, or, by some, Zygana. Anthrocera filipendula is the six-spot burnet moth. The six spots, which are on the superior wings, are red, while the rest of the wings are green. Its caterpillar, which feeds on the plantain, trefoil, dandelion, etc., is yellow, spotted with black. A. loti is the five-spot burnet moth. It is less common. The caterpillar feeds on honeysuckle, bird's foot, trefoil, etc.

BURNETT, Frances Eliza Hodgson, Anglo-American novelist: b. Manchester, England, 24 Nov. 1849. In 1856 went to Tennessee with her widowed mother, and lived there until her marriage in 1873 to Dr. S. M. Burnett. She has since lived in Washington and Europe. Between the ages of 16 and 20 Mrs. Burnett wrote numerous stories for magazine publication—including 'Vagabondia'; 'Theo'; 'The Fortunes of Philippa Fairfax,' etc. This girlish work was collected later by Charles Scribner's Sons in an edition known as 'Mrs. Burnett's Earlier Stories.' Her first serious
literary success was 'That Lass o' Lowrie's' (1877), a novel founded on collier life in Lancashire. This appeared serially in Scribner's Magazine and in book form in 1877. This was followed rapidly by 'Haworths of the Dales' (1878); 'Louisa ana' (1880); 'A Fair Barbarian' (1881); 'Through One Administration' (1883); 'A Lady of Quality' (1886); 'His Grace of Osborne'; 'The De Willoughby Claim' (1899); 'Tennyson and Fox-Seton'; 'The One I Knew the Best of All'; 'The Shuttle'; 'T. T. T.' (1913), etc. Her books for children are 'Little Lord Fauntleroy' (1886); 'A Little Princess' (1905); 'Two Little Pilgrims' Progress'; 'The Secret Garden'; 'The Lost Girl', etc. Her dramatic work comprises plays founded upon 'Little Lord Fauntleroy'; 'A Little Princess'; 'Esmeralda' (1881); 'Phyllis'; 'A Lady of Quality'; 'The Dawn of a To-morrow', etc.

BURNETT, James (LORD MONBODDO), Scottish judge: b. at the family seat of Mon- boddo, in Kincardineshire, 1714; d. Edinburgh, 26 May 1799. After studying at Aberdeen and Edinburgh he went to the University of Groningen, whence he returned in 1737, and commenced practice as an advocate at the Scottish Bar. In 1761 he was sent to the bench on the decease of his relative, Lord Milton. He distinguished himself by his writings as a metaphysician, having published a work on the 'Origin and Progress of Language' (1773-92), and 'Ancient Metaphysics' (6 vols. 1779-99). Lord Monboddo was an enthusiastic admirer of ancient literature, and especially of the works of Plato and other Grecian philosophers. His works contain many interesting observations, but also exhibit some strange and paradoxical opinions. Thus he seriously advocates the existence of satyrs and mermaids, and has advanced some pre-Darwinian speculations on the affinity between the human race and the monkey tribe, which exposed him to a good deal of ridicule on the first publication of his theories. Both his official and his private character were of high standing, and he was, notwithstanding some eccentricities, a man of learning and ability.

BURNETT, Peter Hardeman, first state governor of California and author: b. Nashville, Tenn., 1807; d. San Francisco, 1885. After residence in Missouri and Oregon, where he practised as a lawyer and assisted in the organization of territorial government, serving two terms in the legislature, he went to California in 1848 with one of the first bands of gold diggers, and became prominent in organizing State government without waiting for Congressional sanction. He was elected governor on the adoption of the constitution, but resigned in 1851. In 1857-58 he was judge of the Supreme Court and from 1863 to 1880 president of the Pacific Bank of San Francisco. His published works, marked by lucid exposition and clear logical thinking, include 'The Path which led a Protestant lawyer to the Catholic Church' (1890); 'The American Theory of Government contrasted with reference to the Present Crisis' (1861); 'Recollections of an old Pioneer' (1878); 'Reasons why we should believe in God, Love God, and Obey God' (1884).

BURNETT PRIZES, The. Two prizes in theology founded by John Burnett, of Dens, Aberdeen, Scotland, for the two best treatises on 'The evidence that there is a Being all-powerful, wise and good, by whom everything exists; and particularly to obviate difficulties regarding the wisdom and goodness of the Deity; and this independent of written revelation, and of the revelation of the Lord Jesus; and from the whole to point out the inferences most necessary and useful to mankind.' Burnett, who was born in 1729 and died in 1784, was a merchant of Aberdeen, and was known for his benevolence to the poor. On his death he bequeathed his fortune to found the prizes above referred to, and to establish funds for the relief of the poor and of pauper lunatics. He ordered the prize fund to be accumulated for 40 years at a time, and the prizes (not less than $6,000 and $2,000) to be awarded as above. In 1883 the fund was applied to found a lectureship on natural theology in the University of Aberdeen. Awards of the prizes were, first prize to William Laurentce Brown in 1815; second prize to John Bird Summer in 1848; first prize to Robert A. Thomson in 1855; second prize to John Tulloch in 1860.

BURNLEY, Charles, English composer and writer on music: b. Shrewsbury, 12 April 1726; d. Chelsea, London, 12 April 1814. He studied music under the organist of Chester Cathedral there, and at Shrewsbury, under the direction of his half-brother, an organist. He succeeded in London between 1744 and 1747, under Dr. Arne. In 1751 he obtained the place of organist at Saint Margaret's Church, Lynn Regis, in Norfolk. Here he commenced his 'General History of Music.' In 1760 he returned to London, where his compositions and the musical skill of his eldest daughter, then eight years of age, excited admiration. In 1769 he took the degree of doctor of music at Oxford. In 1770 he visited France and Italy, and two years afterward the Netherlands and Germany, for the sake of his great work. He published accounts of both tours. After his second return he became a fellow of the Royal Society. In 1776 appeared the first volume of his 'General History of Music from the Earliest Ages to the Present Period' (4 vols.). The second was in 1782, and the third and fourth in 1789. He was the author of several other valuable works, among which are the 'Memoir of Handel,' and a 'Life of Metastasio.' He died in the office of organist at Chelsea Hospital, and in receipt of a pension of $1,100. He wrote most of the musical articles in Rees' Cyclopedia. His 2d daughter, Frances or Fanny (Madame D'Arblay, q.v.), well known as an authoress, published a memoir of her father.

BURNLEY, Charles, English classical scholar and critic, son of Charles Burnley (q.v.): b. Lynn, Norfolk, 9 Dec. 1757; d. 28 Dec. 1817. He received his education at the Charter-house School, at Caius College, Cambridge, and King's College, Aberdeen, where he took the degree of M.A. He carried on a private school, distinguished himself as a writer in the Monthly Review and the London Magazine, to which he contributed articles on classical literature; subsequently entered into holy orders, and obtained some preferment in the Church. His valuable collection of books, many of them enriched with manu-
burnish with one end and to erase blemishes with the other.

BURNJIRD, Persia, town of the province of Irak-Ajemi, in the Tahtj River Valley, about 190 miles north by west of Isphahan. It has manufactories of cottons, felt hats, caps, etc., and a trade in skins, most of which are exported to Russia. Roads connect the town with Isphahan and Hamadan. It boasts a castle and numerous mosques. Pop. 25,000.

BURNLEY, England, a parliamentary and county borough in Lancashire, about 29 miles north of Manchester by rail, situated on the small river Brun, near its confluence with the Calder. The town presents a modern appearance, and is, generally speaking, well built, mostly of stone. The town-hall is a large, handsome building, erected in 1887; there is also a commodious exchange, and a convenient market hall. Among the churches the chief place is due to Saint Peter's, an ancient building restored in 1867. A splendidly equipped technical school was opened in 1881. The public utilities are nearly all publicly owned. The manufactures and commerce of Burnley have rapidly increased in recent years. The staple manufacture is cotton goods, and there are large cotton-mills, worsted, and woollen manufactories, several extensive foundries and machine-shops, with collieries, quarries and other works in the vicinity. Burnley is situated on the Leeds and Liverpool Canal, has a good water supply and has fine railway stations. It seems to have been a Roman station, and various Roman remains have been dug up in and around it. Burnley returns one member to Parliament. Pop. 106,765.

BURNOOSE, a large kind of mantle in use among the Bedouin Arabs and the Berbers of northern Africa, commonly made of white or undyed wool, but sometimes also of red, blue, green or some other color, and having a hood which may be drawn over the head in case of rain. In Spain also a similar garment is worn which bears the similar name of albornoz, and the name has also been applied to different kinds of upper garments worn by women of other European countries.

BURNOUF, bûr-noof, Émile Louis, French Orientalist, cousin of Eugène Burnouf (q.v.); b. Valognes, Manche, France, 25 Aug. 1821; d. 1907. After a normal school training, he became professor of ancient literature in the faculty of Nancy, and in 1867 director of the French School in Athens. Among his works are *Essay on the Vedā* (1863) ; *Sanskrit-French Dictionary* (1863-65), the first of its kind in France; *History of Greek Literature* (2 vols., 1868); *Science of Religions*; *The Athenian Legend*; Essays on *Antiquity* (Paris 1879); *Method of Studying Sanskrit* (1859, 3d ed., Paris 1885); *The Mythology of the Japanese*, according to the *Koku-si-Ryakeki*, the first translation of the work on Japanese mythology (1875); *The City and the Acropolis of Athens* (Paris 1877); and *Contemporary Catholicism* (1879). He also edited the letters of his cousin, Eugène Burnouf.

BURNOUF, Eugène, French Orientalist: b. Paris, 12 Aug. 1801; d. there, 26 May 1852. He commenced his studies at the Collège de Louis-le-Grand, became a pupil in the École,
des Chartes in 1822, passed as a lawyer in 1824 and so soon after devoted himself to the study of Oriental languages. In 1826 he attracted the attention of men of learning throughout Europe by his translation in collaboration with his friend, Lassen, an "Essay on the Pali," or the sacred language of the Buddhists in Ceylon and the Eastern Peninsula, and in 1827 by furnishing an explanatory text to the series of lithographic plates prepared by Géringer and Charrière to illustrate the religion, manners, customs, etc., of the Hindu nations inhabiting the French possessions in India. This work was not completed till 1835. In 1832 he was admitted into the Academy of Inscriptions, and in the same year was appointed to the professorship of Sanskrit in the Collège de France, an office which he held till his death. His fame is chiefly due to his having, so to speak, restored to life an entire language, the Zend or old Persian language, with which the Vedas were composed. Anquetil-Duperron had obtained the text of the extant works of this sacred language of the Persians. It is the glory of Burnouf to have interpreted those works with the aid of the Sanskrit. To this part of his labors was attached the "Extrait d'un commentaire et d'une traduction nouvelle du Vendidad-Sadé" (1830); "Observations sur la grammaire de M. Bopp" (1833); "Commentaire sur le Yâṣa" (1833-35). Burnouf also distinguished himself by his labors on Buddhism. On this subject he published the text accompanied by a translation of the "Bhâgavata Purâna" (1840-47); "Introduction à l'histoire du Bouddhisme Indien" (1st vol., 1844), etc. A fortnight before his death the Academy of Inscriptions elected him secretary for life. Consult Lenormant, "Eugène Burnouf" (Paris 1852); Barthélémy-St.-Hilaire, "Notice sur les travaux de M. E. B." (in the 2d ed. of the "Introduction à l'histoire du Bouddhisme" (1876); "Choix de Lettres d'Eugène Burnouf" (1891).

BURNOUF, Jean Louis, French classical scholar: b. Ussel, Marche, 1775; d. Paris, 1844. He was appointed assistant professor at the Collège Charlemagne in 1807 and professor of Latin there in 1816. In 1840 he became university librarian. He exercised a profound influence on classical learning in France. He published a translation of "Tacitus" (6 vols., 1827-33, 1881) and a "Méthode pour étudier la langue grecque" (1814, 1893).

BURNS, Anthony, American fugitive slave: b. Virginia, about 1830; d. Saint Catherine's, Ontario, 27 July 1862. Escaping from slavery he worked in Boston during the winter of 1853-54; but on the 24th December the day after the repeal of the Missouri Compromise and the passing of the Kansas-Nebraska Bill had inflamed the North against the slave power — was arrested on warrant of Charles F. Suttle through his agent Brent. The next day he was taken before United States Commissioner Edward G. Loring for examination; but Wendell Phillips and Theodore Parker secured an adjournment for two days. Burns, meanwhile, was confined in the courthouse under a strong guard, and on the evening of the 26th a great mob of rioting动手 held at Panmure Hall. T. W. Higginson and others had planned to stampede the meeting into storming the courthouse and rescuing Burns, and at the appointed time battered in a door and attempted the rescue themselves, relying upon assistance in their undertaking. The size of the meeting, however, prevented the signals from working well and the leaders from emerging, and after a scuffle in which a deputy was fatally stabbed and several assailants wounded, the latter retired. The next day Loring, an ardent upholder of the Fugitive Slave Law, delivered Burns to his claimant on evidence entirely illegal and worthless even under that law. Escorted by a strong military guard, Burns was taken to a government cutter, through streets draped in mourning and crowds ready to stone the soldiers. A riot at the wharf was only prevented by the action of Rev. Daniel Foster upon his saying "Let us pray!" The crowd uncovered and stood quiet while Burns was taken on board. Indictments were drawn against his would-be rescuers, but quashed for want of evidence. Burns afterward gained his liberty, studied theology at Oberlin College and was eventually settled over a Baptist colored church in Saint Catherine's, Ontario, where he died. Consult Stevens, "Anthony Burns: a History" (1856); Adams, "Richard Henry Dana: a Biographie" (1891); Higginson, "Cheerful Yesterdays" (1898).

BURNS, John, English labor organizer and statesman: b. London, October 1838. He was of humble birth and became a factory employee at the age of 10. He was an omnivorous reader and imbued his socialistic views from a French fellow laborer. By working a year as engineer on the Niger River, he earned enough for a six months' tour of Europe. He constantly addressed audiences of workingmen, and was a persistent labor agitator. He was one of the leaders in the West End riot in London, February 1886, and was imprisoned the same year for maintaining the right of public meeting in Trafalgar square. He, in conjunction with Ben Tillett, organized the successful dock strike in London in 1889. He has been thrice elected to the London county council and has sat in the House of Commons as Labor member for Battersea since 1892. From 1905-14 he was president of the Board of Trade, and in the latter year he became president of the Board of Trade. On the outbreak of the Great European War in August 1914, on account of the war policy of the Asquith cabinet, he resigned his place in the government.

BURNS, Robert, Scottish poet: b. near Ayr, Scotland, 25 Jan. 1759; d. Dumfries, 21 July 1796. His father, William Burns of Burnswark, a native of Kincardineshire, had been a gardener, but at the time of the poet's birth was a nurseryman on a small piece of land on the banks of the Doon in Ayrshire. He was a man of strong intelligence and deep piety, but unsuccessful in his struggle with poverty. His mother was Agnes Brown, a woman of ability, and, though of meagre book education, well versed in folk-song and legend. Robert, the eldest of seven children, went to school for three years, 1765-68, under John Murdoch of Whitehall. At paren Hall. T. W. Higginson and others had planned to stampede the meeting into storming the courthouse and rescuing Burns, and at the
more important part of his education he received from his father and his own reading. In 1766 William Burns himself mortgaged and sold his farm of Mount Oliphant; and the future poet by the time he was 16 was doing a man's work, overstraining his immature physique in performing his share in the vain effort of the family to keep its head above water. The same year he entered in 1777 to Lochlea, about 10 miles distant, where in 1784 his father died. During the Lochlea period, Burns, ambitious to improve his position, went to the neighboring town of Irvine to learn flax-dressing. Nothing came of this move; but while resident there he formed that acquaintance with a dissipated sailor to which he himself ascribed the beginning of his licentious adventures. On his father's death, Robert and his brother Gilbert rented the farm of Mossgill, but this experiment was no more successful than those previously made. While here he contracted an intimacy with Jean Armour, which brought upon him the censure of the Kirk-session. Finally, the poet, dissatisfied with the success of his attempts to satisfy his proclivities by the attempts of his father-in-law to cancel his irregular marriage with Jean and to hand him over to the law, determined to emigrate. For 10 years he had been composing verses, some of which had brought him considerable local fame, and these he collected and published in order to raise money for the voyage; but the unexpected success of this venture (Kilmarnock 1778) roused his literary ambition, gave him fresh courage and led him to change his plans. Instead of sailing for the West Indies, he went to Edinburgh in November 1786, and during that winter was the literary lion of the season. Here he met such celebrities as Dugald Stewart, the philosopher; Blair, the rhetorician; Henry Mackenzie, the author of 'The Man of Feeling'; Lord Glencairn; the Duchess of Gordon, and Creech, the publisher. The last named undertook an enlarged edition of his poems (Edinburgh 1787), and while awaiting for the profits of this venture, Burns made several tours through the country, traces of which are to be found in a number of occasional poems. Creech finally paid him enough to enable him to give substantial help to his brother in Mossgill, and to rent and stock the farm of Dumfries. Having married in 1788 he brought Jean Armour, to whom he was now regularly married, his success and fame having reconciled her parents to the match; and for three years he tried farming. But failure still dogged him, and in 1791 he moved to Dumfries, where he lived on a position in the excise service which he had obtained while still at Ellisland through the influence of some of the powerful acquaintances he had made in Edinburgh. He had, however, lost heart; and after a few years of drudgery, varied with the drinking bouts to which he was constantly tempted both by habit and by the invitation of foolish admirers, he died at Dumfries in his 38th year.

Biographies of Burns have frequently been crossed with the desire to disentangle or to explain away the facts of his numerous amours. There is much controversy over the identity of the semi-mythical Mary Campbell, the "Highland Mary" of the songs; much curiosity over the precise degree of Platonism in his feeling for Mrs. McLeseo, the "Clarinda" of his letters, and the inspirer of a number of lyrics; much difficulty over the information of how long he was in love with his wife. Into these details we do not enter. It is clear enough that Burns was a man of exceptionally powerful passions, that the extreme and depressing hardships of his youth, and, indeed, of the greater part of his life, served to strengthen and to tend his tendencies to conviviality, drove him to excesses of self-indulgence; and that while he strove often and painfully after better things, his strivings were many times without avail. The sport, he calls himself, the miserable victim of rebellious pride, hypochondriac imagination, agonizing sensibility and bedlam passions. These phrases are true enough, though they do not imply the further explanation of his pitiful career that is found in the habits of his class and time, and the untoward nature of his environment.

Something of his education has already been indicated. His schooling left him with a good grammatical knowledge of English and a reading knowledge of Latin, Greek, and to a certain extent of his own century, Addison, Steele, and Pope; Ramsay, Fergusson, Thomson and Beattie; Fielding, Smollett, Sterne and Mackenzie; Shenstone, Gray, and Goldsmith; Hume, Robertson and Adam Smith, and a number of philosophical and theological works. This list is by no means complete, but it is sufficient to correct the impression that Burns's was an "untutored Muse." The literary influences apparent in the work of Burns are of two main classes: English and Scottish. So far as he fell under the former of these he was an inferior poet of the school of Pope, an ardent admirer and imitator of such a minor master as Shenstone. In this field his critical judgment was never more than commonplace, the country, traces of which are to be found in a number of occasional poems. Creech finally paid him enough to enable him to give substantial help to his brother in Mossgill, and to rent and stock the farm of Dumfries. Having married in 1788 he brought Jean Armour, to whom he was now regularly married, his success and fame having reconciled her parents to the match; and for three years he tried farming. But failure still dogged him, and in 1791 he moved to Dumfries, where he lived on a position in the excise service which he had obtained while still at Ellisland through the influence of some of the powerful acquaintances he had made in Edinburgh. in which he achieved his greatest triumphs. Their influence was both general and particular. They showed him by their own success what could be done in the native idiom; and they gave him models of which he was not slow to avail himself. Verses and poems, all but imitations of productions, usually inferior, by Ramsay and Ferguson, and to them and their poetical ancestors he was indebted not only for suggestions as to theme and method of treatment, but also for his most characteristic verse. There is a tenderness and loveliness of the poet's heart in his relation to animals; 'Hallowe'en' gives a vivid picture of rustic mirth and manners, and preserves a mass of folk-lore. Of the additional poems that appeared in the Edinburgh editions, the most notable was 'Tam o' Shanter.' Burn's love of nature and his fondness for the part of Burns to accept from his predecessors all that they had to give, and to seek to maintain loyalty a national tradition rather than to strive after mere novelty, has much to do with his success in carrying that tradition to its highest pitch, and in becoming, in a sense almost unique, the poet of his people.

The first kind of poetry which Burns thoroughly mastered was satire; and the most important of his successful efforts in this form, 'The Jolly Beggars,' from 'The Holy Fair,' 'The Holy Fair,' the 'Address to the Unco Guid,' 'The Holy Fair,' the 'Address to the Deal,' were all written within less than a year (1785–86). Whatever Burns's feelings may have been about what his predecessors and himself, what he loved in them, is, the deeper life and their influence was something much larger than mere personal grudge. Against the narrow, dogmatic, and tyrannical conduct of the so-called 'Auld Licht' party in the Scottish Church, there had sprung up the 'New Lights,' demanding some relaxation of Calvinistic bonds and preaching charity and tolerance. Though not a member of this or any ecclesiastical faction, Burns sympathized strongly with their protest; and the shafts of his satire were directed against both the doctrines of the orthodox party and their local leaders. For some time after the Reformation the Scottish people seem to have submitted willingly to the rigorous domination of the Presbyterians; but, after the struggle against Rome and the persecutions of the Covenanters, there began to appear a more critical attitude toward their spiritual leaders. The spokesmen for the Presbyterians, that spread throughout Europe in the latter part of the 18th century manifested itself in Scotland in a growing disposition to demand greater individual liberty in matters of conduct and belief. It was this disposition that Burns voiced in his satire, the local conditions determining the precise direction of his attack. The substantial justice of his cause, the sharpness of his wit, the vigor of his invective, and the imaginative fervor of his verse, all combined to bring the matter home to his countrymen; and he is here to be reckoned a great liberating force.

Several of the satires were published in the Kilmanock volume, and along with them a variety of other kinds of poetry. In the words of his preface, 'I sang the sentiments and manners he felt and saw in himself and his rustic companions around him.' Some of these are descriptive of sides of humble Scottish life with which he himself was in the closest contact. 'The Cotter's Saturday Night' describes with affectionate reverence the order of his father's house; 'Fuir Maikle,' 'The Auld Mare Maggie,' 'To a Mouse,' and others. phrase of the old song, to fix upon an idea or situation for the new poem; then, humming or whistling the melody about the fields or the farmyard, as imagination and emotion warmed within him, he worked out the new verses, coming into the house to write them down when the inspiration began to flag. Careful consideration of this process, for the reality of which we have his own authority as well as the evidence of the raw material and the finished product, will explain much of the peculiar quality and function of Burns as a song-writer. In George Thomson's collection of 'Scottish Airs' he had a share similar to that in Johnson's undertaking, his work for these two publications constituting the greater part of his poetical activity during the last eight or nine years of his life.

It was characteristic that, in spite of his financial stringency during these years, he refused to accept any recompense, preferring to regard this as a patriotic service. And a patriotic service it was of no small magnitude. By birth and temperament he was singularly fitted for just such a task, and his fitness is proved not only by the impossibility of separating, by a mere examination of the finished songs, the new from the old, but by the unique extent to which his productions were accepted by his countrymen and have passed into the life and feeling of his race. See TAM O' SHANTER; COTTER'S SATURDAY NIGHT; JOLLY BEGGARS, THE.

WILLIAM A. NEILSON,
Professor of English, Harvard University.

BURNS, William Chalmers, Scottish Protestant missionary; b. Dun, Forfarshire, 1815; d. 1868. He received his education at Aberdeen University and entered on the practice of law, which he soon abandoned to enter the missionary field in 1839. For about seven years he led great revivals throughout the British Isles, but set out for China in 1846. He was very successful, having adopted the native costume and manner of life and becoming a fluent speaker in the native tongue. Consult Burns, 'Memoir of William Chalmers Burns' (1870).

BURNS, William Wallace, American soldier; b. Coshocton, Ohio, 3 Sept. 1825; d. Beaufort, S. C., 19 April 1892. He was graduated at West Point in 1847. He served in the war with Mexico and also in the Union army during the Civil War, becoming major-general of volunteers. In 1865 he was brevetted brigadier-general and was for many years afterward in the Commissary Department at Washington, until 1889, when he retired, with the regular rank of colonel.

BURNSIDE, Ambrose Everett, American soldier: b. Liberty, Ind., 23 May 1824; d. Bristol, R. I., 13 Sept. 1881. He served an apprenticeship to a tailor, but received his commission to West Point, where he was graduated in 1847. After serving some years in garrison duty, he left the army as first lieutenant in 1852, and from 1853 to 1858 was engaged in the manufacture of firearms at Bristol, R. I., during this period, in 1856, inventing the Burnside breech-loading rifle. On the outbreak of the Civil War (q.v.) in 1861, he returned to the army as colonel of volunteers, serving from May to August of that year as colonel of the Rhode Island Volunteers, and as such taking part in the first battle of Bull Run (q.v.). On 6 August he was promoted brigadier-general of volunteers and from October 1861 to January 1862 supervised the organization of the "Coast Division" of the Army of the Potomac. From January to July 1862 he commanded the Department of North Carolina; in February captured Roanoke Island, occupied Newbern, N. C., and took Fort Macon, Beaufort. He was raised to the rank of major-general of volunteers on 18 March 1862 and placed in command of the troops that subsequently constituted the 9th Army Corps. In July 1862 and again after the second battle of Bull Run (q.v.) he was offered the command of the Army of Virginia which, after the battle of Bull Run, had been merged into the Army of the Potomac, but each time declined the offer and served with the 9th Army Corps under McClellan. In this capacity he participated in the Maryland campaign (q.v.) against Lee, rendering important services in the battles of South Mountain and Antietam (q.v.), in the latter action on 17 September commanding the left wing. On 10 November of that year he superseded General McClellan in command of the Army of the Potomac. On 13 December he crossed the Rappahannock and attacked General Lee near Fredericksburg, when he was repulsed with a loss of over 10,000 men, and was soon after transferred to the Department of Ohio. In November 1863 he successfully held Knoxville against a superior force, and in 1864 he led a corps, under General Grant, through the battles of the Wilderness and Cold Harbor. Resigning in April 1865, he was elected governor of Rhode Island (1866-68), and United States senator in 1875 and 1881. Consult Poore, 'Life and Public Services of Ambrose E. Burnside' (Providence 1882); Woodbury, 'Major General Burnside and the Ninth Army Corps' (Providence 1867).

BURNSIDE, Helen Marion, English artist and poet: b. Bromley Hall 1844. She published a book of poems in 1864, which made her widely known. From 1890 to 1899 she was designer to the Royal School of Art Needlework. She has published 'The Lost Letter,' 'Tales for Children,' 'The Penny' and many occasional contributions in prose and verse to leading magazines.

BURNSIDE, Ky., town in Somerset County on the South Fork River, and on the C. B. & C. R. and Cincinnati & Southern rail-
roads. The chief industries are lumber manufactures and roller mills. Taxable property amounts to $800,000. Pop. 1,500.

BURNT OFFERING, one of the sacrifices enjoined on the Hebrew Church and nation. It is called, in their language, olah, from the root alu, to ascend, because, being wholly consumed, all but the refuse ashes, was regarded as ascending in the smoke to God. In the New Testament it is called holokia, meaning a whole burnt offering, an offering wholly burnt. In the Vulgate it is called holocaustum, which has the same meaning. Stated burnt offerings were presented daily, every Sabbath, at the new moon, at three great festivals, on the day of atonement and at the feast of trumpets. Private ones might be presented at any time.

BURNT SIENNA, an ochreous earth known as sienna earth (terra di Siena) submitted to the action of fire, by which it is converted into a fine orange-brown pigment used in both oil and water-color painting.

BURNT STONES, a kind of carnelian often met with in ruins. The red color displayed by holding it up to the light is believed to be the result of fire and artificial methods toward the same end have been tried with more or less success.

BURNT UMBER, a pigment of reddish-brown color obtained by burning umber, a soft earthy mixture of the peroxides of iron and manganese, deriving its name from Umbria in Italy.

BURNT WOOD WORK. See PYROGRAPHY.

BURNTISLAND, buirnt-land, Scotland, a royal burgh and seaport of Fife, on the north shore of the estuary of the Forth, ¾ miles north by west of Edinburgh and five miles by steam ferry north of Granton. It is a favorite summer residence and bathing-place as well as a busy port. Its parish church dates from 1594, and close by is Rossend Castle, where Chastelard's indiscreet love affair with Mary Queen of Scots was followed by his execution. The harbor is capacious, of great depth and of easy access, and the docks are extensive and well equipped. Vegetable oil and oil-cake are made, and there are railway repairing works and a distillery. It unites with Kinhorn, Dysart and Kirkcaldy in sending a member to Parliament. Pop. 4,708.

BURFEE, Lawrence Johnston, Canadian author: b. Halifax, Nova Scotia, 5 March 1873. He entered the Canadian public service in 1890; in 1905 he was appointed librarian of the Carnegie Public Library, Ottawa. In 1912 he was appointed secretary of the Canadian section of the International Joint Commission. In addition to editorial work for the publications of the Canadian Archives and the Royal Society of Canada, contributions to various encyclopedias, and its publication, others, the following works: 'Bibliography of Canadian Fiction' (1904); 'The Search for the Western Sea' (1907), a notable contribution to the history of exploration; 'By Canadian Streams'; 'Songs of French Canada' (1909); 'Dictionary of Canadian History' (with A. G. Doughty); 'La Verendrye and the Western Sea' (1911); 'Canadian Humour' (1912); 'Among the Canadian Alps' (1914); 'Sandford Fleming, Empire Builder' (1915).

Burr, Aaron, American clergyman: b. Fairfield, Conn., 4 Jan. 1716; d. Princeton, N. J., 24 Sept. 1757. He was graduated at Yale and was settled as pastor of the Presbyterian Church of Newark, N. J. in 1748 he became president of the College of New Jersey, now Princeton University, succeeding the first president, Dickinson, who held office only a few months. He married a daughter of Jonathan Edwards, and was the father of Aaron Burr (q. v.), third Vice-President of the United States. He published a Latin grammar, known as the 'Newark Grammar,' and 'The Supreme Divinity of Our Lord Jesus Christ.'

Burr, Aaron, American statesman: b. Newark, N. J. (son of the preceding), 6 Feb. 1756; d. Fort Richmond, Staten Island, 14 Sept. 1836. Before he was three years old his parents died, leaving him a considerable estate. He entered the sophomore class of Princeton College in 1769, and was graduated in 1772. At the outbreak of the Revolution Burr enlisted as a private and joined the force before Boston. He volunteered for the expedition to Canada and took part in the attack upon Quebec. For this service he was raised to the rank of major. As aide-de-camp to General Putnam, Burr was engaged in the defense of New York, and shortly after (1777) was promoted lieutenant-colonel with the command of his regiment, the colonel being a civilian. He was at Valley Forge, and distinguished himself at the battle of Monmouth, where he commanded a brigade in Lord Stirling's division. During the winter of 1778 he was stationed in Westchester County, N. Y., but early in the following spring he resigned his commission, partly on account of ill health, and partly through disappointment at not being more rapidly promoted. Burr belonged to the Lee and Gates factions; he always affected to despise the military talents of General Washington; and it is not improbable that these circumstances interfered with his professional career. In 1782 he was admitted to the bar in Albany, and in July of the same year he married Mrs. Provoost, the widow of a British officer who had died in the West Indies. In 1783 he began to practise in New York, and soon obtained a lucrative business. In politics his success was rapid and brilliant. In 1784 he was elected to the State legislature; he was appointed attorney-general of New York in 1789 and United States senator in 1791. While in the Senate several influential members of Congress recommended him for the mission to France, but Washington, with marked emphasis, refused to appoint him. He left the Senate in 1797, and the following year was returned to the State legislature. Some aspersions upon his conduct while in that body, which were thrown out by John B. Church, led to a duel between Burr and that gentleman, in which, however, neither party was injured. Burr was very efficient in the presidential canvass of 1800. To his efforts may be attributed the success of the Republicans in New York, and the action of the State that resulted in the Union depended. On account of the prominence he thus obtained the friends of Jefferson brought him forward for the Vice-Presidency. An equal number of votes having been thrown
for Jefferson and Burr in the Electoral College, the election of a President devolved upon the House of Representatives. Most of the Federal members, taking advantage of the singular turn in affairs, supported Burr. The contest lasted several days. Upon the 36th ballot Jefferson was chosen President, and, in accordance with the provisions of the constitution at that time, Burr became Vice-President. His conduct in permitting himself to be used by his political opponents in order to defeat the candidate of his party, whom he himself had supported, dissolved his connection with the Republicans and destroyed his political influence. The Federalists nominated him for governor of New York in 1804. Some of the leading men of that party refused to support him, and he was defeated. The contest was bitter and led to a duel between Burr and Alexander Hamilton (q.v.), 11 July 1804, in which the latter was killed. Burr was compelled to give up his residence in New York after his removal from the Vice-Presidency in April 1805, he made a journey to the Southwest. His conduct gave rise to the suspicion that he was organizing an expedition to invade Mexico, with the purpose of establishing an empire there which should embrace some of the southwestern States of the Union. He was arrested in Mississippi and taken to Richmond, Va., for trial upon an indictment for treason. After a protracted investigation before Chief Justice Marshall the prosecution was abandoned and Burr was acquitted in September 1807. In 1808 he went to Europe, expecting to get means to carry out his Mexican design. He was disappointed; and after being abroad four years, part of the time in extreme poverty, he returned to America in 1812. He resumed his profession in New York, but never regained his former position at the bar. In 1833 he married Mme. Jumel, a wealthy widow, but they soon separated. Mr. Burr had but one child, the accomplished Theodosia Allston. (See BURR, Theodosia). In person he was below the medium height, but his manners and presence were very attractive. He was an adroit, persevering but not a great lawyer. He cannot be said to have been an orator, yet he was an effective and ready speaker. It has been said of Burr that he was a brilliant, and even a great, man, who was led astray by moral obliquity. In regard to the looseness of his principles, there can be no doubt; but there is a growing tendency to relieve his name of much of the odium that formerly attached to it. He survived nearly all his contemporaries. His body was laid beside his father's at Princeton. Consult Adams, 'History of the United States' (9 vols., New York 1889-91); Davis, 'Memoirs of Aaron Burr' (2 vols., New York 1856); Orth, S. R., 'Five American Politicians: A. Burr' (Cleveland 1906); Parton, 'Life of Aaron Burr' (New York 1858); Schouler, 'History of the United States of America under the Constitution' (6 vols., last ed., New York 1899); Tompkins, 'Burr Bibliography' (Brooklyn 1892); Todd, 'The True Aaron Burr' (ib. 1902); McCaleb, 'The Aaron Burr Conspiracy' (ib. 1903).

BURR, Edward. American soldier; b. Boonville, Mo., May 1859. He studied at Washington University 1874-78, and at the United States Military Academy 1878-82, and on graduation at the latter was assigned to the corps of engineers with the rank of second lieutenant. He was promoted first lieutenant in 1883 and captain in 1894; and as lieutenant-colonel of volunteers commanded the battalion of engineers in the campaign against Santiago de Cuba in June-July 1898. He was appointed colonel 2 March 1912. He is a member of the American Society of Civil Engineers.

BURR, Enoch Fitch, American mathematician and clergyman; b. Green's Farms, Fairfield County, Conn., 21 Oct. 1818; d. 1907. He was graduated at Yale in 1838 and became pastor of the Congregational Church in Lyme, Conn., in 1850. From 1866 till his death he was a lecturer at Amherst College. Among his works are 'A Treatise on the Application of the Calculus to the Theory of Neptune' (1848); 'A Song of the Sea' (1852); 'Aleph, the Chaldean' (1851); 'Pater Mundi' (1869); 'Ad Fidem' (1871); 'Ecce Terra' (1884); 'Cedestrial Empires' (1885); 'Universal Beliefs' (1887); 'Supreme Things in their Practical Relations' (1889); besides several historical stories.

BURR, George Lincoln, American historian; b. Oramel, N. Y., 30 Jan. 1857. He was educated at Cornell University, where he was graduated in 1881, and studied also at Leipzig, the Sorbonne and at Zurich. He became professor of ancient and medieval history in Cornell in 1888 and in 1898 was appointed librarian of the White Historical Library. In 1896-97 he served as historical expert of the Venezuelan Boundary Commission. He has made an especial study of the history of superstition. He has published 'The Literature of Witchcraft' (1890) and 'The Fate of Dietrich Fhade' (1891). He edited the 'Century Historical Series' and is a member of the editorial staff of the 'American Historical Review'.

BURR, Theodosia (Mrs. Joseph Allston), daughter of Aaron Burr, b. New York 1783; d. 1813. She was carefully educated and became very accomplished, showing particular linguistic talent. After the death of Mrs. Burr she presided over her father's household until her marriage in 1801 to Governor Allston of South Carolina with whom she corresponded with her father after her removal to the South in great interest and shows continued devotion to his interests. Her beauty, brilliant personality and relationship to the famous statesman drew public attention to her, especially during her father's trial, and had the effect of enlisting the public sympathy on his behalf. In 1812 she sailed from Charleston in the 'Patriot' for New York, but the vessel was never heard from and was believed to have been lost in the storm or sunk by pirates.

BURR, William Hubert. American educator; b. Watertown, Conn., 14 July 1851. He was graduated at Rensselaer Polytechnic Institute 1872; was employed by the Wrought Iron Bridge Company of New York, and later on the water supply and sewerage systems of Newark, N. J. He was assistant professor and later professor of rational and technical mechanics at Rensselaer Polytechnic Institute 1876-84; became assistant engineer of the Phoenix Bridge Company 1884, and subsequently its general manager; was professor of engineering in the Lawrence Scientific School of Harvard
University 1892-93; consulting engineer to the New York city department of public works 1893-95; of parks and of docks 1895-97; and later of highways. Since 1893 he has been professor of civil engineering at Columbia, and in 1904 became a member of the Isthmian Canal Commission. He is author of the "Stresses in Bridge and Roof Trusses" (1879); "Arched Ribs and Arched Truss Bridges" (1913); "Elementary Electricity of the Materials of Engineering" (1883); "The Theory of Masonry Arches," "Ancient and Modern Engineering and the Isthmian Canal" (1902), etc.

BURRAGE, Henry Sweetser, American clergyman: b. Fitchburg, Mass., 7 Jan. 1837. He was graduated from Brown University, 1861, and entering the 36th Massachusetts as a private, rose to the rank of captain and brevet-major of volunteers. After the war he resumed his studies, graduated at Newton Theological Institution, 1867, was at the University of Halle, Germany, 1868-69, and became a Baptist clergyman in 1869. He was pastor at Waterville, Me., 1869-73; editor of Zion's Advocate, 1873-1905; recording secretary of the American Baptist Union, 1876-1904; recorder Maine Conference, 1889-1912; chaplain National Soldiers' Home, 1905-12; trustee Colby College, 1881-1903; Newton Theological Institution, 1889-1906; fellow of Brown University since 1901. He has edited "Brown University in the Civil War" (1888); "Henry W. Longfellow's 75th Birthday" (1882); "History of the 30th Regiment of Massachusetts Volunteers" (1884); and has written "The Act of Baptism in the History of the Christian Church" (1879); "History of the Anabaptists in Switzerland" (1882); "Rosier's Relation of Waymouth's Voyage to the Coast of Maine in 1605" (1887); "Baptist Hymn Writers and their Hymns" (1888); "History of the Baptists in New England" (1894); "History of the Baptists in Maine" (1904); "Gettysburg and Lincoln" (1906); "Early English and French Voyages" (1906); "Maine at Louisburg in 1745" (1910); "The Beginnings of Colonial Maine" (1914).

Burrard Inlet, an inlet at the southwest corner of British Columbia, a little north of the mouth of the Fraser River. It is more than 40 miles long, and one of the finest harbors on the Pacific coast, and has Vancouver, the terminus of the Canadian Pacific Railway, on its southern shore.

Burrell, David James, American clergyman and author: b. Mount Pleasant, Pa., 1 Aug. 1844. He was graduated at Yale in 1867 and at Union Theological Seminary in 1870. He spent four years in mission work at Chicago and thereafter was successively pastor at Dubuque, Iowa, 1876-87, Westminster Church, Minneapolis, 1887-91, and the Marble Collegiate Church, New York. He has published "Religions of the World" (1891); "Gospel of Gladness" (1892); "The Early Church" (1897); "The Religion of the Future" (1894); "The Wonderful Teacher" (1902); "Teachings of Jesus" (1904); "The Life of the City" (1908); "The Cloister Book" (1909); "In David's Town" (1910); "At the Gate Beautiful" (1911); "The Home Sanctuary" (1911); "The Gateway of Life" (1912); "The Old-Time Religion" (1913); "The Sermon" (1913); "The Church in the Upper Room" (1913); "We Would See Jesus" (1914); "The Apostles' Creed" (1915); "Why I Believe the Bible" (1917). Burrell, Martin, Canadian legislator: b. England 1858. He was educated at Saint John's College, Hurstpierpoint, Sussex, and came to Ontario in 1886, where for 14 years he engaged in fruit growing near Niagara. He removed to British Columbia in 1900, and continued at fruit growing and began to take an interest in local politics. He became widely known as an authority on horticulture, and in 1907 the government of British Columbia appointed him fruit commissioner and sent him as lecturer to England. In 1908 he was elected as a Conservative to the House of Commons and re-elected in 1911. In the latter year he was appointed Minister of Agriculture in the Borden administration.

Burriona, Spain, town in the province of Castellón, eight miles south of the town of Castellón, on the river Seco, and about one mile from the Mediterranean. It is situated in a fertile region. Agriculture and fishing are the principal industries and it has a trade in oil, wine and fruit. Pop. 14,243.

Burrill, Thomas Jonathan, American naturalist: b. Pittsfield, Mass., 25 April 1839. He was graduated at the Illinois State Normal University in 1865, and in 1867, was botanist of Powell's first Rocky Mountain Expedition. Since 1868 he has been a member of the faculty of the University of Illinois and has held the following offices in the university: professor of botany and horticulture since 1868; dean of the College of Science, 1877-84; vice-president since 1879; acting president, 1889-90, 1891-94 and 1904; dean of the Graduate School since 1894. The degree of LL.D. was conferred upon him in 1893 by the Northwestern University. He is a member of several American and foreign scientific societies, and is well known from his writings under more than 100 titles, mostly upon the parasitic diseases of plants, bacteriology, microscopy, fruit growing, forestry, landscape gardening and modern education.

Burritt, Elihu ("The Learned Blacksmith"). American reformer: b. New Britain, Conn., 8 Dec. 1811; d. 7 March 1879. The son of a shoemaker, he was educated in the common schools of his native village, and at the age of 16 was apprenticed to a blacksmith. An early conceived project of reading the scriptures in their original language led him to philological studies in the intervals of labor, and by diligence and a remarkable facility he was soon able to understand works in several languages. He removed to Worcester to take advantage of the library of the Antiquarian Society there, and while still plying his trade became acquainted with the principal ancient and modern languages. In 1846 he went to England, where he formed the "League of Universal Brotherhood," whose object was to
employ all legitimate means for the abolition of war throughout the world. He was constantly engaged in writing and lecturing, and took a prominent part in all the European peace congresses. He returned to America in 1853. He was consul agent at Birmingham, 1865-68. The promotion of temperance, cheap ocean postage and the abolition of American slavery were leading objects of his continued efforts. His publications included 'Sparks from the Anvil' (1848); 'Thoughts and Things at Home and Abroad' (1854); 'Chips from Many Blocks,' etc.

**BURROUGH, BOROUGH, BURROWES, or BORROWS, Stephen, or Stefan, English navigator:** b. Devonshire, 23 Sept. 1525; d. 1584. In 1553 he took a very active part in the expedition dispatched from the Thames under Sir Hugh Willoughby to look for a northwest passage to Cathay and India. There were three ships in the expedition, one of which was under the command of Burrough, who got separated from the other craft during a storm. He continued the voyage alone, reaching Nova Zembla and the island of Wain-gats. In 1556 he made a second voyage into the Arctic region, in 1560 he took charge of another expedition to Russia. In 1563 he was appointed chief pilot and one of the four masters of queen's ships in the Medway, a position which he held for many years. Burrough, who reached 70° 30' N. on one of his Russian expeditions, was looked upon, in his day, as a noted explorer. He seems to have been a very active and intelligent sailor.

**BURROUGHS, George, American clergyman:** d. Salem, Mass., 19 Aug. 1892. He was graduated at Harvard College in 1870, was a preacher at Plymouth, Mass., in 1871, and at Salem in 1880. In consequence of some dispute with his people he returned to Portland in 1863, but, when that town was destroyed by the Indians in 1890, came back to Salem. Though a person of unblemished character, he became one of the victims of accusation by the confessing witches. It was testified that two of his wives had appeared to the witnesses, saying that he was the cause of their death, and threatening, if he denied it, to come in court in person. He was also accused of performing feats of extraordinary strength by diabolical assistance, such as carrying a barrel of molasses, holding out a gun by a finger placed in the muzzle, and of having tortured, afflicted, pined, consigned, wasted and to mention a Mary Wolcott. Although he asserted his innocence so as to draw tears from the spectators, and recited the Lord's Prayer, which it was supposed no witch could repeat without mistake, he was condemned and executed.

**BURROUGHS, John, American essayist and literary naturalist:** b. Roxbury, N. Y., 3 April 1837. In his youth he taught school for about 10 years; he began early to write for the magazines; in 1863 he became clerk in the Treasury Department at Washington, D. C., where he worked for 10 years, carrying on his literary activities simultaneously. Later he became a national bank examiner. In 1873 he built "Riverby," his home at West Park, on the Hudson, where he has since lived, devoting himself to fruit culture, nature study and literature. In 1862 Mr. Burroughs wrote the poem, 'Waiting,' by which he is perhaps more widely known than by any of his books. His first book, 'Walt Whitman, Poet and Poem,' was written in 1886, when he was being the first person of note in the United States to give public recognition of Whitman. His later book on the 'Good Gray Poet,' 'Whitman, a Study,' was published in 1896, and was the result of many years of comradeship with the poet. Mr. Burroughs has gathered most of the harvest for his nature books near at home, either at "Riverby," in his bark-covered study, or in the region of "Slabsides," his retreat back from the Hudson, near West Park, or in later years at "Woodchuck Lodge," on the farm in the Catskills where he was born. He has, however, wandered away from these haunts occasionally, as his books testify—to many parts of the United States, to Bermuda, the West Indies, the Canadas, twice to Europe, on the Alaskan expedition of 1899 with E. H. Harriman, in the Yellowstone in 1903 with President Roosevelt, through the Southwest and Yosemite with John Muir, in 1909, and also to Hawaii. The personal and social life of the region is given in his writings, and the charm of his easy familiar style, with his remarkable observation and interpretation of nature, has done much to popularize the study of nature in our day, while his work on literary criticism, his character studies and his philosophical essays are eagerly welcomed by lovers of good literature. His books, with the dates of their publication, are 'Walt Whitman, Poet and Person' (1867); 'Wake Robin' (1871); 'Winter Sunshine' (1875); 'Birds and Poets' (1877); 'Locusts and Wild Honey' (1879); 'Peace' (1881); 'Fresh Fields' (1884); 'Signs and Seasons' (1886); 'Indoor Studies' (1889); 'Riverby' (1894); 'Whitman, a Study' (1896); 'The Light of Day' (1900); 'Literary Values' (1902); 'Life of Audubon' (1902); 'Far and Near' (1904); 'Ways of Nature' (1905); 'Bird and Bough' (1906); 'Camping and Tramping with Roosevelt' (1907); 'Leaf and Tendril' (1908); 'Time and Chance.'

**BURROWING BEE, any of the species that burrow in the ground and form their nests there. Among the principal kinds are the _Adrena_ and _Halictus_. See Bee.

**BURROWING OWL, a small owl (Speotyto cuvieri) common on the open plains of both North and South America, where it makes its nest in burrows. It is mottled gray in color, has very long legs, scantily feathered and stands, much as a man does from the weight of that of owls generally. It is gregarious, and is especially prevalent on the North American plains in the "towns" of the prairie dogs, and in South America it lives with the vizcachas and cavies, and is thought to warn them by
its excited notes whenever an enemy approaches. Among the many unowl-like traits of this curious little exile from the woods is its cry, which has no resemblance to the ordinary hoot of an owl, but more nearly resembles the chattering of a cuckoo. This owl makes its home wherever it can in some abandoned burrow of a ground-squirrel or other animal, but, finding this, it digs a little cave-like hole of its own, which it furnishes with a bed of soft materials, whereon are laid about eight globular white eggs. The food of these owls consists almost entirely of insects and mice. Consult Coes, E. 'Birds of the Northwest' (Washington 1874); Sclater and Hudson, 'Argentine Ornithology' (London 1888).

BURROWS, William, American naval officer: b. near Philadelphia, Pa., 6 Oct. 1785; d. at sea, 5 Sept. 1813. He served in the war with Tripoli and commanded the sloop Enterprise in its successful action with the British brig Boxer off the coast of Maine. Both Burrows and the British commander were killed in the fight, and they were buried side by side at Portland. Congress struck a medal in honor of the victory and its hero.

BURSA, in anatomy, a sac containing a clear fluid between surfaces which move one upon the other. There are two varieties—mucous, or simple cavities between the skin and bony protuberances, as at the knee, and synovial, or sacs between the muscles or tendons and bony protuberances.

BURSAR, or BURSARY, an endowment in one of the Scotch universities, corresponding to an exhibition in an English university, and intended for the support of a student during his ordinary course and before he has taken a degree in the faculty in which he holds the bursary. Each of the four universities of Scotland has a greater or smaller number of bursaries. As yet the University of Aberdeen is better provided than any of the others with this class of endowments. Bursaries are in the gift sometimes of the Senatus Academicus of the university to which they belong, sometimes of the town council of the city in which the university is situated and sometimes of private individuals. With regard to the manner in which they are bestowed, some are obtained after competitive examination and others are given by the patrons for special reasons. As the former method of bestowing them is found to be the more beneficial in its results, it is gradually becoming the prevailing one, as at Aberdeen it has always been. Bursaries which are in the gift of the Senatus Academicus are all bestowed in this way. In a monastery, the bursar was the one who held and disbursed the income. In the sense of subtreasurer, the term is still used in English universities and in Harvard University and elsewhere. In England it is also applied to candidates for the elementary school-teaching profession receiving maintenance from the state.

BURSCHENSCHAFT, boor-shen-shaft (Ger.), an association formed in 1815 among students in German universities for the liberation and union of Germany.

BURSERACEE (named after the botanist, Joachim Burser), a family of dicotyledonous plants, of which there are about 13 genera and 300 species. The family belongs to the tropics and yields varieties of balsams and resins.

BURSITIS, inflammation of a bursa, most commonly caused by injury. The well-known housemaid's knee is a good example of bursitis. See JOINTS, DISEASES OF.

BURSLEM, England, market town and municipal borough in Staffordshire, within the parliamentary borough of Hanley, in "The Potteries." It is the oldest of the six towns forming the Potteries and is known as "The Mother of the Potteries." It is well built, chiefly of brick; has electric tramways, a fine town-hall, covered market, public baths, hospital and the Wedgwood Institute, comprising a free library, a museum and a school of art. It was founded in 1730. The building is an excellent exemplification of the structural application of ceramics. It has extensive manufactures of china and earthenware, and carries on coal mining. Pop. 41,556.

BURT, Mary Elizabeth, American educator: b. Lake Geneva, Wis. She studied at Oberlin College and entered the teaching profession. For three years she was a member of the Chicago board of education. Later she undertook editorial work and lecturing. She edited 'Little Nature Studies for Little People'; 'Seed Thoughts from Robert Browning,' etc.; has contributed frequently to periodical literature and is the author of 'Browning's Women' (1889); 'Literary Landmarks' (1889); 'The World's Literature' (1890); 'German Idyls (Siegfried)' (1892); 'Stories from Plato and Other Classic Writers' (1893), and collaborated in writing 'The Literary Primer' (1901); 'The Boy General' (1901); 'Poems Every Child Should Know' (1904); 'Poems for Every Child Should Know' (1907); 'Adventures of Pinocchio' (1908).

BURT, Thomas, English labor leader: b. Northumberland, 12 Nov. 1837. He began work in the coal mines at 10 years of age. He early became immersed in the labor movement; was secretary for the miners' union from 1855-1913; has represented Morpeth as a Liberal since 1874; was parliamentary secretary of the Board of Trade from 1892-95, and in 1906 was made a privy councillor.

BURT, William, American Methodist Episcopal clergyman: b. Cornwall, England, 23 Oct. 1852. He was graduated at Wesleyan University in 1879 and at Drew Theological Seminary in 1881. He spent five years in churches at Brooklyn, N. Y., and in 1886 was appointed presiding elder of the district of Milan in the Italian conference. He was in Rome from 1890 to 1904, and there founded schools and a publishing house. In 1904 he was made a bishop. His work has been looked upon with disfavor by the Papal Curia because of the proselyting methods adopted. He has published 'Europe and Methodism' (1909).

BURTON, Edwin Hubert, English clergyman and writer: b. London, 12 Oct. 1870. He was educated at Ware, Ushaw and Oscott; studied law 1888-93; solicitor, High Court of Justice, 1893. He was ordained a Catholic priest in 1898; was curate at Saint Mary and Michael's, London, 1898, when he was appointed
BURTON, Ernest De Witt, American Biblical scholar: b. Granville, Ohio, 4 Feb. 1856. He was graduated at Denison University in 1876 and at Rochester Theological Seminary in 1882, and went to Europe for further study in 1887 and 1888. From 1887 to 1889 he taught in the Rochester Theological Seminary and from 1883–92 in the Newton Theological Institution, first as associate professor and later as professor of New Testament interpretation. In 1892 he was appointed head professor of New Testament literature at the University of Chicago. Among his works are 'Syntax of the Moods and Tenses in New Testament Greek'; 'Harmony of the Gospels for Historical Study,' and 'Handbook of the Life of Christ' (1901); 'Life and Times with A. A. Chavannes'; 'Records and Letters of the Apostolic Age'; 'Handbook of the Life of Paul'; 'Constructive Studies in the Life of Christ' in collaboration with Shailer Mathews (1901); 'Principles and Ideals of the Sunday-School' (1903); 'Biblical Ideas of Atonement' (1909); 'Studies in Mark' (1904), and 'Some Principles of Literary Criticism and their Application to the Synoptic Problem' (1904). In 1892 he became associate editor of the Biblical World and in 1896 was made Assistant Journal of Theology.

BURTON, John Hill, Scottish historian: b. Aberdeen, 22 Aug. 1809; d. 10 Aug. 1881. He was educated at the grammar school and Marischal College in that city. He studied law and was admitted to the bar in 1831. He never succeeded in gaining much practice and soon turned his attention to literature, contributing to the Westminster, the Edinburgh and North British Reviews; and acted for a short period as editor of the Scotsman, and committed that journal to a free-trade policy. With Sir John Bowring he edited Bentham's works, as well as an illustrious 'Benthamiana,' with the aim of making more widely known the opinions of the great apostle of utilitarianism and radicalism. His first original work of importance was the 'Life and Correspondence of David Hume' (1846); in 1849 he published the 'Political and Social Economy'; in 1852 he compiled 'Narratives from Criminal Trials in Scotland.' He commenced in 1853 the publication of his chief work, the 'History of Scotland,' in two volumes covering the period from the revolution of 1688 to the extinction of the last Jacobite rebellion in 1746. This was afterward completed by seven volumes commencing with Agincourt's invasion and ending with the Revolution of 1688. A second edition of the complete history was published in eight volumes in 1873. A series of literary and historical sketches contributed to Blackwood's Magazine formed the basis of two smaller works, 'The Scots Abroad' and 'The Book Hunter.' His last important historical work was the 'History of the Reign of Queen Anne' (1880). In 1854 Mr. Burton was appointed secretary to the Scottish Prison Board, and he continued his connection with this department as a commissioner of prisons until his death. The success of his 'History of Scotland' brought him the appointment of historiographer royal for Scotland. Consult article in Blackwood's Magazine for September 1881, and the memoir by his widow prefixed to 'The Book Hunter.'

BURTON, Lewis William, American clergyman: b. Cleveland, Ohio, 9 Nov. 1852. He was first honor graduate in 1873 of Kenyon College, with A.B., later A.M. and D.D. from Case Western Reserve University 1886 of the South. He was ordained deacon 1877 and priest in 1878, in the Protestant Episcopal Church; was successively in charge of parishes in Cleveland, Richmond, Va., and Louisville. He was consecrated bishop of the diocese of Lexington (eastern half of Kentucky) 1896. He has published sermons, Episcopal charges and addresses and was author of 'Annals of Henrico Parish' in J. S. Moore's 'Virginiana' (1904). He traveled abroad as a member of the Lambeth conferences of the bishops of the Anglican Communion in 1897 and 1908. He is a member of the Phi Beta Kappa Society and of the Society of Colonial Wary; a trustee of Kenyon College and of the University of the South. He is Episcopal head of Margaret College, Versailles, Ky., and of Saint John's Collegiate Institute and Industrial School, Corbin, Ky.

BURTON, Marion Le Roy, American clergyman and educator: b. Brooklyn, Iowa, 30 Aug. 1874. He was educated at Carleton College and at Yale, receiving a B.D. from the latter institution in 1907. He became assistant professor at Yale for one year and in 1908 was in charge of the church of the Pilgrims, Brooklyn. After a year's travel in Europe, he was inaugurated president of Smith College, Northampton, Mass., in 1910. He has written 'The Problem of Evil' (1909); 'The Secret of Achievement' (1913); 'Our Intellectual Attitude in an Age of Criticism' (1913); 'Life Which is Life Indeed' (1914); 'First Things' (1915); also various addresses and reports.

BURTON, Richard, American poet and journalist: b. Hartford, Conn., 14 March 1859. He was graduated from Trinity College, Hartford, and took a degree at Johns Hopkins University in 1881. He became managing editor for the Churchman 1889–90, literary editor of the Hartford Courant 1890–97 and professor of English literature in the University of Minnesota 1893–1902; now in charge of the English department of the University of Minnesota. He has published 'Ode in Time' (1869), 'Midsummer Day' (1897), 'Literary Likings' (1898),
BURTON, Sir Richard Francis, English traveler, linguist and author: b. Barham House, Hertfordshire, 19 March 1821; d. Trieste, Austria, 20 Oct. 1890. He was educated at Oxford with the intention of entering the Church, but in deference to his own urgent request his father obtained a commission for him in the East India Company's service. He joined the army in 1842, served for some years in Sind under Sir C. Napier, explored the Neilliherry Hills, published an important work on Sind and acquired a complete knowledge of the Persian, Afghan, Hindustanee and Arabic languages. Returning to England in 1851, he soon after set out to explore Arabia disguised as an Afghan pilgrim. He published on his return a 'Personal Narrative of a Pilgrimage to El-Medinah and Mecca' (1855) as the result of this daring adventure. His next expedition was into the Somali country in East Africa, from whence he proceeded to the Crimea, where he was chief of the staff of General Beaton, and organized the irregular cavalry. After peace was proclaimed, Burton set out in 1856 along with Captain Speke to explore the lake region of central Africa and discovered Lake Tanganyika. Subsequently he made a journey in the Western States of North America and published an account of the Mormon settlement at Utah in his 'City of the Saints.' In 1861 he married, and he received the same year an appointment as consul at Fernando Po. While fulfilling his duties there he explored the Bight of Biafra, visited the Kamerun Mountains and conducted a dangerous mission to the King of Dahomey. Afterward he was transferred to the consulate of Santos in Brazil, and there he explored his own province, visited the Argentine Republic, crossed the continent to Chile and Peru, returned home after exploring the Pacific coast and published his 'Explorations of the Highlands of the Brazil.' He was now (1871) made consul of Damascus but was soon recalled, and in the following year, after a journey to Iceland, an account of which he wrote, he was appointed consul at Trieste. While occupying this position he led two expeditions into Midian (1876–78), and in company with Commander Cameron he conducted an expedition into the gold-producing country behind the Gold Coast. He remained English consul at Trieste until his death. In his latter years his services to geographical science were acknowledged by the gold medals of the French and English Geographical societies, while in 1886 his services to his country were tardily recognized by the honor of K.C.M.G. Besides the books of travel already mentioned, he was the author of many others, such as 'Sind, or the Unhappy Valley' (1851); 'Goa and the Blue Mountains' (1851); 'Falconry in the Valley of the Indus' (1852); 'First Footsteps in East Africa' (1856); 'The Lake Regions of Equatorial Africa' (1860); 'Abeokuta, or an Exploration of the Kamerun Mountains' (1863); 'Narrative of a Mission to the King of Dahomey' (1864); 'The Nile Basin' (1884); 'Vikram and the Vampires' (1886); 'Zanzibar' (1872); 'Gorilla Land' (1875); 'Ultima Thule, or a Summer in Iceland' (1875); 'Etruscan Bologna' (1876); 'Sind Revisited' (1877), and 'The Gold Mines of Minid.' (1878). In 1885–88 he published a remarkable literal translation of the 'Arabian Nights,' entitled 'Ten Thousand Nights and a Night,' on which his reputation is firmly established. His manuscript translation, with notes, from the Arabic of 'The Scented Garden,' of great value to scholars, was burned by his widow, who deemed it an immoral work. Consult 'Lives' by Hitchman (1887), Lady Burton (1893), Stistized (1897), Wright (2 vols., 1906).

BURTON, Robert, English clergyman and author: b. Lindley, Leicestershire, 1577; d. 1640. He was educated at Oxford, took orders and became rector of Seeky, Leicestershire. His learning, which was varied and extensive, is copiously displayed in the 'Anatomy of Melancholy, by Democritus Junior,' first published in 1621 and repeatedly reprinted. He was a man of integrity and benevolence but subject to strange fits of sadness and melancholy which rendered his conduct flighty and inconsistent. He is reputed to have undertaken the composition of his 'Anatomy of Melancholy' with a view to the dissipation of his morbid feelings. Among those who have been most deeply indebted to Burton is Sterne, as may be seen in his 'Tristram Shandy.' See Anatomy of Melancholy.

BURTON, Theodore Elijah, American statesman: b. Jefferson, Ohio, 20 Dec. 1851. He received his education at Ohio College and at Oberlin; entered the practice of law, which he later abandoned for the political field. In 1889–91 he was in Congress and again in 1895–1909. He was re-elected in 1909–11 but resigned to become senator. While in the House he rendered important services as chairman of the Committee on Harbors and Ports, and at one time served as delegate to the Republican conventions of 1904 and 1908, nominating William H. Taft to the Presidency at the latter. In 1913 he became chairman of the senatorial Committee on Canadian Relations and has also been president of the American Peace Society. His published works are 'Financial Crises and Periods of Commercial and Industrial Depression' (1902); 'Corporations and the State' (1911); 'Life of John Sherman' (1906).

BURTON, a special form of tackle, known either as top burton or sail burton. The former are used aboard ship to support the yards when these are rigged for hoisting heavy loads; the latter are used to hoist sails up to the yard where they are to be bent. They consist of a guide-block, fastened to the under purchase-block and traveling on the hauling line. They help to keep the tackle straight and prevent the sail from yawing as it is hoisted aloft. See Tackle.

BURTON-UPON-TRENT, England, a municipal and county borough in Staffordshire, 11 miles southwest of Derby, on the north bank
of the Trent, in a low, level situation. It is substantially built. Malting and iron-founding are carried on to a considerable extent, but it is chiefly celebrated for its excellent ale, of which vast quantities are made for both home consumption and exportation. For nearly three centuries Burton ale has been known and celebrated, but the latter-day development of the trade dates from the opening of the Midland Railway in 1849. There are about 30 breweries at work, giving employment in the various departments of the trade to about 5,000 men. The largest brewing establishments are those of Messrs. Bass & Co. and Messrs. Allsopp, the former of which covers considerably more than 500 acres of ground, brews 1,400,000 barrels of ale and stout annually and employs 3,000 men. Contrary to common usage, the brewers employ hard water obtained from wells instead of soft water. There are in all about 50 places of worship in the town, which also possesses a grammar school, girls’ high school, almshouses, a dispensary and infirmary, a public library and reading-rooms, school of science and art, handsome public baths, etc. A bridge of 34 arches, built in pre-Norman times, was replaced in 1894. Pop. 40,266.

BURTSCHIEID, bërt’sheid, Germany, southern suburb of Aix-la-Chapelle, and until 1897 an independent municipality of the Rhine province. It is noted for its thermal springs and has manufactures of iron, steel, needles and woolen goods. The woolen industry is the largest of all.

BURTSELL, Richard Laor, American clergyman: b. New York, 14 April 1840; d. Kingston, N. Y., 4 Feb. 1912. He studied in Rome and was ordained to the priesthood in 1862. After returning to the United States and having charge of parishes in New York he was appointed “defender of the marriage tie,” being the first to fill this office, which in 1884 was instituted in the Catholic Church in the United States. Having become connected with the movement headed by Rev. Dr. McGlynn, he was retired from his parish to one of less prominence in 1890. In 1904 he was elevated to the dignity of domestic prelate by Pope Pius X, and in 1905 was made rector of Saint Mary’s Church, Kingston, N. Y.

BURU, one of the Dutch East India islands, in the Indian Archipelago, west of and belongs to the residency of Amboyna. It is oval in shape, 92 miles long and 70 broad, and an area of 3,400 square miles. It has several bays, of which Cajeli is the largest, and contains a safe harbor sheltered from the monsoons. Viewed from this bay the island has a very fine appearance. In the foreground the minaret native houses are seen through the openings of the rich tropical vegetation; while lofty mountains of valuable cinnamoms and balsams rise in the view. The island is watered by 125 streams, large and small. On the northwest side there are vast swamps swarming with crocodiles. The island contains some high mountains—Mount Tumahu having an altitude of 8,330 feet. Buru produces a variety of valuable cinnamons, balsams, resins and odoriferous flowers. The chief article of export is cajeput oil, of which about $50,000 worth is exported yearly; most being sent to Java. The tree from which it is obtained (Melaleuca cajuput) grows also upon the islands of Amboyna, Ceram, Celebes and Sumatra; but the best oil is procured in Buru. The population (about 15,000) consists of Chinese in the interior, and Malays on the coast.

BURWASH, Nathaniel, Canadian educator: b. Argenteuil, near Saint Andrews, Quebec, 25 July 1839, of a loyalist family, who left Vermont during the American Revolution. He was educated at Victoria College, Cobourg, and Yale University, and entered the Methodist ministry in 1860. He was professor in Victoria College, 1867—73; dean of faculty of theology in 1873, and has been president and chancellor of Victoria University, Toronto, from 1887. He was secretary of education for the Methodist Church in Canada, 1874—86, and devoted much time toward bringing about university federation in the province of Ontario. He has published ‘Wesley’s Doctrinal Standards’ (1881); ‘Handbook on the Epistle to the Romans’ (1887); ‘Inductive Studies in Theology’ (1896); ‘Manual of Christian Theology’ (1900); ‘Edgerton Ryerson’ (1902).

BURY, Sir George, Canadian railway official: b. Montreal, 6 March 1866. He was educated at Montreal College, entered the Canadian Pacific Railway service in 1883 as clerk in the purchasing department, rose to be the general superintendent of the Central Division, Winnipeg, and in 1911 was appointed vice-president of the company and manager of their western lines. He was knighted in 1917.

BURY, John B., Irish scholar: b. 16 Oct. 1861. He was graduated from Trinity College, Dublin, in 1883 became professor of modern history in Dublin University, professor of Greek there in 1888, and Regius professor of modern history at Cambridge University since 1902. He has written ‘History of Greece to Death of Alexander the Great’ (1902); and has edited Pindar’s ‘Isthmian Odes’; and ‘Ne- mean Odes’; Freeman’s ‘History of Federal Government in Greece and Italy’; and Gibbon’s ‘Decline and Fall’; ‘Life of Saint Patrick’ (1905); ‘The Ancient Greek Historians’ (Harvard Lectures 1908); ‘Constitution of the Later Roman Empire’ (1909); ‘History of the Eastern Roman Empire’ (1912); ‘History of Freedom of Thought’ (1913); and Freeman’s ‘Historical Geography of Europe’ (1913).

BURY, Richard de. See AUNGERVILLE, RICHARD, PHILOBOSIBON.

BURY, England, a municipal and parliamentary borough, in Lancashire, 10 miles north-northwest of Manchester. It is well situated on rising ground between the Irwell and the Roche, and, being much improved in recent times, now presents the appearance of a clean and well-built town. It has a handsome town hall and Athenæum, a technical school and art gallery, Trevelyan Club, and Philips Hall, etc. Among the churches, Saint Mary’s (the parish church) and Saint Thomas’ are perhaps the finest, being highly ornate Gothic buildings with tower and spire. Bury was at one time the seat of a woollen industry protected by the Flemings in the 14th century. The staple manufacture is that of cotton, and it was here that John Kay invented the fly-shuttle. There are also large woollen factories, bleaching and printing works, dyeworks, foundries, etc. The
borough owns and operates the water supply, gas and electric undertakings. Sir Robert Peel was born at Chamber Hall in the vicinity in 1788; and a bronze statue of him adorns the town. Bury returns one member to Parliament. Pop. 59,040.

BURY SAINT EDMUNDS, England, parliamentary and municipal borough in West Suffolk, situated on the Lark, 26 miles north-west of Ipswich. It contains two fine churches, the Nunnery and Saint Mary. Among other buildings a shire-hall, a guild-hall, a corn exchange, athenaeum with library, etc. Agricultural implements are manufactured, and there is a large trade in agricultural produce. Of many benevolent institutions the principal is a free grammar school founded by Edward VI. Bury Saint Edmunds sends one member to Parliament. It is an ancient place, and derived its name from Saint Edmund, a king of the East Angles, who was buried here. The barons in John's reign met here and swore to obtain the ratification of Magna Charta. Bury Saint Edmunds contains the remains of an abbey, once the most wealthy and magnificent in Great Britain, of which all that remains is the Nunnery tower or Church Gate, one of the best specimens of early Norman architecture in England, and the western gate, decorated in style. Pop. 16,785.

BURYING-BEETLES, coleopterous insects of the family Silphidae. The carrion or sexton beetles are useful in burying decaying bodies of birds, mice, etc., in which they lay their eggs. The larvae are crustacean, flattened, with the sides of the body often serrated, black and of a fetid odor. They undergo their transformations in an oval earthen cocoon. In Necrophorus the antennae have 10 apparent joints, and the rounded club is four-jointed. The genus Silpha, of which S. lapponica is a common species, differs in the third joint of the antenna being no longer than the second but shorter than the first. In Necrophilus the third joint is as long as the first. S. surinamensis has a yellow thorax with a central irregular black spot. Catops and its allies live in fungi, carrion and ants' nests, and are small, black, oval insects. There are between 800 and 900 species of the family, many of which are small and live in caves (see CAVEDWELLING ANIMALS) or in nests of ants.

BURYING-PLACES, localities of seclusion of the dead. The custom of burying the dead in public places prevailed among the most ancient nations, including the Romans, who afterward, in the flourishing periods of the republic, burned their dead and kept the ashes in tombs, collected in urns. The ancient Germans buried their dead in graves consecrated by their priests. With the introduction of Christianity and its burial customs among the Romans, those who were cremated were reserved for the purpose of general burial; and it was regarded as ignominious not to be buried in consecrated earth. The deprivation of the rites of burial was therefore part of the punishment of excommunication. The Romans provided their grave-stones, upon which were inscribed the name of the deceased, and the wish, Sit illi terra levix (*May the earth rest lightly upon him*). This custom was preserved by the Greeks, the Egyptians, and Romans erected over the graves of men of rank, or persons otherwise remarkable, pyramids, mausoleums or temples. After the introduction of Christianity little churches, called chapel, were erected over the graves. Early Christian martyrs were often buried in caverns, which by degrees were enlarged to spacious subterranean vaults. Subsequently others considered themselves happy if their bones were allowed to repose near the ashes of a martyr. As early as the 5th century the Christians built churches over the sepulchres of the holy martyrs; and in the belief that a place was sanctified by their ashes they anxiously sought out, on the erection of new churches in cities, or the transformation of heathen temples into Christian churches, the remains (relics) of the martyrs, and buried them under the altar of the new church to communicate to it a character of greater sanctity. The Emperor Constantine, who died in 337, is supposed to have been the first person who ordered his tomb to be erected in a church. This was done in the Church of the Apostles at Constantinople, of which he was the founder, and therefore probably considered himself as peculiarly entitled to this privilege, and by the style of his sepulchre soon imitated by the bishops, and later all those who had enriched the Church were distinguished by this honor. The Emperors Theodosius and Justinian, indeed, forbade the erection of sepulchres in churches, but in vain. The Philosopher again permitted them to everybody. At present interment in churches is almost everywhere suppressed, or at least permitted only under certain restrictions. Even in Naples and Rome the general practice of erecting sepulchres in churches was forbidden in 1809, and the foundation of burial places without the city was provided for. The custom introduced by the communities of Moravian Brothers, who form their burial places into gardens, is now becoming general; and cemeteries, instead of exhibiting merely dull ranges of tombstones, are adorned with flower plots and ornamental shrubbery. The celebrated burying-place of Père la Chaise, near Paris, is one of the most beautiful and interesting spots in the world. See also BURIAL; CREMATION; CATOPHRAGY.

BUSACO, boo-sä'kô, a hamlet in the province of Beira, on the north side of the river Mondego. It is memorable for the battle, 27 Sept. 1810, between Wellington and Masséna. Wellington, with about 40,000 men on a retreat before Masséna, with a force of 65,000, availed himself of the favorable position of the sierra or ridge here for checking the pursuit.

BUSBEQ or BUSBEQUIUS, Ogier Ghiselin de, Flemish diplomat and author: b. Comines 1522; d. 1592. After having studied in the most celebrated universities of Flanders, France and Italy, he entered the service of Ferdinand, King of the Romans, who in 1555 sent him as Ambassador to Constantinople. In 1562 he returned home, after spending several years as tutor and guardian to the sons of Maximilian II, was sent to accompany the Archduchess Elizabeth (who was to be married to Charles IX) on her journey to France. Busbecq lived there as steward to Elizabeth, and when she left France, after the death of her husband, he remained as Ambassador of Rudolph II. Two important works of his survive, 'Legationes Turcicae Epistolae Quatuor,'
in which the policy, the power and the weakness of the Porte are so profoundly and clearly explained that even at present information may be drawn from them; and 'Epistole ad Rustolphum II.,' a very important work for the history of those times. His style is pure, elegant and simple. During his stay in Turkey he collected Greek inscriptions and manuscripts. In 1823 Forster and Daniell, 'The Life and Letters of Ogter Ghiselin de Busbecq' (London 1881), which contains his most important writings: De Thou, 'Histoire de mon temps' (Paris 1604); St.-Genois, 'Les voyageurs belges' (Brussels 1847); Dupuis, 'Etude sur l'ambassade d'Augier de Busbecques en Turquie' (in Memoriales de la Societé des Sciences de Lille).

BUSBY, Richard, English schoolmaster: b. Lutton or Sutton, Lincolnshire, 22 Sept. 1605; d. 6 April 1695. He was educated at Westminster School and at Oxford, where he entered Christ Church in 1624 and was graduated B.A. four years later, and received his M.A. in 1631. He became a tutor of his college and at the age of 33 was appointed prebendary and rector of Cudworth, in Somersetshire. In 1638 he was elected to a fellowship and later was appointed headmaster of Westminster School and two years later was confirmed in this appointment, which he held continuously till his death. He was strict in discipline and a successful teacher, and among his pupils were many of the greatest men of his time—Dryden, Locke, Atterbury, South, Henry, Hooper and others. His published works were mainly school books, now long out of date. He was buried in Westminster Abbey.

BUSBY, a military headress worn by hus- sars, artillerymen and engineers, consisting of a fur hat, with a bag of the same color as the facings of the regiment hanging from the top over the right side. The style and material of the busby vary in the different branches of the military service. The bag appears to be a relic of a Hungarian headress, from which a long padded bag hung over and was attached to the right shoulder as a defense against sword cuts. It is worn only in times of peace.

BUSCH, Moritz, German publicist: b. Dresden, 13 Feb. 1821; d. 1899. He was educated at Leipzig and in 1847 began his literary work by translating a number of the novels of Dickens and Thackeray. As a member of the Radical party he was disappointed by the failure of the revolutionary movement of 1848 and came to the United States in 1851, but returned to Germany in 1852. He also traveled in the Orient in behalf of the Austrian Lloyds. In 1856 he became editor of the Grenzboten, and in this paper defended the policy of Bismarck. In April 1870 he was appointed to a position in the Foreign Office and accompanied Bismarck to Frize at the time of the Franco-Prussian War as reporter for the press. In 1873 he gave up his official position to become the editor of the Hannoverschen Kuriers, but continued to be a confidant of Bismarck and strongly advocated the Chancellor's policy in his article. After his visit to the United States he wrote 'Wanderungen zwischen Hudson und Mississippi' (1853), and 'Die Mormonen' (1857). Other works of his are 'American Humorists' (translations of selections from Mark Twain, Bret Harte, etc.); 'The History of the International'; 'The Humor of the German People'; 'Count Bismarck and His People During the War with France'; 'Our Chancellor' (a life of Bismarck), and 'Bismarck; Some Secret Pages of His History' (translated into English 1898).

BUSCHING, Anton Friedrich, German geographer: b. Stadthagen, Schauenburg-Lippe, 27 Sept. 1724; d. Berlin, 28 May 1793. He studied theology in Halle from 1744 and was for a time minister of a Protestant church in Saint Petersburg. When acting as a traveling tutor he became convinced of the defects of existing geographical treatises and resolved to write a new one, which he began on his return to Germany in 1752 by publishing a short description of Schleswig and Holstein as a specimen. In 1754 he was made professor of philosophy in Göttingen. In 1766 he was made director of the united gymnasia of Berlin and the suburb Kölln. Before his great 'Erdebe- schreibung,' which he began in 1764 in separate volumes, and which, though not entirely completed by the author, passed through eight editions during his life, neither the Germans nor any other nation had a thoroughly scientific geographical work. Among his important writings is the 'Magazin für Historiographie und Geographie' (25 vols., 1767–83).

BUSCHNAUM, Hermann, German Jesuit: b. Notteln 1600; d. Münster, 31 Jan. 1668. He taught moral philosophy at Cologne and was rector of the Jesuit College at Münster. He is best known through his casuistical work, 'Medulla Theologie Moralis, Facili ac Perspicua Methodo Resolvens Casus Consentientis,' in which he treats of the principles of the Jesuit morals in a detailed and systematic manner. This book passed through 45 editions between 1645 and 1670, and has been reprinted in modern times. After Damien's attempt to assassinate Louis XV of France, the charge was made that it had taught the Jesuits' approval of murder and regicide, it was therefore publicly condemned by the order and burned by the Parliament of Toulouse.

BUSH, Katharine Jeanette, American zoologist: b. Scranton, Pa., 30 Mar. 1855. She received her education in public and private schools at New Haven, Conn., studied zoology under the direction of Verrill at Yale University and in 1879 was appointed assistant of the Yale Zoological Museum. She became a member of the United States Fish Commission, a member of the American Society of Naturalists and the American Society of Zoologists. She was joint editor of 'Webster's Dictionary' (1890 ed.), and is the author of 'The Tuberculose Annels of the Tribes Sabelidas' and 'The Explorers of Harriman Alaska Expedition Series, Vol. XII, 1905); 'Deep Water Mollusca' (1885); 'New Species of Turbonilla' (1890), and contributions to the principal scientific journals.

BUSH, Hans, English lawyer: b. 1815; d. 1882. He received his education at King's College, London, and at the University of Cambridge. He was called to the bar in 1841. He attracted public notice through his advocacy of the establishment of rifle clubs as a means of defense of the nation. While still at the university, he published 'The Rifle and How to Use It' and instituted a rifle club among
the undergraduates. In 1853 he reorganized
the Victoria Rifles, then England's only volun-
teeer body, and lectured, in and out of the
army, on the details of his great hobby. To him belongs
the honor of first suggesting life-saving stations and
of organizing a model station. His prin-
cipal work is 'The Navies of the World: Their
Present State and Future Capabilities' (1859).

BUSH-BROWN, Henry Kirke, American
sculptor; b. Philadelphia, N. Y., 21 April 1837.
He studied art in Paris and Italy and has a
studio in New York. His most important works
are equestrian statues of Generals Meade and
Reynolds and the Lincoln Memorial at Gettys-
burg; the statue of Justizian, Appellate Court,
New York; 'Indian Buffalo Hunt,' Chicago
World's Fair; statues for Hall of Records,
New York. He was elected a member of the
National Sculptural Society and was prominent
in the movement for municipal art.

BUSH CREEPERS, the English name of
the Unicollina, a subfamily of the Sylviidae.
These birds have sharp, conical bills and long,
pointed wings. They are usually diminutive in
size, active in habits, have a twittering note and
build their nests in thickets, solitary bushes or
trees. They are found in the warmer parts of
both hemispheres, some of them, however, being
migratory.

BUSH-DOG, a small wild dog (Icticyon
venaticus), resembling a fox in appearance,
found in Guiana and Brazil. It is distinguished
by its one molar tooth in the upper jaw, has
close hair and a short, stubby tail. Compare
Fox-dog.

BUSH-QUAIL, the Anglo-Indian name
for the button-quail (q.v.).

BUSHBUCK, any of several African antel-
opes, frequenting thickets and bushy regions.
The name applies especially to the diminutive
antelopes of the genus Cephalophus, which the
Dutch of South Africa called "duykers" (q.v.).
These include the smallest members of their
race, some of the males having horns only
3 inches high at the shoulders. They haunt the rocky hill-
sides, leaping with extraordinary agility from
stone to stone and diving into the thickets at
the first alarm. They feed upon berries, leaves,
buds and similar food, rather than upon grass,
and their flesh has a delicate flavor. The name
"bushbuck" is also given, especially in South
Africa, to the larger antelopes of the genus
Tragelaphus, more distinctively known as "har-
nessed" antelopes, because their hides, often
richly colored, are conspicuously marked with
whitish stripes, suggesting a harness thrown
over the back. The largest of these handsome
antelopes is the West African bongo (T. eury-
ceros), of the forests of the Gaboon region,
which stands nearly 5 feet high and has horns
30 inches long. On the opposite side of the
continent the nyala (T. angasi) frequents the
fever-stricken swamps of the East African
coast. Another well-known species of the
swamps of southern and eastern Africa is
Speer's antelope (M. speeri), native names for
which are "nakong" and "sititunga." It differs
from its fellows in having a uniform grayish-
brown silky coat, without any "harness," but
the young are faintly striped and spotted. This
species is one of the best known of African an-
telopes wherever rivers or swamps occur, and
still survives in considerable numbers. That
species most often called the guib (T. scriptus),
still to be found in the jungles along the African
rivers from Abyssinia to the Cape. It is remarkable for its
inferior size, which is about that of a goat, and
for the variability of its markings, which has
led to much confusion in describing it. The
variety most common in Cape Colony is uni-
formly dark brown, with no stripes whatever,
and only a few spots on the haunches. This
genus of antelopes is closely allied to that of
the koodooos (q.v.), and resembles them in that
the females are hornless and usually differ in
color from the males. Consult Lyddeker,
'Game Animals of Africa' (London 1908).

BUSHEL, a dry measure containing eight
gallons or four pecks. The standard bushel in
the United States (originally known as the
Winchester bushel) contains 2150.42 cubic
inches, and holds 77.627 pounds of pure water
at a temperature of 39.8° F, and 30 inches at-
mospheric pressure. The English standard, the
imperial bushel, has a capacity of 2218.20 cubic
inches and holds 80 pounds of pure water at
62° F. See Weights and Measures.

BUSHIDO, boo-shé'dó ("the way of
the warrior"); the ethical code of the Samurai, the
Japanese order of knighthood. It is in some
ways like the code of the knights of the Middle
Ages, demanding courage, honor and loyalty
to country and rulers; it also enjoins the duty of
suicide by hari-kari (q.v.) to avoid loss of
honor. Although the formal code was given up
when feudalism was abolished in Japan, its
ideals still have great influence on the people,
and many of the most prominent of the nation
were educated according to its principles. It
has given women a remarkable position in
Japan and even yet instills in the young lofier
ideals. See SAMSAR.

BUSHING, a piece of metal placed in ma-
achinery to reduce the wear of the major parts
of the machine. It is also used to decrease the
size of perforations and generally to re-
duce friction, eliminate roughness and wearing
parts and to prevent clogging. Bushings gen-
erally are inserted in the machine frame at
those points where axles or other moving parts
are to be inserted and are made of a harder
material than the machine frame.

BUSHMAN, or BOBSESMAINS, a dwarf
African race inhabiting the Kalahari Desert and
some of the more northerly portions of Cape
Colony. Their average height seems to be
rather less than five feet, but the Bushmen of
the Cape are more stunted than those living
farther north. The skin is of a dirty yellowish
color, and they have repulsive countenances,
with a somewhat prominent forehead, thick
lips, large ears and small, deep-set, restless
eyes. They are essentially a nomadic people,
neither tilling the soil nor rearing domestic
animals, but subsisting on the flesh of various
wild animals, and on wild bulbs, roots, fruits,
etc. They live in rock caves or in caves cut
like structures in a bush. Consult Bleek, 'Re-
vard the Fox in South Africa' (London 1864);
Stow, 'Native Races of South Africa' (New
York 1905); Bleek and Lloyd, 'Specimens of
Bushman Folklore' (London 1911).
BUSHMASTER, a large pit-viper (Lachesis mutus) of the rattlesnake family, numerous in northeastern South America, and called by the natives surucuri. It is the largest and most venomous snake known, sometimes reaching a length of nine feet. Its ground color is pale yellow, darker on the back, and marked with a chain of jagged brown spots, and lighter on the belly. It has no rattle, but its tail terminates in a horny spur, which, when the tail is vibrated, strikes against the ground, producing a rattling noise, which can be heard several feet. It is similar to the rattlesnake in its habits, dwells wholly upon the ground, and its poisonous apparatus is greatly developed, making it a very deadly serpent, and one much feared. Consult Hopley, 'Snakes' (London 1882); Bates, 'A Naturalist on the River Amazon' (New York 1884); Molee and Urlich, 'Serpents of Trinidad' in Proceedings Zoological Society of London (London 1894); Ditmars, 'Reptiles of the World' (New York 1910).

BUSHNELL, Horace, American theologian. D. Litchfield, Conn., 14 April 1802; d. Hartford, 17 Feb. 1878. He was graduated at Yale in 1827, engaged in journalistic and educational work, then studied law and theology at Yale, where for a time he was tutor, and in 1833 he began his brilliant pastorate of the North Congregational Church in Hartford, from which he retired owing to failing health in 1853. His writings on theological subjects were as remarkable for the interest and discussion which they aroused among religious scholars and thinkers as for their originality and independence of thought and vigor of utterance. Both as writer and preacher he was a commanding figure, and his influence was far-reaching. His works include 'Principles of National Greatness: Christian Nurture' (1847); 'God in Christ' (1849); 'Christian Theology' (1851); 'Sermons for the New Life!' (1858); 'Nature and the Supernatural' (1858); 'Character of Jesus' (1861); 'The Vicarious Sacrifice' (1865); 'Women's Suffrage, the Reform Movement' (1869); 'Forgiveness and Law' (1874). He also contributed to several periodicals, and propounded many original views, even to the extent of being accused of heresy. However, he maintained his standing and commanded an ever increasing influence until his death. Consult Cheney, Mary B., 'Life and Letters of Horace Bushnell' (New York 1880); Munger, T. T., 'Horace Bushnell, Preacher and Theologian' (Boston 1899). The public services of Dr. Bushnell as a citizen were such as to make him long remembered for his civic pride and devotion to the interests of the city where his life-work was performed. Bushnell Park, Hartford, named in his honor, is a monument to his initiative and persistent efforts, whereby mainly the city came into possession of one of its chief adornments.

BUSHNELL, Ill., city, in McDonough County, 60 miles west of Peoria, on the Chicago, Burlington and Quincy and the Toledo, Peoria and Western railroads. The city has manufactories of wood and steel tanks, pumps, wagons, buggies, brick and garden tools. Poultry farming is an important source of employment. Large quantities are shipped annually and there is a good trade in farm implements. The waterworks are the property of the municipality. Pop. 2,619.

BUSHRANGERS, a name originally applied to desperadoes in Australia who took to the bush and supported themselves by levying contributions on property and persons. Not long after the establishment of penal settlements in Van Diemen's Land and Southern Australia by the British government the bushrangers began to make conditions disagreeable for the settlers in these colonies and their operations finally became so bold that martial law was proclaimed in Van Diemen's Land in 1815; and 15 years later a very stringent act was passed in New South Wales to do away with the nuisance. During the early days following the discovery of gold in Australia, these desperadoes obtained immense sums by robbing the diggers, stage coaches and metal convoys on their way from the mines to the cities and towns. In one haul a notorious gang headed by Capt. Frank Gardiner gathered in £7,490 in bank notes and more than 5,000 ounces of gold. Gardiner afterward came to the United States in 1874. 'Jacky' Jacky, in Tasmania headed six bushrangers and disorders, establishing something very like a reign of terror in parts of the island. They finally made an attack on the governor's quarters on Norfolk Island. Hundreds of these malefactors were captured, tried and imprisoned; while many more were killed by the government police, troops and armed civilians; but the country was not able to rid itself of them until roads were opened up and railways and telephones came, bringing with them rapid and sure communication. Consult Boxall, 'History of the Australian Bushrangers' (London 1908).

BUSHTIT, a very small titmouse of the genus Ptilidryas, two species of which inhabit the western United States. One, the least bushit (P. minimus), is found in summer from the Rocky Mountains to the Pacific coast, and is noted for its nest, which is a form of moss down, lint of plants and similar materials, and is shaped like an old-fashioned purse, 8 or 10 inches in length, suspended from the branch of a bush and entered by a small hole near the top. The lining is of feathers of many varied materials, and the eggs are 8 to 10 in number and pure white. A southern variety of this is the lead-colored bushit. A Mexican species (P. melanois) is distinguished by black patches on each side of the head. The resemblance in the nesting habits of these birds to those of the European titmouse will be noted. See Titmouse.

BUSHWHACKER, a term applied during the Civil War to men living in the States where military operations were carried on, who professed to be neutrals and to be solely occupied in their ordinary vocations, but who seized opportunities to harass or attack individual soldiers or small bodies of their guard.

BUSINESS MANAGER, Municipal. See City Manager.

BUSINESS SCHOOLS. See Education, Commercial.
BUSIRIS, boo-së'-ris, in Egyptian mythology, a being of whom the most contradictory accounts are given by ancient writers, some making of him as a king, others affirming that the name meant simply the tomb of Osiris.

BUSKIN (Latin cothurnus), a kind of high-soled shoe or half-boot, worn upon the stage by the ancient actors of tragedy, in order to give them a more heroic appearance. The Greek word kothornos denoted a sort of closed boot, fitting either foot, worn by women; the tragic boot being the embates or embar. The word is figuratively employed by the Latin authors for tragedy itself, or for a lofty and elevated style. Consult Smith, K. K., 'The Use of the High-Soled Shoe or Buskin in Greek Tragedy of the Fifth and Fourth Centuries B.C.' in Harvard Studies in Classical Philology (Vol. XVI, 1905).

BUSONI, Ferruccio Benvenuto, Italian composer: b. Empoli, Florence, 1 April 1846. His parents, both of whom were skilled musicians, superintended his early musical training. He went to Leipzig in 1866 and in 1868 was appointed teacher at the Conservatory of Helsingfors. He was professor at the New England Conservatory, Boston, in 1891-93 and in 1894 settled in Berlin, where he has continued to reside. He made several very successful concert tours of Europe and also in the United States in 1910-11. He is an excellent performer on the piano. He was made chevalier of the Legion of Honor by France in 1913, the third of his race thus honored. His compositions include a concertstück for piano and orchestra, concerto for violin; 'Pojohlas' Daughter,' a symphonic poem; two suites for orchestra; 'Lustspiel Ouverture'; two string quartets, and the opera, 'Die Brautwahl' (1912).

BUSSA, boos'sâ, or BUSSANG, British Northern Africa, central Africa, capital of Borgu, a wall-encircled town on the Niger at the rapids marking the head of river navigation from the sea. Here, attack by the natives, Mongo, the explorer, was drowned in 1806. Pop. 12,000.

BUSSEY, Benjamin, American merchant: b. Canton, Mass., 1 March 1757; d. Roxbury, 13 Jan. 1842. He was a soldier in the Revolutionary War, became a silversmith in Dedham, afterward a merchant in Boston, where he acquired a large property, from which he bequeathed about $350,000 to Harvard College, one-half for founding the Bussey Institute, a school of agriculture and horticulture, and one-half for the support of the law and divinity schools of the college.

BUSSI, bußë, D'AMBOISE, Louis de Clermont D'Amboise (Stitus pe.): b. 1549; d. 19 Aug. 1579. He acquired an infamous notoriety by the prominent part he took in the massacre of Saint Bartholomew. He afterward attached himself to the Duke of Anjou, and obtaining the command of the cavalry, Anjou made himself universally odious by his pride and oppression. He had the meanness to pander to the low passions of the Duke, and undertook to seduce the wife of the Count of Montmoreau. He tricked cost him his life. Montmoreau, having come to the knowledge of it, obliged his wife to write Bussi, giving him a rendezvous at the castle of Concarneau. Bussi arrived with a single confidant, and was immediately met by Montmoreau, who killed him.

BUSSON, bü-sô, Charles, French painter: b. Montoire, Loir-et-Cher, 15 July 1822; d. 1909. He studied under Rémond and François and devoted himself to landscape painting. His style was not marked by the characteristics of the "open air school," but recalled the canvases of earlier masters in his chosen branch of art. Among his paintings are ‘Les Ruines du château de Lavardin" and ‘La chasse au marais."'BUSSU PALM, a plant (Manicaria succifera), common in the swamps of northern Brazil. Though it rarely exceeds 15 feet in height, it has huge leaves, said to be the largest undivided leaves produced by any palm, even reaching 30 feet in length by 4 or 5 feet in width. After splitting the midrib from end to end the leaves are laid obliquely upon rafters to form thatch for houses. This position makes the spaces between the veins of the leaf carry off water. The spathes are used by the Indians for caps and bags and for cloth-making. The large, hard, three-seeded, olive-green fruits do not seem to be used commercially.

BUSSY-RABUTIN, bü-see-ra-bu-tën, or ROGER DE RABUTIN, COMTE DE BUSSY: b. Épisy, Nivernois, 1618; d. Autumn 1693. He entered the army at the age of 13, and served in several campaigns. Turenne, in a letter to the King, describes him as the best officer in his army, as far as songs were concerned. His scandalous chronicle, entitled ‘Histoire Amoureuse des Gaules," cost him the loss of his official appointment and a year's imprisonment in the Bastille. He was a correspondent of Madame de Sévigné, and is often mentioned in her letters. He had the vanity to suppose that he excelled her in her peculiar art, and his letters were afterward published in seven volumes.

BUST (French buste, Italian busto, of uncertain origin), in sculpture, the representation of that portion of the human figure which comprises the head and the upper part of the body. The bust did not become common among the Greeks until the time of Alexander, nor among the Romans till the time of the empire. Among the Greeks, the portrait busts of the learned formed an important branch of art. The artists in these works exhibited a singular power of expressing character, and in this way we possess what are probably faithful likenesses of Socrates, Plato and other distinguished persons. The first Roman bust that can be depended upon as giving a correct likeness is that of Scipio Africanus the elder. The number of busts of the time of the Roman empire is very considerable, but those of the Roman poets and men of letters have not been preserved in so large numbers as those of the Greeks. A collection of drawings of antique busts was made by Fulvius Ursinus, and published with the title, ‘Virium Illustrium;’ Imhoof (1560; Antwerp 1606); subsequently a similar collection was published in the ‘Iconographie Grecque' of Visconti (Paris 1811), which was followed by his 'Iconographie Romaine' in 1817.
BUSTAMANTE—BUTCHER-BIRD

BUSTAMANTE, boo-sta-mân-tâ, Ana-tasio, Mexican statesman and revolutionist; b. Tiquipan, Michoacan, 27 July 1780; d. San Miguel Allende, 6 Feb. 1853. In 1808 he joined the Spanish army, and for a time fought against the party of the revolutionists, but in 1821 he acted with Iuribe. He was made Vice-President, in command of the army, in the administration of Guerrero, 1829. He afterward revolted and led the Centralist party, and in 1830 became acting President of Mexico. In 1832 Santa Anna opposed him at the head of an army, and he was conquered and banished 1833. When the Centralist party returned to power he was recalled, and in 1837 was elected President of Mexico. In 1842 he was obliged to retire from the Presidency, and was succeeded by Santa Anna. He served in the Mexican army in the war with the United States, retiring from military service in 1848.

BUSTAMANTE, Carlos Maria, Mexican historian; b. Oaxaca, 4 Nov. 1774; d. 21 Sept. 1848. He studied law and in 1801 began its practice. In 1805 he became editor of the Diario de México. He held a command under Mina, in 1812, and was captured at Vera Cruz. He was released, and became a member of Congress and held other public offices. He founded a weekly newspaper, La Avispa de Chilpancingo, whose articles twice led to his imprisonment. His works treat of various periods of Mexican history, and are of special value, as he was an eye-witness of much that he describes. He published a history of the Mexican revolution (1823-32), and histories of the times of Iuribe and of Santa Anna.

BUSTARD Quail, the name given by Anglo-Indians to the button-quail (q.v.).

BUSTARDS, a family of game birds (Otididae) of the Old World, which, however, are not gallinaceous, but are related in structure on the one hand to the cranes, and on the other to the plovers. They are inland birds, haunting dry, grassy and sandy plains, and in the more settled districts resorting to stubble-fields and pasture-land. They have strong legs and feet, as well as good wing-power, and spend more of their time on the ground than in flight. Most of them are birds of handsome plumage, the upper parts being mottled with brown and reddish-brown, with white and black. Ornamental plumages are characteristic of the group, and often form crests, or ruffs, about the head, neck and breast. Bustards are known in the Mediterranean regions, and throughout southern Asia to China and Japan. They also abound all over Africa, and one species (Eupodotis australis) inhabits Australia, where it is called "native turkeys." Those of North Africa and western Asia are known as "houbaras," and form the favorite game-birds of that semi-desert, the oases of Indus and the oases of India; favorites with sportmen, are called "floricans." The typical, and best-known bustard, however, is Otis tarda, now extinct in Great Britain, but numerous throughout the Mediterranean countries. It has somewhat the size and form of a large turkey, and is the species of India, favorites with sportmen, are called "floricans." A remarkable feature of this species is the fact that a great pouched, opening under the tongue, is developed in the throat of the male of some examples during the breeding season. This phenomenon is restricted to adult birds, and the pouch disappears at other times of the year. Its utility is unknown. A much smaller but otherwise similar species, the little bustard (Otis tetrao), is another favorite with European sportmen. The term is sometimes erroneously applied to other large birds, such as the Magellanic penguin (with which consult Afalio, "Sport in Europe" (London 1901); Beebohm, "Birds of Asia" (London 1901); Bryden, "Nature and Sport in South Africa" (London 1897).

BUSTO-ARISIZIO, ar-sîts'îo, Italy, city in the northern division, 21 miles northwest of Milan. It contains a church, designed by Bramante, and containing frescoes by Gaudenzio Ferrari. It has manufactures of cotton goods and a trade in wine. Pop. 25,992.

BUSYBODY, The, a pen name under which Benjamin Franklin wrote a series of papers, modeled on 'The Spectator' of Addison; also a comedy by Mrs. Centlivre, 1769.

BUTADES. See DUBITATES.

BUTANE and IsoButANE, two gaseous compounds of carbon and hydrogen with the same molecular formula, C4H10, yet differing in their chemical properties. They are similar to marsh gas. Crude petroleum contains dissolved butane.

BUTCHER. See ABATTOIR.

BUTCHER, Samuel Henry, Irish classical scholar; b. Dublin, 16 April 1850; d. 29 Dec. 1910. He was educated at Marlborough College, and Trinity College, Cambridge, and was a lecturer at University College, Oxford, 1876-82. From 1882-1903 he was professor of Greek in the University of Edinburgh, and in 1906 he was elected one of the members for Cambridge University. In 1904 he visited the United States to deliver a series of lectures at Harvard University and other places. He has published a 'Prose Translation of the Odyssey' (with A. Lang q.v.) (1879); 'Demosthenes' (1881); 'Some Aspects of the Greek Genius' (1893); 'Aristotle's Theory of Poetry and the Fine Arts, with a Critical Text and Translation of the Poetics' (1895); 'Demosthenes' Orations' (1903, 1907); 'Harvard Lectures on Greek Subjects' (1904).

BUTCHER-BIRD, a shrike of the family Laniidae, representatives of which range throughout the northern hemisphere. They are birds of moderate size, and gray and white in color, with black markings on the head, wings and tail, which are properly included among the insect-eating birds, but have developed certain falcon-like traits. They are of powerful build, with hooked beaks, and strong claws, and in winter, when insect prey is not easily obtained, they are accustomed to strike down small birds, and to tear pieces out of their flesh. These they carry off in their claws to some thorn-tree, or to a fence with spikes, and impale them one by one upon the thorns, or other sharp points, in order to fix them firmly while they feed upon their flesh. It often happens, however, that the largest and one of the most valuable of European game-birds, whose frozen bodies remain hanging upon the thorns, like meat in a butcher's shop; the Germans have a popular belief that nine victims are thus stored at a
time, and call the birds "nine-killers." These shrikes make rude nests in trees and lay four or five eggs, which are incubated except in winter. A typical species, common over northernmost North America, is the great northern shrike (Lanius borealis), which is rarely seen in the United States except in winter. Another species, the loggerhead (L. ludovicianus), dwells in the Southern States and is somewhat smaller in size. Consult Ingersoll, 'Wild Life of Orchard and Field' (1902); Newton, Alfred, 'Dictionary of Birds' (New York 1890); Evans, A. H., 'Birds' in 'Cambridge Natural History' (Vol. IX, ibid., 1900). See SHRIKE.

**BUTE**, bpt, John Patrick Crichton-Stuart, 3d Marquis of: b. Mountstuart, 12 Sept. 1847; d. 9 Oct. 1900. He was educated at Harrow and Oxford. He was mayor of Cardiff in 1891–92, and did much to advance the commercial prosperity of that city. From 1892 to 1898 he was lord rector of Saint Andrew's University, which benefited greatly by his munificence. He donated Bute Hall to Glasgow University. He was deeply interested in Scottish history, and was the author of 'Early Days of Sir William Wallace'; 'The Burning of the Barns of Ayr'; and 'Altus of Saint Columbia.' His succession from the Scottish Presbyterian to the Roman Catholic Church in 1888 caused a sensation in Scotland. He figures as the hero in Disraeli's novel, 'Lothair.' He was the author of an adequate and scholarly translation of the Roman 'Breviary.'

**BUTE, John Stuart**, 3d Earl of, British statesman: b. Edinburgh, 25 May 1713; d. 10 March 1792. His grandfather was created a peer in 1703, and the family was connected with the royal Stuart line. In 1737 he entered Parliament as one of the Scottish representative peers, but was not re-elected in 1741. He then retired to his estates, and lived there wholly secluded till the landing of the Pretender in Scotland in 1745 induced him to go to London and offer his services to the government. He soon gained influence with the Prince of Wales, and succeeded in making himself indispensable to him. At his death, in 1751, he was appointed by the widowed Princess chamberlain to her son, and was intrusted by her with his education. But he never lost sight of his pupil, and possessed so much more influence with the Prince of Wales than her son's particular tutors, the Earl of Harcourt and the bishop of Norwich, that they resigned their offices. George II died 25 Oct. 1760, and two days after Butte was appointed member of the privy council. In March 1761 the Parliament was dissolved and Butte was made Secretary of State. Pitt, who saw his influence in the new council annihilated, resigned the same year. This event made an unfavorable impression on the nation; but Butte, possessing the unbounded confidence of his King, stood at the head of the state. After a severe contest in Parliament, he concluded a peace with France. The terms for England were perhaps not disproportionate to the successes obtained during the war; but Butte was obliged to bear the most bitter reproaches. He, however, succeeded in winning the popular favor, and everything seemed to promise the power of the minister a long continuance. The influence of Butte seemed unbounded, where it was made known, that he had resigned his office as Prime Minister, and intended to retire into private life. In 1766 Butte declared in the House of Lords that he had wholly withdrawn from public business and no longer saw the King; still it was not doubted that his great influence continued. It was only on the death of the Princess of Wales, 1772, that he seems first to have given up all participation in the affairs of government. He spent his last years on his estate. A costly botanical garden, a library of 30,000 volumes, excellent astronomical, philosophical and mathematical instruments, afforded him occupation. His favorite study was botany, with which he was intimately acquainted. For the Queen of England he wrote the 'Botanical Register,' which contained all the different kinds of plants in Great Britain (9 vols. 4to). This work is remarkable, both for its splendor, in which it excels all former botanical works, and for its rarity. Only 12 copies were ever in the pounce of more than $50,000. Consult A. von Ruville, 'William Pitt and Gref Butte' (Berlin 1855); Lovat-Fraser, 'John Stuart, Earl of Butte' (New York 1912).

**BUTE, Scotland, an island in the estuary of the Clyde, with an area of 30,000 acres, belonging principally to the Marquis of Bute. It is about 16 miles long, and the average breadth is 3½ miles. Agriculture is in an advanced state, and there are about 20,000 acres under cultivation. The herring fishery is also a source of considerable profit. The only town is Rothesay, whose ancient castle is one of the many interesting antiquities of the island. Mount Stuart, the seat of the Marquis of Bute, is four miles south of Rothesay. The climate of Bute is milder than that of almost any part of Scotland. The county of Bute comprises the islands of Bute, Arran, Great Cumbrae, Holy Isle, Little Cumbrae, Inchmarnock and Pladda, with a total area of 139,658 acres, but only a small part is under cultivation. Arran is about double the size of Bute, but the other islands belonging to the county are small. The county returns one member to Parliament. Pop. of Bute, 11,835.

**BUTEA, a small genus of trees or woody vines of the family Fabaceae, natives of China and India, noted for their racemes of large, rich, usually scarlet, papilionaceous flowers, for which they are cultivated in warm countries and to a small extent in warm greenhouses. The best-known species (B. frondosa) is called the dhak or pulas tree in India, and is grown out of doors in California. It is a leafy tree, attains a height of 50 feet and bears very slowly orange-crimson flowers, which are used in the Orient under the name keesoo or teesoo for dyeing yellow or orange. Its fibrous roots and bark are used for caulking boats, making rope, etc. Its red, resinous gum, with which the twigs are frequently covered, is said to be very rich in tannin, and is found in the market of India. The seeds are used as a vermifuge.

**BUTESHIRE, Scotland, county in the West Midlands division. It includes Bute, Arran, Pladda, Marnoch, Cumbraes, Iona and several smaller islands; has a total area of 220
square miles and a population of 18,186. Agriculture and fishing are the only industries of any extent. Rothesay, Bute, is the county-seat.

BUTIN, bô-tän, Ulysses Louis Auguste, French painter: b. Saint Quentin 1838; d. Paris, 9 Dec. 1883. He was a pupil of Picot and Pils. His subjects are mostly from the life of the French fishermen, and his work shows remarkable truthfulness and nature. Among his best paintings are 'The Departure'; 'Fishing'; and 'Burial of a Sailor at Villerville.'

BUTLER, Alban, English writer on religious topics: b. 1711; d. Saint Omer 1773. He received his education at that famous centre of English Catholicism, the English College of Douai, was ordained to the priesthood and was successively professor of philosophy and theology at Douai. Later he traveled throughout Europe and was appointed chaplain to the Duke of Norfolk. He became afterward president of the College of Saint Omer. He spent 30 years in compiling his great life-work, 'The Lives of the Saints.' It appeared in four volumes (1756-59) and after his death in 12 volumes with annotations omitted from the former edition.

BUTLER, Amos William, American ornithologist, sociologist and philanthropist: b. Brookville, Ind., 1 Oct. 1860. He was educated at Hanover College and at Indiana University; was one of the founders of the Indiana Academy of Science, and became its president in 1895; became general secretary American Association for the Advancement of Science 1891; vice-president of the section of Anthropology, 1900; president of the National Conference of Charities and Corrections, 1906-07; president of the American Bird Association, 1909-10; chairman of the American Committee on International Prison Congress, 1909-10; vice-president of the International Prison Congress, 1910; secretary of the Indiana Board of State Charities since 1897. He has published 'Birds of Indiana' (1891) and many other papers on ornithology, anthropology and charities and corrections, which have appeared in the publications of scientific societies.

BUTLER, Andrew Pickens, American politician: b. Edgefield District, S. C., 7 Nov. 1796; d. near Edgefield Court-house, 5 May 1857. He was admitted to the bar in 1819, and in 1824 was elected to the legislature as the representative of his native district. In 1831, a period marked by the apprehended collision of South Carolina with the Federal government, on the nullification issue, he was elected colonel of a regiment of cavalry. In 1838, still a member of the legislature, he was made a judge of the Courts of General Sessions and Common Pleas. Subsequently, when a change was made in the judiciary system, he was transferred to the supreme bench of the State, where he continued until 1846, when he was elected a senator in Congress. Soon after taking his seat in this body, he was appointed chairman of the Judiciary Committee. One of his earliest speeches was against making Colonel Benton lieutenant-general of the army. The Kansas question, the action of the secretary of war in withdrawing the order, the abolition question and all others affecting the peculiar interests of South Carolina, and the general welfare of the South, engaged him in frequent debate, in which he always took a conspicuous part. His last speech was in reply to Mr. Sumner, and in defense of South Carolina.

BUTLER, Benjamin Franklin, American lawyer and soldier: b. Deerfield, N. H., 5 Nov. 1818; d. Washington, D. C., 11 Jan. 1893. He was graduated at Waterville College (now Colby University); studied law, was admitted to the bar in 1841, and beginning practice at Lowell, Mass., became distinguished as a criminal lawyer and politician. He was a member of the State legislature in 1853, of the State senate in 1859-60, and a delegate to the Democratic National Convention of 1860, which met at Charleston and afterward at Denver. In 1864 he supported the nomination of John C. Breckenridge, which rendered him so unpopular in the North that he was defeated for governor of Massachusetts in that year. Butler had risen to the rank of brigadier-general of militia; and at the outbreak of the Civil War, he marched with the 8th Massachusetts Regiment, and, after a check at Big Bethel, was appointed to the command of Baltimore and of eastern Virginia, with his headquarters at Fort Monroe. In February 1862 he commanded the military forces sent from Boston to Ship Island, near the mouth of the Mississippi; and, after New Orleans had surrendered to the naval forces under Farragut, he held military possession of the city. His administration was vigorous and while mostly just was severely criticized. Especial notoriety attached to his order directing that women who should publicly insult United States officers be regarded as women of the street. The order was bitterly resented in the South and caused Jefferson Davis to order that Butler be considered a traitor and if captured, that he be hanged. Relieved of his command, he acted under General Grant in his operations against Petersburg and Richmond in 1864. Returning to Massachusetts at the end of the war, he took an active part in politics as an extreme radical, advocated the impeachment of President Johnson, and in 1866-75 was a member of Congress. In 1877 and 1879 he was defeated as candidate for governor of Massachusetts, but in 1882 was elected by a large majority. In 1884 he ran for the Presidency as the candidate of the Greenback and Anti-Monopolist parties, but was defeated, carrying no State. He published 'The Autobiography and Personal Reminiscences of Maj.-Gen. Benjamin F. Butler.' (1892). Consult Parson, 'Butler in New Orleans' (New York 1863): Bland, 'Life of Benjamin F. Butler' (1879); 'Private and Official Correspondence of General Benjamin F. Butler: During the Period of the Civil War' (5 vols., 1918). Consult also Rhodes, James F., 'History of the United States, from the Compromise of 1850' (Vol. V, New York 1902).

BUTLER, Charles, English Roman Catholic historian: b. London, 15 Aug. 1750; d. there, 2 June 1832. He was nephew of the Rev. Alban Butler (q.v.). He was called to the bar in 1791, and was the first Roman Catholic who was admitted, in 1794, to the King's Bench, being the first Roman Catholic to sit as a judge of the Court of King's Bench since the dissolution of the old College of Q. C. during the reign of the last Queen. He wrote 'Hors Biblicae,' giving a history of the original text, early versions and printed editions of the Old and New Testaments, and also of the 'Koran,'
Zend-Avesta and the Edda. This first appeared in 1797, and was followed by Horae Subsecivae, a series of notes respecting the geography, chronology and literary history of the principal codes and original documents of the Grecian, Roman, feudal, and canon law. He continued and completed Hargrave's Cod. Urban. Littletoni; supervised the 8th ed. of Fearon's Essays on Contingent Remainders; wrote a history of the geographical and political revolutions of Germany, and a Historical and Literary Account of the Formularies, Confessions of Faith, or Symbolic Books of Roman Catholic, Greek and Principal Protestant Churches. During the last 25 years of his career he principally devoted his pen to the vindication of the Roman Catholic Church. He published numerous biographies of eminent Roman Catholic divines and authors; continued his uncle's Lives of the Saints, and produced Historical Memoirs of the English, Irish and Scottish Catholics. When Southey's ultra-Protestant Book of Church appeared, it was replied to in Butler's Book of the United Catholic Church, which gave rise to six answers on the Protestant side, two of which were replied to by Butler. His Reminiscences appeared 1822-27. As a constitutional lawyer his reputation was very high.

Butler, Ellis Parker, American humorist: b. Muscatine, Iowa, 5 Dec. 1869. His first great success Pigs is Pigs (1868), was followed by others equally successful. These include The Incubator Baby (1906); Perkins of Portland (1906); Great American Pie Coot (1907); Scotland's Ruined Abbeys (1907); Kilo (1907); That Pup (1908); Cheerful Smugglers (1908); Mike Flannery (1909); Thin Santa Claus (1909); Water Goats (1910); Adventures of a Suburbanite (1911); Jack Knife Man (1910); Donatian Dean, A Tale of the Mississippi (1917). He is secretary and treasurer of the Authors' League of America.

Butler, Howard Crosby, American educator: b. Croton Falls, N. Y., 7 March 1872. He was educated at Princeton University, at the Columbia School of Architecture and at the American schools of classical studies in Rome and in Athens. In 1899, 1904 and 1909 he led three archaeological expeditions in Syria. In 1905 he was appointed professor of the history of architecture at Princeton. His publications are Scotland's Ruined Abbeys (1890); The Story of Athens (1902); Architecture, part II of Publications of American Expedition to Syria (1903); Ancient Architecture in Syria, in Division II of Publications of Princeton Expedition to Syria; also papers in archaeological journals.

Butler, James (Duke of Ormonde), English statesman: b. London, 19 Oct. 1610; d. Kingston Hall, Dorsetshire, 21 July 1688. When Strafford became lord-lieutenant of Ireland, Butler was made commander of the army, but as it consisted of only 3,000 men, and he was surrounded by the English jades, he could do little more than keep the enemy in check, and was obliged to agree to a cessation of hostilities; after which, having been created a marquis, he was appointed lord-lieutenant. On the ruin of the royal cause he retired to France. After the execution of Charles he returned to Ireland with a view to raising the people; but on the landing of Cromwell returned to France. While abroad he exerted himself to further the restoration of Charles; and when that event was brought about by Monk, returned with the King. Before the coronation he was created duke, and assisted at the ceremony as lord high-steward of England. In 1662 he was again appointed lord-lieutenant of Ireland, which country he restored to comparative tranquility, and was an active benefactor of it by encouraging various improvements, particularly the growth of flax and manufacture of linen. On the exile of Lord Clarendon, his attachment to that nobleman involved Butler in much of the odium attached to him, and although, on his recall from Ireland, nothing, on the most rigorous inquiry, could be proved against him, he was removed through the machinations of Buckingham. For seven years he was deprived of court favor, but at length was again appointed lord-lieutenant of Ireland, which place he held until, shortly before the death of Charles, he was recalled to England in which gave rise to six answers on the Protestant side, two of which were replied to by Butler. His Reminiscences appeared 1822-27. As a constitutional lawyer his reputation was very high.

Butler, James Glentworth, American Presbyterian clergyman: b. Brooklyn, N. Y., 3 Aug. 1821; d. Boonton, N. J., 28 Dec. 1916. He was the son of one of the five founders of the First Presbyterian Church in Brooklyn. He was educated at Yale, the Union Theological Seminary and Yale Divinity School, and was ordained in the Presbyterian ministry in 1852. He served in Williamsburg and then at the Walnut Street Presbyterian Church in Philadelphia from 1852 to 1868. Next he became secretary, treasurer and editor of the American and foreign Christian Union, remaining in that field 11 years. He spent the following 20 years compiling a series of 11 volumes entitled The Bible Work, which constitute what some authorities regard as the most comprehensive and valuable commentary on the Bible that has ever been written. It had a wide circulation in many languages. Other works issued by Dr. Butler are Topical Analysis of the Bible (1896); Vital Truths Respecting God and Man (1904); and Present Day Conservatism and Liberalism (1911).

Butler, John, American royalist leader in the American Revolution: b. Connecticut; d. Niagara 1794. He became a leading resident of Tryon County, N. Y.; commanded the Indians in the Niagara campaign (1759) and in the Montreal expedition (1760). At the outbreak of the Revolution he sided with the Tories and became deputy superintendent of Indian affairs. In 1776 he organized a band of marauders, chiefly Indians, and fought the battle of Oriskany (1777); in July 1778, he commanded at the battle of Wyoming. In 1780 he took part in Sir John Johnson's raid on the Mohawk settlements. At the end of the war he fled to Canada, and was appointed Indian agent.

Butler, Joseph, English philosopher and theologian: b. Wantage, Berkshire, England, 1692; d. 1752. Although reared a Presbyterian,
he became a member of the Episcopal Church, and entered Oriel College, Oxford, in 1714. After receiving his degree he took orders and was appointed preacher at the Rolls Chapel, where he preached the famous "Sermons on Human Nature" which gained him a leading place among moral philosophers. These (of which the first three are of fundamental importance) were published in 1726. Ten years later (1736) appeared his famous "Anatomy of Religion, Natural and Revealed," to the Corp of which he contributed. He also gained the friendship of Queen Caroline who at her death left a request that he should receive promotion in the Church. In 1738 he was appointed bishop of Bristol, and in 1750 was promoted to the bishopric of Durham.

Butler's "Sermons on Human Nature" have given him a foremost place among ethical writers, and have had an important place in the instruction at the English universities. His ethical teachings are directed at what might be called "natural" moralities which is a naturalization with clearness by Hobbes in the previous century and which still seemed sufficiently dangerous in the 18th century to require repeated refutation. The doctrines of Hobbes as against which the later moralists directed their attacks were: (1) That moral distinctions are not "natural," founded in the nature of things, but conventional, resting upon the authority of a state founded by social contract; and (2) that human nature is essentially egoistic. These positions had been controverted by Cudworth, Samuel Clarke and others who sought to show that moral relations belong to the very nature of things. Butler chose a more concrete method of inquiry. There are two ways, he says, in which moral questions can be treated. One begins from inquiring into the abstract nature of things, the other from a matter of fact, namely, what the particular nature of man is, its several parts, their economy or constitution; from whence it proceeds to determine what course of life it is which is correspondent to this whole nature. It was this psychological method which Butler adopted. Human nature, he maintains, is to be regarded as a whole or system, which is made up of parts, but whose character is understood until we consider the relations and respects which these parts have to each other. In addition to particular affections and instincts, Butler finds that there is in man a natural instinct which makes for his own preservation and happiness, and also a natural principle of benevolence whose object is the good of others. These are the two general principles which he names self-love and benevolence. Against Hobbes, he argues that the latter is just as fundamental and natural as the former. The constitution of our nature proves therefore that we are made for society. But, on the other hand, Butler will not deny the legitimacy of self-love, or identify, as had been done, the content of morality with benevolence. The self-love which is approved, however, is not a particular affection, but a general principle of regard for one's own happiness and interests. It is "cool" or "rational" self-love which is justifiable. This type of self-love may be perverted into selfishness or egoism by being allowed to operate without due reference to the elements of human nature. It then loses its authority and ceases to be a general principle. Men constantly sacrifice their most evident interest to fancy, inquisitiveness, love, hatred or any vagrant inclination, and thus violate their nature no less in regard to their individual happiness than to their public good. Butler has accordingly a regulative control over the particular passions and inclinations: it possesses higher authority, and this authority is something quite distinct from the question as to which in any given case happens to be stronger. There are no some particular out of which the public good is made up. Butler intends to identify morality with what he calls "rational self-love," and to subordinate benevolence as a particular affection to it. Yet it is evident from the whole context of his ethical system that he rather intends to show that self-love and benevolence are co-ordinate, but not contradictory principles, both superior to what he calls the "particular affections," and both in turn harmonized and systematized in human nature by the supreme principle of conscience. "The self-love of the individual is the ever-regulating principle of benevolence in man, which is in some degree to society what self-love is to the individual." By insisting as he does upon the presence in human nature of these two principles, and their necessary harmony, Butler finds the explanation of making one or other of these principles supreme in conduct, as well as the necessity of denying or explaining away the other. He transcends the fundamental conflict between "interested" and "disinterested" conduct, in which his predecessors and many of those who came after him found themselves involved; and he goes far in suggesting the conception of the complementary character and essential unity of these principles in the idea of a "social self." But Butler's ethical system receives its completion in the idea of conscience as the supreme authoritative principle to which both self-love and benevolence are subordinate. He defines conscience as that "principle of reflection in men by which they distinguish between approvable and disapprovable actions." Moreover, "conscience not only offers itself to show us the way we should walk in, but it also carries its own authority with it, that is our natural guide." The conclusion is that from the very make or character of man, there is a strictest sense a law unto himself. "Had conscience strength, as it has right; had it power, as it has manifest authority, it would absolutely govern the world." Two objections have been brought against Butler's view of conscience by modern writers. In the first place, it is urged that it involves a falling back upon mere intuition, upon a principle that can give no account of itself or of its mode of operation. There are doubtless some passages in his writings which, taken by themselves, might seem to justify this interpretation. But it is necessary to remember that for Butler conscience is reason or reflection, that is, that it is the action of the whole moral constitution of man, and that in following its requirements we are acting in the light of the whole. The second criticism is that for him conscience seems to pronounce infallible judgments, taking no account of circumstances, and not providing for the growth or develop, however, become perverted into selfishness or egoism by being allowed to operate without due reference to the elements of human nature. Yet it is not
for him any mechanically acting faculty; the due proportion between self-love and benevolence is different in different cases, and "can be judged only from our condition and nature in this world." Conscience itself develops with use and practice, becoming more and more adequate to deal with the changing conditions of life. Without actual moral habits and fixed modes of character. Morality for him is no set of fixed axiomatic truths, infallibly perceived once for all; but it is what the moral reason perceives in particular situations to be correspondent to the new conditions of our Constitution when this is seen in its true perspective.

Butler's 'Analogy' is the most famous and most carefully reasoned defense of revealed religion which appeared in England during the 18th century. It was directed against deism (qv.) and sought to meet the attacks which this school of writers brought against the traditional view of theology. Butler undertakes to show that the course of nature suggests not only the conclusions, which the deists admitted, of the existence of God and the duty of worshiping Him, but at much closer, natural occurrences and laws seem to furnish evidence for the doctrines of revealed religion which the deists discarded and denied as immoral. Butler's candor in pointing out what might be called imperfections and injustice in nature, which the deists were inclined to neglect, has led to the remark that his treatment tends to raise doubts rather than to settle them, and that his conclusions might be read by a skeptical mind in a different way. However this may be, one can say that Butler's 'Analogy' together with Hume's 'Dialogues on Natural Religion' served to undermine, long before the appearance of Kant's systematic criticism, the rationalistic conclusions of 'natural religion.' It should be noted that Butler did not profess to furnish a demonstration for the doctrines of revealed religion, but only to show their probability by pointing out their analogy with the course of nature. For man, as he says, in all such matters, "probability is the very guide of life."

There are many editions of Butler's works; the most recent being that of Gladstone in two volumes, 2d ed., 1898. Mr. Gladstone also published a volume entitled 'Subsidiary Studies on Butler.' Consult also Collins, W. L., 'Butler' (Blackwood's 'Philos. Classics'); Stephen, Leslie, 'English Thought in the 18th Century' (Vol. I); Sidgwick, H., 'History of Ethics'; Lefevre, A., articles in the 'Philosophical Review,' Vols. VIII and IX.

JAMES E. CREIGHTON, Professor of Philosophy, Cornell University.

BUTLER, Josephine Grey, English philanthropist: b. Milfield, Gloucestershire, about 1828; d. 30 Dec. 1906. Married George Butler, afterward Canon at Winchester, 1852. She was prominent in efforts for the higher education of women, and for moral reform, and published 'Life of John Grey of Dilston'; 'Life of Catherine of Siena'; 'Recollections of George Butler'; 'Life of the St. Benen'; 'Perspectives and Reminiscences of a Great City'; 'Prophecy and Prophetesses'; 'Nature Races and the War'; 'Silent Victories'; 'The Hour Before the Dawn'; 'Government by Police'; 'The Constitution Violated'; 'Women's Work and Women's Culture'; 'Life of Oberlin'; 'A Voice in the Wilderness.'

BUTLER, Marion, American legislator: b. Sampson County, N. C., 20 May 1863. In 1889 he was admitted to the bar and practised successively in Raleigh and Washington. He was elected to the senate of North Carolina in the late eighties and took a prominent part in railroad regulation legislation. He abandoned the Democratic party in 1892, became one of the organizers of the Populist party and from 1896 to 1904 served as chairman of its executive committee. In 1896 he was elected United States senator, serving until 1902. He successfully piloted through the Senate a bill providing for rural free delivery in the postal service. He also advocated the establishment of postal savings banks. Being defeated for the Senate in 1902, he thereafter allied himself with the Republicans.

BUTLER, Matthew Calbraith, American army officer: b. near Greenville, S. C., 8 March 1836; d. 1900. He studied law at Stonelands, near Edgefield County, South Carolina, and was admitted to the bar in December 1857. He was elected to the legislature of South Carolina in 1860; entered the Confederate service as captain of cavalry in the Hampton Legion in June 1861, and became a major-general through the regular grades; lost his right leg at the battle of Brandy Station on 9 June 1863. He was elected to the legislature of South Carolina in 1865; was elected United States senator in 1877-95; commissioned a major-general of volunteers for the war with Spain, 25 May 1898; and was appointed one of the American commissioners to arrange and supervise the evacuation of Cuba.

BUTLER, Nicholas Murray, American educator: b. Elizabeth, N. J., 2 April 1862. In 1882 he was graduated at Columbia University with the highest honors. In 1882-94 he served as fellow in philosophy and studied in Berlin and Paris for one year. In 1885 he became assistant professor of philosophy and in due time held the chair of philosophy, psychology and ethics. In 1890 on the reorganization of the university he became dean of the Faculty of Philosophy. He founded the New York College for Training Teachers, in 1887, which later became Teachers' College, and is now known as Hunter College, under Columbia University. In 1901 Dr. Butler succeeded Seth Low as president of Columbia. His administration has been most successful in extending the influence of the university in the educational field and in its relation to the life of the country at large. Dr. Butler has taken a deep interest in politics and in 1912 was the Republican candidate for Vice-President of the United States on the ticket with William H. Taft. He has done much for the cause of education, founding the Educational Review in 1891 and editing it for the intervening interval as well as 'The Great Education Story;' 'The Teachers' Professional Library;' and 'Columbia University Contributions to Education and Philosophy.' Dr. Butler has been decorated by several foreign rulers and is the recipient of honorary degrees from a great number of prominent universities at home and abroad. He has published 'The Meaning of Education' (1898, rev. enlarged ed., 1900); 'True and
False Democracy' (1907); 'Philosophy' (1908; 3rd ed., 1911); 'The American as He Is' (1908); 'The International Mind' (1912); 'Why Should We Change our Form of Government?' (1912); 'What a Man Is' (1913); 'Mongolism and Education in the United States,' exhibited at the Paris Exposition (1900); 'A World of Fenriment' (1917).

**BUTLER, Samuel**, English satirical poet:
- B. Strenshead, Worcestershire, 12 Feb. 1612;
- d. London, 25 Sept. 1680. He passed some time in his youth at Cambridge, but never matriculated at the university. He was afterward clerk or steward to several country gentlemen, and later lived in London. He resided some time with Sir Samuel Luke, a commander under Cromwell. In this situation Butler acquired materials for his 'Hudibras' (q.v.) by study of those around him, and particularly of Sir Samuel himself, a caricature of whom constituted the celebrated knight Hudibras. The first edition of 'Hudibras' was published in 1663 and was brought under the notice of the court by the well-known Earl of Dorset. It immediately became highly popular with the prevailing party in Church and state, and served as a general source of quotation; the King himself perpetually answering his courtiers out of 'Hudibras'. Though it rendered its author, it did nothing toward extiricating him from indigence. He was buried in Saint Paul's Church, Covent Garden, at the expense of his friend, Mr. Longueville, of the Temple, and a monument was, 40 years after, erected to his memory, in Westminster Abbey, by Alderman Barber, the printer. 'Hudibras,' both in its style and matter, is one of the most original and witty works that were ever written. As a work intended to ridicule the Puritans its attraction was great but temporary, but as applicable to classes of character found in all ages, its satire will always be relished. Butler's 'Remains in Verse and Prose' appeared in 1759.

**BUTLER, Samuel**, English author and composer:
- b. Langar, 4 Dec. 1835;
- d. London, 18 June 1902. He was educated at Shrewsbury School and Cambridge University, and in preparation for the ministry he did parish work among the poor of London. In 1839 he sailed for New Zealand and became a successful sheep farmer. He returned to England in 1844 and studied art. With Henry Festing Jones, he composed many gavottes, figures, etc., and the cantata of 'Narcissus.' He was also an artist of merit, and for several years exhibited at the Royal Academy. He is best known as a brilliant, original writer in more than one field, and as a master of irony, and few equals among his contemporaries, in this particular more nearly approaching Swift than anyone else. His published books include 'A First Year in Canterbury Settlement' (1863); 'Research on the History of the Phrygian Cap' (1861); 'Luck or Cunning as the Means of Organic Modification' (1886); 'Ex Veto' (1888); 'Life of Dr. Samuel Butler, Bishop of Lichfield' (1896); 'The Authoress of the Odyssey' (1897); 'The Iliad of Homer, Rendered into English Prose' (1900); 'Erewhon Revisited' (1901); and 'The Way of All Flesh' (New York 1903), published posthumously, his best and most popular work. Consult Brewer, 'Samuel Butler: the Man and His Work' (New York 1916).

**BUTLER, William**, English polemical writer:
- d. about 1410. He was the 30th provincial of the Minorites in England. At Oxford in 1401 he wrote a tract against the translation of the Bible into the vulgar tongue. He also wrote a tract, 'De Indulgentia,' four books of commentaries on the 'Sentences of Peter Lombard,' and several tracts against the Wycliffites. He removed to Reading from Oxford. Consult Brewer, 'Monumenta Franciscana' (London 1858).

**BUTLER, William Archer**, Irish clergyman and philosopher:
- b. Annerville about 1814;
- d. 5 July 1848. He was baptized and educated as a Roman Catholic, but became a convert to the Established Church before entering Trinity College, Dublin. He was graduated in 1834 and spent the next two years as a student scholar. In 1837 he was appointed to the new chair of moral philosophy at Trinity, was ordained a minister of the Established Church and was presented to the prebend of Clondeekhorka, Down. In 1842 he was promoted to the rectory of Raynagho. He was an able preacher and an indefatigable pastor. In 1845 the Roman Catholic controversy occupied Butler and he contributed to the 'Irish Ecclesiastical Gazette' a series of 'Letters on Mr. Newman's Theory of Development.' Four years of 1846-47 Butler's efforts were untried as relief officer of his parish. His lectures were issued after his death as 'Lectures on the History of Ancient Philosophy' (2 vols., Cambridge 1850). Other works are 'Sermons, Doctrinal and Practical' (3d ed., Cambridge 1855); 'Eternal Life of Christ in Heaven' (1845). Consult the memoir by the Rev. Thomas Woodward (Dublin 1849) and *Dublin University Review* (July 1849).

**BUTLER, Sir William Francis**, British general:
- b. 8 May 1827; Combe, Devon, 31 Oct. 1838; d. London, 7 June 1910. He was educated at Dublin, and joined the army in 1858. In 1863 he became lieutenant, and in 1874 was promoted to the rank of major. He served on the Red River expedition of 1870-71, and about the same time was sent on a special mission to the Saskatchewan territories. He accompanied the Ashantee expedition in 1874, and in 1879 acted as staff officer in Natal. He also served in Egypt in 1882, and held important commands under Lord Wolseley in the Sudan campaign of 1884-85. From 1890 till 1893 he was in command at Alexandria, and in 1892 was raised to the rank of major-general. He had command of the 2d Infantry Brigade at Aldershot, 1893, and of the southern district at Dongola 1896-98. In 1898 he became commander of the forces in South Africa, and for a time, during the absence of Lord Milner, was acting high commissioner. He was strongly opposed to Milner's policy in the Transvaal, and refused to transmit their petition to the home government,—an action which, among other causes of friction, led to his recall. He had command of the western district, 1899-1905, and concurrently
that of the Aldershot district, 1900-01. He published 'The Great Lone Land: A Narrative of Travel and Adventure in the Northwest of America' (1872); 'The Wild North Land' (1873), the story of a winter journey across northern North America; 'Akim-Foo' (1873), a story of the Ashantee War; 'Far Out' (1876); 'Red Cloud, the Solitary Sioux' (1882); 'The Campaign of the Cataracts' (1887). He was created K.C.B. in 1886 and in 1900 was appointed lieutenant-general. His wife (née Elizabeth Thompson) is famous as a painter of battle scenes. His autobiography, edited by his daughter, was published in 1911.

**Butler, William Morris**, American physician: b. Maine 1850. He was educated at Hamilton College, the New York College of Physicians and Surgeons and at the École de Medicine, Paris; has been professionally connected with several homeopathic hospitals, and has been professor of nervous diseases at the Metropolitan Postgraduate School of Medicine, New York; is professor of mental diseases at Flower Hospital, New York, consulting alienist at the Middletown State Insane Hospital. He has published 'Home Care for the Insane' and 'Mental Diseases and Their Homeopathic Treatment.'

**Butler, William Orlando**, American general: b. Jessamine County, Ky., 1791; d. Carrollton, Ky., 6 Aug. 1880. He was about devoting himself to the legal profession when the War of 1812 broke out. Enlisting as a private soldier in Captain Hart's company of Kentucky volunteers he gained distinction in the battles at Frenchtown and the river Raisin. Subsequently he took a conspicuous part in the battles of Pensacola and New Orleans, was brevetted major, 25 Dec. 1814, acted as aide-de-camp to General Jackson from 17 June 1816 to 31 May 1817, when he tendered his resignation, resuming for the next 25 years the profession of the law. From 1839 to 1843 he served as a representative in Congress from that district, in the interests of the Democratic party. Nominated as a candidate for governor of Kentucky in 1844, he was defeated by the influence of Clay. Created major-general, 29 June 1846, he led with great spirit the daring charge at Monterey, and although wounded on that occasion, still remained for several months with the army. On 18 Feb. 1848 he succeeded General Scott in command of the army in Mexico. The most important operation during his tenure of this office was the defeat of Padre Jarauta and his guerrilla forces by General Lane. His military administration in Mexico was brought to a close on 29 May 1848, when he announced the ratification of the treaty of peace. After his return to the United States he was nominated in 1848 by the Democratic party as candidate for the vice-presidency. He was the author of 'The Elements of History and Other Poems.' Consult Blair, 'The Life and Public Service of William O. Butler' (Baltimore 1848).

**Butler, Zebulon**, American military officer: b. Lyme, Conn., in 1731; d. Wilkesbarre, 28 July 1795. He served in the French and Indian War, and in the Revolution. He commanded also the garrison at Wyoming Valley at the time of the massacre of 3 July 1778, and in 1779 served in Sullivan's expedition against the Indians.

**Butler, Mo.**, city and county-seat of Bates County, 75 miles southeast of Kansas City, on the Missouri Pacific Railroad. Agriculture and coal-mining are the principal industries. The city owns and operates the sewerage system and the electric-lighting plant. Pop. 2,894.

**Butler, Pa.**, borough and county-seat of Butler County, situated on the Connequossing Creek, and on the Pennsylvania and other railroads, 30 miles north of Pittsburgh. It is the centre of a region having coal, iron, oil and natural gas. The chief industry is glass manufacture, and there are also flouring and planing mills, oil-well supply manufactories, also of silk, buttons, carriages, paint, beds of metal. Its noteworthy buildings are a hospital, courthouse and public library. Butler was first settled in 1778 and was incorporated in 1863. The government is vested in a burgess and council, the former being chosen for a three-year term. Pop. 20,728.

**Butler University**, a coeducational (non-sectarian) institution in Irvington, a suburb of Indianapolis, Ind.; organized in 1835 as Northwestern Christian University. Its departments include an undergraduate college, a normal course, departments of art and education, a summer school and extension courses. It has about 540 students, 19 instructors, a library of 13,000 volumes, an endowment of $395,000, an income of $45,000 and property valued at $212,000.

**Butlerov, Alexander Mikhailovich**, Russian chemist: b. Tchistopol, Kazan, 1828; d. Saint Petersburg 1886. He received his university training at Kazan, and was successively professor of chemistry and rector there after 1858. After 10 years at Kazan he removed to Saint Petersburg as professor of chemistry at the university there. He did very important work in organic chemistry, discovered the tertiary alcohols and wrote a masterly treatise on organic chemistry. He believed in spiritualism and is the author of a French work entitled 'Etudes psychiques.' He also contributed to the literature of apiculture.

**Buto**, an Egyptian goddess whom the Greeks identified with Leto or Lathos. She was represented under the guise of a serpent, and the city of Buto, which took its name from her, is supposed to have occupied a site on an island in the modern Lake Burlos in the delta of the Nile.

**ButoN**, boot'ôn, BOETON, or BU-TUNG, an East Indian island, southeast of Celebes, belonging to Holland. Its area is about 1,700 square miles. It is fertile and densely wooded, and is governed by a native chief, subject to the Dutch government. The chief products are copra, rice and maize. The population, mainly Malays, is about 100,000. The chief town is ButoN at the southwestern end of the island.

**Butschli, bút'lesh, Otto**, German zoologist: b. Frankfort-on-the-Main 1848. Since 1878 he has been professor of zoology in the University of Halle. He was the first to establish knowledge of nucleus and cell division, and his writings upon protoplasm
and bacteria have been widely read and discussed. He has published 'Protozoen'; 'Untersuchungen über mikroskopische Schäume und das Protolasma' (1892); 'Untersuchungen über die Mikrostruktur künstlicher und natürlicher Kieselsäuregallerten' (1900); 'Mechanismus und Vitalismus' (1901); 'Vorlesungen über die vergleichende Anatomie' (1910).

BUTT, Archibald Willingham, American army officer: b. Augusta, Ga., 26 Sept. 1866; d. 15 April 1912. He received his education at the University of the South, became a newspaper correspondent for some years and in 1900 was made captain of volunteers. Afterward he received a commission in the regular army, served as quartermaster in the Philippines, Washington and Havana. In 1911 he was made a major. He was personal aide to President Roosevelt in 1908, and to President Taft from 1909 till his death on the Titanic, returning from Europe. Washington is graced with a fountain in memory of him.

BUTT, Isaac, Irish politician; the first to make political use of the phrase "Home Rule"; was the son of a Protestant rector: b. County Donegal, 16 Sept. 1813; d. 5 May 1879. Educated at Raphoe and at Trinity College, Dublin, he gained a brilliant reputation for his accomplished scholarship. In 1852 he was elected to Parliament as a Liberal Conservative for Youghal, for which constituency he sat until 1865. He defended Smith O'Brien and others in the state trials of 1848, and with equal fearlessness and self-devotion all the Fenian prisoners between the years 1865 and 1869. In 1871 he was elected for the city of Limerick to lead the Home Rule party. He published 'History of Italy' (1860) and 'The Problem of Irish Education' (1875).

BUTTE, but, Mont., city and county-seat of Silver Bow County, on the Great Northern, the Northern Pacific, the Chicago, Milwaukee and Saint Paul and other railroads. It is on the high plateau between the Rocky Mountains and the Bitter Root Mountains, 5,800 feet above the sea-level. The city is well-built, the more imposing buildings being the city hall, courthouse and jail, opera-house, the Federal building and at the public high school, completed at a cost of $125,000. The Montana State School of Mines is located here. It has several fine theatres and a good public library. The Columbia Gardens also deserve mention. The public school system is excellent, and there is a public library of more than 35,000 volumes. Butte is the largest mining town in the world, employing thousands of persons in this industry alone. Copper is the chief production, although there are valuable deposits of gold and silver, lead and zinc. The Great Anaconda Copper mine is here, and many other valuable mining properties are within a radius of a few miles of the city. The copper production alone is about 25 per cent that of the United States and 13 per cent that of the world, and the total annual mining output is over more than $60,000,000. Probably no city of equal size in the country is so exclusively given over to a single industry. It has also manufactories of candy, cigars, mattresses and other minor industrial industries. There were 108 establishments with $2,393,000 capital, employing 904 persons. The salaries and wages amounted to $890,000.

The products were valued at $2,907,000 and were made from materials costing $1,317,000.

Butte is the trade and shipping center for southern and western Montana; has an extensive trolley system; gas and electric lights; national and other banks; and several daily and weekly newspapers. Butte is governed by a mayor, elected biennially, and a city council. It spends annually about $300,000 for schools and about $50,000 each for the fire, police and street-cleaning departments. Butte was settled as a gold-placer camp in 1863, laid out as a town in 1866, and grew rapidly after the successful opening up of quartz mining in 1875. It was incorporated by the territorial legislature in 1879, and reincorporated in 1888. In 1881 it was made the county-seat of Silver Bow County. Pop. in 1870 about 300; (1880) 3,363; (1890) 10,725; (1900) 30,470; (1910) 39,165; (1918) about 75,000. If suburbs are included, Consult Davenport, 'Butte and Montana beneath the X-ray' (Butte 1909); Freeman, A Brief History of Butte (Chicago 1900).

Butte, a hill which rises abruptly from the surrounding ground. Such hills are common in the region of the coal-fields, and the term is sometimes applied to high mountains which are more or less isolated from other peaks. See Mesa.

Butter, a product of milk, particularly cow's milk, consisting chiefly of its fatty constituent. It is obtained by churning or otherwise violently agitating milk, or by working the product to remove water and other constituents. Butter fat is not a simple fat, but is a mixture of several fats, which are individual compounds of glycerine and several distinct fatty acids. The principal fats in butter are olein, which constitutes 35 per cent; palmitin, 26 per cent; and myristin, 20 per cent. Laurin, butylin and caproin are present in much smaller proportions, and there are also very small percentages of caprin, stearin, caprylin and other constituents. It has a specific gravity of 0.91 and a melting point of about 92° F.

Butter has been in use from early historic days. It is first mentioned in the Bible in Gen. xxviii. 8. It was used as food and medicine, as an ointment and for the purification of the Greeks probably learned of it from the Scythians or Thracians, and the Romans from the Germans. It was made from the milk of sheep and goats, and later of cows, the method of making being to jear the milk roughly by placing it in skin bags or pouches hung over the backs of trotting horses. Formerly butter was prepared by direct churning of the whole milk; this was both laborious and wasteful of butter fat. To reduce labor and loss the system of setting the milk and skimming off the cream was evolved; since 1877 this method has given way in considerable measure to the use of centrifugal force for the separation of the cream and milk.

The making of good butter begins with the cow. She must be healthy and be well fed. The essential next in importance is absolute cleanliness in the care of the milk. The dairy utensils should be of tin, and never used for any but dairy purposes. They should not be continued in use after the tin plating begins to wear off. They should be washed with a brush,
sever with a cloth, and with hot water and salt soda or borax, and not with soap. The final rinsing should be with boiling water, after which they should be drained and allowed to dry without washing. The process of making butter is divided into the operations of creaming, churning, working and finishing. The fat exists in the form of small globules in the milk, in suspension. In the setting system the milk is placed in shallow pans about four inches high, or in deep ones of about 18 inches, and advantage is taken of the fact that the fat globules, being lighter than water and other constituents of the milk, rise to the surface by the action of gravity. Large fat globules will rise more rapidly than small ones, and the size of the globules varies with different breeds of cattle. In the milk of Jersey cattle they are 1/8000 of an inch in diameter; in Holstein cattle 1/12000 of an inch in diameter. In the shallow pan system the milk is set as soon as possible after it is drawn, and the cream is skimmed off in 2 1/2 to 30 hours. This system is wasteful in that the skim-milk often contains 0.5 to 1.5 per cent of fat. The deep-setting system is less wasteful; the fat in the milk being often reduced to 0.2 per cent. The new-drawn warm milk is placed in cans surrounded by or submerged in water of about 40° F., and the rapid reduction in temperature causes the globules to rise quickly. It is best to skim the cream at the 30th hour; that is, 10 gallons of milk should yield 1 1/2 gallons of cream. The cream is removed by dipping it off, or the skim-milk is drawn off from the bottom of the can. The fat left in the skim-milk consists of the smallest fat globules.

The introduction of the separator and use of centrifugal force has resulted in a more perfect and rapid separation. This force exceeds that of gravity a thousand-fold. The system of separation is continuous, a constant, uniform flow of milk being conducted into a bowl or drum revolving at 5,000 to 9,000 or more revolutions per minute. The inlet tube is in the center of the bowl and reaches almost to the bottom; here the constituents in the milk separate, the heavier serum gravitating to the circumference of the bowl and the lighter portion — remaining in the center. These are forced upward by the incoming milk, and the separated milk escapes through a side tube, while the cream passes through a small outlet in the center. This last outlet can be closed or opened in some machines, thus regulating the percentage of fat in the cream. The machines are of various sizes, from those worked by hand power and doing 200 to 500 pounds of milk per hour, to power machines of 2,000 pounds and over per hour capacity. Some makes have appliances within the bowl to increase the efficiency. A good separator, well run, will not leave more than from 0.05 to 0.1 per cent of fat in the separated milk. The temperature should be kept between 85° and 95° F. for the best results and the speed should not lag.

The cream may be churned at once if sweet cream butter is desired, or "ripened" or soured. The aim of ripening is to develop certain flavors and to produce a kind of acidity which aids in churning and influences the texture. Since the discovery that the changes which commonly take place in milk are due to the action of micro-organisms, it has become part of the butter maker's task to make use only of such organisms as will aid in his work, and eliminate those which tend to impair the product. It has been found that the flavor of butter depends in very large degree upon the kind of bacteria which accomplishes the souring of the cream preliminary to churning. The scientific butter maker, therefore, prepares a "culture" of the beneficial bacteria, keeping it free from all others. In the usual procedure of butter-making on the farm, a "starter" used to start the acid fermentation in the newly skimmed cream, is saved from the preceding batch of sour cream, or from the buttermilk of the preceding churning. This naturally contains a mixture of many bacterial ferments, and too often a large proportion of those which are injurious to butter quality. It is advisable to make the starter out of sweet skim-milk, two or three gallons for each 10 gallons of cream, to be soured. Place it in a covered vessel in a temperature between 75° to 85°. It will require from 18 to 24 hours to become thick. It should be distinctly but pleasantly acid. The top inch should be rejected, as it contains the undesirable bacteria. It is not always possible to obtain the starter from the milk of a mixed herd. In this case it is best to make the starter from the milk of one cow chosen after experiments as to which milk makes the finest flavored butter. Or, as is the habit in many dairies, a pure culture may be purchased (by mail) from the nearest agricultural experiment station and a "mother culture" established from that. One of the essentials in making good butter is the proper care of the cream after churning; if it is to be churned the next day it should be mixed at once with the starter and placed in a temperature of 65° to 70°. If it is to be churned the second day, it should be cooled to 55° to 60°; and if not till the fourth day, it should be cooled to 40° F. Warm cream, fresh from the separator, should never be added at once to the cooled cream; it should first be cooled to the proper keeping temperature. The starter should be mixed in at such a time that the cream will reach the desired degree of acidity by the time it is desired that the degree of acidity may be determined by various tests. The most effective acidity is from 0.6 to 0.7 per cent. When possible it is advisable to pasteurize the milk or cream. This is accomplished by heating the milk to 145° F. for 30 minutes, then rapidly raising it for a moment to 185°, and then rapidly cooling it to 75° or 80°. This destroys about 98 per cent of all the bacteria. It does not, however, destroy the spores, and when making pure cultures of lactic acid bacteria, it is the rule to repeat the pasteurization daily for four days. Into the pasteurized cream is stirred the starter, 18 to 24 hours before the churning is planned, the cream meanwhile being held at a temperature of 52° to 54° in summer, and 58° to 62° in winter. The cream should be strained into the churn, and the churn should be not more than one-third full. A box or barrel churn is the best, and the churning should not be too fast, the idea being to keep the liquid measurably in one body which is thenmercifully from one end of the churn to the other. In the dasher churns much of the cream is overchurned, producing a greasy butter. When the granules of
butter are fairly uniform in size and have the general appearance of cracked corn, the churning is done. It takes about 30 minutes. The buttermilk should be separated quickly, and the butter washed with about the same quantity of water as there was cream in the beginning. Too much water will yield a tasteless butter. The butter is then to be worked by pressure, newly by a rubbing motion, which destroys the grain. A wedge-shaped or square butter-worker is preferable. The butter is usually salted immediately after washing, and before working, the amount of salt used being about one and one-half ounces to the pound of butter. When the washing is done in the churn, the salt is sometimes added in the form of brine composed of one pound of salt to two pounds of water for each 10 pounds of butter. The churn is then set in operation for two or three minutes, and the butter is allowed to stand 15 minutes in the brine before working.

The most common defects of farm-made butter are: (1) Rancidity, due to the cream being too old, or too sour, or having been kept too warm before churning; (2) foul flavor, from the being allowed to absorb bad odors; and (3) "mottles," from buttermilk being worked into the butter instead of having been worked out. Scrupulous cleanliness and attention to details from the feeding of the cows to the placing of the product on the market are imperative. See Butter Worker; Churn; Dairy Industry.

The composition of butter varies. It ranges from 78.88 per cent to 88.41 per cent of milk fat; 7.22 per cent to 15.62 per cent of water; 1.03 per cent to 3.32 per cent of casein, and 1.34 per cent to 4.16 per cent of salt. The best butter has a content of 85 to 86 per cent of milk fat and from 13 to 14 per cent of water.

The quality of butter is judged by its flavor, texture, color, amount of salt and general appearance. Flavor counts about 45 per cent of the points, and varies with the market. Some markets require a mild, delicate butter; for the supply of such the cream is often pasteurized: others require a high flavor, almost verging on rancid. Whitening of the milk or to absorb bad odors should be pronounced, with an absence of rancidity or other flavors. Texture carries 25 per cent of the points and depends upon the granular condition of the fats. The more distinctly the granules show up when the butter is broken the better the texture. The right color depends upon the market requirements; usually a bright golden yellow, as naturally yielded when cows are on grass, is considered ideal. It should be uniform. To ensure this, it is sometimes necessary to use some butter-color: formerly the main one used was arnott; now the coal-tar colors, aniline yellow and butter yellow are used. The vegetable coloring matter is usually dissolved in some oil, and this often gives a peculiar flavor to the butter, so that the coal-tar colors are preferred. Some South American countries require the butter to be a deep orange or red color. A small quantity of salt is often added to improve the palatability; it has little influence on the keeping qualities. The amount varies with trade requirements. Unsalted or slightly salted butter is largely used in Europe and the United Kingdom. The finish and packing of the butter should be attractive and neat. The styles are numerous, but attempts are being made to standardize them. The American butter-tub is generally used here. It holds from 50 to 70 pounds. In Canada and Australia a box holding 56 pounds is used for the export trade. The Danes ship their butter in firkins containing 112 pounds. For local trade the standard rectangle pound print is 4½ x 2½ x 2½ inches. These are wrapped in parchment paper and packed in specially made boxes.

Oleomargarine is the most common adulterant, and its detection, especially when present in only small amounts, is difficult. Cottonseed and other oils have been used. Glycogen has been added to increase the water-holding capacity of the butter, and in butters for South America glucose has been added as a preservative. The various preservatives, as borax, boracic acid, etc., sold under their own and other names, are now prohibited as adulterants.

Renovated or process butter is but low-grade butter which has been melted and put through a chemical process to remove the disagreeable odors and taste; sometimes it is then mixed with soured or separated or whole milk or cream; and from 6 to 10 per cent of fat is added. If the primary article is not too inferior, the resulting product can be sold as good creamery butter; generally its keeping qualities are impaired. In some States and in the United Kingdom all butter so treated must be distinctly branded "Renovated."

During the year 1850 the amount of butter made on farms in the United States was 313,345,306 pounds. As reported by the United States Census of manufactures for 1914 the production of butter in that year amounted to 786,013,489 pounds, valued at $223,179,254, as compared with 627,145,865 pounds, valued at $180,174,790, in 1909, representing an increase of 25.3 per cent in quantity and 23.9 per cent in value.

The farm production of butter (including that made for home consumption) is probably greater than the factory output, and a relatively small quantity of cheese is also manufactured on farms. Statistics in regard to the farm output of these cheese is not sufficiently collected. If the annual cheese output is not less than 200,000 pounds per year once in 10 years. At the census of 1909, 994,650,610 pounds of butter were reported as made on farms. These amounts represented decreases in the decade of 7.2 per cent and 42.6 per cent, respectively, as compared with 1899.

The value of that made on farms ranged in 1919 from 21 cents to 32 cents per pound, depending on location more than upon quality. Creamery-made butter brought from 24 cents for ordinary to 38 cents for extra fancy. The lower prices were generally those in the summer months and the highest ones of midwinter. The cost of transporting the milk to factories is about 1.5 cents per pound of butter. Denmark is at present the leading butter-exporting country of the world, with a record of almost 165,000,000 pounds, valued at $37,000,000, the average price being the highest on the market. The butter exports of the United States in 1915 amounted to 9,850,704 pounds.

The coefficient of digestibility of butter-fat is 96 per cent or over. It is well assimilated, and, like other fats, is a source of heat and energy. Its value as a food and methods of usage are well known. Butter containing 82.4 per cent butter-fat has a fuel value of per pound of
of 3,475 calories, and in a number of dietary studies butter furnished 1.9 per cent of the total food, and 19.7 per cent of the total fat of the daily food. Further information is given in Professor Atwater's reports on dietary studies. Fresh and salt butter are equally valuable. Clarified butter is used in cooking. It is ordinary butter freed from water by heating.

**BUTTER, Artificial.** See OLEOMARGARINE.

**BUTTER-BUR** (*Petasites petasites*), a composite plant, with large rhubarb-like leaves and purplish flowers, growing by the side of streams, allied to coltsfoot. The flowers appear before the leaves. It is a native of Europe, but has become naturalized in a few localities in the eastern United States.

**BUTTER-COLOR,** a preparation employed to color butter and its imitations. Anatto was formerly largely used for this purpose, but is now superseded by coal-tar colors and other coloring substances such as tumeric, saffron, marigold leaves, carrot juice and chrome yellow. Owing to the small quantities used in coloring butter they are quite harmless.

**BUTTER AND EGGS,** a troublesome weed. See TOAD-FLAX.

**BUTTER-FISHES.** The two best known butter-fishes in American waters are denizens of the coast of Massachusetts and New York, the harvest-fish of New Jersey, the dollar-fish of Maine, the sheepshead of Cape Cod, the pumpkinseed of Connecticut and the star-fish of Norfolk. It swims mostly in company with large jelly-fish, whose streamers, while often protecting it from other depredators, are frequently the cause of its death from their stings. The body is ovate and flat, the dorsal and anal fins are each very pointed, and the tail is long and widely forked.

The harvest-fish (*Pepirilus paru*) is another *butter-fish* found from Cape Cod southward to Brazil, but it is most abundant about the mouth of Chesapeake Bay, where it is locally called 'poop].' It has the habit of swimming beneath the Portuguese man-of-war. It is a delicious little pan-fish, about six inches long. On the Pacific coast there are three species, one of which (*P. simillima*) is the Californian 'pompono,' abundant during summer about Santa Cruz, where it is highly prized for its rich and delicate quality, and reaches 10 inches in length. Consult Jordan and Evermann, 'American Food and Game Fishes' (1902).

**BUTTER-MAKING.** See BUTTER.

**BUTTER-TREE,** various tropical or subtropical trees of different genera and even families. Their seeds yield fixed oils which resemble butter and are similarly used or are employed for lighting. The leading group is perhaps the genus *Butyrospermum* of the family *Sapotaceae.* Of this genus the best-known species are *B. longicorne,* the butter-tree, whose wood resembles teak, and is in use in the East; *B. butyricum,* the Indian butter-tree, whose light wood is of no commercial importance; and *B. latifolium,* the East Indian Mahowa, Mahwa or Madhuca. Besides the oil obtained from each of these trees, *B. butyr- cecum* yields an edible fruit, and the corollas of *B. latifolium* are either eaten raw or are used for making a liquor or for distilling their essential oil. *Butyropermum parkii* is the butter-tree of central Africa. It yields the galm or shea butter, obtained by boiling the seeds, which is locally an important article of commerce. The oil is obtained by boiling the kernels of the sun or kiln-dried seeds in water. It possesses long keeping qualities. Various species of the genus *Caryocar* (q.v.), natives of South America, are known as butter-trees.

**BUTTER-WORKER,** a machine designed to unite the small particles of butter, remove the buttermilk and water and incorporate the salt, giving the product a uniform appearance. Hand and power machines are made, the large power workers being also used for blending butters to make them uniform. The makes are variable and numerous; some being combined with a churn, the butter not being removed until it is finished. The former method of working by the hands injured the texture of the product and was too slow. With the present machinery the butter is untouched by hand, can be held at a temperature of 45° to 55° F. during working and is handled expeditiously. They are a necessity in all creameries and dairies where butter is made in large quantities. See also BUTTER; CREAMERIES; DAIRYING.

**BUTTERCUP,** the popular name of two or three species of the *Ranunculus* (q.v.).

**BUTTERFIELD, Daniel,** American soldier: b. Utica, N. Y., 18 Oct. 1831; d. Cold Spring, N. C., 17 July 1901. In 1849 he was graduated at Union College, and for some years engaged in the transportation and express business. At the outbreak of the Civil War he was colonel of the 12th New York Militia. He served in the Peninsular campaign and under Pope and McClellan in 1862. At Fredericksburg he commanded the 5th Corps, and at Chancellorsville and Gettysburg was chief of staff. He served as chief of staff to Hooker at Lookout Mountain, and Ringgold and Pea Vine Creek, and commanded a division at Buzzard's Roost, Resaca, Dallas, New Hope Church, Kenesaw, Lost Mountain and other battles. He was brevetted major-general in the regular army. He resigned in 1882, and served as chief of the United States sub-treasury in New York. He organized and commanded the Washington centennial parade in New York city in 1889, in which over 100,000 persons took part. He was author of 'Camp and Outpost Duty' (1862). He is buried at the U. S. military cemetery, an elaborate and costly marble tomb marking the spot. Consult Butterfield, (Mrs. J.), 'Biographical Memorial' (New York 1904).
BUTTERFIELD, Kenyon Leech, American educator: b. Lapeer, Mich., 11 June 1868. He was educated at the University of Michigan and at the Michigan Agricultural College, and became assistant secretary of the latter in 1883 and later professor of entomology. In 1892 he began to edit the Michigan Groge Viscan and in 1896 became head of a department of the Michigan Farmer. From 1893 to 1899 he also served as superintendent of the Michigan Farmers' Institute and field agent for the Michigan Agricultural College. In 1902-03 he was instructor in rural sociology at the University of Michigan, and in the latter year was named president of the Rhode Island College of Agriculture and Mechanical Arts. In 1906 he was made president of the Agricultural College of Massachusetts. He published 'Chapters in Rural Progress' (1906); 'The Country Church and the Rural Problem' (1911) and contributions on professional topics in agricultural periodicals.

BUTTERFIELD, William, English architect: b. 7 Sept. 1814; d. London, 25 Feb. 1900. He first attained distinction by the introduction of color into ecclesiastical buildings with the aid of bricks and mosaic. Among the notable structures designed by him are Saint Augustine's College at Canterbury; Keble College, Oxford; All Souls' Church, Margaret street, London; and the cathedral at Melbourne.

BUTTERFLY, one of the day-flying Lepidoptera of the sub-order Rhopalocera (compare Moth). This group is distinguished from the moths by the slender, knobbed antennae, which are never hairy or pectinated. The body is small, but there is a greater equality in the size of the three regions (head, thorax and abdomen) than in the moths, the abdomen being much shorter and smaller, as a general rule, than in the lower families of Lepidoptera. The ocelli are usually wanting; the spiral tongue is long, and the broad wings are carried erect when in repose, and are not held together during flight by a bristle (frenum) and socket as in most of the moths.

The caterpillars (larvae) vary greatly in shape and in their style of ornamentation, but they uniformly have, besides the thoracic legs, five pairs of abdominal legs. The pupa is called a *chrysalis* or *aurellan* from the bright golden hues that adorn it in many species, but disappear as the wet tissues beneath the pupa-skin harden, just before the fly appears. A few species, such as those of the genus Vanessa, hibernate, while several species, such as P. antipa, are social as young larvae. Butterflies also occasionally swarm while in the perfect state, such as species of Colias, Cynthia and Danais, multitudes of which are sometimes seen passing overhead in long columns. One of the North American species, and others elsewhere, are migratory, flying southward in autumn.

Butterflies are found in all parts of the world except the coldest, wherever plants exist suitable for food for the caterpillars, but they are most numerous both in species and in individuals within the tropics, and especially in South America. In 1300 species have been described, and it is believed that twice or three times this number are in existence. About 1,000 species inhabit North America. Butterflies are especially liable to local variation, and to seasonal and dimorphic changes, so that entomologists have recorded many sub-species and temperature-forms.

Certain Nymphalidae have glands at the end of the body secreting a repulsive fluid (see Mimicry); in others there are remarkable differences between the sexes; in certain butterflies (Androconia) some of the scales arebattle-dored-shaped, and secrete a special odor. The species of Agrippa, a South American genus, make a clicking noise when flying. While caterpillars are plant-eaters, those of several Lycaenidae are known to be carnivorous, feeding on plant-lice and scale-insects.

The eggs of butterflies have a membranous shell, and exhibit much variety in form and character of surface. Sometimes, they are ribbed. Between these ribs there is frequently found a fine network of raised lines, variously arranged. Sometimes the surface is covered with small pits, sometimes with a series of minute elevations variously disposed. The color is most often greenish white, but many are brightly colored, or have lines and dots of color. Another peculiarity is the minute opening (micropyle) in every egg, by which the spermatozoon may enter. The eggs are laid by the female on a plant that will afford suitable food for the caterpillar when it hatches. They may be deposed singly or in small or large masses; and those that will not hatch until after the following winter are protected in some way, as by a varnish, or otherwise, against the weather. Some butterflies are *single-brooded* others lay eggs twice or more in a season, the early layings hatching quickly and the last lot surviving the winter to establish the species in the succeeding spring. Few adult butterflies survive the advent of the cold season in the North, the species continuing through the survival of eggs, larva or pupa, the last sometimes by burial in the ground.

The caterpillars of butterflies are typically cylindrical and worm-like in form; but some are short and slug-shaped, or irregular in outline. The head is distinct, often large and formed of hard (chitinous) plates, and it bears horn-like projections or protrusible appendages. The thin skin is in many cases brightly ornamented with colors similar to those worn later by the adult fly (imago); but green and gray prevail — tints inconspicuous among the leaves and grasses on which most of the species feed. Most caterpillars live solitary lives; but in some species they are gregarious, and even weave large silken dwelling-places in which they live as a colony.

Caterpillars secrete a cocoon or chrysalis, covering the skin, which from time to time cracks, enabling the creature to crawl out of it, and to begin another period of growth with a new and elastic skin that has formed beneath the old one. Four or five of these molts take place as a rule. When the larva is to hibernate, it usually does so after the first or second molt, and resumes feeding and growth when it wakes up in the spring.

One great distinction between moths and butterflies is in the form and structure of the pupa — that quiescent stage of development in which the caterpillar is transformed to the imago. The term chrysalids is usually applied to the pupa of butterflies, because no such a
1 Amblypodia Amantes

2 South American Silk Moth
3 Chinese Silk Moth
4 Ailanthus Moth
coconut as is common among moths enwraps them. They are naked and hang free from the underside of some support, as a twig or stone, on trees, or trees, in every continent of a tree-trunk, attached to a "button" of silk, and held in place by a girdling thread of silk. Chrysalids are usually protectively colored.

The families of butterflies are few, and all of them, except one small tropical group (Libytheid), are represented in every continent. Following is a list of the five families recognized by American entomologists, beginning with the most primitive and ending with the most specialized: (1) Hesperidae, (2) Papilionidae, (3) Lycaenidae, (4) Lemonidae, (5) Nymphalidae. In the last three families, which comprise the majority of butterflies, the first pair of legs is more or less modified, differing from the two hinder pairs, especially in the male nymphalids, in the more or less aborted tarsi, or toe-joints.

The Hesperidae, or "skippers," have a worldwide range except New Zealand, and are largely represented in the United States. This family contains small, prevalently brown butterflies, with slender bodies and broad, pointed heads, the feelers hooked at the tip. The fore-wing is triangular and pointed in shape, and the prevailing color is brown. The hesperids are remarkable for their short, jerky flights. The pupa is enclosed in a light, silky cocoon called "swallow-tails" from the prolongation of the hind wing in many of them. Yellow is a prevailing color, usually ornamented with black, red-brown or some other dark tint. The wing-neuration differs characteristically from that in other families. All six feet are present in both sexes. The caterpillar is cylindrical, elongate and never hairy, but often tuberculate, and is provided with a retractile tentacle behind the head, which in some species emits a highly disagreeable odor of protective value. The pupa has two anterior projections called "nosehorns," and hangs to its food-plant by its anal extremity, sustained by a loose girdle. This family is distributed throughout the world.

The Lycaenidae are a very large family of small or moderately sized butterflies with slender bodies, the feelers placed close together, and the front feet aborted in the males. The caterpillars are short and hairy, resembling woodlice in shape. The pupa has a well-marked "waist," is clothed with hairs or bristles, is attached to a pad of silk by the cremaster, and is girdled with a silken thread. This family occurs in all parts of the world, and its members are known, on account of their prevailing hues, as "blues," "coppers" and "hair-streaks." In alighting they always fold their wings upright.

The Lemonidae are a small family related to lycænids, which contains brilliant butterflies mostly confined to tropical America, a few bright-brown species, the "metal-marks" of the subfamily Erycinina, occurring in the southwestern United States.

The Nymphalidae embrace a group called "four-footed" or "brush-footed" butterflies, because the foremost pair of feet in both sexes are dwarfed, hairy and held folded up against the body. This is the largest and most prominent of butterfly families, is very ancient and is much subdivided in classification. The caterpillars vary much in form, and some are hairy, or armed with spines or tubercles. The pupa hangs by its "tail," but is not sustained by a silken girdle-thread. The nymphalids are represented in all countries, but most unusually and strikingly in tropical America.

ERNEST INGERSOLL.

BUTTERFLY-FISH, or CORAL-FISH. These beautiful fish represent the large family Chaetodonidae and its allies of the scaly-finned group (Squalidae), and they obtain their English names from their oval form, brilliancy and their quickness of movement, and the fact that their principal habitat is in and around the tropical coral-reefs. They are so compressed as to resemble the "pumpkinseed" sunfishes of the ponds, and are aided in keeping their balance by a very high, arched dorsal fin and an anal fin extended beyond the tail. Their colors are always gay, usually rich orange-yellow, as a ground tint, set off by broad, black bars and thin ornament of variety, besides blue and red touches. The type-genus Chaetodon is represented by several species in the West Indies, and southward, some of which occasionally drift northward in the path of the Gulf Stream. More numerous in American waters is the "black-angel" (Pomacanthus arcuatus), common around Porto Rico and at Key West, where it is caught in traps, or sometimes speared. The "blue-angel" (Holacanthus ciliaris) represents a genus containing several West Indian species, of which the most important is the "rock beauty" (H. tricolor), often exceeding a foot long, and good food, as well as most beautiful. The name "angel-fish" is also given in Bermuda to several similar fishes of the genus Angelichthys, called in Spanish "isabelitas." All these fishes are carnivorous, and Jordan remarks that their excessive quickness of sense and motion enable them to maintain themselves in the struggle for existence in the close competition of the coral reefs, notwithstanding that they are made so conspicuous to their enemies by their bright colors. Consult Jordan and Evermann, 'Food and Game Fishes of America'.
**BUTTERFLY PLANT** — BUTTMANN

**BUTTERFLY PLANT**, an orchid (*Oncidium papilio*) brought from Trinidad. It is so called because its large yellow and red blossoms, poising on slender flower stalks and vibrating with every breath of wind, resemble butterflies hovering on the wing. It is also applied to the Indian butterfly plant, *Phalaneopsis amabilis*, which is another orchid.

**BUTTERFLY-WEEED** (Pleurisy-root), a handsome American perennial herb (*Asclepias tuberosa*) of the family *Asclepiadaceae*, common in dry ground almost throughout the United States and southern Canada. The large, irregular, yellowish-brown, tuberous roots have a nauseous, bitter taste when fresh, merely bitter when dried, and are reputed useful in lung and throat troubles, rheumatism, etc., but seem to be less popularly used than formerly. It is usually administered as a decoction, fluid extract or at times as a powder. The hairy stems, which rise to a height of two or three feet, bear alternate oblong-lanceolate leaves, and several umbels of short-peduncled, bright orange-yellow flowers followed by erect pubescent pods. Unlike other members of the genus, this plant has not a milky sap.

**BUTTERINE**, a substance prepared in imitation of butter, from animal or vegetable fats. The fat is first freed from all impurities, and by heat converted into olein. The olein is then transferred to a churn containing a small quantity of milk and churned into butterine. Sometimes it is colored in imitation of butter. Freshly prepared, it is sweet and palatable, and when spread on bread or cold toast is but slightly inferior to a fair quality of butter. The process has attained such perfection in the matter of manufacture in the United States that it takes an expert to distinguish it from genuine butter, and laws have been passed compelling tradesmen to label each package containing it so that no one may be deceived. See OILMARIGARINE.

**BUTTERMILK**, the fluid left behind after churning milk for butter. It possesses a specific gravity somewhat higher than ordinary milk, owing to the removal of most of the fat, and varying between 1.032 and 1.035 per cent at 59° F. It may be fresh or sour, according to the method of churning. It should not contain more than 0.5 to 0.6 per cent of butter-fat. Its composition is variable, an average of 85 analyses being: Water, 90.1 per cent; casein, 3.0; fat, 1.1; protein, 4.0; milk sugar and lactic acid, 4.0; ash, 0.7 per cent. Its chief matter is usually all digestible, and it is a healthy and nutritious beverage, much relished by many people. Its fuel value per pound is 165 calories. It has about the same value as skim-milk for pig-feeding, and is used in conjunction with corn meal or some other grain, excellent pork being produced. It is also used for calf-feeding, although failures are reported in the undertaking. In fattening poultry it is highly esteemed. See BUTTER.

**BUTTERNUT** (White Walnut), a large spreading tree (*Juglans cinerea*) of the family *Juglandaceae*, native of America, where it ranges from New Brunswick to Georgia and westward to the Dakotas and Arkansas. It sometimes attains a height of 100 feet but usually varies from 50 to 80. It has smooth, gray bark, large compound pubescent leaves, small flowers, followed by oblong, pointed, ribbed green nuts covered with viscid hairs. The ripe nuts when dried have very hard shells and are highly prized for dessert in regions where the trees grow; and the green nuts are used for making pickles. The bark of the stems has been used in dyeing and that of the root in medicine. The wood is used to some extent for cabinet work and interior finish of houses, but is less popular than black walnut. An inferior sugar can be made from the sap. The tree is not quite so attractive as the walnut and is less densely covered with foliage, but is less attacked by insects.

**BUTTERWORT**, a genus of about 30 species of small succulent plants (*Pinguicula*) of the family *Lentibulariacae*, widely distributed throughout the world in bogs and other wet ground. The species have rosettes or tufts of leaves, from among which single-flowered scapes rise to a height of a foot or less. The short, thick, stick-haired leaves attract small insects which are covered by the in-rolling leaf-margins and digested. The leaves of certain species, especially of the common butterwort (*P. vulgaris*) are used like reconstitute milk, and thus form a favorite food in Lapland and the Alps. The milk (reindeer milk in Lapland) is poured upon the leaves, strained, allowed to stand 48 hours, or until creamy and somewhat acid, when it is ready for use as food or for impregnating other purposes. This property is said by some authorities to account for the English name, but others attribute the name to the buttery feeling of the leaves. Several species are cultivated for their dainty flowers, and as curiosities on account of their carnivorous habits, but they are rather difficult to manage unless conditions are naturally right. They are less popular in America as greenhouse plants than in Europe. Several species are natives of the United States.

**BUTTERWORTH**, Hezekiah, American story writer and poet: b. Warren, R. I., 22 Dec. 1839; d. there, 5 Sept. 1905. He was editor of the *Youth's Companion*, 1871-74. He published many popular juvenile stories and travels, including *Zig-Zag Journeys* (1876-90); *Songs of Historical Domes and Baliads Upon Important Episodes in American History* (1887); *The Wampum Belt, or the Fairest Page of History* (1896); *A Knight of Liberty*; *The Patriot Schoolmaster*; *Poems for Christmas, Easter, and New Year*; *The Boyhood of Lincoln*; *Boys of Greenway Court*; *In Old New England*; *Traveler Tales of China*; *Over the Andes*; *Great Composers*; *South America*; and many others.

**BUTTMANN, Philipp Karl**, German scholar: b. Frankfort-on-Main 1764; d. Berlin, 21 June 1829. He was educated at the University of Göttingen and in 1789 was made assistant at the Berlin Royal Library, later becoming secretary and librarian. From 1796 to 1808 he also held a chair in the Joachimsthal Gymnasium at Berlin and on the establishment of the University of Berlin he was appointed professor there. He published *Gründe der Geschichte* (1792; 2nd ed., 1805); *Grundzüge der Geschichtslehre* (1793; 2nd ed., 1805); *Griechische Schlager* (14th ed., 1852); *Textiologus* (1818; 2nd ed., 1860); a glossary of difficult Homeric
words; 'Ausführliche griechische Sprachlehre' (1827); 'Mythologus' (1828); a continuation of Spalding's edition of Quintilian, and editions of various Greek classics.

**BUTTON, Sir Thomas**, English navigator in the 17th century, the successor of Hudson in exploring the northeastern coast of North America. He sailed in 1612 with two vessels, the *Resolution* and the *Discovery*, passed through Hudson Strait, and was the first to reach land on the western coast of the bay. The point which he touched was in lat. 62° and was named by him Careys Swan's Nest. Being obliged to winter in this region, he selected a position near the mouth of a river, first named by him Nelson's, after the master of his ship. Every precaution was taken against cold and icebergs, yet the severity of the climate occasioned much suffering to his crew, and was fatal to a few of them. During the next summer he explored and named several places on the coast of Hudson Bay, and advancing to lat. 65°, became convinced of the possibility of the Northwest Passage.

**BUTTON, a small circular disc or knob of mother of pearl, horn, metal or other material, with a shank or perforations through its centre for attachment to an object, and made to fit into a hole formed in another one for its reception, the two fastening the objects together. Its chief use is to unite portions of a dress together. The ancient method of fastening dresses was by means of pins, brooches, buckles and tie-strings. Buttons of brass are found on dresses of the 10th century. Gilt buttons were first made in 1768 and those of papier-mâché in 1778. Buttons of vegetable ivory are now all but universally used for tweed coats and vests. The palm fruit which yields it is called corozo nut. It is not unlike true ivory but softer, and is easily turned and dyed. These buttons are often mottled with some stain to suit the common patterns of tweed stuffs. Recently a substitute vegetable ivory has been found in the seeds of a common palm of north-east America (Hyphaene theca). These seeds are known to the trade as gingerbread doum, doom or dum nuts. They are much cheaper than the tagua, corozo or South American ivory nuts, and are available in much larger quantities. The difficulty at present is the adaptation of existing machinery to the manufacture of buttons from this African nut, but it is believed that within a short time manufacturers will see the advisability of installing machinery especially designed to make buttons, trinkets and toys in the most efficient manner from this new and less expensive material. Mother of pearl buttons are formed of the beautiful substance of which the large flat shell of the pearl oyster consists, and this has long been a favorite material for buttons. Small cylinders are first cut out of the shells with a turnsaw. These are then split into discs, which are shaped by a steel tool, drilled with holes, and finally polished with rotten stone and soft soap, or by a more recent method with ground charcoal and turpentine. Shells of small kinds of oyster, the *Strombus*, and *Germaea* buttons with metal shanks are also made of this substance.

Among other animal substances used for buttons are ivory, bone, horn, and hoof. From this last so-called horn buttons were some years ago made in enormous numbers by pressing them in heated dies in which the design was cut. There are many kinds of composition buttons, glass buttons, and shells of various variety. For pinched buttons small rods of colored glass are heated at the ends, and pressed into shape by means of a pair of rather long hand pliers, on the ends of which are a die and its counterpart, likewise kept hot. Other kinds are cut out of soft sheet glass, which is coated on the back with tin amalgam like a mirror. With other varieties, some beautiful glass buttons are made in Bohemia, either partly or wholly of aventurine glass; and of this gold-spangled material artistically wrought with other colors, studs and solitaires still more remarkable for their beauty and minute patterns are made at Venice. Porcelain buttons were a few years ago nearly all of French manufacture, but are now made principally at Prague. The plastic clay is pressed into molds of plaster of Paris in the same way as small objects are usually produced in earthenware. Some are plain and others are painted or printed with patterns. More or less expensive buttons are made of jet, hard stone, such as agate, Jasper and marble. Occasionally they are formed of amber, jade or of still more costly materials, as pearls and gems. In recent years, improved methods and machines have been introduced for the shaping as well as for the polishing and finishing of bone, corozo and wood buttons. In England, Birmingham is the seat of the button trade, which, however, is much more largely developed in France. Brass buttons were made in Philadelphia in 1750, and hard-wood buttons were made there soon after. The button factory in Waterbury, Conn., now the seat of the metal button manufacture, was established about 1800. Horn buttons were made in the United States as early as 1812, and the production of buttons covered by machinery was begun at Easthampton, Mass., by Samuel Williston in 1827. The making of composition buttons was begun at Newark, N. J., in 1802, and there have been about 1,500 patents for buttons issued by the patent office of the United States. In 1850 there were in the United States 59 establishments for the manufacture of buttons, with an output whose value was placed at $964,359. According to the returns of the United States census of manufactures for 1914 the button industry comprised 517 establishments, producing in that year 60,602,359 gross of buttons valued at $16,293,198.

The most important branch of the button industry was the manufacture of pearl buttons, either from mother of pearl or ocean pearl or from the shells of the Unios or fresh-water pearl.

In 1914 there were manufactured 26,181,405 gross of pearl buttons, with a value of $509,409, representing 43.2 per cent of the total quantity and 45.4 per cent of the total value. Of this amount, 21,664,436 gross, valued at $4,879,844, were made from fresh-water pearl and 4,516,969 gross, valued at $2,489,304, from mother of pearl glandular buttons with metal shanks are also made of this substance.

Next in importance was the manufacture of buttons from vegetable ivory, the output of this kind amounting to 5,128,005 gross, valued at $2,885,503, or 8.5 and 17.6 per cent of the total in quantity and value, respectively.
The others of the more important classes in point of value were covered buttons, $1,600,178; celluloid, $724,354; shoe, $610,796; bone, $329,934; horn, $299,487; and ivory, $283,484. In addition various other kinds and parts, having a total value of $2,130,254, were manufactured.

Of the 317 factories reporting in 1914, there were 224 located in New York, 81 in Iowa, 60 in New Jersey, 31 in Illinois, 21 in Pennsylvania, 18 in Connecticut, 14 in Massachusetts, 12 in Indiana, 9 each in California, Missouri and Ohio, 5 in Arkansas, 4 in Kentucky, 3 each in Minnesota and Washington, 2 each in Michigan, Rhode Island, Tennessee, West Virginia and Wisconsin, and 1 each in Colorado, Kansas, New Hampshire and Oregon.

Statistics compiled in July 1916 by the Bureau of Foreign and Domestic Commerce showed that American expert traders in buttons indicated an increase of 79 per cent and prospects of further advancement. This was owing to the fact that the normal European production of buttons, the largest in the world, was curtailed by the war. Under usual conditions United States manufacturers enough to meet about nine-tenths of its own requirements and more than half the supply of Canada, which has some factories of its own, and ranks next to the European nations in production. The American export trade in buttons amounting to $654,372 in 1914, more than half of which was with Canada, expanded to $1,171,232 in 1915, with England, Canada, Australia and Cuba the largest purchasers. The bibliography of the button industry is varied and interesting. The most important work on the industry in Europe is Consular Reports Vol. 52, pp. 801-91 (Washington, D. C., 1888); 'The Emilio Collection of Military Buttons, American, British, French and Spanish, with some other countries' (Essex Institute, Salem, Mass., 1911); Ray's, A. R., 'Buttons,' Art Journal, Vol. 71, pp. 7-14 (London 1909); Smith, H. W., 'The Pearl-Button Industry of the Mississippi River,' Scientific American, Vol. 81, pp. 86-87 (New York 1899); Petroi, W. F., 'Buttons from Egypt,' Antiquary, Vol. 32, pp. 134-136 (London 1896) (covered and Celluloid Button Factories in New York City, New York Commission Report (Albany 1915); 'Art in Buttons'—German-American Button Company (Rochester 1906-16).

**Button-Bush, Honey-Ball, or Globeflower.** A North American shrub (Cephalanthus occidentalis) of the madder family, which grows in wet places, and bears extremely fragrant flowers whose small florets are folded or packed into balls, while the long styles and capitate stigmas remind us of pins stuck in a cushion.

**Button-Quail.** A small quail-like bird of the genus Turnix, family Turnicidae, order Hemipodei, of which there are some 20 species in various parts of the Old World, some of which are termed bustard-quail, bush-quail, ortygian and hemipode. They frequent wooded places and afford good sport for the gunner. The males, as well as the females, are brightly colored. They are one of the smallest game birds known, inhabit woody places and feed generally on berries and insects.

**Buttonwood,** a name often given to the North American plane (Platanus occidentalis). See PLANE.

**Buttress,** in architecture, a structure of masonry used to resist the thrust of an arch or vault. It takes the form of a great proportionate thickening of the walls at the point where the thrust affects the wall, the thickness sometimes increasing until the mass of masonry is set across the general direction of the wall. Thus in the developed Gothic style it nearly replaces the wall, because all the space between button and buttress is occupied by a great window. In the case of an archway in a single wall it often happens that the two sides or outer edges of the wall are carried up in such a way that they are spread wider toward the base and approach one another at the top, by means of certain offsets or steps, and these extensions of the wall are called buttresses, although they are mere widenings of the wall. In like manner some English Gothic church towers have curious diagonal spurs projecting on the front and sides, in the form of short pieces of wall built on a prolongation of a diagonal of the square plan, and these are considered as buttresses, although they have very rarely any thrust to resist, because the tower is not often occupied by vaulted chambers, and because the meeting of the two walls would provide sufficient masonry for the practical purpose. It is a vice in that style that these considerations are lost sight of.

Historically, the real buttress begins to show itself in Romanesque work along the walls of the aisles, and is at first a slight projecting pilaster-like thickening of the wall, or a rounded projection like an engaged shaft of a column. These are called by special names, as buttress-pier, pilaster-strip, etc. They were very inadequate for their purpose (see ROMANESQUE ARCHITECTURE) and their presence shows the uneasiness of the early builders in trying to dispense with the precautions taken by their masters, the Romans of the empire, and their hesitation in building what alone would do the work. As the vaulting within became more and more elaborate, the need of the buttress became more evident, and in some Romanesque churches they have been built up after the walls being stayed up with great cost and trouble after they had begun to spread under the thrust of the vault. It was not until the ribbed vault came in and the Gothic style came into being that the buttress took its permanent shape of a piece of wall, thin in comparison to projection; that is to say, having by far its greatest dimension in the direction of the thrust of the vault and therefore at right angles with the wall of the church. Except in modern Gothic exterior buttressing is seldom employed nowadays. It is, however, employed in railway stations and factories, where strong vibration of the floors necessitates the reinforcement of the walls at regular intervals. See FLYING BUTTRESS.

**Buttz,** Henry Anson, American educator: b. Middle Smithfield, Pa., 18 April 1835. He was graduated at Princeton in 1858, and entered the Methodist ministry the same year. He was president of Drew Theological Semi-
nary, 1880–1912, president emeritus since 1912, and has written much on polemics, exegetics and homiletics.  

**BUTYRIC ACID**, an acid obtained from butter; it also occurs in perspiration, in cod liver oil and other fats, and in meat juice. When obtained, as it may be from butter and from sugar, it is in the form of a clear, oily, volatile fluid. It combines with bases, and forms crystals; it is colourless, and possesses no taste. Butyric acid is a colorless liquid, having a smell like that of rancid butter; its taste is acrid and biting, with a sweetish after-flavor. Formula, normal butyric acid $\text{C}_6\text{H}_{12}\text{CH}_2\text{CH}_2\text{COOH}$.  

**BUTYROSPERMUM**, a genus of tropical trees found in the East Indies and Africa, of the family Sapotaceae. One species (B. parkii) is supposed to be the shea-tree of Park, the fruit of which yields a kind of butter that is highly valued and forms an important article of commerce in the interior of Africa. There are several other species of which B. longifolium, or Indian oil-tree, and B. butyracenum, or Indian butter-tree, are well-known examples, yielding a large quantity of oleaginous or butyrous matter. The wood is as hard and incorruptible as teak. See also BUTTER-TREE.  

**BUخار, buk'sár, or BAXAR**, a town of British India, in the district of Shahabad, presidency of Bengal, situated on the south bank of the Ganges, about 60 miles below Benares. It is celebrated for a victory which confirmed the British in possession of Bengal and Bahar, 23 Oct. 1764.  

**BUXTEHUEDE, buk-tè-hoo'de, Dietrich, German organist**: b. Helsingør 1637; d. 9 May 1707. His father was organist at Helsingør for 32 years, and no doubt imparted the art to his son. In 1668 Buxtehude was appointed to the important post of organist at the Marienkirche (Mary's Church) in Lübeck. In 1673 he introduced special church concerts after the evening services on the five Sundays before Christmas. He wrote the music for these concerts, producing new compositions with much rapidity. The great Bach tramped a long distance hear Buxtehude play and to learn from him.  

**BUXTON, Sidney Charles**, 1st Viscount of Newtimber (cr. 1914), G.C.M.G., LL.D., 1916; high commissioner and governor-general of South Africa since 1914: b. October 1853. He was educated at Clifton College and Trinity College, Cambridge; was member of the London school board from 1876 to 1882; of the Conciliation Committee of the Dock Strike, 1889; of the Royal Commission on Education, 1886–89; of the Income Tax Committee, 1904; Under-Secretary for the colonies, 1892–95; M.P. for Petersborough, 1883; and from 1905–10 he was Postmaster-General. While in this latter office he succeeded in introducing penny postage to the United States and reduced magazine postage to Canada. The Insurance Act and the Copyright Act, both passed in 1911, were largely his work, as were the Bankruptcy Act and Extension of Trade Boards Act, 1913, and the Pilotage Act of 1912. He was M.P. for Poplar, 1886–1914. His published works include: 'Political Manual' (5th ed.); 'Finance and Politics' (1783–1885); 'Handbook to Death Duties'; 'Mr. Gladstone as Chancellor of the Exchequer'; 'The Fiscal Question'; 'Fishing and Shooting'; 'Recreations'.  

**BUXTON, Sir Thomas Powell**, English philanthropist: b. Earl's Colne, Essex, 1 April 1786; d. 19 Feb. 1845. He was educated at Trinity College, Dublin, and in 1808 joined the firm of celebrated brewers, Truman, Hanbury & Company, and took an active part in the management; but withdrew from the business in 1811, on the occasion of the Spitalfields distess, he made his first public effort in a speech at the Mansion House, and afterward succeeded in organizing an extensive system of relief. He next proceeded, in concert with his sister-in-law, the celebrated Mrs. Elizabeth Fry (q.v.), to examine into the state of prisons; and as the result of his inquiries produced in 1818 a work entitled 'An Inquiry Whether Crime and Misery are Produced or Prevented by Our Present System of Prison Discipline,' which attracted great attention, and led to the formation of the Prison Discipline Society. In 1818 he was elected member of Parliament for Weymouth, and continued to sit for it in success until 1837. He distinguished himself by his enlightened zeal in the cause of humanity, and was long the right-hand man of Wilberforce, who, on retiring from public life, selected Buxton as the person best qualified to carry out those of his benevolent schemes which remained uncompleted. In 1823 he moved and, with a slight modification, carried a resolution to the effect that slavery, being repugnant to the Christian religion and the British constitution, ought to be abolished. Subsequently in 1831 he made such an impression on the House and country by an admirable speech that the government were glad to take the matter into their own hands and give full effect to emancipation. After his retirement from Parliament the slave trade occupied much of his thoughts, and he published in 1839 a work entitled 'The Slave-trade and Its Remedy.' In 1840 he was created a baronet. Consult 'Memoirs of Sir T. F. Buxton, Bart.' (1872).  

**BUXTON, England**, a town in Derbyshire, 36 miles northwest of Derby and 25 south-southeast of Manchester. The highest town in England and the centre of the Peak District. Buxton has long been famous for its calcareous springs, the waters being taken for indigestion, gout, rheumatism and nervous and cutaneous diseases. The locality was known to the Romans, who had baths here. The season extends from May to October. The town is 1,025 feet above sea-level and is situated in a deep valley. Much of the splendor of Buxton is due to the Dukes of Devonshire, one of whom in 1780, at the cost of $600,000, erected an immense three-storied pile of buildings, called the Crescent. Near Buxton is the Diamond Hill, famous for its crystals; and Poole's Hole, a gas-lit stalactite cavern 790 yards long. Many streets of Scots made several visits to the baths at Buxton while a prisoner in the custody of the Earl of Shrewsbury. Pop. (1911) 10,024.  

BUXTORF — BYBLOS

which he obtained the assistance of many learned Jews, he was engaged by the magistrates of Basel to become professor of those languages, which he taught with great success. His chief works are: 'Lexicon Chaldaicum, Talmudicum et Rabbinicum' (1639); 'The saurus Lingua Hebraica'; 'Biblica Hebraica Rabbinica'; 'Synagoga Judaica hoc est Schola Judeorum' (1604); 'Institutio Epistolariis Hebraica'; 'Concordantiae Bibliorum Hebraicorum.' Consult Kautsch, 'Johann Buxtorf der Ältere' (Tübingen 1880).

BUXTORF, Johann (The Younger), German Hebraist: b. Basel, 13 Aug. 1599; d. there, 16 Aug. 1664; son of the preceding. He entered the University of Basel at 12, became master of arts at 16, and proceeded to Heidelberg and afterward to Geneva. In 1629 he succeeded his father in the chair of Hebrew at Basel and occupied it for 34 years, until his death. The same chair was filled by his son and his nephew successively during 68 years longer, making a combined occupancy of this professional chair by the Buxtorf family for an unbroken period of nearly a century. He spent a great part of his life in controversy with other scholars regarding disputed biblical and theological questions, and especially regarding the antiquity of the vowel system in Hebrew. He completed and published two of his father's principal works, the 'Lexicon Chaldaicum, Talmudicum, et Rabbinicum' (Basel 1639) and 'Concordantiae Bibliorum Hebraicorum' (Basel 1632), the most important publication of his own being the 'Lexicon Chaldaicum et Syriacum' (Basel 1622).

BUXUS, the genus name of a number of shrubs or small trees. See Box.

BUYS-BALLOT, bu-is-ba-lot, Christophorus Henricus Didericus, Dutch meteorologist: b. Kloeinge, Zeeland, 10 Oct. 1817; d. Utrecht, 2 Feb. 1890. He studied at the University of Utrecht, where he became professor of mathematics in 1847, and professor of experimental physics in 1870. In 1854 he was elected director of the Royal Meteorological Institute at Utrecht. He was one of the initiators of the new system, under which, by daily synoptic weather reports, and simultaneous observations by land and sea, meteorologists are kept informed of forecasting changes. His own observations have resulted in the determination of a general law of storms, known as the Buys-Balott law. The inventor of a system of weather signals, he was largely instrumental in bringing about an international uniformity in meteorological observations. His works include 'Changements périodiques de la température' (1847); 'Eeneig reglen voor te wachten van weververandering in Nederland 1860'; in English, 'Suggestions on a Uniform System of Meteorological Observations,' (1872-73); and 40 volumes of the Annual of the Meteorological Institute.

BUYUKDEREH, bi-yook'de-rah, a little town on the western side of the Bosporus 10 miles north-northeast of Constantinople, situated in the midst of a large, deep-boomed valley that separates the Russian and European embassies at Constantinople, and its gardens and palaces, not less than its natural beauty and coolness, make it a favorite promenade ground. The tradition that Godfrey of Bouillon encamped here with his army is not alluded to in the original records of the Crusades.

BUZFUZ, Sargeant, a character introduced by Dickens in the 'Pickwick Papers.' He is the barrister who becomes counsel for the plaintiff in Mrs. Bardell's breach of promise suit against Mr. Pickwick, and is remarkable for the ingenuity he displays in drawing incriminating inferences from ordinary and inconsequential occurrences.

BUZZARD, a term given in America to two distinct groups of birds—buzzard-hawks of the genus Buteo and buzzards, also familiar to Europeans, and the turkey-buzzard—a vulture. The buzzard-hawks are closely related to the eagles, from which they are distinguished by the smaller size in the majority of cases, the smaller and rounder head and a slow and heavy manner of flight. They feed chiefly upon the smaller mammals and reptiles, seldom catching or disturbing poultry, although popularly accused of it and styled 'hen-hawks.' Important North American species of the genus Buteo are the red-tailed hawk, the broad-winged hawk, and the turkey buzzard, all of which are elsewhere described under their names. The most important of the genus Cathartes is the rough-legged hawk (q.v.), and the handsomest one, the Redtail hawk of California. In the southern United States the name usually refers to the common black vulture (Cathartes aura). See Turkey-Buzzard.

BUZZARD'S BAY, on the southeast coast of Massachusetts, is about 30 miles long, and has a mean breadth of seven miles. It is sheltered from the ocean from Vineyard Sound by the Elizabeth Islands. Its chief harbors are those of New Bedford, Wareham, Mattapoisett, Nasketucket and Sippican.

BUZZING, the sounds produced by many insects, other than by mechanical means, that is, by friction. How the buzzing of bees, flies, etc., is produced has been a disputed question. Two distinct sounds may be distinguished—one, a deep noise, is due to the vibration of the wings, and is produced whenever a certain rapidity is attained; the other is an acute sound, and is said to be produced by the vibrations of the walls of the thorax, to which muscles are attached. In Diptera and Hymenoptera, because the integument is of the right consistence for vibration. In both of these, observers agree that the spiracles are not concerned in the matter. Lautodius tells us that the wing-tone of the honey bee is A;' its voice, however, is an octave higher, and often goes to B' and C'. The sounds produced by the wings are constant in each species, except where, as in Bombus, there are individuals of different sizes; in these the larger ones generally give a higher note. Thus, the comparatively small male of B. terrestris hums on A, while the large female hums an entire octave higher. Consult Sharp, 'Insects' (New York 1899); Packard, 'Textbook of Entomology' (New York 1889).

BYBLOS, bib'blos, an ancient maritime city of Phoenicia on the coast of Syria called Jебail, a little north of Beyrouth. It is often mentioned in inscriptions under the form G B L and it also appears in cuneiform documents as
early as the 15th century A.D. either as Gubli or Gublo. It was the chief seat of the worship of Adonis of Thammuz, and of Astarte as Baalat-Gublu. In Ezek. xxvi, 9 the town is called Gebal. To Strabo and the Greek authors it was always Byblos. Philo Byblius was born there. There are extensive remains dating from the Phoenician period and from the times of the Crusades.

BYERLY, William Elwood, American mathematician: b. Philadelphia, 13 Dec. 1849. He was graduated at Harvard College in 1871; was assistant professor of mathematics at Cornell University and at Harvard University from 1876-81, when he became professor. He became professor emeritus in 1913. He is a fellow of the American Academy of Arts and Sciences. Among his works are 'Elements of Differential Calculus' (1879); 'Elements of Integral Calculus' (1881); 'Fourier's Series, Partial Differential Calculus' (1895), and a 'Treatise on Fourier's Series and Spherical, Cylindrical and Ellipsoidal Harmonics' (1893).

BYERS, Samuel Hawkins, Marshall, American writer: b. Pulaski, Pa., 23 July 1838. Educated in schools in Iowa. He served four years in Union army, was captured at battle of Chattanooga. While in prison at Columbia, S. C., he wrote 'Sherman's March to the Sea,' a song that gave its name to the great campaign, and of which 1,000,000 copies were sold. In 1865 he escaped from prison, rejoined the army and served on General Sherman's staff in the Carolinas; was sent down to Cape Fear River and brought the first news north of Sherman's success. After the war he went to Switzerland and in 1889-94 was consul-general to Rome. Later, he was consul-general to Switzerland under President Harrison. Altogether he was some 20 years in the foreign service. He wrote 'Switzerland and the Swiss' during this time, and published a volume of poems, 'The Happy Isles.' On leaving the service he published 'Iowa in War Times'; 'The March to the Sea, or the story of the Great Campaign,' in verse; 'The Honeymoon,' a volume of verse; 'With Flavor of the Earth,' a prose account of his adventures in the Civil War; 'A Layman's Life of Jesus'; 'Twenty Years in Europe, or the Life of a Consul-General' (1896), which contained 50 personal letters to the author from General Sherman; 'Complete Poems' (1914); 'The Bells of Capistrano' (1915), a love poem of the old mission days in California; also 'Glorieta, or The City of Fair Dreams' (1916), a poetical romance of Monterey, Cal., in the Spanish days.

BYERS, William Newton, pioneer, journalist, publicist and capitalist: b. Madison County, Ohio, 22 Feb. 1831; d. 1901. As a civil engineer he served in the capacity of United States deputy surveyor in Iowa, Oregon, Washington, Nebraska and Colorado. He was a member of the first and retiring legislature, and of the first Colorado constitutional convention. In 1864-66 and from 1879-83 he was postmaster of Denver. In 1859 he founded the Rocky Mountain News, of which he was editor and publisher for 20 years. A man of modest and retiring disposition, he was one of the most constructive personalities in the history of Colorado.

BYESVILLE, Ohio, a village of Guernsey County on the Pennsylvania Railroad, 95 miles east of Columbus. It is the commercial center of a large bituminous coal mining region, and has manufactures of bricks, tiles, glass and gas engines. Pop. 3,156.

BYINGTON, Cyrus, missionary among the Indian: b. at Stockbridge, Mass., 11 March 1793; d. Belpre, Ohio, 31 Dec. 1882. His educational advantages were limited, but in his youth he was taken into the home of Joseph Woodbridge in his native town, under whose tuition he studied Latin and Greek and with whom he afterward read law. He was admitted to the bar in 1814 and began to practice, but soon after entered the theological seminary at Andover, Mass., at which he graduated in 1819. Having been ordained to the ministry, he entered the service of the American Board of Commissioners for Foreign Missions (Congregational) and was assigned labor among the Choctaw Indians in Mississippi. Journeying overland from Massachusetts to Pittsburgh, he descended the Ohio and Mississippi rivers in a flatboat to his destination. After working among the Choctaw people in Mississippi for a dozen years, he accompanied them on their westward migration to the Indian Territory, opening up and building a new mission station near Eagle-town, in the southeastern part of the Choctaw Nation, which he named in honor of his native town—Stockbridge. His health failing, in 1851, he went to New York, but later returned and resumed his work among the Choctaw people, which he continued until the outbreak of the Civil War put an end to all missionary enterprises in that section. Early in his missionary career he began to make an exhaustive study of the Choctaw language, a grammar of which was completed in 1834. He also compiled a Choctaw-English dictionary, upon the seventh revision of which he was engaged at the time of his death, nearly half a century after the beginning of his missionary labors. This work, entitled 'A Dictionary for the Choctaw Language,' was issued by the Bulletin 46, of the Bureau of American Ethnology, in 1915.

BYELAW, a particular or private law, as the local or subordinate law of a city, town, private corporation or other organization. The power to make bylaws is usually conferred by express terms of the charter creating the corporation; though, when not expressly granted, it is given by implication, and it is incidental to the very existence of a corporation. The constitution of the United States and acts of Congress made in conformity to it, the constitution of the State in which a corporation is located, and all acts of the legislature constitutionally made, together with the common law as there accepted, are of superior force to any bylaw; and any bylaw, when contrary to either of them, is void, whether the charter authorizes the making of such bylaw or not, because no legislature can grant power larger than it possesses. A valid bylaw of a municipality is a true law, for it has the authority of the State behind it. Bylaws of corporations and societies are merely working agreements between the members than laws, in the true sense. Consult Boisot, 'By-Laws of Private

BYLES, Mather, American clergyman: b. Boston, 26 March 1706; d. there, 5 July 1788. He was graduated at Harvard in 1725; was ordained to the ministry in 1733 and was placed over the church in Hollis street, in Boston, in the year 1733, and obtained a distinguished position among the contemporary clergy. He was learned after the manner of those times, and was more addicted to literary recreations, and had a keener relish of the later humanities than was then common among the members of his profession. As a proof of his recognized excellence in polite letters, we may accept the fact that he was the correspondent of some of the chief poets and authors of England. He was himself a vortary of the muses in a small way, and a volume of his miscellaneous poems was published in 1744. He gave an early expression, too, to the loyalty which distinguished his character through life, in a poem on the death of George I and the succession of his son, in 1727, when he was but 21 years of age. He also tempered the bereavement which Governor Belcher had suffered in the loss of his wife in 1734, by such consolation as an elegiac epistle could convey. It is not likely, however, that his name would have been preserved to this time had his reputation depended on the merits of his poetical effusions. The cheerful flow of his spirits and frank gaiety of his conversation seem to have been something out of the common way, and to have left an enduring mark on the memories of that generation. His piety was tinctured with no asceticism, and the lively sallies of his sprightly imagination, always kept within the limits of decorum, were restrained by no fear of injuring his personal or clerical dignity. He was an ardent Royalist and in 1777 was sentenced to banishment, but was allowed to remain under guard in his own house. This severity was soon relaxed for a while, and afterward renewed. One of the stories told of him is, that wishing to have an expression of it at a distance, he asked the sentry to undertake it. The man objected on the ground that he could not leave the door unguarded; on which the doctor volunteered to be his substitute, and, accordingly, was seen by some, in a powdered wig and cocked hat, with a musket on his shoulder, walking up and down before his house, keeping guard over himself. His release from custody soon followed, on which occasion, alluding to these changes of treatment, he said that he had been "guarded, regarded and disregarded." He, son, Mather, b. 1736; d. 1814, was also a clergyman and became the rector of the Tories, who, expelled from Boston, founded Saint John, New Brunswick.

BYLLYNGE, b'il-ling, Edward, English provincial governor: d. 1687. He became joint purchaser with John Fenwick of a large tract of land in what is now the State of New Jersey. Upon the occasion of a dispute between the two proprietors, nine-tenths remained, by Penn's decision, with Byllinge and was long known as "the Byllinge Tents." He was governor of the Province of West Jersey in 1677. Consuelo Tamer, 'The Province of New Jersey, 1664-1738' (New York 1908); Myers, 'Narratives of Early Pennsylvania, West New Jersey and Delaware, 1630-1707' (New York 1912).

BYNG, George Viscount Torrington, English admiral: b. Wrotham, Kent, 27 Jan. 1663; d. 17 Jan. 1733. He entered the navy at the age of 15. In 1688 he recommended himself to William of Orange, and for his gallant conduct at the battle of Malaga was knighted by Queen Anne. In 1706 he was elected to Parliament from Plymouth. Two years later he commanded a squadron sent out to oppose the Pretender's invasion. He followed the French fleet and forced it to take refuge at Dunkirk. In 1718 he commanded the English fleet sent to Sicily for the protection of the neutrality of Italy, and on 31 July utterly destroyed the Spanish fleet off Messina. Later he became naval treasurer and attained the rank of rear-admiral. In 1715 he was created Knight of the Bath and was First Lord of the Admiralty after the accession of George II in 1727. He was created Viscount Torrington in 1721.

BYNG, John, English admiral: b. 1704; d. 14 March 1757. He was the son of Viscount Torrington, and by his own name the influence of his name, was raised to the rank of admiral. His attempts to relieve Fort Saint Philip, in Minorca, when blockaded by a French fleet under La Galissonnière, proved abortive, and his hesitation in engaging the enemy, when a bold attack might have perhaps gained him the victory, excited the clamor of the nation against him. The ministry, who wished to avert the public odium from their unsuccessful measures, beheld with seeming satisfaction the unpopularity of Byng, and when he was condemned by a court-martial they suffered him, though recommended to mercy, to be sacrificed to the general indignation, and he was shot at Portsmouth. The historical controversy as to his guilt is undecided.

BYNG, Sir Julian Hedworth George, K.C.B., K.C.M.A., M.V.O., English soldier, the 7th son of the 2d Earl of Stafford: b. 11 Sept. 1862. He passed through the Staff College and became lieutenant in the 10th Royal Hussars in 1883. He saw his first service in the Sudan campaign 1884, was present at the capture of Tamai, and received the Khedive's Star for gallant conduct. He rose to captain in 1890, major in 1898, served through the South African War 1899-1902, during which he commanded the South African Light Horse and several flying columns in various parts of Cape Colony and Orange Free State. He was mentioned in despatches five times, received the Queen's and King's medals with six clasps and was brevetted colonel in 1902. For the next two years he commanded his old regiment, was in charge of the Cavalry School at Netheravon 1904-05; commanded the 2d Cavalry Brigade 1905-07; the 1st Cavalry Brigade in 1909; promoted major-general in that year and placed in command of the East Anglian Division, 1910-12. In the latter year he was appointed first commander-in-chief of the Egyptian army under the administration of Lord Kitchener, who undoubtedly influenced the appointment. At the outbreak of the European War he was recalled from Egypt and appointed first officer of the Cavalry Division, which was attached to the 7th Division of the 4th Army Corps. The
Byng family history now repeated itself. General Byng's grandfather, General Sir John Byng, 1st Earl of Strafford, had served as a youth in the disastrous campaign in Flanders under Colonel Wellesley (afterwards Duke of Wellington) in 1793–95. Over 120 years later Sir Julian Byng stood on the same battlefields, but at the side of his grandfather's enemies, the French. Under his command covered the Belgian stronghold of Gravenstegen and he was the first to receive the news of the French defeat. Sir John French, 4th Assistant Adjutant General (20 Nov. 1914). General Byng commanded the 9th Army Corps in the Gallipoli campaign of 1915, and at the end of May 1916 he succeeded Lieut.-Gen. Sir Edwin Alderson in the command of the Canadian corps on the western front. Under his lead the Canadian troops performed prodigies of valor in the great Somme battles (q.v.), and again in the crossing of the German stronghold, Vimy Ridge. In June 1917 General Byng was placed in command of the 3d Army in Belgium under General Allenby, and on 20 Nov. 1917 his army opened what has been described as the most dramatic episode on the western front since the battle of the Marne, namely, the great drive on Cambrai (q.v.). Before the enemy realized what had happened, the so-called 'Hindenburg Line' had been shattered and thousands of prisoners captured. The distinguishing feature of this brilliant exploit was the utter absence of the customary artillery preparation. Accompanied by the formidable 'tanks,' the British infantry advanced at dawn and stormed the enemy's trenches with remarkably few losses. See War, European, Western Front.

BINKERSHOEK, bin'kærz-hoek, Cornelius van, Dutch jurist: b. Middleburg, Zeeland, 29 May 1673; d. 16 April 1743. He studied at the University of Leiden, and was called to practise as a barrister at The Hague, became professor of law at Leyden, and president of the supreme council of Holland. He was one of the most learned among modern citizens. His book De Lexis, 1699, and his treatise De Parole Legatorum Competente was translated by Barbevricq into French under the title of 'Du Juge Compétent des Ambassadeurs' (1728). His most important writings are the 'Observationes Juris Romanis; 'De Domino Maris; 'Questiones Juris Publici; and a digest entitled 'Corpus Juris Hollandici et Zelandici.' A complete account of his works was published at Geneva in 1761, and at Leyden in 1766.

BYR, bár, Robert, pseudonym of KARL ROBERT EMMERICH BAYER (q.v.).

BYRD, bîrd, William, American lawyer and author: b. Westover, Va., 1674; d. there, 26 Aug. 1744. He received a liberal education in England, possessed one of the largest libraries in the colonies, and, having a large property, lived in a splendid style, unrivalled in Virginia. He was a member and a last president of the King's Council. To French Protestants fleeing to him from persecution in France, he extended the most generous assistance. The towns of Richmond and Petersburg were laid out by him, and he was one of the commissioners for establishing the boundary line between Virginia and North Carolina. He was a member of the Royal Society, and as a patron of literature and art deserved remembrance. His own writings include the 'Westover Manuscripts,' embracing 'The History of the Dividing Line,' 'A Journey to the Land of Eden,' and 'A Progress to the Mines.' In The Virginian Magazine of History and Biography (1902) appeared his letters, revealing much of interest concerning his life and career. Consult Trent, 'English Culture in Virginia' (1889); 'A History of American Literature' (New York 1903).

BYRD, William, composer. See Bird, William.

BYRGIUS, bër'ji-üs, Justus (properly Jürg vom Bürg), Swiss mathematician: b. Liechtenstein, Canton of Saint Gall, Switzerland, 28 Feb. 1552; d. Cassel, Germany, 31 Jan. 1632. He was invited to Cassel by the Landgrave of Hesse to superintend the observatory which he had there erected, and constructed a number of astronomical instruments, some curious clocks and other machines, including the proportional compasses. A discovery involving that of the logarithms, and another exhibiting an application of the pendulum to clocks, have been attributed to him. He is eulogized by Kepler for his talents, but censured for his indolence and undue reserve, which kept back his discoveries from the public. Consult Gieswald, 'Justus Byrg als Mathematiker' (Dantzeg 1856).

BYRNE, Thomas Sebastian, American clergyman: b. Hamilton, Ohio, 29 July 1841. He was graduated from Saint Mary's College of the West in 1865. In youth he was an expert machinist, but deciding to enter the priesthood of the Roman Catholic Church, he went, after preparatory training, to the American College in Rome. In 1869 he was ordained in Cincinnati. He devoted himself to literature and teaching in Mount Saint Mary's Seminary; for a time had charge of the Cincinnati Cathedral and again became connected with the seminary, acting as rector until 1894. He wrote 'Man from a Catholic Point of View' (1903), which was read at the Parliament of Religions in Chicago. He has published many other religious works and pamphlets. In collaboration with the Rev. Dr. Pahlisch, he translated Dr. Alzog's 'Church History' (3 vols., 1874–78).

BYRNES, Thomas, American detective and chief of police: b. New York city 1842; d. there 7 May 1910. In young life a gas-fitter, he served in the Civil War with the Ellsworth Zouaves, in 1863 joined the police force of New York city, was promoted captain in 1870, inspector in 1880, superintendent in 1892, and chief of police in 1895. He early became famous for his detective work, and despite great corruption in the police department, maintained an unblemished reputation. The nature of his work is well brought out in two books, one by himself, 'Professional Criminals of America' (New York 1896), and in collaboration with Campbell, H. S. T., and Knox, T. W., 'Darkness and Daylight, or Lights and Shadows of New York Life' (Hartford 1889).

BYRON, George Gordon, 6th lord, English poet: b. London, 22 Jan. 1788; d. Misso-
longhi, Greece, 19 April 1824. He was the son of "Mad Jack Byron," a good-looking profligate soldier, who first married the divorced Mary Hume, and then, in 1797, a daughter Augusta, later Mrs. Leigh. Captain Byron became a widower in 1784 and, a little more than a year later, married a Scotch heiress, Catherine Gordon of Gight. Their only child, the poet, was born at No. 16 Holles street, Cavendish Square, and was lame from birth, owing to a defect in one of his ankles. The influences surrounding the child were deplorable. John Byron, to escape his creditors, had to flee to France, where he died in 1791. Mrs. Byron, with a much reduced income, resided in Aberdeen and proved to be a most indiscreet mother, now fondly petting her child, now reviling him. She was actually guilty of reproaching him for his lameness. The boy himself was capable of great affection for his nurse and for a cousin, Mary Duff, and his schoolmates seem to have regarded him as warm-hearted. His education was not neglected during his early years, but tutors and schools could not make up for his lack of training at home. However, to love nature amid the Scotch hills.

In 1794 the grandson of the then Lord Byron died, and the six-year-old boy became heir to the peerage, which he inherited in 1796. Then his mother obtained a pension and left Scotland. Byron being made a ward in chancery and Lord Carlisle being appointed his guardian, though his mother's lawyer, John Hanson, really looked after his welfare. A quack tortured his foot, and schoolmasters tried to make him studious, his main mental nutriment consisting, apparently, of the Bible and poetry. He wrote love verses to a young cousin, endured his mother's caprices and was doubtless glad to be entered at Harrow in 1801, where, however, he was at first discontented and not liked. He could not make a scholar of himself, though, as Mr. Coleridge has shown, his classical attainments have been much underrated; but he was a good declaimer and through his pluck in fighting and in athletics, despite his deformity, he became a leader in the school. He was romantically devoted to his friends, and once offered to take half the threashing a bully was giving to the boy who later was known as Sir Robert Peel. Impulsiveness characterized both his inordinate attitude toward the school authorities and his love affair with his cousin and senior, Mary Anne Chaworth, who soon married and left him disconsolate. His affection for her seems never to have been entirely effaced. Altogether, his childhood and youth were well adapted to produce a wayward man.

In October 1805 he went into residence as a nobleman at Trinity College, Cambridge. He took full advantage of his privileges, ran into debt, though he had an allowance of £500 a year, gambled, consorted with pugilists, won fame as a swimmer, traveled about in style, and, last, but not least, after stormy quarrels with his mother, successfully asserted his claim to be his own master. He formed some warm friendships with promising students, notably with John Cam Hobhouse, afterward Lord Broughton (q.v.); he dabbled in literature and wrote verses, and he received his M.A. "by special privilege as a peer," in July 1808. Nearly two years previously he had printed "Fugitive Pieces," a volume of poetry, but had destroyed all save two or three copies because a clergyman, a Mr. Braham, had found them as too free. A small edition of what was practically the same book, "Poems on Various Occasions," appeared early in 1807. A few months later this was reissued with considerable alterations as "Hours of Idleness," which was again altered in a second edition of March 1808, two months after the now famous slashing review from the pen of Brougham had appeared in the Edinburgh Review.

Byron's youthful volume certainly gave little indication of the genius he was soon to display, but it called for no severe chastisement. Hence, the editor of the Edinburgh, Jeffrey, got only what he deserved when Byron apologized him in "English Bards and Scotch Reviewers," which appeared anonymously about the middle of March 1809, and was at once successful. It is still decidedly readable in parts and ranks with the best satires of its kind. It went through five editions in two years, the last being suppressed by its author, because he had become the friend of many of his victims.

Meanwhile Byron had settled—if such a word may be used of his riotous occupation of his domain—at Newstead Abbey, and had repaired it on borrowed money. In March 1809 he took his seat in the House of Lords. Then he prepared himself for a tour of the Continent, which was begun with Hobhouse and three servants in July. That Byron was to any marked extent disapproved and misanthropical as his own Harold does not seem likely.

The traveler sailed to Lisbon and saw something of Portugal, Spain, Malta, Albania and Greece. At Athens Byron finished the first canto of 'Childe Harold' and celebrated the charms of his landlady's daughter, Theresa Macri, the "Maid of Athens." Then the friends visited Asia Minor and reached Constantinople shortly after Byron's famous swim from Sestos to Abydos (3 May 1810). About two months later Hobhouse returned to England and Byron to Athens, where, after he spent the winter of 1810-11 apparently studying and writing and making excursions. He reached England, by way of Malta, about 20 July 1811.

Throughout his travels he had been in severe financial straits, which his mother had shared. Immediately on his return she was taken ill, and before he could reach her she died. He mourned for her in a passionate way, and the practically simultaneous deaths of three friends also afflicted him and gave him an excuse for writing melancholy verses. He had brought to England the first and second cantos of 'Childe Harold' and his paraphrase of the 'Ars Poetica,' the 'Hints from Horace.' The latter, which he is said to have preferred, was immediately accepted; for some reason it did not appear during Byron's life. 'Childe Harold,' after some delay, was the means of uniting its author with his famous publisher, John Murray. It appeared in March 1812, after Byron had made a successful speech in the House of Lords. As all the world knows he awoke one morning and found himself famous as a poet; it is no wonder that he put a parliamentary career, in
which he might have done great good, forever behind him.

It has been for some years fashionable to sneer at the earlier cantos of 'Childe Harold'; but they are at least effective poetry, and their novel theme and romantic tone fitted them for the early readers who went wild over them. Melancholy and cynicism in a youth were more likely to attract than to disgust the young and womanly who were subjects of the Regent and contemporaries of Napoleon. Byron, who had previously made a fast friend of his would-be adversary, Thomas Moore (q.v.), became the social lion of the day. He was young and reckless, and unfortunately gave occasion for scandal through his relations with the notorious Lady Caroline Lamb and the equally frail Lady Oxford. People could also gossip about his handsome face and his drinking, and his strange diet for the reduction of his disfiguring obesity. His pecuniary difficulties, too, and his folly in presenting the money from his copyrights to his connection, Dallas, doubtless caused tongues to wag. He enjoyed his vaunts, and even his rustic pursuits, but he was not the ideal. After the failure of the anonymous 'Waltz,' he gave the world 'The Giaour' in May 1813, 'The Bride of Abydos,' in December of the same year, and 'The Corsair' two months later. All were dashed off, all were very popular, all deepened the atmosphere of mystery about him. Scott's supremacy as a romantic poet passed to the newcomer, and although the lines on the Princess Charlotte caused some hard feeling and he threatened to quit poetry, Byron continued for two years to have his fling both as a poet and as a gay man of the world. 'Lara' appeared in August 1814; 'Hebrew Melodies' in January 1815; 'The Siege of Corinth' and 'Parisa' in January and February 1816. The sums paid by Murray for these poems—Byron, harassed by debt, at last began to be businesslike—show plainly how well the poet continued to hold his public. Except for such lyrics as 'She walks in beauty like the night,' the work of this period has in the main failed to hold later generations. This is due no doubt to an unhomely desire on the part of a puritanical race to take it out upon Byron's far from impeccable character and career, as well as to a natural change of taste. Leslie Stephen has remarked upon the work of this period, and to the effect of such a story as that its author wrote the first sketch of 'The Bride of Abydos' in four nights after coming home from balls. That latter-day criticism has been altogether wrong in correcting the excessive praise given by Byron's contemporaries to this facile group of poems cannot be maintained; but it is well to remember that copious power is a good sign of genius, that Byron managed to put into 'The Giaour' not a little narrative vigor and into the whole group of Oriental tales much of the color and the spirit of the East, and that English literature would have been deprived of many beautiful lyric and descriptive passages if he had allowed society completely to turn him to his writing verse.

Meanwhile Byron had seen much of Moore and Rogers and had met, after many years, his half-sister, Mrs. Leigh, the 'Augusta' of some of his best poems, and the being of all others to whom his heart went out most fondly. In after years his memory and hers were to be clouded by a dark suspicion which, whether true or false, would probably never have soiled the ears of the world but for another woman—his wife. Whether the scandal which Mrs. Stowe (q.v.) spread and which Byron's own grandson, Lord Lovelace, unaccountably revived will ever be substantiated or laid completely to rest is a matter upon which the data for a decision are not forthcoming. In the interim generous minds and hearts will prefer to believe in the purity of the 'Epistle to Augusta.'

The story of Byron's courtship and marriage, while less mysterious than that of Milton, is not a clear one. In 1812 he seems to have been rejected by an heiress in expectation, Miss Anna Isabella Milbanke, four years his junior and a connection of his flame, Lady Lamb. The young woman appears to have been fond of mathematics and theology, to have written poems, to have been somewhat priggish and prudish and very self-centred. Some correspondence was kept up between the pair and, as a marriage seemed likely to steady his habits and better his fortune for the time to come, she proposed to him by letter in September 1814. This time he was accepted. Miss Milbanke was apparently proud of her catch and Byron of his. They were married on 2 Jan. 1815 and they seem to have got on well at first, though each later made reports to the contrary. The young wife soon inherited money and promised him a child; the poet behaved himself well on the surface, took an interest in the management of Drury Lane, saw something of Sir Walter Scott (always his defender) and helped Coleridge to publish 'Christabel.' But the pair were evidently incompatible, and after the birth of their only child, Augusta Ada, on 10 Dec. 1815, a separation was arranged for. Lady Byron believing that her husband was insane—a notion obviously stupid, but possibly charitable from her own point of view. The doctor, the lawyer and the father-in-law she let loose upon Byron may have irritated him into conduct that did not allay her suspicions. It is all a tangle; perhaps the easiest way out is to censure Byron and resolutely refrain from admiring his wife.

The separation was followed by an astonishing public clamor against Byron, whose friends seem to have thought his life in danger. Sir Leslie Stephen has contended that the public indignation was not unnatural. Perhaps it was not, in the sense that it represented some of the worst elements of human nature. For a society that tolerated the Regent and his boon associates to fall upon a man and then to condemn him unheard on the score of practically unspecified charges was simply to put an indelible blot upon Englishmen of the upper and middle classes—a blot the blackness of which may be somewhat gauged from the depth of the vindictiveness with which Byron's fame has been since attacked by many of his countrymen. It by no means follows, however, that Byron was at all justified in writing and publishing his numerous poems and passages relating to the separation—though literature without 'Fare Thee Well,' and would like to have had a chance to see his destroyed novel on the 'Marriage of Belphegor'—or that he can be excused for much of his conduct during the exile that began at the end of April 1816 and lasted for the rest of his spectacular life. One
can, however, pardon his constant desire to shock the British public; and, taking account of his temperament, of his varying moods of conciliatory tenderness and defiant scorn toward his implacable wife.

Byron first visited Belgium, traveling luxuriously. Then he went, by the Rhine, to Geneva, where he met the Shelleys and Claire Clairmont, who had made up her mind in London to be his mistress. She bore him in January 1817 a daughter, Allegra, with whom he charged himself and whose death in 1822 grieved him deeply. The intercourse with the Shelleys at Geneva was probably more beneficial to Byron than to Shelley. 'The Prisoner of Chillon,' the most popular of his poems of the type, the third canto of 'Childe Harold' which, thanks to Shelley, showed the influence of Wordsworth, the stanzas 'To Augusta' and other poems are memorials of the period and proofs that his experiences had ripened Byron's poetic powers. After the Shelleys returned to England, Byron, with Holhouse, crossed into Italy.

He was in Milan in October 1816 and then went, for the winter, to the French capital, where he practically remained for three years. His excursions in the Palazzo Macenigo are unfortunately but too well known; yet, although his health and his character suffered from them, to say nothing of his reputation, he did not a little reading, and his poetical genius continued active. The fourth cantos of 'Childe Harold' and 'Manfred,' which date, in part at least, from 1817 and reveal the effects of a visit to Rome, show his genius almost at its zenith, and 'Beppo,' suggested by Frere's 'Whistlecraft Cantos' precluded the greatest of his works—perhaps the greatest of modern English poems—the incomparable medley, 'Don Juan,' the first canto of which was written in September 1818. The first two cantos, between which he wrote 'Mazeppa,' were published, without indication of either author or publisher, in July 1819.

Meanwhile Byron had met the Countess Teresa Guiccioli, the young, beautiful and accomplished daughter of Count Gambas of Ravenna. They became passionately attached to each other, and, aided by the customs of the country, were constantly together at Ravenna and other places, Venetian society finally giving them up when she resided under his roof. At first he treated her with the respect accorded with the lady's elderly husband, it looked as if the temporarily weary lover might regain his freedom; but finally the affection of the Countess prevailed, and Byron, yielding to an influence higher and better than any he had known of late, established himself near her at Ravenna at the end of 1819. Here for a time, at her request, he gave up 'Don Juan,' and, after some translating from the Italian poets, began to write dramas.

His first play was 'Marino Faliero,' in writing which Byron departed from English models and made a diligent study of authorities. It was finished in the summer of 1820 and played unsuccessfully at Drury Lane the next year. The next, 'The Two Foscari,' the powerful, though not stylistically adequate 'Cain: a Mystery,' 'Heaven and Earth,' another 'Mystery,' and the inception of 'Werner,' his best acting play, taken largely from Harriet Lee's (q.v.) story 'Krutzner.' That Byron had little dramatic genius is generally admitted; the literary power which he could not avoid putting into any composition is not, in the case of these experiments, sufficiently recognized.

While writing his dramas, Byron had more trouble with Count Guiccioli, who was finally separated from his wife, and he was led by the Gambas to take a deep interest in the Carbonari conspiracies. He had already in his poetry given evidence of liberal political sentiments; now he subscribed for the patriotic cause, headed a section of the conspirators, and, but for his birth and fame, would have got into trouble with the Austrian authorities. The Gambas and the Countess were exiled from Ravenna, and Byron, after some lingering, joined them at Pisa in November 1821. Here he saw much of Shelley, Medwin, Trelawny and other Englishmen, and here some time in 1822 he wrote an ineffectual drama, 'The Deformed Transform'd.' The same year he made with Shelley and Leigh Hunt (q.v.) the fortunate arrangements which induced the latter to come to Italy and bring the publication of the quarterly journal, 'The Liberal.' The details of this affair are too complicated to be entered upon without ample space. Shelley was imprudent. Byron rather brutal, Hunt exasperating. Shelley's death completed the task still further, and 'The Liberal' expired after four numbers. Its most memorable item was Byron's masterly satire upon Southey, 'A Vision of Judgment,' written in 1821. This Murray had been chary of publishing after the trouble he had had with the orthodox on account of 'Cain'—an episode which had a good deal to do with Byron's willingness to establish a journal the chief expense of which he knew would fall on himself.

Meanwhile 'Don Juan' had been taken up once more, in a deeper vein, and the Gambas had been ordered to leave Tuscany. Byron, whose health and spirits were impaired, followed them to Genoa in the autumn of 1822. Here he wrote his satire 'The Age of Bronze' upon the political reaction of the time, as well as his poor narrative poem 'The Island' and the later cantos of 'Don Juan.' He was growing restless and feared that he was losing his powers; but, fortunately, for his fame at least, a new bustle filled his days. The Whig and Liberal committee was formed in London to aid the Greek revolutionists and at Trelawny's suggestion Byron was made a member. He proposed to go in person to the Levant, and by midsummer of 1823 he completed his elaborate preparations for the expedition. Sailing from Genoa, with rising spirits, he reached Cephalonia early in August. Here he remained four months writing excellent letters of advice and sensibly waiting for a clear opportunity for action, not, in all likelihood, for an offer of the Greek crown. At the end of December 1823 he accepted the invitation of Prince Alexander Mavrocordato to co-operate in the organization of western Greece and sailed for Corfu. He was kindly welcomed. He appears to have shown great tact in harmonizing opposing factions and considerable practical genius as an organizer. He had no chance to lead into action the wild troops over whom he was placed as commander-in-chief, but he did hold out success-
fully against a mutiny, owing by his courage the Sultotes that broke into his tent while he was ill. He recovered somewhat, but exposure to fatigue and the constant rains told heavily upon him, and he took no care of himself. At last he was prostrated with ague and received only the crudest medical attention. After much delirium he passed into a long slumber, which ended in his death at six o'clock in the evening of 19 April 1824. The news was a shock to the world. His body was sent to England and was buried, not in Westminster Abbey, but at Hucknall Torkard, near Newstead Abbey. The Greeks would have liked, more appropriately, to bury him at Athens, and, fortunately, they did secure his heart for interment at Missolonghi. There is no incongruity, however, in thinking of him as reposing, after his stormy life, in company with his passionate mother and his long line of wild ancestors.

Byron's position in English literature is a most fortunate one. It is an inspiration, a spell, a virtue, a retribution. He is the spell cast by his genius upon the romantic writers of their own countries as well as by his devotion to freedom and by the fact that his work in translation does not offend by its slipshod features, almost unanimously—whether, for example, the Frenchmen, or Germans, or Spaniards, or Russians,—place him only below Shakespeare. The English-speaking world knows the work of Chaucer, Spenser and Milton too well to admit such a high estimate of his genius; but it seems to have gone farther astray in depreciation than foreigners have in appreciation of his extraordinary gifts and achievements. With a few honorable exceptions like Matthew Arnold, English critics have magnified Byron's plain moral and artistic delinquencies and have minimized his powerful intelligence, his great range of work—he is one of the best of letter writers and the most brilliant of satirists, as well as the arch-romantic and revolutionary poet, and a notable descriptive and lyric one—his copious crea-tive power, and his great sincerity and strength. They have judged him as somewhat finicky connoisseurs of verse rather than as impartial appraisers of literature. They have under-estimated the hold he has kept upon youth and the attraction which his later work, especially Don Juan, so frequently exercises upon intelligent men of mature years. Whether he will ever receive his due from the more cultured of his countrymen is problematical; but there have been indications of late that a less banal attitude is being taken toward both him and his works. He may not be the greatest English poet of modern times, but he is certainly the most effective of all the enemies of cant. Seapots, Harps, Poets, Priests, Don Juan; Manfred; Vision of Judgment.

Bibliography.—The bibliography of Byron is naturally immense. His memoirs, given to Moore, were burned, after many family complications, in 1824. Moore's 'Life, Letters and Journals of Lord Byron' (1830) is the standard biography. It was included in Murray's edition of the collected 'Life and Works' (1832–35; 17 vols., 1837). The number of separate editions of the poems and of translations of them by others has been superseded by Murray's edition of the works in 13 volumes (6 of prose, edited by R. E. Prothero, 1898–1901; 7 of verse, edited by E. H. Coleidge, 1898–1904). The best one-volume edition of the poems is that by Cole-ridge (1905); the [American] Cambridge edition by P. E. More (1905) is also good. The large list of memoirs and books of biographical value may be represented here by Karl Eitel's 'Lord Byron' (1870), Emilio Castelar's 'Vida de Lord Byron' (1873), J. C. Jeaffreson's 'The Real Lord Byron' (1883), John Nichol's 'Byron' in the 'English Men of Letters' (1880); and Roden Noel's volume in the 'Great Writers' series (1887). Reminiscences by Lady Blessington, Medwin, the Countess Guiccioli, E. J. Trelawny, Hobhouse, Leigh Hunt and many others should also be consulted. Of critical essays, favorable and unfavorable, those by Matthew Arnold, Charles Kingsley, Mazzini, Macaulay, John Morley, J. A. Symonds and Swinburne may be mentioned. Among more recent studies are Byrons: The Last Phase,' by Richard Edgcumbe (1909) and a work in two volumes on Lord Byron's Colours of Fainy (1912–13). The mass of continental criticism is very large and is steadily increasing.

William P. Trent.

Professor of English Literature, Columbia University.

BYRON, Harriett, a character in Richardson's novel, 'Sir Charles Grandison.' She was attached to the hero and was the writer of the greater part of the letters comprising the novel.

BYRON, Henry James, English dramatist and actor: b. Manchester, January 1834; d. London, 11 April 1884. He studied at first for the medical profession, and afterward for the bar, but his passion for the stage caused him to abandon them. He was the first editor of Fun, and also started another paper entitled the Comic Times, which soon ceased to appear. He wrote an immense number of pieces, including a great many farces, bur-lesques and extravaganzas, besides comedies or domestic dramas, such as 'Fra Diavolo' (1858); 'Cyril's Success,' probably his best work; 'Dearer than Life'; 'Blow for Blow'; 'The Lady of Lyons'; 'Uncle Dick's Darling'; 'The Prompter's Box'; 'Partners in Misery' and 'Our Boys' (1878), which had a run of four years and three months, the longest on record.

BYRON, John, English naval officer: b. Newstead, 8 Nov. 1723; d. 10 April 1786. At the age of 17 he sailed with Lord Anson on a voyage round the world, but was wrecked on the coast of the Pacific, north of the Straits of Magellan. Byron, with some of his unfortunate companions, was conducted by the Indians to Chile and remained there till 1744, when he embarked on board the ship Bank of France. George III, who wished to explore the part of the Atlantic Ocean between the Cape of Good Hope and the southern part of America, gave Byron command of a frigate, with which he set sail in June 1764. After having circumnavigated the world, he returned to England at the end of two years to England, where he arrived in May 1766. Although Byron's voyage was not fruitful in discoveries, it still deserves an

PALATINE CHAPEL AT PALERMO
honorahle place in the history of voyages round the world, since he was the first of those renowned circumnavigators of the globe, including Wallis, Carteret and Cook, whose enterprisings were not merely meritorious, but were directed to scientific objects. In 1769 Commodore Byron was appointed to the government of Newfoundland, which he held till 1772. He was raised to the rank of vice-admiral in 1778, was signalised by d'Estaing in an indecisive battle off Grenada in 1779 and died of illness in 1786. Such was his general ill fortune at sea that he was called by the sailors "Foul-Weather Jack."

BYRON BAY, a bay on the northeastern coast of Labrador, situated about lat. 55° N., and long. 58° W., and north of Hamilton Inlet. The width of the bay is about 50 miles.

BYRON ISLAND, Micronesia, a small island of the Gilbert group, in the Pacific Ocean, about 12 miles in length, abounding in cocoanuts. It was discovered by Commodore Byron in 1765, and belongs to Great Britain.

BYRON'S LETTERS. The letters of Lord Byron are numerous. In Moore's 'Life of Byron' 560 appear. It is reasonable to suppose that his biographer did not select the least interesting, and we are thus able to form a tolerably accurate judgment of Byron's merits as a letter-writer. The chief qualities revealed in these letters are naturalness, good sense and straightforward sincerity. He writes much about himself, as every good letter-writer must, but with no more egoism than is usually displayed in a frank communication between friends. The character thus revealed is at total variance with the character invented for him by his critics and his enemies, and partially sustained by the nature of his poems. He appears as the very reverse of a sentimentalist. There are few passages of tenderness; even when he speaks of the death of his daughter, Allegra, for whom he had a deep affection, he does little more than record his loss in the simplest language. In speaking of the death of Shelley the same restraint is practised; beyond a brief picture of the romantic scene on the shore near where the body was burned, there is nothing that reveals the poet. He is at his best when describing his own daily life, his literary aims and ideals and his opinions of his contemporaries. In describing his fellow-writers he sometimes has a flash of true illumination, but his habitual attitude is hostile and satiric. For Walter Scott he has a genuine appreciation; but the rest move him only to contempt — "Southey twaddling, Wordsworth dawdling, Coleridge muddling, Bowles quibbling, squabbling and squelling — Barry Cornwall will do better by and by, if he don't get spoiled by green tea and the praises of Pentonville and Paradise Row."

It is the pervading quality of robustness which is the chief characteristic of the 'Letters.' There is nothing of the delicate word-felicity of Edward Fitzgerald, nor of his fine literary discrimination. There are none of those passages of wild imagination and prophetic passion which give to Carlyle's letters a place in literature equal to that attained by his most deliberate essays and histories. Nevertheless he can strike out memorable phrases, as when he speaks of the unpublished letters of Burns as revealing a strangely antithetical mind — "dirt and deity — a compound of inspired clay."

Nor are his thoughts upon life and religion without value, though to the modern mind, familiar with the problems of philosophic doubt, his reflections may appear to have little depth or originality. They are, however, the sincere utterances of a mind in revolt against the sluggishness of conventional opinion, and intent upon a freedom which few were bold enough to seek. Upon the whole, it may be said that the real Byron is more faithfully depicted in his letters than in his poetry. We cannot read them without being aware of a mind possessing great natural force, character, and tenderness, and, in its criticism, sanity, a hard, clear vision of material facts and a justness of apprehension which belong more frequently to the great critic than the popular poet.

W. J. DAWSON.

BYSSUS, bē'sus, a kind of fine flax, and the linen made from it, used in India and Egypt at a very early date. In the latter country it was used in embalming, and mummies are still found wrapped in it. As an article of dress it was worn only by the rich. Dives, in Christ's parable, is"'

BYSTRÖM, Johan Nikolai, Swedish sculptor: b. Filipstad, Wermland, Sweden, 1805; d. Rome, 11 March 1848. He studied art under Sergell in Stockholm, and in 1810 went to Rome. In 1815 he returned, and winning the favor of the Crown Prince by his statue of the latter, received several important commissions. Several years before his death he again took up his residence in Rome. Among his more important works are 'Drunken Bacchante'; 'Nymph Going into the Bath'; 'Reclining Juno'; 'Hygieia'; 'Dancing Girl'; a polychrome marble statue of 'Victory' in the palace at Charlottenburg; a statue of Linneus and colossal statues of Charles X, XI, XII, XIII, XIV, and Gustavus Adolphus.

BYWATER, Ingram, English scholar: b. London, 27 June 1840; d. 17 Oct. 1914. He was educated at University College and King's College, London, and Queen's College, Oxford. He was Regius professor of Greek at Oxford University 1893-1908. Among his works are 'Fragments of Heraclitus' (1877); 'Works of Friscianus Lysius' (1886); 'Textual Criticism of the Nicomachean Ethics' (1892); 'An Outline of the Art of Poetry, with Translation and Commentary.'

BYZANTINE ARCHITECTURE designates the style and type of architecture which were developed in the Byzantine empire after
BYZANTINE ARCHITECTURE

the fall of Rome, and which spread thence westward into Italy and northward into what is now Russia, where it still persists in attenuated form. The historical and decorative art associated with this architecture was widely diffused through Europe (see Painting), and materially affected Western art. With the final division of the Roman empire between Honorius and Arcadius (395 A.D.), Constantinople became the capital of the Eastern or Greek empire, but the most important city of Christendom; the chief centre for centuries of Christian art and learning, especially of Greek culture as distinguished from the Latin, and of the Eastern Church as distinguished from that of Rome. Under the great Emperor Justinian (527-65 A.D.) there ensued an extraordinary activity in the building of churches, not only in the capital but in Syria, Dalmatia and Macedonia and in Ravenna, the seat of the Byzantine emperors. This architecture was chiefly the work of Asiatic Greeks, who introduced into the construction of churches certain traditional Asiatic forms and methods, especially in types of vaulting in brick or stone, and the arrangement of such a type of church—the basilica, with its three aisles and wooden roof—and substituted for it new types both of plan and construction, of which the dominant feature was invariably a central dome, raised above the surrounding structure and pierced by a ring of windows at its base. They revived certain features of Roman secular vaulted buildings and blended with these an Oriental taste for applied decoration in color, creating out of this combination a wholly new style and new effects. The style thus evolved matured with extraordinary rapidity and then began a long and gradual decline.

If we take the baptistery of the Orthodox and the tomb of Galla Placidia, both at Ravenna, and dating from about 450 A.D., as the earliest examples of the style, less than a century elapsed between its birth and its culmination in the unsurpassed church of Hagia Sophia at Constantinople (532-38 A.D.). This masterpiece was never equaled in scale or magnificence, and indeed was never equalled, in the church of Saint Mark at Venice (1047-71; the façade later) the style flowered in a new masterpiece of great beauty, at the hands of Greek and Italian artists. No other extant example approaches these two in magnificence and artistic merit. During the reign of Justinian several other splendid churches were built at Constantinople and Jerusalem, but even these were far inferior to Hagia Sophia. Except in the one instance of Saint Mark's, all the others that the Byzantines were relatively small in dimension and timid in construction.

Characteristics.—The dominant feature of the style is the central dome on pendentives. The pendentive is a device by which a circular dome can be erected upon four or more isolated supports, instead of upon a continuous circular wall. It consists of a triangular portion of a sphere comprised between two adjacent arches and a horizontal circle touching their summits. Four such surfaces carried by four arches bounding a square meet at the top in a circle to form the base of the dome, or of a circular drum upon which the dome is to rest. By means of eight piers, with their arches and pendentives, the dome may be built over an octagonal space. In either case the openings between the piers allow the floor-plan to be extended in any direction, so that the dome may be used in connection with almost any type of ground-plan; whereas in previous styles it had been almost wholly confined to circular structures, as in the Pantheon at Rome. The Byzantine plans were therefore very varied, and were vaulted throughout in brick. The construction of these domed and vaulted buildings by which were nearly all ecclesiastical, was based generally on the Roman principle of massive internal piers and intermediate columnar supports; but the Byzantine columns carried arches instead of entablatures like the Roman. External buttressing above the roofs of side-aisles or other low portions was another Roman feature derived from bath-halls and the Basilica of Maxentius. Roman also were the system of wall decoration by incrustation with slabs of richly veined marble, the use of marble decorative patterns for floor-pavements, and the employment of monolithic column-shafts of polished granite, porphyry and marble, at once structural and decorative. On the other hand, the Byzantine conceived Latin cross churches as a covering of all surfaces, both of walls and vaults, with a veneer of perfectly flat decoration in color, broken up into minute units, was distinctly Oriental. All carving in high relief was replaced by delicate all-over patterning in very flat low relief, and above the marble wainscoting the walls and vaults were covered with mosaic of minute glass tesserae (see Mosaic) in brilliant colors usually on a gold ground. These mosaics were partly pictorial, representing Christ, saints, apostles and other religious or Biblical subjects, and partly conventional patterns. The Roman types of capital were replaced generally by new types of simpler mass covered with flat-relief carving of foliate and basketwork, and impost-blocks were often introduced between the caps and the heavy arches which they carried.

History and Monuments.—The germ of the style are seen in certain early Christian buildings in Syria and in Dioscletian's palace at Spalato, which was, however, a work of Syrian or Byzantine workmen; more clearly in two 5th century buildings at Ravenna—the baptistery of the Orthodox, having a dome over an octagonal substructure and the tomb of Galla Placidia, a cruciform edifice with a square *lantern* rising above the arms at their intersection, crowned by a dome on rudimentary pendentives. Doubtless, however, the original prototype of one class of Byzantine churches having a central square or octagon surmounted by a lantern, to be found in two Roman buildings erected by Constantine—the baptistery of the Lateran and the tomb of Constantia (Santa Costanza). The roof of the high central part of the former was of wood; of the latter, a masonry dome. The evolution of the central space with a dome on eight supports may be traced through early examples in Syria to Saint Sergius at Constantinople (520 A.D.) where alternate sides of the octagon were occupied by open columnar niches or apsidioles projecting into the surrounding aisle, thence to San Vitale at Ravenna (525 or 527), where there are six such apsidioles; the easternmost bay being in both these churches extended to form a chancel and apse;
and finally to its culmination in the new type of plan seen in Hagia Sophia (The Divine Wisdom, often called "Saint Sophia"); now a museum of art. This church was the work of two architects from Asia Minor, Anthemius and Isodorus, was built under the orders of Justinian in six years (532–38) to replace an earlier church destroyed by fire during a racecourse riot. It occupies a broad rectangle, measuring nearly 330 by 320 feet, and consists of a central nave 243 by 115 feet covered by a dome 107 feet in diameter and 180 feet high, and two half-domes of 100 feet span opening into the two transverse arches of the four that carry the dome. This half is flanked by vast aisles, 60 feet wide, each divided into three parts by two massive buttresses which rise above the roofs of the two-storied aisles. This triple division of the aisles by transverse buttress masses which rise above the aisle roofs is peculiarly derived from the traditional form and construction of the Roman thermes, probably through the intermediary Basilica of Maxentius of the early 4th century. A narthex across the west front preceded by an atrium or fore-court, and the decision of the apse at the east end, make up the total length of 300 feet. Tall columnar apsidioles expand the semi-circular ends of the nave, and recall the six similar apsidioles between the piers of San Vitale at Ravenna. The interior is resplendent with polished columns of costly marble, verd-antique and porphyry, with marble wainscot and superb mosaics, though all human figures have been concealed by gilding and paint on account of Moslem prejudices. The furniture of the church, which was of unrivaled cost and splendor, disappeared centuries ago. In this stupendous work we seem to see the plan of Saint Sergius cut in two and between the two halves an immense square interposed, covered by a gigantic dome on pendentives rising far above the rest of the building. On the other hand, the cruciform type first shown in the tomb of Gall Placidia culminated, also in Justinian's time, in the church of the Apostles at Constantinople. This had five domes, one on each arm of the cross and a central dome dominating the whole. This splendid church was demolished in 1463 by the conquering Sultan Mehemet II, but it had already served as the model for the builders of Saint Mark's at Venice. With the exception of this last named church, none of the other Byzantine churches of Constantinople was of large size. The only other church of Justinian's time that has survived to our day is that of the Holy Peace, Hagia Eirene (miscalled "Saint Irene"), now used as a museum of art. It is, however, a poor example of all embellishments, and is really a late (8th century?) and hasty reconstruction of the original edifice. With its two domes it may have served as the model for the Cathedral of Cahors, France. The later examples of the style in Constantinople were relatively small in scale, sometimes complex in plan, with small domes on high drums (Saint Theodore, Pantokrator, Moné tes Choras, etc.). About 40 of these small churches are extant, mostly transformed into mosques; and only one of them retains any part of its original decorations. This one is the Moné tes Choras, now known as Karihi Jami, dating probably from the 11th or 12th century, with a narthex adorned with mosaics and frescoes which, uncovered about 1880, the Turks have allowed to remain exposed. There are a number of later churches, the work of singularly small size — and at Salonica several of various dates (Saint George, Saint Elias, Saint Bardias, Saint Sophia); besides interesting monastic groups in Macedonia, at Meteora and on Mount Athos. In Russian Armenia (Ani, Etchmiadzin, etc.), the style took on a distinct provincial character, with stone pyramids instead of domes as the outer form of the cupola on a high drum, and often with highly interesting carved interface ornament. The singular and barbarously fantastic forms of churches at Moscow, Kiev and other Russian cities (e.g., the Saint Basil in the Kremlin in Moscow) are remotely derived from the tall-drum domed "lanterns" of the late Byzantine type. Near the middle of the 11th century the desire for the desirous form and construction of the Roman thermes was revived from its low estate, and the native artists and the native art appeared inadequate for the task in hand, except as they were guided and assisted by Byzantine architects. The new church, measuring about 220 by 180 feet, was erected on the cruciform plan of the Holy Apostles' Church at Constantinople, with five domes, of which the central was slightly larger than those on the four arms. The very active Venetian commerce with the East brought in an extraordinary wealth of artistic material — antique columns, veined marbles, carvings from ruined or dismantled churches — and with these and the embellishments of mosaic by Greek artists and their Italian pupils, as well as by later additions of sculpture and furnishings, the interior was made resplendent beyond any other church in Italy or western Europe. Lacking the overwhelming majesty and unity of Hagia Sophia, it has nevertheless an extraordinary beauty of its own. The main construction was begun in 1070; the dome was first put up in 1072; but the building dates from the 12th century, with the extraordinary and marvelously picturesque façade; the wooden exterior domes and Gothic pinnacles were added in the 15th century: some of the mosaics are modern. Unlike the Byzantine churches of the East, which almost wholly lack external embellishment, Saint Mark's is revetted externally with paneling of fine marble. Strange to say, it was never copied or imitated, except in the Romanesque of the Eastern Front at Périgueux (France), which however is totally lacking in the embellishments of marble and mosaic that make up so much of the splendor of the Venetian model. Quite as surprising is the fact that Hagia Sophia, the noblest of all Byzantine monuments, remained absolutely unique and uninspired until the Turkish conquest. It was the Turkish mosque-builders who seized upon its superb possibilities and developed from them a new and splendid type of architecture for their own requirements (see MOHAMMEDAN ARCHITECTURE). An interesting lateral branch of Byzantine architecture is seen in the monasteries erected by Coptic Christians in Egypt, in the 6th-9th
Cathedral of the Resurrection of Christ, Petrograd
centuries, recently explored by the Metropolitan Museum of Art of New York. The domes and surface-carvings of these buildings strongly influenced the development of the Arabic art of Cairo. The great mosque at Jerusalem, known as that of Omar (more properly the Dome of the Rock, Kubbet-es-Sakrah) is probably a reconstruction of the church built on Mount Moriah by Justinian. The decline in the size and splendor of the Byzantine churches built after the 6th century was due to the slow decay of the empire itself in both political and military prestige and power. Those erected in Greece and the Danubian provinces were often of almost microscopic size. The "Old Cathedral" at Athens measures 37 by 32 feet; the dome of another church in the same city is but seven feet in diameter. Many of the later churches have three apses, one at the end of each aisle; and in all the examples after the 7th century the dome is carried on a high drum pierced with windows, forming a "lantern," whereas in the earlier churches the windows penetrated the base of the dome itself. Another innovation was the introduction, into the wall of the main structure, of arched windows coupled in pairs under a discharging arch, often with a marble or stone wall shaft between the two. This feature, together with the central lantern or high cupola over the crossing, was adopted by the Romanesque church-builders of Italy and France in the 11th and 12th centuries, and both became important features in the Western Romanesque style. The partial copying in France of Saint Mark's, and perhaps of Hagia Eirené, at Périgueux and Cahors has been referred to. Besides these there are in Aquitania and in the valleys of the Loire and Charente a large number of domed churches of the 12th century due to Byzantine influence, partly by way of Venetian commerce, partly (according to Enlart) by way of Cyprus where the Crusaders established important Latin Christian communities.

Of the Byzantine secular architecture there are hardly any remains. Doubtless the palaces of the emperors were of great splendor, but the only extant ruin of any importance is that of the palace of the Porphyrogenitus near the Bachierna at Constantinople, of which the walls of the great hall are still standing, but with no vestige of its interior decoration. The vaulted cisterns of the city are still intact, and at Ravenna the front wall of the so-called palace of Theodoric. There are a number of Byzantine fortifications in ruins in various cities of the empire, and Byzantine military architecture was of great importance; but these examples are so ruinous or have been so often and so completely rebuilt in later ages that further notice in this article is unnecessary.

The best general handbook of Byzantine architecture in English is by Sir T. G. Jackson, 'Byzantine and Romanesque Architecture' (Cambridge 1913). There are excellent accounts of the style in F. M. Simpson's 'History of Architectural Development' (Vol. I, London 1910), W. R. Scruggs, 'Dictionary of Architecture' (New York 1901), and in Vol. II of his 'History of Architecture' (ib. 1905). Lethaby and Swainson's 'Sancta Sophia' (London 1894) is an authoritative work. Texier and Pullan's 'Byzantine Architecture' is chiefly concerned with the churches of Salonica. The majority of the most important works on the subject are in French, among which may be mentioned: Bayet, 'L'Art byzantin' (Paris 1897); Ruby, 'Bâtir chez les byzantins' (Paris 1883); Diehli, Ch., 'Manuel d'art byzantin' (Paris 1910); Hubsch,aw,*Monuments de l'architecture chrétienne* (Paris 1886); Puigheri, 'Les églises byzantines de Constantinople' (Vienna 1878), and de Verneuil, 'L'Architecture byzantine en France' (Paris). In German: Essenwein, 'Auszüge der klassischen Baukunst' (in the Handbuch der Architektur, Darmstadt 1886), and the monumental work of Salzenberg, 'Die altchristlichen Baudenkmale von Konstantinopel' (Berlin 1854). In Italian the great work of Ongania, 'La basilica di San Marco' is authoritative.

ALFRED DWIGHT FOSTER HAMLIN,
Professor of the History of Architecture, Columb ia University.
crafstmen also, prohibited from following their callings, turned from religious to Hellenistic motives, and devoted themselves to ivory and goldsmiths' work, miniature painting, and conventional decorative design, Eastern in inspiration. By about the middle of the 9th century, mosaic and painted figures began to be used once more in decoration, and a general activity was resumed in the growing prosperity of the empire under the Macedonian dynasty. (3) The third period dates from the beginning of the Macedonian Dynasty (867 A.D.) to the sack of Constantinople (1204 A.D.). This was the second great stage of Byzantine art. It was two-fold in character, being imperial and secular, and inspired by classic tradition, while at the same time the monastic art of the times continued and preserved its strict and severe traditions. Masterpieces of each type were frequent, both historic and ecclesiastical. The greatest extant monument of this style and period was San Marco, Venice (11th century. (4) The fourth period is that from the Restoration until the Turkish Conquest (1453 A.D.). Although many of the great works of art were produced during this period, it was, on the whole, an age of artistic decline and slow decadence. As the empire was impoverished fewer works were executed in precious metal and ivory. Byzantine art had no period of struggle and slow development, and passed through no archaic stage. It represented the union of the mature styles of the Near East and West, and showed small desire to draw fresh truth from nature, being content instead to fold the stored fruits of its knowledge for the production of its masterpieces. Its chief element was not so much the art of Rome, but of Sassanid Persia and the Hellenized East. It was the East that it acquired its dislike of realistic representation, its love of domed and vaulted buildings and its delight in Oriental decorative pattern and sumptuous richness of color. It was above all a great decorative art — formal, splendid, ceremonial and reflecting the spirit of the court and the Church. We find the key to it, not in nature and the spontaneous joy and beauty of life, but in some such scene as Gibbon has described, when telling of the visit of Luitprand, bishop of Cremona, to the Emperor Constantine VII in the year 948 A.D.: "When he (Luitprand) approached the throne the birds of the golden tree began to warble their notes, which were accompanied by the roaring of two lions of gold. With his companions, Luitprand was compelled to bow and to fall prostrate, and thence to touch the ground with his forehead. He arose, but in the short time the throne had been hoisted from the floor to the ceiling, the imperial figure appeared in new and more gorgeous apparel, and the interview was concluded in haughty and majestic silence." Here we have all the set pageantry and conventionality of Byzantine decoration, which was magnificent for its purpose, but which, in the end, was destined to lose its power, as already the demand for the stimulus and inspiration, and its divorce from life.

Byzantine art was sternly controlled by the Eastern Church which turned in perhaps not unnatural reaction from the pagan love of form, as shown in the sculptures of Greece and Rome, and employed art instead in a decorative manner only, as an expounder of dogma, and an expression of East Christian ideas. In this way it is true painting and conventional decorative design, Eastern in inspiration. By about the middle of the 9th century, mosaic and painted figures began to be used once more in decoration, and a general activity was resumed in the growing prosperity of the empire under the Macedonian dynasty. (3) The third period dates from the beginning of the Macedonian Dynasty (867 A.D.) to the sack of Constantinople (1204 A.D.). This was the second great stage of Byzantine art. It was two-fold in character, being imperial and secular, and inspired by classic tradition, while at the same time the monastic art of the times continued and preserved its strict and severe traditions. Masterpieces of each type were frequent, both historic and ecclesiastical. The greatest extant monument of this style and period was San Marco, Venice (11th century. (4) The fourth period is that from the Restoration until the Turkish Conquest (1453 A.D.). Although many of the great works of art were produced during this period, it was, on the whole, an age of artistic decline and slow decadence. As the empire was impoverished fewer works were executed in precious metal and ivory. Byzantine art had no period of struggle and slow development, and passed through no archaic stage. It represented the union of the mature styles of the Near East and West, and showed small desire to draw fresh truth from nature, being content instead to fold the stored fruits of its knowledge for the production of its masterpieces. Its chief element was not so much the art of Rome, but of Sassanid Persia and the Hellenized East. It was the East that it acquired its dislike of realistic representation, its love of domed and vaulted buildings and its delight in Oriental decorative pattern and sumptuous richness of color. It was above all a great decorative art — formal, splendid, ceremonial and reflecting the spirit of the court and the Church. We find the key to it, not in nature and the spontaneous joy and beauty of life, but in some such scene as Gibbon has described, when telling of the visit of Luitprand, bishop of Cremona, to the Emperor Constantine VII in the year 948 A.D.: "When he (Luitprand) approached the throne the birds of the golden tree began to warble their notes, which were accompanied by the roaring of two lions of gold. With his companions, Luitprand was compelled to bow and to fall prostrate, and thence to touch the ground with his forehead. He arose, but in the short time the throne had been hoisted from the floor to the ceiling, the imperial figure appeared in new and more gorgeous apparel, and the interview was concluded in haughty and majestic silence." Here we have all the set pageantry and conventionality of Byzantine decoration, which was magnificent for its purpose, but which, in the end, was destined to lose its power, as already the demand for the stimulus and inspiration, and its divorce from life.

Mosaics and Painting.—In the second Council of Nicea (787 A.D.) the following statement, from its Acts, shows the attitude of the Church at the time toward painting: "It is not the invention of the painter which creates pictures but an inviolable law, a tradition of the Church. It is not the painters but the Holy Fathers who have to invent and dictate. To them manifestly belongs the composition, to the painter only the execution. This paragraph in the year 948 as, with both Byzantine mosaics and painting. It shows us once more how tradition took the place of nature, and led to both the greatness and the weakness of Byzantine art.

The weakness of Byzantine drawing and painting became apparent after the Restoration. Byzantine art had never been dramatic, and had never been filled with the warmth of human joys and sorrows, an, when the artistic creeds became arid and lifeless, the painter who lost their imaginative power, and were content to copy drawings which were often in themselves copies, and to accept such guidance as has been preserved to us in the 'Guide to Painting,' a collection of artistic precepts collected by its lack of fresh early 13th century, from the works of an earlier and famous Byzantine painter, Manuel Pantelinos of Thessalonica, who may have lived as early as the 13th century. In this guide, exact directions are laid down for the execution of all well-known scenes from Bible history.
Byzantine painting was generally executed in tempera upon plaster or a wooden panel, the outlines of the design being often drawn in with gold. Some of the subjects are still to be seen in the churches, and the painting, which were exported by the merchants, have been spread far and wide. Numberless miniatures were also produced in the monasteries, and these and the panel pictures exerted an immense influence on the art of other countries, particularly in Italy, to which art which was brought into such close touch with that of Byzantium. Even at the present day the Byzantine tradition is the chief force in the painting of many parts of Greece, Russia, and Asia Minor.

Mosaics were the most splendid expression of Byzantine decorative art. The art, which was an ancient one, had probably been derived from the East, and was raised to a position of importance in Egypt in Ptolemaic times. From there it spread out to the rest of the West, where in Rome it grew to be very popular. The Byzantines preferred, however, glass tesserae of various colors to the small cubes of colored marbles commonly employed by the Romans.

Gold and silver tesserae were made by laying gold and silver leaf upon the back of the glass and then covering the leaf by a second thin film of glass to protect it. The mosaics were placed in position by means of cement, and the glowing richness of the solemn figures against their golden backgrounds formed a sumptuous and splendid decoration to dome or wall.

In the 5th and 6th centuries Ravenna, then the artistic centre of Italy, was the most famous centre of the mosaic industry, and was renowned for the magnificent mosaic decorations of its churches. In the early days Venice was under artistic allegiance to Constantinople, and among later mosaics those in the churches of San Marco and the cathedral of Torcello, dating from the 11th century, may be mentioned. Fine mosaics were also produced in the Sicilian churches in the 12th century, although in Sicily the Byzantine craftsmen were probably helped by their western pupils.

Sculpture.—One of the immediate effects of Christianity was a distaste on the part of Christians for monumental figure sculpture, which to their minds was associated with the rites of pagan worship. This dislike was also shared by the all-conquering Arabs, who read in the preachings of Mohammed a prohibition of anything appertaining to idol-worship, a fact which no doubt had its influence on the Byzantines who were in constant touch with the Mohammedans. At this time, also, the general trend of opinion as to artistic decoration in the Near East was in favor of elaborate pattern as opposed to a naturalistic treatment of forms, and Byzantine art, being partly Eastern in spirit, shared to a certain extent the common preference. As the nude was not studied in classic times such few figures as were carved soon lost their close relation to life. Figure sculpture became a dependent of architecture and was often used in connections with the depicting of members of the Imperial family, high officials or famous characters from sacred story. Delicate gradations of relief were avoided, and carvings were largely confined to two planes so that a strong effect of light and shade, without halftones, should be obtained, and the effect of strong pattern produced. Some of the most beautiful Byzantine sculptures are on the capitals, partiuloai and the pulpits, or amboles, in the churches. Here we find the most delicate patterns of natural forms, plants, birds and animals, and also entwined scroll-work and geometrical designs. Among the most famous of the carvings are those in ivory, the diptyches, ikons, caskets, icons on the covers and tablets, many of which were originally colored and gilded. The goldsmith's work, tapestry, weaving and the art of enameling also attained great beauty, and served to keep the Eastern tradition alive in Europe.

BYZANTINE EMPIRE. The. Old Byzantium, founded about 688 B.C., lay in ruins after its destruction in 196 A.D. until Emperor Constantine the Great rebuilt the city and made it the capital of the Roman empire instead of Rome (hence called also Roma Nova). Byzantium was chosen on account of the excellence of the site. On 26 Nov. 328 the cornerstone was laid for the extension of the city walls, and on 11 May 330 the solemn dedication of the new city was made. Two large tracts in the centre were adorned with colonnades and statues, while in the hippodrome was placed the famous serpent-column from Delphi. The whole empire was robbed of its finest treasures of art to embellish the new residence. The Emperor's palace was a magnificent congeries of buildings. The colonization of inhabitants was promoted by granting the privileges of Old Rome to the citizens of New Rome: the councilors were called senators, and the same advantages in the way of bounties and amusements were afforded the people of Byzantium as had been enjoyed by the Romans. The city soon grew in territory to 14 districts. But the people lacked unity, for the population consisted of colonists from many different races. Nevertheless, Byzantium was designed to become a seat and centre of learning. The schools of law were soon in a flourishing state. The bishop of Byzantium acquired the rank of a patriarch and laid claims to supremacy over the Oriental churches. Many councils, or conventions, were held in the city, the most renowned of which are the following: in 381 against the Macedonians, in 553 for the settlement of the controversy over the three capitals, in 680 against the Monotholites, 692 for the ratifica-
tion of the older ecclesiastical observances, 754 against the adoration of images, 869 against the patriarch Photius, and in 879 in his favor. Acting for nothing except to gratify their passion for the hippodrome, the people split into two factions, who named themselves, after the color of the charioteers, the "Blues" and the "Greens," and utterly devoid of higher aims fought each other with passionate hate. Under Justinian I this fictional strife increased until finally what is known as the Nika insurrection broke out. This sedition raged from 13 Jan. to 20 Jan. 532, and ended with the massacre of at least 30,000 human beings in the hippodrome by Bulgar and Latin enmity also took part with great magnificence after its semi-destructive fire and embalmed it with numerous richly adorned churches, the finest of which was the cathedral, Saint Sophia. The strong force defending the city against the violence of enemies. The Avars, strengthened by Bulgarians and Slavs in 626, penetrated several times into the suburbs. In 616 and 620 the Persians under Chosroes appeared before the city walls. The two sieges of the Arabs are particularly celebrated: from April to September 673, when the city was saved by the Greek fire of the Syrian Kallinikos, and 717-18, when Leo the Isaurian defended it. In 1203 the solders of the 4th Crusade marched before the walls of the city to restore to the throne Isaac Angelus, who had been deposed by Alexius. For a long time the inhabitants defended themselves under the leadership of Theodorus Lascaris; but when Alexius on 18 July cowardly took to flight, Isaac was released from prison and restored to the throne, whereupon the leaders of the Crusade marched into and occupied Galata. Meanwhile the bitterness of the Byzantines against the Franks led to an insurrection (February 1204), in which Isaac and his enemies were killed. Alexius V. Ducis Murzuphlos, was immediately defeated by the Crusaders, who took Constantinople by storm on 12 April after a stubborn fight. In the sacking of the city, which followed the battle, the most magnificent treasures of art were destroyed, while most of the rest were carried off to adorn Venice and the cathedral of Saint Mark; and an enormous booty was taken. On 9 May the Crusaders elected Count Baldwin of Flanders emperor, but the new emperor, nearly 200,000 soldiers and the fleet 250 ships. To oppose these the defender, Constantine XI Dragates, had only 11,000 Greeks and 3,000 Italian reinforcements. The Italian soldiers were led by Giustiniani, commanded. In addition to this great disparity in numbers was a further disproportion consisting in the unity of the assailants and the division among the defenders. In Constantinople embittered religious strife raged between the Orthodox and the Unionists (Henotikoi). But in spite of the inequality in strength the besieged, supported by the natural strength of the position and fortifications of the city, repelled the most violent attacks for 40 days. When the emperor, Constantine, refused a voluntary surrender, even with the permission of a free withdrawal of his forces, the city was stormed on all sides, 29 May, and captured. Giustiniani fell, and Constantine met a hero's death in the midst of the battle. In the heat of the conflict the conquerors destroyed everybody that fell in their path. Those that survived were sold into slavery. The city was completely sacked and numerous treasures of art destroyed. At mid-day Mohammed II, the new emperor, invested the beleaguered city and offered up prayers of thanksgiving in Saint Sophia, which became now the principal mosque. Then he ordered all the dignitaries of the empire to be driven into one place and cut down. The city was rebuilt, the fortifications restored, and Constantinople became the capital of the Ottoman empire.

Given in more chronological detail: after the death of Theodosos in 395 the Roman empire was divided between his two sons. Arcadius, whose realm included the western half of the empire, was established in 408-450. The government was ably carried on by his sister Pulcheria during his whole reign, notwithstanding the fact that the Huns under Attila exacted a tribute of 10,000 horses and gold. Pulcheria married Marcianus, who ruled from 450 to 457. This strong emperor refused to comply with Attila's demands. Leo the Thracian became the next emperor (457-74), and
was succeeded by Zeno (474-91), after whose death Anastasius I (491-518), who married Zeno's widow, and proved that the ruler emperors of the empire further than one. The next emperor, Justin, was an Illyrian peasant, who had become an experienced soldier. He reigned from 518 to 527. By the conquests and able administration of the next emperor, Justinian the Great, the empire reached the acme of its prosperity and power. The weak ruler was devoured to bring all under one state, one church and one law. He had the Roman law compiled and published under the form of a monumental code. After his death the empire began to decline. His successor, Justin II (565-78), desired to emulate the great Justinian and win even greater glory. But the Persian War exhausted his resources, while the Avars and Slavs made incursions on the northern borders and the Lombards overran Italy. Inefficient rulers succeeded: Tiberius Constantinus (578-82), Maurice (582-602) and Phocas (602-10). Heraclius ascended the throne in 610 and ruled till 641. By 628 he had restored the empire to its old supremacy. But the provinces had been so long lost that it was almost to ruin. And when the Arabs began their conquests the emperors were too weak to oppose them successfully. Constans II (641-68) was an able ruler, as was his son Constantine (668-685), who fought bravely against the Muslims. But the reign of Justin II (685-95 and 705-11) was disastrous. Leo the Isaurian (717-41) preserved the state. He defended Constantinople against the Saracens and reorganized the empire. Constantine Copronymus (741-75) was a great ruler and succeeded in enlarging the borders of the empire. He planted colonies along the frontiers and encouraged commerce. The next ruler was Leo IV (775-80), who was succeeded by his son, Constantine (780-97), a boy of nine. His mother, Irene, was his guardian until he became of age, after which they ruled conjointly; but in 797 Irene had her son's eyes put out and deposed him, so that she ruled in his stead till 802. The next emperor,Nicephorus I (802-11), paid tribute to the Caliph Harun-al- Rashid, and later was killed by the Bulgarians. Leo the Armenian (813-20) defeated the latter and began a prosperous reign, but was murdered by conspirators. Under Michael (820-29) the Saracens conquered Crete. His son, John, was constantly fighting against the Caliph. He was celebrated for his justice, and he won great renown for the magnificent edifices he erected. Constantinople was now the centre of European trade. Theophilius' son, Michael, was only four years of age when he ascended the throne. He later became a drunkard and was put to death at the instigation of Basil, who succeeded him (867-86). Basil was the first of the Macedonian line of emperors. From this time on the government was good, and the empire continued to be prosperous for three centuries. Basil himself was a man of great ability. His son, Leo the Wise (886-912) and his grandson, Constantine Porphyrogenitus (912-59), were authors of considerable ability. Romanus II (925-33) was a weak ruler, but under the able generalship of Nicephorus Phocas, who married the sister of Romanus, and became emperor in 963, ruling in the name of his two stepsons until 969. The first of these was Basil II (963-1025) and the second Con-
stantine VIII (963-1028). Basil defeated the Bulgarians and extended the boundaries of the empire further than those of Justinian. On the death of Constantine VIII the husbands and creatures of his daughter Zoe ruled for 26 years. The next two years (1054-56) her sister, Theodora, who was virtuous and able, held the reins of government. Important rulers were appointed on the throne for the next 24 years. The Seljuk Turks had been rapidly conquering all the Asiatic possessions of the empire; and the next emperor, Alexius Comnenus (1081-1183) had to face also new dangers from the attacks of the Normans and the Crusaders. But the finances of the empire had been weakened by the growth of the Italian cities and the foundation of the kingdom of Jerusalem. Alexius was succeeded by John the Good (1163-45), who fought courageously against the Turks, Hungarians, Serbians and Armenians. Manuel Comnenus (1143-80) undertook many wars, but exhausted the resources of the empire; and the weak rulers, of the next 24 years brought it almost to ruin. Crete, Corfu, and Bulgaria became independent and the Seljuk Turks menaced Constantinople. The Venetians were hostile and allied themselves with the Crusaders, who coveted the riches of the city. In 1204 Constantinople was captured, and the Latin empire established; but it lasted only until 1261, when Michael Paleologus of Nicaea drove out the Latins and re-established a Byzantine empire, though smaller than it was in 1204. The Paleologi were unable to strengthen the empire or increase its bounds. Michael VIII (1261-82) endeavored to win allies by offering to bring the Greek Church under the authority of the Pope. His son, Andronicus II (1282-1328), was a weak ruler, and civil war was rife at the close of his reign. Disaster followed disaster. The finances were in a hopeless condition, and from now on the emperors were incompetent. The command of the sea was lost, and the Ottoman Turks had already gained a foothold on the ruins of the Seljukian realm in Asia Minor. They conquered the provinces of the Byzantine empire one by one. Under John V (1314-91) the Turks gained their first foothold in Europe. They took Gallipoli in 1354. Manuel II (1391-1425) and John VIII (1425-28) were weak rulers, practically vassals of the Sultan. Constantine XI (1448-53) contended bravely against the Turks, but was unable to check the invaders and retain his capital—the only part of the empire left—and, finally, in 1453 Constantinople was captured by the Turks. This event marked the end of the Byzantine empire. Of the 107 rulers from 395 to 1453, 20 were assassinated, 18 had their eyes put out, or were otherwise mutilated, 12 died in a monastery or prison, 12 died of starvation, 8 in battle, or as a result of accident. Vice and corruption reigned supreme in some periods; the people were servile and superstitious, the government despotic; yet the traditions and civilization of Old Rome were maintained. Frederic Harrison says: 'First the Byzantine Empire preserved more of the tradition, civil and military organization, wealth, art and literature of the older Rome than existed elsewhere; and, secondly, in many essentials of civilization it was more modern than the nascent nations of
the West. The Corpus of Justinian continued to be the law of the Byzantine empire until the 9th century, when a new code was drawn up. Examples of Byzantine architecture can be found in every Mohammedan and Christian land. In the manufacture of mosaics, silks and embroidered satins, the Byzantine empire surpassed all others.

JOSEPH E. HARRY.

Author of ‘The Greek Tragic Poets,’ etc.

BYZANTINE LITERATURE. Byzantine literature comprises the writings of the Greeks from Constantine the Great (324 A.D.) to the fall of the Byzantine empire (1453). The period, however, down to the time of Justinian (527) is generally regarded as belonging to the ancient Greek literature. The Byzantine literature does not so completely lack individuality as is commonly assumed, although it continues substantially the ancient Greek tradition and borrows antique forms. Being a learned nation, it dealt in large measure with the science of antiquity. Through excerpts, compilations, textbooks, scholia and lexica, the Byzantines preserved the knowledge of the ancient world. Even down to the 10th century many were keenly interested in antiquity, as, for example, Arethas and Photius in the 9th century and Emperor Constantinus VII Porphyrogenitus (945–959), who was himself a political and historical writer, and established commissions of scholars, who had compiled encyclopedias for the various sciences. To the same century belongs the great encyclopedic lexicon of Suidas. In the following centuries there came about a revival of classical studies, which were zealously prosecuted, thanks to the enthusiasm and activity of such men as Psellus (11th century), Tzetzes, Eustathius, Gregory of Corinth (12th century) and Planudes (14th century). With these scholars many Greeks associated themselves in uninterrupted succession: Theodorus of Gaza, Lascaris, Musurus, who introduced the epoch of “humanism” in the West. Christianity presented entirely new problems to Byzantine scholarship. Hence theological literature occupies by no means a smaller space in Byzantine literature than in the main a continuation of the tradition of the Church Fathers, but it also unites with ancient philosophy, and reaches its summit in the Aristotelian and theologian, John of Damascus (8th century), and in Psellus. After the 11th century theological literature was revised by the controversy with the “Latinists.” Fully developed also was the science of writing history, which dealt with universal history either in imitation of the manner of presentation or of the language of the ancient models. Special attention too was given to Church and to contemporaneous history, the former is represented by the “Chronicles,” that is, the composers of world-chronicles, such as John Malalas (6th century), George Sincellos, Theophanes Nicephorus and George Monachus (8th century), John Skylitzes (11th century), John Zonaras (12th century), and Glycas (12th century). In the foreground, however, stand the historians, who treat contemporaneous history, or merely a section of the history of the world. If we count, also, the historians of the 5th century (Eunapius, Zosimus, Priscus), who lived in a period really prior to the beginning of Byzantine literature, then we should reckon as the first of the early Byzantine time (to the death of Heraclius, 640), Procopius, Agathias, Petrus Patricius, Menander Prenotos, and Theophanes (about 685–720). After the two following centuries, which mark a period of literary barrenness, we find in the 9th century a revival of literature, which manifests itself particularly in the manifold and varied historical activity of the patriarch Photius, and was further promoted by Constantine VII of the Macedonian house, and continued by historians such as Joseph Genesius and Leo Diaconus. With the many-sided Michael Psellios — statesman, philosopher, philologist and historian — begins in the 11th century another rise of Byzantine literature (Michael Attalates among others), which reaches the summit in the 12th century in the historical works of Nicephorus Bryennius, of Anna Comnena, John Cinnamus and Nicetas Acominatus. This period is also separated from the old development by the form of the language, for, while down to the 10th century concessions were made more and more to the spoken language, with the revival of classical studies in Byzantium the authors endeavored also to approach the antique form in the written speech; and so the gulf widened more and more between the language employed in books and that spoken by the people. Consequently, in the 12th century a reaction set in also against the so-called “vulgar Greek” literature, which selected the popular language as its vehicle of expression (see GREEK LITERATURE). This branch of Byzantine literature confined itself, to be sure, to didactic and devotional, epic and romantic verse and popular books. In the official literature also later, the archaising form of speech held undisputed sway, for example, in the historians, especially in the polyhistors, George Acropolites and Facihermes (13th century), Nicephorus Gregoras and Emperor John VI Cantacuzenus (14th century), Laonicus Chaldonides and George Phranzes (15th century), who portray the downfall of the Byzantine and the establishment of the Turkish empire in Europe. The Greek authors of the following centuries (down to the Greek revolution) must be looked upon as a branch of Byzantine literature, so far as it does not deal with the products of the popular language.

The poetry of the Byzantines has nothing of real importance to show except in the ecclesiastical field. Its chief representative is the
composer of hymns, Romanus, who is supposed to have lived in the 6th century. After John of Damascus, a master of the 9th century, and Cosmas of Jerusalem (7th century) nothing important and individual was produced. In secular poetry the didactic and eulogistic play an important part, as, for example, in George Pindas (7th century). The sententious and epigrammatic poetry is represented by the poetess Casia (9th century), by John Geometres (10th century), Christopher of Mitylene and John Mauropus (11th century). The single drama of the whole period, *Christos Patmos* (11th or 12th century) scarcely deserves this designation, for it is merely a multitude of reminiscences from ancient Greek tragedy. Theodorus Prodromus (also called Ptochoprodromus, *Beggar Prodromus*) showed a most remarkable activity and productivity, if the works that have come down to us under his name are the productions of one individual instead of several bearing the same name. He is the author of a long romance in verse, as well as satirical poems, eulogies and epigrams. In some of his works he makes use of the Bulgarian language and belongs consequently also to the earliest period of Bulgarian literature. The first collection of Byzantine historians, *Historiae Byzantiniae scriptores*, appeared in Paris (1648-1711, 39 vols., reprinted in Venice 1722f., in 28 vols.). A new *Corpus scriptorum historiae Byzantinae,* was published in Bonn (1828-97, 5 vols.) under the auspices of the Berlin Academy of Sciences, but is very unscholarly.

On the whole Byzantine literature is almost without originality, but is valuable for the historical material which it contains. Besides the authors already named we might mention Theodorus Prodromus, who wrote a long romance, in which the heroine is Rhodanthe and the hero Dosikles, Nicephorus Callistus of the 14th century, a writer on ecclesiastical history, John Doxopater of the 11th century, who wrote on rhetoric, and Michael Bellus, the younger, of the same century, who wrote historical and other works. See GREEK LITERATURE, and consult works there referred to.

JOSPEH F. HARRY,
*Author of 'The Greek Tragic Poets,' etc.*

BYZANTIUM, bli-zan’shit-üm, the name of the city of Constantineople before its name was changed by Constantine the Great. It was founded by a colony of Greeks from Megara, who, under a leader named Byzas, settled on what seemed a favorable spot at the entrance to the Thracean Bosporus, in 658 B.C. The city, which was built by the first colonists, was named after their leader. Other colonists followed from different quarters, especially from Miletus, and Byzantium was already a flourishing town when it was taken and sacked by the Persians, in the reign of Darius, the son of Hystaspes. After the retreat of the Persians (479 B.C.) Byzantium soon recovered itself. During the Peloponnesian War it acknowledged for some time the supremacy of the Medes, but afterward fell away. Alciabides recovered it for Athens (409), but it was taken by Lysander in 405. At a later period the Byzantines received support from Athens in their resistance against Philip of Macedon. The barbarian Thracians, who occupied the neighboring territory, and the Celts (Galatians), in their migrations to the East, often appeared to threaten the safety of the town; but in spite of this, chiefly owing to its favorable position for commerce, and even under the Romans it was left free to manage its own affairs, and was allowed to demand dues from all ships passing through the Bosporus, only part of these being claimed by the Romans. At the end of the 2d century of the Christian era Byzantium, unfortunately for itself, sided with Pescennius Niger against Septimius Severus. By the latter it was besieged for three years, and when at last it was forced to surrender Severus ordered its walls to be razed to the ground, deprived the city of its privileges and placed it under the jurisdiction of the Perinthians. For a time the prosperity of the city was annihilated, until a new and more brilliant era began for it under Constantine the Great, after the defeat of Licinius in 330 A.D. Constantine made it the capital of the Roman empire, and changed its name to Constantinople (see Constantinople). Its early form of government was that of an aristocracy, which passed into an oligarchy. In the year 390 B.C. it received from Thrasybulus a democratic constitution, closely resembling that of the Athenians. Byzantium was the great entrepot for the grain trade between the countries bordering on the Black Sea and those bordering on the Ægean.

BYZANTIUM, Bank of. In the remotest historical times Byzantium was not only a city of commercial importance, it was the feeder to Ilium, Tyre and Carthage, and the port through which flowed not merely the envied products of the Orient, but also its science, its art and its delusions. It was the galleys of Byzantium that first bore the spices of India to the Ægean, its rich carpets and metallic wares to Tyre, its Hyperborean missionaries (peripheres) to Delos, its sacred hymn (the maneros) to Egypt, and its fame to Venice and Carthage. (Herodotus, Mel., 32, 36.) The Byzantines engaged the entire trade and prolific fisheries (palamenes) of the Pontic sea; levied tolls upon all vessels passing the Bosporus, and with proud superiority, jeered at the Chalcedonians, who, after following them from Phrygia and arriving at the Bosporus too late to seize upon its commanding shore, had camped upon the arid point now known as Scutari. It is true that the Greeks claimed to have founded Byzantium; they also swore to their lineal descent from the "Eternal Gods"; but Grote has long since pricked these bubbles. Byzantium was in the possession of Cyrus, who died 520 B.C.; and the Ionian Greeks only captured it from the Persians in 478.

Byzantium was probably the most ancient city of the Levant, older than Colchis or Troy, and richer than Tyre or Sidon. To the former she afforded safe passage to adventurous Jason and veneful Menelaus; to others, the commerce of the Mediterranean, the richer her name—Byzantium, Nova Roma, Constanti-nople, Stamboul—she remained for 25 centuries the mistress of two seas; the arbiter and interpreter of two continents; the most inviting and most necessary location for the establishment and maintenance of an international bank.
whose installation took place about 390 B.C., when she became an independent state and shook off the restraints imposed upon her industries and growth by the successive tyrannies of Babylon, Assyria, Persia and Greece.

At this period, shortly after the disastrous Peloponnesian War, Greece was much exhausted; its industries were prostrated, supplies annihilated, and the mines of Laurium, Thasus, Scapte-Hyle, Siphnos, Pangeus, etc., all shut down. Both gold and silver coins were hoarded. In 407 B.C. the Athenians were obliged to melt down the statue of Minerva Victoria and convert it into those base gold coins which Aristotle satirizes in "The Frogs." In time, even the base mine were hoarded and gave way to the iron coins and parchment notes alluded to by Aristotle; the "shinplasters" and "wild cats" of a disturbed and suffering state. Prohibitions against exporting the precious metals had been followed by the usual evasions and these by the inevitable issuance of a fiduciary currency; something by which to trade, something by which to count.

When this makeshift currency was established in Athens the hoarded coins (chiefly silver drachmas) were furtively purchased by brokers, technically at risk of their lives, and sold to merchant with Oriental connections, who even in normal times profited so largely by this trade that now the shipment of silver to the Orient is said to have yielded, clear of all expenses, profits nearly cent per cent: a circumstance due to the superior value of silver as compared with gold, over and against the same relation in the Occident.

According to Boeckh, 772: "The money-changing business, which, if the iron coins were at that time in existence, must have been of special importance, was farmed in Byzantium to a single bank; and all persons were prohibited from buying or selling money elsewhere, under penalty of forfeiting the sums thus bought or sold." As the Hellespont at that period (5th and 4th centuries B.C.) was the principal, although the only channel through which flowed the trade to the Orient; the Bank of Byzantium must have reaped very considerable advantages from this monopoly, even when, before the independence of the state, such monopoly may have been required through Athens: advantages that were doubtless enhanced when Byzantium recovered its entire liberty. But the "money-changing business" was not its only source of profit. The bank collected the Straits duties and farmed the customs; it financed the fisheries, by discounting the obligations of merchant adventurers who were obliged to provide ships, tackle and nets and yet run the risk of storms or a bad catch. The bank also accommodated the foreign merchants who came to buy or sell commodities in the adjacent fairs; of which a great number were held within a short distance of Byzantium, both in Greece, the Isles and "Syria," a name, that according to Herodotus, went at that period for nearly all of Asia Minor west of the Halys. Under its banking laws enacted while Byzantium was under the control of Athens were the following:

1. No banker shall demand (or receive) more interest money than that agreed upon at the time the lender "enters into the market" and is "in good credit." For a similar proviso in ancient India.

2. Nobody who had put in surety for anything may sue for it, he or his heirs ("Put in" is here probably meant for "pledged").

3. Pledges and securities shall not stand but for one year.

4. Counterfeiters and dealers and diminishers of the current coin shall forfeit their lives.

5. No Athenian or sojourner shall lend money to be exported, unless for corn or some such commodity allowable by law. He who sends away money (out of the country), for other uses, shall be brought before the master of the custom house and prosecuted criminally, after the manner of those transporting corn unlawfully. He shall have no writ or warrant against his correspondent, nor shall the archons permit him to have a civil trial.

6. Corporations may make their own by-laws, provided that they are not inconsistent with the public laws (Potter, 'Antiq. Graeca,' II, 198-200).

The numismatic collections of Europe are so full of Byzantine coins of almost every period that they have given rise to numerous works and still more numerous correspondents. Briefly, it may be stated that before the plunder of Persia and India by Alexander the Great, gold was valued in the coinages of the Greek states at 10 times that of the same weight of silver. After his soldiers were so laden with gold spoil that they rejected silver vessels and all other plunder less valuable than gold, and demanded to be led back to Greece because they could carry no more, their leader, in his capacity of King and Basileus, raised by decree the value of gold in his coinages to 12 times that of silver; and so it remained until Byzantium fell to the arms of Rome, and practically throughout the entire Roman domination down to the capture of Constantinople by the Latin forces in 1204, when the various kingdoms and principalities which arose upon the ruin of the empire struck their own coins and fixed their own valuation upon them.

The so-called "leather moneys" of Byzantium and of the various nations which throughout the Dark and Middle Ages issued fiduciary coinages had obligations written on parchment and attested by the proper authorities; of which moneys but a single specimen is known to exist at the present time, preserved in one of the great national cabinets of Europe. For the history of other ancient banks see BARCELONA, BANK OF; FUGGERS, BANK OF THE; GENOA, BANK OF; MEDICI, BANKS OF THE; TYRE, BANK OF; VENICE, BANK OF.

BZOVIUS, Abraham (Pol. Bzowski), Polish scholar and divine: b. Prosowicz, near Mięchow, 1567; d. Rome, 31 Jan. 1637. At the request of Pope Paul V, he spent several years of the latter part of his life in the Vatican, as librarian of the Virgini de Ursinis, and actively engaged in literary pursuits. He was a member of the order of the Dominicans, one of the most voluminous writers of his age, gained for himself a high reputation as professor of philosophy and theology at Milan and Bologna, and crowned the labors of his life by continuing the celebrated ecclesiastical annals of Caesar Baroni, who had left them off at the year 1198, and completed only 12 volumes. Bzovius carried them to the year 1532, in nine volumes.
C

the third character of the English alphabet and of all the alphabets derived from the Latin. In its present form it is a modification of the primitive Greek gamma. That primitive form was \( < \), an angle with vertex pointing to the left; it is the reverse of the ancient Phoenician \( > \), which points to the right, and of the Old Hebrew gimpel, \( > \). The Latin C (used also by the Greeks to some extent) is the ancient Greek gamma retained by the Greeks of Italy and rounded, just as the later Greek gamma symbol, \( \Gamma \), is the angular symbol erected by the Eastern Greeks. The Russian alphabet retains the Greek symbol \( \Gamma \), but its place is fourth, because in that alphabet the sign for the dentilabial \( V \) holds the third place. The Greek gamma (\( <, \Gamma \)) seems to have always represented the same sonant guttural as the English \( g \) in "go." In the Latin alphabet of the Romans, as represented in their earliest inscriptions, the C stood for the same sonant guttural as in the Greek, \( g \) hard; for example, leciq, later written legio, macistatus, later magistraitus; yet at the same time the C represented also the surd guttural \( K \), as it still does in English except before the vowels \( e \) and \( i \) and the diphthongs \( ae \) and \( o\) in words from the Latin. Thus the early Latin alphabet was without the symbol \( K \). There is in this use of the character \( C \) in ancient Roman epigraphy ground for the inference that the early Romans confounded the two gutturals \( k \) and \( g \) hard, as in some localities or in some classes of people the termination \( ing \) becomes \( ink \), and "something" becomes "something." But at a later period the distinction between \( g \) hard and \( k \) was recognized, and then for the designation of the mute guttural the \( kappa \) (\( K \)) of the Greek alphabet came into use in Latin writing. But the \( k \) was afterward rejected, and its only use in Latin was in writing the word Kalenda (abbreviated to kal. or \( k \)) and as an abbreviation of Carthago (Carthage) and of the personal name Caso. No doubt the persistence of \( k \) in kalenda was due to the adherence of the Pontifices to the antique forms of the official calendars; and the \( K \) standing for the forename Casar was retained as a means of abbreviating that name and distinguishing it from the abbreviation of the name Gaius: C. Julius Caesar is Gaius, but C. Fabius Ambustus is Caso. But the \( k \) having been discarded from the Latin alphabet, its function was assigned to the symbol \( \kappa \). Thus \( \kappa \) and \( g \) served as modified forms of \( \kappa \) was adopted, namely, the \( G \) with the value of \( g \) in "go." The soft \( g \), equal to \( j \), was probably unknown to the Romans before the general debasement of the Latin language. After the symbol \( k \) had been discarded and been superseded by \( C \), the symbol \( C \) with the power of gamma, was retained as an initial abbreviation of Gaius, name for a man, and of Gaia (with \( C \) reversed \( C \)), the name of a woman. \( C \) was also retained in the formula \( Cn. \) as an abbreviation of Gaius. This use of the initial \( C \) as representing \( g \) hard (sonant guttural) recalls the primitive equivalence for the Romans of the two gutturals \( k \) and \( g \) hard; but the modern Latinists, unacquainted with such use of \( C \), have usually pronounced Gaius "Kaius" and Cnæus "Knæus," instead of "Gæus" and "Gæus." In the Anglo-Saxon, its alphabet having been derived from the Latin, the \( C \) had everywhere the value of \( K \), and the same is to be said of the Gael; that fact gives presumptive proof that at the first contact of the Gaelic and Germanic races with men of Latin speech the \( C \) in all situations was equivalent to \( k \) in Latin; and the German word Kaiser is proof that when the Germans first heard of Julius and the Caesars who succeeded him the head of the Roman state was "Kaisar," not "Cæsar." The change in the pronunciation of \( C \) from \( k \) to \( s \), as in French and English, to \( ch \) as in Italian, to \( ts \) as in German, appears to have come about after the fall of the Roman empire. In Anglo-Saxon the original Germanic \( K \) sound of \( C \) undergoes palatalization, ending in the English \( ch \); cf. Germanic kerl, A. S. ceorl, English churl. In some cases a word is transferred into English from Scandinavian or a non-palatalizing dialect, giving us a k-sound and a ch-sound side by side; cf. churl and carle, cheap and cope, church and Kirk. In words of true Indo-European descent, English \( C \) corresponds to original \( g \), as Eng. tug, Lat. duco. To a primitive \( C \), \( h \) corresponds in English, as Gr. kínon, Lat. canis, Eng. hound. There is no q in Anglo-Saxon and Old English, so \( cwo \) is written for the modern "quoth." Similarly, cyning is written for king.

As an abbreviation, \( C \) stands for a musical note, for Centigrade, for 100, for the name Gaius. c. stands for cent, for centime, for circa (about). Cn. stands for the name Gnaeus. B. C. stands for before Christ.

C. G. S., or CENTIMETER-GRAM-SECOND. See Metric System, The.

ÇA IRA, sâ är, a popular song of the great French Revolution. The origin and date of this song are both uncertain, and there are various versions of the words claiming to be original. The words are generally supposed to have been written by Ladre, a street singer, and the melody was originally a popular carillon by Bécourt, and a favorite air of Marie Antoinette. In all probability it dates from May or June.
1790. French writers say that Benjamin Franklin, in speaking of the American Revolution, frequently used the expression "Ça ira" ("it will succeed"). The French republicans caught up the phrase, and "consecrated" it to their own revolution in a popular hymn. The refrain of one version runs thus:—

"Ça ira, ça ira, ça ira, ça ira, en dépit d' l'aristocrate et d' la pluie, Ah l' ça ira, etc.
Nous nous mouillerons, mais ça finira,"

referring to the rain which fell during the taking of the Bastile. In 1797 the song was banned by the Directory.

CAABA. See KAAABA.

CAAIING-WHALE. one of several species of porpoise-like cetaceans of the Killer family (Orcidae), characterized by its globose head; properly Globicephalus melas, of the north Atlantic Ocean. It is from 16 to 24 feet long, 10 feet in diameter at its thickest part and weighs between 5,000 and 6,000 pounds. Its pectoral fins are about 5 feet long and 18 inches broad, and its dorsal fin is very low. With the exception of a white streak, which begins in the form of a heart under the throat and gradually narrows to the vent, the whole of the body is of a glossy black color, and hence the fish is frequently known as the blackfish (q.v.) or black dolphin. The teeth are arranged at considerable distances in the upper and under jaw in such a manner that those of the upper jaw fit into the spaces left in the lower jaw, and conversely. Their number is very variable. They are conical in shape, strong, rather long, and end in a point which is a little curved backward and inward. The caaining-whale is very abundant and very widely distributed. It is found in the whole of the Arctic Ocean, and also in the German, Atlantic and Pacific oceans, and even in the Mediterranean Sea. It is remarkable for its gregarious habits, being often found in schools numbering several hundreds, which are led by an old and experienced male whom, it is said, they never abandon. On this account its pursuers always endeavor to force the leader on shore, and when this is accomplished all follow him and are likewise stranded—hence the Scotch name "caasing," equivalent to "driving." In the stomachs of these animals are usually found the remains of cod-fish and various species of cuttle-fish, as well as of herrings, ling and other fishes. The caaining-whale is pursued chiefly on account of its oil. See WHALE.

CAAMA, kâ'ma. See HARTREEST.

CAB, a carriage with two or four wheels, usually drawn by one horse, and plying for hire; a hackney-carriage. One well-known two-wheeled variety is the hansom named after the inventor. Public cabriolets—hooded caiyes carrying one person besides the driver—were introduced in London in 1823, and the name was soon after shortened to cab. See COACH; HACKNEY-CARRIAGE.

CABAL, an English ministry under Charles II (1667-73), composed of Clifford, Ashley, Buckingham, Arlington and Lauderdale, the initials of whose names form this word, which has been perniciously used as a designating term. But the use of this word to signify a body of intriguers was not originally derived from this circumstance, as sometimes supposed, for the word cabala, derived from cabala (q.v.), was used in that sense in French before this time.

CABALA, or CABBALA. See JEWs AND JUDAISM—The Cabala.

CABALLERO, Fernán, férr-nán' kâ-bâ-lyór'ô, pseudonym of Cecilia Böhl von Faber, Spanish novelist, daughter of a German who settled in Spain and married a Spanish lady; b. Morges, near Lausanne, Switzerland, 25 Dec. 1796; d. Seville, 7 April 1877. Brought up in Germany, she went to Cadiz with her father in 1813. She was a polyglot writer, publishing works in Spanish, German and French. Her first novel, 'La Gaviota,' appeared in 1849, and was followed by 'Elia,' 'Clemencia,' 'La Familia de Alvareda,' etc., as well as by many shorter stories. In 1859 she published a collection of folk-tales under the title, 'Cuentas y poesias populares andalucias.' Some of her works have appeared in English translations, including 'La Gaviota' (translated as 'The Sea-Gull,' 1867); 'Elia: or Spain Fifty Years Ago' (1868); 'Air-Built Castles'; and 'The Bird of Truth' (1881). The chief charm of her writings lies in her descriptions of life and nature in Andalusia. She was three times left a widow; her last husband was a lawyer named Antonio Arron de Ayala. Of late it has been discovered that she was a very excellent letter writer, and critics who have examined her correspondence with other authors, the most notable of whom was the Madame de Sévigné of Spanish literature. She forms the subject of one of the 'Six Life Studies' (1880) of M. B. Edwards. Her 'Obras Completas' were published in 18 volumes (Madrid 1855-67), and have since been reprinted in the 'Coleccion de escritores castellanos.' Consult de Latour, A., 'Etudes litteraires sur l'Espagne contemporaine' (Paris 1864); and 'Espagne, traditions, mœurs et littérature' (Paris 1869); De Gabriel y Ruiz de Apodaca, F., 'Últimas producciones de Fernán Caballero,' with a biography (Seville 1878); José María Ausénio, 'Fernán Caballero y la novela contemporánea' (Madrid 1893); Morel-Patio, A., 'Fernán Caballero d'après sa correspondance avec Antoon-Desnos (in 'Bulletin His- panique, Vol. III, Bordeaux 1901), reprinted in his 'Etudes sur L'Espagne, 3° série' (Paris 1904); Pitot, 'Les premiers essais de Fernán Caballero' (Paris 1908); Coloma, 'Recuerdos de Fernán Caballero' (Bilbao 1910). See LA FAMILIA DE ALVAREDA.

CABANEL, kâ-ba-nêl, Alexandre, French artist; b. Montpellier, 26 Sept. 1823; d. Paris, 23 Jan. 1889. He studied with Picot, and after 1860 gave himself mainly to portrait painting. He was for many years a professor of the Académie des Beaux Arts and was especially popular with American patrons. Among his many portraits of Americans is that of Miss Catherine Wolfe, now in the Metropolitan Museum, New York, which contains also his 'Queen Vashti and King Ahasuerus,' and 'Birth of Venus,' See Strahan, 'A History of French Painting' (1899).

CABANIS, kâ-ba-nês, Jean Louis, German ornithologist; b. Berlin 1816; d. 1906. He made an ornithological tour of the North, South, and West, 1839-41, and in 1849 became custodian of the ornithological depart-
CABANIS, Pierre Jean George, French physician and philosopher: b. Cosnac, department of Charente-Inférieure, 5 June 1757; d. Rueil, near Paris, 5 May 1808. In his 16th year he went to Warsaw as secretary of a Polish lord, where the proceedings of the stormy Diet of 1773 filled him with melancholy and contempt of mankind. He began at Paris a complete translation of the 'Vie du Christ' of the reformed Lutheran, and through her with Holbach, Franklin and Jefferson, and became the friend of Condillac, Turgot and Thomas. In his 'Serment d'un Médecin' he formally took leave of the belles-lettres movement. He became Dean of the mediocrity and reorganization of French medical schools and taught in several. He was a leader in the reformation and development of French medical schools and teachers. He published himself in 1791, after the death of Mirabeau. He lived in still closer intimacy with Condorcet. At the time of his death he was a member of the Senate. His 'Rapports du physique et du moral de l'homme,' edited by Peisse (Paris 1844), is his most important work. It displays considerable power of analysis, and advocates the most extreme materialistic doctrines. Consult Dubois, 'Examen des doctrines de Cabanis' (2 vols., Paris 1842); Labrousse, F. 'Quelques notes sur Cabanis' (Paris 1903).

CABARET, ká-bár'-a', derived from the French, signifying inn or restaurant, a term generally applied in the United States since 1910 to the dinners, suppers or meals, the dansants or parties served in hotels and popular restaurants to the accompaniment of singing, instrumental music and dancing. It is an elaboration of the imported café chantant of Paris which provided vaudeville entertainment during meals.

CABAT, ká-bá, Nicolas Louis, French artist: b. Paris, 1812; d. 1893. He studied with Fleres and became prominent among painters of the landscape realistic school. Among his works are 'Fond at Ville d'Avray' (1834); 'A Spring in the Wood' (1864), and 'A Morning in the Park of Magnétot' (1859). The cabbage is a biennial plant, too well known to need description, and constituting one of the most valuable classes of vegetables. The Brassica oleracea, the original species from which the numerous varieties of cultivated cabbages are derived, although in a wild state very rare indeed, since 1834, the celery, the species with which our plants present, is scarcely more than the kale, cauliflower, broccoli, etc., all of which belong to the same family. There are two general classes of cabbage, smooth-leaved and wrinkled-leaved. The smooth-leaved are either red or green and the head conical, oblong, round or flat. The principal varieties are known to have existed at least as far back as the 16th century, but minor varieties are constantly produced by selection and intercrossing. The parent stock is of highly vegetable character, as its habitat and habitat like show; and placed in more favorable conditions, its growth becomes luxuriant. More normally it is carried back into the stem, and this may accordingly become swollen and turnip-like, in which case we have the kohlrabi, of which an extreme subterranean and almost turnip-like variety has also arisen; or it may be, as in the Jersey cabbage, largely applied to the purpose of the growth of the stem, which may reach a height of 8 to 10 feet, and furnish not only walking-sticks, but even spars for small, thatched roofs, etc. The vegetative surplus may, however, also be applied to the formation of buds, which accordingly develop with peculiar exuberance, giving us Brussels sprouts. The most evolved and final variety is the cauliflower, in which the vegetative surplus becomes poured into the flowering head, of more or less checked; the inflorescence becoming a dense corybiform instead of an open panicle, and the majority of the flowers aborting, so as to become incapable of producing seed. Let a specially vegetative cabbage repeat the excessive development of its leaf parenchyma, as we have the wrinkled and blistered savoy. Again a specially vegetative cauliflower gives us an easily grown and hardy winter variety, broccoli, from which, and not from the ordinary cauliflower, a sprouting variety arises in turn. The common cabbage is by far the most valuable to both man and beast. It is also the most productive; for it is believed that an acre of ground will yield a greater weight of green vegetable matter (and thus be more profitable to the farmer) in the shape of cabbage than in that of any other vegetable whatever. It is very abundantly produced by clay soils which are unfit for turnips, and the farmers who cultivate such soils will find it a vegetable worthy of much attention. The cabbage furnishes green fodder for cows and sheep, which is at least as good as turnips or carrots, fattening the animals equally fast, and rendering their milk, butter, etc., to the full as sweet, and is far preferable as it keeps longer in cold, and in spring, and thus supplies green food when no other can be procured. It is eaten by men in three forms, all of which have their admirers, but which vary much in respect to their wholesomeness and digestibility. These forms are sliced raw, plain-boiled and sautéed cabbage or sauerkraut (q.v.), the favorite dish of the German nation. Raw cabbage, sliced fine and eaten with vinegar, either cold, or hot enough merely to wilt the vegetable, is one of the lightest and most wholesome articles of vegetable food, and in this shape will supply a green summer vegetable through the whole of the winter. Its use cannot be too highly recommended. Boiled cabbage takes longer to digest and is more trying to a weak stomach. Cultivation.—The cabbage being biennial, the main crop must be sown the autumn previous to that in which it is to be reaped. Field cabbages and the drum-head varieties that are used in gardens, being late in character, may be sown in July, or from the third week of that
of winter the adult insects crawl under rubbish
to hibernate. The earliest specimens in the
spring crowd under most rubbish,
flies later to cabbages. The very young,
as well as the old, combine to destroy the plant,
which wilts as if poisoned. The insect is very
difficult to kill, so that destruction of the over-
wintering individual is the important point to be
striven for. Diluted kerosene emulsion must
be applied, not too strong to ruin cabbages.
The caterpillar of the cabbage-moth (Pieris
rapo) and its congeners prey on cabbage and
turnip leaves. Cabbages are more or less in-
jured by the web-moth (Plutella xylostella),
the zebra caterpillar (Mamestra picata), the cabb-
bage root fly (Phorbia brassicae), the cabb-
bage weevil (Ostiorhynchus picipes), the cabbage
aphis (Aphis brassicae), etc. All these can best
be destroyed by the use of pyrethrum, or dilute
kerosene emulsion or salt. The larvae or eggs
or infected leaves should be destroyed.

CABBAGE-MOTH. See CABBAGE-
INSECTS.

CABBAGE-PALM, a name given to va-
rious species of the palm-tree, from the
circumstance that the terminal bud, which is of great
size, is edible and resembles cabbage, as in
Oreodoxa olaracea, a native of the West Indies,
the simple unbranched stem of which grows to
a height of 150 or even 200 feet. It is crowned
by a head of large pinnate leaves. The flowers
are placed on a branching spadix and protected
by a double spathe. The unopened bud of
young leaves is much prized as a vegetable, and
the removal of it completely destroys the tree,
as it is unable to produce lateral buds. Ptycho-
 sperma elegans is the cabbage-palm of New
South Wales. The name is also given to species of
Euterpe, and to Sabal palmetto, a Florida
palm.

CABBAGE-ROSE, a species of rose
(Rosa centifolia) of many varieties, supposed
to have been cultivated from ancient times, and
eminently fitted, from its fragrance, for the
manufacture of rose-water and attar. It has
a large, rounded and compact flower. It is called
also Provence (or more correctly Provençale) rose,
from a town in the French department of
Seine-et-Marne, where it is much cultivated.

CABBAGE-TREE, a name given to the
cabbage-palm, and also to a tree of the genus
Andira (q.v.).

CABEIRI, ká-bi'ri, or CABIRI, heroes
or divinities, venerated by the ancients in Samo-
 thrace, Lemnos, and in different parts of the
coasts of Greece, Phenicia and Asia Minor, as
the authors of religion and the founders of the
human race. The multiplicity of names ap-
plied to the same character, the interchange
of the names of the divinities themselves with
those of their priests, the oracular law which
enjoined the preservation of ancient barbaric
names, and thus led to a double nomenclature,
sacred and profane, together with the profound
secrecy of the rites, have involved the subject
in great obscurity. Some have thought that
the Eastern myth of Isis and the Druidism
of western Europe contain traces of the Cabeiri.
Some say there were six, three male and three
female, children of Vulcan and Cabira, daugh-
ter of Proteus. Others make two sons of Jupi-
ter or Bacchus. In Samothrace four were vene-
rated. Recent excavations near Thebes have brought to light much information on the cult of the Cabeiri, one of whom has been identified with Demeter. Two of their ancient temples, in the obscurity of night, were the most famous. Consult Lobef. 'Aglaophamus' (Königsberg 1829); Schömmer. 'Griechische Altertümcr' (Vol. II, Berlin 1894); Pfeiler, 'Griechische Geschichte' (3 vol.; Berlin 1879); Welecker, 'Griechische Götterlehre' (Vols. I and III, Göttingen 1857–62); Lenormant, in Darmberg and Saglio, 'Dictionnaire des antiquités' (Vol. I, Paris 1882); Rubensohn, 'Die Mysterienheiligtümcr in Eleusis und Samothrake' (1892); Robinson. 'Greek Inscriptions from Sardis' (in American Journal of Archaeology, 2d series, 17, 1913; 365, for etymology).

CABELL, William, American statesman: b. Licking Hole, Va., 13 March 1730; d. Union Hill, Va., 23 March 1798. He was a member of the House of Burgesses of Virginia upon the outbreak of the Revolution; took an active part in the affairs of the new nation, and before the adoption of the Federal constitution was presiding magistrate for the United States in Virginia.

CABELLO. See Porto Cabello.

CABER, the undressed stem of a tree, 20 or more feet long, used for trial of strength in Scottish athletic games. It is held upright against the chest, by the smaller end, and tossed so as to strike the ground with the heavier end and turn over. The contestent making the farthest toss with the straightest fall is winner.

CABES, kâbês, or GABES, Africa, a town and port of the French protectorate of Tunis. It stands at the foot of the Jebel Hammarra, on the right bank of the Wad-er-rif, near the head of the Gulf of Caves, and may be said to consist of several villages. It contains an Arabic school, a French garrison and is the seat of the governor of the province. It has some export trade in dates, henna, etc. The Gulf of Caves (Syrris Minor) has at its entrance the islands of Kerkena and Jerba. Its chief seaport is Sfax. Pop. of Caves, 20,000.

CABESTAING, kâbêtàn', Guillaume de, Provencal poet and knight: d. about 1213. According to Boccaccio in the ninth tale of the fourth day of 'Decameron,' Cabestain was the victim in the legend of the 'eaten heart' which originated in Oriental literature, and is also told of Châteland de Coucy, a French troubadour, and of Reinmann von Brembenga, a German minnesinger. In 1212 Cabestain fought in the famous Christian victory over the Moors at Las Navas. He loved and was beloved of Marguerite, wife of Raymond of Château-Roussillon. In jealousy the husband murdered the poet-knight, tore out his heart, had it cooked and served in a meal to his wife. When he told her, she replied 'Since I have eaten such noble food, I shall never eat any other,' and leaping from a balcony, killed herself. A selection of Cabestain's verse is found in Raynard's collection.

CABET, kâ-hâ', Étienne, French communist: b. Dijon, 2 Jan. 1788; d. Saint Louis Mo., 9 Nov. 1856. He was brought up for the bar, and was appointed attorney-general of Corse, from which office, however, he was soon dismissed. He was sent to the Chamber of Deputies in July 1831, and there made himself so obnoxious to the government by his violent speeches, and at the same time by his inflammatory pamphlets and articles, that he was indicted for treason, and rather than subject himself to the imprisonment to which he was sentenced, withdrew for five years to England. While there he published the 'Voyages et aventures de lord Cabot, seigneur de l'Icarie,' in which he elaborated his scheme of communism, which from 1842 to 1848 passed through five editions. He began again to publish La Populaire in 1841, and circulated it widely among the working classes. He also issued an Icarian almanac, several pamphlets and a work on Christianity, which would restore social equality as taught by the early Christians and opposes modern ecclesiasticism. He also wrote a history of the French Revolution from 1789 to 1830 which appeared in a journal entitled La Populaire. On 2 Feb., 1848, a band of Icarians left France for the Red River in Texas, where Cabet had secured a tract of 400,000 acres of land, the free use of which was open to the settlers, under condition that before their departure they should deposit all their funds in the hands of Cabet, who assumed the financial and general control of the expedition. But the expedition turned out badly, and lawsuits were instituted against Cabet; and on 30 Sept. 1849, after he had left France for Texas, he was found guilty by default of swindling his disciples, and sentenced to two years' imprisonment. Meanwhile, with his colony of Icarians much reduced in number, he took up his abode at Nauvoo, on the Mississippi, in May 1850, and soon after returned to Paris. There, after a protracted trial, his innocence was fully established, 26 July 1851, by the Court of Appeal, and the judgment against him was canceled. He returned to Nauvoo, where he continued to preside over his colony but many disappointments and cares embittered his life and accelerated his death. In justice to Cabet it should be said that the highest moral tone prevailed in Nauvoo, and whatever may be the politically-economical objections to his system, the colony presented, as far as the conduct of the settlers was concerned, a model to other work and industry. Consult Shaw, 'Icaria: A Study in Communist History' (New York 1884); Lux, 'Étienne Cabet et und der ikarische Communismus' (Stuttgart 1897); Prudhommeaux, 'Icarie et son fondateur, E. Cabet' (Paris 1907).

CABEZA DE VACA, kâ-bê-thâ de vâ'ka, Alvar Nuñez, Spanish explorer: b. Jerez de la Frontera 1490; d. about 1564. He was second in command in the ill-fated expedition of Pánfilo de Narvaez to Florida in 1528. After the loss of their commander, Cabeza de Vaca, with a few survivors, landed west of the mouth of the Mississippi, and after eight years of wandering and captivity among the Indians reached a Spanish colony on the Pacific. He returned to Spain, and in 1540 was appointed governor of La Plata. He explored Paraguay, but became unpopular with the colonists, and after a defeat by the Indians was arrested on the charge of one of his subordinates, returned to Spain (1543), found guilty and banished to Africa. Eight years later he was pardoned and made judge of the Supreme Court at Seville. He has left an account of his travels and explorations in 'Relacion de los naufragios y
CABEZON—CABINET AND CABINET GOVERNMENT

CABEZON (Sp. 'big head'), a name applied to three or four distinct fishes. 1. Lari-
mus breviceps, occurring in seas from the West Indies to Brazil, and belonging to the family of the croakers or Sciaenidae. It reaches a length of 10 inches. 2. Scorpaenichthys marmo-
ratus, a member of the Cottidae, or sculpins. It is found from Puget Sound to San Diego, reaches a length of 30 inches, and is a common food-fish, but its flesh is coarse and tough. 3. The smooth cabezon (Leptocottus armatus), also a sculpin of the Pacific coast. 4. Porich-thys notatus, a member of the Batschichthidae, found from Puget Sound to Lower California, which reaches a length of 15 inches and is sometimes called 'singing-fish.'

CABILLONUM. See CHALON-SUR-SAONE.

CABINDA, ka-ben'da, or KABINDA, Portuguese West Africa (also called Angola), a seaport town north of the Kongo River in lat. 5° 30' S. It is the most important place in that portion of Angola separated from French Kongo by the boundaries assigned by treaty of 12 May 1886, and from the Belgian Kongo by those prescribed 25 May 1891. Its trade is chiefly in the products of the region as sugar, coffee, coconuts and vegetable oils. Number of inhabitants about 10,000.

CABINET AND CABINET GOVERN-
MENT. The word cabinet was originally applied to the small chambers, closets or private apartments in which sovereigns, ministers and other high officials consulted their trusted ad-
visers. In modern times, where used in connec-
tion with governmental affairs, the word is a collective name applied to the leading officers of state in a number of constitutional govern-
ments who act as a body of advisers to the head of the state and in some countries as the chief executive council and controller of legis-
lation as well. While usually confined to the ministers or department heads of a constitu-
tional government, there is no reason why the term should not be applied also to the chosen advisers of an absolute monarch.

Status and Functions of Foreign Cab-
inets. — Cabinets are widely divergent in their powers and functions. That of England, which is the earliest cabinet, is the direct antithesis of the cabinet of the United States, which is the next oldest, though the two cabinets are similar in this respect, that they are composed entirely (save on rare occasions) of members of the dominant political party, se-
lected by the actual head of the state. The constitutional governments of Europe, the self-
governing British colonies and Japan have completely or imperfectly accepted and ap-
piled the British type, while Sweden and some of the Latin-American republics have patterned theirs after that of the United States. France, which has completely accepted the theory of Cabinet government, is the most important re-
public which has an actual Cabinet government in its modern highly developed form. Cabinets based on the British type may be loosely de-
scribed as executive committees of the legisla-
tive bodies, in which their members have seats, before which they expound and defend the legis-
lative measures they prepare, and to which they are directly responsible—in fact, they are the government. The Cabinet must not be confused with the ministry. All members of the Cabinet are of the ministry—of the mem-
ers of the Commons and Lords who hold office under the government and who retire from office when the government goes out of power, but all members of the ministry are not of the Cabinet. Members of the ministry must sup-
port the policies adopted by the Cabinet—vote with the government as required by their minis-
ters—but they have no voice in determin-
ing these policies. See GREAT BRITAIN—
CROWN AND CABINET; ITALY—POLITICAL AD-
MINISTRATION and CROWN AND PARLIAMENT.

The British Cabinet, a shortened name for "cabinet council"—that is, a council held in the King's cabinet, or private room—gained its name under Charles I, between 1630-40, when it was ostensibly a committee of the privy council to expedite business, but in reality a few of the King's favorites. The sovereign presided at its deliberations, and it was not until George I ascended the throne (1714)—this King being unable to speak the English language—that it became the practice for the mon-
arch no longer to preside over its meetings. But the kings did not give up their control over the power of appointing the great officers of state without a long and bitter struggle; and it was not till George III's insanity loosened his hand that effective control be-
comcd and was said to have won the final victory. Even then, and during the early 19th century, its unity had by no means become so rigid as now; during the latter period many instances occurred of Cabinet members opposing the measures of the majority, and even of the Premier and still retaining their portfolios. But by the 'thirties it had pretty much settled into its pres-
ent constitution and rules. An important change was made in 1782, just after the Amer-
ican Revolution, when its hronics as members were dropped, and the membership confined to "efficient" members—officers of state so im-
portant that they cannot be excluded from it, or personalities so powerful that moribund of-
ices are kept constructively alive to make place for them. There is no absolute limit to the number of members, but custom dictates not less than 11, and the necessity of coming to some agreement and transacting business pro-
hibits its being much in excess of 15. The As-
quilt as the U. S. Cabinet, which has 32 members. As the Premier's duties are of a general character, it is unusual under modern
conditions that he assume control over a department, and he generally takes the office of First Lord of the Treasury, which is practically a new ministry. Of these, following the British tradition, in which from necessity foreign affairs had held the highest place, the secretariat of state—for war, for home affairs, for the colonies and for India; the Chancellor of the Exchequer, the First Lord of the Admiralty, the Lord Privy Seal, the Lord President of the Privy Council, the Lord Chancellor, and the Chief Secretary for Ireland. The last-named may or may not be included, and the heads of other departments may find places if desired. The Prime Minister is the head of the Cabinet; he selects his ministers, enforces harmony and concert of action among them, and by retiring, whether voluntarily or not, renders imperative their resignation. He presides at all Cabinet meetings (the deliberations of which are secret) but has no legal control over that body or its individual members. Besides being Premier, he may hold one or more governmental offices. The ministers are usually men of affairs, successful politicians and able debaters. If they cannot defend the government's policy, or if the floor of the legislative chamber may be turned out, and practical incapacity may render all defense of no avail. The defection of a Cabinet minister not only involves his retirement from the Cabinet but also from the office held by him. All ministers have the right to appear in the legislative chamber and to discuss measures under consideration; they introduce most of the important legislative proposals and also quite effectually control the proposals of private members by making them questions of confidence. The Ministry or ministry. While ministers are present on the floors of the legislative chambers the entire policy and administration of the Cabinet may be subjected to the most searching review by means of parliamentary questions and interpellations put to the ministers in open session. (See GREAT BRITAIN—PARLIAMENT; FRANCE—GOVERNMENT). In some of the countries which have followed the United States form of government the Cabinet members are granted a seat in the legislature for purposes of government, if not of voting. In the Cabinet system the head of the state in whose name all acts of government are performed is legally irresponsible, the responsibility for such acts being assumed by the ministers who countersign or otherwise attest their approval of such acts. The Cabinet's responsibility for all governmental acts is enforced by the legislative body by means of votes of censure or of lack of confidence or by defeating the legislative measures or programs advocated by the ministry. In the event of an adverse vote on their proposals the Cabinet must either resign or dissolve the existing legislature and appeal to the electorate at a new election. The responsibility is collective and the ministry stands or falls as a body or unit. But in England the fate of the Cabinet can only be affected by the censure of the House of Commons; the censure of the Lords can have no adverse effect.

Hence in governments patterned after the British system there is the dominant power in the state and renders wholly impossible the separation of powers, which forms the basic principle of constitutional government. The American Cabinet, or "President's Cabinet," has, of course, grown with the growth of the departments. There were but four Cabinet officers at the outset, the Secretaries of State, of War and of the Treasury, with the Attorney-General. Of these, followed the British tradition, in which from necessity foreign affairs had held the highest place, the secretariat of state was regarded as the most important and honorable, and its incumbent was considered to be in the line of succession for the Presidency, as for several administrations proved to be the case. John Quincy Adams was the last of these, and he appointed his chief rival, Henry Clay, Secretary of State with the presidential succession in view. The same notion has lingered to our own day and caused the Secretary of State to be termed the "Premier" of an administration; in itself an absurd and meaningless term, but with color given it by the preference for this post among some of the ablest party leaders ambitious of the Presidency. The next officer added was the Secretary of the Navy, whose office was created in 1798. In 1829 the Postmaster-General was raised to the Cabinet, though the office had existed 33 years. In 1821 the Secretarieship of the Interior was created and made of Cabinet rank; in 1889 was added the Secretary of Agriculture, in 1903 the Secretary of Commerce and Labor. The last-named office was divided in 1913 into the Department of Commerce and the Department of Labor, and the executive heads of each accorded Cabinet rank. In accordance with Congressional action in 1886 the Cabinet officers rank in order of succession to the Presidency as follows: Secretary of State, Secretary of War, Secretary of the Treasury, Attorney-General, Postmaster-General, Secretary of the Navy, Secretary of the Interior, Secretary of Agriculture, Secretary of Commerce and Secretary of Labor. It will be noted that after the original four the others are named in the order of the creation of their departments, not of their elevation to Cabinet rank. The President's Cabinet cannot, properly speaking, be called a cabinet, in the sense of a unified body, and only once has it been recognized by statute—in the General Appropriation Act of 26 Feb. 1907, where it is called by name in the clause fixing the salaries of its members. It does not act as a unit and has no responsibility as a unit. The word is merely a popular name for the group of officers in charge of the great branches of administration, whom the President consults individually or collectively at will or not at all. A more appropriate term for the President and his advisers would be "administration," since this of itself indicates that the group is restricted to the field of law operating and not concerned with law making, thus distinguishing the group from the British Cabinet which combines both functions and thus may properly be called the "government." The President is the head and centre of the administration, possessing all power of direction, short of suspending the laws, and usually co-operates with the department heads to enforce the principles of the party in power. There are a number of constitutional limitations of authority, the departments being equal in their subordination, and no means of inter-connection, save as they grow out of the Cabinet council. The department heads have nothing to do with legislation, and by law are prohibited from
being members of the legislative body (Art. I, Sec. VI, § 2 of the Constitution). Hence the privilege of debate and even of personal communion with Congress at any time, whereas the President is responsible to the country by popular election. The President very seldom endeavors to direct ordinary department operations, but practical necessity has clothed the secretaries with a measure of authority and discretion. Hence, as department heads, the Cabinet officers are morally responsible to Congress and indirectly to the country for the conduct of the affairs of their separate departments. They are liable to censure and impeachment, and conviction on impeachment means removal from office, which also results actually though not technically from a vote of censure. Appointments of Cabinet officers are subject to the approval of the Senate, which is rarely withheld, and the only limitation on the power of removal is contained in the Tenure-of-Office Act of 1867 (q.v.) was an exception but this act was repealed. In forming his Cabinet, the President usually endeavors to strengthen his administration politically by observing a code of geographical and other rules, distributing his appointments to cultivate doubtful sections or to reward party strongholds. In early times the Cabinet changed with the party, but with the development of the powers of appointment and removal the Cabinet comes into office with the President and retires with him. While in foreign countries ability to debate, personal prestige and political sagacity are usually essential to cabinet appointments, the reverse is true of the President's Cabinet. The President may fill the various portfolios with totally unknown men, in reliance on their unproved abilities, without serious risk, and some of these appointments have been eminently successful. The Secretary of State is usually selected with the greatest care, since he is regarded as the head of the Cabinet in influence and follows the Vice-President in the presidential succession, but he has neither the powers nor the influence of the European Premier, these residing in the President and the Speaker of the House of Representatives.

Cabinet meetings are frequent, occurring twice a week (Tuesday and Friday) when the President is at the seat of government. The procedure resembles a conference of a board of directors, the nature of the discussions depending upon the President. Sometimes they degenerate into mere discussions of routine affairs connected with the various departments. There is no question as to what officers shall sit in the Cabinet nor can outsiders mix in its councils; at times, however, outside persons with information to impart have met with it, but this is regarded more as a special consultation than as a Cabinet meeting. The President consults frequently with cabinet advisers outside his official household, and oftentimes he has certain intimates not connected with the government on whom he depends for impartial and unbiased opinions on matters of special importance to the country. Since Jackson's time these advisers have not attained such influence as to receive the title "Kitchen Cabinet." Cabinet opinions carry weight according to the personality of the President and secretaries and surrounding conditions. As previously stated the President is not obliged to consult the Cabinet but is expected to do so. As a rule, however, he consults regarding matters of grave public importance and very seldom takes action regarding departmental affairs without first consulting the several department heads.

The term Cabinet is sometimes applied in the United States to the heads of State departments advisory to the governor, but this is even less justifiable than its application to the President's advisers, since the State officers are elected by the people on the same ticket with the governor and the latter has no power of appointment removal in connection with the municipal officers accessory to a mayor has some justification, as many of these officers are appointed by him. The history of the national executive departments and of the President's Cabinet will be found under the title United States Be beginning of Executive Departments of the and The Cabinet of the; also the departments by name. In this connection see also CONGRESS; CONGRESSIONAL GOVERNMENT; EXECUTIVE AND CONGRESS; THE UNITED STATES—THE PRESIDENT'S OFFICE; THE VICE-PRES IDENCY, and THE SPEAKER OF THE HOUSE OF REPRESENTATIVES.

IRVING E. RINES.
boards enclosed within doors; and these usually range from those of plain and chaste style to those of a highly ornamented character, decorated with carving, inlaying, marquetry, lacquer, painting, porcelain insets and medallions, enamel or metal appliqués. Cabinetmaking also comprises fine and ornamental joinery, interior wood finish, paneling and lattice work, etc., with their adjuncts of varnishing and polishing. The art of cabinetmaking is said to have originated in the 15th and 16th centuries in Italy and soon spread to France, Germany, the Netherlands and Spain, the cabinetmakers of these nationalities in the 16th and 17th centuries, and English cabinetmakers in the 18th century, rivals each other in the design and production of sumptuous, monumental and costly articles of furniture. Antwerp notably from the 16th century became famous for its output. Historic names among cabinetmakers are those of Boullé, Pierre and André Charles, and Jean Mace, Frenchmen, and Chippendale, English. See Buhlwork; Joinery; Wood-carving.

CABIRI. See Cabiiri.

CABLE, George Washington, American novelist and miscellaneous writer: b. New Orleans, La., 12 Oct. 1844. His father died when he was 14 years of age, and he had to leave school and seek employment as a clerk in order to assist in the support of his mother and sisters. In 1863 he joined the Confederate army as soldier in a cavalry regiment, and served till the conclusion of the Civil War, when he returned to New Orleans and again took to commercial life. But in 1879, being by this time a practised writer, and having had considerable success with his literary ventures, he decided to devote himself entirely to authorship. In 1884 he took up his residence in Massachusetts, where he has originated a system of home culture clubs, since developed into the People's Institute. Mr. Cable is a member of the National Institute of Arts and Letters and the American Academy of Arts and Sciences. His first important book, Old Creole Days (1879), appeared originally in Scribner's Magazine; and since its publication he has written The Grandissimes (1880); Madame Delphine (1881); The Creoles of Louisiana (1884), a history; Dr. Sevier (1884); The Silent South (1885), a plea for the negro; Bonaventure (1888); The Negro Question (1888); Strange True Stories of Louisiana (1889); John March (1894); Strong Hearts (1894); The Cavalier (1904); Bylow Hill (1904); Kincaid's Battery (1906); Posson Jone and Père Raphael (1909); Gideon's Band (1914); The Amateur Garden (1914). The chief interest of Mr. Cable's novels lies in their excellent descriptions of Creole life, a subject which he may be said to have introduced into literature. His pictures of negro life are equally effective, and he handles dialect in a masterly manner. See Grandissimes, THE; Old CREOLE DAYS.

CABLE, a large, strong rope or iron chain used as a mooring tie. The term is most frequently used in its nautical sense to designate the means by which a ship is connected with her anchor. The large ropes used for towing, or for making a vessel fast to a buoy or pier, are commonly known as hawsers. In more recent times the term cable has been expanded to include also the large suspensory ropes (usually of twisted or parallel wires) from which suspension bridges are supported. The endless ropes used to operate the kind of street cars commonly called cable cars or grip cars; the suspended wire ropes known as cableways, for the transport of goods, building materials, etc.; the groups of telephone wires placed in underground conduits or strung overhead in leaden casings; the wires for high voltage electric transmission; the undersea telegraph conductors, and, in fact, any very strong flexible tension connection. Rope cables are made of hemp, manila or other fibre, or of wire, twisted into a line of great compactness and strength. The circumference of hemp rope varies from 3 to 26 inches. A certain number of yarns are laid up left-handed to form a strand; three strands laid up right-handed make a hawser; and three hawser laid up left-handed make a cable. The strength of a hemp cable of 18 inches circumference is about 60 tons, and for other dimensions the strength is taken to vary according to the cube of the diameter. Wire rope has within recent years largely taken the place of hemp for towlines and hawser on board ship. These usually consist of six strands, laid or spun around a hempen core, each strand consisting of six wires laid in the contrary way around a smaller hempen core. The wires are galvanized or coated with a preservative composition. Wire ropes are usually handled on board ship by winding them round a special reel or drum. Hemp cables, moreover, have for long been almost wholly superseded by chain cables; the introduction of steam on board ship having brought in its train the powerful steam windlass wherewith to manipulate the heaviest chains and anchors required.

Chain cables are made in links, the length of each being generally about six diameters of the iron of which it is made, and the breadth about three and one-half diameters. They are generally of eight lengths of 15 fathoms each connected by swivels to prevent twisting. There are two distinct kinds of chain cables — the stud-like chain, which has a tie or stud welded from side to side of the long link, and the short-link or unstudded chain. The cables for use in the mercantile service are made in 15-fathom lengths, but in government contracts chain cables are required to be made in 1 1/4-fathom lengths, with one swivel in the middle of every alternate length, and one joining-shackle in each length. Besides the ordinary links and joining-shackles, there are end-links, splicing-tails, mooring-swivels and bending-swivels. The sizes of chain cables are denoted by the thickness of rod iron employed in forging the links. The following table gives certain ascertained data concerning the cables in ordinary use:

CABIRI — CABLE
CABLE

Compared with the strength of hempen cable, a chain cable of one inch diameter of rod is equivalent to a hemp cable 10½ inches in circumference; 1½ inches, to 13½ inches; ½ inches, to 16 inches; ⅓ inches, to 18 inches; and 2 inches, to 24 inches. In navigation a cable's length is a useful measure of distance, equaling 120 fathoms, or 720 feet, by which the distances of ships in a fleet are frequently estimated. This term is often misunderstood. In all marine charts a cable is deemed 607.56 feet, or one-twelfth of a sea mile. In rope-making the cable varies from 101 to 115 fathoms; cable, 120 fathoms; hawser-laid, 130 fathoms, as determined by the British Admiralty. According to Ure a cable's length is 100 to 140 fathoms in the merchant service. The wire rope used for submarine telegraphy is also called a cable. See CABLES, SUBMARINE.

CABLE, Submarine specially constructed ropes of wire, hemp and gutta-percha, or other waterproofing and protecting materials, laid on ocean or river beds for the purpose of providing means of electrical communication across the bodies of water. Until the discovery of gutta-percha such communication was impossible, as water is so good a conductor of electricity that the submersion of current-carrying wires was dependent upon complete insulation. In this gum, however, such a perfect insulator was found that submarine communication all over the world became merely a question of time, experience and necessity. In 1843 Prof. S. F. B. Morse suggested electrical communication between the United States and Great Britain, but it was not until more than 20 years had passed that practical telegraphy across the Atlantic Ocean was established.

Early Cables.—The first under-water cables were short ones laid across rivers; later the English Channel was electrically "bridged" in this manner. In 1852 Dover and Ostend were connected by a cable 75 miles long and containing six wires. In 1854 Sweden and Denmark, Italy and Corsica, and Corsica and Sardinia were linked. In the same year the New York, Newfoundland & London Telegraph Company was incorporated, mainly through the efforts of Cyrus W. Field and Peter Cooper, of New York, for the purpose of laying a cable between Newfoundland and Ireland, a distance of about 2,000 miles. It received a charter from the Newfoundland legislature, with an exclusive right for 50 years to establish a telegraph between the American continent and Europe via Newfoundland. In 1856 Cape Rey and Cape Breton were united, as well as Prince Edward's Island and New Brunswick. The same year Mr. Field organized the Atlantic Telegraph Company. It was supported by both the United States and British governments, but the results of its efforts were discouraging for several years. In August 1857 an attempt was made to lay a cable by the American frigate Niagara and the British ship-of-war Agamemnon, but about 300 miles from the Irish coast the cable parted, owing to a strain caused by a sudden dip of the sea-bottom. In 1858 the second Newfoundland cable was laid on board, steamed to a point in the Atlantic midway between Valentia, Ireland, and Heart's Content, Trinity Bay, Newfoundland, spliced the cable, and, steering in opposite directions, safely landed the ends at their destinations on 5 August. The cable was 2,500 miles in length, weighed about one ton per mile and cost $1,256,- 250. It was composed of seven copper wires encased in gutta-percha, which in turn was surrounded by a covering of hemp saturated with oil, pitch and beeswax, the whole being protected by an outer sheath composed of 18 strands of seven iron wires each. Despite the success in laying, however, the cable was practically useless. The current was so weak that a message of 90 words from Queen Victoria to President Buchanan took 67 minutes to transmit, and after a few more messages the cable ceased to transmit signals. Two more cables were laid in this year to connect Great Britain with the Continent,—one to Holland and the other to Hanover; and in 1859 saw, among other cable connections, the joining of England with Denmark and France, and of Malta with Sicily.

In 1860 a cable was laid between France and Algiers, and in 1861 Malta was connected with Alexandria and Batavia with Singapore. Failures were met with in attempts to pass through the Red Sea and from Falmouth to Gibraltar, and these, with the ill-success of the Atlantic cable, caused great disappointment to the promoters of the latter enterprise. Capital seemed to have made up its mind that a successful cable across the Atlantic was impossible. In 1865, however, another cable of 2,300 miles and weighing 4,000 tons, was shipped on the Great Eastern, and was successfully paid out for 1,055 miles from Valentia, when it broke, and was abandoned after vain attempts to grapple the lost end. The following year the Great Eastern sailed with a lighter but stronger cable of 2,370 miles and laid it successfully. She then grappled the lost cable of the year before, recovering it from a depth of two miles, spliced it and completed the task by landing the end at Heart's Content.

Advance in Cable-Laying.—With two cables now linking America and Great Britain, confidence was restored, and the manufacture and successful laying of submarine cables went on at a rapid rate. In 1864 a cable was laid from Brest, France, to Saint Pierre, Newfoundland (a distance of 3,100 miles), by a French company. In 1873 a cable joined the cities of Lisbon and Funchal, and in 1874 and 1875 two more cables were laid between Valenica and Heart's Content. The latter weighed less than 900 pounds per mile. Another line from Penzance, Cornwall, to Saint Pierre, 2,920 miles, was laid in 1879, and one from England to Panama in 1882.

Meanwhile an incident had occurred which greatly influenced the expansion of submarine cable systems. In 1870 the British government purchased the entire land telegraph system of the British Isles, and the capital thus liberated, about $50,000,000, was largely reinvested in submarine cable ventures. In 1872 a number of small competing companies with lines through the Mediterranean were consolidated into the Eastern Telegraph Company, and in the following year the Eastern Extension, Australasian & China Telegraph Company was formed, the amalgamation of companies owning cables farther east. Since then the Eastern, Eastern Extension and Associated Cable companies
have become practically one immense organization.

In 1884 John W. Mackay and James Gor-
don Bennett organized a cable system across the Atlantic from Valentia to Torbay, N. S., in the interests of the Commercial Cable Company and the New York Herald. Consolidation of competing companies followed as a matter of course, and now there are practically, besides the French lines, but two competing cable companies in the north Atlantic field — the Anglo- American and the Commercial Cable companies. There are now 15 cables between North America and Europe, some of which run into New York harbor. The cables of 1858, 1865 and 1866 are "dead," and three others have but a brief tenure of life. Nine are "alive" and active.

About 1902 France undertook to lay cables to connect her colonies, and now has over 12,000 miles in operation. A little later the Commercial Cable Company laid its fourth line to connect New York and London, by way of Roscoff, Ireland, Cananéa, M., and Waterford, Ireland. The European Wire put a check on cable-laying for several years.

Pacific Cables.—In the Pacific Ocean the Commercial Company has constructed a cable 6,912 miles long and costing $12,000,000, laid from San Francisco, via Honolulu, the Mid- way Islands and Guam to Manila, in the Philip- pines, with an ultimate extension to Shanghai or Hong Kong. The first section, from San Francisco to Honolulu, 2,413 miles, was opened 1 Jan. 1903. This section is the most hazardous on the route, depressions of 5,160 and 5,269 fathoms having been encountered, and the profile displaying mountains of immense elevation and valleys of corresponding depth. A level plain, with an average depth of 2,700 fathoms, extends throughout the second section, from Honolulu to the Midway Islands, the bottom being of soft mud and extremely favorable for cable-laying. Thence toward Guam an average of 3,200 fathoms is found, and favorable conditions are maintained throughout. The last section is similar in its profile to the first, though the depth averages less, being from 1,400 to 2,700 fathoms. The sea-bed is extremely irregular in outline, with many reefs and shallow spots.

The cable is built around a core formed of copper wire insulated by gutta-percha, around which layers of jute yarn are wound. This, in turn, is sheathed in small cables, each formed of several strands of steel wire. An outer covering of jute yarn, the whole saturated with a bituminous compound, binds together the conduct- ing and protecting wires in one solid mass. The landing of the shore end of the cable at San Francisco was effected thus: A section of six and one-half miles was cut from the main cable on board the cable-steamer Silvertown and loaded on a tender, which steamed toward the shore. On approaching the line of breakers, which were heavy, the shore end was floated on balloon buoys placed every 10 fathoms, and a section of 12 fathoms in length was spliced to the permanent shore connection, and the tender returned to the Silvertown, on board which the shore section was spliced to the main cable. The cable-ship then started for Honolulu in the evening of 14 Dec. 1902.

The Silvertown was specially built for cable-laying purposes. On this trip she carried 2,413 nautical miles of cable, weighing 4,857 tons. She arrived off Honolulu on 9 Dec., 1902, and landed the shore end by buoying the cable; but she employed no tender or horses. Two spider-sheaves were sent ashore and fixed by sand anchors about 60 yards apart. A hauling- line was paid out from the ship, reeled through the sheaves and brought on board again at the end of this line being attached to the cable and the other to the picking-up gear, the engines were started and the cable was dragged toward the shore.

Another Pacific cable has been constructed jointly by the governments of Great Britain, Canada and Australia across the Pacific from Vancouver to Fanning Island, Fiji Islands, Norfolk Island, and thence to New Zealand and Australia. It is practically 8,000 miles long, and the 3,600-mile stretch from Vancouver to Fanning Island makes the longest single section in the world. This cable brought the Australian colonies 10,000 miles nearer to Canada than they were before, and there is now completed a British telegraph gridiron of the world which touches foreign territory only at Madeira and Saint Vincent, in the Cape Verde Islands, both belonging to Britain's old ally, Portugal.

Mention has already been made of the con- solidation of competing lines in the Medi- terranean and the East into the Eastern Telegraph Company. To this huge organization belongs a marvelous network of submarine cables — practically all the cables from Land's End, in England, through the Mediterranean to Suez, on through the Red Sea to Aden, across the In- dian Ocean to Bombay, thence linking into the system Madras, Singapore, Hong Kong, Ma- nila, Australia and New Zealand. In addition, practically all the cables which now surround Africa, and many of those which cross the ocean and follow the coast-line of South Amer- ica, are in its control. To such an organization the laying of 15,000 miles of cable from Eng- land to Australia, via the Cape of Good Hope, at a cost of over $13,000,000, was comparatively easy. Yet this great line may be traced from Land's End in England to Adelaide in South Australia, a distance which a modern Atlantic liner would take six weeks to steam over. The length of cable is more than half way round the globe, and about eight times longer than the first Atlantic cable.

The life of a deep-sea cable, aside from in- juries by ship's anchors, rocks, sharks, sawfish, and swordfish, has been variously estimated at from 30 to 40 years. Sharks occasionally bite cables and leave some of their teeth embedded, and sawfish and swordfish attack them, espe- cially in tropical waters, but on the level plains of ooze two miles or more below the surface cables seem to be almost imperishable. In shal- low water they are most exposed to damage. Deep-sea cables generally weigh from one to one and a half tons per mile, but the portions lying in shallow water are so heavily armored as to weigh from 10 to 30 tons per mile. The breaking strain is about seven tons. Yet in one year the ocean cables of the Commercial Company were severed by ships' anchors five times. In the Firth of Forth in Scotland no less than 13 ship's anchors were once found entangled in a length of four miles of cable. The deep-sea cable costs about $400 per mile,
is made in lengths of 15 to 25 miles and stored in a cable-laying steamship. The cost of coast cables may run up to $5,000 a mile, as they have usually paper insulation, covered with a lead sheath, and heavily armed with wire. Coast cables are made in mile lengths and stored on large reels.

Cable Tariffs and Codes.—In the early days the Atlantic Telegraph Company started with a minimum tariff of $100 for 20 words, and $5 for each additional word. Later this was reduced to $25 for 10 words. It was not until 1872 that a rate of $1 a word was introduced. This word rate system proved so popular that it was soon adopted universally, and since 1888 the cable rate across the Atlantic has been down to 12½ cents a word. Rates now range from the 12½-cent tariff across the Atlantic to $1.33 per word from New York to Japan. The average for the whole world is roughly 50 cents a word. The cost of cabling, however, is greatly influenced by "coding," a system by which business men use secret words for commercial messages, and which has developed to an extraordinary degree of perfection. One code word will frequently stand for 10 or 15 words, and there are instances where one word has been used to represent over 100 words. Practically all commercial telegraph cables are coded, and nearly all departments of commercial and industrial life nowadays have their special codes.

Speed of Transmission.—The cost of deep-sea cables makes it vitally important to get as much work out of them as possible. In the first place the transmission time of messages has been greatly reduced. Formerly from many parts of the world it took 5 or 10 hours to deliver a cablegram where it now takes from 30 to 60 minutes, and across the Atlantic the companies, for stock-exchange purposes at any rate, send a cablegram and get a reply in two or three minutes. In the second place, where traffic is heavy, speed of transmission of the signals has been greatly increased. Across the Atlantic and on three or four of the busy lines of the Eastern Company the art of cable telegraphy has been highly developed.

On the first Atlantic cable the speed was about seven words a minute in one direction only. The speed of recent Atlantic cables is as high as 75 words. In the mean time on land, telegraphy by means of a mirror galvonometer supplied the instrument needed. Lord Kelvin's mirror galvonometer supplied the instrument needed. By this means the speed of the early Atlantic cables was raised to seven or eight words a minute. Subsequently, when heavier cables were laid, the speed was increased to as much as 20 words a minute.

The Siphon Recorder.—In 1870 Lord Kelvin perfected his siphon recorder for working long cables, and it at once supplantèd the mirror instrument, as it worked just as well with feeble currents as gave a written record of signals received and enabled men to do the work of two. An exceedingly light coating of silk (in shape and size like the long, narrow O which would be obtained by winding several hundred turns of fine silk thread around the palm of the open hand) is delicately suspended between the two poles of a powerful magnet. As the electric signals from the cable flow through the coil of wire, it swings round under the influence of the magnet, back or forward according as the current is positive or negative. The motions of the coil are transmitted by silken fibres to a little glass siphon about as thick as a needle and three or four inches long, suspended so as to swing with perfect freedom. One end of the siphon dips into a pot of ink, and the other end hangs close above a moving strip of paper. The signals are so feeble that if the end of the glass siphon rested on the paper it would not move at all, but by causing the siphon to vibrate continuously against the paper the free motion of the siphon is not interfered with and the ink is splattered upon the paper so that the appearance is that of very fine dots and thus records the signals transmitted through the cable. This instrument, though crude at first, has gradually been perfected. It is now the most important part of modern cable equipment and is manufactured in all departments of commercial and industrial life nowadays.
human operator can send so fast. The key used for signaling through the cables by hand is practically the same as the ordinary Morse key, except that two keys are used side by side, one to send positive signals and the other negative signals, the letters of the alphabet being indicated by various arrangements of the two kinds of signals. First-class cable operators can send as many as 30 words a minute for a few minutes, but a sustained speed of 20 words a minute, when working by the hour, is regarded as very good. To take full advantage of the speed of a modern Atlantic cable, therefore, it is necessary to have some automatic method of transmitting. The advantages of automatic transmission are higher speed, greater uniformity of signals, more legibility and fewer mistakes.

The method adopted is simple and beautiful, — a modification of the Wheatstone system. The message is first punched as a series of holes in a paper tape. This perforated tape is then run through an automatic transmitter, and by means of a system of small levers the required key makes a space. In this way the cablegram before him is transmitted at the rate of about 20 words a minute into a perforated tape. From the perforator the tape runs into an automatic transmitter, or "auto." There is a row of small central holes in the tape, and on one side is a row of larger holes. The latter represent the message. A small star wheel in the "auto" engages with the central line of holes and feeds the tape along at a uniform rate. A couple of small steel rods about the size of a knitting-needle, one for each of the two rows of message holes, continually vibrate against the paper. When either of them enters a perforation in the paper, a lever connected with it moves and makes an electric contact, sending a short, sharp signal into the cable.

Cable Relays.—Recently several still more wonderful inventions have been perfected. On land relays are used. For instance, messages from New York to Chicago are automatically repeated at Buffalo or Cleveland, and by automatic repeating every 600 or 800 miles it is an every-day occurrence to telegraph direct between New York and San Francisco. A relay capable of performing similar work for cables has been a dream of cable engineers and inventors for years, and the success of an instrument "human relays" have been employed; that is, at the end of one section of a cable an operator takes the paper record of a cablegram as it comes from the siphon recorder and retransmits it.

But the cable relay is now an accomplished fact. The only hope of constructing such an instrument was to utilize the siphon recorder. One difficulty has been that the movements of the siphon, as shown by the paper records, have till now been most irregular. It has been what photographers would describe as "lack of definition" about the signals, rendering it hopeless to attempt to relay them automatically by machinery. The first thing to do was, therefore, to straighten and sharpen up the signals a bit, and a very able group of cable engineers, including H. A. C. Saunders, electrician-in-chief of the Eastern Telegraph Company, his assistant, Walter Judd, with Dr. Muirhead, inventor of the cable duplex, and Messrs. Brown and Dearlove, succeeded in sharpening them. They secured very regular signals, usually described as "square signals." This result was obtained by means too technical to be described here, but the chief device used is known as an "inductive shunt." Having squared the signals, it was now possible, though by no means easy, to construct a cable relay. Two have been perfected. One is known as the Brown & Dearlove relay, the principal inventor of it being S. G. Brown. The other has been invented by Dr. Muirhead. In both a fine wire terminating in a platinum contact-point takes the place of the ink in the siphon of a recorder. The contact-point instead of resting on the paper tape rests on a rapidly moving metallic surface divided into two parts. In the Brown & Dearlove relay this contact-surface consists of a constantly revolving metallic drum or wheel. The siphon skates, as the inventor describes it, with the utmost freedom on the periphery of this wheel. The drum looks like a phonograph cylinder. As the siphon skates upon the right or left half of this drum it makes a positive or a negative electric contact and automatically transmits a corresponding signal with renewed energy into the next section of cable. In the Muirhead relay the moving metallic surface consists of a small plate vibrating rapidly. The result is the same. Able in this way to make definite electrical contacts through a long ocean cable, an operator can easily work, by means of these contacts, local apparatus moved by more powerful currents. In this way both Mr. Brown and Dr. Muirhead have devised perforators which reproduce at the receiving station perforated tape identical with that used for transmitting the message at the sending station. This tape is available for transmission through an "auto," this plan having the advantage that the signals are retransmitted in as perfect form as the original signals; and, theoretically at any rate, the process may be repeated indefinitely, so that it would be possible to send a cable message automatically through a dozen stations from England to Australia. This will no doubt be done in time, but it is a very slow process getting such complicated and delicate inventions into commercial use. It is a question of time and growth. The Brown & Dearlove relay has been adopted by the Eastern Company, and has been in commercial use. Dr. Muirhead's relay has also proved very successful in several long-distance tests.

Cable Statistics.—In all there are now about 291,000 nautical miles of submarine cables, enough to go about 13 times around the globe. They have cost about $250,000,000, but their market value is considerably higher, as deep-sea cables are solid and profitable investments. All told there are about 50 cable steamers in the world, including those owned by the cable-construction companies and by governments, with gross tonnage of perhaps 85,000 tons.

The Eastern Telegraph Company owns 107 ocean cables of a total length of 46,790 nautical miles. Its cables extend from England to Spain, all through the Mediterranean and Black
seas, to most important points in Africa and on to Australia, the East Coast Extension, Australia China Telegraph Company owns 37 cables of 26,421 miles. The next largest is the Western Telegraph Company, with 30 cables of a total length of 23,836 miles, extending from Portugal across the Atlantic to the principal ports on the east coast of South America. The Western Union Telegraph Company's system is almost as extensive, comprising 27 cables of 23,508 miles. It controls three transatlantic cables and the Gulf of Mexico system. The Commercial Cable Company's system from Ireland via Nova Scotia to New York employs 15 ocean cables with a mileage of 16,595. The Central & South African Telegraph Company has 25 cables of 11,896 miles. La Compagnie Française des Cables Télégraphiques has 24 cables of 11,057 miles, connecting Brest, France, with Cape Cod, Mass., and also Saint Pierre and San Domingo. The Eastern & South African Telegraph Company has 17 cables of 10,490 miles. The Commercial Pacific Company has 8 cables of 10,010 miles, connecting San Francisco, Guam, Manila and Shanghai. La Compagnie Allemande des Cables Transatlantiques has 5 cables of 9,556 miles, connecting Coney Island, N. Y., with Borkum Island, the Azores and Spain. La Grande Compagnie des Telegraphes du Nord has 29 cables of 9,331 miles, connecting northern Europe and Asiatic ports. Die Deutsch-Sudamerikanische Telegraphen-Gesellschaft has 5 cables of 7,354 miles. The West Indian & Panama Telegraph Company has 22 lines of 4,355 miles. Die Deutsch-Niederlandische Telegraphen-Gesellschaft has 3 cables of 3,415 miles. There are 17 other private companies operating 66 submarine cables of a total length of a little over 20,000 miles; the total of privately-owned lines being 418, of 235,680 nautical miles.

The nations of the world own and operate over 2,000 short submarine cable lines, of a total nautical mileage of 55,207 miles. The longest of these is the line from British America through the Pacific to Australia. The greatest number is in Norway, 770, but they average less than two miles in length. The United States owns 15 and about Alaska, and 26 in the Philippines; it has 181 of 5,000 miles; Spain has 25, of 3,158 miles; France 79, of 12,348 miles; there are 224, of 2,909 miles, in the British Isles; Germany controls 98, of 2,956 miles, and the Netherlands 27, of 5,130 miles. Many of the terminals in the countries engaged in the European War have been cut and are out of service until peace is restored and they can be patched up.

Charles H. Cochrane, Author of 'Modern Industrial Progress.'

CABOOL. See KABUL.

CABOOSE, ca-boos', the cook-room or kitchen of a ship. In smaller vessels, the name is a room, but in an enclosed fire-place, hearth or stove, for cooking on the main deck. The cook-room is also known as the "galley." The name caboose also gives a railroad car on freight or construction trains used for carrying brakemen or workmen, tools, etc.

CABOT, George. American statesman: b. Salem, Mass., 3 Dec. 1751; d. Boston, 18 April 1823. He was educated at Harvard College, spending two years there, and afterwards going to sea. He reached the rank of captain while still under 21 years of age. In 1776 he was elected member of the provincial congress of Massachusetts and also of the State Constitutional Convention, and in 1791 he became United States senator from Massachusetts, and proved a steadfast friend of the Washington administration. He yielded essential aid to Hamilton in perfecting his financial system. President Adams appointed him first Secretary of the Navy, after the creation of that office in 1798, but Cabot served only one month. In 1814 he was chosen a delegate to the memorable Hartford Convention, and was elected president of that assembly. In 1793 he introduced the Fugitive Slave Act in the Senate. Consult Lodge, H. C., 'Life and Letters of George Cabot' (Boston 1877).

CABOT, James Elliott, American biographer: b. Boston, Mass., 18 June 1821; d. 16 Jan. 1903. He was the friend and literary executor of Emerson and in 1887 published 'A Memoir of Ralph Waldo Emerson,' a work undertaken at the request of the Emerson family.

CABOT, John, or GIOVANNI CABOTO (in the Venetian dialect, ZUAN CABOTO), an Italian navigator in English employ; the discoverer of the continent of North America. On 5 March 1496 he was given by Henry VII of England letters patent authorizing him to take possession of any countries he might discover. Under this charter, in May 1497, he embarked in a single vessel, the Matthew of Bristol, accompanied by his son Sebastian, and sailed west, as he said, 700 leagues, when, on 24 June 1497, he came upon land which he reported to have been a part of a continent, and which he assumed to be in the dominions of the Grand Cham. A letter of that year represents him as having sailed along the coast for 300 leagues; he landed, but saw no person, though he believed the country was not uninhabited. He planted on the soil the banners of England and of Venice. The exact spot of his landing is not known, but from the La Cosa map and the map of Sebastian Cabot it appears to have been near the mouth of the Grand River, perhaps near Breton, more than a year after Columbus discovered the main land of the continent at Venezuela. On his return voyage he discerned two islands to the starboard, but for want of provisions did not stop to examine them. He reached Bristol in August. His discovery attracted the favor of the English King, who on 3 Feb. 1498 granted him letters patent to impress six English ships at no higher charges than were paid for ships taken for the King's service, to enlist companies of volunteers, "and them convey and lede to the londe and isles of late founde by the seid John." He sailed early in May with two ships, and after a stormy voyage sighted early in June the east coast of Greenland, which he named 'Ladbrador's Land.' He then turned south, skirting the coast of Labrador, Nova Scotia, and New England, and is believed to have reached the parallel of 38° near Chesapeake Bay, after which the return voyage was made. He then passes out of history. Neither the time nor the place of his death, nor his age, is known. Neither is it known what country

**CABOT, Sebastian,** English navigator: b. Bristol, about 1474; other authorities say 1477; d. London 1557. He was the son of John Cabot (q.v.). Sebastian was early instructed in the mathematical knowledge required by a seaman, and at the age of 17 had made several voyages. In 1496 John Cabot obtained from Henry VII letters patent empowering him and his three sons, Lewis, Sebastian and Sanctius, to discover unknown lands, and conquer and settle them. In consequence of this permission John and Sebastian sailed to the northwest on 2 May with the *Matthew* of Bristol, manned by a crew of 18 men. In June 1497 the coast of Cape Breton, or, as some think, of Labrador, was reached. The accounts of this voyage are attended with much obscurity; but a second patent was granted to John Cabot in 1498, and it seems that in a subsequent voyage, the father and son sailed as far south as Chesapeake Bay and were actually the first who saw the mainland of America. Little, however, is known of the proceedings of Sebastian Cabot for the ensuing 20 years; but it seems that, in the reign of Henry VIII, by the patronage of Sir Thomas Peart, vice-admiral of England, he procured another ship to make discoveries, and attempted a southern passage to the East Indies, in which he failed. This disappointment is supposed to have induced him to quit England in 1513 and visit Spain, on the invitation of Ferdinand. The death of the King lost him his patron, and in a few years he returned to England and was employed by Henry VIII to find out the northwest passage. After this expedition he again entered the Spanish service, and in 1526 began a voyage which resulted in his reaching the river La Plata, where he discovered San Salvador, and erected a fort there. He returned to England after the death of Henry VIII and settled in Bristol. He was introduced by the protector Somerset to Edward VI, who settled a pension on him. From this time he was consulted on all questions relating to trade and navigation; and in 1552, being governor of the company of merchant adventurers, he drew up instructions and procured a license for an expedition to discover a passage to the east Indies by the north. He was also governor of the Russian Company, and was very active in its affairs. He was the first who noticed the variations of the compass; and he published a large map of the world, as also a work under the title of *Navigazione nelle parti Septentrionali,* per Sebastiano Cabota.' (1583). See Nicholls, 'Remarkable Life of Sebastian Cabot' (London 1869); Winship, 'Cabot Bibliography' (1900), and Henry Harrisse's unflattering portrayal of 'John Cabot and His Son Sebastian' (London 1895).

**CABRA,** ká'brá, Spain, town in the province and autonomous community of Andalusia, on the east coast of the south-east coast of Córdoba, in a valley almost environed by mountains. It has wide streets; a large, irregular, but imposing looking square; two large and handsome parish churches; a richly endowed college, etc. Captured from the Moors by Ferdinand II in 1240, and recaptured in 1331, in the succeeding century it passed finally into the possession of Spain. It has manufactures of coarse cloth and bricks. Pop. 12,181.

**CABRAL, or CABRERA, Pedro Álvarez, pâ'dro ál've-rêth ka-brâl,* Portuguese navigator: b. about 1460; d. about 1526. In 1500 he received command of a fleet bound for the East Indies, and sailed from Lisbon, but having taken a course too far to the west he was carried by the South American current to the coast of Brazil, of which he possessed knowledge about 24 April 1500, in the name of Portugal. Continuing his voyage he lost several ships and men in a storm, but with the remainder he visited Mozambique, and at last reached India, where he made important commercial treaties with native princes, founded a trading-post at Calicut and then returned to Europe. Despite his discoveries he was for some reason not retained in the service and sank into obscurity. Consult Fiske, 'Discovery of America,' Vol. II (Boston 1892); Capistrano de Abreu, 'Descobrimento do Brasil' (Rio de Janiero (1883)); Varnhagen, 'Historia general do Brasil' (2d ed., 2 vols.).

**CABRERA, Ramon,** Carlist general: b. Tortosa, Catalonia, 31 Aug. 1806; d. Wentworth, England, 24 May 1877. He was brought up for the clerical profession, for which, however, he was unfit by his love of pleasure and dissipation. When civil war broke out between the partisans of Don Carlos and those of the Queen Isabel II, the priests became the most zealous champions of Don Carlos. Their enthusiasm acted so powerfully upon the impetuous spirit of young Cabrera, that he joined in 1833 a small band of guerrillas. He fought with singular ferocity, which rose to fury, when, 16 Feb. 1835, upon the order of the Queen and of Mina, General Noguera, was to death Cabrera's aged mother and his three helpless sisters. Cabrera took vengeance upon all the Christians who fell into his hands. His enemies treated him like a wild animal, and hunted him, after he had eluded the garrisons of Valencia and Andalusia, from one place to another. After a temporary defeat at Torre Blanca he eventually took Morella. Hence in 1838 Don Carlos created him Count de Morella, and at the same time lieutenant-general, and in this capacity Cabrera continued to fight for the cause of the Pretender, and for what he considered the cause of the priesthood and the Church, until 1840, when he was compelled to flee to Paris. By order of Louis Philippe he was arrested and consigned to the fortress of Ham, but was soon set free. In 1848 the French revolution filled Cabrera with the most sanguine expectations; which, however, were doomed to disappointment, as on his arrival in Catalonia he was but indifferently received, and on 27 Jan. 1849, he was severely wounded at Pastoral, although he succeeded in making good his escape to France. In August of the same year he took up his abode in London, where he married a rich English woman. When Alphonso XII was proclaimed King of Spain in 1875 Cabrera advised the Carlists to submit to him. Consult Valras, 'Don Carlos VII et
Ramon Cabrera, translated from the Spanish (Paris 1875); Diaz and Cardenas, 'Galería de Españoles célebres contemporáneos,' Vol. I (Madrid 1841); Valle Inclán, 'La guerra carlista' (Madrid 1908).

CABRERA, a small Spanish island, one of the Balearic Isles, about 10 miles from Majorca. It is about three miles in length and breadth and the coast is irregular. The chief industry of the island is fishing and the permanent population is very small. During the war in the Peninsula Spain used it as a place for receiving convicts.

CABRERA BOBADILLA CERDA Y MENDOZA, kə-brəˈðəl-yə mɛnˈdɔbəlˈθa, Luis Gerónimo Fernandez de, Spanish colonial governor: b. Madrid, about 1590; d. near there 1647. He was viceroy of Peru 1629–39, during which period the useful properties of cinchona bark were discovered and the third ascent of the Amazon made. The chief of the Spaniards caused a revolt among the Urn Indians near Lake Titicaca, which Cabrera had great difficulty in suppressing.

CABRILLA, or HIND, one of the sea-basses (Epinephelus maculatus) found in the Atlantic from Charleston to Brazil. It attains a length of 18 inches and is highly esteemed as food. Another sea-bass (Paralabrax maculatus fasciatus) living along the coast of lower California and highly regarded as a food-fish is called the spotted Cabrilla. See Sea-bass.

CABRILLO NATIONAL MOVEMENT, created 14 Oct. 1913, at Point Loma, Cal., of a small tract of land containing 21,910 square feet which lies within the military reservation at Fort Rosecrans. It is of historic interest because of the discovery of the territory now partly embraced in the State of California, by Juan Rodriguez Cabrillo, who at this point first sighted land on 28 Sept. 1542.

CABUL, CABOOL or KABUL. See KABUL.

CACAHUATE, CACAHUETE, kə-kəˈwətə (nahuatl, “Cacahuatl”), the indigenous peanut of Mexico and Central America. It is practically the same as the mani (q.v.) of Cuba and parts of South America, and it is very much used to take the same member of the family grown in the United States. The cacahuates have been a common food of the indigenous races of the torrid zone of America since prehistoric days. At the time of the conquest of Mexico (1521) the Spaniards found it among the many kinds of fruit and vegetables displayed on the great market of Tenochtitlan (Mexico City). The cacahuates were one of the offerings made to the goddess of growth, fertility and birth, and on certain festive occasions it was the only offering made. A festival in honor of this very ancient religious custom is still heard in Mexico during the novenas or nine days of semi-religious celebration which precede Christmas day, when it is used to stuff earthen jars which are placed on the inside of cages and paper towns in paper houses for decorations. These latter are suspended from the ceiling of the house or in a yard to be knocked down by blindfolded children or young people in a game very much like blindman's buff. For hundreds of years the Mexicans have extracted from the cacahuates a light oil which, when burnt, gives a beautiful, strong, white light. Cacahuates nuts are sold every where in Mexico and Central America, in little stores, on the markets and on the street corners of the towns and villages, and every one buys them as candles are bought in other countries.

CACAO. See Cocoa.

CACCIANIGA, kə-chəˈneɡə, Antonio, Italian writer: b. Treviso 1823; d. 1903. He founded a critical magazine, Lo Spion Folletto at Milan in 1848; being exiled after the revolution of 1848 was for six years a journalist in Paris. He was subsequently mayor of his native town and a parliamentary deputy. He is the author of some notable works of fiction, including 'Il proscritto' (1853); 'Bossetti morali ed economici' (1869); 'La Vita Campesste'; 'Villa Ortensia' (1876).

CACCINI, kə-chəˈne, Giulio, Italian composer: b. Rome about 1546; d. Florence 1618. He was styled the father of a new music, having been the first to write an opera to whom performance in a public theatre. His works include 'Daphne,' and 'Apollo's Battle with the Serpent.'

CÁCERES, kə-kəˈrəs, Andrés Avelino, Peruvian military officer and statesman: b. Ayacucho, in southern Peru, 10 Nov. 1836; d. 20 Nov. 1911. While still young he became military attaché to the legation of the Peruvian government at Paris, and was stationed at that post until 1860. In the Chilean War (1879–83) he served in nearly all of the battles, being rapidly promoted from colonel to the rank of general, and, after the taking of Lima, was made 2d Vice-President in the provisional government of Calderon (June 1883). The imprisonment of Calderon the President, and the absence of the 1st Vice-President made him acting President of Peru. In his refusal to acknowledge the results of the elections the Chileans had placed at the head of the government at Lima, as President, Cáceres was supported by the interior provinces, and he at once planned to depose him. In his first attempt to do so he was repulsed in a bloody street fight, but after raising a larger force he appeared before the city, 1 Dec. 1885, and peaceably persuaded Iglesias to submit the office of President to a general election. This resulted in the election of Cáceres, and on 3 June 1886 he was inaugurated President of Peru. The country prospered greatly under his administration, gradually recovering from the ill effects of the war; a private company absorbed the state railroads and guano beds, and distant vessels loaded with the national debt. In 1890 he was defeated for the Presidency by Bermudez, but was soon afterward, in 1891, appointed by him Peruvian Minister to France and Spain. In 1894, upon the death of President Bermudez, the party of Cáceres seized the reins of government, Cáceres was proclaimed dictator and the Congress forced to elect him President. The ex-dictator, Piérola, however, disputed his right to the office and besieged the city, on 18 March 1895, after a bloody conflict taking place. The treaty of peace was signed between the two parties, in which
Cáceres was obliged to resign the Presidency. He soon afterward fled and Piérola was elected President 10 July 1895. Upon the retirement of Romaña from the Presidency, Cáceres returned to his native land and again entered the political arena. He was sent as Envoy Extraordinary to Italy in 1905, and was assassinated 20 Nov. 1911.

Cáceres, Spain, a town in Extremadura, capital of the province of the same name, 24 miles west by north of Truchillo. It consists of an old and a new town, the former owning the top of a hill, and surrounded by a strong wall flanked with towers, and the latter built round it on the lower slopes. The houses are tolerably well built, but the streets are mostly narrow and steep. Among the objects worthy of notice are four churches, several old feudal mansions and the bull-ring. It is famous for its bacon, has manufactures of linen, woollens, hats, leather, soap, etc., and controls a large trade in the produce of the district. Pop. about 16,000. The province of Cáceres is the second largest of Spain, in the north of Extremadura, owned chiefly by large proprietors, and mostly devoted to cattle-raising; the north half is a good wine country. The area is over 8,000 square miles, and the population about 415,000.

Cáceres Nueva. See Nueva Cáceres.

Cachar, ká-cháh', a district of Assam, India, bounded east by Manipur and the Naga Hills, south by the Lushai Hills, west by Sylhet and the Jaintia Hills, and north by Nowgong district. It comprises a series of fertile valleys diversified by low hills and almost surrounded by mountains. The Barak River flows through the district, its course here being about 130 miles. Lignite and petroleum have been found. Salt is manufactured in small quantities. The forests are of great extent, and constitute the chief natural wealth of the district. Rice and tea are extensively cultivated. Area, 2,472 square miles; pop. 467,300. The chief town is Silchar.

Cachexy, ká-kék'si, or Cachexia, ka-kék'-si-a (Gr., "evil habit of body"), a morbid state of the bodily system, in which there is great weakness, with or without the local manifestation of some constitutional disease. It is not a disease of itself, but the result of diseases such as gout, cancer, lead-poisoning, tuberculosis, syphilis, intermittent fever, excessive use of alcohol, etc., each disease producing its particular modification of cachexia. Thus scrofulous cachexia means the condition of body due to scrofula, shown by slender form, narrow or deformed chest, pallor, diseased glands, large prominent joints, etc.

Cachoeira, ká-shwá'-ť-ra, Brazil, town in the state and 62 miles northwest of Bahia. It stands on the Paraguassu, which divides it into two unequal parts and has often injured it by inundations, and is the entrepôt for the traffic of a large extent of surrounding country. Tobacco and cigars are manufactured, the best brand in Brazil being named from the suburb of Saint Felix. The chief exports are coffee, sugar, fruit, cotton and tobacco. Pop. 15,000.

Cacholong, kásh'-o-long, a mineral of the opal division of the quartz family. It is often called pearl-opal. It is usually milk-white, sometimes bluish or yellowish white, or reddish, opaque or slightly translucent at the edges. Its composition is of silica, like quartz, and its symbol is SiO₂. Some authorities add to the symbol nH₂O, to express a varying amount of water usually found in its composition. Other authorities regard the water content as not characteristic. It often envelops common chalcedony, the two minerals being united by insensible shades. It also associates with flint and semi-opal.

Cachou, ká-shoo', an aromatic sweet-meat in the form of a silvered pill, used for giving an agreeable odor to the breath.

Cachucha, ká-choo'-chá, an Andalusian dance, resembling the bolero, performed to a graceful air in 3-4 time, and with both sexes, but with a strongly marked accent. It is usually danced with castanets, and was introduced on the stage by Fanny Elssler in the ballet of 'Le diable boiteux.'

Cacique, ká-sékh', or Caçique, a title borne by, or a designation given to, the chiefs
of Indian tribes in Central and South America, Cuba, Haiti, etc. The term was formed by the Spaniards from a native Haitian word. Among the Pueblo Indians of New Mexico, there are two tribal divisions—summer and winter. Different caciques preside over each. Their office has religious powers, chiefly; on them also devolves the appointment of the annual government officials. The caciques are appointed for life.

CACIQUE, one of several South American icterine birds, forming the genus Cassicus, and closely related to the Baltimore oriole. They are sometimes uniform black, sometimes black relieved by chestnut, yellow, green or scarlet; the bill is frequently white instead of the usual black or brown. The caciques are noted for their intricately woven, pouch-like nests, composed of thin bark and grasses, several of which, sometimes a yard in length, hang from the outer twigs of a single branch of some large tree, usually overhanging the water, as an extra precaution of safety against monkeys and snakes.

CACODYLE, or CACODYL, kák’-ó-dil,-dil (Gr., "having a bad smell"), in chemistry, a monad radical having the formula As(CH₄), and known as dimethyl arsine oxide. It is of special interest to the chemist because it was the first radical known in which a metal or a metalloid (in this case, arsenic) is combined with an organic base. The compound As₂(CH₄), which was discovered by Bunsen in 1837, and which can exist in the free state, is often called cacodyle, but it is more correctly known as dicacodyl since its molecule consists of two cacodyle radicals. Dicacodyl is obtained in the pure state by heating cacodyle chloride with zinc in an atmosphere of carbon dioxide, but a mixture of cacodyle oxide and dicacodyl (known formerly as Cadet's fuming liquid) may be obtained by distilling potassium acetate with an equal weight of arsenic trioxide. As this is liable to spontaneous combustion, mercuric oxide (HgO) converts both of the constituents of Cadet's liquid into cacodylic acid, (CH₄)₂AsO(OH); and this, in turn, is converted into cacodyle chloride, As(CH₄)Cl, by the action of corrosive sublimate and fuming hydrochloric acid. Cacodyle oxide (known also as alkarsin) may be obtained in the pure state by distilling the chloride with an aqueous solution of caustic potash in an atmosphere of carbon dioxide. Dicacodyl is a colorless oily liquid, heavier than water, boiling at 338° F., very poisonous, and characterized by an intensely disagreeable smell suggestive of garlic. Dicacodyl is known to the chemist as tetra-methyl di-arsenide.

CACOMISTLE, kák’-ó-mis-él, a small Mexican animal (Bassariscus astutus), closely related to the raccoon found in Mexico and neighboring parts of the United States. It is slender, about 16 inches long, with a sharp, fox-like face, large bright eyes surrounded with light patches, and erect ears. The long, soft fur is light brown, above, darker along the back; the under parts are white, and the bushy tail has six broad white rings running around it. In habits it resembles the raccoon. It feeds on smaller mammals, birds and insects. It is frequently tamed by miners and is known to them as the American civet cat.

CACOMITE, kák-o-mé-tā, a plant in Mexico and Central America from which an edible flour is made. It is called in the Nahua tongue ococoxochitl (tiger flower) on account of the appearance of its very handsome and showy blossoms.

CACONGO, kák-kóng’gō, or KAKONGO, a former district of Guinea, Africa, extending along the south Atlantic Ocean, in lat. 5° S., just north of the mouth of the Congo. The Cacongo River enters the sea in lat. 5° 12’ S. This territory was claimed by the Portuguese, and Cabinda, the northern part of it, they still retain; the south and east of the Congo have been absorbed in the Congo Free State.

CACTACEAE. See CACTUS.

CACTUS, the common name for all members of the family Cactaceae, a group of dicotyledons, found in luxuriance in the arid sections of North and South America. Like the watermelon, they have the faculty of absorbing a vast bulk of water, making the stems most succulent.

Giant Cactus or Shauano Cactus near Phoenix, Arizona.

The economic uses of the cacti are many, especially among primitive peoples. One or two species of the genus Anhialonium yield alkaloids which are used in medicine and which were known and used to produce intoxication by the Indians before the advent of the whites, and are still so used to a limited extent. The peculiar reticulations of the vascular or wood systems of many species render them very useful in the manufacture of art goods, otherwise known as curios in magazine sections. The various species are of most importance as articles of food for man and beast. In the semi-tropical and tropical regions of America a large group of the plants belonging to the genus Carnegiea and its allies furnish edible fruits known to the Spanish-American as pitahayas. These
1. Leaf-cactus (Phyllocactus anguiger).
2. Stapelia (simulating a cactus).
3. A Cereus (Cereus dasycaanthus).
5. Wart-cactus (Mammilaria pectinata).
6. Hairy Opuntia (Opuntia filipendula)—a, the blossom, enlarged.
7. Melon-cactus (Melocactus communis).
8. Giant Cactus (Cereus giganteus)—a, blossom, enlarged; b fruit, enlarged.
9. Mexican Opuntia (Opuntia coccinellifera)—a, the fruit (“prickly pear”), enlarged.
CACTUS

Flower of the Hedgehog Cactus
grow for the most part on tall, branching and columnar plants, similar to the familiar giant cactus (Cereus giganteus) of the Arizona desert. These fruits vary in size from three-forth to a foot or larger, depending upon the species. Along the Texas frontier forms grow which are known as Mexican strawberry to the English-speaking people.

Slightly farther the greater part of the fruit produced by this family of plants comes in the flat-jointed prickly pears belonging to the genus Opuntia, the fruit of which are known in Spanish America as tunas. Some of these are extensively cultivated throughout the highland region of Mexico as well as in the Mediterranean region of Europe, Asia and Africa. Prickly pears, although natives of the American continent and its continental islands, are now cultivated or have become naturalized throughout sub tropical regions of the world. The fruits are eaten raw, dried, and in the form of preserves. Their juice are also expressed and fermented into a drink called colonche. It is less common now than formerly to find a distilled drink made from the tuna because of the deleterious effects of tuna alcohol.

On account of their ability to absorb and retain large quantities of water, the cacti, especially the prickly pears, often become important to the stockmen in portions of our southwestern States. They remain green and succulent after other forage has dried up or become exhausted. The rancher then resorts to this rough feed to save his stock. He may singe the thorns off with a brush or, if his herds are large, he may singe them with a modified plunger's torch, or he may even chop the plants into small pieces and feed them in this way.

It is a common practice in southwestern Texas to feed prickly pear and cottonseed meal to stock during the winter. In the vicinity of San Antonio dairymen for a number of years have fed prickly pear to their dairy cows along with a liberal supply of grain and hay. Prickly pears furnish the succulence so essential in milk production and so difficult to obtain in a semi-arid region.

When driven to extremity travelers in the desert have been known to resort to these plants for water supply. The pulpy tissues, preferably of such forms as the barrel cactus (Echinocactus), are macerated to set the juices free. A rather unpalatable and somewhat purgative drink is thus obtained which relieves thirst in a measure. The candied flesh of the barrel cactus forms a palatable sweetmeat.

The flowers and stems of the blooming cactus (Cereus grandiflorus) have been used in medicine, in the form of a fluid extract, as a cardiac stimulant. Its action resembles that of digitalis, but is less uniform.

**CACTUS WREN**, a small wren (Campylorhynchus brunneicapillus) inhabiting the arid and desolate regions of the Mexican border. It is grayish brown above, darker on the head, nearly pure white beneath, with a spotted breast, and a white line over the eye. It makes a large flask-shaped nest of grasses and twigs, lined with feathers, and laid in the crotch of a cactus. This nest is entered by a covered way or neck several inches in length. It is a very slyly bird with a clear, ringing song.

**Cacus**, in Roman legend, a huge giant, in some accounts a son of Vulcan, who lived in a cave on Mount Aventine. Having stolen and dragged into his cave some of the cattle of Hercules, he was caught by the latter when he was caught by the latter when he was passing the entrance of the cave. The Ara Maxima was built by Evander to commemorate this victory. Consult Livy (Bk. 1, 7) and Virgin, *Æneid* (VIII, 184–279.)

**CADA MOSTO, ká'da mo'stô, or CA DA MOSTO, Luigi da, Italian navigator: b. Venice, about 1432; d. about 1480. In 1455 he departed from Lagos, sailed into the river Sene- gal, which had been discovered five years before, and after trading in slaves and gold he steered for Cape Verde, where he joined two other discovery ships, and visited, in company with them, the mouths of the Gambia, the rivers of which had been greatly extolled. In 1456 Cada Mosto, in company with two other ships, made a second voyage to the Gambia. On the way thither they discovered the Cape Verde Islands. The description of his first voyage, "Il Libro de la prima navigazione per l'oceano alle terre de' Negri della Bassa Etiope, di Luigi Cada Mosto" (Vicenza 1507, and Milan 1519), the oldest of the voyages of the moderns, is a masterpiece. The arrangement is admirable, the narrative interesting, the descriptions clear and accurate.

**CADAMBA, ká-dam'bà, or KUDUMBA, the wood of several species of Nauclea, an Indian genus of Cinchonaceae. It is a wood of deep yellow hue, used locally in the manufacture of furniture. N. (Uncaria) gambir is the source of the dyestuff known commercially as gambir or gambier.

**CADASTRAL SURVEY** (F. cadastre, from It. catastro, from Lat. captastrum, "a register for a poll-tax"); Lat. caput, "the head"), a territorial survey in which objects are represented in their true relative positions and magnitudes. A cadastral survey differs from a topographical one, in not magnifying the principal objects. It requires consequently to be made on a larger scale than the topographical survey, so as to admit of a proportionally accurate representation of towns, houses, roads, rivers, etc. The scale on which the cadastral map of the United Kingdom is prepared, 1/20 of the linear measure of the surface surveyed, is an example of the scale of a cadastral survey. This scale corresponds with 25.34 inches to the mile. See Surveying.

**CADDIS-FLY**, the common name of any of the order Trichoptera, a group of aquatic insects, related to and by many supposed to be the ancestors of the moths and butterflies (Lepidoptera). They resemble the lower moths, but the wings are not scaled, except in a very rudimentary way. They differ from moths in having no true "tongue" or well-developed maxilla adapted for sucking the nectar of flowers, but as in moths the mandibles are either absent or obsolete. About 150 species are thus known. All are aquatic, some of which are called "caddis-worms," "case-worms," or "cad-bait." They are more or less cylindrical, with well-developed thoracic feet, and a pair of
feet on the end of the abdomen, varying in length. The head is small, and like that of a tortricid larva, which the caddis-worm greatly resembles, not only in form, but in its habit of rolling up submerged leaves. They construct cases of bits of sticks, sawdust or grains of sand, which they drag over the bottom of quiet pools, retreating within when disturbed. They live on vegetable matter and on water-fleas (Entomophaum), and small aquatic larvae. When about to pupate they close-up the mouth of the case with a grating, or, as in the case of Helicoptus, which is coiled like a snail-shell, by a dense silken lid with a single slit, and in some instances spin a slight, thin, silken cocoon, within which the pupa state is passed. The pupa is much like that of the smaller moths, except that the mandibles are present, and wings and limbs are free from the body. After leaving its case it makes its way over the surface of the water to the shore, sometimes going a long distance. The female deposits her eggs in a double gelatinous, greenish moss, which is attached to the surface of some aquatic plant. Consult McChlairs, 'Monograph of the Trichoptera of the European Fresh-Water Basins; A List Synopsis, Catalogue, and Bibliography of the Neuropteroidea Insects of Temperate North America'; 'Transactions of the American Entomological Society,' Vol. XIX; also a paper by Newham and Betten in 'Bulletin of the New York State Museum,' 47.

CADDIOAN (kâ’dô-an), INDIANS, a fanciful name of North American Indians, comprising the Arikare tribe in North Dakota; the four Pawnee villages, Grand, Tapage, Republican and Skidi, in the Indian Territory; and the Caddo, Kichai, Wichita and other tribes, formerly in Louisiana, Texas and Arkansas. The present number of these Indians is about 2,130, of which 416 are in North Dakota, the rest in the Indian Territory.

CADE, John (the Jack Cade of Shakespear), Irish rebel; d. 11 July 1450. Early obliged to flee from Ireland, he took refuge in France. In 1448 he passed over to England at the moment of great popular dissatisfaction with the ministers of Henry VI. He at once pretended to be a relative of the Duke of York, assumed the name of Mortimer, raised the standard of rebellion in Kent, 8 May, and very soon found himself at the head of 20,000 men. He advanced to Blackheath, and interchanged notes with King Henry, to whom he made known the griefs of his companions. He defeated the royal troops which were sent against him, and entering London, 1 July, immediately caused the arrest and imprisonment of the ministers. At first he kept his army under rigorous discipline, but after a few days' residence in the capital their propensity to plunder could no longer he restrained, and they pillaged some of the finest houses. This aroused the citizens against them, and on the night of 3 July Cade met with his first defeat. A promise of pardon now dispersed most of his followers, and finding his force no longer sufficient for resistance he took to flight, was overtaken, offered resistance and, mortally wounded, was taken prisoner and there slain by Sir John Fastolf and by Sir William de Dreyskirk, with whom he was imprisoned. He was afterwards tried by a court martial and executed. In his day Cade was considered to be the hero of the common people, and his name is associated with the popular rising of 1381. He is known in England as the Jack Cade of Shakespeare, and his memory is kept alive by hisද Caddo tribesmen in the United States.

CADELL, Francis, Scottish explorer in Australia: b. Cockenzie, Scotland, 1822; d. 1879. At the age of 14 he entered the service of the East India Company as midshipman and in 1844 was a sailor. They were sent to explore the Murray River and were engaged in scouting for the navigability of the Murray River in Australia. He then made an extended exploration of that stream in 1860. Subsequently forming a navigation company he reached by steamboat a point on the river's mouth, and in 1878 and 1879 he explored the Murray Bridge River, and in 1878 the Darling River as far as Mount Murchison. While in command of a vessel sailing from Ambonya he was murdered by his crew.

CADENCE, the concluding notes of a musical composition or of any well-defined section of it. See Harmony.

CADENCY, in heraldry, a system of marks intended to show the descent of a younger branch of a family from the main stock. Modern heraldry recognizes nine marks of cadency; the first son bears the label; the second, the crescent; next in order come the mulet, the martlet, the annulet, the fleur-de-lis, the rose, the cross-moline and the orle.

CADINGNA, in music, a flourish of indefinite form introduced on a bass note immediately preceding a close. Formerly the performer improvised his own cadenzas but after Schumann's tune all composers write out the cadenzas and do not trust to the improvisations of every performer.

CADER IDRIS, a mountain in Merionethshire, Wales, the beginning of a chain running northeast. The ridge is nearly 10 miles long, and with its breadth of from one to three miles makes an elevation of great massiveness. Its greatest height is 2,925 feet. It is about five miles southwest of Dolgelly, and there is a fine view of the Irish Sea from the summit.

CADET, ka’dêt, a word having several significations. It is of French origin, and was written capet in the 15th century, from capiteto, little chief, inferior head of a family. Fr. premier, premier.

1. A younger son of a family; that is, one junior to the eldest or heir by primogeniture; the youngest son; a younger branch—or member of a younger branch—of a family. Thus the brothers Coquelin, the famous French actors, were described as Coquelin aîné and Coquelin cadet. The feminine forms are aînée and cadette.

2. In the former French military service—before the Revolution—a gentleman who entered the army without a commission and without pay, two of the offensive professions, as was regularly done by the younger sons of the nobility to find a career for themselves. This last was all the more necessary as the droit d'ânesses, which had prevailed in France since the 12th century, gave the whole inheritable estate to the eldest son, to the detriment of the younger ones. Since the decree of 15 March 1790, hereditary possessions are equally divided among all the children or their descendants, irrespective of sex and primogeniture.

3. A junior clerk in the old East India Company's way to London. The body of students in the United States Military Academy at West Point is known as cadets.
Point, N. Y., is known as the United States Corps of Cadets. They constitute part of the army, but are not officers. Graduates are commissioned as 2d lieutenants. The students in the United States Naval Academy at Annapolis; those of the Royal Military Academy at Woolwich, or the Royal Military College at Sandhurst, are termed cadets, or, in the French military sense, a young man designed to become an officer not by rising from the ranks, but by a course of special instruction to qualify him for the position. A midshipman is a naval cadet afloat. In Germany the cadet system is highly developed. The training ships are called Kadettenschiffe. Cadet schools and corps exist in all the other European armies and navies. The Japanese Cadet School in Tokio has a teaching staff of 239 and over 1,500 students. In China each provincial capital contains a primary military school, where pupils from 15 to 18 years of age undergo a three years' course, proceed to one of the Four Middle Schools for two years, followed by six months' practical training. From there to the Military High School at Paotingfu.

CADETS DE LA CROIX, crwã, the early name by which the Camisards (q.v.) styled themselves, from a white cross they wore under their hats.

CADET'S FUMING LIQUID. See Caodyle.

CADILLAC, kã-dê-yãk, Antoine de la Mothe, French military commander: b. Gascony, France, about 1660; d. France 1720. He came of good family, and having entered the army was for some time captain in Acadia. In 1694 Frontenac placed him in command of Michilimackinac, where he remained until 1697. Cadillac then brought to the attention of Louis XIV a well-considered scheme for a permanent settlement and trading post in the Northwest. On receiving the monarch's approval he founded Detroit in 1701, establishing 50 soldiers and 50 settlers at that point. From 1712 to 1717 he was governor of Louisiana, returning to France in the year last named. The town of Detroit was named in his honor. Consult Burton, 'Cadillac's Village, a History of the Settlement, 1701-10' (1896); Parkman, 'A Half Century of Conflict' (Boston 1892).

CADILLAC, Mich., city and county-seat of Wexford County, on Little Clam Lake, and on the Grand Rapids and Indiana and the Ann Arbor railroads, 98 miles N. of Grand Rapids. It was founded in 1871, incorporated in 1874, and since 1914 has been under the commission manager plan of government. The principal buildings comprise city hall, county courthouse, public library and hospital. Besides the lumber interests of a valuable hardwood timber region, it has a veneer, table, chair and shoe and others factories, chemical works and machine shops. Pop. 8,375.

CADIZ, Ohio, village and county-seat of Harrison County, about 25 miles northwest of Wheeling, W. Va., and 120 miles east-northeast of Columbus, on the Pittsburgh, Cincinnati and Saint Louis Railroad. Cadiz is important as a banking centre and has a large trade in coal, gas, poultry, oil and wool. It was the home of Edwin M. Stanton (q.v.). Pop. 1,971.

CADIZ, kã-diz or kã-dis (anciently Gadara), a seaport and one of the handsomest cities in Spain, 95 miles south-southwest of Seville by rail, is situated at the extremity of a long tongue of land projecting from the Isla de Leon, off the southwestern coast of Andalusia. The narrowness of the land communication prevents its capture by a military force unless the garrison is master of the sea. It is walled, with trenches and bastions on the land side; the houses are high, and the streets narrow. The chief buildings are the great hospital, the custom-house, the old and new cathedrals (with pictures by Murillo), two theatres, the bullring, capable of accommodating 12,000 spectators, and the lighthouse of Saint Sebastian. From the harbor the town presents a magnificent appearance. The Bay of Cadiz is a very fine one. It is a large basin enclosed by the mainland on one side, and the projecting tongue of land on the other. It is from 10 to 12 leagues in circumference, with good anchorage and protected by the neighboring hills. It has four forts, two of which are in cold storage, the grand arsenal, La Caracci, in which are 3 basins and 12 docks. The city touched its greatest prosperity after the discovery of America, when it became the European emporium for the New World. The loss of the Spanish colonies in America dealt it a heavy blow; but within recent years it has made rapid strides despite the imperfect drainage and a bad water supply which are responsible for the high death rate of 44 per 1,000. Cadiz has long been the principal Spanish naval station. It was the centre of the Spanish-American trade, and the commerce of the port was very extensive before the separation of the colonies. The preparation of salt from pits belonging to the government was formerly an important branch of industry, but is now of comparatively little consequence. The manufactures of Cadiz are of comparatively little importance, but in regard to the extent and value of its commerce it ranks as one of the first ports in Spain. Its imports consist of all kinds of foreign colonial produce, coal, cotton and woolen manufactures etc.; its exports of wines, fruits, oils and other products of Spain. The town of Santa Maria, opposite Cadiz, is the principal depot of the wines. It was founded by the Phoenicians about 1100 B.C., and subsequently belonged in succession to the Carthaginians and the Romans. Long in possession of the Moors, it was captured from them in 1202 by Alfonso X. of Castile. In 1587 Sir Francis Drake destroyed the Spanish fleet in the bay; and it was taken by the Earl of Essex in 1596, and from its bay Villeneuve sailed previous to the battle of Trafalgar in 1805. In 1809 it became the seat of the central junta, and afterward of the Cortes. It sustained a long blockade from the French (1810-12), which was not raised till after the battle of Salamanca. In 1823 the French entered it after a short siege. The Spanish revolution of 1808 originated in Cadiz. Pop. 67,174.

CADMAN, Samuel Parks, American Congregational clergyman and author: b. Wellington, Shropshire, England; d. Richmond College, at the age of 50, 1844. A graduate of London University (Richmond College), after he came to the United States, he received the degree of D.D. from Wesleyan
and Syracuse universities, 1898; S.T.D., Columbia University, 1913; D.H.L., University of Vermont, 1913. He was pastor of the Metropolitan Temple, New York, from 1895 to 1900, when he accepted a call to the Central Congregational Church, Brooklyn. Previously he had been a student at Adelphi College in 1913-14. Well known as a public speaker and lecturer, he is author of ‘Charles Darwin and Other English Thinkers’ (1911) and ‘Three Great Oxford Movements’ (1915).

CADMEA, the name given to the acropolis of Thebes, Boeotia, because it was said to have been founded by Cadmus. Only fragments of its walls remain.

CADMIA, a name used by early writers (1) for the mineral calamine (q.v.); and (2) for the sublimate of zinc oxide that often collects on the walls of furnaces used in the reduction of metallic ores, when those ores happen to contain zinc.

CADMIUM, a metallic element resembling zinc in its chemical properties, and discovered by Stromeyer in 1817, in a specimen of zinc carbonate. Cadmium often occurs in ores of zinc to a small extent, blende sometimes containing as much as 3 per cent of cadmium sulphide. The commercial supply of the element is obtained as a by-product in the smelting of zinc, chiefly in Belgium and Silesia. Cadmium sulphide also occurs native as the mineral greenockite (q.v.), otherwise known as “cadmium blende.” In the distillation of zinc ores the cadmium, being more volatile, passes over first; and advantage is taken of this fact for the isolation of the metal in the arts. In Silesia, where the zinc ores often contain considerable quantities of cadmium, the first portion of the distillate is likely to contain as much as from 3 to 10 per cent of cadmium. This is mixed with coal or charcoal and redistilled at a low red heat. Cadmium, mixed with a little zinc, passes over; and by one more distillation the metal is obtained in a fairly pure form. To eliminate the last traces of zinc, the crude metal is dissolved in hydrochloric acid, then diluted and precipitated as a sulphide by a current of sulphurised hydrogen. The sulphide is then dissolved in concentrated hydrochloric acid, and the subsequent addition of carbonate of soda precipitates the carbonate of cadmium, which is reduced to the oxide upon ignition. The pure oxide thus obtained may then be reduced to the metallic form by distillation with charcoal.

Metallic cadmium is lustrous and resembles tin in appearance, though it has a bluish tinge. It is stronger than tin, but, like that metal, it emits a peculiar cracking sound, or “cry,” when bent. At ordinary temperatures it is quite ductile and malleable, and may be drawn into thin wire, rolled into thin sheets, or hammered into foil. At about 175°F. it becomes brittle, however, so that it can be pulverized in a mortar. Cadmium has the chemical symbol Cd. Its specific gravity is about 8.65. It melts at 600°F., and boils at about 1,500°F., yielding a yellow vapour. Its atomic weight is 112.4 if O = 16, or 111.6 if H = 1. Its specific heat is about 0.055, and its linear coefficient of expansion is about 0.0000185 per Fahrenheit degree. Metallic cadmium is used to a limited extent in the preparation of alloys, its general effect being to reduce the melting-point of the alloy to which it is added. The total production of the metal per annum is probably about two tons.

In its chemical relations, cadmium, like zinc, is a dyad. Metallic cadmium undergoes a slow, superficial oxidation upon exposure to the air; and when sufficiently heated in the presence of air it oxidizes rapidly and may even take fire. The resulting oxide, CdO, is brown in color and readily dissolves in acids, giving solution of the corresponding cadmium salts. One of the best known of these salts is the iodide, CdI2, which is used in photography and in medicine, and may be obtained by the action of hydrochloric acid, HCl, upon cadmium carbonate, or metallic cadmium. The bright yellow sulphide, CdS, is formed when the stream of sulphurised hydrogen gas is passed through a slightly acid solution of a cadmium salt; and this fact is used in the detection and isolation of cadmium in qualitative analysis. Cadmium sulphide is used as a pigment, under the name of “cadmium yellow”; it is brilliant in color, and does not change upon exposure to air or light.

CADMUS, in Greek mythology the son of Agenor and grandson of Poseidon. With his brothers he was sent by his father to seek for his sister, Europa, who had been carried away by Zeus, and he was not to return without her. After several adventures, the oracle at Delphi commanded him to desist from further search, to entrust himself to the guidance of a heifer, and where she should stop to build a city. He accordingly went to Boeotia, where he wished to sacrifice the cow to Athena. But his companions, attempting to bring water from the fountain of Ares for the purpose of the sacrifice, were slain by the dragon that guarded it. Cadmus killed the dragon, and, at the command of Athena, sowed its teeth in the earth; armed men immediately sprang up, whom he called Sparti (the sowed), but who perished in a contest with each other, excepting five. With the remainder he built his city, which he named after his father, or Thebes (see THEBES). He became by his marriage with Harmonia the father of Antinoé, Ino, Semele, Agave and Polydorus. After ruling for a time the city which he had built, and the state which he had founded, he proceeded, at the command of Bacchus, with Harmonia to the Enchelae, conquered their enemies, the Illyrians, became their King, and begat another son, Illyrius. Tradition states that Cadmus came to Boeotia from Phoenicia, 1550 B.C., conquered the inhabitants who opposed him, and, in conjunction with them, founded the above-mentioned city. To promote the improvement of his subjects he taught them the Phoenician alphabet, the employment of music at the festivals of the gods, besides the use of copper, etc. Another Cadmus, of Miletus, a son of Pandion, was regarded among the Greeks as the first who wrote in prose. He lived about 600 B.C.

CADOL, Victor Edouard, věk-tȯr ěd-ō-àrd ka-dōl, French dramatist and novelist: b. Paris, 11 Feb. 1831; d. 1898. He was long a prominent writer, and was one of the founders of Le Temps, and was one of the founders of L' Esprit Français. Among his very numerous works, many of which were written in collaboration, are 'La Germaine,' a three act
COUNT GENERAL LUIGI CADORNA
Commander-in-Chief of the Italian armies (1915-17)
comedy (1864); 'Les ambitions de M. Fauvelle' (1867), which ran for over 200 consecutive nights; 'Les Inutiles' (1868); 'La Belle Aventure' (1869); 'La fausse monnaie' (1869); 'Paris pendant le siège' (1871); 'Le spectre de Patrick' (1872); 'Mariage de princesse' (1888); 'Thérèse de Paris' (1893); 'L'archiduchesse' (1897). A corrected edition of his dramas appeared in 1897 entitled 'Théâtre inédit.' Among Cadol's romances are 'Contes gais' (1867); 'Le Monde galant' (1873); 'Madame Elise' (1874); 'Rose' (1875); 'La Grande Violette' (1879); 'Son Excellence Satinette' (1882); 'La Belle Virginie' (1883); 'Tout Seul' (1884); 'Lucette' (1886).

**CADORE, kā-dōrā, or PIAVE DI CADORE, a town of Italy, in the province and 22 miles north-northeast of the town of Belluno, on the Piave, derives its chief interest from being the birthplace of Titian.**

**CADORNA, kā-dōr-nā, Luigi, Count, Italian general, son of General Count Raffaele Cadorna. Born 1850. After receiving his early education at a cadet school he passed the Staff College and was attached to his father's staff in 1870 when the latter—a brilliant soldier—led the Italian army into Papal territory in 1870 and blew in the Porta Pia. He attained the rank of captain in 1875, and was ultimately appointed chief of staff of the Verona Army Corps. After commanding the 10th Bersaglieri he was promoted major-general in 1898 and lieutenant-general in 1905. For a time he commanded the division at Ancona and was subsequently appointed corps commander at Genoa, with the rank of commander-designate of an army in the field. In 1914 he succeeded General Polllo as chief of the general staff. His reputation as a professional soldier had long been established throughout Europe, for he had written works on military science and possessed a unique knowledge of that difficult terrain in which, if ever, Italy would be called upon to fight her old enemy and quondam ally Austria. When Italy entered the war in May 1915 Count Cadorna was given the supreme command in the field. His battle front of about 480 miles was the most difficult one in Europe, presenting enormous geographical obstacles, the angle of the Trentino, the great wall of the Dolomites and the Carnic and Julian Alps. The Italian successes of 1916, including the capture of Gorizia, were neutralized by the great Austro-German drive against Italy that began on 23 Oct. 1917. By the evening of the 29th the whole Italian line was in retreat and General Cadorna fell back upon the Tagliamento. Gorizia fell to the enemy and Udine was lost. The mountain defenses in the Carnic Alps began to crumble and the disaster soon extended to Cadore. Abandoning the Tagliamento line on 5 November Cadorna fell back to the Porta Pia. After a futile attempt to hold the Livenza. The Italian losses were estimated by the enemy at 250,000 men and 2,300 guns, and the Allies suffered a defeat in the field unparalleled in the war. French and American troops were rushed to the scene, but the Italians recovered themselves by their own efforts and made a firm stand on the Piave. On 9 Nov. 1917, a Supreme Political Council of the Allies for the whole of the western front was created, and General Cadorna was appointed a member of the permanent central military committee. On 10 Feb. 1918 Cadorna was succeeded as a member of the Supreme War Council by Gen. Gaetano Giardino. He was succeeded in his command by General Dandolo. See War, European—Austro-Italian Campaign.

**CADORNA, Raffaele, Italian general: b. Milan 1815; d. Turin, 6 Feb. 1897. He served in the Crimean War, and in 1860 was made war minister in Tuscany's provisional government, and military commander of Sicily in 1866. He suppressed the Bourbon insurrection in Palermo in the latter year, and in 1870 captured Rome and was its military governor for a time. In 1871 he entered the Italian Senate. He was the author of 'Osservazioni sull'amministrazione centrale della guerra' (1854); 'Bibliografia delle campagne per l'indipendenza italiana' (1882), and 'La liberazione di Roma nel 1870' (1889).

**CAUDIDAL, Georges, kā-doo'-dahl', French Chouan chief: b. Brittany, 1 Jan. 1769; d. Paris, 25 June 1804. In the protracted and sanguinary contests between the Royalists and Republicans during the French Revolution, the Chouans and Vendéens were the most resolute supporters of the Royal cause; and the energy and ability of Cadoudal soon raised him to an influential place among the adherents of the house of Bourbon. At this time attempts were made by Napoleon to gain over Cadoudal to the cause of the republic, and a lieutenant-generalship in the army was offered as the price of his submission; but he firmly declined all these overtures. He afterward engaged, in concert with General Pichegru and others, in a conspiracy having for its object the overthrow of the consular government and the restoration of the monarchy; which being discovered, Cadoudal was arrested and executed. Consult Georges de Cadoudal, 'Georges Cadoudal et la Chouannerie' (Paris 1889).

**CADUCEUS, kā-dū'-se-ūs, the staff considered as a symbol and attribute of the Greek god Hermes and the Roman god Mercury. It is generally represented as having two serpents twined around it in opposite directions, their heads confronting one another. It is probable that the staves carried by heralds and public criers gave rise to this fable, the fluttering ribbons or fillets tied to the end of the staff, or the green wreaths or bouquets which were tied around it, giving the suggestion of the presence of living serpents. Several different fables were invented by late Greek writers to account for the serpents in a miraculous way. The fable tells that Apollo gave his staff to Mercury in consideration of his resigning to him the honor of inventing the lyre. As Mercury enteredArcadia with this wand in his hand he saw two serpents fighting together; he threw the staff between them, and they immediately wound themselves around it in friendly union. The caduceus is Mercury's peculiar mark of distinction. With this he conducted the shades to the lower world, and from it, in the time of the Roman empire, he received the name of Caducer; yet we find it on ancient coins in the hands of Bacchus, Hercules, Ceres, Venus and Anubis. Among the moderns it serves princi-
pally as an emblem of commerce over which Mercury was the presiding divinity.

CADWALADER, kād-wālā'dér, George, American lawyer and soldier: b. Philadelphia 1804; d. there, 3 Feb. 1879. He practised law till 1846; was made brigadier-general of volunteers; and was brevetted major-general after Chapultepec. He resumed his law practice till 1861; became major-general of State volunteers; was placed in command at Baltimore; accompanied Patterson's expedition to Winchester (1861); and, as one of a military board, directed the United States army operations. He was author of 'Services in the Mexican Campaign of 1847' (1848).

CADY, J. Cleveland, American architect: b. Providence, R. I. He entered the profession of architect in 1870 and among his noteworthy buildings are the American Museum of Natural History, the Metropolitan Opera House, the Brooklyn Art Association, various collegiate structures at Yale, Williams, Trinity and Wesleyan, and numerous churches, hospitals, mansions, commercial buildings, etc., throughout the country. Trinity College conferred on him the degree of M.A. in 1880 and LL.D. in 1905.

CÆCILIAN, sē-sēl-ē-ăn, a member of a family of batrachians, the Cæcilidae, regarded as forming an order, called Apoda, or Gymno- phiona. They are long, worm-like animals, lacking all traces of limbs, and having only a rudiment of a tail. They may be as many as 250 vertebrae. The hinder end is blunt and hardly to be distinguished from the head. The body is covered with a soft, moist skin, and the jaws are armed with rather feeble teeth. These animals are found in the tropical parts of America, Africa and Asia, where they burrow like earth-worms, which they resemble. They are often found in the nests of ants, which they devour. They also feed on worms. The breeding habits of these creatures are not well understood. The eggs are laid either in the water or near it. One species found in Ceylon lays a mass of eggs which are connected by a cord, thus resembling a string of beads. They are deposited in a burrow near the water, and are incubated by the mother until the escape of the young. About 30 species of these animals are known.

CÆCILIUS, sē-sēl-ē-us, Status, Roman comic poet and dramatist. He was born in Gaul of the race of the Iserbians; d. 166 B.C. His contemporaries ranked him with Plautus and Terence and included him in the number 40 comedies of which fragments remain. He was brought to Rome as a prisoner of war, but was freed. He was a friend of Ennius. Volcacius Sedigetus ranks him first among the comic poets of Rome. A few fragments have been preserved, mainly by Cicero and Aulus Gellius. Consult Ribbeck, 'Comiconum Romanorum Fragmenta' (Leipzig 1898).

CÆCULUS, sē-kū-lūs, in mythology, a son of Vulcan, and a great robber, who lived in Italy, and built Premneste; he was unable to find inhabitants he employed the aid of Vulcan, his father, who populated the city for him.

CÆCUM, sē-kūm (Lat. cæcus, blind), or caput coli (head of the colon), a blind pouch into which the small intestine empties. In the human body it is so small as to be practically useless. It is the therefore inclined to be larger in herbivorous animals; but it is lacking in some animals, like the bear, which would seem to require it; and omnivorous or granivorous birds have two cæcæ generally large, while fishes have no true cæcum and in reptiles the cæcum is small. The cæcum aids the digestion in the mammalia by the secretion of a fluid resembling gastric juice.

CÆCUM, Diseases of. Acute disease of the cæcum is usually present in the form of appendicitis (q.v.). Tuberculosis of the cæcum and cancer of the cæcum are described under the terms cancer and intestinal tuberculosis. The chronic diseases of the cæcum may be arranged under the headings, chronic catarrhal inflammation, atony of the cæcum with dilatation, spasm of the cæcum, displacements, and the neuroses of the cæcum. In some instances the cæcum may be thought of as a secondary stomach. Like the stomach, it is a dilated organ at the end of a portion of the intestinal canal, hence its disorders run in a sense parallel to those of the stomach. It is a food pouch which contains a quantity of food ready to be absorbed.

Atony of the cæcum is not an infrequent cause of serious disturbance and is due either to a general body loss of tone, as from wasting disease, from neurotic disturbances, from displacements or from mechanical obstructions. Certain clinicians regard the neurotic disposition or constitution as the most frequent, others regard the mechanical factors to be the most important. Atony may be present alone or be associated with dilatation, which latter is the more frequent.

The symptoms are complex and at times obscure. They are frequent in young adults, usually between 25 and 45. Obstinate constipation is a prevailing state. This is interspersed or broken into, as it were, by paroxysmal attacks of griping pain. These may last a few hours. At times there are simply periods of severe discomfort, with feeling of fullness in the right iliac fossa. Loss of appetite with times nausea and vomiting are present. Examination of the abdomen reveals a fullness and resistance; there is frequent ileo-cæcal gurgling of gases and percussion of the area reveals a greater or less area of tympanites. Diarrhoea is not infrequent during the attacks. X-ray pictures are important in the diagnosis as it is frequently misinterpreted as a chronic ap-
CÆDMON — CAEN

PENDICTIS — which latter condition often accompanies the chronic caecal atony and dilatation. The treatment is by rest, the knees drawn up, hot applications and belladonna. If the pain is severe, high soapsuds enemata are of value. Operation is rarely called for; the chief general treatment should consist in raising the general muscular tone of the individual. Setting up exercises with special attention devoted to the morale of the abdominal muscles is the best treatment. A vigorous attitude will give rise to a strong-minded intestine and do much to relieve the flabbiness and loss of muscular tone of these individuals. They are for the most part people who are chronically sorry for themselves and are usually internally indolent although at times externally fairly active.

Typhlospasm is the name given to an opposing type in which increased tone of the caecum gives rise to a chronic spastic state of the organ. This is found in young adults usually of the more forceful and busy type. Here pain and discomfort are felt and there is a tendency toward increased frequency of bowel movement, two to three small dryish movements a day. The movement usually does not seem to relieve the patient. There is a sense of something "left behind" and mucus and blood are sometimes passed, and the entire colon seems in a tense, full, uneasy state. This type of individual is usually forceful, overaggressive, choleric and impatient. They are frequently haters and often not well socially adjusted, often intensely aware of their environment. The treatment is largely, psychical. Belladonna, chloral and bromides are of value in tiding over the acute periods of distress. A prevailing trend in neurological medicine is to regard these conditions as largely of mental origin in which the mechanical factors, Lane's kinks, etc., are contributing causes.

CÆDMON, kâd'môn, the first Anglo-Saxon poet; d. 680. According to Bede's 'Ecclesiastical History,' Cædmon was a swineherd to the monks of Whitby, and never gave evidence of any poetical talent until one night a vision appeared to him, and commanded him to sing. When he awoke, he found the words of a poem in praise of the Creator of the world impressed upon his memory. This manifestation of talent obtained for him admission into the monastery at Whitby, where he continued to compose devotional poems. An edition of his paraphrase of parts of the Scriptures was printed at Amsterdam in 1655, edited by Junius. Thorpe published an edition of it (London 1832) for the Society of Antiquaries. It has been assumed by some that Milton took some ideas of 'Paradise Lost' from the poems of Cædmon. It is certain that they were very popular among the English and the Saxon part of the Scottish nation, and furnish plentiful materials to the makers of mysteries and miracle plays. In the Bodleian Library at Oxford is a manuscript the contents of which are ascribed to Cædmon, but the best authorities do not consider it to be his. Consult Ten Brink, 'Early English Literature'; Morley, 'English Writers'; Vol. II (1888); and the bibliography in the 'Cambridge History of English Literature.'

CÆLIUS, sè'lûs, Aurelianus, Latin physician, generally supposed to have been a native of Numidia, and to have flourished in the 4th or 5th century of the Christian era. He was a member of the sect of the Methodici, and the author of 'Medicinae Responsiones,' a compendium of the whole science of medicine in the form of a catechism 'Libri Quinque Tar- darum Chronicarum Passionum' and 'Libri Tres Celerum sive Antiquorum Passionum.'

CÆLIUS MONS, one of the seven hills on which Rome was built. It is said to have received its name from Celius Vibenna, an Etruscan, to whom it was assigned. The palace of Tullius Hostilius was on this mount. It is at present covered with ruins.

CAEN, kã, France, town in the department of Calvados, and the ancient capital of Normandy, 125 miles northwest of Paris, and about nine miles from the mouth of the Orne, which is here navigable and crossed by several bridges. There is a dock connected with the sea by both river and canal. Caen is the centre of an important domestic trade, in the market of a rich agricultural district, and carries on extensive manufactures. The streets are broad, regular and clean, the houses well built of white freestone and it possesses various ancient and remarkable edifices. The public parks and recreation grounds are beautiful, and there are various extensive squares and places. The church of La Trinité, a fine edifice in the Norman-Romanesque style, restored in modern times, was formerly the church of the Abbaye-aux-dames, founded in 1066 by Matilda, wife of William the Conqueror. The church of Saint Stephen was founded at the same time by William the Conqueror as the church of the Abbaye-aux-hommes, and though considerably modified since is a noble and impressive edifice. It has two fine western towers 295 feet high. The Abbaye-aux-hommes, built by the Conqueror, who was buried in it, is now used as a college, having been rebuilt in the 18th century. One of the finest churches in Caen is that of Saint Pierre, whose tower (255 feet), terminated by a spire, is exceedingly elegant. Among other public buildings are the Hôtel de Ville, the prefecture and the palace of justice. Caen possesses a university faculty or college, a public library with some 100,000 volumes, and numerous paintings with valuable works of old masters, a natural history museum, an antiquarian museum, etc. The hospital of the Abbaye-aux-dames is one of the best regulated in France. The hospital of the Bon-Sauveur is another admirable institution. The city was formerly fortified, and there are remains of a castle begun by William the Conqueror and finished by Henry I, but since much altered and now used as barracks. Caen first rose into importance in the time of William the Conqueror. In 1346 it was taken by Edward III, at which time it was said to be larger than any city in England except London. Henry VI of England founded a university here in 1431, Caen having been in the possession of the English from 1417 to 1430. It suffered much in the religious wars between the Protestants and the Roman Catholics of France. Admiral de Coligny captured it for the Protestants in 1562. Caen carries on shipbuilding, and its manufactures embrace linen, woolen and cotton goods, lace, ropes, metals, goods, leather, cutlery and various other articles and has foundries, breweries, dyeworks and sawmills. It is also famed for gloves made.
from the skins of the Angora rabbits. It carries on a considerable trade in timber, iron ore, coal, grain and other articles, including agricultural produce exported to England, to which also is still exported the Caen building stone famous for many centuries. A canal connects the port with the sea. Mahére, Laplace, Eée de Beaumont and Auber were born in this city or in its vicinity, and are commemorated by statues. Pop. 46,934.

CAEN-STONE, a cream-colored oolitic limestone from Caen in Normandy, identical with the Bath oolite of England. It is easily carved and has long been highly esteemed as a building stone. Westminster Abbey, Canterbury Cathedral and other English churches are built of it. It is quarried underground in blocks nine feet long, two feet thick. Its amorphous nature prevents its use on external structures in severe climates. Its principal use is for interior work.

CAERNARVON, kâr-nâr’vôn. See Carnarvon.

CÆRULARIUS, Michael, Greek ecclesiastic, the Patriarch of Constantinople, 1043-49. By dispensing with the Latin ritual in many churches of Bulgaria and protesting against the use of unleavened bread by the Latins in the Eucharist, he completed the division between the Latin and the Greek communions. He was formally excommunicated by Pope Leo IX. Some epistolary and letters issued by him are still preserved. Consult Pichler, 'Geschichte der kirchlichen Trennung zwischen dem Orient und Occident' (Munich 1864).

CÆSALPINIÆ, sēs-āl-pi-nē-tā’sē-ē, a family of plants containing numerous genera. The botanical characteristics of the family are: Calyx of five divisions, joined together at different points, or often distinct to the base, with prefloreal imbricate or valvular; petals equal or fewer in number; stamens often not symmetrical to the other parts of the flower, or very irregular, sometimes very numerous, sometimes partly abortive, rarely regular, very often free, or lightly joined together at the base only; ovary raised on a free support, or joined in part to the calyx and becoming legumes, which sometimes contain only one or two ovules, and of which the pericarp may have a fleshy consistence; seeds without perispem; embryo often straight; stems often arborecent or fruticos, sometimes creeping; leaves simple, or more frequently compound, in the latter case frequently bipinnate. The typical genus is Cæsalpinia. The family contains many plants of great economic importance.

CÆSALPINUS, Andreas, or ANDREA CÆSALPINO, Italian physiologist: b. Arezzo, Italy, 1519; d. 23 Feb. 1563. He is first mentioned in public life as a professor of botany in the University of Pisa. He was subsequently made chief physician to Clement VII, and lived during the greater part of his life in Rome. He published works on botany, mineralogy, medicine and the highest questions of philosophy. In his first publication, entitled 'Speculum Artis Medice Hippocraticum,' his knowledge of the system of the circulation of the blood is stated in the clearest manner. The following passage is taken from the second chapter of its first book: *For in animals we see that the nutrient blood is carried through the veins to the heart as to a laboratory, and its last perfection being there attained, it is driven by the spirit which is begotten in the heart through the arteries and distributed to the whole body.* The system accepted since the time of Harvey could hardly be more definitely or accurately stated. His philosophical speculations are contained mainly in his 'Questiones Peripateticæ.' The philosophy of Cæsalpinus was scholastic Aristotelianism, with a leaning toward some of the methods and doctrines of the later transcendental or absolute systems. He reduces the world to the simplicity of two only substances, God and matter, and he makes all finite intelligences, all human, angelic and demoniac souls, to belong to the latter element. Two things are remarkable about his system: (1) The boldness of speculation, unparalleled in his age, with which he seeks a purely scientific view of the universe; and (2) its entirely materialistic character. But more important than either his anticipation of Harvey's discovery or his speculative opinions, were his botanical labors. He was styled by Linnaeus the first orthodox or systematic botanist, and his work 'De Plantis,' was a handbook to Linnaeus in all his classifications. Botany in the time of Cæsalpinus was the popular witchcraft: as a science, it consisted in a mass of erudition about the imaginary but marvelous virtues of plants. Cæsalpinus sought successfully to transfer it from the realm of magic to that of science. He proposed the basis of classification upon which the whole system of Linnaeus rests, namely, the distinction of plants in their parts of fructification. He lived quietly to an old age at Rome, submitting all his speculations to the supremacy of the Church, and presenting in his life an example of every virtue.

CÆSAR, the name of a patrician family of the Julian gens, tracing its origin to Julius, the son of Æneas. The first member of the family who occurs in history with the surname of Cæsar was Sextus Julius Cæsar, praeator, 208 B.C. Cæsar was the family name of the first five Roman emperors. With Nero the imperial family became extinct (68 A.D.), and Cæsar became merely a title of dignity. The Emperor, who bore the title of Augustus, appointed his successor, with the title of Cæsar. On medals and monuments we find the title Cæsar preceding the name of the emperor, as *Img. Cæsar Nerva Trajanus Augustus,* and following that of the designated successor, as *Marc. Aurel. Antonin. Cæsar.* In the lower Greek empire, a new dignity of Sebastocrator was conferred, and that of Cæsar became the third rank in the state. From Cæsar are derived the German *kaiser* and the Russian *tsar.*

CÆSAR, Gaius Julius, the greatest representative of the genius of Rome, a man of consummate ability alike as a general, a constructive statesman and a writer. He was born, according to all accounts, in the 13th or 14th year of the Roman era, c. 100 B.C., but Mommsen, in his 'History of Rome,' considers that the year should be given as 102. Of purest patrician ancestry, and with a family tradition intimately associated with the
rule of the senatorial oligarchy, he was yet, from early youth, a champion of the popular party. His aunt Julia had married Marius, and when, upon the latter's death in 89, Cinna became the leader of the Populares, Caesar entered into intimate relations with him through his daughter Cornelia. But the following year Sulla returned from the East and overwhelmed the foes of the Senate. A reign of terror for the Marian party followed. With characteristic boldness, Caesar refused to divorce his wife in the hope of becoming her father's successor to the dictatorship. In consequence, his property, his position as priest of Jupiter and almost his life. The famous story that Sulla pardoned him with the remark that "he would one day be the ruin of the aristocracy, for in him there was many a Marius," though vouched for by both Suetonius and Plutarch, seems strikingly inconsistent with Sulla's usual remorseless logic. Partly to avoid further trouble, and partly to gain that military experience which was at Rome deemed a prerequisite for a political career, he now went to Asia, and, as a staff officer, served with distinguished bravery at the siege of Mytilene, and afterward against the pirates in Cilicia, but returned home upon receiving news of Sulla's defeat in the "Alliance of the Thracians" (74). In the courts was the natural avenue to popular favor; we presently find him acting as prosecutor in two cases involving extortion in provincial administration. But the culprits, Dolabella and Antonius, belonged to the senatorial order, and his eloquence, though it won applause, failed to move the juries composed of senators. He determined to perfect himself in oratory by studying under the most famous teacher of the age, Apollonius Molo of Rhodes. On the way thither he fell into the hands of pirates near Miletus, and was held for a ransom of 50 talents (over $55,000). During a stay of almost 40 days he won the admiration of his captors by his coolness and wit, and laughingly promised to crucify them all as soon as he should obtain his freedom, a threat which he promptly carried out to the letter. He studied under Molo only a short time, however, for the renewal of hostilities by Mithridates against the Roman province of Asia brought him into the field with some hastiness, and after a brief but effective service, he returned to Rome in the winter of 74-73. He had been elected pontifex in his absence, and now took part, with the utmost energy, in the attempts that were being made to overthrow the Marian constitution. This was accomplished in the year 70, though in a totally unexpected manner, by the legislation of Pompey and Crassus, both of whom had, previous to that time, been supporters of senatorial pre-rogative. Meanwhile Caesar, by his unfailing courtesy and good will, and a lavish generosity that soon plunged him deep into debt, had been winning all hearts. In 69 he was elected questor, and was assigned to the province of Further Spain. But before his departure he lost his aunt Julia and his wife, Cornelia. At the former's funeral he caused busts of Marius to be carried in the procession, to the great delight of the populace, and in the two memorial addresses which he delivered in the forum he eulogized the aims and leaders of the people's party. In Spain he must have noted with appreciation the work of the great Marian generals, Sertorius, the first man who tried to romanize the provincials. Upon his return, in 67, he entered into friendly relations with Pompey, and supported the Gabinian and Manilian laws, by which the latter was to receive the supreme command against the pirates in the west, and Mithridates, in the east. He had now become a recognized figure in the history of the republic. In 65 he was adile, and met the demands of his office with unheard of magnificence in buildings and games. In particular, he stirred the people to frantic enthusiasm by secretly erecting in the Capitol the trophies of Marius and lost; but in consequence, his property, his position as priest of Jupiter and almost his life. The famous story that Sulla pardoned him with the remark that "he would one day be the ruin of the aristocracy, for in him there was many a Marius," though vouched for by both Suetonius and Plutarch, seems strikingly inconsistent with Sulla's usual remorseless logic. Partly to avoid further trouble, and partly to gain that military experience which was at Rome deemed a prerequisite for a political career, he now went to Asia, and, as a staff officer, served with distinguished bravery at the siege of Mytilene, and afterward against the pirates in Cilicia, but returned home upon receiving news of Sulla's defeat in the "Alliance of the Thracians" (74). In the courts was the natural avenue to popular favor; we presently find him acting as prosecutor in two cases involving extortion in provincial administration. But the culprits, Dolabella and Antonius, belonged to the senatorial order, and his eloquence, though it won applause, failed to move the juries composed of senators. He determined to perfect himself in oratory by studying under the most famous teacher of the age, Apollonius Molo of Rhodes. On the way thither he fell into the hands of pirates near Miletus, and was held for a ransom of 50 talents (over $55,000). During a stay of almost 40 days he won the admiration of his captors by his coolness and wit, and laughingly promised to crucify them all as soon as he should obtain his freedom, a threat which he promptly carried out to the letter. He studied under Molo only a short time, however, for the renewal of hostilities by Mithridates against the Roman province of Asia brought him into the field with some hastiness, and after a brief but effective service, he returned to Rome in the winter of 74-73. He had been elected pontifex in his absence, and now took part, with the utmost energy, in the attempts that were being made to overthrow the Marian constitution. This was accomplished in the year 70, though in a totally unexpected manner, by the legislation of Pompey and Crassus, both of whom had, previous to that time, been supporters of senatorial prerogative. Meanwhile Caesar, by his unfailing courtesy and good will, and a lavish generosity that soon plunged him deep into debt, had been winning all hearts. In 69 he was elected questor, and was assigned to the province of Further Spain. But before his departure he lost his aunt Julia and his wife, Cornelia. At the former's funeral he caused busts of Marius to be carried in the procession, to the great delight of the populace, and in the two memorial addresses which he delivered in the forum he eulogized the aims and leaders of the people's party. In Spain he must have noted with appreciation the work of the great Marian generals, Sertorius, the first man who tried to
the following year Caesar was at last able to address himself to the peaceful organization of the new territory.

At Rome, however, a crisis was imminent. The ties between Caesar and Pompey were being rapidly and inevitably slackened. Pompey's wife and Caesar's daughter, was followed in 53 by the defeat and death of Crassus in the Parthian War. Pompey became more and more jealous of his rival's military glory, and the Senate, resolved to crush Caesar at any cost, and itself unable and too slow to stem the streets of Rome, made friendly overtures to Pompey, and in 52 made him sole consul, with practically the powers of a dictator. Caesar's term of office would expire on 1 March 49. It was essential to his safety that he should retain his provinces and his army until after he should be elected consul for 48. But the aristocracy was plainly determined that there should be an interval during which he would be a mere private citizen, defenseless against the attacks of his enemies. It is certain that Caesar acted with great moderation, even sending to Italy two of his legions which the Senate declared were needed for the war in the East, but which, as he had foreseen, were instead placed in camp at Capua; and it is evident that the decisive step was taken. The Senate ordered Caesar to lay down his command on pain of being proclaimed a public enemy. The tribunes of the people, Antony and Quintus Cassius, who had in vain interposed their veto, fled to him for protection in their inviolable office; Caesar with a single legion crossed the Rubicon, the frontier stream of Italy, and war was begun.

In the ensuing five years, all that remained for him of life, the amazing energy and resourcefulness of this extraordinary man are most impressively displayed. In three months, without striking a blow, he was master of Italy, and Pompey, with a small force, barely escaped from Brindisiom across the Adriatic. Caesar had no ships on which to follow him, and besides, the veteran Pompeian forces in Spain must be crushed before they could join their commander. Accordingly after first securing Sicily and Sardinia, through his lieutenants, he crossed the Pyrennes into Spain, and, in a brief campaign of 40 days, perhaps the most brilliant in all his career, extricated himself from apparently certain destruction, and forced the surrender of the entire opposing army. All Spain now declared for him. On his way back he received the submission of Massilia (Marseilles), which had been besieged by Decimus Brutus and Trobius. Eleven days were spent in Rome in administrative work; and early in January 48 he crossed the Adriatic and proceeded to surround Pompey, near Dyrrachium, now Durazzo. But his force was quite insufficient, and, to deprive his foe of the advantage of the sea, he retreated into Thessaly, whither Pompey followed him, and the decisive battle was fought on the plain of Pharsalus, 9 Aug. 48. Pompey had 47,000 infantry and 7,000 cavalry; Caesar only 22,000 infantry and 1,000 cavalry. But the latter's army was composed of veterans, and numbers did not avail. Pompey fled to Egypt where he was brutally murdered. Caesar, who had followed him with all the troops with which he was provided by the forces of the young King Pontus, at last, ultimately, upon the arrival of reinforcements, defeated them, and set Cleopatra upon the throne. He then passed through Syria and Asia Minor, putting affairs on a permanent basis, and incidentally defeating Pharmaces, a son of the great Mithridates. The victory was announced to the Senate by the words "victrix et victor! ("I came, I saw, I conquered!"). Upon his return he announced his intention of pardoning all who had fought against him. In December he left Rome for Africa, where the campaign against the Pompeians, commanded by Scipio, was successfully carried out. He met him at Thapsus, 6 April 46. Cato, unable to defend Utica, committed suicide. Caesar returned to Rome in June, and, after celebrating his victories over the Gauls, Egyptians, Pharmaces and Juba, King of Numidia, who had fought against him at Thapsus, by four magnificent triumphs, flung himself into the work of legislation. Among his reforms was the placing of the calendar, for the first time, upon a scientific basis. But some of his reforms were interrupted by a dangerous revolt in Spain, headed by Pompey's sons, and the campaign against them, ending in the hard-fought battle of Munda, 17 March, and the final settlement of affairs in Spain, necessitated his absence from Rome from the end of April to September 46. The Senate welcomed him upon his return with the most servile flattery. He was already tribune for life; he was now made, for life, dictator and prefector morum, a new term for the censorship; his head was stamped on the coinage, the month of Quintilis was renamed Julius and he was given divine honors. With absolute power thus lodged in his hands, he set about the permanent reconstruction of the government and the social fabric. He made the Senate a much larger and more representative body, increased the number of magistrates, reduced by one-half the recipients of the donation of grain, passed several laws in the interest of the debtor class and of Italian agriculture, prohibited farming by slave labor exclusively, inaugurated a far-reaching plan to colonize in the provinces the unemployed population of Rome and Italy, and laid a legal foundation for the principle of limited local self-government of all Roman communities, wherever they might be. He had in mind, but was not able to carry out, the reform of the laws, the building of public libraries, the draining of the Pontine marshes, the making of a canal through the Isthmus of Corinth, and the taking of a general census which should form a just basis for the imposition of taxes throughout the empire.

But he had risen too high to escape hatred. The plot to assassinate him probably originated in the personal spite of Gaius Cassius, but many of the conspirators, in particular Marcus Brutus, were foolish enough to believe that by the death of the dictator the republic could be restored. On 15 March 44 a., at a meeting of the Senate held in the hall attached to Pompey's theatre, he fell at the feet of his great rival's statue, pierced by 23 wounds.

In studying Caesar's life, one is especially struck by three points: his sane perception of the concrete fact, his indomitable energy and his many-sidedness. More clearly than any other man of that time, he realized that the senatorial oligarchy had been proved wholly incorporeal to govern a great empire, and that the problem could be solved only by the concor-
tion of all power in the hands of a single man. Augustus cautiously veiled the change to monarchy; Julius blantly called things by their real names and paid the penalty with his life. He was a Cassar or Caesar, but of his speeches, warm praised by Cicero and Quintilian, none has come down to us. A treatise on grammar and one on astronomy have also perished. But his enduring fame as a writer rests upon the seven books of 400,000 B.C. (the eighth book is by Aulus Hirtius) and the three books of 'Commentaries on the Civil War.' The former, essentially a political document, published in 51 B.C., is unsurpassed in its succinct simplicity and strength. See Commentaries on the Gallic War.

Bibliography.—The principal ancient authorities are the biographies of Plutarch and Suetonius, Cicero's 'Letters,' Sallust's 'Catiline,' Lucretius' 'Pharsalia,' Caesar's own Commentaries; and the Roman histories of Velleius Paterculus, Appian and Dion Cassius. Mommsen's account in his 'History of Rome' is brilliant but over-enthusiastic. The following books may be recommended: Fowler, 'The Cæsar and the Foundation of the Roman Imperial System' (New York 1899); Dodge, 'Cæsar' (Boston 1892); Drumm, 'Geschichte Roms' (Vol. III, ed. by Gröbe 1906); Froude, 'Cæsar' (New York 1884); Napoleon III, 'Histoire de Jules Cæsar' (Eng. trans., New York 1865); continued by Stoffel, 'Histoire de Jules Cæsar; la guerre civile' (Paris 1887); Holmes, 'Cæsar's Conquest of Gaul' (London 1899); Holmes, 'Ancient Britain and the Invasions of Julius Cæsar' (Oxford 1907); Ferrero, 'Greatness and Decline of Rome' (Vol. II, Eng. trans., New York 1907); Tyrell's edition of the 'Correspondence of Cicero' (Introduction to Vol. V); Scott, 'Portraits of Julius Cæsar' (London 1903); Roper, 'The Likenesses of Julius Cæsar' (in Scribner's Magazine, 1887); Veith, 'Geschichte der Feldzüge C. Julius Caesars' (1906); Holmes-Schott-Rosenberg, 'Cæsars Feldzüge in Gallien und Britannien,' a condensation of the two works by Holmes, mentioned above; Nelson G. McCrea, Professor of Latin Literature, Columbia University.

CÆSAREA, sès-a-rès, the ancient name of many cities: (1) Cæsarea Philippi, or Paneas (deriving its second name from the local deity, Pan, to whom the neighboring groto, the source of the river Jordan, was dedicated), named after Philip, tetrarch of Galilee, son of Herod the Great, who founded it in 3-2 B.C., near the source of the Jordan on the southern slope of Mount Hermon. It is mentioned twice in the Gospels. On its site is the small modern village of Banias. It fell into the hands of the Crusaders in 1130 but was recaptured by the Moslems (1165). (2) Cæsarea Palestina or Stratonis, on the shores of the Mediterranean, about 55 miles northwest from Jerusalem. It was built with great magnificence by Herod the Great, named in honor of Augustus Caesar, and became the metropolis of Palestine, and the seat of the Roman proconsul, as well as a busy seaport owing to the fact that Herod, who encouraged commerce, built there one of the finest ports on the coast, and protected it by a breakwater, the ruins of which still exist there. It was the place where Herod Agrippa was smitten by the angel (Acts xii, 20-23), when Cornelius the centurion resided (x), and Saint Paul was imprisoned two years (xxiii-xxv). It was a place of some importance during the Crusades, but is now a scene of ruin and of utter desolation. Eusebius was bishop of Cæsarea. (3) The ancient capital of Cappadocia in Asia Minor, originally called Mazaca, and now Kaisariah. It is situated in the southeast of the vilayet of Angora, at the foot of the Erjish Dahg, about 160 miles to the southeast of the town of Angora. It was once supposed to contain 400,000 inhabitants. It has now about 70,000 inhabitants, and its position makes it a place of considerable trade. The manufacture of carpets, though of quite recent introduction, is of some importance. Foreign goods are received by way of the railway from Angora to Constantinople. The name Cæsarea dates from the time a palace of some importance Valerian the city was captured by Sapor, when a large number of its inhabitants were slain.

CÆSARIAN SECTION, a surgical operation in obstetrics which consists in delivering a child by means of an incision through the abdominal walls and the uterus. The operation has been recorded since ancient times but was performed at first upon a dead or dying woman and was required by Roman and later by Venetian law. The first recorded instance of operation upon a living woman was in 1500 when a butcher of Switzerland operated upon his wife. After this it was frequently resorted to but with a very high mortality. The mother until the latter half of the 19th century brought the knowledge of antiseptic and aseptic surgery and suturing for control of hemorrhage. The mortality has now decreased from almost 100 per cent to about 5 per cent, and its employment increases in favor. It is indicated when the child is alive and the mother dead, either in labor or in the latter months of pregnancy, in extreme degrees of pelvic contraction, if the existence of malformation or tumor of the uterus, cervix or vagina render normal birth impossible, and in case of material complications such as eclampsia and concealed accidental hemorrhage. The etymology of the name is probably from the Latin verb cedere, to cut, though it has been attributed to Julius Cæsar who is reported to have been born in this manner.

CÆSARIUS, the son of Julius Cæsar and Cleopatra, put to death by order of Augustus.

CÆSARIUS OF NAZIANZUS, Christian scholar of the 4th century. From Alexandria, where his education was received, he went to Constantinople and rose to distinction as a mathematician and physicist. In the Latin editions of Saint Gregory are four dialogues ascribed to him, as also in the 'Bibliotheca
Patrum,) and he is also credited with a work styled 'Contra Gentes.'

CÆSARS, The Era of, also known as the Spanish Era, a period of time reckoned from 1 Jan. 38 a.C., being the year following the conquest of Spain by Augustus. It was much used in Africa, Spain and the south of France; but by a synod held in 1180 its use was abolished in all the churches dependent on Barcelona. Peter the Great of Aragon abolished the use of it in his dominions in 1350. John of Castile did the same in 1383. It was used in Portugal till 1415, if not till 1422. The months and days of this era are identical with the Julian calendar, and to turn the time into that of our era, subtract 38 from the year; but if before the Christian era, subtract 39.

CÆSAR'S COMMENTARIES. This great work contains the narrative of Cæsar's military operations in Gaul, Germany and Britain. It was given to the world in the year 51 a.C. Every victory won by Cæsar had only served to increase the alarm and consternation of his enemies at Rome, and doubt and suspicion were beginning to spread among the plebeians, on whom he chiefly relied for help in carrying out his designs. When public opinion was evidently taking the side of the Gauls and Germans the time had come for Cæsar to act on public opinion. Hence the 'Commentaries,' a hasty compilation made from notes jotted down in his tent or during a journey. As to its truthfulness we do not, decide absolutely, the Gauls not having written their commentaries. But if Cæsar sinned in this respect, it was probably by omission, not by commission. Things the Romans might not like he does not mention: the sole aim of the book is to gain their suffrages. There is no allusion to the enormous fortune Cæsar acquired by plunder. On the other hand, he speaks of his cruelties—for instance, the killing in cold blood of 20,000 or 100,000 prisoners—with a calmness that to us is horrible, but which the Romans would deem natural and proper. The 'editio princeps' or first edition was printed at Rome (1449).

CÆSIUM, sē'zi-äm, a metallic element discovered in 1800 by Bunsen and Kirchhoff, in the form of the chloride, in a mineral spring at Diez, in the state of Hesse-Cassel. It has the historic distinction of being the first element discovered by the agency of the spectroscopist. The metal is widely disseminated, but is seldom found in any considerable quantity. It never occurs in the metallic state, but usually as the chloride or oxide, and commonly associated with the rare element rubidium. Cesium is found in the ashes of many seaweeds, in tea and tobacco and in several mineral springs. It is also a common constituent of the drainage water of mire. Its most important source is the mineral pollucite (q.v.), or pollux, which is found on the island of Elba and in the vicinity of Hebron, Me., and which contains as much as 36 per cent of cesium oxide, with no rubidium. Cesium forms stable salts, and strongly resembles potassium in its chemical properties. It may be separated from this metal by taking advantage of the fact that cesium platinocloride is much less soluble in water than the corresponding potassium compound. Metallic cesium cannot be obtained by reducing the oxide with carbon, but is best prepared by the electrolysis of a fused mixture of four parts of the cyanide of cesium and one part of the cyanide of barium, using aluminum electrodes. It may also be obtained by heating cesium chloride with metallic calcium. It is a silvery white metal, quite soft and ductile, and oxidizing rapidly upon exposure to the air. It also decomposes water with the production of sufficient heat to ignite the liberated hydrogen. Cesium has a specific gravity of 1.88, and melts at about 80° F. Its chemical symbol is Cs, and its atomic weight is 133 (O = 16). Its oxalate and nitrate are used to a limited extent in medicine. The spectrum of cesium is characterized by two blue lines, from which circumstance the element takes its name (cesium, bluish-gray). Cesium stands first in rank among the electro-positive elements.

CÆSTUS. See Cæstus.

CÆSURA, sē'zū-ra, in verse, the resting of the voice on a syllable; in Latin verse, the caesura divides the line into two parts and renders the syllable on which it falls long.

CAF, kä́f, or KAF, a fabled mountain of the Mohammedans which encircles the whole earth. It is the home of giants and fairies, and rests upon the sacred stone Sakhral, one grain of which gives miraculous powers to its possessor. This stone is of an emerald color, and its reflected light is the cause of the tints of the sky. The name "Kaf" is sometimes applied to the Caucasus range.

CAFÉ, kä́f, a coffee-house, enlarged by American usage to include restaurants of all descriptions.

CAFARIELLI, kä́f-a-re-él'ë, François Marie Auguste, French general, brother of the famous bishop of the same name: b. Falga, Haute-Garonne, 7 Oct. 1766; d. 23 Jan. 1849. At the beginning of the Revolution he was employed in the Sardinian army, but joined the army of the republic as a simple dragoon. He was in command of the French army that opposed the Spanish invasion of the Pyrenees in 1793. For his good work in this campaign he was made adjutant-general and later on chief of the consular guard. In 1804 he was charged with the mission to Rome to invite Napoleon to come to Paris to perform the ceremony of Napoleon’s coronation, and on his return was made governor of the Tuileries. He was wounded at Austerlitz, where he distinguished himself for his bravery and ability as a leader; accompanied Prince Eugene in Italy, where he became Minister of War and Marine; took part in the war in Spain, and defended Metz against the Russians. In 1814 he was chosen by Napoleon to conduct the Empress and son from Paris to Vienna. He retired from public life after the battle of Waterloo.

CAFFEINE, kä́f’fé-in, an alkaloid occurring in the coffee bean, and having the formula C₈H₉N₄O₂. It is considered identical with the alkaloid theine, which occurs in tea, and also with guaraine (the alkaloid of guarana); it is present in small amounts in cocoa. It is found also in maté or Paraguay tea, and also in Kola nuts. Coffee contains by weight about 1.5 per cent of caffeine; and tea, from 3 to 4 per cent. It may be prepared by adding basic acetate of lead to a strong decoction of coffee or tea until the tannin that is
present has all been precipitated, removing excess of lead by a stream of sulphurised hydrogen, and then evaporating the filtrate until the caffeine crystallizes out. For commercial purposes it is commonly prepared from tea dust. This is heated for an hour with four times its weight of boiling water, and then mixed with its weight in lime, and dried. The caffeine is dissolved out with boiling chloroform. When prepared from a water solution caffeine consists of a mass of silky needles which contain more or less water; when by a chloroform solution it is anhydrous. It is but slightly soluble in water, alcohol or ether. It has a bitter taste, and although it acts as a weak base, its salts are decomposed by water. See also COFFEE.

CAFFI, kā'fē, Ippolito, Italian artist: b. Bulluno 1814; d. near Lissa, 20 July 1866. He studied in Venice and excelled in matters in perspective and effects of light. He also lived in Rome and traveled extensively in Africa and the East. Among his chief works are 'Isthmus of Suez'; and 'Carnival Scene on the Piazza, Venice' (1855). He was killed on the Italian battleship Re d'Italia in a naval battle of 1866, while present on that occasion with the design of painting a picture of the engagement. He also painted the 'Panorama of Rome.' Many of his works are in the Museo Civico, Venice. Consult his biography by Codognata Bertolani (Venice 1868).

CAFFIN, Charles Henry, American art critic: b. Sittingbourne, Kent, England, 4 June 1854. He was educated at Oxford and, after engaging in school and theatrical work, came to the United States in 1892 and worked in the decoration department of the Chicago Exposition. He went to New York in 1897 and became art critic for Harper's Weekly, New York Evening Post and New York Sun (1901–04). His published works which are popular in style include 'Photography as a Fine Art' (1901); 'American Masters of Painting' (1902); 'American Masters of Sculpture' (1903); 'How to Study Pictures' (1905); 'Story of American Painting' (1907); 'Story of Spanish Painting' (1910); 'Story of French Painting' (1911); 'Art For Life's Sake' (1913); 'History of Study Architecture' (1915).

CAGAYAN, kā-ga'yān', an island of the Philippine group; the largest of six small islets, known as the Cagayan-Sulu group. It is five miles wide and eight miles long. Pop. about 3,500. There are mountains attaining a height of 1,100 feet. The chief products are tobacco and sugar. There are pearl and shell fisheries. Cagayan was sold by Spain to the United States, with Cebito, in 1900, upon payment of $100,000, having been inadvertently excluded from the terms of the treaty of peace.

CAGE-BIRDS, birds kept in cages for the benefit or enjoyment afforded by their powers of song, beauty of plumage, ability to talk or companionship. They have been so kept by human beings ever since prehistoric times. The first essential for the maintenance of birds in captivity is a cage as large as possible, and adjusted to suit them as circumstances permit. Cleanliness is a prime necessity, and the bird should be given a constant fresh supply of water for bathing and drinking purposes, and as much fresh air and light as possible, always, however, avoiding draughts and the sun's direct rays. The food and necessary attention bestowed on the bird vary according to the species.

Birds are captured by means of birdlime or a falling net, but many are taken from their nests when young, and so tamed, or are bred solely for market purposes. An important trade throughout Europe is the rearing of cage-birds, especially German canaries. The best-known songster, and probably the most popular cage-bird, is the common canary (q.q.v.), originally a native of the Canary Islands. It is typical of captive birds generally, in the marked change produced by captivity and selective breeding, in coloring and size, from its original wild state. Other widely known and popular cage-birds are the nightingale, goldfinch, cardinal, mocking-bird, bullfinch, the Indian bulbul, several European thrushes, and others, all of which are fine singers. Among the birds kept because of their beauty are the parrakeets, lovebirds, cockatoos, macaws, the whydah-bird, the painted finches and others. Those imitating human speech are not so plentiful, consisting chiefly of the parrot, of which there are several species, and the starlings, especially the English species, and the Indian mina-bird (q.q.v.). Owning to the change of climate, and especially the cold, nine-tenths of the African parrots transported to Europe or North America die before learning to speak. It is advisable, therefore, to purchase such birds in the spring, thus giving them a chance to become gradually acclimated.

In the case of all cage-birds most particular attention should be paid to their food, and overfeeding must be especially guarded against. Frequently ailments can be greatly benefited by a fresh supply of food given in smaller quantities. Insectivorous birds are most troublesome to care for in regard to food, as their diet is less easily obtained. In case of inability to procure the accustomed food, finely chopped meat should be substituted, and a reasonable quantity of spiders is always beneficial. The universal and most acceptable food to nearly all birds, however, is canary seed, with a little hemp, rape or oats may frequently be mixed to advantage. Seed-eating birds should be given such fresh vegetable matter as soft green leaves, chickweed or lettuce, at regular intervals. Sugar in small quantities is also beneficial, but acid fruits of all kinds should be avoided. A prime necessity in the rearing of cage-birds is something on which the bird may sharpen its bill. This is most easily supplied in the form of sandpaper, or, better, cuttle-fish bone, which is essential to the health of breeding birds. A bird's nails are apt to grow too long as to become troublesome to it, but in clipping them care should be taken to use a sharp pair of scissors, avoiding a possible injury to the foot by twisting. In case of illness due to overfeeding, a drop of castor oil may prove beneficial, especially if it is accompanied by a change of surroundings, quiet and a simpler diet for a time.

Bibliography.—Bechstein, 'Cage and Chamber Birds,' (London 1864), a complete work; and Greig, 'Notes on Cage Birds' (London 1899); Dixon, 'Dovecot and Aviary' (London 1851); Holden, 'Book on Birds' (Boston 1875); Greene, 'Diseases of Cage Birds' (London 1897); Blackester, Swainsland
and Wiener, 'Book of Canaries and Cage Birds' (London); Greene, 'Parrots in Captivity' (London 1845); Hahn, 'Foreign Pincet' (London 1849); and 'How to Sex Cage Birds' (London 1907); Olden, 'Cage-bird Traffic of the United States' (Washington 1907); Norman, 'Aviaries, Birdrooms and Cages' (London 1908); Birchley, 'Birds for Cages, Aviaries, and Exhibitions' (London 1909); Telling, 'Practical Guide to Successful Cage-bird Culture' (London 1909). The Agricultural Magazine and Bird Notes are two monthly magazines published in London and devoted to the interest of cage and aviary birds.

CAGLI, kā'lyē, Italy, city and bishop's see of the province of Pesaro e Urbino at the confluence of the Cantiano and Busso, 18 miles by rail south of Urbino. It has a fine cathedral; the church of San Domenico is noted for its frescoes by Giovanni Sanzio, father of Raphael; and there are interesting archaeological remains dating from early Roman days. Pop. 13,000.

CAGLIARI, kā'l-yārē, Paolo. See VONNESE, PAOLO.

CAGLIARI, Sardinia, the capital of the island, situated on a hill slope near the south coast. It consists of four parts: (1) the Castle or old town; (2) the Marina; (3) Estampache; (4) the Villa Nuova or new town. It is fortified, and is the residence of the viceroy and of an archbishop, and the seat of a university founded in 1596, and revived and remodelled in 1765. Cagliari has some manufactories, and is chief emporium of the Sardinian trade. There are dockyards and a spacious and safe harbor. The 'Castle' contains some important buildings, including palaces of the nobility. The cathedral, partly faced with marble, was completed in 1312, but afterward modernized. The city was founded by the Phoenicians, and there are some interesting remains of Roman times, including an amphitheatre and ancient dwelling-houses. Cagliari was the residence of the kings of Sardinia from 1798 to 1814. It is connected by rail with the most important Sardinian towns. Pop. of commune 59,600.

CAGLIOSTRO, kāl-yos'tra, Alessandro (Cagliostro; real name Giuseppe Balsamo), Italian charlatan: b. Palermo, 8 June 1743; d. Saint Leon, Italy, 26 Aug. 1795. He entered the order of the Brothers of Mercy, where he found an opportunity to cultivate his talents for medical science, by which he afterward distinguished himself. But as he showed at the same time a great love of dissipation, he was compelled to separate from the order. He returned to Palermo, where, among other tricks, he deceived some credulous persons by his pretended skill in the finding of hidden treasures. He also showed himself adroit in counterfeiting handwriting, and attempted to get possession of a contested estate by means of a forged document, but was discovered and was obliged to flee. He now determined to go to Rome, and in his flight from Calabria became acquainted with Lorenzo Felici, daughter of a belt-maker, who appeared to him intended by fortune to assist his designs. He formed an intimacy with her, and they began their travels, in which he assumed the character of a man of rank, first appearing under the name of the Marquis Fellerini, and finally under that of the Marquis di Canossa. He traveled through many countries of Europe, stopped in the capital cities, and by his chemical mixtures, his tricks, and by the amours of his companion, gained considerable sums. He knew how to cheat with great ingenuity, and was always fortunate, and his projects were always in early flight, if men's eyes began to be opened, or waking justice threatened him with imprisonment. The discovery of the philosopher's stone, the preparation of a precious elixir vitae, etc., were the pretenses by means of which he extracted considerable sums from credulous people. Many had recourse to his assistance, not indeed to be initiated into the mysteries of magic, but to purchase at a high rate different kinds of medicine, one of which was the water of beauty. This profitable business permitted him many years; but his trade in medicine began to grow less lucrative, and he determined to seek his fortune as the founder of a new and secret sect. In pursuance of this plan he passed himself off during his second residence in London for a Free Mason, and played the part of a magician and worker of miracles, in which character he drew upon himself the eyes of all the enthusiasts in Europe. The Countess Cagliostro, as her part, did not remain idle. She was the first and most perfect scholar of her husband, and ably played the part of a priestess to this new order. His plan for reviving an old Egyptian order, the founders of which he declared to be Enoch and Elias, contained a mass of absurdities, but his pretensions to supernatural power, the mystery with which his doctrines were enveloped, his pretended ability to work miracles, his healing the sick without pay, with the greatest appearance of generosity, and the belief that, as the Great Kophta (this name he had taken as the restorer of Egyptian monsry), he could reveal the secrets of futurity, gained him many friends and supporters. Cagliostro again traveled through Europe, and attracted great attention in Miltia, Strassburg, Lyons and Paris. While in this last city (1785) he had the misfortune to be implicated in the scandalous affair of the Diamond Necklace, and was banished the country as a confidant of Cardinal Rohan. He now returned to London, and sent many epistles to the leaders, wherein he bitterly complained of the injury he had received in France, and painted the French court in the blackest colors. From London, where he could not long remain, he went to Basel and other cities in that quarter. But at length, listening to the treaties of his wife and other friends, he returned (1789) to Rome. Here he busied himself about Freemasonry; but being discovered and committed to the Castle of Saint Angelo, he was condemned by a decree of the Roman Inquisition to imprisonment for life as a Freemason, an arch heretic and a very dangerous foe to religion. He died after five years' imprisonment. His wife retired to a convent. Consult the Cagliostro bibliography by W. E. Axon in 'Notes and Queries' (4th series, Vol. X, London 1872); Carlyle, Thomas, 'The Life of Count Cagliostro' (London 1878); 'The Life of Joseph Balsamo, Commonly Called Count Cagliostro' (London 1791); Trowbridge, 'Cagliostro; the Splendor and Misery
of a Master of Magic (New York 1910). There is much spurious material in existence concerning Cagliostro, such as the so-called "Mémoires authentiques" (Paris 1786).

CAGNACCI, kán-yă-chî. See Camlassi.

CAGNOLA, kán-vô'łâ, Luigi, Marchese, an Italian architect: b. Milan, 9 June 1762; d. Invorio, 14 Aug. 1833. He was a member of the State Council, and was much engaged in political affairs. His most celebrated works are the Arco della Pace, "Arch of Peace," commenced in 1807 and finished in 1837; the Porta di Marengo, subsequently called Porta di Ticino (both built by order of Napoleon), at Milan; the Campanile, at Urgnano, completed in 1829, and the mausoleum for the Metternich family.

CAGNOLI, kán-yô'li, Antonio, Italian astronomer: b. Zante, Ionian Islands, 1743; d. Verona, Italy, 1816. He was attached in his youth to the Venetian embassy at Paris, where, after the year 1776, he showed more love for astronomy than for diplomacy. Having settled in Verona in 1786 he constructed an observatory in his own house, by his observations in which he enriched the Piazza, and discovered. After the destruction of his observatory by the French (1796), who, however, compensated him for his loss, his instruments were transferred to the observatory of Brera in Milan, and he was appointed professor of astronomy in the military school at Modena. His best works are "Notizie Astronomiche adatt. all’ uso comune" (1802); "Trigonometria Piana e Sferica" (2d ed., Bologna 1804).

CAGOTS, kâ-gôt, a race or caste of men, living in the south of France in the region of the Pyrenees, regarded as pariahs or social outcasts. In former ages they were shut out from society as lepers, cursed as heretics and abhorred as cannibals; their feet were bored with an iron, and they were forced to wear a piece of red cloth in the shape of a duck’s foot on their garments by way of distinction. The only trade they were allowed to follow was that of sawyers or carpenters. They had to enter the church by a special door, and had a special corner set apart for them with a holy water vessel for themselves. Opinions are divided with regard to the origin of the Cagots, of whom there are now comparatively few. They have been considered by some to be remains of the Saracens conquered by Charles Martel. The most plausible conjecture is that which derives them from the Visigoths who established themselves in the south of France and in Spain in the 5th century. The origin of the name has been the subject of equal controversy. Among numerous derivations, is that from cants and gotths, "dogs of Goths." Others derive the name from a word simply meaning leper, and believe that the Cagots were originally lepers, who as such were expelled from the society of and intercourse with their fellowmen. Several similar races, as the Czarts due to inbreeding, are common among them, such as cretinism (q.v.), goitre, etc. Until the French Revolution the Cagots were not considered citizens. Some remains of them, or of corresponding outcasts, are to be found under various names in different parts of France. Their language is a jargon of neighborhood dialects with some original forms. Similar remains are also found among the mountains of North Spain, consult Michel, "Histoire des races maudites de la France et de l’Espagne."

CAGSAUA, kâ-sâ-wâ', or DARAGA, Philippines, town of Luzon, Albay province, two miles north of Albay, an important hemp growing and trading centre. Pop. 18,700.

CAGUAS, kâ-gwâs, Porto Rico, municipality and commune; on the military road, 22 miles southeast of San Juan. It is a thriving tobacco growing and cigar manufacturing centre, and also has marble and limestone quarrying industries. Pop. 10,500.

CAHAN, kâ-han, Abraham, Russo-American journalist and novelist: b. Vilna, Russia, 7 July 1860. He came to the United States in 1882 and has edited several Yiddish periodicals in New York. He was prominent as a labor leader and in time drifted to the Socialists. He became editor of the Jewish daily Vornuvits in 1901. After 1894 he was a constant contributor to American journals, his articles generally dealing with phases of Ghetto life. He has written "Yekl, a Tale of the New York Ghetto"; "Raphael Nariizokh," in Yiddish; "The Chasm"; "The Imported Bridegroom and Other Stories"; "The White Plague, or the Red" (1904); "Ein Historie von die Vereinigte Staaten" (1912); "Yiddish Folk Songs" (1912).

CAHENSLSYIM, a popular name given to a movement in the United States in 1891, among Roman Catholics speaking other languages than English, to have bishops or priests of their respective nationalities appointed over them. It took its name from Herr Cahensley, a layman, secretary of Saint Raphael’s Society for the protection of German Catholic immigrants to this country, on the supposition that he was the chief inspirer of the movement. On a visit to the United States in 1893 Herr Cahensley denied his connection with the scheme. It was vigorously opposed by most of the English-speaking prelates of the Roman Catholic Church in this country. It received no official sanction by the Vatican, and, after considerable agitation in the Catholic and secular press, died out. As a matter of fact, owing to the large immigration of Roman Catholics speaking foreign tongues, priests of their respective nationalities are often appointed to administer to their spiritual needs. This is especially notable in the instance of the Italians. To meet this necessity in the archdiocese of New York, the study of Italian is now made compulsory in its diocesan seminary for all candidates for the priesthood.

CAHILL, Thaddeus, American inventor: b. Iowa 1867. After studies at Oberlin College 1884-85, and a law course at George Washington (then Columbian) University, he was admitted to the bar in 1894, but never practised, devoting himself to mechanical invention. His most notable achievements are the electric typewriter and the telharmonium, the latter a device to produce music electrically by means of dynamos transmitting vibrations from a central station to receiving
telephones. George Washington University conferred on him the degree of D.C.L. in 1900.

CAHORS, ka-ór'. France (ancient Cadurcu-
cum), capital of the department of Lot, and
on the river of that name, 60 miles north of
Toulouse. It is nearly surrounded by the
river, and communicates with the opposite
shore by three bridges, one of which, dating
from the 14th century, is the finest fortified
bridge of mediæval times existing in the
country. Before the conquest of Gaul by
Cæsar it was the capital of the Cadurci, and
under the Romans, who gave it the name of
Divona, it was adorned with a temple, theatre,
baths, an immense aqueduct and forum. Sev-
eral Roman roads can still be traced in its
vicinity. Among the principal edifices are the
cathedral, an irregular structure, supposed to
date from the 12th century; an episcopal
palace, now converted into the prefecture;
three old churches; barracks; a theatre;
and a lyceum or college. In the Middle Ages
it was a great centre of finance operated by
Lombard bankers. Cahors had formerly a
university, which was united with that of
Toulouse in 1371. It was founded in 1322 by
Pope John XXII, a native of the town. The
celebrated jurist Cujsas was a professor, and
Pénélon a student, in it. The manufactures
are rich in wool, and a considerable trade is
carried on in the red wine of the district, in
brandy and nut oil. Coal is worked in the
vicinity. Clément Marot, the poet, and Léon
Gambetta, the statesman, were born here.

CAIAPHAS, ka-ya-fas, the high-priest of
the Jews at the time when the crucifixion
took place. Previously, when the resurrection
of Lazarus had spread dismay among the Jewish
functionaries, it was Caiaphas who suggested
the expediency of putting the Saviour to death,
and when Jesus was arrested in Gethsemane he
was carried first to Annas and then to Caia-
phas, from whom he was transferred to the
high-priesthood of the Sanhedrim. Caiaphas was
deposed, 35 A.D., and Jonathan, son of Annas,
appointed in his stead. Consult Schürer, "Ges-
chichte des jüdischen Volkes" (Vol. II, 4th ed.,
1907); Schmidt, "The Prophet of Naz-
areth" (pp. 285f., 2d ed., 1907).

CAIBARIEN, ki-ba-ré-on', Cuba, a town
of the province of Santa Clara, situated on
the northern seacoast; it has sponge fisheries
and some trade. Pop. about 10,000.

CAICOS, k'i-kös, CAYOS or THE KEYS
(from the Spanish cayo, a rock, shoal or islet),
one of the island groups comprehended under
the general name of the Bahamas, belonging
to Great Britain, consisting of six islands be-
sides some uninhabited rocks; between lat. 21°
and 22° N. and long. 71° and 73° W. The
largest, called the Great Key, is about 30 miles
long. They are wooded and tolerably fertile,
as are the other islands; but an absence of
present the inhabitants are few in number and
mostly engaged in fishing and the preparation
of salt. In 1873 the Turks Islands and the
Caicos were united into a commissionership
under the governor of Jamaica. Pop. (1911)
5,615.

CAILLAUX, ká-yō', Joseph, French
statesman; b. Mâens 1863. After the study
of law he entered politics and became in 1888
inspector of finances. Elected deputy for
Sarthe in 1898, 1902 and 1906, his rise was
rapid. He was thrice Minister of Finance
between 1899 and 1911, when he became Pre-
mier and remainder of which, dating
from the 14th century, is the finest fortified
bridge of mediæval times existing in the
country. Before the conquest of Gaul by
Cæsar it was the capital of the Cadurci, and
under the Romans, who gave it the name of
Divona, it was adorned with a temple, theatre,
baths, an immense aqueduct and forum. Sev-
eral Roman roads can still be traced in its
vicinity. Among the principal edifices are the
cathedral, an irregular structure, supposed to
date from the 12th century; an episcopal
palace, now converted into the prefecture;
three old churches; barracks; a theatre;
and a lyceum or college. In the Middle Ages
it was a great centre of finance operated by
Lombard bankers. Cahors had formerly a
university, which was united with that of
Toulouse in 1371. It was founded in 1322 by
Pope John XXII, a native of the town. The
celebrated jurist Cujsas was a professor, and
Pénélon a student, in it. The manufactures
are rich in wool, and a considerable trade is
carried on in the red wine of the district, in
brandy and nut oil. Coal is worked in the
vicinity. Clément Marot, the poet, and Léon
Gambetta, the statesman, were born here.
Cahors was given up to the English by the
Treaty of Bretigny in 1360. It revolted, and
returned to French allegiance in 1428. Pop.
(1911) 13,650.

CAIAPHAS, ka-ya-fas, the high-priest of
the Jews at the time when the crucifixion
took place. Previously, when the resurrection
of Lazarus had spread dismay among the Jewish
functionaries, it was Caiaphas who suggested
the expediency of putting the Saviour to death,
and when Jesus was arrested in Gethsemane he
was carried first to Annas and then to Caia-
phas, from whom he was transferred to the
high-priesthood of the Sanhedrim. Caiaphas was
deposed, 35 A.D., and Jonathan, son of Annas,
appointed in his stead. Consult Schürer, "Ges-
chichte des jüdischen Volkes" (Vol. II, 4th ed.,
1907); Schmidt, "The Prophet of Naz-
areth" (pp. 285f., 2d ed., 1907).

CAIBARIEN, ki-ba-ré-on', Cuba, a town
of the province of Santa Clara, situated on
the northern seacoast; it has sponge fisheries
and some trade. Pop. about 10,000.

CAICOS, k'i-kös, CAYOS or THE KEYS
(from the Spanish cayo, a rock, shoal or islet),
one of the island groups comprehended under
the general name of the Bahamas, belonging
to Great Britain, consisting of six islands be-
sides some uninhabited rocks; between lat. 21°
and 22° N. and long. 71° and 73° W. The
largest, called the Great Key, is about 30 miles
long. They are wooded and tolerably fertile,
as are the other islands; but an absence of
present the inhabitants are few in number and
mostly engaged in fishing and the preparation
of salt. In 1873 the Turks Islands and the
Caicos were united into a commissionership
under the governor of Jamaica. Pop. (1911)
5,615.

CAILLETET, ka-yé-tä', Louis Paul,
French chemist; b. Châtillon-sur-Seine 1832;
d. 1913. He studied at the School of Mines in
Châtillon and subsequently gave special at-
tention to original researches on the manu-
lizing and liquefying oxygen and nitrogen in 1877, for-
selling by a few days a similar discovery by a
Swiss chemist, and was at once elected corre-
sponding secretary of the Académie des Sciences,
becoming a full member in 1884. He was made
an officer of the Legion of Honor in 1889.

CAILLAUD, ká-yō', Frédéric, French
taveler; b. Nantes, France, 9 June 1787;
d. there, 1 May 1869. In examining the mineral
resources of Egypt he rediscovered the ancient
emerald mines of Jebel Zobara, near the Red
Sea; and his report of a silver mine in 1821 in-
22° N. and long. 71° and 73° W. The
largest, called the Great Key, is about 30 miles
long. They are wooded and tolerably fertile,
as are the other islands; but an absence of
present the inhabitants are few in number and
mostly engaged in fishing and the preparation
of salt. In 1873 the Turks Islands and the
Caicos were united into a commissionership
under the governor of Jamaica. Pop. (1911)
5,615.
CAIMAN—CAIQUE

graphical Society of Paris had offered a premium of 10,000 francs to the first traveler who should reach Timbuctoo. On 13 June 1827 he reached for the first time to geographers of the Niger which he crossed. He then traveled about 200 miles eastwardly over territories never visited before, arriving at Timé 3 August. Here he was detained by illness until 9 Jan. 1828, when he struck on a new road previously unknown to geographers and reached Jenne on 11 March. Here he embarked for Timbuctoo, where he arrived about 11 April, after one month's sail on the Niger. After a short stay of a fortnight, and after a tedious and painful return passage through the desert, he reached Faz, 12 August, and from there returned to France. On his arrival at Toulon he was received with the utmost enthusiasm. He was the first European who ever returned from Timbuctoo, and who had achieved success, while expeditions supported by government had resulted in failure. A special prize of 10,000 francs was awarded to him by the Geographical Society, with the annual prize of 1,000 francs for the most important discovery of the Legion of Honor was conferred upon him by the King, and he became, at the same time, the recipient of a salary in connection with an office, to which he was appointed in the Senate. Furthermore, a pension from the fund set apart for eminent literary and scientific men was decreed to him by the Minister of the Interior, and his 'Journal d'un voyage à Timbuctou et à Jenne, dans l'Afrique centrale,' with geographical data added by Jomard, was published at the expense of government, and appeared at the beginning of 1830 in three volumes.

CAIMAN. See CAIMAN.

CAIN, the eldest son of Adam and Eve; the first murderer, who slew his brother Abel. God drove him from His presence, but relieved his fears by appointing for him a sign, lest anyone finding him should smite him. For the biblical account of Cain and his descendants see Gen. iv-vii. Modern biblical scholars assume that Genesis iv is a composite of stories relating to several Cains. The posterity of Cain is traced from the Flood. Cain founded the first city, which he named after his son Enoch, and his descendants were the first inventors and promoters of the useful and agreeable arts. Josephus relates that he became the leader of a band of robbers, committed all sorts of licentiousness, corrupted the simpicity of primitive manners by his luxury, established the right of property by setting up landmarks and was the inventor of weights and measures. A Gnostic sect of the 2d century were called 'Cainites.' See RELIGIOUS Sects. Consult Stade, 'Das Kainzeichen' (in Zeitschrift für alttestamentliche Wissenschaft, Vol. XIV, pp. 250ff, 1884); Driver, 'Book of Genesis' (1904); Gordon, 'Early Traditions of Genesis' (1907); Church, 'Cain' (in 'Encyclopædia Biblica'); Schmidt, 'Messages of the Poets' (pp. 290ff, 1911); Gunkel, 'Genesis' (3d ed., 1913).

CAIN, ka-ān, Auguste Nicolas, French sculptor: b. Paris, 4 Nov. 1822; d. there, 7 Aug. 1894. He was in early life a carpenter, but subsequently studied under Guionnet and Rude, and devoted his attention chiefly to groups of animals. He received the bronze medal in the great exhibition of 1851, another medal in 1864 and a third at the Universal Exposition in 1867. His largest work was the monument of Duke Charles of Brunswick for Geneva—an equestrian statue representing two lions and a griffin in red marble. Among noted works by him are 'Eagle Defending its Quarry' (1852); 'Combat Between Tigers' (1878); 'Rhinoceros Attacked by Tigers.'

CAIN, Richard Harvey, American clergyman: b. Greenbrier County, Va., 12 April 1825; d. Washington, D. C., 18 Jan. 1887. He entered the ministry at an early age; was elected to the South Carolina Constitutional Convention in 1867, and to the State senate in 1868; and was a member of Congress 1870-80. He was made bishop in the African Methodist Episcopal Church and placed in charge of the churches in Louisiana and Texas, and later was transferred to the first Episcopal district of that church. While in Texas he organized Paul Quinn College in Waco.

CAIN, William, American civil engineer: b. Hillsboro, N. C., 14 May 1847. He was graduated from the North Carolina Military Institute and has been professor of mathematics and civil engineering in the University of North Carolina since 1889. He has published 'Theory of Voussoir, Solid and Braced Arches' (1874); 'Maximum Stresses in Framed Bridges' (1878); 'Solid and Braced Elastic Arches' (1879); 'Symbolic Algebra' (1884); 'Practical Designing of Retaining Walls' (1888); 'A Brief Course in the Calculus' (1905); and contributions to scientific journals.

CAINE, (Thomas Henry), Hall, English novelist and dramatist: b. Runcorn, Cheshire, 14 May 1853. He received his education in the Isle of Man and at Liverpool, and qualified as an architect, but abandoned architecture in order to become a journalist. He lived in London with Dante Gabriel Rossetti from 1881 till the latter's death in 1882, and in that year appeared his 'Recollections of Rossetti.' He had previously published 'Richard III and Macbeth' (1877), a critical work, and 'Sonnets of Three Centuries' (1882). In 1883 he appeared his 'Colwebs of Criticism'; and in 1887 he contributed to the Great Writers series a 'Life of Coleridge.' His first novel was 'The Shadow of a Crime' (1885), followed by 'A Son of Hagar'; but 'The Deemster' (1887) first brought him fame. His subsequent novels include 'The Bondman' (1890); 'The Scapegoat' (1891); 'The Prophet' (1892); 'The Manxman' (1894); 'The Christian' (1897); 'The Eternal City' (1901); 'The Prodigal Son' (1904); 'The White Prophet' (1905); 'The Woman Thou Gavest Me' (1913). His most successful novels deal with Manx life, in the description of which he reveals intimate knowledge of his subject and considerable literary power. His principal novels have been successfully dramatized. In 'My Story' (1908) he records the earliest years of his literary life.

CAINOZOIC. See CENOZOIC.

CAIQUE, kā-ék', a light boat or skiff much used in the Levant, and particularly in the Bosporus.
CAIRD, kārd, Edward, Scottish philosopher: b. Greencock, 22 March 1835; d. Oxford, 1 Nov. 1906. He was educated at the universities of Glasgow and Oxford; was a fellow and tutor of Merton College, and was professor of moral philosophy at Glasgow from 1866 till 1893; and in 1893 succeeded Benjamin Jowett as master of Balliol College, Oxford, a position he held with much distinction until his retirement in 1906. He is author of 'Account of the Philosophy of Kant' (1878); 'Social Philosophy and Religion of Comte' (1885); 'Hegel' (in Blackwood's Series of Philosophical Classics, 1883); 'Critical Philosophy of Kant' (1889); 'Essays on Literature and Philosophy' (1892); and 'The Evolution of Religion' (1893); 'Evolution of Theology in the Greek Philosophers' (1904); 'Lay Sermons and Addresses' (1907); 'Essays on Literature' (1909). He is a brother of John Caird (q.v.).

CAIRD, John, Scottish theologian: b. Greencock, 15 Dec. 1820; d. London, 30 July 1898. He was educated at the Grammar School of Greencock, and at Glasgow University, where he took a high place both in arts and divinity. Having entered the ministry of the Church of Scotland, in 1845 he became minister of Newton- upon-Ayr, and two years later was transferred to Lady Yester's parish, Edinburgh. Between that date and 1862, when he became professor of divinity in Glasgow University, he was minister of Errol, Perthshire (1849-57) and of Park Church, Glasgow (1857-62). In 1873 he was elected principal of his university, a position which he held till his resignation in 1898. He died before his resignation had taken effect. He was generally recognized in Scotland as the most powerful preacher of his time. He published sermons (his sermon 'Religion in Common Life,' preached before the Queen, had an immense circulation, and was described by Dean Stanley as the greatest single sermon of the century); 'Introduction to the Philosophy of Religion' (1880); and 'Spinoza' (1888) in 'Blackwood's Philosophical Classics.' In 1899 appeared 'The Fundamental Ideas of Christianity,' under the editorship of his brother, Edward Caird (q.v.), accompanied by memoir of the author.

CAIRN, kārn (Gaelic curn), a name given to heaps of stones, common in Great Britain, particularly in Scotland and Wales, generally of a conical form. Some are evidently sepulchral, containing urns, stone chests, bones, etc. Others were erected to commemorate some remarkable event, and others appear to have been intended for religious rites.

CAIRNES, kārnz, John Elliot, British political economist: b. Castle Risingham, County Louth, 26 Dec. 1823; d. London, 8 July 1875. After an education at Kingstown and Chester he was for a time employed in his father's brewery at Drogheda, but ultimately went to Trinity College, Dublin. He was graduated in 1854, and two years afterward was appointed Whately professor of political economy at Dublin. His first series of lectures was published in 1857, under the title 'The Character and Logical Method of Political Economy.' In 1859 he was appointed professor of political economy and jurisprudence in Queen's College, Galway, and seven years later was appointed to the corresponding chair in University College, London; but in 1872 the state of his health compelled him to give up active teaching. He had been called to the Irish bar in 1857, but he hardly ever practised. During the later years of his life he suffered much from the effects of an accident to his knee, which befell him while hunting in 1867. Some time left in his death was completely crippled. In 1862 he issued a work in defense of the Northern States of America, entitled 'The Slave Power,' which created a profound impression. The most important of his other works are 'Essays on Political Economy, Theoretical and Applied' (1873); and 'Some Leading Principles of Political Economy Newly Expounded' (1874). He takes rank as one of the leading economists of the 19th century.

CAIRNGORM, kärn-gōrm' (that is, 'blue cairn'), a mountain of Scotland belonging to the Grampian Hills, on the border of Banffshire and Inverness-shire, three miles north of Ben Macdhui in Aberdeenshire. Its summit is 4,084 feet above the level of the sea, and its sides are clothed with pine forests. The group of mountains to which it belongs is known as Cairngorm Mountains. It is particularly celebrated for the regular, brownish yellow crystals of quartz found on it and known as cairngorms. These are also found in many other places, and are much used for seals, brooches, etc. Specimens weighing a good many pounds are sometimes found.

CAIRNS, kärnz, Hugh McCallmont Cairns (1st Earl), Irish lawyer and parliamentary debater: b. County Down, Ireland, 1819; d. Bournemouth, England, 2 April 1885. He was called to the bar at the Middle Temple in 1844, was returned to Parliament for Belfast in 1852 and quickly made his mark in the House by his fluency and readiness in debate. He became Queen's counsel in 1856, in 1858 solicitor-general, and in 1866 attorney-general under Lord Derby. Later in the same year he was a judge of appeal, and in 1867 was created Baron Cairns. Under Disraeli's premiership he became Lord Chancellor in 1868, and again in 1874, and was created Earl Cairns in 1878. For some years he led the Conservatives in the House of Lords with dexterity and vigor, and is ranked among the finest parliamentary orators of his time.

CAIRNS, John, Scottish theologian: b. Berwickshire, 23 Aug. 1818; d. Edinburgh, 14 March 1892. He was ordained at Berwick in 1845, where he remained till 1876, becoming also in 1867 professor of theology in the United Presbyterian Church, and principal in 1879. He was an eminent preacher of a healthy evangelical type, and among his works were 'Life of John Brown, D.D.' (1860); 'False Christs and the True' (1864); and 'The Church in the 18th Century' (1881). Consult Cairns, 'Principal Cairns' (1903); A. MacEwen, 'Life and Letters of John Cairns' (London 1895), and his brother's memoir in the 'Famous Scots' series (1903).

CAIRO, kārō (Arabic El Kāhira, 'The Victorious,' or Misr el Kāhira), Egypt, capital of the country, and largest town in the world situated on the right bank of the Nile, about nine miles above the point where it divides to form
TOMBS OF THE MAMELUKES, CAIRO
the two main branches of its delta. The town is built between the river-bank and the northwestern end of the hills known as Jebel Mokattam, on whose most advanced spur the citadel stands in the centre of the city. Within the last 50 years the town has lost much of its Oriental character, but the Arab quarters still present a maze of narrow streets lined by curious buildings in an endive variety of style. The houses are mostly built of yellow limestone, with flat roofs; and many of them have small gardens behind. In the more modern parts of the city the streets are broader, and many of them are lined by trees and well lighted. The European quarter, known as Ismailiyeh, forms the western part of modern Cairo, and its centre is the octagonal Ezbekiyyeh Garden (20½ acres), with plants from many regions and with an artificial pond.

Here, too, are many cafés, concert-halls and other similar 60,000 visitors. Among the most notable buildings of the European quarter are the consulates, the opera-house, open in winter, the Italian summer theatre, English and German churches, the ministerial offices and the barracks. The chief business street of Cairo, known as Muski, runs east-southeastward from the neighborhood of the Ezbekiyyeh, and the Boulevard Mehemet Ali extends from about the same place southeastward to the citadel. Cairo has more than 500 mosques, but many of them are wholly or partly in ruins. The finest of all is the Sultan Hasan Mosque, a truly noble building with a lofty minaret. Others worthy of mention are: that built in the 9th century by Ahmed ibn Tulun in imitation of the one at Mecca; the Hakim Mosque, dating from the beginning of the 11th century; the Hosen Mosque of the Son of Ali, Mohammed's son-in-law; the Sitti-Zeynab Mosque, named after a grandchild of the Prophet, and the Alabaster Mosque of the citadel, with the tomb of Mehemet Ali, the finest of the modern mosques.

Cairo is one of the great educational centres of the Mohammedan world. The chief of the schools that are associated with the mosque of El Azhar, attended by 6,000 students, and has a history of nearly a thousand years. The tombs in the burying-ground outside the city, many of them in the form of mosques, are remarkably interesting, especially those known as the tombs of the caliphs. The most important gate of the city is the Bab el-Nasr, through which large numbers of pilgrims pass every year on their way to Mecca. The mosques contain valuable libraries, but the chief library of the city is the vice-regal one, founded in 1870, and now containing 17,000 volumes, largely in manuscript.

The trade of Cairo is large and the bazaars and markets are numerous, there being special bazaars for gold- and silver-smiths, tapestry merchants, saddlers, armorers, shoemakers, etc. It has also a large cotton industry. Beside the numerous Mohammedan places of worship Cairo contains English, French, German, Coptic and other churches and Jewish synagogues, and there are European schools and hospitals. The Egyptian Institute, founded at Alexandria in 1859, is now located in Cairo.

The suburb of Nilometer, 1.5 miles northeast of the town, opposite the island of Bulak, forms the port of Cairo, and its narrow streets present a busy scene of Oriental life. The island of Bulak and the left bank of the Nile are reached by a great iron bridge, and there is also a railway and general traffic bridge below the island. To the southwest of the modern town and also on the Nile bank stands the village of Masr el-Atika. On the left bank of the river, almost directly opposite Old Cairo, is the suburb of Gizeh. It has government buildings, a zoological garden, etc., but its chief attraction is the great Egyptological Museum formerly in Bulak, but removed here in 1857. Gizeh has a road and a tramway lead southwestward to the famous group of pyramids called the pyramids of Gizeh. On the island of Roda, between Gizeh and Old Cairo, the celebrated Nilometer was built in 1798, and passed into the hands of the Turks in 1801. The city was occupied by the British in 1882, after the battle of Tel-el-Kebir and has since remained in their hands. Pop. (1911) 654,476, including Pellaehin, Copts, Turks, Arabs and Moslems, besides about 53,000 foreigners from the chief European countries, especially Italy, Greece, France, Austria, England and Germany. Nowhere in the world do the contrasting civilizations of East and West blend more picturesquely than in Cairo.

CAIRO, III., city, port of entry and county-seat of Alexander County, situated at the junction of the Mississippi and Ohio rivers, in the southermost part of the State, with Kentucky on the east and Missouri on the west, 150 miles southeast of Saint Louis, on the Illinois Central, Cleveland, Cincinnati, Chicago and Saint Louis and other railroads. The city was first settled in 1838 by William Bird and was incorporated as a city in 1857. It was expected to become a great commercial centre. Cairo has a commission government, administered by a mayor and four commissioners. It has a large transit trade in agriculture and lumber, and affords a good market for the produce and trade of the Mississippi Valley. The industries include sewing-machine factory, box factories, handle factory, flour mills, wagon works, foundries, etc. The United States census of manufactures for 1880 reported 61 industrial establishments of factory grade, employing 1,769 persons, of whom 1,522 were wage earners, receiving annually $853,-
CAISSON—CAITHNESS

000 in wages. The capital invested aggregated $3,474,000, and the year’s production was valued at $6,500. Of this, $1,500 was the value added by manufacture. The city has four banks with a combined capital of $4,806,690.

A United States custom house is located in Cairo and it has a free public library, courtrooms, United States Marine Hospital, Saint Mary’s Infirmary and Burndurant Hospital. The Federal government during the Civil War used the town as a depot for military supplies. For many years, until levees were built, the city suffered from frequent floods which greatly impeded its progress, the most disastrous of which occurred in 1858. In 1913 $250,000 was appropriated by the State for the repair of levees within the city limits; it is the "Eden" of Dickens’ "Martin Chuzzlewit." The city is growing in wealth and population, has many fine churches and an excellent system of education with six white schools, five colored schools and two parochial schools. The value of its taxable property is $11,000,000. Pop. (1910) 14,540; (1916) 17,000.

CAISSON, a water-tight chest or casing, used in the construction of bridges, quays, etc., large enough to contain an entire pier, which is built in it, the caisson being sunk to the bed of the river. (See FOUNDATION). The pneumatic caisson has an air-chamber in which men may work at the bottom of the water, air pressure being maintained within the caisson sufficient to keep the water out, and the air-space being entered by what is called an air-lock. This form of caisson is used where the water is too deep or the bottom too rocky to permit of the construction of a coffer-dam. The name is also applied to an air-tight structure which is sunk below a vessel by the admission of water, and raises the vessel when the water is pumped out, although the commoner name for this form is "pontoon." It is also used to designate the hollow boat-shaped gate used to close the entrance to a dry dock. (See HARBOURS). In military language, the term is applied to the ammunition carriage attached to a battery of artillery. In architecture caisson signifies a panel left in a vaulted ceiling or more rarely in a wall ceiling or wall. There is no standard size, but the most common arrangement is a pattern of sunken octagons with much smaller sunken squares set diagonally between. The caisson may be decorated with mouldings and ornaments of stucco painted and gilded.

CAISSON DISEASE, or COMPRESSED AIR DISEASE, a disorder occurring among workers in compressed air, who are submitted to a pressure of two or three atmospheres, as in bridge-caissons. The symptoms of the disease do not appear while the workman is under compression but come on after decompression when some minutes or even hours have elapsed. The symptoms were at first thought to be due to mechanical pressure which by producing changes in the distribution of the blood caused congestion or blood stases when pressure was removed. This, however, is contrary to the admission of medical science, as the blood is both pressed outward and bent under pressure and does not agree with experimental evidence. The gas emboli theory is now generally accepted. According to this theory blood in compressed air absorbs an increased amount of oxygen and nitrogen which under compression is distributed to the fluids of the various parts of the body. If now rapid decompression takes place bubblesthe gas will be forced out of solution more rapidly than the gas can be cast off by the lungs and numerous capillary emboli result. These then cause pain in local regions, either by direct or mechanical force, or by cutting off the local blood supply. There may be more or less general pain involving two or three or even all of the extremities and sometimes severe abdominal pain with prostration, which in some cases result in unconsciousness, collapse and death. These symptoms are due to the presence of cord or brain lesions, the result of the gas emboli in the blood supply to the central nervous system. Vertigo with deafness and occasional labyrinthine hemorrhage are sometimes present and probably point to embolism in the labyrinth. Dyspnea and sense of constriction in the chest are also sometimes present but are not fatal. The most successful treatment is that of recompression with gradual decompression carried on in a medical air-lock. This is now required by law in some countries. Prophylactic measures are carried out by careful examination of the workman and elimination of those unfitted for work in compressed air. Predisposing factors are youth or too advanced age, alcoholism, organic disease and fatness. New men should be given a short shift and workmen should be carefully supervised. Fatigue is also a factor. Certain countries and states already have laws regulating shifts and providing for gradual decompression, gauged according to the pressure undergone, which are the chief preventive measures. SMITH ELY JEFFERIES.

CAITÉS, or CAERTÉS, kət-əs, an extinct tribe of Brazilian Indians which, up to the close of the 16th century, inhabited a large portion of the eastern coast region north of the Sao Francisco. Of the Tupi race, they were more warlike than other branches of that family, and, while they exhibited traits that indicated at least a crude sort of civilization, such as life in fixed villages and the practice of agriculture, they were the most cannibalistic of all the Brazilian tribes. In 1554 they murdered the biscutari Indians. The Cariris, or Barbudos, who were shipwrecked on that coast, and their ravages upon the settlements of the colonists aroused an enmity that finally resulted in their complete extinction.

CAITHNESS, kath’nes, a maritime county in the extreme northeast of the mainland of Scotland; area, 686 square miles. The surface is generally level or undulating, and there are few hills of any height, except on the Sutherland border. Much of the surface is deep moss or peaty moor, but there is a fair proportion of fertile land in the eastern part. About one-quarter of the whole surface is under crops and rotation grasses, or in permanent pasture. Of corn crops oats is by far the most important. Sheep farming is largely engaged in, and a considerable area is under deer forest. Only a very small portion of the country is wooded. The coast, precipitous and bold and rocky; in the southeast low and sandy. The chief headlands are Dunnet Head on the north coast, Duncansby Head at the northeast corner, Noss Head and the Orm on the east coast. The largest bays are
Dunnet Bay on the north and Sinclair’s Bay on the east, but Thurso Bay and Wick Bay are also noteworthy. There are many lakes, some of which are one for the largest is Loch Watten, near the centre of the county. There are no navigable rivers. Caithness is poor in metallic minerals, but excellent flagstones have been quarried for many years and form one of the chief exports of the county. Many of the inhabitants are engaged in fishing, and Wick is one of the chief centres of the Scottish herring-fishery. The manufactures are subsidiary to its other industries. Wick, the county town, is a royal burgh, and Thurso is the only other town. The antiquities of Caithness are numerous, and include old castles, so-called Pic’s houses, monoliths, etc. The county returns one member to Parliament. Pop. (1911) 32,010.

CAIUS, kā′yūs. See GAIUS.

CAIUS, kā′s, John, English physician, the founder of Caius College, Cambridge University: b. Norwich, 6 Oct. 1510; d. Cambridge, 29 July 1574. His name was Kaye or Key, which he Latinized into Caius. He took his degrees at Gonville Hall, Cambridge, and was chosen fellow of his college. While at Cambridge he distinguished himself by various translations from the classical. He spent some time in travel in the Continent, studied medicine at Padua, under Montanus and Vesalius, and took his doctor's degree at Bologna (1541). In 1542 he lectured at Padua on the Greek text of Aristotle, and in the following year made a tour through Italy, visiting the principal libraries, in order to compare the manuscripts of Galen and Celsius. He returned to his native country in 1544, and practised, first at Cambridge, then at Shrewsbury, and afterward at Norwich. He was appointed by Henry VIII lecturer on anatomy to the Company of Surgeons, London. In 1547 he became fellow of the College of Physicians, and was appointed court physician to the young King Edward VI, which appointment he retained under the young Queen Mary and Elizabeth. In the reign of the latter, an exciting controversy arose between the surgeons and physicians of London, as to the right of the former to administer internal remedies for sciatica. Caius argued the negative on behalf of the physicians, and the decision was against the right of the surgeons to continue the practice of administering medicines. He was elected president of the College of Physicians for seven years in succession. There is extant a book of the college annals from 1555 to 1572 written by him in Latin, the earliest account we have of the transactions of that college. He was dismissed from the royal service in 1568 on suspicion of favoring the Catholic party. He obtained permission to reside and raise Gonville Hall into a college, which still bears his name (Gonville and Caius College), and accepted the mastership thereof. His last days were passed in the seclusion of his college. His works are numerous, on various subjects; many of them have been reprinted in modern times. See his ‘Works,’ edited by J. S. Roberts, with memoir by J. Venn (New York 1912).

CAIUS CESTIUS, kā′yūs ses′ti-us, Pyramid of, a sepulchral monument, a pyramid of the time of Augustus, standing at Rome. Built of brick and stone and encrusted with white marble, it is more than 114 feet in height, while each side of the base measures 90 feet. This contains a small burial chamber, which is painted with arabesque.

CAIUS COLLEGE. See GONVILLE AND CAIUS COLLEGE.

CAIVANO, kī′va-no, Italy, a city lying north of Naples, at a distance of about five miles, and connected with the latter by tramway. It was a fortified town in the Middle Ages, and at present is interesting as the centre of a fertile agricultural district that produces fruits, wine, olives, grain, hemp, etc. There are also a few manufactories. Pop. about 13,000.

CAIX, kā′-ēks, Napoleone, Italian philologist: b. Bozolo, near Mantua, 1845; d. 1882. His education was obtained at Cremona and Pisa, and in 1869 he was called to the chair of ancient languages in the Lyceum of Parma, becoming professor of Romance languages and comparative philology in the Institute of Higher Studies in Florence in 1873. He was a prolific writer, and among his many works are ‘Saggio sulla storia della lingua latina di’Italia’ (1872); ‘Sulla lingua del Contrast’ (1876); ‘Le origini della lingua Poetica Italiana’ (1880).

CAJAMARCA, kā′-ha-mar′-ca’, or CAXA-MARCA, Peru, the name of a department and city in the valley of the upper Marañón, or Amazon. The department lies in a very mountainous region. Pop. 213,391. The city stands on the eastern declivity of the Andes in a rich silver mining district, 75 miles from Trujillo. It lies about 350 miles to the northwest of Lima, has broad and well-paved streets and several plazas or squares. The climate is equable, the temperature being very moderate because of the elevation. It contains several handsome churches and flourishing manufactories of steel articles, straw hats, cotton goods, woolens and cutlery. The inhabitants are considered the best workmen in silver and iron in Peru. An extensive trade between the inland provinces and Lambayeque and Trujillo is carried on through this town. Woolen fabrics form the chief exports, and European sugar, brandy, wine, iron, steel and other articles are imported in return. In the vicinity are the baths of the Incas, and a volcanic lake, into which, according to tradition, were cast the throne and regalia of the Peruvian monarchs, the last of whom, Atahualpa, perished here in 1533 by the hands of Pizarro. Pop. about 9,000.

CAJEPUT, kā′jē-pūt, or CAJUPUT OIL, the volatile oil obtained by distillation from the leaves of the cajuput-tree (Melaleuca cauput or minor), belonging to the order Myrtaceae. This tree has lanceolate, aromatic leaves and spikes of odorless flowers, and is common in many islands of the Malay Archipelago, India and the hot sections of Australia. Booro, one of the Moluccas, yields the bulk of the oil exported, although much comes from other islands. It is mostly sent to Singapore, when it is re-exported to other countries. The oil is of a pale-green color, very limpid, lighter than water, of a strong smell, resembling both turpentine and camphor, and of a strong pungent taste. It is often adulterated with other essen-
tial oils. The color of the oil depends on the presence of a little copper, which must be re-
moved by redistillation before the oil is fit for use in perfumery, and with it has many applica-
tions, being used as a carminative, an antispas-
modic, a rubefacient and a sudorific. The active principle of cajeput oil is the camphor
`cinene` (\(\text{Ca}_2\text{H}_4\text{O}\)). \text{Kuyuput}, the native name of the tree, means "white wood," and refers to the color of the bark.

**CAJETAN, kā`jē-tan, or CAJETANUS, Tommaso de Vio, Italian cardinal:** b. Gaeta, 25 July 1470; d. Rome, 9 Aug. 1534. He entered the order of Dominican friars, graduated as a doctor and was elected general of his order in 1508. When Pope Julius II was sum-
mmoned to appear before the council of cardinals assembled at Pisa and afterward at Milan, in the interest of King Louis XII of France, Ca-
jetan undertook his defense, asserting that to the Pope alone belonged the power of con-
voking a council. He was appointed cardinal in 1517 by Leo X, and sent as a legate in Ger-
many to bring the Emperor Maximilian and the King of Denmark into the league formed against the Turks. His efforts to make Luther-
ian recant his doctrines proved in vain. In 1519 he was present, as Roman legate, at the assembly of the electors of the empire, and sided with the partisans of Don Carlos of Spain, who was elected emperor under the name of Charles V. He then returned to Rome, but was soon or-
dered by Adrian VI to Hungary, which was invaded by the Turks. In 1524 he was recalled to Rome by Clement VII. On the capture of Rome in 1527, being taken prisoner by the im-
perial troops, under the command of the Con-
stable of Bourbon, he had to pay 5,000 crowns as a ransom for his liberty. He made a transla-
tion of the Old Testament, with a commenta-
tary, and wrote a treatise on the authority of the Pope, which was answered by the faculty of the University of Paris. He also wrote com-
mentaries on parts of Aristotle's writings and on the `Sumara` of Aquinas. The latter is reprinted in the definitive edition of the great
Aquinas issued under the patronage of Leo X; a collection of his works, to which his life is prefixed appeared at Lyons in 1639 (5 vols.). Consult Schulbach, `De Vita ac Scriptis de Vio Cajetani` (1881).

**CAJIGAL, kā-hē-gāl, DE LA VEGA, Francisco Antonio, Spanish colonial governor:** b. Santander, 5 Feb. 1695; d. there, 30 April 1777. He held the post of governor of Santiago, Cuba, 1738-47, and in 1742, during the course of the war between Spain and England, repelled an attack by Admiral Vernon. He was governor-
general of Cuba 1747-60, and while in office established an arsenal and navy yard at Ha-
vana. During a part of 1760 and the year fol-
lowing he was viceroy of Mexico. Withdraw-
ing to Spain after this, he became councillor of the War Department (1761), and on the outbreak of hostilities with England in 1762 went to the front and fought in Portugal under the orders of the Count of Aranda. After the war, he returned to the Council of War, whose dean he became in 1768.

**CAJORI, că-jōr`é, Florian, Swiss-American mathematician:** b. Saint Aignan, Switzer-
land, 28 Feb. 1859. He came to the United States in 1873 and studied at the University of
Wisconsin and at Johns Hopkins and Tulane universities. In 1885-88 he was professor of mathematics at Tulane and removed to Colo-
rado College in the latter year, where he be-
came professor of physics and mathematics and later dean of the School of Engineering. He has published `The Teaching and History of Mathematics in the United States` (1890); `A History of Mathematics` (1909); `A History of the Calculus and Its Applications` (1914); `A History of Mathematics` (1898); `A His-
tory of Physics` (1899); `Introduction to the Modern Theory of Equations` (1904; 1912); `A History of the Logarithmic Slide Rule` (1909).

**CAKCHIQUEL, kāk-chē-kēl,** a tribe of Mayan stock occupying northern and central Guatemala. They are probably an off-shoot of the Quiché, as they resemble that tribe closely in customs and language. They were conquered by Alvarado in 1524, and at that time had a well-developed civilization, as is shown by their architectural ruins and their system of hieroglyphic writings. They had an intense religious veneration for maize, and it is even probable that they were the first to cultivate it. Consult Brinton, `Annals of the Cakchiquels` (Philadelphia 1885); Stoll, `Manual de la geografia y de la republika Guatemala` (Zürich 1844); Thomas and Swanton, `Indian Languages of Mexico and Central America` (Washington 1911).

**CAKE-URCHIN, SAND-CAKE or SAND-DOLLAR,** a flat, round sea-urchin two or three inches in diameter (Echinarchus para) which lives buried in the sand in the shallow portions of the north Atlantic, from low-water mark to 40 fathoms. It is occasionally thrown ashore on beaches. The body is protected by limestone plates, and the ambulacra, or delicate suckers, are arranged in a rosette on the upper side of the animal, the mouth being on the under side. See also SEA-URCHIN.

**CALABA OIL,** an excellent illuminating oil obtained from calaba-nuts, the seeds of Calo-
phyllum calaba, a tree of the order of Guttifera that flourishes in Brazil and the West Indies, and yields useful timber. The yield of oil is from 50 to 55 per cent of the weight of the nuts after they are divested of their shells — equiva-
 lent to about 30 per cent of their gross weight. The oil consists of the glycerides of palmitic, stearic and oleic acids and contains about 15 per cent of a greenish resin which is poison-
ous, and renders the oil inedible. It is, how-
ever, used medicinally. Calaba oil solidifies at 38° F., and melts again at 46°. Its saponi-

**CALABAR, kā-lā-bār, or kēl-a-bār,** Africa, the former name of a district on the west coast, extending eastward from the Niger delta, and now included in the Niger Territories. The name is now applied to two towns and two rivers in that region. Old Calabar is a port in southern Nigeria, situated on the east bank of the estuary of the Cross River at the point where it receives the waters of the Old Calabar River. It contains, among other buildings, a Presbyteran Mission Institute for natives, a large prison, good hospitals and marine work-
shops. Its climate, like that of all the coastal settle-
ments in this part of the continent, is very
unhealthy. The rainfall is very great, tornadoes are frequent and the temperature is very high. The value of its exports, consisting chiefly of palm oil, palm kernels, and rubber, exceeds $1,000,000, and its imports are valued at rather more. New Calabar is situated farther east on one of the mouths of the Niger known by the same name. Its trade is less than that of Old Calabar, but is nevertheless of considerable value. Since 1904 the official style of Old Calabar has been Calabar.

**CALABAR BEAN**, or **ORDEAL BEAN**, the brown or reddish-brown kidney-shaped seed of *Physostigma venenomum*, a climbing, woody, West African vine of the pea family (*Leguminosae*), reaching a height of 50 feet. The flowers are purple, resembling the sweet pea, and each pod contains two or three seeds, which are about one inch long with a blackish groove along the convex edge; and in the interior an air-cavity which enables the heavy seeds to float on water. This bean is very poisonous, and has been much used in paste or in infusion in the trial by ordeal conducted by the native medicine men of West Africa. If the person accused of witchcraft or crime vomited the mixture, he was declared innocent; if he did not vomit, death ensued. At one time 70 children in Liverpool ate some of the beans; one who ate four seeds did not vomit and died; all the rest vomited and recovered. In poisoning with this bean vomiting should be encouraged; the stomach washed out and atropine administered if the dose has been small; if the dose was large atropine hastens death. Two alkaloids are prepared from the Calabar bean, calabarine and physostigmine. The latter has the strongest known power of contraction upon the pupil of the eye, and is used in subcutaneous injection by oculists for this purpose. It is also used in the treatment of photophobia and glaucoma. In medicine, physostigmine is used in connection with tetanus antitoxin in the treatment of lock-jaw, and also in chronic constipation and certain diseases of the bladder.

**CALABASH GOURD**, **BOTTLE GOURD**, **WHITE PUMPKIN**, *Lagenaria vulgaris*, the only cultivated or common wild species of its genus, which belongs to the family *Cucurbitaceae*, distinguished from the species of the closely related genus *Cucurbita* by having white instead of yellow flowers, distinct instead of united anthers, and seeds with distended edges. It is a climbing annual vine, 30 to 40 feet long, with a musky odor and sticky texture. It is a native of tropical Asia and Africa, and is grown in warm countries for its very variable smooth, hard-shelled fruit, which, while young and soft, is used by some races as food; but much more generally the ripe fruits are used for making utensils such as dippers, cups and pitchers. Some of the largest fruits are used in India and other Eastern countries in raft-construction and for buoys. These fruits range in size from a few inches to five feet or even more, and from their resemblance to various objects are called Hercules' club, dipper, bottle, snake, sugar trough, etc. The plant is often cultivated in the United States, but is less frequently seen in the North, where the season is usually too short for the fruits to fully mature. A sunny exposure in warm, quick soil, and cultivation similar to that given squashes and melons, will suit the plan well.

**CALABASH NUTMEG**, a tree (*Monodora myristica*) of the family *Myristicaceae*, introduced into Jamaica probably from West Africa. The fruit resembles small calabashes, hence the name. It is called also American nutmeg or Jamaica nutmeg.

**CALABASH TREE**, a tree (*Crescentia cujete*) of the West Indies and tropical North America, of the family *Bignoniaceae*, about the height and dimensions of an apple-tree, with crooked, horizontal branches, wedge-shaped leaves, pale-white flowers on the trunk and branches, and a roundish fruit, from two inches to a foot in diameter. The greenish-yellow skin of the fruit encloses a thin, hard and almost woody shell, which is used for the same purposes as water-cans, goblets, cups, etc. So hard and close-grained are these shells that when they contain fluid they may even be put several times on the fire as keetles. Any in use. When intended for ornamental vessels, they are sometimes highly polished, and have figures engraved upon them, which are variously tinged with indigo and other colors. The calabash contains a pale-yellow, juicy liquid with an unpleasant taste, which is esteemed a valuable remedy in several disorders, both external and internal.

**CALABAZAR**, kā-la-ba-thār', Cuba, city of the province of Santa Clara, situated 20 miles north of the city of Santa Clara. It has a fine municipal building. The Calabazar River is crossed at this point by a fine railroad bridge, the best of its kind in the country. Pop. 1,496; municipal district, 16,979.

**CALABOZO**, kā-la-bō-thō', Venezuela, town in the state of Miranda (Guzman Blanco), 120 miles south-southwest of Caracas, on the left bank of the river Guaro, in the midst of the llanos. It was founded in 1730, is tolerably well built and has rather a pleasing appearance. Its church, though not very handsome, is commodious. The principal wealth of the inhabitants consists of cattle. There is a considerable trade in live stock, hides, cheese, timber, etc. The neighboring ponds abound in electrical eels. Pop. 6,000.

**CALABRIA**, Italy, division of the kingdom, comprising the southwest peninsula or toe of Italy, from about 40° N. lat. to the Strait of Messina; area estimated at 5,819 square miles. It was formerly divided into three provinces— Calabria Citeriore, the most northerly; Calabria Ulteriore I, the most southerly; and Calabria Ulteriore II, between the two former; but these have been renamed respectively Cosenza, Reggio di Calabria and Catanzaro. The central region is occupied by the great Apennine ridge, wild and bleak, to which, however, whole colonies with their cattle migrate in the summer. The flats near the coast are marshy and unhealthy, and inhabited by herds of buffaloes; but the valleys at the foot of the ridge are well watered and produce most luxuriant vegetation. The vine, the orange and lemon trees, the fig, the olive and all the fruits of southern climates, grow there to perfection. The climate was reckoned salubrious in ancient times; but in some places the accumulated malaria produces disease in the hot season. Corn, rice, saffron, anise, licorice, madder, flax, hemp,
this town, then called Calagurris, siding with Sertorius, was besieged by Afranius, one of Pompey's adherents, and the insurrection reached to such extremity that they fed on their wives and children; whence the Romans were wont to call any grievous famine James Calagurritana. Quintilian was born here about 35 A.D. Pop. 9,897.

CALAIS, ka-lā', France, a seaport town and fortified place of the first class, in the department of Pas-de-Calais, 20 miles northeast from Boulogne on the Strait of Dover, and about 21 miles east-southeast of the port of Dover. It is situated at the junction of several canals, and by railway is directly connected with Paris, from which it is distant 185 miles. The town consists of two portions, almost entirely separated by basins or water areas connected with the harbor accommodation. These are Calais proper or the old town farther to the north, and Saint Pierre or the new town, now a great manufacturing centre, and incorporated with the other portion only in 1885. The whole is enclosed by a new line of circumvallation, and is also defended by a citadel and seven detached forts and batteries. On the land side the country is flat and marshy, and can be laid under water to strengthen the defenses. The streets are broad and well paved, the houses substantially built of brick, and the hotels in general excellent. The chief square is the Place d'Armes, where the old Hôtel de Ville, built in 1740 (restored in 1867), is located. The new town hall is on Place Centrale. The principal church, Notre Dame, contains a fine altar-piece in Genoa marble. Other noteworthy objects are the Hôtel de Guise, originally founded by Edward III of England; the column erected to commemorate the landing of Louis XVIII in 1814; barracks; and the Hôtel Dessin. Calais is the seat of a commercial court and chamber of commerce and has a college, a commercial school, school of design, school of hydrography, etc.

The harbor is accessible at all states of the tide, and is entered between two long piers. The works include extensive graving dock and wet dock accommodation. Calais is one of the principal ports for the debarkation of travelers from England, there being day and night communication with Dover by steamboat. There is a submarine cable to England from this port. The manufactures of the town are important. The silk and cotton trade and hosiery trade employ thousands of hands. Various other industries are also carried on, such as flax-spinning, lace-making, hosiery, engineering, net-making, brewing, etc. Vessels are built here, and fitted out for the cod fishery and fisheries. It is the entrepôt for an important district, and a considerable trade is carried on in grain, wool, wine, sugar, timber, coal, etc., and not less than 55,000,000 of eggs are annually exported to England. Calais is a town of considerable antiquity. In 1347 it was taken by Edward III of England, after a siege of 11 months. The famous incident of the six burgesses having their lives saved at the intercession of Queen Philippa belongs to this siege.

CALAHORRA, kā-la-ør'ra, Spain, a town of Old Castile, near the south side of the Ebro, in the province of Logroño, and 32 miles south-east of the city of Logroño by rail. It is a bishop's see, and contains a cathedral, three parish churches and three convents. In 78 B.C.,
CALAIS, kā'ls, Me., city, port of entry, and county-seat of Washington County, situated on Saint Croix River, opposite Saint Stephen, N. B., and on the Saint Croix & P. and Canadian P. railroads, 120 miles east of Bangor. It is the extreme northeast seaport of the United States and is connected by steamship lines with Boston, Portland and Saint John, N. B. It has a large lumber trade and numerous foundries, machine shops, shipyards, granite quarries and other extensive mechanical industries, including shoe factories, plaster works, etc.; a national bank, several newspapers, high and grammar schools, electric lights, a public library and an assessed property valuation of $2,500,000. The government is vested in a mayor and council elected annually. Pop. 6,116.

CALAMAMCO, a woolen stuff made in the Netherlands, the warp of which is sometimes mixed with silk or goats' hair. It has a fine gloss, and is checkered in the warp so that the checks are seen on one side only. It was fashionable in Addison's time.

CALAMANDER WOOD, a hard wood of Ceylon, obtained from a species of ebony-trees.

CALAMARY, The old European name of the 10-armed cuttle-fish. See Squid.

CALAMATTA, Luigi, Italian engraver: b. Civitā Vecchia, Italy, 12 July 1802; d. Milan, 8 March 1869. He was educated in Rome under Marchetti and Riccianesi, but was much in Paris, where he was a follower of Ingres. In 1837 he became professor of the École des Beaux-Arts in Brussels and among his pupils were Gustave Biot, Leopold Flameng and Charles Blanc. He founded a school of engravers in Brussels under government direction, and in his latest years was professor of drawing in the Academy of Milan. He is well known by his engraving of the head of Napoleon, from the death mask, and portraits of Ingres, Paganini, Guizot, George Sand, *Francesca da Rimini*; *La Gioconda* da Vinci, and the *Madonna di Foligno* after Raphael. Consult Alvin, *Notice sur Luigi Calamatta* (Brussels 1882).

CALAMBA, kā-lăm'bā, Philippines, a town of the province of Laguna, situated in the southern part of the island of Luzon, about 30 miles southeast of Manila. It is connected with several important towns by highways, and has a telegraph station. Pop. about 13,000.

CALAMBAC, aloes-wood, the product of a tree, *Agularia agallocha*, growing in China and some of the Indian islands. It is of a very light, spongy texture, and contains a soft, fragrant resin, which is changed by the natives into a pungent perfume.

CALAMB, ka-lăm, Alexandre, Swiss landscape artist: b. Vevey, Switzerland, 28 May 1810; d. Mentone, France, 17 March 1864. His life was passed mainly in Geneva, where a monument was erected to him in 1880. He was ranked among the best landscape painters of his day. He devoted the most, if not all, of his contemporaries in portraying Alpine scenery. Among works by him are *Bernese Oberland* (Leipzig Gallery); *Wetterhorn* (Basel Museum); *Lake of Lucerne* (Berlin Museum); *Shreckhorn*; *Lake of the Four Cantons.*

CALAMIANES, kā-lā'-mē-ā'ñēs, a cluster of islands in the Philippine Archipelago, of which Busuanga, Calamian and Linacapan are the most important; Busuanga is 36 miles long and 17 miles broad. There are about 98 islands in the group, with a total land area of 675 square miles. Pop. 17,000.

CALAMINE, a native basic metasilicate of zinc, having the formula (ZnOH)_2SiO_3. In England the name is applied to the carbonate ore and the name given to the silicate is smithsonite. The mineral, now known as smithsonite, was formerly included here, but James Smithson, in 1803, showed that the two species are distinct. The two are usually found together. Calamine occurs in hemimorphic, rhombohedral crystals, usually with a hardness of from 4.5 to 5 and a specific gravity of between 3.4 and 3.5. It also occurs in massive forms, sometimes mammillary in shape, and often cellular. In the United States calamine is found in fine crystalline form in New Jersey, Pennsylvania and Virginia; and both crystalline and mammillary in Missouri, Utah and Montana. In localities where it occurs in quantity it constitutes a valuable ore of zinc.

CALAMINT, any plant of the genus *Calamintha*, belonging to the family *Menthaceae*. The plants are herbs or shrubs with usually entire leaves, and dense whorls of purple-white or yellow flowers, with a two-lipped corolla and didynamous stamens not projecting from the corolla. Five species are British. They all contain a volatile oil, and a pectoral medicine is obtained from them. In the United States several species are also found.

CALAMIS, Greek sculptor, satyruary and embosser of Athens, a contemporary of Phidias, who flourished between 467 and 429 B.C. Pliny bestows the highest praises upon his horses. Among his most celebrated works were a statue in metal of Apollo Alexieus in Athens, in 429 B.C., and which has erroneously been supposed to be the Apollo Belvedere; a colossal statue of Apollo in bronze, 30 cubits in height, which was taken to Rome by Lucullus; and a Jupiter Ammon consecrated by Pindar at Thebes. Consult Gardner, E. A., *A Handbook of Greek Sculpture* (pp. 232-36, London 1911).

CALAMITE, a genus of fossil plants very characteristic of the coal measures. They occur in the Devonian rocks, and in other formations up to the Jurassic, in which one species is found. Their classification is not finally determined, but they are generally regarded as closely related to the *Aquifolium* or horsetails. The stalks are striated longitudinally, and interrupted with rings marking a regular articulation.

CALAMITY JANE. See Burke, Jane.

CALAMUS, a remarkable genus of palms, the species of which are mostly Indian, and are very different from most other palms, having slender, many-jointed, reed-like stems, often stretching to a length of several hundred feet. Some have the stems erect, others climb and trail among trees on which they support themselves, hanging on by the hooked prickles that terminate their leaves. Some have leaves at
intervals along the stem, others only at the extremity. The stems are hard, smooth and sili- ceous on the surface, and from their toughness and pliancy they are much used in the regions where they grow for matting, strong ropes, plaited work, etc. Bridges over streams are frequently made of ropes formed by twisting up their stems, and in the West Indies and the Eastern seas often carry cables of the same kind.

CALAMUS, a popular name for the sweet flag (*Acorus calamus*), of the family Araceae. This plant is found in wet land from Nova Scotia to Florida, and westward to Kansas and Minnesota. The pungent, bitterish, acrid root stocks have been used in medicine, especially among the colored people of the southern United States. It is sometimes cultivated as an ornamental plant in wet places, and is attractive for its erect, sword-shaped leaves, which in one variety are striped with yellow.

CALAMY, Edmund, Puritan clergyman: b. London, England, February 1600; d. there, 29 Oct. 1666. He studied at Pembroke Hall, Cambridge (1616-19), where he attached himself to the presbyterian party, and in 1639 was chosen minister of Saint Mary's, Aldermanbury, Lon- don. He entered warmly into the controversies of the time, and became noted as a leading man on the side of the Presbyterians. He had a principal share in the composition of *Smectym- num*, a work intended as a reply to Bishop Hall's *Divine Right of Episcopalcy* (London 1640), and one of the most able and popular polemics of the day. Like the mass of the Presbyterian clergy, he was monarchical and not a radical in his political opinions. He did not approve, therefore, of the execution of Charles, and of Cromwell's protectorate, and did not hesitate to avow his attachment to the Royalist cause. He was one of the deputies appointed to meet Charles II in Holland and confer on the subject of his restoration. He took part in the Savoy Conference (1661) but was ejected from his living by the Uniformity Act (1662); for venturing to preach in his church (December 1662) he was cast into prison, but released by Charles II.

CALAMY, Edmund, English clergyman, grandson of the preceding: b. London, 5 April 1671; d. there, 3 June 1732. He was educated among the Dissenters and in Holland, and later became pastor of a congregation in Westminster and published an abridgment of Baxter's *History of His Life and Times*, with a continuation; *Influence of the Scriptures*; *Life of Increase Mather*; *Historical Account of My Own Life* (London 1830); and also carried on through the press controversies with Bishop Hoadly and others. He is well known for his *Nonconformists' Memorial* (1778) which is the best historical source concerning the 2,000 ministers ejected from the Church of England by the Act of Conformity. Consult Palmer, *Abridgment of the Nonconformists' Memorial* (London 1802-03).

CALANCHIA, ka-lân'cha, Antonio de la, Peruvian chronicler: b. Chiquisca 1584; d. Lima, 1 March 1654. He belonged to the Augustinian order, and was rector of the Col- legio de San Ildefonso in Lima. Afterward he traveled extensively through Peru. He wrote *Crónica moralizada del Orden de S. Agustin en Peru,* first printed at Barcelona in 1638 in folio, which is an important source for early Peruvian history. It was continued in a second volume, never completed, however, by Fray Diego de Cordova (Lima 1653). The first volume was translated into French as *Histoire de l'église du Peru aux antipodes* (Toul- ouse 1653), and into Latin (Antwerp 1651) is called a translation. The original work appeared at Barcelona 1639, under the title *Crónica moralizada del orden de Sán-Augustin en el Perú.* The Spanish bibliographer Antonio creditis Calanchia with another work, *Crónica de los santuarios de Nuestra Señora de Copacabana y del Prado* (Lima 1653).

CALANUS, Indian philosopher, much es- teemed by Alexander the Great. At the age of 73, 323 a.c., being seized with illness at Per- sepolis, he caused a funeral pile to be erected, which he ascended with a composed contem- nence, and expired in the flames, saying, that having lost his health and seen Alexander, life had no more charms for him.

CALAS, kà-làs, or kà-làs, Jean, French judicial martyr: b. Languedoc 1698; d. Toul- ouse, 9 March 1762. Brought up in the Catho- lic religion, he had established himself as a merchant in Toulouse. He had four sons and two daughters whom he educated himself, and was held in general esteem, when he was sud- denly accused of the crime of murdering one of his sons. In 1761 his eldest son, Marc Antone- nie, a young man of irregular habits and a gloomy disposition, was found strangled in his father's house. It was reported that the unfortunate youth had been put to death by his father because he wished to become a Catholic. Jean Calas and his whole family were arrested, and a prosecution instituted against him, in support of which numerous witnesses came forward. The Parliament of Toulouse con- demned him by eight voices against five, to be tortured and then broken on the wheel; and on 9 March 1762, the sentence was executed. He suffered the torture with firmness, and pro- tested his innocence to the last. The youngest son was banished forever, but the mother and servants were acquitted. The eldest son, an unhappy man retired to Geneva. Voltairre, then at Ferney, became acquainted with them, and for three years exerted himself to defend the memory of Calas, and to direct attention to the defects of the criminal law which affected profoundly the legal attitude toward the French Protestants. The widow and children of Calas also solicited a revision of the trial. Fifty judges once more examined the circumstances, and declared Calas altogether innocent, 9 March 1765. The King, not being his own son, sought to recompense the family for their un- deserved losses, and people of the first rank emulated each other in endeavoring to relieve them. Consult Coqueler, *Jean Calas et sa Famille* (Paris 1858); *Causes Célebres* (Vol. IV, 1875); Allier, Raoul, *Voltaire et Calas* (Paris 1898); Masmonteil, *La législation crimi- nelle dans l'œuvre de Voltaire* (Paris 1901); Fällenlty, *Life of Voltaire* (2 vols., London 1903; New York 1905).

CALASIO, ka-làs-i-làs, Philippines, a town of the province of Pangasinan, situated in the western part of the island of Luzon, a
CALATAFIMI — CALBAYOG

few miles from the coast of the Gulf of Lingayen, on the main highway to Manila. Pop. (1903) 16,539.

CALATAFIMI, kā-la-tā'-ē-mē, Sicily, town in the western part of the island, in the district of Trapani, 57 miles southwest of Palermo. It is situated in a mountainous district, near the coast. It is badly built, and has a ruinous castle on the summit of a neighboring hill, now used as a prison. The environs are well cultivated and extremely fertile. A ruined Saracen castle stands above the town. In 1560 a battle took place here between Garibaldi's forces and Landi's Neapolitan troops, in which the latter were defeated. Pop. of commune (1910) 10,486.

CALATAGIRONE, kā-lā-tā'-je-ro-nā, or CALTAGIRONE (ancient CALATA HIERONTIS), Sicily, town in the province of, and 36 miles southwest of, Catania direct. It stands on two hills, 2,000 feet above sea-level, and consists generally of spacious, clean and well-built streets. There is a fine promenade and marketplace, beside which stands the old castle. It is the birthplace of the town of the three churches and a college. Its inhabitants are highly skilled in the arts. It has a considerable commerce, and is celebrated for the manufacture of terracotta ware. It was fortified by the Saracens, and wrested from them by the Genoese. Roger Guiscard gave it important privileges. There are interesting Greek, Roman and Moorish remains. Pop. (1910) 43,169.

CALATAYUD, kā-la-tā'-yood', Spain, the second city of Aragon, 48 miles southwest of Saragossa. It stands on the Jalón, near its confluence with the Jiloca, at the foot of two rocky heights crowned with the ruins of Moorish forts. The upper or Moorish town is a very wretched place, but the modern town below is well built and contains many remarkable edifices, among which the most conspicuous are the church of Santa María, once a mosque, and surmounted by an octagonal tower; and that of San Sepúlcre, a Doric structure containing many curious relics. Red wines are produced in the neighborhood, and above 10 miles from the town there are sulphur baths. The poet Martiál was born at Bilbilis, a former town on the site of the present Bambolla, two miles east of Calatayud. Pop. (1911) 11,594.

CALATRAVA, kā-la-trā'vā, Order of, a Spanish order of chivalry, originated during the Moorish wars. Calatralva la Vieja, taken from the Moors in the 12th century by the king of Castile, was committed to the Templars, who guarded it till 1158. At this time, a powerful army advancing to besiege it, despaired of being able to defend it, restored it to the king, who offered it in absolute property to whosoever would defend it. Two monks of the abbey of Citeaux (Cistercians), in France, presented themselves and were accepted. They proved a curse, and offered a pardon of sins, and being supplied with money and arms, were able to repel the invaders. Thereupon, having received the investiture of the town and other donations, they instituted the same year (1158) an order into which all the nobility of Castile and Navarre were emulous to enter. In 1164 the chevaliers of this order, by sanction of Pope Alexander III, separated them- selves from the monks, and the order became purely military. They still followed the rule of the Cistercians, until Paul III dispersed them from the vow of chastity. The almost uniform success of the Knights of Calatrava against the Moors gave rise to the orders of the Hospital and of St. John, the latter, however, more exterminated, the survivors transferring the seat to the castle of Salvatierra. In 1523 the grand mastership was transferred to the Crown by a papal bull, the knights being permitted to marry once by way of compensation for their loss of independence. Since 1806 the body has been continued as an order of merit.

CALATRAVA LA VIEJA, ve-a-hā, a ruined city of Spain, situated on the Guadalquivir, about 12 miles northeast of Ciudad Real. It was captured by Alfonso VIII of Castile, who gave it to the Templars. They in turn, restored it to Sancho III (1157). Its defense against the Moors, undertaken by Raymond, abbot of Fitero, and Diego Velasquez in 1158, after it had been abandoned by the Templars, is famous on account of its having originated the Order of Calatrava and has so often been cited in literature. Pop. (1910) 12,350.

CALAVERAS GROVE, the most northern of the California groves of big trees, containing about 100 of these trees. The tallest one is known as the "Keystone State," and is 235 feet in height and 45 feet in girth. The "Mother of the Forest" is another tree of notable size, being 315 feet high and 61 feet in circumference. The grove is a State reservation.

CALAVERAS SKULL, a widely disputed fossil skull, now preserved in the Peabody Museum, Cambridge, Mass., reported by Prof. J. D. Whitney to have been found in 1866 in the undisturbed auriferous gravels of Calaveras County, Cal. Whitney assigned the skull to late Tertiary (Pliocene) times. The skull corresponds in type with those of modern Indian inhabitants of the district. Consult Hrdlicka, "Bureau of American Ethnology, Bulletin 33" (Washington, D. C., 1907).

CALAVERITE, a native gold telluride, AuTe₂, with the average composition: tellurium, 57.4 per cent; gold, 42.5 per cent; silver, 3.1 per cent. It was originally described by Genthi as a very rare massive gold (and silver) telluride from Boulder County, Colo. It is the commonest of the gold ores of Cripple Creek and occurs there in beautiful triclinic crystals. It is found also in great abundance at Kalgoorlie, West Australia. Calaverite occurs with petzite at the Stanislaus mine, in Calaveras County, Cal., and with sylvanite at the Red Cloud mine in Boulder County, Colo. It is often confused with "sylvanite" by the miners, but while it is practically of the same qualitative composition as sylvanite, carries a proportion of gold 25 to 40 per cent greater, and only about one-third as much silver. It has a brilliant metallic lustre, pale bronze-yellow color, a hardness of 2.5 and a specific gravity of about 9.

CALBAYOG, kāl-bā'-yōg, Philippines, town of Samar province at the mouth of the Calbayog River on the eastern coast of Samar, north-west of Cathalan. Hemp, the chief product, copra and fine timber are shipped to Manila. Pop. 16,000.
CALC-TUFA, a variety of calcite essentially travertine. It is formed in streams or springs by deposits of calcium carbonate in a cellular form. It often contains fossil twigs, moss leaves, seeds, etc.

CALCAIRE GROSSIER, käl-sär grō-sē-ār, a coarse limestone of the Middle Eocene Tertiary series of the Paris and London basins. Its limestone strata furnish building material for the city of Paris. The fossils of the Calcaire Grossier are remarkable for number and for the variety of forms, some 500 species in all being represented, including water shells as well as marine shells and rising up to the remains of the mammals.

CALCAR, or KALKAR, Jan Stephanus van, yan stē-fān'-ōs van käl-kär', Dutch painter: b. Calcar in Westphalia 1510; d. Naples, 1546. He studied so thoroughly the style of Titian, that their pictures cannot always be distinguished. Later he imitated the style of Raphael with equal success. The 'Mater Dolorosa,' in the Boisserée collection in Stuttgart, a perfect work of art, is by him. Another small portrait of his, the 'Infant Christ with the Shepherds,' was a favorite with Rubens. In this piece the light is represented as proceeding from the child. He designed almost all the portraits in Vasari's Lives, and the figures for the anatomical work of Vesalius.

CALCAREOUS, a term applied to substances partaking of the nature of lime or containing quantities of lime. Thus, we speak of calcareous waters, calcareous rocks, calcareous soils. Calcereous spar is calcite (q.v.).

CALCAREOUS TUFFA. See CALC-TUFA.

CALCASIEU, käl-kä-shō, a river of Louisiana, rising in the western part of the State. It flows through the parish of the same name, and after a southerly course of about 200 miles enters the Gulf of Mexico through Lake Calcasieu. It drains a large area in southwest Louisiana, and is navigable by small boats for about 130 miles.

CALCEOLARIA (Latin, calceolus, a little shoe, alluding to the form of the corolla), a genus of plants of the family Scrophulariaceae, mostly natives of South America, especially of Chile and Peru. They are characterized by having the corolla with a very short tube, with two lips, concave or shaped like a hood, the upper one very small, under the one greatly inflated. They are common as greenhouse or outdoor plants. There are about 200 species, of which about 20 are in cultivation, and their varieties are very numerous. The flowers of the indigenous species are white, yellow and purple. They are greatly excelled in beauty by the cultivated varieties, which acquire numerous tints in these colors, and have besides on the lower part of the corolla, the part which bears the strictest resemblance to a shoe, large spots, or innumerable small points of a different color, which have a very graceful effect. They grow best in a rich, open, sandy garden mold, and are propagated by seeds or cuttings, the herbaceous part by the former method.

CALCHAQUI, kal-chä-kē, a South American tribe formerly living in the northwestern part of Argentina. They were conquered by the Incas of the 15th century, and the ruins of their buildings and tombs indicate quite an advanced stage of civilization. They extended over considerable area of territory now belonging to Argentina. They lived in villages, as the surviving stone inclosures, mounds, cemeteries and art products show. They were visited by the Jesuit missionaries, but were destroyed by the inroads of the Spaniards. The tribe is now extinct and all record of their language is lost. Consult Chamberlain, A. F., in the American Anthropologist (N. S. Vol. XIV, pp. 503-07, 1912).

CALCHAS, kal-häs, a legendary priest and prophet of the Greeks at the time of the Trojan War, who foretold that Troy would not be subdued by them till the 10th year of the siege. At his advice, Iphigenia was sacrificed at Aulis to appease Artemis. He himself accompanied the Greek army to Troy. During the siege, the Greeks were attacked by a plague, and Calchas declared that it was the effect of Apollo's anger, because they had deprived his priest of his daughter Clytie, whom Agamemnon had selected as his mistress. He counseled the Greeks to appease Apollo by storing the damsel; and it was by his advice that they afterward built the wooden horse. There are various legends relating to his death. The most common is that he died of grief caused by his failure in a cure attempted with Mopus at Colophon. At Apulia, where he had a temple and an oracle, his grave is shown.

CALCIFEROUS, a geologic term applied to the sandy limestones found in Pennsylvania, extending across New Jersey and New York to Canada, and known as the Beckmantown beds. The formation is probably the equivalent of the magnesite limestones of Iowa and Missouri and belongs to the Canadian epoch of the Lower Ordovician. See ORDOVICIAN.

CALCIMINE, a mixture of zinc-white, glue, water and pigments, used to finish the plaster walls of buildings. In cheaper forms, lithopone or Paris white is substituted for zinc-white. A superior dampproof form uses casein instead of glue. See WHITEWASH.

CALCINATION, a term now used as practically equivalent to roasting. It is derived from the Latin word calc, meaning quicklime, and received its present signification by extension from its original meaning of obtaining lime from limestone by the application of great heat. The process contemplates a very high degree of heat, but lower than the fusing point of the substance treated. By calcination many substances may be reduced to a friable condition, and freed from constituents capable of passing off in the form of gas or vapor. Thus various salts may be deprived of water of crystallization, and rendered amorphous in this way; the hydrated carbonate of magnesium is reduced to the pure oxide, known as calcined magnesia; limestone is converted into quicklime, etc. Calcination is usually the first process in the extraction of metals from their ores. The oxides of metals produced by this process were formerly known as calxes, but this term is now disused. It depends on circumstances which oxide is obtained, if the metal, like lead, can form more than one. The weight of the total calx is equal of course to that of the metal and the oxygen with which
CALCEOLARIA (FISHERMAN’S BASKET)
CALCITE

1 Calcite Crystals, Bigrigg Mine, England

2 Calcite "Bird's Nest," Reichenbach, Hesse, Germany
it has combined, but the calc itself is specifically lighter than the metal. Platinum, gold, silver and some other metals are not affected in this way, and on this account they are called the noble metals. See Combustion.

CALCITE, -sit, also known as calc-spar, a native carbonate of calcium, crystallizing in the rhombohedral system, and exhibiting over 300 distinct crystals of general forms or "habit." The mineral also occurs massive, fibrous, granular, lamellar, compact, earthy, stalactitic, nodular. In other forms it exhibits minute percentages of magnesium, iron, manganese, zinc and lead, replacing equivalents of calcium. Its typical crystals exhibit a very perfect cleavage, commonly splitting up, from a blow, into many small rhombohedrons. Pure crystals have the composition carbon dioxide 44 per cent, lime 56 per cent. They show a vitreous or earthy lustre and have a specific gravity of about 2.72, and a hardness of about 3, though the latter varies somewhat with the face of the crystal. Calcite may be transparent, translucent or opaque, and in color may vary from white, or colorless, to black, also brown, violet, blue, green, yellow and red. It exhibits the phenomenon of double refraction powerfully, and transparent crystals of it (called *Iceland spar* because first obtained from Iceland) are used in the manufacture of polarizing prisms. (See Light.) Limestone, marble and chalk are commonly classed as massive or cryptocrystalline varieties of calcite. Oolite (q.v.) is a granular limestone composed of innumerable minute rounded concretions. Pisolite is a similar variety in which the spheres are as large as peas. The stalactites and stalagmites of many caves (q.v.) are calcite. Mexican onyx, travertine and calc-tufa (q.v.) are a few of the many other varieties of calcite. Varieties containing other metallic carbonates are known as baricate, strontianocalcite, ferrocalcite, etc. Calcite effervesces briskly even in cold acid. It occurs abundantly all over the world; especially choice specimens of crystals come from Germany, England, Guanajuato, Mexico; Rossie, N. Y.; Joplin, Mo., and Lake Superior. Examples of the stalactite forms are found in caves of Schoharie, N. Y., and at Wier's Cave in Virginia. The various rock forms of calcite are burned to make lime, and also in mixture with silica and alumina in the manufacture of Portland cement. See GLASS; CEMENT.

CALCITE GROUP, in mineralogy, an important series of rhombohedral carbonates of the bivalent metals—calcium, magnesium, iron, manganese, zinc and cobalt. The series includes calcite, CaCO₃; dolomite, (Ca, Mg) CO₃; ankerite, CaCO₃(Mg, Fe, Mn) CO₃; magnesite, MgCO₃; mesite, 2MgCO₃ FeCO₃; siderite, FeCO₃; rhodochrosite, MnCO₃; smithsonite, ZnCO₃; and spheroocalcite, CoCO₃.

CALCUIUM, a metallic element first obtained in the free state by Sir Humphry Davy in 1808. Its compounds are exceedingly abundant and are widely distributed. Calcium carbonate, CaCO₃, is familiar in its various forms of marble, chalk, limestone and calcite. The sulphates, CaSO₄, is also very common, and is perhaps best known in the form of gypsum, which contains two molecules of water, and therefore has the formula CaSO₄ + 2H₂O. Calcium phosphate also occurs in nature in considerable quantities, both in the form of fossilized bones and as a constituent of apatite (q.v.) and its various modifications.

Metallic calcium may be obtained by the electrolysis of the fused chloride (which melts at a red heat), or by decomposing the iodide with metallic sodium. It is a white metal with a light yellow hue, has a hardness about equal to that of gold and is very malleable and ductile. Its density is 1.546 and its melting point about 1465° F. Its chemical symbol is Ca. Its specific gravity is about 1.58 and its atomic weight is 40.0 (O = 16). Perfectly dry air does not affect it at ordinary temperatures, but in moist air it becomes rapidly coated with the hydrate Ca(OH)₂. When strongly heated in air it burns with a yellow flame, taking up oxygen to form the oxide CaO. It decomposes water rapidly, passing into the form of the hydrate, with evolution of hydrogen. It melts at a red heat, has a specific heat of about 0.169 and has an electrical resistance only about one-twelfth of that of mercury.

In its chemical relations calcium is a dyad. It combines with almost every known acid, and yields a vast number of compounds, many of which are of great industrial value. Of these the best known are the carbonate, oxide, hydrate, chloride, sulphate, phosphate, fluoride, carbide and bisulphide, and the indefinite mixture of the chloride and hypochlorite known as bleaching-powder (q.v.).

The carbonate occurs native in large quantities, as already noted. It is also commonly present in ground water as obtained from wells and springs. It is almost insoluble in pure water, but dissolves to a considerable extent when the water contains free carbon dioxide in solution. It is this compound that gives to water what is known as "temporary hardness." Upon boiling, the free carbon dioxide held in solution is expelled, and the lime carbonate is therefore precipitated also, so that the water loses that part of its hardness which is due to the presence of the carbonate. This effect is well illustrated, in regions where the soil is rich in limestone, by the crust of lime carbonate that is deposited upon the interior of household kettles that are used for heating. Calcium carbonate also gives rise, in steam boilers, to troublesome deposits that keep the water out of contact with the metal plates, which, in such cases, become overheated and seriously impaired in consequence. To prevent this action, chemists often recommend the addition to the water in the boiler of a certain amount of ammonium chloride (sal ammoniac). This compound combines with the lime carbonate to form calcium chloride, which is exceedingly soluble, and ammonium carbonate, which is volatile, and therefore passes away with the steam. Beautiful as this process is in theory, it cannot be recommended for adoption in practice, because if the sal ammoniac is present in any excess it induces rapid corrosion of the boiler plates.

When calcium carbonate (more familiarly known as carbonate of lime) is strongly heated in a current of air, it loses its carbon dioxide and becomes converted into a substance known to the chemist as calcium oxide CaO, and in the arts as quicklime, burnt lime or simply lime. Pure calcium oxide (or lime) is a white, mor-
phous substance, infusible, glowing with a dazzling white light when strongly heated, possessing caustic properties and acting as a powerful chemical base. When treated with about one-third of its own weight of water, lime passes into the form of the hydrate or hydroxide, Ca(OH)_2, with the evolution of much heat. The process of converting it into the hydrate by the addition of water is called slaking, and the resulting hydrate is known in the arts as slaked lime. Mortar is composed of a mixture of slaked lime and sand, the silica (or sand) slowly combining with the lime to form a silicate after the mortar has been applied. Slaked lime, or calcium hydrate, is somewhat soluble in water, its solution being known as lime water.

Calcium chloride is formed when calcium carbonate is dissolved in hydrochloric acid. It is exceedingly soluble, but upon evaporation of its solution it separates in white, needle-like crystals having the formula CaCl_2 + 6H_2O. When these are heated to about 400° F. they lose five-thirds of their weight of water and become converted into CaCl_2 + 2H_2O, in which form the chloride is commonly used. Thus prepared, calcium chloride is a white, porous solid, which absorbs moisture with great avidity, and hence is exceedingly valuable to the farmer in allowing plants and other gaseous bodies. It forms crystalline compounds with ethyl and methyl alcohols, which are again resolved, by the addition of water, into calcium chloride and the free alcohol. On account of this property it has been used for the preparation of these alcohols in the pure state. See also CALCIUM CHLORIDE.

Calcium hyperchlorite is a bleaching agent which is more stable than ordinary bleaching powder (chloride of lime), yielding a clear solution in water and containing from 80 to 90 per cent of available chlorine. (See BLEACHING.) It is made by passing chlorine gas into milk of lime at a temperature not exceeding 90° F., and then concentrating the solution to crystallization. Besides its bleaching properties it is used in very large quantities for the purification of water in reservoirs for drinking purposes.

Calcium sulphate occurs native in the anhydrous form, as the Shaherud salt, and, combined with two molecules of water, it also occurs abundantly as gypsum. It is soluble in 400 parts of water, and, like the carbonate, it occurs quite generally in the waters of wells and springs. Like the carbonate, too, it makes the water in which it occurs hard; but the hardness due to the presence of the sulphate cannot be removed by boiling, and it is therefore said to be "permanent." Calcium sulphate produces deposits in steam boilers that are far more troublesome and injurious than those due to the carbonate, since the sulphate is deposited in a hard, compact, stony form, and can be removed only with difficulty.

When gypsum is moderately heated it loses its water of crystallization and becomes converted into a substance that is commercially known as plaster of Paris, from the fact that the gypsum from which it is prepared (and which is also called plaster of Paris, though rarely) occurs abundantly in the Tertiary formations of the Puy-de-Dôme. When moistened by the addition of the proper quantity of water, takes up two molecules of water again, and rapidly sets into a hard, solid mass which expands somewhat at the instant of solidification. It is much used in making casts and molds. These are harder and better when the plaster is wetted with a solution of alum than they are when pure water is used for this purpose. If equal weights of the hydrous sulphates of calcium and of potassium are wetted with about four parts of water, the mixture sets like plaster of Paris, with the formation of a double sulphate of calcium and potassium, having the formula CaSO_4·KSO_4·H_2O. The casts so obtained exhibit polished surfaces, superior to those obtained with pure plaster.

Calcium fluoride, CaF_2, occurs native as fluor spar, or fluorite, and is used to some extent as a flux in metallurgical operations, to which circumstance it owes its name (Latin fluor, a flux). It is also used in the manufacture of vases and other ornamental articles and as a source of hydrofluoric acid, which is set free when the fluoride is treated with warm sulphuric acid.

Calcium carbide, CaC_2, has long been known, and was prepared by Wöhler in 1852 by melting an alloy of zinc and calcium in the presence of carbon. Its commercial importance, however, dates from the discovery by Professor Willson in 1892, that it can be formed by the direct combination of lime and carbon at the temperature of the electric furnace. Large quantities of it are now made by this process at Niagara Falls, at Spray, N. C., and elsewhere. Calcium carbide in its commercial form is a dark-gray substance, often almost black. It is hard, infusible and incombusible, with a specific gravity of about 2.24. Its value in the arts depends upon the fact that when it is thrown into water a double decomposition occurs, by which acetylene gas is formed, in accordance with the equation CaC_2 + 2H_2O = Ca(OH)_2 + CH_2. See ACETYLENE; CARBIDE.

Calcium phosphide, CaP_3, has the property of decomposing insensibly when thrown into water with the evolution of phosphuret hydrogen which takes fire spontaneously. It is used in several forms of marine signal lights and also in naval target practice at night.

Calcium sulphide, CaS, and, combined with two molecules of water, also occurs as a white powder when a solution of a calcium salt is added to a solution of an alkaline sulphide. The sulphide so formed requires 800 parts of pure water to effect its solution. It is far more soluble in sulphuric acid, however, and it is believed that the sulphuric acid acts upon it to produce a new but comparatively unstable compound, CaSO_4·SO_3, to which hypothetical substance the name calcium bisulphate, or bisulphide of lime, has been given. Upon exposure to air the bisulphate solution gradually deposits crystals of the monosulphide, having the composition CaSO_4·2H_2O. On the commercial scale the bisulphite solution is prepared by passing sulphur dioxide gas (SO_2) through "milk of lime" (that is, water containing slaked lime in suspension). The monosulphide of lime is first formed, and by the continued action of the sulphur dioxide this passes into solution in the form of the bisulphite. The usefulness of bisulphite of lime in the arts depends upon the power of CaSO_4·2H_2O, by which the fibres of wood are cemented together. Thus, in the sulphite process of manufacturing...
CALCULATING MACHINES

wood pulp, chips of wood are submerged in a solution of the bisulphite and heated for some hours in closed digesters, by the action of steam. By this means the chips are disintegrated, the gummy connector materials being entirely dissolved away, and the wood being thereby reduced to a mass of separate fibres, which after simple washing and bleaching are ready for use in the manufacture of paper. See Electrochemical Industries.

CALCULIUM CARBIDE. A compound crystalline substance composed of calcium and carbon. Its symbol is CaC₂. When pure it is colorless and transparent, but as found in commerce it is of a lustrous reddish-brown or blackish color, being discolored by iron. It is a substance of great economic importance, owing to the fact that it decomposes with water at ordinary temperatures, with the formation of acetylene gas. See Calcium; Carbide; Electrochemical Industries.

CALCULUIIUM CHLORIDE. The commercial supply of this important chemical salt is obtained from natural brines found in several localities in Ohio and West Virginia. The output in 1916 was 26,062 tons (20,535 tons in 1915), valued at $216,729. In addition to this direct and recorded production there were thousands of tons produced as a by-product in the manufacture of soda. The uses of calcium chloride are constantly increasing in number. One of the most important is the addition of 3 per cent to Portland cement permits cement work to be carried on during freezing weather. In the water-jackets of water-cooled automobile engines a 20 per cent solution of calcium chloride will remain liquid down to a temperature of 9 degrees below zero. In refrigerating apparatus it is much superior to common salt (sodium chloride), remaining liquid at a much lower temperature. Because of its affinity for moisture it is used to sprinkle roads, tennis courts and playgrounds, to prevent dust. It is used also to preserve railroad ties and fence posts, and other timber used under similar conditions, and also in the manufacture of important dyestuffs. See also Calcium.

CALCULUIIUM LIGHT. A brilliant light produced by directing the flame of an oxy-hydrogen blowpipe against a block of compressed quicklime. It had long been known that lime emits a light of extraordinary brilliance and whiteness when strongly heated in this manner, but the first practical application of the principle was made by Capt. Thomas Drummond in 1825, in connection with the trigonometrical survey of Ireland. The calcium light is constantly employed in the production of theatrical effects and for the projection with a stereopticon of photographic pictures upon a screen. It is also called Drummond light, lime-light and oxy-hydrogen light.

CALCULATING MACHINES. These machines are classified according to their use, as arithmetical or geometrical; the former dealing with combinations of numbers, the latter with calculations of length, area, and contents. In the first class the operations performed by the machine may be simply addition, in which case it is called an adding machine. Some of these simple machines also perform subtraction. The multiplying machines are far more complicated and perform also division, and they can be manipulated so as to work problems in the rule of three, and extract square roots.

In the simple adding machine the number is always progressively added, a unit at a time. Several different devices have been employed by inventors to accomplish this result. The simplest is a train of wheels bearing the nine digits and zero on the face of the wheel near its outer edge. On the first wheel (at the left) units are counted up to 10. At the tenth count the next wheel to the left is moved one cog by a stud which operates each time the "units" wheel makes a complete revolution. The "hundreds" wheel, next again to the left, is in like manner turned one cog when the "tens" wheel completes one revolution; and so on. The result is read through a "window" showing the uppermost figure on each wheel. On this principle the automobile speedometer and the trolley-car fare indicator are operated. Other devices include a rocking sector of a circle, operated by a key. On the curve of the sector are nine teeth, with a wheel with nine teeth. When the key marked 9 is depressed, the entire sector moves in gear with the counting wheel giving it a complete turn. When the key marked 4 is depressed only four of the teeth engage the wheel which is thus turned only four-ninths of a complete revolution. A second sector placed to the left of the first and operated in the same way would count tens, and a third sector still farther to the left would count hundreds; and so on up to as many places as desired. Several variations of this system have been utilized. The key may not move the sector when it is pressed, it may simply set a stop or check, and the movement may be produced by a lever, or by electric mechanism. This is the device used in the cash register, and in the Burroughs Adding Machine.

Another application of the same fundamental idea is the stepped cylinder, in which ridges running lengthwise of the cylinder take the place of cogs on a wheel, each pair of ridges are of different lengths, appearing as steps, each succeeding ridge being longer by one unit than the ridge preceding. By sliding a toothed counting-wheel across the cylinder, a distance regulated by the position of the desired number on a scale, and turning the cylinder by a crank, the respective number of ridges at that plane will operate the counting-wheel. This device is utilized in the Arithmometer and other machines of the Thomas type. A variation of this idea consists of a series of rails in place of the ridges on the cylinder—as in the Mercedes machine.

Another basic device is a cylinder having cogs which may be withdrawn into the body of the cylinder by adjusting a cam-shaped ring. The teeth or cogs which remain projecting beyond the surface of the cylinder are those which operate the counting wheel. The action may be similar to that of the sector, the teeth operating in one plane, or it may follow the plan of the stepped cylinder, by means of the "stepped" and operate on a sliding carriage. This device is used on the Brunsviga machine, and the many modifications of it. Adding machine attachments have been devised for type-
writers, whereby figures set in a column by the typewriter are added by the attachment and the total may be printed in at the foot of the column.

The Abacus, described elsewhere in this encyclopedia, in one of its varied forms is widely employed in India, China and Japan for making a variety of mathematical calculations, generally for commercial accounting. The geometrical class of calculating machines the simplest type is a measuring wheel which is graduated on its circumference, and is run over the lines to be measured, a recording mechanism at the axis showing the total distance traversed. The slide rule is a device of some little antiquity, having been invented in the logarithmic type in 1620 by Gunter. Many other mathematicians followed with variations and adaptations. The slide rules are classified as (1) those working with movable indexes, and (2) those with adjacent sliding scales. To the first class belong the circular scales of Oughtred, Scott, Nicholson and Weiss; and the spiral scales of Milburne, Adams, Nicholson and Lilly. To the second class belong the straight rules of Partridge, Everard, Roget and Mannheim; the circular rules of Biler, Sonne and Charpentier; and the cylindrical rule of Thacher. The standard British slide rule is of the Mannheim type, and carries four scales, two on the stock and two on the slide. The slide is set for the problem in hand, and the result is read by a "runner," or the rule may be turned over and read from scales on the back. The Integrator is a mechanical apparatus for solving graphically differential equations. Planimeters are machines which measure lines and the areas of plane surfaces. There are several types, but only one, the polar planimeter, is in use at the present day. There are two separate fixed points on this machine, one of which is the pole. From these points reach out arms to a carriage on which is a tracing wheel and calculating mechanism mounted on a sleeve, which slides along graduations on one of the arms. A modification of this machine has a long straight rail against which a guide is held while the machine is being operated. The Integrator is another form of planimeter by which many intricate problems may be solved mechanically. The name "Harmonic Analysers" is given to another machine of similar construction. The "Tide Predictors" of Roberts and Lord Kelvin are among the remarkable mechanisms devised to solve mathematical problems. With these machines set with a duplication of the component forces operating upon the tide at any port, the mechanism delivers in about two hours a tracing showing graphically the movements of the tide at that port for a year in advance.

The Hollerith electric tabulating mechanism used by the United States Census Bureau is prominent among the remarkable calculating machines that have been developed in America. Three separate machines constitute the outfit. The first one punches holes in cards, in any one or more of 240 places; the second tabulates the cards, while the third sorts them. Machine No. 1 has a keyboard of 240 keys, this being the number of answers called for in the census blanks of the bureau. The operator takes a return blank, representing the report of some individual, and, as he reads it, strikes the appropriate keys, which results in the punching of a card, that becomes a mechanical counterpart of the original return. As the average number of questions answered on each return is but 15, the work is not so tedious as might be inferred from the statement as to 240 questions.

When the cards of a State have been punched, they are brought to the tabulating machine, which is the real calculating machine. This machine reads the holes of the cards that are fed into it, and makes an electrical record of each hole, according to its position, adding up the totals for each hole, and showing them on dials. When the cards are all fed through, the total of each of the 240 replies is enumerated. The third machine is a sorting box, which serves to secure answers to cross-questions. For instance, if it is desired to know how many white persons are among the total number convicted of crime, the sorting box will locate all cards having the holes corresponding to these two statements, and give the total. In this way a great variety of statistics are made available which it would be too expensive to gather or compute in any other way. For other information on this subject, see Cash Register; Computing Scale. Consult Cajorl, F., 'A History of the Logarithmic Slide Rule' (London 1909); Horsburgh, E. M., 'Modern Instruments and Methods of Calculation' (London 1914); Pickworth, C. N., 'The Slide Rule: A Practical Manual' (London 1910).

CALCULUS. As used in medicine the term calculus (Lat. calculus, a pebble or small stone) is applied to certain concretions occurring in the cavities or tissues of the body, usually as the result of the deposition of solids from some natural secretion. Calculi may be of many different sorts, and vary greatly in consistency, some being merely crumbling masses that can be crushed between the fingers, while others are extremely hard. Calculi occurring in the lacrimal or tear passages are called dacryoliths, while salivary calculi are found in the salivary glands or their ducts, and amygdololiths in the tonsils. So-called rhinoliths are concretions which sometimes develop in the nasal cavities, usually as the result of the presence of some foreign body. The term tooth calculus is sometimes spoken of as dental calculus. Pneumololiths occur in the lung and broncholiths in the bronchi; pancreatic calculi are found in the pancreas. The breast and prostate gland also occasionally harbor calcareous concretions, which in the former case are called lacteal calculi. The deposits of chalk about the joints in gouty persons are sometimes referred to as arthritic calculi. Intestinal calculi or enteroliths may give rise to serious disturbances, and if they happen to occur in the appendix often simulate date or other fruit stones in appearance. Before appendicitis was well understood their true nature often passed unrecognized and when they were discovered in cases of the disease the malady was mistakenly attributed to the swallowing of such foreign bodies. The two most important types of calculi, however, are the biliary calculi or gallstones, and urinary calculi.

Gall-stones are very common and fortunately usually do not give rise to symptoms. It is estimated that in Europe 10 per cent of the
entire population have gall-stones, while in this country their frequency is held to be about 7 per cent. As their formation is probably encouraged by sedentary life and conditions favoring stagnation of the bile, such as tight lacing, lack of exercise and constipation, they are three times commoner in women than in men. They rarely give symptoms in younger persons, and about half of the patients are over 40 years of age. Pregnancy is said to be of importance in favoring their formation. Biliary calculi may be extremely small or may attain considerable size, stones as large as an English walnut not being at all uncommon. They also vary greatly in number and the smaller ones may be present in hundreds. They are composed principally of cholesterol (q.v.), with varying but much smaller amounts of bile pigment, lime and magnesium salts, fatty acids and bile acids. It is now generally assumed that an inflammatory or catarrhal condition of the mucous membrane of the gall-bladder (q.v.) and the calculi associated, furnishes the starting point of gall-stone formation. As already stated gall-stones may remain in the gall-bladder for years without causing symptoms, or their presence may be accompanied by inflammatory changes in the organ, or it may lead to disturbances of various sorts, of which pain, local tenderness, persistent or remittent jaundice, clay-colored stools and chills and fever are conspicuous features. While a rational and hygienic mode of life will do much to prevent the formation of gall-stones, if they are present and give rise to symptoms that are at all severe surgical intervention is usually necessary to effect a cure.

Urineal calculi may be found either in the kidney, ureter or bladder, and are accordingly called renal, ureteral or vesical calculi. Kidney stones of small size often pass into the ureter and during their journey downward to the bladder give rise to severities of renal colic which in the agony and general prostration they cause are very similar to those of biliary colic. The pain is felt lower down in the abdomen and also in the back; frequently also radiating along the inner surface of the thigh. Aside from the attacks of colic renal stones may cause pain in the back, chills, fever and bloody or turbid urine containing pus. Coral calculi are large stones which gradually fill the pelvis of the kidney, and in the conformation reproduce with great fidelity the irregularities and recession of this cavity. Very small concretions pass into the bladder without difficulty and are evacuated in the urine as gravel. Stone in the bladder is rare in women and in the male sex is seen most frequently in infancy and after the fifth year. The symptoms include pain increased by jolting or bodily motion, frequent urination, pain at the end of urination — and sometimes sudden stoppage of the stream owing to the fact that the stone rolls into the neck of the bladder shutting off the flow — and usually bloody and turbid urine. Stone is especially common in old persons on account of the cystitis (q.v.) often present. Urinary calculi may be composed of various materials, of which uric acid and urates, calcium oxalate (calcium carbonate), ammonium phosphate and ammonio-magnesium phosphate are the commonest, singly or in combination. Rarer forms are made up of calcium carbonate, cystin or xanthin. The cut section usually shows a laminated structure and a nucleus or starting point, which may be a blood clot, a shred of tissue, a bit of mucus, a small renal calculus, a mass of urates or a foreign body. Any conditions encouraging excessive deposition of the urinary constituents predispose to urinary calculi. Among such causes are lack of exercise, digestive disorders, defective oxidation, excesses in eating or drinking, catarrhal conditions of the urinary tract, etc. The tendency to stone formation is particularly pronounced in those having what is called the gouty or lithicemic diathesis. The diagnosis of renal calculi is facilitated by the use of the X-ray, while for the detection of bladder stones a special form of steel sound termed a stone seeker is introduced into the bladder. The cystoscope is also of great service in this field. Individuals predisposed to stone should keep the urine abundant by the free use of water — preferably distilled — and moderate exercise. They should avoid disturbances of various sorts, of which pain, local tenderness, persistent or remittent jaundice, clay-colored stools and chills and fever are conspicuous features. While a rational and hygienic mode of life will do much to prevent the formation of gall-stones, if they are present and give rise to symptoms that are at all severe surgical intervention is usually necessary to effect a cure.

CALCULUS, The Infinitesimal. The Infinitesimal, or Differential and Integral, Calculus is not so much a branch of mathematics as a method or instrument of mathematical investigation, of indefinite applicability. The masters now seldom try to treat it in less than a thousand large pages; here we may hope no more than to expose its basic principles, to illustrate its characteristic processes and to exhibit some of its more immediate applications, with their results. Even so little will require the utmost condensation and self-explaining abbreviations.

We might define the Calculus as the Theory and Application of Limits, so central and dominant is this latter concept. We must then, clear the ground for its full presentation.

Successive addition of the unit 1, continued without end, gives rise to the assemblage of positive integers, in which all additions, multiplications and involutions are possible. This assemblage is ordered: i.e., of two different elements, a and b, either a < b or a > b; and if a < b and b < c, then a < c. To make all subtractions (inverses of addition) possible, we annex the symmetric assemblage of negative integers, any negative integer as a (or -a), being defined by the equation a + a = 0, this 0 itself being defined by a - a = 0. To make all divisions (inverses of multiplication) possible, we annex the assemblage of fractions, quotients of integers by integers. This total assemblage of integers and their quotients, both + and —, we may call the domain or assemblage of rational real numbers, wherein all direct operations (of addition and multiplication) and also the inverses (subtraction and division) are possible. For a precise definition of the processes of
annexation here involved, see Algebra, Definitions and Fundamental Concepts.

The operation of involution is direct, a special case of multiplication, but is not commutative like addition and multiplication: thus \( a + b = b + a, \ ab = ba, \) but in general \( ab \neq ba \) unless \( a = b \) or one of them is zero. Thus the operation of involution is not commutative. The inverse of \( a \) is \( \frac{1}{a} \) if \( a \neq 0 \). It has two inverses: Given \( b \) and \( c \), to find \( a \) and given \( a \) and \( c \), to find \( b \). The former gives rise to roots or surds, the latter to logarithms. But neither of these can in general be found in the universe of rationals; to make such inversions always possible, we must still further enlarge the domain of number by annexing Irrationals. These demand exact definition.

Divide the assemblage of rationals into two classes, \( A \) and \( B \), any member \( a \) of the first being \( a < b \) to any member \( b \) of the second. Three possibilities present themselves:

1. \( A \) may contain and be closed by a number \( a > a \) to any other \( a \) but not \( < a \).

2. \( B \) may contain and be closed by a number \( b < a \) to any other \( b \) but not \( > a \).

3. Neither \( A \) may contain a largest \( a \), nor \( B \) a smallest \( b \). Then we may form (1) \( A \) of 2 and all rationals \( < 2 \); or (2) \( B \) of 2 and all rationals \( > 2 \); in either case 2 is a border (frontière) number; or (3) \( A \) of all negatives and all positive rationals whose squares are \( < 2 \) and \( B \) of all positive rationals whose squares are \( > 2 \). Here there is no border number among rationals. But a border does exist, defined as \( > a \) to any \( a \) but \( < a \). We name it second root of 2 and denote it by \( \sqrt{2} \) or \( 2^{\frac{1}{2}} \).

All such common borders are called Irrationals. The assemblage of Irrationals is determined by all such possible partitions of rationals \( (A, B) \). The assemblage of all rationals and all such Irrationals is the assemblage of Reals. It remains and is possible to extend the operations of arithmetic to all Reals. In particular, the assemblage of rationals is dense; i.e., between any two there is an infinity of others; in the same sense the assemblage of Reals also has density. Again, always on dividing all Reals into \( A \) and \( B \), in such a manner that each member of \( A \) is each member of \( B \), there will be a border in one set at \( A \) or the least in \( B \), all less numbers being in \( A \), all greater in \( B \). Hence, and in this sense, the assemblage of Reals is named continuous.

In this continuum, admitting no further introductions, suppose a magnitude to assume successively an infinity of values: \( v_0, v_1, \ldots v_n \ldots \) \( v_n^+ \ldots \); it is then called a variable, \( V \) and its values in order form a sequence, \( S \). It often happens that \( V \) will approach some constant \( L \), so that by enlarging \( n \) we may make and keep the modulus or absolute worth (i.e., radius of sign) of the difference \( V - L \) any preassigned positive magnitude, \( c \), for all following values of \( v \); in symbols, \( |V - L| < c \) for every positive \( k \). Then \( L \) is called the Limit of \( V \): \( L = \text{Lim} \ v \). Plainly, \( V \) cannot have two limits as thus defined. It is evident that \( V \) has a limit when and only when \( |V - L| < c \). If \( V \) changes always in the same sense, by increase or decrease, it has a limit when and only when \( |V - L| < c \). When \( V \) increases (positively or negatively) beyond any assignable \( L \), it is often said to have \( \infty \) as limit.

A perfect geometric illustration is found in the sequences \( I \) and \( C \) of inscribed and circumscribed regular polygons of the circle. Here every \( C \) is \( > I \); also \( C_n - I_n < r \); also \( C_n - I_n + I_n < r, C_n - A_n < r \); \( A_n - I_n < r \) (\( A \) being the circle-area); hence \( A \) is the common limit both of \( C_n \) and of \( I_n \) for \( n \) increasing without \( \infty \).

Algebraically, if \( C_n, C_{n+1}, \ldots \) be the sequence (\( O \)) of odd convergents and \( C_n, C_{n+1}, \ldots \) \( C_n \) the sequence (\( E \)) of even convergents in an infinitesimal continued fraction

\[
\frac{1}{1 + \frac{1}{1 + \frac{1}{1 + \frac{1}{1 + \cdots}}} = \text{as \ convergent, then every } C_n^{+} > C_n^{o}, \text{also } C_n^{o+} - C_n^{o+} + C_n^{o}< C_n^{o}, C_n^{o+} < C_n^{o+}; \text{and } C_n^{o+} - (\sqrt{13} - 3) < r, (\sqrt{13} - 3) - C_n^{o}< r.
\]

The odd convergents from above and the even convergents from below close down endlessly upon their common limit, \( \sqrt{13} - 3 \); as quadrants of a hyperbola and its conjugate close down upon their common asymptote.

The difference \( |V - L| \) is a variable small at \( \infty \) and is called \( \infty \) infinitesimal (\( o \)); its limit is 0. The quotient of two \( o \)'s will generally be a variable; if it has a finite limit \( L \), the \( o \)'s are named of the same order; if the limit of the quotient is 0 (or \( \infty \)), the numerator (or denominator) is of higher order. If any \( o \) be chosen as standard, it is called principal infinitesimal; any other whose \( p \)th root is of the same order as the principal \( p \) is itself said to be of \( p \)th order.

Easy theorems are now proved as to the limits of the sum, difference, product, quotient or variables. In general: If \( R(w, u, v, \ldots) \) be a rational function of simultaneous variables, \( u, v, w, \ldots \); and if \( w, v, w, \ldots \) have limits, \( l, m, m, \ldots \); then \( R(w, v, w, \ldots) \) has a limit \( R(l, m, m, \ldots) \); always provided that this latter does not involve a division by 0, which has no sense.

If two \( V \) differ at most by a \( \sigma \) and one has a limit, the other has the same limit. Hereby there becomes possible a Calculus of the Limits of Variables instead of the Variables themselves. These limits are often far more the important, as we shall soon see.

A variable \( V \) (or sequence \( v_0, v_1, \ldots \) ) is bounded above when we may assign a value \( M \) that it cannot exceed; then there is a certain smallest number its upper limit, which it cannot exceed. Similarly, it is bounded below when we may assign an \( m \) below which it cannot sink; then there is a certain greatest number, its lower limit, under which it cannot descend. If \( V \) may assume either of these limits as one of its values, then that limit is attainable and is a Maximum or a Minimum; otherwise it is unattainable. If \( V \) be a proper fraction, its limits, 0 and 1, are not attainable. When \( V \) may assume every value between its attainable limits, \( a, b \), it is said to vary continuously in the interval \([a, b]\). But if \( a, \) or \( b, \) both are unattainable, we shall say that it is continuous in \([a+\alpha, b]\) or \([a, b-\alpha] \), or \([a+\alpha, b-\alpha] \).

When to values of one magnitude correspond values of another, the magnitudes are called Functions of each other (Limitants). The one to which arbitrary values may be supposed given is called the argument or independent variable; the other, whose corresponding values
CALCULUS, THE INFINITESIMAL

may be reckoned or observed (or which at least exist), is called the function. Such are a number and its logarithm or sine; the radius of a sphere and its surface or volume; the elasticity of a medium and the velocity of an undulation through it; etc. The general functional connection of and is expressed by.

If, in , then is a function of .

If , then is a rational function of ; otherwise, an irrational function.

If to any one value of there corresponds one unique value of , then is a one-valued or unique function of ; if be a unique function of , then there exists between and a one-to-one correspondence.

If and 

then and denote inverse functions. A function may reduce to a constant; as , for every finite when .

As ranges in , function will also range. Similarly, may have an upper limit and a lower limit; then is bounded in , and is its oscillation. If either or be absent (or ), this oscillation is . If we put , we get sub-intervals such that for at least one , and in none; the oscillation will not be in any .

If approaches , no matter how, approaches as its limit, then is continuous at (i.e. for ). Or, if is bounded in and if the limit of its oscillation be for vanishing, then is continuous at . That is, we must be able to and keep the oscillation of small at will by making and keeping the fluctuation in small at will.

It may be that limit of is only for , then is named continuous right of ; or that is continuous only for , then is named continuous left of . Only when the is left of, and or (i.e. of being the same), is continuous at .

If is continuous at all points (values of ) right of and left of, it is named continuous in .

The infinitesimal is called the (immediate) vicinility (or neighborhood) of .

A change in the value of is conveniently denoted by , read difference- or Delta-; hence and will denote corresponding (simultaneous) differences or changes in and .

If is continuous in , we may cut this latter up into finite sub-intervals, each so small that the oscillation of in each shall be . Hence Heine calls uniformly (equally, gleichmässig) continuous in . This corresponds to uniform convergence, as of a power-series,

opposed to non-uniform or infinitely slow convergence (Seidel, 1850). Finer discriminations must here be omitted.

Continuity in the same functional property with which the Calculus is concerned. Since

and cosine are everywhere continuous, but tan is discontinuous for ,

where and cosine are everywhere continuous, but tan is discontinuous for ,

Similarly, is discontinuous at , at an extremely important discontinuity.

So is discontinuous at , leaping from to ; the discontinuity is 2. It is generally assumed that Continuity holds throughout the Processes of Nature.

Again, is not defined for , but whatever value be assigned it there, it remains discontinuous, since sin 1/ vibrates infinitely fast between +1 and −1 for . Again, may approach a limit for vanishing, yet not approach . Thus, let .

A decreasing geometrical series, ratio , hence . Then as , . But for , . There are many immediate consequences of continuity, which we have no space to discuss here, such as: A function continuous in is continuous in its upper and lower limits (its maximum and minimum); it also assumes at least once every value between and , a property, however, not peculiar to continuous functions (Darboux).

The notion of function is at once extended to several variables, , . One- or many-valued, algebraic or transcendental, etc., as before. Each variable, as , has its range or interval ; so its , etc. All possible sets of values , ... form an assemblage or the Domain (D) of variation. Any set (or point) for which any variable has an extreme or border value, as or , or , or , is a border point; the assemblage of all such is the border or contour of . A simple geometric description of in rectangular co-ordinates for only two variables, and , are the limits of or sides ; beside , , , and ; of three variables, , , it would be a cuboid bounded by the planes . The point (x, y) or (x, y, z) is anywhere in or on the rectangular or cuboid. Such a may be thought cut up into elements, infinitesimal rectangles or cuboids. Suppose any point , within an element. If now approaches , ... approaches point , ... , no matter how, then approaches a point, ... (point, ...).

This amounts to saying that the oscillation of shrinks toward zero as the element contracts, no matter how, about the point; that is, infinitesimal function-changes correspond to any and all infinitesimal argument-changes in the immediate vicinity of the point.

Any is called continuous within when continuous at every point in . But on this border, as , , etc. approach , ... the point must not get without D. An f is continuous in the (immediate) vicinility of a point, when continuous within an infinitesimal D including that point.
In general, theorems holding for functions of one variable may be extended, with proper modifications, to functions of several variables.

**Derivatives.** In the study of functional dependence, the main subject of scientific inquiry, it is of first importance to know how corresponding changes in the magnitudes are related. To discover this, we form the quotient of corresponding differences, \( \frac{\Delta y}{\Delta x} \) called Difference-Quotient (DQ). In general, it is very complex, but breaks up into two parts, one independent of \( \Delta x \), the other vanishing with \( \Delta x \). The first is the important part and is named Derivative (D) or Differential Coefficient (DC). More formally, if \( y = f(x) \) be a unique continuous function of \( x \) in \([a, b]\), and \( x \) be any point therein, and if

\[
\frac{dy}{dx} = \lim_{\Delta x \to 0} \frac{f(x + \Delta x) - f(x)}{\Delta x}
\]

approaches a limit as \( \Delta x \) approaches 0, no matter how, then that limit is called Derivative (D) of \( f(x) \) as to \( x \), at the point \( x \). If \( f(x) \) has a D at every point of \([a, b]\), the assemblage of them forms a new function, the Derivative of \( f(x) \) for \([a, b]\), which we may write \( f'(x) \) with Lagrange, or \( \frac{df(x)}{dx} \) with Cauchy. Hence

\[
\frac{df(x)}{dx} = f'(x) + \sigma.
\]

**Geometric Interpretation.** The Differential Calculus originated in the Problem of Tangents. Let \( P \) be any point of a curve referred to rectangular axes \( X, Y \), and let \( P \) be between \( Q \) and \( Q' \). Draw secants \( PQ, PQ' \), sloped \( \theta \) and \( \theta' \) to \( X \), and \( \phi \) to \( \theta \) and \( \theta' \) to each other; draw ordinates through \( P, Q, Q' \); through \( P \) and \( Q' \) draw parallels to \( X \), meeting ordinates through \( Q \) and \( P \) at \( D \) and \( D' \). Then

\[
PQ = \Delta x, \quad PQ' = \Delta x', \quad DQ = \Delta y, \quad PD' = \Delta y'.
\]

Also

\[
\frac{\Delta y}{\Delta x} = \tan \phi, \quad \frac{\Delta y}{\Delta x} = \tan \phi', \quad \tan (\phi' - \phi) = \frac{\Delta y}{\Delta x} = \tan \phi.
\]

If now by approaching \( Q \) and \( Q' \) to \( P \) we can make and keep \( \phi \), and therefore \( \tan \phi \), small at will, then the secants settle down into a common position called tangent to the curve at \( P \) (sloped \( r \) to \( X \) and the common limit of \( \frac{\Delta y}{\Delta x} \) and \( \frac{\Delta y}{\Delta x} \) is tan \( r \); or \( f'(x) = \tan r \). But if \( P \) were an angular point, then \( PQ \) and \( PQ' \) would not tend together, \( \frac{dy}{dx} \) would tend to one limit, the progressive differential coefficient, and \( \frac{dy}{dx} \) to another limit, the regressive differential coefficient; only when these two coalesce there is a Derivative proper. Thus in \( y = x (\frac{1}{e^x} - 1) / (\frac{1}{e^x} + 1) \), at the Origin, Lim. \( \frac{dy}{dx} = (\frac{1}{e^x} - 1) / (\frac{1}{e^x} + 1) \), the progressive \( DC = 1 \), the regressive \( DC = -1 \), the two limiting positions of the secants are perpendicular.

How thickly may such salients be strewn along a curve? To have a D, i.e., to be differentiable, plainly the function must be continuous; it was long thought that this necessary condition was sufficient, that the continuous function possessed in general a D, save at certain special points. It was Riemann who first suggested (at least as early as 1861) the astonishing possibility that such an \( f(x) \) as

\[
\frac{\Delta y}{\Delta x} = \sum_{n=1}^{\infty} \frac{\sin(n\pi x)}{n!},
\]

though everywhere continuous, was nowhere differentiable; but as he left no proof, it was generally thought he meant strictly that the D did not exist for any value of \( x \). In any case Weierstrass himself produced (18 July 1872) an example of such a function, \( y = \sum_{n=0}^{\infty} \frac{\sin(n\pi x)}{n!} \), where \( a \) is an odd integer, \( b, c, d \) be a positive number \( < 1 \), and \( ab > 1 + \frac{\pi}{n} \), which, though everywhere continuous, has nowhere a D, since the progressive and regressive Difference-Quotients are everywhere opposite in sign and increase oppositely toward \( \infty \) as they pass over into Differential Coefficients (Math. Werke von K. Weierstrass, II, p. 71–74). Geometrically, in the graph of the differentiable function, the polygon formed by \( n \) consecutive chords tends toward the curve for \( n \to \infty \). For \( PQ \) to \( PQ' \) tend to coalesce as \( Q \) and \( Q' \) both approach \( P \), the triangle \( PQ'' \) becomes flatter and flatter (we may suppose the arc \( PQ'' \) steadily enlarged under a microscope to its original length as \( Q \) and \( Q' \) close down on \( P \)), the curve we may say is elementally straight at \( P \). But with Weierstrass’s function the polygon remains always re-entrant, a zigzag, and as consecutive chords, \( PQ \) and \( PQ' \), tend to separate at a straight angle. Such discontinuities may yet present themselves to the future student of nature.

If \( y = x^a \), \( \frac{dy}{dx} = 2x \Delta x + \Delta x^2 \), \( \frac{dy}{dx} = 2x \Delta x \), whence \( \Delta x = \frac{\Delta y}{2x} = \frac{\Delta y}{\Delta x} \). Here \( y \) is the area of a square of whose side is \( x \), and \( 2x \) is the border of the square perpendicular to which the square expands, the \( D \) is the front of variation. Similarly, if \( y = x^2 \), \( D_y = 2x \), the circumference, the front of variation perpendicular to which \( x \) varies. If \( y = x^3 \), \( D_y = 3x^2 \), the front of variation perpendicular to which \( x \) varies. If \( y = 4x^3 \), \( D_y = 4x^2 \), the sphere surface, the front of variation perpendicular to \( x \). For \( y = x^4 \), \( D_y = 4x^3 \), again the whole front of variation, though here our powers of envisagement fail us. Thus we are conducted to the Derivation of Assemblages, for which the reader must be referred to this latter subject.

**Kinematic Illustration.** Let \( s \) = length of path of a moving point \( P \), described in time \( t \); \( \Delta s \) and \( \Delta t \) = corresponding changes in \( s \) and \( t \); then

\[
\frac{\Delta s}{\Delta t} = \bar{v} = \text{average speed during } \Delta t;
\]

Lim. \( \frac{\Delta s}{\Delta t} = \text{instantaneous speed at } t = \text{speed at the instant } t \) (i.e., end of \( t \) and beginning of \( \Delta t \)). There is no motion at the instant of time, nor at the point of path, but only
CALCULUS, THE INFINITESIMAL

during the time and space immediately about the point and instant. Instantaneous speed is a technical term for limit of average speed in the instantaneous vicinity of the point and instant. This instantaneous speed generally varies with $t$, and its $D$ as to $t$ is named acceleration and is written $\frac{dv}{dt}$. The product of this acceleration by the mass of the moving $P$ yields the all-important motion of force. The $D$ of this acceleration might be called second acceleration, but the notion has not yet proved useful in Mechanics (q.v.).

The notion for $D$ may be this or that. Newton used the dot, thus $\dot{s}$, to denote derivative as to $t$, as still do the British; Lagrange, the accent, $\dot{F}(x)$, still common; Cauchy, the operator $D$, with or without subscribed argument $x$; others subscripts, as $y_k, y_n, \text{etc.}$: most common, most expressive, but possibly misleading is the Leibnitzian $\frac{dy}{dx}$, not a fraction (thus far at least), not the quotient of $dy$ divided by $dx$, but the limit of the fraction $dy/dx$ for $dx$ vanishing, no matter how.

Sometimes we write $\frac{d}{ds}$ for $D_s$, thus: $y_s \equiv D_s y \equiv \frac{dy}{ds}$, etc.

Lagrange (‘Théorie des Fonctions,’ 1) attains the notion of Derived Functions (or $D_s$) by substituting $x + \xi$ for $x$ in $F(x) = a_0 + a_1x + a_2x^2 + \cdots + a_nx^n$, whence $F(x + \xi) = F(x) + F'(x)\xi + \frac{1}{2} F''(x)\xi^2 + \cdots + \frac{1}{n} F^{(n)}(x)\xi^n$,

where each $F$ turns out to be formed from the preceding in the same way; they are the Derived Functions of $F$. A near-lying Generalization considers $f(x) = \sum a_n(x - a)^n$, $n = 0$ supposed absolutely convergent for all values of $|x - a| < R$, i.e., for $x$ within $[a - R, a + R]$.

Then in the same [ ] all the $\infty$ series

$$\sum_{n=m}^{\infty} a_n(x-a)^n$$

will also converge absolutely. Denote them in turn by $f'(x)$, $f''(x)$, $\ldots$. Choose $\xi$ so that $|x - a| + |\xi| < R$; then the series

$$\sum_{m=0}^{\infty} \frac{f^{(m)}(x)}{m!}$$

will also converge absolutely in the same [ ] and will equal $f(x + \xi)$. These Sums $f'(x)$, $f''(x)$, $\ldots$ are called 1st and 2d, etc. Derived Functions of $f(x)$, which may be called its own 0th Derived Function. If instead of the inconvenient Lagrangian accents we put Cauchy's $D_s$'s with proper exponents, we perceive that these latter, denoting order of differentiation, obey the same laws as ordinary exponents:

$$D^{m+n} = D^m \cdot D^n, \quad D^m \cdot D^n = D^m \cdot D^n, \quad D^m, \quad D^n, \quad D^{m+n}.$$

It is usual, though not quite satisfactory, to denote the value of any derived function at any point $(x - a)$ by writing $a$ for $x$, thus: $f(a)$. At this stage the $D$-notation is not so convenient. These special values are seen to be $f^{(n)}(a) = \frac{n!}{n} a$. On finding hence the $a$'s and substituting in the definition of $f(x)$ we get

$$f(x) = f(a) + \sum_{n=1}^{\infty} \frac{f^{(n)}(a)}{n!} (x - a)^n$$

Such is the ordinary Taylor's Series, or MacLauren's (more justly Stirling's) in case $a = 0$.

Lagrange supposed (amazingly, Picard) any arbitrary $f(x)$ expansible in positive integral powers of $(x - a)$, except for special values of $a$. However, presupposed only uniqueness and continuity in a definite interval, there may be no value of $a$ in the interval for which such expansion is possible. Thus, $f(x) = -(x)$ for $z < 0$ and $\rightarrow 0$ for $z \geq 0$ cannot be developed in positive integral powers of $x$ for $x$ positive and $\rho$ not integral. Hence this Lagrangian notion of derived function, while in general agreeing with the notion of $D$ as limit of difference-quotient, is not yet so universal.

The notion of Differential, though unnecessary at this stage, is commonly introduced thus: From $\frac{dy}{dx} \equiv f'(x) + a$, $dy \equiv df(x) = f'(x)dx + a$. This first part of $df(x)$, namely, $f'(x)dx$, proportional to $dx$ and of the same order of infinitesimality, may be defined as the Differential of $f(x)$ and may be denoted by $df(x)\; x$, which is thus a finite variable for $dx > 0$. For $f(x) = x$, we have $dx = dx$, which is therefore differential of $x$. Hence $dx = df(x)$, i.e., the $D$ of $f(x)$ as to $x$ is the quotient of the differentials of $f(x)$ and $x$ (Leibnitz). Here $\frac{dy}{dx}$ is strictly a fraction whose terms are no means "ghosts of departed quantities" (Berkeley). Geometrically, $dy$ is the $dy$ prolonged up to the tangent at $P$, change of the ordinate of the tangent when abscissa changes by $dx$; $\lim_{dy \rightarrow 0} \frac{df(x)}{dx}$. This notion of differential, though useful in geometry, mechanics and elsewhere, rather embarrasses the theoretical development of the subject. Hence the terms Derivation (\"Derivation\"), to differentiate, and hence the names Differential Calculus, Differential Coefficient.

On these bases the structure of the Differential Calculus may now be safely erected. Primary formulæ, easily established, are as follows (D meaning always Derivative as to $x$, $u$, $v$, etc., being simultaneous functions of $x$):

$$D(u + v - w) = Du + Dv - Dw$$

$$D(uv) = Du + u'Dv = uv\left(\frac{Du}{u} + \frac{Dv}{v}\right)$$

$$D\left(\frac{u}{v}\right) = \frac{u'v - uv'}{v^2}$$

$$(u + c)' = u'$$; $$(uv)' = c: u'$$.

Very important is Mediate Derivation, when $y$ is function of a function of $x$, as $y = f(\phi(u))$, $\phi(x)$, hence $y' = f'(x)\phi'(u)\phi'(x)$. If then $\phi$ and $f$ have definite $D_s$, $\phi'(u)$ and $f'(x)$, we have

$$\frac{dy}{dx} = \frac{dy}{du} \cdot \frac{du}{dx}$$

hence $y' = y'u' = f'(u)\phi'(u)'$. $f'(x)$,
But $y z$ may exist even when the supposition fails, and this rule with it.

In particular, if $y = f(x)$ and inversely $z = f(y)$ and if either variable has a $D \neq 0$ so has the other. For if $f'(x) \equiv \lim \frac{dy}{dx} \neq 0$, then $\frac{dy}{dx} = f'(x)$ and hence $\lim \frac{dx}{dy} = \frac{1}{f'(x)}$ or $f'(y) = \frac{1}{f'(x)}$, i.e., in general, the $D$'s of $x$ as to $y$ and of $y$ as to $x$ are reciprocals of each other: $y z = \frac{1}{y z}$.

If $y = f'(x)$ is a function, then $x$ and $y$ increase (or decrease) together, $f(x)$ is called increasing at $x$. But if $y = f(x)$ be a function of $x$ and $y$ change oppositely, $f(x)$ is decreasing at $x$.

Hence if $f'(c) = 0$, $f(x)$ must be $f'(c)$ on one side of the point $c$, and $f'(c)$ on the other. Hence Rolle's Theorem: If $f(x)$ vanishes at $a$ and $b$ and has a $D$ at every point within $[a, b]$, then this $D$, $f'(x)$ vanishes at some point within $[a, b]$.

Now, $f(x) = (b-a) \phi(x) - (x-a) \phi(b) + \phi'(b) \phi(b)$ is such an $f(x)$, made to order, $\phi$ being differentiable within $[a, b]$. Hence $f'(x) = (b-a) \phi'(x) - \phi(x) + \phi'(b) \phi(b)$, and $\phi'(x) = 0$ for some $x$ in $[a, b]$. Hence $\phi'(x) = \phi'(b) \phi(b)$, and $\phi'(x) = \frac{1}{\phi'(b) \phi(b)}$.

Commonly we write $a \pm h$ for $a + h$ and $b \pm h$ for $b$; then $e^{x} = e^{x + \theta h}$, where $\theta$ is in $[0, 1]$, so that $\theta \phi' = e^{x + \theta h}$, the extremely important result for finite increments. Hence we see at once that if the $D$ is everywhere $0$ within an interval, the function is constant in that interval; and hence that two functions whose $D$'s are equal in an interval can themselves differ only by a constant in that interval — a Theorem at the base of the Integral Calculus.

Passing now to $D$'s, we first attempt $y = e^{x}$.

Hence

$$y + dx = e^{x} + dx = e^{x + dx} = e^{x} \left( 1 + dx + \frac{dx^{2}}{2} + \ldots \right).$$

Hence

$$\frac{dy}{dx} = e^{x} \left( 1 + \frac{dx}{2} + \frac{dx^{2}}{3} + \ldots \right).$$

This is term by term, except the first, less than $e^{x}$, whose limit is 1; hence $D \frac{dy}{dx} = e^{x}$ on $D e^{x}$, the exponential $e^{x}$ is unchanged by Differentiation as to its exponent. Hence $D e^{x} = e^{x}$. Hence, if $y = \log x$, $e^{x} = y$, $e^{x} y = 1$, $y = e^{-x} = 1$; or $D \log x = \frac{1}{x}$. Hence

$$D \log u = \frac{u}{u}.$$  Hence, if $y = x^{n}$, $\log y = \log x^{n} = n \log x$; $D y = D x^{n} = n x^{n-1}$.

For $y = \sin x$, $2 D y = \sin(x + 2dx) - \sin x = 2 \cos(x + dx) \sin dx$; $\frac{dy}{dx} = \cos(x + dx) \frac{dx}{dx}$; hence

$$\frac{dy}{dx} = \cos(x + dx) \frac{dx}{dx} = \sin(x + \frac{\pi}{2})$$; hence

$$D \sin u = \cos u \cdot u \frac{du}{dx}.$$  Hence $D \cos x = - \sin x$.

Cosine as to the angle merely adds $\frac{\pi}{2}$ to the angle. Also, $D \tan x = 1 + \tan^{2} x = \sec^{2} x$. If $y = \sin^{-1} x$, $\sin y = x$, $y \frac{dy}{dx} = 1$, $y = \frac{1}{\sqrt{1 - x^{2}}}$; hence

$$D \sin^{-1} x = \frac{x}{\sqrt{1 - x^{2}}}.$$  Similarly for $\cos^{-1}$. If $y = \tan^{-1} x$, similarly $D \tan^{-1} x = \frac{1}{1 + x^{2}}$.

Specially, if $D \sin^{-1} \frac{x}{a} = \frac{1}{\sqrt{a^{2} - x^{2}}}$, $D \tan^{-1} \frac{x}{a} = \frac{1}{a^{2} + x^{2}}$.

Similarly we treat the hyperbolic sine and cosine and tangent ($\sinh x$, $\cosh x$, $\tanh x$), and their inverses $\sinh^{-1} x$, $\cosh^{-1} x$, $\tanh^{-1} x$, with the important results:

$$D \sinh x = \cosh x, \quad D \cosh x = \sinh x, \quad D \tanh x = 1 - \tanh^{2} x,$$

with easy generalization for $u$ and $\frac{x}{a}$, — formulæ especially important in Integration. By Derivation the anti-transcendentals are thus reduced to algebraic forms, while the exponentials and goniometrics return into themselves; hence the inverse of Derivation, whatever it may be, is applied to algebraic forms, may give rise to transcendentals. So much for ordinary algebraic and simple periodic functions.

The Infinite Series cannot always be differentiated by differentiating term by term, but only under certain conditions of equable convergence. If each term $f_{n}(x)$ of $f(x) = \sum_{n=0}^{\infty} f_{n}(x)$ be unique and continuous and if $\Sigma f_{n}(x)$ converge, for every $x$ in $[a, + d]$, and if $L f_{n}(x) = f_{n+1}(x)$ — for such a series the Theorem holds: If each term has a finite progressive $D$, $f'_{n}(a)$, and if the series of $D$'s, $\Sigma f'_{n}(x)$, converges equably for every $dx > 0$ and $dx > 0$, then

$$f(x) = \sum_{n=0}^{\infty} \frac{f_{n}(x) + dx}{dx} - f_{n}(a)$$

for $dx > 0$.

In general, this narrower Theorem will answer: If, for every $x$ in $[a, + d]$, each $f_{n}(x)$ is unique, continuous, and has a $D$ (and for $x = a$ at least a progressive $D$), and if both $\sum_{n=0}^{\infty} f_{n}(x)$ and $\Sigma f_{n}(x)$ converge, the latter equably, then $L f(x) = f(x)$, and $f(x)$ has a progressive $D$ at $a$, which is $\Sigma f'_{n}(a)$: i.e., we form the $D$ of the infinite series by summing (to $\infty$) the $D$'s of the terms (for details see Real Variable, Theory of Functions of the).

For $D f(x)$ as to $x$, where $x = x + y$, see Complex Variable, Theory of Functions of.
A D of a first D is called a second D, written variously \( f'(y), Ds^2, \frac{d^2y}{dx^2}, \) and so on for the 3d, 4th, ... nth Ds. We see at once,

\[
Dn^m = \frac{m!}{(m-n)!} \frac{\sin \theta}{\cos \theta} (x + \pi n)^{2n-1}
\]

A rational fraction must first be decomposed into such fractions. The exponential \( e^x \) repeats itself steadily, \( D(e^x) = e^x \); hence \( \phi(D) = \phi(a)e^x \), \( \phi \) being algebraic and rational. The log \( x \) is at once reduced to a fraction by \( D \log x = \frac{1}{x} \). For a product \( uv \) we have Leibnitz's Theorem:

\[
D(uv) = u Dv + v Du + \frac{n(n-1)}{2!} u^2 v' + \ldots
\]

precisely as in the Bionomial Theorem, the subscripts denoting the Ds. For a quotient \( \frac{u}{v} \), we write \( \frac{D(u)}{D(v)} = \frac{vDu - uDv}{v^2} \). From these \( n+1 \) simultaneous equations we find the \( n \) unknowns, \( y, x, y_n, y_{n-1}, \ldots \); this elimination is linear in \( y_n \) and yields

\[
y_n = \frac{(-1)^n n!}{n^2!} \frac{\mu v 0 0 \ldots}{\mu v ^2 \mu v \ldots}
\]

Applications. 1. Let \( P \) be any ordinary point of a curve, \( S \) the foot of the ordinary \( y \), stretched evenly along \( Y \), the assemblage of \( y \)-values is not stretched evenly along \( Y \), but is stretched, compressed, folded, crumpled in countless ways. The study of \( Y \) becomes the study of the intimate texture of this \( Y \) axis bearing the assemblage of \( y \)-values.

If now \( y = x + cy \), \( w = u + iv \) are complex variables, and \( w = f(a) \), then \( a \) is indeed compounded of \( x \) and \( y \), not however in just any combination, as \( x+cy \), \( x-2iy \), but only in the one combination \( x+i(y+c) \). The domain of \( z \) is the \( X \) plane of \( w \), the \( Y \) plane of \( w \), as two we may take the floor and a wall or the ceiling. Not having a 4th dimension at command, we cannot envisage \( w = f(a) \) as a surface, as we did \( y = f(x) \) as a curve. We must again think of two points \( P \) and \( Q \), in \( X \) and \( Y \) connected by an elastic rod, \( PQ \); if \( P \) moves about in \( X \), \( Q \) moves about in \( Y \), obeying \( w = f(a) \). We may think of the texture of \( XY \) as uniform, then the texture of \( UV \) will not be uniform, but stretched, compressed, folded and crumpled in countless ways. The study of \( w \) now becomes the study of this intimate texture of \( UV \).

As in \( y = f(x) \) the derivative \( y_x \) is the part of the \( ds \) that is entirely independent of \( ds \) so \( w_x \) must be independent of \( ds \) as \( y_x \) is the same whether \( ds = \pm 1 \) or \( = -1 \), so in general \( w_x \) is the same no matter how \( ds \), along whatever path of value. Geometrically this signifies that if \( p, q \) be two intersecting paths of \( x \) and \( y \), the corresponding intersecting paths of \( w \), then \( p \) and \( p+q \) and \( q \), intersect under the same angle. Hence the angles of the curvilinear triangle \( (p, q, p') \) of the corresponding curvilinear triangle \( (p, q, p') \); hence the two corresponding infinitesimal curvilinear triangles of the chords (or tangents) will be similar, the ratio of similitude being \( w_x \) which of course varies from point to point: the one plane is a map of the other and the textures are similar in the smallest parts. Such is the geometric interpretation of the Derivative of Functions of a Complex Variable (q.v.). It would seem that such interpretations might be indefinitely extended.
a we find the 4-cusped Hypocycloid, \( r^4 + y^4 = c^4 \), as the envelope, or path of the instantaneous pivot.

Hence Plücker's double conception of a curve as path of a point gliding along a straight line that turns about the point, and envelope of a straight line that turns about a point that glides on the straight line. The relation connecting the corresponding magnitudes, arc-length \( s \) (of the path) and angle \( a \) (through which the straight line turns), is the intrinsic equation of the curve. The \( DQ \cdot \frac{da}{ds} \) is named average curvature of \( ds \); its limit \( \frac{d}{ds} \) is named instantaneous curvature (\( \kappa \)) at \( P \). Plainly \( da = a \cdot \tau \); hence

\[
\kappa = \frac{dy}{dx} \cdot \frac{d}{ds} = \frac{d}{dx} \tan \tau \cdot \frac{dx}{ds} = \frac{y'}{(1 + x^2)^{\frac{3}{2}}}
\]

(N.B. The Differential Triangle \( PDQ \) formed by \( dx, dy, ds \), yields at once

\[
s^2 = x^2 + y^2 \frac{dx}{ds} = \frac{1}{1 + y^2} \frac{dy}{dx} = \frac{y^2}{1 + y^2}
\]

In the circle \( \kappa \) is the constant \( \frac{1}{r} \), hence the curvature of the circle is the reciprocal of the radius. For any point of any curve the reciprocal of this curvature is called the radius of curvature \( \rho \); hence this \( \rho \) at any point is the radius of a circle of equal curvature, hence called circle of curvature.

To illustrate.—Draw \( PT \) and \( PN \), tangent and normal to the curve; about \( K \) and \( K' \) on \( PN \), with radii \( \rho' > \rho \) and \( \rho'' < \rho \), through \( P \) draw two circles, one less, the other greater than the circle of curvature. Let \( \rho' \) and \( \rho'' \) approach and coalesce in \( \rho \); then \( K \) and \( K' \) approach and coalesce in \( K \) the centre of curvature, and the \( \sigma \) about \( K \) is the osculatory circle.

Otherwise, through \( P \), and \( Q \) and \( Q' \) on opposite sides of \( P \), draw a circle. Let midnormals to \( PQ \), \( PQ' \) meet \( PN \) at \( S', S'' \), and each other at \( S \); as \( Q' \) and \( Q'' \) approach and coalesce in \( P \), \( S', S'', S \) all approach and coalesce in their common limit \( S \) (or \( K \)). Hence the osculatory circle = circle through three consecutive points of a curve, and centre of curvature = intersection of two consecutive normals.

The co-ordinates (\( u \) and \( v \)) of \( K \) are given by

\[
u = x - \frac{y^2}{2} (1 + y^2), \quad v = y + \frac{1}{2} (1 + y^2)
\]

Eliminating \( x \) and \( y \) between these equations and the equation of the curve, we get the equation connecting \( u \) and \( v \) for every \( K \), i.e., the equation of the Evolute, or locus of the centres of curvature of the original curve (the Involute).

Since \( u, v \), \( u^2 + v = 0 \), the tangents at corresponding \( P \) and \( K \) are perpendicular, the normal to the involute is tangent to the evolute. Also, it is easy to prove that the arc-length in Evolute can differ only by a constant from the radius of curvature (\( \rho \)) in Involute. Hence a point of a cord held taut while being unwound from the evolute must trace an involute; hence the former name. To any involute there is only one evolute, but to any evolute there are infinitely many (so-called parallel) involutes.—An excellent illustration of a one-valued determination with many-valued inverse, and also of the definiteness of differentiation as compared with the indefiniteness of its inverse, Integration (see below). Some curves reproduce themselves in their evolutes, notably Cycloid and Logarithmic Spiral, which latter inspired the engraving and epitaph on the tomb of Jacob Bernoulli (1654–1705): Eadem mutata resurgo. The general theory of the Contact of curves, Asymptotes etc. beautifully exemplifies this Calculus, but cannot be treated here (see Curves, Higher Plane).

Indeterminates.—If for \( x = a \) both terms of a fraction \( y = \frac{a}{\phi(x)} \) vanish, then \( y \) loses definiteness, taking the unmeaning form, \( y' = \frac{a}{\phi(a)} = \frac{\phi(a)}{\phi(a)} \) (Cf. Algebra).

The fundamental example is \( y = \frac{x^n - a^n}{x - a} \) for \( x = a \). However, we may still seek Lim. \( \frac{\phi(x)}{\phi(a)} \) for \( x = a \), though it would be arbitrary to assume this limit as the value of \( \frac{\phi(x)}{\phi(a)} \) (D'Abelaux). If \( x = a \) be removable from both terms, we may cancel it for \( x = a \), and then seek the limit for \( x = a \). Thus \( x = a \)

\[
ax + a^2 \quad \text{for} \quad x = a + 0, \quad \text{this last} = 3a^3 \quad \text{for} \quad x = a; \quad \text{hence} \quad \text{Lim.} \quad x = a \quad \text{or} \quad a = 3a^3, \quad \text{but not} \quad x = a = 3a^3
\]

for \( x = a \), unless arbitrarily. Now \( x = a \) = \( \phi(a) \) = \( \text{Lim.} \phi(x) \)

\[
\text{Lim.} \phi(a) = \text{Lim.} \phi(a) = 0 = \phi(a) \quad \text{(L'Hospital)}
\]

Hence the ordinary rule: Take the limit of the quotient of the \( D \)'s of the terms at the critical value. Or, expand the terms in the neighborhood of \( a \), simplify, cancel the vanishing common factor, and evaluate for \( x = a \). Similarly, with proper modification, we treat \( \infty \); and \( \infty = \infty \), reduced to 0. Indeterminate exponentials like \( 1^0, \infty^0 \) etc., are first reduced to 0 by passing to Logarithms.

Maxima and Minima are points where a curve ceases to ascend and begins to descend; accordingly at such points the \( D \) must change sign; hence must pass through 0, if continuous. This passage is from + to − for a maximum, from − to + for a minimum. Hence the ordinary rule: To maximize or minimize \( f(x) \), put \( f'(x) = 0 \); the \( x \)-roots will yield maximal or minimal values of \( f(x) \) according as they make \( f''(x) \) negative or positive. For \( f''(x) = 0 \), treat 3d and 4th D's precisely as the 1st and 2d D's. The same rules result from expanding \( f(x) \), as by Taylor's Theorem. Special cases (as of \( D \) discontinuous) call for special treatment, often preferably geometrical or mechanical.

The geometric depiction of a function of two independent variables, \( z = f(x, y) \) or \( F(x, y, z) = 0 \), is of course a surface (\( S \)): at any point \((x, y)\) in the plane erect the corresponding value.
of $z$; the ends of these $z$'s form $S$. We may pass on $S$ from $P$ to $P'$ in $\infty$ of ways; e.g., parallel to $ZX$; then $x$ and $z$ would change, but not $y$. Hence there would be simultaneous $dz$ and $ds$, but $dy=0$. Then \( \frac{ds}{dx} \) is written $\partial z/\partial x$ (Jacobi), and is read partial D of $z$ as to $x$. Similarly, for a path of $P$ parallel to $YZ$, there are simultaneous $dy$ and $ds$, but $dx=0$. \( \frac{ds}{dy} = \frac{dx}{dy} = \text{partial D of } z \text{ as to } y. \)

For $u=f(x, y, z)$ institution fails, but we think each $P$ in $[x, y, z]$ as weighted with the proper $w$ instead of erecting this $u$ perpendicular to $[x, y, z]$. As $P$ moves, the weight $u$ changes. For motion parallel to $X$ both $dy$ and $ds$ are $0$ and \( \frac{du}{dx} = \frac{du}{dx}, \) etc. Of course, the foregoing presumes that $x$ and $w$ actually admit of the derivations in question.

**Differentials, Partial and Total.**—By Definition, \( \frac{du}{dx} \) is partial D of $u$ as to $x$, etc. \( \frac{du}{dx} + \ldots = \text{total D of } u. \)

Geometrically, on $z=f(x, y)$, the path of $x$-change is parallel to $ZX$, hence $\frac{dx}{dz} = \tan \tau$, as before. Similarly $\frac{dy}{dz} = \tan u$. The plane through the tangents to these paths (at $P$) is in general the plane tangent to $P(x, y, z)$ to $S$.

Clearly its equation is $w-z=(u-x)^2 + (v-y)\frac{dz}{dx}(w, v, w)$ being the current co-ordinates for the plane. This equation assumes the symmetric form $w-x = F_z + (v-y) F_y + (w-z) F_w = 0$, since $\frac{\partial z}{\partial x} = -\frac{F_z}{F_x}$, etc. Hence the equations of the normal are $u-x = F_z F_x$, etc. As to existence, the tangent plane is conditioned like the tangent line. Through $P(x, y, z)$ and two neighbor points, $Q$ and $R$ (as $z+dz$, $y+dy$, and $x+dx$), and $x, y, dx, dy, dz$, pass a secant plane $II$. Let $K$ and $Q$ descend any wise upon $P$. If the tiltings of $II$ approach $0$, if $II$ settles down toward the same fixed position, no matter how $dx$ and $dy$ approach 0, i.e. independently of $dy$ and $dz$, then the limiting position of $II$ is the tangent plane at $P$. But at the vertex $P$ of a cone ($s^2 + a^2 = m^2$), $II$ rolls forever around the cone as $Q$ and $R$ circle around $P$.

Here, at $(0, 0, 0), \frac{\partial z}{\partial x} = x = m^2$, and \( \frac{\partial z}{\partial y} = -m^2 \) lose all meaning, as do tangent plane and normal; but if both be functions of an arbitrary $t$, we have the Total $D$ of $z$ as to this $t$: \( \frac{dz}{dt} = \frac{dy}{dt} = 0, \) + and $\frac{dy}{dt}$, or the Total Differential is the sum of the Partial Differentials. For $t=x, \frac{dz}{dx} = f_x + f_y \cdot y, or \( \frac{dz}{dy} = y, f_x + f_y \cdot dy $, a fundamental theorem holding when at $(x, y)$ the DQ $f(x + dx, y + dy) - f(x, y)$ is an equably continuous function of $y$ and $dz$.

Earlier $D$'s are pure when the same Independent Variable is retained, mixed when it is changed. So $\frac{\partial z}{\partial x}$ and $\frac{\partial z}{\partial y}$ are pure, but $\frac{\partial z}{\partial x} \frac{\partial z}{\partial y}$ is mixed. In mixed $D$'s the question arises: Is the order of Derivation indifferent? The answer is, Yes, $\frac{\partial z}{\partial x} \frac{\partial z}{\partial y} = \frac{\partial z}{\partial y} \frac{\partial z}{\partial x}$ but only under conditions. For a power-series the case is clear, but the general investigation is subtle, and the result is involved and tedious. The theorem holds: When, for $x$ in $[a-h, a+h]$, and $y$ in $[b-k, b+k]$, $f(x, y)$ is uniquely defined, and the $f(n-1)(n^2) DC$'s exist and are finite, and all the mixed ones are continuous as to both $x$ and $y$, then everywhere in the same rectangle $2h, 2k$ all the other mixed $DC$'s of the $n$th order exist, and the order of derivation is indifferent. Also, if, besides, everywhere in the rectangle the $(n-1)$-mixed $DC$'s of the $n$th order, $\frac{\partial^{n-1} f}{\partial x^{n-1} \partial y}$ exist finite, and at $[a, b]$ are continuous as to both $x$ and $y$, then all other mixed $DC$'s exist at $[a, b]$, the order of derivation being indifferent. Space is want- ing for the proofs.

The Taylorian Series or Law of the Mean may now be extended, under proper conditions, to develop $f(x, y)$ near $(x, y)$, thus:

$$f(x + h, y + k) = f(x, y) + \frac{k}{h} \frac{\partial f}{\partial x} + \frac{h}{k} \frac{\partial f}{\partial y}$$

$$+ \left( \frac{h}{2k} \frac{\partial^2 f}{\partial x^2} + \frac{k}{2h} \frac{\partial^2 f}{\partial y^2} + k \frac{\partial^2 f}{\partial x \partial y} \right)$$

$$+ \frac{1}{n} \frac{\partial^n f}{\partial x^n} \left( \frac{x}{n} + \frac{k}{n} \right)$$

Symbolically,

$$f(x + h, y + k) = f(x, y) + \frac{h}{x} \frac{\partial f}{\partial x} + k \frac{\partial f}{\partial y}$$

The last term is the remainder $R_n$, which must converge upon 0, for $n \to \infty$, to be neglected. A sufficient condition therefore is that the partial $D$'s of $f$ remain finite near $(x, y)$ for $n \to \infty$. This is not a necessary condition, however, to find which is not easy nor attempted here.

Geometrically, take the tangent plane at $P$ as $XY$, the normal as $Z$. Develop $z=f(x, y)$
CALCULUS, THE INFINITESIMAL

every normal section is principal, the point \( P \) is an umblic or cyclic point. If the indicatrix is a parabola, then \( S \) is edged or ridged (cylindrical) at \( P \).

The notion of surface-curvature is generated and defined quite like that of line-curvature.

Draw the normal \( N \) to \( S \) at every point of the border \( B \) of \( DS \), forming a ruled surface, \( R \). Draw parallel to each \( N \) a radius of a unit-sphere, forming a cone \( C \) cutting out \( DS \) on the sphere-surface, which subtends a (so-called) solid angle \( \delta \) at the centre. This we also define as the solid angle of the \( N \)'s, and further define the average curvature of \( DS \) as the ratio \( \frac{\delta}{\sqrt{S}} \).

(Take of a cord passed round the gorge of \( R \) and then tightened, compressing \( R \) into \( C \) without changing the solid angle).

If the unit solid angle or steradian (Halsted) be subtended by \( r \), the whole solid angle about centre \( = 4\pi \); then the metric numbers of \( \delta \) and \( \frac{\delta}{\sqrt{S}} \) are equal, hence the curvature of \( S = \frac{\delta}{\sqrt{S}} \), and \( \lim \frac{\delta}{\sqrt{S}} = S' = a \), instantaneous curvature at \( P \) in (\( DS \)) = \( K \).

If \( R \), \( R' \) be the principal radii of curvature at any \( P \) on \( S \), then \( K = \frac{1}{RR'} \); moreover, this \( RR' \) is not affected by bending \( S \) in any way without stretching or tearing—a beautiful Gaussian theorem of profound philosophic import. In this sense, an \( S \) that may be flattened out into a plane (a Developable) has 0-curvature; for such, \( RR' \) must become \( \aleph \); hence either \( R = \aleph \) or \( R' = \aleph \). But \( RR' = (1 + \rho^2 + q^2)/(\rho_1 - \rho) \), where \( \rho = \rho_1 - \rho_2 \), \( q = \rho_2 \), \( r = \rho_1 \), \( s = \rho \) (Euler). Hence \( r - s = 0 \) is the equation of Developables. For Applications and further illustrations, see SURFACES, THEORY OF.

The difficulty in dealing with Implicit Functions (obtained by unsolved equations in the Existence-theorems, which can only be stated. I. Let \( F(x, y) = 0 \) at \( (x_0, y_0) \), and have 1st partial \( D' \)s fine and continuous about \( (x_0, y_0) \), and \( F_{xx} = 0 \) at \( (x_0, y_0) \): then there is a \( y = y(x) \) that \( D' \) comes \( y_0 = y(x_0) \) and satisfies identically \( F(x, y) = 0 \) in the vicinity, and is unique, and has a \( D \), \( y_2 = \phi(x) = F_{xx}/F_{yy} \). II. Quite similarly for \( F(x, y, z) = 0 \), \( z = \phi(x, y) \), the last being statement: has two partial \( D' \)s.

Most generally (III) let \( F_1, \ldots, \) \( F_n \) be \( n \) functions of \( m \) variables \( x, y, \ldots \), and \( n \) variables \( u, v, \ldots \), all the \( F \)'s vanishing at \( (x_0, y_0, \ldots, u_0, v_0, \ldots) \), all admitting partial \( D' \)s in that vicinity, and \( J(F_1, \ldots, F_n, w, v) \) \( \neq 0 \) (p. 176), at \( (x_0, y_0, \ldots, u_0, v_0, \ldots) \): then there is a system of functions of \( m \) independents \( x, y, \ldots \), that become \( u_0, v_0, \ldots \) at \( (x_0, y_0, \ldots) \), that satisfy identically all the \( F \)'s in that vicinity, and pass in general \( D' \)s.

Hence we have as the ordinary rule for finding \( y \) from \( F(x, y) = 0 \) differentiae \( F_0 \) as to \( x \) regarding \( y \) as a function of \( x \), as in mediate derivation, and solve the result as to \( y \).

To find now maximum or minimum \( y \) in \( F(x, y) = 0 \), differentiate \( F \) as to \( x \) regarding \( y \) as a function of \( x \), as in mediate derivation, and solve the result as to \( y \).
CALCULUS, THE INFINITESIMAL 173

maximum for \( F_{xx} \) and \( F_y \) like-signed, minimum for \( F_{xx} \) and \( F_y \) unlike-signed, and no determination for \( F_{xx} = 0 \).

Often we seek (so-called) relative maximum and minimum of \( z = f(x, y) \) when \( F(x, y) = 0 \). The former equation is a surface \( S \), the latter an intersecting surface determining a path over \( S \).—we seek the peak and valley points in this path. Differentiating we find as the prime condition, \( F_x, F_y, -F_z = 0 \), \( J(f; F; x, y) \), from which and \( F = 0 \) we find the \( x \) and \( y \) that maximize or minimize \( f \).

More generally we seek maximum or minimum of a function of \((m + n)\) variables, \( f(x, y, u, v, \ldots) \), under \( n \) conditions \( F_1(x, y, \ldots, u, v, \ldots) = 0 \). Theoretically we might eliminate \( n \) variables \( u, v, \ldots \) leaving the other \( m \) independent; it is better to let them remain considered as functions of the \( m \) independents, \( x, y, \ldots \). Hence, on putting each partial \( \partial F = 0 \), we get \( m \) equations which, with the \( n \) \( F = 0 \), form \((m + n)\) equations for finding \((m + n)\) unknowns \( x, y, \ldots \). Discriminants between maximum and minimum by the sign of \( df \) will now be tedious, but often geometrically or mechanically unnecessary.

Simpler and swifter is Lagrange's Method of Multipliers. We form a new function, \( \phi(x, y, u, v, \ldots) = f(x, y, \ldots, u, v, \ldots) - \Sigma \xi_i F_1(x, y, \ldots, u, v, \ldots) \). Only so long as each \( F = 0 \) will \( \phi \) identify for all values (under consideration) of the variables. We now determine these \( \xi \)'s so as to make vanish simultaneously all the partial \( \partial \) of \( \phi \) as to \( x, y, \ldots \). The \( n \) conditions are rolled off from the \( m \) unknowns \( x, y, \ldots \). We may proceed similarly in dealing with Envelopes, where \((n + 1)\) parameters are connected by \( n \) conditions.

Transformation of Variables is often necessary, like transformation of Co-ordinates. The formulae, simple at first, soon become highly complicated and we are led into the Theory of Substitutions, Invariants, Reciprocal and the like, which cannot be treated here.

Integration.—As the Differential Calculus is the doctrine of Limits of Quotients of Simultaneous Infinitesimal Differences, so the Integral Calculus is the doctrine of Limits of the Sums of Infinitesimal Products that increase in number while decreasing in size, both indefinitely. The type is the quadrature of an area \((A)\) bounded by \( X, Y \), a curve \( y = f(x) \), and two end-ordinates, \( x = a \) and \( x = b \). Cut it into \( n \) strips, \( dA \), standing each on a \( dx; \) their sum is \( A \); plainly \( YdX > dA > YdX \) \( Y \) being the greatest, \( y \) the least, ordinate standing on its own particular base \( dx \). Since \( \Sigma x = b - a \), \( \Sigma y = f(x) \) is continuous, finite, one-valued throughout \([a, b]\), each \( Y - y \) is an \( t \); hence \( \Sigma (Y - y)dx < \Sigma dx \), \( Y - y < (b - a) \); hence \( \lim \Sigma (Y - y)dx = 0 \). Hence \( A \) is the common limit of every \( \Sigma dy \), written \( \int_a^b ydx \), named Definite Integral \((DI)\) of \( f(x) \) (the Integral) as \( x \), between the extremes (end-
put $x$ or any other symbol for $x$. The integral depends for its form solely on $f$; for its value, on $a$ and $b$ also.

Hence integration and derivation or differentiation are inverse operations and \( \int = D^{-1} \). The direct $D$ yields a definite result, the inverse \( \int \) yields a result definite only as to form, up to an additive constant, $C$. (Cf. Evolute and Involute, above). Derivation simplifies, reducing even transcendentals to algebraics; integration complicates, lifting algebraics and even rationals up into transcendentals (as $\sqrt{a^2-x}^2$ and $\frac{1}{x}$). Derivation is deductive and can create no new forms. Integration is inductive and creates an infinity of new forms, all defined as integrals.

Operating directly on $y=f(x)$ by a series of differentiations as to $x$, say $\phi(D)$, we get some function of $x$, as $X$, or $\phi(D)y=X$. If we know $X$ and $\phi$, we may seek that $y=f(x)$ that will yield $X$ on being subjected to the train of operations $\phi(D)$; i.e., we seek to invert at once the totality of operations $\phi(D)$, so that $y = \frac{X}{\phi(D)} = \phi^{-1}(D)X$. This inversion is solving the Differential Equation $\phi(D)y=X$, and is perhaps the most profound of mathematical operations, of immense and even unconquerable difficulty, overcome as yet only in special cases. Thus $x^2 \frac{dy}{dx} = 3x \frac{dy}{dx} + 4y = 2x^2$, where $\phi(D) \equiv D^2 - 3xD + 4$, yields, as result of the inverse $\phi^{-1}(D)$ or $\phi(D)$,

\[
y = x^2(4A+B \log x + \log x^2),
\]

where $A$ and $B$ are arbitrary constants. Other forms of $\phi(D)$, quite as simple, yield far higher transcendentals.

Inverting a table of elementary $D$'s we get a table of elementary Integrals. The art is to reduce other forms, if possible, to these elementary forms; when impossible, we must introduce transcendentals defined by integrals.

Change of Variable is the most fruitful method of Reduction. By direct differentiation, $D\phi(u) = \phi'(u) \cdot u_x$; also $D\phi(u) = \phi'(u) u_x$;

\[
\int \phi'(u) du = \phi(u) = \int \phi'(u) u_x \cdot dx.
\]

In this 2d \( \int \), all is supposed expressed through $x$.

Hence, to pass from an old to a new variable of integration, multiply by the $D$ of the old as to the new, or divide by the $D$ of the new as to the old; i.e., the $\int$ sign,

\[
du = u_x \cdot dx, \quad dx = \frac{du}{u_x}.
\]

Of course, the extremes must be properly adjusted.

Integration by parts is also a powerful reduction process. From $(uv)_x = u_xv + uv_x$ we have

\[
uv = \int u_xv \cdot dx + \int uv_x \cdot dx, \quad \text{or} \quad \int uv_x \cdot dx = \int u_xv \cdot dx.
\]

This latter \( \int \) may be simpler, or may return into the first, or other advantages may accrue.

Thus $\int \cos x \cdot \cos x \cdot dx = \int \sin x \cdot \cos x + \int \sin x \cdot \cos x \cdot dx$

$= \sin x \cdot \cos x + x - \int \cos x \cdot dx$; whence

\[
2 \int \cos x \cdot dx = x + \sin x \cdot \cos x.
\]

Similarly for any integral power of sine or cosine except $\sin^2 x$ and $\cos^2 x$, which are reduced by passing to the half-angle, $\frac{x}{2}$.

What is the range of such reductions? What functions can we thus integrate in terms of known functions? Few enough. Of Algebraics,

I. Rational functions, $\frac{a}{x^b}$, by decomposition into part-fractions.

II. Rational functions of $x$ and $\frac{ax+b}{cx+d}$, etc. Put $ax+b = m x + m$, $m$ being

L.M.C. of $b$, $b'$, etc. Here with, if \( \int \) becomes rational in $u$.

III. Rational functions of $x$ and $\sqrt{ax^2+2bx+c}$.

If we think of $y^2=ax^2+2bx+c$ as a conic, and $y-\beta = u(x-a)$ as a segment through a point $(a, \beta)$ of the conic, then we may express both $x$ and $y$ rationally through $u$, which reduces this case to I; $(a, \beta)$ may be taken variously. Generally we bring $y'$ to the form of sum or difference of two squares by putting $x = u + h$.

IV. Rational functions of $x$ and $y$, these being co-ordinates of a unicursal $F(x, y) = 0$. We shall then have $x = \phi(u)$, $y = \psi(u)$, where $\phi$ and $\psi$ are rational, whereby these Abelian Integrals reduce to I.

The binomial $x = (a+bx)^p$ can be reduced to II, and hence integrated, not generally, but in these important cases, by putting $w = x^p$.

1. $p$ integral; if $\frac{m+1}{n} = \frac{r}{s}$ ($r$ and $s$ integers),

\[
\text{put } w = x^{\frac{r}{s}}.
\]

2. $m+1$ integral; if $\frac{r}{s}$ ($r$ and $s$ integers),

\[
\text{put } w = a+bw^\frac{r}{s}.
\]

3. $\frac{m+1}{n} + p$ integral; if $\frac{r}{s}$ ($r$ and $s$ integers), put $a+bw = w^p$, which reduces it to 3.

Of Transcendentals.— 1. Rational functions of $\sin x$ and $\cos x$. Put $w = \tan \frac{x}{2}$, a very important substitution.
2. Rational functions of \(e^{x^2}\). Put \(w=e^{ax}\).

3. Rational Integral functions of \(x, e^{ax^2}, e^{ax^3}, \ldots \). \(\sin mx, \sin nx, \ldots, \cos mx, \cos nx, \ldots\)
Express the sines and cosines through imaginary exponentials. In the result express the imaginaries through sines and cosines. Here are included rational functions of the hyperbolic sine and cosine.

4. Rational Integral functions of \(x\) and \(\log x, x, x, \sin x, \sin x, \ldots\).

If \(f(x)=R(x, \sqrt{T}), T\) of 3d or 4th degree in \(x\), we cannot rationalize but must introduce Higher Transcendents. Let

\[
\Phi = \int_0^1 \frac{dx}{\sqrt{1-x^2}} = \int_0^1 \frac{\cos^{-1}(x)}{\sqrt{1-x^2}}.
\]

Here \(x\) and \(u\) are functions of each other and it seems natural to take \(u\) as function, \(x\) as argument; but in \(L=\int_0^1 \frac{dx}{\sqrt{1-x^2}} = \sin^{-1}(x), x=\Phi(u)\)

\(\sin l\) is a much simpler (periodic) function of \(I\) than \(f\) is of \(x\); hence we may suspect that \(x\) above is a simpler (periodic?) function of \(u\) that \(f\), namely \(\Phi\). Hence Abel thought the theory might be simplified by inverting the dependence before him assumed — one of the greatest divination in mathematical history. We write

\[
\Phi = \Phi(u) \text{ (Weierstrass), } u = \int_0^1 \frac{dx}{\sqrt{1-x^2}}.\]

Hence \(u = \frac{1}{\sqrt{1-\Phi^2}}\) and so on. Now just as sine and cosine have one period \(2\pi\), so \(\Phi\) has two periods, \(2\pi\) and \(2\pi\), it is an Elliptic or Doubly periodic function. The Theory of such Functions, one of the most august creations of the last century, is conspicuous in Analysis. Of Hyper-elliptic Integrals there is no space to speak.

The integral of an Infinite Series may be found by integrating term by term only when the series converges uniformly within an interval comprising the extremes of the integration. It is seen that the integrable forms are absolutely many, relatively few, the integration generally giving rise to a new function.

Thus far we have raised no question as to Integrability, the Integral being supposed unique, continuous, definite and therefore integrable, in \([a, b]\). But when, if ever, may we let one or more of these conditions fail? As to continuity, Riemann has discussed profoundly, In what cases is a function integrable, and in what not? and still further particular interest has been attained by Du Bois Reymond and Weierstrass. It is of particular interest to know whether \(\Sigma \delta e_\xi\) will vary finitely with varying modes of divisions of \([a, b]\). Riemann calls the subintervals \(\delta_1, \delta_2, \ldots\); the greatest fluctuation of function-value in each \(\delta_\xi\) he calls \(D\); then must \(D\delta e_\xi\) be infinitesimal. This it follows that when, as each \(\delta_\xi\) sinks indefinitely toward 0, the sum of subintervals, in which \(D\) is \(\sigma\) itself, is infinitesimal, then the sum \(\Sigma\) has a definite limit, the same however \([a, b]\) be subdivided. Hence the integral \(I = \int_a^b f(x) \, dx\) exists when \(f(x)\) is finite and unique in \([a, b]\), and when for every infinitesimal positive \(\varepsilon\) there is also a positive \(\delta\) such that \(|x-a| < \delta\) when each \(\delta < \varepsilon\).

Plainly such is the case (1) for \(f(x)\) continuous throughout \([a, b]\); but also (2) when \(f(x)\) is finitely discontinuous at a finite number of points in \([a, b]\), and when \(f(x)\) has an \(\infty\) of maxima and minima, or is quite undetermined (though finite), at a finite number of points in \([a, b]\), as \(\sin \frac{1}{1-x} \) at 1 and 2;

(3) even when \(f(x)\) is discontinuous or finitely indeterminate at an \(\infty\) of points and has an \(\infty\) of maxima and minima in the vicinity of an \(\infty\) of points, provided only all these points of finite function-fluctuation form not a linear but only a discrete mass of points (Punktmenge) — the function is then said to be only pointwise (punktirt) discontinuous (Hankel). A discrete or manifold of points is an \(\infty\) of points in a finite interval \([a-h, a+h]\), so distributed at subintervals that the sum of these subintervals may be made small at will by enlarging at will the number of subintervals. Otherwise, the mass is linear. Functions linearly discontinuous are not integrable. For Cantor’s more comprehensive theory of Derived Masses (‘Math. Ann.,’ XVII, 338f), see Assemblages.

Du Bois Reymond has shown (‘Journ. f. d. r. u. d. a. Math.,’ 79, 21f) that the product of two such integrable functions is itself integrable.

Thus far the integrand has been finite. But the \(\int_0^1 \frac{dx}{\sqrt{1-x^2}} = \pi/2\), although the integrand \(= \infty\) at \(1\). In general, if \(f(x)\) be \(\infty\) or discontinuous, or oscillatory at \(x=0\) in \([a, b]\), then

\[
\int_a^b f(x) \, dx\]

loses meaning; but if the sum

\[
\int_a^e f(x) \, dx + \int_e^{e+\beta} f(x) \, dx
\]

nears a definite limit no matter how \(a\) and \(\beta\) approach 0 indefinitely, then this limit is named value of \(\int_a^b f(x) \, dx\).

Such is the case only when \(\int_a^e f(x) \, dx\) and \(\int_e^{e+\beta} f(x) \, dx\) converge each toward 0, as \(a, a', \beta, \beta'\), all close down on 0, \(a' < a, b' < \beta\); i.e., the immediate neighborhood of \(a\) must contribute infinitesimally to the integral. Similarly for any number of points not forming a linear mass.

So, too, we may let either extreme, as \(b\), increase toward \(\infty\) if only the total contribution of the infinitely remote region be infinitesimal, i.e., if \(\int_{a'}^{b'} f(x) \, dx < \eta\) for \(b\) however large, \(b'\) being first taken sufficiently large.

Double Integrals \(\int_a^b \int_a^b f(x, y) \, dy \, dx\). Think of a definite region \(R\) in \(XY\), at each point of which is erected a perpendicular \(z\), all forming a cylindric volume (\(V\)) bounded by \(XY\), the surface
The formula for the cylindrical surface standing on the border \( B \) of \( R \). To find \( V \) we may cut up \( R \) into elements \( (dR) \), as by parallels to \( X \) and \( Y \), and \( V \) into elementary cylinders \((dV)\) on these elementary bases. Thus:

\[
V = E f(x, y) dR = \int f(x, y) dR.
\]

Here we assign no extremes to \( R \); the integration stretches over all of \( R \), so that \( B \) corresponds to the extremes of simple integration. It is and must be indifferent in what order the elements \( dR \) are taken; hence we may sum up first along a strip parallel to \( X \), and then sum all such strips along \( Y \). This double summing is expressed by a **Double Integral** \((II)\) thus:

\[
\int \int \int f(x, y) dx dy = \int_a^b \int_a^b f(x, y) dx dy.
\]

Here for any value of \( x \) the values of \( y \) are determined by the equation of \( B \). Hence \( b \) and \( y \) are functions of \( x \); but \( a \) and \( y \) depend on the extreme parallels to \( Y \) tangent to \( B \), hence are absolute constants.

It is geometrically clear that \( II \) is perfectly **definite**, but we must ask in default of Geometry, when does \( \Sigma \) approach the same **limit** independently of the function-value chosen for each \( dR \) and the way in which each \( dR = 0 \), as their number \( \rightarrow \infty \)? \( \omega \) Answer: When \( \Sigma D_k dR_k = 0 \) as each \( dR_k \rightarrow 0 \), \( D_k \) being the greatest fluctuation in function-value in \( dR_k \). When is this the case? \( \omega \) Answer: (1) When \( f(x, y) \) is **continuous** throughout \( R \); (2) when \( f \) at single points or on single lines \((\omega = 0)\) becomes **discontinuous** or indeterminate or oscillatory; (3) when \( f \) becomes thus **finite** but becomes **finite** or indeterminate or oscillatory along an \( \omega \) of lines \((\omega = 0)\), if only the sum of the elements \((dR_k)\) where \( D \rightarrow \sigma \), is itself \( < \varepsilon \) (infinitesimal); i.e., when the linear masses do not form an area (or planar) mass, i.e., when their initial elements form not a linear but only a discrete mass.

May \( f(x, y) \) attain \( \approx \) and \( II \) retain sense? \( \omega \) Answer: If \( f \) attains a definite \( \approx \) but only at definite points, or along a curve and of order \( < \varepsilon \), then the \( II \) remains definite and finite; also the order of integration remains indifferent. Here the contribution, to the \( II \), \( \approx 0 \) as the element of area \((XY)\) shrinks toward 0 along the curve; i.e., the volume \( \varepsilon \) shoots up to \( \approx \) only along an infinitely sharp edge.

So, too, the **region** \( R \) may stretch out any way toward \( \approx \) if \( f \) shrinks faster than \( R \) spreads; e.g., \( R \) may spread over all the plane, if in all regions \( f \) becomes 0 of higher than \( 2 \)d order. 

Minuter discussion must be foregone.

Extremely important is the change of variables in \( II \). In simple integration \( dV = du dv \) under the \( \int \), whereby we pass from \( x \) to \( u \) as variable of integration. In passing from \( x, y \) to \( x, v \), under the \( \int, du dv = M dx dy \), but what is \( M \)? It is \( \frac{\partial}{\partial y} \frac{\partial}{\partial x} = \frac{\partial u}{\partial v} \frac{\partial v}{\partial y} \).

The remarkable expression, introduced by Jacobi and named by him the **Functional Determinant**, is called the **Jacobian** (Salmon). As already exemplified, it plays the role of derivative of the system

\[
\frac{\partial(u, v)}{\partial(x, y)} = \frac{\partial(u, v)}{\partial(x, y)} - \frac{\partial(u, v)}{\partial(x, y)} = 1.
\]

just as \( \frac{\partial(u, v)}{\partial(x, y)} = 1 \). Also \( \frac{\partial(u, v)}{\partial(x, y)} = \frac{\partial(u, v)}{\partial(x, y)} \). Thus \( \frac{\partial(u, v)}{\partial(x, y)} = 1 \). Again, if \( \frac{\partial(u, v)}{\partial(x, y)} = 0 \), then \( F(u, v) = 1 \), and so on.

From \( II \) we readily pass to the triple \( I \),

\[
\int_a^b \int_c^d f(x, y, z) dx dy dz,
\]

and hence to multiple \( I \)'s in general. The higher Jacobian maintains its role: \( \frac{\partial(u, v, w)}{\partial(x, y, z)} = \frac{\partial u}{\partial x} \frac{\partial v}{\partial y} \frac{\partial w}{\partial z} \), and so on in general.

Thus, to pass from rectangular to polar co-ordinates, \( x = r \cos \theta, y = r \sin \theta \), \( J(x, y; \rho, \theta) = r^2 \cos \theta \sin \theta \), \( \rho = r \cos \theta \), \( \phi = \theta \sin \theta \), \( \phi = r \cos \theta \), \( \theta = \phi \), \( \phi = \theta \), \( \phi = \theta \), \( \phi = \theta \), \( \phi = \theta \).

Analogy readily extends these forms to \( n \)-fold spaces. Thus the Jacobian appears geometrically as a real **derivative**, the limit of the ratio of two simultaneous changes.

The single \( \int_a^b f(x) dx = F(b) - F(a) \), where \( f = F' \) expresses the sum-value of \( f \), integrated along the length \( b-a \), through the *end-values* of some \( F \) at \( b \) and \( a \); can the double \( \int_0^\pi f(x, y) dx dy \) integrated over the region \( R \) also be expressed through the *end-values* of some \( F(x, y) \) along the contour of \( R \)? This query is much harder to answer, but is answered similarly: If \( f(x, y) \) is integrable in \( R \), then in general \( \int_0^\pi f(x, y) dx dy \) is for every included value of \( y \) a continuous function of \( x, F(x, y) \), and for every included value of \( x \) an integrable function of \( y \).

Then the \( D I \int_0^\pi f(x, y) dx dy = \int F(x, y) s dx dy \), where \( s \) is the contour of \( R \) and \( u = \) slope of the normal (drawn inwards at any point of \( s \)) to the \( +Y \)-axis. This latter is a curvilinear \( \int \), geometrically depicted as a wall built up (resp. down) along the contour \( s \) of \( R \).
Similarly a \( \int \int \int \) of \( f \) extended throughout a volume (or three-wayed spread) may be expressed through the end-values of a certain \( F \) integrated over the entire surface \( (S) \) of the volume, whereby a space-integral is turned into a surface-integral and conversely:

\[
\int \int \int \left( \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} + \frac{\partial f}{\partial z} \right) dx \, dy \, dz = \int \int \left( \frac{\partial m}{\partial x} + \frac{\partial m}{\partial y} + x \frac{\partial m}{\partial x} \right) ds,
\]

where \( ds \) along the normal to \( S \) corresponds to \( dx \) on \( X \), etc. These conversions (of Green and Riemann) are equally important to pure and to applied mathematics.

The most immediate geometric problem of integration is **Quadrature**, or in any straight-length—an arc-length. This latter must be defined as the **common limit** of the length of inscribed and circumscribed polygons of which each side=0.

Since \( x = \sqrt{(x - y^2)} \), \( S = \int \sqrt{(x^2 + y^2 + dz)} \),

If now \( w = \phi(t) \), \( y = \psi(t) \), be continuous functions of \( t \), with finite limits of value, then this integration is possible, and the curve is **rectifiable**. Such is not the case in Weierstrass's curve; there the oscillations (maxima and minima) are infinitely many in every neighborhood however small, nor is the variation finite in any such neighborhood—the arc is infinite between any two points.

**Volume** is given by triple integration,

\[
\int \int \int dx \, dy \, dz,
\]

extremes defined by the bounding surface. Often the area of a section perpendicular (or possibly oblique) to an axis, as \( x \), is a function of \( x \), \( z = f(x) \); then \( V = \int_{x} Sds \).

In the important case of **Revolute** (of an area bounded by \( x \)), the curve, and two \( y \)-ordinates,

\[
s = \pi y^n, \quad V = \pi \int y^m dx.
\]

Quadrature of a curved surface is sometimes called **Conformation**.

Here again the area must be defined as the common limit of the surface area of polyhedra inscribed and circumscribed, no matter how. The surface element \( ds \) or \( (4s) \) about \( P \) may be viewed as projected into the element \( dx \, dy \) in \( XY \) and having a limiting ratio \( 1 \) with the corresponding element \( d\II \) in the plane tangent at \( P \). The slope of this plane to \( XY = \gamma = \text{slope of normal to } Z \);

Hence Lim. \( dS = d\II \), \( dx \, dy = dx \, dy \), hence \( \gamma = \frac{|F_x + F_y + P_z|}{P_y} \); hence \( S = \int \int \frac{1}{|F_y|} dx \, dy \), the region of integration

in \( XY \) being the projection thereon of \( S \), under obvious conditions. Often the surface is given **parametrically**, i.e., \( x, y \) and \( z \) as functions of the independents, \( u \) and \( v \). Then we write off the rectangular array

\[
\left| \begin{array}{ccc}
\frac{\partial x}{\partial u} & \frac{\partial x}{\partial v} & \frac{\partial x}{\partial w} \\
\frac{\partial y}{\partial u} & \frac{\partial y}{\partial v} & \frac{\partial y}{\partial w} \\
\frac{\partial z}{\partial u} & \frac{\partial z}{\partial v} & \frac{\partial z}{\partial w}
\end{array} \right|
\]

and form therefrom the three Jacobians, by deleting the columns in order, commonly written \( A, B, C \). Hence, by easy substitution for \( \int \int \int \sqrt{A^2 + B^2 + C^2} \, du \, dv \).

At every point \((x, y, z)\) of \( S \) there is co-ordinated a point \((u, v)\) of a plane.

For Revolutes, \( S = 2\pi \int yds \).

Differentiation de Curva in Curvam.—We have found the \( D \) of an \( f \) as to either extreme, but the integral may contain a parameter, thus \( f(x, p) \, dx \). The \( f \), being then a function of \( f \), is also a function of \( p \) and may be differentiated as to \( p \), giving rise to **Parametric Derivation**. Thus, \( I = \int a^b f(x, p) \, dx \), hence \( I_p = \int a^b \frac{dx}{dp} f(x, p) \, dx \).

If now we differentiate the integral first, and then integrate, we obtain the same result. Hence the order \( \int_a^b f(x, p) \, dx \) is equivalent to \( \int_a^b f(x, p) \, dp \).

This holds generally, if for a definite interval \( [a, b] \), and for \( [a, b] \), \( \frac{\partial f(x, p)}{\partial p} \) is in general (with possible exception of only discrete masses of points) a continuous function of both \( x \) and \( p \); then \( \int_a^b \frac{\partial f(x, p)}{\partial p} \, dp = \int_a^b \frac{\partial f(x, p)}{\partial x} \, dp \).

If \( f \) appears in either \( a \) or \( b \) or both, then \( \int_a^b \frac{\partial f(x, p)}{\partial p} \, dp = \int_a^b \frac{\partial f(x, p)}{\partial x} \, dp \).

If the \( \int \) be an integrable function of \( p \), \( F(p) \), in \( [a, b] \), integrating as to \( p \) we get

\[
\int_a^b \{ \int_a^b f(x, p) \, dx \} \, dp = \int_a^b F(p) \, dp,
\]

and the order of integration is indifferent while \( f \) is a continuous function of both \( x \) and \( p \).

Thus the \( \int \) may be treated as function of any parameter in \( f \), when the extremes are constant, as \( 0, 1, \pm \infty \), and this gives rise to an important set of concepts and to the **Theory of Definite Integrals**. Thus, for \( 0 < a < 1 \), \( \int_0^\infty x^{-1} \, dx = \frac{\pi}{\sin \alpha} \), and is a function of \( \alpha \). Among such the **Eulerian**s are conspicuous, especially that of \( 2 \) species (Legendre),

\[
\int_0^\infty x^{a-1} \, dx = \Gamma(a), \text{ or better by the Gaussian } II(a-1), \text{ through which counts—}
\]

\[\text{Also } S = \int \sqrt{1 + F^2} \, \rho \, d\rho, \quad F = x + y + z, \quad \rho = x^2 + y^2 + z^2. \]
less others are expressible. This \( I \)-or \( II \)-
function has remarkable properties:

1. \( I(x+1)=xI(x) \), or \( \frac{I(a)}{a!}=\Gamma(a) \),
   the factorial property, \( \Gamma(n+1)=n! \).
   But the factorial loses its meaning if \( n \) is not a positive
   integer, while \( I \) and \( II \) retain theirs: thus,
   \( \Gamma(1)=\Gamma(1)-\sqrt{\pi} \).

2. \( \Gamma(a) \Gamma(1-a)=\pi \frac{\sin \alpha}{\cos \alpha} \),
   Euler's beautiful discovery.
   Hereby arguments complementary to 1 are set in mutual relation,
   as \( \sin(\pi - a) = \sin a \), \( \tan a \tan(\pi - a) = 1 \),
   so that from \( \Gamma(1) \)
   we may reckon \( \Gamma(1) \). Hence we need reckon
   \( \Gamma(a) \) only for \( a \) in \([0, \frac{1}{2}]\), as \( \sin a \) only for \( a \)
   in \([0, \frac{\pi}{2}]\).

\( \Gamma(a) \) and particularly \( \log \Gamma(a) \) may now be
differentiated with highly interesting results,
\[
\frac{d}{da} \log \Gamma(a) = \sum_{n=1}^{\infty} \frac{1}{(a+n)^{m}}.
\]
This \( \Sigma \) is uniformly convergent for \( a > 0 \); however, we may
integrate term-wise from 1 to \( a \) and get
\[
\int_{0}^{a} \log \Gamma(a) \, da = \sum_{n=1}^{\infty} \frac{1}{(n+1)^{m}} (a+n) + C,
\]
where \( C \) is the Eulerian or Mascheronian Constant.

\[
\Gamma(1) = \Gamma(1) = 0.5772156649 \ldots \text{calculated by}
\text{Euler to 15 and by Legendre to 19 decimals.}
\]

Hence, by a 2d Integration,
\[
\log \Gamma(a) = \sum_{m=1}^{\infty} \frac{1}{m(1+\frac{a}{m})^{m}} - 1
\]
\[
\Gamma(a) = \Pi_{m=1}^{\infty} \frac{1}{m(1+\frac{a}{m})^{m}} - 1
\]
\[
\Gamma(a) = \prod_{m=1}^{\infty} \frac{1}{m(1+\frac{a}{m})^{m}} - 1
\]
\[
\Gamma(a) = \Pi_{m=1}^{\infty} \frac{1}{m(1+\frac{a}{m})^{m}} - 1
\]
\[
\Gamma(a) = \Pi_{m=1}^{\infty} \frac{1}{m(1+\frac{a}{m})^{m}} - 1
\]
\[
\Gamma(a) = \Pi_{m=1}^{\infty} \frac{1}{m(1+\frac{a}{m})^{m}} - 1
\]

Such is Gauss's Definition of \( \Gamma(a) \) for every
finite \( a \) for which no factor in the denominator
vanishes. Herewith we are brought to the expression
of functions not through infinite
\[
\frac{a(1+a)}{(a+1)(a+2) 
\]
\[
\frac{a(1+a)}{(a+1)(a+2) 
\]
\[
\frac{a(1+a)}{(a+1)(a+2) 
\]
\[
\frac{a(1+a)}{(a+1)(a+2) 
\]

This subject, of infinite range, cannot be
pursued here—hills peep o'er hills, and Alps
on Alps arise. The fundamental theorems
were rigorously proved first by Weierstrass
(Jour. f. d. r. u. d. a. Math., L). It may be
added that the 1st Eulerian,
\[
\int_{0}^{x} \frac{1}{x^{(1+a)x^{a}}} \, dx
\]
is denoted by \( B(a,b) \) (Binet) and is connected
with the 2d by \( \text{B}(a,b)\Gamma(a+b)=\Gamma(a)\Gamma(b) \),
and being expressible thus simply through \( \Gamma \) has
not so much independent significance.

The central notion of the \Integral Calculus, the
\textit{Limit of a Sum}, is more obvious than that
of the \Differential Calculus, the \textit{Limit of a Quotient}.

The foundations of the one are also seen to be much broader than those of the
other, so that the former is not merely the
inverse of the latter. The twin seizing upon the
two great aspects of History, the Dynamical and the
Statical, Process and Result. While the
Integral Calculus borrows its speed and directness
from the Differential Calculus, its own
reaction upon this latter is instant and powerful.
Thus, from integration by parts we have
\[
\int f(x) \, dx = \int a \, dy - \int a' \, dy - \int f(x) \\
\int a' \, dy = \int a \, dy + \frac{1}{2} \int a'' \, dy
\]

Evaluating between the extremes 0 and \( h \) we get
Bernoulli's Series (with Remainder):
\[
\phi(h) = \phi(0) + h \phi'(h) - \frac{h^2}{2} \phi''(h) + \frac{h^3}{3} \phi'''(h) - \ldots
\]

\[
\pm \frac{1}{n^2} \int_{0}^{h} \frac{h^m}{n^{m+1}} \, dy.
\]

To avoid the alternation in sign we take
\[
\int \phi(x) \, dx + \frac{1}{n} \sum_{n=1}^{\infty} \frac{h^m}{n^{m+1}} \, dy
\]

Such is the swiftest, directest, nearest-lying
foundation of the fundamental \textit{Taylor's Series},
by which the value of \( \phi \) at \( x \) is built up
out of the value of \( \phi \) and its \( D's \) at \( x_0 \).
The \( K \) is here yielded as a definite integral, from
which form the other forms, as Lagrange's,
Cauchy's, Schömilch's, come at once on applying
the Maximum-Minimum Theorem. This
development holds under the two necessary and
sufficient conditions (Pringsheim):

1. That \( \phi(x) \) possess everywhere in \([x_0, x+R] \)
definite finite differential coefficients of every

2. That Lim. \( \frac{1}{n} \phi(x) \), \( k \) converge uniformly on \( 0 \) (for \( n \to \infty \) for all pairs \( h, k \)
for which \( 0 < h < k < R \).

The Infinitesimal Analysis or Method of
Limits is very highly developed and is applicable
to almost every subject of exact thought,
often asserting itself in the most surprising
adorn and in the \textit{Theories of Numbers} and of
\textit{Knots}, to which it might seem wholly alien,
suddenly unlocking and laying wide open secret
passages utterly unsuspected. In particular
the Integral Calculus shows itself amazingly
and unendingly fertile in the generation of
new notions. As other and still other fields are
exposed to investigative thought, the Calculus
will receive more and more applications and
there seems to be no limit to the subtlety and
refinement of its processes, to the keenness and
penetration that may be given to this two-
edged sword of the spirit, the strongest,
sharppest and most flexible ever fashioned or
wielded by the mind of man.

\textbf{Historical Sketch.}—Passing by anticipations,
especially of Integration, that reach back
at least to Archimedes (267-212 B.C.), we come
to Barrow's \textit{Lectiores Opticae et Geometricae}.
CALCULUS OF VARIATIONS

(1669–70), on which Newton collaborated, how much no one knows. Barrow used the Differential Triangle even in 1664 (indefinite parvum, . . . ob in deinde curvam parvitudinum), calling in the name of the term (d' Alembert, A and E, 1638). Newton was busied with Series at Cambridge, 1665–66 (eo tempore pestis ingruens coeq mel hinc fugere) in his famous letter, filling 30 pages in the Opuscula, to Oldenberg, Secretary of the Royal Society, 24 Oct. 1670. His MS. 'De analysi per aequationes numero terminorum infinitas' (partially published first in Wallis's Works, Vol. II, 1693) was shown to Barrow, Collins, Lord Brouncker in 1669, wherein he used o for a magnitude ultimately vanishing, as had James Gregory already in his 'Geometria pars universalis' (1667, Venice). He treated Rectification, Cubature and Mass-Centre determinations as reducible to Quadrature and to be solved by introducing the notion of 'Momentum'—instantaneous change, thus going beyond Barrow. Newton's 'Methodus Fluxionum et Serierum infinitarum' was ready for the press before 1672, but not printed till 1736. In it he proposes, (1) to find the value y at any instant from the velocity—one (from the range) of the two several Derivations and Integration conceived kinematically. The equi-crescent magnitude x, as a space, is called fluens (Cavalieri fluens, 1639, Napier fluxus, 1614, Clavius fluere, 1574); the velocity he writes x and calls fluxio—our Derivative (as to the time t). 'Momentum' varies as fluxion, is written xo, and corresponds to our Differential x (incrementa indefinite parva). This treatise seems to have been revised after 1673, hence does not clearly attest Newton's knowledge in 1671. Leibnitz wrote, 26 Oct. 1675 (following Cavalieri), Omnia ut, etc.; but 29 Oct. 1675, 

\[ \int f(x) \, dx \]

\[ \sum \text{pro omn. ut f pro omn.} \]

id est summa ipsum 1; again, the same day, nompe ut \[ \oint \text{angetit, ita d minute dimensiones.} \]

\[ \int f(y) \, dy = x^2 \]  \[ \text{but the 3 was originally 5.} \]

His 'Characteristic Triangle' equivalent to the Differential \[ \text{and Integral 'Calculus.' Under date of 11 Nov. 1673, Leibnitz wrote} \]

\[ \int f(y) \, dy = x^2 \]

\[ \text{but the 3 was originally 5.} \]

"Characteristic Triangle," equivalent to Differential Triangle, he took not from Barrow but from Pascal. All attempts to show any real dependence of Leibnitz on Newton have failed. These terms of the new Method were abroad in the air.

**Bibliography.**—Leibnitz and his school, especially the Bernoullis, poured forth memoirs abundantly. Leibnitz first, 'Nova Methodus pro maximis et minimis, itemque tangentibus, etc. I apud Acta Eruditorum, 1684. Newton gave his method of prime and ultimate ratios in geometric form in his 'Philosophiae Naturalis Principia Mathematica,' 1687. Johann Bernoulli's 'Lectiones Mathematicae' was the first textbook of the Integral Calculus, composed at Paris 1691–92, published 1742; Taylor, 'Methodus incrementorum directa et inversa' (1715); D'Alembert, 'Mémoire sur le calcul intégral' (1739); Maclaurin, 'A Treatise on Fluxions' (1742); Euler, 'Introd. à l'Analyse des Lignes Courbes Algébriques' (1750); Lacroix, 'Traité du calcul diff. et du cal. int.' (1779); Lagrange, 'Théorie des fonctions analytiques' (1797); Cauchy, 'Cours d'analyse' (1821); 'Lesons sur le calcul différentiel' (1829); Duhamel, 'Cours d'analyse' (1840), third edition, by Bertrand (1874–75); De Morgan, 'Diff. and Int. Calculus' (1842); Todhunter, 'Diff. and Int. Calculus' (1852); Price, 'Infinitiesmal Calculus' (1854); Gerhardt, 'Die Entdeckung der höheren Analysis' (1855); Bertrand, 'Traité du Cal. Diff. et du Cal. Int.' (1864–70); Hermite, 'Cours d'Analyse' (1873); Williamson, 'Diff. and Int. Calculus' (1872–74); Meyer, 'Theorie der bestimmten Integrale'—nach Lejeune-Dirichlet (1853); Lipschitz, 'Lehrbuch der Analysis' (1877–80); Honel, 'Cours de Calcul Infinitésimal' (1878–79); Dini, 'Analisi Infinitesimale' (1877–78); 'Fondamenti per la teoria delle funzioni di variabili reali' (1878); Harnack, 'Die Elemente der Diff.-und Int. Rechning' (1881); Stolz, 'Allgemeine Arithmetik' (1885–86); 'Grundzüge der Differential- und Integralrechnung' (1893–96–99); Tannery, 'Introduction à la théorie des fonctions d'une variable' (1886); Laurent, 'Traité d'Analyse' (1885–92); Picard, 'Traité d'Analyse' (1891–1903); Genocchi-Prano, 'Calcolo differenziale e principii di calcolo integrale' (1884, German translation 1898–99); Cantor, 'Geschichte der Mathematik' (1880–90–01); Jordan, 'Cours d'Analyse' (1893–94–96); Serret, 'Cours de Calcul diff. et int.' (1869, Harnack's German translation, 2d ed., by Bohmian and Zerme, 1899–1904–05); de la Vallée-Poussin, 'Cours d'Analyse infinitésimale' (1903); Goursat, 'Cours d'Analyse mathématique' (1902–04); Humbert, 'Cours d'Analyse' (1905–07); 'Lesons sur les fonctions de variables réelles' (1905); Kiepert-Stegemann, 'Grundriss der Differential- u. Integral-rechnung' (1905).

Elementary textbooks on the calculus are legion, and of very various merits, though those in favor at American universities do not vary much from type. Those of Byerly and of Os-good are perhaps as good as any. Among the older books, those of Williamson, though in many respects obsolete, give a training in the purely formal treatment of the subject that is not to be surpassed. The more advanced books generally go by the name of 'Cours d'Analyse' or 'Introductions to Analysis'; they partake equally of the nature of textbooks and of independent investigations. They are only accessible to those who already have a thorough grounding in the elements of the Calculus.

**William Benjamin Smith,**
Professor of Mathematics, The Tulane University of Louisiana.

**CALCULUS OF VARIATIONS.** The. The Calculus of Variations is a natural outgrowth of the Infinitesimal Calculus (q.v.)—in particular of the Integral Calculus (q.v.) and of
Differential Equations (q.v.). In the Integral Calculus, properly speaking, only integrals of the type \( \int f(x, a_1, a_2, \ldots) \, dx \) are considered, where 
\[ f(x, a_1, a_2, \ldots) \] 
is a function of the variable of integration \( x \) and of several parameters \( a_1, a_2, \ldots \) which are independent of \( x \). In solving differential equations of the type \( dy/dx = f(x, y) \)
we are in one sense dealing with a new type of integral, \( \int f(x, y) \, dy \). Such integrals, in which \( y \) is to be replaced by a certain function of \( x \), are called line integrals.

The integrals considered in the Calculus of Variations are essentially of this kind, but we shall see that the more interesting problems are those in which still another element is introduced. The integral

\[ I = \int_{x_1}^{x_2} f(x, y, y') \, dx, \tag{1} \]

where \( y' = dy/dx \), can be evaluated whenever \( y \) is known as a function of \( x \). For if \( y = \Phi(x) \)
be the known value of \( y \) in terms of \( x \), and if \( \phi(x) \) and \( \phi'(x) = d\phi(x)/dx \) be substituted for \( y \) and \( y' \) respectively under the integral sign, the integrand becomes a function of \( x \) alone, and the integral itself has a definite numerical value, at least under certain very general restrictions which need not be stated here. Thus to every function of \( x \) which can be substituted for \( y \) there corresponds a definite number — the value of \( I \) and \( y \). We shall denote the value of \( I \) relating \( y = \Phi(x) \) defines a curve \( C \) in the plane of \( x \) and \( y \). We shall denote the value of \( I \) which corresponds to the function \( \Phi(x) \) by the symbol \( I_\Phi \).

The central problem of the Calculus of Variations is the determination of a curve \( K[y = \Phi(x)] \), for which the value of \( I, I_\Phi \), is less than [greater than] the value of \( I \) for any other curve \( C \) \( y = \psi(x) \), which satisfies the conditions of the particular example.

In most of the simpler examples it is specified or implied by the conditions of the problem that the curves \( C \) considered shall all pass through each of two given fixed points \( P_0(x_0, y_0) \) and \( P_1(x_1, y_1) \), whose abscissae are respectively \( x_0 \) and \( x_1 \), the limits of integration of the integral \( I \). Hence only those functions of \( x \) \( \psi(x) \) are to be considered for which \( \psi(x_0) = y_0 \) and \( \psi(x_1) = y_1 \).

In order to clarify the general problem, let us consider the example

\[ L = \int_{x_1}^{x_2} \sqrt{1 + y'^2} \, dx. \]

This is a familiar integral; it is the formula for the length of any curve \( y = \Phi(x) \) between any two of its points. With respect to this integral the statement of the simplest problem of the Calculus of Variations is as follows: Given two fixed points \( P_0(x_0, y_0) \) and \( P_1(x_1, y_1) \) in the \( xy \) plane to determine that curve \( y = \Phi(x) \) joining \( P_0 \) and \( P_1 \) for which the value of the integral \( L \), i.e., the length of the arc \( P_0P_1 \), is at a minimum. Accepting the Euclidean postulate that the shortest distance between two points is measured along the straight line joining them, it is evident a priori that the solution of this example is the straight line \( P_0P_1 \), or

\[ y = y_0 + (x - x_0)(y_1 - y_0)/(x_1 - x_0). \]

It is at least plausible that any conditions which we may discover must, in this particular example, be satisfied by this function.

It is easy to see how this simple problem may be generalized. For we might inquire what is the shortest path between a fixed point and a fixed curve, or between two fixed curves. Again, obstacles may be placed in the plane, and the shortest path then sought. This latter idea leads to an important application of the general theory: the determination of the shortest path between any two fixed points of a given surface, the surface being thought of as an obstacle placed in the plane. The most general problem of the kind mentioned above may be thought of as the determination of a certain shortest path.

An entirely distinct generalization of the preceding problem is that in which the integral involves derivatives of higher order than the first, i.e., of the type:

\[ \int f(x, y, y', y'', \ldots, y^{(n)}) \, dx. \]

Another is that in which the integral involves several dependent variables:

\[ \int f(x, y, z, \ldots, y', z', \ldots) \, dx. \]

Finally, the integral considered may involve two (or more) independent variables and require two integrations:

\[ \int \int f(x, y, z, p, q) \, dx \, dy, \]

where \( p \) and \( q \) denote \( dx/dy \) and \( dy/dx \), respectively, and where the function to be determined is a function of \( x \) and \( y \), which is 

Further generalizations are evident and would tend only to confuse it stated here. We shall return briefly to these generalized problems, but we shall state theorems principally for the simple integral \( I \) in one dependent and one independent variable. Many of these theorems can be generalized without essential difficulty to the other cases which have been mentioned.

Returning to the integral \( (1) \), let us consider the history of the problem very briefly. Although a previous problem had been considered by Newton in 1687 ('Phil. nat. prin. Mathem.' II, Sec. 7, Prop. 34), the first problem which came rise to any general theory and encouraged investigation was the so-called problem of the brachistochrone — or curve of quickest descent — which we shall discuss as a particular example.

This problem was stated by Johann Bernoulli in 1696, solved by him in the following year, by his brother Jacob in 1701 in an important memoir dealing with more general problems, and by Euler in 1744 in an important treatise 'Methodus inveniendi linearis curvas'... It has remained of interest down to the present day, probably the last paper concerning it being that by Bolza, 'Bull. Amer. Math. Soc., 1904, No. 1,' in which a final solution is given.

In the paper mentioned Euler first gave the first necessary condition (known as Euler's condition) or less properly as Lagrange's condition in its general form, and developed the theory in several directions, solving incidentally many problems from the formal standpoint. Following Euler, Lagrange introduced
many simplifications and generalizations in a
series of important papers (cf. his ‘Works,’
and his books ‘Théorie des fonctions’ and ‘Cal-
cul des fonctions’). In particular the Method
of Multipliers for the treatment of problems of
relative extrema, which we shall discuss briefly,
is due to Lagrange. The other prominent
names in the early history are Legendre, for
whom the second condition is named; Gauss,
who first studied double integrals with variable
limits; Jacobi, who discovered the condition
which bears his name; and Du Bois-Reymond,
who initiated the very modern critical develop-
ment of the theory. We shall restrict ourselves
to a reference to Todhunter, ‘A History of,...
The Calculus of Variations,...’ (Cambridge
1861); and Pascal, ‘Calcolo delle variazioni’
(Milan 1897; German trans. by Scheppr.
1899); and Kneesser, ‘Variationsrechnung’ and
‘Ency. der Math. Wiss., II A 8, 1900’; and
Bozla, ‘Lectures on the Calculus of Variations’
(Chicago 1905). In these books exact and
complete references to the literature of the sub-
ject and notes concerning its history up to the
dates of publication may be found. It should
be noted that only the latter of these books con-
tains references to the important developments
published since 1900.

Precise Statement of the Problem.—It is evident upon examination that the naive con-
ception of the problem does not permit of exact
mathematical treatment. For definiteness, let us
suppose that the function \( f(x,y) \) in (1) is
an analytical function of its three arguments
inside of a certain three-dimensional region \( K \),
which may be finite or infinite, but which ex-
pressly does not include any points at infinity.
Let us also restrict ourselves to curves of the
form \( y = \psi(x) \), together with its first der-
ivative \( \psi'(x) \), is a continuous, single-
valued function of \( x \) in the interval \( a < x < b \),
and that \( \psi(x) \) and \( \psi'(x) \) are equal, re-
spectively, to the ordinates \( y_a \) and \( y_b \) of the fixed
points \( P_a \) and \( P_b \). We shall call these ‘curves
of the class \( B \).’ If there is a single one of these
curves \( y = \psi(x) \), or \( K \), for which \( I \) is less than
[greatest value of \( I \)] for any other curve \( C \)
[except \( \psi(x) \)] of the class \( B \), that curve \( K \) is said
to render the given integral \( I \) an absolute mini-
mum [maximum]. It is evident that this will
rarely occur, as is also the case in extrema of
functions of a single variable. If we now set
(2) \( \phi(x) = \psi(x) + \eta(x) \), i.e., \( \eta(x) = \psi(x) - \phi(x) \),
and if there exists a positive number \( \delta \) such
that \( I_e \) is less than [greater than] \( I \) whenever
the condition

\[
|\eta(x)| < \delta, \quad x_1 < x < x_2,
\]

then \( K \) is said to render the integral \( I \) a weak
minimum [maximum] among the curves of the class
\( B \). If instead of (3) we merely require the
condition

\[
|\eta(x)| < \delta, \quad x_1 < x < x_2,
\]

the curve \( K \) is said to render a strong minimum
[maximum]. If in addition to (3) [or (4)] we
also require that \( \eta(x) = 0 \),

\[
x_1 + (b-2) \cdot d \leq x_1 \leq x_2 + (b-1) \cdot d < x_2,
\]

then \( n \cdot d = x_2 - x_1 \), the curve \( K \) is said to
render \( I \) a limited weak [strong] minimum
[maximum].

Geometrically these conditions mean that the
curves compared to \( K \) must lie, in the case of a
strong extremum (i.e., maximum or minimum),
close to the curve \( K \); in the case of the weak
extremum, they must lie close to \( K \) and vary
only a little from \( K \) in direction; in the case of
a limited extremum, they must cut \( K \) at
least once in every vertical strip of width \( \delta \).

It is easy to show that if \( K \) is to render \( I \) an
extremum (of any sort), \( \psi(x) \) must in general
satisfy the equation

\[
\frac{d}{dx} \left( \frac{df}{dy} \right) - \frac{df}{dy} = 0,
\]
or

\[
\frac{d^2f}{dy^2} y'' + \frac{df}{dy} y' + \frac{df}{dy} \frac{df}{dy} \frac{df}{dy} = 0,
\]

which is known as Euler’s (or less properly as
Lagrange’s) equation. For we have

\[
I_e = \int_{x_1}^{x_2} f(x, \psi(x) + \eta(x), \psi'(x) + \eta'(x)) \, dx,
\]

which must be a minimum [maximum] for
\( \eta(x) = 0 \). Replacing \( \eta(x) \) by \( \varepsilon \lambda(x) \), where \( \lambda(x) \) is
an arbitrary function and \( \varepsilon \) is a variable pa-
rameter, \( I_e \) will evidently be a function of
the parameter \( \varepsilon \) alone:

\[
I_e = F(\varepsilon) = \int_{x_1}^{x_2} f(x, \psi + \varepsilon \lambda, \psi' + \varepsilon \lambda') \, dx,
\]

it is readily demonstrated that the ordinary
rule applies and that we can have an extremum
only if

\[
dI_e/d\varepsilon = F'(\varepsilon) = \int_{x_1}^{x_2} \left\{ f_x(x, \psi + \varepsilon \lambda, \psi' + \varepsilon \lambda') \lambda + f_y(x, \psi + \varepsilon \lambda, \psi' + \varepsilon \lambda') \lambda' \right\} \, dx = 0,
\]

when \( \varepsilon = 0 \), or \( F'(0) = \int_{x_1}^{x_2} \left( f_x \cdot \lambda + f_y \cdot \lambda' \right) \, dx = 0 \),

where \( f_x = df/dy \), etc. Integrating the second
term by parts, we get

\[
F(0) = \int_{x_1}^{x_2} \left\{ f_x(x, \psi, \psi') - d \frac{df}{dy} f_y(x, \psi, \psi') \right\} \, dx = 0,
\]

or since \( \lambda(x) \) evidently vanishes for \( x = x_1 \)
and for \( x = x_2 \),

\[
\int_{x_1}^{x_2} \left\{ f_x(x, \psi, \psi') - d \frac{df}{dy} f_y(x, \psi, \psi') \right\} \, dx = 0.
\]

But \( \lambda(x) \) was itself any permissible function of
\( x \), and it is not hard to prove that the integral of
such a product, of which one factor is arbitrary,
can vanish only if the other factor vanishes.
This gives precisely the equation (6). Certain
further considerations are necessary to show
that this proof, which implicitly assumes the
existence of the second derivative of \( \psi(x) \),
does not involve any restrictions. (Cf. Bolza, ‘Lec-
tures,’ Chap. 1).

Assuming the further details without proof,
it becomes evident that any curve \( K, \psi = \psi(x) \),
which is to render \( I \) a minimum (of any sort)
must satisfy the differential equation (6).
Since \( f \) and its derivatives are known functions,
(6) is an ordinary differential equation of the
second order, linear in \( d^2f/dx^2(f''y'y') \). The
coefficient of \( y'' \) is \( d^2f/dx^2(f''y'y') \). If this
coefficient \( f_{yy} \) does not vanish, one and only
one solution of (6) passes through a given
point in a given direction. The general solution of (6) contains two arbitrary constants:

(12) \( y = f(x, a, \beta) \).

Any one of these solutions, i.e., any solution whatever of (6) is called an extremal. Hence the required curve \( K \), if it exists, must be an extremal, and it is necessary to search for it only among the extremals. But \( K \) was to connect \( P_1 \) and \( P_2 \). Usually, however, there is only one of the extremals (12) which passes through two given points, for the equations,

(13) \( \gamma_1 = f(x_0, a, \beta), \gamma_2 = f(x_0, a, \beta), \)

usually determine \( a \) and \( \beta \), and hence also determine a single extremal joining \( P_1 \) and \( P_2 \). If this is actually the case, either that extremal is the required solution \( K \), or else there is no solution of the problem.

A large number of special cases lead to differential equations which can be solved directly.

For example, if \( I = \int f(x, y, y') \sqrt{1 + y'^2} \, dx \), we shall have

\( f(x, y, y') = \sqrt{1 + y'^2} \), whence \( f_2 = f_2 = f_2 = f_2 = f_2 \),

\( f_{2y'} = 0, f_{2y'} = (1 + y'^2) \), and the equation (6) takes the form \( y'' = 0 \). The only solutions of this differential equation are the straight lines \( y = ax + b \). It follows that if there is any curve of the class in the plane along which the distance between two given fixed points is at a minimum, that curve is the straight line joining the two points. This result is independent of the Euclidean postulate, and depends only upon the definition of length by means of the preceding integral.

The problem of the brachistochrone, mentioned above, is to find the curve along which a particle, with initial velocity \( v_0 \), will descend most quickly from a given initial point \( P_1 \) to another given point \( P_2 \). It is easy to show that the time of descent is given by the formula

\( I = \int \gamma_1 \sqrt{1 + y'^2} \, dx \),

hence Euler’s equation (6) is

\( \frac{d}{dx} \left( \frac{y''}{\sqrt{1 + y'^2}} \right) = 0 \),

which gives at once \( y'' = c^2 (1 + y'^2) (v_0 + 2g (x_0 - x)) \). This equation may be readily solved in parametric form, and we find:

\( x - A = \frac{-2g}{c} + x_0 \),

\( y - C = \frac{-2g}{c} + x_0 \),

where

\( A = \frac{-2g}{c} + x_0 \),

\( B = \frac{-2g}{c} + x_0 \).

These extremals are cycloids on horizontal base, the radius of the generating circle being \( (A + B)/2 \), and one cusp being at the point \( (A, C) \). Further investigation is necessary to decide just when a given pair of points can be connected by such a cycloid (cf. Bolza, ‘Lectures,’ p. 236). If such a cycloid can be drawn, we can infer that it is the solution if there is any solution. If no such cycloid can be drawn, we can infer that there is no solution in the region \( R \).

The problem of finding the geodesic lines on a given surface is that of minimizing the integral,

\( I = \int \gamma \left( E + 2Fy' + G y'^2 \right) \, dx \),

where \( \gamma = \phi(x, y) \) is the surface and where \( E = 1 + x'^2, F = x y', G = 1 + x'^2 \). Euler’s equation therefore coincides with the usual equation for the geodesic lines:

\( \frac{d}{dx} \left( \frac{G y' + F}{\sqrt{E + 2F y' + G y'^2}} \right) = 0 \),

and the geodesic lines are the extremals of this problem, i.e., no line not a geodesic can be a shortest line on a surface.

Though the proof of the necessity of Euler’s condition was satisfactory, even in a cruder form, to the originators of the subject, a desire to formulate sufficient conditions arose. Thus Legendre showed that a second necessary condition for a minimum [maximum] is that the condition

\( f y''(x, \psi(x), \psi'(x)) > 0 \quad \text{if} \quad x_0 < x < x_1 \)

be satisfied along the supposed solution \( y = \psi(x) \) between the end points. We shall prove this, and we shall see that the same condition is actually a sufficient condition for a weak limited minimum if the sign in be removed.

Jacobi then showed, by means of the second variation of the given integral, that a third necessary condition for a minimum [maximum] is that the integral

\( d(x, x_0) = \int_0^x (x) \, dx \)

should not vanish for any value of \( x \) in the interval \( x_0 < x < x_0 \) where \( d(x, x_0) \) is a solution of the equation

\( f y''(x, \psi(x), \psi'(x)) + \frac{df}{dx} \psi' \frac{d\psi'}{dx} = 0 \),

which vanishes for \( x = x_0 \). The proof, which is omitted, can be found in Bolza, ‘Lectures,’ Chap. 2. A beautiful geometrical interpretation of this condition exists: if we consider the one parameter family of extremals through \( (x, x_0) \), and call their envelope \( E \), the extremal which joins \( x_0 \) to any point beyond its point of tangency with \( E \) cannot possibly render the integral a minimum [maximum] between those two points, i.e., the envelope of the extremals through \( (x, x_0) \) bounds all the points which can possibly be reached by a minimizing extremal from \( x \).

It was long believed that Jacobi’s condition, together with the previous two, was a sufficient condition. That such is not the case, was first pointed out by Weierstrass, who also showed that Jacobi’s condition, while not sufficient for a minimum in general, is sufficient for a weak minimum (if the point \( (x, y_0) \) lies inside the envelope of the extremals through \( (x, y_0) \) bounds all the points which can possibly be reached by a minimizing extremal from \( x \).

Cf. Bolza, ‘Lectures,’ Chap. 3.

That the preceding conditions are not sufficient is most readily seen by giving an actual example in which the extremals, though all the above conditions are satisfied, do not minimize the integral. Such is the example (see Bolza, ‘Lectures,’ p. 73),

\( f(x, y, y') = y'^3 (y'^2 - 1) \)

Here the extremals are straight lines, but it is easy to join two points for which all the preceding conditions are satisfied by a simple broken line for which the value of the integral
is less than that along the straight line extremal. Of course, the comparison line used varies considerably from the straight line extremal in direction, though not in position.

Weierstrass, in 1879, gave a fourth necessary condition. He defines a new function,

\[ E(x, y, y', p) = f(x, y, y') - f(x, y, p) \]

Then Weierstrass’s (fourth) necessary condition for a minimum [maximum] is

\[ E(x, y, y', p) \geq 0 \quad [\leq 0] \quad x_{0} \leq x \leq x_{0}, \]

where \( x, y, p \) are the values of \( x, y, dy/dx \) along the extremal between the end points, and where \( y' \) is any finite number whatever. (Cf. Bolza, ‘Lectures,’ Chap. 3). Since we have

\[ \text{Limit} \quad \frac{E(x, y, y', p)}{(y' - p)^{2}} = \frac{1}{2} f' y' \]

it follows that it is also necessary that \( f' y' \geq 0 \), which is precisely the second (Legendre’s) necessary condition mentioned above. It is easy to show that if (a) the end points can be joined by an extremal \( K \), (b) a one parameter family of extremals \( \{y = \varphi(x, \alpha)\} \) can be found, one of which is \( K \) itself, and one and only one of which passes through each point of the plane near \( K \), so that \( y = \varphi(x, y) \) can be found, i.e., a function which gives the slope of the extremal of the family at any point \( (x, y) \) near \( K \), then the integral

\[ J = \int_{x}^{x_{0}} [f(x, y, p) + (y' - p) f_{p}(x, y, p)] \, dx \]

is independent of the path of integration inside the field just constructed near \( K \), and we have

\[ I_{K} = \int_{x}^{x_{0}} E(x, y, y', p) \, dx \]

along \( \gamma \).

where \( C \) is any curve of the class \( B \) in the field about \( K \), since \( I_{K} = I_{\gamma} \). It follows that the condition

\[ E(x, y, y', p) \geq 0, \quad x_{0} \leq x \leq x_{0}, \]

for all \( x \) and \( y \) near \( K \) and for the function \( p(x, y) \) just mentioned and for any finite value of \( y' \) whatever, is a sufficient condition for a strong minimum, if the sign of equality holds only for one. Cf. Osgood, ‘Annals of Mathematics,’ II, 3. Bolza, ‘Lectures,’ Chap. 3. Actually it is possible to show (cf. Hedrick, ‘Bull. A. M. S.,’ IX, 1) that for a limited minimum the conditions remain the same except that Jacobi’s condition may be omitted. The conditions in the various cases may be summarized in the following scheme:

<table>
<thead>
<tr>
<th>Limited variations</th>
<th>Unlimited variations</th>
</tr>
</thead>
<tbody>
<tr>
<td>Weak</td>
<td>Strong</td>
</tr>
<tr>
<td>Euler’s necessary.</td>
<td>Euler’s necessary, Legendre’s necessary, Weierstrass’s necessary.</td>
</tr>
<tr>
<td>Euler’s sufficient.</td>
<td>Euler’s sufficient, Legendre’s sufficient, Weierstrass’s sufficient.</td>
</tr>
</tbody>
</table>

It is seen on glancing at the table that from the simple conditions (Euler’s and Legendre’s) for limited weak variation we proceed to any other case by adding Weierstrass’s conditions in the case of a strong minimum, and Jacobi’s in case of an unlimited minimum, only. A fifth necessary condition for a strong extremum, independent of all the others, has been discovered by Bolza.

In special problems the irksomeness of these conditions can sometimes be circumvented. For instance, given a problem in which \( \frac{df}{dy} > 0 \) for all values of \( x, y, y' \), then the necessary and sufficient condition for a limited strong minimum is the possibility of finding a solution of Euler’s equation joining the two given end points. Such is the case in the geodetic problem and also in the integral which leads to Hamilton’s principle; and in each of these cases, fortunately, a limited strong minimum is all that is desired. Similar simplification occurs in every case when \( \frac{df}{dy} > 0 \) for all values of \( x, y, y' \). For then Legendre’s and Weierstrass’s conditions are always satisfied, and may be abstracted from the above table. For this reason Hilbert has called a problem in which \( \frac{df}{dy} > 0 \) for all \( x, y, y' \) contained in a singly connected region \( R \), in which the given end points lie, a ‘regular’ problem of the Calculus of Variations.

Considering the example \( \int_{x}^{x_{0}} \sqrt{1 + y'^{2}} \, dx \), we see that \( f y' > 0 \) for all finite values of \( x, y, \) and \( y' \) whatever. Since

\[ E(x, y, y', p) = \frac{(y' - p)^{2}}{2} - f y' (x, y, p) \]

it follows that such an example surely satisfies Weierstrass’s sufficient condition, provided that a field exist in the manner specified above. But in this case, since the extremals are all straight lines in the plane, it is obvious that all other conditions are satisfied. Hence the straight line joining any two points actually minimizes the given integral, i.e., the straight line is the ‘shortest’ line between any two of its points if the preceding integral be the definition of length.

In the problem of the brachistochrone, mentioned above, it is shown that the extremals found (cycloids) actually render the integral of the problem a minimum provided no cusp lies between the end points. (Cf. Bolza, ‘Lectures,’ Chap. 4, pp. 126, 136, 146).

Returning to the integral which defines length, it is evident that some other integral might as well have been selected as the definition of length, if we are not to assume an intuitive knowledge of it. The variety of choice is limited only by the selection of those properties which we desire to have hold. This leads very naturally to The Inverse Problem of the Calculus of Variations: Given a set of curves which form a two-parameter family. What is the condition that they be the extremals of a problem of the Calculus of Variations? What are the conditions that they actually render the integral thus discovered a minimum? Let
CALCUTTA

$y = F(x, a, b)$ be the given family. Then (cf. Bolza, 'Lectures,' p. 31) the integrand of any interval for which these are extremals must satisfy the equation

$$\frac{\partial f}{\partial y} - \frac{\partial f}{\partial y'} = \frac{\partial f}{\partial y} \cdot \frac{\partial y}{\partial y'} - \frac{\partial f}{\partial y'} \cdot \frac{\partial y}{\partial y'},$$

where $y' = G(x, y, y')$ is the differential equation of the given family. This equation for $f(x, y, y')$ always has an infinite number of solutions, of which only those are actually solutions of the given inverse problem which satisfy the relation $f y'' > 0$, and these are solutions in any region free from envelopes of one-parameter families of the given extremals. Some interesting conclusions for particular forms are to be found in a paper by Stromquist, 'Transactions of American Mathematical Society' (1905).

Another interesting class of problems are the so-called isoperimetric problems. These are problems in which a further restriction is placed upon the solution by requiring that it shall give a second (given) integral a given value. Such is, for example, the problem of finding the curve of maximum area with a given perimeter. The solution is obtained by means of the so-called method of multipliers, which is too long for presentation here. Consult Bolza, 'Lectures,' Chap. 6.

This article is too short to give any account of the details of the work for double integrals. Suffice it to say that the known methods fall closely those given above for simple integrals. In the other possible problems mentioned above the same holds true. An interesting application of these other problems occurs in the well-known Problem of Dirichlet, which is fundamental in mathematical work. Another is the important problem of Minimum Surfaces. Another is the well-known theory of mechanics based upon Hamilton's Principle or one of the analogous mechanical principles. The modern methods have made these theories more rigorous.

Bibliography.—The following is a list of the more important works and articles published in America concerning the Calculus of Variations, the one by Chicago (1900); and various papers, 'Annals of Mathematics'; and 'Transactions of the American Mathematical Society'; Bolza, various papers, 'Bulletin American Mathematical Society'; 'Transactions American Mathematical Society', etc. (1901-06); brochures published in the Chicago Decennial publications, including the Lectures on the Calculus of Variations mentioned above (Chicago 1904): Carll, 'Calculus of Variations' (New York 1885); Hancock, various papers in 'Annals of Mathematics'; and 'Calculus of Variations' (Cincinnati 1894); Hedrick, articles in ' Bulletin American Mathematical Society' (1901-05); Osgood, 'Annals of Mathematics' (II, 3) and 'Transactions American Mathematical Society' (II); Whittemore, 'Annals of Mathematics' (II, 3).

The foreign literature is well collected for reference in the footnotes to Bolza's lectures and in the following books and articles: Kneser, 'Variationsrechnung' (Braunschweig 1917); 'Ency. of Math. Wiss.' (II, A 8) (Leipzig 1904); Migno-Lindeloff, 'Calcul des Variations' (Paris 1861); Pascal, 'Calcolo delle Variazioni' (Milano 1897), German trans, Leipzig 1899); Todhunter, 'History of the Calculus of Variations' (Cambridge 1861); Zermelo u. Hahn, 'Ency. d. Math. Wiss.,' (II A 8a) (Leipzig 1904).

The literature is altogether extremely extensive, covering, as it does, a period of over 200 years. It is evident that the more important papers for present use are those of recent date.

An important phase of the subject which has necessarily been overlooked is the general proof by Hilbert (1900) that at least an improper minimum always exists. Consult Bolza, 'Lectures,' (chap. 7).

CALCUTTA, INDIA

THE JAIN TEMPLE, CALCUTTA
CALCUTTA 185

office, custom house, Bengal secretariat, etc. The European retail trading quarter occupies a small area to the east of the above area. Everywhere outside of the European quarters Calcutta is interspersed with bâtiks, or native hamlets, and the notion of the cemeteries and the town is largely built over with small bâtki villages. The most interesting of the European suburbs is the French quarter, in which a city of palaces in front, is one of pigs-sties in the rear. First among the public buildings is old Government House, the vice-regal residence, situated, as already mentioned, on the Esplanade. It was built in 1799-1804, and with its grounds occupies six acres. Four wings extend toward the four points of the compass from a central mass which is crowned with a dome and approach from the north by a portico. The High Court, the town-hall, the Bank of Bengal, the government office, post-office, etc., are among the other public buildings in this locality, while further to the north stands the mint, near the banks of the Hooghly. The chief of the Anglican churches in Calcutta is the cathedral of Saint Paul's, at the southeastern corner of the Maidan, a building in the Indo-Gothic style, with a tower and spire 201 feet high, consecrated in 1847. Saint John's Church, or the old cathedral, is another important church, in the graveyard surrounding which is the tomb of Job Charnock, founder of Calcutta. The chief Presbyterian church is Saint Andrew's, or the Scotch Kirk, a handsome Grecian building with a spire. The Roman Catholics have a cathedral and several other churches; and there are also places of worship for Greeks, Parsees and Hebrews. Hindu temples are numerous but uninteresting; among the Mohammedan mosques the only one of note is that which was built and endowed by Prince Ghulam Mohammed, son of Tippoo Sultan. The religious, educational and benevolent institutions are numerous. Various missionary and other religious bodies, British, European and American, are well represented. There are four government colleges, the Presidency College, the Mohammedan College and the Bethune Girls' School. There are five colleges mainly supported by missionary efforts; besides several others, some of them under native management. Other educational institutions include Calcutta Medical College, a government school of art, Campbell Vernacular Medical School and a school of engineering at Howrah, on the western side of the river. Besides these there is the University, an examining and degree-conferring institution. Among the hospitals are the Medical College Hospital, the General Hospital, the Mayo Hospital (for natives), and the Eden Hospital for women and children. The Martinère (so named from its founder, General Martin, a Frenchman in the East India Company's service) is an important institution for the board and education of indigent Christian children. Elementary and other schools are increasing in numbers. The Asiatic Society was founded by Sir W. Jones in 1784. The study of languages, literature and antiquities of Asia. The Botanic Garden occupies a large area on the right bank of the river. Calcutta possesses a number of public monuments, most of them in or about the Maidan. Several governors-general are thus commemorated, as also Sir David Ochterlony and Sir James Outram, "the Bayard of the East," of whom there is a monument. Also a statue by Foley. The city is lighted partly by gas, partly by electricity. There is an extensive system of tramways. The sanitation of Calcutta, though vastly improved in recent years, is still defective, more especially in the suburban districts, whereas the ditches or the swamps are so numerous. The Calcutta Improvement Commission was formed in 1912 to aid in town planning and in the improvement of public health. One difficulty in the way is the site of the city itself, which is practically a dead level. An act which came into force in 1889 brought a large additional area under the municipal authorities, and since then much has been done in the way of drainage, opening up of arterial streets, alignment of roads, etc. The water supply has also been improved, and a treated water from the Hooghly (there is a pumping station at Patla, 16 miles above Calcutta) is now available at the daily rate of 36 gallons per head in the city, and over 15 in the suburbs, besides a supply of unfiltered water from the river and other purposes. The mortality throughout the entire municipality in 1912 was 28.1 per 1,000, a great improvement on former times, and the birth-rate 21.06 per 1,000. The death-rate is far higher among the natives than among the Europeans, and in the native quarters cholera is said to be seldom absent. The healthiest months are July and August, which form part of the season of rains; the unhealthiest are November, December and January. The mean temperature is about 79°, the average rainfall a little over 66 inches. The port of Calcutta extends for about 10 miles along the river, and is under the management of a body of commissioners. Opposite the city it is crossed by a great pontoon bridge, which gives communication with Howrah for vehicles and foot passengers, and can be opened at one point to let vessels pass up or down. It cost $1,100,000. Besides the accommodation for shipping furnished by the river, there are several docks. The trade of Calcutta being the commercial centre of India. There is a very extensive inland trade by the Ganges and its connections, as also by railways (the chief of which start from Howrah), while almost the whole foreign trade of this part of India is monopolized by Calcutta. In 1913-14 the gross tonnage of the shipping inward and outward was over 6,926,817 tons; the total of exports and imports at the wet docks was about 4,800,000 tons. The total over-seas trade in merchandise during the fiscal year ended 31 March 1916, amounted to $452,785,005. The year's imports were valued at $167,666,650 and the exports at $285,119,855. The chief exports are opium, jute and jute goods, tea, grain and pulse, oilseeds, raw cotton, indigo, hides and skins, silk and silk goods, seeds, coal and coke, raw hemp, mica, etc. The most important imports are cotton goods, sugar, metals, machinery, oils, railway plant and rolling stock, cutlery, salt and spices. The jute manufacture is extensively carried on, also that of cottons. The first factory in Bengal of the East India
CALDARA—CALDERON

Company, which was incorporated by royal charter in the year 1600, was established at Hooghly, 28 miles farther up the river, in 1644. Job Charnock, the company's agent, was driven out of this settlement in 1686, and the English then occupied part of the present site of Calcutta, which in 1699-1700 became the head-quarters of the commercial establishments of the company in Bengal. In 1700 the company acquired from Prince Azim, son of the Emperor Aurungzebe, the three villages of Suitam, Halisahar, and Calcutta, and Govindpore, for an annual rent of 1,195 rupees, and these formed the nucleus of the present city. The original Fort William, named after William III, was built in 1696, on a site considerably to the north of the present fort. Calcutta was taken and plundered by Suraj-ud-Dowlah in 1756, and retaken by Lord Clive in 1757. To the capture by Suraj-ud-Dowlah belongs the episode of the "Black Hole" (q.v.) of Calcutta. When the British recovered possession, much of the town was in ruins and had to be rebuilt, so that it may be said to date only from 1757. Clive built the new Fort William on the site of Govindpore, between 1757 and 1773. In 1773 Calcutta became the seat of British government for the whole of India, and so continued until 1911, when announcement was made, for political and climatic reasons, of a change of capital to the city of Delhi, the ancient seat of the Mogul empire. Pop. (1911) 896,067.

CALDARA, Polidoro. See CARAVAGGIO.

CALDER, Alexander Stirling, American sculptor: b. Philadelphia, 11 Jan. 1870. The son of Alexander Milne Calder, himself a sculptor, whose work is represented by the General Meade statue in Fairmount Park, and by the sculptural decorations in the city hall, Philadelphia, after early instruction at the Pennsylvania Academy, went to Paris and studied under Chapu and Falguière. On his return he was appointed instructor in the School of Industrial Art, Philadelphia. Among his notable productions are 'The Dozing Hercules,' 'Primeval Disconsolate,' 'The Man Cub,' 'The Miner,' 'Narcissus' and the six heroic figures of leading Presbyterian theologians above the entrance to the Witherspoon Building, Philadelphia.

CALDER, James Alexander, Canadian statesman: b. Ingersoll, Ontario, 17 Sept. 1868. He was educated at Ingersoll Public School, High School, Winnipeg, and was graduated from the University of Manitoba in 1888. He entered the teaching profession, was principal of Moose Jaw High School 1891-94, inspector of schools for the Northwest territories 1894-1900 and deputy commissioner of education for the territories 1901-05. He was called to the bar of the territories in 1906. He was elected to the local legislature of Saskatchewan for South Regina in 1905, but was defeated in 1908, and afterward reelected and served as the first Provicial Treasurer and Minister of Education in the Scott ministry he showed a thorough mastery of the details of legislation and was aided by his singularly lucid expository style. In 1910 he became Minister of Railways. During the ill-health of Premier Scott he was acting head of the government, and on his retirement he declined the succession in favor of William Mar-

tin. In October 1917 he joined as one of the Western Liberal representatives the Dominion Union ministry formed by Sir Robert Borden, in which he assumed the new portfolio of Immigration and Colonization.

CALDERA, Chile, a seaport in the province of Atacama, 25 miles by rail from the city of Copiapó, and connected also with the points of the central valley and west coast. Among Chilean ports, Caldera ranks as 15th in the value of imports and as 19th in the value of exports. For the mineral productions of this region, the climate and agricultural products (with the aid of irrigation) see Chile. Pop. about 3,000.

CALDERON, Francisco García, Peruvian statesman: b. Arequipa 1834; d. Lima, Peru, 21 Sept. 1905. At the age of 21 he was a professor of jurisprudence, a member of the Peruvian Congress 1867 and Minister of the Treasury 1868. After the occupation of Lima by the Chilean army, during the war between Chile, Peru and Bolivia, 1879-81, he was made president of a provisional government formed under the protection of the Chilean authorities, Feb. 1881. His government was recognized by the United States, the Central American republics and Switzerland. He pledged himself to conduct his government upon principles not opposed to the fundamental conditions demanded by Chile for the final arrangement of peace, but failing to do this, he was arrested, 6 Nov. 1881, by order of Gen. Patrick Lynch, rear-admiral and general-in-chief of the Chilenos, and sent as a prisoner to Valparaiso. Upon his return to Lima in 1886 he was elected president of the Senate and was made rector of the University of San Marcos. He worked earnestly for its rehabilitation after the war and by 1886 its restoration was in great part effected, new buildings constructed and normal university life resumed. He aided in securing the Grace contract through which Peruvian finances were placed on a sound basis and the commercial stability of the country assured a great degree of permanency. His principal works are 'The Dozing Hercules,' 'The Man Cub,' 'Narcissus'; a work, 'Consult Markham, C. R., 'History of Peru' (Chicago 1892); García's 'Le Perdú contemporain' (Paris 1907); Martin, M., 'Peru of the Twentieth Century' (London 1911).

CALDERON, Philip Hermogenes, English painter, of Spanish parentage: b. Poitiers, 3 May 1833; d. London, 30 April 1898. He was the son of Juan Calderon, at one time professor of Spanish literature in King's College, London. Coming to England about 1845, he became shortly afterward the pupil of a well-known engineer; but his artistic ability was so pronounced that his father allowed him to devote himself to the study of art at the British Museum and the National Gallery. In 1853 he went to study under Picot at the Ecole des Beaux Arts in Paris. In 1856 the French Academy in 1853, his picture being named 'By the Waters of Babylon.' Among the many pictures he subsequently produced are 'Broken Vows' (1857); 'Far Away' (1858); 'The Gasker's Daughter' (1859); 'Liberating Prisoners on the Young Heir's Birthday' (1861); 'After the Battle' (1862), one of his most successful works; 'The English
Embassy in Paris on the day of the Massacre of Saint Bartholomew (1563); 'Her Most High, Noble and Puissant Grace' (1565), the last two being among his finest works; 'Whither?' (1587 — his diploma picture); 'Sighing His Soul Out in His Lady’s Face' (1866); 'Spring Driving Away Winter' (1870); 'On Her Way to the Throne' (1871), a sequel to his masterpiece of 1865; 'Victory' (1873); 'Half-hours with the Best Authors'; 'La Gloire de Dijon' (1878); 'Renunciation of Saint Elizabeth of Hungary' (1919, National Gallery, London), probably his greatest work; 'Home They Brought Her Warrior Dead'; 'Aphrodite'; 'The Answer' (1897) and 'Ruth' (1897). Elected A.R.A. in 1864, he became, three years later, a full academician. He gained in 1867 the first French gold medal awarded to an English artist, and in the same year was made keeper of the Royal Academy, in which position he remained until his death. In 'Broken Vows' he betrayed a tendency to the pre-Raphaelite style, but he did not retain this influence long, and his next work betrays his French technical training, while his subjects reflect English popular sentiment.

CALDERÓN, Serafín Estebanés, Spanish writer: b. Malaga, Spain, 1799; d. Madrid, 7 Feb. 1867. He was professor of poetry and rhetoric at Granada, 1822–30, and resigned and went to Madrid. There he collected a library of old Spanish literature, especially of ballads, whether manuscript or in print; the collection is in the National Library at Madrid. He wrote a volume of poems, 'Poesías del Solitario' (1830); a novel, 'Christians and Moriscos' (1838), and a very valuable study of 'The Literature of the Moriscos.' He also wrote 'The Conquest and Loss of Portugal' and a charming volume of 'Andalusian Scenes' (1847).

CALDERÓN DE LA BARCA, Pedro, Spanish poet and playwright: b. Madrid, 17 Jan. 1600; d. there, 25 May 1681. He was the last of his line, which embraced the reigns of three kings, one of whom, Philip IV, was a generous patron, and exerted a profound influence upon the dramatist's art by demanding of him spectacular plays for his own court theatre in the royal palace, coinciding with the golden age of the Spanish drama, and his death marked its close.

Of Calderón's life little is known except that it was uneventful and blameless, in which respect he contrasts favorably with his famous contemporaries and rival, Lope de Vega. His father, who was of noble origin, served as secretary to the Treasury Board under Philip II and Philip III. When nine years of age, Calderón was sent to the Jesuit College at Madrid, from which at the age of 14, he entered the University of Salamanca, not without first giving evidence of precocity and an interest in the drama by writing a play, known now only by title, 'The Chariot of Heaven' (i.e., Elijati's). The influence of Jesuit teaching is seen in his plays, where the dramatist reveals an unusual fondness for dialectics. Some of his most successful dramas defend the attitude of Jesuits toward the doctrine of freewill. These influences were continued at the University of Salamanca, where professors stoutly championed the Jesuit cause against the professors of the University of Coimbra. At Salamanca Calderón studied mathematics, philosophy, geography, history, civil and canon law, and graduated in 1619. While at the university he continued to write plays, and, according to his panegyrist and earliest biographer, Vera Tassis, with such marked success that his name became known throughout Spain. Nevertheless, he planned to enter the legal profession in his native city, but, as he himself records, the desire to win a prize in a poetical tournament organized in 1620 to honor the patron saint of Madrid, Saint Isidor, made the poet of him. He failed, however, to win a prize, but in a second contest two years later he was awarded a third prize for a euphuistic poem of little promise. More significant, as indicating the esteem in which he was already held by contemporary writers, is the fact that he contributed one of three commendatory poems to the official account of the second contest prepared by Lope de Vega. In 1625 Calderón entered the army for service in Lombardy and Flanders. Upon his return to Spain he began to occupy the court of Philip IV as a kind of official playwright and master of the revels. For these services he was honored with knighthood in 1630, and later was granted a pension. In order to qualify for a chaplaincy endowed by his maternal grandmother in his parish church of San Salvador, he became a priest in 1651. It is usually stated in biographies of Calderón that he now ceased to write for the secular stage and produced only "autos sacramentales" for the feast of Corpus Christi. Documents published by Pérez Pastor (1905) show, however, that he wrote plays at rare intervals for the royal theatre in the palace of the Buen Retiro. Calderón was by nature a serious and pious man, and his literary production from 1651 on consists almost entirely of "autos sacramentales," most of which were adaptations of his earlier secular plays. In 1653 Philip IV appointed Calderón to a chaplaincy in Los Reyes Nuevos at Toledo, but the absence of the poet from the court proved unsatisfactory to the King, and so in 1663 he made him one of his honorary chaplains at Madrid. On his death, in 1681, all Spain mourned for him. Foreign scholars vied with Spaniards in paying tribute to his memory. During his long life he had been honored by royalty, and the principal cities of Spain commissioned him annually to write their "autos sacramentales." Many of his plays had been translated into French and Italian. In Spain his dramatic works remained popular until about the middle of the 18th century, when pseudo-classical critics singled him out as the special butt of their attacks on the national drama. In 1763 the performance of "autos sacramentales" was forbidden by law. Calderón's plays were censured for the importance given in them to intrigue, with the consequent neglect of character study. His brilliant, but at times pompous and euphuistic style — especially in plays composed for the royal theatre — also met with disapproval. About the year 1800, the romantic critics of Germany, Friedrich Schlegel, started a furore for Calderón which made him during two decades the most popular dramatist of modern times. This extravagant enthusiasm for the Spaniard is well exemplified in Shelley, who recommended his plays "with inexpressible wonder and delight," and
CALDERÓN Y BELTRAN — CALDWELL.

was inspired to throw over their perfect and glowing forms the grey veil of my own words, with what success is seen in his famous, although often inaccurate, rendering of parts of "The Wonder-Working Magician." At present, partakers of a natural reaction, and partly because critics like Grillparzer and Menéndez y Pelayo have set up the counterclaim of his more spontaneous and less conventional contemporary, Lope de Vega, Calderón is held in less esteem than formerly.

Calderón's plays can be grouped under five headings, as follows: (1) Religious or sacred plays, to which class belong three of his most successful works, "The Wonder-Working Magician" (q.v.), "The Devotion to the Cross" and "The Firm Prince." These plays have as their themes conversion from paganism, the repentance of a sinner, who thereby receives pardon, and the fortitude of a Christian hero. (2) Philosophical plays, the best-known being "Life is a Dream" (q.v.). (3) Tragedies, or so-called honor plays, a representative work of this peculiarly Spanish type of play being "The Mayor of Zalamea" (q.v.). (4) "Cloak and sword" comedies, plays of intrigue which reflect the customs of the dramatist's age. It was part of these plays that Goethe was thinking when he remarked that Calderón's characters are as alike as bullets or leaden soldiers cast in the same mould. In this type of play Calderón was surpassed by Lope de Vega, Tirso de Molina, and Alarcón. (5) "Autos sacramentales," in which Calderón was acknowledged a master without a peer. The modern reader is interested only in the few lyrical passages which occur at rare intervals in arid wastes of philosophical or theological discussions and abstractions.

Bibliography.—"Biblioteca de Autores Españoles" (Vols. VII, IX, XII, XIV, LVIII); "Select Plays" (ed. N. MacColl, London 1888); "Six Dramas of Calderón" (freely trans. by E. Fitzgerald, London 1903) by Schmidt, F. M.; "Die Schauspieler Calderón's" (Elberfeld 1857); M. Menéndez y Pelayo, "Calderón y su Teatro" (Madrid 1881); Breymann, H., "Calderón-Studien" (a pretentious but incomplete and inaccurate bibliography, Munich 1905).

Milton A. Buchanan,
Professor of Italian and Spanish, University of Toronto.

CALDERÓN Y BELTRAN, Fernando, Mexican dramatist and poet: b. Guadalajara, 20 July 1809; d. Ojocaliente, 18 Jan. 1845. Throughout Spanish America his plays, such as "The Journey," "Anne Boelyn" and "The Return of the Crusader," have been extremely popular. As a lyrical poet his work is characterized by dramatic fire, and he is popular, not only in Mexico, but throughout the whole of Spanish America.

CALDERWOOD, David, Scottish clergyman and ecclesiastical historian: b. Dalkeith 1575; d. Jedburgh, 29 Oct. 1650. In 1604 he was sent as an usher to Crailing, in Roxburghshire, where he distinguished himself by his opposition to episcopal authority. In 1617 he was banished from the realm for his contumacy and went to Holland, where, in 1623, he published his work entitled "Altare Dramasenum." He returned to Scotland, and became minister of the church of Pencaitland, near Edinburgh, and in 1643 was appointed one of the committee which compiled the directory for public worship in Scotland. He then engaged in writing the history of the Church of Scotland, in continuation of that of Knox, a work which was published as the Woodrow Society, with a life by the Rev. Thomas Thomson, from his manuscript in 1842-49, in eight volumes.

CALDERWOOD, Henry, Scottish philosopher: b. Peebles, 10 May 1830; d. Edinburgh, 19 Nov. 1897. He received his early education at the Edinburgh Institution and High School. He afterward attended the university of that city, and while a student published his "Philosophy of the Infinite" (1854), an attempt to controvert the views of Sir William Hamilton. He became minister of Greyfriars United Presbyterian Church, Glasgow, in 1856, and in 1868 was elected professor of moral philosophy in Edinburgh University, a chair which he occupied for the rest of his life. His chief works are his "Handbook of Moral Philosophy" (1872); "Relations of Mind and Matter" (1873); "Evolution and Man's Place in Nature" (1873); "The Relations of Science and Religion" (1881); and a "Life of David Hume" (1896). He devoted much of his time to work for educational and temperance reform. Consult the biography (London 1900) by his son, W. C. Calderwood, and D. Woodside, which contains a chapter on Calderwood's philosophy by A. S. Pringle-Pattison.

CALDICOTT, Alfred James, English musician and composer: b. Worcester, England, 1842; d. 24 Oct. 1897. After studying at Leipzig under Richter and Moscheles he was organist of Saint Stephen's Church in his native town for a time, becoming professor in the Royal College of Music in 1882. Among his works, besides many songs, glee, etc., are the cantatas 'The Widow of Nain' (1881) and 'A Moss Rose Tent' (1883) and the operas 'Old Knocksle' (1884).

CALDWELL, Alexander, American banker: b. Drake's Ferry, Huntington County, Pa., 1 March 1830. He attended public and private schools until 16 years of age. In 1847 he enlisted as a soldier in the Mexican War, entering the company of his father, who was killed at one of the gates of the city of Mexico. In 1848 he returned to Columbus, Pa., where he entered a bank, and later took up business. In 1861 he removed to Kansas, where he engaged in the transportation of military supplies at the various posts on the plains, and became largely interested in railroad and bridge building. He was elected to the United States Senate as a Republican, took his seat 4 March 1871 and served until 24 March 1873, when he resigned. He is president of the Kansas Manufacturing Company and president of the First National Bank of Lebanonworth since 1897.

CALDWELL, Charles Henry Bromedge, American naval officer: b. Hingham, Mass., 11 June 1828; d. Boston, 30 Nov. 1877. He did a notable service in an expedition against a tribe of cannibals inhabiting one of the Fiji Islands, defeating them in a pitched battle and destroying their town. In the Civil War he commanded the "Husca," taking part in the bom-
bardment of forts Jackson and Saint Philip and the Chalmette batteries, and in the capture of New Orleans. He was promoted commodore in 1874.

Caldwell, Howard Walter, American historian: b. Bryan, Ohio, 26 Aug. 1858. He was graduated from the University of Nebraska in 1880 and is professor of American history and jurisprudence there. He has written 'History of the United States, 1815–1861' (1896); 'Studies in History' (1898); 'A Survey of American History' (1898); 'Some Great American Legislators' (1898); 'Life of Henry Clay' (1899); 'Expansion of the United States' (1900); 'Education in Nebraska' (1902); 'Civil Government of Nebraska' (1902); 'Source History of the United States' (1909); 'Outlines with References for American History 1783–1877' (1910).

Caldwell, James, American clergyman: b. Charlotte County, Va., April 1734; d. 24 Nov. 1781. After graduating at the College of New Jersey, now Princeton University, he became a Presbyterian pastor at Elizabethtown. During the growing antagonism between the colonies and Great Britain, he warmly took the side of the former, and when hostilities began, became chaplain to the New Jersey brigade, and took an active share in its campaigns, fighting "with the sword in one hand and the Bible in the other." Irritated at the unexpected and obstinate resistance made by the Jersey troops and yeomanry, the English began to burn the houses, and the property of the villagers at Connecticut Farms. In one of the houses was the family of Mr. Caldwell, whose wife had retired to a back room with her two youngest children — one an infant in her arms — where she was engaged in prayer, when a musket was discharged through the window. Two balls struck her in the breast, and she fell dead upon the floor. On 23 June General Knyphausen made a second incursion with about 5,000 troops. On this occasion he passed over the same route to Springfield, where a battle was fought. Among the most active in the fight was the chaplain Caldwell. The British were compelled to retrace their steps, which they did with all possible rapidity. He was shot and killed by an American sentinel in the course of a dispute over a package the latter desired to examine. The soldier was tried and executed for murder later. In 1846 a monument was raised to Caldwell's memory in Elizabeth.

Caldwell, Joseph, American educator: b. Lamington, N. J., 21 April 1773; d. Chapel Hill, N. C., 20 Jan. 1835. He was graduated at Princeton in 1791, delivering the Latin salutatory, and then taught school in Lamington and Elizabethtown, where he began the study of divinity. He became tutor at Princeton in April 1793, and in 1796 was appointed professor of mathematics in the University of North Carolina. He founded the institution, then only five years old, in a feeble state, nearly destitute of buildings, library and apparatus, and to him is ascribed the merit of having saved it from the verge of bankruptcy. He was made its president in 1804 and held the office till his death, with the exception of the years from 1812 to 1817. Princeton gave him the degree of D.D. in 1816. In 1824 he visited Europe to purchase apparatus and select books for the library of the university. A monument to his memory has been erected in the grove surrounding the university buildings. He published 'A Compendious System of Elementary Geometry,' with a subjoined treatise on plane trigonometry (1822), and 'Letters of Carleton' (1825).

Caldwell, William, Scottish-American educator: b. Edinburgh, Scotland, 10 Nov. 1863. He was graduated from the university of his native city and was assistant professor of logic and metaphysics in that institution 1887–88. In 1891 he was called to the same School of Philosophy, Cornell University, New York; in 1892 to the University of Chicago, and from 1894 to 1903 he was professor of moral and social philosophy in the Northwestern University at Evanston, Ill. In the latter year he was appointed Macdonald professor of moral philosophy in McGill University, Montreal. He has published 'Schopenhauer's System in Its Philosophical Significance' (1896); 'Pragmatism and Idealism' (1913); and contributions to the leading psychological and philosophical reviews.

Caldwell, Idaho, city, county-seat of Canyon County on the Oregon Short Line Railroad, 26 miles direct west of Boise. It is in the Payet-Boise Reclamation project, a rich farming region, yielding wheat, flour, cereals, fruits, potatoes and live stock. It has municipally owned waterworks, a Carnegie library, courthouse, city hall, and the College of Idaho is situated here. Here 30 Dec. 1906, ex-Governor Steunenberg was assassinated by Harry Orchard. Pop. 3,543.

Caldwell, Kan., city in Sumner County, on the Chicago, Rock Island and Pacific, the Atchison, Topeka and Santa Fe and Kansas and Southwestern railroads. The principal industries are the manufacture of ice and flour. There are two banks whose combined resources amount to $1,750,000. The public buildings include two primary and one grade and high schools, a city hall, Carnegie library, opera house. The government is by a commission, and the municipality owns the gasworks and water plants, which have been brought up to date recently at a cost of $95,000. Pop. 2,500.

Caldwell, N. J., city in Sussex County, on the second ridge of the Orange Mountains, 10 miles west of Newark, the county-seat, and on the Erie Railroad. It is mainly a residential city, has two banks with combined resources of $2,000,000, and taxable property of an aggregate value of $3,500,000. There are three public schools and a Carnegie library and town hall. Pop. 3,500.

Caldwell, Ohio, village, county-seat of Noble County, on the Ohio, Vevay and Western and the Cleveland and Marietta railroads, 35 miles north of Marietta. Coal mines and oil wells are worked and the village owns waterworks and electric-lighting plant. Pop. 1,430.

Caldwell, Tex., town and county-seat of Burleson County, on the Gulf, Colorado and Santa Fe Railroad, 87 miles southwest of Austin. It is the trading centre of a stock raising and cotton growing region and has cotton-gin, oil and grist mills, ice-factory and brick yards. Pop. 1,476.

Caleb, son of Jephunneh, a descendant of the tribe of Judah, or according to some au-
thorities a foreigner of Kenite origin incorporated with that tribe, according to Ussher born 1530 a.c., was sent with Joshua and 10 others to conquer the land of Canaan. When Joshua had conquered the country, Caleb reminded the Jews of the promise which had been made by God, that they should enjoy this country. He obtained the city of Hebron for his share of the spoil, besieged and captured it, and drove out three couples, or Anakim. He then marched against Kirjath-sepher, and offered his daughter Achsah to the first who should enter it. Othniel, his nephew, was the successful aspirant for the fair Jewess. Consul More, 'Judges' (1805); Myer, ed., 'Die Entstehung des Judentums' (1896); id., 'Die Israeliten und ihre Nachbarstämme' (1906).

CALEB WILLIAMS. Caleb Williams, the best-known novel and most widely read book of William Godwin, published in 1794, embodies many of the ideas of the author celebrated as 'Inquiry Concerning Political Justice.' The hero, from whom the book takes its name, a lad of humble origin but uncommon intelligence, becomes involved in the after effects of a feud between two wealthy and influential country gentlemen, Tyrrel, a sensual, boorish square, and the more courteous and refined Falkland. Becoming possessed, through an inordinate curiosity, of the secret that his master, Falkland, had murdered Tyrrel and allowed the blame to lie on innocent men, Williams is unremittingly persecuted by his master. Lodged in jail at Falkland's instigation on charge of felony, the hero, after one unsuccessful attempt, finally escapes, and in the course of his adventures meets with many class of society — highwaymen, artisans, blood-hunters and magistrates — but never escapes the consequences of Falkland's malevolence. The thesis of the book is the inequality of man before the law. Having innocently incurred the enmity of the influential, Williams cannot henceforth obtain either legal or social redress. The results of injustice are also illustrated among other members of the humbler classes, and a secondary thesis of the book is that many thieves and highwaymen are driven to their mode of life simply through injustice of laws and customs. Falkland's desire to preserve his reputation at all hazards and Tyrrel's exclamation that the lives of 20 such as his ward are not worth one hour of his convenience, are typical of the anti-social feeling that Godwin attacks.

Throughout, the book is written in a vigorous and vivid style, which, in spite of its conscious stateliness, retains vitality and has made it one of the minor classics of English literature. The solution of the relation of 'Caleb Williams' to the theories of the time is to be found in H. N. Brailsford's 'Shelley, Godwin and Their Circle.'

WILLIAM T. BREWSTER.

CALEDONIA, the name by which the portion of Scotland north of the rivers Forth and Clyde is better known to the Romans. The year 80 of the Christian era is the period when Scotland first becomes known to history. The invasion of Caesar did not immediately lead to the permanent occupation of southern Britain. It was only in the year 43 that the annexation of this portion of the island to the Roman empire began. It was completed superficially about 78, and two years were occupied in reconciling the natives to the Roman yoke. Agricola then moved northerly along the eastern route, and occupying the country up to the line of the Friths of Clyde and Forth. Agricola ran defensive works across this line, and hearing, in the third year of his occupation, rumors of an organized invasion in preparation by the Caledonians, a name applied to the dwellers north of the boundary, he resolved to anticipate them, and again advanced northward. The Roman army marched in three divisions. The weakest, consisting of the ninth legion, was attacked by the barbarians, who fought their way to the Roman camp. Agricola came to the rescue, and the Romans were victorious. The Roman army now advanced to Mons Grampius, where they found the enemy, 30,000 strong, under a chief named Galgacus. Agricola had stretched his line as far as he deemed prudent to prevent being outflanked. The auxiliaries and Romanized Britons were in the centre and front, the legions in the rear. The Caledonians are described as riding furiously about in chariots between two wealthy and influential country gentlemen, Tyrrel, a sensual, boorish square, and the more courteous and refined Falkland. Becoming possessed, through an inordinate curiosity, of the secret that his master, Falkland, had murdered Tyrrel and allowed the blame to lie on innocent men, Williams is unremittingly persecuted by his master. Lodged in jail at Falkland's instigation on charge of felony, the hero, after one unsuccessful attempt, finally escapes, and in the course of his adventures meets with many class of society — highwaymen, artisans, blood-hunters and magistrates — but never escapes the consequences of Falkland's malevolence. The thesis of the book is the inequality of man before the law. Having innocently incurred the enmity of the influential, Williams cannot henceforth obtain either legal or social redress. The results of injustice are also illustrated among other members of the humbler classes, and a secondary thesis of the book is that many thieves and highwaymen are driven to their mode of life simply through injustice of laws and customs. Falkland's desire to preserve his reputation at all hazards and Tyrrel's exclamation that the lives of 20 such as his ward are not worth one hour of his convenience, are typical of the anti-social feeling that Godwin attacks.

Throughout, the book is written in a vigorous and vivid style, which, in spite of its conscious stateliness, retains vitality and has made it one of the minor classics of English literature. The solution of the relation of 'Caleb Williams' to the theories of the time is to be found in H. N. Brailsford's 'Shelley, Godwin and Their Circle.'

WILLIAM T. BREWSTER.

CALEDONIA SPRINGS, Canada, town of Prescott County, Ontario, on the Canadian Pacific Railroad, 65 miles west of Montreal, a health resort frequented for its alkaline springs.

CALEDONIAN CANAL, in Scotland, counties of Inverness and Argyile, connects the North with the Irish Sea, extending from Murray Firth through Lochs Ness, Oich and Lochy, in the great glen of Caledonia, to Loch Elie. The total length is 60½ miles, of which the lochs compose 37½. It was built to shorten the distance between Kinmaird's Head and the Sound of Mull, which had offered a very difficult passage. By the canal route, the distance was reduced from 500 to 250 miles. It allows passage of ships of 500 to 600 tons. The canal was begun in 1803, and opened for navigation about the close of 1823.

CALEF, Robert, American merchant of Boston: b. about 1648; d. Roxbury, Mass., 13 April 1719. His fourth son, also named Robert, died in 1722 or 1723, aged about 41. One or the
other of these men was the author of a remarkable book on the witchcraft delusion in New England. The best authorities, notably James Savage and Wm. P. Poole, ascribe it to the younger, who was about 23 when it appeared. The book was entitled ‘More Wonders of the Invisible World’ (London 1700), the title being suggested by Cotton Mather’s ‘Wonders of the Invisible World.’ The substance of it had been circulated in manuscript several years previous to its publication and its malicious attacks on Cotton and Increase Mather caused a bitter and life-long quarrel between the former and the author. The book abounds records of cases. His book has not become very rare and copies bring high prices in the book auctions. It was reprinted at Salem in 1796, 1823 and 1861, and at Boston in 1828 and 1865.

CALENDAR, a system of dividing time into years, months, weeks and days for use in civil life, or a register of these or similar divisions. Among the old Romans, for want of such a register, it was the custom of the pontifex maximus, on the first day of the month, which began with the new moon, to proclaim (calare) the month, with the festivals occurring in it. Hence, calendar (the first of the month) and calendar. The periodical occurrence of certain natural phenomena gave rise to the first division of time. The apparent daily revolution of the sun about the earth occasioned the division into days. The time at which a day begins and ends has been differently fixed, the reckoning being from sunrise to sunrise, from sunset to sunset, from noon to noon, or from midnight to midnight. The changes of the moon, which were observed to recur every 29 or 30 days, suggested the division into months, but the month now used, though nearly equal to a lunation, is really an arbitrary unit; and, as a still longer measure of time was found necessary for many purposes, it was supplied by the apparent yearly revolution of the sun round the earth, producing the changing seasons. The time of this revolution is now known to be 365 days, 5 hours, 48 minutes, and 46 seconds, but as it has at various times been reckoned differently, this has given rise to corresponding changes in the calendar. This unit of time is called a solar year. The division into weeks, which has been almost universally adopted, is not founded on any natural phenomenon, and, as it originated in the East, has been ascribed to the Jews, till the time of Moses in regard to the observation of the seventh day as a day of rest. By other authorities it has been ascribed to the number of the principal planets, a theory supported by the names given to the days. It was not used by the Greeks, nor by the Romans, till the time of Theodosius. The great influence of the sun’s course upon the seasons naturally attracted the attention of men at all periods to this phenomenon; accordingly all nations in any degree civilized have adopted the year as the longest unit of time. The year of the ancient Egyptians was based on the changes of the seasons alone, without reference to the lunar month, and contained 365 days, which were divided into 12 months of 30 days each, with five supplementary days at the end of each year. The Jewish year consisted of lunar months, of which they reckoned 12 in the year, intercalating a 13th when necessary to maintain the correspondence of the particular months with the regular recurrence of the seasons. The Greeks in the earliest period also reckoned by lunar and intercalary months. They divided the month into three decades, a system also adopted long afterward at the time of the French Revolution. It possesses the advantage of making the smaller division an exact measure of the larger, and under it the number of a day in the 10-day period readily suggests its number in the month. The Greeks in the time of Solon had a year of 12 months alternately of 29 and 30 days, the total number of days being 354, and the year being very nearly equal to a lunar one. Soon afterward a month of 30 days began to be intercalated every other year in order to reconcile their year with that founded on the sun’s movement, but as the error was still very large the intercalary month was afterward omitted once in four times. The Hebrew and also the Greek year thus both varied in duration according to the number of the very month was introduced or omitted. This, with the uncertainty as to the exact duration of the year, was a constant source of confusion. Various plans for the reformation of the calendar were proposed from time to time; but all proved insufficient till Meton and Euctemon finally succeeded in bringing it to a much greater degree of accuracy by fixing on the period of 19 years, in which time the new moons return upon the same days of the year as before (as 19 solar years are very nearly equal to 235 luniations). (See Cycle). This mode of computation, first adopted by the Greeks about 432 B.C., was so much approved of that it was engraved with golden letters on a tablet at Athens. Hence the number showing what year of the metonic cycle it is is called the golden number. This period of 19 years was found, however, to be about six hours too long. This defect Calippus, about 102 years later, endeavored to remedy, but still failed to make the beginning of the seasons return on the same fixed day and time. The Romans first divided the year into 10 months, but they early adopted the Greek method of lunar and intercalary months, making the lunar year consist of 354, and after-
ward of 355 days, leaving 10 or 11 days and a
fraction to be supplied by the intercalary di-
visions of the arrangement of which was placed
under the charge of the pontiffs, continued until
the time of Caesar. The first day of the month
was called the calends. In March, May, July
and October, the 15th, in other months the 13th,
was called the ides. The ninth day before the
ides (receding intervals) was called the nones.

The other days of the months they reckoned
forward to the next calends, nonees, or ides,
whether in the same or the succeeding month,
always including both days in the reckoning.
Thus the 3d of March, according to the Roman
reckoning, would be the fifth day before the
nones, which in that month fell on the 7th.
The 8th of January, in which month the nones
happen on the 5th, and the ides on the 13th
was called the 6th before the ides of January.
Finally to express any of the days after the
ides, they reckoned in a similar manner from
the calends of the following month. From the
inaccuracy of the Roman method of reckoning
it appears that in Cicero's time the calendar
began the vernal equinox almost two months
later than it ought to be. To check this irregular-
ity Julius Caesar invited the Greek astrono-
mer Sosigenes to Rome, who, with the assist-
ance of Marcus Fabius, invented that mode of
reckoning which, after him who introduced it
into use, has been called the Julian calendar.
The chief improvement consisted in restoring
the equinox to its proper place in March. For
this purpose two months were inserted between
November and December, so that the year 707
(a.c.), called from this circumstance the year
of confusion, contained 14 months.

In the number of days the Greek computation
was adopted, which made it 365 1/4. The number
and names of the months were kept unaltered
with the exception of Quintils, which was
henceforth called, in honor of the author of the
improvement, Julius. To dispose of the quarter
of a day it was determined to intercalate a day
every fourth year between the 23d and 24th
of February. This was called an intercalary
day, and the year in which it took place was
called an intercalary year, or, as we term it, a
leap year.

This calendar continued in use among the
Romans until the fall of the empire, and
throughout Christendom till 1582. The festivals
of the Christian Church were determined by it.
With regard to Easter, however, it was neces-
sary to have reference to the course of the
moon. The Jews celebrated Easter (that is, the
Passover) on the 14th of the month Nisan
(or March); the Christians in the same month,
but always on a Sunday. Now, as the Easter
of the Christians sometimes coincided with the
Passover of the Jews, and it was thought un-
Christian to celebrate so important a festival
at the same time as the Jews did, it was re-
solved at the Council of Nice, 325 A.D., that
from that time Easter should be solemnized on
the Sunday following the first full moon after
the vernal equinox, which was then supposed
to take place on 21 March. As the course of the
year was longer and the determining the time of Easter, the lunar Cycle
of Meton was taken for this purpose; accord-
ing to which the year contains 365 1/4 days, and
the new moons, after a period of 19 years,
return on the same day as before. The inac-
curacy of this combination of the Julian year
and the lunar cycle must have soon discovered
itself on account of which was placed
under the charge of the pontiffs, continued until
the time of Caesar. The first day of the month
was called the calends. In March, May, July
and October, the 15th, in other months the 13th,
was called the ides. The ninth day before the
ides (receding intervals) was called the nones.

The other days of the months they reckoned
forward to the next calends, nonees, or ides,
whether in the same or the succeeding month,
always including both days in the reckoning.
Thus the 3d of March, according to the Roman
reckoning, would be the fifth day before the
nones, which in that month fell on the 7th.
The 8th of January, in which month the nones
happen on the 5th, and the ides on the 13th
was called the 6th before the ides of January.
Finally to express any of the days after the
ides, they reckoned in a similar manner from
the calends of the following month. From the
inaccuracy of the Roman method of reckoning
it appears that in Cicero's time the calendar
began the vernal equinox almost two months
later than it ought to be. To check this irregular-
ity Julius Caesar invited the Greek astrono-
mer Sosigenes to Rome, who, with the assist-
ance of Marcus Fabius, invented that mode of
reckoning which, after him who introduced it
into use, has been called the Julian calendar.

year was longer and the determining the time of Easter, the lunar Cycle
of Meton was taken for this purpose; accord-
ing to which the year contains 365 1/4 days, and
the new moons, after a period of 19 years,
return on the same day as before. The inac-
}
that of the old and that of the new year, as January 1752–53.

In France, during the Revolutionary epoch, a new calendar was introduced by a decree of the National Convention, 24 Nov. 1793. The new reckoning was to begin with 22 Sept. 1792, the day on which the first decree of the new republic had been promulgated. The year was made to consist of 12 months of 30 days each, and, to complete the full number, five féte days (in leap year six) were added at the end of the year. Instead of weeks, each month was divided into 10, 20, 30, or 38 days, consisting of 10 days each; the other divisions being also accommodated to the decimal system. This calendar was abolished at the command of Napoleon, by a decree of the Senate, 9 Sept. 1805, and the common or Gregorian calendar was re-established on 1 January of the following year. The Mohammedans employ a lunar year of 354 days and 12 lunar months, which have alternately 29 and 30 days. Thirty years (or 360 years) in every cycle an extra day is added at the end of the year. The months and the seasons do not correspond and the first of the year may fall at any time during the solar year. The months are named Muharram, Safar, Rabia I, Rabia II, Jomadi I, Jomadi II, Shaaban, Ramadan, Shawwal, Dulaakada and Dulkegga. The Mohammedan era is computed from the first day of the year of the Hejira, or flight of Mohammed to Medina. It corresponds with 15 July 622 of the Christian era. The Mohammedan year, which began on 28 Oct. 1916 was the 15th year of the 45th cycle, or the year 1335 of the Mohammedan era. See also CHRONOLOGY; CYCLE; EPOCH; HEJIRA.

CALGARY, Canada. The city of Calgary is situated in the province of Alberta, at the junction of the Bow and Elbow rivers, 840 miles west of Winnipeg, and 2,626 miles west of Montreal. The site is picturesquely, as the city lies in a species of natural bowl. From Calgary, the Rocky Mountains 80 miles away are clearly visible. Before the advent of the Canadian Pacific Railway 30 years ago, Calgary was an important trading post and headquarters for the ranching country of southern Alberta. With the establishment of transcontinental communication, Calgary assumed a place on the map and rapidly began to develop commercially.

Calgary is the entrance of two great passes through the mountains and surrounded by both a fine agricultural and ranching country, Calgary has naturally become an important railway centre. Lines belonging to the Canadian Pacific Railway, Canadian Northern Railway, and Canadian National Railway run south via Lethbridge through the Crow’s Nest Pass. The city is also served by the lines of the Grand Trunk Pacific and the Canadian Northern.

The city has an altitude of 3,410 feet above sea-level, and enjoys a bracing and healthful climate. The average temperature is 35.2 and the rainfall 19 inches. While low temperatures are of regular occurrence in the winter, the climate is agreeably modified by the warm Chinook winds which frequently bring a cold spell to a sudden and welcome close.

Buildings.—Calgary is a very substantially built city, and its combine in its having nearly extensive quarries of excellent sandstone. Calgary stone, as it is called, has been used with excellent effect in the Provincial Parliament Buildings at Edmonton. Handsome public and office buildings and business blocks line the downtown streets. Knox Presbyterian Church, built of Calgary stone, is one of the finest specimens of ecclesiastical architecture in western Canada.

Government.—Calgary was founded in 1883 and incorporated in 1894. Its municipal government consists of an elective mayor and council and an elective board of commissioners. Calgary employs a slightly modified form of the single tax. The city owns its own electric street railway, with 60 miles of tracklage in operation. It operates its own gravity water system and sewerage system, and owns its own asphalt paving plant. Natural gas sells for 35 cents per 1,000 cubic feet, and at 15 cents for power. Water power has also been brought in and of this 31,100 horse power is already available.

Religion and Education.—Calgary is the seat of Anglican and Roman Catholic bishoprics, and all the leading religious denominations are well established. Educational facilities are amply and generously provided. There are 32 public and high schools, four Roman Catholic separate schools and a Normal School. The provincial government opened in 1916 an Institute of Technology and Manual Arts.

Industrial Progress.—Western Canada is substantially an agricultural country, but Calgary has had a considerable industrial development, and is the chief distributing centre between Winnipeg and the Pacific. Though coal is not mined in the immediate vicinity, coal is being worked on an extensive scale at Lethbridge and Bankhead, both of them points within 100 miles. Natural gas has been piped into the city from Bow Island, 100 miles distant. Oil was discovered in 1914 a short distance south of Calgary, and the indications are promising. The foothills of the Rockies to the west form an admirable grazing country and large herds of stock are raised. These contribute the raw material for the successful stockyards and extensive packing plants which are amongst Calgary’s most important industries. Excellent clays for brickmaking exist. Calgary is the site of one of the Dominion government’s great interior storage elevators and has become an important centre in the grain trade. Large milling establishments flourish. Manufacturers include biscuits, boxes and breakfast foods. A large business is carried on in building materials, harness and leather goods, iron and metals, aerated waters, beer, etc. The Canadian Pacific has erected at Calgary car shops costing over $3,500,000, with an annual wage bill of
$3,400,000. Pop. (1911) 43,704; special
Dominion census of 1916, 55,000.

WILLIAM A. R. KERR,
Dean of the University of Alberta.

CALHOUN, käl-hoon', John Caldwell,
American statesman: b. Abbeville District, S.
C, 18 March 1782; d. Washington, D. C, 31
March 1850. He was graduated with distinc-
tion at Yale College in 1804, and was admitted
to the South Carolina bar in 1807. After serv-
ing for two sessions in the legislature of the
native State, he was elected to Congress in
1811. From that time until his death, a period
of nearly 40 years, he was seldom absent from
Washington, being nearly the whole time in the
public service, either in Congress or in the
Cabinet. When he first entered Congress the
disputes with England were fast approaching
actual hostilities, and he immediately took part
with that portion of the dominant party whose
object was to drive the still reluctant admin-
istrations into a declaration of war. They suc-
cceeded, and, as a member of the Committee on
Foreign Relations, he reported a bill for de-
claring war, which was passed in June 1812.
When Monroe formed his administration in 1817,
Calhoun became Secretary of War, a post
which he filled with great ability for seven
years, reducing the affairs of the department
from a state of great confusion to simplicity
and order. In 1824 he was chosen Vice- Presi-
dent of the United States under John Q.
Adams, and again in 1828 under General Jack-
son. In 1828, a protective tariff was enacted
which bore very heavily on the agriculturists of
the South and hence was known throughout
that section as "The Tariff of Abominations."8
Mr. Calhoun prepared a paper declaring that the
"United States is not a union of the people,
but a league- or compact between sovereign
states, any of which has the right to judge when
the compact is broken and to pronounce any
law to be null and void which violates its con-
ditions." This paper was issued by the legis-
lature of South Carolina and was known as "The South Carolina Exposition." This
view of the United States constitution as a
compact between the States had been many
years before strongly expressed in the Virginia
and Kentucky Resolutions.9 Mr. Calhoun's
stance was drawn up by James Madison, often styled the "Father of the Constitution," and the latter by
Thomas Jefferson. The Kentucky resolutions
had suggested nullification as a remedy. Alex-
ander Hamilton in The Federalist frequently
spoke of the United States as a "Confederate Republic" and a "Confederacy" and called the
constitution a "compact." Washington fre-
cently referred to the constitution as a "compact," and spoke of the Union as a "Con-
federacy" at the time of the Louisiana
Purchase. Hon. Timothy Pickering of
Massachusetts advocated the right and advisa-
bility of secession and Hon. Josiah Quincy of
the same State in 1811 expressed similar views.
Hence John C. Calhoun propounded no new
or strange doctrine, but one which had found
advocates before, and in the North as well as
in the South.

In 1828, the friendly relations between Mr.
Calhoun and President Jackson were broken off, when the latter ascertained that Calhoun
had sought to have him called to account for
his acts in the Seminole War. This breach
was still further enlarged when Calhoun re-
fused to co-operate with President Jackson in
the effort to reinstate Mrs. Eaton in Washing-
ton society.

When Mr. Calhoun found that the repeal
of the tariff of 1828 could not be secured through
President Jackson, he resigned the Vice-Presi-
dency and entered the Senate from South Caro-
olina. On 26 July 1831 he published, a paper
favoring free trade and declaring that the
"great conservative principle of Union is nullification." The tariff question was settled
by a compromise in 1832.

Mr. Calhoun feared that the slavery quarrel
would some day disrupt the Union and there-
fore endeavored to check all discussion of this
issue. He opposed Jackson's removal of the
funds from the National Bank and also assailed
the "spoils system." He supported Van Buren's
"sub-treasury system" favored his re-election
and secured for him the electoral vote of South
Carolina. He defended Tyler for vetoing the
recharter of the United States Bank, and as
Secretary of State under that President was
largely instrumental in bringing about the
annexation of Texas. He regretted the division
of the Union into sections, but, recognizing a
fact which already existed, he advocated a dual
executive, one from the North, the other from
the South, each having the power to veto an
act approved by the other; thus preventing the
passage of any law offensive to either section.
His motive in this was the preservation of the
Union, which he dearly loved.

He died 31 March 1850, having spent the
last few months of his life in writing his "Dis-
quision on Government" and his "Discussion
on the Constitution and Government of the
United States" which has been pronounced the
most remarkable discussion of the rights of
minorities ever written. Mr. Calhoun was of
attractive personality and of irreproachable
character, to which Daniel Webster testified in
his grand eulogy on the great South Carolinian.

His "Collected Works" appeared 1853-54, and
his correspondence, edited by Jameson, in
1900. Consult Lives by Jenkins (1851); Von
Holst (1882); Benton, "Thirty Years' View" (1854); Dodd, "Statesmen of the Old South" (New
York, 1911); Hunt, "J. C. Calhoun" (Philadel-
phia 1908); Peck, H. C., "The Jack-
sonian Epoch" (1906); Peck, H. T., "American
Party Leaders" (New York 1914); and
Calhoun's correspondence, edited by J. F. Jameson
(1900).

J. T. DERRY,
Author, History of Georgia.

CALHOUN, Simon Howard, American
Congregational missionary, linguist and trans-
lator: b. Boston 1804; d. 1876. A graduate of
Williams College in 1829, from 1836 to 1874
he labored as a missionary in the Levant and
Syria. An expert in Turkish and Arabic, he collabo-
rated with William Goodell on the first Turkish
translation of the Bible.

CALHOUN, William James, American
He practiced as a lawyer at Danville, Ill., from 1875
to 1898, when he removed to Chicago to become
senior member of the law firm of Calhoun, Ly-
ford & Stidham. In 1867 President McKinley
had appointed him special commissioner to
CALI—CALICO-PRINTING

Cuba and in 1898, member of the Interstate Commerce Commission. President Roosevelt
weighed the voices from him in a moment in Vienna
in 1905 and he served as Minister to
China from 1909 to 1913. The subsequent
Chinese policy of President Wilson was
severely criticised by him.

CALI, ka-lé, Colombia, South America, a
city near the confluence of the Cali and Cauca
c in the department of Cauca, and north of
Popayan, the capital of that department. It is
one of the ancient cities of the republic
(founded in 1536) and to-day is important on
account of its location in an agricultural district
and on the Pacific Railway, from Buenaventura
to Cali and thence through the Cauca Valley, a
distance of 108.1 miles. Cali is also con-
nected by a short steam tramway with the
Cauca River. Pop. 27,747.

CALICE, Count Heinrich, Diplomatist, an
ambassador and linguist of international fame:
18 August 1831; d. Goerz, 28 Aug. 1912. His first
activities began in the year 1857 when he was
appointed consul for the Dual Monarchy at
Constantinople. Later he served in Liverpool,
China and Japan. In 1876, while the Serbian
War was in progress, he was sent with full
powers, by Count Andrassy, as the Austro-Hungar-
ian representative, to the eventual conference
that ended in imitation of the Congresses
between Russia and Turkey. At the Conference
Ignotieff, the Russian Plenipotentiary, strongly
urged armed entry into Serbia, but was resisted
by Lord Salisbury, supported by Count Calice.
In 1880 Baron Calice was appointed Austrian
Ambassador to the Porte,—which position he
held for 26 years. Notwithstanding the fact
that he presented four ultimatums to Turkey,
he was at all times a trusted friend of the ex-
Sultan. Baron Calice was the oldest active
diplomatist in Europe, and became the dean of
the diplomatic corps in Constantinople.

CALICO-PRINTING, the art of produc-
ing on calico or cotton cloth variegated patterns
by the process of printing; the object, as a rule,
being to have the colors composing the designs
as fast as possible to washing and other influ-
ences. It is similar to the art of dyeing, but
different in so far that the coloring mat-
ters are fixed on certain parts of the fabric
only, to form a pattern. Linen, wool and silk
fabrics are printed in a similar manner, but less
extensively. The origin of the art of printing
is probably coeval with that of dyeing (q.v.).
India is generally regarded as the birthplace of
calico-printing, and the word calico is derived
from the name of the Indian town Calicut,
where it was at one time extensively manufac-
tured and printed. Calico-printing, as an
Egyptian art, was first described by Pliny in the
1st century. Indian printed chintz calicoes were
introduced into Europe by the Dutch East India
Company, and the first attempts at imitating
them in Europe are said to have been made in
Holland, but at what exact date is uncertain.
The art, however, spread to Germany and England, where it is said to have been intro-
duced about 1676, two of the earliest works be-
ing situated at Richmond on the Thames, and
at Bromley Hall, Essex. In 1738 calico print-
works were established in Scotland in the
neighborhood of Glasgow, and in 1764 at Bam-
ber Bridge, near Preston, in Lancashire. At
the present time the chief seats of the calico-
printing trade in Great Britain are in the
neighborhood of Glasgow and Manchester.
The chief European seat of calico-printing is
Mulhausen, in Germany, and it is practised in
various towns in France, Austria, Russia, Swit-
zerland, Holland and the United States.

Calico-printing is of a highly composite
character, and enlists not only the co-operation
of the arts of designing, engraving, bleaching and
dyeing, but also an important element of suc-
cess, the science of chemistry.

The first operation to which the gray calico
is submitted, as it comes from the loom, is that
of singeing. This consists in burning off the
loose downy fibres from the surface by passing
the pieces rapidly, in an open and stretched con-
dition, over red-hot plates or a row of smoke-
less Bunsen gas flames. The object of singe-
ing is to obtain a smooth printing surface on
the calico, thus ensuring the production of clear,
sharp impressions during the printing process.
The next operation is that of bleaching, which
consists in boiling the fabric, which has been
singed, in solutions, followed by a treatment with cold
dilute solutions of bleaching-powder and acid,
interspersed with frequent washings with water.
By these means the natural impurities of the
cotton are removed, and the calico ultimately
presents a snow-white appearance. A number
of pieces are now stitched together, wrapped
on a wooden roller, and passed through a so-
called shearing machine, in which, by means of
a spiral cutter similar to that in a lawn-mower,
any projecting knots, loose fibres or down are
finally removed. In this condition the calico is
ready for the printer.

The printing of the patterns upon the cloth
may be carried out in various ways, the earliest
method being by means of wooden blocks, on
which the figures of the patterns stood out in
relief. Where several colors were employed
in one pattern, a block for each color was neces-
sary. In a set of blocks for one pattern, each
block, although at first having the same design
drawn upon it, was cut in such a manner that
it ultimately transferred only a single color,
which appeared in different parts of the pat-
tern. When all the blocks had been applied,
the various colors printed completed the origi-
mal design. To ensure the correct juxtaposition
of the colors, each block was furnished with
brass points at the corners, in order to guide the
workman. The printer first furnished the
front of the block with the requisite color by
pressing it several times on a piece of woolen
cloth suitably stretched and supported on a so-
called color-sieve, and which had been previ-
ously brushed over with color by a boy attend-
ant. The printer then applied the block to the
surface of the calico, which was stretched on a
long table covered with felt, striking the back
of the block with his hand or with a small mal-
et. The operation of block printing was slow
and tedious and though many improvements
have been introduced, and it can even be
affected by mechanical power, as in the so-
called Perrotine machine, it is now only em-
ployed to a very limited extent for certain
special kinds of work. Another mode of print-
ing, introduced about 1700, is by means of en-
graved copper-plates, but its employment is
also similarly restricted.
The modern method of printing, which dates from 1785, is effected by means of engraved copper cylinders, and this method has now practically superseded all others.

The method of engraving employed varies according to the kind of pattern to be put on the roller. In the case of very large patterns the figures are engraved by hand on the cylinder, with the use of the ordinary tools of the copper-plate engraver. For smaller designs, however, which are often repeated, it is usual in the first instance to engrave the pattern by hand on a very small cylinder of soft steel in intaglio, just as it will ultimately appear on the copper. This steel cylinder, which is called a die, is then tempered to a high degree of hardness, and by means of machinery is pressed against another cylinder of soft steel, on which the pattern is thus made to appear in relief. This last cylinder, called the mill, is then hardened, and, being pressed against the copper cylinder, the figures are indented and the roller is ready for use. In the first instance the original pattern of the designer has always to be engraved or repeated an exact number of times over the roller to be engraved. In order to reduce the amount of skilled labor one repeat only of the pattern is engraved on the die; the mill, which is of larger diameter, has two, three or four repeats; while the number of repeats on the circumference of the copper cylinder is still greater. A third method of engraving, which has now largely superseded the foregoing, is that of etching, in conjunction with the pantograph system of transferring the design to the copper roller. The roller, being coated uniformly with a bituminous varnish, has the pattern traced on the varnish in the pentagraph machine by a set of diamond points, and it is then submitted for a very brief period to the action of nitric acid. In the parts where the pattern has been traced the varnish is removed, there the copper is speedily attacked by the acid, and the pattern is thus etched upon it. After removing the varnish the roller is ready for printing.

The cylinder printing machine consists of a large central iron drum, around which are arranged one or more engraved copper rollers, according to the number of colors to be printed simultaneously. Each roller is provided with the means of making general adjustments, in order to determine the exact position of the color which it prints. The central drum is wrapped with cloth, and it is further provided with an endless blanket and back-cloth, so as to present a yielding surface to the printing rollers. The cloth to be printed passes from a roll behind the machine, round the central drum in a tightly stretched condition, while the several printing rollers press forcibly against it. Each roller, as it revolves, is fed with color from a small trough below, the superficial color being scraped off the plain surface of the roller by means of a sharp-edged steel blade, or "doctor," thus leaving the color only in the engraved portions. As the rollers thus charged with color press against the cloth, the latter absorbs the color from the engraved pattern, and the pattern is thus transferred to the calico. By this machine as much work can be performed in three minutes as could be done by block-printing in six hours. After the cloth has received the impression from the rollers it passes over a series of steam-heated flat irons, chests or cylinders, and is thus dried.

In close connection with this printing-machine is the so-called color-house or color-shop, where the solutions of coloring matters are suitably thickened and made ready for the printer. The color-house is provided with numerous steam-heated copper pans, and the use of the ordinary tools of the calico-printer. The color-mixtures are stirred with wooden blades by hand, or by mechanical agitators, and carefully strained through cloth before use. The thickening of the color-solutions is managed with starch, flour, gum, dextrine, albumen, etc., is necessary to prevent the spreading of the color by capillary attraction beyond the printed parts, and thus ensure sharp and neat impressions. Near the color-house is a chemical laboratory, and a drum room containing the store of coloring matters, dyewood, extracts, thickenings, chemicals, etc.

The various classes or styles of calico-prints are usually arranged either according to the chief dyestuff employed alone, by the calico-printer and only furnish useful colors if applied in conjunction with certain metallic salts or mordants, of which the chief ones here employed are the acetates of aluminum and iron. At first the pattern is printed on the white calico with these or similar mordants alone, and only after they have been suitably fixed is the madder or other similar coloring matter applied in the dye-bath, where for the first time the desired colored pattern appears. The aluminum mordant yields reds and purple, iron yields purple or black, a mixture of iron and aluminum yields chocolate, etc. The fixing of the mordant after printing and drying is effected by passing the printed calico through the so-called anhydride machine, which is suitably heated and charged with moisture, where the acetic acid of the printed mordants is driven off, leaving the aluminum salt in an insoluble form on the calico. A more complete fixing of the mordant is subsequently effected by passing the fabric through solutions containing silicate or arseniate of soda, and a final washing completes its preparation for dyeing. The dyeing operation consists in boiling the fabric in a solution or decoction of the requisite dyestuff. After dyeing, the stained unprinted portions are cleaned and purified, while the printed colors are rendered more brilliant by washing, soaping, coloring, etc. Variety of effect is produced by printing the same fabric two or three times (print, cover, pad) with various designs before proceeding to the ageing, etc. If in the first instance a portion of the pattern is printed with lime-juice (citric acid), it resists or prevents the fixing of the mordants applied over it in the second and third printings, and the part remains undyed and ap-
pears as a so-called resist white. In a similar manner, stannous chloride, mixed with aluminum acetate before printing, resists the fixing of iron mordants printed over the aluminous mordant, and a resist red pattern under a purple cover is obtained, presuming madder to be the dyestuff employed. Alizarin now replaces the madder, and similar variegated effects are obtained if other mordant dyestuffs are employed, for example, cochineal, quercitron bark, etc. Formerly a preparation of madder, termed garancine, was largely employed, and gave rise to the garancine style, in which the colors were fuller and darker, the prevailing hues being browns, chocolates, drabs, etc. Since the range of colors yielded in the madder style is limited, additional colors, as green, blue or yellow, may be printed in by block after dyeing, etc., and are fixed by steaming. If the whole fabric is evenly impregnated with mordant by means of a "paddling-machine" and dried, and then a pattern is printed over the mordant with lime-juice, the mordant is removed from the printed parts, and remains white in the subsequent dyeing. Such a print would be termed a padded style with discharge white.

Steam Style.—Many coloring matters, differing from each other widely in character, are fixed by the operation of steaming instead of by dyeing, so that this style is somewhat varied in character. Ordinary steam-colors consist of a thickened mixture of dyeweed extract and mordant, with the addition of assistant metallic salts and acids. The mixture is printed upon the white calico, which, after drying, is exposed from a half to one hour in closed chambers to the action of steam. This steaming operation effects the combination of the coloring matter and mordant, and the color is thus developed and at the same time fixed upon the calico. Black is produced with logwood extract and chromium acetate, scarlet produced with cochineal extract and stannous chloride. The prints are washed and dried after steaming, the colors being usually bright, but not very fast. Steam colors, fast to light and soap, are obtained in a similar manner by printing mixtures of alizarin and allied coloring matters with mordants, and then steaming. These are used in the so-called mordant style. Black is fixed the calico, which is fast red, pink, purple, etc., appear. In the pigment style use is made of pigments, or insoluble colored mineral powders as ultramarine-blue, chrome yellow, Guignet's green, etc. These are mixed with a solution of egg or blood albumen, printed and steamed. The albumen coagulates on steaming, and thus adheres firmly to the cloth, at the same time enclosing the pigments within the coagulum. Such colors are fast to light and soap, and may therefore be printed simultaneously with the steam alizarin colors for the production of variegated fast prints. Another class of colors are the so-called basic colors, as magenta, aniline blue, etc. Their solutions may also be thickened with albumen, printed and steamed, to give fast steam-colors. It is more usual, however, to print a mixture of the thickened color solution and tannic acid, and to pass the steamed print through a boiling solution of tartar emetic. By this means an insoluble color-lake (tannate of amyntomy and color) is fixed to the calico, which is fast to soaping but not to light. Basic colors applied in this manner are now usually printed along with the steam alizarin colors, instead of pigments, thickened with albumen, and variegated fast prints are thus obtained. Loose pigment colors are basic colors thickened with starch or gum tragacanth only, and then steamed. Such prints do not even stand washing with cold water.

Turkey-red Style.—In this style use is made of the fact that turkey red is at once bleached by the action of chlorine. Plain dyed turkey-red calico is printed with tartaric acid, dried and passed through a mixture of potash or bleach-powder. In the printed parts chlorine gas is evolved, the red is destroyed and a white discharge pattern is produced. A blue pattern results if Prussian blue is added to the printing mixture; yellow is obtained if a lead salt is added, and the fabric is afterward passed through bichromate of potash solution, whereby yellow chromate of lead is produced; green results from a mixture of the blue and yellow; black is printed direct. These and other discharge colors may also be obtained by other methods.

Indigo Style.—Of the numerous indigo styles in use it is only possible to refer to one or two of the most important. Indigo blue patterns on a white ground are obtained by printing a thickened mixture of finely-ground indigo and caustic soda on white calico, previously impregnated with glucose. A subsequent steaming reduces the indigo to indigo white, and causes it to penetrate the fibre, while a final washing oxidizes, regenerates and fixes the color. Resist white pattern on a blue ground is obtained by first printing upon white calico a resist paste composed of gum or flour, China clay, sulphate of copper, etc. When the printed calico is dyed in the indigo vat the paste resists the entrance of the color, partly in a mechanical and partly in a chemical manner, hence the blue is only fixed in those parts which are unprotected by the paste, after the removal of which by washing, the white pattern appears. Various resist colors, as yellow, green, etc., are obtained by the addition of different chemicals to the paste and altering the after-processes. A discharge white pattern on a blue ground is obtained by printing on plain indigo-blue dyed calico a solution of bichromate of potassium mixed with gum, and then passing the fabric through a solution containing sulphuric and oxalic acids. During this passage there is liberated, in the printed parts only, chromic acid, which at once oxidizes and destroys the blue, producing the desired white pattern. Colored discharge patterns are produced similarly by employing albumen thickening instead of gum thickening, and adding to the printing mixture such pigments as are not affected by acids, for example, vermilion, chrome yellow, Guignet's green, etc.

This method is now being superseded by the Freiberger process, a simpler and more productive way of discharging, the reagents used being either chromic acid, sodium chlorate or in some cases, bromate and, still more recently, nitrates. This latter method passes the cotton fabric imprinted with nitrate discharging color through hot and concentrated sulphuric acid and, by accurate control of the strength, temperature and time exposure, not only preserves the fabric in undiminished strength but obtains
the most accurate and permanent discharge effects.

Bronze Style.—Manganese brown or bronze is decolorized by reducing agents; hence white discharge patterns on a bronze ground are obtained. Manganese or manganese-brown dyed calico with a mixture of stannous chloride and oxalic acid, and then steaming. Colored discharge patterns are obtained if coloring matters are added to the printing mixture which are not affected by reducing-agents, or which even require stannous chloride as a mordant to develop the color as Prussian blue, chrome yellow, Persian-berry yellow, Brazil-wood pink, safranine, acridine orange, etc.

Aniline Black Style.—Aniline black being a product of the oxidation of aniline, patterns in this color on a white ground are obtained by printing a thickened solution of aniline hydrochloride containing the oxidizing agent, sodium chlorate, and a salt of copper or vanadium. When the printed fabric is slightly steamed or exposed to the air, which happens previously, the impression, which is at first devoid of color, gradually becomes dark green, and this by a final treatment with an alkaline solution, soap, etc., changes at once to a rich black. The color is extremely fast to light, although previously bleached with lithographic, or oil, colors and dispensing with the practice of fixing the colors after printing, which is essential when aniline or allied colors are used. The actual process is continuous, as in ordinary copper rollers being used for impressing the pattern the effects are obtained by the use of continuous metal plates, or tubes, upon which the designs are transferred directly in the manner employed in ordinary lithographic printing on paper. It is said to cheaper production greatly, for as soon as an order is completed of one design, the rollers may be cleaned and fresh patterns immediately transferred.

Bibliography.—Blackwood, William, ‘Calico Engraving’ (London 1913); Stütz, Ernest, in the ‘Journal of the Franklin Institute’ (January 1914).

CALIFORNIA, principal Pacific Coast State of United States (No. 31 in order of admission), bounded north by Oregon, south by Mexico (Lower California), east by Nevada and Arizona, west by Pacific Ocean. Extreme length about 800 miles, coast line 1,076 miles, greatest width about 270 miles. Area (No. 2 in United States), 158,360 square miles (2,380 water). Pop. (1910) (No. 21 in United States) 2,377,549, an increase of 892,496 (60.1 per cent) since the census of 1900. Pop. (1916) 2,938,654, an increase of 561,105 (23.8 per cent) in six years.

Topography and Climate.—Its peculiar shape, determined less by political than by natural delimitations, gives California a character unique among the States, climatically and economically. It has a range of climate all its own, and its boundaries include all the climates in North America. It is longest of the States; and, in proportion to its length, narrowest. It corresponds with an area which upon the Atlantic seaboard should run as far inland as does South Carolina, and as long coastwise as from Charleston to Boston. This in itself gives large range of climate by latitudes; but its topography and its climatizations greatly increase this range. Its peculiar projection or leaning out upon the Pacific; its enormous coastline (somewhat less than one-fifth total coastline of the United States); and particularly its exposure to the west and south upon this great

equalizer; its contact on the east with the "Great American Desert"; its huge mountain systems; and its orographic protection against the north, are all vital factors in determining its atmospheric temperament. While the Atlantic seaboard is made humid by the warm Gulf Stream, and is open to the north (its mountains being scattered far out), California is screened from the Arctic air-currents by a vast Alpine range, almost unbroken in its whole length and with its lowest passes 50 per cent higher than the highest peak east of Colorado. The wettest pass in California is 8,000 feet; 41 exceeding 10,000 feet and 11 exceeding 13,000 feet. From its northern boundary down to Point Conception, California is washed by the cold Kuro Siwo, or Japan current, swinging back from the Arctic; and the exposure is largely westerly. From this point southward the exposure is more southerly, the Japan current is deflected far off-shore, and the coast is sheltered by a long line of islands. Tempered on one side by an equable ocean, on the other by great land masses, California is still further differentiated by its mountain systems. Roughly speaking, it is all "under wall." Two huge cordilleras, insculpting at the north and south, form an almost complete circumsallation of the great agricultural region; while to the south, though the ranges are much broken down, there is something like a repetition of this pattern, on a much smaller scale; the whole forming something like an inverted figure 8. In their major loop, these ranges enclose one great central valley, practically level, of 18,000 square miles,—or about the aggregate area of Massachusetts, New Jersey and Delaware,—screening it from the Arctic, and filtering the winds from sea and desert. This great remnant is broken down only at the Golden Gate, through which, in a mile-wide passage, the drainage of this enormous watershed reaches the sea. In their imperfect minor loop, there is a broken congeries of valleys aggregating an almost equal area, sheltered from the desert, but as a rule open southerly toward the here warmer sea. To the east of the main wall lies a large but almost uninhabited area, strictly desert, and part of the great interior wastes. The inclination of the State to the west, and its concave dip in this respect, is the fact that despite its narrowness the extremes are three-fourths as far apart in longitude as in latitude. The southeast corner or San Bernardino County is nearly 500 miles more easterly than False Cape; while from Oregon to the Mexican line the north and south distance is about 655 miles.

The Coast Range, altitude 2,000 to 8,000 feet, rather closely follows the coast line from Oregon to Point Conception; south of which topographic hinge it breaks down as to be relatively unimportant. The Sierra Nevada proximately following the east line of the State, at an average distance of 50 to 100 miles therefrom, is "the largest and most interesting chain of mountains in the United States" (J. D. Whitney). The Range, which extends from Lower California to Alaska, this range in California is 600 miles long and 75 to 100 miles wide,—its base covering four times the area of Massachusetts. The snow-line averages about 2 miles wide. Its surpassing peak (Mount Whitney, highest in the United States) is 14,522 feet (Langley). Its passes average 11,000 feet, the lowest being 9,000 feet, and the most used (Kearsarge) 12,000 feet. The western slope is gradual, averaging about 100 feet to the mile; its eastern slope 10 times as rapid, being by far the steepest general gradient in North America. At many points the fall is 10,000 feet in a mile; and from the highest peak in the United States one looks down nearly 15,000 feet into Death Valley, some 200 feet below sea-level. This vast granitic range is the most remarkable register of glacial action on the earth's surface. Derivations *perhaps a vertical mile* (Muir) it is still the most Alpine cordilleran in North America. It holds 1,500 glacial lakes,—the lake line being at about 8,000 feet. Of small residual glaciers, Muir has counted 65 between 36° 30' and 39°. Its Yosemite (including the famous one so-called, the Hetch-Hetchy, and minor ones) are noted among geologists as well as travelers—well-like valleys gouged deep in the granite by glaciers, and of scenery nowhere surpassed. The highest water-fall in the United States (Hetch-Hetchy 3,727 feet) is in this region. Upon the huge moraines left by that continental incubus of ice grow the noblest coniferous forests in the world,—greatest in variety of species, in density of merchantable lumber and in size, age and beauty of trees. These forests cover 44,700 square miles (a larger area than the entire States of New Hampshire, Vermont, Massachusetts, Connecticut, Rhode Island, Delaware and Maryland together). California is fifth in area of forests and second in stand of lumber (200,000,000,000 feet, exceeded only by Oregon with 225,000,000,000 feet). Eighteen national forests reserves in the State cover 19,508,000 acres. The cut of 1916 was nearly three times that of 1890. It comprised: redwood, 490,828,000 feet; Western (white) pine, 494,973,000 feet; Douglas fir, 141,200,000 feet; sugar pine, 165,-461,000 feet; white fir, 85,918,000 feet; spruce, 10,000,000 feet; cedar, 16,587,000 feet; hemlock, 500,000; other trees, 25,000,000 (1,430,467,000); shingles, ties, etc., 1,000,000 feet; a total, 1,560,467,000 feet. To this should be added 30,000 cords of tan-oak bark, valued at $600,000. Total value of product, 1916 (exclusive of fuel) $47,000,000. Fuel wood amounts to about $9,000,000. The Big Tree is the largest and oldest of growing things on earth; averaging 275 feet high and 20 feet diameter. The largest reach over 325 feet high and 36 feet diameter, with an age of 5,000 years. Muir "never saw a Big Tree that had died a natural death." The other Sequoia (Sempervirens), or California redwood, covers an area of about 2,000 square miles. It is second only to the Big Tree in size, reaching 18 feet diameter; and like it is found nowhere else. It belongs to the Coast Range, as the Big Tree to the Sierra. It is almost exclusively used in California for sheathing. The immunity of a city like San Francisco from great fires, though windy, hill-built, and of "frame," is largely due to the low inflammability of this redwood lumber. The sugar pine, the yellow pine, covered, reaches 245 feet high and 18 feet diameter; the yellow pine 220 feet high and 18 feet diameter; the Douglas spruce, king of spruces, 200 feet high, 8 feet diameter; the Libocedrus, or incense cedar, 150 feet high and 7 feet diameter; the white silver fir 200
feet high, 6 feet diameter; the magnificent silver fir 250 feet high and 5 feet diameter. The oak is a familiar sight at most of our shabby tree, but of great economic importance in feeding the Indians and horses; in a good year its crop of excellent nuts is enormous — estimated (Muir) equivalent to 50,000 acres of wheat in food value. These are often fed to horses instead of barley. The shagbark hickory (which reach great size); also maples, yews, birches, alders, sycamores, cottonwoods, aspens, madronos, etc. A California palm (Washingtonia) is native in mountain canyons along the southerly desert, and is now largely used for street ornamentation. Specimens planted by the Franciscans have reached a height of 80 feet. The flora of the State includes about 2,500 species, and is of great interest. In the great central valley in February or March one can travel 400 miles, treading flowers at every step; and as much is true in other parts of the State.

No other State contains a moiety of the vast number of exotic trees now in California. Fruit, ornamental and shade trees from every country in the world are represented here. Nearly 11,000,000 tropical fruit trees are bearing in 1918. Millions of pepper-trees (Molle) from Peru are used on streets, etc.; and of Australian eucalyptus (intro. 1858), there are now over 15,000,000, including about 100 varieties, for fuel and ornament. Setting 3,000,000 acres to orchard and other trees within a generation has partially balanced the deforestation, though not where needed to offset the denudation of the watershed by lumbering and forest fires.

The most striking meteorological feature of California is perhaps the ordering of its seasons, of which it has practically but two, the wet and dry. The winter, or rainy season, is approximatively from late October to late April, with 15 to 25 rainy days, an annual precipitation ranging from 23.53 inches for San Francisco (far greater than the extreme northern 14.56 inches for Los Angeles, and 10 for San Diego. For six months after 1 May, rain is practically unknown, except showers in the high mountain regions, etc. In 1917-18 there were 361 days with precipitation in rain in Los Angeles, the largest city west of Saint Louis. In the high Sierra the winter precipitation takes the form of snow, with an annual fall of 30 to 50 feet, thus supplying the natural reservoirs which feed the streams, upon irrigation from which agriculture largely depends. But in Oregon, which bounds California on the north, we have the familiar eastern seasons; and again in Arizona and Nevada, abutting upon the east, winter snow and summer rains characterize the meteorology. This California differs altogether from all its neighbors and has well been called an "Island on Land." Within its own limits, also, it has extraordinary range of climates, as it were in strata, following the topographic contours. Thus in the vicinity of Los Angeles it is possible at times to take a sleigh-ride within 12 miles of the city on one side (and looking down upon blossoming orange groves not five miles distant), and by an hour's ride to bathe in the Pacific, which has here a winter temperature of 60°. Within a short journey from almost any given point one may find almost any variety of climate, from below sea-level to nearly 15,000 feet above it; from the extreme but arid and non-grazing desert to the mountain to eternal snow; from palms and perennial roses to the primeval coniferous forests, or to the desolation of alkaline Saharas. Although all California shares the seasonal peculiarity of California climate, the northern and southern parts of the State — many varieties of the State — many varieties of the State — many varieties of mountain to eternal snow; from palms and perennial roses to the primeval coniferous forests, or to the desolation of alkaline Saharas. extirpated. At the American occupation, elk were seen in droves of thousands. Great numbers were killed from the deck of steamers plying to Sacramento. Occupation of the State by Indians immemorially, and by Spaniards for nearly a century, had not appreciably diminished the wild animals; but the same wanton sport which exterminated the bears and wolves exterminated tens of millions of the American bison on the great plains has in California made the great mammals nearly extinct. The grizzly bear (the State emblem) once in great abundance in all parts of the State is now scarce; the black, cinnamon and brown bear are more common, though rare. Sea lions of a ton weight are still found along the coast, and their populous rookeries a few hundred feet from the 4Cliff House4 in San Francisco are an object of interest to travelers. The California lion, mountain lion or puma, is still not infrequent, and wildcats abound in the mountains. The coyote is common and of utility in decimating the hordes of rabbits, though an ill-judged bounty on coyote scalps has of late years much reduced the animal. This small wolf. The beaver, once in vast numbers here, is now confined to the remotest streams; and the valuable sea otter is almost extinct. Black-tailed and mule deer are still reasonably frequent; but the antelopes, which once roamed the northern and southern valleys in great bands, have hardly a representative left. The same is true of the mountain sheep (Ovis Ammon), once common in all the higher ranges. Spermophiles, or ground squirrels, and five species of gopher, are innumerable; and a great pest to the farmer as well as carriers of bubonic and other diseases. The Federal and State governments are making scientific campaigns to exterminate them. Millions have been poisoned. The true gray squirrel is common in the north. Jack rabbits and pocket gophers are abundant in all parts of the State, despite community "drivers" in which sometimes tens of thousands are killed in a day. The birds of California number above 350 species. The largest winged creature in North America is the California condor. Quail of two species are in vast abundance throughout the State.

Earthquakes.—While the Pacific Coast of North, Central and South America in general is peculiarly liable in recent geological times to seismic disturbances, California has never experienced an earthquake of the second magnitude, nor probably even of the fourth. The only first-degree earthquake in the United States was that of New Madrid, Mo., in 1811. The largest city in the world, if built upon its epicentre would have been immediately wrenched off the map. California has never had an earthquake approaching in severity that of Charles-ton, S. C., in 1886. The most serious "trem- bles" of California were in 1812 when the fall of the Mission tower of San Juan Capistrano killed 30 persons in the church. It did not special damage elsewhere in the village; and 1872 when some old adobe houses in Owens Valley collapsed and killed 19 Mexicans. The "Earthquake" of San Francisco, April 1906, was a very minor shock (geologically) — not above the 6 or 7th magnitude. It broke rusty water mains in the 30 feet of sand with which lower San Francisco is "filled." It threw down a few decrepit frame buildings, on the same sand "fill," but not a single respectable structure in the city. Fire caught in one of the wrecked tenements; and half San Francisco was consumed because there was no water to check the fire. In Charleston, practically every building was wrecked by the earthquake.

The unremitting tension upon the crust of the entire earth has found its "safety-valves" in California. The earthquake "faults" are not only known and visible, but mapped. There is no excuse for building towns or reservoirs across one of these "faults." For this reason, the foremost geologists agree (vid. Branner) that California is safer from earthquakes than are many States where these safety-valves have not yet been developed, and earthquakes are as yet strangers.

River Systems.—As in most arid States, the drainage of California is simple. For some 300 miles on its southeastern edge the State is bounded by the Colorado River, which rises in the Rocky Mountains in Colorado and flows 1,360 miles to the Gulf of California. No tributaries whatever from California, all east-bound streams from the Sierra Nevada being lost in the desert. On the western coast, though a few rivers reach the sea (like the Klamath, Mad, Eel and Salinias) they are relatively unimportant and incidental. The real drainage system of the State has outlet through San Francisco Bay and the Golden Gate, by two chief inland rivers which join about 60 miles northeast of San Francisco. Both rise in the Sierra Nevada, the Sacramento (370 miles long) to the north, the San Joaquin (350 miles long) to the south. Their main course averages along nearly the median line, north and south, through nearly two-thirds the length of the State. They have no tributaries worthy of the name from the great westerly mountain wall, the Coast Range; their waters being fed almost exclusively from the vast Alpine chain which is in effect, though not politically, the eastern boundary of California down to latitude 33° 30′. Their important feeders from the Sierra are the Feather, Yuba, Cosumnes, American, Mokelumne, Kern, Kings, etc. All these are fine mountain torrents, beloved of sportsmen, and flowing through magnificent scenery, but not of navigable ways. The most important is the Feather, which has a large drainage area. Several streams in southern California, like the Los Angeles, San Gabriel and Santa Ana, reach the sea, but all are practically exhausted by irrigation uses, except during winter flood-water. The many streams from the abrupt eastern slopes of the Sierra Nevada all disappear in alkaline "sinks,"—like Pyramid Lake, the Mojave River, Mono Lake and Death Valley,—and never even in flood reach the ocean by their great natural conduit, the Colorado River.

The total mean annual run-off (in acre-feet) of 32 chief California rivers is 59,078,200. The Colorado River is enormously largest, with 16,900,600 acre-feet; the Sacramento next with 9,770,000; the Feather 5,880,000; American 3,820,000; Yuba 3,050,000. The San Joaquin, Kings, McCloud, Merced, Stanislaus and Kings rivers all exceed 1,000,000 acre-feet; and the Tuolumne 2,000,000. Seven others exceed 500,000.

The Sacramento and Colorado are navigable to light-draft steamers to the State capital and
to Needles, respectively. The lakes of California are not important as to navigation. Tulare Lake, receiving the drainage of the Kern, Kaweah and Kings rivers, is 700 square miles in area, but only 40 feet deep. In very high water, it will overflow into the San Joaquin; but ordinarily its income of water is secured for by evaporation. Lake Tahoe in the extreme north, at an elevation of 6,200 feet, is 20 miles long and 1,500 feet deep, and famous for the purity of its waters, the beauty of its scenery and its trout. This lake is the headwaters of the Truckee River, of which there are a great number in the Sierra, mostly at altitudes exceeding the highest mountain summits east of Colorado. The lower-lying lakes of the State are mostly without outlet, and of various degrees of brackishness, culminating in the "sink" of the Amargosa River nearly 200 feet below sea-level on the eastern side of the range, where evaporation has left vast alkaline deposits, now of great commercial value.

Geology.—The main axis of the Sierra Nevada is of granite throughout. To the north there are some metamorphic peaks, and many summits are capped with volcanic materials. Mount Shasta in the far north is an extinct volcano. In the far south is Lassen's Peak, (10,577 feet), of late years sometimes emitting smoke. This granite core is flanked by a very heavy mass of slaty, metamorphic rocks,—mostly argillaceous, chloritic and talcose slates,—constituting the great auriferous belt of the Sierra. The Coast Range is made up almost entirely of cretaceous and tertiary marines, chiefly sandstones and bituminous shales. It is in this belt that the recent vast development of petroleum has been made.

Besides the vast reaches of alluvial soils in the lower valleys, which were first selected for agriculture, an enormous area of disintegrated granite gravels along the foothills and first activities has been found the most productive soil in the State, particularly with reference to valuable crops. These great granite beds, which seem to the farmer from the black "bottoms" of Ohio the most unpromising of soils, are in reality rich in all the elements of plant food. The vast majority of the valuable orchards of southern California, are planted upon this granitic detritus; and without exception the finest oranges and other citrus fruits come from this soil. The relative aridity of California, long supposed to be a curse, is now known to be a two-fold blessing. Exhaustive analyses, comparative with every portion of the Union, show these gravels to average much richer in chemical constituents than soils leached out by excessive rainfall. Furthermore, the fact that precipitation is not invariably sufficient to ensure crops has compelled irrigation, which does ensure them; so that farmers in the arid lands have much greater crop-certainty than those of regions with most abundant rainfall.

Agriculture.—In no item of its history has California been more unlike other States than in development and sequences of agriculture. The first (and for 60 years commercially chief) industry was cattle — derived from herds introduced from Mexico by Mariano Galvez, 1769, and chief wealth of the Mission establishment and Spanish colonists. It was a generation after the American occupation before agricultural ture was seriously undertaken; and for another term of years it was chiefly a gigantic seasonal "gamble with the weather" in dry-farming of cereals. The characteristic features of agriculture up to about 1870 were enormous holdings,—reckoned by at least tens of thousands of acres,—with the single crop (almost exclusively wheat and barley) and purchase of every other article of necessity or luxury. On areas of hundreds of square miles there were an individual or corporate owner, a single crop, and a few hundred raisings at the height of the season and their temporary quarters. A few of these enormous ranchos still survive; and Miller and Lux still farm about 1,000,000 acres, with 20,000 acres in a single field. But within a generation the typical character of agriculture in California has radically changed. The greatest record drought (1864) which not only destroyed grain but hundreds of thousands of cattle (60,000 head being sold that year in Santa Barbara at 37½c. per head), exclusion of the Chinese, who supplied the chief reliance for labor on the great ranchos, the fall in wheat, and other factors, led to the breaking up of these gigantic domains. A slight idea of the change may be had from the census that in 1850 the average size of all California farms was 4,456 acres; and in 1910, 318 acres. Along with this great dry-farm gambling — for such it was — sheep became a leading industry in the State, particularly in southern California. But the enormous increase in value of land has reduced sheep to a valuation of $17,000,000. The city of Pasadena (Pop. 40,000) was a sheep pasture in 1870.

Within about 30 years — that is, since 1885, — the general character of California farming has changed to small holdings, occupied not by tenants but by American owners, with families, with diversified crops, and obliged to purchase only the luxuries of life; with intensive methods and certainty (by irrigation) of crops. California has now one-fourth of all the irrigators in the United States. The average size of irrigated farms is in southern California 214 acres; in rest of State about 82 acres. The typical California farm under the present system is a quarter or half of an acre, irrigated either by its own pumping plant or from a community ditch, and yielding an annual income of not less than $200 per acre and sometimes $900.

Perhaps the greatest single factor in bringing about this structural change was the orange. In 1862 there were 25,000 orange trees in the State, all seedlings, and deriving from Mexico, where the fruit was introduced by the Spaniards nearly three and a half centuries earlier. In 1873 two seedless orange trees from Brazil were sent from the Department of Agriculture in Washington to Riverside, Cal. From these two parent trees has sprung the modern orange industry of California — and practically of the United States; as Florida, the only other orange State in the Union, yields only one box of oranges to California's two. Millions of trees grafted from their "buds" are now bearing in this State, and the hereditary fruit, seedless and delicious, leads the American market. This has its highest consumption practicably continuous (shipments being made every month in the year) has been for these

reasons, and aesthetic ones, a large attraction to high-class immigration, and an important factor in shaping agricultural methods. For development of the industry, see statistics below.

In deciduous fruits, total production, shipments fresh, canned and dried, California has within a generation come to lead the Union; as it leads in all tropical fruits.

**Beet Sugar.**—California was the first successful grower of sugar beets, and has by far the largest factories. In 1909 it was second to Colorado in the value of its beet-sugar output ($11,981,000), or 25 per cent of the total. The beet sugar industry of the United States originated at Alvarado, Alvarado County, Cal. In 1916 the output of its 11 beet-sugar factories was 472,770,100 pounds of sugar; value, $30,800,000. In 1917 the number of beet-sugar factories and acreage planted to beets had increased in one year over 26 per cent. California beets averaged 7 per cent higher in sugar than those of other States. The effect of the great war and government control on agriculture in California (as elsewhere) is not yet to be prophesied, particularly as to beet sugar, wheat, beans and live-stock. In 1917 the production of sugar beets was 2,636,800,000 pounds. Within a decade California has become the greatest producer of beans (navy and frijol, but principally lima). In 1916 the yield of beans was 5,047,082 bushels, valued at $19,144,000. In 1917 there were 8,035,000 bushels at double the value per bushel. This industry is practically confined to Ventura, Los Angeles, Orange and San Diego counties. Within less than a decade, also, cotton has come to count in the agricultural resources of California. Imperial County, organized 1907 (a recently re-described desert, often compared with the valley of the Nile), now produces annually 65,000 bales of cotton (40 per cent Durango or long-staple) worth $9,380,000, besides a great variety of other vegetable products. It lies along the Colorado River, just north of the Mexican line. Ten years ago a desert, it has now a population of 50,000, with several small cities and tens of thousands of acres under cultivation by a huge irrigating system from the river.

With modern refrigerator freight cars, a vast quantity not only of citrus and deciduous fruits, but of fresh vegetables, is now shipped from California, 2,000 to 3,000 miles to the Eastern States, including some 800 carloads of celery annually from one small town. Strawberries are in the Los Angeles market every month of the year, but are shipped (as are blackberries, raspberries, loganberries, etc.) to Arizona and New Mexico only in summer; as are also the famous cantaloupes and watermelons. California is foremost producer of the most extraordinary of forage plants, the Arabian-Spanish-Mexican alfalfa. This produces, under irrigation, about one ton per acre for each of four to eight cuttings per annum. In 1917 it sold at $26 per ton. In 1910 there were 487,134 acres planted to alfalfa; in 1916, 862,534 acres.

Up to 1908 the hop industry of the United States was all in Maine, Vermont and Massachusetts. Soon New York, with better soil, had a monopoly; then Wisconsin and Michigan became important hop-growers. In 1916 five counties of California produced more hops than all the rest of the United States. In 1916 the live-stock in the State, valued at $14,380,000, included 95,000 horses, valued at $45,396,000; 70,000 mules, valued at $8,120,000; 591,000 milch cows, valued at $39,597,000; 1,636,000 other cattle, valued at $62,332,000; 2,524,000 sheep, valued at $16,911,000; 994,000 hogs, valued at $10,059,000; and poultry valued at $19,000,000, making a total value of $201,395,000.

In the same year the total value of the State’s dairy products amounted to $40,310,105, consisting of 70,030,174 pounds of butter, worth $19,181,204; 7,745,124 pounds of cheese, worth $1,203,592; and other produce valued at $19,925,249.

The sensational achievements of Luther Burbank in hybridizing fruits—for instance, the creation of a large plum without any pit whatever—are already world-famous. Almost as remarkable results have been reached in floriculture. Seeds and bulbs are raised on a great scale; carnations, calla lilies and other flowers being grown outdoors by the 10-acre field. A large proportion of the flower seed of the United States is grown in California, and it supplies most of the mustard of the nation. The total area of California farms is now over 46,000 square miles, considerably exceeding the entire area of States of New Hampshire, Vermont, Connecticut, Rhode Island and Maryland. The State was seventh in the Union in per capita value of farm products ($68) and fifth in value of products of farm ($1,816) as compared with Ohio, $929 in 1900. California had in 1910, 87,670 farms; total value of farm property, $1,448,560,000; total value of farm products 1899, $131,690,606. Total acreage in farms, 27,883,000 acres, of which 11,380,000 acres are improved. The area farmed decreased 3 per cent, 1910 to 400,000. In 1850 there were 872 farms; in 1890, 18,716; in 1870, 23,724. The development of farming is briefly indicated as follows to 1910—the latest Federal figures available. The great increase since 1910 cannot be officially stated.

The largest number of farms was in Los Angeles County (6,577); three other counties
had over 3,000 farms each; Santa Clara, 3,995; Sonoma, 3,676; and Fresno, 3,290. Of all farms, 84,692 were farmed by whites; the rest by Indians, Chinese, negroes, Japanese.

Dairy cows had increased nearly one hundred-fold since 1850, in 1910 being 464,000. Horses (1910), 462,000; mules, 68,000; sheep, 2,325,000; swine, 749,000; of other cattle there were 1,155,000. Total value of domestic animals 1910, $119,487,452—including poultry and bees, $4,500,000; animals sold and slaughtered, $15,754,965; poultry and eggs, $6,356,780; wool, $1,707,088. Sheep and wool decreased steadily, from 1879, with the great increase in value of lands for farming.

From 1850 to 1900 the population increased sixteen-fold; number of farms over eighty-fold. California was one of the few States in 1900 that in 30 years added more to its agricultural than to its other population.

Irrigation and Horticulture.—Development of the new and characteristic agricultural era in California is outlined by these statistics from the last available census (1910).

Of the 72,542 farms in the State, 25,675 or 35.4 per cent were irrigated, an increase of 44 per cent in 10 years; the number of irrigators increased in the same term 87 per cent, showing the great subdivision of the lands—nearly twice as many people living on the same area. Total cost of construction of all irrigating systems, $19,181,610; so the irrigated crop of 1899 alone paid nearly $14,000,000 in excess of total cost of works. Los Angeles County led by far in number of irrigators (4,005); only Fresno (2,459) having one-half as many. In number of acres Fresno County was far in the lead, with 283,737 acres; Kern next with 112,533 and Merced, 111,330. Of the total 1,445,872 acres irrigated in 1910 (last available figures), 1,293,608 were irrigated from streams. There were 2,361 artesian wells and 10,924 pumped. By 1914, the pumping-plants for irrigation had increased to 24,589. More than half the flowing artesian wells in the United States were in California; and a large number of farms were served by electric power pumped from underground wells.

Of deciduous orchard trees there were in the State, in 1916: Apples, 61,752 acres; apricots, 96,716 acres; cherries, 13,484 acres; figs, 10,872 acres; peaches, 107,971 acres; pears, 40,324 acres; plums, 22,805 acres; others, 19,000 acres; a total of 372,924 acres planted to deciduous orchard trees. In 1916 the shipment of fresh deciduous fruit from 50 counties of northern California were 17,890 carloads; from the seven counties of southern California 450 carloads, having a total value of $29,500,000. In 1916 the citrus fruits (orange, lemon and grape-fruit, nearly all from southern California), were 92,607 acres; shipments reached a total of 45,083 carloads, valued at $41,348,000.

Dates were recently introduced from the government experimental stations in Arizona. In 1916 the Coachella Valley produced $65,000 of dates. The acreage has vastly increased since. There are over 7,000 bee-keepers in the State, owning more than 600,000 colonies. The production of honey in 1916 was 11,100,000 pounds, valued at $642,000.

California was first (1769), and is still practically the only State to produce the olive and its oil. Thirty-eight counties now grow the olive, though only in a half a dozen is it important. The olive is a million bearing trees in the State, and half as many not yet bearing. The California "ripe" olive has become of great commercial importance; while the "dehydrated" seems destined to become even more popular.

The annual production of oil (1916) is 1,000,000 gallons; packed olives, 18,000,000 gallons.

Of dried fruits the output is larger than in any other State.

Almonds and walnuts are not "commercially" produced elsewhere in the United States. Both crops have more than quadrupled in a decade. In 1916 the yield was, for California, 3,400 tons of almonds and 12,800 tons of walnuts.

California produces 95 per cent of the United States almond crop; and over four times the nation's importation of this nut. The aguacate, avocado or alligator pear (from Guatemala) is of recent introduction, but there are already over 35,000 trees in southern California; and the ordinary income is $200 per tree—the fruits selling as rarities at 50 cents to $1.25 each. In the last census year the number of plum and prune trees was greater than the total number of all deciduous trees 10 years before. The number of apricot trees had more than doubled in the decade.

Total number of semi-tropical fruit trees had increased from 1,809,161 to 8,996,459 in the decade. Of the latter number 62.8 per cent were orange trees; 17 per cent olives; 16.6 per cent lemons; 21 per cent figs. Other trees included were guavas, kaki, limes, pineapples, pomelos, etc. The counties of San Bernardino, Los Angeles, Riverside and Orange contained more than four-fifths of the orange trees. The number for the State increased nearly five times in 10 years. Orange and lemon shipments increased about eight-fold in the decade. San Diego and Los Angeles counties contained more than half the lemon trees of the State, the number being more than 14 times as great as 10 years before. There were 5,648,714 orange; 1,493,113 lemon; 1,530,164 olive trees in the State.

Strawberries, blackberries, raspberries, loganberries and other small fruits are valued at about $2,000,000. Fifty-seven million pounds of raisins were produced in the State.
Viticulture.—California has over 90,000,000 grape-vines (more than all the rest of the Union), occupying 355,000 acres; representing an investment of $150,000,000. The State shipped in 1916 10,741 carloads, valued at $13,000,000. It is the only raisin State. In 1916 it shipped (from 22 counties, though Fresno is centre) 128,500 tons of raisins. The seedless-raisin industry began in Fresno County, and has grown from 3,500 tons in 1897 to 45,000 tons in 1916.

The best dry wines are grown almost exclusively in the northern half of the State; the best sweet wines exclusively in the southern. The recent (1917) vote in Los Angeles prohibits the use of beverages above 14 per cent alcohol in the State; the trade in the largest city in the West thus to restrict. It permits the 14 per cent claret of the North, but inhibits the 21 per cent ports, sherrys and other fortified sweet wines of the South. California is committed to a policy of "local option," as regards the liquor problem, but the great majority of the smaller cities are (nominally) "bone dry." On 1 April, 1918, the 200 saloons in Los Angeles (600,000 population), closed their doors, being "voted out" by a large city majority. It was then the largest city in the Union without liquor license. The effect of the prohibited movement on the whole grape industry and the 100,000 persons directly dependent upon it can be inferred. The ordinance was voted in November, and became effective only four months later. This was virtual confiscation of several million dollars in stock, leases, licenses, fixtures, etc. At the same time there were still 1,750 places in San Francisco where "hard drinks" could be secured.

Mining.—As early as 1690, Loyola Casallo mentioned placer gold in the San Joaquin Valley. Some nuggets were described by Antonio Alcedo, (1785) in the 18th century. Not later than 1841, gold was found on San Francisco Creek, Ventura County, about 45 miles from Los Angeles, and was "washed" there by Mexicans on a modest scale. On 19 Jan., 1848, James W. Marshall, an American from New Jersey, employed by the Swiss pioneer, John Sutter, in building a saw-mill near Coloma, on the north fork of the American, picked up yellow metallic flakes in the mill-race; the news spread in spite of efforts to suppress it, and in a few months the gold rush was on. Up to 1848 the whole United States had produced less than $12,000,000 in gold since the discovery of America; in five years following, California alone yielded over $250,000,000 in gold. In 1851, the total gold output from 1848 to 1 Jan., 1851, was $1,653,594,500. It now averages 2½ million per year. This first bonanza in United States history had a profound economic, sociological and political effect. "Sound money" was as yet unknown in this country; silver and gold together in the Union up to 1849 had not reached $25,000,000 in total output; and the instability of the currency prior to the California gold discovery is familiar to students. The California gold-fund not only precipitated such a shifting of population as had not before been dreamed of on this continent; it brought about the admission of the Union of a State distant 2,000 miles from any other State. —California was the first State in the geographic western half of the United States, and sixth west of the Mississippi River,—it furnished the finances for the great civil achievement nominally most concerned with slavery, and gave the free States a majority in the United States Senate. It is probably not fanciful to hold that this "irrepressible conflict" could not so soon have opened had the nation been so short of bullion and of credit as it was prior to the gold discovery of 1848. Furthermore, in 1859, almost exclusively with California capital, labor, enterprise and machinery, the great silver bonanzas of Nevada (just across the Sierra) began the remarkable record of 21 years, in which they produced over $300,000,000 in bullion.

The first mining in California by Americans was crude, as it had been in Mexican days—"washing out" the auriferous gravels in the "gold pan." The first step in advance was the "rocker," employing two men, and foreshadowing a certain associative effort. Next came the "Long Tom," which made also for stability, since it could not be carried. Then came the sluice-box, a small wooden flume with wooden riffles on the bottom, behind which the gold sank and was saved, while the lighter sand and gravel were swept on by the swift current. In 1852, E. E. Matteson, a Connecticut Yankee, invented hydraulic mining, the greatest advance ever made in the placers. Water under high pressure, served through a nozzle called the "monitor," thrown 200 or 300 feet with such nozzle force that a crowbar could not be thrust into the jet, ate away whole hillsides almost as hot water disintegrates sugar, the detritus passing through long riffles; the sluice-boxes. Hydraulics was the most essential yet made in mining, it was long disastrous to ultimate development of the State, agriculturally. In 1880 it was proved by engineers' measurements that on the Yuba River alone more than 100,000,000 cubic yards of gravel had been washed by hydraulics into the bed of the stream, raising it 70 feet, and burying 15,000 acres of farm lands under the debris. After a long and bitter fight, the "anti-Stickens" campaign ended in 1884 in favor of the agricultural interests, and hydraulic mining in California has never since been on a large scale.

Quartz mining—that is, deep mining on the original veins from whose waste the placers derive—began in 1851, but did not take chief rank for many years. The first large scale "lead" from the discovery to 1859 inclusive, was in million dollars, 5, 10, 45, 75, 85, 65, 65½, 65, 57, 50 and 50. The total gold output from 1848 to 1 Jan., 1848, was $1,653,594,500. It now averages 2½ million per year. This first bonanza in United States history had a profound economic, sociological and political effect. "Sound money" was as yet unknown in this country; silver and gold together in the whole Union up to 1849 had not reached $25,000,000 in total output; and the instability of the currency prior to the California gold discovery is familiar to students. After a long and bitter fight, the "anti-Stickens" campaign ended in 1884 in favor of the agricultural interests, and hydraulic mining in California has never since been on a large scale.
CALIFORNIA

"soft money" or a depreciation of currency. The largest mint in the world is located in San Francisco.

In the sixties, extensive experiments were made by Thomas Scott of the Pennsylvania Railroad to develop petroleum in California, even shipping around the Horn barrels for the experiment. For reasons, chiefly administrative, the experiment failed.

Petroleum.—In 1875, J. D. Whitney (of Yale), perhaps the greatest geologist of the United States, and for years State geologist of California, stated that while there were surface indications of petroleum, it was geologically impossible that California should become a great producing petroleum State, and there could not be flowing oil wells like those of Pennsylvania. The enormous surface indications in many parts of the Coast Range tempted further exploration; and within a year after Professor Whitney's prophecy, oil was struck in Los Angeles County at Puente; and soon thereafter in Los Angeles City and also in Ventura County. By 1883, there were about 100 wells in California producing in a year 400,000 barrels. By 1900, the annual product had increased to 4,324,484 barrels, with 1,590 producing wells, and 470 drilling. In February 1918, the total number of producing wells was 8,158. A majority of the California oil wells are flowing when first tapped. The famous "Lake View" spouted about 90,000 barrels a day for a long time, and continued to flow for more than a year. Other wells have spouted from 30,000 down to 10,000 barrels a day. The life of a flowing well varies from six months to three years. For these great gushers, whole valleys are dammed up as reservoirs are dammed for water; and the petroleum product makes lakes of large size. The oil fields touch 17 counties in a line over 600 miles long. The vast majority of the product is in eight counties in the south in the following order (1916):

Oil wells are from 700 to 4,000 feet deep. In the Summerland district, in Ventura County, most of the production is from wells put down in the bed of the ocean from piers. Thousands of miles of pipe-lines deliver at tide-water the product from Kern River and other districts. In 1916 (except for Oklahoma which has recently outstripped it) California produced nearly 50 per cent of the total petroleum of the United States and over 10 times as much as Pennsylvania.

California locomotives nearly all burn crude petroleum, as do the steamers. Steam and electric roadbeds are "oiled" for thousands of miles. An overwhelming majority of the manufacturers of the State use it for fuel. It is equivalent to coal at about $3 per ton. There can be no fuel famines in California. The mud road has disappeared from the progressive streets. Farmers drive (mostly by auto and truck) to market over unpaved roads made by mixing the universal disintegrated granites with crude oil and steam-rolling the surface. The production of natural gas increased from $34,578 in 1900 to $28,717,537 in 1916—a gain of 82 times in 16 years. Twelve counties produce this commodity but the output is overwhelming from Kern (over 60 per cent of total), Santa Barbara, Orange, Fresno, Los Angeles and, Yavapai counties in that order. One pipe line (the "Midway") transmits 23,000,000 cubic feet per 24 hours, and is 107 miles long. In 1916 there were 31 plants in the State making gasoline, having an aggregate capacity of 61,400 gallons per day. The petroleum of California, in its varying forms has not only been one of the greatest industrial and economic factors of the State, but has contributed to Paleozoology the most extraordinary find in history—not even surpassed by the remarkable deposits of actual fossils at Agate Springs, Neb.—the "La Brea Rancho," partly within the city limits of Los Angeles, discovered in 1906, a unique preservative of Pleistocene remains. In a space of about 1,400 feet long, northwest by southeast, and 150 feet wide, 53 skeletons have been discovered, of which many were before unknown to science. In the same area, crude oil is still bubbling up; and jackrabbits, owls and smaller animals are caught in it at night, taking it for water, and being "hogged down. In the Pleistocene period, southern California was a tropical jungle roamed by the largest land mammals. The drying up of the region, the extinction of tropical forests and of lakes and water-courses, brought about the rapid extinction of these ancient species. On the "La Brea" is a little pond of about an acre of asphaltum springs, still bubbling. In Pleistocene days, the Imperial elephant came down here to water, and was caught in this oozing quicksand. Sabre-tooth tigers sprang upon their backs and devoured them alive—and other tigers disputed the prey; and all slowly sank down to be preserved hundreds of thousands of years for science, to-day. The skeletons of 50 species of mammals and 50 of birds have been exhumed here, and new material is constantly coming up. The great bird of 14 feet wing spread—the teratornis—is the largest of the winged creation found here. The sabre-tooth tiger was known to science before, but with forelimbs reaching below the lower lip. In this incommensurable cemetery have been taken out, already, 630 sabre-tooth tigers with an average length of 10 inches for those great canine teeth, seven inches below the gums. The first complete skeleton of the Imperial elephant was taken out here; and 16 other specimens have been found. Over 200 of the "big wolves"—very much larger than the modern timber wolf; 7 mastodons; 39 giant ground sloths; 39 bisons; 59 horses and 39 camels, and new varieties of the little sloth, the antelope and a cat as large as the jaguar (whereas the puma was before the largest, except the lions and tigers). Other museums have fragments of the giant ground sloth; but the only complete specimen is from here. Of the little sloth, here are the only 11 skulls known. This is the only place known in the world where bones have been preserved in asphalt. They are not fossils, and their durability is a matter of surprise, though they are in perfect consistence. The "valleys" made by the dead animal tracks as they had been buried in soil. The Museum of
History, Science and Art, in Los Angeles, has a vast quantity of material unmounted, and 15 examples mounted of the most important of these unique prehistoric creatures. The owner of "La Brea" has donated 32 acres of this waste land, and Los Angeles County will build a park and subsidiary museum on the spot around this death valley which attracted these forgotten animals of the Pleistocene period. The petroleum trap will be maintained as it has been for so long; except that it will show the modern excavations and some bones in situ.

Mining Output in 1910 and 1917—California, while first in present annual output of gold, is overwhelmingly first in total production; having produced more than all the rest of the United States put together. It is second in output of copper, eighth in silver, first in borax and soda, second in petroleum, fifth in salt, first in asphaltum, tungsten, quicksilver (with two-fifths of the total production of the world); and with a range of mineral productions entirely without parallel in North America.

The principal products with their respective values were (1917):

The total metal output of the 589 active mines of California for 1916 amounted to a value of $38,749,263, a figure $7,484,419 greater than for 1915, and a new record in the mining history of the State. But this increase is to be attributed to the greatly enlarged output of copper, zinc and lead; for the gold output showed a fall, of $1,031,555. In detail, the year's record shows: gold, 1,035,744.6 ounces, valued at $21,410,741; silver, 2,564,354 fine ounces, valued at $1,687,835; copper, 55,897,118 pounds, valued at $13,750,691; zinc, 15,256,485 pounds, valued at $2,044,369; lead, 12,407,493 pounds, valued at $651,117.

The reduction in the gold output was nearly all in the deep-mine production, and is laid partly to the two months' strike of miners in the Mother Lode district, and partly to the higher wages paid at the copper mines, which drew away a considerable body of miners. The placers are credited with 40 per cent of the total yield, as compared with 38 per cent for 1915. More than seven-eighths of the placer total was recovered by the 53 dredges throughout the State. The largest dredging operations were carried on in Yuba County, where 13 dredges, some of them the largest ever built, were at work during the year. Some platinum also was obtained by the dredges. The largest output of copper was in Shasta County, which produced 50 per cent more than in 1915. The lead output was nearly three-fold that of 1915, and nearly all came from Inyo County. Shasta and Inyo counties produced nine-tenths of the zinc output, and San Bernardino County the remaining tenth. The total tonnage of ore mined and treated in California in 1916 was 3,187,642 short tons. From this was recovered an average value of $9.77 per ton—a figure surpassing the former record ton-value of $7.87, made in 1915, by 24 per cent.

Minor mineral products (1917) by thousand dollars: Antimony 5, asbestos 5, barytes 10, bituminous rock 60, coal 25, dolomite 15, feldspar 7, fuller's earth 4, graphite 45, iron 10, lead 60, iron 3, limestone 155, marble 40, platinum 25, potash 25, silica 35, soapstone 15, soda 85.

Manufactures—For its first 80 years entirely pastoral, for its next 20 years chiefly mining, for the next 60 years overwhelmingly devoted to agriculture, horticulture and viticulture, California has in the last decade (to 1917) become the ninth manufacturing State in the Union. This is due not alone to the vast range of productivity but still more to the unprecedented development of petroleum-fuel and hydro-electric power. Between a population of 92,597 in 1850 and 2,938,659 in 1916, California's population increased 31-fold. Its economic progress has been perhaps as surprising. The United States census of 1914 shows nearly 5,000 manufacturing industries, of which 71 produce more than $500,000 a year each (including four that exceed $50,000,000 and 11 between $10,000,000 and $50,000,000). Value increased, in five years, more than value increase of United States as a whole.

See also, elsewhere, statistics of oil refining, packing fish, fruit and vegetables, etc., under their headings.
Detailed statistics of minor manufactures may be found in the census of manufactures of the Department of Commerce, United States of America.

Even in the four years since the issue of the last (1914) bulletin, enormous changes have taken place in nearly every item of the total United States trade upon the Pacific Ocean, and nearly one-fifth of the total coastline of the United States. All this, added to its relation as outlet for an enormous inland territory, including not only California but New Mexico and Arizona, gives great importance to its commerce. San Francisco (1905) though the 11th city of the Union in population was third in commerce. Its exports for 1916 were $127,598,531 and imports $117,128,253 (including exports to China $4,857,956 and to Japan $24,818,324). Operations in the Philippines and development of the Oriental trade are bringing about for California the realization of Seward's prophecy (about 1865) that the Pacific is to be the chief theatre of the world's new, but highly important industrial advance, is the long-distance transmission of electric power from mountain streams. In this California has for years led the world. When a 33,000-volt, 82-mile line from San Bernardino to Los Angeles was installed (1900), it far exceeded any other line in the world in length and voltage. Then 40,000 volts were brought 140 miles from Yuba River to Oakland—with cable crossing Carquinez Straits by suspension span of 4,400 feet, 300 feet in air. The longest power transmission in the world was that from Colgate to San Francisco, 211½ miles. Plants have been built to transmit 28,000 horse power from Kern River, 116 miles, to Los Angeles; and 120,000 horse power from San Joaquin River, 180 miles, to San Francisco; and 218 miles to Los Angeles. One electric company expended $250,000 per month for a year, in electric development in and around Los Angeles. Two companies in the northern part of the State are developing 169,000 horse power for long-distance transmission. Not only are nearly all streets and houses lighted, and street-cars propelled by this new, far-fetched fuel, but thousands of the smaller manufacturing establishments are run by hydro-electric motors, with Philactis parva and bulkena), which skirt the littoral from about Point Conception to San Diego. These kelp beds cover 50,000 acres. Kelp pirates had for several years ravished the beds to a small degree by a crude method, and extracted the potash still more crudely; destroying the plants which they tore out by the roots, and causing great havoc among the young fish, of which the most important have their spawning-beds and nurseries in this same kelp field. State legislation has now been secured to regulate the harvesting of the crop by scientific methods, so that it will be enduring. Kelp is the algal sea. The more it is cut (scientifically) the better it thrives. There are (1918) eight corporations with plants, with an investment of $6,000,000, kelp with a fleet of special boats of 12 to 600 tons capacity, and with reciprocating knives which cut the kelp not over five feet below the surface, without any injury whatever to this curious marine plant, or the myriad fish-spawn sheltered thereby; and carry the harvest to be treated in great modern plants.
The product of potash (selling in 1918, at $450 a ton, multiplied about 700-fold), amounts to $2,700,000. The wet-tons harvested in 1917 were 400,000; yielding 6,000 tons of potash at 1¼ per cent of potash to the wet-ton. The large content of ammonia and iodine by-products is very important, and it is ready being saved — though too recently for accurate statistics. The harvest, under this scientific treatment, lasts all the year, three crops annually; the average, per acre, being 7½ wet-tons. No method is known to increase the acreage of the kelp beds; but under the present system the crop will be perennial. About 75 per cent of the possible gathering is now harvested. On account of its vital relation to the important fisheries of California, the administration of this industry has wisely been placed under the control of the State game and fish commission. Whether to be rated among the agricultural, manufacturing or marine products, this Sea Alkaline, in view of the constant value of the production and its exhaustible field, and its proximity to factories by rail makes this extraordinary industry of southern California worthy the attention of economists.

The first commercial production of potash in California was in 1915 increasing the acreage of kelp. The first potash derived from mineral sources was produced as a by-product from cement treater dust, at Riverside, in 1915. The yield of potash from purely mineral sources for 1920 was approximately 120,000 tons, valued at $2,200,000. This is principally from the cement treater dust in Riverside County and the evaporation of the natural brines in Searles Lake, San Bernardino County. Eight corporations are now engaged in the manufacture of mineral potash; and in spite of the youth of this industry, it is already important. The development of the mineral industry is barely begun, and its potentialities can hardly be estimated. The kelp potash can be practically measured as above. But the mineral potash cannot be. It is the consensus of producers that there is an enormous possibility for the mineral potash industry in the great deposits now being developed in California.

Fisheries.—In 1865 there were 650 vessels, mainly herring vessels and whale fisheries in the Pacific. The centre of the industry was San Francisco. Half a century later, San Francisco was still the foremost whaling port of the New World, but the industry had shrunk to $132,000. Long Beach, southern California, is important in this fishery, and the market has become a valued market food. The State is the richest in marine and fresh-water fish; and ranks second or third, at present, in the canned pack. This was until recently almost altogether salmon. But within a few years the so-called “Tuna” (really the albacore), and the sardine have become rivals of the salmon pack. The centre of this industry is in southern California, at Los Angeles Harbor (formerly San Pedro). Another important fishing and cannery port is San Diego. The total pack for southern California, 1916, was:

<table>
<thead>
<tr>
<th>Fish</th>
<th>Cases</th>
<th>Value</th>

</tr>
</tbody>
</table>

The value of the salmon pack (entirely confined to northern California) was, for 1916, approximately $8,375,000. The sardine pack, for northern California, for 1916, had increased from 30,000 cases to 250,000 cases. Japanese and Chinese and other alien fishermen dry large quantities of fish which are not recorded in State or Federal statistics. Throughout, the fishermen are about 90 per cent aliens. Statistics are not readily available, under a loose system of State supervision. Probably now that the government has taken control of the food supply it will soon be easy to get some accurate idea of this product, which is enormously larger than the recorded statistics. Among the most important marine fishes are the chicken-haibug, sole, tom cod, rock cod, rock bass, mackerel, Spanish mackerel, barracuda, pompano, sand-dab, red snapper, hound and other valued varieties, besides many fish of lesser estimation. These marine fish are in the market the entire year, at reasonable prices. The San Francisco market lists 133 varieties on sale by seasons. Of the fresh water fish, the striped bass of the Sacramento River is an esteemed delicacy. Salmon, sturgeon, steel-head trout, rockfish and smelt, running from sea to stream, are abundant here. Within the last 30 years all varieties of trout (besides the native) have been successfully colonized in California, which now exceeds any other State in the variety, size and abundance of trout. Black bass, shad, codfish, crab, etc., have also made handsome growths here. For game fish and sport, California is admitted to lead the world not only in trout and black bass, but in the marine fish, like the leaping tuna of Catalina Island, which has built up itself an international reputation. For cups and medals and strict laws. The record tuna of 251 pounds and the black sea bass of 380 pounds were taken with light rod and reel and 21-strand line. The coast is very rich in shell fish. It is against the law to have in one's possession a crab less than six inches in diameter. But though large, they are delicious. Shrimps are abundant. Crawfish, like the eastern lobster in flavor but without mandibles, are abundant. The native oyster is small but flavorful; and eastern oysters which are here and are excellent in flavor. Mussels, clams, razor-shells, cockles and other edible mollusks are in great abundance. The mollusk most prized by the epicure, though still little known, is the abalone. Its beautiful shell is familiar to collectors all over the world, when polished—a beautiful nacre univalve, measuring from six inches longer diameter, upward (six inches being the minimum allowed by law). It requires much labor to pry it from the rocks, and still more to beat it into edibility; but when properly macerated it is much sought after delicacy in the market. All game fish, as well as all game quadrupeds and birds, are protected by strict State laws, rigidly enforced. The State has 12 fish hatcheries, turning out annually, of fry: trout, 17,000,000; quinnet salmon, 20,000,000; shad, 1,000,000.

The Mount Shasta hatchery produces more salmon and trout fry than any other in the world. Besides these State hatcheries, there are four hatcheries and egg-collection stations under Federal control.
The value of marine fish, fresh, in 1917 was $11,795,000; packed, $15,235,000; a total value of $27,030,000.

Railroads and Street Railways.—In 1870 the State had 525 miles of railroads, 7,529 in 1895, and 12,145 in 1916. This mileage permitted by the Los Angeles Standard-Union.
museums of scientific importance in the State — in Berkeley, San Francisco and Stanford, with the Southwest Museum in Los Angeles and the County Museum, with its wonderful array of Pleistocene semi-fossils.

Churches.—Though founded and civilized by the Catholic Franciscan Friars in 1769 (the first Protestant sermon being preached here 80 years later), California is richer per population in Protestant churches than most of the Puritan States; having (1916) 2,370 Protestant churches, valued at $21,400,565; membership 328,631 (an increase of 60 per cent in 10 years) and under 25 denominations. These churches contributed to missionary purposes in 1916 $1,650,926. Los Angeles city had 281 Protestant churches with 58,685 members or 10 per cent of the population. San Francisco had 100 such churches with 15,713 members, or 3¾ per cent of the population. Los Angeles County leads the State with 104,418 members or 31 per cent of total Protestant membership of the 58 counties. Alameda comes next with 21,750 members. Twelve denominations maintain 17 Protestant religious schools and colleges, of which more than half are in southern California. It is widely recognized that lack of co-ordination causes great wastefulness in this church work.

The Christian Science churches are multiplied in number and membership very greatly in the last decade; but no statistics are available. They are not included in the list of Protestant or other churches.

The Catholics have 539 churches, of which 298 have resident priests, 155 mission stations, 15 orphan asylums and 8 homes for the aged.

Church membership is as follows:

<table>

Total Protestant | 355,631
Catholic | 520,233

Charities and Penal Institutions.—California has two State prisons, three industrial reform schools, five asylums for the feeble-minded, for deaf, dumb and blind, and a great number of public and private hospitals, asylums, orphanages, etc. There are 64 orphan homes, of which 36 receive State aid. There is also a Federal prison on Alcatraz Island in San Francisco Bay.

Military and Naval Establishments.—There are garrisons and fortifications at the harbors of San Francisco, Los Angeles and San Diego — respectively The Presidio, Fort MacArthur and Fort Rosecrans. There is also a navy yard at Mare Island, and an arsenal at Benicia. The largest training camp in California in the Great European War was Fort Kearsney, located near San Diego. Under contract with the government there is being built in 1918 a large number of wooden and steel and concrete ships, of 3,000 tons and upward, for commerce during and after the war. This ship-building is almost exclusively in Los Angeles Harbor, Long Beach and San Francisco.

State Government.—State control has been extended for four years, except assemblymen for two; no bar to re-election; governor’s salary, $6,000;
two-thirds vote in each house passes bill over governor's veto. If he does not act on any bill within 10 days, it becomes law, unless adjournment of legislature prevents return of bill, in which case it becomes operative if within 10 days after such adjournment the governor approves it. Legislature limited to 40 members in session 80 in house; meets biennially, in January of odd-numbered years. Sessions not limited, but pay allowed members for only 60 days — $8 per day, with traveling expenses and mileage 10 cents per mile. No bill can be introduced after 50th day of session. State constitution is notable for numerous restrictions on legislative action; provision for three-fourths majority verdict of juries in civil cases; and prohibition of Chinese suffrage and of employment of Chinese on State works, or by corporations. The initiative, referendum and recall are also in full use. California was sixth State to adopt "Woman's Suffrage." There are 40 State commissions, expending annually nearly $5,000,000. California is represented in the U.S. Congress by 3 senators, nine congressmen (prior to apportionment of 1901, seven congressmen). Electoral vote, nine.

Population.—The settlement of California, steadily progressive for 65 years, has been marked by two of the most remarkable shifts of population anywhere recorded. Everything considered, the "Gold Rush" of 1848-49 has no parallel. In first 12 months after the discovery of a small flake of gold at Sutter's Mill, 42,000 Americans from the far Eastern States made their way across the unbroken plains with wagons. This great migration continued uninterrupted for years. Its demands brought about the first large development of steam navigation; and the finest clipper ships that had ever been built were constructed for the California trade. In 1845 the white population of California was about 5,000; 4,000 of whom were Spanish Californians, 300 "Americans," 300 English, Scotch and Irish, and the remainder "scattered." By 1850 this number had increased to 19,597; by 1855 to 107,000. That is, in 12 years over 370,000 persons reached California by an overland journey of 2,000 miles; or by a voyage of 19,000 miles around the Horn in sailing ships; or by the 5,000 mile voyage of Pacific steamers. For all these and other reasons, it is the isthmus. For the first decade this precipitate migration was overwhelmingly of men; and this preponderance of males, with dearth of families and of women, colored in almost every social, political and economic aspect the early fortunes of the State. The scarcity of home life, and profligacy abundance of money, brought about an era of luxury in private and public expenditures on such a scale as was then hardly dreamed of in the Eastern States. San Francisco had less than 150,000 people when it began to build the largest hotel in the world — covering two and a half acres and costing $7,000,000. Everything was in this proportion. Enormous subscriptions were sent to relieve great catastrophes of fire, pestilence which at one time touched the world. Its were made to education and other public utilities, on a scale never yet surpassed and at that time elsewhere unheard of. For a generation San Francisco was a proverb the world over of princely living and good living. This large population was largely of young men, vigorous, adventurous, mostly unattached, far from home and the conventions, and under excitation of sudden wealth, shaped and established such an epoch, social and financial, as no other American State has ever comparably known.

It was only after the first decline in the "diggings" — after the pursuit of gold became less a fortunate scramble for surface nuggets, and mining had come to demand skill, patience, and business methods — that attention began to be paid to the soil. Though for 80 years the Franciscan missionaries had already proved, in little oases about their missions, the wonderful fertility of California, the aridity of climate and the "look" of the land, so unlike in color and texture to soils recognized as fertile at home, led the adventurers to believe for years that California was worthless except for mining and stock-raising. It was only when the real fecundity of the soil began to be understood that character of population underwent essential change. Immigration in the first decade was almost purely of male fortune-hunters and adventurers, none of business character. They came to get rich and go home. But when the slow comprehension dawned that in agricultural possibilities the State was inconceivably richer than in mineral resources, and that here was not only the most hospitable of climates, but the most generous land for homebuilding, an entirely different type of migration began — the migration of families. This stream, small at first, has continued steadily since about 1870. In 1886 the completion of a competing railroad into southern California — to which its first transcontinental line had brought but slow increase of population or development — precipitated another migration numerically greater than the gold rush, almost as rapid, far longer continued and of entirely different category. It was characterized by well-to-do and educated families, without the heroic qualities of the pioneers, but of much higher average in the civic and financial scale. They came not to tame a wilderness, but to enjoy such a land as travelers seek along the Mediterranean. They came to build homes and create a new and cultured class of men who had probably never been found among an equal population. It is only by reference to the peculiar character of this migration that the development and progress of California in all social, educational and material lines during the last 25 years seems at all credible.

In 1880 the population was 864,694; in 1890, 1,208,130; in 1900, 1,485,053; in 1910, 2,377,549, an increase of 60.1 per cent since the census of 1900; in 1910 it was 2,938,654. The recent great increase in population, however, has been disproportionately in the seven southern counties of the State. Much more than half of the State gain for 20 years has been in eight counties, including in the northern half of the State only the city and county of San Francisco. Since 1880, Los Angeles had by 1910 outstripped in population 99 other American cities then numerically larger. In 1910 it was the 36th city in the Union in population, and only 13 cities in the Union had gained as many people in the decade. There were 117 incorporated cities and towns; 50 places exceeding 5,000 popu-
CALIFORNIA

1. The Arroyo Seco ("Dry Wash"), a typical ravine between Los Angeles and Pasadena and its concrete bridge 1,460 feet long, 160 feet high.

The first large aviation field-meet in the United States was held in Los Angeles County about 1911. Until recently surpassed by a field in Texas, the North Island Field, San Diego was the largest in the country. Up to date, 1918, it has had the fewest fatalities, the climate and conditions making this location particularly adaptable for the training of beginners in aviation. Los Angeles is the world's chief center of the moving-picture industry; the expenditure within the city by the film industry, amounting to about $20,000,000 a year, and the actors including nearly all the famous stage favorites. The fact that weather conditions are favorable nearly all the year is no more important than the fact that almost every landscape from that of Palestine or the Sahara to that of the Alps, from perpetual summer and roses to snowbanks and glaciers and deserts and almost every other geographic range can be duplicated within easy reach of the various studios, of which there are several in Egypt and Babylon and Switzerland, France, England and New England, South America—the pictures of these are almost entirely located in southern California. As with Florida, Switzerland and parts of New England, the tourist must be reckoned by the economist among the assets of the State. This is overwhelmingly the case in the southern counties, where the tourist influx amounts in value to from $75,000,000 to $100,000,000 per year. In 1915, over 250,000 tourists visited southern California. Unlike the case of other summer or winter resorts the number of tourists who remain permanently or return soon to become residents causes the increase in population which has, no parallel in United States history. The climate, the scenery, the romance of the missions and other history, the educational and other advantages, the class of population already here, the growth of automobilizing and the unrivalled facilities for this in southern California have conspired with other causes to make it the most visited State in the Union. Its permanent immigration is small from foreign countries except by individuals. Its great growth comes from the better classes of the Eastern States. From Point Conception (nearly half the total coast-line of the State) the littoral is dotted with dozens of cities, towns and resorts largely depending upon their interests of bathing, boating, fishing, yachting, etc. The most important of these, from north to south, are Santa Monica, Venice, Ocean Park, Redondo, Long Beach, La Jolla and Coronado at San Diego. The important seaside towns have their enclosed swimming tanks; but many people take surf baths every month in the year. For climatic reasons above stated, the seaside above Point Conception is not as popular nor as populous for marine diversions, the water and the weather being alike too cool. Perhaps the most famous of these seaside resorts is the Island of Catalina, about 20 miles off coast from the harbor of Los Angeles, with its placid bay and its remarkable "Marine Gardens" which are viewed through glass-bottom boats; and its fishing which is internationally famous. California is the paradise of the automobilist, as it has more autos per capita than any other part of the world. Within 10 years (ending with 1917) over $40,000,000 have been spent
CALIFORNIA

by State and counties on *good roads*—of native asphalt and gravel, largely founded on concrete, and generally smooth as a table. One can ride almost from end to end of the State on these luxurious roads—and over 1,000 miles in Los Angeles County alone. There are many extraordinary scenic drives—some over a mile above the sea. This has naturally led to the decimation of deer, duck, rabbits, quail and trout; as well as the multiplication of cattle. There were in 1917 over 400,000 auto-vehicles in the State—about two-thirds in the southern half. Southern California has also the largest per capita number of telephones in the world. The automatic telephone was perfected here. The number of telephones in California, 1 Jan. 1918, was 699,470, being one telephone to every 4.38 persons; for San Francisco, 130,175, being one to every 3.56 persons; for Los Angeles, 132,662, being one telephone to every 3.79 persons. Comparison is often more graphic and more instructive than mere figures. California has a total area practically equal to that of Maine, New Hampshire, Vermont, Massachusetts, Connecticut, Rhode Island, New York and Pennsylvania combined; or England, Ireland, Scotland, Wales, Barbados, Mauritius, Straits Settlements, Java, and the Northern provinces of India; or the Hawaiian, Samoan, and Tonga Islands; or the Philippines, Hawaii, Porto Rico, Samoa and Guam, with Massachusetts and Connecticut thrown in. California has in its 18 *National Forests* more acres of great trees than the total area of the States of New Hampshire, Vermont, Massachusetts, Maine, New York, and Pennsylvania combined; and California’s acreage to vegetables another Rhode Island and Delaware—and nearly another Delaware thrown in; and the national reserves are less than half the forestation of the State. California has enough primal desert to blanket most of New England. But in that same desert is more mineral production per annum (except coal and oil) than is recorded for all States east of the Alleghanies in all their history.

California’s hay, grain and alfalfa fields are nearly as large in area as the States of Connecticut and Delaware. California’s fruit farms cover an area twice as large as Rhode Island; and California’s acreage to vegetables another Rhode Island. Nor do these figures for vegetables include half another Rhode Island cultivated home-lots. California’s acreage in beans, sugar, beets and potatoes is 15 per cent larger than Rhode Island.

History—The name California, for which so many preposterous derivations have been urged, is taken from a Spanish romance, called ‘*Serras de Esplandian*’ (‘*Exploits of Esplandian*’), by Ordoñez de Montalvo (translator of ‘*Amadis de Gaul*’), printed about 1510, and often mentioned in old sources. *California* was a mythical island on the right hand of the Indies, very near the Terrestrial Paradise, peopled with Amazons and Griffins. The name was afterwards applied to the peninsula (extensively by Jimenez 1533) and is first recorded thus in Fregiado’s diary of Ulloa’s coastwise voyage in 1539. In time it came to be used indefinitely for the whole Pacific Coast from the peninsula practically to Nootka; and later the *California* (Lower or Lower California and Alta (Upper) California, the former including about what is now the Mexican Peninsular Territory. The first European to touch the present State was Alarcon, who went up the Colorado River some hundreds of miles in 1540. The first seaboard exploration was by Cabrillo 1542; and the next important coast explorations were by Sir Francis Drake in 1579, and described the coast of Upper California was in 1579 by the Franciscan missionaries under Junipero Serra, with a small escort of Spanish troops. These pioneer missionaries had by 1800 founded 18 missions, whose total population, mostly Indian neophytes, was 13,000. Three other missions were established by 1823. The mission period lasted about 65 years; converted over 80,000 Indians; erected in the wilderness at least $1,000,000 worth of buildings, and had developed stock-raising and wheat on a scale which astonished Humboldt. In 1834 the Mexican government *disestablished* the missions and confiscated their property. The Indians were scattered, and perished in great numbers. The buildings were plundered and left to decay. At present the Landmarks Club (incorporated) is preserving the mission edifices. The State passed from Spanish rule to that of the Mexican republic, 1821; was seized, practically without resistance, by the United States in 1845, and ceded by Mexico at close of Mexican war; admitted to the Union 9 Sept. 1850. The discovery of gold caused an unprecedented transcontinental migration (see *Population*). Aside from the great impetus given steam and clipper ships, the migration had other unique features,—like the Merchants’ Express, which employed 5,000 men, 2,000 wagons, and 25,000 head of oxen in freighting across the continent; and the Pony Express, which carried mail (letters only) at $5 per half ounce, 1,950 miles horseback from Independence, Mo., to San Francisco, in 10 days; and the Butterfield stages, 8 times a month between Saint Louis and San Francisco, via Texas and New Mexico; quickest time, 21 days from New York to San Francisco. Extraordinary records were made in this overland traffic. Robert H. Haslam (‘*Pony Bob*) made one continuous ride of first miles in 1861. William F. Cody (‘*Buffalo Bill*) over 384, without stopping except for meals and to change horses,—both as riders of the Pony Express. The quickest time made by this route (1,950 miles), was 7 days, 17 hours. The growth of this overland traffic led California capitalists, heavily subsidized by government, to build a transcontinental railroad. Ground was broken at Sacramento for the Central Pacific Railroad 8 Jan. 1863. The road was completed by driving of a spike of pure California gold by Governor Stanford in the presence of distinguished company at Promontory, Utah, 10 May 1869. In 1877 the Southern Pacific Railroad from Texas tidewater to San Francisco was completed. In 1885 the Atchison, Topeka and Santa Fe Railroad reached Los Angeles from Saint Louis; and in about 1910 was extended to San Diego. The latter and the Southern Pacific Railroad are among the longest railroad systems in the world, the former with a mileage of 8,648 and the latter with a mileage of 7,065. The modern development of California dates from competition of two lines during the decade beginning 1886.

The swift creation of an American commonwealth by the sudden horde of adventurous pioneers upon whom that duty at once devolved
State Capitol at Sacramento, Cal.
is perhaps the most remarkable monument to the genius of the American people for self-government. Ninety thousand wanderers, homeless, jobless, wifeless, broke, hastened to their deaths, or lost so anxiously and suddenly, without any help of the outside world, within a year had been silenced and firmly established on the western side of the United States. The desperadoes who flocked in from all parts of the world including a large contingent of Australian convicts were firmly suppressed, though not at once. Between 1849 and 1856 there were in San Francisco alone 1,000 homicides and seven executions. In 1856 the second vigilance committee, composed of the best citizens, after full and formal trial, publicly hanged half a dozen of the worst desperadoes, and banished scores of others on pain of death. Since that time law and property have been quite as safe in California as in the Eastern States. Chinese exclusion, though finally a national measure, was brought about by California, which then contained a majority of all Chinese in the country. In 1879 California voted exclusion by 154,638 to 883. The number of Chinese in the State has decreased from 75,132 in 1880 and 72,472 in 1890 to 45,753 in 1900. The bitterness aroused by the exclusion struggle has passed, and Chinese are well treated.

California entered the Union as a free State, thus giving balance of power to the North. In State elections since the war it has been peculiarly independent, having gone Democratic in 1867, 1875, 1882, 1886 (Democratic governor and Republican lieutenant-governor, who became governor by his superior's death) and 1894; Republican in 1871, 1879, 1890, 1898 and 1902.

In politics, California is counted "Safe Republican." For its first half century it came near alternating between the two great parties; but from 1902 to 1918 it has elected only Republican governors (including a "Progressive"). In national politics it has given its electoral vote in the same 16 years for only one Democratic President—Wilson, second term. This was largely by the women's vote and on the slogan "He kept us out of war." The presidential vote of California was decisive. California was the sixth State to adopt (1911) equal suffrage, and the first State of considerable size—being more than double the total population of the five earlier equal suffrage States. In 1916, out of a population of 3,000,000, the total registration was 1,314,446; the total vote nearly 80 per cent of this, ranging from 39 per cent to 46 per cent women. No woman has been elected to a Federal or State office; about 30 have been appointed. In counties and cities, over 50 women have been elected to office from 18 superintendents of schools, to one county clerk and the only councilwoman in the county (Los Angeles). There are several policewomen, probation officers, etc.; and many serving on civic commissions. The question of their eligibility on juries is not yet (1918) determined, and depends on the ruling of the judge. Women have procured the introduction and enactment of laws in varying importance and value, chiefly concerned with women and children, prohibition and the social evil.

Next to the gold excitement (see Mining and Population) the most sensational era in California history was the great bonanza silver period from 1859 to 1880. The mines were in Nevada, but were owned in San Francisco, and an era of stock-gambling therefore unbroken in history, and probably not yet surpassed, sprang from their sensational yield. Stocks on the San Francisco board rose $1,000,000 a day for many months, and sales in one year were $120,000,000. Everybody gambled in stock from bankers to scrubwomen. In 1875, with less than 200,000 population, San Francisco had 100 millionaires. The "Consolidated Virginia" mines paid $1,000,000 per month dividends for nearly two years. One lode was valued at nearly $400,000,000; $250,000,000 was spent in "developing" a small group of hills. The decadence of these great bonanzas, following the subsidence of gold mining to sober methods, at last turned more general attention to agriculture, the real wealth of the State. (See Agriculture.) In 1880 California was first in the Union only in gold, sheep and quicksilver; all other industries being far down the list. It is now first in gold; ninth in sheep; first in diversity of crops; first in milk for making butter, canned fruits, dried fruits, barley; first in number of irrigated farms; first in average wages in manufacturing establishments; first in borax, asphalt, quicksilver, platinum; second in copper; third in wheat; first in beef sugar; first in hops; first in oranges, lemons, olives and all semi-tropical fruits, honey, prunes, walnuts, almonds, beans, grapes, pears, peaches, cherries, apricots, etc.; first in electric power transmission; third in ship-building; second in petroleum; fifth in total value of farms (excluding farms, $2,000,000,000); twelfth in total value of manufactured products.

The highest California gold product in any one year was $55,000,000. The total agricultural products for 1916 were $194,556,000; and total value of manufactured products (1916) $712,800,764.

A South Sea bubble as wild as the Comstock silver stock-craze was the great "Land Boom" of southern California, 1886-87, a period of land-gambling never quite equaled in any other part of America. An area as large as New England was involved, with varying intensity; but the chief focus of excitement was in Los Angeles, San Bernardino and San Diego counties. Scores of thousands of city lots were staked out far from towns; hundreds of miles of cement sidewalks and curbs were laid; scores of big hotels and other buildings erected as baits, and great quantities of lands (purchased at from $10 to $30 per acre) were sold in town lots at $1,000 to $10,000 per acre. In Los Angeles County alone, with a population then not over 50,000, real estate transfers recorded in 1887 were over $100,000,000. Excursion auction sales of new "towns" sometimes realized $250,000 in a day; and $100 was often paid for a place in the line waiting for a sale to open. The collapse of this gigantic bubble, early in 1888, was as extraordinary in its freedom from disaster as it had been in its inflation. Not a bank failed, nor a business house of respectable standing; and while desert town lots reverted to acres of value, all really desirable real estate, rural and urban, has constantly advanced in value every year—thanks to the uninterrupted continuance of large and wealthy immigration. Building of
homes and setting out of orchards continue on an extraordinary scale. "Local option" is in force; and nearly all towns of southern California are "prohibition."
CALIFORNIA, Pa., a borough in Washington County, on the Monongahela River, three miles south of Pittsburgh, on the P. V. and C. Railroad. The largest coal mine in the world is located here (Vesta No. 4). There are also manufactures of glass bottles and foundry and machine shops. The resources of the two banks amount to $1,735,045. The Southwestern State Normal Schools and the borough public and high school are situated here. The latter and the borough building are fine structures. The government is in the hands of a council of seven members. Pop. about 2,300.

CALIFORNIA, University of, a university of the state system in California, but supported as well by the income from endowments and by national aid.

In 1869 the College of California, which had been incorporated in 1855 and which had carried on collegiate instruction since 1869, closed its work of instruction and transferred its property, on terms which were mutually agreed upon, to the University of California.

The university was incorporated by a law which received the approval of the governor, 23 March 1868. Instruction was begun in Oakland in the autumn of 1869. The commencement exercises of 1873 were held at Berkeley, 16 July, when the university was formally transferred to its permanent home. Instruction began at Berkeley in the autumn of 1873. The new constitution of 1879 made the existing organization of the university perpetual.

The professional schools were contemplated in the original plan, but not organized till later. The executive board consists of the governor and lieutenant-governor of the State, the speaker of the assembly, the State superintendent of public instruction, the president of the State Agricultural Society and the Mechanics' Institute of San Francisco, and the president of the university (all regents ex officio), and 16 others appointed by the governor for a 16-year term with the advice and consent of the senate. The university comprises the following colleges and departments: (1) In Berkeley: the colleges of letters and science of commerce, agriculture (courses at Berkeley; farms and laboratories, etc., at Davis, Riverside, Whittier, Chico, Santa Monica, Tulare County, Mелиoland and Kearney Park, Fresno County), mechanics, mining, civil engineering, chemistry; the schools of education, jurispudence, medicine (first year and part of second year), the university extension division, the California Museum of Vertebrate Zoology; (2) at Mount Hamilton: the Lick Astronomical Department (Lick Observatory); (3) at Santiago, Chile: the D. O. Mills Observatory; (4) in San Francisco: the California School of Fine Arts, the Hastings College of Law, the medical school (part of second year, and the third, fourth and fifth years, including the University Hospital, the George Williams Hooper Foundation for Medical Research, the college of pharmacy, the California College of Dentistry, the California College of pharmacy, the institute of ophthalmology, archaeology and art; (5) in Los Angeles: Los Angeles Medical Department (graduate instruction only); (6) the Scripps Institution for Biological Research at La Jolla; (7) the Herriot Research Laboratory of Biology at Pacific Grove, and (8) the Summer School of Surveying at Swanton.

In 1898 Mrs. Phoebe Apperson Hearst informed the regents that she proposed to erect a building, but wished first a worthy general plan for the Berkeley campus, and that she would bear the expense of an international competition to obtain such a plan. In 1898 an international jury assembled at Antwerp and voted upon more than 100 plans submitted, awarding prizes to 11 composers invited to the visit the university and to prepare revised plans for a second competition. In September 1899, the jury met again in San Francisco and gave the first prize ($10,000) to M. Emil Benaud of Reims. Among the 11 composers invited to Berkeley in many conferences with the university authorities, M. Benaud undertook a revision of his drawings to fit the plans to the actual necessities of the site and the prospective needs of the university. In December 1905, he submitted a design which the regents adopted as the permanent plan. To Mr. John Galen Howard was entrusted the development of the plan, as supervising architect. In realization of the Hearst plan, several buildings have been completed including the Hearst Memorial Mining Building, given by Mrs. Hearst for the college of mining of the university and as a memorial to the late Senator George Hearst; California Hall, for which an appropriation of $250,000 was made by the California legislature, and the president's house. Another notable building is the beautiful Greek theatre, an open-air auditorium, seating 8,000, patterned after the classic theatres of Greece and the Greek colonies, and given to the university by Mr. William H. Ralston. Other new buildings is the library, for which generous provision was made by Mr. Charles F. Doe of San Francisco, who bequeathed $700,000 for this purpose.

Since this time gifts and appropriations have made possible the erection of a series of new buildings. As a memorial to her husband, the late Judge John H. Boalt, Mrs. Elizabeth J. Boalt in 1898 made a gift of about $100,000 to the university for the erection of a Hall of Law. Members of the bench and bar of California subscribed an additional $50,000 and on the 28th of April, 1911, the Boalt Hall of Law, constructed of white granite and completely equipped with library, offices and class rooms, was formally dedicated. Upon the death of Mrs. Jane K. Sather on 12 Dec. 1911, President Wheeler, as her trustee, sold to the regents of the university property valued at $400,000 which Mrs. Sather had left as a gift to the university. Of this sum $200,000 was devoted to the erection of the Sather Tower, a white granite 302 feet in height, designed after several similar towers in Italy, but not a direct replica of any one. In 1917 the Sather Bells, made in Europe.
CALIGULA

at a cost of $10,000, were hung in the Sather Tower and the Sather Esplanade was con-
struction at a cost of $40,000. Benjamin
ide Wheeler Hall, one of the new classroom
building, was made ready for occupancy in
January 1917. It was built at a cost of $720,000,
of white granite, and represents the Georgian
tradition in architecture. It contains an audi-
torium seating 1,020 people, 62 classrooms, 48
studies for members of the faculty (each study
accommodating two), a large and comfortable
faculty room, and accommodations for 4,889
students at one time. Hilgard Hall, the new
agriculture building, was dedicated in the sum-
er of 1917. It was built of reinforced con-
crete at a cost of $362,000, to house instruction
in agronomy, citriculture, forestry, genetics,
pomology, soil technology and viticulture. The
exterior of this building is notable for the
highly original treatment of decoration in
sgraffito—the use of colored cements for adorn-
ment of concrete surfaces. Work was started
in 1917 on Gilman Hall, which is being built at
a cost of $220,000, to house the research labora-
tories in chemistry. It will be used by the fac-
culty and by graduate and undergraduate students. Reinforced
concrete is the building material used. These
three buildings were designed by John Galen
Howard, professor of architecture and super-
vising architect in the university. Under his
direction also has been completed the university
library, at a cost of about half a million dol-
ars, making the total cost of the building $1,400,000. Special features of the new portion
are a second reading room seating 240 readers
and added facilities for periodicals (of which the university receives 8,000 titles), 20 seminar
rooms, 22 faculty studies and space for book-
stacks to hold 1,250,000 volumes, although at
present this space is only utilized for some
600,000 volumes. In San Francisco the univer-
sity has built the university hospital at a cost
of $700,000, with accommodations for 225
patients. It is mainly intended as a laboratory
for the university's medical school and the
Hooper Foundation for Medical Research.

The university has 542 officers of instruc-
tion, a library of 360,000 volumes, an art gallery, museums and laboratories, also
the agricultural experiment grounds and sta-
tions, which are invaluable adjuncts of the
farming, orchard and vineyard interests of the
State. In San Francisco there are 150 officers of
instruction, besides demonstrators and other
assistants, and 775 students. Tuition in the col-
leges at Berkeley, during regular sessions, is
free to residents of California; non-residents
pay a fee of $10 each half year. In the pro-
"fessional colleges, in San Francisco, except that of
law, tuition fees are charged. The instruc-
tion in all the colleges is open to all qualified
persons, without distinction of sex. The
constitution of the State provides for the perpetua-
tion of the university with all its departments.

In 1917 there were 3,850 students in all the
departments, a gain of about 60 per cent, due to
the entrance of the United States into the war,
were women; it is also to be noted that a com-
paratively large proportion of students is in the
general or academic courses, as distinguished
from the technical and professional courses.

CALIGULA, Gaius Cæsar Augustus Germanicus, Roman Emperor, a son of Germanicus
and Agrippina: b. 31 Aug. 12 A.D., in the camp at Antium, and brought up among the legions;
d. 24 Jan. 41 A.D. He received from soldiers the surname of Caligula because he usually wore the calige, the boots commonly used
by the soldiers. He understood so well how to insinuate himself into the good graces of Tibe-
rius that he not only escaped the cruel fate of his parents, and brothers, and sisters, but was
ever loaded with honors. Whether, as some writers inform us, he removed Tiberius out of
the way by slow poison is uncertain. When
the latter was about to die he appointed, ac-
根据 to Suetonius, Caligula and the son of
Drusus, Tiberius Nero, heirs of the empire.
But Caligula, universally beloved for the sake
of his father, Germanicus, was able without
difficulty to obtain sole possession of the
throne. Rome received him joyfully, and the
distant provinces echoed his welcome. His
first actions were just and noble. He interred, in
the most honorable manner, the remains of
his mother and of his brother Nero, set free
all state prisoners, recalled the banished and
forbade all prosecutions for offenses com-
mitted before the magistrates free and indepen-
dent power. Although the will of Tiberius had
been declared by the Senate to be null and void, he fulfilled every article of it, with the exception
only of that above mentioned. When he was
chosen consul he took his uncle, Claudius, as
his colleague. Thus he distinguished the first
eight months of his reign by many magnani-
mous actions, when he fell sick. After his
recovery, by a most unexpected alteration, which has given good grounds to suspect his
sanity, he suddenly showed himself the most
cruel and unnatural of tyrants. The most ex-
quise tortures served him for enjoyment.
During his meals he caused criminals, and even
innocent persons, to be stretched on the rack
and beheaded; the most respectable persons
were daily executed. In the madness of his
arrogance he even considered himself a god,
and caused the honors to be paid to him which
were paid to Apollo, to Mars, and even to
Jupiter. He also showed himself in public
with the attributes of Venus and of other
goddesses. He built a temple to his own divin-
ity. At one time he wished that the whole
Roman people had but one head, that he might
be able to cut it off at one blow. He fre-
frequently repeated the words of an Alexandrian poet, Oderint dum metuant—"let them hate so long
as they fear." He squandered the public money
with almost incredible prodigality. One of his
greatest follies was the building of a bridge
between Baiae and Puteoli (his "seventy-miler"), in order that he might be able to boast of marching
over the sea on dry land. He had it covered
with earth, and houses built on it, and then
rode over it in triumph. He gave a banquet
in the middle of the bridge, and to celebrate
this great achievement ordered numbers of the
spectators whom he had invited to be thrown
into the sea. On his return, he entered Rome
in triumph, because, as he said, he had con-
quered nature herself. After this, he made
preparations for an expedition against the Ger-
man, passed with more than 200,000 men over
the Rhine, but returned after he had traveled
a few miles, and that without having seen an
enemy. Such was his terror, that, when he
came to the river, and found the bridge ob-
structed by the crowd upon it, he caused himself to be passed over the heads of the soldiers. He then went to Gaul, which he plundered with unexampled rapacity. Not content with the considerable booty thus obtained, he sold all the property of both his sisters, Agrippina and Livilla, whom he banished. He also sold the furniture of the old court, the clothes of Marcus Antonius, of Augustus, Agrippina, etc. wherever he went he was welcomed with the intention of going to Britain. He collected his army on the coast, embarked in a magnificent galley, but returned when he had hardly left the land, drew up his forces, ordered the signal for battle to be sounded, and commanded the soldiers to fill their pockets and helmets with shells, while he cried out, "This booty, ravished from the sea, is fit for my palace and the capitol!" When he returned to Rome, he was desirous of a triumph on account of his achievements, but contented himself with an ovation. Discontented with the Senate, he resolved to destroy the greater part of the members, and the most distinguished men of Rome. This is proved by two books which were found after his death, wherein the names of the principal chieftains (636 A.D., Heg. 13) which one was entitled Gladius (Sword), and the other Pugillus (Dagger). He became reconciled to the Senate again when he found it worthy of him. Caligula's morals were, from his youth upward, corrupt. After he had married and repudiated several wives, Cesonia retained a permanent hold on his affections. A number of conspirators, at the head of whom were Cærea and Cornelius Sabinus, both tribunes of the praetorian cohorts, murdered him in the 29th year of his age, and the fourth of his tyrannical reign, which thus lasted from 37 to 41 A.D. Consult Baring-Gould, 'The Tragedy of the Caesars' (London 1892).

CALIPH (Fr. calife, Ar. khilif’a, calif, successor), is the name assumed by the successors of Mohammed in the government of the faithful and in the high-priesthood. Caliphate is therefore the name given by historians to the empire of those persons who are Arabs founded in Asia, and impelled by religious enthusiasm, enlarged, within a few centuries, to a dominion superior in extent to the Roman empire. The title is still borne by the Sultan of Turkey. Mohammed, in the character of the prophet of God, made himself the spiritual and temporal ruler of his people. In the following account the dates both of the Hegira and the Christian year are often given. The difference in the mode of computing the Mohammedan year has caused considerable divergencies among authorities in regard to the exact dates of the particular events of Mohammedan history.

After the death of the Prophet the election of a successor occasioned considerable excitement, Mohammed having left no son and nominated no successor. Abdullah Ibn Abu Kofas, called Abubekr, that is, father of the virgin (because his daughter Ayesha was the only one of the wives of Mohammed whom he had taken as a virgin), succeeded the Prophet over Ali, the cousin and son-in-law of Mohammed, and became the first caliph, 632 A.D. (year of the Hegira 11). Victorious over enemies at home, by the aid of his general, Khaled, "the Sword of God," he proceeded, as the Koran directs, to spread the doctrines of Mohammed by arms among the neighboring nations. With the watchword, conversion or death, a numerous army of volunteers inspired with zeal for the holy war, penetrated into Syria and Mesopotamia, but before much could be done, Abubekr died after he had filled the place of the Prophet two years and four months. The Prophet having once acquired a strong footing in Syria by the treacherous surrender of Bosra, they undertook, under Khaled, the siege of Damascus, and having repulsed two large armies, sent by the Emperor Heraclius to the relief of the city, they obtained possession of it by a capitulation (635 A.D.), the terms of which were perfidiously broken. Khaled pursued his victorious path in retreating Christians. By him and other generals, though not without a brave resistance on the part of the Greeks, the subjugation of Syria was completed (638 A.D., of the Hegira 17). Jerusalem having been compelled to surrender (638 A.D., Heg. 18), the Caliph placed the solitary rock over which the city was built, either in person to fix the terms of capitulation, which subsequently served as a model in settling the relations of the Moslems to the subject Christians. These terms were carefully observed by the conscientious caliph. The new Persian empire of the Sassanide was also overthrown, and Mesopotamia and other extensive regions overrun. Equally successful was the Mohammedan general, Amru, in Egypt, which was subjected to the caliphate in two years (641). Omar was the first who bore the appellation of Emir al Moumenen ("Prince of the Faithful")—a title inherited by all succeeding caliphs. Many of these conquests were over Christian populations who readily changed their creed and adapted themselves to the new rule.

After the murder of Omar by a revengeful slave (644 A.D., Heg. 23), a council, appointed by him on his death-bed, chose Osman, or Othman, son-in-law of the Prophet, parking over Ali. Under him the empire of the Arabs continued to expand. From Egypt the tide of conquest advanced westward along the northern coast of Africa, as far as Ceuta. Cyprus too (647 A.D.), and Rhodes (654 A.D.) were conquered; but the former was lost again, two years after. An agitation against Othman now arose, partly owing to the fact that he favored and aggrandized his own family connections in every way, and entrusted the provinces, not to the most capable, but to his favorites. To many also the claims of Ali to the caliphate were deemed superior to those of Othman. The dissatisfaction thus excited occasioned a general insurrection in the year 656 (Heg. 34), which terminated in Othman's death.

Ali, the son-in-law of the Prophet by Fatima, became the fourth caliph, by the choice of the people of Medina, and is regarded as the first legitimate possessor of the dignity by a numerous sect of Mohammedans, which gives him and his son, Hassan, almost equal honor with the Prophet. This belief prevails among the Persians, and others who belong to the Shiite sect as opposed to the Sunnites or Orthodox. Instead of being able to continue the conquests
of his predecessors, Ali always had to contend with domestic enemies. Among these was Ayesha, the widow of the Prophet, called the mother of the believers, and especially the powerful Moawiyah, governor of Syria, who all laid claim to the government. These were able to create suspicion, and spread the report that Ali had instigated the murder of Othman. In vain did he endeavor to repress the movement against his person; Amr, for the government of the provinces to his friends. Nowhere were the new governors received. The discontented collected an army and made themselves masters of Bassora. Ali defeated it, and Tellah and Zobeir fell; but he could not prevent Moawiyah and his friend Amru from extending their party and maintaining themselves in Syria, Egypt, and even in a part of Arabia. Three men of the sect of the Kharejites proposed to restore concord among the faithful, by having the heads of the parties, Ali, Moawiyah and Amru; but Ali only fell (661 A.D., Heg. 40). He was a man of a cultivated mind, and was the author of a collection of sentences or moral maxims, etc. on the death of the man, had the desire to defend the caliphate against the indefatigable Moawiyah; a treaty was concluded between the two, by which Hassan solemnly abdicated the government (661). Some years later he perished by poison, said to have been administered by one of his wives at the instigation of Moawiyah.

Moawiyah I transferred the seat of the caliphate from the city of the Prophet, Medina, where it had hitherto always been, to Damascus, in the province of which he had formerly been governor (673 A.D., Heg. 54). With him began the series of the caliphs called Ommiades (or Ommayads), which name this family bore from Moawiyah's progenitor, Ommiyah. Not long after his accession he was obliged to quell an insurrection of the Kharejites by a campaign, and a rebellion at Bassora by severe punishments. He then seriously meditated the entire subversion of the Byzantine empire (q.v.). Rhodes was attacked, and the famous colossus was brought into the city. The emperor in person marched through Asia Minor, meeting but little resistance; then crossed the Hellespont and laid siege to Constantinople, but was obliged to raise it (669 A.D., Heg. 49). Other generals were more successful against the Turks in Khorasan, and the regions extending to the borders of India.

The next caliph, Jezid (or Yazid), was not altogether a worthy successor of his father, the politic Moawiyah (660 A.D., Heg. 60). At first he was not able, even of the two holy cities, Mecca and Medina, which, as long as the caliphs had resided in the latter city, had enjoyed a principal voice in their election, but which had not been consulted when Moawiyah, according to the custom of the caliphs, appointed his successor in his lifetime. This discontented espoused the cause, either of Houssain, the famous son of Ali, or of Abdallah, Zobeir's son, both of whom had laid claim to the caliphate. A rebellion of the inhabitants of Iraq in favor of Houssain, led by Muslum. Houssain's cousin, was suppressed by the prudence and decision of Obeidallah, governor of Cufa; and Houssain, who had accepted the invitation of the conspirators, was killed (660 A.D., Heg. 61), to the great grief and rage of all those who took part with Ali's family—a feeling still cherished by the Shiites. Abdallah Ebn Zobeir was recognized as caliph in Medina, where Jezid was put to death for his insubordination and skepticism. On this account Medina was invested, stormed and sacked; and Mecca, in which Abdallah took shelter, was besieged, but during the siege Jezid died.

After Jezid's death (683 A.D., Heg. 64) his son, Moawiyah II, a weak but pious youth, became caliph, but after a reign of 40 days he died when he was meditating abdication. By this time Abdallah Ebn Zobeir had caused himself to be proclaimed as Prince of the True Believers, and he had a powerful following. For a period anarchy prevailed. Irak, Hejaz, Yemen and Egypt acknowledged Abdallah Ebn Zobeir as caliph. In Syria, Dehac, regent to Abdallah, was at first chosen caliph; but the people of Damascus against his interrogator, of the race of the Ommiades, caliph, who made himself master of all Syria and Egypt. Khorasan separated from the caliphate, and submitted to a prince of its own choosing—the noble Salem. Afterwards, by the will of Obeidallah (65) Solomon Ebn Sarad excited a great rebellion in the discontented in Syria and Arabia, and pronounced both caliphs deposed, but was defeated by the experienced soldier Obeidallah. Merwan (who died in 685) had been compelled to promise on oath to leave the caliphate to Khaled, the son of Jezid, yet he nominated his son Abdalmelek as his successor. Under him (685 A.D., Heg. 65) Mokthar, a new rebel against both caliphs, was subdued by one of them, Abdallah (686 A.D., Heg. 67); but this only made Abdallah more formidable to Abdalmelek, who, in order to be able to direct all his forces against him, concluded a peace with the Greek emperor, Justinian II, in which, reversing the order of the Koran, he conceded to the Christians a yearly tribute of 50,000 pieces of gold. He then marched against Abdallah, defeated him twice, and took Mecca by assault. In this last conflict Abdallah fell. Thus Abdalmelek united under his dominion all the Mussulmen, of whom he marched through Asia Minor, meeting but little resistance; then crossed the Hellespont and laid siege to Constantinople, but was obliged to raise it (669 A.D., Heg. 49). Other generals were more successful against the Turks in Khorasan, and the regions extending to the borders of India.

The next caliph, Jezid (or Yazid), was not altogether a worthy successor of his father, the politic Moawiyah (660 A.D., Heg. 60). At first he was not able, even of the two holy cities, Mecca and Medina, which, as long as the caliphs had resided in the latter city, had enjoyed a principal voice in their election, but which had not been consulted when Moawiyah, according to the custom of the caliphs, appointed his successor in his lifetime. This discontented espoused the cause, either of Houssain, the famous son of Ali, or of Abdallah, Zobeir's son, both of whom had laid claim to the caliphate. A rebellion of the inhabitants of Iraq in favor of Houssain, led by Muslum. Houssain's cousin, was suppressed by the prudence and decision of Obeidallah, governor of Cufa; and Houssain, who had accepted the invitation of the conspirators, was killed (660 A.D., Heg. 61), to the great grief and rage of all those who took part with Ali's family—a feeling still cherished by the Shiites. Abdallah Ebn Zobeir was recognized as caliph in Medina, where Jezid was put to death for his insubordination and skepticism. On this account Medina was invested, stormed and sacked; and Mecca, in which Abdallah took shelter, was besieged, but during the siege Jezid died.

After Jezid's death (683 A.D., Heg. 64) his son, Moawiyah II, a weak but pious youth, became caliph, but after a reign of 40 days he died when he was meditating abdication. By this time Abdallah Ebn Zobeir had caused himself to be proclaimed as Prince of the True Believers, and he had a powerful following. For a period anarchy prevailed. Irak, Hejaz, Yemen and Egypt acknowledged Abdallah Ebn Zobeir as caliph. In Syria, Dehac, regent to Abdallah, was at first chosen caliph; but the people of Damascus against his interrogator, of the race of the Ommiades, caliph, who made himself master of all Syria and Egypt. Khorasan separated from the caliphate, and submitted to a prince of its own choosing—the noble Salem. Afterwards, by the will of Obeidallah (65) Solomon Ebn Sarad excited a great rebellion in the discontented in Syria and Arabia, and pronounced both caliphs deposed, but was defeated by the experienced soldier Obeidallah. Merwan (who died in 685) had been compelled to promise on oath to leave the caliphate to Khaled, the son of Jezid, yet he nominated his son Abdalmelek as his successor. Under him (685 A.D., Heg. 65) Mokthar, a new rebel against both caliphs, was subdued by one of them, Abdallah (686 A.D., Heg. 67); but this only made Abdallah more formidable to Abdalmelek, who, in order to be able to direct all his forces against him, concluded a peace with the Greek emperor, Justinian II, in which, reversing the order of the Koran, he conceded to the Christians a yearly tribute of 50,000 pieces of gold. He then marched against Abdallah, defeated him twice, and took Mecca by assault. In this last conflict Abdallah fell. Thus Abdalmelek united under his dominion all the Mussulmen, of whom he marched through Asia Minor, meeting but little resistance; then crossed the Hellespont and laid siege to Constantinople, but was obliged to raise it (669 A.D., Heg. 49). Other generals were more successful against the Turks in Khorasan, and the regions extending to the borders of India.
taleb, uncle of the Prophet, began to be formidable. Under Hisham an end was put to the progress of the Saracens in the west by the energy of Charles Martel, who annihilated their armies at Tours in 732, and at Narbonne in 736. Walid II was murdered after a reign of one year (744 A.D., Heg. 124). Al Walid's sons and reigns of Jezid III and of his brother Ibrahim, Merwan II followed, with the surname (respectable among the Arabs) of the Ass (Al Hemar). Ibrahim, the Abasside leader, being imprisoned and put to death by his prince, his brother Al Affas took up the cause of the Abassides and assumed the title of caliph. In the resulting war Medwan was twice defeated, and fell (750 A.D., Heg. 133). With him terminates the series of caliphs of the race of Ommiyah. The furious Abdallah, uncle of Ibrahim and Abul Abbas, treacherously destroyed almost all the Ommiades by a horrible massacre at a meeting to which they had been inveigled. One of the family, Abderrahman, grandson of Hisham, having taken refuge in Spain, escaped the massacre and founded the independent caliphate of Cordova. See Spain.

Abul Abbas, first of the Abasside caliphs, died young in 754 A.D. (Heg. 136). His brother, Abul Giafane, died. Al Affas ("the Victor of the Victors"), was obliged to contend with a rival in his uncle, Abdallah, whom he, however, overcame. He acquired his surname by his victories in Armenia, Cilicia and Cappadocia. Spain was lost by him, however, as well as Africa. In the year 764 he founded the city of Bagdad on the Tigris, and transferred thither the seat of the caliphate (768 A.D., Heg. 149). He died on a pilgrimage to Mecca, leaving immense treasures (775 A.D., Heg. 158). Mohammed Mahdi, his son and successor, a man of a noble character, had to contend with the turbulent inhabitants of Khorasan under the pretended prophet, Hakeem, and died 785 A.D.; and Musa or Hadi, his grandson, met with the same opposition from the AlI party under Houssain. Hadi’s mother was a strong-minded and ambitious woman, who wished to rule her son, and with him the state, and this led him to try to poison her. She, however, caused him to be smothered before he could effect his purpose.

Abul Abbas had a son, but by his brother Harun (789 A.D.), who was, denominated Al Rashid ("The Upright"), on account of his justice, and is famous for promoting the arts and sciences. He concluded a truce (an actual peace could never be made with Christians) with the Greek empress Irene (789 A.D.), who consented to pay him tribute. Yahya, a member of the house of Ali, disputed with him the possession of the throne, but subsequently submitted. Harun, however, tarnished his reputation by the murder of Yahya, and still more by the murder of his sister, and her favorite, the Barmecide Giafar, and by the expulsion and persecution of the whole family of the Barmecides, whose services to the state and himself had been of very great value. Harun divided the African provinces among his sons, the elder, Hisham, to reign over Egypt, Libya, Syria, Egypt and the rest of Africa: under him Al Mamun was to govern Persia, Turkestan, Khorasan, and the whole East; and Motassem was to rule Asia Minor; Armenia and all the countries on the Black Sea. The younger brothers were to succeed Amin in the caliphate. Thus, in Khorasan, through which Harun was passing in order to quell a rebellion that had broken out in Samarcand, he was arrested by death, of which he had been forewarned by extraordinary dreams (809 A.D., Heg. 190).

Al Amin the Faithful (his proper name was Mohammed) was undeserving of this name. Untrue to his obligations as a ruler, and addicted to all kinds of sensuality, he left the discharge of his duties to his vizier, Fadhel. The vizier, from hatred of Mamun, persuaded the caliph to appoint his brother Thaher as his successor, and deprive Motassem of his portion of territory. A war arose between the brothers. Mamun’s general, Thaher, defeated the armies of the caliph, took Bagdad, and caused Amin to be put to death (813 A.D., Heg. 194).

Mamun was recognized as caliph. Nobler in his inclinations than Amin, he cherished the arts and sciences but, like his brother, he left the government and armies to his ministers. His measures to secure the caliphate to the Alides in order to please his favorite Riza, excited the powerful Abassides to an insurrection. They declared Mamun to have forfeited the throne, and proclaimed Ibrahim caliph, but submitted again, after the death of Riza, when the caliph had changed his sentiments. The vast empire of the Arabs, embracing numerous provinces in two quarters of the globe, could hardly be held under his sceptre. There is but one step, and that an easy one, under a weak sovereign, from a vice-royalty to a kingdom. The wisdom of the former Abassides could only retard this evil; the faults of the latter precipitated it. Even under Harun Al Rashid the Alides had founded an independent empire in Tunisia (800 A.D., Heg. 181), as had likewise the Edrises in Fes. Thaher, having been appointed governor of Khorasan, made himself independent. From him the Thaherides derived their origin. Mamun sent Thomas, a Greek exile, with an army against the Greek emperor, Michael II the Stammerer. Thomas depopulated Asia Minor, and laid siege to Constantinople; but a storm destroyed his fleet (823 A.D., Heg. 207). A second attack on the imperial city was repelled by the aid of the Bulgarians. Thomas was taken prisoner and executed by order of the emperor. A fleet into which the Mussulmans were then divided. Mamun acted with toleration. He died 833 A.D. (Heg. 218). During his government (about 830 a.D., Heg. 215), the African Arabs conquered Sicily and Sardina, where they maintained themselves about 200 years, till the latter island was torn from them by the Pisans in 1016-17, and the former island by the Normans between 1061 and 1090.

Motassem, at first named Billah (by the grace of God). Harun’s third son, built a new city, Samara, 56 miles from Bagdad, and transferred thither his residence. In his wars against the Greeks and rebellious Persians he first used Turkish soldiers. From grief at the death of his private physician, Motassem became insane, and died. In 842 A.D., Al Mamun died.

Vathek Billah, his son, member of the Moazazite sect, exerted himself to promote the advancement of science; but he was an enervated voluptuary, and died of nervous weakness (846 A.D., Heg. 232). A contest for the succession, between his brother Motawakkel and his
CALIPH

son Mothadi, was decided by the already powerful and arrogant Turkish bodyguard in favor of the former, the more unworthy competitor. Under Motawakkel it became more and more customary to carry on all wars by means of Turkish mercenaries. Thus the Arabs were rendered unwarlike and effeminate, as must necessarily be the case in a hot climate with those who do not live in constant activity. Motawakkel manifested a blind hatred of the Avides, not sparing even the memory of the deceased, who in revenge he embittered against the spirit, and a proneness to sensuality and cruelty. His own son, Montasser, trained to early indulgence in all vices, and often barbarously treated by him, conspired against him with the Turkish bodyguards and effected his murder (861 A.D., Heg. 247).

The Turks, who now arrogated the right of electing the caliphs, called the murderer to the throne of the faithful, and compelled his brothers, who were innocent of the atrocious act, and whose names were the caliphate on Mothadi Bilah. One of them, at Cufa, was defeated and put to death; but the other founded an independent empire in Tabristan, which subsisted half a century. The discord of the Turkish soldiers completed the dismemberment of the empire. One party raised to the throne Motaz, second son of Motawakkel, and compelled Mostain to abdicate. Motaz Bilah soon found means to get rid of him as well as of his own brother Muwiaid. He then meditated the removal of the Turkish soldiers; but before he found courage to execute his projects they rebelled on account of their pay being in arrear, and forced him to resign the government. He soon after died (869 A.D., Heg. 255). They called the caliphate on Mothadi Bilah, son of the Calip Vathek, but deposed this excellent prince 11 months after, because he attempted to improve their military discipline.

Under Motawakkel's third son, the sensual Mothadi Bilah, whom they next called to the caliphate, Muafeek his brother succeeded, by his prudence and courage, in overcoming the dangerous preponderance of these Turks. Motamed transferred the seat of the caliphate from Samara back to Bagdad in the year 873 (Heg. 257), where it afterward continued. In the same year, owing to a revolution in the independent government of Khorasan, the dynasty of the Thaherides gave place to that of the Soffarides, who eventually extended their dominion over Tabristan and Segistan. The governor of Egypt and Syria, Achmet Ben Tulun, also made himself independent (877 A.D., Heg. 263), from whom are descended the Tulunides. The brave Muafeek annihilated, indeed, the empire of the Zinghians, in Cufa and Bassora, 10 years after its formation (881 A.D., Heg. 264); but he was unable to save the caliphate from the ruin to which it was continually hastening.

Motamed died soon after him (892 A.D., Heg. 279), and was succeeded by Muafeek's son, Mothadad Bilah. He contended unsuccessfully with a new sect, that had arisen in Iraq, the Carmathians (899 A.D., Heg. 286)—against whom his son, Moktaphi Billah (902 A.D., Heg. 289), was more fortunate. He was still more successful in a war against the Tulunides, as he again reduced Egypt and Syria in 905 (Heg. 292). Under his brother, Moktadair Billah, who succeeded him at the age of 13 years (905 A.D., Heg. 299), rebellions and bloody quarrels between the sovereigns disturbed the government of the empire. He was several times deposed and reinstated, and finally murdered (931 A.D., Heg. 319). During his reign Abu Mohammed Obeidallah rose in Africa, who, pretending to be descended from Fatima, daughter of the Prophet (therefore from Ali), overthrew the dynasty of the Avides in Tunis, and founded that of the Fatimides (910 A.D., Heg. 298). Not satisfied with reigning independent of the caliph, this party, as descendants of the Prophet, asserted themselves to be the only lawful caliphs.

Shortly afterward the dynasty of the Boudies, in Persia, rose to authority and power (925 A.D., Heg. 322), and extended the power of the caliph. The only change was that the Samanides had taken the place of the Soffarides. In a part of Arabia the heretic Carmathians ruled; in Mesopotamia, the Hammadites. In Egypt, which had just been recovered, the Avides, or Abbasides, were called to be a sovereign. From him descended the Akschidites. Kaher Billah, Mothadad's third son, merited his fate, on account of his malice and cruelty. The Turkish soldiers having recovered their power drove him from the throne into exile (934 A.D., Heg. 322), in which he perished five years afterward. Rhadi Billah, his brother, bore the dignity of an emir al omra (*captain of the captain*), with which the exercise of absolute power, in the name of the caliph, was united; and thus the caliph was more and more thrown into the background. The first who was invested with this dignity was Raial; but it was soon torn from him by the Turk Jakan, by force of arms, in the year 939 (Heg. 327). Jakan extended the office to such a degree as to leave the caliph nothing, but the name of his temporal sway, and even assumed the right of determining the succession to the throne. Raial was indemnified by receiving Cufa, Bassora and Irak Arabi as an independent government.

The next caliph, Moktaki Billah, Moktader's son, made an effort to regain his independence by the murder of Jakan; but he was soon compelled by the Turkish soldiers to appoint Touas, another of their countrymen, emir, who made this office hereditary. He formally devised it to a certain Schirzad, but it soon came into the possession of the Persian royal house of the Boudies, whose aid the succeeding caliph, Moktaki Billah, solicited against the tyranny of Schirzad. The first Boudie emir, Mozeddulat, left it as an inheritance to his posterity. Not the caliph but the emir now reigned in Bagdad, though over only a small territory. In every remote province there were independent princes.

To continue the catalogue of the names of those who were henceforward caliphs would be superfluous, for these Mussulman popes had not by any means the power of the Christian. It would be too tedious to trace the branches into which the history of the caliphate is now divided; but we must briefly show the great
changes which the different states and their dynasties have undergone, and which gave rise to the domination of the Ottoman Porte.

During the minority of the Akschidite Ali, the Fatimite Morz Ledinillah, at that time caliph in Tunis, subjugated Egypt in 969 (Heg. 388), and founded Cairo, which he made the seat of his caliphate. There were, consequently, at this time three caliphs—at Bagdad, Cairo and Cordova,—each of which declared the others heretics. But the Fatimites as well as the Abbassides fell under the power of their vassals, and, like them, the Omейyades in Cordova were deprived of all power by the division of Spain into many small sovereignties, till they were entirely subverted by the Moresbesh.

Ilkan, King of Turkestan, having conquered Khorasan, and overthrown the Samanidades, was expelled again by Mahmud, Prince of Gizia, who founded there the dominion of the Gaznevides, in 998 (Heg. 388), who were soon, however, thrown out by the Seljuk Turks under Togrut Beg in 1030 (Heg. 421). Ilkan was an able and valorous leader, conqueror also Charasim, Georgia and the Persian Iran. Called to the assistance of the Caliph Kajem Bemellah, at Bagdad, against the tyranny of the Bouide emirs, he proceeded to Basra and seized the office in 1053 (Heg. 448), by which means the dominion of the Turks was firmly established over all the Musulmans. To his nephew, Alp Arslan (who defeated and took prisoner the Greek Emperor Romanus Diogenes), he left this dignity with so great power that these Turkish emirs al omra were frequently called the Sultans of Bagdad. Turkish princes, who aspired to be sovereigns in the other provinces, were at first satisfied with the title of atabaek (father, teacher), such as the atabeks of Irak and Syria, of Azerbaijan, Farsistan (Persia) and Farsistan. It was the atabeks of Syria and Irak with whom the Crusaders had principally to contend. The first was called Özamededdin Zenghi by the Franks, Zanghi by the Greeks, and the afterward termed sultans. The Caliph of Bagdad was recognized by all as the spiritual sovereign of all Musulmans: his temporal authority did not extend beyond the walls of Bagdad. Nomreddin Zenghi, so often being requested by the Fatimite caliph Aded to protect Bagdad against his vizier, sent to Cairo, in succession, Shirkahu and Salaheddin or Saladin; but the latter overthrew the Fatimites (as schismatic anti-popes), and usurped the authority of Sultan of Egypt in 1170 (Heg. 556) with which he united Syria, after Nomreddin’s death. This is the great Salaheddin, (Saladin), the formidable enemy of the Christians, the conqueror of Jerusalem. The dynasty which commenced with him was called, from his namesake, Ayyouh, the Ayyoubite. They reigned over Egypt till expelled by the Mamelukes in 1250. The Seljuk sultans of Irak were overthrown in 1194 (Heg. 590) by the Charasians; and as those of Khorasan were extinct, there remained of the Seljuk dominions nothing but the empire of Iconium or Roum, in Asia Minor, from which the present Turkish empire derives its origin. See OTTOMAN EMPIRE.

The Charasian Sultans extended their conquests far into Asia, until their territories were invaded by the Tartars under Genghis Khan, in 1220 (Heg. 617). They were finally totally destroyed by his son Octai. Bagdad, also, the remains of the possessions of the caliphs, became the easy prey of a Mongol horde under Holagu, in 1258 (Heg. 630), by the treachery of the vizier Al Kami, and a slave, Amram, under the 50th caliph Motazem. The nephew of the cruelly murdered Motazem fled to Egypt, where he continued to be called caliph under the protection of the Mamelukes, and bequeathed the Mohammedan popedom to his posterity. When the Turks conquered Egypt, in 1517, the last of these nominal caliphs was carried to Constantinople and died, after returning to Egypt in 1538. The Turkish Sultans subsequently assumed the title of caliph, and have retained it to the present day, with the claim of spiritual supremacy over all Mussulmans, though this claim is little regarded outside his own dominions, and strongly disputed by the Persians. Consult Muir, Sir William, ‘Annals of the Early Caliphate’ (London 1853); id., ‘The Caliphate: Its Rise, Decline and Fall’ (ib. 1891); Syed Ahmed Ali, ‘A Short History of the Saracens’ (New York 1889); Lane-Poole, S., ‘The Mohammedan Dynasties’ (London 1894); Weil, ‘Geschichte der Chalifen’ (5 vols., Mannheim and Stuttgart 1840-62).

CALIPUS, a Greek astronomer, who was the first to discover the inaccuracy of the golden number or period invented by Meton, and attempted to remedy it by the invention of a new cycle of 76 years, being only six hours less than the quadruplet of Meton’s period. It commenced 331 B.C., and being accepted particularly by astronomers in giving the date of their observations, is frequently mentioned by Ptolemy. Though more perfect than Meton’s period, it was shown to be inaccurate by Hippocrates, who substituted for it a cycle of 345 years.

CALISAYA BARK, the yellowish bark of Cinchona Calisaya (q.v.).

CALISTHENICS, or CALLISTHENICS, the art of promoting gracefulness, strength and health by means of the lighter forms of gymnastic exercise. See GYMNASTICS.

CALIVER, an early form of hand-gun, musket or arquebuse, lighter and shorter than the original musket, fired without a rest and much more rapidly. It seems to have gone out of fashion about 1630. Its name is derived from the fact that the bore was of uniform calibre, so that a common supply of bullets might be used by an entire company.

CALIXTINES, ka-likes’tins, or UTRAQUISTS, a sect of the Hussites in Bohemia (q.v.), who differed from the Roman Catholics principally in giving the cup in the Lord’s Supper to laymen, from which circumstance they got their name, derived from the Latin calix, “a cup.”

CALIXTUS, the name of several popes.

1. The first of this name, a Roman bishop, was the 7th pope (217 to 229, or from 218 to 223), when he suffered martyrdom according to some accounts.

2. Guino, son of Count William of Burgundy, archbishop of Vienne, and papal legate in France, was elected in 1119, in the monastery of Clugny, successor of the expelled Pope, Gelasius II, who had been driven from Italy by the Emperor Henry V, and had died
in this monastery. In the same year he held councils at Toulouse and at Rheims, the latter of which was intended to settle the protracted dispute respecting the right of investiture. As the Emperor Henry V would not confirm an agreement which had been made on the subject, Calixtus repeated anew the excommunion which he had already pronounced against him when legate in 1112. He excommunicated also the anti-pope, Gregory VIII, and renewed former decrees respecting simony, lay investiture, and the marriage of priests. Successful in his contest with the Emperor on the subject of investiture, by means of his alliance with the rebels in Germany, in particular with the Saxons, he made his entrance into Italy in 1120, and with great pomp into Rome itself; took Gregory VIII prisoner in 1121, and banished him to a monastery. He availed himself of the troubles of the Emperor to force him, in 1122, to agree to the Concordat of Worms. After an energetic pontificate he died at Rome in 1124. Calixtus III, chosen in 1168 in Rome as anti-pope to Paschal III, and confirmed by the Emperor Frederick I in 1178, was obliged to submit to Pope Alexander III. As he was not counted among the legal popes, a subsequent one was called Calixtus III. This was a Spanish nobleman, Alfonso Borgia, counsellor of Alfonso, King of Aragon and the Sicilies. He was made Pope in 1455. He was at this time far advanced in life, but equalled in policy and energy the most enterprising rulers of the Church. He appointed an ecclesiastical commission to reconsider the case against Jeanne d’Arc, and its decision was that she died a martyr to her faith, her king and her country. In order to appease the displeasure of the princes and nations occasioned by the proceedings of the councils of Constance and Basel, he instigated them to a crusade against the Turks. His intention was counteracted in Germany by the discontent of the states of the empire with the Concordat of Viretta, which he had already signed. By the appeals of the universities of Paris and Toulouse against the title for the Turkish war, King Alfonso, moreover, was indignant at the refusal of the Pope to acknowledge his natural son Ferdinand as king of Naples.

Calixtus (properly Callisen), Georg, gâr'îg, German clergyman, the most able and enlightened theologian of the Lutheran Church in the 17th century: b. Medelbye, Schleswig, 14 Dec. 1586; d. 19 March 1656. In 1609 he visited the universities of the south of Germany; in 1612 those of Holland, Britain and France, where his intercourse with the different religious parties which had already produced the Thirty Years War, had already developed the independence and liberality of opinion for which he was distinguished. In 1614 he was made professor of theology at Helmstedt, and he held this post till his death. He was the author of the Holy Scriptures, transubstantiation, celibacy, supremacy of the Pope, and the Lord’s Supper belong, even according to the judgment of learned Roman Catholics, to the most profound and acute writings against Roman Catholicism. But his erudition and historical knowledge exposed him to the persecutions of the zealots of his time. His assertion that the points of difference between Calvinists and Lutherans were of less importance than the doctrines in which they were agreed, and that the doctrine of the Trinity was less distinctly expressed in the Old Testament than in the New, and his recommendation of good works, so far as they were nearly, a the research of hereafter. He made Christian morality a distinct branch of science, and, by reviving the study of the Christian fathers and of the history of the Church, prepared the way for Spener, Thomasius and Semler. Commut Hunte, E. L., "Calixtus and the Thirty Years War" (Halle 1856–57); Dowding, W. C., ‘German Theology during the Thirty Years War’; ‘The Life and Correspondence of G. Calixtus’ (London 1863).

Calking, kök'îng, the process of driving tarred oakum into the seams between the planks of ships, in order to render the joints water-tight. A wisp of the oakum is drawn out and rolled together between the hands, and, being laid over the seam, is driven by a wedge-shaped instrument called a calking iron. The work is afterward gone over with a more powerful instrument of the same kind, which is held by one man and struck with a beetle held by another. When all the oakum is forced in that is practicable, the seams are payed over with melted pitch, and where they are to be covered with copper, a thread of spun yarn is laid in to make them flush with the planks.

Calking, Franklin Welles, American author: b. Iowa County, Wis., 5 June 1857. He was an early explorer of parts of Black Hills of South Dakota and made acquaintance with many Indian tribes. His studies of bird and animal life have given him rank as a naturalist. He was educated for the law and had practice in counsel; also had experience as ranchman and railway contractor. He began writing for The Youth’s Companion at 22 years of age and has been one of the chief contributors to that magazine for 35 years; is author of a number of syndicate serials which have been running in various magazine sections of newspapers for 30 years, and contributes to many periodicals: author of Tales of the Air, (1883); The Cougar-Tamer (1899); My Host the Enemy (1901); Two Wilderness Voyagers (1902); ‘The Wooing of Tokala’ (1907).

Calking, Gary Nathan, American scientist: b. Valparaiso, Ind., 18 Jan. 1869. He was graduated at the Massachusetts Institute of Technology in 1890. He received the degree of Ph.D. at Columbia in 1898. In 1900 he became instructor in zoology at Columbia University; adjunct professor of zoology 1902; professor of protozoology 1909. He was biologist of the New York State Cancer Laboratory 1904–08; president of the American Association for Cancer Research 1913–14; and is vice-president of the Society of Experimental Biology and Medicine. He has published ‘The Protozoa’ (1901); ‘Protozoology’ (1909); also numerous scientific papers.

Calking, Mary Whiton, American psychologist, educator and author: b. Hartford, Conn., 30 March 1863. She studied at Smith College and at Clark and Harvard universities and from 1905 was assistant professor of philosophy and psychology at Wellesley College. Her published works include ‘Introduction to Psychology’ (1910);
CALKINS—CALLAO

State. He projected and built the third railroad in the United States, from Tallahassee to Saint Marks, and also located the town of Port Leon, which was afterward destroyed by a cyclone. He always considered himself a Jackson democrat, as opposed to later democracy. Feeling that he had fought on Jackson's side for every inch of ground from Tennessee to the peninsula, he regarded himself as one of the builders of the nation, and during the Civil War was one of the few men in the South that looked on secession as treason. On 12 Feb. 1861, he wrote a long letter to John S. Littell of Pennsylvania, deploring secession, but defending slavery. See also CALL, WILKINSON, nephew of the preceding.

CALL, Wilkinson, American lawyer and politician: b. Russellville, Ky., 1834; d. 1910. Early in life he removed to Florida where he was admitted to the bar. He entered the Confederate army in the Civil War and attained the rank of adjutant-general. In 1865 he was elected to the United States Senate, but was not permitted to take his seat. He was again elected in 1879 and served thereafter for 18 years.

CALLA, a genus of plants of the Arum family, containing a single species, growing in bogs in Europe, Asia and eastern North America. The plant commonly cultivated under the name of calla is Zantedeschia aethiopica.

CALLAHAN, James Morton, American publicist: b. Bedford, Ind., 4 Nov. 1864. He was graduated at the University of Virginia in 1884 and completed the work for the doctorate at Johns Hopkins in 1897. He was engaged in historical research (at Washington, D. C.) and lecturer on American diplomatic history at Johns Hopkins University 1898-1902, and since 1902 professor of history and political science, West Virginia University. He has written 'Neutrality of the American Lakes' (1898); 'Cuba and International Relations' (1899); 'American Relations in the Pacific and the Far East' (1901); 'Diplomatic History of the Southern Confederacy' (1901); 'The American Expansion Policy' (1908); 'Seward's Mexican Policy' (1909); 'History of West Virginia' (1914); and various monographs and encyclopedia articles. Editor of 'West Virginia University Studies in American History'; Historian of Semi-Centennial Commission of West Virginia, 1913.

CALLAO, kāl-yā'o, Peru, seaport city, capital of Callao province, on Callao Bay, seven miles by rail, steam and electric, west of Lima. The spacious harbor affords safe anchorage, making Callao the principal port of the country; defended by three forts and sheltered southward by San Lorenzo Island, nine miles in circumference, and rising 600 feet above sea level. An earthquake and tidal wave destroyed the early city in 1746 and the modern city is three-quarters of a mile from the original site. The city itself is uninteresting, and the climate unhealthy. Business centres around the harbor, which is modern in every respect, with concrete piers, floating dock, gas and electric lighting, steam. In 1890, 1,100 vessels of 2,672,000 tonnage entered and cleared the port annually. Callao has lumber,
CALLAWAY — CALLENDER

iron and sugar manufacturing industries; exports sugar, minerals, cotton, hides, bone, cocoa, wool, etc., to the value of over $7,350,000 annually, and imports coal, beer and manufactured articles valued annually at about $13,434,250. Callao dates from early Spanish times; in 1624 it was besieged unsuccessfully by the British pirate, Clark, who died there. Incorporated as a town in 1671; it was submerged with all its inhabitants during the earthquake of 1746, and when the sea is calm, the ruins are still distinguishable under water. The harbor saw the naval victory of the independent Chileans in 1820 over the Spaniards who surrendered Callao, their last foothold in Peru, the following year. Callao suffered volcanic disasters in 1825 and in 1868. In 1866 it was bombarded by a Spanish fleet and in 1890 by the Chileans who took possession the following year. It was restored to Peru by the treaty of 1883. Pop. 32,000.

CALLAWAY, Morgan, American educator; b. Cuthbert, Ga., 3 Nov. 1862. He was educated at Emory College, Ga., and at Johns Hopkins University, and has been professor of English in the University of Texas from 1890. He has published 'The Absolute Participle in Anglo-Saxon' (1889); 'The Appositive Participle in Anglo-Saxon' (1901); 'The Infinitive in Anglo-Saxon' (1913); and contributions to reviews.

CALLAWAY, Samuel Rodger, American railroad president; b. Toronto, Canada, 24 Dec. 1850; d. New York, 1 June 1904. At the age of 14 he entered the employ of the Grand T. Railway and later was in the service of the Canadian Express Company, and Great W. Railway. His rapid progress thereafter may be summarized as follows: in 1875 he became superintendent of the Detroit and M. Railroad; in 1880, manager of the Chicago and G. T.; in 1884, vice-president of the Union P. and allied lines of nearly 6,000 miles; president of the Toledo, Saint L. and K. C. Railroad, 1887-95; president of the Lake Shore and M. S., 1897-98; president of the New York C. and H. R. Railroad, 1899-1901. He was regarded as one of the busiest railroad managers in the United States. From 1901 he was president of the American Locomotive Company.

CALLCOTT, kol'kot, Sir Augustus Wall, English painter; b. Kensington, 20 Feb. 1779; d. there, 25 Nov. 1844. He studied portrait-painting under Hoppner, but soon discovered that his genius lay in another department of art, and was so successful in his delineation of landscape, that in 1807 he was elected an associate of the Royal Academy. In 1837 he was knighted, and in 1843 was appointed keeper of the royal collections of pictures. He suffered much from ill health for many years before his death. Callcott excelled in the delineation of coast scenes, and, like Turner, has been called the "Modern Claude." Examples of his paintings are 'The Mouth of the Tyne' (1820); 'Entrance to the Pool of London' (1816); and 'Milton Dictating to his Daughters' (Leeds).

CALLCOTT, John Wall, English composer, brother of Augustus Wall (q.v.); b. Kensington, 20 Nov. 1766; d. near Bristol, 15 May 1821. He at first intended to become a surgeon, but abandoned the intention, and devoted himself to music. In 1785 he competed for the prizes of the Catch Club, and gained three out of four gold medals. In the following decade the same club awarded him 20 medals. In 1790, when Haydn arrived in England, he studied under him, and the same year obtained from Oxford the degree of musical doctor. In 1805 he published his 'Musical Gram- mar'; and in 1806 was preparing to deliver lectures on music at the Royal Institution when his mind gave way, and he never completely recovered, although his insanity left him on one occasion for three years. He ranks among the most eminent of English composers, and was especially celebrated for his glee compositions. His best works were published in two volumes by his son-in-law, Mr. Horsley, in 1824.

CALLEJA DEL REY, kal'-ya-ha del ra. Félix María, Spanish general; b. Medina del Campo 1750; d. Cadiz 1820. He distinguished himself in Mexico by quelling the insurrection instigated in 1810 by Hidalgo, who was on the point of seizing the city of Mexico, when Calleja was charged by the viceroy, Venegas, to oppose his progress. After the death of Hidalgo, in which both parties strove to surpass each other in a display of cruelty and brutality, Calleja succeeded in defeating Hidalgo's army, and on 2 Jan. 1812, he took possession of the principal fortress Zitaquaro, and massacred the inhabitants. Hidalgo, who fell near Guadalajara, was succeeded by the priest, Morelos, who defended Cuautla Amilpas against the attack of Calleja with great bravery until 2 May 1812, when famine forced him to surrender. Calleja again signalized his victory by acts of barbarism, and was rewarded for his zeal, 4 March 1813, by the appointment of viceroy, in which capacity he continued to alienate the feelings of the Mexicans by his relentless rigor. The priest, Morelos, fell into his hands and was shot, 22 Dec. 1815. Subsequently he promulgated an amnesty, but as he was unable to restore peace to the distracted country, he was recalled. On his return to Spain he was created Conde de Calde- ron, and in January 1820, while preparing to sail from Cádiz to Paraguay, his troops having mutinied, he was captured and remained prisoner in the fortress of the Isla de León until the insurrection was quelled by Ferdinand VII, when he died, soon after having recovered his liberty.

CALLENDER, Hugh Longbourne, English physician; b. Hatheron 1863. A student of Trinity College, Cambridge, since 1902 he is professor of physics at the Imperial College of Science, London, having previously held a similar position at McGill University, Montreal 1893-98, and at University College, London, 1898-1902. He is author of 'Law of Conden- sation of Steam' (1898); and 'The Imperial College of Science' (London 1904).

CALLENDER, James Thomas, American publicist; b. Scotland; d. 1813. He came to Philadelphia as a refugee from England in 1790 having been exiled for his pamphlet 'The Political Progress of Great Britain.' He published, in America, 'The American Register, and was editor of the Richmond Recorder. He wrote 'Sketches of the History of America'; 'The Prospect Before Us.'
CALLENDER, John, American historian and Baptist minister: b. Boston, Mass., 1706; d. Newport, R. I., 26 Jan. 1748. He collected many valuable papers relating to the Baptists in America; and published 'A Centennial Discourse on the Civil and Religious Affairs of the Colony of Rhode Island' (1739), which was the only history of that State for more than a century. The State Historical Society revived it, with notes by Rev. Romeo Elton (1838), and a memoir of the author.

CALLET, kā-lā, Antoine François, French historical painter: b. Paris 1741; d. Paris 1823. He obtained the grand prize in 1764 for a painting entitled 'Biton and Cléobis dragging the chariot of their mother to the temple of Herē.' This picture was purchased by the Academy. Among his noted paintings are 'Winter Saturnalia,' 'The Festival of Bacchus,' 'Summer,' 'Spring' (all four in the Louvre), 'Battle of Marengo,' 'The First Consul entering Lyons,' 'The XVIIIth Bruiney and Nepotism,' 'The Marriage of Napoleon and Marie-Louise,' 'Capitulation of Ulm,' 'Battle of Austerlitz.' Callet was one of the best decorative painters of his day, and became a member of the Academy in 1780. He painted three portraits of Louis XVI, one each of Louis XVIII and the Comte d'Artois and Comte de Vergennes, then Minister of Foreign Affairs, and several other portraits now in the Louvre.

CALLET, Jean François, French mathematician and educationalist: b. Versailles, 25 Oct. 1744; d. Paris, 14 Nov. 1798. He completed his studies at Paris in 1768, and in 1779 gained the prize which the Academy of Arts at Geneva had offered for escarmouche in watches. In 1788 he was appointed professor of hydrography at Vaneu and shortly after obtained the same appointment at Dunkirk. He was afterward professor in the school of geographical engineers, Paris. He is best known by his 'Tables of Logarithms.' He was also one of the first to propose a regular telegraphic code for commercial purposes, using the word 'telegraphic' in the French sense.

CALLERY, Walter, American Baptist clergyman: b. Dover, Del., 19 Aug. 1858. A graduate of Crozier Theological Seminary at Upland, Pa., he was ordained to the ministry in 1880 and after holding pastorates at Bethelhem, Pa., 1880-82; 18 high Avenue Church, Philadelphia, Pa., 1882-91; Emmanuel Church, Cambridge, Mass., 1891-93; Tabernacle Church, Boston, 1893-1902; Upland, 1903-09, in the latter year he became pastor of the First Church, Jamaica Plain, Boston. He specialized in sociology and pedagogy, was one of the founders of Prospect Union, an affiliation of Harvard Union for the education of workingmen, was general secretary of the Baptist Young People's Union of America, and managing editor of the official magazine Service 1902-05.

CALLICRATES, Greek architect of the 5th century B.C. He was a contemporary of Ictinus and with him erected the Parthenon at Athens.

CALLICRATIDAS, a Spartan, succeeded Lyonsard in the command of the Lacedaemonian fleet against the Athenians, in 406 B.C. He defeated Conon at Mitylene, captured the fleet of Diomedon, and was afterward himself defeated by the Athenians at Arginusae, where he was drowned.

CALLIÉRES, kā-b-yār', BONNEVUE, Louis Hector, Chevalier de, French colonial administrator: b. France 1639; d. Quebec, 26 May 1703. He was governor of Montreal in 1664, and impressed on the French government, during a special visit to France, the necessity of capturing New York so as to maintain French supremacy in Canada. He had previously led a division of the French and Indian forces which in 1697 unsuccessfully attacked the Five Nations in New York State. In 1699 he became governor-general of Canada, succeeding Frontenac, and was the founder of Detroit, Mich.

CALLIGONUM, a genus of shrubs belonging to the Polygonaceae. They are leafless plants, with small flowers, branches jointed, dichotomous, and the fruit a large, four-cornered nut. The root of C. Pallida, a leafless shrub found in the Mediterranean, furnishes from its roots, when pounded and boiled, a gummy, nutritious substance like tragacanth, on which the Calmucks feed in times of scarcity, at the same time chewing the acid branches and fruit to allay their thirst.

CALLIMACHUS, Greek architect and sculptor: d. Athens 366 B.C. He adorned the Corinthian capital and designed the mystic golden lamp which shed perpetual light on the Erechtheum. Consult Gardner, W., 'Handbook of Greek Sculpture' (London 1911).

CALLIMACHUS, Greek poet and grammarian: b. Cyrene, about 310 B.C.; d. about 240 B.C. He opened in Alexandria a school of grammar, that is, of the belles-lettres and liberal sciences, and could boast of several scholars of distinguished attainments, such as Eratosthenes, Apollonius Rhodius, Aristophanes of Byzantium and others. Ptolemy Philadelphus presented him with a place in the museum and gave him a salary, as he did other men of learning. After the death of Philadelphus, he stood in equal favor with Ptolemy Euergetes. Under these circumstances he wrote most of his works, the number of which was, according to him, over 800. With the exception of some fragments, we have of these only 64 epigrams and six hymns. His works in prose include the 'Tablets' in 120 books (a critical bibliography); 'Memorabilia'; 'Causae' (4 books); in poetry, the best known is his 'Hecale,' which Ovid used in his 'Philémon et Baccis.' In 1893, research in Egypt uncovered some 50 verses of this poem, which are published in Gomera, 'Neue Bruchstücke aus der Hekale des Callimachos' (Vienna 1893). His poem on the hair of Berenice has been preserved in the Latin adaptation of Catullus ('De coma Berenices'). 'Callimachus' poems bear the stamp of their age, which sought to supply the want of natural genius by a great ostentation of learning. Instead of noble simple grandeur, they exhibit an overcharged style, a false pathos and a straining after the singular, the antiquated, the learned. His elegies are mentioned by the ancients with great praise and served Propertius as models. The best editions of the hymns and epigrams are those of Meineke (Berlin 1861); Schneider 1870-73; Wilkomowitz (Berlin 1897). Consult also Kenyon, 'Recent Greek Literary
CALLINGER—CALMETTE

CALLINGER, an ancient hill fort and town in India. See KALINJAR.

CALLINUS OF EPHESUS, the earliest Greek elegiac poet, flourished probably about 700 b.c. Only one elegy and a few fragments are extant; these have been edited by several scholars, among them Bergk, in the ‘Poetic Lyric Greek’ (Leipzig 1878). Consult also Wright, ‘A Short History of Greek Literature’ (New York 1907).

CALLIOPE, käl-hô-pê. (1) In Greek mythology, one of the Muses (q.v.) She presided over eloquence and epic poetry. She is said to have been the mother of Orpheus by Apollo. She was represented with an epic poem in one hand and a trumpet in the other, and generally crowned with laurel. (2) An asteroid (No. 22). It was discovered by Hind on 16 Nov. 1852. (3) A musical instrument, consisting of a series of steam whistles, pitched to proportions of the scale, and grouped together and operated by a keyboard.

CALLIOPE HUMMING-BIRD. See HUMMING-BIRD.

CALLISTHENES, Greek historian: b. Olynthus, about 365 B.C.; d. 328. He was a nephew and pupil of Aristotle, and was appointed to attend Alexander the Great in his expedition against Persia. His republican sentiments roused him until for a courtier, but his unpardonable crime was his opposition to the assumption of divine honors by the conqueror. On a charge of treason he was put to death, by what method historians are not agreed. Of several historical works written by him only fragments remain. A work on Alexander was once thought to be his, but it has since been proved to be of later date. Consult Christ-Schmid, ‘Geschichte der griechischen Litteratur’ (Vol. II, Munich 1911).

CALLISTO, in Greek mythology, a nymph of Artemis, daughter of Lycaon, King of Arcadia. According to the modern prevalent story of this maiden, Zeus loved her, and her son Arcas was hid in the woods, and preserved, while she was changed by the jealousy of Hera into a bear. Zeus placed her, with her son, among the stars, as the constellation of the Great Bear. Arcas became the ancestor of the Arcadians.

CALLISTRATUS, Athenian orator: b. about 400 B.C.; d. 361. In 377 B.C. he played an active part in the movement for the formation of a new Athenian League. His eloquence is said to have fired the imagination of the youthful Demosthenes. For his Spartan sympathies he was condemned to death by the Athenians, and on his return from exile in Macedonia was actually executed.

CALLOT, Jacques, French etcher: b. Nancy 1592; d. there 1635. He overcame many obstacles to his study of art, twice running away from his parents. He went to Italy, learning from Rubens how to give himself up entirely to his love for engraving, and became famous for his etchings. He studied with Parisi at Florence and served at the court at Tuscany. In the space of 20 years he designed and executed about 1,600 pieces, most of them, except sacred subjects, representations of battles, sieges, dances, festive processions, etc. The ‘Misères et malheurs de la guerre,’ in 18 pieces, may be mentioned as a remarkable series. He executed works of this kind for Cosmo II of Florence, Louis XIII of France and the Duke of Lorraine. His ‘Pair’ and his ‘Beggars’ are called his best pieces. He was the first who used in his etchings a grey tone — the vernice grossa dei lignanuoli of the Italians; and was the first to make etching an independent art. He was distinguished for his piety, magnanimity and regularity of life. Consult Mâeume, ‘Recherches sur la vie et les ouvrages de J. Callot’ (Paris 1860), and Green, J. H., ‘A Catalogue and Description of the Works of the Celebrated J. Callot’ (London 1804).

CALLUNA. See Heather.

CALLUS, an abnormal hard growth, either carneous or osseous. The new growth of bony substance between the extremities of fractured bones, by which they are united, is an instance of the latter. External friction or pressure produces the former, as in the hands of laborers and the feet of persons who wear ill-fitting shoes. A temporary or provisional callus is a flange of callus formed on the ends of broken bones which move freely upon one another and separate widely; and acts as a splint would. When the amount of callus is excessive, permanent injury may result to neighboring structures since nerves and tendons may be included or a joint rendered useless. Surgical operation is sometimes necessary under these conditions. See Corn.

CALMET, kal-mâ’, Augustin, French exegetical and historical author: b. Mesnil-la-Horgne, near Toul, France, 26 Feb. 1672; d. Paris, 25 Oct. 1757. He entered the order of Saint Benedict in 1698, and became the head of several abbeys in succession. In 1698 he became teacher of philosophy and theology in the abbey of Moyen-Moutier; in 1704, subprior of a convent of learned monks at Münster in Alsace; and in 1706 he went to Paris to undertake the publication of his commentary on the Bible. He afterward became (1715), abbot of Saint Leopold in Nancy (1718), abbot of Senones in Lorraine (1728). He was an industrious compiler of voluminous works. Among them are ‘Commentary on the Old and New Testaments’ (23 vols., Paris 1707–16); ‘Historical and Critical Dictionary of the Bible’ (4 vols., Paris 1722–28); and ‘Ecclesiastical and Civil History of Lorraine’ (4 vols., Nancy 1728; 2d ed., 6 vols., 1745–47). For his life consult Fangé (Senones 1766); Didot, A., (Nancy 1861); for his correspondence, Guillaume, P. E. (Nancy 1875).

CALMETTE, Gaston, French journalist: b. Montpellier 1858; d. Paris, 16 March 1914. As editor of the Figaro from 1903, and noted for his fearlessness in attacking his political opponents, regardless of consequences, he was shot and killed by Mme. Caillaux, wife of Joseph Calmette, M. himself being former Premier, whose private correspondence, obtained surreptitiously, Calmette had threatened to publish. Calmette was a chevalier of the Legion of Honor, and had been decorated with the grand cross of the order of Charles III by the King of Spain.
CALMON, kil-mōn', Marc Antoine, French political economist: b. Tarnies, Dordogne, 3 March 1815; d. Paris, 13 Oct. 1890. In 1845 he became undersecretary of State in the Department of the Interior, and in December 1872 prefect of the Department of the Seine. He entered the National Assembly as life member in 1875, but will be longest remembered for his writings on political economy, which include "Les impôts avant 1790" (1863); "William Pitt, étude financière et parlementaire" (1865); "Histoire parlementaire des finances de la Restauration" (1868-70); "Études des finances de l'Anatolecque depuis la réforme de Robert Peel, jusque en 1869" (1870); "Histoire parlementaire des finances de la monarchie de Juillet" (4 vols., 1899). He edited Thiers' "Discours parlementaires" (15 vols., Paris 1879-83).

CALMON DU PIN E ALMEIDA, Miguel, Brazilian statesman: b. Santa Amara, Bahia, 22 Dec. 1796; d. Rio de Janeiro, 5 Oct. 1865. He entered the Constituent Assembly in 1822, was senator in 1840, Prime Minister in 1840 and again in 1843 and resided in Europe as special envoy 1844-47. He was created viscount in 1849 and Marquis of Abrantes in 1854.

CALMS, Region of; or, Zone of, tracts in the eastern Atlantic and eastern Pacific oceans on the courses of the tradewinds, where calms of long duration prevail. This region is not the same all the year through, but follows the course of the sun, and lies farther north or farther south according to the hemisphere in which the sun happens to be. About the winter solstice its average northern limit is in lat. 5° N., and in the months about the summer solstice its average northern limit is about 12° N. lat. The southern limit lies nearly always to the north of the equator, varying between lat. 1° and 3° N.; but it is sometimes, though rarely, so far south as lat. 1° or 2° S. During the months following the winter solstice its average breadth is four degrees, while in the months following the summer solstice it is about six degrees, and it is much more especially on the northern margin of this region, but even there, there is an occasional light breeze, but not sufficient to fill the sails. The climate of this region is extremely unpleasant, for the atmosphere is moist and foggy, and the sky generally overcast and gloomy, and the heat is intense and unvarying. Almost every day there occurs a violent storm of thunder and lightning, accompanied by sudden blasts of wind, and by rain which falls in regular streams for hours together. On this account the region is dangerous to navigators. To increase these dangers there is between lat. 4° and 10° N., and long. 18° and 23° W., a tract of considerable extent, which seamen call the "rainy sea," and which, with only rare intervals of calm, is visited by almost constant storms of thunder and lightning, and violent falls of rain, from which it is very difficult for a sailing vessel to make its escape.

CALMUCKS. See Kalmucks.

CALOCHORTUS, a genus of plants of the lily family, containing about 50 species, natives of western North America. They are known as Mariposa lilies, star tulips and globe tulips. The plants have narrow leaves and showy, tulip-like, white or pale or bright yellow flowers, often spotted with darker colors. Many of the species are frequent in cultivation.

CALOMARDE, kā-lo-mär'de, or CALOMARDA, Francisco Tadeo (COUNT OF ALMEIDA), Spanish statesman: b. Villal, Aрагón, 1775; d. Toulouse, France, 1842. He studied law, entered political life and sustained the national cause in resistance to Napoleon. In 1814 on the return of Ferdinand VII, Calomarde was made chief secretary of the Department of Indian Affairs. Here he was convicted of bribery and banished to Toledo and afterward to Pamplona. In 1815 he held a similar post in the Ministry of Justice, and was made chief secretary of the American Order of Isabella the Catholic. In 1823 he received the appointment of secretary to the regency, and subsequently an important office in the royal household, and he was appointed Minister of Justice. He organized the corps of royalist volunteers, recalled the Jesuits, reopened the convenuts and closed the universities. Ferdinand VII decorated him with the order of Charles II, and on the birth of Isabella he became Knight of the Golden Fleece and, by order of the King of Naples, Duke of Santa Isabel. He established the King's Order of Charles IV, admitting women to the succession. In 1832, when Ferdinand's death was supposed to have taken place, Calomarde was the first to bend his knee before Don Carlos. The King recovered physically, but lingered in a semi-idiotic condition; of this Calomarde took advantage, by extorting from his signature to the act of 31 Dec. 1832, reintroducing the Salic law, by which Ferdinand abdicated in favor of Don Carlos instead of the Infanta Isabel. When Ferdinand revealed this fraudulent proceeding Calomarde was banished to Aragon, and later avoided imprisonment by escaping to France in disguise. Here he passed the rest of his days in obscurity.

CALOMEL, the sub-chloride, or "mild" chloride of mercury, HgCl (or Hg₂Cl₂), known to chemists as "muriatic," known to physicians as "mercuric chloride," and distinguished from it by corrosive sublimate, HgCl₂, which is known as "mercuric chloride." It is prepared by adding an alkaline chloride to a solution of a mercuric salt, usually the nitrate. The precipitate is thoroughly washed to remove the last remaining trace of the unchanged alkaline chloride. In the use of calomel as a medicine particular attention should be given to its liability to generate corrosive sublimate by decomposition. This effect may be produced by bitter almonds or cherry-laurel water, or any other substance containing hydrocyanic acid, being administered simultaneously with it. Nitro-muriatic acid produces the same effects, as also, to some degree, the chlorides of potassium, sodium and ammonium. If there is any possible chance of its adulteration with corrosive sublimate, it may be tested by shaking a sample with a little alcohol and dipping a knife blade in the solution. The presence of even so minute a proportion of corrosive sublimate as 1/500 of 1 per cent will produce a blackening of the steel blade. It is rendered ineffectual by the alkalies and alkaline earths. Calomel is regarded as the most valuable of the mercurial preparations, though some medical innovators reject it. It is employed as a purga-
tive, operating chiefly upon the liver by stimu-

lating its secretory functions. Being slow in its
action, and liable to salivate if too long
retained, it is usually administered with some
saline cathartic. It is also given as a remedy
for worms and as an alternative in derangement
of the liver. Calomel occurs native in Spain,
Bohemia, Serbia, Mexico and elsewhere, in the
form of tetragonal crystals white in color (or
nearly so) with a hardness of from 1 to 2
and a specific gravity of 6.48. In this form it
is known to miners as horn-quicksilver.

CALONNE, kā-lōn, Charles Alexandre
de, French statesman: b. Douai, 20 Jan. 1734;
in 1783 as Comptroller-General of the Finances.
In this office he continued till 1787. During
this period he maintained the public credit by a
punctuality till then unknown in the payments
of the royal treasury, though he found it
drained to the lowest ebb. He labored with
unwearied assiduity to restore the equipoise
between the annual income and expenditure,
and to provide a supply for the emergencies of
the state, without increasing the burdens of the
people. For this purpose he advised the King
to re-establish the ancient usage of convening
national assemblies of the "notables," to whom
he proposed the bold project of suppressing
the pecuniary privileges and exemptions of the
nobility, clergy and magistracy. This measure
alarmed those powerful bodies, and Calonne
found it necessary to retire to England, where
he wrote two defenses of himself—his 'Petition
to the King' and 'Reply to Necker.' On
the breaking out of the Revolution he supported
the Royalist party with much zeal, both by his
pen and his journeys to various countries of
Europe on their account. Consult Susane, 'La
tactique financière de Calonne,' with bibliog-
raphy (Paris 1902).

CALOPHYLLUM, a genus of trees be-
longing to the family Gutiferaceae, and natives
of warm climates. They have large shining
leaves and showy transverse parallel veins.
Some of the species yield excellent timber.
C. inophyllum affords a medical resin, the taca-
mahac of the East Indies. The seeds yield
dombia oil, which is used for burning, for
making ointment, etc. C. calaba is a West Indian
species whose oil is used for illuminating
purposes.

CALORESCE, the phenomenon of the
transmutation of heat rays into light rays;
a peculiar transmutation of the invisible calorific
rays, observable beyond the red rays of the
spectrum of solar and electric light, into visible
luminous rays, by passing them through a solu-
tion of iodine in bisulphide of carbon, which
intercepts the luminous rays and transmits the
calorific. The latter, when brought to a focus,
produce a heat strong enough to ignite com-
bustible substances, and to heat up metals to
incandescence, the less refrangible calorific
rays being converted into rays of higher re-
frangibility, whereby they become luminous.
Tyndall first described it in the book men-
tioned below. See also FLUORESCENCE. Consult
Tyndall, T. "Heat a Mode of Motion" (New
York 1905).

CALORIC (Latin calor, "heat"), a name
formerly given to a hypothetical, impondera-
ble substance of gaseous form, whose existence
was postulated in order to explain the observed
phenomena of heat. It is not known whether this
substance exists, and the word is now practi-
cally obsolete, except as an adjective in such
expressions as "caloric effect," "caloric engine," etc.,
where it stands for the words "thermal" or
"heat," though sometimes in a special sense.
For a statement of the theory of caloric
and caloric theory, consult Metcalfe's 'Caloric'
(2 vols., Philadelphia 1859). See also HEAT;
THERMODYNAMICS.

CALORIE, or CALORY, the unit of
heat in the c. g. s. system; being the amount of
heat necessary to raise the temperature of a
kilogram of water one degree Centigrade, or
from 4° to 5° C. In ultra-scientific researches
the calorie is determined by taking 1/100 part
of all the heat required to raise 1 gram of
water from 1° to 100° C. It is used as a
standard of heat by physicists as the term
"foot-pound" is employed as the unit of energy.
It is also known as the "greater calorie," to
distinguish it from the "small calorie," in
which the unit of mass is the gram instead of
the kilogram. Its mechanical equivalent is
4.187 joules, that being the amount of energy
which disappears when one calorie of heat is
developed. See CALORIMETRY.

CALORIMETER, The Respiration. A
respiration calorimeter is an instrument of
precision by means of which gaseous exchange
and heat production can be measured. It com-
prises a chamber in which the interchange of
gases and the production of heat occurs, the
walls of which are air-tight and heat-proof,
with accessory devices by which any gases
added to or removed from the air of the cham-
ber are measured, while the heat imparted to
the air of the chamber is also removed and its
quantity determined. The apparatus was origi-
nally designed for use in the study of funda-
mental problems of physiology with the living
organism, particularly with respiration, but it has been found valuable for a great
variety of other uses.

Investigations of nutrition commonly com-
prise what are known as complete metabolism
experiments. The subject, for example a man,
is given a prescribed diet during an experi-
mental period which may continue several days.
All his food and drink and all solid and liquid
excreta are weighed and samples analyzed.
From a comparison of the quantities of ele-
ments and compounds in the materials taken
into and given off by the body it is possible
to tell whether the store of material has in-
creased or decreased under the experimental
conditions. In order that the balance may be
complete, however, it is necessary to include
with the data obtained by analysis of the solids
and liquids, the quantities of oxygen consumed,
and those of water vapor and carbon dioxide
given off by the lungs and skin. To this end
the subject remains during some part or all
of an experimental period in a device called
a respiration apparatus by means of which these
quantities may be measured. From all of the
data thus obtained it is possible to estimate with
considerable accuracy the actual transformation
of matter within the body.

The transformations of energy are likewise
learned from comparison of the intake and
the
output of energy by the body, the quantities of energy being measured as heat, because other kinds of energy can be converted into heat and whatever the nature of the energy utilized in the body it is ultimately converted into heat, and eliminated from the body as such. The actual income of energy to the body is the difference between the potential energy of the combustible material in the food and drink and that of the oxidized residues of food and body material in the solid and liquid excreta, which are determined by burning samples of each in oxygen in a bomb calorimeter. The actual output of energy by the body is the heat resulting from the expenditure of energy in the maintenance of bodily functions and the performance of muscular work. To measure the amount of energy given off from the body and after it leaves is determined, and from these data the quantities of gases imparted to the air by the subject are ascertained. By another method somewhat similar the air leaving the chamber is passed through purifying devices which remove all the carbon dioxide and water vapor from it, the amount of each being found from the gain in weight of its absorber. The quantities of gaseous exhalation can be determined with considerable accuracy in such manner, and with small animals as subjects the consumption of oxygen can also be ascertained; but with larger animals, such as man, the determination of the quantity of oxygen consumed is somewhat more difficult. This can be accomplished more readily by the closed circuit method in which air is withdrawn from the chamber, passed through the purify-

Respiration Calorimeter, in Laboratories of the United States Department of Agriculture, Washington, D. C.

as heat, the respiration apparatus in which the subject spends the experimental period is arranged also as a calorimeter. The term "respiration calorimeter" is intended to signify that the device measures simultaneously the respiratory exchange and the heat output of the body. In recent years a large amount of work has been done with the respiration calorimeter in experiments in which measurements of the gaseous exchange and energy production were the chief end, few or none of the other factors of income and outgo being considered.

Several methods of measuring the respiratory exchange are employed. One of the simplest is that in which a constant current of air is passed into and out of the respiration chamber by means of pipes through the walls, which are otherwise air-tight. The volume of air passed through the chamber is measured, and the composition of the air before it enters ing devices and returned again to the chamber, and oxygen is supplied to it to replace that used by the subject. The gain in weight of the air purifiers shows how much carbon dioxide and water vapor were brought out of the chamber, and the loss in weight of the oxygen container shows how much of this gas was admitted to it; from these data, with allowance for any change in the composition of the air of the chamber, the actual respiratory exchange by the subject is determined.

Various methods are also employed to determine the amount of heat produced by the subject in the respiration calorimeter. One method in common use at the present time is to take up the heat as fast as it escapes from the body by a current of cold water flowing through a coil of pipe in the chamber. From the weight of water flowing through the coil and the difference between the temperature of the water entering and that of the water leaving
the coil, the quantity of heat carried out is computed. This constitutes the major part of the heat given off from the body of the subject. A small part, however, leaves the chamber as latent heat. The temperature of the air in the chamber is controlled so that no heat will be transmitted through them from within or without. The illustration gives a general view of a respiration calorimeter of this type as employed in the laboratories of the United States Department of Agriculture in investigations with men and women. The respiration chamber of this apparatus is 6½ feet long, 4 feet wide and 6½ feet high. Though it is rather small, a person can remain in it very comfortably during a period of even several days' duration. The subject enters the chamber through the large opening in the side in which a pane of glass is sealed during an experiment, thus serving as a window, though there is a small electric light inside to provide further light if needed. There is also a small electric fan to keep the air stirred, and a telephone by which the subject may communicate with those on the outside. On the walls are hooks for clothing and shelves for books, food receptacles and the like. A tubular opening in one wall, called the "food aperture," has a tightly closing door on each end by means of which receptacles for food and excreta and other objects may be passed into or out of the chamber. The furniture, which varies with the character of the experiment, comprises a chair, a table and a cot, which may all be folded into small bulk, and devices with which definite amounts of muscular work may be performed. The present apparatus is sufficiently accurate for the purpose for which it is used is demonstrated by the fact that it measures at least 99 per cent of the quantities of oxygen used and of water vapor, carbon dioxide and heat produced when known amounts of alcohol are burned in test experiments within the chamber.

The first respiration calorimeter employed in America was devised and constructed in the laboratory of Wesleyan University by the late W. O. Atwater, then director of the Office of Experiment Stations of the Department of Agriculture, and professor of chemistry, and Dr. E. B. Rosa, of the United States Bureau of Standards, then professor of physics at Wesleyan University, who began work on it in 1892. The original device combined an open circuit respiration apparatus similar in principle to that of Pettenkofer of Munich, but was altered in detail in accordance with modifications in method of investigation; and a calorimeter that was quite original, the principal features of which were suggested by Professor Rosa. The completion of this apparatus and the continuing experiments with it were the outcome of the investigations on the nutrition of man which were begun by the United States Department of Agriculture in 1894, and were put in charge of Professor Atwater. During the 12 years in which it was in use at Wesleyan University the respiration calorimeter was considerably modified, particularly with respect to the exchange of oxygen and carbon dioxide, being changed from an open to a closed circuit type to afford better means of determining the consumption. In 1907 it was transferred to Washington and completely reconstructed in the laboratory of the Department of Agriculture, where it continues in use at the present time. The apparatus, larger and less cumbersome, is a smaller respiration calorimeter of similar nature but with modifications that make it to a considerable extent automatic in operation, has been constructed and employed for use in the study of metabolic activity of small magnitude, as, for example, the ripening of fruits, the wintering of bees and other problems.

Respiration calorimeters are important aids in research and are in use in many laboratories. They have been found of great value for clinical purposes and for the study of pathological and other medical problems as well as general problems of health and hygiene. Their application to botanical research opens up a large field which is very promising from a theoretical as well as from a practical standpoint.

CHARLES F. LANGWORTHY, United States Department of Agriculture.

CALORIMETRY ("heat measurement"), the art of measuring the quantity of heat that a body absorbs or emits when it passes from one temperature to another, or when it undergoes some definite change of state. In order to execute such measurements it is first necessary to adopt some convenient and accurate unit, in terms of which the quantities of heat that are to be measured can be expressed. Several such units have been proposed, but none has yet met with universal favor among physicists. One of the simplest that has been suggested (at least so far as the principles involved are concerned) is the quantity of heat that is required to melt 1 kilogram or a pound of ice. Evidently it will require precisely 10 times as much heat to melt 10 pounds of ice as to melt 1 pound, and hence, if the quantity of heat required to melt one pound of ice is taken as the unit of heat, the measurement of any given quantity of heat becomes reduced to the simple operation of observing how many pounds of ice the proposed quantity of heat can melt. The earliest form of heat-measuring device (or "calorimeter") based upon this idea is that invented by Dr. Joseph Black about the year 1760. It consists simply of a block of clear ice, in which a cavity is made, the cavity being closed by a slab of ice laid upon the main block. To make the use of this device plain, let us suppose that it is desired to determine the quantity of heat that is given out by a certain fragment of platinum in cooling from 100°F. to the freezing point. The chamber in the block of ice is first carefully wiped dry, and the platinum, heated accurately to 100°, is quickly introduced, and the covering lid of ice is laid in place. The platinum gives up its heat to the ice about it, with the result that a certain weight of the ice is melted, and a corresponding amount collects within the chamber. When it is certain that the platinum has attained the temperature of the ice, the slab covering the excavation in the main
block is lifted off, and the water that has collected about the platinum is removed and weighed. The quantity of heat given out by the platinum in one minute is the quantity required to melt one pound of ice. Lavoisier and Laplace improved Black's calorimeter in certain respects, while retaining its main features. Their instrument consists essentially of three distinct concentric chambers. The inner one is the only one in which the experiment is to be performed; it is placed in the middle chamber, the ice whose melting is to serve as a measure of the heat given out is placed, in the form of broken lumps, in the intermediate chamber, surrounding the object to be investigated. In the outer chamber, which encloses the two other as completely as possible, broken ice is also introduced, to prevent the conduction of heat into the apparatus from the outside. The quantity of ice melted is determined by observing the amount of water that is formed in the middle chamber, this being drawn off by a conveniently situated tube and tap. This apparatus has been described as an improvement upon that of Black; but the only way in which it is superior to that instrument is in the respect that it does not call for large blocks of pure clear ice. In other particulars it is somewhat inferior to the simpler apparatus of Black. The quantity of water that is produced, for example, cannot be determined with the same degree of accuracy as in Lavoisier and Laplace's instrument. The ice calorimeter of Bunsen was a far greater advance. This ingenious apparatus consists of an inner chamber, for the reception of the object to be studied, and an outer enveloping one, which is entirely filled with a mixture of ice and water, and from which a graduated capillary tube is led away. The whole instrument is surrounded by broken ice, as in Lavoisier and Laplace's form, in order to protect the interior parts from the effect of external thermal influences. When the apparatus is in perfect working order, the mixture of ice and water in the intermediate chamber should be neither melted nor freezing, but should be in exact equilibrium in this respect.

Upon the introduction of the object to be studied into the central chamber, the ice in the intermediate chamber begins to melt, just as in the types of calorimeter already considered; but the essential peculiarity of Bunsen's instrument consists in deducing the quantity of ice that is melted by observing the change of volume of the contents of the intermediate chamber, as shown by the motion of the water in the graduated capillary tube that leads away from that chamber; advantage being taken, for this purpose, of the known fact that ice diminishes in volume upon melting, so that when the exact diminution in the volume of the contents of the intermediate chamber is known, we can calculate with a considerable degree of precision the quantity of ice that has been melted. Bunsen's calorimeter is an admirable instrument, capable of giving results of great accuracy when intelligently handled.

Another unit of heat that suggests itself quickly upon the question is the quantity of heat given out by a pound of steam when it condenses into a pound of water at the same temperature. A calorimeter based upon this idea was also used by Bunsen, but the steam calorimeter was brought to its present excellent form largely through the labors of Dr. J. Joly. In his type of the instrument the object to be studied is suspended from one arm of a delicate balance. After being accurately weighed, the object is bathed in an atmosphere of steam, with the result that it absorbs a certain amount of heat as its temperature rises to that of the steam. But the heat thus absorbed by the body under examination can be obtained only from the steam itself; and since we never have the steam part with heat in this way without condensing, it follows that there is deposited upon the body a weight of condensed moisture that corresponds precisely to the quantity of heat that has been absorbed. The amount of this moisture is determined by careful weighing; and it is evident that the quantity of heat absorbed by the experimental body in passing from its original temperature to the temperature of the steam is then immediately known, if we take, as the unit of heat, the quantity of heat that is given out by a pound of steam in condensing into a pound of water at the same temperature. In practice, numerous corrections are of course necessary, as with all other instruments of precision. It may be imputed to the apparatus and the steam calorimeters are primarily intended to determine the heat emitted or absorbed by a body in passing from any given temperature to some one particular temperature that is always the same (that is, the freezing-point in the one case and the boiling-point in the other), yet it is always possible to determine the quantity of heat emitted or absorbed by the body between any two temperatures, by performing two experiments in succession, the body having these respective temperatures as its initial temperatures in the respective experiments. It is plain that the quantity of heat emitted or absorbed between the proposed initial and terminal temperatures can then be obtained by simply subtracting one of these results from the other.

Another and more familiar unit of heat is the quantity of heat required to warm a given weight of water one degree on a given thermometric scale. (See Calorific.) Thus in general engineering practice in the United States and in England, it is customary to define a heat unit as the quantity of heat that is required in order to raise the temperature of a pound of water one degree on the Fahrenheit scale. This definition is good enough for rough purposes, because it conveniently happens that there is no great difference between the quantity of heat required to warm a pound of water from 32° to 33° and the quantity required (for example) to warm it from 99° to 100°. This, however, we can only regard as a fortunate accident; and for accurate scientific purposes we must recognize that the equality is only approximate, and we must adopt some particular temperature range as a part of our definition. Thus it is common to define the British heat unit, when great accuracy is desired, as the quantity of heat required to raise the temperature of a pound of water from 59° to 60°; although some authorities, apparently without sufficient reason, make the temperature range from 32° to 33°, and others have chosen other positions on the temperature scale for the defining degree. It is unfortunate that no general agreement has yet been reached on this point. In accurate scientific work the unit of heat is usually taken as
the quantity of heat required to warm a kilogram of water from 15° C. to 16° C., or (which is practically the same thing) from 14.5° to 15.5° C. It would appear that several very good results may be added at 40° C. as the standard temperature to be used in defining the heat unit. For example, the specific heat of water has its minimum value not far from that point; or, in other words, any small uncertainty in the actual realization of the temperature contained in the definition would have little or no effect if that temperature were 40° C. Again 40° C. is the temperature at or near which the differences between the various thermometer scales that are in practical use reach their maximum; and this means that at or near this temperature a slight error in the standardization of the thermometer that is used would have the least effect upon the verification of the heat unit. Moreover, 40° C. (104° F.) is a touch warmer than the assumed 30° C.; the general temperature of the laboratory in which work is being carried out; and it is well known to be easier to realize a temperature that is lower than that of the surrounding air, than it is to realize one that is lower. From every point of view, therefore, 40° C. (or thereabouts) would appear to be the best temperature to assume in establishing the definition of the heat unit; a unit of heat being then defined as the quantity of heat required to raise the temperature of a kilogram of water from (say) 39° C. to 40° C. Yet, cogent as these reasons would appear, no authority has yet suggested this particular temperature as the standard.

In measuring the quantity of heat emitted by a body by observing the change of temperature produced in a given mass of water when the water absorbs the heat so emitted, a great variety of forms of apparatus may be used. In some cases the heated body may be plunged into the water directly, the water being kept well stirred, and its temperature taken at the beginning and end of the experiment. In other cases, and especially when the body under examination cannot be allowed to come in contact with the water, it is necessary to adopt some other method, such as enclosing the experimental body in a water-tight envelope of some kind, and afterward making due allowance for the heat capacity of the envelope. In cases, for example, in which the heat generated by the combustion of fuel is to be measured, the fuel must be enclosed in an air-tight crucible, to which oxygen is admitted by one tube, and from which the products of combustion are drawn off by another. The crucible is surrounded by a mass of water that is disposed in such a way that it is likely an average of the heat that is produced as possible. A direct observation of the temperature of the water in the calorimeter is made before and after the combustion, and the change of temperature so obtained gives a first approximation to the amount of heat that has been liberated.

This result has to be corrected, however, for the thermal capacity of each part of the calorimeter that has been warmed during the experiment, and for that of the gases admitted and drawn off, and also for any loss of heat that may have occurred through radiation. The precise details of the corrections will vary, however, with the design of the calorimeter, and with the mode of conducting the experiments.

For a discussion of the relations of the different units of heat that have been mentioned above, and for an account of the experiments that have been made for determining the differences in the heat capacity at different temperatures, see Heat (q.v.) constructed on a large scale are used to measure the amount of heat given off by an animal or human being, the amount of food and air supplied being recorded. Considerable success has been attained in ascertaining the fuel value of various foods by W. O. Atwater and by the Nutrition Laboratory of the Carnegie Institution of Washington. A very good account of the subject of calorimetry in general will be found in Preston's 'Theory of Heat' (London 1894), which also contains valuable references to original papers. The various forms of calorimeter that are used in practical engineering are explained and illustrated in Carpenter's 'Travels and Wonders of Engineering' and in almost all general textbooks on physics. Consult 'Philosophical Transactions of the Royal Society of London' (1894), and Wiedemann's 'Annalen der Physik und Chemie' (Vol. XXXVII, p. 494, 1889). See Fuel.

CALOTROPIS, a genus of asclepiads forming shrubs or small trees natives of the tropics of Asia and Africa. There are three species, and their flowers have a somewhat bell-shaped corolla, expanding into five divisions. C. gigantea, the largest of the genus, forms a branching shrub or small tree about 10 feet high, with a short trunk four or five inches in diameter. Its flowers are of a pretty rose-purple color. Cloth and paper have been made from the silky down of the seeds. The bark of the roots of some species furnishes the substance called mudder, which is used in India as a diaphoretic. The juice has been found very efficacious in the cure of elephantiasis, in syphilis and anasarca. From the bark of the plant is made a substance called mudderine. The bark of the young branches also yields a valuable fibre. The leaves warmed and moistened with oil are applied as a dry fomentation in pains of the stomach; they are a valuable rubefacient. The root, reduced to powder, is given in India to horses. An intoxicating liquor, called bar, is made from the mudder by the hillmen about Mahabaleshwar, in the western Ghauts.

CALOTTISTS (French Calottiste, kal'o-tistes'), or the Régiment de la Calotte, a society which sprung up at Paris in the last years of the reign of Louis XIV, and took its name from the word calotte, a flat cap formerly worn by the absbee and which was the symbol of the society. All were admitted whose odd behavior or character, foolish opinions, etc., had exposed them to public criticism. Every one who made himself particularly ridiculous received letters, patent authorizing him to wear the calotte. They had a singular coat of arms, on which was the sceptre of Momus, with bells, apes, rattles, etc. On their principal standard were the words, Favet Momus, luna infelix. On the death of Torsac, the colonel of the Calottists, the death of the Emperor (in allegorical style) which the Calottists pronounced on this occasion, was suppressed. Aimon, colonel of the guards, hastened to Marshal Villars with their complaints, and concluded with the
words, "My lord, since the death of Alexander and Caesar, the Calottists have not had any protector besides you, and the order was re- tracted. They became, however, too bold, attacked the ministers and even the King himself; and the regiment was in consequence dissolved. After the restoration the epiphlet, Régime de la Calotie, was applied to the clerical influence in politics. The "Mémoires pour servir à l'Histoire de la Calotie" (Basel 1725) is an amusing little book. Consult "Journal historique et anecdotique du règne de Louis XV de l'avocat Barbier" (ed. 1857).

CALOTYPE, a photographic process invented by Talbot, and patented in 1841. Paper saturated with nitrate of silver is dried and then immersed in a solution of potassium iodide for a few minutes, and again dried and kept in the dark. When wanted for use it is brushed over with a solution of gallo-nitrate of silver, and immediately exposed in the camera. The image thus formed may be left to develop itself, and then thoroughly washed and fixed with hyposulphite of soda; or a customary developer may be used. The process is no longer in use commercially, but is occasionally revived by amateurs.

CALOVIO (Latinized form of original German name, KALAU), Abraham, German Lutheran theologian; b. Mohrungen, Prussia, 16 April 1612; d. 25 Feb. 1666. He became rector of the gymnasium in Danzig (1643) and professor of theology in Wittenberg (1650). He was the chief representative of controversial Lutheran orthodoxy in the 17th century, and waged war incessantly on Arminian, Socinian, Reformed and Roman Catholic doctrines, and with the greatest bitterness against Calixtists. He was six times married, the last time in his 72d year. His chief writings are "Systema Locorum Theologicorum" (12 vols., 1655-77); "Biblia Illustriata" (4 vols.), defending the orthodox views of inspiration against Grotius.

CALOYRS (σαβύς, "beautiful", ροδός; and ἀνές "an old man"), Greek monks belonging with a few exceptions to the order of Saint Basil, who lead a very austere life, eating no meat and observing the fasts of the Greek Church rigidly. They do not even eat bread unless they have earned it. During their seven weeks of Lent they pass the greatest part of the nights in meditation and grief for their own sins and those of others. The caloyrs of the Greek Church occupy a position of much greater importance than the members of the religious fraternities of the Church of Rome, inasmuch as all the higher Church dignitaries—bishops, archbishops and patriarcs—are chosen from their number. They are, indeed, the only individuals in the Greek Church who are instructed in theology and even among them the amount of theological learning is very limited. They are commonly educated at the monasteries on Mount Athos, and on the isle of Patmos, but besides these there are many monasteries dispersed over the archipelago and the Morea, and a few elsewhere belonging to this class of monks. Their most celebrated monastery in Asia is at Mount Sinai. They do not all agree as to their mode of life. Some of them are cenobites; that is, they live in common. Others are anchorites, living alone, or with only one or two companions; and others again are recluse, who live in grottoes or caverns in the greatest retirement, and are supported by alms supplied to them by the monasteries of the hills. There are also convents of female caloyrs. The Turks sometimes call their dervishes by this name.

CALPE, kāl'pē, the ancient name of the rock of Gibraltar (q.v.), at the southern extremity of Spain, the northern of the two hills called by the ancients the "Pillars of Hercules" (q.v.). Across the straits of Gibraltar, on the African coast, was Abyla, the southern pillar.

CALPREE. See KALPI.

CALPRENÉDE, kāl'prēnē'd, Gautier de Costes de la, French romance writer: b. Tol- gou, Gascony, 1610; d. Paris 1663. He was an officer of the guards and royal chamberlain, and one of the authors who in the 17th century brought into fashion a new kind of voluminous and long-spun romances of chivalry. He wrote "Cassandra"; "Cleopatra"; and "Paramond," besides 10 tragedies, among which are "La mort de Méthridate" (1635); "Jeanne d'Angieterre" (1636); "Le Comte d'Essex" (1638). His romances were highly celebrated, and are the best of their kind. Consult Fourecaud-Lagraze, "Le Périgord littéraire; La Calprenédé" (Ribéac 1877); Morililot, "Le roman en France" (Paris).

CALPURNIA, the fourth wife of Julius Caesar, married to him 59 B.C. She was a daughter of L. Calpurnius Piso Cæsonius, who was consul 58 B.C. Shakespeare introduces her into his tragedy. "Julius Caesar." The name is also that of the daughter of L. Calpurnius Bestia, wife of P. Antistius, who took her own life when she learned that her husband was slain by order of the younger Marius, 82 B.C.

CALPURNIUS, Titus, surnamed SICULUS, Latin poet: b. about 30 A.D.; d. about 80. Seven eclogues composed by him are extant, but nothing whatever is known with certainty about his life, and even his name is doubtful. The poems attributed to him are evidently modeled on Virgil's more famous eclogues. They are exaggerated and artificial. They have been edited by Schenkl (Leipzig 1885); Keene (London 1887); and translated by Scott (London 1890). Consult Butler, "Port-Auguston Poetry" (pp. 150-59, Oxford 1909). See NEMESIUS.

CALTANISSETTA, kāl-tā-nē'sēt'a, Sicily, capital of the province of the same name, on the right bank of the Salso, 62 miles southeast of Palermo. It is fortified, and has a citadel and cathedral, with paintings of the later Sicilian school, public gardens, a seminary, a gymnasium, a school of technology, broad streets and well-built houses. In the vicinity, at Terra Pilata, are springs of petroleum and of hydrogen gas, a mud-volcano and important sulphur mines, producing annually about 5,500 tons. In the neighborhood there still stands a Norman monastery built by Roger II in 1153. Caltanisetta owes its origin to the Saracens, by whom it was called Kalat of Muro (the lady's castle). The province of the same name has an area of 1,445 square miles. Pop. 40,297.

CALTHA, the genus of ranunculaceous plants to which the marsh-marigold (C. palustris) belongs. See Cowslip.

CALTROP, a kind of thistle growing in southern Europe. It is armed with prickles,
which, if trodden on by men or animals, are capable of wounding. Hence in the military art the name of caltrop is given to an instrument with five or six projecting points, and when used in a triangular form, three of them being turned to the ground and the other pointing upward. They are used to impede the progress of cavalry.

**CALUMBA or COLOMBO**, the root of *Jateorrhiza columba*, an herbaceous plant, belonging to the family Asparagaceae, which grows in Ceylon in the neighborhood of Colombo, whence it is said to derive its name. It is imported in the form of round slices or cut pieces, the interior of which is of a greenish-yellow color, while its thick and furrowed skin is greyish-brown; its odor is slightly aromatic, but somewhat nauseous; its taste extremely bitter. Calumba is often administered as a tonic, and is considered an excellent stomachic. It is regarded as of great value in chronic diarrhea and dysentery; but it is necessary that all symptoms of inflammation should have disappeared before it can be used. It is usually given as a decoction, less commonly in the form of pills or powders. The root of an American gentian, *Fraseria cornute*, is substituted for the true calumba, and is hence frequently called the false calumba. It is not very bitter, and is almost without smell; it has no very marked effects.

**CALUMET**, Mich., township in Houghton County, at the terminus of the Mineral Range Railroad, 42 miles north of L'Anse and 68 miles northwest of Marquette. It is the seat of the famous Calumet and Hecla copper mine, the richest in the world, producing nearly 50,000 tons a year. It is the trade and supply centre of the Superior mining district, and has a national bank, several weekly newspapers, many manufactories and an assessed property valuation of over $26,000,000. A $10,000,000 water-power project on the Sturgeon River, 15 miles to the south now completed, affords cheap freight rates to a handsome number of industrial plants, elevators, and coal docks. Commerce in a recent year amounted to 6,549,576 short tons, consisting of coal, grain, iron ore and merchandise, valued approximately at $162,000,344. Pop. about 33,000.

**CALUMET**, the pipe of peace, a tobacco-pipe used by the North American Indians. On ceremonial occasions, as when Indian chiefs and warriors meet in peace, or at the close of a war with those of another nation, in their talks and treaties with the whites, or even when a single person of distinction comes among them, the calumet is handed round with ceremonies peculiar to each tribe, and each member of the company draws a few whiffs. To accept the calumet is to agree to the terms proposed; to refuse it is to reject them. Some symbols of amity are found among all nations; the white flag or flag of truce of the moderns and the olive branch of the ancients are similar in character to the Indian calumet. There is also, it appears, a calumet used in the ceremonial declaration of war and differently made from that of peace. Tobacco is smoked in the calumet and the leaves of the tobacco plant. The bowl of this pipe is made of different kinds of soft stone, especially of a kind of red soapstone, and the stem of a reed, or of some light kind of wood which is easily perforated. This stem is adorned in various ways, sometimes it is marked with the figures of animals and hieroglyphical delineations, and almost universally has beautiful feathers attached to it, disposed according to the taste of the individual or of the tribe to which he belongs.

**CALUMPIIT**, Philippines, a town of the province of Bulacan, situated in the southwestern part of the island of Luzon on the Pampanga River. It is about 27 miles north-west of Manila, with which it is connected by rail. Pop. about 15,000.

**CALVADOS**, kãlvá'dos', France, a northern maritime department, bounded on the north by the English Channel, and east and west and south by the departments of Eure, Manche and Orne. The soil is generally fertile, supplying wheat, barley, oats and rich pasturage for cattle, sheep and horses, which, with swine, constitute the principal wealth of Calvados. Fishing is also a thriving industry. Calvados is named for its cider. The climate is healthful, though changeable. Iron, marble, slate and coal are found. The area is 2,198 square miles. It is so called from Calvados, corruption of 'Salvador,' the name of a vessel of the Spanish Armada, which was wrecked on the coast here. Capital, Caen. Pop. 396,310.

**CALVAERT, kãlvâr', Dionys (called in Italy Dionisio Fiammingo), Flemish painter: b. Antwerp 1555; d. Bologna, Italy, 17 March 1619. He went very young to Italy as a landscape painter, where, in order to learn how to draw figures, he entered the school of Pontana and Sabbatini, in Bologna, with the latter of whom he visited Rome. After having passed some time in copying the paintings of Raphael, he opened a school at Bologna, from which proceeded 137 masters, and among these Albano, Guido and Domenichino. The Bolognese regarded him as one of the restorers of their school, particularly in respect to coloring. Calvaert understood perspective, anatomy and architecture; but the attitudes of his figures are sometimes mean and exaggerated. His best paintings are to be seen at Bologna and others are to be found in England, Dresden and Vienna.

**CALVARY**, the English name for the eminence, which was the scene of the crucifixion of Jesus Christ. It lay beyond but near Jerusalem, and by some it is identified with the old House of Stoning, or place of public execution, according to the law of Moses, on the top of the remarkable knoll outside the Damascus gate, on the north side of Jerusalem. It was from this cliff that the criminal used to be flung before being stoned (according to the Talmud), and on it his body was afterward crucified; for the spot commands a view all over the city, and from the slopes round it the whole population might easily see him. In the Catholic countries the name is applied to the representation of the passion and crucifixion, by three crosses, with life-size figures of Christ and the thieves and a number of surrounding figures, representing the most present at the crucifixion. The Calvary at Aix-la-Chapelle is represented by a church on a hill, around which are 12 stones, with sculpture marking the events which occurred on the journey of Jesus to Mount Calvary. The road leading to Calvary is called *Via Dolorosa*.9
CALVÉ—CALVIN

CALVÉ, kā'vō, Emma, French opera singer: b. Madrid, Spain, 1864. Her real name is Emma Rodriguez de Fermoselle, and she was a descendant of a Spanish mother and French father, and was educated in a convent school in the south of France. She studied under Rosine Laborde and made her début at Brussels in Gounod’s ‘Faust,’ 1882. She has made successful tours of the United States in leading rôles, her first appearance in New York being on 29 Nov. 1893; and has been popular in opera comique and grand opera in Europe. Some of her best rôles are ‘Chevalier Jean’ (1885); and Massenet’s ‘Navarrese’ (1895). After 1899 she devoted herself to concert tours.

CALVERLEY, Charles Stuart, English poet and humorist, son of the Rev. Henry Blayds: b. Martley, Worcestershire, 22 Dec. 1831; d. London, 17 Feb. 1884. In 1852 his father dropped the name of Blayds and resumed that of Calverley, formerly borne by his family. He was educated at Christ’s College, Cambridge, and during his college career showed great skill in Latin and Greek composition, in 1856 was second in the classical tripos and was appointed fellow in 1858. As a writer of English poetry he could not hope to become self famous. He afterward studied for the bar, and was called in 1865, but his promising legal career was cut short by a serious accident which befell him on the ice in the winter of 1865–67. The effects of this misfortune clouded the whole of the remainder of his life. As a parodist and writer of light verses Calverley is perhaps unequalled, but his published volumes are not numerous. The earliest of them appeared in 1862 under the title of ‘Verses and Translations’; and the others are ‘Translations into English and Latin’ (1866); ‘Theocritus Translated into English Verse’ (1869); ‘Fly Leaves’ (1872); and ‘The Idyls of Theocritus and the Eclogues of Virgil Translated into English Verse; with an Introduction by R. Y. Tyrell’ (London 1908). A ‘Memoir and Literary Remains’ were published by Sendall (London 1885).

CALVERT, George. See Baltimore Family.

CALVERT, George Henry, American writer: b. Baltimore, Md., 2 Jan. 1803; d. Newport, R. I., 24 May 1869. He was a grandson of Lord Baltimore. After graduating at Harvard in 1823 he studied in Göttingen; then returning to Baltimore, became editor of the American and a contributor to various periodicals. In 1843 he removed to Newport, R. I., of which city he was elected mayor in 1853. His published books include ‘Illustrations of Phrenology’ (1832); ‘Poems’ (1847); ‘Joan of Arc’ (1860); ‘Goethe, his Life and Works’ (1872); ‘Brief Essays and Brevities’ (1874), and ‘Wordsworth: a Biographical Study’ (1875); ‘Three Score and Other Poems’ (1883). He translated the correspondence of Schiller and Goethe (1845) and Schiller’s ‘Don Carlos’ (1836).

CALVERT, Leonard. See Baltimore Family.

CALVI, kä'vë, Lazzaro and Pantalone, Genoese painters, sons of Agostino Calvi: the former b. 1502; d. 1568; the latter d. 1595. They painted in concert many pictures in Genoa, Monaco and Naples. In particular, the façade of the Palazzo Doria (now Spinola), a spirited composition crowded with figures highly exalted. Lazzaro was the more inventive genius of the two, his brother generally working out the details of their joint productions.

CALVIN (modified from the French form Cauvin or Cauvlin), John, Swiss reformer of the 16th century: b. Noyon, Picardie, 10 Oct. 1509; d. Geneva, Switzerland, 27 May 1564. Though born in humble condition, his father, as procureur-fiscal of the district of Noyon and secretary of the diocese, was able by personal influence to further the interests of his family. Calvin’s mother, Jeanne Lefranc, was distinguished alike by personal beauty and piety. Even as a lad Calvin was deficient in physical vigor, but gave early tokens of more than ordinary intellectual powers, a circumstance that attracted to him the regards of a noble family at Noyon who received him under their care and gave to him the same opportunities of schooling as were enjoyed by their own children (1523). It was his father’s original intention to fit him for the priesthood and in pursuance of that end he entered the Collège de la Marche at Paris; then to the Collège Montaigu where he was trained in logic by a learned Spaniard who afterward directed the education of Ignatius Loyola while a student at the same university. He easily stood in the front rank of his fellow-students but was little disposed to affiliate with them, and from a certain unsocial severity of bearing acquired among them the nickname of the Accusative Case. At the age of 12 he received part of the chapel revenue of Noyon in return for some services there. In 1527 his father secured for him the curacy of Saint Martin de Martinville, from which he resigned in 1529, in favor of his younger brother, and in the same year exchanged the curacy for that of Pont l’Evêque, his father’s birthplace.

Then his father changed his plans with reference to John and determined to have him prepared for the profession of law, putting him for that purpose under instruction at Orleans (1528), where he studied first at St. Ouen, then at d’Etoile and Bourges (1530), where he applied himself to his studies with the same assiduity evinced at Paris, and attained immediate distinction, though at the expense of impaired health. Without confining himself strictly to the curriculum of the school he devoted himself at the same time to the study of Greek under the German professor, Melchior Wolmar, whose Protestant views strengthened the bias toward the new faith already existing in his pupil’s mind, for his attention had previously been drawn to the careful study of the Scriptures by his kinsman Olivetan, the first Protestant translator of the Bible into French. When Calvin was 22 his father died, whereupon the young man gave up his law studies and returned to Paris, where he met Le Fèvre and Farel, studied theology, issuing soon after his first publication, an annotated edition of Seneca’s ‘De Clementia.’ Up to this point it is safe to presume that his interests and ambitions were purely those of a humanist, and whatever thought he may have had in regard to the need of reform in the matters of Church doctrine
and discipline, he doubtless felt with Erasmus and Reuchlin that all the reforms that might be required would come about as the result of completer knowledge.

It was not long after this that he experienced what he calls his "sudden conversion." He writes: "After my heart had long been prepared by the most earnest self-examination, on a sudden the full knowledge of the truth, like a bright light, disclosed to me the abyss of errors in which I was wandering, the sin and shame of which I was left to feel. I saw the presence is near of kin to that of Luther, and we are set thinking also of the "great light" that shone upon Saul as he was nearing Damascus. Yet with all the profound disclosure thus made to him, he still felt no special call to the work of preaching the reformed doctrine and sought only for the undisturbed retirement that would permit him farther prosecution of his serious studies.

His friend Nicholas Cop had been elected to the chairmanship of the University of Paris and at his request Calvin prepared for him an inaugural address which was substantially a defense of the reformed doctrine (1533). To the Sorbonnists this was intolerable, and Calvin was forced to leave Paris. He spent some time at home, read the Bible, and then returned for a while to his native place, resigned the preference he held in the Roman Catholic Church and for nearly three years led a wandering life. We find him at Saintonge; at Nérac, the residence of the Queen of Navarre; at Angoulême, with his friend Louis Tillet; then in Paris again. To escape persecution in France, he fled to Basel, where in 1536, at the age of 26, he published his Institutes. This remarkable work was intended to be a vindication of the Protestant doctrine, and its dedication to the reigning king, Frances I, sought to create royal sympathy for the cause and for its persecuted adherents. It has been claimed that no other work, written at so early an age, has produced such a marked influence upon the opinions and practices both of contemporaries and posterity. Although the book as then composed was but the germ of what it was subsequently developed into, yet the line initially laid down by Calvin never swerved from. By his Catholic opponents his work was styled the "Koran of the heretics."

After completing this work he went for a short time to Italy to visit Renée, the Duchess of Ferrara. Finally he made a visit to his native town; and after selling the paternal estate, which had devolved on him at the death of his eldest brother, set out with his brother and sister for Strassburg. The direct road being dangerous, they went through Geneva. The situation, political and religious, which he there confronted, however, vetoed his plans and really determined his entire subsequent career. That situation briefly outlined is as follows: The Duke of Savoy, unable to secure the submission of Geneva, had by the aid of Pope Leo X forced upon the city the reluctant acceptance of John, the Bastard of Savoy, as bishop, it being stipulated that the civil administration of the city should be vested in the Duke. The Genevese revolted under the lead of John Bodmer, with whose daughter, Berthelier was executed and Bonivard became the "Prisoner of Chillon" (1530-36). Defeat did not, however, extinguish the spirit of revolt. Of the two parties into which the Genevese were divided, the Confederates ("Eidgenossen," a word from which perhaps comes the word Huguenot) looked for relief to the Swiss, and the Mamelukes favored supporting the Duke. The Confederates prevailed, the Duke was defeated and all power both military and civil passed into the hands of the people. This was in 1533.

To this civil overturning succeeded an ecclesiastical revolution. Protestant tendencies had established themselves in Bern, and from there had extended themselves to Geneva. The struggle in the latter place was a severe one, but Protestantism gained ground till under the leadership of Farel and with the assistance of Bern an ecclesiastical reconstruction was effected, the bishop driven out, Protestantism established and Geneva left independent. This meant not only a new form of doctrine and mode of worship, but a reformed system of morals, and thereby a strain put upon the large profligate element of the population which worked a reaction strenuously encouraged by the Savoyards and the Catholic priests. The entire city was in this way wrought into a condition of tumultuous faction, and it was just in the midst of this upheaval that Calvin arrived at Geneva as already stated, and took lodgings for the night with the distinct intention of going on to Basel the next day. Farel, who was in charge of the Protestant movement, learned of Calvin's presence in the city, through Louis du Tillet, got into communication with him, and in an interview graphically described by Calvin in the preface to his 'Commentary on the Psalms' (a work especially rich in autobiographical references), entreated him to remain and help work out the problem of Protestantism in Geneva, denouncing upon him the curse of God if he refused. Calvin was aye-stricken by what seemed to him the prophetic deliverance of Farel and yielded to his Elijah-like exultation, so that the dictum is well justified that "Farel gave Geneva to the Reformation and Calvin to Geneva."

He prefaced his work in Geneva by introducing and setting in operation a series of stringent regulations relative to doctrine, discipline and daily conduct. Amusements like dancing and card-playing were punishable offenses, not because in his judgment inherently wrong, but because so abused that the only safe course was to prohibit them altogether. The stringency of this policy excited a revolt led by the Libertins, so styled, and participated in even by many of the same "Eidgenossen" that had helped wrest Geneva from the grasp of the Duke. The opposition culminated in an act of Council expelling Calvin and Farel from the city (1538), the latter going to Neuchâtel, and Calvin to Strassburg, where, with a sense of relief, he thought to find himself free to gratify his tastes and resume his studies. Here again, however, as at Geneva, he was stirred by an intimidating call and applied himself to the work of ministering to the French refugees there gathered. It was during his stay in Strassburg that he married a lady of admirable character, Ida, but the Defeas of Strassburg with the hood of Liége, with whom he lived in relations of tender attachment till her death nine years later, their only child, a son, dying in early infancy.
In Geneva, in the meantime, matters had been going from bad to worse, till by the united voice of government and people Calvin was called. Crime and vice had become rampant. Catholics were planning for the restoration of the old faith. Cardinal Sordelet had addressed to the people a flattering and coaxing letter, calling them back to the Catholic Church. To that letter Calvin while still in Strassburg had published a reply both sagacious and masterly. Bern was suspected of having ambitious political designs on the city. The local government was too weak to maintain itself amid such a storm of conflicting elements and so after three years the people turned again helplessly to the man they had exiled. He fought against the overtures tendered him but was overborne by their earnestness and unanimity and came back to Geneva to make there his life-long home (1541).

Calvin entered at once upon his office of administrative head of the city, considered in both his ecclesiastical and civic character. Though confined to the two in his own capacity, he was no Erastian, and Church and State stood to him as theoretically distinct, and yet contributing, each, to the interests of the other, the Church infusing its spirit into the State and the State in turn furnishing authoritative support to the Church. Civil authority, previously widely distributed, he made more oligarchic and vested it primarily in what was known as the "Little Council of Twenty-five." The code devised for the city bears everywhere the marks of Calvin's authorship. For this his legal training especially qualified him. Larger and smaller matters alike came under his purview. Like the English Englishman the Genevese legislator traced his system of enactments by a liberal infusion of the Mosaic letter and spirit. Ecclesiastical discipline was delegated to the Consistory, composed at first of 18 members, 6 clerical and 12 lay, with Calvin as its president. The city was divided into districts or parishes and a system of vigilance so thoroughly organized that every family was at least once a year visited by responsible parties for purposes of censure, counsel or relief.

Although introducing his administration with a measure of moderation, its animus soon evinced itself in a way that made evident the lawless and vicious classes what it was they had to contend with, and a wide-reaching opposition began immediately to organize itself. This opposition included the Libertines and the "Patriots," which latter class bitterly opposed the close aristocratic lines with which the previous popular government had been replaced and regarded with jealousy the foreigners that in great numbers were coming to make their home at Geneva. The enmity toward him and his administration was still further fanned by the irrational and mercenary severity shown in the punishment of small offenses, such as the beheading of a child for striking its mother, the committal of heretics to the flames, the eliciting of testimony by torture. His rule was one of terror and he was hated and published. Mobs attempted to intimidate him. Dogs in the street were named after him. To antagonize Calvin was a crime, as Castello found to his cost, and to speak disrespectfully of predestination, as did Bolesec, a felony. But cases like these two are quite eclipsed by the instance of Servetus.

Servetus was a Spaniard, a scholar of independent thought, who convinced himself of the groundlessness of papal claims, but without cordially accepting the theology of Protestantism. In 1531 he published a book entitled 'The Errors of the Trinity.' Irritated by Calvin's treatment of him and his speculations he resorted upon him and the Reformed doctrine flatly and acrimoniously. Though out of sympathy with the Roman Catholic Church Servetus continued for 20 years in outward conformity with its doctrine and discipline and then wrote another volume under the title 'The Restoration of Christianity.' This was issued by him during his residence at Vienne and resulted in his arrest at the instance of the archbishop. A copy of the work came under Calvin's eye, who declared that if Servetus were to come to Geneva he should not get away alive if his authority was sufficient to prevent it. Having escaped from Vienne Servetus did come to Geneva, where his presence was known to the knowledge of Calvin, who ordered his arrest. Thirty-eight heretical propositions were alleged against him, among others the rejection of the Trinity and speculation leaning toward pantheism; and, although he conducted his defense with vigor and with a degree of acuteness, he was condemned and, to the disgrace of the Protestant cause, was burned a little way out from Geneva on 27 Oct. 1553. It is claimed in behalf of Calvin that he tried to mitigate the severity of the penalty. However that may be, he was set on pursuing Servetus to the death, and it is on record that he wrote as follows to Farel two months before the execution.—"I hope the sentence will be capital but desire the atrocity of the punishment to be mitigated." It has to be remembered however that all of this was in keeping with the barbarism of the age and that so gracious-spirited a man as Melancthon gave to it his assent. After the execution of Servetus and the expulsion of the Libertines two years later, Calvin's power in Geneva was firmly established. He used his influence vigorously for the defense of Protestantism throughout Europe. By the mediation of Theodore de Bèze he made his influence felt in France in the great struggle on there between the hierarchical party with the Guises at its head and the Protestants led by Condè and Coligny. In 1561, his energies began to fail, and after much bodily suffering, he died.

During the entire course of his conflict with heresy and the Libertines, Calvin was actively engaged in preaching and lecturing. He had crowds of hearers from all parts of Europe. Protestant refugees were invited upon his lectures and discourses and went back carrying with them the impression made upon them by his doctrines and personality. Thus was he able to stamp himself ineffacably upon the religious thought of his own and aftertimes, and to cause Geneva to sustain to the Latin nations in particular a relation similar to that subsisting between Wittenberg and the Germanic. The weight and permanence of the influence he exerted was due partly to his own idiosyncrasies. Both his mode of thinking and point of action were measurably determined by his natural temperament and his physical debility. He
CALVINISM—CALVINISTIC METHODISTS

was composed principally of will and brain, with too little of the tenderer sensibilities to sweeten the action of the one or to rectify the aberrations of the other. Naturally enough then he made the doctrine of God’s sovereignty the keystone of his system, and could conceive of heresy as being none other than the unpardonable sin. The same combination of volitional and intellectual genius made him also a born organizer, enabling him to compact and mature the reform tendencies of the times into a corporate whole where before everything had been incipient and sporadic.

Calvinism is Augustinianism in its developed and Protestant form, the two theologians coinciding in their views of predestination, sin and grace, though differing in the matter of justification and other less important matters. The keynote of Calvinism is not predestination, as is sometimes claimed, but divine sovereignty, out of which, understood as Augustine and Calvin understood it, predestination issues as a necessary corollary. Predestination so derived carries with it the notion that those who are elected to be saved are so elected by the arbitrary action of the divine will;—He hath mercy on whom he will have mercy, and whom he will he hardeneth. The motive, therefore, leading to God’s exercise of grace in specific cases has its inexplicable grounds in the mind of God, and is nowise referable to any condition existent in the sinner. "Infralapsarianism," "Permissive Decree," etc., are merely philosophical attempts to relieve divine arbitrariness from the charge of immorality.

Among Calvin’s most important works are "Christiane Religionis Instituio" (1536); "De Necessitate Reformandae Ecclesiae" (1544); "Commentaires sur la concordance ou harmonie des Evangelistes" (1561); "In Novum Testamentum Commentarii"; "In Libros Psalmorum Commentarii"; "In Librum Geneseeorum Commentarii." The first edition of Calvin’s whole works is that of Amsterdam (1671, 9 vols. fol.), but this has been superseded by the definitive and critical edition begun by J. W. Baum, E. Cunizit and E. Reuss, and finished by Lobstein and Erichson (59 vols., Brunswick and Berlin 1863–1900). By the Calvin Translation Society, his works have been collected, translated into English in 51 volumes (1843-55). Consult for biography Beza, T. de (Geneva 1564, new ed., 1869), the original life, written a few months after Calvin’s death; Bolsec, J. (Lyons 1577; new ed., 1875), written from the Roman Catholic standpoint; Henry, P. (3 vols., Hamburg 1835–44), English translation abridged and altered by Stebbing (London 1851); Dyer, T. H. (London 1850); Bungener, F. (Paris 1863, English trans., Edinburgh 1863); Staehelin, E. (Eibergen 1863); Pierson, A. (Amsterdam 1883–91); Walker, W. (New York 1906); all of which are written from a Protestant point of view. A very impartial and valuable book from a Roman Catholic is that by Kampschulte, F. W., Johann Calvin, seine Kirche und sein Staat in Genf (Leipzig 1889-99). An exhaustive work in the very same line is that by Durrermegue, E. (Lausanne 1899–1908), containing many original drawings, facsimiles, etc., and is the work of a lifetime. For detailed history of the life of Calvin, consult d’Aubigné, M., "History of the Reformation in Europe in the Time of Calvin;" Fisher, G. P., "The Reformation;" Schaff, Philip, in "History of the Christian Church" (Vol. VII, pp. 257-1844, New York 1892); article on "Calvin" in the "Schaaff-Herzog Encyclopedia of Religious Knowledge." A very complete bibliography is given in Schaff’s "Credos of Christendom." See INSTITUTION OF THE CHRISTIAN RELIGION.

CHARLES H. PARKHURST.

CALVINISM. The system of religious thought taught by John Calvin, which maintains that God is the sovereign ruler of the world and every good thought comes directly from him. The conception of the sovereignty of God did not originate with Calvin; it is as old as the Hebrew writings; but he emphasized it in such a way that it impressed itself upon the religious thought of his day and has continued to be the conception of God held by all Christian denominations and by many of whom it is made such a cardinal belief that the possibility of doubting it is not even brought into question. The dominant features of Calvinism impressed themselves upon his followers so thoroughly that they became a moving power in the lives of people. Calvin followed the belief in predestination to its logical conclusion and he proclaimed that some were born to life and some to damnation; he taught that regeneration could be obtained only through the spirit of God acting upon the human heart; that God will keep to the path of righteousness only those to whom he has given regenerating grace, and that he who is elected will continue in the way of righteousness. Calvinism emphasizes the unchangeable nature of God, his never-dying love and his justice; for the manifestation of these, his great and glorious attributes, he created the world and all that is therein. He foreordains everything that comes to pass; and the world moves forward according to his plans. Calvinism lays stress upon election, redemption, bondage of will, grace and the perseverance of the saints. According to Calvinism the fall of man was predestined, and all descendants of Adam have inherited his sin and the accompanying punishment.

All Calvin’s religious beliefs are logically stated and developed in his "Institutio Christianae Religionis;" but, with all his care, he left certain questions unanswered; and these have divided his followers into two camps or schools, the "Supralapsarian" and the "Infralapsarian," who differ principally on the order of the divine decrees. The former looks to the final result, as the first thing contemplated in these decrees; whilst the latter tries to soften the pronounced theory of predestination by having God permit man to fall. This softened form of predestination is the one generally accepted by Calvinists. (See CALVIN, JOHN.) Consult Bright, "Select Anti-Pelagian Treatises of St. Augustine" (London 1890); Calvin, "The Institutes of the Christian Religion;" (Philadelphia); Hodge, A. A., "Commentary on the Westminster Confession of Faith" (Philadelphia 1869); Kuypers, A., "Calvinism, The Stone Lectures" (New York 1898).

great evangelistic movement in the 18th century, differed with regard to the doctrines of grace, Wesley being Arminian, and Whitefield Calvinistic. Whitefield may be regarded as the founder of Calvinistic Methodism. Other names, and especially that of Howell Harris, of Trevecca, should be mentioned in connection with it. In its distinctive form it dates from 1725, but did not completely sever its connection with the Church of England till 1810. In government it is now Presbyterian. Its great seat is Wales and it is claimed as the only denomination in Wales of purely Welsh origin. The Calvinistic Methodists exist in three divisions: the Whitefield Connection, 1741; Courtenay's Huntington's Connection (Huntingdonians) 1748; Welsh Methodists, 1750.

CALVO, kāl′vō, Carlos, Argentine jurist and author: b. Buenos Aires, 26 Feb. 1824; d. Paris 1906. On 25 June 1860 he was accredited to the courts of Paris and London as minister plenipotentiary, and resigned after having fulfilled his special mission. In 1885 he became Argentine Minister at Berlin. In 1869 he was elected a corresponding member of the Paris Academy of Moral and Political Sciences, and later received the decoration of an officer of the Legion of Honour. He wrote numerous works, the most important of which are: 'Complete Collection of Treaties, Conventions, and Other Diplomatic Acts of All the Latin-American States' (15 vols., 1862-69); 'Historical Annals of the Revolution in Latin America' (3 vols., 1864, and late dates); 'International Law in Theory and Practice' (2 vols., 1870-72, 5th ed., in 6 vols., Paris 1896), a work considered by jurists as one of the most remarkable on its subject; 'The Emigration and Colonization' (1875); 'Dictionary of Public and Private International Law' (2 vols., 1885); 'Manual of Public and Private International Law' (3 ed., 1892). The 'Calvo Doctrine,' advanced by him, provided that the collection of pecuniary claims made by citizens of any country against the government of another country should never be made by force. Practical application of that doctrine to crises that arose subsequently was urged by the Argentine Minister for Foreign Affairs, Dr. Luis Maria Drago (q.v.), whose name has therefore been associated with South and Central American protests against the employment of foreign naval or military forces to coerce debtor nations on those continents.

CALVUS, Gallus Licinius Macer, Roman orator and poet, a son of the annalist and orator of the same name: b. 82 a.c.; d. about 47. He left 21 orations, but few fragments survive. One of these, against Vainius, whose counsel Cicero was, produced so powerful an effect that the accused interrupted the orator and exclaimed, 'Judges, am I to be condemned because my accuser is eloquent?' His poems were ranked with those of Catullus. He is often praised by Cicero (Brutus, 289-85; Ep. ad Fam., 15, 21). The fragments of Calvus's writings have been collected by Plessis (Paris 1896).

CALX, properly lime or chalk (hence calcareous earth*); but the term is more generally applied to the residue of a metal or mineral which has been subjected to violent heat, burning or calcination, solution by acids or detonation by nitre, and which is or may be reduced to a fine powder.

CALYCANTHUS, a genus of plants of the family Calycanthaceae. Four species of American fragrant shrubs, often grown for ornament. C. floridus and C. ferritis are found in the Alleghany Mountains from Pennsylvania southward; C. occidentalis, in California. They are popularly known as sweet-scented shrub and Carolina or American allspice. The leaves are green and rather large, and the flowers usually some shade of chocolate or purple; both are sweet-scented. In the northern United States the species are scarcely hardy, though some thrive in the vicinity of New York city upon well-drained, rather rich soil in somewhat sheltered situations.

CALYDON, an ancient city of Eetolia, celebrated in the stories of King Ceneus, the Calydonian boar and Dejanira and Hercules. The Romans, according to their measurement, placed it at seven and one-half miles from the Ionian Sea on the river Euenus. The heroes, Meleager, Tydeus lived there. In the reign of Augustus 31 a.c. the inhabitants were moved to the city of Nicopolis which they founded to commemorate the victory of Actaeon. Recent explorations point to the site of the city at Kastro of Kurtagà on the Euenus.

CALYDONIAN BOAR, in Greek mythology, a boar sent to lay waste the fields of Ceneus, King of Calydon, the ancient capital of Eetolia, when he omitted a sacrifice to Artemis. The goddess sent the boar when Ceneus was absent on the Argonautic expedition. No one dared to face the monster, until Meleager, the son of Ceneus, was bidden by heroes, pursued and slew him. The Curetes laid claim to the head and hide, but were driven off by Meleager. Later accounts make Meleager summon to the hunt heroes from all parts of Greece, among them Atalanta, who gave the monster the first wound. This hunt is often found in Greek art. The best known is in the pediment of the Temple of Athena Alea at Tegea by the great sculptor, Scopas, some fragments of which are now in Athens. Consult Gardner, E. A., 'A Handbook of Greek Sculpture,' (pp. 378-81, London 1911).

CALYMENE, kāl′i-mē-nē, a genus belonging to the fossil order of the trilobites, characteristic of the lower and middle Ordovician formations of the Lower Silurian strata of Europe. In this genus the head is almost semi- circular and deeply divided by longitudinal furrows. The eyes are situated on the lateral lobes. The rings of the thorax and abdomen are difficult to distinguish from each other. The thoracic segments are from 10 to 14 in number. The abdominal rings are distinct and never attached to each other. The genus includes about 20 species, of which the Calymene Flumenbachii may be taken as the type. The members of this genus have the power of rolling themselves up like a ball.
CALYPSO, in Greek mythology, a daughter of Atlas (some say of Nereus and Doris, or of Oceanus and Thetis). She inhabited the woody island Ogygia situated deep in the ocean, and lived remote from all intercourse with gods and men. She rescued the shipwrecked Odysseus and kept him with her seven years; but though she promised him immortality, she was unable to fulfill his desire to return to Ithaca. At the command of Zeus, brought by Hermes, she allowed him to depart on a raft of his own making. Grief for his departure brought about her death.

CALYPTREA, a genus of gasteropod mollusks belonging to the family of the Calyptraeidae, resembling limpets in certain characteristics, but differing from them in structure. This genus consists of small marine shellfish, coiled in form, but sometimes very flat; they are fragile, and are distinguished by a conical shell or testaceous process attached to the bottom of the cavity of the shell. The branchiae of this mollusk are composed of long and thin hairlike filaments. It is sometimes found as a fossil.

CALYPTREIDAE, a family of limpets, including those called slipper limpets or cup-and-saucer limpets. See LIMPET.

CALYX, in botany, the exterior covering of a flower; that is, the outermost floral envelope consisting of a circle or whorl of leaves external to the corolla, which it encloses and supports. The parts or leaves which belong to it are called sepals; they may be united by their margins, or distinct, and are usually of a green color and of less delicate texture than the corolla. In many flowers, however (especially monocotyledons), there is little or no difference in character between calyx and corolla. In some groups of plants the calyx is wanting.

CAM, kä̂n, Augustus Nicolas, French sculptor: b. Paris 1822. He was a pupil of Rude; his first works represent small animals, but he chose the large beasts and birds of prey for his subjects. Among his best-known works are 'Linnets Defending Their Nest Against Rats'; 'Tiger in Conflict with a Crocodile'; and 'Eagle and Vulture Wrangling over the Carcass of a Bear.'

CAM, kä̂n, or CAO, kä̂n, Diogo, Portuguese explorer of the 15th century, who followed up the course of Prince Henry of Portugal, sailed along the west coast of Africa, and in 1484 discovered the mouth of the Congo, near whose bank an inscribed stone erected by him as a memorial was found in 1829. He then continued on to Cape Cross, where he also left a pillar dated 1485. This monument is now at Kiel, and three others which he erected are in the museum of the Lisbon Geographical Society. On Cam's return from his first voyage, his sovereign, Joan II, ennobled him (April 1484). He established Christianity in one of the Kongo states.

CAM, kä̂n, an English river formed by the junction of two streams, one of which (the Granta) rises in Essex and flows northwest, while the other (the Rhee) rises in the north of Hertfordshire, and flows northeast. The united stream flows sluggishly northward through Cambridgeshire, and falls into the Ouse some four miles south of Ely after a course of about 40 miles. The university town of Cambridge is situated on its banks a few miles below the confluence of the head-streams. It is navigable to Cambridge and is famous in connection with the boating races of the students of Cambridge University.

CAM, in machinery, a simple contrivance for converting a uniform rotary motion into a varied rectilinear motion, usually a projecting part of a wheel or other revolving piece so placed as to give an alternating or varying motion to another piece that comes in contact with it and is free to move only in a certain direction.

CAM AND ISIS, a familiar couplet by which the sister universities of Cambridge and Oxford are often mentioned. The allusion is to the rivers on which they are situated.

"May you, my Cam and Isis, prosper long;"  
The right divine of kings to govern wrong."  
POW. "The Ducund."  
"The dropping Muses, (Sir Industry,)  
Brought to another Castalia.  
Where Isis many a famous nursing breed  
Of genius, that they may in ages reared  
In pensive mood."  
THOMSON. "Castle of Indolence."

CAMAGUEY, Cuba, (formerly Puerto Principe), (1) town, capital of the province of Puerto Principe, 170 miles northwest of the city of Santiago de Cuba. It was originally founded in 1515 at Nuevitas, the site of an old Indian village, on the northern coast, but was moved to its present site in 1516. For a time after 1800 it was the seat of government for the Spanish West Indies, and until the end of Spanish rule was an important military post. It is the largest inland city of the island, and is connected with its port, Nuevitas, by railroad. It is the centre of a cattle-raising district, and exports cattle, hides, etc.; sugar also is cultivated somewhat in the vicinity and exported. The town is very medieval in appearance, the streets are narrow and the houses old; during the American occupation a number of wells were bored to obtain a pure water supply, the streets were repaired, a good drainage system introduced and buildings for schools remodeled.

(2) Province, east of the centre of the island, bounded on the east by Oriente and on the west by Santa Clara; area, 11,000 square miles. The north of the province is mountainous, the most of the surface being high tableland affording excellent pastureage. The chief industry is cattle raising, which, though it deteriorated during the war, is being rapidly revived, and the number of cattle largely increased; the finest horses on the island are also raised here. The province is also well wooded, and lumbering is an important industry; the minerals include iron, copper, and asphalt, all of which are mined to some extent, asphalt being of the most commercial importance. General agriculture is carried on mostly in the vicinity of the town of Puerto Principe, and its port, Nuevitas; sugar is the most important agricultural product. The province was a centre of the insurrectionary movement, and Cubitas in the northern part was the seat of the insurgent government in 1896-98. Camaguey is the second province of Cuba in size but is least densely populated.
CAMMIEU, ká-má'-ye, or CAMAYEU, a painting wherein there is only one color, and where the lights and shades are off gold, wrought on a golden or azure ground. When the ground is yellow the French call it cirage; when gray, grisaille. This kind of work is chiefly used to represent bas-reliefs. The Greeks called pieces of this sort μονοχρωμα. The technique is still used in two or three different colors, which, however, do not represent the natural colors of the objects depicted.

CAMAJUANI, ká-má-hwá'-né, Cuba, an inland city in the province of Santa Clara, about 20 miles from the north coast of the island. It has rail connection with the capital and other northern cities. Pop. about 5,000.

CAMALDOLITES, CAMALDULIANS, or CAMALDUNIANS, a religious order established in 1012 by Saint Romuald, a Benedictine of Ravenna and a member of the family of the dukes of Ravenna, in the valley of Camaldoli, near Arezzo, in the Apennines, and continued to exist until 1911. They were originally hermits living in separate cells, but as their wealth increased the greater part of them associated in convents. They existed in Italy, France, Germany and Poland. In the 18th century there were five independent fraternities of them, which are here mentioned in the order of their foundation: (1) at Camaldoli; (2) at Murano in the Venetian territory; (3) on Monte Corona, near Perugia; (4) at Turin; (5) the French fraternity, the first chapter of which was that of Notre Dame de la Consolation. They all held in common white garments, and the austerer rules of the Benedictines. The hermits wore beards, and had still more severe rules than the monks in regard to fasting, silence and penances. Their life was devoted to contemplation rather than to active work. A small branch of the order, consisting of nuns, was founded in 1086, which has now five convents in Italy. There is in the vicinity of Naples a mountain which takes its name from a convent of the Camaldoli situated on its top, from which the traveler enjoys a prospect of remarkable grandeur and beauty. The order has greatly declined, but still has several monasteries in Italy, one in Poland and one in Brazil. Its greatest members have been Gratian, the canonical jurist of the 12th century, and Pope Gregory XVI (1831-46).

CAMALIG, ká-ma-lej, Philippines, a town in the southeast part of the island of Luzon, situated within six miles west-northwest of the city of Albay in a plain near the source of the Juanay River. Hemp-growing is the leading industry. Pop. 14,688.

CAMA Y LIBERMORE, ká-ma'-rá é lv-er-mo-ré, Manuel de la, Spanish naval officer. b. in Malaga in 1836. He was educated at the naval academy in San Fernando, and served in the Mexican campaign as staff officer of the French general, Francois, Viscount de Gravière, and later acted as sailing master and lieutenant of the Villa de Madrid and the Veredora. He was active in the campaign against Peru and Chile, and in the struggle with Cuba (1868-78); and commanded a squadron in the Philippines as captain. Later he became chief of the naval commission to the United States and London, and rear-admiral. He commanded the squadron in the Philippines during the progress of the Spanish-American War. On 16 and 17 June the Cadiz reserve squadron under Admiral Cámara left port and sailed eastward through the Mediterranean. His fleet included troopships convoyed by the Pelayo and the best of the men-of-war, except those with Cervera in the West Indies. The United States consul at Port Said protested against permitting the Spanish fleet to refill its bunkers with coal there; nevertheless Cámara received orders to proceed through the Suez Canal. At this juncture an official bulletin of the Navy Department at Washington announced that Commodore Watson would "take under his command an armed squadron with cruisers and proceed at once to the Spanish coast." That was on 27 June. As though to emphasize the threat came Cervera's defeat on 3 July. On 6 July Cámara's squadron was recalled to protect the Spanish coast; and so Watson's fleet, which had scarcely begun to exist, had yet completely fulfilled its destiny. In his capacity as chief of the training ships for cadets and captain-general of the department of Ferrol, he became vice-admiral in 1903 and retired in the same year.

CAMARASAURUS, ká-ma-ra-só'-rí'su, a genus of amphibious dinosaurs (see DINOSAURIA), resembling the brontosaurus but of more massive proportions, with heavier fore limbs and shorter tail. An incomplete skeleton found in the Jurassic strata near Cañon City, Colo., was the first of these gigantic animals discovered in America. It was deposited in the American Museum of Natural History, New York. The length of this animal was estimated by Professor Cope at 75 feet; its name was suggested by the hollow-chambered vertebrae of the back and neck. The atlantosaurus, of which the femur is over six feet long and two feet across at the head, was probably the same animal.

CAMPARUE, La., ká-má-ró', France, an island in the department of Bouches-du-Rhône, southeast France, formed at the mouth of the river by its two principal branches. It has an area of about 300 square miles. It is protected from the inundations of the river by dykes, and is mostly an unhealthy tract of pools and marshes, only a small portion of it being cultivated. Horses and cattle are raised on the island.

CAMAQUILA, ká-má-ra-lé'ya, a word first used in Spain, but now in other countries also, to express the influence of certain persons in obstructing the operation of the official organs of government. When Ferdinand VII, in 1814, returned to Spain, he was surrounded by flatterers, who prevailed upon him to violate his promise of giving the people a constitution. They were called camarilla either from the room where they remained in waiting, or in allusion to the Council of Castile (Cámara de Castillo). Until the revolution of 1820 the camarilla consisted mostly of men without talent and passionately opposed to everything new; but when the King recovered his power in 1823 they became more influential and have since repeatedly interfered with the ministers.
CAMARINA—CAMBAY

CAMARINA, ká-ma-ré'na, Sicily, an ancient town on the southern coast of the island, founded by the Greeks from Syracuse in 599 B.C. Its first overthrow, which occurred 553 B.C., was the result of a revolt from the parent city. On its reduction it was razed to the ground, but was afterward rebuilt. It was in an exposed position in the Carthaginian and Roman wars, and was several times taken, retaken and destroyed. Its ruins to-day are about five miles in circumference.

CAMARINES, North and South, Philippines, two provinces in the southeastern part of the island of Luzon. Area, 3,279 square miles. The name is also applied more vaguely to the whole of the southeastern peninsula of the island. The formation of the peninsula is volcanic; the Caraballos range of mountains extends its whole length, from north to south, and seven of its peaks are active volcanoes. One of them, which is continually emitting smoke and flame, is well known to mariners coming from the east and forms a kind of natural lighthouse. The most important product is rice. The soil of the two provinces possesses the same remarkable fertility which accompanies all the volcanic formations throughout the archipelago. Tobacco, sugar, coffee, cocoa and indigo are largely produced for exportation; but the chief occupation of the inhabitants of the Camarines is the culture of the pineapple, and the manufacture of pina cloth (q.v.). The women of the Camarines are regarded as the most artistic embroiderers in Luzon of the delicate pina and also display singular skill in the working of gold and silver filigree. All the artificers in precious metals are women; and some articles of jewelry, especially their neck chains, are very beautiful. The agriculture of the Camarines indicates in some respects a degree of progress beyond that of the other provinces of the island. The ox, and occasionally the horse, are used in plowing, instead of the slow, unwieldy buffalo, so generally preferred by the native East Indian farmer. The Camarinions have also discarded the primitive plow, formed from a single piece of crooked timber, with a point hardened by fire; and have substituted in its place a more modern style of implement. The provinces have well-constructed roads; the rivers abound in fish and are crossed by substantial stone bridges. The Naga River, which drains the lakes Bato, Baaq, Buhi and Iryga, and empties into the Bay of San Miguel, is navigable about 40 miles for vessels drawing not more than 13 feet of water. The industrial development of these provinces has been accompanied by a notable increase in population; and this is composed, with but small exception, of the brown race of the Philippines, which has yielded so readily to the influences of Christian civilisation. The Camarines have not had their progress retarded like other provinces of Luzon, by the troublesome presence of the wild negrito race.

CAMASS, a genus (Comassia) of plants of the lily family, including six species, natives of western North America. They have narrow leaves and many-flowered racemes of blue, purple or white flowers. Some of the species are in cultivation. The bulbs of the common camass (C. quamash) of the northern Pacific Coast were a favorite food of the Indians.

CAMASS-RAT, a rodent quadruped of the northwestern United States, similar to the gopher (q.v.). Its chief food is the camass (Comassia esculenta).

CAMBACÉRES, kám-bás-sá-rás, Jean Jacques Régis de, Duke of Parma, French statesman: b. Montpellier, 18 Oct. 1753; d. Paris, 8 March 1824. His zeal and talents soon obtained him distinction, and the office of a counsellor at the cour des comptes at Montpellier. At the beginning of the Revolution he received several public offices, became in September 1792 a member of the Convention, and labored in the committees, particularly in the committee of legislation. On 12 Dec. 1792 he was commissioned to inquire of Louis XVI whom he desired for his counsel, and it was on his motion that the counsel was allowed to communicate freely with the King. In January 1793 he declared Louis guilty, but disputed the right of the court to pass sentence, and voted for his provisional arrest, and in case of a hostile invasion, death. On 24 January he was chosen secretary of the Convention. As a member of the Committee of Public Safety he reported, in the session of 26 March, the treason of Dumouriez. In August and October 1793 he presented his first plan for a civil code, in which his democratic notions were displayed. Subsequently, as a member of the Council of the Five Hundred, he presented the Projet de Code Civil (1796), which became the foundation of the Code Napoléon. On 20 May 1797 he left his seat in the council. A year afterward he appeared among the electors of Paris; and after the revolution of the 30th Prairial, VII (19 June 1799), was made Minister of Justice. On the 18th Brumaire he was chosen second consul, and in that office made the administration of justice the chief object of his attention. After Napoleon had ascended the throne, Cambacérès was appointed arch-chancellor of the empire, and after obtaining many high distinctions, became in 1808 Duke of Parma. During the campaign against the allied powers in 1813, Cambacérès was made president of the council of regency. At the approach of the allies in 1814 he followed the Court to Bayonne, and, from that place sent his consent to the abdication of the Emperor. When Napoleon returned in 1815 Cambacérès was again made arch-chancellor and Minister of Justice, and subsequently president of the Chamber of Peers. After the second fall of Napoleon he was banished, as a regicide, but in 1818 was permitted to return.

CAMPALUC, kám-ba-lúk', the name by which the city we now call Peking became known to Europe during the Middle Ages. It was the form given by Marco Polo (q.v.) to the Tartar word, Pambaluc.

CABAY, kám-há', British India, a seaport of Hindustan. Bombay presidency, the chief town of a native state of the same name, at the head of the Gulf of Cambay, 76 miles north-northwest of Surat. It was once a place of importance, but owing to the silting-up of the gulf, and the bore or rushing tides, has greatly declined. Some of the tides rise 6 to 7 feet in an hour, rising as high as 33 feet, and are very
DANGEROUS TO SHIPPING. AMONG THE BUILDINGS ARE SEVERAL MOSQUES AND HINDU TEMPLES, AND MANY RELIGIOUS STRUCTURES OF THE JEWS. THE NATIVES ARE EXPERT JEWELERS AND GODSMITHS, AND AGATE, CARNELIAN AND ONYX ORNAMENTS ARE EXPORTED. THE TRADE IS CHIEFLY IN COTTON, IVORY AND GRASS; THE LATTER PRODUCT BEING SHIPPED TO BOMBAY. POP. c. 1,870,000.

CAMBERT, KAHN-BAIR, ROBERT, FRENCH MUSICIAN: B. PARIS, ABOUT 1628; D. LONDON 1677. HE FOUNDED THE ROYAL ACADEMY OF MUSIC, NOW THE PARIS GRAND OPERA. HE WAS THE FIRST FRENCH OPERA COMPOSER, HIS WORKS INCLUDING 'LA PASTORALE' (1659), THE FIRST FRENCH MUSICAL COMEDY; 'ARIANET ET BACCHUS' (1661); 'POMONE' (1671); AND 'ADONIS.' FOR 22 YEARS HE WAS ASSOCIATED WITH THE ABBE PERRIN IN THE CONDUCT OF FRENCH OPERA, AND GOING TO ENGLAND SUBSEQUENTLY BECAME 'MASTER OF THE MUSIC' TO CHARLES II.

CAMBERWELL, ENGLAND, A METROPOLITAN AND PARLIAMENTARY BOROUGH OF LONDON, ON THE SOUTH OF THE THAMES, IN SURREY, BETWEEN LAMBETH ANDDeptford. Area, 4,480 ACRES. THE BOROUGH HAS INAGURATED A GREAT WORKING-CLASS HOUSING SCHEME. ITS THREE DIVISIONS, NORTH CAMBERWELL, PECKHAM AND DALWICH, EACH RETURN ONE MEMBER TO PARLIAMENT. POP. (1911) 261,328. CONSULT ALLPORT, 'COLLECTIONS ILLUSTRATIVE OF CAMBERWELL AND NEIGHBORHOOD' (1841); BLANCH, 'YE PARISH OF CAMBERWELL: ITS HISTORY AND ANTIQUITIES' (1875).

CAMBERWELL BEAUTY, THE COMMON ENGLISH NAME OF THE FANESIA OR FANESIA ANTIPOP, A LARGE AND BEAUTIFUL BUTTERFLY FOUND IN GREAT BRITAIN, BUT MUCH MORE COMMON ON THE CONTINENT OF EUROPE AND IN NORTH AMERICA, WHERE IT IS CALLED MOURNING CLOAK. IT MEASURES THREE INCHES OR MORE BETWEEN THE EXTERIOMITIES OF ITS EXTENDED WINGS, WHICH ARE OF A DARK-BROWN COLOR, WITH A BROAD LIGHT-YELLOW BORDER, AND A ROW OF BLUE SPOTS NEAR THE EDGE.

CAMBIV, IN BOTANY, THE LAYER OF DELICATE THIN-WALLED CELLS SEPARATING THE WOOD FROM THE BAST IN A GREAT MANY STEMS AND IN A CROSS SECTION APPEARING AS A RING. THE GROWTH OF THE STEM TAKES PLACE BY THE DEPOSITION, ON THE OUTSIDE OF THE WOOD, OF NEW WOOD-LAYERS FORMED FROM THE CAMBIUM, AND, ON THE INSIDE OF THE BAST, OF NEW LAYERS OF BAST FORMED FROM THE OUTER CELLS OF THE CAMBIUM LAYER. TO THIS CIRCUMSTANCE—that it produces different kinds of cells—it owes its name (connected with the Latin cambire, to exchange). In conifers and dicotyledonous woody perennials the primary bundles are arranged in a circle, and their cambium layers are thus made to form a more or less continuous ring of cambium in the stem. By the deposition of new layers of wood and bast regularly taking place, especially in spring, at the inner and outer surfaces of this cambiumring, the stem is caused to increase in thickness.

CAMBLES, A GLUTINOUS KING OF LYDIA, WHO IS SAID TO HAVE EATEN HIS OWN WIFE, AND AFTERWARD KILLED HIMSELF FOR THE ACT.

for the surcharge of the Tonlé-Tom, the Tonlé-Sap ("Sweet Water River"), expanding in the Great Lake, 100 miles by 25 miles in area, with a maximum depth of 65 feet. The greater part of the country is low, well watered and heavily timbered. The climate presents a dry and wet season (June to November) and is fairly healthy. The soil is amazingly fertile, producing large quantities of rice, besides silk, pepper, maize, sugarcane, cotton, betel, tobacco, indigo, coffee, etc. Timber is abundant. Gold and precious stones are found, besides iron, tin, limestone and salt. The breeding of cattle is a flourishing native industry. Among wild animals are the elephant, wild buffalo, deer and tiger. The Cambodians were formerly a highly cultured and civilized race. Various architectural remains, witnessing to former greatness, are found throughout the country. The present population is very mixed, being composed of Annamites, Malays and Chinese, with a seasoning of aboriginal racial elements. The religion is Buddhism. Polygamy is practised, the number of wives being regulated by the social status of the husband. In early times Cambodia was a powerful state to which even the kings of Siam paid tribute, but it gradually fell into decay, until about the close of the 18th century the Siamese annexed part of Cambodia to their own land, and reduced the rest of the country to a state of dependency.

France, on 11 Aug. 1863, concluded a treaty with the king of Cambodia, Nerodom, placing Cambodia under a French protectorate. This treaty was superseded by that of 17 June 1884, under which the king of Cambodia acceded to all the reforms, administrative, judiciary, financial and commercial, which the government of France might institute. The present King Sisowath succeeded to the throne in 1907. The chief imports are salt, sugar, wine and various manufactured goods, such as textiles and arms; the exports include salt-fish, spices, cotton, tobacco and rice. The external trade is mostly passed through Saigon in Cochin-China. The capital is Phnom-Penh (pop. 54,621). Pop. 1,654,252, of which about 1,100 are Europeans, exclusive of military.

CAMBODIA, or MEKONG, a large river of southeastern Asia, which rises in Tibet, passes through Yunnan, a province of China, Laos, Anam, Cambodia and French Cochin-China, and falls into the Chinese Sea by several mouths, after a course of about 2,600 miles. Its navigation is much interrupted by sandbanks, rapids, etc., at various points of its middle and upper course. The Tonlé-Sap (a lake covering an area of 100 square miles in the dry season and 770 square miles in the rainy season), on the frontiers of Cambodia and Siam, is connected with the Mekong.

CAMBON, käⁿ bôn, Jules Martin, French diplomatist: b. Paris, 5 April 1845. He studied for the law and fought in the Franco-Prussian War, reaching the grade of captain. Entering the civil service, he became prefect ofConstantine in 1878, prefect of the Department du Nord in 1882, prefect of the Rhone in 1887, governor-general of Algeria in 1891 and Ambassador to the United States 1897-1902. In that capacity he represented Spain in drawing up the Spanish-American protocol in 1896. From 1902-07 he was Ambassador at Madrid, and from 1907-13 was Ambassador at Berlin, where he made strenuous and successful efforts to find a peaceful solution of the Agadir crisis of 1913. He is a brother of Pierre Paul Cambon (q.v.).

CAMBON, Pierre Joseph, French statesman: b. Montpellier, 17 June 1754; d. near Brussels, 15 Feb. 1820. Engaged in commercial pursuits, he became interested in the Revolution, and on hearing of the flight of Louis XVI he caused the republican government to be proclaimed in his native town. He was sent to the legislative assembly, and while supporting the cause of democracy, gave particular attention to financial matters. Most of the great measures which enabled the government to get through the revolutionary period were suggested or controlled by him; and to him the honor is due of having laid the foundation of the modern financial system of France. He promoted the confiscation of the estates of the emigrés in 1792, and made, after 10 August, a report in which he argued that Louis XVI, having held a secret correspondence with the enemies of France, should be deposed.

He presided over the last sittings of the legislative assembly, and afterward took his seat as a member of the Convention. Here he opposed with equal energy the partisans of monarchy and of terrorism. When Louis XVI was arreigned before the Convention, he voted for his immediate death, and against the appeal to the people. He opposed the creation of the revolutionary tribunal, and insisted upon trial by jury. At the opening of the Convention, he had been appointed member of the Committee on Finances; 7 April 1793 he entered the Committee of Public Safety. On 2 June, when the Gironists were threatened by the infuriated mob calling for their proscription, he boldly took his place among them, hoping to be able to save them from violence and arrest. The next year he made another report on the administration of finances, which is considered a masterpiece of financial ability, and gives a full sketch of the plan which was afterward adopted for the regular registration of public debt. In the conflict which brought on the revolution of the 9th Thermidor, Cambon took part against Robespierre and his adherents; but though he had been instrumental in their defeat, he was charged with having been the author of a warrant was issued against him. He succeeded in eluding arrest, and, when amnesty was proclaimed by the Convention, he retired to an estate in the vicinity of Montpellier. In 1815 he was elected a member of the Chamber of Deputies. On the second return of the Bourbons, he was exiled as a regicide.

CAMBON, Pierre Paul, French diplomatist: b. Paris, 20 Jan. 1843. He was graduated at the Ecole Polytechnique in 1863, and, after serving as secretary to Jules Ferry, became secretary of prefecture for the Alpes-Maritimes, prefect successively of the departments of the Aube, Doubs and Nord and French resident-general in Tunis. He was appointed Ambassador to Spain in 1880, was transferred to Constantinople in 1890 and to London in 1898. To him is due in large measure the sealing of the Anglo-French entente.

CAMBORNE, England, market town of Cornwall, 11 miles northwest of Falmouth, situated on the slope of a gently rising hill. There
is a granite church in the Perpendicular style, restored in 1862. It also contains a market-hall, a mining school, a workingman's institute, and a museum of mineralogy. Near it are extensive lead, tin and copper mines, and mining machinery is manufactured. Pop. 15,829.

CAMBRAI, kà̃brẵ, or CAMBRAY, France (Flemish, KAMBRYK), fortified city on the Scheldt, in the department Nord, 37 miles south-southeast of Lille by rail. From this place the linen cloth known by the name of cambric got its name. Cambrai is the seat of an archbishop. The Revolution stripped it of all its principal ornaments. The beautiful cathedral and the tomb of its archbishop, the celebrated Fénélon, were razed to the ground. There is a new monument to the memory of Fénélon in the present cathedral, a modern building of indifferent architecture. There is a large and handsome modern Hôtel de Ville and an ancient belfry tower. Cambrai is the seat of a diocesan seminary, communal college and has a valuable public library. Cambric and other linen goods, cotton, leather goods, sugar, soap, paper, furniture, etc., are manufactured; and there is a trade in grain, oil-seed, hemp, etc. Cambrai is the Camaracum of the Romans. In 1508 the league against Venice was concluded at Cambrai between the Emperor Maximilian, Louis XI of France, and Ferdinand of Aragon; and in 1529 the peace with Charles V. Louis XIV took Cambria from the Spaniards in 1677, and it was finally confirmed to France by the Treaty of Nijmegen in 1678. Pop. 21,791.

CAMBRIA, the Latin name of Wales (the Roman Britannia Secunda), derived from Cymri, the name of the branch of the Celts to which the Welsh belong, by which they have always called themselves.

CAMBRIAK from "Cambria," an ancient name for Wales) is a term applied to the earliest time period of the Paleozoic Era, and to the system of rocks laid down during that period. It was first applied by Murchison and Sedgwick to rocks of England and Wales, about 1835, and indicates the time when animal life on the earth was already highly differentiated. All the great groups of the animal kingdom except the vertebrates were present then and definitely characterized. The principal types, so far as the fossil evidence goes, were Brachiopods and Trilobites, but many others existed, such as mollusks, marine worms, siliceous sponges, graptolites and jellyfish, and by the end of the period starfish and crinoïds. It is probable that plants, such as seaweeds, existed, but the evidence is very obscure. The climate during the Cambrian period was probably warmer, even up to the Arctic Circle, but not torrid. This evenness of temperature may have been due to a much larger part of the earth's surface being covered by water than in later time, or to a difference in the composition of the atmosphere, more carbon dioxide being present. At the beginning of Cambrian time the North American continent was probably larger than now. On the east a sound stretched from Labrador to Alabama, separating an island known as Old Appalachia, which extended east beyond the present coast. Central United States was largely land. On the west, a second sound extended from the Arctic south into Nevada and California, separating another land mass on the west, which also probably reached beyond the western coast.

During Cambrian time the continental land mass slowly sank, and by the end of the Cambrian a great interior sea covered the whole Mississippi Valley and large areas both east and west. Changes in land and sea were also going on in other continents, large parts of which were under water during late Cambrian time. The period was without notable folding, but was marked by great volcanic activity in Wales and Scotland. In China, Norway and possibly at other points, rocks of very early Cambrian, or else of very late Alggonkian Age, bear evidence of glacial origin.

The Cambrian system is fairly well defined at its base, since the rocks are deposited upon the upturned, eroded edges of Alggonkian and older strata, indicating a great time break. The top of the Cambrian grades into the Ordovician, so that geologists are not able to define the line of demarcation. In North America the rocks of the Cambrian system are divided into three series, as follows: (1) The Lower Cambrian, or Georgian, (2) the Middle Cambrian or Acadian, and (3) the Upper Cambrian, or Potsdam (Saratogan). The Lower Cambrian rocks are largely restricted to the long narrow sounds already described. As the continent gradually sank, the areas of Cambrian deposition became larger, and Middle and Upper Cambrian sediments were laid down over much of central United States from the Appalachians to the Sierra Nevada, south as far as northern Arkansas. They have since been eroded from parts of this area, and in still other parts lie hidden below more recent deposits. Cambrian rocks outcrop in large areas in the Appalachian Mountains, the Adirondacks, central Wisconsin, the Ozarks and in many isolated patches in the Rocky Mountains, as well as at numerous other points. The rocks indicate generally a period of tranquil change, the ocean slowly advancing over the sinking continent and islands, just as one may see it to-day along great stretches of coast. The rocks are chiefly shallow water formations, including conglomerates, sandstones and shales, containing fossils by no means unknown. In a few places as at South Mountain, Pa., there are rocks representing lava and volcanic ash interstratified with detrital sediments. In the Appalachian region, the Cambrian sediments vary from 3,000 to 12,000 feet in thickness. Over central United States they are much thinner, but in British Columbia they are reported to reach the enormous thickness of 40,000 feet.

In Europe the Cambrian rocks are generally developed more fully than in North America; thus the conglomerates, sandstones, shales, slates and quartzites of the Welsh Cambrian are fully 20,000 feet thick and contain much volcanic material. They are rocks indicating shallow-water conditions, and show three divisions. They extend from Wales, along Sweden, Norway and Lapland into Russia, having in Sweden a thickness of 2,000 feet. To the east the Cambrian formations thin out, and in central Russia die out altogether, the Ordovician resting directly on the Archaean. There are considerable areas of Cambrian in Germany, Bohemia, France, Portugal and Spain; also in
CAMBRIC — CAMBRIDGE

northeast China, in the Salt Range in India, in Australia and in Argentina.

Charles Laurence Dake,
Assistant Professor of Geology and Mineralogy,
University of Missouri School of Mines.

CAMBRIC, a fine, thin kind of linen cloth manufactured originally, it is said, at Cambrai (q.v.) in French Flanders, whence the name. Cambric is manufactured in the north of Ireland, in England, Switzerland and France, and is now chiefly used for handkerchiefs. The name is also applied to a cotton fabric which is in reality a kind of muslin.

CAMBRIDGE, Ada, the pseudonym of Mrs. George Frederick Cross, Australian novelist, dau. of Sain, Norfolk, England, 2 Nov. 1844. She was married in 1870 to Rev. G. F. Cross and went with him to Australia, where she resided in bush country districts. She is the author of 'My Guardian' (1877); 'In Two Years' Time' (1879); 'A Merchant' (1882); 'A Marked Man' (1891); 'The Three Miss Kings' (1891); 'Not All in Vain' (1892); 'A Little Minx' (1893); 'A Marriage Ceremony' (1894); 'Fidelis' (1895); 'A Humble Enterprise' (1896); 'At Midnight' (1897); 'Mother Familien' (1898); 'Path and Goal' (1900); 'The Devastators' (1901); 'Thirty Years in Australia' (1903); 'Sisters' (1904); 'A Platonic Friendship' (1905); 'A Happy Marriage' (1906); 'The Eternal Female' (1907); 'The Retrospect' (1912); 'The Heart in the Dark' (1913).

CAMBRIDGE, Adolphus Frederick, 1st Duke of, b. London, 24 Feb. 1774; d. 8 July 1850. He was the youngest son of George III, and the uncle of Queen Victoria. He entered the British army as ensign when 16 years of age, and completed his education at the German University of Göttingen. He leaned at first to the side of the opposition on the question of the French war, but afterward sided with the government. He served in the Hanoverian and British armies in several campaigns on the Continent. In 1816 he was sent to Hanover as vicerey, and administered the affairs of the kingdom with wisdom and discretion. In 1837, on the separation of Hanover from the British Crown, he returned to England again. From that period until his death he was best known to the public as the president of charitable societies.

CAMBRIDGE, George William Frederick Charles (2d Duke of), English general, son of the preceding; b. Hanover, 26 March 1819; d. Hanover, 31 Dec. 1894. His rise in the army was phenomenally rapid, and was due to his close relationship to the Crown. When a lad of 19 he became a colonel, and at 26 was a major-general. In 1850 he succeeded his father as Duke of Cambridge, in 1854 was advanced to lieutenant-general, and in 1856 to that of general. He commanded the two brigades of Footguards and Highlanders which formed the first division of the British army. He led these troops into action at the battle of Alma, and at Inkerman had a horse shot under him. He was constitutionally not well adapted for high command in the field, lacking the imperturbability of the born soldier. After his experiences at Inkerman his physician directed him to withdraw for a time from camp life. He retired first to Pera, and soon after to England. On the resignation of Viscount Hardinge in 1856, he was appointed commander-in-chief of the British army. As commander-in-chief he opposed most of the reforms introduced into the army, including short service and the abolition of purchase; but he loyally carried out changes which he did not approve. He retired in 1865. Consult Sheppard, 'Private Life of H.R.H. the Duke of Cambridge' (London 1906); Verner, 'Military Life of the Duke of Cambridge' (2 vols., London 1905).

CAMBRIDGE, England, an inland county bounded on the north by the county of Lincoln; on the west by Northampton, Huntingdon and Bedford; on the south by Hertfordshire and Essex; and on the east by Suffolk and Norfolk. A great part of the northern half of the county belongs to the fen district; farther south it is undulating, and in the southeast some heights occur. The principal rivers are the Cam or Granta, and the Ouse, with the Nene in the north. An important portion of the county, including the Isle of Ely, belongs to the great artificially drained tract known as the Bedford Level (q.v.). About nine-tenths of the total acreage of the county is now productive, and a greater proportion of land is under corn crops than in any other county in the kingdom. Potatoes, turnips and mangold are the chief green crops. The southern portion of the county abounds in dairy farms, celebrated for the production of excellent butter and cheese. The part of the county extending from Cogmagong Hills to Newmarket, and the parliamentary borough of Cambridge, each returning one member to Parliament. Administratively the ancient county embraces the two counties of Cambridge and the Isle of Ely. There are two municipal boroughs, Cambridge and Wisbech. The educational institutions include a day training college for schoolmasters, and the new Homerton undenominational training college for women at Cambridge, and a theological college founded in 1876 at Ely; there are also more than 225 elementary schools in the county. Area, 553,241 acres. Pop. 190,074. See also CAMBRIDGE, University of.

CAMBRIDGE, England, capital of the county of Cambridge, is situated on the Cam, about 56 miles north by east by rail from London. It is a municipal and parliamentary borough, the seat of a celebrated university (see
CAMBRIDGE, University of), and has a large agricultural market.

Geology.— The geological formation of Cambridge and the surrounding district consists chiefly of clay. The following strata are to be found — Chalk, Marl, Cambridge Greensand, Gault, Kimmeridge Clay, Oxford Clay, Amphiill Clay, Cheraton Clay, and some recent alluvium which borders the rivers and tributaries, consisting of peat, sandy loam, etc. The town is made up of three main thoroughfares, two running north and south and the other east and west.

Public Buildings, Libraries, etc.— The city possesses a Guildhall, including municipal buildings, law courts and public free library. There is also a spacious corn exchange, attended weekly by buyers from all parts of the United Kingdom, and a cattle market. Addenbrooke's Hospital is a noted institution, connected as it is with the Cambridge University Medical School. Cambridge was one of the first towns to establish a public free library, which now comprises a central library and a number of branches with a collection of upwards of 50,000 volumes.

Churches.— Cambridge is fortunate in the number of its ancient churches, two of which are worthy of mention. The church of Saint Benedict's is the oldest in the pre-Conquest date. It possesses a tower in the Saxon style of architecture. That of the Holy Sepulchre or "Round Church" is one of four round churches in England, and was probably in existence about the year 1130. The largest parish church is that of Saint Mary the Great (College Church), built in the perpendicular style. Other churches of interest are the Abbey (early English, 13th century), Saint Edward (rebuilt in the 14th century with the exception of the tower which is a work of the 12th century), Saint Michael (13th century), Trinity (about 1274), Saint Mary the Less (1340), Saint Botolph (14th century) and Saint Peter, which has examples of 12th century architecture. The church of Great St. Mary in Cambridge dates from the year 1457, and it is now well represented by its churches. The Roman Catholics have a fine church built in the early decorated style. It was commenced in 1887, through a donation from Yolande Marie Louise de Puffendorf, large congregations. Johnny Stittle, the hedges, occupied a unique position at the end of the 18th and beginning of the 19th century, drawing a large congregation from both town and University. Thomas Hobbes was among the first to let out horses for hire, and the originator of the proverb "Hobson's Choice."

Education.— Cambridge has 20 public elementary schools, including higher grade schools, among which may note the Perse grammar schools, founded by Dr. Stephen Perse in 1615. The Wesleyans are represented in education by the Leys school, the Roman Catholics by Saint Edmund's House, the Presbyterian Westminster College, and more recently from Cheshunt, Herts, to Cambridge, preliminary to the erection of a new college. Homerton College has about 150 female students in training for educational duties.

Railroads.— The railway companies which have connections at Cambridge are the Great Eastern, the Great Northern, the Midland and the London North Western.

Recreation Grounds.— Cambridge is fortunate in its number of common lands and recreation grounds, numbering in all and having a total area of 300 acres. Of the recreation grounds Parker's Piece is a noted cricket and football ground, where all the University matches were played, until they purchased their own grounds.

Government.— The corporation of Cambridge, under the "Municipal Reform Act," consists of a mayor, 10 aldermen and 30 councilors. The University also returns its quota of two aldermen and six councillors. The town returns one member to Parliament.

History.— There is every proof that in its early days Cambridge was an important trading centre. Its situation on the Cam made it easily accessible from the surrounding district for miles around, and provender, fuel and merchandise were conveyed by water to all parts of East Anglia. It was the seat of Stourbridge Fair, one of the largest fairs in England. The Romans occupied the town is evident from the fact that numerous Roman remains have been found at various periods. Miles of ancient earthworks, said to be of British origin, surround Cambridge, and in the town itself there is a large mound called "Castle Hill," probably of Saxon origin and raised as a defense against the incursions of the Danes. In the years 870 and 1010 the town was destroyed by the Danes. William the Conqueror built a castle here in 1068. The year 1110 is alleged to be the date of the origin of the university, at which time, we read that learned monks visited Cambridge to teach philosophy and other sciences. Richard II held a Parliament at Cambridge in 1388.

The town was frequently visited by the plague ("Black Death"), and in 1630 the mortality was terrible. At the time of the Civil War Oliver Cromwell (formerly a student of Sidney Sussex College) represented Cambridge in Parliament, and the town supplied a large number of men for the Parliamentary forces. The plague at Downside did considerable damage both to the colleges and to the Parish churches in 1643. Queen Victoria and her consort visited Cambridge in 1845 and again in 1847, and as Chancellor of the university, the influence for good, exercised by the Prince Consort, was predominant. The King and Queen visited Cambridge on 1 March 1904 to open the new University museums. The second meeting of the British association was held at Cambridge in 1833, and subsequent meetings were held in 1845, 1862 and 1904. Apart from the University, Cambridge would lose much of its importance. The colleges with their various styles of architecture, surrounded by gardens and 'college walks,' are a constant source of delight. The river Cam winds its course through the college grounds for a distance of about three-quarters of a mile. Nine bridges connect the colleges and grounds where nature and art combine. Below the town, the river is the scene of the well-known college boat races which occasion the visit of thousands of people.
Area and Population.—The town covers an area of 3,278 acres. Much house property has been destroyed to make room for the continuous additions to colleges and university buildings, with the result that residents have migrated to adjacent districts. Pop. 40,022.

Bibliography.—Atkinson and Clark, "History of Essex" (1870); on Harvard, "History of Cambridge" (1819); Clark, "Historical and Descriptive Notes on Cambridge"; Cony- beare, "History of Cambridgeshire" (1897); Cooper, "Annals of Cambridge, 693–1853" (5 vols.); "Memorials of Cambridge" (3 vols., 1865); Stubbs, "Cambridge and its Story" (1903).

CAMBRIDGE, Ill., the county-seat of Henry County, a village on the Rock Island and Peoria Railroad, about 28 miles southeast of Rock Island. Surrounded by a productive agricultural district, it has a thriving domestic and export trade in farm produce, grain and cattle, etc. Pop. 1,277.

CAMBRIDGE, Mass., city and one of the county-seats of Middlesex County, situated on the Charles River and the Fitchburg division of the Boston and Maine Railroad, also connecting with the Boston and Albany Railroad; opposite and joined by nine bridges. It was founded in 1630-31, under the name of "Newe-Towne," or "Newtown," and did not receive its present name until several years later. In 1636 the General Court appropriated $2,000 to locate a school in Old Cambridge, which later became Harvard College, now Harvard University. In 1631 Cambridge was 35 miles long and only one mile wide, including the townships now incorporated as Billerica, Bedford, Lexington, Arlington, Brighton and Newton, all these having been gradually separated from it. The city was formerly divided into villages called Old Cambridge, Cambridgeport, East Cambridge and North Cambridge, names which are still used to designate certain districts. It has grown into a populous centre, manufacturing glass, furniture, organs, steam-engines, etc., the total value of which amounts annually to over $45,000,000. Nearly 1,200 retail establishments supply the wants of Cambridge, paying $2,250,000 a year in wages and having sales of over $15,000,000. The first printing office in the United States was located in Cambridge, and the "Bay Psalm-Book," published by Stephen Day and printed in 1640, was the first book from this press. Cambridge has now extensive printing establishments, including the Riverside Press, the Athenaeum Press and the University Press. For historical and literary associations, Cambridge is one of the most famous cities in the United States. The "Craige House," built by Col. John Vassall in 1759, was Washington's headquarters in 1775-76, and afterward became the home of the poet Henry W. Longfellow until his death. On Elm avenue is "Elmwood," the birthplace and home of James Russell Lowell, who lived here 1819-91. A part of the place, bought by public subscription, is preserved as a public park. This city was the home of Oliver Wendell Holmes, William Henry Channing, Margaret Fuller Ossoli, Col. Thomas Wentworth Higginson, Louis Agassiz, John Fiske and Charles Eliot Norton. The fine city hall and land for a park was the gift of a former citizen, Frederick H. Ringde, who also presented the city with a public library, an institution now called the Ringde Manual Training School, and other benefactions which amount to more than $1,000,000. The beautiful Mount Auburn cemetery is partly in Cambridge and partly in Watertown. Among important buildings are those of Harvard University; Radcliffe College; Cambridge Hospital; Manual Training school; the 1st and High Schools; Public Library; and Middlesex County Courthouse. Much has been accomplished toward developing a system of parks which includes nearly the entire river front, and extends around the manufacturing district. In two recent years the total building operations in new factories, fine apartment-houses and private residences amounted to $5,000,000. The total value of taxable property is $130,000,000. The city buildings, land and equipment are valued at $4,000,000; its parks at $3,000,000, and it owns its waterworks which cost $6,500,000. The administration consists of a mayor and city council. Pop. 114,000. Consult Bacon, "Cambridge and Vicinity" (Newark 1892); Page, "History of Cambridge" (Boston 1877); Eyst, "History of Cambridge" (Cambridge 1913). See HARVARD UNIVERSITY.

CAMBRIDGE, Md., a city and county-seat of Dorchester County, 58 miles southeast of Baltimore on the Choptank River near Chesapeake Bay and on the Seafood and Cambridge Railroad. Cambridge was settled in 1664 and was incorporated as a city in 1900. It is governed by a mayor, elected every two years by the city council, which includes the mayor and four aldermen. Cambridge has important manufactures of underwear and lumber and as the centre of a fertile agricultural district has an active trade in farm produce and live stock. Fruit, vegetable and oyster canning industries are carried on to a considerable extent. Pop. 6,407.

CAMBRIDGE, N. Y. village of Washington County, on the Delaware and Hudson Railroad, 28 miles northeast of Albany. The Cambridge Valley Agricultural and Stockbreeders' Association is located here and seed, steel plow, chaplet and knitting industries are carried on. The village was incorporated in 1866. Pop. 1,727.

CAMBRIDGE, Ohio, city and county-seat of Guernsey County, on the Baltimore and Ohio and Pennsylvania railroads, 55 miles north of Marietta. It is situated on a hill 800 feet above sea-level, in a coal and iron region which has also deposits of pottery clay. The industries are chiefly mining and manufactures connected with these resources. The United States census of manufactures for 1914 reported 39 industrial establishments of factory grade, employing 1,656 persons, of whom 1,435 were wage earners, receiving, annually, $1,112,000 in wages. The capital invested aggregated $2,969,000, and the year's output was valued at $3,924,000: of this, $416,000 was the value added by manufacture. Natural gas is used for heating. The city owns and operates the water works. The city has five banks, courthouse, children's home and Carnegie Library. It was settled in 1804.
was incorporated as a city in 1887 and received a new charter of administration in 1893. A mayor, elected every two years, and a council govern the city. Pop. 13,000.

CAMBRIDGE, University of. Situated at Cambridge, England. Its origin is very obscure, and of its early history, before the 12th century, there are only very scanty records. It is clear that a university existed long before the foundation of the oldest college, and that it was powerful enough to claim and to obtain from the town very important privileges, such as immunity from taxation, the right to test weights and measures and to prescribe what amusements should be allowed or forbidden. From the bitter feeling aroused by the possession of these and other privileges frequent serious outbreaks of hostilities arose between the town and the university, resulting in the wanton destruction of valuable records, which has left little or no material for a connected history. It is probable that the university owed its origin to the schools in connection with the priory of Saint Frideswyde and the conventual church at Ely. The earliest recognition of Cambridge as a university is contained in a writ of the 3rd year of Henry II, 1121, ordering all clerks who had been excommunicated for their adherence to Louis, son of the king of France, to depart the realm. The number of students was increased in the same reign by a migration of students from Paris in 1229, and further by a like migration from Oxford in 1240. In the early part of the 13th century students lived where they pleased, but in time they inaugurated a system of hostels or lodging-houses, in which a number had to live under the supervision of a superior; and out of this system of hostels sprang the collegiate system. The oldest of the colleges, Peterhouse, was founded in 1284 by Hugh de Balsham, bishop of Ely; it was followed by Clare College, founded in 1335 by Lady Elizabeth, granddaughter of Edward I; Pembroke Hall, in 1347, by Marie de St. Paul; Gonville Hall, afterward Gonville and Caius College, in 1348 by Edmund Gonville; Trinity Hall, in 1350, by William Bateam, bishop of Norwich; Corpus Christi College, in 1352, by the joint efforts of two Canons of Ely; St. John's College, in 1376, by John Christi and the Guild of the Blessed Virgin; King's College, in 1441, by King Henry VI; Queen's College, in 1448, by Margaret of Anjou, though it was not till 1479 that it received its code of statutes from Elizabeth Woodville, the consort of Edward IV; Saint Catherine's Hall, in 1452, by Robert Wodelarke, provost of King's College; Jesus College, in 1496, by John Alcock, bishop of Ely; Christ's College, in 1505, by the Lady Margaret, Countess of Shrewsbury; New College, in 1505, by the same Margaret; Emmanuel College, in 1508, by the Lady Margaret; Magdalene College, in 1542, by Sir Thomas Audley; Trinity College, formed by the union of the earlier foundations of Michaelhouse, 1324, and of King's Hall, 1337, and founded in 1546 by Henry VIII; Emmanuel College, in 1584, by Sir Walter Mildmay, a college dear to all Americans as that in which John Harvard, founder of Harvard College, was educated; Sidney Sussex College, in 1536, by the Lady Frances, Countess of Sussex; Downing College, in 1800, by Sir George Downing; Selwyn College Public Hostel, founded in 1882 in memory of George Augustus Selwyn, late bishop of Lichfield, former Vice-Chancellor of New Zealand. Each of these colleges is a separate corporation governed by its own statutes and practically independent of the university, though the connection between the two is necessarily very close, as every member of the university is a member of some one of the colleges, as a non-collegiate student. The head of a college is styled the master, except in the case of King's College, where he is styled the proctor, and of Queen's College, which is ruled by the president. Other college officers are the tutor, who stands in loco parentis to the undergraduates, and the dean, who is responsible for the services in the college chapel, and for college discipline.

A code of statutes was given to the university by Queen Elizabeth, and this code remained in force till 1588, when a new code was framed by a royal commission; this latter code was again revised in 1852, when they took their present form. In 1874 all regalia were finally abolished except for degrees in divinity; and in 1894 the university surrendered the last of its privileges over the town, which it had retained since the 13th century, and then only put an end to the bitter feeling which had existed for centuries between the town and the university, and which had led to frequent outbreaks of hostilities between the two bodies.

The university was incorporated in the reign of Elizabeth, by the name of "The Chancellor, Masters and Scholars of the University of Cambridge." The executive authority of the university rests in theory with the chancellor, who is elected for life; but as he is non-resident, it is practically in the hands of the vice-chancellor, who is elected annually from among the heads of colleges. The ultimate decision of all questions touching academic policy rests with the senate, a body composed of all those members of the university who have proceeded to the M.A. or some higher degree, and whose names are on the registers of members of the senate. All legislative proposals so far as they are consistent with the statutes, which can only be altered by act of Parliament, are framed by the vice-chancellor in conjunction with the senate, a body elected by the resident members of the senate and consisting of the chancellor, the vice-chancellor, four heads of colleges, four professors, and eight other members of the senate. These proposals, having received the sanction of the council, are offered to the senate in the form of bills or resolutions, and must pass the senate before they can take effect. Of the other officers of the university the most important are the two proctors, whose duty it is to attend to the discipline of all persons in status pupillari and to read the grades in the senate house; the registrar, who keeps the archives of the university; the public orator, who is the voice of the university on all important occasions, who writes letters in the name of the university and is admitted to honorary degrees in a Latin speech; the librarian, who has charge of the university library. A general board of studies supervises the system of teaching as a whole, and each department of study is controlled by a professor and a syndicate or board. The teaching of the
undergraduates is undertaken partly by the university and partly by the colleges. It takes mainly the form of lectures, delivered either by the university professors or readers, and open to all members of the university; or by college lectures to members of particular colleges or groups of colleges.

The academic year is divided into three terms: the Michaelmas term, lasting from 1 October to 19 December; the Lent Term from 8 January to within a few days of Easter; the Easter Term from three weeks after Easter to 24 June. The undergraduates reside either in rooms belonging to the several colleges or in rooms in the town licensed for the purpose. They dine together in the college hall, but all other meals are taken in their own rooms. Academic dress, a gown and square college cap, must be worn in the college hall and chapel. Before proceeding to any examination for a degree they must have resided for the greater part of each of the three terms; and must have passed the previous examination, commonly called the "little Go," a somewhat elementary examination in classics, mathematics and divinity. Exemption from this examination can be obtained by passing various non-university examinations. The student can then, if he wishes to proceed to an "Honors" degree, devote the rest of his time to his special subject, and having kept his terms, is qualified to become a candidate for honor in a tripos, as honor examinations are called. If he wishes merely to obtain a pass degree he must first pass the general examination of somewhat similar nature to the previous, but more advanced, and can then proceed to one of the special examinations, as they are called. These examinations are in the same subjects as the tripos examinations, but the questions set are of a much less advanced nature. A student who passes a tripos is called an honor man; one who passes in a special examination is called a pass man (commonly "Pollman," from οἱ πολλοὶ). The names of successful candidates are arranged in three classes, called in the case of the mathematical tripos, wranglers, senior optimes and junior optimes; in the case of the examinations merely first, second and third. Under the rule that every student before proceeding to a degree must have kept residence at least nine terms, there are some important exceptions. Graduates of other universities, British and foreign, who can produce evidence of special qualifications, can qualify for the B.A. degree by passing a tripos examination, or by submitting for approval a dissertation on some subject connected with the special branch of study. Students, from various educational institutions for adults both at home and in the colonies, which are said to be "affiliated" to the University, are allowed practically the same privileges. Further, diplomas in public health, psychological medicine, anthropology, tropical medicine, agriculture, geography, mining engineering and forestry are granted, after examination, to persons who are not members of the university. Having obtained the B.A. degree the student can then, after the lapse of three years, apply for the M.A. degree, and thereby, for the first time, he obtains a voice in the government of the university. He can exercise a vote in the senate, and can "non-
been established just outside Cambridge for the education of women. The students at these colleges are admitted to university and college lectures and to the various examinations for honors. The names of those who pass are placed in the published lists, and certificates are granted to them. Many of them have obtained the highest honors, but the university confers no degrees upon them. Two movements of the last half century have served to bring the university *into closer connection with education generally throughout the country.* By the local examinations, established in 1858, the standard of instruction in so-called middle schools has been raised to and maintained at a high degree of excellence; and the movement has spread beyond all expectations. The other movement, known as the University Extension Movement, which originated in a course of lectures delivered in one or two of the large towns in the north of England in 1867, has had an equally remarkable success. The scheme is an attempt to solve the problem of how much of what the universities do for their non-students can be done by university lectures for persons unable to get to the university. The method of teaching *has four characteristic features — the lecture, the class, the weekly paper work, and the examination.* The members of the university whose names were on the board in 1915 numbered 14,417, of whom 10,908 were members of the senate or other graduates, and 3,449 undergraduates. A tabulated statement issued at the end of 1915 showed that 10,250 were serving in war duties. In that year the enrolments of undergraduates numbered 1,097, having shrunk to one-third of the usual number owing to war conditions. The ordinary income of the university for 1916 was £37,184, that of the colleges £237,405. The war has also affected adversely the finances of the university, which is faced with a probable deficit at the end of 1916 of £13,500.

CAMBRIDGE MANUSCRIPT, the CODEX CANTABRIGIENSIS or BEZÆ, the most famous of the uncial MSS. in the University Library, Cambridge, England, consisting of a copy of the fou: Gospels and the Acts of the Apostles. It was presented in 1581 to the University of Cambridge by Theodore Beza (q.v.). The Codex Beza and the Codex Laudianus at Oxford differ widely in text from all texts of other codices. Scrivener, the editor, and other critics look upon these divergences as interpolations of which the Codex Beza is said to contain no less than 600. Scrivener, nevertheless, believes that the Codex Beza is derived from an original of not later than the 3d century. Bornemann on the other hand contends that the Codex Beza contains the original text and that the majority of both church and state demands toleration and latitude of religious opinion. Hence they were frequently termed latitudinarians (q.v.). This position was the result of a faith in reason and a con-
viction that free inquiry and discussion could not be prejudicial to theological truth, and that rigid uniformity of doctrine is neither possible nor desirable. At the same time they distinguish between dogma and true religion. The former is external and necessarily changes from time to time. Religion is the spiritual life springing up in the soul, the union with the divine, which manifests itself through the moral life. The spiritual life is no mere subjective fancy, but is the true reality, more real and abiding than the world of sense and matter.

In philosophy, the Cambridge Platonists were idealists, emphasizing the reality of the ideal essences of things and the highest truth and reality that these possess, both in the intellectual and moral sphere, as opposed to what is material and sensuous. Cudworth, who was the most important representative of the school, names his chief works ‘The True Intellectual System of the Universe,’ and ‘The Eternal and Immutable Principles of Morality.’ From these titles the general standpoint of the whole school appears. Cudworth was acquainted with the writings of Descartes and corresponded with him on philosophical subjects, but the real inspiration of the school came from Plato and Neo-Platonists like Plotinus, Proclus, Hierocles, all of whom are abundantly quoted in uncritical fashion. Neglect with too, their thought and activity were influenced greatly by Hobbes (q.v.), who stands for materialism and for relativism and a naturalistic system of ethics. Indeed the work of Cudworth and Henry More, the two most prominent writers of the school, may be said to be explicit attempts to refute Hobbes. Cudworth’s work is the more ponderous and learned, abounding in quotations drawn from many sources. More we find a more mystical tendency, with perhaps deeper speculative insight.

James E. Creighton,
Professor of Philosophy, Cornell University.

CAMBRIDGESHIRE, England, an inland eastern county of England; greatest length, about 46 miles: breadth, 33 miles: area, 898 square miles. Arable land, meadow and pasture constitute about three-fourths of the county, the rest being fens. The surface is marshy, flat and thinly wooded, except in the southern portion, which is somewhat elevated and on the chalk formation. The northern section forms part of the Bedford Level. The principal watercourses are the Lark River, the Nene, which borders the county on the north, and the Ouse, which crosses the middle of the country from east to west, with its tributary the Cam. All of these are navigable for some distance. For parliamentary purposes the county is divided into three divisions (northern or Wisbech, western or Chesterton, and eastern or Newmarket) and embraces also the parliamentary borough of Cambridge, each of which returns one member. Cambridge University also returns two members. In the higher sections of the land is a heavy loam, the black, spongy soil of the fens, when drained and burned, in dry years, produces large crops of wheat, oats, barley, potatoes, cole-seed, hemp, hay and flax; fine butter and cream cheese are produced on the meadows of the Cam; and the Isle of Ely, a part of the fen-tract and within the Bedford Level, is noted for its garden vegetables. Cattle and sheep are reared on the thin chalky soils, and horses, cattle, sheep and pigeons on the fens. The manufactures are mostly done for second-hand use, used in the agricultural industry; apart from that, brewing and malting are the chief industries, and there are paper and parchment mills, and coarse earthenware and needles are manufactured. Cambridgeshire was anciently the seat of a powerful tribe, the Iceni. There are interesting Roman remains, and the county is specially rich in ecclesiastical buildings replete with architectural, historic interest. Pop. 198,074.

Cambronne, käh-brôн, Pierre Jacques Étienne, Count of, French general. b. Saint Sebastian, near Nantes, 26 Dec. 1770; d. 5 March 1842. He served on the national guard in the Vendée in 1792; distinguished himself by the capture of a Russian battery at Zurich in 1799; and took part in the campaign in 1800–13. He went to Elba with Napoleon, and returned with him in 1815. Napoleon made him general and gave him the rank of count. At the battle of Waterloo he commanded a division of the Old Guard, and is credited with having made the famous reply to the demand for surrender, ‘La garde meurt et ne se rend pas.’ (‘The guard dies, but never surrenders’). It is now certain, however, that he did not say this, but gave himself up as a prisoner to General Halkett, and was taken to England. At the time of the restoration of the Bourbons he was on the list of proscriptions, but was exonerated by two court-martials, and in 1820 appointed commandant of Lille by Louis XVIII.

Cambscan, a prince of Cambaluc (Peking), whose name is a corruption of Genghis Khan, while the description applies apparently to his grandson, Kublai Khan. This was Milton’s form of the Cambyskan of Chaucer’s fragment of a metrical romance, ‘The Squieres Tale.’ Spenser continues and finishes the tale in his ‘Faerie Queene’ (IV, ii and iii); and John Lane, a friend of Milton’s father, also wrote a continuation. Some of the romantic elements in it are widespread in Oriental story, occurring in the ‘Arabian Nights,’ the ‘Panchatantra’ and elsewhere.

Cambyse, käm-bsèz̩, I, Persian king. His historical character is involved in great doubt, but he is commonly identified as the son and successor of Teisipus, and father of Cyrus the Great (q.v.).

Cambyses II, king of the Medes and Persians: d. 522 b.c. He was the son of Cyrus the Great, and grandson of Cambyse I, and became, after the death of his father, king of the Medes and Persians, 529 b.c. In the fifth year of his reign he invaded Egypt, killed King Psammetichus III at Pelusium, plundered Memphis, and conquered the whole kingdom.
within six months. He now wished to send a fleet against Carthage, to conquer Ethiopia, and to obtain possession of the temple of Jupiter Ammon. He sent out three expeditions, however, did not take place, because the fleet, which was manned with Phcenicians, refused obedience to him in a war against their kindred. The army which was sent against the Ammonites perished in the desert; and to these expeditions, however, whose head he himself had set out against the Ethiopians, were compelled by hunger to retreat. From this time he gave himself up to the greatest cruelties. On his entrance into Memphis, seeing the Egyptians engaged in the celebration of a feast in honor of their god Apis, whom they had found, he believed that they were rejoicing at his misfortunes. He caused the holy bull to be brought before him, slew him with his own sword and caused the priest to be scourged with rods. To drown his remorse he indulged in wine. No relation was held sacred by him when intoxicated. He caused his brother Smerdis, a dream concerning whom had disturbed him, to be murdered. His sister and wife Atossa, who lamented the death of Smerdis, he killed with a blow of his foot. These and other acts, almost indicating insanity, had irritated his subjects. A magian availed himself of his discontent, and obtained possession of the throne under the name of Smerdis, whose death had been concealed. Cambyses had resolved to go to Susa, in order to punish him, when, according to the account of Herodotus, as he was mounting his horse, he received a wound in the hip from his sword, in consequence of which he soon died, at Ecbatana, Syria, leaving no children. Somewhat different accounts are given by Ctesias and others. See CURUS; DARIUS; MEDIA; PERSIA. Consult Lincke, ‘Rambyses in der Sage, Literatur und Kunst des Mittelalters’ (in Eber’s ‘Festschrift,’ Leipzig 1897).

CAMDEN, Charles Pratt (1st Earl of) of English statesman: b. 1713; d. London, 18 April 1794. After studying at Eton and King’s College, Cambridge, he entered as a student at Lincoln’s Inn, and in due time was called to the bar. In 1754 he was chosen member of Parliament for the borough of Downton. After acquiring great reputation as an advocate, he was, in 1757, appointed attorney-general, and in the same year was elected recorder of the city of Bath. While he held the office of chief justice of the common pleas Wilkes was arrested on a general warrant as the author of the ‘North Briton.’ He was committed to the Tower as a state prisoner; and being brought, in obedience to a writ of habeas corpus, before the Court of Common Pleas, Chief Justice Pratt discharged him from his confinement on 6 May 1763. The behavior of the judge on this occasion, and in the consequent judicial proceedings between the printers of the ‘North Briton’ and the messengers of the House of Commons, and other agents of the ministry, was so acceptable to the metropolis that the city of London presented him with the freedom of the corporation, in a gold box, and requested to have his picture. In July 1765 he was raised to the peerage, by the title of Baron Camden; and about a year after made lord chancellor. In this capacity he presided at the decision of a suit against the messengers who arrested Mr. Wilkes, when he made a speech, in which he stated that ‘it was the unanimous opinion of the court, that general warrants, except in cases of high treason, were illegal, oppressive and unconstitutional.’ On his opposing the taxation of the American colonies, he was deprived of the seals in 1770. He came into office again as president of the council, under the administration of the Marquis of Rockingham, in March 1782; on whose death, he resigned the following year. He soon after, however, resumed his place under Mr. Pitt, and in 1786 was made Earl Camden and Viscount Bayham. His popularity was very great in the American colonies, as is shown by the many counties, towns and villages named in his honor.

CAMDEN, William, English antiquary and historian: b. London, 2 May 1551; d. Chiselhurst, Kent, 9 Nov. 1623. He was educated at Christ’s Hospital and Saint Paul’s and Oxford. In 1575 he was appointed second master of Westminster School, and at this time began to make collections for his greatest work the ‘Britannia,’ written in Latin and giving an account of the British Isles from the earliest ages. It was published first in 1586, and gained a high reputation at once. It was revised and enlarged by the constant work and study of Camden, and by 1607 had passed through six editions. In the same year it was translated into English by Philemon Holland; by Edmund Gibson in 1722 (2 vols.); by Gough and Nicols (2d ed., 1800). Hume, in his ‘History of England’ ranks Camden’s works among the best historical productions composed by any Englishman.

In 1593, Camden became head master of Westminster, for which school he drew up a Greek grammar (1597). The same year he obtained the office of Clarendon King-at-Arms. In 1622 he founded a professorship of history at Oxford which he endowed with the valuable manor of Bexley in Kent. He was buried in Westminster Abbey. His house at Chiselhurst was the residence of Napoleon III (1871). His other works consist of ‘Annales Rerum Angllicarum et Hibernicarumregnante Elizabethe, ad annum salutis’ (1559, latest ed., 1717), ‘A Collection of Ancient English Historians’ (Frankfort 1603, 6th ed., 1607); ‘An Account of the Monuments and antiquities of the Kingdom of England and Westminster Abbey’ (1600); ‘Narrative of the Conspiracy called the Gunpowder Plot’ (1607) written in Latin at the King’s command.

CAMDEN, Ala., town and county-seat of Wilcox County, on the Louisville and Nashville Railroad, 60 miles southwest of Montgomery. The centre of the fertile Black Belt of Alabama, it has cotton, cottonseed oil, stock raising and lumber interests. Pop. 648.

CAMDEN, Ark., city and county-seat of Ouachita County, 115 miles southwest of Little Rock, on the Rock Island, the Southern, the Saint Louis and Iron Mountain and other railroads and on the Ouachita River. The city has a library and courthouse, machine shop, cottonseed-oil mills, lumber mills, washtub factory, gloves, door factories, spokes, wagon works and a cotton compress. There is a large river trade in cotton, lumber, pork and live stock. Pop. 3,995.

CAMDEN, Me., town and summer resort 37 miles southeast of Augusta, served by the Eastern Steamship Company’s vessels. Besides
its summer trade it has important wool and felt manufacturing interests. Pop. 3,015.

CAMDEN, N. J., city, port of entry and county-seat of Camden County, on the Delaware River, opposite Philadelphia, with which it is connected by several ferries. The city is situated on a level plain and the streets cross one another at right angles. It is noted for its immense market gardens and important manufactory and is the site of several large ship building concerns. Area, five square miles. According to the latest Federal census Camden had 817 manufacturing establishments, employing $30,000,000 capital and 20,000 persons; paying $10,000,000 wages. The most important industries are foundry and machine-shop-products, ship-building, worsted goods, oil cloth, boots and shoes, masonry, textile fabrics, talking machines, saws, pens, iron mills, etc. The United States census of manufactures for 1914 recorded 343 industrial establishments of factory grade, employing 25,727 persons, of whom 22,490 are wage earners, receiving annually $12,967,000 in wages. The capital invested aggregated $101,- 433,000, and the year's production was valued at $71,405,000: of this, $35,436,000 was the value added by manufacture. There are nine banks, with a combined capital of $3,000,000. The assessed value in 1915 exceeded $80,000,000, and the tax rate was $2 per $100. In 1917 there were in the city more than 200 miles of paved streets, 60 miles of sewers, 115 miles of water mains; and gas and electric street lighting and waterworks plants, the latter owned by the city. The notable buildings are the city hall, county buildings, hospitals and churches. At the close of the school year 1915 there were 38 public school buildings, 20,000 pupils, 510 teachers, a public and private high school. The city was settled in 1681 by William Cooper and was incorporated as a city under an act passed 14 Feb. 1828. Pop. 102,465.

CAMDEN, S. C., town and winter resort, county-seat of Kershaw County, at the head of navigation on the Wateree River, and on the Atlantic Coast Line, the Southern and the Sea- board Air Line systems, 32 miles northeast of Columbia. In a fertile, productive region, it has manufactures of cotton cloths, yarns and oil, bricks and lumber articles, and trades in naval stores, cotton and rice. Quakers from Ireland settled here in 1750 and received a town charter in 1791. Here 16 Aug. 1780, Baron De Kalb was mortally wounded during the victory of the British under Lord Cornwallis over the Americans under General Gates; and here 25 April 1781 the British under General Rawdon drove back the Americans under General Greene at the battle of Hobkirk's Hill. During the Civil War General Sherman's troops 25 Feb. 1865 sacked and almost totally destroyed the town. Pop. 3,569.

CAMDEN, Battle of, a battle fought near Camden, S. C., 16 Aug. 1780, between the American troops under Gates and the British under Lord Rawdon. Shortly after the British captured Charleston in May, all South Carolina was in their hands except for the guerrillas in and near Marion, Ninety Six, and Camden. Gates, attacking them at different places, was defeated, and the British captured Savannah and occupied trading stations. Washington had already sent De Kalb (q.v.) with 1,400 Maryland and Delaware regulars, among the best troops in the army, to save it, but the new disaster called for fresh efforts and a first-rate new commander of the Southern Department to succeed Lincoln. Washington wished to send Greene; but a popular clamor for Gates, who was so steadfastly credited with the victory of Cowpens, led Congress to give him the post. He took command at Hillsborough, N. C., where De Kalb was vainly waiting for General Caswell and the North Carolina militia to come up from South Carolina. Gates therefore, determined to march south and join Caswell, and thus reinforced, seize Camden and the Wateree, near which was their camp—the strategic centre of the State, and the converging point of the chief northern roads. It was held by Lord Rawdon with a comparatively small force. A fortnight's starving march of 150 miles, in the course of which he picked up a company of Virginia regulars and the North Carolina men, brought him in front of Rawdon, strongly posted across the road 15 miles northeast of Camden. He might either attack with superior forces or hold Rawdon with a part while he sent the rest around his flank to seize Camden in the rear; but he did neither, and, after waiting two days without apparent prospect, moved north to Clermont, or Rugely's Mill, and assumed a delaying position, 13 miles north of Camden. Here he was joined by 700 Virginia militia, but sent off 400 of his splendid Maryland regulars to help Sumter cut the British communications far to the southeast, and Cornwallis joined Rawdon, giving the British 2,000 trained men. Gates had no intelligence department, and supposed he still had only Rawdon's small force before him; and about 10 p.m. of 15 August started down the road to surprise Rawdon, Cornwallis at the same hour starting north to surprise him. The vanguard met about 3 a.m. a few miles above Camden, and the Americans were routed; but some British prisoners informed Gates that Cornwallis was in front with 3,000 men. Gates had 3,052, most of his nominal force being on paper or helpless with dysentery; and over half of them were militia who had never been under fire and did not even understand using a bayonet. De Kalb, the brave but judicious officer, wished to fall back on Rugely's Mill; but the other officers thought it too late to retreat, and Gates deployed his men, with as bad judgment as the decision to fight at all. The road ran through a level field flanked by swamps, so that everything depended on the firmness of the front rank; but he massed all the regulars on one wing and all the militia on the other. De Kalb held the right opposite Rawdon, with the Delaware regiment and the 2d Maryland brigade in front, the 1st Maryland in reserve; the left wing had the Virginia militia in front and the North Carolina troops in the rear, opposed to Col. James Webster, with Tarleton's cavalry in reserve. Gates' tactics were as ill-judged as his arrangement; he ordered the first charge made by the Virginia men, who did not even know how to march in order. They became tangled and while trying to reform, Webster's onrush broke them in wild panic; they threw down their loaded guns with bayonets set, without firing a shot, and for the guerrillas in the near vicinity and the North Carolina men fired several volleys, but all the rest fled like their neighbors, and the one exception soon shared their flight. Meanwhile, the 2d Maryland twice drove back Rawdon, then broke his ranks with a bayonet charge,
CAMELIDÆ

1 Guanaco

2 Dromedary

3 Two-Humped Camel
and held the field. But Webster and Tarleton, following the routed mob, had flankd the 1st Maryland and after an obstinate fight crowded it off the field; and, taking the 2d Maryland in the rear, compelled it too, to retire, after a fierce resistance. De Kalb fought to the last, and was captured, mortally wounded, with 11 wounds. The stubborn fight of the regulars is shown by the fact that the Delaware troops were nearly annihilated, and the Maryland regiments lost nearly 300 killed. There were about 1,000 killed and wounded, and as many prisoners taken, with seven cannon and 2,000 muskets. The British lost 324.

For the time the American cause in the South was ended. Gates escaped to Hillsborough, but was shortly supplanted by Greene, who wrought a wonderful transformation in a few months.

CAMDEN SOCIETY. An English association established in 1838 at London, for the purpose of publishing historical and anti-

quarian information, named in honor of William Camden. Its publication began in 1841, the first series including 10 volumes. The second series up to 1900 included 63 volumes. In 1901 a new series was begun. Up to 1913, 23 volumes have been published.

CAMDEN TOWN, England, a district of London in the Metropolitan borough of St. Pancras and county of Middlesex. It takes its name from the Earl of Camden who acquired property here by marriage. The houses, which are in general of recent erection, are regular and substantial buildings. The district lies northeast of Regent's Park and north of the Euston station of the London and North Western Railroad.

CAMEL, a large ruminant of the genus Camelus, family Camelidae (q.v.), two species of which have been domesticated since prehis-
toric times, and used as riding-animals and beasts of burden in the desert regions of the Old World. Although much search has been made, no wild species of camel can be found except one breed, the single-humped variety, discovered by Prejevalsky, which inhabits central Asia, northward to Siberia, but it is not certain whether it represents an original wild species, or is a degenerate race long ago escaped from domestication.

The Arabian camel (Camelus dromedarius) has one hump on the shoulders; the Bactrian camel (C. bactrianus) two. These are composed of muscle, flesh and fat, which in times of famine is reabsorbed to a large extent. After it has been exhausted, a rest of three or four months, with abundance of food, is necessary to restore it. The former is the more common species, and is used from Mongolia and northwest India throughout south-central Asia, Asia Minor, Arabia and northern and eastern Africa, and to some extent in Spain and else-
where. At the time of the rush of gold-seekers to California about 1850, efforts were made to naturalize camels in the arid regions of the southwestern United States, as a means of carrying supplies to the army posts there, but they proved unsuccessful, mainly on account of their intractable and vicious disposition.

The original home of the single-humped camel is uncertain, but as it is better adapted to a sandy region than is the Bactrian species, it is thought to have been in the Sahara or Arabian desert. Its peculiar adaptability to life in sandy regions is noticeable in many ways. The callous cushions (pads) on its feet are protected upon the chest and the joints of the legs, on which it rests when rising, kneeling or lying down, and protect these parts from abrasion by the sharp sand. Its wedge-shaped cutting-teeth are well fitted for cropping the short, shrubby plants of the desert. Its long eyelashes protect it from the glaring sun and from the drifting sand; and the ability to close the oblique nostrils at will prevents the entrance of dust. The most remarkable provision for life in arid regions, however, is found in the structure of the stomach, the interior of which has no villi on its surface. Both the compartments of the paunch contain a number of pouches or cells in their walls, each of which may be closed and separated from the remainder of the paunch. These are filled and cleared out, when the camel drinks, and by these means it can store more water than is requisite for its immediate use, and so save up a store which may gradually be drawn upon during long journeys over waterless districts. The sense of sight and smell are very acute, and it is capable of discerning water at a great distance. By reason of these qualities it has been a most important factor in the colonizing of the countries that lie south and east of the Mediterranean, Black and Caspian seas, and such deserts or fertile areas as are separated by desert waters; in fact students of civilization believe that these regions could hardly have become the abode of a settled civilization had it not been for this useful animal.

The Bactrian camel is of smaller size and heavier build, and, by its harder and more cloven feet, and longer and finer hair, is better adapted to a rocky and cooler region. Its habi-
tat is central Asia. Like the southern species it has wonderful endurance, withstands the terrific summer heat of Persia and the Tibetan plains, and the Arctic cold of the passes of Hindoo-Kush and Mongolia. They have been successfully employed as army transports by the English in northwestern India and central Tibet for many years, through all weathers, trains of these camels, sometimes of many thousands, were almost the only means by which tea and other merchandise was transported between China and Russia.

The many breeds of camel exhibit great diversity. Some are those bred only for the saddle, others as baggage-carriers or draft animals, for they are also trained to haul carriages in harness. Properly, a "dromedary" is any camel of either species of a saddle-breed, distinguished for its speed and ease of gait. As a beast of burden the camel has great powers of endurance. The Arabian species carries twice the load of a mule, while it is not unusual for the Bactrian species to carry half a ton weight upon its back; by reason of which it is sometimes poetically termed the "ship of the desert." Caravans frequently contain as many as 1,000 camels, which move along at a steady and uniform pace of about two and a half miles an hour. When bred especially for the purpose they have been known to carry a traveler 100 miles a day. They move with a pacing motion, lifting the feet on the same side successively.
Their value money is about the same as that of horses of similar grade and purpose.

The camel serves the nomadic inhabitants of Arabia and the Sahara and the East in many ways besides as a riding animal or beast of burden. It gives them hair that may be woven into the coarse fabric for tent-covers and ropes, or the finer shawls and rugs that are often of great market value. Its milk and flesh are food and its hide and bones are utilized, while its dried dung serves as fuel when no wood is obtainable; and from its tracks, in reading which the Bedouins are amazingly skilful, the nomad derives information of interest and importance as to the movements of neighbors or the strategy of enemies. This animal forms an important element in the economy of the civilized people of those regions, in warfare as well as in agriculture and commerce. A camel-corps has long been a regular part of the organization of the British army in Egypt and in northeastern India, serving as effective cavalry.

**CAMEL**, a water-tight box or caisson, used to raise a sunken vessel or to float a vessel over a shoal or bar. Its invention is ascribed to the Dutch and its first use is said to have been about 1668. It is sunk by the admission of water and is attached to the vessel, after which the water is pumped out, and the camel, rising by its buoyancy, lifts the load. Modern camels are built of steel and fitted with machinery for working the chains which support the wreck or attach it to the camel.

**CAMEL-BIRD**, a book-name of the ostrich (q.v.).

**CAMEL-CRICKET**. See MANTIS.

**CAMELFORD**, England, village on the Camel, 28 miles northwest of Plymouth. The streets are spacious and well paved, but the houses are in general very indifferent. Five miles to the northeast of Camelford are the ruins of King Arthur's castle of Tintagel, and about two miles to the north are the celebrated slate quarries of Delabole. The inhabitants are chiefly engaged in agriculture.

**CAMELIDEAE**, a family of ruminant mammals, including the Old World camels (genus Camelus) and New World guanacos and vicuñas (genus *Lama*), as the existing remainder of a divergent group formerly closely connected both in structure and in geographical distribution. It forms a distinct section of the *Ruminantia* named *Tylopoda*, in reference to the character of the feet, in which only the third and fourth toes are developed, and these are embedded in a cutaneous pad, forming a broad elastic sole to the foot. The two metapodial or "cannon" bones of each of the long limbs are separated for a considerable distance at the lower end, where the articular surfaces, instead of being pulley-like, with deep ridges and grooves, as in other recent split-hoofed animals (*Artiodactyla*), are rounded and smooth. The toes terminate in small nails, and the weight of the animal rests upon the padded sole of the foot instead of on hoofs, in adaptation to the soft, sandy soil of deserts, in which this race of animals seems to have lived ever since its origin. The dentition of the prolonged jaws has certain peculiarities. The full number of incisors is present in youth, but in the upper jaw these disappear, except the outermost, which persist through life, while those in the lower jaw are permanent. Canines are present in both jaws. The molars are of the selenodont type. The neck is very long and flexuous; the shoulders are high; and the hinder part of the body is much contracted and drooping in appearance. The tail is well developed and the skin is thick and with horns and the nostrils are high and may be closed against the admission of dust; and the lips are prolonged and flexible. There are no horns or antlers in either sex. The interior anatomy is peculiar, principally in the character of the digestive organs, described in the article CAMEL. See CAMELIDEAE, FOSSIL.

**CAMELIDEAE, FOSSIL.** The evolution of the camel (q.v.) through the Tertiary and Quaternary periods is nearly as completely known as that of the horse, and is hardly less instructive. The camels now inhabit central Asia and northern Africa, their size as a gazelle, in North America. No fossil camels or llamas are found in these countries in deposits much older than the Quaternary. But in the Tertiary strata of North America have been found a series of animals which appear to be the direct ancestors of this family, and contemporaneous with the primitive hoofed animals of the earliest Eocene. The earliest member of this series, ancestral probably to the camels among other ruminants, is *Trigonolestes* of the Lower Eocene, smaller than a domesticated rabbit, with the complete series of incisor, premolar and molar teeth, the molars of the primitive buno dont type (see *Bunodont*) and probably five complete toes, the side toes very slender, and the metapodials all separate. In the Upper Eocene stage, *Protolophaeus*, as large as a jack rabbit, the molars have become selenodont (q.v.), as in modern camels, but with shorter crowns, and the side toes in the hind leg are represented only by splints. In the Oligocene stage, (*Protobrotherium*), as large as a modern camel, the molars have longer crowns, the splints are reduced to small nodules of bone and the metapodials, though still separate, are closely appressed. In the Miocene stage (*Procamelus*, etc.) the metapodials are sometimes separate, sometimes united; the incisors and premolars are generally reduced in size and the anterior upper incisors are often lost; and the form of the teeth and skull comes closer to the modern type. The Pliocene camels (*Pluochena*, etc.) are still closer to the modern type, all with united metapodials and reduced incisors and premolars, and at this epoch they spread to South America and the Old World, the gradual rising of the continents having made land connections between them about this time. During the Pleistocene epoch the camels all became extinct except the Camels (*Camelus*), the direct ancestors of the Arabian dromedary which they still survive in the alien continents to which they had wandered.

The most remarkable peculiarity of the camels is the adaptation of the stomach, which enables the animal to go a long time without water (see *Camelus*). There is no direct evidence of the evolution of this character. But the cushioned foot, equally an adaptation to desert life, is not indicated (by the form of the toe bones) in any ancestral camel pre-
vious to the Miocene, from which time it became gradually more marked. We may suppose, therefore, that the earlier ancestors of the camel were antelope- or deer-like in their habitat, and were gradually adapted to desert life.

Besides the main line of descent there were, especially in the Miocene, side branches now extinct, one of which (Aficamelus) was single clavate giraffes in proportions, although not related to the giraffes, which were evolved in the Old World at the same epoch.

It is a general law in the evolution of any race of animals that at each succeeding stage in its development the progressive characters appear at an earlier period in the lifetime of the individual. The young individuals of one stage resemble the adults of the preceding stage, while the old individuals take on some of the characters of that next succeeding. This is well illustrated in the camels, especially of the Miocene epoch; in young individuals the metapodial are always separate, as they are in all adult camels of the Oligocene, and they are usually not completely consolidated until a comparative late period. In modern camels and llamas, they are consolidated before birth. The anterior incisors and premolars usually drop out in old individuals of Miocene camels; in the later stages they are minute stumps or scales which disappear early in life.

CAMELIA, ka-mel'-ya, a genus of plants belonging to the family Ternstræmiææ, beautiful flowering shrubs, natives of Asia. The name Camellia was given to this genus by Linneaus in honor of Kamel or Camellus, a Moravian Jesuit. Camellia japonica, as it grows in the woods and gardens of Japan and China, is a lofty tree of beautiful proportions, and clothed with a deep green, shining foliage, with large, elegant flowers, either single or double, and of a red or pure white color. There are numerous varieties of this species in China, the greater part of which have found their way to Europe and America, while other new varieties have been produced by breeding. The double-white, double-striped and double-waratah, the last so called from the central petals resembling those of the waratah plant of Australia, are considered the finest varieties, and both grow and flower well. The peony-flowered and fringed are also much admired. The oil-bearing camellia (C. sasanqua) is cultivated for its seeds, from which an oil is expressed that is very generally used by the Chinese in their cookery. It thrives best in a red sandy soil, and attains a height of six to eight feet, producing a profusion of white blossoms and seeds. Besides these species C. reticulata is cultivated.

The single red camellia is propagated by cuttings, layers and seeds. It forms suitable stocks on which the others are either inarched or budded and engrafted. The cuttings to be selected are the ripened shoots of the preceding summer; these are taken off in August, being cut smoothly at a joint or bud; two or three of these cuttings then planted firmly in the soil with a dibble. Inarching or engrafting is performed early in spring, when the plants begin to grow. A few seeds are sometimes obtained from the single red and semi-double camellias, and from the single waratah. These require two years to come up, but make the best stocks of any.

AMELOPARD. See Giraffe.

AMELOPARDALIS, one of the northern circumpolar constellations added by Hevelius in 1690. It is a large, irregularly shaped constellation, something like the animal, and is more than 40° in length, with its head close to the North Pole. It borders upon Ursae Minor, Draco, Ursa Major, Lynx, Auriga, Perseus, Cassiopeia and Cepheus. It contains no stars brighter than the fourth magnitude, and was put in to fill up a part of the sky otherwise uncovered by constellations. Being introduced later than Bayer's time, it has no letters except α, β, and γ, which Baily introduced into the "B. A. C." in 1845. While these have not been universally accepted by astronomers, they will probably be adopted in a general revision of the northern constellations.

AMELOT, in the Arthurian legends, the city where King Arthur's palace with the Round Table was located. Tennyson, in "The Coming of Arthur," describes the rich and splendid royal court, and mentions it in others of the "Idyls of the King" and in "The Lady of Shalott." It is also referred to by Shakespeare in "King Lear." The site of Camelot has been much in dispute; Shakespeare supposed it to be in Somersetshire; Tennyson and Capell located it at or near Winchester; and Caxton placed it in Wales. The monks of Glastonbury were chiefly responsible for the Somerset theory, which they maintained for the purpose of attracting thither pilgrims and so enriching their monastery.

AMELAE'S HUMP, one of the peaks of the Green Mountains, in Vermont, 17 miles west of Montpelier. Its height is about 4,100 feet.

AMELAE'S THORN, a genus of plants belonging to the family Fabaceae. They are herbaceous or half-shrubby plants, with simple leaves, minute stipules, axillary peduncles terminating in spines, and red flowers arranged in racemes. Only three species of this genus are known, Alhagi camelorum, A. gracorum and A. mauro- rum. They grow in the deserts of Egypt and the East, and their common name is derived from the fact that they afford a food much relished by camels. The species yield a gummy, saccharine exudation like manna.

AMELAE. See KAMEN.

AMEOS. Certain carved reliefs on stones, shells or other substances in which the engraver takes advantage of the medium having two or more super-imposed layers or stratifications of different colors or tones to obtain the most striking effect. The derivation of the word is contested. The late Rev. Charles King, one of the most prominent collectors and authorities, says the term comes from the Arab word cam-an, a flower, and it was used since the Crusades. He says the term camahuutm (from the Syriac chemeia, a charm) first appears in the 13th century. In early times the cameo has also been termed cademus. In modern cameo examples the relief or subject is composed from the upper layer and the lower layer is utilized as background. The substance used covers a wide range, among others: Agate, onyx, sardonyx, opal, amethyst, emerald,
CAMERA—CAMERA LUCIDA

Julien de Fontenay, known in art as Coldore, did such splendid work that Queen Elizabeth employed him at her English court, where he produced things in turquoise and onyx (one is in the Victoria and Albert Museum, London, another in the Cabinet de France, Paris). Henri IV was extremely infatuated with cameos and wore 12 of them as buttons (they represented the 12 Caesars), also a cameo in his own person, which are in the Cabinet de France. Among the noted family of Pichlers, gem engravers who did fine cameo work, are Giovanni, of Florence, and Luigi, second son of Antonio; the latter was Austrian court engraver under Francis I. In the 17th century the cameo was so much in vogue that the celebrated Flemish artist Rubens designed a number of copies of antiques. In the 18th century Jacques Guay, of Marseilles, did beautiful work; Jean Laurent Nater, of Nuremberg, was great in imitating antiques, and even the Marquis de Pompadour engraved and signed the Genius of Music cameo. Artist Bonché designed cameos and Louis Chapat, and the most noted cameo artist of all, Joseph Pichier, who have left us were worn as animate art. The Simona (father and son), as well as Berini and Jéffroy, belong to the well-known cameo artists of the 19th century. Bernardo Pistrucc did fine work in London. A Scotsman named James Tassie reproduced (late 18th century), to propagate art knowledge, beautiful copies in glass of antique cameos which are collected by connoisseurs of this day on their art merits; they are fetching $10 or more these days though sold originally at $2.50; their colors are very brilliant, but these pieces closely resemble antiques. Besides the collections in Paris already mentioned, there are extensive cabinets at Dresden, Vienna, the Saint Peters burg Hermitage Museum, Florence, Rome, Naples and London.

CLEMENT W. COUME.

CAMERA, Photographic, a camera obscura so constructed that sensitized plates or films may be placed at the back and receive the image. There are many styles of camera in use, those of the tripod variety being used for portraits and landscapes where a steady support is required and the hand camera for instantaneous exposures, used by tourists on account of its convenient shape and size. See CAMERA OBSCURA; PHOTOGRAPHY.

CAMERA LUCIDA (Lat. ‘light chamber’), an optical instrument employed to facilitate the sketching of whole figures, as they act by total reflection, and may have various forms, of which that proposed by Wolleston, and illustrated in the accompanying figures, is one of the commonest. The essential part is a totally reflecting prism with...
CAMERA OBSCURA

four angles, one of which is 90°, the opposite one 135° and the other two each 67° 30'. One of the two faces which contain the right angle is turned toward the object to be sketched. Rays falling in a straight line on its face, as seen by the observer, are totally reflected from the face εσd to the next face σd, whence they are again totally reflected to the fourth face, from which they emerge in a straight line. The eye (pp) placed so as to receive the emergent rays will see an image of the object in a direction of right angles to that in which the object lies. In practice the eye is held over the corner σ of the prism in such a position that one-half of the pupil receives these reflected rays, while the other half receives light in a parallel direction outside the prism. The observer thus sees the reflected image projected on a real background, which consists of a sheet of paper for sketching. He is thus enabled to pass a pencil over the outlines of the image—pencil, image and paper being simultaneously visible. It is very desirable that the image should lie in the plane of the paper, not only because the pencil-point and the image will then be seen with the same focusing of the eye, but also because parallax is thus obviated, so that when the observer shifts his eyes the pencil-point is not displaced on the image. The introduction of an ordinary "stop" as used in photography remedies this defect, although greatly reducing the volume of light passing. As the paper, for convenience of drawing, must be at a distance of about a foot, a concave lens, with a focal length of something less than a foot, is placed close in front of the prism in drawing distant objects. By raising or lowering the prism in its stand (Fig. 2), the image of the object to be sketched may be made to coincide with the plane of the paper. The prism is mounted in such a way that it can be rotated about either a horizontal or a vertical axis; and its top is usually covered with a movable plate of blackened metal, having a semi-circular notch at one edge for the observer to look through.

Another form of the camera lucida, that of Amici, an Italian optician, is sometimes preferred to that of Wollaston, inasmuch as it allows the observer to change the position of his eye considerably without ceasing to see the image of the object he is tracing. The prism in this case is triangular in shape, and one of the angles is a right angle. In using it, the right angle is turned upward, so that one of the perpendicular faces is turned toward the object in an oblique direction, while the edge of the other perpendicular face meets a transparent glass plate at right angles. The rays from the object falling upon the face of the prism which is turned toward it are, after being more or less refracted, thrown upon the base of the prism, from which they are again totally reflected in the direction of the other perpendicular face. In emerging from the prism of this face they are again refracted and thrown upon the transparent glass plate. By this, again, the rays are partially reflected, being thrown upward in the direction of the eye of the observer, who, looking through the plate, sees an image of the object on a sheet of paper beneath, the outlines of which can be traced by a pencil as before. Perhaps the most important use of the camera lucida is its adaptation and attachment to the microscope; but here also direct photography has almost wholly superseded handwork.

CAMERA OBSCURA (Lat. "dark chamber"), an optical instrument employed for exhibiting the images of external objects in their forms and colors, so that they may be traced and a picture formed. From certain scattered observations in the writings of Friar Roger Bacon, in the 13th century, it would appear that he was acquainted with the principle upon which the camera obscura is constructed, but the first complete description of this instrument is found in the "Magia Naturalis" of Giambattista della Porta, published in 1569, and Porta is commonly credited with its invention.

In its simplest form the camera obscura consists of a darkened chamber, into which no light is permitted to enter except by a small hole in the window-shutter. A picture of the objects opposite the hole will then be seen on the wall, or a white screen placed so as to receive the light coming through the opening. The images thus obtained become sharper as the size of the hole is diminished; but this diminution involves loss of light, so that it is impossible by this method to obtain an image at once bright and sharp. This difficulty can be overcome by placing a lens in the opening in the shutter. If the objects in the external landscape are all at distances many times greater than the focal length of the lens, their images will all be formed at sensibly the same distance from the lens and may be received upon a screen placed...
at this distance. The images are inverted, and are of the same size whether the lens is in position or not, so long as the screen remains fixed; but they are far sharper and more distinct when the lens is used. As an attraction at seaside resorts and other places of amusement, the camera obscura consists of a small box, generally 11 by 12 by 10 inches, covered by opaque curtains and having at its top a revolving lantern, containing a lens with its axis horizontal, and a mirror placed behind it at a slope of 45°, to reflect the transmitted light downward of a sheet of white paper lying on the top of a central table. Images of external objects are thus depicted on the paper, and their outlines can be traced with a pencil if desired. It is still better to combine lens and mirror in one by the arrangement represented in section in the figure. Rays from external objects are first refracted at a convex surface, then totally reflected at the back of the lens (or prism), which is plane, and finally emerge through the bottom, which is concave, but has a larger radius of curvature than the first surface. The two refractions produce the effect of a converging meniscus. The camera obscura, which was formerly chiefly employed for purposes of amusement, has now become well known from its adaptation to photography. See Photography.

CAMERARIUS, ká-má-rá̂t-rōos, Joachim, German Jesuit and educator: b. Bamberg, 12 April 1500; d. Leipzig, 17 April 1574. His proper name was Liebhard but he changed it to Camerarius, because his ancestors had been chamberlains (Lat. camerarius) at the court of the bishops of Bamberg. At the age of 13 he entered the University of Leipzig. In 1518 he began to teach Greek at Erfurt; in 1521 he taught at Wittenberg, where he became the friend of Melancthon; and in 1541 he undertook a professorship at Leipzig, which he retained until his death. He contributed not only to the progress of knowledge by his own works and by editions of classical authors, but also by a better organization of the universities of Leipzig and Tübingen and of the gymnasium at Halle. He took an important share in the political and religious affairs of his time, and in 1555 was deputy of the University of Leipzig to the Diet of Augsburg. His critical judgment was superior to that of Melancthon, whose equal he was in classical studies, and he must be ranked as the greatest German classicist of his century. Together with many theological and biographical books, his works include editions of Homer, Homeric Poems (with the so-called schola of Didymus, Basel 1541); Greek Elegiac Poets (Basel 1550); Theocritus (Frankfort 1545); Sophocles (Basel 1556); Herodotus (Basel 1540 and 1557); Theophrastus (Basel 1541); coeditor on Galen (Basel 1538); Quintilian; Cicero (1540); and several others. Consult Bursian, Geschichte der klassischen Philologie in Deutschland (pp. 185–90, Munich 1883), and Sandys, 'A History of Classical Scholarship' (Vol. II., Cambridge 1908).

CAMERARIUS, Rudolph Jakob, German botanist: b. Würtemberg, 12 Feb. 1665; d. Tübingen, 10 Sept. 1721. He is known as the discoverer of the sexual relation in plants. He was in charge of the botanical gardens at Tübingen and was also a medical professor.

CAMERINO, ká-mè-rí-nô (ancient Camerinum), Italy, a town in the province of Macerata, 41 miles southwest of Ancona, between the Chienti and the Potenza. It is the seat of an archiepiscopal dating from 1787, and contains some good public buildings, among which are the archiepiscopal palace, the ducal palace, the cathedral built in 1832, occupying the site of a temple of Jupiter. There is a university, founded in 1727, and a bronze statue of Sixtus V, erected in 1587. Silk is grown and manufactured here. Pop. 11,689.

CAMERLENGO (lt. camerlingo, 'a chamberlain'), one of the highest officers of the Vatican court, who controls the finances and secular interests of the Pope. A cardinal camerlengo, during a vacancy in the Holy See, takes charge of all the temporalities, and presides over the apostolic chamber or palace. The other cardinals assist in spiritual offices. There is also a camerlengo of the Sacred College of Cardinals, and a camerlengo of the Roman clergy.

CAMERLYNCK, ká-mér-lînk, Achille, Belgian sociologist and Biblical scholar: b. Reninghelst, Belgium, 9 May 1869. He was educated at Routers, Bruges and at the University of Louvain. He was ordained priest in 1894, and from 1899 to 1910 was professor of Scripture and sociology at the Seminary of Bruges. In 1910 he became dean of Ostend and rector of Saints Peter and Paul, Ostend. He is a member of the Belgian Superior Council of Labor and the Belgian Society of Sociology. He is the author of Saint Irénée et le canon du Nouveau Testament (1896); 'De quarto Evangelii auctore dissertato' (2 vols., 1898–99); 'Quelques considérations sur la base philosophique du socialisme scientifique contemporain' (1900); 'De l'opportunité d'une enquête ethnographique et sociologique sur les peuples incultes' (1905); 'Compendium Introductioinis generalis in Sacram Scripturam' (2 vols., 1911–13); 'Evangeliorum et Apostolorum, Martinum, Matthaeum, Marcum et Lucanum synopsis' (with Dr. Coppieters, 1908). He edited Van Steenkiste's 'Commentarius in Epistolam Catholicam' (5th ed., 1909) and 'Commentarius in Actus Apostolorum' (6th ed., 1910), and was a contributor to 'Collationes Brugenses,' 'The Catholic Encyclopedia,' and 'Annales de la Société Belge de Sociologie, etc.'

CAMERON, Agnes Deans, Canadian educator, traveler and lecturer: b. Victoria, B. C., 1863; d. there 1912. She taught for 18 years and became widely known for her interest in exploration and national development, giving lectures in Canada, Great Britain and the United States, based on personal observation of the natural resources of Canada, during travels all over the little known country extending to the Arctic Ocean. She was elected vice-president of the Canadian Women's Press Club in 1909. She was associate editor of the Educational Journal of Western Canada, and author of 'The New North' (1909) and 'The Outer Trail' (1910).

CAMERON, Arnold Guyot, American educator: b. Princeton, N. J., 4 March 1864. He was graduated at Princeton University in
1886, and during the next two years studied abroad. In 1888-91 he was professor of French and German languages and their literatures in Miami University; in 1891-97 assistant professor of French in the Sheffield Scientific School of Yale University; and in 1897 accepted the chair of French at the John C. Green School of Science of Princeton University. He is editor of the textbooks ‘Daudet,’ ‘Mérimée,’ ‘Lût,’ ‘Coppee and Maupassant,’ and ‘The Goncourts,’ and has lectured on literary topics.

CAMERON, Sir Charles, Scotch journalist and politician; b. Dublin, 1841. He was educated at Madras College, Saint Andrew's, Trinity College, Dublin, and at medical schools in Paris, Berlin and Vienna. He edited the North British Daily Mail from 1864 to 1874, and from the latter year till 1900 was one of the members of Parliament for Glasgow. The adoption of six-penny telegrams was the result of a resolution which he introduced in the House, and he was likewise instrumental in the conferring of municipal franchise upon women in Scotland. He was knighted in 1893.

CAMERON, Sir Charles (Alexander), Irish physician; b. Dublin, 16 July 1830. He was elected public analyst for the city of Dublin in 1862. In 1867 he was elected professor of hygiene and chemistry in the Royal College of Surgeons in Ireland. He was knighted in 1886 in recognition of his services to public health. He has written ‘Chemistry of Agriculture’ (1857); ‘Lectures on Public Health’ (1868); ‘History of the Royal College of Surgeons, Ireland, etc.’ (1886); ‘Elementary Chemistry and Geology’ (1886); ‘Reminiscences’ (1913).

CAMERON, Charles Duncan, English soldier; d. 1870. He served in the Kaffir War (1846-47) and in the Crimean War at the defense of Karas. In 1860 he became British consul in Abyssinia. He undertook two years later to deliver a letter from Queen Victoria to King Theodore, and was imprisoned by the King for 14 months on the charge of interfering with the inquilin polity of that country. He was released only to be shortly imprisoned again, together with Rassan, agent of the British government, and others, their final release being effected by the advance of English troops upon Theodore's stronghold at Magdala in April 1868. An account of these matters by Cameron was published in the Parliamentary Printed Papers (1868-69).

CAMERON, Sir Douglas Colin, Canadian knight and statesman; b. Hawkesbury, Ontario, 1854. He became a prosperous lumber capitalist with business interests in Manitoba, British Columbia and Ontario. He was prominent as a Liberal member in the Ontario legislature 1902-03, in 1911 received the appointment of lieutenant-governor of Manitoba and was knighted in 1914.

CAMERON, Edgar Spier, American mural artist; b. Ottawa, Ill., 26 May 1862. After early study and training in New York and Paris, he, with Walter McEwing and Robert Reid, were selected to execute the mural paintings for the Chicago World Fair. The decorations in the Library of the Supreme Court, Spier's work, III., were representative of mural work, while distinctive easel work includes 'The Youth of Christ,' his most important work. 'Glass Blowers' and 'Dreamland,' exhibited at Berlin in 1910. From 1891-1900 he was art critic and correspondent of the Chicago Tribune, and at the Paris Exposition, 1900, was a member of the international jury. MARGARET CAMERON, his wife, is well known for successful portraiture and genre work.

CAMERON, Frank Kenneth, American chemist; b. Baltimore, Md., 2 Feb. 1869. A student at Johns Hopkins University, after instructing at Cornell and at the Catholic University of America, he was associated with the United States Department of Agriculture and became head of the laboratory of soil chemistry. His technical writings include numerous departmental bulletins and 'An Introduction to the Study of the Soil Solution' (1910); and 'The Soil Solution, the Nutrient Medium for Plant Growth' (1911).

CAMERON, George Frederick, Canadian poet; b. New Glasgow, Nova Scotia, 1854; d. 1885. He was educated at Queen's University, Kingston, Ontario; resided for a time in the United States; returned to Canada, and edited the Kingston News. As a lyrical poet he received high praise from leading critics, his songs on Spanish expression in Cuba being especially full of fire.

CAMERON, James Donald, American capitalist and politician; b. Middletown, Pa., 14 May 1833. He is the oldest son of Simon Cameron (q.v.), and was graduated from Princeton College in 1852. He devoted himself to business pursuits and in 1851 was made vice-president and two years later president of the Northern Central Railroad. He remained in this office till 1874. In 1876 President Grant appointed him Secretary of War, and in 1877 he succeeded his father as United States senator from Pennsylvania. He was re-elected in 1883 and 1890. He retired in 1897. He was prominent in the campaign of 1876, first as opposing the nomination of Blaine, and then in working for Hayes' election. But Hayes refused to continue the Cameron in the Cabinet. In 1880 he was chairman of the Republican National Committee. Consult McClure, 'Old Time Notes of Pennsylvania' (Philadelphia 1905).

CAMERON, John, Scottish scholar; b. Glasgow 1579; d. there, 13 May 1625. He was educated at the University of Glasgow, and at the age of 20 held an appointment there as reader in Greek. In 1600 he went to the Continent, where his ability and erudition secured for him several appointments at Bergerac, Sedan, Saumur and other seats of learning. Returning to Great Britain in 1620, he was two years later appointed principal of the University of Glasgow; but in less than a year returned to Saumur, and thence to Montauban, where he received a divinity professorship. Here, as at Glasgow, his doctrine of passive obedience made him many enemies, by one of whom he was stabbed in the street, and he died from the effects of the wound. Sir Thomas Urquhart styles him a 'walking library,' and Milton, 'an ingenious writer in high esteem.' He was considered one of the best scholars of his day; in Biblical criticism he was inclined to be perverse; where there was argument, he usually chose the opposite view to that held by other divines, especially Beza. His theolog-
ical opinions were of a somewhat lax character, his eight works, in Latin and French (10 vols., 1610–42) being said to be the foundation of Moses Amyraut's doctrine of universal grace (1634). His followers are sometimes called Cameronites. His collected works were published with a memoir by L. Cappel (Geneva 1642).

Cameron, Sta Matthew Crooks, Canadian statesman and jurist: b. Dundas, Ontario, 1822; d. 1891. He was called to the bar of Upper Canada in 1849, and was first returned to Parliament in 1851. He subsequently sat in the provincial legislature of Ontario; was provincial secretary 1867–71; commissioner of Crown lands 1871; and leader of the opposition 1872–76. He was appointed to the bench in 1878, and in 1884 became chief justice of the Court of Common Pleas of Ontario. He was knighted in 1887.

Cameron, Richard, Scottish Covenant: b. Falkland, Fifeshire, 1648; d. Ayrmoss, 22 July 1680. He was at first a school-master, and for a time was tutor in the family of Sir Walter Scott of Harden. Being converted to the presbyterian faith, he became an enthusiastic votary of the Covenant. On 20 June 1680, in company with about 20 other persons, well armed, he entered the village of Sanguilar, and proclaimed at the cross that he and those who adhered to him renounced their allegiance to the King on account of his having abused his government, and also declared a war against him and all who adhered to him, at the same time avowing their resolution to resist the succession of his brother, the Duke of York. The privy council immediately put a reward of 5,000 merks upon Cameron's head, and 3,000 upon those of Cargill and Douglas, his associates, and parties were sent out to waylay them. The little band kept together their arms for a month in the mountainous country between Nithsdale and Ayryshire. But on 22 July, when they were lying in Ayrmoss, near Auchinleck in Ayryshire, Bruce of Earlshall approached them with a party of horsemen from much superior in numbers. A brief skirmish took place, in which the insurgents were allowed even by their enemies to have behaved with great bravery; but nothing could avail against superior numbers. Cameron, being among the slain, his head and hands were cut off and carried to Edinburgh, along with the prisoners. Consult Herkies, 'Richard Cameron' (in 'Famous Scots Series,' New York 1890). See Cameronians; Cameronian Regiment.

Cameron, Simon, American statesman: b. Donegal, Lancaster County, Pa., 8 March 1799; d. there, 26 June 1889. He learned printing and in 1820 he was editor of a paper in Doylestown, Pa., and in 1822 held a similar post in Harrisburg. He then interested himself in banking and the building of railroads, and for a time served as adjutant-general of Pennsylvania. In 1838 he was commissioner to settle accounts with the Wimehago Indians and was accused of swindling them. From 1845 to 1849 he was United States senator from Pennsylvania, elected for the Democratic party. He became a member of the Republican party on its formation, and in 1850 was again elected United States senator. He was unsuccessfully supported for the offices of both President and Vice-President in the National Convention of 1860, and in 1861 was appointed Secretary of War by President Lincoln. He advocated the arming of fugitive slaves and other extreme measures. In January 1862 he resigned from the cabinet, and was appointed Minister to Russia. He succeeded in gaining the support of the Russian government for the Union. In November of the same year he resigned, and lived in retirement till 1866, when he was again elected to the United States Senate. In 1872 he became chairman of the Committee on Foreign Affairs. In 1877 he retired from the Senate in favor of his son, James Donald Cameron. His influence over the Republican party was strong, and his power in the politics of his State practically absolute. The control was transferred later to M. S. Quay and Boies Penrose. Cameron was the first powerful State "boss" in American politics. His ideals may be gathered from his definition of an honest politician as "one who will stay bought when he is bought." He was a vigorous opponent of civil service reform during the administration of President Hayes. Consult McClure, 'Old Time Notes of Pennsylvania' (2 vols., Philadelphia 1905).

Cameron, Verney Lovett, English traveler in Africa: b. Weymouth, 1 July 1844; d. Leighton Buzzard, 26 March 1894. He entered the British navy in 1857, and in 1872 was chosen by the Royal Geographical Society of London to conduct an expedition for the relief of Dr. Livingstone. He was only in time to meet the remains of Livingstone at Uyanwembe, but pushed onward to Ujiji on Lake Tanganyika, and partly circumnavigated this great sheet of water, establishing the fact that its outlet was the Lukuga. Not being able to follow the Lualaba River downward, he continued his journey westward to Benguela, and was thus the first to cross tropical Africa from east to west. Returning to England in 1876, he was raised to the rank of a commander. In 1878 he made a journey through Asia Minor and Persia in order to satisfy himself of the feasibility of a railroad connecting India with the Mediterranean, and in 1882 with Sir Richard Burton explored the country behind the Gold Coast. He published accounts of his journeys in his 'Across Africa' (1877); 'Our Future Highway to India' (1888); 'To the Gold Coast for Gold' (with Sir R. F. Burton, 1883). He died from an accident in the hunting field.

Cameron, Mo., city of Clinton County on the Chicago, Rock Island & Pacific and the Chicago, Burlington & Quincy railroads, 50 miles northeast of Kansas City. The dairying industry is important, gloves are manufactured, municipal waterworks and electric lighting plants are operated and Missouri Wesleyan College is situated here. Pop. 2,980.

Cameron, Texas, city, county-seat of Milam County, on the Gulf, Colorado & Santa Fé and the San Antonio & Aransas Pass railroads, 53 miles south of Waco. Stock raising and cotonnerc are paramount; coal and timber are exploited from neighboring deposits. Cameron was founded in 1875. Pop. 3,263.
CAMERON HIGHLANDERS—CAMILLUS

CAMERON HIGHLANDERS, the old 79th Regiment in the British army, raised in 1793 by Allan Cameron of Erroch. It wears the Highland dress and forms the first battalion of the King’s Own Cameron Highlanders. Its depot is at Inverness and its record office is maintained at Perth. A second battalion is now linked with the regiment, the first being known as the 79th Foot.

CAMERONIAN REGIMENT, a British regiment raised in 1689 among the Camerons of the west of Scotland to support William III, and long famous as the 26th Regiment. It fought in the first battle of the Cameronians, Scottish rifles (Regimental District No. 26; Depot and Record Office Hamilton, N. B.), the second battalion being the old 96th Regiment. It takes its name from William Cameron, and its origin goes back to the time when the Covenanters went armed to public meetings.

CAMBRONIANS, a sect of Scotch Presbyterian dissenters, named after Richard Cameron. James I had enforced on his Scottish subjects a liturgy which the people abhorred, and this led, in 1638, to the formation of the Cameronians, who upheld half of the true religion and the freedom of the kingdom. The organization of the Scottish presbytery was still further completed in the adoption of the Presbyterian form of Church government, a Calvinistic concept, and the two catechisms, which documents are the standards of the Scottish Kirk to this day. Throughout the revolution of 1688 the Camerons maintained inflexible hostility to the royal usurpation of religious freedom. They supported the Prince of Orange as the rightful King of England, but were displeased and disappointed by the form in which the Presbyterian Church was restored. In 1709 they exerted all their influence against the union of Scotland and England. The prelacy of this denomination was not organized until 1 Aug. 1743, when an act of toleration was procured in their favor. They still have a distinctive existence in Great Britain and America, under the name of Reformed Presbyterian.

CAMEROONS, kā’moōnz’, or KAMERUN, a German colonial possession in West Africa having originally an area of 191,130 square miles, which was increased in 1911 to 295,000 square miles by France agreeing to cede the Kongo territory as compensation for loss of German influence in Morocco. It is bounded by Lake Chad on the north, French Congo on the east and south, Spanish Guinea on the southwest and the Bight of Biafra and Nigeria on the west. From the sea to Lake Chad it measures over 700 miles, and its greatest breadth from east to west is 600. The territory receives its name from the Cameroon River, which enters the Bight of Biafra by an estuary nearly 20 miles wide. The swamps along the banks of the river render this district unhealthy for Europeans. Northwest of the river lies the volcanic group called the Cameroon Mountains, which rise to a height of 13,760 feet. The lower slopes of these mountains are more healthy and are covered with ebony, redwood and palm trees. The climate is warm and the River is the much longer Mbam, entering the Bight of Biafra a little south of the former, and navigable for 40 miles inland to Idia.

Among cultivated plants are the banana, oil-palm, cocoaanut, groundnut, manioc, yam, sweet-potato and colocasia; of more recent introduction are cacao, coffee, tobacco, etc. Among the minerals are gold and iron. There is a considerable trade in cotton, ivory and oil. The inhabitants are almost entirely of the Bantu stock, widely diffused throughout the more southerly portion of the continent, and many of them have almost regular European features. The coast of the Cameroon territory was annexed by Germany in 1884, and the interior was afterward acquired, the whole having been a German colony under a governor. The seat of government was at Buea, situated 3,000 feet above sea-level near the coast. At Duala there was a commodious floating dock; 150 miles of railroad had been constructed and there was wireless communication with Berlin through Togoland. The colony had never raised sufficient revenue to meet its expenditure, the last figures of which were 588,300, with receipts £56,300, imports £1,712,000 and exports £1,165,000.

In August 1914 operations were begun by the British against the Cameroons, which culminated in January 1916 when 14,000 native troops and 900 officers withdrew over the southwestern frontier into Spanish Guinea and there gave up their arms. A month later the northern garrison capitulated.

CAMLING, kā-mĕl’ing, Philippines, town of Luzon, Tarlac province, on the Camiling River, 80 miles northwest of Manila. Fine timber, rice, corn and sugar are the chief products. The place has an unwholesome reputation as a hiding place for thieves and outlaws. Pop. 26,000.

CAMILLA, in Roman fable, a virgin, said to have been a daughter of Metabus, a Volscian king, and to have aided Turnus against Æneas (Virgil, Æneid, vii). She was slain by Arruns, an Etruscan ally of Æneas (Virgil, Æneid, xi, 648-833).

CAMELLE, kā-mēl’, the heroine of Dumas’ novel, and the play adapted from it. (See LA DAME AUX CAMELIAS); also the heroine of Corneille’s Les Horaces; founded on the old Roman legend of the Curtiati.

CAMILLUS, Marcus Furius, Roman patriarch: d. 365 B.C. He is famous as the deliverer of the city of Rome from the Gauls. He first came into notice as consular tribune in 403 B.C. His military successes were numerous, but the accounts of them have become mixed with considerable mythological fiction. In 396 B.C. he was made dictator during the Veientine War, and captured the town of Veii after it had defended the Roman power for more than 10 years. In 394 B.C. Camillus besieged the Falerii, and by an act of generosity induced them to surrender. Three years later the envy and jealousy of enemies caused him to fall for a time, and he was living in retirement when the Gauls, under Brennus, invaded and captured Rome, with the exception of the Capitol. Camillus was now appointed dictator a second time, and was successful in repelling the invaders, rebuilt Rome and gained new victories over the Volsci and others. In 386 he was elected dictator for the third time and refused the office. In 381 he carried the Roman arms
to victory against Preneste and other Latin towns. For the fourth time he became dictator in 368, but abdicated in the same year. A new invasion of the Gauls called him, at the age of 80, once more to that position, and he defeated and dispersed the barbarians near the site of Alba Longa, and concluded a peace between patricians and plebeians and aided in passing the Licinian Laws. He erected a temple to Concordia near the Capitol, retired from public life, and died of the plague in about 365 B.C., universally respected and lamented. See ROME, HISTORY, and consult Plutarch, 'Camillus.'

CAMINATZIN, kā-mē-nā-tān', or CACU-MAZIN, Mexican king: d. 30 June 1520. He was nephew of King Montezuma and reigned over Tezcuco at the time of the Spanish conquest. Caminatzin, with more courage and enterprise than his uncle, proposed to his subjects a declaration of war against the foreigners. The proposal was received with enthusiasm, and Caminatzin called upon the Spaniards to leave the country immediately or to expect to be treated as enemies. Montezuma invited his nephew to Mexico to become reconciled with the Spaniards. The answer of Caminatzin was that he could enter Mexico only to destroy the tyrants of his country. Montezuma then despatched secret agents to Tezcuco to get possession of the young prince by whatever means. His first officers and nearest friends were corrupt, and he was delivered by them to Cortés and imprisoned. He perished during the evacuation of Mexico by the Spaniards.

CAMISARDS, kām'-zārds, Protestants in France (in the Cévennes), who, in the beginning of the 18th century, in consequence of the persecution to which they were exposed after the revocation of the Edict of Nantes in 1685, rose against the royal deputies. The name is usually thought to be derived from "camise," a provincial form of the French word "chemise," signifying a shirt or smock, and it is said to have been applied to them because their ordinary outer garment was a smock or blouse. The first occasion on which they broke out into open revolt was the assembly of the royal deputies on the night of 24 July 1702, when 50 of them attacked the house of the Abbé du Chayla, one who had signalized himself by his cruelty during the persecutions. They set free the prisoners whom they found confined in the dungeons, and put the abbé himself to death. This was the signal for a general rising of the mountaineers. The government sent troops to punish the authors of these acts. A certain Jean Cavalier, a peasant, whom a fortune-teller had pointed out as the deliverer of Israel, placed himself at the head of the Camisards. His unlimited authority with his adherents, his talents and courage, enabled him to oppose the measures of experienced generals with so much success that negotiation was substituted for force. The Marshal Villars in 1704 made a treaty with Cavalier, by virtue of which Cavalier himself was received into the royal service as a colonel. This treaty, however, did not satisfy his associates, because it did not compensate them for their losses and on that account Cavalier was reproached as a traitor who had sacrificed the cause of his coreligionists to his own interest. At the court, too, he was received with coldness, so that in a short time he was glad to go into voluntary exile. He went to England, where Queen Anne gave him a favorable reception. Voltaire, who became acquainted with him in London, speaks of him in high terms. At the time of his death Cavalier was general and governor near Paris. The name camisars blancs (white camisars), or cadets de la croix (cadets of the cross), was given to a band of Roman Catholics formed to put down the Calvinistic Camisards, who were called camisars noirs, or black Camisards. See also FRANCE—HISTORY.

CAMLET, or CAMLET, (in French, camelot), a name applied in England to a fabric made of long wool, hand-spun, sometimes mixed with cotton or linen yarn. Various derivations of the word are given. Some consider it to be of the same root with camel, because it was originally made of camel's hair; others derive it from the Arabic chamal, signifying fine, because according to them it was originally made of the fine hair of the Angora goat.

CAMMAERTS, cām-'mārts', Emile, Belgian poet and journalist. He gained a worldwide celebrity by his fierce poetic denunciations of the German invasion of Belgium in 1914. But though his muse at times rises to impassioned heights, it is rather as the poet of domestic joys and sorrows that he shines; it is through the tender details of his descriptions that he makes his best verses. With a number of exiled literary and artistic compatriots, Cammaerts issued in 1916 a work in recognition of the help given by the British empire and the United States during the great War. It bore the title of "A Book of Belgium's gratitude. Consul, to the poet. Let to the poet, and autres poèmes" (New York 1916) : Chants patriotiques et autres poèmes, in French and English.

CAMMERHOFF, John Christophe Frederick, Moravian bishop in America: b. near Magdeburg, Germany, 28 July 1721; d. Bethlehem, Pa., 28 April 1751. He was educated at Liena, and at the age of 25 was consecrated a bishop in London and came to America as Bishop Spangenberg's assistant. He preached in Pennsylvania and New York, but his greatest successes were made among the Indians. The Iroquois adopted him into the order of the Oneida nation, and gave him the name of Gallichio, or "A Good Message." In 1750 he undertook amid great hardships a tour to Onondaga. It occupied three months, embraced a distance of 1,600 miles and was filled with hair-breath escapes. He was too weak to endure such enterprises, and died the following year. The Iroquois mourned him as a brother and said of him "He was an honest, upright man, in whose heart no guile was found." Thirty years later Zeisberger heard his name mentioned among them with deep respect and veneration. The memory of his devotion and irrepressible missionary zeal has ever been held in honor by the people of his faith.

CAMÕES, kā-môn'ēsh, or CAMÕENS, Luiz Vaz de, Portuguese poet: b. Lisbon probably 1524 or 1525; d. 1797. His father, Simon Vaz de Camões, was a ship-captain, who perished by shipwreck on the coast of Goa about 1552. Camões studied at Coimbra, of which his uncle, Dom Bento de Camões became chancellor in 1539, the year of Luis'
entrance to the university. At that time writers were esteemed in proportion as they imitated the ancients. Camões was inspired by the history of his country, and by the manners of his age. His lyric poems, like the works of Dante, Petrarch, Ariosto and Tasso, belong to the literature formed under the influence of Christianity. After the completion of his studies he returned to Lisbon, where he fell deeply in love with a lady of the palace, Catharina d’Atayada. Violent passions are often joined with great talents—Camões had both. He was exiled to Santarem on account of disputes in which his love for Catharina involved him. From despair he became a soldier, and served in the fleet which the Portuguese sent against Morocco. He composed poetry in the midst of battles, and as danger kindled his genius, so genius animated his courage. An arrow deprived him of his right eye before Ceuta. He hoped that his wounds would receive a compensation, though his talents were not appreciated; but envy opposed his claims. Full of indignation, he sought himself neglected, he retired to the Moluccas in 1553 for India. His powerful imagination was excited by the heroic deeds of his countrymen in this quarter, and although he had much reason to complain of them, he could not resist the desire of celebrating their glory in an epic. But this vanity of mind, essential to the poet, is not easily united with the moderation which a dependent condition demands. Camões was displeased with the abuses of the government in India, and wrote a satire, which caused his banishment to Macao. Camões was recalled from the Moluccas, but after three years of captivity a new viceroy recalled the decree of banishment against him, and appointed him administrator of the effects of deceased persons at Macao. His chief poem, the ‘Lusiad,’ was composed partly during the period of his captivity, and partly while he held the office of administrator. Camões was at last recalled from his banishment. At the mouth of the river Mekon, in Cochín-China, he was shipwrecked, and saved himself by swimming—holding in one hand about ten of the 5367 MSS of his poem, the only treasure which he rescued from the waves. In Goa he encountered new persecutions; was confined in prison for alleged embezzlement of funds entrusted to him during his tenure of office at Macao, and not allowed, until his friends became responsible for him, to embark and return to Lisbon in 1569. King Sebastian, yet hardly past the age of childhood, took an interest in Camões. He accepted the dedication of his epic (which appeared in two editions, varying both in the text and the orthography, in 1572), and being on the point of embarking on his expedition against the Moors in Africa, felt more sensibly than others the genius of the poet, who, like him, loved dangers if they led to glory. On 12 June, 1577, before Alcâçaç in 1578, and with him the royal family became extinct, and Portugal lost her independence. Every source of assistance, as well as every hope of Camões, was destroyed by this event. So great was his poetry that at night a slave, whom he had brought with him from India, begged in the streets in order to support the life of his master. In this misery he yet wrote lyric poems, some of which contain the most moving complaints. This hero of Portuguese literature, the ornament of his country and Europe, died in a hospital, neglected. In 1596 a splendid monument was erected to his memory. Vasco da Gama’s expedition to India is the subject of his great poem. The parts of it which are set to music are the episode of Ines de Castro, and the appearance of Adamastor who, by means of his power over the storms, aims to stop Gama’s voyage when he is about to double the Cape. In conformity to the taste of the time, Camões united in this poem a narrative of the Portuguese history with the splendor of poetic description, and Christianity with mythological fables. He pleased himself with tracing the descent of the Portuguese from the Romans, of whom Mars and Venus are considered the progenitors and protectors. Since fable ascribes to Bacchus the first conquest of India, it was natural to represent him as jealous of the undertaking of the Portuguese. If the imitation of the works of classical antiquity has been of any disadvantage to the ‘Lusiad,’ the injury consists, perhaps, in a diminution of the originality which one expects in a work in which India and Africa are described by an eye-witness. The general interest of the poem consists principally in the patriotic feeling which pervades it. The national glory of the Portuguese appears here in every form which invention can lend to it, and therefore the countrymen of Camões must naturally admire this poem more than foreigners. Some critics pronounce the ‘Lusiad’ a mere powerful and pure historical painting by Tasso. ‘The Poem Delivered.’ A valuable edition of the ‘Lusiad’ (Os Lusiadas, etc.) was published by Joze Maria de Souza-Botelho (Paris 1817). It has been translated into English by Fanshaw, Mickle and Duff; by J. J. Aubertin (with Portuguese text), and by Sir R. F. Burton (with ‘Life of Camões, Commentary,’ etc.; 6 vols., London 1881). The works of Camões, besides the ‘Lusiad,’ consist of sonnets, songs, odes, elegies, eclogues, redondilhas, epigrams, satires, letters and three dramas, ‘A Cidade do Falecimento’ and ‘The Poem Delivered.’ A valuable edition of the ‘Lusiad’ (Os Lusiadas, etc.) was published by Joze Maria de Souza-Botelho (Paris 1817). It has been translated into English by Fanshaw, Mickle and Duff; by J. J. Aubertin (with Portuguese text), and by Sir R. F. Burton (with ‘Life of Camões, Commentary,’ etc.; 6 vols., London 1881). The works of Camões, besides the ‘Lusiad,’ consist of sonnets, songs, odes, elegies, eclogues, redondilhas, epigrams, satires, letters and three dramas, ‘A Cidade do Falecimento’ and ‘The Poem Delivered.’
CAMOMILE. See Chamomile.

CAMONICA, kä-mô'-nê-kä, or VALLE CAMONICA, a valley in North Italy, in the province of Brescia, formed by two branches of the Rhetian Alps, watered by the Oglio, and stretching about 50 miles from north-northeast to south-southwest as far as Lake Isco. It is a mountainous thoroughfare between Italy and the Tyrol. It has quarries for iron, copper, lead, marble and slate. Its soil is fertile, agriculture being one of the leading occupations; maize, grapevines and mulberry trees are extensively cultivated.

CAMORRA, an association in Naples, the members of which (Camorristi) carried on extortion as a regular business and were found at markets, fairs and public gatherings in the exercise of their employment. The band became known in 1820, when it was not political but social, originating in the Neapolitan prisons, then filled with victims of Bourbon misrule. It was carried into the city in 1830 and became a political body of great influence in 1848. A determined effort was made to exterminate it in 1877, but in spite of the lessening of their power it has still remained vigorous. In 1900, a government inquiry was made in the course of a libel suit, the result of which was the formation of the Honest Government League and the consequent defeat of the Camorra in the municipal elections of 1901.

They were divided into several classes,—those who dressed as gentlemen and mingled with people of rank; those who practised their work on tradesmen and the like; and the political and murdering camorrists. There were various ranks and grades which might be attained in the Society, and certain ceremonies of a very severe character were celebrated. The Association extended its ramifications over entire Naples. It had central stations in all of the large provincial towns and 12 in the city of Naples. Consult Monnier, 'La Camorra' (Florence 1863); Alongi, 'La Camorra' (1890); Heckethorn, 'Secret Societies of All Ages' (London 1897).

CAMOUFLAGE, ca' moo-fläzh. This art is in reality an adaptation of the science of color to meet man's requirements according to the plan of nature's protective coloring but the idea may be greatly extended in scope as will be briefly suggested in the following paragraphs. It is well known that many species of birds, fishes and animals assume colorings and patterns which quite effectively conceal them in their natural environments. Some of these change their colorings and patterns from season to season and the chameleon and certain fishes have the ability to alter their color very quickly to an approximation of that of their immediate surroundings. Some fishes are also able very quickly to imitate approximately the pattern of the background upon which they are placed. The effectiveness of this scheme of protective coloring has indicated to man the possibility of providing protective concealment for men, batteries, etc., in warfare and in other activities and the science of color has revealed other ways to be employed. In warfare the aim is to provide a covering which closely imitates that of the surroundings. In order to provide effective concealment it is necessary to consider the character of the lighting and herein the greatest obstacles are usually encountered because of its changeableness. The scheme will be introduced by means of a few examples. It is easy to mask a battery in the summer time and green foliage by using a screen of green branches, grass, etc. The duck-hunter utilizes a suit of grass or a blind of vegetation in the same manner. In other seasons suitable changes in the screens may be made to it. Soldiers are used to move about in a snow-covered winter landscape which is devoid of vegetation this may be accomplished by means of white clothing and even white masks or paint on their faces. On an overcast day the concealment may be accomplished quite effectively but on clear sunny days the shadows cast upon the surface of the snow and the shadows on the various contours of the form usually render complete deception impossible especially if the soldiers are moving. If the winter landscape is not wholly barren of trees or shrubs and the soldier is on stationary outpost duty, a dark gray cloak is effective. In the case of vessels it has been found that a mottled pattern of grays has been quite effective toward rendering them indistinguishable or practically invisible. If they lie low in the water it is obvious that the deception is generally more successful. However, the appearance of the surface of the water varies with the lighting and with the character of the sky and of the waves. It is obvious that the surface of the water assumes many appearances with a given lighting and sky condition, including the calm smooth surface, the choppy sea and the long swells or rolling sea. To a distant observer these differ least in appearance on a uniformly overcast day. On a sullen day there are usually bright high-lights on the waves which are reflected images of the sun. Furthermore the surface color of the water is largely due to reflected images of the sky and clouds. The color of a smooth surface of the water at some distance from a given observer appears to him quite similar to that of the lower portion of the sky in the direction in which he is gazing. This is readily seen if a diagram is made and the optical reflection—the angle of incidence is equal to the angle of reflection—is applied. When small waves are running, beautiful color-effects are seen if the color of the zenith or upper portion of the sky differs materially from that of the lower sky near the horizon, as is usually the case after sunset. Such a surface of water appears to be a series of stripes alternating in color. From the simple diagram previously suggested it will be seen that the lagging side of a wave is reflecting toward the observer an image of a patch of sky near the horizon and the advancing side is reflecting an image of a patch somewhat nearer the zenith. If these patches are different in color, the beautiful effects already mentioned are accounted for. These different appearances of the water have been discussed in order to show that the best protective coloring for vessels differs according to lighting, sky condition, and surface character of the water. In other words, practical, several removable coverings differing in pattern, could be provided. In general the most suitable color is bluish gray but there is always the difficulty with glistening high-lights, even if
smoke can be suppressed or avoided. It is a comparatively simple problem to provide a coating for rendering a low-lying ship inconspicuous or even invisible under specific conditions of lighting, sky and surface of the water; however, in practice a compromise must be made in order that one coating will serve well under all conditions. In marine camouflage the outline of the vessel is important for it is usually seen against the sky by the submarine or distant enemy. The science of color can be used effectively in revealing guns, soldiers, etc., belonging to the enemy if they have not been provided with coverings closely resembling their environments. The plan is quite the reverse of camouflage in that it aims to augment the contrast in hue or in brightness. In general, all objects are “colored”; that is, relatively few objects are without hue. The latter are the whites, blacks and intermediate grays. We see an object only when there is a contrast between it and its background or immediate surroundings. This contrast may be in hue or in brightness but usually it is a mixture of both. Camouflage aims to eliminate these contrasts. It is a fact of color-science that a colored object — for example, a pigment — will not appear, in general, the same under two different illuminants. Both the hue and value or reflection factor of a colored object change with the illuminants. For example, in Fig. 1 are shown the relative values or brightness-contrasts of six colored fabrics under red, green and blue lights, respectively, as indicated. For example, the lower middle one, which was a blue fabric, is very dark under red light and is very bright under blue light. This experiment is significant in indicating the possibilities of using various colored screens before the eyepieces of field glasses and telescopes. A study of a landscape by means of such filters may reveal objects owing to the augmented contrast which would not be otherwise sufficiently conspicuous. Experiments made by the author before the beginning of the European War indicated such possibilities. For example, a khaki cloth amid green foliage may be made to appear darker or brighter than the surrounding green foliage by viewing it through blue-green and yellow-orange filters respectively. Actual measurements of the ratio of the brightness of the khaki cloth to that of a green leaf were respectively 0.7 through a blue-green filter, and 1.5 through a yellow-orange filter. These ratios are on the basis that, under daylight illumination, the two objects appeared of the same brightness when viewed without colored filters. The applications of colored screens to field glasses appears to be well worth while for many purposes outside of warfare. In order to meet all the conditions to be found, a series of filters, say blue, green, yellow, orange and red, could be provided in pairs for field glasses and arranged in a convenient manner for quickly changing from one set to another. These screens should be as pure in color as practicable. Another promising filter is a yellow or canary screen whose object would be to eliminate the bluish haze which is usually present in distant landscapes. A large percentage of light is sacrificed with such screens but fortunately the intensity of daylight is usually far greater than is necessary. It is doubtful that artificial light will play an appreciable part in the art of camouflage in warfare; however, it has possibilities in other fields in certain developments in color-effects applicable to the stage, etc. Applying the principle already discussed briefly in connection with Fig. 1 it is possible to relate various colors with certain patterns in such a manner that certain parts of the scene will disappear completely under a given illuminant. For example, a gray on a red background is readily distinguished under ordinary light because of the difference in brightness and in hue. Under a red light there will be no difference in hue if the red background has been properly selected in relation to the illuminant. There remains, then, only the possibility of a contrast in brightness which depends upon the relative amounts of light reflected by the gray and red objects. If the gray is properly selected it will appear of the same brightness as the red background under the red light and therefore will be indistinguishable or invisible. By the use of the same principles applied to a number of pigments (those having the quality of high transparency being more satisfactory), striking disappearing effects can be obtained by varying the color of the illuminant. The effect which is possible by applying these principles is illustrated in Fig. 2 although rather feebly,

![Fig. 2 — Illustrating changing of scenery by the use of colored lights or camouflage applied to canvas](image-url)
CAMP

possibilities on the stage, in displays and in advertising. Ordinary pigments are not as satisfactory as water colors or paints made by coloring a white base with aniline dyes. In applying the art of camouflage it is seen that the science of light and color contains the underlying principles. With a thorough acquaintance with these methods can be accomplished, some of the efforts of the enemy to conceal soldiers, batteries, etc., could be rendered ineffective by utilizing colored screens on telescopes and field glasses unless the colors were very carefully chosen by the enemy. For example, for perfect concealment the object must possess the same color as its surroundings, not only as viewed by the eye but as analyzed by the spectroscope. This point is too intricate to discuss in detail but in color-work it is always well to remember that in respect to color the eye is synthetical and not analytical. In other words, the eye records only the integral effect of the spectral colors of which ordinary colors consist. For example, two yellows may appear the same to the eye even though they may be quite unlike in spectral composition. If the latter is true, the two yellows will not in general appear alike under any other illuminant. Camouflage has been practised in all wars, but in the European War of 1914 it has been highly developed. Consult Luckiesh, M., 'Color and Its Applications.'

M. LUCKIESH.

CAMP, kāmp, Maxime du. See DU CAMP, MAXIME.

CAMP, Walter, American manufacturer and writer: b. New Britain, Conn., 7 April 1859. He was educated at the Hopkins Grammar School and at Yale University, from which he was graduated in 1880 with the degree of A.B. For over 30 years he has been associated with the New Haven Clock Company, of which concern he is now president. He was active in the management of athletics at Yale, giving especial attention to football. On this sport he became a leading American authority, and was in demand on various committees which undertook the revision of football rules and brought about the present system of play. He became a member of the Yale University Council. He is a prolific writer on sports, of articles relating to the effect of sport and play-grounds on the development of character; is sports editor of various periodicals; also, a liberal contributor on sporting topics to The Century, Harper's, Collier's, Saint Nicholas, and numerous other American and English magazines. He is editor of The Boys' Magazine; editor-in-chief of 'The Young People's Library.' He is author of 'The Substitute' (1895); 'Jack Hent of Yale' (1909); 'Old Ryerson' (1911); 'Danny Fists' (1913); 'Captain Danny'; 'Danny the Freshman'; 'Bridge Don'ts'; 'Auction Bridge Don'ts'; 'Auction Bridge up to Date'; 'Book of College Sports'; 'American Football'; 'Football Facts and Figures' (1886); 'Football'; 'Yale, Her Campus, Class-Room and Athletics'; 'Drives and Puts,' with Lillian Brooks (1899).

CAMP, in military use, the place and aggregate body of tents or huts for soldiers in the field. In modern times a difference is often made between camp, bivouac and cantonment, the first signifying the quarters of an army sheltered in tents; the bivouac, the situation of one which dispenses with them, and remains either entirely in the open air, or, when time allows it, in huts built of branches, etc.; the cantonment when the troops occupy buildings in towns or villages. Camps, in a general sense, are of very ancient origin, since almost all nations in their infancy lived as nomads, dwelling in tents, as is the case with many tribes in Asia and Africa at the present day, for example, the Arabs. Among the Greeks, the Lacedaemonians seem to have been the first who devoted attention to the art of forming military camps. The form which they adopted was the circular, that being the form which was best calculated to enable the general, who had his tent in the centre, to have a view of the whole camp, and to dispatch assistance in the shortest possible time to any part of the camp that might be attacked. The Romans probably first carried the art of encampment to a high degree of perfection, on account of their many wars in distant and a given illuminant, though they may be quite unlike in spectral composition. If the latter is true, the two yellows will not in general appear alike under any other illuminant. Camouflage has been practised in all wars, but in the European War of 1914 it has been highly developed. Consult Luckiesh, M., 'Color and Its Applications.'

M. LUCKIEH.

CAMP, kāmp, Maxime du. See DU CAMP, MAXIME.

CAMP, Walter, American manufacturer and writer: b. New Britain, Conn., 7 April 1859. He was educated at the Hopkins Grammar School and at Yale University, from which he was graduated in 1880 with the degree of A.B. For over 30 years he has been associated with the New Haven Clock Company, of which concern he is now president. He was active in the management of athletics at Yale, giving especial attention to football. On this sport he became a leading American authority, and was in demand on various committees which undertook the revision of football rules and brought about the present system of play. He became a member of the Yale University Council. He is a prolific writer on sports, of articles relating to the effect of sport and play-grounds on the development of character; is sports editor of various periodicals; also, a liberal contributor on sporting topics to The Century, Harper's, Collier's, Saint Nicholas, and numerous other American and English magazines. He is editor of The Boys' Magazine; editor-in-chief of 'The Young People's Library.' He is author of 'The Substitute' (1895); 'Jack Hent of Yale' (1909); 'Old Ryerson' (1911); 'Danny Fists' (1913); 'Captain Danny'; 'Danny the Freshman'; 'Bridge Don'ts'; 'Auction Bridge Don'ts'; 'Auction Bridge up to Date'; 'Book of College Sports'; 'American Football'; 'Football Facts and Figures' (1886); 'Football'; 'Yale, Her Campus, Class-Room and Athletics'; 'Drives and Puts,' with Lillian Brooks (1899).

CAMP, in military use, the place and aggregate body of tents or huts for soldiers in the field. In modern times a difference is often made between camp, bivouac and cantonment, the first signifying the quarters of an army sheltered in tents; the bivouac, the situation of one which dispenses with them, and remains either entirely in the open air, or, when time allows it, in huts built of branches, etc.; the cantonment when the troops occupy buildings in towns or villages. Camps, in a general sense, are of very ancient origin, since almost all nations in their infancy lived as nomads, dwelling in tents, as is the case with many tribes in Asia and Africa at the present day, for example, the Arabs. Among the Greeks, the Lacedaemonians seem to have been the first who devoted attention to the art of forming military camps. The form which they adopted was the circular, that being the form which was best calculated to enable the general, who had his tent in the centre, to have a view of the whole camp, and to dispatch assistance in the shortest possible time to any part of the camp that might be attacked. The Romans probably first carried the art of encampment to a high degree of perfection, on account of their many wars in distant and a given illuminant, though they may be quite unlike in spectral composition. If the latter is true, the two yellows will not in general appear alike under any other illuminant. Camouflage has been practised in all wars, but in the European War of 1914 it has been highly developed. Consult Luckiesh, M., 'Color and Its Applications.'

M. LUCKIESH.
there was a gate. That behind the prætorium was called porta prætoria, the one on the opposite side porta decumanus. The other two were at the ends of the prætoria, and were called respectively porta principalis dextra and porta principalis sinistra. The camp was improved in strength and convenience according to the time that it was occupied, and in some cases, from the want of the men, it was made the basis of their military operations.

After the invention of gunpowder, entrenched camps, such as that just described, proved of very little service, as they afforded no protection against projectiles shot from long ranges, and it became necessary to keep the mass of the army not actually engaged at such a distance in the rear of the fighting line as to be beyond the reach of the most powerful guns of the enemy. In the European War ranges as high as 18 miles were attained, and in a few instances 20 miles was recorded for a few shots from each new gun. The camp, in the old sense, therefore, has lost its former significance, and has become little more than a depot or stockade for the people living on the line and its immediate supports being protected underground in dugouts and bombproof constructions.

With the advent of the fighting aeroplane a new danger has to be met. These machines may rise behind the enemy lines to a height where they are no longer visible, and travel many miles to the rear of an opponent's fighting line and drop high explosives upon a camp which is safe from gunfire. In these conditions the camp must be so disguised by the art of camouflage (q.v.) as to be indistinguishable from the adjacent country when viewed from above by the aviator. The camp defenses then become reduced to two: (1) Against spies; and (2) against aircraft. For the former, quick-firing guns which may be pointed upward at a high angle, are mounted on automobile trucks, and stationed at outlying points surrounding the camp. It has recently become common to form camps in time of peace for the sake of disciplining the soldiers to a camp life, and exercising them in the evolutions and manœuvres of actual warfare. These are called camps of instruction, of which examples are seen in the United States, where the organizations of the different States are accustomed to annual encampments for these purposes; also in the camp for British troops at Aldershot, and temporary camps throughout Great Britain for the training of the militia and volunteers, and in the like customs and establishments of other countries. Such camps are generally of a permanent type, with substantial buildings and arranged to provide many more of the comforts of life than is usual with camps in the field.

In the United States army the duty of selecting the site and laying out the camp devolves upon the engineer corps. This section of the work of the engineers is termed technically "castrametation." The practice followed requires that the site shall be on slightly sloping ground, surrounded with open space, and far from exposure. The surface should be well covered with short grass, and the subsoil should be sandy or gravelly. For a summer camp a high and breezy spot is selected: for a winter camp a site with a southern exposure, and a windbreak of woods toward the north. The water supply should be pure, abundant and reasonably accessible. Good roads should approach the camp site from several directions, and pasture and supplies should be available near by. The streets of the camp are ditched on both sides, and each tent is surrounded with a shallow trench. The streets are swept daily, and no refuse is permitted to lie between the tents. As a protection against epemics, the camp is moved to a new site every two or three weeks. The United States soldier carries as a part of his pack a half of a "pup" tent, which but need to the half carried by another soldier forms a shelter for the two men. When set up it covers a ground area of six feet in length and four feet in width, and is three feet high at the peak. A regiment of 2,200 men requires an area of close to 30 acres, equivalent to a plot of ground about 1,100 feet square. For the permanent camp of instruction there is required also a considerable area for drills, parades and manœuvres. This need not be directly adjacent, but should be conveniently near the camp, and be readily accessible by rail. Consult Moss, J. A., "Manual of Military Training" (Menasha, Wis., 1915); and "Training Officers' Manual" (Menasha, Wis., 1911).

CAMP ALLEGHANY, W. Va., a Confederate camp where an engagement took place 13 Dec. 1861. After the affair at Camp Bartow, 3 Oct. 1861, the Union troops had remained at Cheat Mountain Summit. Gen. R. H. Milroy, who was in command 12 Dec. 1861, determined to attack Camp Alleghany, the summit of Alleghany Mountain, to which the Confederates had fallen back from Camp Bartow, and which was held by Col. Edward Johnson, with 1,400 men and eight guns, partially entrenched. With 1,800 men Milroy marched to Camp Bartow, 12 December, and made his dispositions. One column of 900 men, under Col. James A. Jones, was to ascend the mountain, until near its summit, when, leaving the road, it was to move to the left and attack Johnson's right and rear, while another column of 900 men, under Col. G. C. Moore, was to follow the Greenbank road and by a circuitous route, concealed by heavy forests, assail Johnson's left. The attacks were to be simultaneous at 4 A.M. of the 13th. Jones started at midnight, gained his assigned position on time, and waited for Moody, but his presence being discovered, he was quickly engaged and for a time met with success, driving the Confederates before him, but Johnson rallying his troops on that flank and fighting desperately, Jones was repulsed after a two-hours' contest, leaving his dead and many wounded on the field. While Jones was being driven from Johnson's right Moody was slowly approaching his left. He had been delayed by the difficulties of his route, and it was after 8 o'clock when he became engaged, and was met by such a severe fire of artillery and musketry that he could make no progress, but continued a desultory skirmish until afternoon, when he fell back, and the whole Union force, without a man, marched back to Cheat Summit. The action was the most severely contested one of the West Virginia campaign of 1861. The Union loss was 20 killed, 107 wounded and 10 missing; the Confederate loss 20 killed, 98 wounded and
CAMP BARTOW. or GREENBRIER RIVER, W. Va., a place where an engagement in the Civil War was fought, 3 Oct. 1861. On 2 October the Confederates held Camp Bartow, where the road from Beverly to Staunton crosses the Greenbrier River, with about 2,500 men and eight guns, under command of Gen. H. R. Jackson. Gen. J. J. Reynolds, commanding the Union troops at Cheat Mountain Summit, 12 miles west, concluded to feel Jackson's position and, if possible, force it. He marched at midnight of the second with about 5,000 men and 13 guns, drove in a picked post west of the Greenbrier on the morning of the third, and coming to within 600 or 700 yards of Jackson's entrenched position beyond the stream, opened on it with his artillery, the Confederates promptly replying. Several guns were disabled on either side, and Reynolds then, under cover of a demonstration on Jackson's left, moved with six regiments to turn his right. The regiment to make the demonstration on the left crossed the stream, but was quickly driven back, and the six regiments were about to cross the stream on Jackson's right they were met by such a severe fire of artillery and musketry that Reynolds deemed further effort inadvisable and withdrew with a loss of 43 killed and wounded. The Confederate loss was 39 killed and wounded. Consult 'Official Records' (Vol. V).

CAMP DISEASES, disorders common to camp life and more or less incidental to the conditions of active military service, which are often such as to increase the virulence of ordinary diseases. They are generally of epidemic or infectious type, due in large measure to overcrowding and uncleanness. The formerly dreaded scourge known as camp fever, or typhus, is now easily controlled by keeping the men free from the body lice which carry the disease from one man to another. Improper food, exposure to wet and to extremes of temperature, hard muscular labor, unhygienic surroundings and immoral or intemperate habits, contribute to the general conditions in which disease flourishes. Some of the troublesome infectious diseases of military life are: Asiatic cholera, bubonic plague, cerebrospinal meningitis, diarrhoea, dysentery, influenza, malaria, measles, mumps, typhoid fever and tuberculosis. Typhoid fever has been enormously decreased through inoculation with anti-typhoid serum. Alcoholism and venereal diseases depend on personal habits; bronchitis, frost-bite, pneumonia, rheumatism, snow-blindness and sunstroke come from exposure to the weather. Scurvy was formerly common, but it is now not often met with, owing to scientific feeding. From forced marches or severe exertion the modern soldier often suffers from heart-trouble, which often permanently incapacitates him for further service. However, the medical corps of modern armies are so efficient that the proportion of cases of sickness and of deaths resulting therefrom is less than in most well-organized communities at home, owing doubtless to the fact that in the army the orders of the medical staff are compulsory.

CAMP FIRE CLUB OF AMERICA, a social organization with headquarters in New York city, incorporated in 1904, devoted, in the interests of higher sport, to the protection of wild animals, birds and fish, and the preservation of forests. Formulated by the well-known naturalist, Dr. William T. Hornaday, its code of ethics forbids "the killing of all female hoofed animals, the sale of wild game for food, declares a good photograph of a large wild animal in its haunts entitled to greater credit than the dead trophy of the animal, and counsels the greatest conservatism in the killing of all kinds of game, and strict observance of all legislation calculated to protect and increase the supply of game." Membership now numbering nearly 500 and including well-known American sportsmen, writers on outdoor life, painters and sculptors of animal and bird life, is limited to "those who have camped in the wilderness a total of 30 days or more, and who have successfully hunted and killed at least two specimens of big game." The club has energetically initiated and supported legislative action in the interests of its purposes, notably the Hornaday clause in the 1913 tariff law "prohibiting the importation in the United States of wild birds' plumage for millinery purposes."

CAMP FIRE GIRLS, an organization designed to assist in the development and dissemination of the home spirit, differing in this respect most strikingly from the organization called "Girl Scouts" which duplicates Baden Powell's original "Boy Scouts" of England, and so is primarily military and patriotic. The distinction becomes clearer if we recall the founder's words: "Here is an organization [Camp Fire Girls] that is back of the home. It is helping girls and mothers to discover that there are more interesting and happy things to do and relationships to enjoy in connection with everyday life than are to be found in the commercially supplied amusements." Its president is Dr. Luther Halsey Gulick; the organization dates from 1911; the membership in 1916 was given as 7,000.

CAMP HOSPITALS. See HOSPITALS. MILITARY.

CAMP-MEETINGS, gatherings for religious purposes, held usually in thinly populated districts, and continued for several days at a time, with the view of securing prolonged and uninterrupted spiritual exercises. Assemblies of a like kind have been more or less usual at various periods in the history of the Christian Church; but it was in connection with Methodism in the United States that such meetings became especially prominent. The introduction of the protracted camp-meetings into England in 1799 by Lorenzo Dow led to the separation of the Primitive Methodists from the Wesleyans. See CHAUTAQUA.

CAMP SCHOOLS, summer camps for girls and boys affording opportunities for physical training and educational advantages. In some of the camps, regular instruction is given in school subjects, mainly to assist students who have failed of promotion in school or who wish to prepare for entrance examinations. In other camps, there is no formal study of school subjects, but instruction is provided in nature study, camp craft, manual training, photography, music, besides the usual activities in land and water sports. In addition to this, the camps

CAMPA. See ANTL.

CAMPANA, kâm-pân’ya, Girolamo (called de Veagn), Italian sculptor; b. Verona 1552; d. about 1623. He was a pupil and assistant of Cataneo, many of whose works he completed. His earliest known work is a statue of the Doge Leonardo Lovedan in SS. Giovanni e Paolo, Venice. Among his own works are the bronze group for the high altar of San Giorgio; a Madonna and child in San Salvatore; the Saint Anthony in San Giacomo de Rialto, considered his masterpiece, and the altar in the Santi Giovanni e Paolo (all at Venice). Padua, Verona, and Udine also possess beautiful specimens of his art. His technical ability was of a high order and his treatment of decorative effects was highly successful. However, he was fettered by the mannerisms of his age.

CAMPAGNA DI ROMA, Italy, a territory which comprehends the greater part of Old Latium, from 30 to 40 miles wide and 100 long. By it is usually understood the desert plain which begins near Ronciglione or Viterbo, and including the Pontine Marshes, extends to Terracina. In the middle of this region lies Rome, on its seven hills, and on the Tiber. A sandy plain stretches along the Mediterranean. The ground is never more than 200 feet above sea-level and is entirely volcanic. The lakes of the Campagna are evidently craters of extinct volcanoes. Thus the Lake Regillus above Frascati lies at the bottom of an inverted cone of hard, black lava, rising in wild and naked masses from 40 to 60 feet high. The craters containing the lakes of Albano and Nemi have a very regular conical form. The Lake of Albano is also remarkable for its aqueduct, or emissarium, one of the most ancient and excellent works of the Romans, which discharges the waters of the lake through the mountains. It answers its original purpose even at the present day. There are, also, many sulphur springs here, particularly between Rome and Tivoli, where the water issues almost boiling from the earth, and forms the Lake of Solfatara, which contains floating islands, consisting of a calcareous deposit, that collects round substances thrown in to the water. The vapors which rise from the ground all over the Campagna, and especially in the neighborhood of this lake, render the whole district unhealthy. The soil of the Campagna is in general dry, but very fertile in the lower parts. In the middle of the summer, when fivers render a residence in the Campagna very dangerous, all the inhabitants who can do so take refuge in the neighboring towns or in Rome itself; or they may retire with their cattle to the mountains. Besides huts, innumerable ruins of temples, circuses and monuments are scattered over the Campagna, particularly near the Via Appia; and long rows of aqueducts, some in ruins, some in a state of preservation, are overgrown with ivy and other plants. In the winter flocks of sheep pasture in these solitudes; during the summer they are driven up the Apennines. Herds of half-wild cattle remain during the whole year in the Campagna. The herdsmen are mounted, and armed with long lances, with which they manage the cattle very skilfully. Scarcely a ninth part of the Campagna is cultivated, the rest is used for pasturage. In the times of the ancient Romans, this dreary solitude exhibited a smiling picture of abundance and fertility. Yet even in those times the climate was far from being a healthy one. Strabo, Livy, Cicero, Horace and others agree in describing the districts in the neighborhood of Rome, Ardea and other towns within stones throw what is now the Campagna di Roma, as extremely unwholesome, especially at certain seasons of the year; and it was only through the greatest exertions on the part of the ancient cultivators, and the numerous aids to cultivation that stood at their command, that this tract, now so desolate, was then made so productive. Several of the popes, particularly Pius VI, have attempted to lessen the insalubrity of the air by the draining of the Pontine Marshes which form the southern portion of the tract. In recent years the Italian government has taken up the problem, and has accomplished much in the way of reclamation by planting eucalyptus trees, and by drainage and other works, thereby increasing the healthfulness of this historic region.

CAMPAGNOLA, Domenico, Italian painter and engraver: flourished about 1520. He was probably born at Padua, where he was a rival of Titian in painting the frescoes in the Scuola del Carmine and in the Scuola del Santo. He is considered one of the best painters of the Venetian school, and his work as an etcher is less important. Of 14 engravings which are known to belong to him, 10 are dated 1517, and one, ‘The Descent of the Holy Ghost,’ bears the date 1518.

CAMPAN, kânp’n, Jeanne Louise Henriette, French authoress (GENEST): b. Paris, 6 Oct. 1752; d. Mantes, 16 March 1822. She became reader to the daughters of Louis XV; gained the favor of the wife of the Dauphin, afterward Queen Marie Antionette, who gave her in marriage to the son of her private secretary, M. Campan, and appointed her the first lady of the bed-chamber. Mme. Campan gave her patroness many proofs of fidelity and attachment and wished to follow her into the temple after 10 Aug. 1792, which, however, Pétion did not allow. After the fall of Robespierre, Madame Campan established a boarding school for the education of young ladies at Saint Germain, which soon acquired a wide reputation. On this account Napoleon appointed her the principal of an institution founded by him for the daughters of the officers of the Legion of Honour, and she was organized and superintended for seven years. After the restoration Louis XVIII abolished the institution, and Madame Campan lost her
situation. Her only son died in 1821, in consequence of ill treatment inflicted because he was a relation of Marshal Ney. She published 'Mémoires de la vie privee de Marie Antoinette' (1823); 'Journal anecdotique' (1824); 'Correspondance inédite avec la reine Hortense' (1835); 'De l'éducation.' Consult Flamermont, Jules, 'Les mémoires de Madame de Campan' (1862). Ney was in 1826.

**CAMPANA, kämp-pá'na, Pedro (in the Netherlands known as Peter de Kempeneer), Flemish painter of Spanish descent: b. Brussels 1503; d. there 1580. In 1530 he went to Italy for study of the Italian masters; he visited Venice and then the patronage of Cardinal Grimani, for whom he painted several pictures. At Bologna he painted some of the decorations of the triumphal arch for the reception of Charles V; he later lived in Seville, Cordova and other cities of Andalusia, and in 1562 returned to Brussels where he became chief engineer of the Duke of Alva, and in 1563 became art director and maker of cartoons for the Brussels tapestry works. In style he combined to some extent the characteristics of the schools of Antwerp and the Flemish painters. His best-known work is in the cathedral at Seville, the 'Descent from the Cross.' His 'Purification' and 'Resurrection' are also in the Seville Cathedral; other paintings of his are in the same city and he also painted the altar-piece of the church of Santa Anna in Triana, a suburb of Seville. The National Gallery, London, contains his 'Christ Preaching in the Temple.'**

**CAMPANARI, Giuseppe, Italian operatic baritone: b. Venice 1859. Both as orchestral 'cello player and soloist with the Boston Symphony Orchestra 1884–93, he became known to cultured musical circles, and attained national reputation by his appearance as Tomino in the first American production of 'Pagliacci.' He was a member of the Metropolitan Opera Company 1895–98, later confining himself to concert work with occasional appearances in opera. His musical career began as a 'cellist at La Scala Opera House, Milan, where he also studied singing.**

**CAMPANELLA, kämp-pá'n-dž'la, Tommaso, Italian philosopher: b. Stilo, Calabria, 5 Sept. 1589; d. Paris 1639. He displayed great quickness of parts when quite young, and at the age of 15 entered into the order of the Dominicans. He studied theology and other branches of knowledge with assiduity, but was principally attracted by philosophy. The opinions of Aristotle, then generally taught in the schools, appeared to him unsatisfactory; and in 1591 he published at Naples a work entitled 'Philosophia Sensibis Demonstrata,' intended to show the futility of the prevailing doctrines. He claimed that God alone is pure Being, and that being implies as its essence the power whereby it acts, the knowledge that reveals it to itself, and the love which inclines it to will its good. He held a political theory based on the idea of, and individual liberty. This book procured him some admirers, and more enemies. He then went to Rome, and afterward to Florence, where he was well received by the Grand Duke Ferdinand. In 1598 he returned to Naples, and revisited shortly after Calabria, where, in the following year, he was arrested on a charge of conspiracy against the Spanish government, to which Naples was then subject. A scheme was imputed to him of having engaged the three aids of Marie Antoinette' (1823); 'Journal anecdotique' (1824); 'Correspondance inédite avec la reine Hortense' (1835); 'De l’éducation.' Consult Flamermont, Jules, 'Les mémoires de Madame de Campan' (1862). Ney was in 1826.

At length, in 1626, Pope Urban VIII procured his removal to Rome, and in 1629 gave him his liberty, and bestowed on him a pension. Dreading some further persecution from the Spaniards, he withdrew in 1634 to France, where he was honorably received by Louis XIII and Richelieu, and much esteemed by the learned men of that country. He died at the monastery of his order. Campanella was a firm believer in astrology and magic. Among his numerous works may be mentioned 'Atheismus Triumphatus' (1631); 'Monarchia Messiae' (1633); 'Prodromus Philosophiae Instaurande' (1617); 'De Sensu Rerum et Magia' (1620); 'De Monarchia Hispanica Discursus' (1640); 'Epistolae epistolicae partes quattuor, hoc est de rerum natura, hominum moribus, politica, cui Avistas solis adiuncta est, et Æconomica' (1622). A 'Life of Campanella,' by Baldacchini, was published at Naples (1840–43).**

**CAMPANERO, See Bell-Bird.**

**CAMPANI-ALMENIS, kämp-pán'ě al-mě'nís, Matteo, Italian merchant and statesman, fl. 17th century. In optics, his greatest achievement was the manufacture of the object-glasses through which Cassini discovered two satellites of Saturn. He wrote 'Horologium solo naturae motor' (1678), a work on the construction of clocks.**

**CAMPANIA, Italy, an ancient province of the Roman republic and empire, and a department of the modern kingdom of Italy, lying along the Tyrrenhian Sea and bounded on the land side by Latium, Campania, and Lucania, which, partly on account of its natural curiosities, including Vesuvius, the Phlegrean fields, the Lake of Avernus, and partly for its remarkable fertility, was a favorite resort of the distinguished Romans, who built there magnificent country-houses. Cuma, Puteoli, Naples, Herculaneum, Pompeii, Baiae, Stabiae, Surrentum, Nola, Teynium, Venafrum and Capua, the principal cities of Campania, are names rich in classical associations. The Appian and Latin ways led into the interior of this charming province. The early inhabitants were of the Oscan race, who were displaced by the Greeks; the latter founding the cities of Cumae and Neapolis. The Etruscans later obtained possession of it, but the Oscan element was still considerable and so remained until the time of its Romanization about 90 B.C. Cicero had a villa at Pompeii and under Augustus, Campania and Latium formed the first district of Italy. The vineyards of Mons Massicus and Ager Falerum were famous at an early period, as also the olives of the country and the olive oil. Campania is the most beautiful and fruitful part of Italy, and no traveler can wish for a more delightful country than the fields of Campania, filled in the month of April with barley four feet high, and adorned with lofty poplars, which are connected by luxuriant vines, forming a
CAMPANILE—CAMPANINI

Canopy over the fields. "There," says Goethe, "it is worth while to till the ground." The modern department of Campania includes the provinces of Avellina, Benevento, Caserta, Napoli and Salerno, covering an area of 6,227 square miles. Pop. (1 Jan. 1915) 3,426,754.

CAMPANILE, käm-pä-na'le, a detached tower containing bells. Campaniles are most common in Italy. Several of them have deviated considerably from the perpendicular, in consequence of their great height and narrowness of base. The earliest examples date from the 5th century and are circular in form, the most notable examples being those of the basilicas of Saint Apollinare Nuovo and Saint Appollinare in Classe at Ravenna. After the 8th century the square design prevailed. Brick was always used in Rome, while marble or stone entered into their composition in northern Italy. The campanile of Pisa, called Torre Pendente (or Leaning Tower), is one of the most remarkable. Its architects were Bonano of Pisa, and Willhelm of Innsbruck, and it was begun in 1174. The building consists of eight stories, each one of which is surrounded by columns, and it inclines nearly 13 feet from the perpendicular. Another celebrated campanile is that which was begun at Florence in 1334, after the designs of Giotto, and finished by Taddeo Gaddi. Its height approaches 300 feet, and it is adorned with 54 bas-reliefs, and 16 statues, representing biblical, pagan and allegorical subjects. Giotto intended to surmount this tower with a spire nearly 100 feet high, but his intention was never carried out. The Torre degli Asinelli and the Torre di Garisenda at Bologna are also remarkable specimens of the campanile. The campanile of Saint Mark's Church, Venice, is probably the best known to Americans. Begun as far back as 888 by Pietro Tribono, it did not assume the form which tourists are familiar with until 1590. For centuries its majestic height dominated the city. Its pinnacle was about 325 feet from the ground.

In 1417 a marble top was put on the old tower. One hundred years later it was crowned with the figure of an angel nearly 16 feet high. Simple in design, the campanile stood out in sharp contrast with the famous belfry of Florence.

The Loggetta at the foot of the campanile was built by the famous Jacopo Sansovino, and was the rendezvous for the nobles of the town. Sansovino adorned it with reliefs and with bronze statues of Minerva, Apollo, Mercury and Peace. The bronze doors of the vestibule have long been regarded as masterpieces that deserve to rank by the side of the work of the great Italian sculptors. Like many another Italian structure, the Loggetta lost much of its old-time significance. From a meeting-place for the nobles it degenerated into a waiting-room for commanders of the guards during the sessions of the great council. Latterly it was used for auctions and lottery drawings.

The tower was peculiar in that it had no staircase. It was ascended by a winding inclined plane, and ended in a few steps. The tower was always open; but visitors were not allowed to enter alone. For that reason a single traveler was compelled to engage a bystander to accompany him.

From time immemorial a watchman was stationed in the lantern. In the days of the grand maritime Venetian republic it was from the tower that the watchman caught the first glimpse of home-coming war vessels. In modern times the watchman no longer scanned the horizon for vessels, but kept a lookout upon the city for fires.

The campanile served other purposes as well. It was also used for the purpose which its name signifies. According to some authorities, four bells were hung in the olden days in this tower, to be sounded for different purposes. La marangola was sounded at dawn to call the laboring classes; la settimazzona opened the official bureaus; la trotterar called the councils to duty; and the bell del maleficio tolled out the requiem for those who were put to death. A fifth bell was later brought from Candia and tolled only on Ascension Day. In 1518 there hung halfway up the tower a wooden cage, in which prisoners were kept until they were starved to death. Scientifically the tower was of interest by reason of the fact that from it Galileo made many observations. On the morning of 14 July 1902, the campanile collapsed and fell with a great crash into the square. The church of Saint Mark and the palace of the Doges were not damaged, but the campanile in falling carried away the Sansovino Loggetta and the library of the Royal Palace. Steps were taken at once to rebuild and the cornerstone of the new edifice was laid on 24 April 1903. A strengthened pile foundation was put in place and the campanile re-erected in the form it had presented since being remodeled in 1517. A study of the data provided by the examination of the remains of the fallen tower showed that the bricks had been used for various purposes at a previous stage, in arches, fortifications, tops of walls, etc. The most important fact was that they were not Venetian, but Roman bricks. Moreover, when they were manufactured, they were not manipulated like modern bricks, but formed from slices of clay, as they were found without the natural layers being disturbed. This process resulted in each individual brick being able to support a weight quite four times as great as the modern brick. The bricks examined are of the 1st century. One bore the impression of a horseshoe, proving the debated point that horseshoes were then in use. In the Renaissance period a few campanili of note were erected; the finest is that of San Giorgio Maggiore by Palladio and Scamozzi in Venetia. It is of brick with a marble superstructure and has a spire. Modern examples of this kind of construction are the campanile of the Capitol at Rome, the Victoria Tower by Barry at the Houses of Parliament, Westminster, the great tower of the Basilique du Sacré Cœur, Montmartre, Paris, and the memorial tower in the Brown University campus at Providence, R. I.

CAMPANINI, käm-pä-ne'ne, Italo, Italian singer: b. Parma, 29 June 1846; d. Vigatto, 23 Nov. 1896. His father was a blacksmith. At 14 the boy enlisted in Garibaldi's army and served in two campaigns, after which he worked at his father's trade until the age of 18. Meanwhile, having shown that he possessed an excellent voice, he had taken singing lessons, and after spending a year at the Conservatory in Parma, he appeared in that city as the noted
in ‘La Sonnambula,’ but suffered failure and ridicule. He still continued to sing in public, and in 1869 began to study under Lamperti, a celebrated teacher of Milan. In that city, at La Scala, he sang in ‘Faust,’ and immediately was acclaimed a great tenor. He appeared in London in 1872, and in the following year made his first visit to the United States, appearing with Niisson at the Academy of Music, New York, in ‘Boris.’ Afterward, in this country and Europe, he sang with great success, and was regarded as the foremost tenor of his time. The partial failure of his voice, mainly through an affection of the throat, caused some interruption of his career but scarcely diminished his popularity until near the close of his life.

**CAMpanula, Bell Flower, or BellWort, a genus of annual, biennial and perennial herbs of the family Campanulaceae.** The species, of which there are about 300, are almost all natives of the cooler parts of the northern temperate zone, and among them are some of the most widely grown garden plants, which are popular on account of their bell-shaped blue, violet or white flowers, and the ease with which they are cultivated. *C. rafunculus*, native of Europe, Asia and North America, is the bell of Scotland, so frequently mentioned in literature. Several species are natives of North America.

**CAMPANULACEAE, a family of herbaeous and shrubby plants, generally abounding in a bitter, white juice. Their leaves are alternate and entire or toothed, rarely opposite. Their flowers usually form spikes, thyrsi or heads. They have a monosepalous calyx, with four, five or eight persistent divisions, and a regular, monopetalous, usually bell-shaped corolla, having its limb divided into as many lobes as there are divisions of the calyx. The stamens are five, the anthers free, or brought together in the form of a tube. The ovary is inferior or semi-inferior, with two or more cells, each containing numerous seeds. The style is simple, terminated by a lobed stigma, sometimes surrounded by hairs. The fruit is a capsule crowned by the limb of the calyx, with two or more cells opening either by means of holes which are formed near the upper part, or by incomplete valves. The seeds are very small and very numerous. These plants are chiefly natives of the temperate and colder climates of the northern hemisphere.

**CAMPANULARIANS, or SERTULARIANS, hydroids of the order Calyptoblastea, formerly called Campanulariae. They are always colonial and possess hydrotroche, and in many cases medusa, with auditory organs on the flaps. The ectoderm is protected by a horny or chitinous sheath (perisarc) enveloping the zooids. The hydroids retract, when disturbed, into small cups (hydrotroche), arranged in opposite rows or the sides as in *Sertularia* and, occasionally at the ends of the stalks, as in *Campanularia*, while the sheaths (gonothece) protecting the medusa-buds are distinguished by their much larger size and cup-shaped form. The Sertularians abound on seaweeds, and may be recognized from their resemblance to mosses. The medusae of these and many other hydroids can be collected by a tow-net, and emptied into a jar, where they can be detected by the naked eye after a little practice. It is possible that the extinct palaeozoic group, Graptolites, belong near the Campanularians, as they have a similar perisarc composed of cells (hydrotroche). Consult Agassiz, A., ‘The American Zoology, an Illustated Catalogue of the Museum of Comparative Zoology at Harvard College, No, 2, Cambridge 1865;’ Agassiz, E. C. and A., ‘Seaside Studies in Natural History (Boston 1871); Nutting, ‘American Hydroids’ (‘Special Bulletin of the U. S. National Museum’; Washington 1900), contains a full bibliography.

**CAMPARDON, Emile, French writer; b. Paris 1834. He was educated at the Ecole des Chartes, and then had charge of the archives there. In this position he had opportunity to examine the documents relating to the 18th century and the period of the French Revolution. He has written among other historical works ‘History of the Revolutionary Tribunal of Paris’ (1861); ‘Marie Antoinette at the Conciergerie’ (1862); ‘Madame Pompadour and her Courts’ (1863); ‘Unpublished Documents of J. B. Poquein Moliere’ (1863); ‘Voltaire, Unpublished Documents’; ‘The Royal Academy of Music in the 18th Century; and ‘Memoirs of Frederic III, King of Prussia’ (with E. Bourticar).

**CAMPBELL, Alexander, known as the founder of the Disciples of Christ or ‘Campbellites’: b. Ballymoney, Antrim County, Ireland, 12 Sept. 1788; d. Bethany, Va., 4 March 1806. His mother’s ancestors were French Huguenots. His father, Thomas Campbell, a clergyman and teacher in the Church of the Covenanters and Seceders, in April 1807 sailed from Londonerry to Philadelphia and located at Washington, Pa. (one year after the establishment of Washington College). Young Alexander embarked with the remainder of the family in October 1808, but the ship was wrecked on the coast of Scotland which gave him an opportunity to attend Glasgow University for a year. In August 1809 he again embarked with the family and after arriving at New York went directly via Philadelphia and over the mountains to Washington, Pa., where, under the direction of his father, he prepared for the ministry.

In March 1811, at West Liberty, Va., he married Miss Margaret Brown of Buffalo Creek, Brooke County, Va., and thereafter resided at the home of his father-in-law, from whom he later (1814) received a deed for the home property. Immediately following his marriage he took steps to become naturalized. In the same year he was licensed by a church, and began near home a series of preaching tours. In 1812, after following his father in a movement to reunite different religious denominations, he took the lead in organizing the Disciples of Christ (q.v.), based on the doctrine that the Bible should be used as the only text. Through his preaching tours, which in later years were gradually extended throughout the South and Middle West and eastward to Massachusetts Bay, he became widely known. He also won a wide reputation through his pub-
lic debates with prominent Presbyterian minis-
ters in 1820–23, and later through more fa-
mous debates with Robert Owen in 1829 and
Archbishop Purcell in 1837. In 1818–19 he es-

tablished Buffalo Seminary and sent for his
father to assist in the work of instruction; and
in 1823 he established the Christian Baptist,
which in 1826 became the Buffalo Baptist En-
blisher and continued under his editorship until
1865. In 1827, finding it inconvenient to mail
his letters and publications at West Liberty, he
succeeded in establishing at his residence at
Buffalo a post-office under the name of Bethany,
which also became the name of the town later
laid out by him (1847). He thus obtained the
franking privilege which enabled him greatly
to extend his correspondence. In 1829–30 he
represented Brook County in the Virginia Con-
stitutional Convention. In the debates he took
an active part in urging a system of free popu-
lar education and a more equitable representa-
tion of the western counties in the legislature.
In 1840 beginning with an endowment from his
own means, he founded Bethany College, which
was chartered in 1851, and he remained presi-
dent of the institution until his death. In 1847 he
visited England, France, Scotland and Ireland.
In 1850 by invitation, in connection with one of
his eastern trips, he made an address in the
House of Representatives at Washington.
CAMPBELL continued to write and preach until
1865. He published many religious volumes, including hymnbooks and a translation of the New Testament. In
1861 he published the Memoirs of Thomas
Campbell, his father and associate, who died at
Bethany on 4 Jan. 1854.

CAMPBELL, Alexander, American politi-
cian: b. Concord, Pa., 4 Oct. 1814; d. La Salle,
III., 9 Aug. 1898. He received a common-school
education and entered the iron business, re-
moving to Illinois and attaining prominence in
local politics. He was mayor of La Salle, III.,
in 1852, a member of the Illinois legislature in
1858 and a member of Congress in 1875. He
was widely known as the "father of the Green-
back party."

CAMPBELL, Sir Alexander, Canadian statesman:

b. Yorkshire, England, 9 March 1822; d. Toronto, 24 May 1892. He began the practice of law in 1843 as a partner of Sir John A. Macdonald. In 1858 he entered the legis-
lative council, and in 1863 was elected speaker. In
1864–67 he was commissioner of Crown
lands. He was a delegate to the Confederation
conferences in 1864, received a nomination to the Dominion Senate (1867), where he was the
government leader, and was Postmaster-General
in the first Federal Cabinet. In 1873 he be-
came Minister of the Interior. With the
other Cabinet officers, he resigned in the same
year on account of the Pacific Railroad scandal.
On the return of Macdonald to power, he was
successively Receiver-General of Militia and
Defense and Postmaster-General. From
1881–85 he was Minister of Justice, and from
1887–92 lieutenant-governor of Ontario. He
represented Canada at the Colonial Conference
held in London in 1887. He was created K.C.
M.G. in 1879.

CAMPBELL, Archibald. See Argyle,
CAMPBELL of.

CAMPBELL, Bartley, American drama-
tist: b. Allegheny City, Pa., 12 Aug. 1843; d.
Middletown, N. Y., 30 July 1886. He entered
journalism early in his career and established
the Evening Mail in Pittsburgh (1868) and the
Southern Magazine in New Orleans
(1869). His first drama that met with success
in New York was A Fair Warning, appearing in
1879. 'Fairfax, or Life in the Sunny South,' and
'The Galley Slave,' were on the metropolit-
ian boards during the same season. Included in
his plays are 'Matrimony'; 'The White
Slave'; 'Siberia'; and 'Paquita.' Several of
his plays were brought out in England. He
was manager of the Fourteenth Street Theatre,
New York, for some time. He became insane
in 1886 and died in an asylum.

CAMPBELL, Beatrice Stella Tanner (Mrs
Patrick Campbell), English actress: b. Lon-
don 1867; married in 1884 to Patrick Campbell,
who was killed in 1900 in the Boer War. Her
first appearance on the professional stage was
made in 1888 at the Alexandra Theatre in Liver-
pool. She has been particularly successful in
such plays as 'The Second Mrs. Tanqueray,'
'John-a-Dreams' and 'Signs of Life'
by Mrs. Ebbsmith. She has also appeared in such
Shakespearean roles as Juliet, Ophelia and
Lady Macbeth in conjunction with Sir John
Forbes-Robertson; and has played Mélisande
to the Pelléas of Sarah Bernhardt. She has
frequently visited the United States, playing in
most of the leading cities. She married in
1914 George Cornwallis-West.

CAMPBELL, Sir Colin, English soldier
and administrator: b. 1776; d. 1847. He was
first a midshipman; then entered the army,
fought with Wellesley in India, 1801–04, and
was present at the battle of Assaye. He served
also in Denmark and the Peninsula, and was
on Wellington's staff at the battle of Waterloo.
He was lieutenant-governor of Nova Scotia,
1834–40, and of Ceylon, 1839–47.

CAMPBELL, Sir Colin (Lord Clyde),
British general: b. Glasgow, 20 Oct. 1792; d.
14 Aug. 1863. His father was a merchant,
named Macliver. He was educated at the ex-
 pense of his mother's brother, Col. John
Campbell, and owing to an error of the Duke
of York's when the youth was introduced to
him as a candidate for a commission, assumed
the name of Campbell. Entering the army in
1806, and serving in the Peninsula War (1810–
13), he was severely wounded at the siege of
San Sebastian and the passage of the Bidasao.
He served in Nova Scotia in 1814, and then
passed nearly 30 years in garrison duty at
Gibraltar, Barbadoes, Demerara and various
places in England, in 1837 becoming lieutenant-
colonel of the 98th Foot. He served in India
prior to the Crimean War, on the outbreak
of which, in 1854, he was appointed the engin-
eers of the Highland brigade. The victory
of the Alma was mainly his; and his, too, the
splendid repulse of the Russians by the "thin
red line" in the battle of Balaklava. When, on
11 July 1857, the news reached England of the
sepoys mutiny, Lord Clyde was at once in the
command of the forces in India. He effected the relief of Lucknow on 19 March
1858, and succeeded in quelling the mutiny.
He was created Baron Clyde in July of the same
year.
CAMPBELL, Colin, Scottish clergyman and Egyptologist: b. Campbeltown, Argyllshire, 1848. He was educated at the universities of Edinburgh and Heidelberg, entered the ministry of the Established Kirk of Scotland, and has been minister of the parish of Dundee from 1883. He preached nearly every year from 1883 to 1900 lectures in the Theological Institute of Balmoral Castle and Crathie Parish Church, and has published ‘The First Three Gospels in Greek’; ‘Critical Studies in Saint Luke’s Gospel’ (1891); ‘Two Theban Queens’ (1909); ‘Two Theban Princes’ (1910); ‘The Miraculous Birth of King Amon-hotep III and Other Egyptian Studies’ (1912).

CAMPBELL, Douglas Houghton, American educator: b. Detroit, Mich., 16 Dec. 1859. He was graduated at the University of Michigan in 1882 (Ph.D. in 1886), and then studied in Europe for four years. Returning he was professor of botany in the University of Indiana till 1891, when he was called to the similar chair in Stanford University. He is author of ‘Elements of Structural and Systematic Botany’ (1890); ‘Structure and Development of Mosses and Ferns’ (1895); ‘Lectures on the Evolution of Plants’ (1899); ‘A University Textbook of Botany’ (1902); ‘Plant Life and Evolution’ (1911).

CAMPBELL, Edward de Mille, American industrial chemist: b. Detroit, Mich., 9 Sept. 1852. He studied at the University of Michigan, and after serving as chemist to the Ohio Iron Company in 1886, to the Sharon Iron Company, Pennsylvania, in 1887, to the Dayton Coal and Iron Company, Tennessee, in 1888, from assistant professor in 1890 he advanced to the position of director of the chemical laboratory at his alma mater, the University of Michigan, in 1905.

CAMPBELL, George, Scottish clergyman: b. Aberdeen, 25 Dec. 1719; d. 6 April 1796. He was educated at Marischal College, and afterward articled to a writer of the signet at Edinburgh. In 1741 he relinquished the law and studied divinity at Aberdeen. He was ordained in 1748, became pastor of a church in Aberdeen 1757, where he was a fellow member of Thomas Reid in a philosophical society, and in 1775 was appointed principal of Marischal College. In 1763 he published his celebrated ‘Dissertation on Miracles,’ in answer to Hume’s essay. In 1771 he was chosen professor of divinity, and in 1776 gave to the world his ‘Philosophy of Rhetoric,’ which established his reputation as a grammarian and critic. His ‘New Translation of the Gospels’ appeared in 1778. Consult the biography by Keith prefixed to Campbell’s ‘Lectures on Ecclesiastical History.’

CAMPBELL, Sir George, English administrator and author: b. 1824; d. London, 18 Feb. 1892. He was educated at Haileybury for the East Indian service and held several important posts under the Indian government. He represented the Kirkcaldy burghs in the House of Commons from 1860 till 1875. He was sent to India in 1875 until his death. The success that had attended him as an administrator in India did not follow him as a politician. He published ‘India as It May Be;’ ‘The Ethnology of India’ (1865); ‘Handy Book of the Eastern Question’ (1870); ‘Black and White in the United States;’ ‘The British Empire’ (1887); ‘Memoirs of My Indian Career’ (1893).

CAMPBELL, Harry, English physician: b. Margareting, Essex, England. He studied medicine at Saint Bartholomew’s Hospital College and was appointed to the staff of North-west London Hospital, 1886, and that of Welbeck Street Hospital, 1896. He has published ‘The Physiology of Eyesight’ (1885); ‘The Caustion of Disease’ (1889); ‘Flushing and Morbid Blushing’ (1890); ‘Differences in the Nervous Organization of Man and Woman’ (1891); ‘Headache and Other Morbid Cephalic Sensations’ (1894); ‘Respiratory Exercises in the Treatment of Disease’ (1898); ‘On Treatment’ (1907).

CAMPBELL, Helen Stuart, American author: b. Lockport, N. Y., 4 July 1839. She was educated at Mrs. Cook’s Seminary, Bloomfield, N. J., 1850–58, and very early began contributing to periodicals. From 1881 to 1884 she edited Our Continent (Philadelphia). Her especial interest has been in social and ethical questions, such as the condition of the poor, household management, etc., and her writings for the most part consist of essays and stories illustrating these topics. Chief among them are ‘The Ainslee Series’ (1864–69); ‘Six Simons’ (1878); ‘Unto the Third and Fourth Generation’ (1880); ‘Under Green Apple Boughs’ (1881); ‘The Easiest Way in Housekeeping and Cooking’ (1881); ‘The Problem of the Poor’ (1882); ‘Mrs. Herndon’s Inoculation: a Novel’ (1885); ‘Female Prisoners of Poverty’ (1887); ‘Prisoners of Poverty Abroad’ (1889); ‘Roger Berkeley’s Probation’ (1881); ‘Anne Bradstreet and Her Time’ (1892); ‘Women Wage-Earners’ (1893); ‘In Foreign Kitchens’ (1894); ‘Some Passages in the Practice of Dr. Martha Scarborough’ (1893); ‘Ballantyne: a Novel’ (1901).

CAMPBELL, Henry Donald, American scientist: b. Lexington, Va., 29 July 1862. He was graduated at Washington and Lee University in 1882; later studied at Berlin and Heidelberg, and in 1887 became a professor of geology and biology at Washington and Lee University. He was made dean in 1906 and was acting president of the university January to July 1912.

CAMPBELL, James Edwin, American politician: b. Middletown, Ohio, 7 July 1843. After an academic education he was admitted to the bar. During the Civil War he served for a time in the navy and was with the Mississippi and Red River flotillas. He was a Democratic member of Congress, 1883–89; governor of Ohio, 1890–92. He was defeated for re-election by William McKinley, afterward President of the United States. In 1895 he was again a candidate, but was defeated by A. S. Bushnell.

CAMPBELL, James Mann, Scottish-American clergyman: b. Scotland, 5 May 1840. He received his education at the universities of Edinburgh and St. Andrews. He became a Presbyterian minister in 1869 and went to the United States. He has lectured much on religious themes and has published ‘Unto the Uttermost’ (1889); ‘The Indwelling Christ’ (1895); ‘After Pentecost, What?’ (1897); ‘The Teachings of the Books’ (1899); ‘ Clerical Types’ (1900); ‘Bible Questions’;
CAMPBELL, James Valentine, American jurist: b. Buffalo, N. Y., 25 Feb. 1823; d. Detroit, Mich., 26 March 1890. His family moved to Detroit in 1826. He was graduated at Saint Paul's College, L. I., in 1841; was admitted to the Michigan bar, 1844; practised with success until 1857. He was then elected a judge of the Supreme Court of Michigan, re-elected at every succeeding election, and was chosen chief justice, for five terms in succession. From 1859 he lectured for 20 years in the law department of the University of Michigan. Much of his leisure was devoted to literary and historical studies, especially the history of Michigan and the Northwest Territory. Until 1854 he was a Whig, but thereafter acted chiefly with the Republicans. He wrote 'Outlines of the Political History of Michigan' (1867).

CAMPBELL, John, American editor: b. Scotland 1653; d. March 1728. He was one of a large number of Boston booksellers and public officials whose relationships are not determinable. John, as postmaster, was the news centre of the New England provinces; and in 1703 was writing 'news letters' of European news to Governor Winthrop of Connecticut and perhaps to other governors, made up of information received from arriving travelers, etc., with inferences as to New England policy. In 1704 he concluded to make these public and for sale; and on 24 April issued the first news paper, the Boston News Letter (q.v.), which he edited till 1722. In 1719 he was deprived of the postmastership. He was justice of the peace for Suffolk County for some years.

CAMPBELL, John. See Argyle, CAMPBELLS OF.

CAMPBELL, John, British historian: b. Edinburgh, 8 March 1708; d. 28 Dec. 1775. His writings before 1742 were published anonymously. From 1755 to the close of his life he was agent of the British government for the province of Georgia. Among his works are 'A Concise History of Spanish America' (1741); 'Lives of the English Admirals' (1744); 'A Survey of the Present State of Europe' (1750); and 'Trade of Great Britain to America' (1772). He also wrote many of the biographies in the 'Biographia Britannica,' and Samuel Johnson makes many allusions to his erudition and popularity.

CAMPBELL, John (BARON), Lord High Chancellor of England: b. Springfield, near Cupar, county of Fife, Scotland, 15 Sept. 1779; d. 22 June 1861. He was educated at the grammar school of Cupar, and at 12 entered the University of Saint Andrews (1791) for the purpose of studying for the Church. After remaining, however, for some years at college, he resolved to abandon the clerical profession, and determined to try his fortune in London. In 1798 he quitied his native country for the metropolis, where he became reporter and theatrical critic on the Morning Chronicle. In November 1800 he entered as a student of Lincoln's Inn, and in 1806 was called to the bar. He traveled the Oxford circuit, and obtained considerable practice. In 1830 he was elected member of Parliament for Stafford, and in 1832 was appointed solicitor-general. In 1834, on the retirement of Sir William Horne, he became Attorney-General, and the same year was elected one of the members of Parliament for the city of Edinburgh, serving till 1841, when he was created chancellor of Ireland, and raised to the peerage as Baron Campbell of Saint Andrews. He had scarcely, however, assumed his official duties in Ireland, when he quitied office with the Melbourne ministry; and having now more leisure, he edited his 'Lives of the Chancellors,' the first series of which was published early in 1846. On the accession of Lord John Russell to power in that year Lord Campbell accepted the chancellorship of the exchequer, but shortly after the accession of Queen Victoria, he was appointed to the exchequer, and in 1859, on Lord Palmerston's resumption of the premiership, Lord Campbell reached the highest legal dignity in the British empire, becoming Lord High Chancellor. Consult 'Life of Lord Campbell,' by his daughter, the Hon. Mrs. Hardcastle.

CAMPBELL, John Archibald, American lawyer: b. Washington, Ga., 24 June 1811; d. Baltimore, 12 March 1889. He was graduated from the Georgia University in 1826 and was admitted to the bar in 1829 before coming of age, by virtue of a special act of the legislature. Removing to Alabama he soon became prominent in his profession, and in 1853 was appointed associate justice of the Supreme Court of the United States, resigning in 1861. He was subsequently appointed Confederate Secretary of War, and was one of the commissioners named by President Davis to meet President Lincoln and Secretary Seward at the conference in Fortress Monroe in February 1865. He was imprisoned some months after the close of the Civil War and on his release resumed his legal practice.

CAMPBELL, John Douglas Sutherland. See Argyle, CAMPBELLs OF.

CAMPBELL, John Lyle, American chemist: b. Rockbridge County, Va., 7 Dec. 1818; d. Lexington, Va., 2 Feb. 1886. He was graduated at Washington College (now Washington and Lee University) in 1843. On leaving college he became assistant in the academy at Staunton, Va., and afterward had charge of a similar institution in Richmond, Ky. In 1851 he was called to the chair of chemistry and geology at Washington College, an office which he continued to occupy until his death. He was a recognized authority on the geology of Virginia, and wrote reports on that subject as well as frequent contributions to the scientific journals. Among his larger works are 'Geology and Mineral Resources of the James River Valley' (1882), and 'Campbell's Agriculture: a Manual of Scientific Agriculture for the School and Farm' (Philadelphia 1859).

education at Edinburgh Academy, and afterward attended the University of Glasgow and Trinity and Balliol colleges, Oxford. Ordained in 1857, he became vicar of Milford, Hants, in the following year, a post which he held till his appointment, in 1863, as professor of Greek in Saint Andrew's University, a position he held until 1892. The 1894-95 series of Gifford Lectures at Saint Andrews was delivered by him. As a writer he is known mainly by his editions and translations of ancient Greek authors, the chief of which are Plato's 'Theaetetus' (1851); Plato's 'Sophist and Politicus' (1867); 'Sophocles—The Plays and Fragments' (1879); 'Sophocles in English Verse' (1873-83); 'Eschylus in English Verse' (1890); and Plato's 'Republic', (with Benjamin Jowett 1894); 'Tragic Drama in Eschylus, Sophocles and Shakespeare' (1904); 'Paralipomena Sophocles' (1907). 'The Christian Ideal,' published in 1877, is a volume of sermons; and his other works include a 'Guide to Greek Tragedy' (1891); 'Life of James Clerk Maxwell' (with W. Garnett 1882); 'Life of Benjamin H. Spalding' (1888); 'Religion in Greek Literature' (1898), the substance of his Gifford Lectures.

**CAMPBELL, Mrs. Patrick. See CAMPBELL, BEATRICE.**

**CAMPBELL, Reginald John, English Congregational clergyman:** b. London, 1867. After receiving a collegiate training at University College, Nottingham, and Christ Church College, Oxford, he entered the Congregational ministry in 1895. He first held the pastorate of the Union Church, Brighton, where he quickly acquired celebrity as a preacher. He succeeded Dr. Parker at the City Temple, London, in 1903, continuing there until his resignation in 1915. For a time his attitude to the fundamental doctrines of Christianity occasioned alarm among orthodox Congregationalists, his 'New Theology' (1907), which set ethics above dogma, being especially the centre of attack. By 1915 he had swung in the other direction, for in October of that year he announced his intention of seeking orders in the Anglican Church, and was ordained to the diaconate at Birmingham, 24 Feb. 1916. He has published 'The Making of an Apostle' (1898); 'The Restored Innocence' (1898); 'A Faith for To-day' (1900); 'Christianity and the Social Order' (1903); 'Thursday Mornings at the City Temple' (1908).

**CAMPBELL, Robert, British fur trader and explorer:** b. Glenlyon, Scotland, 1808; d. 1894. He entered the service of the Hudson's Bay Company in 1832; and in 1838 began a series of explorations in the Northwest, in the course of which he discovered Frances Lake, the Pelly and Loups rivers and the upper Yukon, which he traversed under the impression that it was the Colville, but the identity of which he subsequently established.

**CAMPBELL, Thomas, British poet:** b. Glasgow, 27 July 1777; d. Boulogne, France, 15 June 1844. He was educated at the University of Glasgow, where he distinguished himself by the excellence of his poetical translations from the Greek. After leaving the university he resided for a short time in Edinburgh; and sprang suddenly into fame by publishing, in 1799, 'The Pleasures of Hope.' It produced an extraordinary sensation, and soon became a familiar book throughout the kingdom. This was due not more to the graces of its style than to the noble purity of its thoughts. After the publication of 'The Pleasures of Hope' he went to Germany, where he met Klopstock at Hamburg, and visited the scene of the battle celebrated in 'Gebhard,' one of the most famous of his poems. The appearance of the English fleet caused him to leave Altona, where he resided for some time. During this tour several of his best lyrics were written or suggested, among them 'The Exile of Erin,' 'Ye Muses, ye Elysian Bards,' and the 'Banim of the Baltic.' In 1803 a new edition of 'The Pleasures of Hope,' with other poems, appeared, and in that year he married. Settling in London, he devoted himself to literary work; and in 1805 obtained a pension of £500, through the influence of Fox, of whose politics he was an admirer. After this he appears for a time to have given his attention less to poetry than prose, but in 1809 he again made his appearance as a poet, and published 'Gerrard of Wyoming,' which was followed by 'The Poem of Samson,' considered superior to 'The Pleasures of Hope.' In 1814 he visited Paris, and in the following year he received a legacy of over £4,000. In 1820, by his 'Specimens of the British Poets,' accompanied with critical essays, he proved himself the possessor of great critical acumen and an admirable prose style. In 1820 he became editor of the New Monthly Magazine, a position which he held till 1830. As an editor he was a signal failure. In 1824 he published 'Theodore,' which, though not devoid of fine passages, scarcely sustained his reputation. For many years he took an active interest in the emancipation of Greece and Poland, and in the foundation of the London University, of which he considered himself the originator. He was lord rector of the University of Glasgow from 1826 to 1829. In 1828 his wife died, and thenceforth his vigor, both bodily and mental, began to decline; and though he afterward published 'Letters from the South' (1837), describing a visit which he had paid to Algiers, and 'A Life of Mrs. Siddons' (1834-40), 'Life of Petrarch,' and either wrote or edited 'The Life and Times of Frederick the Great,' he failed to equal his more youthful efforts. In 1831-32 he was editor of the Metropolitan Magazine, and in 1832 he founded the Polish Association. Among his works not mentioned above are 'The Advent,' a hymn; 'Love and Madness'; 'Lord Ullin's Daughter'; 'The Wounded Hunsar'; 'Gilderoy'; 'The Soldier's Dream'; 'Judith'; 'The Name Unknown'; 'The Turkish Lady'; 'Lochiel's Warning'; 'The Rainbow'; 'The Last Man'; 'Navarino'; 'Pilgrim of Glencoe'; 'Moonlight,' etc. See Beattie, 'Life and Letters of Thomas Campbell'; and Redding, 'Literary Reminiscences of Campbell.'

**CAMPBELL, Thomas W., American clergyman:** b. Three Rivers, Quebec, Canada, 24 Sept. 1851. He was graduated from Union University in 1879, and became a Methodist minister. Joining the Reformed Episcopal Church, he was elected a bishop in 1891, and presiding bishop in 1894. In 1895 he moved to Brooklyn, N. Y., to become pastor of the Reformed Episcopal church of the Reconciliation,
and resigned to enter the Presbyterian Church in 1808. In October 1899 he became pastor of the Noble Street Church, Brooklyn, N. Y.; resigned October 1905; organized Stoney Brook Association and Assembly; secretary and manager till May 1915.

**CAMPBELL, William, American soldier:** b. Augusta County, Va., 1745; d. Rockey Mills, Va., Aug. 1781. He was of Scottish descent. Commissioned a captain in the first regular troops raised in Virginia in 1775, and later becoming a colonel of militia, he distinguished himself greatly in the battles of King’s Mountain and Guilford Courthouse. His military career was short but brilliant, and on all occasions marked by conspicuous bravery. Lafayette gave him the command of a brigade of riflemen and light infantry. Washington, Gates and Greene, the Virginia legislature and the Continental Congress expressed their high sense of his merits and services. He was taken fatally ill a few weeks before the siege of Yorktown. He married a sister of Patrick Henry. Consult Warfield, E. D., (in the Magazine of History, January, 1887).

**CAMPBELL, Wiliam Lowndes, English royal governor of South Carolina:** b. (?) d. 5 Sept. 1778. He was the youngest son of John, 4th Duke of Argyle. He received a captaincy in the British navy, 20 Aug. 1762; was a member of Parliament in 1764, and governor of Nova Scotia, 1766-73. In 1774 he was appointed governor of South Carolina, entered upon his duties in June 1775, was courteously received by the people, for whom he professed great friendship. The hollowness of his promises was soon proved, however, of doing his residence in Charleston unsafe, he fled on board a British man-of-war, where he was soon joined by his wife, who was a Miss Sarah Izard, sister of the patriot, Ralph Izard, who belonged to the wealthiest family in the province. In 1776 Campbell served as a volunteer on board the Peter Parker’s flagship, Bristol, in the attack on Fort Sullivan, 28 June, and was severely wounded early in the action, while in command of the lower deck. He ultimately died from the wounds he received at this time. Consult McCrady, ‘The History of South Carolina in the Revolution’ (Vol. I., 1901).

**CAMPBELL, William B., American soldier and statesman:** b. Sumner County, Tenn., 1 Feb. 1807; d. near Lebanon, Tenn., 31 Aug. 1867. He was educated in Abingdon, Va., and studied law at Winchester, Va., in the then noted law school of the Hon. St. George Tucker. He began the practice of his profession in 1829 at Carthage, Tenn., was elected attorney-general of his district in 1830, a member of the legislature in 1835. He resigned and raised a company of dragoons to serve in the war with the Indians in Florida in 1836. In this year also he formed a volunteer company, of which he was made captain, and fought in the Creek and Seminole War as part of the 2d Tennessee Volunteers under Col. William T. Rose. In 1837 Captain Campbell was elected to the United States Congress and served four terms successively. In 1844-45 he served as major-general of his military division. He was colonel of the 1st Tennessee Regiment in the Mexican War. He was present at Matamorcas (Palo Alto), Monterey, where he was conspicuous for his gallantry. He was at Vera Cruz on 22 March 1847 and at Cerro Gordo, 18 April 1847. In all he displayed unfailing courage and great capacity as commander. On his return to Tennessee Colonel Campbell was elected unanimously circuit judge in his native place. He held the post for several years, filling it with dignity and wisdom. In 1851 he was elected governor of Tennessee, serving one term and declining re-election. He was a member of Congress in 1865-66. In his public life he escaped to a marked degree the censures and criticism incident to public station, as a result of his integrity and untiring devotion to duty.

**CAMPBELL, William Wallace, American astronomer:** b. Hancock County, Ohio, 11 April 1862. After graduation from the University of Michigan he was professor of mathematics at the University of Colorado in 1886-88, and instructor in astronomy and assistant in Detroit Observatory, University of Michigan, in 1888-91, making a specialty of comet observations and orbit computation. He became astronomer in 1891, and director in 1901 of the Yerkes Observatory, and also had charge of eclipse expeditions to India, Spain and Flint Island. He received several medals in recognition of his work, including the Janssen prize of the Paris Academy of Sciences in 1910 and the Bruce gold medal in 1913. Besides many papers on the motion of solar eclipses, stars, comet orbits and on the spectra of nebulae, comets and stars, he has published ‘The Elements of Practical Astronomy’ (1900); ‘The Return of Halley’s Comet’ (1909) and ‘Stellar Motions’ (1912).

**CAMPBELL, William Wilfred, Canadian poet:** b. Berlin, Ontario, Canada, 1 June 1861. He was educated at Toronto University and the Episcopal Theological School, Cambridge, Mass., and was for some years in the Episcopal Ministry in Canada, in order to devote himself entirely to literary pursuits. He has published ‘Lake Lyrics’ (1889); ‘The Dread Voyage’ (1893); ‘Mordred, a Tragedy,’ and ‘Hildebrand’ (1895), the latter two being dramas in blank verse; ‘Beyond the Hills of Dream’ (1899); ‘Sights of S. Britain’ (1906); and the novels, ‘Ian of the Orkneys’ (1906); ‘A Beautiful Rebel’ (1909); and ‘The Canadian Lake Region’ (1910).

**CAMPBELL-BANNERMAN, Sir Henry, English statesman:** b. 7 Sept. 1836; d. London, 22 April 1908. He was the son of Sir James Campbell, but added the surname Bannerman, under the will of a maternal uncle. In 1868 he was elected member of Parliament for Stirling borough. From 1871-74, and from 1880-82, he was financial secretary of the War Office; 1892-94, Secretary of Admiralty; 1894-95, Chief Secretary for Ireland; 1896 and 1892-95, Secretary of War. In February 1899 he became leader of the Liberal party; on 4 Dec. 1903 succeeded Sir Arthur Balfour as Premier. He distinguished himself by his patience and common sense. He gathered around him a min-
CAMPBELL ISLAND—CAMPE

CAMPBELL ISLAND, a lonely island in the Pacific Ocean in lat. 52° 32' S., long. 169° 9'E., 36 miles in circumference. Though very mountainous, it has several good harbors. It is a dependency of New Zealand and 180 miles south of the Auckland Islands. It is volcanic, with a rich and rare flora.

CAMPBELFORD, Canada, town in Northumberland County, Ontario, beautifully situated on the Grand Trunk Railway, 32 miles west of Belleville and on the Trent Valley Canal. It manufactures woolens, has pulp, paper and flour mills, bridge works and shoe factory. Pop. (1911) 3,051.

CAMPBELLITES, followers of Rev. John McLeod Campbell, who was deposed from the Church of Scotland in 1831 for teaching the universality of the atonement. He established a church at Glasgow in 1833. The name is also applied to members of the Church founded in the United States by Alexander Campbell. See Disciples of Christ.

CAMPBELL'S STATION, Tenn., the scene of an engagement between Federal and Confederate forces, 4 Nov. 1863. Gen. Braxton Bragg, who was besieging Chattanooga, detached Longstreet's corps of 10,000 men and 35 guns, with Wheeler's cavalry force of 5,000 men, to capture Burnside or drive him out of East Tennessee. Longstreet reached the south bank of the Tennessee, near Loudon, on the 13th, and that night and next day laid bridges at Huff's Ferry, two miles below Loudon, and began crossing his infantry. Burnside, who was holding the north bank of the river from Kingston to Lenoirs, concluded to leave one brigade at Kingston and retire the rest of his command to Knoxville, about 30 miles, where he had prepared to make a stand behind defensives works. He skirmished sharply with Longstreet's advance on the 14th and gradually fell back on 15th, at night concentrating Hartranft's and Ferrero's divisions of the 9th corps and White's of the 23d, at Lenoirs. He had about 5,000 men. Longstreet followed, attacked during the night and was repulsed. Before daybreak of the 16th Hartranft, with his division of cavalry, was put on the march to secure Campbell's Station, the intersection of roads coming from the south. After destroying many wagons and contents, taking the teams to assist his artillery over the bad roads, axle-deep in mud, Burnside followed with the other two divisions, artillery and trains, closely pursued by Longstreet, with Hood's division, commanded by Gen. Micajah Jenkins, with whose advance his rearguard had several sharp encounters. McLaw's division of Longstreet's corps took a more direct road to the left, the two roads intersecting about a mile southward of Campbell's Station, 15 miles south of Knoxville. Hartranft reached the coveted point in advance of McLaw's and, turning west on the Kingston road, deployed his division in such manner as to confront McLaw's, and at the same time cover the Lenoir road, along which the trains were moving in advance of the infantry. He had scarcely made his dispositions when McLaw appeared and attacked, but Hartranft held on until cavalry, with the trains and the remainder of the troops, had passed and the troops taken position, when he fell back and formed on the left of White's division, in position half a mile beyond the junction of the two roads, Ferrero's division on White's right, and the artillery on commanding ground sweeping the road and the open country in front. The jaded train continued on the road to Knottsville. McLaw's advanced and drew up in the plain, but the forbidding aspect of Burnside's artillery, which opened viciously on him, forbade direct attack with infantry, whereupon he opened with artillery, and Longstreet continued attacks upon both flanks of Burnside's line, which were made and nicely repulsed; but, largely superior in numbers, Longstreet was able to move around both flanks, especially on Burnside's left, which obliged him to fall back to a ridge nearly a mile in the rear. This he did in a handsome manner, though under a heavy and constant fire, and closely pressed on all sides. It was four o'clock when Hood's division made an attack on Burnside's left, which was repulsed, McLaw attacked his right and was thrown back, and Longstreet then prepared for a general advance of his entire line, but before his preparations were completed it was becoming dark and his train secure and well on the road. Burnside, after dark, resumed his march. His advance reached Knoxville about daybreak next morning, 17 November, Longstreet warily following during the day, and the siege of Knoxville began. In this action at Campbell's Station and the skirmishes preceding it at Huff's Ferry, Lenoirs, and on the march, the Union loss was 303 killed and wounded, and 135 missing. The Confederate loss is not definitely known. Hood's division, the most seriously engaged, lost 174 killed and wounded; the loss of McLaw was much less. Consult Official Records (Vol. XXXV); the Century Company's 'Battles and Leaders of the Civil War' (Vol. III); Woodward's 'Burnside and the 9th Army Corps.'

CAMPBELLTON, Canada, seaport in Restigouche County, New Brunswick, on the Intercolonial Railway. It is the northernmost town in the province and a great centre for hunters of game. Light and water are municipally owned. Its industries include foundry and machine shops, lumber, shingle and planing mills, woodworking factories, etc. Pop. 3,817.

CAMPBELTOWN, Scotland, seaport and popular summer resort, famed for its scenic and historic attractions, in Argyllshire, on a fine bay indenting the southeast point of the Kintyre peninsula, 82 miles by water southwest of Glasgow. Whisky distilling is the chief industry, producing annually over 2,000,000 gallons, half of which is exported. Coal is mined, woolens manufactured, shipbuilding with allied industries carried on and the fisheries are important. The ruins of the ancient church founded by Saint Columba, and the sculptured granite cross of archaeological fame, from Iona, stand in the principal street. An ancient stronghold of the Macdonald of the Isles, here in 1647 at Dunaverly Castle 300 of the Macdonalds were slain after their surrender. Pop. 9,500.

CAMPE, kâm'pê, Joachim Heinrich, German teacher and juvenile author: b. Deensen,
Brunswick, Germany, 29 June 1746; d. 22 Oct. 1818. He studied at Halle for the Church, acted for some time as a teacher in various positions. He ardently supported the education reforms of Basedow whom he succeeded during the year 1777 as the head of the Philanthropinum in Dessau. In 1786 he was chosen by the government of Brunswick to superintend and reform the schools of that duchy, but his radical views brought him into conflict with the Church and government and he was unable to put them through. He became likewise the head of a schoolbook publishing house at Brunswick, and his own works, which were issued from it, contributed greatly to extend its reputation. These consist principally of educational works and books for youth, the most successful being 'Robinson Crusoe der Jungere,' an adaptation of Defoe's 'Robinson Crusoe.' This attained an immense popularity, being translated into almost all the languages of Europe. He also wrote a 'History of the Discovery of America,' Consult Leyser; 'Joachim Hoffman,' 2 vols. (1784; 2d ed. 1786).

CAMPECHE, or CAMPEACHY, Mexico, seaport town in the state and on the bay of the same name, on the west coast of the peninsula of Yucatan, about 100 miles southwest of Merida, with which it is connected by railroad. Under the Spanish régime Campeche was one of the three open ports of this coast, and its general aspect still gives evidence of its former wealth and importance. Founded in 1540 on the site of a native village, of which there are interesting remains, the city has witnessed many important events down to the revolution of 1842. It contains a citadel, a university with a museum, a hospital and a handsome theatre. Campeche is an important mart for logwood or Campeachy wood, of which great quantities are exported. Other important products are wax, cedars and henequen or sisal-hemp, sugar, salt, mahogany and hides. Owing to the shallowness of the roadstead large vessels have to anchor five or six miles off. There is a lighthouse on the coast at the point Pop. 10,207. The state of Campeachy has an area of 18,991 square miles. Pop. 87,000. The Bay of Campeche, part of the Gulf of Mexico, lies on the southwest of the peninsula of Yucatan, and on the north of the province of Tabasco.

CAMEGGIO, kām-pē′jō, or CAMEGGI, Lorenzio, Italian ecclesiastic: b. Bologna 1472; d. Rome, 25 July 1539. He succeeded his father as professor of law in the University of Padua in 1511, and gained a high reputation. When holding this office he married, and became the father of several children, but having lost his wife, took orders. Pope Julius II made him bishop of Petri, and Léo X., after giving him a cardinal's hat, employed him on several important missions, the execution of which gave him some prominence in connection with the Reformation. One of his missions was to Germany, for the purpose of regaining Luther; and another to England, to attempt to levy a tithe for defraying the expense of a war against the Turks. He failed signally in both, but ingratiated himself with Henry VIII., and was made a cardinal by the archbishop of Bologna (1524). Under Clement VII he was sent as legate to the Diet of Nuremberg, where he vainly endeavored to unite the princes in opposition to Luther; and to the Diet of Augsburg. He again visited England, with extensive powers to decide in the question of divorce between Henry VIII. and Queen Catherine; but his temporizing measures lost him the confidence of all parties, as well as his bishopric of Salisbury. Notwithstanding his repeated failures, he remained high in favor at the papal court. At his death he was archbishop of Sabina. His tomb is in the church of Saint Maria of Trastevere.

CAMPEN. See KAMPEN.

CAMPEN, Jacob de. See KAMPEN, JACOB DE.

CAMPEN, Jan van. See KAMPEN, JAN VAN.

CAMPER, kām′për, Pieter, Dutch anatomist: b. Leyden, 11 May 1722; d. The Hague, 7 April 1789. He distinguished himself in anatomy, surgery, obstetrics and medical jurisprudence, and also as a writer on aesthetics. From 1750 to 1755 he was professor of medicine at Franeker, and from the latter date to 1763 at Amsterdam. Henceforth till his resignation in 1773 he held a professorship at Groningen. His 'Dissertation on the Natural Varieties,' etc., is the first work in which was thrown much light on the varieties of the human species, which the author distinguishes by the shape of the skull. His 'Treatise on the Natural Difference of Features in Persons of Various Countries and Ages,' and one on 'Beauty as Exhibited in Ancient Paintings and Engravings,' followed by a method of delineating various sorts of heads with accuracy, is intended to prove that the rules laid down by the most celebrated limners and painters are very defective. His general doctrine is, that the difference in form and cast of countenance proceeds from the facial angle. His collected writings were published under the title 'Œuvres qui ont pour objet l'histoire naturelle, la physiologie et l'anatomie comparée' (3 vols., Paris 1803).

CAMPEDOWN (Dutch, Camperdon), Holland, a stretch of sandy hills or downs in the province of North Holland, between the North Sea and the small village of Camp, off which the British, under Admiral Duncan, gained a hard-won victory over the Dutch, under De Winter, 11 Oct. 1797. For this victory Admiral Duncan was raised to the peerage as Viscount Duncan of Campedown. His son became Earl of Campedown, and this title still belongs to a descendant.

CAMPERO, Narciso, nār-thē′sō kām-pē′rō, Bolivian statesman and soldier: b. Tojo (now in Argentina) 1815; d. Bolivia 1896. He studied and traveled in Europe, and on his return entered the Bolivian army, and rose to the rank of brigadier-general. He was Minister of War in 1872. After the overthrow of Hilarión Darío in 1880 he was chosen President of Bolivia. He commanded the combined forces of Peru and Bolivia in Tacna campaign, but was defeated at Tacna, 26 May 1880. Internally, his administration was quiet.

CAMPHAUSEN, kām′fōw-zēn, Wilhelm, a German military painter: b. Düsseldorf, 8 Feb. 1818; d. there, 16 June 1883. He studied under Alfred Rethel and Carl Sohn. His
paintings include 'Cromwellian Troopers' (National Gallery, Berlin); 'Doppel after the Assault' (same); 'Charles I at Naseby' (Kunsthalle, Hamburg); 'Tilly at Breitenfeld' (Cologne Museum); 'Napoleon III after Sedan,' and portraits of Emperor William, Bismarck and Wolz. He was at first of the romantic school, and although his best works are historical, they are depicted with fine attention to detail and realism.

**CAMPHENE, or CAMPHINE, (1)** a general name for those terpenes which are solid at ordinary temperatures (see **TERPENE**); (2) a purified form of turpentine, obtained by distilling that substance over quicklime in order to remove the resins that the crude product contains, and widely used as an illuminating oil before petroleum was available.

**CAMPOL, a substance now better known as borneol (q.v.).**

**CAMPHOR, a white, translucent, crystalline substance occurring in the wood and bark of the camphor laurel (Cinnamomum camphora, or Laurus camphora), a tree indigenous to Japan and central China, and cultivated in many warm countries. The camphor "gum" is obtained by distilling the leaves, bark and chips of the wood with steam and afterward driving out the water and volatile oils from the distillate with a low degree of heat, and then subliming the gum at 350°F. Purified camphor consists of a clinging mass of tough, colorless, hexagonal crystals which break apart readily, but cannot be reduced to powder except with the addition of a little alcohol—which evaporates spontaneously during the grinding. It has the chemical formula C_{10}H_{16}O, melts at 350°F., boils at 500°F., and sublimes to an appreciable extent at practically all temperatures. It has a strong, pleasant, characteristic odor, and a peculiar, cooling, aromatic taste. Its specific gravity is about 0.992, and it dissolves to a slight extent in water, and freely in alcohol or ether. Small shockings of it exhibit lively motions when thrown upon a water-surface that is absolutely free from oily matter. (See **SURFACE TENSION**). It is familiar about the household, on account of its use for protecting furs and woolen fabrics from the attacks of moths and other insects, and in domestic medicine. It is also employed in the manufacture of celluloid and various explosives.

"Synthetic camphor" is the name given to a camphor artificially prepared from turpentine oil. It is identical with natural camphor except that it is optically inactive. The process by which it is made consists of first converting the turpentine into pinene hydrochloride (which is known commercially as "artificial camphor") and then changing this to camphene by the elimination of the hydrogen chloride. Oxidation of the camphene by any of several patented processes yields the synthetic camphor.

The name "camphor" has been given to many similar substances of widely different derivation: as peppermint camphor (menthol); cedar camphor (from the oil of juniper); cubeb camphor (from the oil of cubebus); thymol (from the oil of thyme), etc. At one of the government experiment stations in the United States a good yield of natural camphor has been secured from young seedlings, mown down like grass at the close of the first season's growth, and distilled in the green state. See **BORNEOL**.

**CAMPHORIC ACID, an organic substance crystallizing in colorless, needle-like, monoclinic crystals, and obtained by oxidizing camphor by boiling it with concentrated nitric acid, or with an alkaline permanganate. It has the formula C_{10}H_{16}O, and a specific gravity of 1.19, and melts at about 370°F. It is almost insoluble in cold water, but is soluble in hot water, alcohol and ether. Camphoric acid has a limited use in medicine in the treatment of chronic disorders of the respiratory system.

**CAMPHUYSEN, kâmp'hoi-tzên, Dirck Ra-felz, Dutch theologian and poet:** b. Gorkum 1586; d. Dokkum, 9 July 1627. He lost his parents at an early age, and was left to the care of an elder brother, who, thinking that he observed in Rafelsz an inclination for painting, placed him as a pupil in the studio of the artist, Dirck Gouwerts. He soon abandoned art to devote himself to theology, which was the reigning passion of the age. He embraced the doctrines of Arminius, and shared in the persecutions under which Arminianism then suffered; was expelled from the city of Vleuten; became a fugitive from village to village, a prey to suffering and privation and found now in writing short poems his only relief and consolation. These are generally upon religious subjects, and are characterized by a remarkable degree of feeling. Recent art criticism has shown that the paintings formerly attributed to him were, in point of fact, by the other Camphuysens, his nephews, R. G. and J. G. Camphuysen, or his son, Gouvert.

**CAMPI, kâm'pē, a group of Italian artists who founded what is known in painting as the school of Cremona. Of the four of this name, Giulio, Antonio, Vincenzo and Bernardino, the first and the last are the best known. Giulio (b. probably about 1500 or 1502, d. in 1572), the eldest and the teacher of the others, was influenced by Giulio Romano after 1540; as his paintings of that period proved show and acquired from the study of Titian and Porporone the skill in coloring which gave the school its high place. Bernardino (b. about 1522, d. about 1590 or 1595) was the greatest of the school. He took Romano, Titian and Correggio in succession as his masters. It is important to note that, while the first three—Giulio, Antonio and Vincenzo—were brothers, the common assumption that the fourth, Bernardino, belonged to the same family, is not supported by any positively known facts.

**CAMPINAS, kam-pē'nas, Brazil, town on the Piracicaba River, state of São Paulo, 114 miles by rail from the port of Santos, and 65 miles northwest of São Paulo. It is an important coffee exporting centre, also producing sugar, corn and fruits. The situation of the town is unhealthy. Pop. 34,000.**

**CAMPION, Edmund, English theologian:** b. London, 25 Jan. 1540; d. 1 Dec. 1581. He was educated at Christ's Hospital and Saint John's College, Oxford, and distinguished himself greatly, becoming B.A. in 1561 and M.A. in 1564. Though at first a Roman Catholic he adopted nominally the Reformed faith and took deacon's orders in the Church of England.
When Queen Elizabeth visited Oxford in 1566 he was selected to make the oration before her, as formerly while at school he had been chosen to make the oration on the death of Mary on her accession. He went from college to Ireland, and while there wrote the history of that country, a superfluous work of no real value, and connected himself with the Roman Catholic Church. His enthusiasm leading him to seek to make proselytes to his new faith, he was seized and imprisoned; but after a short time effected his escape to the Low Countries, and soon after joined the English college of Jesuits at Douay, passed his novitiate as a member of that Society, and became distinguished for his piety and learning. At Rome in 1573 he was admitted a member of the order of Jesuits, after which he resided for a time at Vienna, where he composed a tragedy, which was received with much applause and acted before the Emperor; and at Prague, where he taught rhetoric and philosophy for six years. Sent by Gregory XIII on a mission to England in 1581, he challenged the universities and clergy to dispute with him. His efforts were followed by so large a number of conversions as to disquiet the ministry of Elizabeth; and he was arrested and thrown into the Tower upon a charge of having excited the people to rebellion, and of holding treasonable correspondence with foreign powers. Being tried, he was found guilty, condemned to death for high treason and executed at Tyburn. The insults of the populace attended him to the Tower, where torture was fruitlessly applied to extort from him a confession of treason or a recognition of the supremacy of the English Church, and after his death a fragment of his body was sent to each of the principal towns for exposure. Besides his history of Ireland, he wrote 'Decem Rationes' ("Ten Reasons"), and compiled a 'Universal Chronology,' and collections of his letters and several essays were published after his death. He was beatified by Leo XIII in 1886. His biography has been written by Richard Simpson (London 1857), and a complete list of his works is to be found in De Backer's 'Bibliothèque de la Compagnie de Jésus.'

CAMPION, Thomas, English poet: b. London, 12 Feb. 1567; d. London, 5 March 1619. His father died when Campion was nine years of age, and his mother soon after. His stepfather, Augustine Steward, sent him to Cambridge. He had intended studying law at Gray's Inn, but did not practise and was not admitted to the bar. Information concerning the rest of his life is vague. In 1606 he appears as a physician in London, where he remained until his death. He wrote a volume of 'Poems' (1595), being Latin elegies and epigrams. He wrote a masque for the occasion of the marriage of Lord Haynes, and three masques for the court of James I. He published (1610-12) four 'Books of Airs,' containing songs written by himself to airs of his own composition; the first book contains 'Day Diu', 'Ditty of Mora,' 'Motte,' 'Conceits of Lovers'; the third and fourth are not distinguished by any separate sub-title. In his songs the verse and the music are most happily wedded. He was very popular in his own day, he soon sank into oblivion. His works are full of freshness and charm. Consult the edition by A. H. Bullen, which excludes 'A New Way'; 'Songs and Masques' (ed. by Bullen, 1903, with an introduction by Janet Dodge); 'Poems' (ed. by Vivian, 1907); 'Complete Works' (ed. by Vivian, Clarendon Press, 1908).

CAMPLI, kâmp-plî, Italy, a town in Naples, in the province of Teramo, and five miles north of the town of Teramo. It has a cathedral, three churches, an abbey, several convents, a hospital and a mont-de-piété. Pop. 7,230.

CAMPO BASSO, kâmpô-bâsô, Niccolo (Conte di), Italian soldier: fl. in the latter half of the 15th century. He had first supported the house of Anjou in the kingdom of Naples, but afterward transferred his services to their opponent, Charles the Bold, Duke of Burgundy. At the siege of Nancy, in 1477, on the approach of a superior force under Ferrand, Duke of Lorraine, to relieve the place, Campo Basso deserted to the enemy immediately before battle. The Burgundians were in consequence defeated, and the Duke himself slain. The treacherous Italian was supposed to be the murderer.

CAMPOFORMIO, Italy, town 66 miles northeast of Venice, famous for the treaty of peace between Austria and France which was signed in its neighborhood, 17 Oct. 1797. Its chief provisions were that Austria should cede the Belgian provinces and Lombardy to France, receiving in compensation the Venetian states.

CAMPO MAJOR, Portugal, city of Alemtejo province, 11 miles northeast of Elvas. Situated at an altitude of nearly 1,000 feet, a meteorological station is maintained here. Wine and woolen goods are manufactured. The town is celebrated in literature and history by Scott's ballad, 'The Bold Dragoon,' depicting an incident of the siege in 1811 during the Peninsular War. Pop. 6,000.

CAMPO SANTO ('holy field'), the name given to a burying-ground in Italy, best known as the appellation of the more remarkable, such as are surrounded with a double and richly adorned. The most famous Campo Santo is that of Pisa, which dates from the 12th century, and has on its walls frescoes of the 14th century of great interest in the history of art. Among more modern Italian cemeteries, that of Genoa is distinguished for its magnificence.

CAMPO SANTO OF THE DISSENT-ERS. See BUNHILL-FIELDS.

CAMPOAMOR Y CAMPOSORIO, kâmpÔ-â-môr e kâmpô-ô-so-rô. Ramon de, Spanish poet: b. Navia, 24 Sept. 1817; d. 11 Feb. 1901. He studied medicine with great enthusiasm and thus got his first love of science which never left him and which continued to influence powerfully all his literary work and, to a certain degree, his political and social writings. But though his love of science remained with him he soon tired of medicine and turned to literature. Realizing that his education was superficial, he laid in a thorough knowledge of the literature and art of his own and foreign lands, he shut himself up in the public library and went through a self-imposed course of reading intended to help him to a literary life. His literary work, which at the beginning was as much journal-
istic as anything else, early brought him into prominence in political circles and he received one political office after another. When Christina fled from Spain in 1840, Campanoamor defended her and ever afterward he continued to show admiration for and devotion to her. Naturally, holding these views, he was a Conservative, views which were somewhat modified in his later days. But to his political views we owe a great deal of his prose work which was looked upon as one of the most powerful influences at work in Spain in the middle of the last century. This political work brought to Campanoamor, among other offices, those of governor of Alicante and Valencia and State Counsellor under Alfonso XII (1874). The political views held by him at this period of his life are pretty fully and forcibly expressed in 'Polémicas con la Democracia,' and other works of a like nature, which present vividly the burning political and social questions of the day. Even his philosophical works, mostly of an eclectic tendency and subjective idealism, are influenced by political ideas and the struggle in which he was engaged.

Already when scarcely out of his teens, Campanoamor began to be recognized as a poet of force and futurity, and the Liceo Artístico, of which he was a very active member, published a volume of his poems in 1840 and followed up with his 'Fabulas' two years later. In the same year a Madrid house published 'Los ayes del alma'; all of which brought him immediate popularity and gave him an entrée into journalism and literary life. He became an editor on El Español, a most valued contributor to El Heraldo, one of the strongest and most feared political writers of the day, and one of the most prolific contributors in Spain to magazines, reviews and newspapers. His work was widely copied by the provincial press, so that his name was soon found among the best known in literary circles and by the general public wherever the Spanish language was spoken. With this publicity his popularity as a writer grew with great rapidity. In 1862 he was elected a member of the Spanish Academy. Gradually he grew tired of political controversy and, in his latter days, he devoted his time and energy to work of a strictly literary nature, in which poetry began to take the foremost place.

Juan Valera, the great Spanish critic, has said of Campanoamor that love and joy are the characteristics of the first half of his life. This is not altogether true, for the sadness, bitterness, mild cynicism and scepticism of his later writings show through frequently in his earlier work. Yet, he is ever the artist and his touch is sure and true. A word painter, he is vivid, passionate, yet ever true to nature. As a poet and thinker, as a molder of new forms of expression and shades of thought, he is in the forefront of Spanish poets of the past century. The various faults attributed to him by his severest critics are but the reflection of the age in which he lived and labored; for he is at once realistic, sceptical and spiritual, all in a mild way that conveys the impression that faith and doubt are constant occupants of his thought. In the mastery of his art we are conscious that he is toying with a constantly intruding paganism. For he is a veritable creature of moods, passing from the highest pinnacle of joy to the lowest depths of despair. As a poet, Campanoamor possesses a style characterized by much variety and lending itself to exactness of reasoning and of form of expression, to facility of character painting and naturalness of dialogue. This combined with his power of story construction, his directness of presentation and his energy and directness of style, rather than his facility of political thought, created for him a place in the field of political controversy.

Campanoamor ranks higher as a poet than as a prose writer or philosopher. Among his best known poetical works are 'Dolores' (1840); 'Los ayes del alma' (1842); 'Fabulas' (1842); 'Ternezas y flores' (1843); 'Colon' (1851); El Drama Nacional'; 'Cuentos amorosos'; 'Pequeños poemas'; 'Nuevos pequeños poemas' (1887); 'Dolores y cantares' (1882); 'Poemas y fabulas'; and 'Humoradas.' His dramas, which were never successful on the stage, include 'El honor'; 'Guerra á la guerra'; 'El palacio de la verdad'; 'Glorias humanas'; 'Cuerdos y locos.' His most important prose works are 'Historia critica de las Cortes reformadoras'; 'Filosofia de las leyes'; 'Las polémicas con la Democracia'; 'El Personalismo'; 'Lo Absoluto'; 'El ideismo'; 'Canovas'; 'La Politica.'

JOHN HUBERT CORNYN,
National University of Mexico.

CAMPOBASSO, Italy, city, capital of Campobasso (formerly Molise) province, on Monteverde in the Apennines, 2,200 feet above sea-level, 170 miles by rail east-southeast of Rome. It is a busy agricultural market centre with long-established manufactures of steel and iron ware, notably cutlery. It has a healthful climate, good educational institutions, a cathedral, and the romantic ruins of a feudal 15th century castle overlooking the city. Pop. 17,000.

CAMPOBELLO, New Brunswick, an island, eight miles long, in Passamaquoddy Bay, Charlotte County, situated outside of the Maine boundary, in lat. 44° 57' N. and long. 66° 55' W. It is noted as a summer resort, where the summer and lead ores exist, the inhabitants are chiefly engaged in the herring, mackerel and cod fisheries. From 1769 Admiral Owen's family retained it as private possession. It was acquired in 1880 by a group of capitalists from Boston and New York. Pop. 1,230.

CAMPODEA, a wingless insect of the order Thysanura. Owing to its very primitive features it has been regarded by Brauer and by Packard as being the form nearest related to the probable ancestor of all insects. It is a little white insect living under stones. The body is long and narrow, each thoracic segment being equal in size, the antennae being long and narrow, while the body ends in two very large, slender, many-jointed appendages. It is very agile in its movements and might be mistaken for a young centipede (Lithobius). Though allied to the bristle-tail (Lepisma) it is still more primitive. The mouth-parts have not degenerated but are partly withdrawn within the head. It has a pair of short vestigial legs on the first abdominal segment. This and other features suggest its origin from some form
CAMPOS, kám'pōs, Arsenio Martínez de, Spanish military officer: b. Segovia, Spain, 14 Dec. 1831; d. 3 Sept. 1900. He was graduated at the Military Staff School in Madrid and appointed a lieutenant in the army in 1858; served on the staff of General O'Donnell and became chief of battalion in the Morocco campaign of 1859; was on duty in Cuba with the rank of colonel in 1869–72. Returning to Spain, he became a leader in the restoration of the monarchy (1875). With General Jovellar, he called Alphonso XII to the throne; was made commander-in-chief of the Catalonia district, and crushed Don Carlos at Peña de Plata in 1876. For these services he was promoted captain-general. In 1877 he was appointed commander-in-chief in Cuba, and brought the revolution to a close chiefly by means of concessions, which, as Minister of War and Premier in 1879, he endeavored unavailingly to carry out. He was Minister of War in 1881 and 1883, and commander of the Army of the North of Spain in 1884–85, president of the Spanish Senate in 1885 and captain-general of New Castile in 1888. In April 1895 he was appointed governor-general and commander-in-chief in Cuba, but in January 1896 was recalled to Spain. He found the insurrection more formidable than he had anticipated, and his failure to pursue a vigorous war policy caused much dissatisfaction in Spain. On his arrival in Madrid he repeated his belief that the trouble in Cuba could only be ended by granting reforms. In 1899 he was, for the third time, president of the Senate. For accounts of his important connection with Cuban affairs, see SPAIN—HISTORY.

CAMPOS, Brazil, city of Rio de Janeiro state, on the Parahyba River, 30 miles from the sea at the head of navigation for small ships, and 116 miles northeast of Rio de Janeiro city. The trading center, since its establishment in 1730, of a fertile alluvial sugarcane growing region, also producing coffee, rice, cotton and tropical fruits, its chief industrial establishments are sugar refineries. Campos is the starting point for several small independent railroad lines and communicates indirectly with Rio de Janeiro by way of Macuca. The city, electrically lighted, has many fine buildings. Pop. of city 22,500; of municipal boundaries 78,000.

CAMPRA, André, French composer: b. Aix, Provence, 4 Dec. 1660; d. Versailles, 29 July 1747. He served as master of the King's chapel, and composed for the Royal Academy of Music. He ranks among the most distinguishers composers of operas, his themes being classical love stories, notably 'Hesione' (1700); 'Iphigenie en Tauride' (1711); 'Triomphe de l'Amour'; 'Les Amours de Mars et de Vénus.'

CAMPU, CAMPUS, or CAMPULUNG, Roman city and summer resort, capital of Muscel department, in the Carpathian Mountains, at the head of a gln of the Tirgului River. It is the terminus of a branch railway from Ploesti, exporting the products of its paper mills, operated by river water power. Besides ancient Roman remains there are also an interesting 13th century monastery and a cathedral. Pop. 13,000.

CAMPUS MARTIUS (known also as Campus, merely) was a large place in the suburbs of ancient Rome, consisting of the level ground between the Quirinal, Capitoline and Pincian hills and the river Tiber. From the earliest times it seems to have been sacred to the god Mars, from which circumstance it received its name. It was originally set apart for military exercises and contests, as also for the meetings of the comitia by tribes and by centuries. In the later period of the republic, and during the empire, it was a suburban pleasure ground for the Romans, and was laid out with gardens, shady walks, baths, etc. After the time of Julius Caesar it became crowded with public buildings and monuments. Consult Platner, 'The Topography and Monuments of Ancient Rome' (pp. 339–92, New York 1911). The district is now called Campo Marzo, in which the greater part of modern Rome lies.

CAMPUS SCCELERATUS, a name given to a spot within the walls of Rome, and close by the Porta Collina, where those of the vestal virgins who had transgressed their vows were entombed alive (Liv. viii, 15), from which circumstance it took its name.

CAMUCCI, kā-moo-chē'ne, Vincenzo, Italian historical painter: b. Rome, 21 Feb. 1771; d. there, 2 Oct. 1844. He followed the academic-classical style, and is generally regarded as the most notable successor of Mengs in Rome. Among his best-known works are 'Death of Caesar' and 'Death of Virginia' (originals in Capodimonte at Naples); a altar-piece representing the incredulity of Thomas (in Saint Peter's, Rome); portrait of Thorwaldsen, painted in 1808; portrait of Pius VII, painted 1814; portraits of the King and Queen of Naples, painted in 1814; 'Christ Blemished by the Children,' painted for Duke Blacas d'Aulps, 1820; portrait of Pius VIII, now in Cesena, 1829; 'Virgin Reading Aloud from His Own Poems,' painted for Prince Alexander of Russia, 1839; and 'Camillus Preserving the Capitol,' painted for the King of Sardinia, 1840.

CAMUS, kā'mūz, Armand Gaston, French revolutionist: b. Paris, 2 April 1740; d. 2 Nov. 1804. A zealous and ascetic Jansenist and a master of ecclesiastical law, he was elected advocate-general of the French clergy, and in 1789 member of the States-General by the people of Paris. He now appeared as the resolute foe of the ancient régime, gained possession of and published the so-called 'Red Book,' with its details of expenditures so disadvantageous to the court and its ministers. While attempting to capture Dumouriez he was himself captured and, after two years in Austria, was exchanged for the daughter of Louis XVI. He was absent in Belgium during the King's trial, but sent his vote for death. He was made member and afterward president of the Council of Five Hundred, but resigned in May 1797 and devoted his time to the direction of the conservator of the national archives, and as such preserved the old documents of the abolished
corporations and institutions, and wrote several legalistic works. CAMWOOD, BARWOOD, or RINGWOOD, a red dye-wood (Baphia nitida) obtained in Brazil and also in Africa of the family Leguminosae. It once was common in the neighborhood of Sierra Leone, and was also found in Tonquin and other parts of Asia. The woody rind is a very fine color, and is principally used in turnery for making knife-handles and similar articles. The dye, mordanted with alum and tartar, obtained from it, is brilliant, but not permanent.

CANA OF GALILEE, town in Palestine, at no great distance from Capernaum (or Capharnaum), remarkable chiefly as having been the scene of our Lord's first miracle. It was there that He turned water into wine (John ii, 1). It was also the city of Nathanael and the place where Jesus, having been appealed to by the nobleman from Capernaum on behalf of his dying son, gave a word effected the cure:

A long-established tradition has identified it with a village bearing the name of Kefr' Kenna, which lies about four miles northeast of Nazareth; but in recent years two other sites have been mentioned by Bible students as possible claimants, namely, Kanet-el-Jehil, about six miles farther north, and Ain Kana, which lies somewhat nearer to Nazareth. It is to be said that Kefr' Kenna is at present a village of about 600 rough and uncivilized inhabitants, but has two churches, one Franciscan, one Greek. At Kanet-el-Jehil there are only ruins. The argument in favor of Ain Kana is purely etymological and is not supported by tradition.

CANAAN, kā'nān, the ancestor of the Canaanites (q.v.). He was the son of Ham and the father of Sidon and Heth (Gen. x, 6ff.) and the brother of Cush, Mizraim and Put. In Rabbinical literature he is the first of the seven sinners who made idols for the heathens (Chronicles of Jerahmeel, p. 167). He was predestined for this and similar sins, as he was born on the Ark, contrary to God's wish that the sexes be separated therein. The curse of Noah (Gen. ix, 18-22) descended on him because of the sin of his father, Ham (Gen. ix, 20-27), which story many biblical scholars believe the have been told at first of Canaan. Probably this conclusion was reached because it was contrary to Jewish sentiment for an innocent man to be punished for the sin of another. The story of the curse was written, according to some, to account for and justify the servile condition of the Canaanites and the Israelitish supremacy.

CANAAN and CANAANITES, geographical and ethnological terms applied to the country and the inhabitants of southern Syria in general. The country extended from the foot of Mount Hermon to the lower end of the Dead Sea, including territory both east and west of the Jordan; that is, Judea, Phoenicia and Philistia proper. Ethnologically the name was applied to all of the heathen peoples (Jebusites, Hittites, Amorites, etc.) whom the Israelites found west of the Jordan. The country is in some instances called Canaan, and in consequence it appears (e.g., Hos. xii, 8: Is. xxiii, 8) in the general sense of merchant. The geographical inference is that the land was originally a small strip of coast, gradually extended by conquest. The etymology has been derived from the dialectic word meaning "low," because of the fact that in Egyptian the word appears with the article prefixed "the canaan;" but this derivation has been contested, and the suggestion has been made that the land took its name from the people, not vice-versa.

The earliest mention of "Canaan" is found in the Amarna tablets where the name is used interchangeably with "Amurrû" for the land subject to the Amorite Aziru (163, 41) (see AMORITE), but mostly as a general nomenclature of Syria. In the Egyptian inscriptions, Canaan (Ka-n’n) is mentioned at the time of Seti I, and within the territory of Phoenicia in the days of Rameses III; and the "land of Canaan" apparently as Philistia in two papyri from the 19th dynasty. Coins from the time of Antiochus IV and his successors bear the legend of "Laodicea, a metropolis in Canaan."

What the original language of the Canaanites was we do not know, but in later times it was understood to mean Hebrew or the closely allied Phoenician dialect.

On the basis of the Egyptian and Assyrian inscriptions the history of Canaan may be divided into three periods: (a) the pre-Israelitish, from about 3800 B.C. down to the definite constitution of Israelitish supremacy; (b) the Israelitish supremacy from about 1100 B.C. — 740 B.C.; (c) decline of this supremacy ending in the absorption of Canaan by Assyria and Babylonia 588 B.C. After the return of the Hebrews from the so-called Babylonian exile, the history of the north and south becomes involved in the various attempts to found a world power by Persia, Macedonia and Rome. The characteristic note in the history is the impossibility of political union among the various peoples, probably due to the split-up nature of the coast lands which they inhabited. Consult the Tel-Al-Amarna Letters (ed. by Winckler with trans. 1896); Sellin's report of the excavation at Tel Tanners; Vincent, 'Canaan' (1902); Benigeri, 'Hebraïsche Archäologie' (1907); Bohl, 'Kanaänäer und Hebräer,' and any of the biblical dictionaries.

CANA-BOTA, a large shark (Hexanchus or Notidanus) which frequents the waters of the Bay of Biscay and the Mediterranean. Specimens have been found in the waters near the West Indies.

CANCCE, kān'kē, (1) in Greek mythology, a daughter of Aeolus and Enarete, who was punished by death because of her unlawful passion for her brother; she is mentioned in Gower's 'Confessio Amantis,' and in Chaucer's 'Man of Law's Tale.' (2) In Chaucer's 'Squire's Tale' the daughter of King Cambuscus, who being the possessor of a magic ring, can understand the love plaint of a female hawk.

CANAUCHUS, Greek sculptor of the 6th century, B.C. He was a native of Sicyon in Achaia. His most celebrated works were two statues of Apollo, one in bronze executed for the temple of Apollo at Phthiitia, and the other for the city of Thebes. Representations of the statue of Miletus have come down to us on the coins of the period.

1. GEOGRAPHY. I. GENERAL.—Area and Boundaries.—With the exception of Alaska, Greenland, Newfoundland, and the two small islands of Saint Pierre and Miquelon, all the northern half of the North American continent is comprised in the Dominion of Canada. Alaska, the great peninsular projection at the northwest corner of the continent, with a narrow strip of coast depending from it southward, belongs to the United States; Greenland, a huge island at the northeast corner, is Danish; Newfoundland, another island blocking the mouth of the Saint Lawrence estuary on the east coast of British, and Saint Pierre and Miquelon, lying off Newfoundland, are French. To the north of the continent there is a cluster of large islands, divided from the mainland and from one another by comparatively narrow channels. All of these form part of Canada and are included in its area, but as yet they have been only partially explored, and their exact dimensions are not known. The official estimate, as nearly accurate as it can be made at present, gives the total area of Canada, including the great fresh-water lakes wholly within its boundaries, as 3,729,665 square miles. The boundaries separating Canada from its only continental neighbor, the United States, are to a greater extent meridians of longitude or parallels of latitude. Between Canada and Alaska, beginning from the north, the boundary follows Iona from 140° W. from the Arctic Ocean to Foxe Basin, St. Elias. 20 miles of the Pacific, from which point it is an irregular line running about parallel with the coast round the heads of all bays and inlets of the sea at a distance of 20 to 30 miles inland. It reaches tide-water again at the head of Portland Channel, down which it passes, terminating in the Pacific Ocean. All the islands of the coast south of lat. 54° 40’ belong to Canada as far as the southern extremity of Vancouver Island, except that a cluster of small islands between the southern end of Vancouver Island and the mainland, but south of lat. 49°, are included in the territory of the State of Washington. The international boundary begins again in Juan de Fuca Strait. It takes a devious course from Vancouver Island to lat. 48° on the coast of the continent, and then follows the 49th parallel as far east as Lake of the Woods. A water boundary here begins, up Rainy River and its headwater series of lakes, cutting across the height of land to another chain of small lakes and following Pigeon River to its mouth in Lake Superior. From this point the boundary is the chain of Great Lakes and the Saint Lawrence River to its intersection with lat. 45°. The line now follows a more or less arbitrary course along the 45th parallel for some distance, then rising irregularly to the north almost to lat. 47° 30’, then down the upper course of the Saint John River as far as Grand Falls, then due south to the Saint Croix River, which it follows to the Bay of Fundy. The areas in square miles of the individual provinces and territories since the realignment of territory in 1912 are as follows:

Main Physical Features.—The four principal surface divisions are: (1) The Appalachian region, forming the extreme southeastern corner; (2) the Laurentian plateau or peneplain, with its fringes and outliers of lowlands, comprising the remainder of the eastern half of Canada; (3) the central highland of the mountain region to the west. Each of these divisions represents, on the whole, a different geological formation and has its own peculiar physical features. I. The Appalachian region of Canada is the northern extremity of the system of parallel ranges of mountains pushed up, as it were, from the southeast against the great archean, or Laurentian, area. The ranges all run from southwest to northeast, the Nova Scotian peninsular being without a corresponding extension in the United States. The hills are composed of older rocks, rising out of the carboniferous strata which once overlay the whole district, but of later formation than the Laurentian plateau to the north. They are much weathered and the river valleys have been comparatively well eroded. II. The Laurentian plateau or peneplain which covers about half the entire area of Canada is, geologically speaking, the nucleus of the continent. It presents a shield-shaped surface of archean rocks, broken into the north by Hudson Bay, and extending south to the Saint Lawrence River.
As is implied by calling it a peneplain, it is a much-weathered surface, nowhere rising to any great height, but maintaining a fair elevation above the sea. The greatest elevations are along the west shore of Hudson Bay. It is a country of hard, crystalline rocks, everywhere scored by glacier action, and sparsely covered with soil in which pine, spruce and other northern trees grow more or less densely, giving place in the higher latitudes to mosses and lichens. As a result of the melting of the glaciers which covered this region in the last geological period, the whole surface is a net-work of small lakes and streams. The latter have been unable to wear down the hard rocks to any appreciable extent, and consequently present all diversities of level with many falls and rapids in their course.

The western limit of the plateau is marked by a series of great lakes, from Great Bear Lake in the north to Lake Huron near the southern extremity. Adjoining the Laurentian plateau on the north and south there is, as it were, a fringe of later geological formations. Most of the large islands north of Hudson Bay as of the mainland west of it appear to consist chiefly of older sedimentary rocks in undisturbed arrangement, but the partial glaciation of these islands has hitherto prevented any detailed geological or other survey. South of the Laurentian plateau again occurs a lowland area, consisting of the valley of the Saint Lawrence River and the peninsula enclosed by the three lower members of the chain of great lakes. It is small in extent, but of great importance in the history of Canada, because the first European settlements were established herein within its limits and it still contains the greater part of the population. III. The central plain is of vast extent, reaching from the Arctic Ocean to the Gulf of Mexico, so that only its northern portion lies in Canada. It is the elevated bed of a carboniferous sea, and from a breadth of 800 miles at the international boundary it is gradually narrowed toward the north by the westly trend of the Laurentian plateau and broken into by subsidiary ranges of the Rocky Mountains. Still farther north, where it terminates at the Arctic Ocean, it again expands to a width of about 300 miles. There are three steppes of different elevations in this great plain, rising from east to west, and the general slope is from the southwest downward to the east and north. IV. The fourth great region, the mountain belt, is also of vast extent, being traceable in greater or lesser width from the Tierra del Fuego, at the extremity of South America, to the farthest western point of Alaska. In Canada this mountain, or Cordilleran, region attains a breadth of about 400 miles, the greatest average elevation being in the southern portion. The Rocky Mountains, the most easterly range, are paralleled by a succession of smaller ranges, the most westerly of which is represented by the mountains of Vancouver Island and the Queen Charlotte Islands. The geological age of this division is more ancient than that of the central plain, and the changes in the crust have been violent and abrupt. From the base of the Rocky Mountains, the youngest of the ranges of the Cordilleran System.

**Altitudes and Slopes.**—The greatest altitudes in Canada are in the Saint Elias range of mountains, a small group near the Alaska frontier, not far from the Pacific Ocean. Mount Logan is the highest of these and is estimated at 19,539 feet. The next greatest elevations are in the ranges along the west shore of Hudson Bay and the parallel ranges immediately to the west, where several peaks exceed 12,000 feet, although only one, Mount Robson, possibly reaches 13,500. The height of the ranges west of the Rocky Mountains becomes less and less as they approach the Pacific Ocean, and in Vancouver Island the highest peak is under 7,500 feet. The next greatest altitudes are in the extreme east of the Laurentian plateau, in northern Labrador, where a range of hills occurs, bordering on the Atlantic Ocean, which attains a height of 6,000 feet. Elsewhere in Labrador the Laurentian plateau seldom exceeds 1,800 feet, and on the west side of Hudson Bay the Laurentian area is lower and gradually merges in the central plain. The Appalachian region contains ranges of low hills nowhere exceeding 4,000 feet, which is only reached in the extremity of the Gaspé peninsula. The central plain rises in three steppes from the valley of the Red River, about 800 feet, downward to the foothills of the Rocky Mountains, where it has an extreme elevation of 4,200 feet and an average elevation of about 3,000 feet. The Saint Lawrence lowlands are nowhere much higher than 1,000 feet, or about 500 feet above Lakes Huron and Erie, and sink gradually with the Saint Lawrence River to its mouth.

**Water Ways.**—The distribution of land and water in Canada has rendered the interior continental area peculiarly accessible. The Gulf of St. Lawrence is a large arm of the sea affording ready means of entrance from the east; and leads to the broad estuary of the Saint Lawrence River. Exploration naturally followed this highway. No mountain barriers occur to obstruct or divert approach by the rivers Saint Lawrence and Ottawa to the chain of great lakes that extend to the very centre of the continent. The length of continuous waterway from the Atlantic Ocean at the Straits of Belle-Isle to the head of Lake Superior is 2,388 miles. Similarly Hudson Bay, a huge landlocked sea, communicating with the Atlantic by Hudson Strait, reaches even farther west than Lake Superior to the south of it. It was by way of Hudson Strait and Hudson Bay that the English explorers arrived at the great interior plains, just as the French voyageurs penetrated to the same region by the Saint Lawrence and the Great Lakes. The first systematic attempt at settlement of what is now the province of Manitoba, where the prairies begin, was by way of Hudson Bay, when Lord Selkirk established his colony of Highlanders at the junction of the Assiniboine and Red rivers in the first years of the 19th century. Two great waterways are found in the central area leading up from Hudson Bay and from the Arctic Ocean to the very base of the Rocky Mountains. These are the Nelson-Saskatchewan and the Mackenzie-Athabasca river systems, both of which were well-traveled highways for voyageurs and fur-traders long the unexplored territories. When the Red River Valley had reached the Ontario peninsula. In the Appalachian region there is one river of considerable length, the Saint John, which flows across the ranges into the Bay of Fundy. The mountain region possesses
its great rivers in the Columbia, the Fraser and the Yukon, all of which originate at the western base of the Rocky Mountains and empty into the Pacific Ocean, are obstructed by numerous and fierce rapids and have not afforded the same facilities for navigation as the rivers of the central and eastern areas. In recent years, however, the Yukon has become a great highway leading to the gold-fields of Alaska and the Klondike is no longer an isolated region.

Climate and Vegetable Productions.—

The climate of Canada has the usual characteristics of a continental climate in its extremes of heat and cold, but the presence of vast bodies of water, Hudson Bay and the Great Lakes, in the very heart of the continent, has introduced modifications of temperature which differentiate Canada from other great continental areas. Thus, the Laurentian lowlands enjoy a temperate and fairly equable climate, and are wholly free from the advent of the whirling winds. The central prairies, moreover, though subject to extremes of temperature, obtain sufficient moisture for growing wheat, except in the extreme southwestern portion. Here an area of aridity has been established, and this semi-arid region which has so great an extension south of the international boundary. The grassy plains are liable to frosts in the early and late summer, perhaps in consequence of the general slope down toward the Arctic Ocean, with no intervening chain of mountains. It has been found, however, that where the ground has been broken up for agriculture over considerable areas these unseasonable frosts do not occur, and at the same time there is a marked tendency to an increase in the average precipitation. The western portion of the central plain enjoys milder winters than the eastern, owing to the phenomenon known as Chinook winds, which cross the mountain ranges from the west and descend upon the plain as warm, dry winds, evaporating moisture and raising the temperature. This contrast is even more marked in the north than in the south of the area. In the mountain region great variations are presented both in temperature and humidity. The southern lowlands, extending up to the crest of the first range of mountains upon it have a very mild and very moist climate. The western slopes of the ranges farther inland also receive abundant rainfall and are clothed with dense forests. But the interior plateau receives very little moisture, and its altitude and dryness combine to give it extremes of temperature in summer and winter. The northern part of the Laurentian plateau on either side of Hudson Bay is, for climatic reasons, almost uninhabitable. This is a fact that clings to the southern portion of the same plateau give place to grasses, sedges and mosses, and ice remains in the rivers and lakes throughout the brief summer. This tundra region, some of which has not yet been explored, covers an area of perhaps 200,000 square miles, equal to one-fourth of Hudson Bay, and presents under the name of "the Barren Grounds," and half as much east of Hudson Bay, in the Labrador peninsula. The climate of the Appalachian region is influenced by its proximity to the Atlantic Ocean, and presents a milder type of climate. There are three well-defined belts of vegetation in eastern and central Canada. The southern part of the central plain is a region of treeless, grassy prairies, once the home of countless buffalo. In the extreme north, on either side of Hudson Bay are the Arctic tundras, the Barren Grounds, where only moses and other hardy plants grow, and where the only feeding for enormous herds of caribou and a smaller number of musk-oxen. Between these two treeless regions is the great forest belt which covers the whole of eastern Canada and extends across the central plain to the mountains, verging considerably south in consequence of the decreasing severity of the winters, until in the valley of the Mackenzie River it reaches beyond the Arctic circle. In the northern latitudes the forest is composed chiefly of pine, spruce, tamarack and aspen poplar, but in its southern extension, and especially in the Saint Lawrence lowlands and the Appalachian region, deciduous trees, such as the maple, beech and ash, are mingled with the conifers and even replace them in the river valleys. Before the advent of the whites the natives cut down the trees and farther north, and forest is giving place to farms wherever the soil is suitable. The prairie region is being rapidly converted to agricultural uses, even the semi-arid corner being capable of cultivation by the aid of irrigation. The mountain region, throughout almost its entire extent, is heavily wooded near the coast and on the western slopes of the inland range. The enormous height and girth to which trees of some species, such as the Douglas fir and western red cedar, may attain are well known. The river valleys and alluvial flats of the southern portion are suitable for agriculture, but the interior plateau does not receive enough moisture and is given over to ranching.

II. THE PROVINCES.—[For the sake of convenience and completeness, the physical features and topography of the provinces comprising the Dominion are here briefly treated. The articles in this work on the individual provinces should be consulted for further information.]

Nova Scotia.—Third in area to the United States, Nova Scotia, the most southerly member of the Appalachian region in Canada, consists of a peninsula about 250 miles long and 100 at its greatest breadth, and its continuation, the island of Cape Breton, which is separated from Nova Scotia proper by a narrow strait, the Gut of Canso. More or less parallel to the length of the peninsula run ranges of low hills, which near the Atlantic become mere ridges of rock. The country on this, the southern side of the province, is wild and seacoast, and dotted with small lakes. Agriculture is confined to the alluvial land along the river valleys, and the villages and towns for the most part are situated on the coast at the heads of the numerous bays which here indent it. The north shore of the peninsula is of a totally different aspect. The extended ridge of trap which forms the southern shore of the Bay of Fundy is broken into in a few places only, and long narrow bays are thus formed, into which the tide rushes with gushing force. The agricultural district of the province is behind this protecting wall of trap, and the hills beyond are covered with fertile soil and clothed to their tops with dense hardwood forests. The marshes
formed by the enormous tides of Minas Basin and Chignecto Bay, the two heads of the Bay of Fundy, have been reclaimed and diked, and form the most fertile pasture country. The orchards of the sheltered valleys on this side of the peninsula are celebrated. The chief region of mining and industrial development is the northeast portion, facing Northumberland Strait and the Gulf of Saint Lawrence. Here coal and iron are extensively worked; gypsum also occurs in large quantities and is exported principally from the district around Minas Basin. Gold, on the other hand, is found in the wild rocky region along the southern or Atlantic coast, and is mined on this side from one end of the peninsula to the other. The fisheries of Nova Scotia have always been an important industry, carried on from every harbor of the province. Cape Breton Island, of irregular shape, about 100 miles long by 80 broad, forms part of the province of Nova Scotia. An arm of the sea, entering from the northeast, almost divides the island in two; actual division is accomplished by a canal across the narrow neck of land. A great part of the island to the north is a high table-land, and the valley formed by Port au Bras d'Or channel is the most picturesque district in the province. At the east side occur the coal and iron ore deposits which are making Sydney, its chief town, one of the industrial centres of Canada.

New Brunswick.—The second in importance of the maritime provinces is New Brunswick, occupying the centre of the Appalachian region of Canada. It forms an irregular square of about 200 miles in extreme length and breadth, bounded on the north by the Bay of Chaleur and the province of Quebec, on the east by the Gulf of Saint Lawrence and Northumberland Strait, on the south by Nova Scotia (at the isthmus) and the Bay of Fundy, and on the west by the State of Maine and the province of Quebec. Two lines of hills traverse the province; one follows the coast-line of the Bay of Fundy, the other, starting from the same southwestern angle, runs diagonally across the province to the northeast. Between the two lines is a broad, rolling table-land, sloping down to the east coast, and beyond the diagonal range of hills the northwest region of the province is a rolling country, fertile and well suited for agriculture, but at present covered with forests. New Brunswick is a country of fine rivers, which have cut broad valleys through the soft rocks of the interior and afford access from the sea-coast to the innermost recesses of the province. The Saint John River flows south from the extreme northwest angle, entering the Bay of Fundy not much more than 30 miles from the international boundary. The Saint Croix, forming the boundary, also falls into the Bay of Fundy. The Restigouche, flowing into the Bay of Chaleur, the Miramichi into Miramichi Bay in the Gulf of Saint Lawrence, and the Richibucto, into Northumberland Strait, are the other large rivers. A dense forest, chiefly spruce, still covers most of the province, and lumbering is the principal industry. The fisheries are second in importance. Agriculture follows the river valleys mainly, but the marsh lands at the head of the Bay of Fundy have been converted into rich pastures, and new land in the interior is continually being brought under cultivation. In time, no doubt, the whole of the level area in the centre of the province will be devoted to agriculture, when the forest wealth has been exhausted in that region. The mineral resources of New Brunswick have not yet been developed to any extent.

Prince Edward Island.—Prince Edward Island, the smallest province of the Dominion, is an island in the Gulf of Saint Lawrence, 145 miles long, with an extreme breadth of about 30 miles, separated from New Brunswick and Nova Scotia by Northumberland Strait, which varies from 9 to 30 miles in width. The curving coast on the north side of the island is broken by a deep bay with a narrow entrance, and terminates in long, narrow points. The south coast is very irregular, presenting a succession of bays and inlets. The island has a uniform, gently undulating surface, everywhere fertile, and for the most part cleared of woods and brought under cultivation.

Quebec.—The oldest province, Quebec, formerly a French colony, is still largely inhabited by French-speaking people, although in the extreme south a group of counties, commonly known as the Eastern Townships, were settled almost exclusively by English-speaking Canadians. The province of Quebec is the largest in Canada. It now embraces the whole of the Labrador Peninsula except the strip of eastern coast which belongs to Newfoundland. Its western boundary is Hudson Bay, James Bay and a north and south line from near the southern extremity of James Bay to the head of Lake Timiskaming, an expansion of the upper Ottawa River. The southern boundary is irregular, consisting of the Ottawa River nearly to its mouth, then the 45th parallel of latitude, and the rest of the international boundary eastward as far as New Brunswick, and finally the Restigouche River and the Bay of Chaleur separating it from that province. The island of Anticosti and the Magdalen group in the Gulf of Saint Lawrence belong to Quebec. The whole of the valley of the Saint Lawrence River, from a short distance above Montreal, lies within its boundaries and constitutes the Eastern townships, the chief agricultural district. The principal affluents of the Saint Lawrence are also cultivated, and two new agricultural districts, that watered by the upper Ottawa and the country about Lake Saint John, out of which flows the Saguenay River, are also a great influx of settlers. Except for the northern portion of the Labrador peninsula and the area in the extreme northwest of the province, which drains into James Bay, all the rivers empty into the St. Lawrence River or Gulf. From the north come the Ottawa, the Saint Maurice and the Saguenay, and many others of less note farther east, while from the south the only ones of importance are the Richelieu, flowing from Lake Champlain, and the Saint Charles, emptying nearly opposite the city of Quebec. The general slope of the country is thus apparent. The southern edge of the Laurentian plateau, which runs not far from the Ottawa and Saint Lawrence rivers, comes quite down to the eastern coast. South of the Saint Lawrence River the fertile lowlands are bounded by the ranges of the Appalachian system, which approach ever nearer to the river until, in the Gaspé peninsula, they also reach the water's edge. Next to agri-
culture the chief industry of the province is lumbering. The immense extent of the forests on the Laurentian plateau provides a source of supply that is virtually inexhaustible, and the recent development of the manufacture of pulpwood has given new value to the smaller and softer trees such as the spruce. The mineral wealth of Quebec is at present undeveloped. Recent geological investigations have proved the existence of copper, platinum and antimony in the southern part of the province. Most of the best quality is found in the southeastern part and virtually constitutes the world's sole supply of the mineral. Mica is also mined.

Ontario.—The province adjoining Quebec on the west, Ontario, is the most populous and wealthy of Canada. It extends from the province of Quebec to Lake of the Woods. It is bounded by the province of Quebec from its southeastern extremity on the Saint Lawrence River to James Bay in the north. Its northeastern boundary is that between Hudson Bay. On the west a wholly artificial boundary line separates it from the province of Manitoba, consisting of the boundary of the old province of Manitoba running due north from the Lake of the Woods, and then a line running northeast from the northwestern corner of the old Manitoba to Hudson Bay where the 89th meridian of west longitude intersects the shore of the Bay. The southern boundary is the international boundary formed by the chain of Great Lakes and the Saint Lawrence River. The whole of the province is thus to the north of the great waterway, but as both the Great Lakes and the Saint Lawrence River in its upper course lie at the very southern limit of the area which they drain, Ontario contains all the tributary rivers of the Saint Lawrence system as far down as the Ottawa River. These, however, are not as numerous as might be expected, for the height of land between the Hudson Bay and Lake Superior slopes runs very near to the lake. Almost all the northern part of the province, therefore, drains into James Bay and Hudson Bay by many rivers of fair size, of which the chief are the Severn, Albany and Moose rivers and their tributaries. Lake Nipigon, which flows south exceptionably into Lake Superior. In the extreme west a corner of the province belongs to the Lake Winnipe area. There are no ranges of mountains in Ontario. The Laurentian plateau includes the northern half of the province, while the rest is part of the Saint Lawrence lowlands. The lowlands, and especially their western extremity, the peninsula between Lakes Huron, Erie and Ontario, are the chief agricultural district, provided with an excellent climate and soil, and its southern portion is the principal fruit-growing district in Canada, the chief products being peaches, grapes, strawberries and apples. Hops, tobacco and flax are also cultivated successfully in this part of Ontario. The northern part of the province beyond Lakes Huron and Superior has recently begun to be opened up, and its agricultural possibilities are being developed with great rapidity. Lumbering has always been the chief industry and the timber limits producing pine have begun to show signs of exhaustion. The increasing demand for wood-pulp has however given new value to the great northern belt of forest, which is mainly spruce. Ottawa is the chief centre of the manufacture of lumber; its situation on the Ottawa, the great log-carrier of two provinces, and the magnificent water-power of the Chaudière Falls, utilized for operating the sawmills, give it advantages over all competitors. The mineral resources of Ontario have begun to be turned to account. In the western part of the Ontario peninsula petroleum wells have long been worked but production is now diminished. The comparatively rare metal, corundum, occurs in southern Ontario. The province ranks third among the silver-producing countries of the world, owing to the recent discoveries in the Cobalt district. Copper is mined in increasing quantities in the Sudbury district, which is also rich in nickel. In production of nickel Ontario now ranks easily first among countries. Iron is found in many different localities but the ore is principally mined in the Algoma district. The water-power of the rapids in the Saint Mary River connecting lakes Superior and Huron has been utilized, and great iron and steel manufactures have been established at the town of Sault Ste. Marie.

Manitoba.—The next province westward is Manitoba. It extends from the international boundary on the south to Hudson Bay and the 60th parallel of latitude on the north. It is bounded on the east by Ontario and on the west by a line running north and south, coinciding with long. 102° in its northern portion as far as lat. 56°, but from there south trending slightly eastward until it intersects the international boundary in long. 101° 20'. The southern part of the province is one of the chief wheat-growing districts of Canada. It consists of a perfectly level plain, the alluvial bed of a former lake, through which winds the Red River. This first prairie steppe is bounded on the east by the Laurentian plateau which covers all the eastern part of Manitoba beyond Lake Winnipe. Westward, an escarpment, nowhere rising higher than 500 feet above the level of the first steppe, runs in a northwesterly direction and marks the beginning of the second prairie steppe, which presents a more undulating surface. The area covered by this steppe is considerable. Lake Winnipeg, a very large lake, is within the boundaries of Manitoba, as are also Lake Manitoba and Lake Winnipegosis, with others of smaller size. The chief river of the southern part of the province is the Red River which enters Manitoba from the south and empties into Lake Winnipeg. At Winnipeg the Red River is joined from the west by the Assiniboine, which with its affluent waters all the southwestern part of the province. The northern portion of the province, added in 1912, contains the lower course of the Churchill River and the whole of the Nelson River which flows out of Lake Winnipeg. These are the two largest rivers of the province. The Saskatchewan also, which flows into Lake Winnipe, and thus may be considered as the upper course of the Nelson River, passes through Manitoba in the latter part of its lower course. The predominating interest of the province is agricultural. The largest territory recently added to the area is forested to a considerable extent and may prove to contain valuable minerals. But at present both
lumbering and mineral industries in the province are in their infancy.

Saskatchewan.—The province of Saskatchewan, established by Act of Parliament in 1905, is bounded on the south by the international boundary and on the north by the 60th parallel of latitude, and extends from the Manitoba boundary westward as far as the 110th meridian. It is thus a huge rectangle about equally divided between prairie and wooded country, the limit of each being nearer than the latitude would indicate, and wheat can be grown successfully in the valley of the Peace River near the northern boundary of the province. Besides agricultural possibilities, there are mineral resources of great value, as yet only partially developed. Coal is found throughout a large area, and in various formation, from anthracite to lignite. Bitumen (in the "tar sands" of northern Alberta), oil and natural gas are also important assets.

British Columbia.—British Columbia occupies the whole of the mountain region from the international boundary to lat. 60°. It also cuts off a portion of the central plain, where the eastern boundary of the province leaves the Rocky Mountains and runs north along long. 120°. Vancouver Island and the other islands off the mainland are included in the boundaries of the province. West of the broad chain of the Rocky Mountains, which form the eastern boundary, three other ranges run approximately north and northwest, the northern part of the province, being extinguished northward by the more recent upheaval of the Rockies, whose axis inclines to north-west. These smaller and lower ranges are, in order from east to west, the Purcell, the Selkirk and the Columbia systems. Near and parallel to the Pacific coast another broad mountain system, the Coast Range, extends northward into Yukon Territory and Alaska, where it reaches its greatest elevation. Between the Coast and Columbia ranges there is the interior plateau, about 100 miles in breadth and from 2,000 to 3,000 feet in elevation. To the north it is cut off by transverse ranges of mountains. Vancouver Island and the Queen Charlotte islands are the unsubmerged remains of a subsidiary mountain range in the Coast Range. The rivers and lakes of British Columbia occur in deep valleys between the ranges. The Columbia River and its chief affluent, the Kootenay, take a remarkable course through the valleys between the ranges, running north and south in great loops. The lake-like expansions of both rivers form the chief navigable inland waters of British Columbia. The Fraser River which rises in the Rocky Mountains flows at first north, but soon turns westward round the head of the Cariboo Mountains, and finally runs almost due south cutting a deep channel in the interior plateau. It breaks through the Coast Range and reaches the sea not far from the international boundary. Its chief affluent is the Thompson. Both are very turbulent streams and form an additional obstacle rather than an assistance to inland communication. The northern half of the province is still very imperfectly explored. In a central elevated plateau many rivers take their rise in extensive lakes, such as lakes in the Fraser, others, such as the Liard, east into the Mackenzie basin, others again like the Skeena and Stikine westward into the Pacific Ocean. What British Columbia lacks in a system of navigable inland waterways is more than made up by its densely-forested coast line, where many magnificent harbors for sea-going vessels of any draught are available, from Port
1 Mt. Assiniboine, the Matterhorn of the Canadian Rockies

2 Mt. Robson, the Monarch of the Canadian Rockies
Simpson and Prince Rupert at the north to Burrard Inlet at the south extremity. The coast of Vancouver Island is also well supplied with harbors. British Columbia, although possessing less territory, is not without its agricultural industries. The interior plateau forms a good ranching country, and in the sheltered valleys, where irrigation can be introduced, fruit farms are very successful. Lumbering is one of the great industries of the province, and timber is cut in the northern districts and freighting roads and even of prospecting. The most important mining industry, however, is coal mining. Vast deposits have been explored and are being worked in various parts of the province, and coal is now being exported to Nanaimo and Comox and in the Rocky Mountains at Crow's Nest Pass. Another great industry of British Columbia is the salmon fishery, which is carried on chiefly at the mouth and in the lower reaches of the Fraser River. Canneries are also established at the mouths of the Naas, Skeena and other rivers.

Yukon.—The Territory of Yukon, under the government of a governor and an executive council, in part elective, lies north of British Columbia and is bounded on the west by Alaska. It has also a northern coast-line on the Arctic Ocean, but a comparatively short one, its eastern boundary being an irregular line sloping from southeast to northwest, for the most part following the easternmost range of the Rockies. The Yukon river, the outlet of the Mackenzie river basin, for the mountain boundary is low and the upper waters of many streams tributary to the Liard River, which flows into the Mackenzie River, take their rise in the eastern part of the Territory and flow south. In the north portion also the Peel River flying parallel to the Mackenzie, is contained within the boundaries of the Territory for most of its course, but bursts through the mountain barrier near its mouth and empties into the Mackenzie where the delta of the latter begins. The great part of Territory, however, is watered by the Yukon and its tributaries, the Teslin, Lewes, Pelly, Stewart and Klondike rivers, all flowing from southeast or east, and in the northern portion the Porcupine, which begins by flowing northeast as if to join the Mackenzie, but turns sharply and flows due west until it crosses the boundary into Alaska. The mountain system of the Territory is the series of parallel ranges of the Rockies, decreasing in elevation as they run farther north and turning eastward into the Alaskan peninsula.

The Northwest Territories.—The remainder of Canada, north of the provinces and east of the Yukon Territory, including the islands in the Arctic Ocean, is broadly described as the Northwest Territories, the former provisional districts of Mackenzie, Kee-watin and Franklin having been discontinued. This vast country is under the direct control of the Dominion government. It is very sparsely populated by Indians and Eskimos, together with a few white trappers. It is employed by the Hudson's Bay Company, and missionaries. The valley of the Mackenzie River in the west is fertile and covered with trees almost to the very mouth of the river in the Arctic Ocean. The climate in that region is not so severe as to be harmful to activities which would seem to imply: the summers, though short, are hot and the summer days long, and vegetables and some cereals have been raised by Hudson's Bay Company's agents at most of their posts in the district. Coal moreover occurs and also pitch, petroleum and natural gas. The fur trade, which is still a considerable industry, is carried on over the whole area covered by the sub-Arctic forest, and much of this vast northern territory will remain the home of many species of fur-bearing animals as long as the forest remains to shelter them. But the northern portions of the country on each side of Hudson Bay must remain a hunting country only. The Arctic archipelago has at present only a sentimental value, and the seal fishery is important and there are undeveloped salmon and other fisheries along the coasts of potential wealth. The series of daring British explorers who, in their search for a northwest passage, discovered the various islands and claimed them for British territory, are commemorated in the names given to the islands themselves and to the principal bays, straits and headlands. For ordinary purposes and for men of the white race they are utterly uninhabitable.

Editorial Staff, Review of Historical Publications Relating to Canada.

2. OUTLINE HISTORY AND POLITICAL DEVELOPMENT (1534 to 1918). When the Dominion of Canada came into existence in 1867 the word 'Canada' received a wholly new significance. Its origin is
doubtful but it was applied loosely in the early time to the regions occupied by France on the Saint Lawrence, called by the French themselves New France. When in 1673 France surrendered her New World territory to England the term "Canada" was commonly used for the new British dominions. In 1774 these dominions, including part of the Canadian Northwest and what is now the northern tier of western American States, were officially called the "Province of Quebec." Canada does not appear technically until 1791, when the name was used in a constitution given to Upper and Lower Canada, practically the Quebec and Ontario of the present time. Later these provinces were known as Canada East and Canada West. Not until 1867 did Nova Scotia and New Brunswick become a part of Canada. In considering the history of Canada as we now understand the word, it is important to remember that it includes a settlement of the French in the provinces of Nova Scotia, New Brunswick, Lower Canada, Upper Canada, etc., until 1867.

In the succeeding articles the epochs in Canadian development are treated in detail. It is sufficient here to outline the chief phases of Canadian history. The French were the first to recognize the resources and the value of Canada. The French had been the first to come to Canada, in the 16th century, and they had founded La Salle's colony. The French missionaries were the first to enter Canada, in the 17th century, and they had founded Montreal in 1642, but it was long after the first colony was founded.

The second epoch is that of French colonization and exploration until the final struggle with Britain for the country. When the first pioneer efforts were over France undertook the serious work of colonization, with Quebec as her centre of influence. Her aim was to transplant French social life to North America. Huge grants of land were given to seigneurs who were to play the role of lords in Canada, with vassals looking to them for land and paying rent for the land which they occupied. The system was ungenial to the new world, but it survived during the whole period of French supremacy and is a picturesque and interesting phase of French colonization. See article SEIGNIORIAL TENURE.

The first permanent settlement apart from trading posts occupied only in the summer was at Port Royal, now Annapolis, in Nova Scotia. Here the French planned really to till the soil and develop the country. From the first the colony had a terrible struggle for life. In 1613 the English from Virginia destroyed it, and, after it was restored to France in 1632, the adjacent American colonies were always planning to drive out the French. After a chequered history they at last succeeded in 1710, during the reign of Anne, in taking final possession of the fort, and it became Annapolis. The quiet village of the present day was thus the object of strife between two nations for well nigh 100 years.

Samuel de Champlain was one of the pioneers at Port Royal, but in 1608 he turned to the Saint Lawrence and made the beginnings of Quebec, long the centre of political and commercial life in Canada. By instinct Champlain was an explorer. Like others of that and a later time he hoped that the Saint Lawrence might be a water route to China. To Lake Huron and Lake Ontario Champlain penetrated, but the obstacles were enormous. The Iroquois Indians were hostile to the French from the first, and it is hardly strange that with their menace added to the natural difficulties Champlain could do but little of lift the veil from the North American interior.

Nor was he left free from European rivals. The English followed the French to the Saint Lawrence. Quebec they attacked and captured in 1629, and over it the English flag floated for three years. When in 1632 France recovered the place the fortunes of Canada were committed to a great commercial company. This company was called the Company of New France. Champlain was to be lord of the land and to have in his hands the work both of trade and of settlement. In France it had the powerful support of Cardinal Richelieu, but when at Quebec in 1635 Champlain died, New France lost its ablest leader, and the company lost interest. In the end it failed. Both in India and in America in the 17th century the French commercial companies had no success while their English and Dutch rivals succeeded.

After 1635 Canada was the scene of varied activity. It was an age of religious zeal in Europe, and the Jesuit and other missionaries planned to convert and control the savage native tribes of the country. In what is now northern New York, in Ontario, and in Quebec the missionaries did heroic work. Since the French missionaries were the friends of the Huron tribe, the relentless Iroquois, bent on destroying the Hurons, pursued too, the French. By 1649 the Huron settlements and the French missions were alike destroyed, and the French were driven back for a time to their base at Quebec. They had founded Montreal in 1642, but it was long only a fortified outpost to check the Iroquois.

But missions represent only one, if the dominant, phase of French interest. The great interior Exercises all the fascination of the unknown upon the chivalrous minds of the French explorers. Radisson, La Salle, Marquette, Joliet are only the best known of the leaders who penetrated to the interior before 1700. On Lake Huron, Lake Michigan, Lake Superior, on the Mississippi, even in the far west of Canada and the United States the survival of French names to this day bears witness to the activity of these explorers. It was a French Canadian, La Vérendrye, who first advanced so far across the prairie as to justify a belief, still held by many, that he came in sight of the Rocky Mountains. But this was not until 1743, and it now appears likely that he did not advance beyond the Black Hills in South Dakota.

Between missions and discovery the slow and laborious work of colonization was in danger of being forgotten, but there grew up gradually on both sides of the Saint Lawrence and near the mouths of its tributaries, colonies of French farmers. The river was their highway. For protection from the Indians they lived as close together as possible and so they divided the land
into long narrow strips with the houses stretching in a line on the river front. To the present day it is the most conspicuous feature of the French Canadian farms. Colonization was slow work. Adventurous Frenchmen preferred the wild life of the forest, and it was so difficult to attract settlers that in 1700 there were hardly more than 6,000 Europeans in the whole of New France. They enjoyed no semblance of political liberty. Between an aggressive church and a ignorant people, the French province of New France was a mere vassal state. The subjection of the French habitation is in striking contrast with the liberty of New England. Toward the end of the 17th century New France was committed to a very able Governor, Frontenac (q.v.). He had a definite program. He would curb the Church, which aimed to exclude settlement from the interior so that the missionaries might be alone with and thus continue to control the Indian tribes; he would hold back the English, build a chain of forts from the Saint Lawrence by the Great Lakes and the Ohio to the mouth of the Mississippi to shut them out from the West, and finally drive them into the sea. It was a great plan, but it required resources beyond anything that France could command. In Europe she was fighting William III of England (q.v.) with all her people and needed all the strength she could muster. So Frontenac died in 1698 with his plans unrealized, but he had done a definite work. The mission stage was ended in New France. Entrenched on the Saint Lawrence and soon on the Mississippi, France was ready to engage in the supreme struggle to make the interior French and to build up a great transatlantic empire for the glory of the French nation.

The next epoch in Canada’s history covers the prolonged struggle resulting in the British conquest. Probably impossible of realization in any case, the plan of a French empire in America was ended by Louis XIV’s misfortunes in Europe. With a great alliance against him, the British, obliging to make the Peace of Utrecht (q.v.) in 1713. In this he surrendered his claims to Hudson Bay, to Newfoundland and to Nova Scotia. This was the beginning of the end. Though in Cape Breton, France built a great fortress, Louisbourg, so as to command the Saint Lawrence (q.v.), her allies and needed all the strength against her were too great. Walpole managed to keep Great Britain at peace until 1744, but when war then broke out France and England engaged in a final struggle for which reason. The Treaty of Aix-la-Chapelle (q.v.), in 1748, did not really bring peace. Both sides were preparing steadily for renewed conflict. On the Ohio, on the Atlantic Coast, on the Great Lakes, on the Saint Lawrence, a deadly conflict went on after 1755, and when on a September day in 1759 Wolfe (q.v.) defeated Montcalm (q.v.) before Quebec, the issue was at last decided. By the Treaty of Paris (q.v.) in 1763, France surrendered her dominion of New France to Great Britain.

The 4th epoch in Canadian history covers British rule from 1763 to the Confederation of the Provinces in 1867. After the conquest in 1763, Canada was for a time governed by the British without creating a special constitution for the country, and not until 1774 did the Quebec Act (q.v.) provide for a permanent system. The Quebec Act played a great part in both American and Canadian history. It set up a despotic system of government, and it aimed to bring the whole western country under this despotic régime at Quebec. While introducing British criminal law in the country, it re-established the French civil law. The seigneurs retained their feudal rights, the Church was given legal power to collect the tithe.

In the English colonies the Quebec Act caused discontent. They did not desire despotism as a neighbor; they did not wish to be checked in the West, they disliked the legal establishment of Roman Catholicism, and when the colonies revolted the Quebec Act was one of their grievances. They resolved to attempt the overthrow of British rule in Canada and allied, as they hoped, with the conquered French rising against their new masters they planned to make the revolt continental in character. But in 1775 and 1776 the American army failed to take Quebec; and some of the French showed fight on behalf of Great Britain. Soon the plan to drive the British from Canada was abandoned and the country remained firm in its British allegiance.

Probably with this failure the die was cast finally; it is certainly true that the intervening seven score years have never seen the hope of the prospect of the union of Canada with the United States. When the Loyalists, driven from the United States, found homes in Canada they treasured bitter memories of the revolutionary struggle and rendered the prospect of union even more remote. But once settled in Canada these refugees from the United States demanded the self-government which they had enjoyed at home, and at last in 1791 the British Parliament established Lower Canada and Upper Canada each with a legislature of its own and with some, though not a complete, measure of self-government. In 1812 the United States and Great Britain drifted into war, and the second failure at that time to overthrow British rule in Canada confirmed the results of the defeat before Quebec in 1776.

In 1837 there was armed rebellion in the two Canadas. In Upper Canada the inhabitants claimed the complete control of their own affairs that the Colonial Office in London persistently refused, and to which the government took up arms. In Lower Canada there was a war of races. The French majority demanded that they should dominate in the councils of the country. The English minority, allied usually with the governor, resisted this claim, and at length some of the French also appealed to arms. Each revolt failed completely, but the risings threw into a clear light the causes of discontent in Canada and in time a remedy was furnished.

Lord Durham, an English radical Whig, went out to rule Canada with despotic authority and to restore order, in a very able report, published in 1839, urged that the English province and the French province should be united under one legislature. This was done. In 1841 Canada received a new constitution and in 1848 for the first time, the people of the two provinces could demand respect and consideration. With more than a million people Canada could no longer be treated as the child of the Colonial Office. After a few doubtful years under the new constitution, the Earl of Elgin, the governor-general sent out from England, defi-
nitely, amidst some riotous events in 1849, recognized the supreme authority of the Canadian Parliament in internal affairs. Since that time political warfare in Canada has been between Canadian parties and not between Canada and the Colonial Office.

But the union of the two provinces contained nothing of finality. Lord Durham had hoped that the union of British Columbia and the Province of Canada would precipitate the French. Instead the French asserted themselves and, since each province equaled the other in the number of its representatives, the work of government under the party system proved extremely difficult. A better political temper was growing up throughout British North America. Once free to control their own affairs the provinces saw the advantages of union. Their insight was quickened when in 1860 an advantageous Reciprocity Treaty with the United States came into effect. In self-defense it became necessary to increase the commercial and political strength of the provinces. With surprising rapidity negotiations were successfully concluded between 1864 and 1866, and in 1867 the Dominion of Canada came into existence.

The events connected with Confederation furnish a distinct epoch in Canadian history. In the next and concluding epoch the various provinces have been welded together until a real national life has appeared. The development of Federal government in Canada presents some interesting contrasts with the Federal system in the United States. Sir John Macdonald (q.v.) aimed to make the Federal power strong, the Provincial power relatively weak, and, since his was a master mind that directed Confederation, the Canadian constitution reflected his views. The powers of the provinces are strictly defined, the undefined residue remaining with the Federal government. Carrying out his views Macdonald frequently tried to curb the provinces, and advancing as an end there was a cry for provincial rights. In spite of Macdonald's desires, development in Canada has been rather in the direction of strengthening the authority of the provinces, but it is still true that a province in Canada does not represent a State of the Union in political authority. The Federal government can disallow Provincial legislation; it can dismiss a Provincial lieutenant-governor and has done so more than once. But as a result of the experience of half a century, a fairly stable balance between the two jurisdictions has now been reached. During this time a real unity has grown up in Canada, and it makes Canadians, as it long since made Americans, one in sentiment from ocean to ocean. The French-speaking province of Quebec is perhaps a partial exception. But on most great questions of national interest Quebec, too, is at one with the rest of Canada.

Bibliography.—The beginner in Canadian history cannot do better than read A. G. Bradley's little volume called Canada (Longmans, Green & Co., London) as also his larger volume, Canada in the Twentieth Century, which describes present-day conditions. He might substitute the more scientific volumes on Canada in Sir Charles Lucas's Historical Geography of the Countries of Canada, under French Rule, by Sir Charles Lucas; Canada under British Rule, by J. D. Rogers; Canada, Geographical, by J. D. Rogers (Clarendon Press). Professor W. L. Grant's school book, the History of Canada, is the best small book on Canadian history. Miss Agnes C. Laut's volume, Canada, the Empire of the North (Toronto), has imagination and vitality.

The most exhaustive general work on Canada is Canada and Its Provinces (Toronto), a huge two-operative work by Professor C. W. Colby (22 vols.). Kingsford's History of Canada in 10 volumes (Toronto) is full but lacks method. The Chronicles of Canada, (Glasgow) are 32 small, readable volumes, sold only by subscription; Stephen Leacock has in the series three volumes, The Dawn of Canadian History, an account of early discovery; The Mariner of Saint Malo, a life of the first French discoverer in Canada, Jacques Cartier; and Adventures in the Far North, an account of the Arctic. To find the Northwest Passage, which includes the tragic story of Sir John Franklin. Other well-known writers, such as Miss Agnes C. Laut, Colonel William Wood, Sir Joseph Pope and Professor C. W. Colby, have volumes in the series, which covers the whole history of Canada. The Canadian Historical Society publishes biographies of the chief leaders in Canadian history.

For special periods, Biggar's Early Trading Companies of New France (University of Toronto) is a learned account of early discovery. The history of the French régime has been told with great literary charm and ripe scholarship by Francis Parkman (Boston). His volumes can be read with pure enjoyment. The Pioneers of France in the Early World is an account of Cartier, Champlain and other early leaders. The Jesuits in North America describes heroic and tragic missionary labors. The Old Régime in Canada describes the planting in Canada of the French type of society which still endures in the province of Quebec and the Great West and of Frontenac and New France under Louis XIV describes French efforts and policy in North America at the end of the 17th century, while A Half Century of Conflict (2 vols.), Montcalm and Wolfe (2 vols.) and The Conspiracy of Pontiac (2 vols.) give the story of the final long struggle between France and Britain which in the end brought Canada under the British flag. George M. Wrong's Fall of Canada (Clarendon Press) may be said to supplement Parkman by its full account of the last year of French rule. Wood's Fight for Canada covers the Seven Years' War in Canada.

Of English speaking Canada the story has as yet been less thoroughly told and one or two of the following works are out of print. Bourinot, Canada under British Rule (Cambridge University Press) in a brief outline. Bradley's Making of Canada (Constable) and Lucas's History of Canada, 1763-1812, and his The Canadian War of 1812 (Clarendon Press), both cover this history down to 1815 including the War of 1812-15 with the United States. The later period has not yet been covered in a single adequate work and the story must be studied in the lives of the chief actors. The most interesting book on the history of Canada, as Wallace's The Family Compact, Grant's Tribune of Nova Scotia (Howe), and Sir Joseph Pope's Day of Sir
John Macdonald. In the ‘Makers of Canada’ there are some excellent lives: Lindsay’s ‘William Lyon Mackenzie’ tells the story of the leader of the Canadian Reformers and his ‘Lord Sydenham,’ an account of the governor of Canada who brought about the Union of 1841; Parkin’s ‘Sir John Macdonald,’ a good account of that statesman; and Skelton’s ‘Day of Sir Wilfrid Laurier.’ Dent’s ‘Story of the Upper Canadian Rebellion’ and his ‘Last Forty Years, Canada since the Union of 1841’ are interesting but not now out of print. Boyd’s ‘Sir George Etienne Cartier’ (New York) is a very full recent account of the French Canadian leader in the federation movement. Sir Joseph Pope’s ‘Life and Times of Sir John Macdonald’ (London, Arnold) and Sir John Willson’s ‘Sir Wilfrid Laurier and the Liberal Party’ (Toronto, Morang) each in two volumes, are very full and excellent. Siegfried’s ‘The Race Question in Canada’ (London) is a penetrating study of French ideals.

The vital phase of the later history of Canada is the expansion of the West. Miss Agnes C. Laut’s ‘Conquest of the Great North-West’ (Toronto) is a stirring account of the Hudson Bay Company. Short’s ‘Vikings of the Pacific’ (New York) is the story of discovery from the Pacific side. Sir William Butler’s ‘The Great Lone Land’ and ‘The Wild North Land’ (London) are vivid accounts of life on the prairie before the settlers came in. Burne’s ‘Search for the Western Sea’ (Toronto) is a record of the discovery of the West. Milton and Cheadle’s ‘The North-West Passage by Land’ (London) is an equally vivid account of crossing the Rocky Mountains in the sixties and should be supplemented by G. M. Grant’s ‘From Ocean to Ocean,’ written 10 years later (Toronto 1873). Hayden’s ‘The Riders of the Plains’ (London) describes the work of the mounted police in the West, work that has kept the frontier life of Canada almost free from crime. Laut, ‘The Canadian Commonwealth’ (Indianapolis) is a racy discussion of present day problems. The Constitution of Canada will be found in Egerton, ‘Federations and Unions in the British Empire’ (Clarendon Press).

On Canada’s relations with the Empire ‘The British Empire’ (Pollard, editor) and The Round Table, a quarterly, should be consulted by serious students. The University of Toronto Library publishes an annual ‘Review of Historical Publications relating to Canada,’ in which all books on Canada are reviewed from year to year (21 vols. up to 1918). Larned’s ‘Literature of American History’ (American Library Association) has a good Bibliography of Canada.

GEORGE M. WONG,
Professor of History, University of Toronto.

3. THE ERA OF EARLY DISCOVERY.

The early history of Canada from 1497 to 1632 may for the sake of convenience be divided into four periods: (1) The period of the early explorations along the Atlantic seaboard, 1497–1533; (2) the discovery and occupation by the Spanish of the gulf and river of Saint Lawrence, 1534–43; (3) the rise of the fur-trade, 1544–1612; and (4) the first permanent colonization, 1613–32.

The Explorations along the Atlantic Sea-
the modern Table Hill in 57° 40'. Since they had not penetrated to the bottom of Davis Strait they naturally supposed it was merely a gulf of the Sea of Baffin. Sailing north along Cape Breton Island they gave to Cape Ray the name of "Cape Saint George," and called Saint Pierre, Miquelon and Langley islands the "Trinity group." Since their provisions were none too plentiful they decided to turn their course westward and explore New England and Point aux Basques for more of the Table Hill in the north. Following on down this coast, which in their opinion was that of Asia, they reached Cape Race and the region explored in the previous summer. Proceeding on toward the south they reached the western coast of New York. They were now much struck by the distance westward they had come. The East coast of Greenland lies in 43° while the longitude of Sandy Hook is 74°, which is only four degrees of a degree less than that of Cuba. Cabot could well say, therefore, that he had now "sailed in this tracte so farre towarde the weste, that he had the Ilande of Cuba on his left hande in the same degree of longitude, in the west of Ireland, the country of the Great Khan. Although silk and brazil-wood grew at the spot where he landed, it was his intention on the next voyage to proceed on down that coast till he reached China. But before all this was accomplished his men came the spices and precious stones he had seen at Mecca. Henry VII was delighted and granted Cabot a yearly pension of £20. On 3 Feb. 1498 new letters patent were issued authorizing Cabot to prepare a fresh fleet of six vessels. In order to secure skilled seamen and probably also to hear news of what Columbus had done, Cabot about this time made a trip to Lisbon and Seville. In Lisbon he came across a certain João Fernandes, called "Labrador," because he owned land on the island of Terceira. When Cabot informed this man of his discovery, Fernandes in turn told him how he himself had also visited a region to the west of Iceland and north of the point in Asia reached by Cabot. The latter's curiosity was roused. Here was perhaps a shorter way of returning to Asia than by crossing again the dreaded western ocean. On Cabot's return to Bristol with Fernandes, a brief consultation with the merchants of that town who had been trading to Iceland seemed to Cabot that this was the best route to take. By the beginning of May the two vessels manned by 300 men were in readiness. Since it was known that Cabot was taking the route via Iceland, "in his company sailed also out of Bristol three or foure small ships fraught with slieght and grosse merchandizes, as course cloth, caps, laces, points and other trifles." Early in June they reached the east coast of Greenland a little north of Cape Farewell. As Fernandes had already told them of this region they named it the "Labrador's Land." On coasting north along this desolate shore, they found the ice to grow steadily thicker and heavier and the cold to become more and more intense. It was also noticed that the coast trended continually eastward. Finally on 10 June in late 60° 30' the crews mutinied and refused to proceed further in that direction. Cabot was thereupon obliged to turn his ships about and to head back to the south. On reaching Cape Farewell, the sailors west and explored the southern and also the western coast of Greenland. On meeting with ice again on the west coast they once more headed west until they arrived off the coast of the present Labrador, near
discovery of this mainland and the appearance of its inhabitants excited considerable interest, more especially English interest, and several English vessels, under the leadership of John Cabot, explored the region to the south. The autumn passed, however, without anything being seen of him or his vessel. In that summer an English expedition had been dispatched to the same coast by João Fernandes, now a naturalized Englishman, and several other English merchants, but on their return in the autumn with three Indians they reported that they had seen nothing of Gasper Corte-Real. In January 1502 his rights were transferred to his brother Miguel, who left Lisbon on 10 May with three vessels to search for his lost brother. They reached Newfoundland toward the end of June and on the 24th of that month named the modern Saint John's, "the river Saint John," in commemoration of the feast of Saint John the Baptist. To facilitate the search each ship was ordered to visit a certain portion of the coast and to return to Saint John's by 20 August. Two of the vessels returned at the date fixed but the vessel of Miguel never did more. Another English expedition also visited the same coast in that year and on 20 September King Henry VII granted a pension of £10 each to two naturalized Portuguese in consideration of the true service which they have done unto us to our single pleasure as Capitaines into the newe founde lande." No trace had been seen by them, however, of either of the missing Corte-Reals. In the hope of finding some trace of them, King Manoel dispatched two vessels to that coast in the following year, but neither of these vessels nor those which were sent out in that year by the merchants of Bristol saw any trace of them. They were thereupon given up for lost. The rich codfishing on this coast had now become so well known that in 1504 the French and Bretons began to resort thither. Two years later a tax was laid on the cod from these parts taken to Portugal. The French rapidly increased in numbers and in 1512 when the first Spanish expedition to this coast was fitted out the latter got their pilots in Brittany. By 1519 the French fleet numbered 100 sail and included vessels from Dieppe all the way down to Bayonne. In 1520 Alvares Fagundes of Vianna in Portugal explored the region between Saint Pierre and Miquelon and the coast of Nova Scotia. On his return he received a grant of these regions from the King of Portugal. It is possible that a colony was sent thither in 1525. In this same year the Emperor Charles V dispatched Estevan Gomez (q.v.), who had sailed with Magellan, to discover in the north a strait similar to the strait of Magellan in the south. Gomez explored the Bay of Fundy and then followed the coast southward as far as the West Indies. On his return to La Corunna with a ship-load of Indian bones he got a grant of 1,527 "two English vessels, the Sanson and the Mary-of-Giford, the latter being a three-masted barque of 250 tons' burden, were sent out to find a northwest passage. On meeting with icebergs at the mouth of Davis Strait they headed south. On 1 July in 52° a storm separated them and the Sanson was never heard of again. The Mary-of-Giford on reaching Saint John's on 3 August found "eleven sail of Normans and one Britaine and two Portugall Barkes and all a fishing." Finding no news here of the Sanson, she continued her course to the south "oftentimes putting her men on land to search the state of those unknown regions." On one of these occasions the Italian pilot, who may possibly have been Giovanni Verrazano, who had explored this coast for Francis I in 1524, was killed by the Indians. In the middle of November the Mary-of-Giford reached the West Indies. Being refused permission to enter San Domingo, she set sail again for England. In the course of her voyage she had met more than 50 French, Portuguese and Spanish fishing-vessels, which shows the proportions to which the codfishing on the Banks had then attained. Each year in fact the numbers increased.

The Discovery and Occupation by the French of the Gulf and River of Saint Lawrence, 1534-43.—Though during the course of the first three decades of the 16th century various English, Portuguese, French and Spanish expeditions had explored the seaboard of eastern North America none of them had penetrated into the interior. The first to do this were the French in 1534. The French fishermen who resorted every summer to that portion of this main coast which was rich in cod had noticed that a bay, called by them the "Bay of Castles," lay off the land thereabout, extended so far inland that not one had ever been able to reach the head of it. It was just possible, therefore, that this might be the entrance to a strait similar to that found by Magellan in the south. On this being reported to the authorities at home an expedition was dispatched from Saint Malo in the spring of 1534 under the pilot Jacques Cartier with orders to explore this opening. Cartier reached Bonne Espérance Harbor inside the Strait of Belle Isle (then called the "Bay of Castles") on Wednesday, 10 June. Having discovered on examining the coast beyond this point with the long-boats, that it was completely barren and rocky, sail was made on Monday, 15 June, from Bonne Espérance Harbor in order to explore the land seen to the south. Following this south shore of the Strait of Belle Isle they were led steadily down the west coast of what we now call the island of Newfoundland. Off Saint George's Bay to the north of Cape Ray they had stormy weather for a week, which forced them to beat up and down. On resuming their course southward they fell in with the Bird Rocks, which lie 55 miles north-northwest of Cape Breton Island. The island to the south of these they named "Brion Island." After the Admiral of France. From the currents observed here Cartier surmised that the opening beside Cape Breton Island was a strait and that one could sail from Brion Island directly into the Atlantic. "Should this prove to be the case," added Cartier, "it would mean a great saving both in time and distance should anything of importance be discovered on this voyage." As is well known, this opening, Cabot Strait, is now used quite as much as the Strait of Belle Isle. Leaving
Brion Island on Saturday, 27 June, they crossed over to the Magdalen Islands, by which they coasted the northwestern corner until the following Monday, 29 June, when on the wind veering to the south they had to set sail toward the west. They were under the impression that these islands formed the main shore on the south side of the gulf, and when on Tuesday morning, 30 June, they reached Cacumpeque Bay in Prince Edward Island, they believed that this latter formed part of the same main shore with the Magdaelens. The western end of the island of Prince Edward Island from the mainland, was mistaken for a bay and called "Saint Leonore's Bay" in memory of a Breton bishop whose festival is celebrated on 1 July. Coasting northward along the New Brunswick shore they believed on reaching Chaleur Bay that they had at last found a passage into the South Sea. On Thursday, 9 July, they discovered that it was merely a deep bay, "whereat," says Cartier, "we were much put out." On account of the heat of the sun they called it the "Bay of Heat." Pursuing their course northward they entered Gaspé Bay, where they were detained for ten days by bad weather. On Friday, 24 July, the day before they set sail, they set up a cross 30 feet high as a landmark and also seized the two sons of an Indian chief who had come down to the sea with his tribe to fish. Rounding the peninsula of Gaspé, they were heading straight for the mouth of the Saint Lawrence, when one of the mirages so common in those parts led them to believe that this passage between Gaspé and Anticosti was merely a land-locked bay. They consequently crossed over and followed the south shore of Anticosti as far as the eastern extremity of that island. Continuing on along the north shore of Anticosti they set off on a long circuit round the point of its western end and finally brought back to the Strait of Belle Isle or the "Bay of Castles," whence they had set out. The fishermen's statement had been fully confirmed. This narrow opening had turned out to be a great gulf with probably a sound entering from the Atlantic near Brion Island. There was also a prospect that the opening they had just discovered in the northwest corner of this gulf would yet lead them into the South Sea. Setting sail from Belle Isle on Saturday, 15 August, they reached Saint Malo in safety on Saturday, 5 September. As they were in great hopes that the opening in the northwest corner of this large inland gulf would eventually lead them to the South Sea, a fresh expedition consisting of three vessels was sent out under Cartier in the spring of 1535 to explore it. Passing through the Strait of Belle Isle and along the north shore of the gulf they anchored on Monday, 9 August, in a small bay on the Quebec shore, opposite Anticosti. As the following day was the feast of Saint Lawrence, this bay was christened "Saint Lawrence's Bay." The name afterward spread by mistake to the whole gulf and was finally extended to the river. The two savages who had passed the winter with Cartier in France, now informed him that the land on the south side of this Saint Peter's Strait was an island and that further west he would come to the mouth of a very large river. Where that river rose they did not know. With this information he helped Cartier proceeded through the passage north of Anticosti and passing on up the gulf entered the river Saint Lawrence which separates the two savages called it the "River of Hochelaga." On arriving at the mouth of the Saguenay his Indian guides informed him that this river took its name from a kingdom lying toward the northwest which was "rich and wealthy in precious stones." Pleased with this information Cartier pushed up on the "River of Hochelaga" until he reached a large island which he named the "Island of Orleans" after Francis I's third son, Charles, Duke of Orleans. On the banks of a small stream which he named "Saint Lawrence stood the home of the two Indians who had passed the winter in France. For this and other reasons Cartier laid up his two largest vessels in this stream and with his third vessel and two long-boats pushed on westward to visit another Indian village called Hochelaga. The shallow water at the head of Lake Saint Peter, which he named the "Lake of Angouleme" after Charles, Duke of Orleans, checked the further progress of the sailing vessel which had to be left behind there. Pushing on in their long-boats they reached the Huron-Iroquois village of Hochelaga on the island of Montreal at the foot of the Lachine rapids on Saturday, 2 October. On the following morning a visit was paid to this village and an ascent was also made of a mountain near at hand which Cartier named "Mount Royal." From this point they had a magnificent view of the surrounding country. They specially noticed the rapids, which checked further progress westward and heard from the savages that there were falls of water beyond. Just above the rapids another river entered the main stream. According to the savages this was the best route to the kingdom of Saguény, whose inhabitants were clothed like the French and had great stores of gold and other precious metals. Cartier made his way back to his vessels on the Saint Charles and in the course of the winter, during which part of his crew was carried off by scurvy, sought to obtain as much information as possible about this northern Mexico called by the savages the "kingdom of Saguény." That King Francis might have as much information as possible on this subject Cartier, on the day he had a large cross erected to mark the French possession of this region, ordered his men to seize the chief of this village and eleven others whom he placed on board his vessels as prisoners. Leaving the Saint Charles with only two of his vessels on Saturday, 6 May, he passed down the south shore of the Saint Lawrence and the passage to the south of Anticosti Island, which on his first voyage he had mistaken for a bay. From Chaleur Bay he steered for Brion Island and discovered after leaving it that the coast to the south was not the main shore but a group of islands. Heading still to the east he reached...
Cape Breton Island and found his conjecture as to the existence of a strait here to be correct. After touching at the islands of Saint-Pierre and Miquelon he left one of his long-boats in a small harbor 10 miles north of Cape Race and then on Monday, 9 June, set sail for home. They reached Saint Malo in safety on Sunday, 16 July.

During the wars in which France was then engaged, nothing further was done until the winter of 1540-41, when an expedition was organized to proceed to the conquest of this rich kingdom of Saguenay. While Cartier was to act as pilot, the command of the land forces was given to a Picard nobleman named Roberval, who had distinguished himself in the recent wars. Through a delay about the artillery, the latter was not able to be ready in time, so Cartier set sail from Saint Malo alone with five vessels on Monday, 23 May. They had a bad passage out and having waited some time in Newfoundland for Roberval did not reach the island of Orleans until the end of August. Cartier took up his quarters this time at the river of Saguenay, and some week later he sent back two of his vessels to France with letters unto the King and to advertise him what had been done and found: and how Monsieur de Roberval was not yet come, and that he feared that by occasion of contrary winds and tempests he was driven backe againe into France. Five days later Cartier set off in two long-boats to re-examine the rapids of Hochelaga and find out what arrangements should be made for passing them in the spring with the vessels of Saint John's. At anchor there in the harbor of Saint John's he was much surprised one morning to see Cartier arrive. According to Cartier's account hee could not with his small company withstand the Savages, which were about two days in making, him. On being commanded, however, by Roberval to return he and his company, mooved as it seemeth with ambition, because they would have all the glory of the discouerie of those partes themselves, stole privly away the next night and departed home for Brittany. Roberval was thus obliged toward the end of June to make his way up the Saint Lawrence alone. He took up his quarters in the buildings at Cap-Rouge which Cartier had vacated. On 14 September he sent back to France two ships "to carrying news unto the king and to come backe againe ye were next ensuing furnisht with victuals and other things." During the course of the winter 50 of his people were carried off by scurry, so that when he set sail from Saint John's in the spring of 1542 he had but 8 boats and 40 men. The remainder who only numbered 30 were left in charge of the fort. How far up the Saint Lawrence Roberval penetrated we do not know; for no further account of his movements has come down to us. It seems probable, however, that after penetrating a short distance up the Ottawa and getting a sprinkling of gold he returned to Cap-Rouge where he found Cartier, who had been sent out to bring him home. In the course of the autumn the rest of the men returned. On the failure of this expedition becoming generally known a new proverb was coined. When any object in appearance of value was found to be worthless, it was called a "Canadien diamond."

The Rise of the Fur Trade, 1544-1612.—

During the 10 years in which the French had been busy exploring the gulf and river Saint Lawrence and seeking to reach the mysterious kingdom of Saguenay, the number of vessels of various nationalities engaged in the fishing trade along the Atlantic seaboard had been steadily increasing. On his arrival at Saint John's, Newfoundland, on 8 June 1542, Roberval had found "seventee shippes of fishers," which were six more than Rut had met there in August 1527. Out of this annual fishing trade, which was carried on along the coast from Belle Isle to Cabot Strait, gradually grew the fur trade. The fishermen, when riding at anchor in a bay or inlet, found that the savages of the neighborhood were always ready to part with their furs for a mere trifle. Since these furs sold in Europe at a high price, the practice grew up among the fishermen of bringing out each year a supply of trinkets on purpose to barter for furs. The returns were so good that in process of time some vessels made a specialty of the fur trade. Thus in 1569 we have in the records of the French vessel du Havre that "had a trade with the people of divers sorts of fine furres." In 1581 some Saint Malo merchants sent a small barque of 30 tons into the upper Saint Lawrence, and so successful did the voyage prove that in the following year they dispatched a ship of 80 tons. In 1583, in which year the merchants of Saint Malo sent three vessels to the Saint Lawrence, Stephen Bellinger of Rouen "brought home a kynde of muske called castor; divers beasts skynnes, as beares, otters, martens, lucernes, seals, buffs, dere skynnes, all dressed and painted on the innerside with divers excellent colours." In the following year the merchants of Saint Malo brought back with them two savages in order that they might learn French and afterward facilitate more extended trading relations. The result was that in 1585 they sent 10 ships into the Saint Lawrence. In January 1588 two of Cartier's descendants obtained a monopoly of this fur trade, but so great was the outcry raised by the other excluded merchants that in May the monopoly was revoked. The trade continued to remain open like the fishing trade until 1599. In addition to cod, some of the vessels fished for furs, and toward the close of the century there was a great development of the walrus-fishing. In the spring of 1591 the Bonaventure of Saint Malo made her way to the Magdalen Islands in the Gulf of Saint Lawrence, where she "slewe and killed to the number of fifteen hundred morses or oxen" as the walruses were then called. With the 40 tons of train-oil into which these were boiled down she reached the mouth of the English Channel in safety, but was there captured by an English vessel from Bristol. Relying on the information thus ob-
tained, a vessel was sent thither from Falmouth in 1593, and though she took certain Sea-
oxen, it was "nothing such numbers as they might have had, if they had come in due sea-
son," for they arrived late in the summer. In the spring of 1594 the Grace of Bristol set sail to
Anticosti, "being informed that the Whales which are deadly wounded in the grand Bay
(the Gulf of Saint Lawrence), and yet escape the fisher for a time, are wont usually to shoot
themselves on shore there." Finding no whales she made her way back to the bay of Placentia
in Newfoundland, where she met "fishermen and sailors of Saint John de Luz and of Sibiburo [Ciboure] and of Biskay to the number of three score and odd sayles." After fishing there for some time she made her way to Ferryland on the east coast, where lay "two and twenty sayles of Englishmen." In that port she "made up her
fishing voyage" and set sail for home. In the summer of 1597 the Hopewell of London, of 120
tons, was driven away from the Magdalen by two ships of Saint Malo and two others of
Ciboure, "in the mouth of the Loire. Since this last hailer from a Catholic part of France it was decided to capture her. "We first," says the account, "sent our boat aboard the Rocheller to certify him that we were his
friends and to request him not to hinder our fight with the enemy. This message being sent,
we made all the haste we could unto the ship of Belle Isle, which first began with us with three
great shot, one whereof hit our main-top
saile, but both the other missed us. And we also sent one unto them, then being approached
were unto them ten or twelve of us went in a
shallop to enter them. And when we boarded
them in our boat, they betokee themselves to their close fights, playing chiefly upon us with shot and pikes out at two meeres' breadth. We entered very dangerously, escaping meere dangers both by shot and pike. Some of our
men were wounded, but no great harme was
done." With this prize the Hopewell returned to England. In the following year an unsuc-
sessful attempt was made to establish a colony on Sable Island. The Marquis de la Roche
had obtained his first letters patent authorizing him to occupy land in the region of
Newfoundland in 1577, and in 1578 he had set sail therewith two vessels. The "pinnace," however, had been obliged to return through "fowell weather," and, though the larger vessel, after being "well beaten by four English ships which this French ship had thought to have robbed," had "taken her course for Newfoundland, we do not know what was done there. It is probable, however, that La Roche merely selected a spot for settlement, since it was not until 1584 that the colonists were embarked. Unfortunately "his greatest ship of 300 tons was blown away westward and there was never anything more heard of them," before the war of the west coast of France, and so the expedition came to naught. From 1589 to 1590 La Roche was kept a prisoner by the Duc de Mercœur, but on his release he made a fresh attempt to establish a colony. In the summer of 1598 he landed on Sable Island 60 "sturdy male and
female beggars," taken from the prison of
Normandy. On reaching this island, on the mainland he was blown all the way back to
France. No fresh attempt was made to con-
tinue his colony, and when the remnant was
succeeded by a fishing vessel in 1603, only 11
persons were still alive. On this failure of La
Roche's colony, no sign was left that France
claimed the region of the Saint Lawrence as
her own. To remedy this state of affairs a monopoly of the fur trade for 10 years was
granted in the spring of 1599 to a fur trader of
Honorfleur, who yearly out of a certain vessel
of the Saint Lawrence. The condition was that he should people the country each year with
50 colonists. In fulfilment of this agreement, on the conclusion of his annual barter with the
Montagnais at Tadoussac in the summer of
1599, he left behind 16 men barded together
for warmth in a small log hut at the mouth of the Saguenay. On the return of the vessels in the following summer, no fresh colonists were landed and only five of the former batch were found. The French took this as an occasion to claim their exclusive rights to the fur trade. To quiet matters, a commission was appointed in the winter of 1602-03, which recommended the admission of certain Rouen and Saint Malo traders on condition they should bear their share of the cost of colonization. Before, however, more colonists were sent out it was deemed advisable to explore the country in detail in order that the best site available might be chosen for the settlement. This survey was carried out in the summer of
1603 by Samuel de Champlain, an officer of the
navy, and Dupont-Grave, one of the fur traders. The result was that in the spring of
1604 a fresh monopoly for 10 years was given to a company formed by the Sieur de Monts
on conditions, but not without a year should be taken out. The first settlement was
formed in the summer of 1604 on the island of
Sainte Croix, in the Bay of Fundy. "The Fort
hee [De Monts] seated at the end of the Iland,
opposite to the place where he had lodged his
Canon, which he considered the end to command the river up and down. And out of the same Fort was the Switzerland lodging, great and large, and other small lodgings, representing as it were a suburb. Some had housed themselves on the firme lande neere the brook. But within the Fort was Monsieur de Monts his lodging made with very faire and artificil Carpentrie worke, with the Banner of France upon the same. At another part was the store-house wherein consisted the safety and life of everie one, likewise made with faire Carpentry worke and covered with reedes. Right over against the said store-house were the lodgings and houses of these Gentlemen; Monsieur D'Orrille, Monsieur Champlain, Monsieur Chat. Brouager. Opposite to Monsieur de Monts, his said lodging, there was a galerie covered for to exercise themselves either in play or for the workmen in time of raine. And between the said Forte and the Plaforme, where lay the Canon, all was full of gardens whereunto everie
one exercised himself willingly.* The winter of 1605–06 proved severe on the exposed islet of Sainte Croix, where it turned out to be extremely sandy, that in the following summer the settlement was transported across the Bay of Fundy to the harbor of Port Royal (now Annapolis Basin), where the buildings were put together in the form of a large square. The winter of 1605–06 again proved a hard one, however, and, owing to the late arrival of the company's vessel, not only were all the furs taken by interlopers, but the colonists themselves finally embarked in two small boats in order to find a fishing vessel willing to take them back to France. They fortunately met their own vessel, in which they returned to Port Royal. In the spring of 1607, however, the company's monopoly, which had legally seven years more to run, was suddenly repealed through the intrigues of the Hatters' Corporation of Paris. Nothing remained but to send out a vessel to bring home the colonists at Port Royal, which was done.

The regions farther to the west, exploration De Monts now turned his attention to the Saint Lawrence. In order that he might retrieve a part, at least, of his losses, King Henry IV allowed him a monopoly of the fur trade there for one year. In the summer of 1605, accordingly, Champlain repaired to that part of the river called Quebec, or "the Narrows," where he constructed a trading-post. It was hoped that this would not only give them an advantage over the other competitors in the years of open trade, but would also hold the warlike nation of the Iroquois in check and allow the Algonquins, who came down every summer with furs from the upper Ottawa, to go backward and forward on the Saint Lawrence in all security. When Henry IV heard of the construction of De Monts' post at Quebec, he renewed his monopoly for another year. Taking advantage of this, Champlain, in the summer of 1609, accompanied the Montagnais and the Algonquins on the warpath against the Iroquois. In order to see the palaces of which they had heard so much, and also have their share of the victory over the Iroquois, the Hurons, who dwelt beyond the Algonquins on the shores of Georgian Bay, came down to Quebec, for the first time, in the summer of 1609. In the spring of 1610, Champlain combined force of 200 Iroquois on Lake Champlain. At the sight of the French and the report of their firearms the enemy broke and fled. The Hurons were delighted, and promised to come down henceforward every summer to the annual barter. In was same year (1609) the Sieur de Poutrincourt (see BIENCOURT DE POURTRINCOURT, JEAN) established himself with his family in the buildings formerly occupied by De Monts' colony at Port Royal. He continued to reside here until his home was burned by the English in 1613. Although during the winter of 1609–10 De Monts sought to have his monopoly renewed, or at any rate the trade reserved to him, in the region explored by Champlain in his expedition against the Iroquois, the king took the advice in the spring of 1610 the fur trade was thrown open to the merchant marine of France to the same extent as the cod, whale and walrus fishing. The result was that so many traders resorted to the country that summer that many ships found it impossible to get rid of even a portion of their cargoes. There was a similar inroad in the summer of 1611. The result of this competition were soon apparent among the savages. Not only did they ask more for their furs, but they also began to have a poor opinion of the palefaces, whom they saw even strip blood-stained furs off the corpses of dead Indians. De Monts also felt it to be unjust that he should be put to the expense of keeping up the post at Quebec when no advantages were accorded him in return. During the summer of 1612 Champlain was kept in France by a fall from a horse, and he improved the opportunity by seeking to bring about a better order of things in the Saint Lawrence. Through his efforts the system of open trade was brought to an end in the autumn of 1612.

The First Permanent Colonization, 1613–32.—In order that the licentiousness of a few merchants should not spoil the trade in the upper Saint Lawrence and ruin the prospects of exploring, with the help of these Indians, the interior of the country, the King's uncle, the Comte de Soissons, to apply in the autumn of 1612 for a monopoly of the fur trade above Quebec. This was granted on condition that, during the 12 years it lasted, six families a year should be taken out by the company. Although Soissons died a few weeks later, the monopoly was transferred, at Champlain's request, to Soissons's nephew, the young Prince de Condé. As no time was left to form the company before the trading season opened, Condé merely issued licenses to seven merchants to barter above Quebec. They were each to place four men at Champlain's disposal in case he had need of them. On account, however, of the licentiousness of some of the traders in the previous summer when Champlain was absent, neither the Algonquins nor the Hurons put in an appearance in 1613 at the rapids. At this Champlain set off up the Ottawa with a few attendants, and by his exertions induced over 80 canoes to come down to the barter. In the same summer of 1613 an English vessel from Virginia destroyed De Poutrincourt's home at Port Royal, and also captured a French vessel sent out by the Jesuits to form a colony at Mount Desert, on the New England coast. In the summer of 1614, however, the formation of the new company for trade in the Saint Lawrence. On the failure of the La Rochelle merchants to appear, the whole of the shares were divided among the traders of Rouen and Saint Malo. On reaching the annual barter at the Lachine Rapids in the spring of 1615, Champlain found that his absence in the previous summer had made the Indians doubt his friendship. In order to regain their confidence, and also explore the regions farther to the west, he set out with the Hurons on their return. He was thus able during the winter of 1615–16 to learn much of the geography of the present western Ontario as well as the region about Lake Ontario, to the southern shore of which he accompanied a war expedition against the Iroquois. So greatly were they impressed with the help thus accorded them that they accompanied Champlain in great numbers on his return to the Saint Lawrence in the spring of 1616. For this reason, also, the barter of 1617 and 1618 were greatly attended. Notwithstanding this increase of trade, the company...
unfortunately did nothing toward establishing a local source of supply, and paid almost no attention to colonization. Only one family was brought out, and it was treated in an extremely unjust manner. Not only were none of its members allowed to engage in the fur trade, but while paying very high prices for all the stores bought from the company they were obliged to sell their own produce at the very low prices current in France. When Champlain, as the representative of the vicerey, sought to secure the fulfilment of these conditions as to colonists, defense and local sources of supply, he simply made himself disliked. In the spring of 1619 they even refused him a passage to Quebec. At the King's express command he returned there in 1620, only to find the factory so tumble-down that the rain came in on every side. When this was notified to the admiral of France, who had succeeded Condé as vicerey, he at once revoked the monopoly of the company and gave the trade to the wealthy merchants, William and Emery de Casson. The old company, however, appealed to the King. Pending his decision both parties sent out vessels in the summer of 1621 and each left servants of its own to winter at the factory. In the course of the winter of 1621-22 these two companies amalgamated with a fresh monopoly which was to run until the year 1635. Unfortunately this united company neglected colonization and local sources of supply as much as its predecessor. The result was that in the spring of 1623 when the vessels arrived late they found that for some months all the inhabitants of the factory had been living on roots and berries. The same state of affairs recurred a few years later. Champlain, who was still governor, did his best to keep this united company up to its engagements, but whenever he returned to France everything was allowed to go to ruin. Although on his departure in the autumn of 1624 he left the new factory almost completed, he found on his return two years later that not a single nail had been driven in since he went away. "It could have been finished," said Champlain, "if in a fortunat, had they been willing to work, but that is just what they will not do." As little attention was paid to a local source of supply, and when, in the summer of 1627, the principal supply-ship failed to appear, the outlook for the winter was far from bright. To make matters worse, war broke out between England and France in the spring of 1628 and several Factory ships were sent into the Saint Lawrence. Although Champlain bravely refused to surrender the factory, the fleet sent out to Quebec by a new company which Riche- lieu had formed was captured below Tadoussac. At the same time a Scottish colony was founded at De Poutrincourt's old quarters at Port Royal. In the winter of 1628-29 these Scottish and English merchants formed themselves into one company and sent out two fleets in the spring of 1629. While one brought fresh stores to Port Royal, the other entered the Saint Lawrence and summoned the factory at Quebec to surrender. As no help of any sort had come since 1627 and all the inmates had been living for some time on roots and berries, Champlain was forced to comply. In July 1629 a French flag was run up on the flagstaff. The new company formed by Richelieu, called the Company of New France, also sent out a fleet, however, which not only succored the small French post at Cape Sable, below Port Royal, but also succeeded in dislodging Lord Ochiltree, who had formed a settlement on Cape Breton Island. He and his people were taken prisoners, and out of the material of their buildings a new French fort was constructed in one of the neighboring harbors. Here a garrison of 40 men was left. In the autumn of 1629 the French applied for the restitution of Quebec, since it had been surrendered after the conclusion of peace on 29 April. King Charles I acquiesced, but the negotiations dragged on until the spring of 1632. In the meanwhile both companies sent out provisions to their posts; the Company of New France to Cape Sable and Cape Breton Island, and the English and Scottish company to Port Royal and Que- bec. Finally, on the conclusion of the Treaty of Saint-Germain-en-Laye on 20 March 1632, the post at Port Royal was made over to the Company of New France, while the old United Company was allowed to engage in Quebec for one year in order to recuperate itself for its heavy losses. In the summer of 1633 its servants retired and the whole of New France passed into the hands of the Company of New France, which held it until the year 1664.

H. P. Biggar,
Author of 'The Early Trading Companies of New France.'

4. UNDER FRENCH RULE (1632-1755)- When the Treaty of Saint Germain-en-laye (1632) restored to France (see FRANCE—His- tory), her possessions in North America, Acadia and Canada were still savage wastes. Prior to this date Port Royal and Quebec had hardly advanced beyond the status of convenient landing points, while Tadoussac and Three Rivers were mere rendezvous for barter. In theory the profits of the fur trade were enormous, but disaster or disappointment seemed to follow each venture with dismal regularity. At the same time the attempt to establish permanent colonies had been attended by only a moderate degree of success. Louis Hébert and a few of his followers remained at Quebec for 21 years before the surrender of that place to the English, but their privations were constant and severe. Those who supported themselves by agriculture were less than a score and the total popula- tion barely passed 100. As for the missionary efforts, which constituted a third form of French activity in Canada, neither Jesuits nor Recollets had gained more than a handful of converts and a certain amount of friction between the two orders already existed. One hopeful sign was indeed visible, for in 1627 the Company of New France took form with Richelieu (q.v.) and other prominent people at its head, but this organization (better known as the Company of the Hundred Associates) was just beginning to show signs of vitality when Quebec fell (1629) into the hands of Kirke (see KIRKE, SIR DAVID). The general state of the situation can be described in a single phrase. Though individuals had displayed great offense and splendor and heroism, the French as a nation had not impressed them- selves deeply upon the western hemisphere.
Between the Treaty of Saint Germain-en-Laye and Wolfe's decisive victory over Montcalm's forces, a period of over 127 years marked the extent of genuine colonization. It cannot be said that in wealth and population New France kept pace with the English colonies from Massachusetts to Georgia; but while the economic basis of the French was less solid, their geographical range was wider and their institutions were equally distinctive. For a century and a quarter France continued to be an active competitor for the control of this continent and maintained a strong foothold upon it. Moreover, the Canadian French, the habitants, developed feelings of local pride and patriotism which, though they did not begot political restlessness, are not less noticeable than the pride and patriotism of the English in America. From 1632 to 1759 New France was a colony peopled by vigorous and resourceful inhabitants. Unfortunately it possessed a defective system of administration, but its annals are adorned by noble deeds and its history presents a characteristic form of civilization.

Of the two regions which France regained in 1632, Canada was destined to be the more important and to be held upon the firmer tenure. Acadia with its long frontier of seacoast lay open to easy attack from the side of New England and after 1621, when James I gave Sir William Alexander the charter of Nova Scotia (see NOVA SCOTIA-HISTORY) its population contained a Scottish element. At the moment when Port Royal fell to the English for the second time (1628) the ablest and most loyal Frenchman in Acadia was Charles de la Tour, but on the formal restoration of the colony four years later Isaac de Razilly, a relative of Richelieu, was appointed royal lieutenant. During his lifetime the French in Acadia proved able to hold their own against New England and even to destroy posts which the English had established on the coast of Maine. De Razilly's death, however, precipitated an acute quarrel between de la Tour and the able, unscrupulous Charnisay, who had come to the colony with de Razilly in 1632. The prosecution of the feud between these rivals led, among other things, to a famous siege of Port Royal and a spirited but fruitless defense of the stronghold by Mme. de la Tour in her husband's absence. The long and bitter broil ended peacefully enough in the marriage of de la Tour and Mme. Charnisay after the death of Charnisay and Mme. de la Tour, but meanwhile the prosperity of Acadia had been seriously hampered by a domestic feud which unsettled the whole administrative system and raised the issue of Catholic versus Huguenot. In 1654 Acadia was seized by the English for the third time and held till 1667, when France regained it by the Treaty of Breda (see BREDA, TREATY OF). During the greater part of the next 20 years peace between the two nations prevailed along the Atlantic coast, broken by occasional hostilities which was always in dispute; but with the renewal of hostilities in the reign of William III Acadia suffered severely and had not repaired her losses when the war of the Spanish Succession (see Succession Wars) broke out. This time the contest for supremacy reached a final settlement in one part at least of the New World. Nicholson's occupation of Port Royal (which he recaptured from the French) in 1750, together with Marlborough's victories in Europe combined to secure Acadia to England by the Peace of Utrecht (1713) (see Utrecht, Peace of). But even then the triumph of the English was not complete, for the island of Cape Breton still remained in the hands of France and the guns of Louisburg, guarding the entry to the Gulf of Saint Lawrence, declared more plainly than words that the Atlantic seaboard would not be surrendered to England without a further struggle. In marked contrast to their precarious hold upon Acadia, the French built up along the shores of the Saint Lawrence a colony which, whatever its shortcomings, did not change hands with every generation. Canada was far from invulnerable, as the capture of Quebec by Kirke had already proved and as its siege by Phips (see Phips, Sir William) was to prove once more in 1690; but long stretches of wilderness separated it from the English settlements, while the navigation of the river presented grave difficulties to the French fleet. The fate of Sir Hoveden Walker, whose powerful fleet was shattered among the shoals of the Egg Islands (1710), shows that sea power could not be brought to bear against Canada so readily as against Acadia, and the fierce raids of Frontenac illustrate with equal force the ability of the French to defend themselves by land. French rule in Canada lasted long enough and was sufficiently secure to furnish a great object lesson in colonial method. Apart from military history and the pathos which belongs to the loss of an empire, the life of New France is more interesting in the 17th than in the 18th century. The two generations that elapse between the return of Champlain (q.v.) and the death of Frontenac (q.v.) (1633-98) are marked by a series of striking exploits and the establishment of fixed institutions. Energy and enthusiasm abound; the explorer and the missionary are lavishing their lives on causes which mean infinitely more to them than any form of personal ambition; the colonist is becoming a native, a habitant, whose concerns are increasingly associated with America; problems of Church and state are arising to vex the souls of governors and prelates. On every side there are signs of that fresh vigor which derives its impulse from the novelty and charm of the wilderness. In dealing with the progress of Canada during the middle and latter part of the 17th century it is necessary to distinguish between the regions which were claimed by right of discovery and those which were effectively occupied by settlement. Before Frontenac's death lands had been cleared and rendered fit for cultivation at a good many points between Tadoussac, where the Saguenay enters the Saint Lawrence, and Montreal. Above Lake Saint Louis there were forts at important strategic points like Kingston (then Fort Frontenac) and Detroit, but for agricultural purposes the colonial zone stopped at the Lake of Two Mountains. Further to the north the Saint Lawrence the French were led inev-
itably to the Great Lakes and thence by an easy passage to the Mississippi. Thus their explorations belong no less to the history of Illinois, Michigan and Wisconsin than to that of Canada. In the Laurentian Valley the river was another Nile with a further element added, besides being the great local thoroughfare it was a highway that opened the route to the mother country. If, unlike the Nile, its waters could not be made to produce a rice crop, they abounded in the fish which were so necessary to the food of a Catholic family. The system of land allotment sprang from the one cardinal condition of life on the banks of a central stream. Each peasant had his strip of water frontage, however narrow, and was able at a moment’s notice to embark in his own bateau or canoe. The only towns of Canada were Quebec, Three Rivers and Montreal, all situated on the Saint Lawrence, and no permanent settlements were made in any part of the country unless within easy reach of it or its tributaries. The men of the taxing or service companies were really less suited to farming than the south, and in the valley of the Richelieu, the outlet of Lake Champlain, many of the best seigneuries sprang up. The settlement of the Richelieu Valley was also intended to provide a bulwark against the Iroquois.

Closely connected with the distinction which has just been made between the Laurentian Valley and the back or upper country (pays d’en haut) is the contrast between peasant and woodsman. According to the system of land tenure that prevailed in Canada under the Old Regime rural society was divided between the seigneurs or landlords and the seigneuriales or tenants. In Canada, as in France, gentility and the possession of an estate went together, but there is this important difference between the feudalism of the mother country and the colony, that whereas in France the peasants bore appreciable burdens during the 17th century, in Canada no seigneuriale could be seriously crippled by the taxes or services to which he was bound. Feudalism, an institution of the 9th century, could not be transplanted without change to the New World in the age of Louis XIV. The French of Normandy and Brittany made admirable colonists, when once they had been induced to embark in a great enterprise, but proved conditions must be held out before emigrants would come forward. Moreover in a country of virgin forest it was impossible that peasants should be taxed as their kindred were in a land of ancient cultivation. In view of these considerations the habitants received their farms on very reasonable terms. How moderate were the demands of the seigneur may be seen from a single instance. A deed of 19 June 1664 concedes a lot of land three arpents in front by 40 in depth (about a hundred acres) in consideration of 20 sous and one good five capon for each arpent of front and one sou of cens, payable at the principal manor-house of the seigneur on Saint Martin’s day in each year so long as the grantee shall occupy the land. The habitant had in a certain sense the character of a woodsman, for a large part of his time was devoted to hewing down the forest, but he was not a woodsman in the fullest sense of the word. Besides the stationary peasant who cultivated his strip of land in the valley of the Saint Lawrence, the population of New France embraced many restless and adventurous spirits who roved the woods, traded in beaver skins whenever they could elude the monopoly, intermarried with the Indians and evaded the restraints of civilization without punishment from civil or ecclesiastical law. The coureurs de bois (wood-runners), this type of colonist whose generic name, was one of the most remarkable adventurers that this continent has ever seen. Though his vices were an object of scandal to the missionaries and his legal immunity to the government, he possessed the virtues of fearlessness and initiative to an exceptional degree. The comrades of Magellan and Drake were no more daring or resourceful than the coureurs de bois who pressed on from the valley of the Saint Lawrence into the wilds of the pays d’en haut and found amid the dangers of forest or prairie the fullest excitements of a nomadic life. Their names, for the most part, have perished; but legends like that of the Chasse-galerie bring to the memory of all the habitants of the country of the New France, and found amid the dangers of forest or prairie the fullest excitements of a nomadic life. Their names, for the most part, have perished; but legends like that of the Chasse-galerie bring to the memory of all the habitants of the country of the New France, and

In passing from these general statements regarding country and inhabitants, it is hard to say whether a place of greater prominence should be given to the government or the Church. One should be careful not to represent the French Canadians of the 17th century as slaves—a tendency too current among English writers at the present day. The feudalism of New France was feudalism in its most mitigated form and the habitant was not, like the landless peasant of the lower countries, in the same position as a serf in England. Nevertheless French Canada was overshadowed by two institutions which visibly embodied authority as authority was not visibly embodied in New England or the Old South. Whether or not paternalism was the bane of Canada is an open question to be answered by the historical student in accordance with his own scheme of philosophy. The broad fact is that the Crown and the Clergy divided between them an extremely large part of the wealth of the world in which the habitant lived. From 1632 to 1663 the affairs of Canada were controlled, under the Crown, by the Company of the Hundred Associates. Had this corporation been better managed, or rather had it been actuated by a larger sense of duty than it showed, a more distinguished reputation and eventually handed over to the King a flourishing possession; but looking only to the greatest immediate return it wasted a fine opportunity and does not merit comparison with either the East India Company (see EAST INDIA COMPANIES) or the Hudson’s Bay Company (q.v.). After 1663 executive power in Canada was bestowed by the King to the governor and the intendant, with whom were associated the bishop and a board of councilors varying in number from 5 to 12. The governor, who was always a noble, held the highest office in the colony though he did not possess so much real power as the intendant. He commanded the forces, was the channel of diplomatic intercourse with the English and the Indians, occupied the relation of the colonial society and was authorized to follow his own judgment regarding matters of emergency. With finance, however, he had little or nothing to do, and from the whole field of civil administration, he was excluded by the intendant at his side of the intendant. This official-be
longed ordinarily to the middle class and had been trained to law or business. The Crown seems to have acted on the maxim "Divide and Rule." Both governor and intendant were required to keep a large amount of criticism and gossip. The intendant passed judgment on the acts of the governor and the governor was not slow to express his opinion concerning the administration of the intendant. Neither received untrammeled authority, for an autocratic King like Louis XIV insisted upon reserving the use of his prerogative. The government of New France was less rigid and cumbrous than that of the Spanish possessions under Philip II, but the principle of absolutism carried out at such a distance from the court could not fail to impair the efficiency of administration.

The position of the Church in New France cannot be properly described unless a reference is made to the domination which controlled Europe during the age of colonization. Seventeen years before Cartier's first voyage to the Saint Lawrence (1534) Luther had denounced the sale of indulgences at Wittenberg. In the interval between Cartier's first voyage and the death of Calvin (1541) a struggle between the Church and the Reformers was being fought which was to form the mood of devotion that prompted Frenchmen to leave the civilization of Europe for a life of privation among the barbarous heathen of Canada. Here the colonizing impulse proceeded solely from a desire to spread the faith. With Olier and Des Jardins the Society of Notre-Dame de Montréal, there was no thought of gaining wealth through the fur trade. The charter of the Society expressly states that its members detach themselves from all regard to temporal interest and take for their one purpose the conversion of the natives. From 1642 to the close of the century Montreal was an outpost of civilization and Christianity, exposed to frightful dangers, as the exploit of Dollard (1660) and the Lachine Massacre (1689) testify, but defended by men who cared more for religion than for life. In the relations of the Church with the habitants friction seldom arose. There is reason to believe that the Jesuits incurred some unpopularity because they did not favor the appointments of curés in the outlying districts, but for the most part the attitude of the peasants toward the clergy was one of complete deference. Until 1665, when the Carignan Regiment came to Canada, religious life in New France was not remarkable for any of the many features of a theocracy. Religion was supported by the state and derived a strong support still from the energy of the religious. The prevalent mood was pietistic and public opinion sanctioned the ecclesiastical punishments which were called forth even by minor offenses against morals. Apart from Church festivals the routine of daily life at Quebec or Montreal made little provision for relaxation or entertainment. Taverns were under the ban, dancing parties were prohibited and the general demeanor of sobriety would have met favor in the eyes of a New England Puritan. The coming of the Carignan Regiment broke in on this religious Arcadia and proved an entering wedge for frivolity, but in the early days the temper of New France was deeply religious, if not ascetic. One other aspect of ecclesiastical affairs deserves emphatic notice. While the clergy had to do with a docile population and were animated by pure enthusiasm in their work among the Indians, the religious life of the colony was not free from friction. The Jesuits, the Recollets, and after them the Sulpicians, felt that their interests were threatened by the enmity of the Jesuits. The Jesuits in turn prevented...
the Abbé de Quelus, an able Sulpician, from being made bishop of Quebec, casting their influence in favor of Laval (see Laval, Montmorency, Francis Xavier Merri, 1601) on the question of precedence, and with Avan- geau, whom he defeated in the question of selling brandy to the Indians. The difficulty over precedence brought in the whole issue of Church and state; the quarrel over the brandy question was less lofty but more practical. The position of the Church was that brandy should not be sold to the savages under any circumstances. The general, though not the invariable, position of the government was that if the French did not sell brandy to the Indians the latter would buy rum from the Dutch and English. The Church as a whole and the habitants as a whole lived on excellent terms; but there was much friction between the religious orders, the coureurs de bois were a thorn in the side of the clergy, and a governor of secular tastes, like Frontenac, made up a running feud with the hierarchy for years.

The mention of Frontenac’s name recalls a striking personality, for of all the governors who were sent out to New France during the long reign of Louis XIV he must be called the ablest and most formidable. That his policy toward the Church was judicious or free from prejudice cannot be maintained, nor can it be forgotten that his memory is defaced by the stain of fearful massacres. But he was bold, resourceful and thoroughgoing. His name is connected to the interests of Canada. Throughout both periods of his rule (1672-82; 1689-98) he was master of the situation as none of his predecessors had been, and during the seven years of his absence from the colony the failures of La Barre and Denonville served to set off his virtues in the strongest light. The main political problems with which he had to deal were the enmity of the Iroquois, the aggressive policy of the English as suggested by Governor Dongan, and the external French influence from the Great Lakes into the valley of the Mississippi. Speaking broadly the Iroquois were the chief menace of Canada in the last part of the 17th century as the English were its chief menace in the first part of the 18th. As the most formidable Jesuit martyrs, Jougues and Brébeuf, met death at their hands; the most brilliant deed of courage which the annals of New France contain was Dollard’s flight against them at the Long Sault; it was in their face that Madeleine de Vercheres shut the door of her father’s fort. Whether left to themselves or set on by the English they had every disposition to molest the French. The spirit of conciliation they mistook for weakness and, as Frontenac saw, the only way to impress them was by a show of strength. In 1698 he ravaged their country more thoroughly than De Tracy had done 30 years earlier, burned their palisades, destroyed their corn and convinced them that he had a power which they must respect. The next year they returned to the attack, opening the language of humility. Frontenac’s attack upon the English dates from the beginning of his second term of office. Returning to the colony in 1689 he found that French prestige had vanished almost wholly during his absence. To impress the Indians and terrorize the English he equipped those raiding parties which carried the torch and the tomahawk into Mississauga Falls and Casco Bay. As a tour de force of endurance, this winter campaign of the French was a remarkable feat, but the atrocities which accompanied it cannot fail to awaken the deepest abhorrence. Parkman finds extenuation for Frontenac in the hardship of the quarters, in no whit more ruthless than his times and his surroundings, and some of his contemporaries find fault with him for not allowing more In- dian captives to be tortured. Many surpassed him in cruelty, none equalled him in capacity and vigor. Everything considered, this must be called a mitigated sentence, and apart from all considerations of humanity it may be doubted whether Frontenac’s policy of carnage was a sound one. Its momentary success in impress- ing the Indians was not an equivalent for the spirit of vengeance which it awakened among the English. From 1690 forward New France and New England have their rancorous en- mities which continue to exist quite irrespective of peace or war between the two. Phips may be turned back from Quebec but the memory of massacre endures until French power in Canada has been destroyed. A much brighter feature of Frontenac’s régime is the progress made by French exploration in the Far West. While the famous journey of Mar- quette (q.v.) and Joliet (q.v.) down the upper waters of the Mississippi (1673) may be more fitly connected with the names of Courcelle (q.v.), Frontenac’s predecessor, and of Talon (q.v.), the territory which these intrepid explorers of La Salle (q.v.) and Tonty (q.v.) fall within the period of Frontenac. It was by favor of Frontenac that the fort at Cataracouti (now Kingston) was placed in La Salle’s hands, thus enabling him to establish a fixed base at the east end of Lake Ontario for his operations on the Great Lakes and beyond. As far as the Huron country the French had been on familiar ground ever since the days of Champlain, but their chief triumphs in opening up the hinterland were won under Frontenac.

The 18th century opened for New France with bright prospects which were destined never to be realized. The war that closed at the Peace of Utrecht was celebrated (q.v.) by the most celebrated of the Jesuit martyrs, Jougues and Brébeuf, met death at their hands; the most brilliant deed of courage which the annals of New France contain was Dollard’s flight against them at the Long Sault; it was in their face that Madeleine de Vercheres shut the door of her father’s fort. Whether left to themselves or set on by the English they had every disposition to molest the French. The spirit of conciliation they mistook for weakness and, as Frontenac saw, the only way to impress them was by a show of strength. In 1698 he ravaged their country more thoroughly than De Tracy had done 30 years earlier, burned their palisades, destroyed their corn and convinced them that he had a power which they must respect. The next year they returned to the attack, opening the language of humility. Frontenac’s attack upon the English dates from the beginning of his second term of office. Returning to the colony in 1689 he found that French prestige had vanished almost wholly during his absence. To impress
Europe. Until 1745 its strength remained untested, but the French themselves thought it impregnable and the English looked upon it with distrust. The War of Austrian Succession offered an excuse. Massachusetts was ready for the attack. Governor Shirley (see Shirley, William) devised the plan, which was daringly executed by a colonial fleet under William Pepperell (q.v.) in co-operation with four British men-of-war. The capture of Louisbourg by a militia force was the greatest humiliation which France had suffered in America and its restoration by the Peace of Aix-la-Chapelle (1748) (see AIX-LA-CHAPELLE, TREATIES OF PEACE CONCLUDED AT) came to New England as the sorest affront which it had ever received at the hands of the home government.

At the Peace of Utrecht New France contained a population of rather more than 25,000. In 1750, when Canada was ceded to England, the number of inhabitants had increased to about 60,000. It is obvious that this rate of increase was trivial in comparison with the progress of the English colonies during the same period, and when we remember the unusual fecundity of the French Canadians, some special reason needs to be assigned for the slow development of the colony. The cause of this striking phenomenon will be found in the fact that immigration was not spontaneous, as in the case of the English colonies, but controlled by government. Partly owing to the institutions which prevailed in France during the 17th and 18th centuries, and partly owing to gross mismanagement of colonial affairs by the court of Versailles, New France was handicapped in the long race with its southern rivals. This fact must be brought out because it is often erroneously stated that the Frenchman has never made a good colonist. The biography of Canada from Champlain to Montcalm gives the direct negative to such an idea: Maladministration, the lack of local self-government and excess of loyalty to inherited institutions account for the defeat of the French in America rather than the want of promptness, courage, industry and resource. It must be remembered, moreover, that the English colonies took root in a soil which was fitted to stimulate rapid growth. The long calm which followed the Peace of Utrecht (1713-42) was often broken by signs of acute restlessness. As early as 1725 the Marquis de Beauharnois, who had become governor in succession to Vaudreuil, was busy with schemes for keeping the English within the limits they already occupied. This meant that their expansion northward should be checked in the vicinity of Lake George and their expansion westward by the range of the Alleghenies. Far from losing their love of exploration, the French pushed farther and farther westward with each decade. Michilimackinac was to Verendrye and Silesia from Frederick the Great, one of Verendrye's sons caught the first glimpse of the Rocky Mountains. In America the hostilities which accompanied the War of Austrian Succession centred at Louisbourg and accordingly this conflict affected Canada less than the two preceding wars had done. But every man of colonial origin, English and Irish as well as French, who adhered to the Peace of Aix-la-Chapelle was merely an armistice. Unsettled boundaries suggested endless friction, especially in Acadia and the Ohio Valley. The line which was run by Céloron de Bienville at the instigation of France at excluding the English from the Ohio and, according to patriotic opinion in such colonies as New York, Pennsylvania and Virginia, amounted to a cens censibus. Before the development of the western trade the English and French had been separated by a wide zone of wilderness. The expansion of both races brought them face to face at the junction of the Alleghany and the Monongahela. Should the stronghold built in this angle be called Fort Duquesne or Pittsburgh? Here was an issue on which hinged the future of a continent. It was the misfortune of the French both at home and in Canada that their administrative system suffered from the worst evils of a corrupt absolutism. At Versailles the folly and extravagance of Louis XV, at Quebec the unthinking policies of the Intendant Bigot, were but a poor preparation for war. And so the small but valiant race of the Canadian French bore the burden of vices not their own when they entered upon the last act of an irrepressible conflict. 5. GREAT BRITAIN'S FIGHT WITH FRANCE FOR NORTH AMERICA—1753-43. For several years previous to the formal declaration of war between England and France, in 1756 (see CANADA—UNDER FRENCH RULE), the stirring events in the Ohio Valley and in distant Acadia foreshadowed a great crisis, during which territorial disputes, aggressions and political intrigues would be lost sight of for the moment, and the question paramount would be the supremacy of France or of England in North America. The policy of France, as dictated from Versailles, had not been broad enough to successfully promote colonization, in the sense of expansion, or even to maintain permanent occupancy, although this was much desired. And the honest designs of her colonial administrator, La Galissonniere, to increase the dominion of his royal master, at an opportune moment, met with no responsive aid. The mother country was wedded to schemes of aggrandizement at home, and was inclined to leave her colony to work out its own future. Besides, the French then, as now, were rather a stay-at-home people. New France was consequently weak in soul, English and French alike, in a position to retain her empire in the North, and, moreover, her influence was being undermined by official corruption. Great Britain, on the other hand, had the real advantage of superior numbers in the New World, although she had no definite colonizing policy, being smarting from the effects of an earlier administration, due rather to ignorance than to knavery. The disputes touching possessions in Acadia were of long standing. By the 12th
article of the Treaty of Utrecht (see URECHT, PEACE OF), Nova Scotia, within its ancient boundaries, had been ceded to the Crown of England. A controversy soon arose over the interpretation of a certain clause. Great Britain claimed that her possessions under the Treaty of Utrecht were of the same extent as those in Canada, as defined by the Treaty of Breda; but France protested that the territory she then received was quite distinct from the ancient boundaries, which confined Nova Scotia to a portion of the southern peninsula. At the conclusion of the Treaty of Aix-la-Chapelle (see AIX-LA-CHAPELLE, TREATIES OF PEACE CONCLUDED AT), when Louisbourg (q.v.) was restored to the French, the boundary questions were referred to commissioners, each Court agreeing that, until a decision was reached, no fort or settlement should be attempted upon the debated ground. But the shrewd La Galissonnière, disregarding the stipulation, if he was ever officially acquainted with it, commenced the construction of forts, and fomented discontent and claimed it for England. The importance of Nova Scotia in the future development of Canada was apparent to each nation, both from a strategic and commercial point of view, but neither power could furnish the necessary colonial resources to arm the sufficient strength to support its ambition. The policy of Great Britain toward Nova Scotia was most short-sighted. Instead of encouraging the emigration of a desirable class, intended to grow up with the Acadians and form a united and loyal people, she allowed the French for nearly 40 years, to regard the country in the light of an exclusive settlement. It is true that they were good subjects; but they were French at heart, and it remained to be proved whether, under extraordinary pressure, their sympathies would incline to France or not. The possibility of such a contingency was for years practically ignored, but when it was seriously considered the methods adopted were ill-advised. The lands of the French were divided and subdivided, until nearly all was ceded; but Great Britain decreed that new lands could be acquired only by Protestants. The question of religion, therefore, became a condition of tenure. Shirley (see SHIRLEY, WILLIAM) was largely responsible for the government of Nova Scotia, was firmly convinced that until French influence was exterminated British interests could not flourish; and so be endeavored to effect the conversion of the inhabitants, suggesting that rewards be given to those who renounced their faith. The King favored an assurance that the people should enjoy the exercise of their religion, but Shirley, in a proclamation, omitted the passage as dangerous. The home government then consented to a scheme for promoting the loyalty of the province by the importation of foreign Protestants, to mingle with the Acadians—a fusion possible under the British flag; but doubtful at such a critical moment, when the military organization was wanting to protect the frontier, or to inspire confidence in the stability of British institutions. Government agents in Geneva, and elsewhere, were active in advertising in the papers for settlers, and bargaining with poor artisans. But the scheme fell through; though at last 3,000 good settlers were landed at Chiboucto Bay in 1749, from which at length sprang the important naval port of Halifax (q.v.). In the meantime, however, a great struggle was impending, which led to the deportation of 8,000 Acadians (see article ACADIAN REFUGEES), whose subsequent misery and suffering contribute the darkest page to the history of New England. At the same time allegiance was demanded by Governor Cornwallis, which from time to time was deferred. While, on the other hand, the fiery zealot, Le Loutre (see Le LOUTRE, LOUIS JOSEPH), backed by the Indians, exercised every effort to influence over the people. Le Loutre detested the English, and was generally successful in persuading the unhappy people that an oath of allegiance to a Protestant monarch was very much like being disloyal to their faith, the penalties for which did not cease with their natural existence. But, although the dark deeds which were being enacted in 1753, concerning Nova Scotia, had a distinct bearing upon the approaching conflict, they were of secondary importance, and were claimed by the colonists, when compared with the prize which both France and England coveted—the possession of the Ohio Valley. The details of the contest in this section cannot be given here. (See BRADBURY, EDWARD, COLONIAL WAR IN AMERICA; FONT NÉCESSITÉ, PITTSBURGH, HISTORY; WASHINGTON, GEORGE). The effect of Braddock's defeat was felt in the expeditions of Shirley against Oswego (q.v.), and in that of Johnson against Crown Point (see CROWN POINT, FORT OF). A body of provincials had been raised, and placed under the command of Johnson for the reduction of Crown Point. But Dieskau intercepted, and almost captured, a detachment of this expedition. Reinforcements arrived at a critical moment, and the tables were turned by the capture of Dieskau. This circumstance was made a great deal of, but, nevertheless, Crown Point was un molested, and still in the hands of the French. War and bloodshed had desolated the homes of the colonists, and over all of them hung the dread of the tomahawk and the scalping knife of the Indian. Panic-stricken, they could devise no means of defense, and surrender seemed preferable to flight or massacre. The Indians were still at peace, the determination of the British had driven into exile the unhappy Acadians. But their own position there was by no means to be envied. British prestige was indeed at a low ebb in America, when the struggle between the two powers was superceded by a contest between the two two powers, which commenced officially when King George II signed the declaration of war against France in May 1756. The situation in New France was indeed acute. Agriculture had been neglected, grain was scarce, horses were slaughtered for food, famine was imminent. But it should be borne in mind that this deplorable state of affairs was not the inevitable outcome of the struggles through which New France was forced to pass, but the condition actually created for profit, toiled for and plotted for by Bigot, in order that he might appear as the real savior of the distressed colony. The advice of the intendant to his somewhat weak-kneed, and certainly dishonest, henchman, Vergor, to "cut and slip,
and make hay while the sun shone, in order that he might have the means to build a château in the midst of it. He did not count on the rapidity with which the war would terminate, as he intended to follow himself, though on a grander and more colossal scale. New France was to be pillaged. The people must be subdued, and bodily suffering would prove effective when less persuasive methods might fail. New life was to be infused to the colony for a moment when the Marquis de Montcalm (q.v.) arrived in Canada in the spring of 1756, with 1,200 troops and ample supplies. No better general could have been chosen than Montcalm. In fact, men of his mold were just what New France needed most at this time. He was an excellent soldier and had already won renown. He was loyal to his sovereign, at a time when loyalty was not profitable; he was brave and courteous, and he dearly loved France. Vaudreuil, the governor, was a Canadian, and attached to the land of his birth, but he despised every form of interference from France. Hence there was constant friction. Bigot, the representative of the King, loved his master and the cause for which he fought more than he understood in which they contributed to his needs; and his needs were of abnormal proportions. The conduct of Montcalm throughout the war, until the supreme hour when he yielded up his life in defense of the colony, formed a striking and pleasing contrast to the actions of his two colleagues. He was also fortunate in the chief officers under him.

England was far less happy than France in the choice of the commander-in-chief of her forces. Lord Loudon was marched out of the fort. Then followed a frightful scene, which has unjustly tarnished the memory of Montcalm. The Indians, disapproving of the plunder to which they looked forward at the sack of the fort, fell upon the prisoners with fury, and horribly massacred nearly 100 before any means could be taken to prevent them. Montcalm and Lévis did their best to arrest the fury of the savage hordes and save many lives; but the mischief was done, and dire vengeance was threatened. Notwithstanding the dismal failure of Loudon, Pitt was still determined to reduce Louisburg, which was to be made the chief objective in the campaign of 1758. Loudon had been recalled, and the command was entrusted to a man who had already done good service in Germany. The chief officers under him were Lawrence and Wolfe. The force consisted of about 12,000 men. On the 2d of June part of the fleet anchored in Gabarus Bay, a few miles from Louisburg, Boscauen being the admiral in command. The expedition was a joint one, both naval and military. Wolfe was the most conspicuous figure of all present. His brigade made the real attack from the boats, while Whitmore's and Lawrence's supported him by feints in other places. The landward siege was well pressed home, and Louisburg, the gateway of New France, soon fell, and being shortly after razed to the ground, literally became a thing of the past.

Success had attended British arms in other quarters. Bradstreet at the head of 3,000 men had captured Fort Frontenac, which the unwisdom of Vaudreuil had left inadequately supported, although it was a most important post commanding Lake Ontario and serving as a
base for the Ohio forts. De Noyan, the governor, had demanded reinforcements, but, in the place of troops, Vaudreuil had dispatched a one-armed man to his assistance, and, as resistance was futile, capitulation followed. Fort Duquesne had also become a British post, and now bore the name of Fort Pitt. Forbes, in the face of great difficulties, had endured the perils and suffering of a winter's march; and, when at last his bravery and determination had triumphed over every obstacle, and the fort was in sight, he found that it had been evacuated. With the evacuation fell all harmless occupation, Abercromby was making a worse mess of affairs at Ticonderoga (q.v.). The French had been expecting an attack at this vital point, which commanded the route by way of Lake Champlain, and threatened Montreal. A large body of men had been ordered there in the spring by Montcalm; but the withdrawal of so many troops under Loudon had convinced Vaudreuil that it would be an opportune moment to create a diversion on the St. Lawrence. With the aid of the Acadians, 1,600 men were detached for the purpose. By the middle of June Montcalm had only 3,000 men at Ticonderoga, the battalions of La Sarre, Languedoc, Bearn, Béarn, Gueugne and Royal Roussillon, with two good engineers. The place was by no means strongly fortified, but works were hastily thrown up in advantageous positions. In the meantime the formidable army under Abercromby, consisting of regulars and provincials, in all 15,000 men, was encamped about half a mile from the fort. But the real head of the army, Lord Howe, the best soldier in America, as Wolfe had said, had been killed in a prelimin ary skirmish, and the commander was powerless to act. Something had to be done, however, and Abercromby moved his whole force against Carillon. Montcalm's army had been increased by 500 men under de Lévis; and after a seven hours' blundering assault, Abercromby was completely outgeneraled and had no retreat. The victory covered Montcalm with glory, and he is frequently referred to as "the hero of Carillon." But although he had won glory for French arms, the victory was a blow to the prestige of Vaudreuil and signified the farther accentuation of discord which produced serious results in future operations.

In 1759 Pitt was at last in a position to put his greater scheme into practice. The tide of war was almost on the turn, and he seized opportunity beforehand. The Seven Years' War (q.v.) was being waged in many parts of the world; in fact, in a purely military sense, there were several different wars going on at the same time. But there was one great connexive force which made them one, and that was the British navy. Formed into the very middle of their great imperial war, which began after the fall of the Stuarts in 1668, and was continued as one single age-long and world-wide struggle for the over-sea dominion, it was now to be strengthened by the battle of the Plains of Abraham. The heart of it lay in the fight for American dominion; and the central episode of this fight itself is to be found in the expedition against Quebec, which culminated in the renowned battle of the Plains of Abraham. The four real conquerors of New France are Pitt, Anson, Saunders and Wolfe. The names of Pitt and Wolfe have always been on every tongue; but the equally important ones of Anson and of Saunders have been unduly forgotten. Pitt, of course, was the originator and in himself, the most important of the four.

As the whole fortunes of the war were really determined by the British command of the sea, it is absolutely necessary to understand the naval side of the campaign, not only for its own sake, but also for the sake of its relation to the whole work of the army. In the ever-memorable year of 1759, it was entirely due to the navy that England remained safe at home, and it was more than half due to the navy that she emerged as a conqueror abroad. France had prepared a gigantic scheme of invasion. One fleet was to sail for Ireland, where the troops were to be met on landing by a general rising in their favor. The Jacobites were to be stirred into insurrection by another French fleet destined for Scotland; and a third, larger than both the others united, was to convey innumerable troop-boats across the Channel, as they made a dash for the south of England. To guard against this national danger the navy then had to face their first regular test of blockade ever known. Boscawen blockaded Toulon, Hawke blockaded Brest, Rodney cruised off Havre and Admiral Smith kept the reserve fleet always ready in the Downs. Meanwhile, however, Pitt was preparing a counterstroke; not at France herself—where she would be stronger than England in a campaign fought out on her own home base—but at her over-sea possessions in Canada, from which she was separated by those 3,000 miles of hostile waters, which the British command of the sea had practically made a British possession. Thus Montcalm had to await attack in utter isolation, on the far side of an immense stretch of territorial waters, across which Wolfe advanced in perfect safety to meet him. And it is in this battle that the British navy's squadron was not only a strong one, for it comprised a full quarter of the whole navy, but that it was playing an integral part in a universal scheme of strategy—for all seas are strategically united. Wolfe's campaign was only a landing-party on a large scale. There were twice as many seamen as landsemen engaged in the taking of Quebec. Saunders had over 18,000 sailors, more than two-thirds of whom belonged to the navy, while Wolfe had less than 9,000 soldiers. The total British force, therefore, amounted to 27,000 men. Saunders and Wolfe received their secret instructions from the King in February, and immediately after sailed for Nova Scotia. The final rendezvous was Louisburg, where over 8,000 men were assembled in April. On 1 June the fleet began its dangerous voyage, with no less than 200 vessels of all sorts and sizes. It was navigated in perfect safety to the Island of Orleans, where it arrived on 27 June, and was not discovered until the tremendous gun salute two days later, nor by the costly display of fireworks, in the shape of fire ships, destined to work its destruction. The picket boats met the attack well up stream, and, "taking hell in tow," as a bluejacket forcibly expressed it, put all the enemy's vessels ashore, where they burned them-
selves out. Wolfe established three camps. The principal one was at Montmorency, just beyond the falls. The second was on the island of Montmagny, where the water was very convenient for a hospital and stores. The third was at Point Levis, which Vaudreuil foolishly refused to occupy, in spite of Montcalm's sensible advice, and which was consequently left open for Wolfe to build his batteries on. These batteries literally pounded the town to pieces; as a manuscript note on a plan of the siege in the French War Office truly remarks, "ce ne fut pas un siège, mais un bombardement." Among other projectiles of all kinds, 36,000 solid cannon balls were fired from this caign of vantage. Montcalm's position was still immensely strong, in spite of the loss of the Levis Heights. The upper town of Quebec is built upon the extremity of a long promontory which is bound on the south by steep cliffs, 200 or 300 feet sheer up above the Saint Lawrence, and on the north by lower, but still easily defensible, cliffs overlooking the valley of the Saint Charles. The town was held by 2,000 men under de Ramezay. It had a double line of batteries, with redoubts in the middle. The French disposed of trenches and enfilade fire, along the water front below them. The only open ground in the vicinity was round the mouth of the Saint Charles. But this was well entrenched, and the trenches were carried on continuously for seven miles along the Beaufort shore to the Montmorency, opposite Wolfe's camp.

Wolfe's first attempt to break through was made some distance up the Montmorency, where he tried to force his way across the fords and so attack the entrenchments in the rear. But he was repulsed with loss, in a bush-fight in which his regulars were at a great disadvantage. His second attempt was a more serious one. On 31 July he tried to carry the Montmorency Heights by storm, a mile on the Quebec side of the falls. But as his troops had to be collected from several quarters, in full view of the French, Montcalm easily anticipated him at the right spot, before he could deliver the assault. Besides the heavy guns, the French plan could not be carried out even according to Wolfe's intentions, because the grenadiers, 1,000 strong, suddenly broke into a wild charge before being properly formed up, and lost nearly half their numbers in a fruitless effort to scale the heights. Then a terrific thunderstorm burst on the scene of carnage, making the heights more slippery than ever, and so he had no choice but to call off his men at once. After this repulse Wolfe fell seriously ill, and toward the end of August he gave his brigadiers, Monckton, Townsend and Murray, a memorandum of three other plans for assaulting the trenches and asked them "to consult together for the public utility." Their council of war resulted in a complete rejection of all his suggestions; because, as they well remarked, the storming of such works from open ground would certainly be both difficult and dangerous. Moreover, even if the works themselves were carried, there would still remain the fortified lines of the rest of the promontory beyond, to keep him out of Quebec, until the lateness of the season would compel him to raise the siege. Their own plan was to take all the available men up the Saint Lawrence, and land at any suitable point between Cap Rouge, which was nine miles, and Pointe aux Trembles, which was 22 miles, above Quebec. Wolfe informed Pitt, in a dispatch written on 2 September, that he had acconised in this plan, and intended to put it into operation at once.

The Montmorency camp was cleverly evacuated, without the loss of a man, by a general naval and military demonstration against the entrenchments, which made the French feel sure that another attempt to storm the position there was about to take place. From 7 to 10 September the rain suspended all operations; and on 10 September Wolfe made his final reconnaissance. He was already well posted on the lie of the land in every direction, and the idea of attacking above Quebec was thoroughly familiar to his mind long before it was mentioned by his brigadiers. On 19 May he had said to his uncle, that he "reckoned on a smart action at the passage of the Saint Charles unless we can steal a detachment up the river and land it there, four, five miles, or more above Quebec." This plan was better than the brigadiers', as it contemplated seizing the ground much closer to Quebec than the finest objective point they proposed trying. At the final reconnaissance he chose the Founon, where a path led up to the Plains of Abraham, within two miles of the walls. If he could get up there without any serious check, he saw that he could forestall Montcalm by forming a line less than three-quarters of a mile from the city, where the promontory was narrow enough to be commanded by his small army, and where the mixed regulars and irregulars of New France would be forced to meet his homogeneous British red-coats on a flat and open ground. The French were on the alert everywhere along the north shore, from the falls up to Pointe aux Trembles, a distance of 29 miles — except just at the Founon itself. They could not tell what Wolfe was about, nor where the bulk of his men were, behind the impenetrable screen of the ubiquitous British fleet. They were naturally very apprehensive of another desperate attack on their trenches; they were well prepared against an assault upon the town, which was so strongly fortified by nature; while the constant movement of the fleet, and occasional landings from it, in the vicinity of Pointe aux Trembles, 22 miles up, made them think that any new plan would probably take the form of an advance in force by land from somewhere whereabouts. One man, indeed, besides Wolfe, was thinking of the Founon, and that man was Montcalm. On 5 September he had sent the regiment of Guienne, to the Heights of Abra- ham, but Vaudreuil withdrew it on 7 September, and left no defense there, except the puny Samos battery near Sillery Point, and 100 mi- litiamen at the top of the Founon, under the treacherous Verger. Even on 12 September, the very eve of the battle, Montcalm had again ordered the same regiment back, this time to the Founon itself. However, Vaudreuil had again countermanded the order, saying, "We'll see about it to-morrow." But Wolfe himself was up there on that very eve. The account of the battle of the Plains of Abraham, see Colonial Wars in America; Montcalm; Quebec; Wolfe.

The winter at Quebec, after its capture, was a terribly trying one for the little British gar-
rison; and so many men died of scurvy that, in the following April, when de Lévis marched out of Montreal with 7,260 men, expecting several thousand more to join him on the way, Murray could only muster 3,886 effectives. There was a second battle of the Plains, in which Lévis defeated Murray, who in less than two hours lost over one-third of his men. A second investment followed, and Lévis was in the act of advancing to storm the walls, when the vanguard of the British fleet suddenly entered the harbor. The French had now no choice of action. They hurriedly abandoned their camp, and retreated, in all haste, on Montreal, both by land and water. Then, step by step, the final British advance converged on the doomed colony. Murray came up steadily from Quebec, in close touch with Lord Colville’s squadron, which the French had absolutely no means of resisting. Haviland advanced from the south by way of Lake Champlain; while Aberhart, with the main army, came down the Saint Lawrence from the Lakes. When the united British army, 17,000 strong, actually landed on the Island of Montreal, the few remaining outposts were taken, and de Lévis in a body, and he found himself left with only some 2,000 of the faithful French regulars. The capitulation of New France occurred two days later, on 8 Sept. 1760. The French troops were disarmed. The Canadians had already dispersed. The American militia went back to their homes. The fleet sailed away to their stations. The British regulars took up their winter quarters. And the New Regime began. The Seven Years’ War is one of the most pregnant events in history; and its results have continued to exert a vast determining influence on the fortunes of every world power, down to the present day. In Europe it foretold the ultimate decline of France and Austria, and the ultimate rise of Prussia to the leadership of Germany. But its significance for the English-speaking peoples lies mainly in the fact that it was the most truly imperial war they ever waged; and its most dramatic episode—the battle of the Plains of Abraham—will serve to mark forever three vital stages in three great epochs of modern times—the passing of Greater France, the coming of age of Greater Britain and the birth of the United States.

ARTHUR G. DOUGHTY,
Dominion Archivist; Author of 'The Battle of the Plains,' etc.

6. UNDER BRITISH RULE TO CON- FEDERATION (1760-1864). At the moment when Vaudreuil (see VAUDREUIL-CANAV- NAL, PIERRE) capitulated to Amherst (September 1760) (see MONTREAL—History) there were no English in Canada save the troops and a few civilians who had come with them. But, outwardly at least, this act of surrender placed the French Canadians and the English colonists in America on the same basis as subjects of the British Crown. One sovereignty was thus established over a vast area where dwelt two races whose origins, sentiments, faith and institutions might have been so different. The sharpest contrast. A century later the face of the situation was profoundly changed. The American Revolution had created a second sovereignty in this region at a time when the population of Canada was almost wholly French, and yet by 1860 the Canadian English had come to outnumber the Canadian French. The maintenance of the bond with Great Britain, the rise of the United States and the influx of English settlers are the broad conditions which have affected the progress of Canada since the cession.

Three years elapsed between Vaudreuil’s surrender and the Treaty of Paris, which confirmed Great Britain in the possession of her American conquests. During this interval the country remained under military rule, and though General Murray’s relations with the subject population were marked by sympathy and tact, it was impossible that a sense of permanence should be inspired by such a document as the Act of Capitulation. The text of the treaty, in its turn, left many essential points unsettled, especially in the domain of law, and not until 1774, when the Quebec Act was passed, did French Canada receive from the British Crown and Parliament a charter upon which it could rely. The first 14 years of British rule were, however, a time of great importance in that the experience gained during this period suggested to Canada a kind of national force at the present day. The mass of the French population, seigneurs and habitants alike, accepted the change of masters in a spirit of resignation. Their courageous support of Montreal and Lévis is proved by a large variety of evidence. They seem to have shown as much daring as the French regulars, together with a superior knowledge of the country and a better grasp of the tactics which were suited to American warfare. That the deportation of the Acadians had stimulated their resistance to the British is more than probable, but in any case loyalty and patriotism would have led them to make a brave defense. Once beaten, they accepted the situation frankly and were not encouraged to rebel by that restlessness of the Indian tribes which took form in the conspiracy of Pontiac (1763-64) (see PONTIAC). The contrast between their docility and the growing dissatisfaction of New England and Virginia did not fail to leave an impression on the official mind both in Quebec and London. The result was that when difficulties arose between them and their English fellow-subjects the government was not disposed to espouse the cause of the latter. Apart from the respect for their property, the guarantee of their religious institutions was the question which came nearest to the hearts of the French Canadians. By Article 27 of Vaudreuil’s Capitulation it was agreed that "the free exercise of the Catholic, Apostolic and Roman religion shall subsist entire in such manner that all classes and peoples of the town and rural districts, places, and distant posts may continue to assemble in churches, and to frequent the sacraments as heretofore, without being molested in any manner, directly or indirectly." This clause of the capitulation was confirmed at the Treaty of Paris (see PARIS, TREATIES OR) with the condition "as far as the laws of Great Britain permit," but any restriction which might seem to be placed upon religious toleration was to be removed by means of a separate treaty rather than real. The communities of nuns were not disturbed even at first, and after a few years of deprivation large estates were restored to the Sulpicians. The Jesuits also would probably have received a continuation of their endowment for the special circumstances attending their
suppression in France shortly before the Treaty of Paris of 1763 and the partial suppression in 1773. As it was, the scrupulous care with which governors like Murray and Carleton (see CARLETON, SIR GUY) carried out the policy of toleration reassured the hierarchy and made it a firm supporter of British rule. Had there been no other factors in the political life of the country than the government and the French Canadians, the first years of the new order would have been peaceful enough. It is true that the commission of Governor Murray (1763) was marked by incidents of less auspicious than the assembly as might hereafter be convened by the governor and council it shall, before their sitting, take the oaths mentioned in the act entitled 'An Act for the further security of his Majesty's person and government, and the succession of the Crown in the heirs of the late Princess Sophia, being Protestants,' etc. In other words, every French Canadian who aspired to sit in the assembly of the colony must subscribe to the disqualification of the adoration of the Virgin and the sacrifice of the mass. Such language (borrowed from the laws of England) would have seemed offensive had political life become active in the colony, but as no assembly was convened till 1791 it remained shorn of practical significance. Real difficulty sprang less from the disaffection of the "new subjects" than from the presence in Canada of certain "old subjects," that is to say, of the English who had come to Quebec and Montreal at the close of the war. Here was a fresh element in the population, small but active and bitterly opposed to the recognition of French institutions. Prior to the outbreak of the Revolution an influential proportion of the English living in Canada were natives of the American colonies who had moved to the northern part of the British dominions with the design of enriching themselves through the fur-trade. Their antagonism to the French was prompted partly by race and religion but also by dissatisfaction with the French law, discouraged the use of the French language, destroyed or fettered the hierarchy, and incidentally have made themselves a dominant class. At no time before the passage of the Quebec Act could they have numbered more than a fifteenth part of the population, but, owing to the strength with which they raised the cry of the ruling race, they enjoyed a position of great prominence. Unfortunately for the success of their program, they incurred the dislike of the local authorities by an extreme radicalism of utterance and demeanor. Carleton, in particular, discounted them and held them to be infected with the mutinous views which were becoming so increasingly prevalent in the English colonies.

Sir Guy Carleton, afterward Lord Dorchester, is the most striking figure in Canadian history from the Conquest to the days of responsible government. The close friend and confidant of Wolfe, he began his career as a soldier. Circumstances made him an administrator and he ended by reaching the full stature of a statesman. Those who approve the policy embodied in the Quebec Act will, of course, rank him higher than he will be ranked by those who deny the wisdom of that far-reaching measure, but regarding the quality of his mind, the firmness of his temper and the justice of his intentions, opinion is undivided. After serving with distinction in the campaigns of 1759 and 1760 he returned to Canada as administrator of the government in 1766. In 1769 he became governor-in-chief; and from this date until his final surrender of power remained among all Englishmen the leading authority on Canadian affairs. The Quebec Act was the fruit of information and advice which he supplied; it was he who repelled Montgomerie's invasion, and the Constitutional Act of 1791 which gave the colony its first training in self-government was largely his work. During a formative period of 30 years his policy of generosity toward the defeated race was the policy of the British government. Murray, whose language reflected his personal resentment, says of the "old subjects": "I retract them in general the most immoral collection of men I ever knew." Carleton, though less severe in his strictures, formed a highly unfavorable opinion of them and expressed his preference for the French Canadians with perfect freedom. According to his forecast, which in this respect has not been altogether justified, the valley of the Saint Lawrence was unlikely to be inhabited by any large number of Englishmen. Most of the English who were then resident in Montreal and Quebec had come in the train of the troops and would probably return with them. The traders had not been successful and would soon disappear. To quote his own words, it remained that "barring a catastrophe too shocking to think of, this country must to the end of time be peopled by the Canadian race." The Canadians, he continues, are not a migration of Britons, who brought with them the laws of England, but a populous and long-established colony. Thus believing that the French could never be supplanted he concluded that their customs, ecclesiastical and legal, should be retained. A detailed statement regarding the Quebec Act will be found elsewhere (see the article THE QUEBEC ACT). Here it need only be said that its territorial provisions were extremely distasteful to the English colonies and that its concessions to the French Canadians have supplied a solid ground work for their loyalty to the British Crown. Whether Sir Biennent Taché was correct when he said, "The last gun that will be fired for British supremacy in America will be fired by a French Canadian," must be termed matter of conjecture; but the sentiment which prompted him to speak so fervently was gratitude for the Quebec Act. This measure provided an unobjectionable oath of allegiance, sanctioned the Roman Catholic religion in so far as it did not conflict with the King's supremacy, and ordained that "in all matters of controversy relating to property and civil rights, resort shall be had to Upper Canada as the rule for the decision of the same." Hence English criminal law and French civil law were established side by side in the regions covered by the act. When Upper Canada was constituted in 1791 it received the common law of England unmodified and un-
limited, but French civil law still survives in the province of Quebec.

At the same time when Great Britain was endeavoring to meet the wishes of her French subjects, the question of Canada was becoming an additional source of friction between the mother country and her older colonies in America. Not only did the English colonies disapprove a policy which heaped such favors upon the French, but some of them represented the King's disposition of the recently acquired territory to the west of the Alleghenies. In the royal proclamation of 1763 nothing was said concerning the government of this valuable region, an omission which disappointed Virginia and other colonies ambitious of expansion. Worse still, the Quebec Act handed over the western country to Canada, shutting out the older colonies and rendering an immense area subject to the operation of French civil law. At any time such action would have provoked remonstrance; in 1774 it quickened the resentment which had been gathering strength ever since the passage of the Stamp Act. How prominent Canada was in the eyes of the Continental Congress may be inferred from the decision, speedily formed, to gain control of it by force. The sequel was a severe blow to the Revolutionary cause. Montgometry (see Montgomery, Richard), advancing by Lake Champlain and the Richelieu, occupied Montreal and nearly succeeded in capturing Carleton, who was the head and front of the defense. Simultaneously Benedict Arnold (q.v.) made his way through the woods of Maine to the valley of the Chaudière and despite dreadful privations appeared before the walls of Quebec. On the arrival of Montgomery from Montreal a siege was commenced, but the sufferings of the troops proved so intolerable that it was decided to carry the town by assault. On 31 Dec. 1775, the two generals made a desperate attempt to force a passage through the streets of the Lower Town. During the fight which ensued Montgomery was killed and the British encountered Carleton drove out the invaders with heavy loss. The war in Canada dragged on during the greater part of 1776 but before the close of that year the Americans had been repulsed at all points and the issue, so far as it affected Quebec, was decided. In the British laws enacted by the Quebec Act the later accretions of English-speaking colonists will range themselves. As the bulk of the new population professed the deepest affection for Great Britain, a separatist movement was not to be thought of, but it was equally certain that disagreement would arise within Canada over the issue of legal and ecclesiastical institutions. As early as 1785 the Loyalists resident on and near Lake Ontario sent a petition to England praying that they might enjoy the blessings of the British constitution and of exemption from French tenure of property. Carleton, now Lord Dorchester, was eminently suited to effect an arrangement between the Loyalists and the French Canadians, toward both of whom he was drawn by feelings of strong sympathy. After establishing the 1788 special regulations for the administration of districts inhabited by Loyalists, he assisted in the preparation of the Constitutional Act (1791), a measure which was designed to do away with the grievances of the Loyalists without creating a sense of grievance among the French. Under the Constitutional Act, which in the British Parliament received support from Pitt and Burke, a division was made between Upper and Lower Canada. For each of these provinces a act created a legislative council and an assembly, but no independent power with respect to tariff legislation was granted. Clergymen of whatever denomination were declared ineligible to sit either in the council or the assembly, but freedom of worship was guaranteed to all. Catholicism in perpetuity and the Protestant clergy received as an endowment one-seventh of all waste lands belonging to the Crown. Some idea of the relative importance of the two provinces at this date may be gathered from the fact that in Lower Canada the legislative council was to
CANADA—UNDER BRITISH RULE TO CONFEDERATION (6)

consist of not less than 15 members, while in Upper Canada the minimum number was placed at 20. The difference in the representation between the number of members in the assembly — the minimum of 50 in Lower Canada as opposed to a minimum of 16 in the other province. Although grave troubles afterward arose under the operation of the Constitutional Act, the measure seems to have encountered little opposition in Canada save from the English minority in Quebec, whose leaders looked forward with discontent to the prospects of political inferiority. No tests excluded Roman Catholics from the council or the assembly, and after the elections of 1792 the latter body in Lower Canada contained 34 French as against 16 English members.

Within six months from the day when the first Canadian legislature met, Great Britain joined Austria and Prussia in their war against revolutionary France. While British North America was not drawn into the vortex of England's contest with the Convention, the Danes, the French, and the American empire, it felt the influence of that long struggle in more ways than one. Besides Canada's part in the War of 1812, which was a by-product of the larger strife, one must mention the attempt of French republicans to make trouble for England in Lower Canada, and a certain neglect of Canadian issues by the home government which may be ascribed to the pressure of more critical questions in Europe. At about the same time when Genet was endeavoring to raise the United States against Great Britain, agents of the National Convention sought to provoke a disturbance among the habitants of Quebec. The execution of McLane and the imprisonment of Fréchette for life are the chief incidents in this abortive undertaking. Of much more consequence was the failure of the colonial office to watch the working of the Constitutional Act in Lower Canada. The council, whose members were appointed by the governor, speedily became a stronghold of English interests. The assembly, whose members were chosen by popular vote, assumed no less speedily a French complexion. As the council considered itself to represent the dominant power and was quite free from the control of the assembly, it was naturally in this sense extraneously offensive to the French majority in the other house. The Constitutional Act gave representation but did not recognize the principle of ministerial responsibility to the popular branch of the legislature. In an age of mounting democracy, this type of government was open to fierce attack, especially when the question was complicated by racial prejudice. Between 1791 and 1812 the most maladroit governor of Lower Canada was Sir James Craig, who for three years (1808-10) carried on open strife with the assembly and finally had recourse to a coup d'état. In his assault upon the Canadien, a Nationalist newspaper, he unwarrantably arrested Bedard as the publisher of treasonable articles, dismissed Panet, the editor, imprisoned him, and eventually imprisoned six of the leading members of the assembly. Craig's action was due to a sincere belief that the French Canadians were disloyal because they criticized the conduct of the war and they had been identified by any notable dissensions. Through no fault of her own, and simply by virtue of being a British possession, Canada was drawn into the War of 1812 (see United States—War of 1812). Among the causes of the war, the only one which concerned her directly was the ill-founded contention that English officials were trying to stir up an Indian attack upon the American colonists in the West. From the outbreak of hostilities till the conclusion of peace Canadians of both provinces conducted the defense of their country in a truly patriotic spirit. The Loyalists were stimulated by the memory of their expatriation and fought enthusiastically for the British cause under Brock and Sheaffe. The French Canadians guided by Bishop Plessis (see Plessis, Joseph Octave) of Quebec, himself the descendant of a New England captive, displayed an attachment to England which had not been so clearly apparent at the time of Montgomery's invasion. Salmon's victory at Chateauguay proved that the French peasants had not lost their ancestral courage or their knowledge of the methods to be pursued in guerilla warfare. At Queenstown Heights (see Queenstown) and Lundy's Lane (see Lundy's Lane, Battle of) the Loyalists acquitted themselves well in the open field. The War of 1812 contributed much to the formation of a patriotic sentiment which was independent of provincial boundaries. The political unrest which affected most civilized countries in the generation following the battle of Waterloo appeared in Canada under an acute form and was not quieted until after the rebellion of 1837. The Upper Province, free from the problem of a mixed nationality, had hitherto been undisturbed by violent disputes, but as time went on the Constitutional Act was found unsatisfactory — or rather, the act gave no redress of the grievances which grew up under the existing system of administration. In Lower Canada the claims of the assembly found an eloquent champion in Louis Joseph Papineau (q.v.), the most prominent French Canadian of his generation. It should be clearly pointed out that the grounds of discord were different in this case, the development of agitation went on simultaneously and the two movements, each proceeding from its own set of conditions, reacted strongly on each other. English radicals and French radicals were brought into close sympathy as agitators by their common opposition to the established order. In both cases there were minorities whose privileges depended upon the maintenance of the constitution and the bitterness of the struggle for responsible government was intensified by the presence of these vested interests. In Upper Canada the contest between officialism and reform did not centre round the first principles of politics so much as it did round the exercise of power by certain individuals. The main strife was one of old settlers against new arrivals; the main issue in the lower classes was the political issues coming in to complicate the situation and render it disagreeable. A few families of Loyalist stock constituted a local oligarchy from which were drawn the chief officials of the colony. As the number of this ruling class belonged almost wholly to the Anglican
Church, and used their influence freely to benefit the Anglican clergy, they provoked the opposition of the dissenters who formed a majority of the more recent immigrants. The political solidarity of Anglicanism and the "Family Compact" led both to be denounced by the champions of responsible government—Robert Gourlay, William Lyon Mackenzie, Dr. Ralph and Egerton Ryerson. The clergy reserves were represented as a symbol of government by privilege and Roman Catholics united with Protestant dissenters to demand the application of the laws of Upper Canada to the support of schools. It will be seen that these sources of discontent were hardly of a fundamental character, but the population of Upper Canada was not one to bear political grievances lightly. In Lower Canada the situation was more intricate and more serious. When the excitement caused by the War of 1812 had died away, the relations between council and assembly resumed their former rancor, while the assembly and the executive became involved in a prolonged dispute over the sum of $10,000. By the financial provisions of the constitution certain revenues were at the disposal of the Crown and the assembly had control of certain other revenues which originally were much smaller. Through the expenses of the colony, the assembly's share of the revenue kept growing larger in proportion to that of the Crown, and at the same time the Radicals discovered that they could place the government in a very awkward position by refusing their consent to appropriations. The advent of which the assembly possessed through its power to keep up a perpetual dispute over fiscal matters was used with much tactical cleverness, though perhaps with less genuine patriotism than might have been desired. The fight against privilege (and there can be no doubt that the council had excessive privileges) was accompanied by a revival of racial feeling among the French Canadians. With Papineau for their leader the Nationalist majority in the assembly used language which showed that their brightest ideal was not summed up in subjection to British sway. Gradually the English element was eliminated from the ranks of the reformers, and though a few politicians of English birth (the so-called "Irishmen") during the disturbances of 1837 his sole hope of success lay in the support of the French. Under such a system of government as was provided by the Constitutional Act, the role of the governor assumed a degree of importance which it does not possess at present in any self-governing colony of the British Empire. Had able men than Sir Francis Bond Head and Lord Gosford represented the Crown in Upper and Lower Canada during the acrimonious debates of 1836, there might have been no breach of the peace. As it was risings took place in both provinces, the Radicals of Upper Canada being encouraged by some initial successes which the party of Papineau had gained in the autumn of 1837. The rebellion cannot be dignified by the name of "Rebellion," for its revelations were accompanied by slight fatalities and the issue was never in doubt. The French Canadian peasants who took the field were defeated at Saint Charles and Saint Eustache, and in Upper Canada the appeal to force collapsed after a farcical skirmish at Montgomery's Tavern, near Toronto. In 1838 fresh disturbances occurred at a few places in Lower Canada, only to be repressed with a promptness which showed the futility of further resistance. Apart from the domestic bitterness occasioned by these outbreaks, they were the cause of a diplomatic crisis in that the American sympathizers of Mackenzie's American sympathizers led to strained relations between Great Britain and the United States. The burning of the Caroline (q.v.) and the fight at Pelee Island (q.v.) were international episodes of the first importance. The best fruit of the rebellion was Lord Durham's report and the transformation of British colonial methods which followed it. In 1838 the Earl of Durham (see DURHAM, J. G. L., EARL OF) was sent to Canada as governor-general and given a commission to investigate the state of the country. The blue-book in which he described the causes of the rebellion and suggested remedies for obvious evils is held, by common consent, to rank first among the documents of the Colonial Office. Whether the commission was chiefly the work of Charles Bulwer, or by both in conjunction with Gibbon Wakefield, the report as it stands is a classic in political literature. The two essential recommendations which it makes are that responsible government be freely conceded and that the provinces of Upper and Lower Canada be reunited with a view of allaying the racial discord which had raged so fiercely in Quebec under the Constitutional Act. The Union Act of 1840 was the immediate sequel of Lord Durham's proposals and a first step toward the political consolidation of British North America. The salient feature of this constitution may be defined as the transfer of political power to an assembly which was chosen on a very democratic basis, though not by universal suffrage. The legislative council, with members appointed by the Crown, was retained, but real authority centred in the popular branch of the legislature. To the assembly each province contributed 42 members and it was provided that a general election should be held every four years, subject to the chance of a dissolution by the governor-general during the interval. The Union Act had imperfections and inconveniences which finally furnished a strong argument for Papineau during the disturbances of 1840-67 Canada gained a political training which was invaluable and escaped from the worst of the anomalies that had provoked the rebellion. At first the act seemed to favor the English, inasmuch as French were to be an official language; but in 1848 it was restored to its former position of parity. With the establishment of democratic principles the party system reached a maturity which before had been unknown in Canada. Lapointe (see LAPIONTAINE, SIR LOUIS H.), Baldwin (see BALDWIN, ROBERT), McNab (see MCBNAR, SIR ALAN N.), Macdonald (see MACDONALD, SIR JOHN A.), Brown (see BROWN, GEORGE), Cartier (see CARTIER, SIR GEORGE E.), and many other accomplished politicians found free scope for their engagements in the ranks of Reformers or Conservatives. Much of the legislation which marks this period (for example, the abolition of seigniorial tenure in 1854) was designed to adjust the life of Canada to modern conditions. Given at the cost of partitioning with a picturesque instinct or discarding an ancient view of the
relations which should subsist between church and state. The Reformers, however, had no exclusive possession of the liberal spirit, for it was a Conservative administration which abolished the clergy reserves. Education in both provinces began to receive an amount of attention which had not been paid to it hitherto. Judged also by economic results the progress of Canada under the Union Act was extremely satisfactory.

As the confederation movement is considered separately (see the article on The Confederation), it will be unnecessary to discuss here the causes which suggested to Canadians a larger political conception than is represented by the Union Act. But in conclusion some reference should be made to the progress of Canada as affected by its relations with England on the one hand and with the United States on the other. From 1840 onwards the country enjoyed self-government in all matters of an imperial character, but it remained a colony and never considered itself to be a co-ordinate part of the British empire. In the second quarter of the 19th century the fixed belief of English ministers was that colonies are a kind of fruit which drops off the parent tree when it has become ripe. The rebellion of 1837 coming when liberal principles were triumphant in the mother country prompted the adoption of a generous colonial policy which has never been abandoned, but its effect upon the rise of imperial sentiment was only indirect. Yet notwithstanding the absence of a full partnership between Canada and England, the loyalty of the colony was signally illustrated during the first century of British rule. Despite friction between races, the pressure of foreign invasion and the existence of political privilege in both provinces, the attachment of an overwhelming majority of the population to British institutions and the British connection remained firm even throughout the decades that preceded the rebellion. The division which the American Revolution created between the United States and British North America could not fail to affect the fortunes of Canada in the most vital manner. Apart from the distractions caused by the filibustering raids of 1838, the question of boundaries was for long periods together unpleasantly prominent. The Webster-Ashburton Treaty of 1842, though it was received with great dissatisfaction in New Brunswick and Quebec, did good rather than harm by settling an irritating dispute. The Reciprocity Treaty of 1854, which was largely due to the efforts of Lord Elgin, brought the two countries into more direct contact than ever before, promoted friendly intercourse, and opened a source of prosperity to Canada during the 13 years of its existence (1854–67). Its repeal by the United States was in large measure due to a resentment which had arisen from Great Britain's attitude during the American Civil War. The fact remains that in its birth year the Dominion of Canada was excluded, by action not its own, from reciprocity in natural products with the United States. See the articles Union Pacific Rule; The Clergy Reserves; Seigniorial Tenure.

7. THE MARITIME PROVINCES TO CONFEDERATION. The early history of the three eastern seaboard provinces of Canada is an important incident in the long dramatic struggle between France and England for world-empire. Their place on the map linked their destinies with those of New France on the one hand, and of New England on the other. The tale of their settlement and organization into communities is part of a greater story, the overflow of European peoples into the New World. They have been profoundly affected by great events outside their borders, European wars and political changes on this continent; and if they have not as yet reacted on the history of the world, as a nation they are young; their history is yet to make.

Nova Scotia.—In 1604, Sieur de Monts, a Huguenot gentleman adventurer and trusted soldier of Henry IV, made a voyage to the great Atlantic peninsula, which is now called Nova Scotia (q.v.). He was to found a colony in return for his broad patent to trade in furs. After exploring the rugged eastern and southern coast-line, he discovered the beautiful Annapolis Basin, and wintered, suffering terribly, on the island of Saint Croix. The next year, after searching as far south as Cape Cod for a suitable place, he turned back to the Annapolis Basin, and planted his colony on its shores, naming the cluster of huts Port Royal. The colony did not flourish, and, in 1613, it was destroyed by a force under Argyll from the newly-founded colony of Virginia.

The French name for the country was Acadie, a musical native word, often mistaken for Arcady. It means "abounding in," as in Shu-benacadie, and conveys the idea of a wilderness, comprising what is now Nova Scotia, New Brunswick (q.v.) and part of Maine. In 1621, this territory was granted by James I to Sir William Alexander (q.v.), a Scottish gentleman, to be colonized on a plan distinctly medieval. Alexander was to parcel out his province into "baronies," six miles long by three deep, to gentlemen, who were to "plant" them with settlers. Each baronet was to have almost regal powers within his own domain, even striking his own coinage, and "repelling" criminals from the King's courts of law to his own. The colony was to be a new Scotland, even by a legal fiction, part of the county of Edinburgh. One small settlement was actually made on the Annapolis Basin in 1629, but it came to nothing, and the colony handed back to France in 1632, by the treaty of Saint Germain-en-Laye. Still, to this day, the baronets of Nova Scotia form a distinct order in the British aristocracy, and the provincial flag bears the azure saltire of Sir William Alexander and the red lion of Scotland ramping in gold.

For 22 years, the French had undisputed

possession, and succeeded in planting a colony on the feudal pattern, as far removed as possible in principle from republican New England. The farms were given to the military in paternal; the land was held by seigneurs and titled by a dotile tenancy. The habitants were chiefly unlettered peasants from the country about Rochelle. In Acadie, they found broad marsh lands beside tidal waters, resembling the country they had left, but with long dykes of logs and earth on the river banks, and peacefully cultivated the rich fields the salt tides fertilized. Population grew slowly. In 1671, there were 378 persons in the colony; in 1683, 600, chiefly about Port Royal. An interesting census of Acadie was made in 1686 by de Meulles, intendant of New France, who visited the scattered settlements and numbered the families, acres of cleared ground, boys, girls, foolis, horned cattle, swine and sheep in each of the new Colonies which had grown to 10,331, including 30 soldiers at Port Royal. Although thickest about the seat of government, the Acadians had spread along the coasts and so far as the Bay of Fundy. Many women were in the habit of bringing wheat, peas and rye and raising cattle, sheep, swine and poultry; they also built small boats for the shore fisheries. An observer relates that when the manure-heaps beside their barns grew unmanageable, they moved the barns. Few women came with the first settlers, who married with the Indians, and always lived on friendly terms with them. Priests of the Sulpicians and Missions-Étrangères were their trusted guides both before and after the English conquest. See article Acadian Refugees.

Throughout this period, the chief interest lies in the shifting fortunes of one family. Claude de St. Etienne, Sieur de la Tour, a ruined Huguenot gentleman of Champagne, came out early in the 17th century, with his son, Charles Amador, a boy of 14, to better himself in the new colony. After Argall's raid, the two lived for years like Indians among the Indians. Their stronghold was Fort Saint Louis, or Sable, now Annapolis Royal, and Port Lamour. In 1627, Charles petitioned Louis XIII to be made commander of the coasts of Acadie, and his father took the petition to the French Court. On his return voyage the next year, he was captured by Kirk's fleet and taken prisoner to England. Here he became a friend of Sir William Alexander, married a maid of honour to Queen Henrietta Maria and was made a baronet of Nova Scotia, as well as his son, with large grants of land to support their titles. With his wife he came back to Cape Sable, where Charles held the one solitary post for France in Acadie. By persuasion, and at last by force, he strove to win his son over. Failing in both, he begged permission to live in Acadie, rather than return to England in shame, or to France and lose his head. This Charles granted, and Claude with his bride, this effects, two valets and two femmes de chambre disembarked. In 1635 Denys the historian found them living there in comfort.

Charles' loyalty by making him his lieutenant-general in Acadie. In 1632, Isaac de Razilly took possession of the province in the name of France; his chief officers were La Tour the younger and D'Aulnay Charnizay. On the death of de Razilly in 1636, the territory was divided between the two; La Tour established himself in baronial state at the military on his Huguenot bride, but D'Aulnay made Port Royal, across the bay, his headquarters. D'Aulnay intrigued against his rival at the court of France and procured his recall to answer charges of fraud upon de Biencourt, his former officer. La Tour went with his forces to go to France, and tried to enlist the Puritans of Boston on his side. Failing them, he obtained help from Rochelle; the proud city of the waters* sent him supplies, munitions of war and 140 soldiers in the Clement. When the Clement arrived in the spring of 1643, she found Port Saint John closely beset by D'Aulnay and 500 men. Being closely pressed, La Tour and his devoted wife slipped through the blockade by night, reached Boston safely, returned with reinforcements and drove D'Aulnay back to Port Royal. But D'Aulnay's hate was not easily tilled. He went to France to raise another force against his enemy. At the same time, Madame La Tour went to Rochelle, to gather more of hostile arms and help growing wheat, pease and rye and raising cattle, sheep, swine and poultry; they also built small boats for the shore fisheries. An observer relates that when the manure-heaps beside their barns grew unmanageable, they moved the barns. Few women came with the first settlers, who married with the Indians, and always lived on friendly terms with them. Col. Francis Nicholson, took Port Royal after a brief but gallant defense by Subercase. Port Royal at once became Annapolis Royal, in honor of the reigning sovereign, but it was not until 1713 by the Treaty of Utrecht (q.v.), and assiduously against the will of Louis XIV, that Acadie became finally a part of the British Empire.

From 1710 to 1749 a small British garrison at Annapolis Royal held the province tenaciously for England. The fort, though well placed, and a Vauban plan, was ruinous; the earthen walls were always crumbling into breaches; the gun-carrigages would not bear the guns; the barracks were roofless; for years the men were without bedding, stockings, greatcoats or medicines. Supply-ships from England came once a year and brought provisions for nine months instead of 12. The hostile population would not take New England money for it must have been of evil. His authority would not honor the governor’s drafts; the Boston merchants refused credit. During Walpole’s long peace England seemed to forget the lonely garrison, while the French priests were agents for the French government, undermining the English. Louisbourg, the new French city on the island of Cape Breton, was yearly growing in power; millions of livres were spent on its defenses, for France was bound to win back her lost province. All the time, convinced of its importance to the empire, one discouraged English governor after another held doggedly to his post.

The government was military, not civil, for the Acadians being Roman Catholics were, by the laws of England, incapable of voting; but at least one official regretted that they could not be given representation. They were governed by their deputies, the “ancienst” and most reputable men of each parish, chosen every year or about 11 October. These were responsible for the good behavior of their districts and for the execution of orders transmitted by the governor-in-council. Philipp, colonel of the 20th regiment, was governor for about a year. He was a hardy fisherman, who presided twice, but resided mainly in London, while lieutenant-governors, chiefly regimental officers, Armstrong, Cosby, Mascarene, administered the colony. The governor was supreme; but to assist him, he had a small council, whose functions were advisory and executive. These officials did their best to advance British interests, giving the litigious Acadians justice in their endless disputes, and making wise suggestions for the improvement of the colony, which had vacancies that led to rivalry in the Duke of Newcastle’s closet of unopened dispatches.

On the outbreak of the War of the Spanish Succession (see Succession Wars) the men of Massachusetts rose and by splendid audacity struck down the stronghold of French power, Louisburg; but that glorious adventure belongs to the annals of New England rather than of Nova Scotia. In the summer of 1744, gallant old Mascarene sustained two hot sieges in his ramshackled stronghold, but the first force was led by young Belleisle and other Acadians; the second, by Du Vivier, a descendant of Charles de la Tour. In 1746, Ramezay encamped against him, awaiting D’Anville’s armada, but did not fight. The same winter, he surprised Noble’s force at Grand Pré, and killed, wounded or took prisoner nearly 200 men.

When the war ended by the Treaty of Aix-la-Chapelle in 1748, Cape Breton was restored to France, and Louisburg, the Dunkirk of America, resumed its old attitude of menace to the very life of the English colonies. Then at last sluggish England moved to save the key to her possessions over-see. Nova Scotia was to have an effective garrison to counter-check Louisburg. In June 1749 a fleet of 13 transports, bearing some 3,000 colonists, and escorted by the sloop-of-war Sphinx, reached the great three-fold harbor of Chebucto, long known for its excellence to French and English mariners. The leader of the expedition was Col. Edward Cornwallis, twin brother of the gay archbishop of Canterbury, and uncle of the Lord Cornwallis, who surrendered Yorktown. His authority did not see service at Fontenoy and Preston Pans, and although his military reputation was afterward clouded by his share in the Rochefort and Minorca fiascos, he did his work as a city-builder well. The new military post, Halifax (q.v.), was quickly laid out. The Acadian population organized into a militia and a rough line of stockade and block-house run along the streets of tents and log-huts. In spite of the character of the settlers, trade-fallen soldiers and sailors, and the plague that carried them off in hundreds; in spite of Indian massacres, opposition from local smugglers, extortions of Boston merchants, discouragements from the home government, Cornwallis made Halifax a place on the map of the world. The founding of Halifax brought about the second capture of Louisburg, leaving the way free for Quebec (q.v.) and the downfall of the French power in America. Emigrants from Old and New England flocked to the new city. In 1750 and again in 1752, some hundreds of settlers came from the Palatinate. After a brief stay in Halifax, they were transferred to the island-studded bay of the La Hève, the old headquarters of de Razilly, where they have grown into a race of hunters and fishermen in his own town, Lunenburg, is the Gloucester of Canada.

In 1752, Cornwallis returned to England crippled by rheumatism, but his successors, Hopson and Lawrence, built strongly on the foundation he had laid. Their great problem was the growth of French power in the fortress of Louisburg and in the Acadian population. Under English rule, the habitants were far happier than under their old masters. The nominal government at Annapolis Royal had been powerless for good or evil, but legally it did not extend beyond a cannon-shot from the walls of Fort Anne. It was precisely under English rule that the Acadians increased and multiplied, and, beginning to press upon the means of subsistence, spread outward, round the Bay of Fundy, to the marsh-lands on the further shore. Their law-suits were nearly always over disputed lands, or boundaries. In 1755, they numbered about 10,000 persons. England and France were then mustering all their forces for the coming struggle of the Seven Years’ War. No one could foretell that it would be final or which country would win. England seemed to be at the lowest ebb of fortune and spirit. Brown’s lugubriousété—The Maritime Provinces to Confederation (7) — 393

male predicted her immediate downfall. France seemed strong in the New World; she had hemmed the disunited English colonies in with a chain of forts from the mouth of the Mississippi to Louisiana. Louis XVI had never ceased to regret the loss of Acadie or to plan for its recovery. The province was the pivot of the whole situation in the east. In these circumstances, the presence of the alien French population in it constituted a grave danger. The claim has been set up that they were neutrals; they had this idea themselves; but this strange notion was simply due to the impotence of the British government. They were no more neutrals than the people of Alsace and Lorraine were after their transfer to Germany in 1871. They were British subjects by conquest, by treaty, by the formal taking of an oath of allegiance and by the common law of nations, but they refused to consider themselves as such. They imagined subjects against another war, or the return of the Pretender. Whether they left the province or remained in it was not a matter of indifference. If they stayed, they afforded a shield to hostile operations; if they went, they would strengthen and feed the garrison of Louisbourg. In this dilemma, the old proposal of Shirley’s was renewed, their deportation. In the autumn of 1755, after Braddock’s defeat gave the signal for war, this was done. The idea originated in New England and was carried out by New England men, acting under the orders of Governor Lawrence. At Grand Pré, Pisiquid, Chignecto and Annapolis Royal, the men were called together and made prisoners, and placed on board the transports; their families followed them. The embarkation consumed long weeks. Finally the ships sailed and distributed the unhappy people among the Atlantic colonies. In all, some 7,000 persons were in this way removed from the province. Opinions differ as to the measure. The French theory is the natural brutality of the English; one writer finds his reason for it in the greed of Lawrence to seize on the belongings of the poor peasantry. The general English view is that it was a war all round, but imperative for self-preservation; and this theory has the support of Parkman.

With the deportation of the Acadians came peace with the Indians. In 1761, Argimoooh, "the great witch," and his braves buried the hatchet in Halifax and washed the war-paint from their bodies. Now for the first time settlers were safe outside the pickets of the city; and the country began to fill up. Emigrants from Connecticut occupied the waste lands of the North, New Englanders settled in the Gaspe and the Western Isles settled about Pictou harbor. Presbyterians from the north of Ireland found homes in Colchester. Before and after the Revolutionary War, thousands of devoted Loyalists came to the province, some to remain, some to pass on. Shelburne, a city of these exiles, numbering 10,000 at one time, passed away like a gipsy encampment. The long wars of peace began with countless inroads upon the wilderness. In a century the Acadians had spread, cleared forest and shore, and settlements were eating into the forest, and hamlets were springing up beside the empty harbors. Before the end of the century, the great industries of shipbuilding and the fishery were in their vigorous infancy. The American Revolution left few marks on the history of the province: efforts were made to bring the colony into revolt with the rest, one daring man planned the siege of Halifax, and some of its patriots with the rebels were tried for treason. There was even something like a tea riot in Halifax; but the conservative forces held the province firm. Halifax prospered, as it always did in war-times, through supplying the army and navy, and the sale of the many prizes brought to port. With the return of peace, the tide of prosperity promptly ebbed. In three great wars since its founding, Halifax was a nest of privateers, which brought large returns to their owners.

Colonial government was at first military. All power was vested in one man, the governor, or his lieutenant-governor, who was usually a soldier. To advise him, he had a council, and his instructions were those of the Crown. As the Acadians were incapable of representative institutions, they were governed through their deputies. Members of the old council were sworn into the new one by Cornwallis, who became governor. His large instructions empowered him to summon assemblies and make laws; but the first assembly was not elected until 1758. From this time, the chief power passed from the governor to the council, a small coterie of Halifax officials and merchants, appointed for life, who sat in secret session and were not responsible to the people. The powers of the assembly were curiously limited, and friction between the two bodies was constant. Governor succeeded governor, almost always an army officer with high Tory views of prerogative and military conceptions of his office. He was gently guided through his unfamiliar civic part by permanent officials in the council like Richard Bulkeley, who came out as aide to Cornwallis and died provincial secretary in 1800. The tone of society as well as government was conservative, not to say reactionary. This state of things lasted until well into the fourth decade of the 19th century. With its large military system as all poor parliaments lived by supplying them, Halifax was in many respects an English garrison town in America. In the first session of the House of Assembly, the Church of England was established by law; the first college was modeled on Oxford, and its statutes required subscription to the Thirty-nine Articles both at matriculation and on taking a degree.

The agitation for reform began outside, for the country was pitted against the city. Jotham Blanchard and Edward Carhart of the Gilead and the Western Isles settled about Pictou harbor. Presbyterian from the north of Ireland found homes in Colchester. Before and after the Revolutionary War, thousands of devoted Loyalists came to the province, some to remain, some to pass on. Shelburne, a city of these exiles, numbering 10,000 at one time, passed away like a gipsy encampment. The long wars of peace began with countless inroads upon the wilderness. fax magistrates, in plain terms, of pocketing public money. Their indignation was extreme and they began a libel suit against the daring editor. If truth is libel, Howe had no case; and no lawyer would undertake it. Howe conducted his own defense, and by a brilliant address to the jury secured a triumphant acquittal. From that hour he was the idol of the people, whose cause he had espoused. On the other hand, several hot upholders of the existing order challenged him; he fought one duel, and, having proved his courage, wisely declined further argument by pistol. Howe was a good example of the popular tribune, emotional, eloquent, social, with the faults of such a nature, but possessing tact withal and the statesman's insight into great problems far beyond the ken of provincial politicians. On such questions as the union of the remaining British American colonies, communication between them, the federation of the empire, Howe was far in advance of his time, and his ideas were formative. Henceforth, his career was in politics, rather than in the law. In 1832, Elgin, Lord of All the Isles, recalled him to Halifax in 1836, he at once attacked existing abuses in a series of resolutions, which served chiefly as a program of reform. Soon afterward he began an important correspondence with Lord John Russell, the colonial secretary, upon the difficulties of local government. As a result, the latter instructed Sir Colin Campbell, the governor, to introduce certain of the changes suggested by Howe. This Sir Colin refused to do, and Howe began an agitation which led to his recall. He was succeeded by Lord Falkland, whose remedy for the trouble was coalition in the council. Four of the old council were dismissed, and four Liberals, Howe among them, took their place. But the two interests were irreconcilable: Howe and his friends soon resigned, and began to lay before the people the evils of the irresponsible system. In the election of 1847 Howe and his party swept the country. The new assembly passed a vote of want of confidence in the council, which then dissolved. After a period of weakness, the Liberals were re-established, and the principle of responsible government was established.

The situation of the colonies remaining to Britain on this continent in the first half of the 19th century was of course much less pleasant than it had been before 1760. Nova Scotia was largely virgin forest, with struggling towns and widening clearings: Lower Canada was alien in speech and religion; both passed through the throes of rebellion. The Great West was supposed to be uninhabitable. The provinces by the sea were poor, thinly settled, each with its own government and its own tariff wall against the rest. The 20th century dawns on a united and prosperous country stretching from the Atlantic to the Pacific. For years Howe pointed out the value of union, for the object lesson of the Great Republic was hard to mistake. But here, as in the case of the 13 colonies, before and after they achieved their independence, each province had its own pride, interests and jealousies. Besides these, the geographical barrier to communication was insurmountable; but the locomotive engine changed the face of affairs and provided the solution of the problem. The universal fever for building railways reached the provinces. The first railway in Nova Scotia united Windsor, Halifax, and Truro; the first in New Brunswick, Saint John and Shediac. A bolder idea was to join the provinces, inland and seaboard, by an intercolonial railway. If united for commerce, why should not the colonies be united for government?

It cannot be said that anywhere in the Maritime Provinces was there a popular movement in favor of union. It was the thought of a few strong, far-seeing men, with powers of persuasion, like Macdonald in the West and Howe in the East. Nova Scotia has the honor of leadership in bringing about the Charlottetown conference. When the question came, in 1848, Howe was in opposition, and Tupper carried the resolution through the House. By a curious irony of fate, Howe was now led to combat the very measures he had fought for so long. He took advantage of his opponent's failure to submit such an important measure to the verdict of a popular election and he roused the people into fury against confederation. They were bought and sold, he told them, "for 80 cents a head, the price of a sheepskin." In the next election, the great issue was repeated. The union. Howe re-carried the country, and Tupper was the only conservative returned. Howe tried every legal means to detach his province from the union, but the British government refused to reconsider the measure in Parliament, and Howe would not appeal to Washington, or have recourse to arms. He sought "better terms" for his province from the Dominion government, and entered the Macdonald ministry to assist in working out the problems of the new experiment in government. Though not a consistent man, Howe was a great man; with all his faults, he loved Nova Scotia well, and Nova Scotia will long cherish his memory.

New Brunswick.—The waterway of the Saint John as a greater Indian road, attracted the attention of the French fur traders early in the 17th century. La Tour fixed his headquarters at its mouth. It is still the main artery of the province. There were also French settlements on the rivers and harbors, such as the Miramichi, the Restigouche, and the St. John. The town of Rochelle was partly fortified; the town at Beauport's Point had 200 houses and a chapel. These settlements were not permanent. There was a small colony from Massachusetts at Maugerville on the Saint John; in 1760; but the history of New Brunswick as a political unity begins with the close of the American Revolutionary War.

In some respects, the struggle of the 13 colonies for independence was a civil war, for all the colonists were not of the same mold. Some of the best regiments on the King's side were raised in America. For instance, Fanning, the second governor of Prince Edward Island, at one time judge of the Supreme Court of North Carolina, raised and commanded the King's American Regiment. When the British cause was lost, such forces were disbanded, and the citizen soldiers, impoverished by eight years of war, could not or would not live under the new government. Many of the official class, the Episcopal clergy among them, were also on the losing side. For the defeated, there was no mercy; the fierce republicans would not let them live in the country. After the surrender at Yorktown (q.v.), thousands of these unfortunate fathers of New York and other seaports. No provision was made for
them in the terms of peace; but public sympathy was aroused on their behalf, the British Parliament took generous measures for their relief, Sir Guy Carleton stood their friend. Ships were provided to carry them away, large grants of land were made to them in the loyal colonies, with tools, supplies and provisions for one, two, or three years. Some went to England, but the great majority found homes in the northern wildernesses. There some 30,000 exiles, many of the educated and cultured classes, found refuge. In American history these are the Tories, traitors to their country; in Canadian history, they are the United Empire Loyalists, the makers of the new Dominion. More than any other class of emigrants, they formed present Canadian sentiment and institutions.

The great emigration took place in 1783. On 18 May a fleet of 19 transports, with some 3,000 Loyalists on board, reached the mouth of the Saint John. Here a great stream of 450 miles pours through a narrow break in the rocks into a small harbor, where the flood-tide rises 26 feet. As the tide ebbs leaves 12,000 squatted ships aground. All round are desolate hills masking the fertile region beyond. This unpromising site the Loyalists chose for their city. They were men of the 8th, 9th, 19th regiments, the New Jersey Volunteers, and the Queen’s Rangers. The grantees’ list show good substantial English names. The “fall” fleet brought 1,200 more, and Parrtown, so called in honor of Governor Parr, of Nova Scotia, began its career with a population of 5,000. Politically, it was situated in Sunbury County, Nova Scotia. Soon the Loyalists showed active discontent at Governor Parr’s delay in making out their grants, and in giving them representation in the House of Assembly and, in spite of his opposition, they succeeded in persuading the British government to erect their county into a separate province with a royal governor, council and House of Assembly of their own. This was done in 1784, and the province of New Brunswick was created by royal charter, with Carleton, brother of the famous Sir Guy Carleton (q.v.) for governor. His commission and instructions were practically the same as those given to Cornwallis in 1749. This council of 12 members exercised both executive and legislative functions. The first House of Assembly, of 45 members, was elected, not without riot, in 1785, and met for the first time in the following January. In this year, Parrtown was incorporated as Saint John (q.v.); it was the first city in British America to receive a charter. It is modeled on the charter of New York, and gives the mayor the office of garbling spices and the right to appoint the bearer of the great beam. No emigrant or other person could sell goods without first obtaining the freedom of the city. From the founding of the province until 1832, no changes were made in the constitution. As in Nova Scotia, the prevailing ideas were high Tory; and popular rights received little attention.

New Brunswick’s chief wealth is her great forests; and her two chief industries, lumbering and ship-building, soon sprang up: but agriculture languished. Population followed the waterways, the natural timber roads from the interior. Down to the time of the Crimean War the timber-trade was fostered by last legislation. The province grew, but not steadily: periods of prosperity were followed by periods of depression. Many emigrants brought out by the timber-ships simply passed through to the United States. The Reciprocity Treaty of 1852 was a boon to the Maritime Provinces: its abrogation injured trade.

During the War of 1812, the province was harried by some sea-hogs, and New Brunswick was not invaded, like Upper Canada, because New England was opposed to the war. In the provincial sea-port privateering also flourished. Dalhousie College was founded with customs money taken at Castine by an expedition from Halifax. After 1815, settlers from the United States began to occupy disputed territory between New Brunswick and Maine. The boundary between the two, left vague by the treaty of 1783 almost led to war. The northwest line was to run due north from the source of the Saint Croix River to the height of land between the Saint Lawrence and the Atlantic. Instead of one chain of high lands, there are two chains: between them lay the disputed territory, comprising some 20,000 square miles. In 1794, a commission was appointed to determine the line. The Americans wished to extend the due-north line to the Mètis River in Quebec: the British wished to make Mars Hill the limit, and they could not agree. Another attempt at settlement was made by the Treaty of Ghent. The King of the Netherlands was appointed arbitrator, but his award was not accepted. In 1839, the difficulty became acute. Some lumber-thieves cut timber on the disputable land; the governor of Maine sent a sheriff and posse to drive them out, and New Brunswick lumbermen resisted the officers of the law. The squabble roused intense feeling on both sides. The governor of Maine called for 10,000 troops to guard the State’s rights. The governor of New Brunswick, Sir John Harvey, sent two line regiments with artillery and volunteers to the scene of action. Nova Scotia voted all her militia and £100,000 to aid the sister colony; the Canadians also put. Thomas Carleton, brother of the famous Sir Guy Carleton (q.v. for governor. His commission and instructions were practically the same as those given to Cornwallis in 1749. This council of 12 members exercised both executive and legislative functions. The first House of Assembly, of 45 members, was elected, not without riot, in 1785, and met for the first time in the following January. It is modeled on the charter of New York, and gives the mayor the office of garbling spices and the right to appoint the bearer of the great beam. No emigr
As in other colonies, the irresponsible council became an abuse, and many were the contests between it and the assembly. In 1832, a second council was established with executive, but not legislative functions. This was done by the home government in its desire for uniformity in the colonial governments; but the parliamentary aspect of the question with respect to an effective executive council or cabinet to carry out the will of the majority were slow in being understood. It was six years later before the executive included a member of the elected assembly. Slowly the province worked out the problem of self-government. In 1839, when Sir John Harvey read to his legislature, Lord John Russell's despatch on tenure of office, and unlike the governor or Nova Scotia was in accord with its proposals, the assembly, after full debate, actually refused the boon of responsible government. In 1848, however, the modern system in essential particulars was recognized by formal resolution. Charles Fisher, and L. A. Wilmot, afterward judge and lieutenant-governor, were the leading reformers, and two of the most prominent of the reformers, looking at the wrong done by the system, and Sir John Harvey, in were in complete sympathy with the popular movement.

New Brunswick was represented at the Charlottetown conference, where the preliminaries of confederation were discussed. At the Quebec conference, the leading men of the opposition as well as of the party in power were delegates. The 72 resolutions then agreed upon were to be submitted to the various legislatures for their approval. Before the New Brunswick assembly they could be dissolved, and in the new House, a large majority were pledged to oppose them. This led Nova Scotia to withhold the resolutions, as no vital union could be effected with the upper provinces that left out New Brunswick. However, when the House opened in 1866, the majority committed themselves to the policy of union in the speech from the throne. The House dissolved on the issue, and, sentiment having changed, in the new election, the unionists were returned by a large majority. New Brunswick had been out of the federation since its original members of confederation. See article Confederation; also New Brunswick.

Prince Edward Island.—The large crescent-shaped island in the southern part of the Gulf of Saint Lawrence is supposed to have been discovered by Cabot, and afterward by Cartier, who named it Isle Saint Jean. After the conquest, it was still called Saint John's Island until 1780, when the local legislature named it New Ireland, an act disallowed by the British parliament. It was governed from Louisbourg. In 1752 the population was 1,354. Three years later, after the fall of Beaumont and the expulsion of the Acadians, many took refuge there. At the fall of Louisbourg in 1758, the population was at least 4,000 souls, in four thriving parishes. The fertile "Garden of the Gulf," as the islanders love to call their little sea-girt province, was even then worthy of the name. Casgrain calls it a second Acadie; for hence also the Acadians were expelled. When Captain Holland made his survey in 1764, he found only 30 Acadian families "on the footing of prisoners," and a tiny British garrison in a miserable fort.

In 1763, the year of its cession to England, Lord Egmont proposed a plan of settlement worthy of Sir William Alexander in its feudal character. One feature was a chain of baronial castles from one end of the island to the other; but the plan was never carried out. In 1767, the entire island was divided into 67 lots or townships, of some 20,000 acres each, and granted, by lot, in one day to a number of influential Englishmen, on the old condition of settling so many emigrants within a certain time; they were to pay a perpetual quit-rent, or land-tax. Here began the curse of the absentee landlord, which laid the island under a blight for more than a century. At first, it was annexed to the government of Nova Scotia, but in 1768 it was, on the petition of a majority of the proprietors, erected into a separate province. In 1770, the first royal governor, Colonel Patterson, arrived with his official staff, whose salaries were to be paid from the Public Treasury. The formative ideas here were also high Tory. Roman Catholics were not permitted to settle; no schoolmaster from England might teach without a license from the Bishop of London. Population grew slowly; for few of the proprietors fulfilled the conditions on which they got the land. In 1773, the first House of Assembly was elected. Its first act was to confirm all the past proceedings of the governor and the council.

On the outbreak of the Revolutionary War, two American vessels, sent to cruise in the Gulf for British ordnance stores, raided Charlottetown and carried away some prominent officials. For this Washington cashiered the delinquent officers and released the prisoners with expressions of regret. Another raiding expedition from Machias came to nothing, and the island remained free from molestation till the close of the war. In 1781, proceedings were begun in the Supreme Court against the townships in arrears with the quit-rents, and various holdings were escheated and sold, it was thought, without due notice to the landholders. The unimproved waste land was an obstacle to colonization; the owners neither planted settlers nor paid the quit-rents, on which the revenue depended. The landlords argued for the defense, that some of them were officers on active service, that the war had prevented settlement, and that the lands were sold to persons on the ground at absurdly low prices. In rebuttal, Patterson urged that in the midst of a disastrous war, both money and purchasers were scarce; the island might have been captured or ceded back to France. He admitted that he bought up escheated lands, but held he was within his rights as a citizen in doing so; he had also, at his own risk, saved out of the sales, various lots for the absentee owners. In response to various petitions from the proprietors, the home government granted them relief, and sent a draft bill to Governor Patterson, making the sales voidable. This he was to submit to the assembly, but he suppressed it for two years. A new assembly was elected in 1784. It resolved to complain to the King against the governor for disposing of the lands so hastily, when he dissolved it.
The war was now over; the exiled Loyalists were pouring into Nova Scotia, and Patterson hoped to divert the desirable stream of emigration into his own province. Many Loyalists came; by special favors he secured them to his interest. Many of them settled on the lands sold in 1781, and in 1785, secured an assembly certain to support him. It passed an act approving his conduct in escheating the unimproved estates, but the home government disallowed the act and recalled the disobedient official. In 1789, he was again admitted at last to the English Draft Act, already mentioned, to the assembly, which passed it with haste, as also another act of the governor's framing restoring the escheated lands to the rightful owners, but saddling them with heavy expenses; this the home government disallowed and dismissed the members of the council concerned in it.

The new governor, Edmund Fanning (q.v.) arrived in November, but Patterson refused to vacate his office, and the winter was spent in the assembly of fifty or more members, but in the spring, Fanning was firmly established. The escheated lands remained in the quiet possession of their purchasers, some of whom came to terms with the original grantees. Fanning was a native of New York, a graduate of Yale, and a D.C.L. of Oxford. Through the Revolutionary War, he commanded the King's American Regiment and was twice wounded. In his administration, the land question smouldered. The chivalrous Earl of Selkirk, who also settled settlers in Upper Canada and the Northwest, brought out in 1803, 800 of the Clan Ronald Macdonalds and settled them about Point Prim.

Fanning was succeeded by Des Barres, a Swiss officer in the British service, famous for his surveys, his amours and his great age; he jumped over a settle when he was more than a hundred years old. His administration was uneventful, but not so that of his successor. Charles Douglas Smith, brother of the famous Sir Simon, who died in Acre, was a fine example of the old-fashioned high Tory royal governor. His first address to the assembly, when it met in November 1813, was insolent and dictatorial. In the following January, he adjourned it and did not convene it again until 1817. Between this and 1820 the legislature was three times assembled and dissolved, after short sessions, by this exponent of personal rule. His proceedings in regard to the quit-rents were also oppressive. In 1818, in opposition to the express commands of the home government, Smith enforced the payment of quit-rents in arrears. His action, however, the British government disallowed, and ordered part of the exactions to be refunded. Then, for three years, no attempt was made to collect the odious tax; in some instances payment was refused by the receiver-general. In 1823 another effort was made by the governor to enforce payment. The Gaelic-speaking Highlanders of King's County were required to pay duties that seemed obsolete, or give promissory notes at 10 days. In the depth of winter, they must haul their farm produce to Charlottetown and sell at a sacrifice to meet these demands. Without a legislature, the people petitioned High Sheriff MacGregor to call public meetings for the discussion of grievances. The gathering at Charlottetown drew up an address to the King, rehearsing a long list of charges against the governor, and requesting his recall. Smith retorted by opening a libel suit in the Court of Chancery, over which he himself presided, against the committee on the King's address in the House of Assembly. He claimed to prevent the petitions reaching England, but the custodian of them escaped to Nova Scotia. For merely publishing an account of the proceedings the editor of the local paper was brought into the Court of Chancery for libel. When he revealed the names of the men who had been admonished by the chancellor-governor in the vein of Jeffreys. This energetic ruler, who shook his fist at the speaker of the assembly and gave him three minutes by the watch to adjourn the House, was recalled in 1824, when he had brought his long-suffering province to the verge of rebellion.

Governor succeeded governor; the island grew in population and prosperity; fisheries and husbandry throve; but the land question was not yet definitely decided by the fact that the original proprietors had died and bequeathed or had transferred their rights in the island. In 1859 Sir Samuel Cunard (q.v.), the Halifax merchant who founded the famous line of steamers, proposed that the whole question be referred to a commission of three members, one to be appointed by the Crown, one by the island Assembly and one by the proprietors. To this all agreed. Howe was the nominee of the Assembly. The commission sat in the Colonial Building in Charlottetown, examined many witnesses, though not on oath, and heard counsel on behalf of both parties. They afterward visited the shire towns and acquired a vast amount of information on the difficulties. Their report is dated 18 July 1861. It condemns the original method of granting the island, commends the land purchase act, by which the Selkirk and Worrell estates had been acquired for the people, and considers some such system to be the solution of the vexatious problem. It recommends the British government to guarantee a loan of £100,000, which would enable the local government to enter the open market for the purchase of estates. But the home government refused to be bound by the findings of the commission. The old difficulty remained until the island came into the Confederation in 1873, when the Dominion government placed $800,000 to the credit of the province for the purchase of estates and the local legislature made the sale of estates, on evaluation of commissioners, compulsory.

Charlottetown was the scene of the historic conference of delegates from the maritime provinces to discuss union, when the representatives of the Canadas came knocking at the door, but the islanders were not in favor of any change in their status. There was prejudice, the conception of a new nation was hard to grasp and the main issue was befogged by parish politics. Although islanders took part in the Quebec and London conferences also, the island remained outside Confederation until 1873, when the crippling of the provincial means by extensive railroad building led the people to a reconsideration of the matter. The Dominion government gave generous terms, and the little province, while losing nothing of autonomy, entered
into a larger national life. See articles in this

lege, Halifacs.

8. CONFEDERATION. In 1837 there
took place two rebellions: one in Upper and
British, the other in Lower and French, Can-
da, simultaneous, but almost unconnected,
and scarcely united in sympathy, since the Brit-
ish Protestants of the upper province were by
no means fraternally linked with the French of
the lower. In Upper Canada the rebellion was
a rising of a democratic party, including many
of the most recent colonists and some from the
United States, against the personal rule of the
imperial governor and the domination of a po-
litician. Lord Durham nicknamed the Family Compact,
and consisting largely of U. E. Loyalists, which
monopolized public offices and emoluments. Its
leader was Lyon Mackenzie, a man honest and
right in his main aim, if responsible govern-
ment is right, but wanting in wisdom and
capacity as a leader. The object of the extreme
wing was an independent republic or annexa-
tion to the United States. That of the less
extreme wing was responsible government on the
British model. The political crisis and the
outbreak of civil war were brought on by the
indiscretion of an inexperienced governor, Sir
Francis Bond Head, who (1835-38) threw him-
self into the arms of the Family Compact and
the Tory party. In Lower Canada the rebellion
was a rising of the French, the conquered race,
who formed the great majority, against the
monopoly of office and power by the British
and conquering race, exercised largely through
a council appointed by the imperial governor.
Its object was the assertion of French equality
and right. It had been preceded by a series of
angry controversies between the French
patriots and the governor with his British
councillors and the Colonial Office at their
back. Both rebellions were quelled (1838) with
ease, without much bloodshed, that in
Upper Canada by the loyal militia, that in
Lower Canada by the Queen's troops. There
were few executions, but some of the leading
insurgents were driven into exile. The constitu-
tion of Lower Canada was suspended, but
that of Upper Canada was not.

The Liberal party in the mother country was
now in the ascendant, having carried Par-
liamentary reform. It looked with sympathy on
the struggle of the Canadians for free institu-
tions. Lord Durham (q.v.), son-in-law of the
Whig Prime Minister, Earl Grey, and though
an aristocrat a strong Liberal, was sent out
(1838) to study the situation. In a report of
remarkable ability, which has been regarded al-
most as the gospel of colonial liberty, he de-
cided in favor of extending to Canadian respon-
sible government on the British model,
requiring the governor, instead of ruling per-
sonally, to be guided, like the British sovereign,
by the advice of responsible ministers, who
were to be elected by the free will of the people.
The report at the same time recom-
}(399)
self with the exercise of an informal influence, rendered important by his character and ability. He could even flatter himself that he did more in this way than he could have done with the formal powers of the governor. He came in, however, for the last of the storm. The Liberal party, now in power, passed an act called the Rebellion Losses Act (1849), indemnifying those who had suffered losses by the destruction of their property in the suppression of the rebellion. This the Tories regarded as the indemnification of the rebels. Their cry was taken up by the Tory party in Great Britain. Elgin gave his assent to the act, reluctantly it seems, in compliance with the rule which required him to be guided by the vote of Parliament and the advice of his responsible ministers. The Tories, now playing the part of insurgents in their turn, rose, burned the Parliament House at Montreal (1849), with its irreplaceable archives, and stoned the governor-general, who had a narrow escape from their fury. After the Rebellion Act had been assented to and was supported by the home government. After this his reign, or rather his term, was peaceful and generally popular, though more popular with the Liberals than with the Tories. The triumph of the free trade policy in Great Britain and American aid had made the friction less. Navigation Acts and was excluded from the market of the United States, bred commercial depression and discontent. The consequence was a manifesto signed by leading commercial men and pointing to union with the American republic as a remedy in the last resort. To put an end to this movement by removing its cause, Lord Elgin went to Washington and negotiated a reciprocity treaty with the United States (1854). This, following the repeal of the Navigation Acts and the release of the Canadian trade from the fetters which they imposed, restored prosperity, allayed discontent and put an end to the desire of annexation.

After the Rebellion Act, the most hotly debated of the political questions was that of the secularization of the clergy reserves (1854) (see CANADA—CLERGY RESERVES), tracts of land, which, before the revolution of 1837, the Crown of England had established in Canada, had been set apart for the maintenance of the clergy of the state church. After a long struggle secularization was carried, and the state church, with its privileges, ceased to exist. King's College, Toronto, which, so far as the teaching staff was concerned, had, like Oxford and Cambridge, been Anglican, was turned into the University of Toronto (see TORONTO, UNIVERSITY OF), and thrown entirely open to all denominations. Under Bishop Strachan, the powerful Anglican leader of the day, high Anglicans seceded from the University of Toronto and founded the University of Trinity College (1852). Other churches, during the continuance of the exclusion, had obtained charters for universities of their own, and dissipation of resources not more than sufficient, if collected, to maintain one great university, was the result.

The abolition of the seigniories (1854) in French Canada (see article SEIGNIORIAL TENURE), relics of the Old Bourgeois regime, the oppressive privileges of the seignior, was another change obviously demanded by the new order of things. It was accomplished peacefully, without violation of the rights of property, and with entire success. Another necessary change was the abolition of the aristocratic custom of primogeniture in succession to land, for which was substituted the democratic principle of equal partition, "giving up," as the movers called it. The Tory party, sympathizing with aristocracy, faintly resisted the change. The progress of democracy was further marked by a change in the constitution of the Legislative Council which formed the Upper House of Parliament. Instead of being nominated by the Crown, as it had hitherto been, it was in 1856 made elective.
